FIFTY-EIGHTH QUARTO VOLUME

From January 1, 1915 to June 30, 1915

Railway Age Gazette

(Established in April, 1856)

SIXTIETH YEAR

NEW YORK CHICAGO CLEVELAND LONDON

1915
FIRST HALF

INDEX

Fifty-eighth Quarto Volume—January 1, 1915, to June 30, 1915.

[Space forbids making the index of the *Railway Age Gazette* so detailed as to show every reference in the entire half year to every detail of every subject. General headings, therefore, are used which are intended to be inclusive, and if the reader fails to find a particular subject under the specific heading with which he connects it in his mind, if he will look under the general subject of which this is a branch he should find the article he is looking for. For instance, one of the articles published during this half year was entitled "A Billion Dollar Confiscation." This article dealt with the general subject of the Interstate Commerce Commission's accounting rules and in particular with their rules for charging for depreciation on equipment. The article is indexed, therefore, under Accounting—Depreciation, I. C. C. Rules for. There is also, it might incidentally be mentioned, a cross reference Depreciation—see Accounting.]

W. E. HOOPER	H. F. LANE	C. W. FOSS
B. B. ADAMS	R. E. THAYER	F. W. KRAEGER
E. T. HOWSON	A. C. LOUDON	K. L. VAN AUKEN
H. H. SIMMONS	C. B. PECK	E. G. ZACK

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico	$5.00
Canada	6.00
Foreign Countries (excepting daily editions)	8.00
Single Copies	15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention daily issues, North America, $1; foreign, $2.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue 8,900 copies were printed; that of these 8,900 copies 7,863 were mailed to regular paid subscribers to the weekly edition, 250 were provided for counter and news companies' sales, 1,054 were mailed to advertisers, exchanges and correspondents, and 233 were provided for samples and office use; that the total copies printed this year to date were 8,900, an average of 8,900 copies a week.

The **RAILWAY AGE GAZETTE** and all other Simmons-Boardman publications are members of the Audit Bureau of Circulations.

VOLUME 58 JANUARY 1, 1915 NUMBER 1

Contents

*Illustrated.

Car Construction in 1914

Probably the most interesting feature of the figures for car construction in 1914 is the increase in the number of all-steel box cars built, the greater part of which is due to the adoption of the all-steel type of construction on the Pennsylvania Railroad. It will be noticed also that there is a considerable increase over 1913 in the number of steel underframe box cars built, while the number of steel frame box cars falls off materially. At first glance it might seem that the steel frame construction is losing in popularity, but there may be other explanations for these figures. In a year of depression like the one just past many of the railroads order little or no equipment, so that the cars built are for a comparatively few roads and it is difficult to point to any definite tendency which is indicated by the construction figures. There is also an increase in the number of steel underframe passenger cars built, but most of these were built for a comparatively few roads, some of which favor this type of construction. The all-steel car preponderates, although there is a falling off in the total number of cars built. Of the wooden passenger equipment cars, the greater proportion were milk, refrigerator, and cars for other special service.

Increased Capacity in Existing Locomotives

The ever pressing need of greater trainloads has increased locomotive dimensions and capacities so rapidly that the large locomotives of a few years ago, which the more modern equipment replaces, have developed a serious problem for the motive power and operating departments to solve. There are numbers of these locomotives which possess more capacity than is needed for way-freight or branch line service, yet in many cases it has been necessary to place them in such service, as well as in switching. Many of these engines are capable of developing a maximum tractive effort which will start very heavy trains, but are deficient in boiler capacity and are therefore incapable of economically hauling such trains for any distance. If there were some way of increasing the steam making capacity of such locomotives they could take their place in heavy main line service; in fact, such an increase in boiler capacity could very easily obviate the necessity of a road's making considerable expenditures for new locomotives of greater capacity. The difficulties attending the use of superheated steam with slide valves and the expense necessary in applying piston valve cylinders have prevented the use of superheaters in many such instances. Of the past year's locomotive development, therefore, perhaps the one of most direct interest to railways is that which has shown the possibilities of increased capacity obtainable from existing locomotives. It is now possible to apply piston valves without going to the extent of entirely new cylinder and saddle castings, and the use of the superheater and the brick arch, even on narrow firebox locomotives, has given remarkable results in increased hauling capacity. It is therefore probable that the immediate future will see the modernizing of the large locomotives of a few years ago, in considerable numbers.

The Electrification of Steam Roads in 1914

The past year has witnessed marked progress both in the adoption of electric operation on existing steam roads and in the design of transmission and motor equipment. The important improvements in the equipment are discussed on another page by N. W. Storer. There was completed the first year of electric operation of the Butte, Anaconda & Pacific where heavy tonnage ore trains have been handled regularly on steep grades with marked reductions in operating costs. The New York, New Haven & Hartford also finished the electrification of its four-track main line into New Haven. The Chicago, Milwaukee & St. Paul is proceeding with the electrification of the first engine district of 114 miles from Harlowton, Mont., to Deer Lodge, crossing the Rocky mountains, which is the first step in the electrification of 440 miles of main line extending west to Avery, Idaho. The trolley poles have been erected for a considerable distance and a contract was given recently for 12 electric locomotives and substation equipment. It is expected that the first district will be completed for operation late next fall. The Norfolk & Western is engaged in the electrification of 30 miles of its line between Bluefield, W. Va., and Vivian. The power house and overhead construction are completed, and the first locomotive tests are now being conducted. Another large project now under construction involves the electrification of 80 miles of suburban tracks on the Paoli subdivision of the Pennsylvania in the suburbs of Philadelphia. This project is also approaching completion, and if successful will undoubtedly lead

to the electrification of other suburban lines of the same road in this vicinity. The Canadian Northern is completing the electrification of its new entrance into Montreal through Mt. Royal tunnel. Another interesting project on which electrical studies have not yet been completed is that of the operation of the five-mile tunnel of the Canadian Pacific at Rogers Pass, B. C. Upon its completion late in 1916 it will be operated electrically.

Thus, it is evident that the electrification of steam roads is making steady progress. At present over 2,250 miles of such tracks have been converted for electric operation and over 280 electric locomotives are employed regularly in addition to motor cars, etc.

SOME REASONS FOR OPTIMISM

EVERYBODY directly or indirectly connected with the railway industry should enter the year 1915 with a feeling of optimism. The year which closed yesterday was certainly a most unsatisfactory one in the railway business and the railway supply business. The situation in these industries was bad enough before the war began. The decline in total railway operating revenues per mile in the fiscal year ended on June 30, 1914, was less than 3½ per cent; in other words, the total loss of traffic was comparatively small. But the total operating revenues did not reflect the true condition of the railway business. There were very heavy increases in operating expenses due to advances in wages. There were very heavy increases in taxes. Such increases in expenses and taxes had been going on for years. There had been no advances in rates to offset them. The consequence was that affairs in the railway business got sadly out of joint, and demoralization ensued. This demoralization in the railway business produced a terrible effect on the railway supply business, and a less serious, but nevertheless serious, effect on other classes of business concerns.

While the total operating revenues per mile in the fiscal year 1914 declined less than 3½ per cent, the net operating income per mile declined almost 16 per cent; and this in spite of the fact that the most strenuous efforts were made by the railway managers to curtail expenses. They were unable to pay the increased taxes and to meet the advances in wages, while at the same time employing the same number of men and making the same expenditures for equipment and supplies as before. To offset the increases in wages and taxes they laid off as many employees as they could and cut their purchases as much as they could. What was the result? In 1914 the total wages paid were greater than in any preceding year, but these total wages were paid to a very much smaller number of men than were employed in the preceding year. We have secured from the railways entering Chicago, and published on another page, statistics showing the reduction which they made in the numbers of their employees in the year ending August 1, 1914. This date was chosen for comparative purposes because it was the one on which the great war in Europe began, and therefore, up to that time the condition of the railway business in this country had not been affected by the war. As our statistics show, the railways entering Chicago had before the war began reduced the number of their employees by 91,000. The situation on the roads entering Chicago unquestionably was typical of the situation on all the railways of the country, and if this was the case, then on August 1, 1914, the railways of the United States had on their payrolls almost 200,000 less men than they had a year before.

The effect of the curtailment of railway purchases was even more serious in proportion. We have also collected, and publish elsewhere, statistics showing the number of men normally employed and the number employed on August 1, 1914, by a large number of representative railway supply concerns throughout the United States. These figures show that before the war in Europe began these concerns were employing 40 per cent less men than they do normally. Doubtless their condition was typical of that of railway supply concerns in general.

Needless to say, the effect of the situation in the railway and railway supply businesses was felt throughout every other line of business in America. The hundreds of thousands of men who were out of employment in these industries had their power to buy from the retail merchant greatly curtailed. This affected the ability of the retail merchant to buy from the wholesale merchant. This affected the ability of the wholesale merchant to buy from the manufacturer. There resulted a general dislocation of industry, and unemployment all along the line, from the railway at one end to the purchasers of all kinds of raw materials at the other. The conditions have grown much worse since the war began. The number of men in the railway and railway supply businesses out of employment is much greater now than it was on August 1. But this aggravation of the situation is attributable to the war.

What were the causes of the conditions prevailing in the railway and railway supply businesses before the war began? They were partly due to the decline in traffic; but this decline was relatively small. They were due chiefly to the fact that, not only in the fiscal year 1914, but for some years before, there had been heavy increases in wages, taxes and the rate of interest which the railways had not been permitted to offset by increases in their rates. That was the main and fundamental thing that was wrong with the railway business. That was the main cause of the reduction in net operating income. That has been the main cause of unemployment in the railway business. That has been the main cause of the reduction in railway purchases and of unemployment in the railway supply business. And that probably has been the main cause of the industrial depression which so long has been felt in every line of business.

Now, what has happened to justify us in saying that everybody directly or indirectly connected with the railway industry should enter the year 1915 with a feeling of optimism?

For years the spokesmen of the railways and students of their business had been endeavoring to show the public, the press and the Interstate Commerce Commission that it was only a matter of time until disaster would overtake the railways and the other industries of the country if railway expenses and taxes continued to increase and the roads were not allowed to deal with these tendencies by advancing their rates. It long seemed impossible to make the public, the press and the commission recognize the facts and act accordingly. This was the cause, and a justifiable cause, of the pessimism regarding the future of the railways which prevailed widely. During the last year that ground for pessimism has been removed. The public and press were brought to a full realization of the facts. The Interstate Commerce Commission showed by its decision on July 29 that it had become aware of the situation, and it showed this more fully still in its recent decision in the reopened 5 per cent rate case. The commission did not give the railways all that they asked for, or thought they were entitled to receive, but it did assent unreservedly to the proposition that the net earnings of the eastern railways had become too low. It accepted the view of the railway managers as to the reasons for this, and it has given the railways some of the advances in rates they asked for and some they did not ask for. It is to be regretted, no doubt, that the commission did not go farther. But the problem with which the commission is dealing is a big problem. Being a big one, it cannot be solved in a day. The important thing was to get the commission to realize and concede that the railways must have advances in their rates and to grant some of the needed advances. The commission has now granted some advances in the eastern rates, and there is strong reason for believing that it will grant further increases both on the eastern and western roads if the cases are properly presented to it and to the public. We add, "and to the public," because the developments have shown that the railways must try their cases before the bar of public opinion as well as before the commission and the courts. And one of the encouraging features of the situation is that those who led the railways in their contest for rate advances in the east demonstrated that

they had learned how to try their case before the court of public opinion.

In another column of this issue Chairman Kruttschnitt of the Southern Pacific discusses the subject, "Whither Are the Railways Drifting?" Mr. Kruttschnitt shows clearly the serious conditions with which the railways are confronted. But he also expresses confidence that the outcome will be the success and continuance of private ownership and management subject to public regulation. Doubtless there will be no great and immediate change in business conditions. Doubtless improvements will come slowly. But, on the other hand, doubtless the decisions of the commission in the 5 per cent case marked the beginning of a change in our policy of regulation. That such a change cannot fail in a comparatively short time to prove beneficial to the railways and all related industries and ultimately to all the industries of the country, can not be intelligently questioned. The campaign for fair regulation and for the benefits it will confer has not been finished. But after many battles have been lost a great battle at last has been won. If the entire campaign for fair regulation is to be ultimately successful it must be pushed on both vigorously and courageously, but that it will be the *Railway Age Gazette* has no doubt.

It is only a matter of time until traffic in general will begin to increase. The trouble in the past has been that whether traffic increased or not, expenses and taxes increased more in proportion, and, therefore, net earnings tended to decline. Under a policy of fair regulation, which will give the railways the advances in rates that they need, increases in traffic will be accompanied by proportionate increases in net earnings. And reasonable increases in net earnings will restore prosperity to the railway and railway supply businesses, give back their jobs to the hundreds of thousands of men in these industries who are now out of employment and exert a salutary influence on the industry of the United States in general.

RAILWAY CONSTRUCTION IN 1914

THE mileage of new lines built is generally considered one index of the conditions existing in the railway industry. The marked decrease in the mileage built in 1914, as indicated in the statistics published in another column, would therefore lead one to believe that 1914 was an unusually bad year for the railways. The new mileage constructed was only half as much as in the previous year, and was the least for any year since 1895. While a reduction was expected by everyone, its extent will surprise even many closely in touch with conditions. For the first time more mileage was built in Canada in 1914 than in the United States, although Canada was only 60 miles behind the United States in 1913. This is the first time, in fact, that any country in the world has exceeded the United States in this regard.

Another significant feature of last year's record is the completion of many large projects which have been under way for two or more years, such as the Magnolia cut-off of the Baltimore & Ohio, the new lines of the Louisville & Nashville in Tennessee, Alabama and Kentucky, the new lines of the Northern Pacific from Tacoma, Wash., to Tenino, and the extensive double track work of the Chicago, Milwaukee & St. Paul in Iowa. These projects were all undertaken before the depression of the last year was felt so keenly, and it was advisable to carry them through to secure a return on the large sums already spent. Bearing this in mind, one can see that, even the low figures for 1914 do not indicate fully the depression which has existed in railway construction.

This condition is not surprising in view of the increasing difficulties under which the railways have been laboring. The continuance of unfavorable agitation and legislation, the attitude of the employees as evidenced in the demands for full crew laws, and the decreasing business in the face of increasing costs of materials and labor, have all served to make the railways hesitate before authorizing large investments for extensions to reach new territories or for costly improvements in existing facilities. A study of the detailed statistics shows that no long extensions were built last year and that a large proportion of the new mileage was composed of short lines to reach traffic which already existed.

While the decrease in the mileage of new multiple main tracks built reflects the same general unsatisfactory conditions, it also indicates that the present railway facilities are not being taxed to their capacity. Following the traffic congestion of 1906 and 1907, and of 1910, the roads spent large sums in the construction of new terminals and additional main tracks to enable them to handle the increasing traffic quickly and economically. As a result they have a plant capable of handling more business than is actually being offered to it now, and the demand for more multiple main tracks is not so urgent.

The distribution of new mileage between the different states last year is interesting and shows a tendency evidenced in recent years. If the country is divided into four groups, the territory west of and including Colorado leads with over 645 miles of new line. Next to this the largest mileage was built in that portion of the country south of the Ohio and east of the Mississippi rivers, where 485 miles of new road was built last year. Less than 125 miles was built east of Chicago and north of the Ohio river. The relatively active construction in the far west and in the southeast is in accord with the comparatively rapid development of these areas. This undoubtedly accounts for Florida leading the country in new mileage, as large areas have been made available for cultivation by the reclamation of swamp lands in recent years.

Less than 280 miles of new line was completed in the states lying between Chicago and the Rocky mountains, and over 100 miles of this was in North and South Dakota. In Texas, which for a number of years led in the amount of new line constructed, only 51 miles was built, as compared with 356 miles in the previous year, while in Oklahoma only 4 miles was built. The figures for some of the other states in this area—Kansas, 11 miles; Missouri, 4 miles; Nebraska, 1 mile; Iowa, 26 miles—are equally instructive, when it is remembered that these states have led in the passage of drastic regulatory measures. While the development of these states, and especially of Texas and Oklahoma, is retarded by the lack of railway facilities, it is only reasonable to expect that this condition will exist so long as the law makers and commissioners maintain their present attitude.

While the mileage of new lines completed in Canada in 1914 shows a decrease of over 1,000 miles as compared with 1913, it is larger than for any year previous to 1912. The decrease last year is an indication that the unusually rapid development of western Canada, in which the railways have led in the opening up of new territories, is returning to a normal basis. The pushing of the coast extensions of the Grand Trunk Pacific and the Canadian Northern also aided considerably in increasing the figures for 1913.

It is very difficult at this time to predict what the new year will produce. At present there is probably less construction work under way than at any time within the present generation. But the general cessation of construction activities in the past three or four years, during which time the population and the industries of the country have been steadily growing, the recent favorable action of the Interstate Commerce Commission in the rate advance case, indicating a greater realization of the needs of the roads on the part of this and other commissions, and the changing public sentiment, as indicated in the nullification of the Missouri full crew law by referendum vote, indicate that the coming year may be one of considerably increased activity along construction lines. More work than ever before remains to be done which the railways desire to undertake whenever they are in a position to obtain the necessary funds are available at reasonable rates.

LOCOMOTIVE DEVELOPMENT IN 1914

THE number of locomotives built in the calendar year 1914 was 1,265, which is the lowest of any year since 1897, when the number built was 1,251, and constitutes a marked falling off from 1913, when there were 5,332 built. The falling off in building was of course due to the general business depression, but the poor business conditions have by no means eliminated developments tending toward the improvement of the locomotive.

A year ago we referred to what is without doubt the highest development of the Atlantic type locomotive, embodied in the latest engine of that type built by the Pennsylvania Railroad. These locomotives were largely the result of long continued experiments along the lines of refinement in design and increase in boiler capacity. A number of them have been built and are in daily service hauling very heavy trains on extremely fast schedules. The same policy which resulted in the production of this Atlantic type locomotive has, during the past year, produced on the Pennsylvania a Mikado and a Pacific type locomotive which are especially noteworthy. Interchangeability of parts has been carried out in these two locomotives to a considerable extent, the boilers of the two engines being identical. On the testing plant at Altoona the Pacific type locomotive recently developed approximately 3,200 horsepower, a truly remarkable figure, and in this connection it is interesting to note that this horsepower was obtained when the locomotive was equipped with a type of exhaust tip having four internal projections, and that the horsepower obtainable with the ordinary form of exhaust tip was considerably less.

Heat treated steel takes a prominent place in the design of the Pennsylvania locomotives, and of locomotive design in general it may be said that alloy steels continue in favor for such parts as axles, crank pins, main and side rods, frames and springs.

The large locomotive is again to the fore in 1914. The Pacific type locomotives built by the American Locomotive Company for the Chesapeake & Ohio lead in point of total weight for this type, this being 312,600 lb., while the maximum tractive effort of 46,600 lb. developed by these engines is also the greatest for this type. The heaviest locomotive of the Mikado type of which we have record is also a Chesapeake & Ohio engine and weighs 322,500 lb. The Baldwin Locomotive Works built during the year for the Baltimore & Ohio a 2-10-2 type locomotive which has a total weight of 406,000 lb., and is the heaviest locomotive ever built on a single set of drivers. The world's record for large locomotives was again broken by the construction for the Erie Railroad by the Baldwin Locomotive Works of a 2-8-8-8-2 type, Triplex compound articulated locomotive using the weight of the tender for adhesion and having a total weight of 853,000 lb. This locomotive has a theoretical maximum tractive effort of 160,000 lb. and has hauled a train of 251 loaded cars weighing 17,912 tons. A few locomotives of the Mountain, or 4-8-2 type, were built during the year, but they are intended for service under special conditions and there does not seem to be any general tendency to go beyond the Pacific type for hauling heavy passenger trains.

The mechanical stoker has taken a prominent place in increasing locomotive capacity, and there are a number of locomotives now in service which would not have been built had it not been possible to fire them by mechanical means. On large hand-fired locomotives the use of coal pushers in the tender, for moving the coal forward within the reach of the fireman, has greatly increased.

During the year experiments have been completed resulting in the successful use of powdered coal in locomotive fireboxes, and while the results of these experiments are not yet available it is probable that when published they will prove of very considerable interest and value.

The large locomotive is likely to continue in favor in new construction, although it may be doubted that the two-cylinder type can be carried much beyond present dimensions because of limitations in clearance. The possibilities in the use of three cylinders were brought out recently in a discussion before the American Society of Mechanical Engineers by J. B. Ennis, chief mechanical engineer of the American Locomotive Company, and it would not be surprising to see steps taken in the near future toward developing large locomotives with this cylinder arrangement. With few exceptions the compound locomotive has gained nothing in favor during the past year, although the Mallet type continues in use for the particular classes of work for which it is suited, and it is of special interest to note that a large locomotive of this type which was built by the American Locomotive Company in 1912 for the Virginian Railway has developed in service a horsepower somewhat over 3,000. This power is noteworthy when it is considered that it was necessarily developed at low speed.

For the future it may be said that further economies will probably develop from superheating, and while the use of feed water heaters in America has thus far been only of an experimental nature, the results obtained are promising and would seem to indicate its development before long toward an extensive use. Considered from all standpoints the locomotive development of the immediate future will probably continue along the lines of increased capacity through the means of refinement in design and the application of economy producing features and those which tend directly to increase boiler capacity.

RECEIVERSHIPS AND FORECLOSURE SALES

IN 1896 there was a greater mileage of railroad in the United States in the hands of receivers than in any other year since that time. In that year according to the Interstate Commerce Commission's figures, 30,475 miles of road were being operated under receiverships. At the end of December, 1914, according to the compilation which has been made by the *Railway Age Gazette*, 21,048 miles of road, with a total funded debt of $830,728,790 and a total capital stock of $434,599,738, was in the hands of receivers. During the calendar year 1914, 22 roads, with a total mileage of 4,222, with a funded debt of $137,250,296, and with a capital stock of $62,321,150 were put

Total	4,222	137,250,296	62,321,150

a The company had only a few miles of track laid, but some terminals at Martin Point, Alaska.

b Under an agreement made in 1909 the Baltimore & Ohio guaranteed principal and interest of $12,500,000 first and refunding mortgage 4 per cent bonds of the Cincinnati, Hamilton & Dayton, and of these bonds there were $7,500,000 outstanding in the hands of the public at the time of the receivership in July. In addition, the Baltimore & Ohio had advanced $3,900,000 for construction purposes, taking as collateral $4,861,000 of these bonds, and in addition the Baltimore & Ohio had advanced $1,800,000 for equipment, $1,200,000 for reconstruction of property destroyed by the flood, and $3,200,000 for general treasury purposes.

c Arrangements had been made with the Jay Gould estate by which the $11,000,000 3-year 5 per cent notes, which fell due August 1, were to have been extended for two and a half years at 6 per cent, but the war and subsequent disturbance of the financial markets generally led to an appointment of a receiver.

d The receivership, it was said, was brought about through the refusal of the National Railways of Mexico to reopen the bridge across the Rio Grande at Laredo, Tex. All of the securities, both bonds and stocks, are owned by the National Railways of Mexico.

e Half of the stock of this company is owned by the Colorado & Southern and the other half by the Chicago, Rock Island & Pacific or subsidiaries.

(*f*) The road had, it is understood, abandoned its schedules and was delivering mail by automobile. The receivership proceedings were at the request of the stockholders.

into the hands of receivers. As will be seen from the comparison of the roads placed in the hands of receivers during each one of the years of which a record has been kept by the *Railway Age Gazette*, there have been only one year in which a greater mileage of road went into bankruptcy, and no year since 1896 in which there was as great a mileage in the hands of receivers. Whereas, however, 1896 was not the culmination of a period of depression, but was the beginning of better times, and by 1898 the mileage in the hands of receivers was reduced to 12,744, 1914 shows no tendency toward improvement, but a continuance of the downward tendency. There were only eight roads which were taken out of the hands of receivers in 1914, and none of these were important.

Of the roads that went into the hands of receivers in 1914 the two most important were the Cincinnati, Hamilton & Dayton, operating 1,015 miles of road, and the International & Great Northern, operating 1,106 miles of road. The immediate cause of the Cincinnati, Hamilton & Dayton receivership was the road's inability to recover from the effects of the flood of the year before and the Baltimore & Ohio's unwillingness to jeopardize its own position by making further advances to its controlled road at a time when its own credit was put to so severe a strain by business depression and the war. The immediate cause of the International & Great Northern receivership was the European war and the inability of the company to refund $11,000,000 notes which fell due August 1.

The Cincinnati, Hamilton & Dayton was taken out of the

receiver's hands in 1909 when a plan of readjustment was put through by which the Baltimore & Ohio took the control of the company and charge of its operation and in return guaranteed some of its securities. The Cincinnati, Hamilton & Dayton before that receivership was overcapitalized and the readjustment was by no means drastic. With the Baltimore & Ohio's credit behind it and with favorable conditions, or even average conditions, it would have probably gotten along all right. The floods of 1913, however, were fatal.

The International & Great Northern is a Gould property, but with better credit than some of the other Gould roads. Arrangements had been made for the refunding of $11,000,000 5 per cent notes for two years and a half. The details, however, of the arrangement had not been carried through when the European war was declared, and the consequence was that the general upset of financial markets made the fulfillment of this plan impossible. A receivership, therefore, followed.

The foreclosure suit and sale in respect to the Chicago, Rock Island & Pacific Railway Company stock which was deposited under the Chicago, Rock Island & Pacific Railroad Company 4 per cent bonds is not, of course, included in our table showing either receiverships or foreclosures, since this table applies only to railroad companies which are operating companies.

The most discouraging feature about the fact that nearly 10 per cent of the total mileage in the United States is in the hands of receivers, is the indifferent attitude with which the public can regard this fact. The receiver must operate the property. The public loses nothing directly. There is no present prospect of any such period of prosperity as followed in the years after 1896. Roads like the Pere Marquette get deeper and deeper into the mire. It is only indirectly that the public is affected and that after some length of time. Then the impairment of railroad credit becomes apparent, and then it is that the public sees how widespread is the harm which railroad bankruptcy on a large scale may entail.

RATE SUSPENSIONS BY THE INTERSTATE COMMERCE COMMISSION

THE *Railway Age Gazette*, in its issue of December 11, published an editorial headed "Absentee Landlordism and the Commission" dealing with the suspensions by the Interstate Commerce Commission of tariffs containing increased freight rates, and criticizing the commission for entrusting too many imporant matters to subordinates.

We have received a letter from an officer of the commission quoting the following extracts from the editorial, and then stating that there is "absolutely not one word of truth in any statement quoted:"

". . . the suspension of unimportant . . . rate advances . . . have been left to be settled wholly by young employees of the Commission. . . . No commissioner personally even knows of the matter, but a law clerk receives a letter from some shipper, whose responsibility he knows nothing of, protesting against the advance. To be on the safe side he suspends the advanced rate . . . and at the expiration of a year or a year and a half it is found that the advanced rate is entirely reasonable. . . . The railroad never had a chance to justify the rate before it was suspended, never even had a hearing. Some commissioner may theoretically have passed on the case, but if he did it was in a purely cursory way. . . . The Interstate Commerce Commission . . . has to leave innumerable important decisions to $1,500-a-year clerks. . . . It is, therefore, a palpable injustice for the commission to permit its clerks automatically to suspend any advanced rates if there seems to be the remotest possibility of a protest from shippers. . . ."

In response to a request for a full statement of the procedure followed in suspending rates the officer of the commission who criticized the foregoing charges, replied, in part, as follows:

"I would advise that during the 11 months which ended on October 31, 1914, 149,031 separate publications, each containing many and various rates, classifications, fares, or charges were filed in this office.

"The number of proceedings instituted on our Investigation and Suspension Docket during this period was 188, and 147 such cases were disposed of. In 27 instances the tariffs under suspension were voluntarily withdrawn by the carriers; in 6 instances the protests were withdrawn and the proceedings subsequently dismissed; in 44 instances the proposed changes were allowed as filed; in 25 instances they were allowed in part; in 42 instances they were disallowed, and in 3 instances proposed reduced rates were afterwards justified by the carriers and the commission's order of suspension was vacated. In one instance the increased rates under suspension were after hearing required to be canceled, but, upon rehearing, were permitted to become effective.

"During this same period the commission declined to suspend tariffs in 205 instances.

"Immediately upon receipt of a complaint, in any form whatsoever, in respect to an increased rate which is contained in a tariff filed with the commission but which has not yet become effective, it goes to our Suspension Board, composed of Messrs. J. M. Jones, chief of our Division of Tariffs; Hugo Oberg, a rate expert; S. H. Smith, also a rate expert, attorney, and chief of our Division of Inquiry; J. H. Fishback, chief of our Division of Correspondence and assistant to the secretary, and the secretary. The complaint and all possible questions arising in consequence of the complaint in connection with the rates complained of are considered carefully by this board, and it prepares a statement of all pertinent facts in respect thereto, which together with the entire file in each case is laid before the commission, and is considered by the commission, and when I say by the commission, I mean by each member of the commission, and each member of the commission votes as to whether or not any rate shall or shall not be suspended. No rate in any tariff has ever been suspended by the commission without a quorum vote by the commissioners.

"Furthermore, when a protest against a proposed increased rate is received by us we transmit to the carrier, filing the tariff containing said proposed increased rate, information respecting the protest, and give the carrier an opportunity to submit such explanation as it may desire to make, as to the reasons for the increased charges or changes in regulations. In instances, after we have transmitted these statements to the protestants, their protests have voluntarily been withdrawn. Whenever the carrier or the complainant requests a hearing prior to the effective date of the proposed change in rate, it is always granted and the representatives of the carriers and of complainants, or either, are given an opportunity to be heard, and any carrier is at liberty at any time to ask the commission for an opportunity to explain orally the reasons why changes, either in rates or regulations, have been proposed."

The *Railway Age Gazette* has at various times criticised the giving of the power to the commission to suspend advances in rates, and it believes that there are some features of the law which should be corrected, but we have never intended to criticize the commission unfairly and we are convinced that the editorial in question did contain erroneous statements and was unjust to the commission. Moreover, as a large number of railroad men and others have an erroneous impression regarding the routine work of the commission in handling suspensions of rates, we are glad to publish the foregoing statement regarding the procedure followed. In this connection it may be worth while to give the salaries paid the members of the suspension board. They were stated to be as follows in the commission's annual report for 1913: Mr. McGinty, $5,000; Mr. Jones, $5,000; Mr. Smith, $3,900; Mr. Fishback, $2,400; Mr. Oberg, $1,740.

While, as the foregoing clearly shows, the statements in the editorial in question did injustice to the commission, it does not by any means follow that criticisms of the exercise of the suspension authority are not justifiable. Regardless of the principles on which the commission has been acting, or the procedure by which it has carried them out, the great objection remains that in the exercise of its discretion it has been suspending a large number of rates after comparatively little complaint, and, in cases where it has found later that the advances are reasonable, it has been depriving the railroads for too long a time of revenue which they have needed and to which they have been entitled.

Chairman Harlan, of the commission, in his dissenting opinion in the rehearing of the 5 per cent case, pointed out that the carriers contended that their necessities were so urgent that they could not await an increase of revenues from the other sources suggested by the commission, and added: "Relief, however, could be had immediately if the commission would refrain from a too free use of its power to suspend increases in rates pending investigation. *This power is exercised, in my judgment, with unnecessary frequency*, in view of the opportunity that shippers have of testing the reasonableness of increased rates upon formal complaint filed with the commission; and, in my judgment, the Congress never intended so free a use of it when the power to suspend was granted to us."

This statement from the chairman of the commission supports the position we have taken that the power of suspension is being abused.

The Railway Situation from Different Viewpoints

WHITHER ARE THE RAILWAYS DRIFTING?

By J. Kruttschnitt
Chairman, Executive Committee, Southern Pacific Company

To answer your questions, whither the railways of the United States are drifting, and where they are finally likely to land, we must consider: (1) The present condition of the railroads; (2) what has cast them adrift, and (3) the forces that will determine whether they are to remain in the hands of their owners, or to be irretrievably wrecked and pass to the government.

(1) It cannot be denied that our railroads are in a state of severe stress. Gross revenues have been falling for many months, expenses and taxes have been rising rapidly and uninterruptedly, and under these influences net earnings are vanishing at an alarming rate. The shrinkage of the margin between revenues and expenses has affected railroad credit, and owners of money are unwilling, except on terms commensurate with the risk, to invest it in enterprises whose capital is grudgingly allowed by regulating bodies to earn less than is earned by capital invested in farms, manufactories, banks, and other enterprises. It is not as generally known as it should be, that the railroads are now earning a smaller surplus than they did eight or ten years ago, although in that period one and a half to two billions of dollars have been spent in extensions, equipment, terminals, additional main tracks, and miscellaneous additions and betterments. As the railroads cannot afford to pay higher rates for capital than they can make it earn, they have necessarily had to stop purchasing locomotives and cars, discontinue extensions and improvements, and reduce expenditures for maintenance and operation, to a point where most efficient public service is impaired.

(2) Many causes have contributed to bring the railroads to their present condition. The principal one is the fall in surplus, caused by smaller revenues and greater expenses—the former brought about by regulating bodies, the latter by unreasonable demands of labor and expensive, embarrassing, and obstructive laws, supplemented by orders of forty-nine commissions, whose dicta have the force of law and from which there is no appeal to the courts. As examples, we may cite:

Full crew laws.

Laws limiting the size of freight trains.

Expenses of federal and state valuation.

Expenses of changing methods of accounting, and of keeping two or more sets of accounts.

Next is the increase in taxes. Through methods which have increased railroad taxes much more rapidly than taxes on other property, the general public is discriminating unjustly against that part of the public which has devoted its property to public use. Commissions seem to forget that they are the representatives of *all* of the people, and not of those people only who use the railroads, and that their duty is to deal as justly with the owners as with the users of railroads. Rates are reduced and reparation is granted to railroad users easily and quickly, in marked contrast to the deliberation with which requests for increases in rates are treated, and which, if granted, are never coupled with reparation, no matter how long and unreasonable the delay of investigation may have been. In the five years during which their application for an increase in rates has been under consideration by the Interstate Commerce Commission, the railroads affected have no doubt spent enough money in conducting their case and in supplying unusual and useless information and statistics, to absorb a large fraction of one year's expected gain from the increase.

(3) To public opinion, the supreme force that dominates and controls all classes and political parties in our country, we must look for a solution of the problem of the future of our railroads. It decreed years ago that unjust discrimination by its railroad servants and unfair practices with respect to railroad *users*, should cease; and these evils no longer exist. The same supreme power will, when convinced that the time for action has arrived, decree that unjust discrimination by its legislative and administrative servants, and unfair practices with respect to railroad *owners*, shall cease. Legislatures and commissions will be made to realize that power is delegated to them for the benefit of *all* classes of citizens—owners as well as users of railroads, unorganized as well as organized labor—and evidence is afforded by the utterances of the press and of those occupying high public office, that the spirit of fairness and justice in the American people has been quickened, and public opinion is even now compelling the attention of politicians. The public's attitude toward recent unreasonable demands of organized railroad labor, foreshadows the modification of existing laws governing mediation and arbitration of industrial disputes so as to afford public opinion opportunity to influence the settlement of demands of railroad servants before permitting them to deprive the country of transportation by rail.

The majority of the American people do not desire government ownership of railroads, and will finally substitute constructive for destructive regulation, and will insist that the powers of all public servants be co-ordinated so that all will work for the common good. Unfair discrimination against the railroads will cease, and even-handed justice will be accorded to both railroad owners and users. When the general public understands how it has been misrepresented by unjust and unwise public servants, and how perilously near to ruin they have brought all business interests in our country, in starving and threatening the life of the railroads, they will not long delay the exercise of the necessary corrective power. Indeed, it must be apparent to the most superficial observer even, that public opinion has already been aroused, and its effect has been seen in the recent solution of a long-pending and exceedingly vexatious problem.

WHY THE VALUATION SHOULD NOT BE DISCONTINUED

By Charles A. Prouty
Director of Valuation, Interstate Commerce Commission

You ask me to write you briefly why the valuation of railways now in process by the United States government should not be discontinued.

The Supreme Court of the United States has decided, and it is today universally accepted as a legal principle, that a railroad is entitled under the constitution of the United States to a fair return upon the *fair value* of the property which it is devoting to the public service.

The power of the court—certainly the power of the federal court—can only extend to fixing the limit below which the legislative branch of the government may not go, and in my own opinion a commission may and should establish a rate substantially higher than this court limit. A commission may also consider in the fixing of individual rates circumstances and conditions which could not properly influence the court in passing upon the question of confiscation. But, nevertheless, while the function of the commission differs from that of the court, when the question before legislature or commission is upon the

general level of railroad rates, the fundamental fact still is the *value* of the property devoted to the public service.

It appears, therefore, that whether court or commission is dealing with a general schedule of rates, the all-important inquiry is, What is the *value* of this property? Now, how can court or commission discharge its full duty; how can justice be done between the public which pays and the railroad which exacts, until this question has been answered? Should not the government of the United States, if it is to undertake the regulation of railroad charges, ascertain in the speediest and the most complete manner possible the value of the property which is being devoted to that service?

It may be said with truth that the value of a railroad for rate-making purposes has never yet been clearly defined, but it is also true that courts, commissions and economists are all one in the opinion that for the determination of this question certain facts must be marshalled, of which the principal are, cost of reproduction new, cost of reproduction less depreciation, original investment in the property, and the history of that investment. These facts must be had before value can be determined, and these facts are now being collected by the government.

It is true, as I have myself pointed out, that the value of a railroad cannot be made the basis of its rates in the same way that the value of a gas plant or a water plant or a system of street railways can be, for the railroads of this country stand in competition with one another and their rates cannot be independently established. But while this infirmity goes to the making of a particular rate, it does not apply to railway rates as a whole. In the past the question presented to the federal commission has usually been one of individual rates. Is this rate too high as compared with some other rate or as compared with rates in general? Today our railroads are claiming that railroad property as a whole is receiving too little for the service rendered and that railroad rates as a whole must be advanced.

I have been quoted as saying that the Eastern Rate Advance Case should not be decided until the railroads of this country had been valued. That would have been an absurdity, for the commission must have dealt with that question when it arose upon the best evidence available, but I did say, and I repeat, that questions of that character can never be satisfactorily and finally decided until the railroads of this country have been valued by the government. This application for an advance will by no means be the last, and the commission must find some solid ground on which to stand. The people of this country desire to treat its railroads justly, and they must do so if an efficient service is to be rendered, but they also desire to know, and they are entitled to know, what the actual value of these properties is.

It is suggested that some particular railroad, or the railroads of some particular section, should be valued in order that it may appear whether such a valuation is of service in rate-making. This assumes that it is still an open question whether the value of railroad property is of significance in the making of railroad rates; but the Supreme Court has decided that the value of the property devoted to the public use should be the controlling factor, and has applied that decision in several cases itself.

Our railroads have earnestly urged in recent discussions that their credit was in serious danger. When a private industrial plant desires to establish its credit it employs some competent means of appraising the value of its property and exhibiting that value to the investing public. The investor desires to know the inherent value of the thing in which he invests. What could more strengthen the credit of the railroads of this land than a certificate from the government of the value of their property, especially when the government is legally and in good conscience bound to allow sufficient earnings to justify that valuation?

There is also a business reason why the present valuation should be prosecuted to a speedy completion.

No precedent existed for the doing of this work upon the scale required by the Valuation Act, and the development of the present organization has been necessarily experimental and therefore slow and expensive. That organization has been substantially completed and should be entirely perfected by July 1 next. Beginning January 1, 1915, the present force of the commission should proceed at the rate of from 20,000 to 25,000 miles per annum. The same overhead organization could take care of 50,000 miles per annum. Good business economy would require that the work be developed up to that stage within the next six months and kept there until completed. To adopt any other course, if this work is to be done at all, would involve great pecuniary loss.

EFFECT OF THE RATE ADVANCE DECISION

By Daniel Willard

President of the Baltimore & Ohio

What the decision might be said to indicate or promise for the future is, in my opinion, even more valuable than what it actually gives in the way of immediate increase in rates.

The present report of the commission should be read in conjunction with that given under date of July 29, in order to realize the scope of the decision and its ultimate effects. In that it has extended the territory and the classes of traffic to which the 5 per cent increase may be generally applied, the commission has afforded a further measure of immediate relief; but what I consider of even more importance is its recognition of the needs of the railroads for increased revenues and the reiteration of its former statement as to its duty and purpose to aid, so far as it legally may, in the solution of the problem as to what course the carriers may pursue to meet the situation.

Personally I was disappointed because the commission had not granted the full 5 per cent advance which was asked for, and that coal, coke and ore, which constitute nearly two-thirds of the entire tonnage handled by the Baltimore & Ohio Railroad, were among the articles to which the 5 per cent increase does not apply.

While I feel disappointed and earnestly believe that it would have been better for all concerned if the full increase as requested had been granted, nevertheless I have found much in the decision that is encouraging. The commission in its report finds that "from whatever comparative standpoint used, the net operating revenues of the last fiscal year must be regarded as unduly low; that the operating costs and operating revenues fail to show the tendency to such concomitant variation as should prevail in the transportation industry; and that while the gross revenue declined only 3.4 per cent, the net revenue shrank approximately 17.7 per cent as against the previous fiscal year"; the commission concluding that "the indication is that some important items of cost have become relatively inelastic, and that a fall in gross revenues leaves an increasingly narrow margin of net revenue." This is exactly the contention of the railroads. It is what they foresaw in 1910, and it is what they have been urging that the results of the operation of the years since then have demonstrated.

It is a fact, as the commission says, that a condition has come about whereunder it is absolutely impossible for the railroads to hold their expenses in proper relation to their gross earnings, and this is due to many different influences which have been quietly at work for a number of years. Among such influences may be mentioned, full crew laws, hours of labor laws, higher wages, certain standard minima of service prescribed in some states by public commissions and insisted upon none the less strenuously in other places by the force of public opinion, increased taxes, etc., etc. These influences or conditions, whether in themselves good or bad, have all contributed to bring about the state of affairs so clearly recognized by the commission, and in my opinion fully justify the railroads in their efforts to obtain higher rates.

The commission also says, "We can not view with favor any attempt to obtain an increase in net revenue through unduly restricted expenditures upon maintenance," and it is most en-

couraging that the commission should have spoken as it did concerning that particular matter. It was urged during the hearing in the 5 per cent case by some of those claiming to speak with authority for the public that the railroads were spending too much upon maintenance, and it was also urged that if the railroads would spend less for maintenance, they would be able with existing rates to pay a fair return upon the capital invested. It is clear, however, that the commission was not misled by such arguments.

It is also encouraging to have the clear statement of the commission that "if we are to set rates that will afford reasonable remuneration to these carriers, we must give consideration to the increased hire of capital as well as to other increased costs." This increased cost of capital was one of the contentions urged most strongly by the carriers in support of their request for advanced rates.

The commission in its report of July 29 suggested ten sources of additional revenue for all carriers throughout official classification territory, and now stated in that connection: "It is expected that the constructive work suggested in the original report for the purpose of conserving and augmenting the net revenues of the carriers generally will be carried forward without interruption"—and it is perhaps in that particular paragraph that I find most encouragement in the last decision.

The carriers, while admitting that increased revenue might be gained from the ten suggested sources pointed out by the commission, were convinced that much time would be required in the working out of the various problems presented, and urged that an immediate increase was necessary and should be granted to meet the pressing needs of the present, feeling certain that it would develop as the case proceeded, that the increased revenues from all the sources suggested, including the 5 per cent advance, if granted, would not be too great for the proper needs of the situation, and, speaking in that connection, Chairman Harlan of the commission, uses these words:

> My own view of the record has been and is that the carriers in that territory, considered collectively, are in need of more additional net income than the amount, $50,000,000, which they estimated the proposed 5 per cent increase in rates would yield.

I appreciate the very difficult problem that was presented to the commission in connection with this case, and I am not ignorant of the arguments that have been urged by some against any action by the commission intended to be helpful to the railroads. I realize also the limitations established by law within which the commission must act. It should be encouraging, therefore, to all real friends of the railroads, and by that I mean all who are interested in the proper industrial development of this country, that the commission has been willing to treat the question before it in a broad way, and while not granting all the immediate relief specifically asked for, by the railways, and in the manner requested, it has recognized, unanimously, the necessities of the carriers and had again reiterated its former statement that:

> It is our duty and our purpose to aid, so far as we legally may, in the solution of the problem as to the course that the carriers may pursue to meet the situation.

I am confident that the result of this inquiry will be to bring about a much better understanding of the railroad problem by all concerned or interested in that question. Further, I feel confident that better working relations will be established between the railway managers, the regulatory bodies and the shippers, and I am hopeful that because of such better understanding and relations the railroads, the shippers and the regulating agencies, both state and federal, will be able in the future to work out to a satisfactory conclusion the many serious problems that are certain to occur under our system of private ownership with government control.

I think that upon the whole the ultimate result of Mr. Brandeis' connection with the case will be beneficial to the railways. The commission had unanimously held that the evidence in the record was sufficient to convince it of the necessity for increased net revenues, a view in which Mr. Brandeis evidently concurred. Indeed in his argument in the first case, as well as in his brief, he clearly recognized and frankly admitted the needs of the carriers for increased net revenues. He opposed, however, the proposition to obtain the increased net revenues by a uniform advance of freight rates and suggested other methods and sources through which the proper measures of relief might be obtained. It must be admitted by all that rates clearly unremunerative ought to be advanced, and that services performed without charge should either be discontinued or be properly paid for. Concerning these and many other things I think the majority of railroad managers would be in full accord with Mr. Brandeis. Incidentally, the very searching investigation conducted by the commission into the general subject of railroad practices, did more to disabuse the public mind concerning such matters than anything else that could possibly have happened. Undoubtedly, abuses have existed in connection with railroad management as has been the case in all other lines of human endeavor, but the commission's report would indicate that the most searching investigation failed to develop that any serious abuses exist at the present time which could have any material influence upon the condition of the carriers involved in this hearing, and the result of the inquiry should not only be gratifying to holders of railroad securities, but it is also a tribute to the efficiency and character of present railway management.

I have no definite information, but judging from estimates that have been prepared at various times, and assuming the full co-operation of all state bodies is had in applying the increase to intrastate traffic as well as interstate, I believe that the Baltimore & Ohio will realize as much as $2,000,000 per annum, or approximately one-half of what a 5 per cent increase on freight rates on all traffic would have amounted to on the basis of the freight earnings in the fiscal year 1913.

REGULATION OF RAILWAY OPERATION

By W. J. Jackson

Chairman of the Special Committee on Relations of Railway Operation to Legislation

In response to your request I am glad to make a brief statement of my personal views as Chairman of the Special Committee on Relations of Railway Operation to Legislation. These have been gradually formed through three years of study of the problems confronting us, and are necessarily subject to such modification as future developments may require.

The minutiæ of railway operation are so numerous, and are so interrelated that it is unreasonable to expect that a correct understanding of the questions involved in legislation on the subject can be reached by those responsible therefor, without the assistance only to be obtained from those who have the necessary knowledge.

With some exceptions almost all bills relating to railway operation are drawn by those who have no practical acquaintance with the subject. Bills which are intended to remedy conditions of one kind, do not actually reach those conditions, but affect another set which it was not intended to cover. Or, if they do reach the intended conditions, they also have a bearing on other matters equally outside the purposes of their authors. Bills which apparently involve little or nothing, may commit the roads to expenditures of such amounts as to be wholly prohibitory and beyond the bounds of reason.

In all propositions involving legislation on operating matters, five questions, therefore, inevitably present themselves.

1. What is the precise purpose?
2. Will the suggested form of legislation accomplish that purpose?
3. What is the real necessity for it?
4. What will it cost?
5. Is the object worth the cost?

The primary function of this committee, then, is to provide legislators with correct replies to these questions, and this is

best accomplished by producing before them men who have accurate knowledge of the particular subjects involved.

In most instances it has been found that when these correct answers have been furnished, the vast majority of the proposed bills are dropped by their advocates.

The measures which are not eliminated by this procedure fall into three classes.

1. Those designed to promote practices which are desirable from every point of view.
2. Those designed to promote uniformity.
3. Those promoted by special interests.

In regard to the first class, we have conceived it to be the function of this committee to assist in the formulation of such legislation, with a view to having it practical, enforceable and beneficial, and after its enactment, to contribute to its successful administration by promoting a uniform understanding on the part of all concerned, and by securing the general co-operation of the roads in its intelligent enforcement.

As to the second class, uniformity inevitably means change. Unless the object sought is of such importance as to justify the danger which often is caused by changes in operating methods, the committee has not deemed it necessary to go so far in its co-operation. Should a real necessity exist, however, the same course would be pursued as in the case of the first class.

The third class, of course, presents the most serious problem. The special interests pushing different items of legislation range from an obscure patentee on the one hand to a combination of labor organizations on the other, with all possible combinations of interests between the two named.

This committee has, however, never felt justified in departing from the fundamental principle adopted at the inception of its work, and has in all cases simply endeavored to see that the exact facts surrounding each bill were placed in the possession of those who must be responsible for the legislation.

That this course has been the correct one has been proven by the results.

FROM A WESTERN INVESTMENT BANKER'S POINT OF VIEW

By J. Herndon Smith

Smith, Moore & Company, St. Louis, Mo.

For some time it has been apparent that investors prefer many other kinds of investments to railroad securities. In fact, for the past two years it has been almost impossible to sell railroad securities of any kind in this western country. Even receiver certificates—issued at the expense of all other securities—at a very high rate of interest, have failed to "tempt" capital.

Being in the investment banking business I have naturally tried to find out *why* these conditions exist.

From canvass of many of our large investors, the reason appears to be due to loss of confidence—resulting mostly from the inability of railroads to show a satisfactory statement of earnings, on account of increase in cost of operation and decrease in rates, and the inability of railroads to obtain permission from the Interstate Commerce Commission to advance rates sufficiently to show the margin of safety that formerly existed. Another reason which has been apparent, is the exposures of financing of certain large systems, which has proved disastrous to these companies.

Consequently there is a very decided preference on the part of investors for municipals, public utility and industrial bonds as against railroad securities. As an example of this: One of my customers who handles trust estates, mostly for widows and orphans, which aggregate over $200,000,000, of which $60,000,000 is in railroad bonds, has not bought a railroad security during the past two years; and they tell me they will not put a cent into railroad securities until the railroads are allowed to increase their rates not only to a substantial amount over fixed charges, but enough to enable them to pay off each year some part of their indebtedness, either by sinking fund or serial bond.

To my mind, one of the worst features of railroad financing in the past has been that there has been no provision made in advance for paying off indebtedness at or before maturity. I believe that if railroad bonds are issued on a serial plan, or with a large sinking fund, which would practically retire the issue at maturity, it will go a long way towards helping to restore confidence on the part of investors.

The Interstate Commerce Commission has granted the application of the eastern railroads to increase their rates in part, but I think it will be some time before this will very materially help the earnings of the eastern roads.

The roads west of the Mississippi have not received any increase as yet, and they are also hampered by the attitude of the state commissions in different western states. Railroad credit has been so much impaired in the past few years that it is going to take much larger earnings to restore the confidence on the part of investors than it would have if the increase in rates had been granted some time ago.

FROM A NEW YORK INVESTMENT BANKER'S POINT OF VIEW

By A. B. Leach

President Investment Bankers' Association

In the confusion of tongues, all noisy with the railroad rate problem, the piling up of statistics and figures by the technical journals dealing with this most important subject, it has often seemed to me that perhaps our people were losing sight of what, to my mind, is one of the cardinal points in this controversy.

The railroad problem, with which this country is grappling, is not a new one. It has been before the public constantly. This should not surprise us. The developments of the railroads are so essentially linked up with the development of the country at large that it is small wonder that upon the railroads should be focused at all times a great deal of attention.

We all remember very well the first stage of railroad building in this country. If we follow this history it can easily be seen how the present situation constitutes a distinct and logical phase in the development. Great was the need in the middle of the nineteenth century for railroad communication; insistent was the demand for transcontinental lines, feeder lines and well constructed terminals, in order that this country could be given the development to which it was so fully entitled. It was realized that a railroad once constructed, as by magic touch, turned enormous areas of little use theretofore to the community at large, suddenly into busy agencies for local upbuilding and business development of the country in general. It can therefore easily be understood, how from all sides aid not only was promised but also literally given to the pioneer railway builders of this country, in the way of land grants and substantial subsidies, in some cases, lower rates for taxation, high returns in freight and passenger charges, liberal rights of way, while cities and villages competed with each other for the location of the lines. It was realized that funds invested in railways would not only be of great benefit to the communities served and to the new states which they were upbuilding, but that it would also benefit the country as a whole. It was expected that these inducements would be of great ultimate profit to those who were courageous enough to invest their money in what was at that time considered an extra hazardous investment.

History tells us that a very large percentage of all these enterprises became bankrupt, not because the enterprise or the motives in building the property were not intrinsically sound, but merely because the business did not develop fast enough to carry the interest and other fixed charges necessary for the completion of the property. As one authority puts it: "So rudimentary was the industry of the country and so small its rates of increase that the best located lines, instead of creating as they do now, an annual traffic much ex-

ceeding their cost, were a heavy charge upon the bondholders and stockholders."

The first stage of railway building in this country was one of misfortune, one that in a great many cases brought very heavy losses to the investment world. Nevertheless, the fact stands out clearly, that these railways, no matter what their financial vicissitudes might have been, were the greatest upbuilders of the country. They were monuments of enterprise, bearing testimony to American courage, pluck and perseverance, that made possible the growth and development of the very states and cities which now are among the loudest in their outcry against the railroads.

A second stage in railway history was then ushered in. Upon the debris of the old properties new companies were built up. The construction that took place in the first period had given a tremendous impetus to the productivity of the country and led to greater diversification of production. Consequently, there was a large demand for more railroad communication. While in 1840, the ratio of mileage of railroads to population was one mile of road to every 7,415 inhabitants, and in 1850, it was one mile to every 2,398; in 1860, this ratio had declined to one mile for every 1,027 inhabitants; in 1870, to one mile for every 729, and in 1880, to one mile for only every 538 inhabitants. Between 1855 and 1865, the mileage of railroads in this country was doubled, notwithstanding a panic (the one of 1857) and that our Civil War intervened. This increase in railroad mileage continued unabated. Existing railroads grew prosperous.

What happened before in history then happened again. Managers in charge of these prosperous properties—we say advisedly, managers, because not in all cases were they real owners, the ownership being vested in stock and bondholders scattered all over the globe—became arrogant. They imagined themselves to be the owners of the road instead of the servants of the stock and bondholders and of the public. Their attitude toward the public became unreasonable; their financing became extravagant, not to use a stronger term; in a word, the railway managers felt that they were above the public. "The public be damned," was the motto.

As action inevitably produces reaction, the answer to this arrogance and unreasonable attitude of the railway managers was increased legislation. First, by the several states, then, by the Federal government. We got a large number of state railway commissions, and alongside of them the Interstate Commerce Commission was called into existence. The powers of the latter were continually increased, and at the present time in the hands of this commission rests such a stupendous authority in matters relating to the prosperity or adversity of millions of people as no official body of men has ever possessed.

With the event of this increase and regulation, the pendulum swung too much into the other direction and little regard was meanwhile given to the complete change in attitude on the part of the railway managers. A new school of railway managers who were not first and foremost financiers, or possibly Wall Street speculators, took a hold of the properties. Many of these operators had started railway operation at the very lowest round of the ladder, and their present position is a fine tribute to the highest ideals of American democracy. This school of railway managers substituted for the above-quoted motto another one, more in harmony with a broad vision. "The public be pleased" was their motto, and in that spirit of public policy, railway operation is at present conducted in this country.

However, the public mind, with preconceived notions, in many cases handed down from past generations, has been framed in such a manner that I feel that the railways today are not receiving that just and reasonable treatment which I believe we, as Americans, are always ready to accord to every one.

Three things stand out in the present situation.

First—We have reached a period of *overregulation*, as a result of which investment of new money in railway properties today is at its minimum. Unless a sudden and radical change is brought about, this overregulation will lead the railways into bankruptcy. History points out that all conditions are more or less transient and that nothing has really come to stay. Personally, I believe that the American people are too sensible not to be willing that the railways shall be run in such a way and shall charge such a price for the service that real money invested in railway property will become profitable and pay a satisfactory and constant rate of return. Those who are intently watching the trend of public sentiment have seen that this desire of the American people for fair play is again manifesting itself in many ways, and consequently a change in overregulation of our railroads and at least in the obstructions put in their way for earning a reasonable return on the investment, may be expected.

Second—Commerce, without transportation, is impossible. No community has ever prospered without adequate transportation enabling it to bring its products with great despatch to the distant places where they were needed, and at the same time giving it the facilities for having brought to its door, without delay, all it needs. Therefore, every community served by a railroad is directly interested in the welfare of that railroad. It is imperative for the growth of any community that the company serving it with transportation should be solvent; that its business should be profitable and that it will be in a position to give to that community the very best service in every respect. In order to do this, the railway company should have excellent facilities in rolling stock, roadbed, stations and other physical characteristics, and none of these can be had if the railroad in question is constantly harassed by federal and local authorities hampering it in its endeavor to earn a reasonable return on its investment, in order to establish thereby the credit so essentially necessary for keeping its physical as well as its financial position in first-class condition. I don't think I am over optimistic when I state that our communities are becoming more and more conscious of this necessity and this has much good in store for the future.

Third—The American people have never been nor ever will be a nation desirous of cheapness only, in any product. They want the best that there is. Even under present conditions, American railway service is still, in many respects, unmatched and the best of any in the world. Private initiative has established in this country a record of attainment that can stand comparison with any of the government owned railway systems of Europe. It certainly would be one of the greatest misfortunes that could happen to this country, both for the sake of the railways and the people, if government ownership would be inaugurated, and I am sure, if I judge recent development aright, that whatever inclinations there might have been of going into the direction of government ownership, a second and saner thought on the subject is now manifesting itself.

For the reasons outlined above, I believe that a change is due, that better, fairer and more reasonable treatment of the railways is to be had.

I have the highest respect for the Interstate Commerce Commission, not only as a most desirable regulative body, far to be preferred above the conflicting authorities of state commissions and state legislators, but also in regard to its personnel. I believe most confidently in the good faith and the integrity of these gentlemen. But does it not appear that they have been burdened with an impossible task, and that too great an authority has been placed on their shoulders?

All things point to the fact that a cure of the railway rate situation lies in the stopping of further legislation. Let the railroads run their own properties. Let not the authority to run the business be snatched away from the railroad's operators and be exercised by those who have no responsibility, whatsoever, to the owners of the properties. Let us not be misunderstood. We do not want to go back to the chaotic conditions of the seventies and thereabouts. We wish to see established, how-

ever, a condition of affairs whereby the railroads run their own properties, of course, under legislative authority, assuring equal treatment to every shipper, big and little, but the railroads in turn insisting:

First—That in the way of charges, a fair value shall be paid for every dollar of obligation issued;

Second—That the railways shall be relieved, as far as passenger traffic is concerned, of local legislative restrictions.

The railways are the largest business interests in this country, they control more trade in the way of purchasing power, and are more nearly alive to the success of their business, than any other enterprise.

If our railways are not properly managed, prosperity in this country is impossible. If they are to be constantly restricted by unreasonable legislation, if they continue to remain a most popular thankful and remunerative object for baiting on the part of politicians, big and small, then so long will general prosperity not come to this country. Luckily, we enter the new year with hopeful signs, indicating that an ever increasing number of our citizens is getting nearer to a full and unbiased realization of the real facts, and to a better understanding of the true merits of the cause of the railroads.

PROGRESS IN RAILWAY ELECTRIFICATION IN 1914

By N. W. Storer
General Engineer, Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.

All those who are interested in the electrification of steam railways have every reason to feel encouraged at the progress that was made during the past year. While no great electrification projects have been completed, the developments have been continuous and of far-reaching importance.

MERCURY ARC RECTIFIER

Probably the most important advance that has been made during the year is that in the development of the mercury arc rectifier in its adaptation to heavy railway service. This, of course, is not a new development, nor was it applied commercially during the year except in a very limited way, but the progress has been great and the results that have been achieved in its operation—both on the locomotive supplied with power from a single phase line and in substation use—have been such as to give the greatest encouragement to the belief that in a very short time the rectifier will be a thoroughly commercial article. The rectifier can be used with either the d. c. or the single-phase a. c. system. In the d. c. system its place will be in the substation in place of the synchronous converters and motor generator sets which are now used to transform from alternating to direct current. Here its high efficiency under all conditions of load and its adaptation to any commercial frequency make it certain that if it proves to be a satisfactory piece of apparatus, it will be used very largely for substation work where direct current is applied to the trolley.

On the other hand, its successful performance on the Pennsylvania combination car which was fitted up as a 1,000-h.p. locomotive, and which has been in operation on the New Haven system for the past nine months, shows that it is equally applicable to such service. With this apparatus any direct current locomotive can be adapted for operation from a single phase trolley by the addition of a transformer, rectifier, and a few additional pieces of control; thus, all of the advantages of transmission at high voltage alternating current will be enjoyed and all of the advantages of the direct current motor will be secured, together with the flexibility in speed control which results from changing the voltage applied to the motor. The Pennsylvania car referred to is one of the standard suburban steel combination cars and is equipped with four 250-h.p. d. c. motors. It has the transformer, rectifier and control equipment located in the baggage compartment and is really a locomotive of 1,000-h.p. capacity. A single rectifier furnishes all of the current required by these four motors. The efficiency of the rectifier will vary from 95 to 98 per cent, depending on the voltage which it supplies. For voltages of 1,200 or over, the efficiency will be above 97 per cent at all loads.

THE D. C. SYSTEM

New records have been made during the past year in direct current railway electrification. The Butte, Anaconda & Pacific, which is operating at 2,400 volts d. c., reports most satisfactory results. Direct current at 2,400 volts is also being applied to the third rail on another line, and the Chicago, Milwaukee & St. Paul has given a contract for the equipment of a subdivision of its line with 3,000 volts d. c., but of even greater importance are the tests which have been made at East Pittsburgh with still higher voltages. The great drawback to the use of high voltage direct current has been the difficulty of building high voltage motors for car equipments. This difficulty seems to have been largely overcome since an equipment consisting of two 100-h.p. motors has been operated successfully on a car at East Pittsburgh from an overhead trolley with voltages from 5,000 to 7,000 d. c. The tests were remarkably successful, both as regards motors and control, and the further development of this apparatus will be watched with interest. The apparatus has thus far been tested only in an experimental way; it is, however, shortly to be placed in actual service on a branch line of a large system where it can be given a thorough test. If it is found that direct current at a voltage of 5,000 can be utilized commercially for railway purposes without increasing the cost of equipment or of maintenance to an undue amount, there is no question but that such an equipment, together with the mercury arc rectifier for substation use, will have a large field.

THE SINGLE PHASE SYSTEM

The single phase system has made notable progress during the past year. The New York, Westchester & Boston Railway, handling a heavy suburban service out of New York, the Spokane & Inland Empire, and the Chicago, Lake Shore & South Bend, are all operating with the series compensated motor. At this time, however, there are three alternatives that may be presented to the railroad adopting single phase current for its trolley:

First, it may use the commutator type motor. Many improvements have been made in this form of motor which will tend to increase its reliability and decrease the cost of maintenance. This is the motor which the Pennsylvania has adopted for its suburban electrification at Philadelphia.

Second, it may select the split phase locomotive. This is the type that has been adopted by the Norfolk & Western for the electrification of its Elkhorn grade. This system employs a phase converter which is a rotating piece of apparatus located in the cab of the locomotive, which serves the triple purpose of supplying polyphase current for the induction motors which are used to drive the locomotive, and also drives the ventilating fan and the air compressor. It is generally recognized that the induction motor has many admirable characteristics, chief among which are light weight and rigid design, high efficiency, and ability to automatically regenerate power on descending grades. This type of motor makes it possible to secure an output from a locomotive with a given number of drive wheels, which would be practically out of the question with the commutator type of single-phase motor on account of its larger dimensions. The use of this type of motor in heavy freight service on mountain grades is especially desirable on account of the automatic regenerative characteristics which enable a train to be operated down grade at a constant speed without the use of brakes.

The third alternative is the rectifier locomotive which, as previously explained, uses d. c. motors with rectifiers and single phase transformers.

These three alternatives make the single phase system attractive for heavy electrification for long lines where the high voltage of transmission is of paramount importance. The

high voltage direct current system has also shown its ability to handle practically any traffic. With satisfactory operation promised for the various systems, the selection will depend upon the local conditions surrounding each proposition.

HOW RAILWAY EARNINGS SHOULD BE INCREASED; A SHIPPER'S VIEW

By P. W. Coyle

Traffic Commissioner, Business Men's League of St. Louis

That commercial conditions are out of joint there seems to be no question. The real cause of this condition is difficult to determine and the remedy that should be applied to give relief to the carriers, which will enable them to obtain desirable net results, is indeed a perplexing problem.

It would seem, however, that in order to give fair consideration to the subject we should take a retrospective view and examine some of the fundamental features involved. Primarily, of course, the legitimate purpose of the railroads is to furnish adequate transportation to the shipping and traveling public on as economic and equitable a basis as possible. When the means to this end are misused, or perverted, commerce must suffer to the degree that it is thus intimately associated.

In the construction and management of railroads, as in that of other business enterprises, the desire for personal gain and the consequent sharp competition have dominated the management of these properties until, in many cases, the interests of the public have been overlooked or made secondary to these dominating influences.

Up to a few years ago these carriers gave scant recognition to their obligations as public utilities. It is also unfortunate, but, nevertheless, true, that the desire for personal gain so dominated the management of many railroads in the early days that there is left, as a result, a trail of perversion of railroad property to individual use, running through the financial history of certain railroads almost, if not quite, transcontinental in extent. This perversion of railroad property is the foundation of large fortunes invested in other properties, in some instances so closely allied to the railroads as to sap the vitals of the latter, and it is significant that most of the railroads expressing the greatest degree of suffering, in consequence of their impoverished condition, are those through whose financial history runs this trail of perversion.

Of course, we cannot go back and repair all of this damage. It should be kept in mind, however, sufficiently to enable us to view the entire situation calmly and deliberately, because it cannot be said of the railroads of this country as a whole, that they are in the impoverished condition of the roads indicated.

I am, therefore, greatly in doubt as to whether a general advance in the rates is the sole contribution which should be made to bring about satisfactory net results.

Obviously, the dominating influence in railroad management today seeks to serve the public along legitimate lines and conserve the interests of the users and the owners of the properties, subject to reasonable governmental regulation.

In any event, we must recognize the fact that all railroads are intimately woven into the commercial fabric of the country, and we should not, therefore, jeopardize the entire business structure by singling out these roads whose systems have been impaired until they are, figuratively speaking, the weak threads, and require all to atone for their transgressions; nor should we allow their dire necessities to unduly influence our actions in attempting to prescribe a general remedy.

The question comes to my mind frequently: Is the public demanding too much of the carriers in the way of service, both freight and passenger? or rather, have not the carriers given to the public from time to time more service than was really demanded, simply to attract traffic or divert it to individual lines without particular regard to commercial conditions, or the necessity of the public? It, therefore, appeals to me that there is much room for economy in this respect, especially in passenger service, without injury to communities or individual interests.

Since rates are practically fixed by commission, apparently an unnecessary amount of money is expended by the carriers in soliciting business, both freight and passenger, which expense in the last analysis, of course, is borne by the shipper and the passenger. However, I can readily see where the capital invested in railroads must be consistently protected in this respect, so long as there is any element of competition between the carriers. Hence, great economy regarding this feature or others which might be suggested, could not reasonably be expected unless the railroads were permitted to, in some manner, pool their interests, subject, of course, to national supervision.

It would seem, too, that better results might be obtained both for the public and the carriers, if the latter were given a little more latitude in the management of their properties and the conduct of their business in general, subject only to national regulation.

From my viewpoint the greatest need of regulation, at the moment, is that which will enable or compel the carriers to so adjust their rates and regulate their service as to eliminate discriminations between communities, which in certain cases might be done by advancing rates or curtailing service without material injury to the public.

To this end I believe it would be mutually beneficial to the carriers and the public if the right to suspend rates were so modified as to give greater initiative to the career, and the jurisdiction of the Interstate Commerce Commission be so extended, or the co-ordination of that body and the state commissions made so complete, as to make it impossible for the action of the latter to in any wise nullify or affect the action of the former.

SHIPPER ADVOCATES CAR POOLING

By J. S. Marvin

General Traffic Manager, National Automobile Chamber of Commerce

A number of suggestions have been made for increasing the net revenue of the carriers, and many of them have opened discussion which is interesting and which will probably prove valuable, but I will devote the time and space allotted to me for a shipper's point of view to one subject on which all interests are fairly in accord and which it seems to me should have particular prominence at this time. Extensive results appear possible through a change in the American Railway Association's rules governing the interchange of its members' cars, or at least through the removing of a large proportion of such cars from the application of these rules.

The principle underlying car service rules from the beginning has been that each road is entitled to have its cars returned to the home rails when made empty on another road. While this appears as a natural statement of property rights, it is of very doubtful application under our present extensive railroad systems or in considering the best interests of the carriers, individually or collectively, and of the shipping public, which is entitled to have the several roads so organize themselves and their methods in certain respects as to constitute in effect one great system for the handling of the country's commerce. To illustrate: A freight car owned by the A. B. C. railroad is loaded today at a point on that road to a destination west of its own rails on the D. E. F. railroad. It is placed at destination on consignee's sidetrack, perhaps some distance from the breaking-up yard. The consignee unloads this car in the morning and the same day desires to load a carload of freight to a point still farther west, but the car service rules do not permit him to use this identical car, which must be returned, loaded or empty, to the home road. The railroad on which he is located is therefore required to take this car from his siding back to the yards and switch another car from the yards, or possibly from some other point on its line, into the factory for the outgoing load, notwithstanding

the fact that both cars are practically identical in size and carrying capacity. The cost of tracing and car accounting, telegraph service in the handling of equipment, empty car hauling, switching expenses, congestion of the yards and shippers' sidings, involved in the carrying out of these rules, is incalculable and must be tremendous when it is considered that these rules govern the handling of the more than two million freight cars now in service on our railroads. While the D. E. F. railroad is performing this service for one of its shippers, the A. B. C. railroad is doing the same where a D. E. F. car is on a factory siding empty and could be loaded east except for the rule. Similar conditions prevail in public freight yards.

The fact is that these rules, if enforced absolutely during periods of heavy traffic and car shortage, would cause interruption and delays in the handling of freight that would result in enormous losses to shippers. At such times the circumstances compel the railroads to ignore the rule to a very large extent, and we have the spectacle of railroads being forced to abandon an operating rule that they may handle commerce when it is at its height. In other words, instead of facilitating traffic the rule is impracticable and works contrary to the best interests of the carriers and the shippers as a whole when business is heavy, while on the other hand, when business is light and the carriers would like to reduce their operating expenses the rule is more closely complied with, particularly on account of the per diem system of charges under which each road tries to keep foreign equipment off of its rails as much as possible. Therefore, in periods of slack business we have the railroads undertaking a sort of solitaire on a great scale with freight cars as the cards, and thousands and thousands of these empty cars are hauled to get them onto the home rails, and we all know that there is no greater item of dead loss to the railroads than the hauling of empty cars.

Is this avoidable? Probably not entirely, but to a very great extent, yes, and in saying this I am not expressing an individual opinion that is contrary to the views held by operating officials. It is not a new suggestion. For years railroad operating officials of high standing have expressed themselves openly, and committees of railroad experts in this branch of the service have done the same, to the effect that the present rules should be changed, and succeeded in great part at least by a pooling arrangement that would obviate the stated difficulties and expense. Shipping interests are in favor of it. The National Industrial Traffic League has been urging the railroads for more than a year to take a definite step towards the change, realizing the greatly simplified service that would result where, instead of one car on a shipper's siding as used in the illustration quoted, they are more likely there in multiples of ten. This means that shippers must state in advance to the carrier serving them what shipments they have to move, the destinations and the routes, and the carrier then undertakes to furnish them cars that will answer the purpose according to the present rules which restrict cars to certain directions and routes, notwithstanding the fact that the shipper probably has on his siding all or most of the cars necessary, but of other ownership. And it is a daily occurrence for a shipper to be denied immediate service when empty cars are available, because the carrier will not permit him to load those particular cars in the direction the shipments must go, and he must wait until they can get other cars, although of identical size and carrying capacity. Should the suggested spotting charges be permitted a further injustice would be done the shipper in not permitting him to load the car already spotted. Such delays frequently mean a direct financial loss to the shipper through his inability to get bills of lading for goods ready to ship. It is also apparent that this condition enters very largely into the periodical so-called car shortages.

It is not contended that all cars could be pooled at once. Some roads have better cars than others; they are of greater carrying capacity; and there are a great many cars especially adapted to the particular traffic originating on the roads which built them; the financial obligations assumed by carriers in some cases for equipment must be properly protected. But these are details which could be worked out in view of the tremendous benefits to accrue, and considering the long time which this plan has been discussed and the endorsement it has had from experts it would seem that in this branch of railroad operation the shipping public is entitled to have the railroads make a definite start towards its accomplishment. It is true that a standard for box cars is now under consideration, whereby, hereafter, such cars would be built more nearly alike in dimensions, capacity and mechanical details. But the results of this proposal are at best a long way in the future and I see no reason why it should precede a start on the pooling proposition. There are thousands of cars now in service that are practically alike and a freer use of this large group would relieve the situation and make the application of the home and home rule more possible of enforcement on cars which really require it. And it must be borne in mind that owning roads today, even if they consider their cars better than others, have them returned in great part only when other roads have no use for them. The per diem charge for the use of box cars is the same regardless of their construction and capacity, and whatever plan adopted could properly recognize the roads which have furnished their full quota of equipment and reversely those that fail to do so.

At the recent meeting of the National Association of Railway Commissioners the Committee on Railway Service and Railway Accommodations stated in its report, "we are still impressed that too much time is lost in handling foreign equipment by empty movements or holding cars in order to load in the direction of home." The Interstate Commerce Commission has stated that the present rental and rules are sometimes not equal to the necessities of the situation and do not fully comply with the duties imposed by the act to regulate commerce, which requires reasonable regulation with respect to the interchange of cars so that through routes may be kept open. The commission characterized the stealing of equipment by one road from another as "loose and archaic methods of a disorganized industrial system" and "not the expression of civilization which leads to order, system and certainty" (22 I. C. C., 39). The American Railway Association has a commission of its own members to supervise the observance of car service rules, and this commission has stated that the sudden enforcement of drastic measures tending to return box cars to owners without regard to the traffic offered would result in a decrease in the loaded mileage of box cars that would result in new and greater shortages at all points in the country; it stated that while special equipment and open cars could probably be effectively regulated by the present rule, box cars cannot, because the practice of the home route for such cars is an economic waste. Therefore we have commissions, the shipping public and railroad officials in favor of a change. There has been any amount of discussion and recommendation on the subject, but "what's everybody's business is nobody's business." Such matters are usually of broad import and cover the entire field of certain industry. They become association business. By all means let the American Railway Association right now give one of its experts the particular and only task of formulating an up-to-date plan for free interchange of the thousands of box cars which are practically alike. The carriers' demands for increased rates have led to counter demands that all possible economies be effected. With cars now in plentiful supply and largely on home rails, and with traffic light, the situation is well in hand for the move. The time is opportune.

New Railway in Corea.—The Seoul-Gensan Railway was formally opened on September 6. Its construction was begun during the late war, but suspended until October, 1910, since which time the work has been carried on with vigor. The railway crosses the peninsula from east to west and is 141 miles in length.

Cars and Locomotives Ordered and Built in 1914

Equipment Market Was Poor, Particularly During Latter Half of Year. Grounds for Optimism Now, However

In 1914 railways and other purchasers of cars and locomotives in the United States, Canada and Mexico placed orders for 80,264 freight cars, 2,002 passenger cars and 1,265 locomotives. In the same period there were built in the plants of the various car and locomotive companies and the several railroad shops 104,541 freight cars, 3,691 passenger cars and 2,235 locomotives. These totals as a whole rank with the lowest yet experienced since the compilations of these figures were begun. It will surprise many to learn, however, that even with the war in Europe, the general business depression in America and the financial difficulties of the railways, the returns for the past year are much better than those for 1908 and that, in particular, the orders for freight cars were from 25 to 33 per cent and the orders for passenger cars approximately 50 per cent greater than in 1908.

The tables in the following pages contain detailed statements of the new freight cars, passenger cars and locomotives ordered by the railroads, private car lines and industrial companies of the United States, Canada and Mexico. Although the compilation of figures from such numerous sources is subject to some slight omissions however great the care taken, the results are sufficiently accurate to meet the general purpose for which these statistics are prepared, namely, to show the character and extent of the purchases of rolling stock in 1914 as compared with previous years.

The data given herewith are compiled from official sources. The *Railway Age Gazette*, in answer to its inquiries this year, received communications either stating that no cars or locomotives were ordered in 1914 or containing the details of orders, if such were placed, from all but three of those railroads in the United States, Canada or Mexico owning over 500 freight cars. It also received similar information from the greater part of the remaining smaller roads and from a majority of the private car lines. In those cases in which no replies were received the data were taken from the weekly records of the paper or from the reports of the builders.

These weekly records show that the orders for cars and locomotives held up exceedingly well during the first six months of the year, but that during the latter six months the number of orders placed was almost nil. It would be hard to find a clearer indication of the effect on the railways or on the railway supply companies of the war and the adverse rate decision, since superseded.

The total of freight cars ordered in 1914, 80,264, compares with a total for 1913 of 146,732. Of the 1914 total over 90 per cent were specified as having all-steel or steel underframes, and approximately 60 per cent as having friction draft gear. Another indication, also, of the tendencies in freight car construction is the total of 2,693 all-steel box cars. A surprising feature of slightly different nature is the fact that the orders for hopper cars in 1914 were less than 25 per cent of the number ordered in 1913.

The total of passenger cars ordered in 1914 was 2,002, as compared with 3,179 in 1913. All but 234 of the 1914 total were specified as being of all-steel construction or as having steel underframes. Of the locomotives ordered in 1914, 1,265, as compared with 3,467 in 1913, 970 or 78 per cent were specified as

Freight and Passenger Cars Built Each Year Since 1899.

having superheaters and 767 or 60 per cent as being provided with brick arches. Another interesting feature is the prominence of the Mikado and Santa Fe types.

The returns relating to cars and locomotives built in 1914 have come from builders in both the United States and Canada and, as was the case in 1913 and 1912, the output of the several railroad shops is also included. Of the total of 104,541 freight cars built, 44,098 were of all-steel construction; 51,515 had steel underframes and only 8,928 were of wood. Of the 3,691 passenger cars built, 3,441 were of all-steel construction, 94 had steel underframes and only 156 were of wood.

Returns from the locomotive builders show that 2,235 locomotives were built, a considerable drop from the 3,467 of 1912. Of the total 1,962 were for domestic use and the remainder, 273, for export.

It does not take an optimist to see that 1915 will be a far more prosperous year for the railway equipment market than the year just past. That, to be sure, is not saying a great deal. It is almost universally agreed, nevertheless, that the tide has turned. The railroads have been awarded at least a considerable part of the 5 per cent increase for which they asked, and that combined with the opening of the stock exchanges should soon put them in a position to purchase the cars and locomotives for which many of them are in urgent need. The railway equipment builders are also beginning to receive new business from abroad, and several large orders have already been placed.

Total freight	tons	27,771,467	27,598,467	55,369,934

In all items except copper and salt the movement was considerably lighter than in 1913. The decrease in soft coal was 23 per cent, in wheat 27 per cent, in other grain 39 per cent, and in passengers 23 per cent.

DIVIDEND CHANGES

The accompanying table shows the changes in amount of dividends declared in the calendar year 1914 as compared with the calendar year 1913. In some cases dividends are declared in one year, payable in the next. Wherever this has occurred the table is based on the time when the dividend was declared, not when it was paid.

All the important changes were, as will be seen, reductions. The Atlantic Coast Line and Louisville & Nashville reductions reflect conservatism rather than absolute necessity, as does also the reduction and payment in scrip by the Southern Railway. The Michigan Central reduction indicates conditions with that company, and the Seaboard Air Line and Central of Georgia reflect temporary disappointment in plans which had been working out successfully, due to conditions in the South since the war. The Buffalo, Rochester & Pittsburgh reflects conservatism and the large falling off in business between the Lakes and Pittsburgh.

a The annual rate to January, 1913, was 4 per cent, and in July, 1913, a semi-annual dividend of 1 per cent was declared, apparently reducing the annual rate to 2 per cent, which was, however, increased in 1914, as shown in the table.

b The stock is a 6 per cent cumulative stock.

c An extra dividend consisting of $315,000 first mortgage bonds was paid during the fiscal year ended June 30, 1914, to the parent company, the Toledo, St. Louis & Western.

d There is no regular annual rate for this stock.

e Besides the regular dividend of 8 per cent in 1914 an extra dividend of 10 per cent in cash and 40 per cent in stock was paid under the lease agreement of August, 1914, and also 28 per cent extra in cash, which represented the annual 8 per cent dividends on the stock dividend declared in January, 1911, and held up by the courts until August, 1914.

f The regular annual rate on the stock is 10 per cent, but in each year since 1909 up to and including 1913, extra dividends of varying amounts have been declared, the extra dividend in 1913 being 5 per cent.

g The reduced dividend of 2 per cent declared in October, 1914, was paid in interest bearing scrip.

h In January, 1914, an extra dividend, consisting of Baltimore & Ohio preferred to the amount of 12 per cent on the par value of Union Pacific and Baltimore & Ohio common to the amount of 22½ per cent on the par value of Union Pacific and $3 per share of Union Pacific, was declared and paid in July. The regular annual dividend, therefore, was reduced by 2 per cent, since the return on the extra dividend would amount to just about 2 per cent.

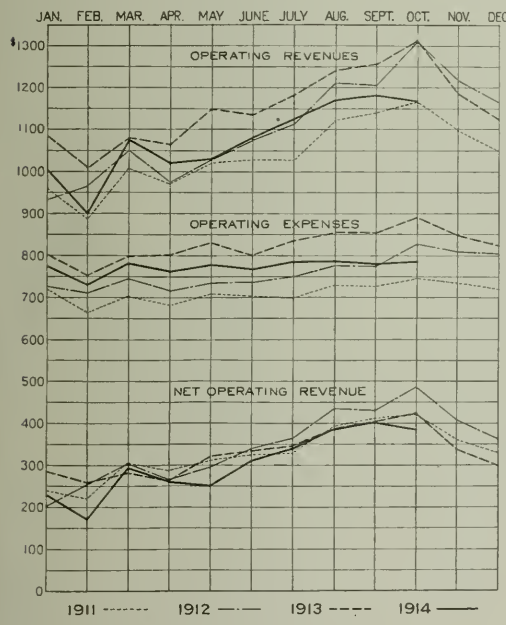
English Railwaymen's Union Invests in Municipal Stock.—The National Union of Railwaymen of England has recently effected an investment of $150,000 in stock of the Derby Corporation, Derby being headquarters of the Midland Railway.

The Trend of Railway Earnings in the Year 1914

Steadily Declining Gross Revenues Are Not Offset by Lower Operating Expenses Despite Economies

By Frank Haigh Dixon
Professor of Economics, Dartmouth College; Chief Statistician, Bureau of Railway Economics

So widespread has been the public interest in the application of the eastern railways for a 5 per cent increase in their freight rates and so much more detailed and exact than usual is the public information as to the financial condition of the railways in general, that a review of the trend of earnings during the year need be little more than a comment on the more significant statistics. Month by month for nearly two years, with only an occasional variation to relieve the monotony, the story has been the same—a slow but continuous fall in gross earnings, a failure to offset this decline altogether by the cutting of expenses in spite of determined attempts that have involved abandonment of many plans for maintenance work, and a resultant heavy decline in net earnings. With the constantly increasing burden of labor costs, the proportion of the expenses



Comparative Chart of Earnings and Expenses

that are fixed beyond the control of the carriers is becoming steadily larger. The result is that in periods of declining traffic the power of the roads to preserve their net by reducing expenses is being lessened. Only by such radical action as the laying off of employees and the reduction of train service can the situation be met in any degree.

Table I, based on the compilations of the Interstate Commerce Commission, presents the revenues and expenses for the fiscal years 1911 to 1914 of all railways having annual operating revenues of $1,000,000 or over, and includes about 90 per cent of the mileage of the country. Were the statistics for the other 10 per cent of the mileage available, the per mile figures would be somewhat less, but the relation of the different years would be only slightly affected. This table shows a figure for operating revenues per mile for 1914 in excess of that for 1911 and 1912, but less than 1913 by 3.4 per cent. Operating expenses could not be reduced in the same proportion, but were held almost stationary, showing an increase in 1914 over 1913 of 0.5 per cent. The result was that net operating revenue declined 12 per cent in 1914 as compared with 1913. In fact the net per mile is the lowest figure since 1908, the year following the panic. As the commission states in its decision on the rehearing of the 5 per cent case, "from whatever comparative standpoint viewed, the net operating revenues of the last fiscal year must be regarded as unduly low."

Depression in business never seems to reach the tax gatherers. The item of taxes shows handsome increases each year, the 1914 per mile figure being 9.6 per cent larger than that of 1913, 14.3 per cent larger than 1912, and 24.9 per cent larger than 1911. As a consequence per mile figures of operating income are even more discouraging than those of net earnings.

For the purpose of bringing the discussion down to include the latest available information, Table II has been prepared showing gross revenues, expenses and net per mile by calendar months for the years 1911 to 1914. It should be explained that the figures for the months of July to December for the years 1913 and 1914 are not exactly comparable with the rest of the figures, because of a change in accounting methods prescribed by the commission, effective July 1 of this year. However, this change does not disturb any of the conclusions to be drawn from the exhibit. It will be observed that operating revenues per mile in 1913 were larger than for either of the two previous years for every month except November and December. October would also have shown a decline except for a change in accounting methods. The year 1914 shows a decline from 1913 for every month thus far reported, the heaviest fall being 11 per cent in the months of February and October. In other words, a decline in earnings beginning in the fall of 1913 has continued since uninterruptedly. Operating expenses throughout the months of 1913 are larger than for the two previous years, although the increase was arrested in December and on the old accounting basis, would have been about at a standstill. The splendid efforts of the roads to meet the situation are shown in the 1914 figures, where the decline in operating expenses per mile shows an almost uninterrupted progress until it reaches the percentage of 11.8 for the last month reported. The outcome as shown in the net revenue columns is not so gratifying as these percentages of decline in operating expenses would lead one to expect. Declines in net operating revenue per mile are shown for every month of 1914 except March, and they run as high as 34 per cent in February and 22 per cent in May. To understand these great variations from month to month, one must take the three factors together of gross revenue, expenses, and net. For example, in March the gross earnings were nearly as large as in the previous year; the policy of economy had been inaugurated and expenses per mile were cut down 2.1 per cent. As a consequence net showed an increase of over 4 per cent. On the other hand, in October, the last month reported, gross fell off 11 per cent. Yet in spite of the fact that the slash in expenses was the greatest of any month of the year, it was impossible to neutralize the heavy decline in business, and net shows a 9.4 per cent decrease per mile as compared with 1913.

The statistics of this table are presented graphically. The heavy black line illustrates the 1914 situation. The striking features on this diagram are the relatively low position of the 1914 curve of operating revenues, the increasing gap between the 1913 and 1914 curves of operating expenses and the per-

sistent depression of the 1914 curve of net revenue below those of the three other years.

Table III presents for the year 1914 in comparison with 1913 the monthly revenues and expenses per mile from January to October, arranged by districts. This makes possible a localization of the favorable and unfavorable factors of the situation, which is obscured in a table presenting the facts for the country as a whole. But a glance at the table shows that roughly speaking, the conditions have been general and that no section thoroughly were the roads able to put their policies of economy into operation that five months showed increases in net revenue, and these included the last three months. The increase for September was nearly 7 per cent. In the west, the month of March alone showed an increase in net revenue, and October's decline amounted to 9.6 per cent. The south showed increases in three months, that for April being as large as 13.6 per cent, yet this favorable exhibit was more than offset by a decline in October of 31.6 per cent.

TABLE I—REVENUES AND EXPENSES IN THE AGGREGATE AND PER MILE OF LINE OF STEAM ROADS HAVING ANNUAL OPERATING REVENUES OF $1,000,000 OR OVER; FISCAL YEARS ENDED JUNE 30, 1914, 1913, 1912 AND 1911

* Decrease. def. Deficit.

seems to have escaped the business depression or to have failed to meet it in part by a curtailment of expenses. In the comparison of the monthly figures, the last month reported, October, showed that the unfavorable business situation had by that time affected railways generally, for there was a decline of 10 per cent in the east, 17 per cent in the south, and 9 per cent in the west. In the east and west, declines in operating expenses per mile appeared in every month, increasing in amount, and reaching in October, 14 per cent in the east and 9

What will be the effect of the commission's grant of the increase in rates to the eastern carriers, it is too early to state with any exactness. If it has its much predicted psychological effect and starts a revival in business, the roads should at least for a time gather the increase into their net revenue purse. How long such a happy state of things can continue will depend upon the amount of deferred maintenance which must be resumed, and upon the attitude of labor. If the brotherhoods feel that a large part of the increase belongs to them, they will

TABLE II—MONTHLY REVENUES AND EXPENSES PER MILE OF LINE: 1911, 1912, 1913 AND 1914

* Decrease. † Includes "outside operations" (Revenues and Expenses each average from $20 to $25 per mile).

per cent in the west. In the south there were increases in operating costs in five of the ten months reported, but the last month of October disclosed a vigorous handling of the situation. The percentage decline jumped from 4.7 per cent in September to 10.7 per cent in October. With these variations in gross revenue and the introduction of temporary and radical economies by railway executives, startling variations in net revenue are hardly to be wondered at. The east in 1914 as compared with 1913 showed declines in net per mile as heavy as 39 per cent in January and 56 per cent in February. Yet so

make the usual moves to put themselves in possession. But in the present temper of the commission, the shippers, and the people generally, they might well sit down and reason together before taking so hazardous a step. After all, the largest single advantage to the roads that will be realized from the commission's decision will be the restoration of confidence to the investing class—an assurance that regulation does not mean oppression, and that administration of public service industries involves reasonable rates from the standpoint of the carrier quite as truly as from that of the shipper.

* Decrease.

New Railway Construction Statistics for 1914

Less Track Was Laid in the United States Than for Any Year Since 1895. Canada Also Shows Decrease

During 1914, a total of 1,531.80 miles of new first track was completed in the United States. In the same period 565.58 miles of second track and 29.84 miles of other multiple main track was built and placed in service. In Canada, 1,978.07 miles of first and 152.50 miles of second track was built during the past year. No new mileage was reported from Mexico. These figures are based upon returns made directly to us by the different roads, supplemented by our own construction records, and are as complete as it is possible to compile at this time.

The mileage of new lines built in the United States was practically the same for the three preceding years. This year it fell to one-half the figure for these years, as shown by the accompanying tables and diagram. In 1913, 3,071 miles of new construction was reported, while in 1914 the amount of new line built was 1,532 miles—the lowest figure since 1895. The mileage of new line completed this year was only 25 per cent of that for 1902, the high record year.

The figures of new construction by years, beginning with 1893, are as follows:

1893	3,024	1904	3,832
1894	1,760	1905	4,388
1895	1,428	1906	5,623
1896	1,692	1907	5,212
1897	2,109	1908	3,214
1898	3,265	1909	3,748
1899	4,569	1910	4,122
1900	4,894	1911	3,066
1901	5,368	1912	2,997
1902	6,026	1913	3,071
1903	5,652	1914	1,532

New mileage was reported built in 1914 by 166 companies, including subsidiary companies of larger roads separately. No new or second-track mileage was added in Alaska, Arizona, Colorado, District of Columbia, New Hampshire or Vermont. For some years the state in which the largest new mileage has been built has been in the West. This year a Southern state, Florida, takes the lead, with 220 miles of new lines. Other states with over 100 miles of new lines are California, Idaho and Washington.

The longest continuous line reported completed last year was the extension of the Burlington from Casper, Wyo., to Orin Junction, 61 miles, and the next longest line was that of the Charleston, Atlantic & Western from Andrews, S. C., to Charleston, 57 miles. The Atlantic Coast Line also completed an extension from Dunnellon, Fla., to Wilcox, 50 miles. The greatest total mileage completed by any one road, including its subsidiaries, was built by the Chicago, Milwaukee & St. Paul, with a total of 122 miles. The Southern Pacific System was second, with 92 miles. Sixty-five per cent of the mileage of new lines was built in ten states.

Our reports show that 566 miles of second track was built in 1914 as compared with 1,264 miles in 1913, and 1,073 miles in 1912. This work was distributed through 30 states and territories, although 64 per cent was built in five states. The Chicago, Milwaukee & St. Paul led, with 110 miles of second track between Green Island, Iowa, and Manila. The Atlantic Coast Line completed 62 miles of second track between Selma, N. C., and Parkton, while the Northern Pacific completed 55 miles in Washington, and the Norfolk & Western completed 54 miles in Virginia.

The 30 miles of other multiple main tracks was divided between third track, 10 miles; fourth track, 19 miles; fifth, sixth, seventh and eighth tracks, each 0.1 mile. This was all composed of small projects, the largest of which were 5.35 miles of fourth track on the Delaware, Lackawanna & Western, in Pennsylvania, and 4.53 miles of fourth track on the Philadelphia & Reading, in New Jersey.

The above figures do not include the relocation and rebuilding

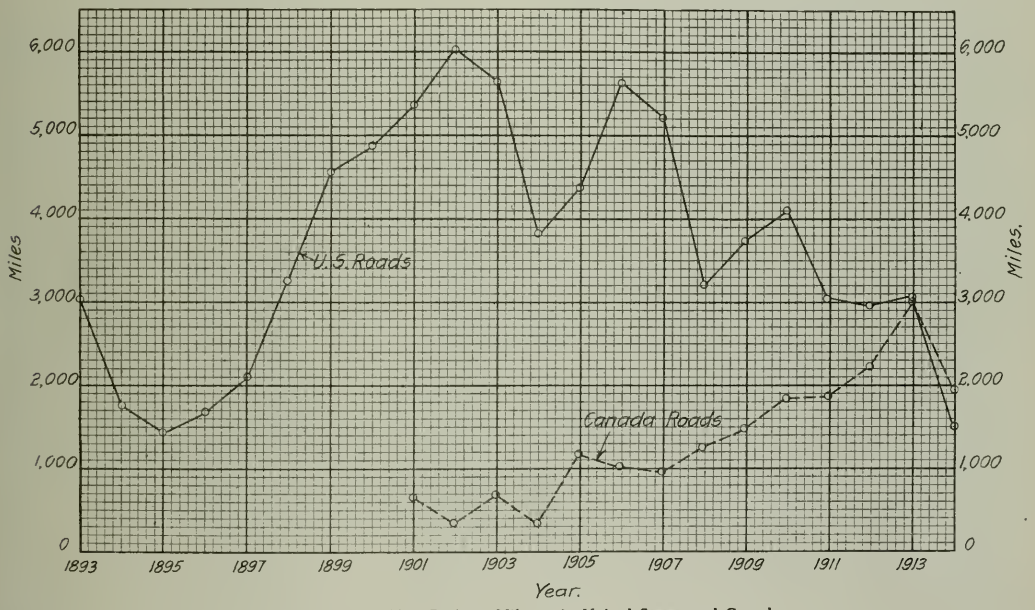

Diagram Showing New Railway Mileage in United States and Canada

of existing lines where the mileage is not increased. Thus, some of the most important projects now under way involving very heavy work, do not appear in the statistics.

At the close of the year, 1,015 miles of new first track was under construction and uncompleted in the United States, in addition to 1,229 miles of new lines surveyed and 2,031 miles projected. On the same date 71 miles of second track was under construction and 194 miles projected. On January 1, 1914, 1,522 miles of new line was under construction, 1,511 miles of additional line had been located and 1,296 miles was projected, while 408 miles of second track was under construction and 249 miles located or projected.

While the mileage of new lines built in Canada did not show as great a decrease as in the United States, the reduction there is also marked. There was 1,978 miles of first track and 152 miles of second track completed in 1914 as compared with 3,013 miles of new first track and 353 miles of second track in 1913. The Canadian Pacific built 620 miles of new line; and the Canadian Northern and its subsidiaries built 515 miles, while the Grand Trunk Pacific built 249 miles. Nearly all of this mileage is in western Canada. The construction of second track was confined entirely to the Canadian Pacific. At the present time, 465 miles of new first track is under construction in Canada, with 2,127 miles additional surveyed and 80 miles projected.

As would be expected, the disturbances in Mexico have caused an entire cessation of railway construction in that country, and no new mileage was reported.

The comparative amounts of various classes of new tracks built in each state during 1914 are shown in the two accompanying tables and in detail in data following.

UNITED STATES.

Alabama

First Track

	Miles.	Miles.
Atlanta, Birmingham & Atlantic—Helena to Falliston	1.00	1.00

Second Track

Louisville & Nashville—Decatur to Boyles	28.30	
Nashville, Chattanooga & St. Louis—Between Mile 123 and 129	2.91	
Southern Railway—Birmingham to North Birmingham	2.60	33.81
Total of all track		34.81

Arkansas

First Track

Butler County—To Piggott	2.24	
Cairo, Truman & Southern—Judd Hill beyond Weona	10.00	
Fourche River Valley & Indian Territory—Bellevue to Thornhury	4.86	
Helena, Parkin & Northern—To Woodville	6.00	
Little Rock, Maumelle & Western—Not specified	4.00	27.10

Second Track

Fourche River Valley & Indian Territory—Not specified	0.50	0.50
Total of all track		27.60

California

First Track

Central Pacific (So. Pac.)—Ten miles west of Susanville to Westwood, 21.00 miles; Oakland to Oakland Pier, 2.00 miles; at Fruitvale, 0.30 miles; total	23.30	
Colusa & Hamilton—Near Razor to North of Glenn	8.30	
Minkler Southern (A. T. & S. F. C. L.)—Between Minkler and Exeter	8.88	
Mount Tamalpais & Muir Woods—At Muir Woods	0.72	
Northwestern Pacific—Between Willets and Shively	32.80	
San Diego & Arizona—Coyote Wells to Westwood	8.80	
Southern Pacific—Oakland to Oakland Pier, 1.90 miles; Viola Junction to Viola, 8.50 miles; total	10.40	
Trona Railway—Between Trona and Searles	10.71	103.91

Second Track

Atchison, Topeka & Santa Fe Coast Line—Between Fresno and Calwa	3.25	

CALIFORNIA (*Continued*)

	Miles.	Miles.
Central Pacific (So. Pac.)—Colfax to east of Magra, 8.50 miles; Oakland to Oakland Pier, 2.00 miles; at Fruitvale, 0.30 miles; total	10.80	
Northwestern Pacific—Baltimore Park to San Rafael, 1.35 miles; San Anselmo to San Rafael, 1.54 miles; total	2.89	
Southern Pacific—Oakland to Oakland Pier	2.00	18.94
Total of all track		122.85

SOUTH MANCHURIA RAILWAY TO BUILD LOCOMOTIVES FOR KOREA.—The shops of the South Manchuria Railway at Shahokou are now building locomotives for the companies' lines and have recently completed one of consolidation type. It is said that these shops will construct locomotives for the Korean railways, which are also of standard gage.

Mileage of American Railroads Block Signaled

A Total of Eighty-eight Thousand Miles. Nearly Thirty Thousand Miles Equipped with Automatic Signals

The mileage of railroad in the United States operated under the block system on January 1, 1915, as shown in the large table printed herewith, is 88,128 miles. The increase over the total given in our table of one year ago is 943 miles; but this comparison is somewhat inaccurate for reasons given with last year's statement. The more significant total is that of automatic block signal mileage; 29,689 miles of road, as compared with 26,123 reported a year ago and 26,569 reported a year ago by the government. This increase of something over 3,000 miles of automatic signaling compares with 3,827 miles increase in 1913. The year 1914 makes a better showing than was to have been expected. The 1913 increase was very large, compared with years before that. Now, as in former years, the smaller increase in the grand total is explained by the fact that a large mileage of automatic signals was installed to take the place of the manual or telegraph block system. The detailed comparison of the totals of the *Railway Age Gazette* tables for three years is as follows:

	Automatic		Manual		Total	
	Jan. 1.	Increase over prev. year.	Jan. 1.	Increase over prev. year.	Jan. 1.	Increase over prev. year.
1915.....	29,869	3,566	58,443	decrease	88,128	943
1914.....	26,123	3,827	61,062	5,127	87,185	8,954
1913.....	22,296	1,961	55,935	decrease	78,231	1,821

These figures are to be understood with the usual conditions, with which the reader is assumed to be familiar. Some of the roads with light traffic, reporting the manual block system in use, employ it usually only for passenger trains. A number of roads, notably the Pennsylvania, exclude from their statement of total mileage operated, all lines on which there is regularly in service only one locomotive. Our statements, like those issued by the government, deal only with passenger lines; yet a number of roads have installed automatic block signals on lines used exclusively for freight; and in some of the statements these freight lines have been included.

Four roads appear in the list this year for the first time: the Canadian Pacific, the Rock Island Southern, the South Dakota Central and the Western Maryland. The signals reported by the last-named road are automatic.

Below will be found the usual statements of proposed new work, including proposed interlocking signals. As in former years, many prominent roads reply that their plans for 1915 are not yet ready to be given out. The more important items of proposed new mileage are those under the heads of the Boston &

LINES IN CANADA WORKED BY BLOCK SYSTEM.

	Automatic miles of road	Manual miles of road	Total miles of road
Canadian Pacific (East of Fort William)....	226	4,428[1]	4,654
Canadian Pacific (Western Lines).....	...	....	....
Canadian Government (Intercolonial).....	43	....	43
Dominion Atlantic	...	273	273
Grand Trunk	2	3,619[3]	3,621
Michigan Central	245[2]	....	245
Toronto, Hamilton & Buffalo.....	62	....	62
Total	578	8,247	8,898

[1]Includes 366 miles double track; also includes 73 miles single track, worked by electric train staff.
[2]All double track.
[3]Includes 653 miles double track.

Maine, the Chicago, Milwaukee & St. Paul, the Delaware & Hudson, the El Paso & South Western, the Erie, the Great Northern, the Illinois Central, the Louisville & Nashville, the Alabama Great Southern and the Texas & Pacific. In two cases, and perhaps in others, automatic block signal items here noted refer to installations which are to take the place of the manual block system.

The Panama Railroad is now operated by the block system; automatic, 40 miles single track, 7 miles double track; manual, single track, 7 miles.

Canada.—The block system is now operated in Canada on 8,825 miles of road, of which 578 miles is automatic, as reported by the six companies given in the table in the previous column.

PROPOSED NEW WORK

The Atchison, Topeka & Santa Fe plans this year to install a mechanical interlocking plant of 20 levers, at Erie, Kan.; and the Gulf, Colorado & Santa Fe will install a similar plant at Longview, Tex.

The Baltimore & Ohio Chicago terminal is planning to extend its automatic block signaling 2.33 miles during the coming year.

The Boston & Maine expects to install automatic block signals this year on its line between White River Junction, Vt., and Wells River, 40 miles.

The Carolina, Clinchfield & Ohio expects to open during the coming year an extension to Elkhorn City, Ky., and on this line there will be automatic signals over a length of two miles, through Sandy Ridge tunnel, single track.

The Central New England plans this year to install automatic signals on two miles of new second main track.

The Chicago & North Western expects to install three electric interlocking plants at drawbridges during the coming year; two at Milwaukee, with 33 and 45 levers respectively, and one at Deering, Ill.

The Chicago, Milwaukee & St. Paul proposes this year to install automatic block signals on 101 miles of its line, double track, now operated by the manual block system.

The Chicago, Rock Island & Pacific plans to install this coming year an electric interlocking plant at Walnut street, Peoria, Ill., 28 levers.

The Cumberland Valley has under construction at Chambersburg, Pa., an electric interlocking plant of 24 levers.

The Delaware & Hudson expects to extend its automatic block signals about 23 miles during the coming year.

The Delaware, Lackawanna & Western plans to install an electro-pneumatic interlocking plant of 31 levers at the drawbridge over Buffalo river.

The Detroit, Toledo & Ironton expects to install interlocking plants during the coming year at three points, two of which are joint as between this road and the Detroit United Railways.

El Paso & Southwestern.—This company plans to install automatic block signals on 29 miles of road during the coming year.

The Erie plans during the coming year to install automatic block signals, in place of the manual block system, on 43 miles of road, double track, as follows: Solon, Ohio, to Cleveland, 16 miles, and Kent, Ohio, to Leavittsburg, 27 miles.

The Grand Trunk plans to install automatic block signals during the coming year on its line between Forty-seventh street, Chicago, and Thornton Junction, Ill., about 17 miles.

The Great Northern plans during the coming year to install automatic block signals on 200 miles of its line. The signaling plans for 1915 include also two mechanical interlockings at Duluth, 16 levers each; one of 22 levers at Aberdeen, S. D., and one of nine levers at Calumet, Minn.

The Illinois Central statement shown in the table includes 7 miles, automatic, single track, only recently completed, between Mercer, Ky., and Graham; and the Yazoo & Mississippi Valley includes 20 miles just finished on the line between Baton Rouge, La., and Kenner. These two installations are parts of a considerable program of new construction, the balance of which, about 195 miles, will be completed during 1915. This new work, yet

† No report received; figures repeated from last year. [1] Erie: 84 miles of freight lines block signaled. [2] Includes only the four-track line. [3] Includes some lines operated for freight only. [4] Includes passenger lines only. [5] Excluding lines on which only one engine is in service. [6] The discrepancy in totals is due to a duplication of mileage in which both automatic and manual systems are used.

to be finished, includes 62 miles additional between Baton Rouge and Kenner, and 14 short sections on the Illinois Central, the more important of which are the following: Gibbs, Tenn., to Trimble, 18 miles, double track; Dyersburg, Tenn., to Curve, 15 miles, double track; and the following, all single track: Leitchfield, Ky., to Horse Branch, 24 miles; Mona Siding, Iowa, to Benson, 10 miles; Tip Top, Ky., to Graham, 10 miles; Coleman, Ill., to Plato Center, 9 miles, and Cecilia, Ky., to East View, 8 miles.

The Interborough Rapid Transit Company, New York City, plans during the coming year to install electro-pneumatic interlocking at Chatham Square junction, on the elevated lines, the machine to be of 23 levers. This will take the place of a mechanical interlocking.

The Louisville & Nashville during the coming year will complete work, now under way, which will equip with automatic block signals the line between Cincinnati, Ohio, and Winchester, Ky., 97 miles. About 90 miles of this division of the road—Winchester to Corbin—has been equipped with automatics during the past year.

New York Central Lines.—The Cleveland, Cincinnati, Chicago & St. Louis will install electric interlocking at Nokomis, Ill., 32 levers.

The New York, Ontario & Western contemplates the installation during the coming year of a mechanical interlocking plant at Campbell Hall, N. Y., of 56 levers.

The Norfolk & Western has prepared plans for the installation of automatic block signals on 25 miles of road, which plans will be carried out whenever there shall be sufficient improvement in business to warrant the expenditure.

The Oregon Short Line will install at Pocatello, Idaho, an electric interlocking machine, having 8 working levers and 3 spare spaces. The machine will be type "F" of the Union Switch & Signal Company.

The Pennsylvania advises that the only signaling plans which have been completed for the coming year are those in connection with the electrification of the main line from Philadelphia to Paoli, 20 miles, four-track. In connection with this work, the electro-pneumatic interlocking at Bryn Mawr will be replaced by Union electric interlocking, type F; and all of the

signals between Overbrook and Paoli will be taken out and replaced by "beam-light" signals.*

Queen & Crescent.—The Cincinnati, New Orleans & Texas Pacific is to install electric interlocking, 12 working levers, at McLean avenue, Cincinnati; and mechanical interlockings at Robbins, Tenn., 13 levers, and at Mile 225, 7 levers. The Alabama Great Southern will install at Chattanooga two electric interlockings, one of 16 working levers and one of 47; and the plans for the year include new automatic block signals on 22 miles of road.

The Southern Pacific plans to install three large power interlockings during the coming year; at Davis, Cal., and at Bloomington, Cal., the General Railway Signal Company's model 2—eighty levers at Davis and twenty-four levers at Bloomington: at Fourth street, San Francisco, the Union Switch & Signal Company's electro-pneumatic, 107 levers.

The Texas & Pacific has under construction automatic block signals on 23 miles of line, to be ready to put in service early in 1915. It is expected that 17 miles additional will be equipped with automatic block signals during the year, or 40 miles altogether.

The Toronto, Hamilton & Buffalo has contracted with the General Railway Signal Company for three interlockings on the branch line from Smithville to Dunnville, namely; at the crossing of the Michigan Central at Attercliffe, 28 levers, and at the crossing of the Grand Trunk, 16 levers; and at Dunnville, crossing of the Grand Trunk, 16 levers. All of these are mechanical interlockings.

*"Beam light" is a term used to designate a signal consisting wholly of lights, uncolored; and the indications are given by means of shape. A row of four lights, arranged horizontally, means stop; a similar group inclined 45 degrees upward means caution, and a row arranged vertically means proceed. By putting over the lights a suitable hood, the signals are made visible in daylight, and tests have shown that they can readily be seen in bright sunlight at a distance of 4,000 ft.

UNEMPLOYMENT RESULTING FROM RAILROAD DEPRESSION

For the purpose of obtaining an indication of the amount of unemployment that has resulted from the unsatisfactory conditions of the railroad business, with the consequent effect on the railroad supply business, which has been one of the chief causes of the general business depression, the *Railway Age Gazette* asked the railroads entering Chicago for a statement of the number of men in their employment on August 1 and June 30, 1914, as compared with the number employed on those dates in 1913. It also asked the members of the Railway Business Association, including the principal companies throughout the country that make and sell materials, equipment and supplies to railroads, for the number of men in their employment on August 1, 1914, as compared with the number employed under normal conditions. August 1 was selected, instead of a later date, because the European war began on that date and the figures as of that date exclude effects which are attributable to the war.

As the total operating revenues of the railroads of the United States for the fiscal year ending June 30, 1914, showed a reduction of only 3.4 per cent per mile as compared with the previous year, indicating that general business was not far below normal, while their operating income was reduced 15.7 per cent, the reductions in forces made by the railroads and the railway supply companies manifestly have resulted from conditions affecting the railroad business that did not exist in the general business situation. This is further supported by the fact that of 32 supply companies that advised us they had made no reductions in force, 22 are only partially dependent on the railroads for business.

Statements were received from 20 railroad systems entering Chicago, covering their entire mileage, and including nearly all of the larger systems entering that city, and from 152 companies that sell to railroads, although the information received was not in all cases entirely complete, and some companies gave the number employed now instead of on August 1. A compilation of the information furnished us shows the following:

20 RAILROADS

Number employed June 30, 1913	879,492
Number employed June 30, 1914	809,929
Reduction	69,563
Per cent reduction	7.9
Number employed August 1, 1913	855,761
Number employed August 1, 1914	764,827
Reduction	90,934
Per cent reduction	10.8

SUPPLY COMPANIES

78 companies employ normally	251,795
Employed August 1, 1914	153,537
Reduction	98,258
Per cent reduction	39.1
*34 companies employ normally	86,644
Employed in December, 1914	32,266
Reduction	57,378
Per cent reduction	64

24 companies reported reductions in force, in wages or in time without giving figures.
32 companies reported no reduction in force.
2 companies reported increases in force.
28 companies also working part time.

*Including 18 companies that reported both for August 1 and for December.

A detailed statement for the railroads entering Chicago is given in the accompanying table, including five companies that asked that the figures be given without reference to their names. The lines of these companies extend to almost all parts of the country, from the Atlantic to the Pacific and from Minnesota to the Gulf of Mexico, and therefore the condition as to unemployment shown by them may be considered as fairly representative. By applying the percentage of reduction shown as of August 1, 1914, by these roads to the total number of employees reported by the Interstate Commerce Commission for June 30, 1913—1,815,239—it may be conservatively estimated that over 192,000 railroad employees were laid off during the year ending August 1, 1914.

Some of the figures furnished by the railroads require some explanation. Where the figures are given for another date than August 1 it has been indicated in the table.

The Baltimore & Ohio furnished a more complete statement, giving the number of employees in the various departments and for additional dates. From the following table it will be noted that the estimated number of employees for December 31, 1914, was 20,164, or about 33⅓ per cent. less than for June 30, 1913.

NUMBER OF MEN EMPLOYED ON BALTIMORE & OHIO SYSTEM

	Departments

*Estimated.

The Chicago & Alton says in connection with its statement that, while some of the difference between the 1913 and 1914 figures is due to the business depression, a large part of it is accounted for by the fact that in 1913 the company was performing some extraordinary improvement and construction work, the completion of which reduced the forces.

The Chicago, Indianapolis & Louisville also gave the number of employees on November 1, 1914, 3,474, which is 378 less than for August 1, 1914, and 521 less than for June 30, 1913.

The reduction of forces in the railroad supply business is naturally larger in proportion than on the railroads themselves, because the reduction of railway traffic was much smaller than the reduction in business of companies that are almost or entirely dependent upon the railroads and some of which may have no business when the railroads are not buying any more than necessary. Moreover, the figures given showing the reduction in forces by the railroad supply companies are by no means fairly representative of their conditions, because a large number

of them, in addition to laying off men, were also obliged to reduce the working time, and consequently the wages of employees who were retained. Twenty-four companies that gave us no detailed figures showing the number of their employees reported that the number had been reduced from 10 to 50 per cent or that the working time, payroll or capacity had been reduced from 20 to 50 per cent.

Moreover, of the companies that did give figures showing reductions in force, 28 also reported that the employees retained were working part time. One company normally employing 15,500 men had reduced its force on August 1 to 5,700 and in December to 2,800. Another company normally employing 17,841 men had reduced its force to 7,098 on August 1 and on September 12 to 3,329, the weekly payroll having been reduced from $275,000 to $25,000. A car building company normally employing from 1,300 to 1,400 men had reduced the number to 936 on August 1 and in September closed its plant entirely. Two large car companies had each reduced their forces by nine thousand on August 1, 1914.

THE RAILWAYS AND THE COMMISSION

[From the North American Review]

Here is the key-note of the whole situation. An increase in rates by governmental authority which would help to offset the tremendous loss of $120,000,000 of net operating railway revenues in the year ending June 30, 1914, would do more than any other conceivable thing to make possible the general trading which is essential to renewal of confidence and business activities in the United States. It is not, moreover, a mere matter of stocks and bonds; a far more vital thing even than that is credit. Railway companies cannot obtain money for extensions, betterments, or even maintenance when hovering in the shadow of bankruptcy. And this means that manufacturing concerns, iron makers, steel makers, tie makers, and all of the innumerable others who ordinarily supply the railway companies with all sorts of material are estopped completely from performing their normal functions.

Why? Because higher rates are not really needed? No. That fact has been established beyond question. Because the public objects? No. The public long ago was convinced that the higher costs of living and wages reach to the railway companies no less than to all others. Because the Interstate Commerce Commission cannot or will not perceive the "extraordinary emergency" mentioned by the President as making for a "very real need?" Possibly, to a degree; but clearly the chief obstacle in the way of first steps toward prosperity, in the way of open markets, in the way of the United States government, the Democratic party, and the Democratic President, is Louis Brandeis, counsel and guide of the Interstate Commerce Commission, who solemnly insists that the right to "regulate" rates comprises only the right to "reduce" them. The natural assumption is that if that had been the intent of Congress, Congress would have said so, but Mr. Brandeis holds or at least asserts the contrary view—and the amenably automatic commission obediently acquiesces.

What to do in such a circumstance? Technically the President is helpless, and Congress, too. Government by commission invariably involves abandonment of authority by the chosen representatives of the people. The President does right, therefore, even while making his own opinion known, in keeping within the strict letter of the law and refraining from interference. But even a commission which plumes itself upon being on a plane with the Supreme Court is no greater than the source of its creation; and we say plainly to the patient President that, if this particular body should persist in its present inexcusably dilatory, incomprehensibly stupid, and arrogantly obdurate course, he can do no more popular thing than to ask a willing Congress to legislate it out of existence.

PROGRESS ON THE ALASKA RAILWAY SURVEYS

Since the creation of the Alaskan Engineering Commission about May 1, 1914, considerable progress has been made in the selection of a route to the interior of Alaska. Owing to the shortness of the season in that country, the commission decided immediately on its organization to place as many men in the field as could be employed to advantage. Fourteen locating parties were sent out, twelve of which were given the customary quota of engineers for the running of preliminary lines while one was organized to make special topographical surveys and another to conduct an extensive reconnaissance. Owing to the difficulties of transportation a large pack train was provided for each party, and in some cases boats were furnished for use on the various rivers.

The commission had at its command all the information gathered by previous commissions or furnished by various railroad parties who had considered building into this territory. In some cases this information was in the form of preliminary surveys and estimates, but it usually was in the form of a report on a reconnaissance. As it was not feasible to make careful surveys of all the possible routes from the sea coast to the interior in one season, the attention of the commission was directed especially to the making of a careful preliminary survey of the route from Portage Bay to Fairbanks via Broad Pass with a branch to the Matinuska coal fields, Broad Pass being in the main Alaska range about 256 miles from Portage Bay. A survey was also made from Chitina on the Copper River & Northwestern to the Matinuska coal fields. Two bases of supplies were used, one at Ship Creek, the head of deep water navigation on Cook's Inlet and the other at Fairbanks, the principal interior town. From these points supplies were sent to the different camps by pack trains or boats.

The distance thus outlined covers about 750 miles. It was divided between the several preliminary parties, each taking what it could cover with a good preliminary line during the short season. The first party began work about June 15, and the last early in July. Their season's work was completed at various dates between September 15 and November 5. In this manner a very good preliminary line was run and careful topography was taken for a considerable distance on each side. Maps were made on a working scale and a location projected for the purpose of getting an estimate of the cost.

In addition to the surveys between Portage Bay and Fairbanks, and to the Matinuska coal fields, a careful survey was also made of the existing line of the Alaska Northern extending north from Seward for 72 miles. Data were also gathered for a line from mile 39 of the Copper River & Northwestern to the Bering river coal fields via Lake Charlotte, while a reconnaissance was made for several hundred miles through the Susitna and Kuskokwim valleys. The members of the commission also made various careful examinations of several other proposed railroad termini, including Valdez, Cordova, Katalla and Controller Bay, and gathered a great deal of information regarding other feasible routes from the seaboard into the interior.

The field parties have now been disbanded and a small force of office men are employed in condensing the data for a report

WHY A RAILROAD SHOULD PAY A DIVIDEND*

BY IVY L. LEE
Executive Assistant, Pennsylvania Railroad Company

At the recent hearing before the Interstate Commerce Commission in the rate advance case, when Daniel Willard, president of the Baltimore & Ohio, was on the stand, Mr. Brandeis said:

"You have defended here today a reduction of practically everything that has to do with this railroad. You are putting off expenditures and necessarily, in the course of that, discharging employees. And the only thing that is maintained at its standard is the dividend."

To suggest the cutting or passing of dividends as a preliminary step in railroad economy is to strike at the very roots of our present business processes. The pride of the Pennsylvania Railroad is that since the company began to operate trains nearly seventy years ago it has always paid a cash dividend. The shareholders of this company have paid into it a total of about $540,000,000; and the outstanding capital stock is $499,265,700. This means that there is no "water."

On its stock the company has since the beginning paid an average dividend of 6.1 per cent. The policy has been to pay a reasonable dividend and to make that dividend secure. What was left over after interest and dividends went back to the public in improved service, in facilities which did not add to earnings.

All the money received by the railroad company goes back to the public. Out of some $381,000,000 received last year by the Pennsylvania System from all sources, all but $10,417,531 was paid out for wages, materials, taxes, bond interest and dividends. In other words, less than three cents out of each dollar received was at the year's end available for extraordinary expenses, and to protect the company's credit against the future.

During the past 17 years the Pennsylvania Railroad System has paid out in wages $1,932,626,384. It has paid to its stockholders in dividends less than one-fourth as much—$434,613,302—and it has paid a dividend to the public in the form of non-income adding improvements which cost $366,372,902.

The policy of the Pennsylvania Railroad from the beginning has been to maintain such a standard of credit and financial stability that in times of stress investors could look to Pennsylvania stock as a sure fortress.

The purpose of a railroad is to give good service at fair rates and to earn a dividend on its capital. The owners of a railroad are primarily concerned with the earnings as a whole. The details of charges and service they are anxious to have adjusted to promote the convenience and the prosperity of the community.

If it were not for the capital invested there would be no Pennsylvania Railroad. Society considers it important to pay interest on savings bank deposits; but a larger part of such deposits earn their interest through investments in railroad securities. Why then propose to penalize the man who invests direct instead of through the medium of the savings bank or the insurance company?

Society commends the man who saves money, buys a house and thus avoids paying rent. But what about the man who saves money and buys railroad stock, depending upon his dividends with which to pay his house rent?

The dividend—the payment for all capital—is a sort of back-salary to those who have denied themselves the immediate benefit of earnings in order to assure themselves future benefits. They invest their savings. The fact that there are some large fortunes which do not imply such self-denial does not invalidate the great fact that the vast amount of money invested in railroad property in this country is from the savings of the people.

The insurance companies alone have over $1,500,000,000 invested in railroad securities, and the savings banks upward of $800,000,000. There are 30,000,000 insurance policy holders and 10,000,000 savings banks depositors in this country. Here then are 40,000,000 separate accounts which have indirectly invested about $2,500,000,000 in railroad bonds.

This takes no account of upward of $4,000,000,000 in American railroad securities held in Europe; it takes no account of that vast number of our own people who have directly invested their money in railroad securities. Restrict them to a small return on their money when times are prosperous; deny them a fair return when times are bad, and the railroads of this country will palsy and shrivel.

To insure a fair dividend to the railroad investor is the concern and the obligations of the public, which wants good service; it is the profound duty of the employee.

The Pennsylvania Railroad System paid to its 250,000 employees last year $189,000,000 in wages. This was at a rate of wages 35 per cent higher than in 1900. In other words, had the 1900 rate of wages been paid in 1913 the total payments would have been only $125,000,000. Total wage payments in 1900 were about $71,000,000, so that the increased rate of payment for 1913 was actually more than the total wage payment of 1900.

The Pennsylvania Railroad paid to its 90,000 shareholders last year about $29,000,000 in dividends, and the annual rate of dividend was precisely what it was in 1900.

Wages to employees were 35 per cent higher, but holders of Pennsylvania Railroad stock enjoyed no higher wages for the use of their money than they did 14 years ago. Many stockholders bought their shares at a substantial premium above par, and many paid into the company $120 for $100 par value of stock. And for holders of Pennsylvania stock the price of living has gone up exactly as for the men in the shops or on the road.

The wage-earner has a very great incentive to protect the Pennsylvania dividend. The Pennsylvania Railroad has always paid the highest rates of wages in the territory through which it moves, and employees of other railroads have sought to get their wages adapted to the Pennsylvania standard.

The safety of the Pennsylvania's dividend must be secured if the company is to enjoy the confidence and support of those to whom the public must look to obtain money to supply future needs. Ninety thousand people, among whom there are nearly 45,000 women, have had such faith in the fact that the management and the employees would protect the integrity of that dividend that they have invested in our stock. More persons have intrusted their money to the officers and employees of this company, to enable the Pennsylvania Railroad to pay the wages it does and give the service it does, than to any other railroad in the world.

This company is not owned by a few capitalists. Some 20,000 persons own less than 10 shares each of our stock. All the directors and all the employees together own less than 5 per cent of the total capital. In the very highest sense of the word, our officers and employees are trustees. If, then, we are to keep faith with these people, located as they are in all parts of the world, must we not feel that every employee of this company when he enters its service undertakes an implied contract that in so far as in his power lies he will neglect no opportunity to see to it that dividend is earned and paid?

*From an address at meeting of the Media Division, Veterans' Association of Pennsylvania Railroad Employees at West Chester, Pa., November 19, 1914.

RAILWAY CROSSINGS IN ZURICH TO BE ELIMINATED.—The managing directors of the Swiss Federal railways and the Municipal Council of Zurich have finally entered into an agreement for the reconstruction by the former of the Zurich Sea Left Bank Railway, within the city limits of Zurich.

General News Department

The Commercial Club of Puyallup, Wash., has adopted resolutions urging the repeal of the full crew law passed by the state legislature in 1911.

The large roundhouse of the Duluth, Winnipeg & Pacific at Duluth, Minn., was destroyed by fire December 25. Several locomotives were damaged.

R. H. Aishton, vice-president of the Chicago & North Western has been named by President Wilson as a member of the Industrial Relations Commission. The appointment is to fill the vacancy caused by the resignation, some time ago, of F. A. Delano, who became a member of the Federal Reserve Board.

The annual meeting of the Western Society of Engineers, Chicago, will be held on January 13 and 14, 1915. The annual banquet will be given at the Auditorium hotel on Wednesday evening, January 13. The following day will be devoted to an inspection of important engineering work in the vicinity of Chicago by special train. That evening a smoker will be held at the society's rooms with moving pictures of the San Diego and San Francisco expositions.

In response to a request from a committee of the city council for a conference regarding the beginning of work on the new Union station in Chicago, the officers of the company have announced that a meeting of the directors will be held in Chicago on January 12, to consider the entire construction program. The council committee desires to persuade the railroads to begin work at once on the terminal improvements in Chicago in order to give employment to a large number of men.

F. A. Spink, traffic manager of the Chicago & Western Indiana and the Belt Railway of Chicago, has been elected chairman, and Frank T. Eyman, assistant freight traffic manager of the Chicago & North Western, vice chairman, of the Railroad Subdivision of the Chicago Association of Commerce for the ensuing year. The other members of the committee are James Webster, assistant freight traffic manager of the New York Central Lines West of Buffalo; A. C. Ridgway, second vice-president of the Chicago, Rock Island & Pacific, and J. C. Clair, industrial commissioner of the Illinois Central.

Ralph Peters, president of the Long Island Railroad, continuing a custom of several years' standing, held informal receptions to employees of the road at three of the principal terminals on Wednesday and Thursday, the two days preceding Christmas. He shook hands with ten or fifteen hundred men, calling a large portion of them by name. Outsiders who were present remarked that there was "none of the artificial and forced atmosphere often observed on such occasions." Those who attended received the special attention of Don Hudnell, who has been messenger and clerk for four successive presidents of the road, and from him each man received a cigar, while each woman employee received a box of candy.

On Wednesday, December 23, an inspection of the railroad Y. M. C. A. buildings in the vicinity of Chicago was made by the Railroad Department Committee, including H. G. Hetzler, president of the Chicago & Western Indiana, general chairman; A. M. Schoyer, vice-president, Pennsylvania lines; Robert Quayle, general superintendent, motive power and car department, Chicago & North Western; W. J. Jackson, receiver and general manager, Chicago & Eastern Illinois, and other officers of the roads interested. The party traveled by special train, visiting the building at the Chicago & Eastern Illinois yard at Dolton, the Chicago & North Western building at Fortieth avenue, Chicago, the Dearborn station department of the Chicago & Western Indiana, the Grand Trunk department at Fifty-first street, the Fifty-ninth street department of the Pennsylvania and the Glenn Yards department of the Chicago & Alton.

Colonel Jose Rodriguez, general manager of the National Railways of Mexico, says that a large order for fuel oil has been given to the Waters-Pierce Oil Company. This oil is being obtained from the United States, and many carloads have already entered the country through El Paso en route to distributing points in Mexico. The cutting off of the supply of crude oil from the Tampico fields made it necessary to buy in the United States. Announcement is also made by Colonel Rodriguez that arrangements have been made with American concerns to supply large quantities of timber, iron, steel and other materials for the construction of cars in the shops at Aguas Calientes. These shops were recently reopened and are now running to their full capacity, giving employment to about 4,500 men. Employment is now being given to several thusand men in the building of new bridges, relaying track and general rehabilitation work upon different divisions of the system.

Parcel Post News

[From the New York World]

Representative George J. Kindel, of Colorado [a former railroad man] . . . has been in New York looking into the operation here of the parcel post. He declares that he has "new proof of the petty larceny of the system."

"New York people," he said, "are paying $1,000,000 a year more for service by parcel post than they would for the same service by express. For distances of from 50 to 150 miles the parcel post beats express, and for uninsured 5-pound packages up to 600 miles. But beyond that it's very different.

"Between New York and Boston the parcel post rate on 20 pounds is 44 cents. Post Office officials say they pay the railroads 33 cents for this haul, but the express company will pick up the package, insure it for $50 and deliver it at the other end, all for 36 cents. . . . Parcel post rates meet express rates on 5-pound packages in the 300-mile zone; they practically meet them on 10-pound packages in the 150-mile zone, and they do meet them on 20-pound and 50-pound packages in the zone. When you get to the 1,000-mile zone—New York to Chicago for instance—the insured rates by express and parcel post are, respectively, as follows: 5 pounds, 31 and 42 cents; 10 pounds, 42 and 72 cents; 20 pounds, 64 cents and $1.32.

"Now here comes the thing that angers me. The new express and parcel post rates, which went into effect February 1 last, were fixed by the Interstate Commerce Commission, which said to the express companies: 'You must put in these rates,' and to the Post Office Department, 'you may put in these rates.' We are paying $2,000,000 for the Interstate Commerce Commission, and that is the kind of service we are getting. . . ."

While in New York Mr. Kindel got the figures of the parcel post traffic here for the two weeks ending October 15. To all zones, 8,994,175 packages weighing 9,491,747 pounds were carried in that time, the postage paid being $521,361.54. By zones this business was distributed as follows:

First (50 miles), 811,180 packages, postage, $38,410.57; second (150 miles), 1,125,529 packages, $48,609.21; third (300 miles), 1,262,918 packages, $54,846.03; fourth (600 miles), 1,173,216 packages, $62,675.28; fifth (1,000 miles), 1,411,718 packages, $74,035.48; sixth (1,400 miles), 1,243,944 packages, $69,275.07; seventh (1,800 miles), 770,929 packages, $72,919.77; eighth (over 1,800 miles), 773,129 packages, $83,375.72.

"You will notice from these figures," Mr. Kindel said, "that the average weight of the packages was less than one ounce over one pound. The people are chiefly sending by the 'new' parcel post the things they sent by the 'old.' The great glory of the parcel post, you know, was to be its effect on the cost of living. You are not going to reduce the cost of living by packages that weigh a pound each.

"In the local, first and second zones the number of packages weighing above twenty-one pounds sent from New York in two weeks was 4,940; their weight was 141,482 pounds, and the postage paid on them was $1,378.99. The bulk was just one-sixtieth of the total.

"A mail order house will ship 100 pounds by express to Des Moines, for example, break the package up there into five twenty-

pound parcels and reship by post. They will save $5 per 100 pounds on the all-parcel-post rate by doing it.

"Let me give you one other illustration of our system. Lord & Taylor have houses in both this country and Germany. The rate on their 11-pound parcels from Germany to Cuba is 50 cents; to Mexico, 55 cents. . . . From Germany they can post 11 pounds to San Francisco for 81 cents; from New York the rate is $1.32.

"What I want to do about all this is to have the weight limit increased, first of all, to 100 pounds. Then I want the rates revised."

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

AIR BRAKE ASSOCIATION.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—A. G. Thomason, Demurrage Commissioner, Boston, Mass. Annual convention, April, 1915, Richmond, Va.

AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D., L. & W., Hoboken, N. J. Next meeting, October, 1915.

AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, Illinois Central, East St. Louis, Ill. Annual meeting, May 21-24, 1915, Richmond, Va.

AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next meeting, May 20-21, 1915, San Francisco, Cal.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 20 W. 39th St., New York. Annual convention, October, 1915, San Francisco, Cal.

AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—H. C. McConnaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

AMERICAN RAILROAD MASTER TINNERS, COPPERSMITHS AND PIPEFITTERS' ASSOCIATION.—W. E. Jones, C. & N. W., 3814 Fulton St., Chicago. Annual meeting, Chicago.

AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next session, May 19, 1915, Atlantic City, N. J.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 19-21, 1915, Detroit, Mich.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June 9-11, 1915, Atlantic City, N. J.

AMERICAN RAILWAY SAFETY ASSOCIATION.—L. F. Shedd, C. R. I. & P., Chicago.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—Owen D. Kinsey, Illinois Central, Chicago. Annual meeting, July, 1915.

AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. W. Hunt, 220 W. 57th St., New York, Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

AMERICAN SOCIETY OF ENGINEERING CONTRACTORS.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Atlanta, Ga.

ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—C. W. Egan, B. & O., Baltimore, Md. Annual meeting, third week in May, 1915, Galveston, Tex.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual meeting, October, 1915.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 22-25, 1915, Rochester, N. Y.

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

FREIGHT CLAIM ASSOCIATION. Warren P. Taylor, R. F. & P., Richmond, Va. Annual meeting, June 16, 1915, Chicago.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

INTERNATIONAL RAILWAY CONGRESS.—Executive Committee, 11, Rue de Louvain, Brussels, Belgium. Next convention, June 23 to July 6, 1915, Berlin.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago. Annual meeting, May 17-20, 1915, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 829 W. Broadway, Winona, Minn. Next convention, July 14-17, 1915, Sherman House, Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, C. H. & D., Lima, Ohio. Annual meeting, August 17, 1915, Philadelphia, Pa.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. I. Goodwin, C. R. I & P., Eldon, Mo.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May 26 to 28, 1915, Chicago, Ill.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 14-17, 1915, Detroit, Mich.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June 14-16, 1915, Atlantic City, N. J.

NATIONAL RAILWAY APPLIANCES ASSOCIATION.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15-19, 1915, Chicago.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

RAILROAD MASTER TINNERS, COPPERSMITHS AND PIPEFITTERS' ASSOCIATION.—U. G. Thompson, C. & E. I., Danville, Ill. Annual meeting, May, 1915.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Next meeting, October, 1915.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa. Next meeting, March 15, 1915, Chicago. Annual meeting, September 21-24, 1915, Salt Lake City, Utah.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, L. S. & M. S., Box C, Collinwood, Ohio. Annual meeting, May 17-19, 1915, Hotel Sherman, Chicago.

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders and Master Mechanics' Associations.

RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Annual meeting, September 14-16, 1915, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, C. R. I. & P., La Salle St. Sta., Chicago. Annual meeting, September, 1915.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. R. R., Atlanta, Ga. Next regular meeting, January 21, 1915, Atlanta, Ga.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEWARK.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, Newark.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7122 Stewart Ave., Chicago. Annual meeting June 15, 1915, Minneapolis, Minn.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, September, 1915, Chicago.

WESTERN CANADA RAILWAY CLUB.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

Traffic News

In Cleveland it is reported that the Pennsylvania and the New York Central have announced that free delivery of passenger tickets to residences and offices will be much curtailed. The delivery service in Cleveland has cost each of these roads, it is said, about $100 a month.

A press despatch from San Francisco says that the three lines of steamships running between that port and the Atlantic coast through the Panama canal have agreed on an increase in the rates of transportation on iron and steel goods and certain other commodities.

The American steamship "Pathfinder" left Galveston December 25 for Bremen, with a cargo of cotton, 6,650 bales, the first cotton to go to Germany since the beginning of the war. The freight rate on this cotton, $3 per 100 lb. is said to be the highest ever paid at the port of Galveston. A year ago the current rate was about 35 cents per 100 lb.

The Pennsylvania Railroad reports that the parcel post packages sent out in the mail cars of that road from New York and from Philadelphia in the seven days ending with December 24, numbered about nine millions. The Christmas rush was about 50 per cent heavier than a year ago. Three times the regular force of men to handle the mails had to be kept on duty at stations.

On Wednesday, December 30, the Delaware, Lacakawanna & Western took out of Hoboken a special train of 12 cars destined for Los Angeles over the Atchison, Topeka & Santa Fe, carrying seven companies of motion picture actors, going out to begin their winter season. The train consisted of five sleeping cars, a dining car, a buffet car, a parlor car and four baggage cars.

Nine representatives of the passenger department of railroads operating in Indiana called on Governor Ralston and members of the Indiana Public Service Commission on December 21, to discuss the proposal to repeal the two-cent fare law and establish a rate of 2½ cents a mile in its place. The railroad men pointed out that the Interstate Commerce Commission had recognized the need for a higher rate of passenger fares and had allowed advances in the interstate rates, but that similar changes could not be made in the intrastate fares without a change in the state law. Neither the governor nor the members of the commission would commit themselves as to their attitude. The railroad men said they were preparing to make a direct and public appeal to the assembly of Indiana for the repeal of the present two-cent fare law and the enactment of a new law authorizing a fare of 2½ cents a mile. The rate charged prior to the enactment of the present law was 3 cents a mile. Representatives of the railroads in Ohio also held a conference with the state public utilities commission on December 22, and asked the commission to recommend the repeal of the two-cent fare law and the substitution of a law providing for a 2½-cent rate.

Increased Use of the Multiplication Table

Scales of rates to be used in making the general increase of 5 per cent in freight rates recently ordered, have been submitted to the commission by C. C. McCain, chairman of the Trunk Line Association committee. The first class rate between New York and Chicago will be 78.8 cents per 100 lb., and the other five classes will be graded proportionately. To points intermediate between New York and Chicago, taking 71 per cent and higher of the New York-Chicago class rates, the new tariffs will become effective on January 15, and to points taking a lower percentage of the rates they will become effective February 1.

From New York to points taking 60 per cent of the Chicago rate, the charges on the various classes will be as follows: First class, 47.3 cents; second, 41 cents; third, 31.5 cents; fourth, 22.1 cents; fifth, 18.9 cents, and sixth, 15.8 cents.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission has suspended from January 1 to May 1, 1915, certain tariffs of the Baltimore & Ohio, the Central of New Jersey, the Delaware, Lackawanna & Western, the Erie, the Lehigh Valley, the New York Central & Hudson River, the New York, Ontario & Western, the Pennsylvania and the West Shore, containing increased charges for the handling of freight by lighter and float from and to points in New York harbor, both within and outside free lighterage limits.

Rates on Grapes to Points in Montana and Wyoming

Lindsay & Company et al. v. Northern Pacific et al. Opinion by Commissioner Clements:

The commission finds that the rates on grapes from producing points in New York, Pennsylvania, Michigan, Iowa, Missouri and Kansas to points in Montana and Wyoming are not unreasonable. Complaint dismissed. (32 I. C. C., 287.)

Gravel and Sand Switching Charges at Chicago

Opinion by Commissioner Clements:

The commission finds that a proposed cancellation of absorption of switching charges on sand and gravel from Janesville, Beloit and other Wisconsin points to Chicago and from these points and also from Carpentersville, Algonquin and Elgin to certain points in Indiana within the Chicago switching district is justified. (32 I. C. C., 291.)

Joint Rates Between Rail and Water Lines

Eastern Shore Development Steamship Company v. Baltimore & Ohio et al. Opinion by Commissioner Meyer:

The commission finds that the refusal of the Baltimore & Ohio to establish through routes and joint rates in conjunction with the complainant, a water line, between landings on Chesapeake Bay and its tributary waters on the one hand and points on the Baltimore & Ohio and its connections on the other is unreasonable and discriminatory. (32 I. C. C., 238.)

Rates on Potatoes and Onions From St. Matthews, Ky.

St. Matthews Produce Exchange v. Louisville & Nashville et al. Opinion by Commissioner McChord:

The commission finds that the rates on potatoes and onions from St Matthews, Ky., and other stations to Cincinnati, Ohio, and via that point to central freight association territory are not unreasonable or discriminatory as compared with the rates from Louisville. Certain local rates from St. Matthews and other stations, however, when used in connection with interstate shipments of potatoes and onions via Louisville, Ky., are found unreasonable. (32 I. C. C., 233.)

Rates on Cement From Ada, Okla.

Oklahoma Portland Cement Company v. Arkansas, Louisiana & Gulf et al. Opinion by Commissioner McChord:

In a complaint dealing with cement rates from Ada, Okla., to all points in Louisiana west of the Mississippi, southern Arkansas and certain destinations in eastern Texas, the commission finds that Ada should be put on a 3-cent differential under the Kansas gas belt rates to the Arkansas destination points and a 2-cent differential under the Kansas gas belt rates to the Louisiana and Texas points. The St. Louis, Iron Mountain & Southern is required to establish through routes from Ada to the destination points to which it operates through routes from the Kansas gas belt. (32 I. C. C., 221.)

STATE COMMISSIONS

The Alabama Railroad Commission has approved a proposed increase in freight rates on the railroads of that state, averaging 10 per cent.

The New Hampshire Public Service Commission has approved tariffs filed by the Boston & Maine, advancing passenger fares in that state on January 1 to the basis of 2½ cents a mile. Similar tariffs filed by the B. & M. in Massachusetts have been suspended by the Public Service Commission of that state until February 1.

John P Dohoney, investigator of accidents for the Pennsylvania Public Service Commission, in his annual report, which covers eleven months ending June 30, 1914, says that on the railroads of the state 15 passengers, 328 employees, 555 trespassers and 93 other persons were killed during the year and a total of 9,199 persons were injured. The street railways reported 170 persons killed and 2,991 injured, 19 of the killed being passengers. Of persons who were killed while under the influence of intoxicating liquor the railroads report 24, and the street railways 9, all of these being, apparently, trespassers. The public grade crossings in the state of Pennsylvania number about 10,000, and in the six months ending June 30, 15 people were killed and 34 injured at crossings which are classed as protected; that is to say, they were equipped with gates, or bells, or both, or were attended by watchmen.

PERSONNEL OF COMMISSIONS

Henry Clay Hall of Colorado has been nominated by the President to succeed himself as a member of the Interstate Commerce Commission.

The governor of Pennsylvania has appointed Walter H. Gaither, of Pittsburgh, a member of the Public Service Commission of the state, filling a vacancy. Mr. Gaither was for a number of years a newspaper reporter in Pittsburgh. The governor has designated ex-Governor Samuel W. Pennypacker as chairman of the commission.

Richard Sachse has been appointed chief engineer of the California Railroad Commission. Mr. Sachse has been acting chief engineer of the commission since December 1, 1913. He is a graduate of the Royal Technical Institute of Dresden, Germany. After completing the course in civil and structural engineering, Mr. Sachse was secretary to the chief engineer of the Joint Government Board of Germany, France and Great Britain on preliminary railroad location investigations in West Africa. In 1903 he came to the United States and did engineering work in Chicago, Milwaukee and other places. During 1906 and 1907, he was assistant engineer in the United States Reclamation Service, and thereafter he was connected successively with the land department of the Southern Pacific and the construction department of the Western Pacific. In December, 1911, he began work for the California Railroad Commission as assistant engineer and was later appointed to the position of principal assistant engineer in direct charge of valuation work.

COURT NEWS

The Chicago Association of Commerce, the Illinois Central and the Morton Salt Company have filed in the Federal Court at Chicago an appeal from a recent decision of the Interstate Commerce Commission, ordering that salt rates from the Michigan fields to points in Illinois shall not exceed, by more than 2½ cents per 100 lb., the rates from Chicago and Chicago rate points to the same destination. The ground given for the objection is that the decision deprives Chicago of the advantage which it has heretofore had by reason of cheap lake transportation.

EGYPTIAN RAILWAY AFFAIRS.—The military authorities of Egypt find the facilities afforded by the Egyption State Railways workshop at Boulac, Cairo, very useful. Among other things they have recently placed an order for the manufacture in them of 2,000 camp bedsteads for the use of troops.

Railway Officers

Executive, Financial, Legal and Accounting

W. P. Briggs has been appointed general attorney of the Pacific & Idaho Northern, with headquarters at New Meadows, Idaho.

H. D. Davis has been appointed contract attorney for the Missouri Pacific and the St. Louis, Iron Mountain & Southern, with headquarters at St. Louis, Mo.

A. T. Hardin, vice-president of the New York Central & Hudson River at New York, has been appointed vice-president in charge of the operating department, embracing transportation, construction, roadway and equipment, with headquarters at New York, of the New York Central Railroad, which is the name of the new company which has taken over the New York Central & Hudson River and the Lake Shore & Michigan Southern. J. J. Bernet, vice-president of the Lake Shore & Michigan Southern, at Chicago, has been appointed resident vice-president of the New York Central Railroad, with headquarters at Chicago, and will act as the general representative of the company in that territory and perform such other duties as may be assigned to him.

Operating

Henry Miller has resigned as general manager of the Wabash, effective January 1, but will continue as a director and vice-president of the company.

J. W. Leonard, assistant to vice-president of the Canadian Pacific at Montreal, Que., will leave that company on January 1 to assume the general management of the Toronto Terminals Railway at Toronto, Ont.

O. H. Hobbs, superintendent of the Baltimore division of the Baltimore & Ohio at Baltimore, Md., has been transferred to Parkersburg, W. Va., as superintendent, succeeding C. E. Bryan, transferred. M. H. Cahill, superintendent of the New Castle division at New Castle, Pa., has been appointed superintendent of the Baltimore division, succeeding Mr. Hobbs. J. W. Kelly, Jr., superintendent of the Cumberland division at Cumberland, Md., succeeds Mr. Cahill, and C. L. French, assistant general superintendent at Pittsburgh, Pa., has been appointed superintendent of the Cumberland division, succeeding Mr. Kelly, and the position of assistant general superintendent at Pittsburgh has been abolished. S. A. Jordan, superintendent at Winchester, Va., has been appointed assistant superintendent of the Baltimore division, with headquarters at Brunswick, Md., and H. F. Howser, road foreman of engines at Brunswick, Md., has been appointed road foreman of engines and assistant trainmaster of the Shenandoah district, with office at Harrisonburg, Va.

Traffic

A. A. Heard, general passenger agent of the Delaware & Hudson at Albany, N. Y., has resigned, effective January 1.

Drew Head has been appointed assistant general freight agent of the Gulf, Colorado & Santa Fe, with headquarters at Galveston, Tex.

Myron Wood, general agent of the Pittsburgh & Lake Erie at Youngstown, Ohio, since May, 1888, retires on January 1, under the retirement rules of the company. He has been in the service of this road since February, 1879, and for many years served as chief clerk and joint freight agent of the Pittsburgh & Lake Erie and the Erie.

Fred E. Signer, whose appointment as general eastern freight agent of the Lehigh Valley, with headquarters at New York, has already been announced in these columns, was born at Buffalo, N. Y. He began railway work in 1886, as clerk with the Buffalo, New York & Philadelphia, now a part of the Pennsylvania Railroad. He was then consecutively in the service of the Chicago & Atlantic, now a part of the Erie, at Chicago, the Southern Pacific, at Los Angeles, Cal., the Chicago & Alton, at Chicago, and the Wabash at Chicago. From 1898, to May, 1900,

he was board of trade representative of the Wabash, and then for about two years was agent of the Wabash & Lackawanna Despatch. He was then general freight and passenger agent of the Cincinnati, Richmond & Muncie, now part of the Chesapeake & Ohio of Indiana, until 1903, when he became general manager of the Lehigh & Wabash Despatch. In January, 1906, he was appointed assistant general freight agent of the Wabash at St. Louis, Mo., and the following November became general freight agent of the Wisconsin Central at Milwaukee, Wis., and later at Chicago. He was general freight agent of the Minneapolis, St. Paul & Sault Ste. Marie following the absorption of the Wisconsin Central by that road, in charge of the Chicago division, remaining in that position until 1910, when he was appointed commissioner of the Association of Lake Lines, with headquarters at Buffalo, N. Y., which position he held at the time of his recent appointment as general eastern freight agent of the Lehigh Valley, as above noted.

Engineering and Rolling Stock

C. H. Seabrook, superintendent of machinery of the International & Great Northern, with headquarters at Palestine, Tex., has resigned, effective January 1.

C. E. Bryan, superintendent of the Ohio River division of the Baltimore & Ohio at Parkersburg, W. Va., has been appointed division engineer of that territory.

Harry Bortin has resigned as assistant to general secretary of the Presidents' Conference Committee on Valuation, and after January 1 will engage in private practice, specializing in valuation work. He was formerly engineer in charge of the valuation department of the Union Pacific.

E. Ben Carter, superintendent of maintenance of way of the Florida East Coast at St. Augustine, Fla., has been appointed chief engineer, with headquarters at St. Augustine, and his former position has been abolished. C. S. Coe has been appointed engineer of maintenance of way, reporting to the chief engineer.

C. E. Brinser, division engineer of the Camden Terminal division of the Pennsylvania Railroad and the West Jersey & Seashore at Camden, N. J., has been appointed division engineer of the Williamsport division of the Pennsylvania Railroad, with office at Williamsport, Pa.; J. T. Skillman, division engineer of the New York, Philadelphia & Norfolk at Cape Charles City, Va., succeeds Mr. Brinser, and M. W. Clement, supervisor of the Pittsburgh division at Conemaugh, Pa., succeeds Mr. Skillman.

H. Cramer, road foreman of engines of the Seaboard Air Line at Savannah, Ga., has been appointed supervisor of locomotive operation of lines south of Columbia, with headquarters at Jacksonville, Fla., and T. U. Brown has been appointed supervisor of locomotive operation, lines north and west of Columbia, with headquarters at Hamlet, N. C. J. R. Bissett has been appointed road foreman of engines of the South Carolina division, with headquarters at Savannah, Ga., and the River Junction line formerly under the supervision of the road foreman of engines of the Florida division is now under the supervision of the road foreman of engines of the South Carolina division. A. E. Hopkins, road foreman of engines of the North Carolina division at Hamlet, N. C., has been transferred to the Alabama division in the same capacity, with headquarters at Americus, Ga., and W. W. Payne has been appointed road foreman of engines of the North Carolina division, with headquarters at Hamlet, succeeding Mr. Hopkins.

OBITUARY

George M. Sargent, general agent of the San Pedro, Los Angeles & Salt Lake at Chicago, died suddenly at his home in that city on December 27.

Franklin Fairman, formerly auditor of the Illinois Central, died at his home in Chicago on December 26, aged 81 years. Mr. Fairman was connected with the Illinois Central from 1855 to July, 1904. He filled minor positions until 1862, when he was made assistant general freight agent. Later he was successively auditor of freight accounts, freight auditor, and auditor of freight receipts until November, 1900, when he was appointed auditor, which position he held until his retirement in July, 1904.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Illinois Central has ordered 25 switching locomotives from the American Locomotive Company.

The Tuscarora Valley has ordered 1 ten-wheel type locomotive from the Baldwin Locomotive Works.

The Cambria & Indiana has ordered 1 Mikado type locomotive from the Baldwin Locomotive Works.

The Nashville, Chattanooga & St. Louis has ordered 10 Mikado and 6 Pacific type locomotives from the Baldwin Locomotive Works.

CAR BUILDING

The Wisconsin & Michigan is in the market for 40 box cars.

The Lake Superior & Ishpeming is in the market for 400 ore cars.

The Grand Rapids & Indiana is in the market for 6 70-ft. steel passenger coaches and 1 70-ft. postal car.

The Atchison, Topeka & Santa Fe has ordered 100 10,500-gal. tank cars from the Pressed Steel Car Company in addition to the 100 recently reported.

The Union Tank Line has ordered 500 6,500-gal. capacity tank cars from the Standard Steel Car Company, in addition to the 500 cars reported last week.

The Chicago Great Western has just purchased 100 second-hand coal cars from the Pennsylvania Coal & Coke Corporation. This order is in addition to a recent order for 300 similar cars.

IRON AND STEEL

The New York Central Lines are in the market for 44,000 tons of steel rails.

Kasara Railway Tunnel Near Bombay.—A railway tunnel 1,507 ft. in length is now being constructed for the Great Indian Peninsular Railway in the Western Ghats, about 100 miles from Bombay. The contractors, Pauling & Co., of Bombay, began work on the tunnel by machine drills on December 6, 1913. To expedite the work two shafts, one of 101 ft. and the other of 89 ft. were sunk. The headings met on July 8 of this year, construction having progressed at the rate of 215 ft. per month. It is expected that the work will be completed in July, 1915. The tunnel is being worked out on the Belgian system—by opening out the top section first, inserting the arching where necessary, and taking the lower part out subsequent to formation. The tunnel will render unnecessary a reversing station now required on account of heavy grades.

The Fuel Supplies of the Railways of New South Wales.—The railways of New South Wales are at present using about 1,250,000 tons of coal per annum, and the government has more than once expressed the opinion that it would be a good thing if a state-owned mine were worked for the production of this coal. Mr. Cann, minister for mines, in a recent speech, said that the government really needed three collieries. Tests had been made on 40,000 acres of land held by the Crown, near Lithgow, and good coal had been proved. In the South Coast district the Crown had reserved all the mineral rights under the National Park area, and there was nothing to prevent them having a mine there that would put out 2,000 tons a day. The Sydney city council is also inviting applications for the sale to the council of a coal mine within 120 miles of Sydney, or for a contract extending over a long period. Among local coal-owners neither project is regarded as being very promising.—*The Engineer.*

Supply Trade News

The General Railway Signal Company on January 1 will move its New York office from 55 Liberty street to 30 Church street.

The Nachod Signal Company, Inc., has moved its offices from 50 Church street, New York, to 4777 Louisville avenue, Louisville, Ky

Fred N. Baylies, assistant sales manager of The Aluminum Company of America, with offices in Chicago, has been appointed eastern manager of The P. & M. Company, with headquarters at 30 Church street, New York City, effective January 1, 1915. Mr. Baylies has been a director of The P. & M. Company since its incorporation.

By a recent decision of the directors of the Pullman Company, the work of building one steel sleeping car a day will continue throughout the winter months. Because of the small demand for cars during the past few months a discontinuance of this policy had been considered, but the recent decision will afford work to the men during the winter.

The T. A. Willson & Co., Inc., Reading, Pa., was awarded the grand prize at the Second International Exposition of Safety and Sanitation, held at the Grand Central Palace, New York, from December 12 to 19. The award was given to the company in recognition of the merits of the Willson eye protectors, namely the Willson Safety Glass, the New Willson Goggle and the Albex Eye Protector.

TRADE PUBLICATIONS

BOILER TUBE CLEANERS.—The Wm. B. Pierce Company, Buffalo, N. Y., has issued a circular entitled "How to Clean Arch Tubes Clean," which describes the Dean boiler tube cleaner and explains how it does its work. This boiler tube cleaner has been standardized by the Illinois Central.

PORTABLE ELECTRICALLY DRIVEN TOOLS.—The Neil & Smith Electric Tool Company, Cincinnati, is now sending out catalog No. 4, describing and illustrating the company's line of Ideal Portable Electrically Driven Tools. Included are various types of grinding tools, electric drills, electric portable screw drivers, etc. The catalog describes each appliance in detail and is well illustrated.

ROLLING RAILS.—The Lackawanna Steel Company has just issued a booklet describing in detail the deseaming process for rolling rails by which the outer surface of the rail bar is milled off by a special machine, thereby removing the larger part of the seams, which are otherwise carried into the finished rail. This process was described by Robert W. Hunt in our issue of December 4. The booklet is well illustrated.

ELECTRICAL APPLIANCES.—The Western Electric Company is now distributing the first edition of its 1915 Electrical Supply Year Book in the form of a most comprehensive catalog of the goods handled by the company, bound in cloth and containing over 1,200 pages. The book contains between its covers illustrations and price lists of all sorts and kinds of electrical instruments, its many sections being devoted respectively to Interphones and Accessories, Power Apparatus, Protective Apparatus and Switchboard Accessories, Measuring and Testing Instruments, Batteries and Accessories, Electrical House Goods and Novelties, Lighting Fixtures and Accessories, Wiring Devices, Knife Switches, Fuses and Cut-outs, Wire, etc. The catalog is a radical departure from accepted practice in two ways. It is the intention of the company to issue the book annually, whereas the practice in the past has been to issue a new catalog not oftener than once in three years. In addition, and perhaps more important, the price lists have been entirely readjusted so that now one discount is made to apply to nearly the entire line of electrical appliances, in place of a different discount for almost every different class of apparatus. The book is remarkably well edited up and will undoubtedly prove valuable to the buyer of electrical supplies.

Railway Construction

ARKANSAS MINING & DEVELOPMENT COMPANY'S LINES (Electric).—We are told that this company expects to let contracts early in 1915 to build an electric line from Hoxie, Ark., west via Portia, Black Rock, Denton, Smithville, Nelsonville, Poughkeepsie, Evening Shade, Zion, Lacrosse, Melbourne and Newburg to Calico Rock, 72 miles. A branch is also projected from Nelsonville southwest via Shelbyville and Cave City to Batesville. The plans call for building a total of about 130 miles. J. W. Myers, Nashville, Ark., may be addressed. (September 18, p. 549.)

BIG HORN CANYON IRRIGATION & POWER COMPANY (Electric).—We are told that location surveys have been finished for the line to be built from a point near Custer, Mont., to Big Horn canyon, 68 miles. John J. Harris, president, Hardin. (February 27, p. 451.)

CANADIAN NORTHERN ONTARIO.—An officer writes that the company has projected a line from Toronto, Ont., to Thorold and Niagara Falls, Ont., 79.63 miles.

CANADIAN NORTHERN QUEBEC.—An officer writes that surveys are being made to build an extension from Huberdeau, Que., to St. Remi, eight miles.

COLUMBIA & NEHLEM.—An officer writes that this company during 1914 finished work on a section of eight miles from Columbia, Ore., towards the Nehlem river. In addition 18 miles are now under construction to Nehlem, on which grading work will be completed ready for track laying in about 30 days.

MINNESOTA, DAKOTA & WESTERN.—An officer of this company, which operates a line from International Falls, Minn., to Nakoda, also to Pelland, Laurel and Loman, writes that the company has given a contract to the Minnesota & Ontario Power Company to build an extension from Littlefork, south to Craig, 45 miles.

NASHVILLE, CHATTANOOGA & ST. LOUIS.—An officer writes regarding the report that a line is to be built from Guntersville, Ala., via Warrenton to Bean Rock, that the company has made some surveys near Guntersville, but it is not probable that the work will be carried out in the near future, as the improvement has not yet been authorized.

PACIFIC ELECTRIC.—Work on the extension from Arlington to Corona, Cal., 7.75 miles, is about 50 per cent completed. The average cut a mile on this extension will be about 3,000 cu. yd., and the average fill 3,500 cu. yd. The maximum grade is 0.95 per cent, and the maximum curvature is 3 deg. There will be no bridge work other than a few culverts which will be put in by company forces. The grading contract was awarded to Robert Sherer & Co., Los Angeles. This railroad company has also under construction extensions between Hawthorne and El Segundo, Cal., and from Santa Ana to Orange, Cal.

PENSACOLA, MOBILE & NEW ORLEANS.—An officer writes that this company is building with its own forces a 25-mile section from Pemono, Ala., to Mobile. E. M. Laughlin, Pensacola, Fla., may be addressed.

PORTLAND & OREGON CITY (Electric.)—This line is being built between Milwaukee, Ore., and Oregon City, a distance of 16 miles. Work is about 75 per cent completed and is being done by company forces.

RHODE ISLAND COMPANY (Electric).—An officer of this company, which operates electric lines in Rhode Island and Connecticut, writes that during 1914 the company built 5.28 miles of first track and .85 miles of second track at different locations in Rhode Island.

SAN PEDRO, LOS ANGELES & SALT LAKE.—Maps for a proposed line to extend through the Angeles forest reserve, California, have been filed by this company. However, construction work will not begin for a time.

SOUTHERN RAILWAY.—An officer writes regarding work on the extension of the Wauhatchie Railway that the line is being

built from Wauhatchie, Tenn., the northern terminus of the rails of the Alabama Great Southern, to a connection with the Lookout Mountain Tunnel line of the Southern Railway. A large amount of the work was done some years ago, but the line was never placed in service. The Southern Railway is now putting the tunnel line into shape and some double track is also being constructed on the Belt Railway of Chattanooga which, in connection with the Wauhatchie extension, will provide a double track line from the Chattanooga terminal station to Wauhatchie, six miles, enabling the Alabama Great Southern to enter Chattanooga over its own tracks and those of the Southern Railway instead of using the tracks of the Nashville, Chattanooga & St. Louis as at present. With the completion of the new line the Memphis division trains of the Southern will also use this new route between the Chattanooga terminal station and Wauhatchie, but will continue to use the tracks of the N. C. & St. L. between Wauhatchie and Stevenson, Ala.

Three Forks, Helena & Madison Valley.—An officer of this company, which started work in 1912 on a line from Helena, Mont., south via Radersburg, Three Forks and Ennis to Yellowstone Park, about 150 miles, writes that no work has been carried out during the past year. Grading has been finished on 20 miles, but no track has yet been laid. The company expects to resume work and complete at least 25 miles, early in 1915. E. A. Tennis, president, Three Forks, Mont.

Warren, Johnsville & Saline River.—An officer writes that work is now under way building a five-mile logging line for the Bradley Lumber Company from Johnsville, Ark., towards Peters Lake. The company is carrying out the work with its own forces.

RAILWAY STRUCTURES

Appleton, Wis.—The Chicago & North Western is preparing plans for a single track bridge across the Fox river near Appleton, Wis.

Jacksonville, Fla.—The Railroad Commissioners for the State of Florida have issued an order requiring the railroads interested in the proposed new union terminal station at Jacksonville to build on the Myrtle avenue site, instead of at Lee street on the site of the present station. The railroads have been given until May 1, 1915, to file additional completed yard plans if desired. (February 6, p. 297.)

St. Catharines, Ont.—A contract for the steel superstructure of the St. Paul street high level bridge over the old Welland canal has been given to the Canadian Bridge Company, Walkerville, at $91,000. The contract includes rails and track fittings. The bridge is to carry tracks for operating street railway cars.

Shelby, N. C.—Bids will probably be asked for about March 1, to build two bridges on the proposed line of the Shelby Northern from Shelby, N. C., north to Casar, 21 miles. S. S. Royster, president. C. R. Poole, Rockingham, N. C., is interested.

Bavarian Railway Statistics.—A recent British consular report on the trade of Bavaria for 1913 and part of this year contains some interesting information on the state railways of that part of Germany. At the beginning of this year, the total length of the state system was about 4,950 miles, of which slightly under 120 miles were built during 1913. The report mentions that only a few miles of purely local lines have been added since the beginning of the present year, and it is to be assumed that new construction is now entirely at a standstill. Complete details of receipts and expenditures are apparently only available down to 1912, when the revenue amounted to $76,029,840, and the expenditure, "including amortization and interest on invested capital," was $71,077,500. The net revenue is thus returned at $4,952,340, as compared with $5,569,560 in the previous year. In three successive years a total of $3,450,600 has been voted for electrification, of which more than half, $1,846,800 to be precise, figured in the 1914-15 budget. It may be doubted whether the government will now be able to commit itself to this expenditure. During 1912, the state railway administration paid over $170,100 as compensation in respect of accidents due to the negligence of employees. As the annual average for the past five years amounts to about $243,000, there has probably been an improvement in this respect.

Railway Financial News

Chicago, Rock Island & Pacific.—It is understood that the company has made arrangements with New York bankers for the renewal of a loan of $2,500,000, which matured December 31, and which was negotiated in June. The extension runs for three months, with interest at 6 per cent.

Great Northern.—The lease of the United States Steel Corporation ore lands by the Great Northern Ore Company expired on December 31. It was decided a considerable while ago not to renew the lease.

Lake Shore & Michigan Southern.—See New York Central Railroad.

Lehigh Valley.—Vice-President Smith is quoted as saying that no immediate issue of bonds on the terminal at Buffalo is contemplated. The plan is to make a mortgage on these terminals, but no action will be taken in the immediate future.

New York Central Railroad.—Application has been made to list on the New York Stock Exchange $249,590,500 stock of the New York Central Railroad, which is the name of the new company which has taken over the New York Central & Hudson River and the Lake Shore & Michigan Southern. The first meeting of the board of directors of the new company was noted in these columns last week.

The $249,590,500 represents the amount of the new stock to be issued at once. The consolidation plans provided that $50,409,500 should be retained in the treasury, making $300,000,000 in all. The $249,590,500 stock which the New York Central Railroad seeks to list is to be devoted to an exchange of stock on the following basis: New York Central & Hudson River Railroad stock, par for par, $225,581,066; Lake Shore & Michigan Southern Railway minority stock, $4,706,900, five shares of New York Central for one of the Lake Shore, minority stockholders in the other subsidiaries, $574,934.

New York Central & Hudson River.—See New York Central Railroad.

Toledo, St. Louis & Western.—The court has authorized the receivers to pay the semi-annual interest due January 1 on $9,500,000 prior lien 3½ per cent bonds.

West Jersey & Seashore.—A meeting of the stockholders has been called to authorize an increase in the capital stock of the company by $3,000,000 and the issue of $13,000,000 general and refunding mortgage bonds. The Pennsylvania Railroad controls the company through stock ownership and will receive new stock to the extent of about $2,000,000 to pay off advances to the company.

Russo-Swedish Railways.—The Stockholm newspapers report that Russia has approached the Swedish government respecting its attitude on the question of connecting the railway systems of the two powers by a bridge at Karungi, a city situated on both sides of the frontier formed by the River Torne. The eastern part of Karungi belongs to Finland and the western to Sweden. A railway is now in course of construction on the Finnish side, between the cities of Torneaa and Finnish Karungi, opposite the terminus of the Swedish railway system. It is understood that the Swedish government has replied that it is necessary to place the matter before the Swedish Riksdag.

Electrification in Italy.—In order to operate the extensions of the electrically equipped sections of the Italian state railways now under construction, 34 new 3,000-volt three-phase 16⅔-cycle locomotives have been ordered by the government—18 of the 4-6-4 type, weighing 84 tons, from Brown, Boveri et Cie., and 16 of the 2-6-2 type, weighing 68 tons, from the Italian Westinghouse Company. Both are driven by side-rods from two motors, jack-shafts at the ends being employed in the former, but not in the latter. The motors develop 1,300 h.p. each at 45 miles an hour. By a combined arrangement of pole-changing and cascade connection four economical speeds are obtained, namely, 22, 30, 45 and 60 miles an hour respectively.

The Argentine Loan

On Monday, January 4, a syndicate of American bankers offered to the American public $15,000,000 6 per cent notes of the Argentine government and the entire offering was sold within a few hours. The amount is, of course, almost insignificantly small when compared with the scale on which London bankers finance foreign needs; but as an indication of the actual steps which are being taken toward extending trade possibilities to South America, this piece of financing by American bankers for the Argentine government is a most propitious opening for 1915. The prejudices and practical difficulties in the way of selling American supplies, including, of course, railway supplies, to South American countries are as nothing compared to the fundamental difficulty which has heretofore existed, in that South American countries buy from the nation which finances their needs, and heretofore the United States has not been the banker for any foreign country of importance. As the New York Sun points out, this Argentine loan is the latest of a series which, within the last few weeks, has totaled $72,590,000 of foreign government loans offered publicly in the United States. Encouraging as this is from the manufacturers' and railway supply concerns' point of view, it emphasizes the point made by the railroads in their case before the Interstate Commerce Commission that the railroads are faced with an unprecedented competition in their bid for capital to be subscribed by the American investor. The Argentine loan was offered to yield 6 per cent on the one-year notes and 6¼ per cent on the two and three-year notes, the offering being divided into three series.

Broad Interpretation of Demurrage Rules

The Supreme Court of the United States recently rendered a decision by Chief Justice White, in a demurrage case, which is likely to have considerable importance in its effect on the interpretation of demurrage rules. The case was that of the Berwind-White Coal Mining Company against the Erie, and involved the question whether demurrage charges should be paid on carloads of coal shipped by the plaintiff coal company from West Virginia to Chicago, there to be reconsigned. It was insisted on behalf of the plaintiff that the tariff only authorized demurrage at destination and that the cars never reached their destination. They were held at Hammond, Ind., where are located the storage tracks of the railroad for cars billed to Chicago for reconsignment. This is a considerable distance from the terminals of the road nearer the center of the city, but is convenient to belt lines by which cars can be transferred to any desired new destination, and, as the court observes, the holding on such tracks of cars consigned as were those in question, was in accordance with a practice which has existed for more than 20 years. "Under these circumstances," the chief justice concludes, "the contention of the coal company is so wholly wanting in foundation as in fact to be frivolous." The decision is important not only in making it clear that the payment of demurrage charges may not be avoided on a technical claim that delivery was not actually effected at the destination named, but especially because it shows that the Supreme Court believes that the demurrage rules should be interpreted broadly and that their purpose should not be nullified by frivolous technicalities.

Train Crews and Safety

The Public Utilities Commission of Connecticut, after a thorough investigation of the operation of both freight and passenger trains in the state, with reference to the number of brakemen required, has recently issued a report finding that in general the trains "are now sufficiently manned, and operated with a degree of safety which no order for a general increase of trainmen would augment." One of the principal arguments advanced by railroad officers against the "full crew" bills has been that there is no necessity for legislatures to regulate the number of brakemen when the state railroad commissions have ample authority to do this if the safety of the public or of the employees requires action. This argument prevailed with the legislature of Connecticut at the 1913 session, when, for a bill requiring the employment of additional brakemen, there was substituted one directing the state commission to investigate the requirements and conditions of the service and make whatever orders might be deemed necessary. The report of the commission was published in part in the *Railway Age Gazette* of December 18, and some of its findings make instructive reading. "We feel," said the commission, "that to increase the prescribed minimum gen-

erally, or to increase the train crews beyond a reasonably safe requirement, would tend rather to lessen efficiency, and to decrease safety in operation because of a greater division of responsibility and the lessened individual alertness which would follow. The facts brought out in the present investigation disclosed no instances of the jeopardizing of the safety of either the public or employees which increased train crews would prevent. It is the belief of this commission that, of all the railroad accidents attended by fatalities which have been reported to and investigated by it, not one has been attributable to an insufficiency in number of the train crew involved." It is hardly to be expected that such conclusions will have weight with the class of politicians who are always eager to vote for anything a labor union asks, but they should influence legislators who have been deceived into thinking the train crew bills were safety measures.

DISCREDITABLE ACTION REGARDING RAILWAY MAIL PAY

BY passing the railway mail pay rider to the postoffice appropriation bill introduced by Chairman Moon, of the House Committee on Postoffice and Post Roads, the House of Representatives has added another very discreditable chapter to the very discreditable record which Congress and the postoffice department have been making for years in dealing with the question of compensating the railways for carrying the mails.

The question of the reasonableness of railway mail pay had been vigorously raised by the carriers before the parcel post law was pasesd, and they had presented to the department, to Congress and to the public convincing evidence that the government was not adequately remunerating them. Despite this, Congress enacted the parcel post law, thus adding largely to the mail service which the railways had to render without providing for any additional compensation for the service. After the roads had been carrying the parcel post matter some time for nothing, Congress provided for an increase in mail pay not exceeding 5 per cent. This was wholly insufficient to cover the increased expense forced on the carriers by the parcel post.

Meantime, a joint committee, created by Congress for this express purpose, was engaged in investigating the whole subject of railway mail pay. This committee prepared a report severely criticising the attitude which the postoffice department had assumed, and recommending a further increase in mail compensation of at least $3,000,000 a year, together with action to relieve the railways from the rendering of certain incidental services which are now rendered without payment and which represent an expense to them of several million dollars annually. Thus, the claim of the railways that they were being unjustly dealt with received the sanction of a body created by Congress itself to determine the facts and the equities involved.

Mr. Moon and his committee ignored the report of the Joint Congressional Committee, of which former Senator Bourne, of Oregon, the author of the parcel post law, was the chairman. They reported a rider to the postoffice appropriation bill which would increase the pay of the railways by $2,000,000 during the next year, but the later effect of which would be, according to a statement made by Mr. Moon on the floor of the House, to reduce their compensation by $8,000,000 annually. One does not have to be apt at figures to see that between the recommendation of the Bourne committee and Mr. Moon's estimate of what the enactment of his measure would save to the government, there is a difference of at least $11,000,000.

On what grounds did Mr. Moon demand the passage of his bill? Chiefly on grounds political. With engaging frankness he said, "the Democratic committee on postoffices and post roads asks for a rule to consider legislation that would save to this country millions of dollars; and *the Democrat who turns his back on that demand violates the best interests of the Democratic party.*" In other words, this bill ought to be passed, not because it was based on investigation, not because it was honest, not because it was fair or in the public interest, but because it was conceived that it would promote "the best interests of the Democratic party." And now, convinced by Mr. Moon's extraordinary argument, the House has passed his bill.

It is impossible to characterize the course of Mr. Moon, of his committee and of the House of Representatives in parliamentary language. Impervious to every argument based on considerations of fairness and honor, they have attempted to commit the government of the United States to a policy of robbery of the railways in order that for political reasons it may show a profit in the operations of the postoffice department. Such action either will or will not deprive the railways of a fair profit from the handling of all their business. If it does deprive them of a fair profit from all their business its tendency must be to starve the roads, and thereby disable them from rendering satisfactory service in the transportation of freight and passengers as well as mail. If it does not deprive the railways of a fair profit this will be due to the fact that they will be allowed to charge travelers and shippers high enough rates to reimburse them for the loss which they will suffer from their mail business. In that event, shippers and travelers will be required to pay higher rates than they otherwise would be in order that the postoffice department may show economies in operation and profits which in reality do not exist.

Is this a suitable way for the government of the United States to transact its business at a time when it is engaged in thundering and legislating against inefficiency and crookedness in other lines of business? Ought it not to teach business concerns generally how to be fair and honest and decent by example as well as by regulation? The crookedest bunch of pirates that ever gutted a corporation in Wall Street were as good citizens as members of Congress who will commit the government to a policy of robbing corporations for political purposes.

The obviously fair and square thing for Congress to do would be to delegate to the Interstate Commerce Commission the authority to fix reasonable rates for carrying the mails. Why should passenger rates, express rates and freight rates be made subject to the commission's jurisdiction while the rates for carrying the mails are subject to the arbitrary fiat of the politicians in Congress and the politicians in the postoffice department?

"POISONING THE WELLS"

THE hardest task ever undertaken in the history of mankind is for public utility corporations to please their professional critics. The managers of steam railways, electric railways, light and power companies and similar concerns receive innumerable requests from the universities for co-operation in carrying on their business courses. In many instances these requests are specifically for practical lectures on practical subjects by men who are practical because they are now engaged in the kinds of work which the students are trying to fit themselves to do. Recently, the American Electric Railway Association adopted a "code of principles," one of the proposals of which was that men of prominence in the electric railway field should avail themselves of the opportunities presented to make addresses before student bodies in order that a more thorough and better understanding between the railways and the public might be brought about.

This called forth the following comment from the New Republic, a new weekly magazine: "We are much in need of a far more thorough exposition of the practices and purposes of the public service companies—an honest partisan exposition of their side, with no pretense to a monopoly of 'correct principles.' But a deliberate policy of 'influencing public

opinion at its source' is sure to be worse than futile." Then followed the familiar "well-poisoning" figure.

The implication regarding the purposes and motives of the Electric Railway Association is plain. But who, pray, is to determine whether an exposition of the practices and purposes of the public service companies is honest or is intended to "poison the wells"? The man who makes the exposition is quite as likely as anybody else to know the honesty of his own motives; and if he happens to be a practical expert on his subject he is quite as likely to know whether his statements are correct or not as is anybody else—as is, for example, some writer who adopts the pose of omniscience, and then devotes his life to carping, superficial, negative criticism of those who are engaged in constructive work.

It is to be hoped that the doors of the lecture rooms of our universities will be opened wider and wider to those who really know, because they have learned in the hard school of experience, and that those who really know will more and more frequently enter. Lectures by such men will help to purify some wells which have already been poisoned by numerous writers and teachers who really know nothing about commerce or industry, and who have become neo-socialists and are making their students neo-socialists because they have immured themselves in their libraries and buried their noses in books, instead of getting out into the great world of human activity and learning what is really going on there.

THE SECURITY OF EQUIPMENT TRUST CERTIFICATES

THE Investment Bankers' Association committee on equipment trust certificates urges members of the association to insist, as a condition of purchase of equipment trust certificates, that certain rigid requirements be complied with by the railroad company. The report of the committee is published elsewhere in this issue. In the opinion of the committee 20 per cent of the cost of the equipment should be paid for in cash by the railroad company; the certificates should mature semi-annually or annually within a period of ten years or less; bankers buying issues of equipment trust certificates should require periodical reports from the railroad company as to the condition of the equipment securing the certificates, and great care should be taken that the title to the equipment does not pass through the railroad company's possession so that there may be no possibilities of legal difficulties because of provisions of other mortgages of the railroad in case of the necessity for foreclosure of the equipment trust certificates.

Railroad men, who are even more concerned with the maintenance of railroad credit than are the bankers, will be thoroughly in accord with the last of these suggestions. Equipment trust certificates have generally been considered particularly good investments because of the tangibility of the assets securing them and the directness of the lien on the assets created by the indenture. The value of equipment trust certificates as investments is enhanced by the fact that in case of a receivership the trustee of equipment certificates is in a strategic position in a great many cases as compared with the trustees of other mortgages because of the simplicity of enforcing his demands, whereas the trustee of a general mortgage may find it necessary to bargain and finally accept a compromise in any plan for reorganization, since the assets securing the general mortgage bonds are inseparable from assets and equities of other security holders.

The other two suggestions, however, are open to argument. It is a practical and physical impossibility for a railroad management to know at any given date just what is the condition of its freight cars. Some of these are scattered all over the country. Repairs are being made by other lines for which the railroad company responsible for the equipment may not receive bills for a considerable period. There is furthermore a question as to the advisability of bankers attempting to directly supervise details of railroad operation such as the repairs of equipment. When and how repairs should be made is an operating question controlled, of course, like many other operating questions, by the ever present financial question as to the company's immediate resources and income. As such it would be likely to suffer rather than be benefited through interference in the consideration of it by bankers. The general credit of a railroad company issuing equipment trust certificates should, and does among discriminating investors, affect the price at which equipment trust certificates of that company can be sold. One of the factors in the general credit of a company is the adequacy of maintenance.

The facts that underlie this particular recommendation of the committee have to do with the relations of the investment banker and his customer. The investment banker knows that in the great majority of cases the individual customer relies on the reputation of the banker offering him an investment fully as much as he does on his own knowledge of the security behind the investment or the credit of the company issuing the securities. While this is admittedly true, it does not and ought not to clothe the investment banker with the responsibility of detailed supervision of keeping intact the security back of bonds or equipment trust certificates. The banker's responsibility should be that of making a very thorough investigation of the credit, maintenance policy, etc., of the railroad company before recommending to his customer equipment trust certificates or any other securities of the company. This, however, is about as far as the banker's responsibility can extend.

The other suggestion that 20 per cent of the cost of equipment be paid in cash by the railroad company and that the certificates be paid off in instalments within a period of ten years, suggests some considerations as to the advantages or disadvantages to a railroad company of financing through the sale of equipment trust certificates. As a matter of fact, it is more often the roads whose mortgages are such as to make it difficult for them to pay for equipment out of the proceeds of general mortgage bond sales, or whose current funds are not sufficient to permit of the purchase of equipment outright from current funds, that resort to the issue of equipment trust certificates. But if equipment trust certificates are resorted to, a railroad company has to face a semi-annual drain on its current funds which may come at a time that is quite inconvenient, and it has eventually to pay for the equipment entirely out of surplus earnings, assuming, of course, that the company remains solvent. For instance, a road buys 110 locomotives costing $2,200,000 cash. It has to draw on its current funds for $200,000, for which in some cases it is possible to use the proceeds of general mortgage bond sales, but in others not possible, depending, of course, on the provisions of the general mortgage. It issues $2,000,000 equipment trust certificates maturing in ten annual instalments.

Assuming that the company is liberal in its expenditures for maintenance and its charges for depreciation, in the neighborhood of $330,000 will be spent in repairs each year, $66,000 will be charged each year for depreciation, and $200,000 will be paid out of current funds each year and charged to additions to property, through income and surplus, for maturing instalments of the equipment trust certificates. At the end of five years there will be but $1,000,000 of securities outstanding against equipment intrinsically worth at least $1,700,000, with a further charge to expenses of $330,000 for depreciation. If the road has shown a surplus or at least not shown a deficit for the five-year period, the $330,000 charged for depreciation is an addition to its assets through income, although, of course, it is not a specific fund or asset set aside. At the end of ten years the company will have paid for the equipment entirely out of earnings and further charged expenses with $660,000 for depreciation. All this amounts to a quite rapid addition to property investment without any addition—after the transaction has been completed—to capital securities and is all very conservative and possible for a strong road; but it is the weak roads which have in the past found their way out of difficulty in certain cases through the issue of equipment trust certificates. Viewed from this angle 20 per cent paid from current funds and a limitation to 10 years seems rather more than ample protection to safeguard equip-

ment trust certificates. The investment banker's suggestion is analogous to the Interstate Commerce Commission's requirements in regard to depreciation in that it accentuates the weakness of weak roads and the strength of strong roads.

THE PRACTICAL LIMIT OF DETAIL IN THE FEDERAL VALUATION

THE abstract of the instructions to the federal valuation parties published on another page will be of special interest to engineers, outlining as it does not only the methods for the conduct of this work, but the nature and extent of the information which the government forces are to secure.

The roadbed is to be cross sectioned with almost the same detail that it would be measured up for a contractor's estimate, and all material is to be classified. The ties and track fastenings are to be estimated from a count of the actual number in two 600-ft. sections per mile. The weight of the rail in all main and side tracks, together with the year in which they were laid, are to be ascertained, while the depth of the ballast is to be determined by digging into it at intervals not greater than 1,000 ft.

The prosecution of this work in such detail will impress many railway engineers as unnecessary. There is no question but that the valuation is being made in much greater detail than a possible purchaser of the roads would require. It would seem that the amount of earthwork, especially on lines completed within the past few years, could be determined with sufficient accuracy for all practical purposes from the records of the company, checked by accurate measurements of limited stretches at various intervals. Likewise, the records of rail in main tracks, which most roads keep for their own purposes, should, if verified by a reasonable amount of checking, be accepted as affording complete and accurate information.

In the determination of hidden quantities and unit costs for earthwork and other materials it will be necessary for the government to consult the records of the roads, and such records will undoubtedly have considerable influence in the final determination of the prices used. If reliance is placed on the records of the roads for such data it would not seem inconsistent to accept information as to other quantities which investigation shows are reasonably accurate.

The federal act providing for the valuation does not state the purpose for which it shall be made, whether for rate-making, the regulation of securities or ultimate government ownership. Therefore, it is necessary for the government forces to secure data in sufficient detail to provide the necessary information for any or all of these purposes. As in the case of any project of great magnitude and without precedent, it will be recognized as advisable for the government to collect too much rather than not enough data. Valuations made by some of the states and by the railways themselves have not withstood the test of the courts because of the inadequate data on which they have been based. Now that the government is definitely committed to this project it is highly expedient that it be carried through with the proper degree of thoroughness to withstand any attacks of this character. Also, in order satisfactorily to execute this project it is necessary to establish a spirit of mutual confidence, and of co-operation, between the forces of the carriers and those of the government. But if this spirit is established it will undoubtedly be possible to accept considerable data from the carriers which the government forces are now collecting independently in the field.

It is equally to the interest of the carriers and the government to eliminate all unnecessary duplication of work in order to reduce the expense to the practical minimum, as well as to hasten the completion of the entire valuation. The instructions under review may, therefore, be assumed to show the maximum amount of data which the government forces are to be called upon to collect, and it may reasonably be expected that as the forces, both of the government and of the railways, become better organized and more familiar with their duties, material modifications in the instructions will be made.

Letters to the Editor

ERRORS IN LOCATION AND CONSTRUCTION

St. Louis, Mo.

To the Editor of the Railway Age Gazette:

On reading your editorial on the subject of valuation in the issue of December 18, the thought occurred to me that the so-called valuation is an inventory of what exists on the road at the time it is taken, to which current prices are supposed to be applied to obtain the "value" of the property. But does this ascertain the value? Where a road has been built two or three years the "cost" (which is but the "value") might be ascertained, if it were not already known from the auditor's books. But when a road has been built 25 or more years the question of experience comes in, aside from any "adaptation or solidification of roadbed."

At the time the railroad was built errors of judgment were certainly made in the haste of location and construction, and all the years since have shown these, and they have been corrected. Grades were too low in places, bridges were too small or wrongly placed, damages had to be paid (often extending over many years) for defective drainage, personal and other injuries took place, etc. No engineer is infallible, and if the road were to be "reproduced at present prices" none of these errors would be taken into account, although they undoubtedly would occur. The percentage for contingencies would be very large, in many cases from 50 to 100 per cent.

C. D. Purdon,
Chief Engineer, St. Louis Southwestern.

THE BROOKLYN SIGNALING CONTRACT

New York City.

To the Editor of the Railway Age Gazette:

In the article in your issue of December 25, "Signals for New Brooklyn Subways," there is an error in the paragraph reading: "When the new bids were opened the Federal Company, whose bid was higher than that of the General, protested that the action of the company and of the Public Service Commission was irregular and unwarranted."

This company was never asked to submit but one bid, upon one set of specifications. Upon these specifications the Federal Signal Company was the low bidder. The Federal company was subsequently requested to meet the price which had been offered by the General company after the bids were opened, with the privilege to the New York Municipal Railway Company to substitute a speed control and cab system, provided a satisfactory scheme could be developed.

The Federal company offered to grant the privilege of this substitution, but refused to lower the price $100,000 to meet the revised bid of the General company, which had reduced its original price $515,000; this for the original specifications with the additional option to substitute a speed control system.

The only communication received by the Federal company from the New York Municipal Railway Corporation, after the bids were opened, was the following from the president of the latter corporation, as follows:

> I have yours of even date. I assume that your company would be able to develop a system which might be as efficient as that proposed by the General Railway Signal Company, but even upon this assumption we save something over $100,000 by adopting their proposal as against yours.

In view of the above it is evident that there were only one set of specifications offered for bidding, and the chief engineer admitted at a hearing which was held before the Public Service Commission that he would not know how to draw up specifications for a speed control system.

Federal Signal Company.

Organizing the Supply Department on the Seaboard Air Line

Sufficient Facilities and No Division of Authority Proved to Be the Essentials of Success of This Organization

By H. C. Pearce
General Purchasing Agent, Seaboard Air Line

The purpose of the organization of the supply department of the Seaboard Air Line is best expressed in President Harahan's circular of July 19, 1913, which reads:

The General Purchasing Agent will have charge of the purchase of all materials and supplies. He will have charge of the Stores Department, which department will have jurisdiction over all materials and supplies on the railroad not actually in the hands of the various officers for application to specific work. The Purchasing Agent and General Storekeeper will report to the General Purchasing Agent.

The problem was how to place the resources immediately under control and at the same time carry on the considerable work that was under way without delay or incurring any unusual expense. It was necessary to act quickly in order to meet the unfavorable business conditions that had already set in.

The Seaboard Air Line operates 3,100 miles in the states of Virginia, North Carolina, South Carolina, Georgia, Alabama and Florida. It has extensive terminals at Portsmouth, Va.; Hamlet, N. C.; Atlanta and Savannah, Ga.; Jacksonville and Tampa, Fla. The territory it serves and the class of traffic that it handles makes it subject to very close supervision and closer operation.

The stock on hand, as represented by the balance sheet, was small considering the mileage, being only $1,896,755, June 30, 1913, including rail, fuel, cross ties and dining car supplies. Mr. Harahan was too close an observer to be misled by the figures shown by the balance sheet. He knew that there was a large amount of material on hand that was not reflected by these figures, and that the purchases were entirely out of line. He had a thorough investigation made by an expert which proved that his conclusions were correct.

It was the same old story. In order to forestall criticism and investigation, which is always aimed at the stock as reflected by the balance sheet, and the payroll, it was necessary to resort to the common practice of charging out the material when it was received and letting the users handle it, or, in other words, handle the bills instead of the material. Naturally the material was scattered over the entire system, each individual looking out for himself as best he could. There were storekeepers at some of the more important points, but they merely looked after the delivery of the material as best they could. No attempt was made to handle other than supplies used by the mechanical department.

After making a careful inspection of the property, I was satisfied that while the usual thing to do would be to call for sufficient facilities and organization to inventory, bring in and arrange the material at central points for issue at once, such a plan would involve an investment and operating expense that would not be considered, and besides, I was not fully convinced that this expense was warranted, or that reasonably good results could not be obtained in a different way and without in any way diverting from the purpose desired.

The plan decided upon was to organize the purchasing, storing and distributing first, and follow up later with the organization of the division stores and outside depots. A review of this work may be of interest to those who have similar problems to meet:

PURCHASING

Consolidation of Purchases.—Arrangements were immediately made to have the purchasing agent buy everything except commissary supplies. This included locomotive fuel, cross ties, lumber and stationery, as well as a large quantity of materials and supplies which were formerly purchased by division officers, such as superintendents, division engineers, roadmasters, etc., under the guise of emergencies. It is absolutely necessary to consolidate the purchase of all material in one office in order to exercise the necessary control.

Consolidation of Requisitions.—Arrangements were promptly made to have all requisitions pass through one channel where they could be recorded, checked, consolidated and filled from available material, or arrangements made for purchase under proper specifications. Requisitions are given a number when received by the general storekeeper and this number serves as a requisition, inquiry, proposal, order and correspondence file number; thus making one number the means of identification for all interested parties. This, it will be appreciated, is of great importance in systematizing the ordering, tracing, inspection and accounting.

Inquiries or Bids.—Arrangements were made to send out inquiries, or what are commonly known as bids, for all materials or supplies not covered by contracts or agreements. It was arranged to first establish an inquiry list of commodities arranged alphabetically. This list is added to or deducted from as occasion demands. Inquiries are sent out to all firms on this list. The proposals received are tabulated on quotation sheets and the business awarded, everything being equal, to the lowest bidder. This sheet, including the inquiry and proposal, together with copy of the order, is attached to the requisition, to which is added any subsequent correspondence.

Price Records.—Price cards and loose leaf price books were established, thus giving a perfect description of commodities arranged in alphabetical order, showing the quantity, order number, date of order and name of seller, together with prices and delivery point. Quotations are entered on the same card, except that they are entered in red. These cards also answer the purpose of a correspondence index file.

The price cards present a picture of each transaction. They serve the further purpose of a correspondence file and a still further purpose of a record of quantities for comparative purposes.

Checking of Invoices.—A copy of the order is placed on the order file, in addition to the copy which is filed with the requisition, arranged numerically. This gives the name and address of the seller, description of material, prices, quantity, agreed delivery, quotation number, routing and destination. The invoices are checked against this record before they are sent to the general storekeeper's office, and date of shipment as shown on invoice and bill-of-lading entered thereon.

It is the duty of the purchasing agent to see that all invoices are accurately checked as regards quantity, prices, date of shipment, delivery and delivery point before the invoices leave his office.

Tracing.—A systematic system of tracing was installed. This is done from the order file referred to above. It is the duty of the clerk having charge of this work to see that deliveries are made in accordance with the deliveries specified on the face of the orders, and to guard against overshipments. Orders should show the deliveries, and material should be traced before being asked for. The delivery should be as much a part of the agreement as the price. It is the duty of the purchasing agent to see that deliveries are made in accordance with terms of purchase. He should not wait until he is asked to trace for material.

STORING

Organization of Stores.—It was decided to organize two general supply depots to care for the system at the two principal shops. Sufficient platforms, racks and bins had to be provided

to properly segregate not only the material on hand, but the material that was not needed, which we intended to bring in from off the line, and take back from the shops where it had been drawn and not used.

We decided that in order to save time and expense, we had better go ahead and do this work with store labor under our own supervision.

The stock was arranged in section order, which consists in a section being assigned to the same general class of material, which is based on combining such classes of material as would naturally be handled to the best advantage by a single man. For example, all of the air brake material, lubricators, injectors, sanders, etc., were segregated in one section, the idea being that the man who has charge of this section of material must have knowledge of this class of equipment. Another section contains bolts, nuts, lag screws, etc., which can be placed in the hands of a laborer without technical knowledge. Bar iron, flues, firebox steel, tank steel, arch brick, etc., were segregated in one section for the reason that this class of material is usually maintained adjacent to the boiler and smith shop.

The plan has as its basis the purpose of having one man who has actual knowledge of and who is responsible for the ordering, receiving and delivery of every item in his charge, actually handle it with his own hands, as well as keep his stock records. The plan is broad and flexible enough to meet any conditions.

Preparation of Stock Books and Standard Lists.—Due to the fact that the practice had been to send a large portion of the requisitions directly to the purchasing agent, it was very difficult to secure proper description of material. It was necessary that stock books be prepared immediately, giving this information, so that we could use these books as a guide in checking requisitions, both as regards quantities and description.

The stock books are fundamental, and must be so prepared and maintained as to show what is actually on hand at each point every thirty days, what is due on unfilled obligations and the average monthly consumption over a period. Each item must be fully and completely specified, and still further, identified by a number. This record is the basis of calculations in placing requisitions for future requirements, plus such additional information as may be known to the storekeeper at the time.

Inspection of Material.—Arrangements were made to have all material as far as possible pass through the general stores for the purpose of proper inspection and control. Probably nothing has been so sadly neglected as the inspection and checking of material. This is due to the mistaken idea of the economy of direct shipments to save handling.

There is only one way to have material properly inspected, compared and checked, and that is to have it pass through the general stores where we have sufficient trained men to properly do the work. Material which requires chemical analysis or technical inspection is covered by an inspection certificate which is attached to the purchase bill.

The best inspection of all is that of the section storekeeper who receives and handles the material in conjunction with the user. These men are in position to know what is best suited for the work, and it is wonderful what can be accomplished by applying this method of inspection to most materials and supplies.

DISTRIBUTION

Store Delivery.—Realizing the importance of having the material delivered directly to the users instead of over counters, as is the usual practice, a store delivery system was installed at once, which consists of an organized force sufficient to deliver the material directly to the users instead of having mechanics come to the storehouse and be waited on by attendants.

In addition to the expense and delays of having mechanics and helpers leave their machines to go to the storehouse to obtain material instead of having the material delivered directly to them, as it should be, another fundamental fact must be apparent—that in this way the section storekeeper is in position to actually know that the material is needed and that it is suitable for the work required. This enables him to utilize a great deal of material which otherwise would become obsolete. It also enables him to keep up his stock and prevent the accumulation of a surplus, either in the stores or in the shops.

During July, there were 5,575 individual deliveries made to the shops at Portsmouth, or an average of 214 for each working day. The force consists of a foreman, one man and four boys. Boxes are placed at 25 points throughout the shops and regular trips are made every 30 minutes, and as many additional trips as may be necessary—the boys picking up and bringing in the tickets on their rounds. This crew also brings back to the stores the shop-made material and repair work.

Supply Train.—Supply cars consisting of one car for miscellaneous material and track tools, and a car for oil, had been in operation on local trains, but they were not a success. The supply train was established in November, 1913. This train delivers all material used for ordinary maintenance and operation except rail, ties and lumber, and it picks up all serviceable tools and salvage that for any reason is not needed. An inspection of all supplies and tools at each tool house and supply depot on the system is made every 60 days, and only what is actually needed, after a personal inspection on the ground, is delivered.

The supply train is to the system what the store delivery is to the shops. This train should be accompanied by the road-master, division engineer, general storekeeper or inspector of stores. It offers the only thorough and practical method of distribution and control of materials and supplies for maintenance and operation, and is the only medium by which accurate information can be obtained as to what is needed before it is delivered, the service materials and tools are giving, and other information which a supply officer must have first-handed in order to intelligently provide and control issues.

Reclamation of Material and Sorting of Scrap.—Practically no attention had been given to the reclamation of material and the sorting of scrap. The practice had been to sell a great deal as miscellaneous scrap. This for the purpose of saving the cost of handling.

This work was taken over September 1, 1913. From that date all scrap received was carefully sorted into classes, in addition to the enormous quantity which was already stored in the yard. Facilities are being gradually installed and the work of reclamation is being gradually increased. In the meantime, everything which we believe can be reclaimed is being segregated and laid aside until we have the facilities to do the work properly.

There is an unlimited field for saving in the handling of salvage on a railroad. Nothing should ever be scrapped that can be made available for use at less than the purchase price.

Stationery Store.—The purchase of stationery was formerly done by the stationery storekeeper. The turning of this work over to the purchasing agent greatly reduced the prices of all forms. We recently installed a printing press which further reduced the cost of forms.

The cost of stationery does not reflect what was done for the reason that during the past year we purchased a great many mechanical appliances, such as billing machines, adding machines, comptometers, etc. The saving effected in printed forms was more than consumed by the cost of these mechanical appliances, the cost of which was charged to the same account.

Division Stores.—As soon as the two general supply depots were properly organized, we took up the work of organizing the division stores along the same general lines. This work has progressed slowly, and it will take considerable time to go over and arrange all of the material at outside points, ship in what is not needed and arrange the remainder in sectional order. Uniform stock books will be established at all division points this year.

With two general stores properly organized and the supply train system thoroughly installed, we are in position to reduce the stocks at outside points to a thirty days' basis, and maintain them with the minimum of expense. The purpose is to re-

duce the stocks of material at outside points until we will deliver each month only sufficient to take care of the requirements for the succeeding month, picking up and bringing back to the general supply depots what remains for any reason. Division engineers' and roadmasters' stores are being dismantled and the material brought into the general supply depots.

The following, so far as such things do, will reflect the work accomplished:

Unapplied material recovered and returned to the Stores	$121,507.00
Usable material recovered from scrap and returned to the Stores	6,482.00
Usable material reclaimed from scrap, issued and charged direct to the Maintenance of Equipment	24,544.00
Scrap reclaimed and credited to Maintenance of Equipment	208,428.00
Scrap reclaimed and credited to Maintenance of Way	58,117.00
Inventory overage charged direct to Store Stock and credited to Operating Expenses	55,818.00
Material investment reduced	227,983.00
Purchases reduced	178,606.00

The real work, however, consists in the organization and system which has been installed, the merit of which will be reflected in decreased purchases the ensuing year.

It will be recalled that the reorganization was not effected until July 19, 1913, and we really did not get started until September, so that these figures only cover a period of ten months.

The merit of the supply department consists in providing better service with less expense and *less net cost for materials.* Work of this kind can really only be reflected in the final operations of the property.

Attention is called to the fact that we made no expenditures for improvements and facilities other than such as we have done ourselves. We were simply obliged to do the best we could with what we had.

My experience has fully convinced me that no supply department can be effective, no matter what the experience or ability of its officers, that has not a well defined purpose and a thoroughly practical plan, fully understood and supported by the chief executive.

Our railroads must realize before the question of supply can be properly controlled, that the great need is to discourage the accumulation of large quantities of material in advance of requirements, and that the presence of material unused, is a much greater sin than its absence.

I am firmly of the opinion that a plan can be devised and carried out whereby work will not suffer for lack of material when once it is thoroughly understood in the operating departments that it is as wasteful to have material unapplied as it is to have labor unemployed.

There are certain fundamental principles involved in carrying out any plan, which must be understood and adhered to.

First.—Sufficient facilities and organization to properly purchase, care for and distribute what is actually needed, and some method of determining that material is actually required and will be used promptly. The time to reduce purchases is before they are made. No real economy can be obtained when everyone has all they need at all times. Material for specific work should not be bought until it has been decided beyond reasonable doubt that it is going to be used and within a specified time, and the purchase arranged accordingly. A large percentage of the material on our railroads is material which was ordered for some particular work and the work either curtailed or abandoned.

Maintenance officers should be held rigidly accountable for material on hand unused. Broadly speaking, there should be no stock outside of the storehouses. Altogether too much attention has been paid to complaints that work was delayed or the cost increased for want of material. Few of these complaints are justified, and are merely a fence. Very little work is ever delayed on a railroad for want of material. There is always enough to do on a railroad so that there should be no delay to work as a whole. Fear of criticism and desire for commendation has made many of our supply officers and storekeepers impotent. These officers must be supported and strengthened in their efforts to control the purchases and stocks and prevent unnecessary accumulation.

Second.—There must be no division of responsibility from the time the purchase is authorized until the material is actually delivered to the work and the salvage disposed of.

With these principles clearly defined and understood, the work is then a matter of system and applied common sense.

PROSPECTS OF STATE OWNERSHIP IN ENGLAND*

BY W. M. ACWORTH

When I was invited last spring to address you this autumn on the subject of Railway Nationalization, none of us expected that we should be confronted with a *fait accompli.* Today the railways of this country, with unimportant exceptions—Ireland has got home rule in this matter—are nationalized. And it has been done so quietly that the man in the street doesn't know that it has been done, and that the porter in Queen street is at this moment a government official. But so it is, and it shows how easily the thing can be done. It may be undone—I don't think it will be—if two of the most influential men in the cabinet get their way, and induce their colleagues to see what a good opportunity the conclusion of the war would be for bringing forward a great scheme of social policy which cuts across normal political divisions.

But in any case, what has been done once can be done again. And it may be done again in the same way—taking over the whole thing as it stands by an interim arrangement and dealing gradually with knotty problems, such as the rights of the different classes of shareholders, the reorganization of the tariffs of the unified system, the right of state servants to strike, and so on—I only mention a few.

That nationalization of our English railways is bound to come, I have long believed. That it will come pretty soon, I fully expect. Judging by the evidence before the Royal Commission now sitting, the great majority of the great manufacturers and traders of the country are opposed to it, the Leeds Chamber of Commerce among the number. But the captains of industry have few votes; the railway servants alone can vote them down; the Trade Union vote would simply swallow them. And I have no doubt which way the working classes, who expect the bottomless purse of the state to provide simultaneously higher wages, shorter hours, easier work and lower fares, would vote.

For my own part I shall greatly regret the change, which I believe to be inevitable. Not only because:

> "Men are we and must grieve when even the shade
> Of that which once was great has passed away,"

but because we shall lose, in my judgment, more than we can gain. I admit we shall gain something—a good deal perhaps. English business admittedly had grown slack—take the iron and engineering trades for instance—twenty years ago. Rule of thumb methods, antiquated machinery, neglect of cost accounting, and so forth, held undisputed sway. English business was effectually awakened by the severity of foreign competition. English railways are not exposed to foreign competition, and their methods still need modernization. The railway profession nowadays need the best brains and high scientific training. Our railways mainly recruit their headquarters staff from the rank and file. The headquarters staff of the civil service are the pick of the very best brains of the country. I cannot doubt that nationalization would *at the outset* lead to more scientific and, therefore, more economical operation.

I will concede another point and a big one. No nation has yet solved the problem of satisfactory state control of a private railway system. Our railways used to be pretty well controlled by competition. But competition is dying before

*An address delivered before Leeds Luncheon Club, Leeds, Eng., on November 16, 1914.

our eyes. There remain the Board of Trade and the Railway Commission. Nobody, I assume, supposes that they control the railways. The Royal Commission now sitting has shown no signs so far of having begun to think out a scheme of adequate control, or even of appreciating that such a thing is required. France used to have, under the name of *Comite Consultatif*, a really competent body of experts controlling its railways on the commercial side. But of recent years political pressure has greatly increased the membership of the committee till it has become an overgrown debating society, whose debates are not primarily conducted from the point of view of the public interest. As for America, high hopes were entertained not long since of the Interstate Commerce Commission. But its recent record has disappointed even its most fervent admirers. And at this moment the commission, having done its worst in impairing the credit even of the strongest companies, is occupied in eating with what grace it can a decision on the most important question ever submitted to it, which it pronounced after twelve months' inquiry as recently as last July.

Private railways must be controlled by the state. And when one admits that no state has yet discovered a satisfactory way of doing it, one may seem to have gone a long way in admitting the necessity for state ownership. And yet I still think that the balance of argument is definitely on the other side for two main reasons, financial and political. Though the doctrines of the Manchester school are out of fashion nowadays, it still remains true that the state cannot, or at least does not, conduct business as efficiently and economically as private enterprise. I have said that I believe that state management in this country at this moment would induce immediate economy. I have not said, and I do not think, that it would secure better public service. And I still believe that, if our railways remain in private hands, and have to work out their own salvation, they will be operated twenty years hence more efficiently than they ever would be by any government department. The largest part of the expenditure of a railway is the wages bill. Does anyone believe that the state gets as good value for £1 spent in wages as the private employer? Whether our English railwaymen are underpaid at present, I am not concerned to discuss. I only wish to point out that, under a state system, wages must go up sharply, and that the public will have to foot the bill.

It is in Prussia, if anywhere, that government railways are efficient. And yet I believe that any impartial expert, comparing Prussia with France, and taking into consideration the conditions, geographical, commercial, and economic, the service rendered, and the rates charged, would come to the conclusion that the French companies, hampered though they are at every turn by political interference, are managed more efficiently and economically than the Prussian state system. As for the exploits in disorganization of the French government since it took over the Western Railway, it is only kind to draw a veil over them, and say that things have been so bad that it is impossible that they should not get better. But, if the Prussian state cannot hold its own with the French companies, still less can the Australasian state railways face comparison with American companies. Comparing the efficiency of the Victorian or New South Wales railways with that, I will not say of the Pennsylvania, but of the Southern Pacific or even the bankrupt St. Louis & San Francisco, would be as absurd as comparing a blunderbuss with Lee Metford.

Even more important to traders than the quality of service given is the scale of rates charged. If our railways are nationalized they will need to earn much the same net revenue as at present; or else saddle a deficit on the taxpayer. Private companies naturally try to raise the necessary revenue with the minimum of economic friction. Their motto is "Charge what the traffic will bear." Drop the rates where the traffic cannot bear them; keep them up where the traffic can. Their goods manager is from his situation impartial between rival claims. By training he is an expert to know where the shoe most pinches. The state instinctively tends to broad general rules and a dead level of uniformity. And, in practice, at least in a parliamentary country, adjustments towards uniformity can only be downwards. And this means that certain individuals, in no way specially meritorious, will secure increased profits at the expense of the general public. Under a state system I have no doubt that rates would be reduced to a dangerous extent. It is emphatically untrue that reduction of rates always increases net revenue. If it were true, why do not the commercial companies reduce rates today? The famous apple woman who could afford to sell each apple at a loss because she sold so many lived in Ireland. And Ireland is an exceptional country.

I have left to the last what is in my mind the final and crucial point—politics. Under a state system, to quote the words of the famous Italian commission of thirty years ago, "Politics would corrupt the railways. And the railways would corrupt politics." The Italians since then have put the question to the test of experience, and have abundantly proved that the commission was right. I cannot attempt to give you the evidence. It is to be found all over the world, from Belgium and France to Argentina and Peru. Some samples culled from the records of our own Australasian colonies will be found in Sir Charles Owens' evidence before the Royal Commission. I have myself called attention to evidence from Canada and the Cape to the same effect. It is safe to say that no democratic state has ever yet succeeded in keeping railway management out of politics. In my belief no democratic state ever will. And it is because I believe that politics would corrupt the railways and railways would corrupt politics, not necessarily through money bribes but through the worse and more insidious bribery of votes, that I shall oppose government ownership of railways in England as long as the question remains an open one. But I fear I shall live long enough to say, "I told you so."

RAILWAY AFFAIRS IN OTHER COUNTRIES

The illustration shows a German troop train which was wrecked while running at high speed near Stendal, Geomany, when it ran into the rear of a freight train. The train was carrying soldiers who had recovered from their wounds to such

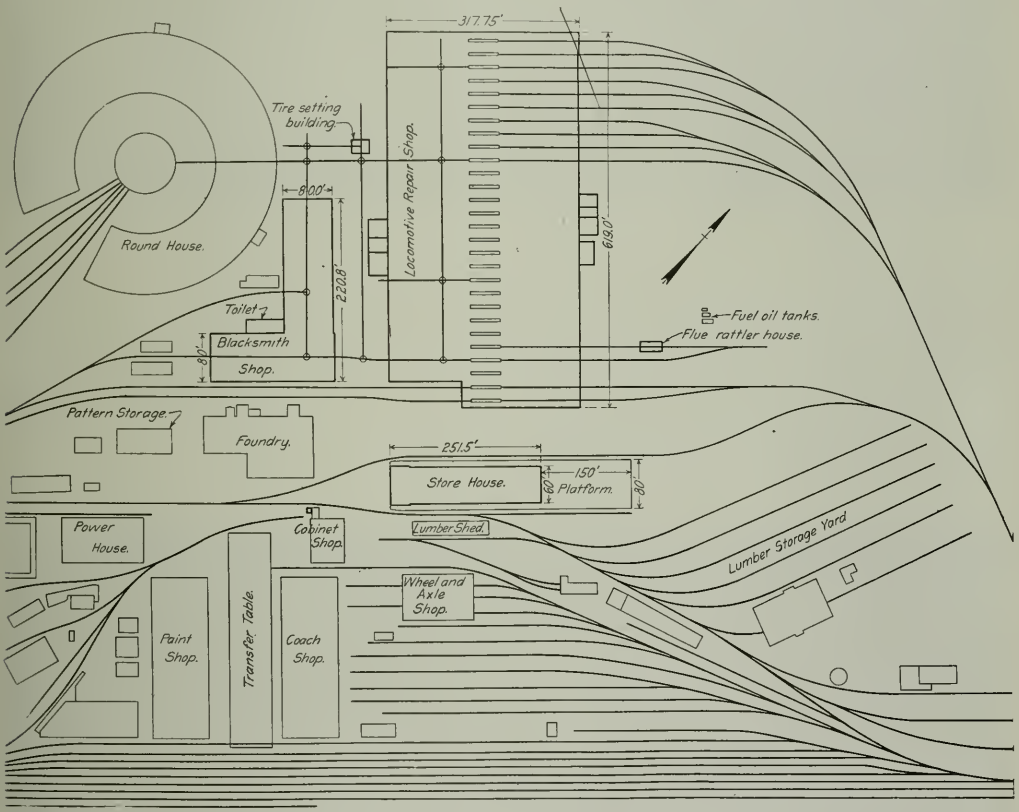
an extent that they were returning to the French battlefields. The cars were telescoped and several of them totally wrecked, a large number of the returning soldiers being killed and seriously wounded.

New Chicago & Alton Shops at Bloomington, Ill.

Increased Facilities for Heavy Repairs Provided by Construction of Three Large Modern Buildings

The Chicago & Alton has maintained car and locomotive repair shops in connection with its engine terminal at Bloomington, Ill., for many years. When the necessity arose for increased capacity in these shops some time ago, the advisability of removing these facilities from Bloomington was considered, but to prevent this the city agreed to furnish the land necessary for the enlargement of the shops and yards sufficient to care for requirements for some time to come. The new buildings just completed on this land, which adjoins the old site on the north, comprise a locomotive shop, a blacksmith shop, a storehouse, a tire heating building and a flue rattler building. A number of unique features were introduced in the design of these buildings, notably the placing in one structure of the several departments of the locomotive shop and the improved layout of the blacksmith shop. The general layout provides not only for existing and probable future needs but for the utilization as far as possible of the old shops and for the development of a well defined scheme that will ultimately utilize the tract in the most economical and effective manner. The arrangement of the new buildings and their relation to the old buildings, the storage yard tracks and platforms are shown in the plan.



Layout of Chicago & Alton Shops at Bloomington, Ill., Showing New Buildings Recently Completed and Their Relation to the Yards and the Old Buildings

LOCOMOTIVE REPAIR SHOP

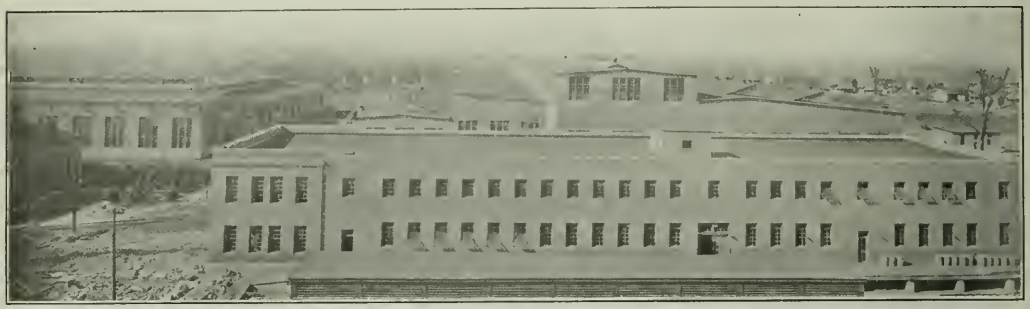
The locomotive repair shop is 619 ft. long and 317 ft. wide, covering an area of nearly 4½ acres. The building is divided into five longitudinal bays housing the erecting shop, the machine shop and the boiler and tender shop, as well as the master mechanic's and foreman's offices, tool rooms and sub-store rooms. This combination of the various departments under one roof without partitions admits of such an arrangement of tools that work and materials may pass through the shop in an orderly and progressive manner with the least possible rehandling.

This building consists of a structural steel frame on concrete foundations with side walls of concrete up to the window sills and brick above that level, with the exception of the high walls of the central erecting bay which are of tile with stucco finish. The floor consists of a 4-in. sub-base of tarred rock well rolled and covered with a 1-in. layer of sand and tar in which is embedded an underflooring of 3-in. yellow pine overlaid by a

1 1/16-in. maple floor. The roof has wood purlins with 2-in. planks covered with prepared roofing. The building is well lighted as the combined window area of the side walls and the saw tooth and monitor roof construction amounts to over 28 per cent of the floor area. The artificial lighting consists of Tungsten nitrogen-filled lamps in 400-watt units spaced to eliminate shadows and the necessity for individual lamps on the machines except for inside work.

The shop is heated by an indirect blower system located in two specially constructed rooms outside of and immediately adjacent to the main walls of the shop and situated one on either side of the building about midway of its length. These rooms are large enough to be divided, a part of the space being used for lavatory and locker rooms for the men. The blower system consists of two 240-in. steel plate exhauster type fans direct-connected to horizontal throttling engines. These fans draw air through 20,200 sq. ft. of Vento heaters and discharge it through concrete underground ducts to register boxes located along the outside walls and on interior columns. The Vento heaters are supplied by high pressure steam transmitted from the power house about 1,000 ft. away at 125-lb. pressure, which is reduced in the fan room to 1½ lb. The exhaust steam from the fan engine is also used in the heaters. A suitable system for the unwheeling of locomotives being of 150 tons capacity equipped with two trolleys of 75 tons each located on the upper runway, while the lower runway carries a 10-ton messenger crane. On every alternate column between the erecting pits jib cranes are provided for handling materials on the front ends of the locomotives.

Adjoining the erecting bay to the south is a 60-ft. bay in which are located the heavy machine tools which are served by a 10-ton traveling crane. South of this bay is another 60-ft. bay in which are placed the lighter tools. The heavy tools are all equipped with individual motor drive, while the lighter ones are arranged in groups driven by motors of 20 to 25 hp.



Looking Over the New Chicago & Alton Shop Buildings, Store House in the Foreground, Blacksmith Shop to the Left and Locomotive Shop to the Right

North of the erecting bays are two 60-ft. bays devoted to boiler and tank work. These two bays are served by traveling cranes, one of 15 tons capacity and the other in the boiler assembling bay of 40 tons capacity, each equipped with two trolleys. The hydraulic riveter is centrally located in the boiler shop with a tower constructed especially for it and is served by its own 25-ton crane.

BLACKSMITH SHOP

The blacksmith shop is of brick and steel construction on concrete foundations similar to that of the locomotive shop. It is an L-shaped building 80 ft. wide, one wing being 200 ft. long and the other 300 ft. long. All the steam hammers, ranging in capacity from 300 lb. to 6,000 lb., are assembled in the 200-ft. wing, and the forges and small power tools in the 300-ft. wing. The roof trusses on the former wing are 10 ft. higher than those on the latter in order to provide the 30-ft. headroom required

General View of the Interior of the Locomotive Shop Taken from the Light Machine Bay

of piping is provided for distributing live steam, compressed air, fuel oil and water for fire protection, drinking and hydraulic pressure throughout the shops.

The erecting bay, located in the center of the building, is 75 ft. wide, center to center of columns, and contains 28 pits. It is served by two traveling electric cranes on two levels, the crane

for the jib cranes and hammers. A space 100 ft. long has been partitioned off in the longer wing for use as a tinshop temporarily until this space is required for blacksmith work, when the tinshop will be removed to other quarters.

In the general design special care was taken to provide a layout that would afford opportunity for an orderly progression of the work through the shop, and ease and economy in transporting materials or parts to the point of final use in the locomotive shop with which it has suitable track connections.

Excellent ventilation is provided by the monitors in the roof in addition to the means for removing smoke and gases from the forges. A lavatory is located in the angle of the "L" in an addition just outside the main building, which includes both toilets and washroom facilities for the men.

STOREHOUSE

The two-story brick storehouse is located east of the locomotive shop and separated from it by a 95-ft. storage yard. This building is 60 ft. wide and 250 ft. long without a basement, the first floor being on an earth fill affording facilities for handling and storing heavy materials on a level with the car floors. A wooden platform 10 ft. wide on concrete piers extends the entire length of the building on both sides, and a large storage platform 80 ft. by 100 ft., with the floor laid on an earth fill, is provided at the north end.

Ample storage bins, arranged in transverse rows to give a maximum of light in the aisles, are provided in the house. The second floor, where the lighter materials are stored, is served by an electric freight elevator of 5,000 lb. capacity, while a chute is provided by which small packages made up on requisition can be transferred to the first floor for delivery. At one end of the building is provided office space for the general storekeeper and his clerks, adequate toilet facilities and a first-aid hospital.

To permit the erection of the new buildings and the laying of some of the tracks it was necessary to remove two rather old buildings of stone masonry. These were of considerable size, one of them being two stories high, but they were successfully moved with their contents intact.

These new shop buildings were designed and constructed by Westinghouse, Church, Kerr & Co., New York, acting in cooperation with H. T. Douglas, Jr., chief engineer, and J. E. O'Hearne, superintendent of motive power of the Chicago & Alton, the actual field construction being in charge of P. J. Watson, assistant engineer.

COMBINATION THROUGH CLASSIFICATION AND TERMINAL YARD*

By W. C. Copley

Freight Trainmaster, Pennsylvania Railroad, Altoona, Pa.

The following description covers actual practice in a supposedly well designed, operated and organized yard—a main line yard on the Pennsylvania Railroad located between Chicago and New Jersey, consisting of more than 200 miles of track and having standing room for over 10,000 cars; it handles 6,000 cars per day of through business, about equally divided as to directions, and 3,500 inter-yard movements exclusive of the through business; that is, cars to and from the shops, transfer warehouses, and industrial and public delivery sidings. This makes it a combination through classification and terminal yard. The 6,000 cars of through business means that that number of cars are despatched from the yard, or in other words the cars are counted only once on the outgoing trip. The terminal or inter-yard movement of 3,500 cars per day represents each movement of a car within the yard after it has been classified and placed in the classification yard up to the time it is returned to the hump for a re-classification for final despatching from the yard.

When a train arrives in the receiving yard, the road conductor delivers his card manifests to the assistant yardmaster in charge of the movement in the direction the train is going, who counts the manifests and marks on his train register the engine number, the arrival time in the receiving yard and the number of manifests representing cars in the train. The manifests are then turned over to the assistant yardmaster's clerk, who takes out any for cars he may have "hold" or "change" orders for. He also takes a book record of all the city delivery cars in the train. The manifests are then turned over to the reconsigning clerk, located in the same office, who represents the freight agent. This clerk picks out those for any bill-of-lading or reconsignment cars he may hold orders to rebill. About 200 cars per day of this class of freight pass through the yard, 75 per cent of which are changed or re-billed before the cars are classified, while the remaining 25 per cent go to the hold-track to await disposition. The manifests are next turned over to the conductor or car-marker, who takes them into the yard, passes along the train and compares the numbers and initials with the cars as they stand to make sure that each car is represented by a manifest.

While the manifests are being thus handled the car inspectors make a thorough inspection of the train under blue flag protection, making any slight repairs which can be made in the receiving yard, and marking for the shop any cars with defects that cannot be thus repaired. As the car marker compares the manifests with the cars in the train, he chalks the front end of each car for the track on which it is to be placed in the classification yard beyond the hump; he faces down the manifests for any cars he may mark for the shops. Upon returning to the assistant yardmaster's office he makes out a shifting slip for the use of the leverman in the tower, who operates the switches from the hump to the classification yard; he then removes from the pack the manifests for cars for the shop, sealing them in an envelope marked "Shop cars out of train of Engine ———." The manifests for the other cars are sealed in a separate envelope, which shows the engine which brought the train to the yard, the number of the track on which the train was received, and the time it was marked. He then pins his switching slip to the envelopes containing the manifests and places the entire pack in a pigeon-hole in the assistant yardmaster's office, representing the track in the receiving yard that the train is on.

The train is now prepared for classifying over the hump. The manifests are given to the man in charge of the hump engine; the engine is placed back of the train and the manifests are delivered to the conductor in charge of the hump, who in turn delivers the switching card to the leverman, and forwards the manifests for the train, still sealed in the envelope, to the assistant yardmaster at the despatching end of the yard; he sorts the pack, placing the manifests in pigeon-holes representing the tracks on which each respective classification of the various cars in the train is made. The manifests for shopped cars are turned over to the shop car clerk in the tower at the hump; it is his duty to take a book record of the face of the manifest, including the date, the number of the engine bringing the train into the yard, and the time the train was shifted, which, of course, gives the time the car was delivered to the shop.

The shop cars are delivered direct from the hump to the interchange track between the main classification yard and the shop repair tracks. A shop engine then places them on the repair tracks, which hold from 15 to 25 cars each. The shop car clerk takes the numbers of the cars standing on the repair tracks and then returns to the tower, picks out the manifests for the cars undergoing repairs, as they stand on the repair tracks, and marks on the back the number of cars on the track, as well as the track number on which the cars stand, checking cars already entered in the book as going to the shop, giving the time and date. After the cars have been repaired, the shop engine pushes them out through a depressed track beyond the hump; the hump conductor goes to the tower and gets the manifests representing that track, chalks the cars for their respective tracks and makes out a shifting slip the same as had been done

*Received in the contest on The Operation of Terminal Yards. Other papers in this series appeared in the issues of October 9, October 16 and October 30

in the receiving yard. The shop train is then re-classified over the hump the same as a through train. Not a single manifest for a shop car has been lost at this point in the ten years this system has been in force.

The manifests for the city delivery cars, including those containing material for the shops, are sent by messenger to the agent at the transfer station as soon as the train is marked, and a "put-card" is issued for each car in place of the original manifest. It indicates for whom the car is to the yard conductor, and on what particular industrial siding or shop track the car is to be placed. This gives the freight agent an opportunity to make out his freight bills and notify the consignee that his car has arrived with the approximate time it will be delivered on his siding, which is about six hours after arrival in the receiving yard.

The shifting service for the inter-yard movement is divided into districts, and each conductor in this service is regularly assigned his work for the day. Each crew is responsible for the proper and prompt performance of service assigned to it.

The yard is divided into seven districts, each under the supervision of an assistant yardmaster, who is responsible for the performance of crews while in his territory. In addition to these assistant yardmasters there are two yardmasters, one eastbound and one westbound, whose duty it is to pass from one to the other of the assistant yardmasters' districts and see that they are properly performing their duties, and to relieve any congestion that may occur at any point. Day after day these crews perform the work assigned without receiving a single order from a yardmaster or an assistant yardmaster. However, if at any time, the work assigned a crew should be lighter than usual, the conductor when he gets through his work is required to report promptly to the yardmaster, in which case he will be used in any service in any portion of the yard where he may be needed. Six day crews and four night crews are engaged in this inter-yard service, while the through business is much greater in volume; it is less difficult to handle, except that about 1,800 cars per day must be weighed. In the westbound yard, where 60 per cent of the cars handled are empty, it has been found necessary to maintain what is termed a perpetual record of empty cars as they stand on the classification tracks. This record is made by the assistant yardmaster at the hump end of the yard, who counts the number of cars for each classification track as shown on the switching card when the train is started and classified over the hump. He adds the number of cars for each track to those already standing on the track, while the clerk at the despatching end of the yard telephones the assistant yardmaster at the hump the number of cars taken off of each one of the tracks at the despatching end. The assistant yardmaster subtracts this from those already shown on the card. This gives the exact number of cars on the classification tracks at all times. This record has been running for 14 years, and provides the same check on the number of cars on each track as if they were loaded cars with manifests. In addition to the through business passing through the westbound yard about 400 empty and 100 loaded cars originate daily on the industrial and track delivery sidings, coal wharves, shops and transfers, etc., all of which are delivered to the loaded or empty receiving yard by yard engines and are classed as inter-yard movements.

The yard is equipped with advance or departure tracks in both directions. The trains are made up exclusively by yard engines in the classification yard and are hauled to the advance tracks, there being no attempt to couple the air hose or to make any minor repairs until after the trains have been delivered to the advance tracks. Protecting the train with blue flags at either end, a force of air brake inspectors then takes charge, tests the air, and makes such minor repairs as can be made on these tracks, holding the air pressure on the train until the arrival of the road crew and until the engine is attached. It is only necessary for the road crew to make a service application of the air, as the inspectors have given them information as to the number of air brake cars in service and the number of cars, if any, on which the air is cut through.

Two men, known as car tracers, cover all the hold-for-order industrial, team and M. W. tracks, and all outlying sidings twice each 24 hours, thus avoiding an unnecessary delay to cars for any reason, such as awaiting an agent's "put-card," errors on the part of the car markers or the men making out the put-card, as well as furnishing the necessary information for the demurrage charges where the car is held in excess of the specified time by the consignee or consignor. Through and local records are also maintained in the office of the assistant freight trainmaster, who is in direct charge of the yard. The through record is taken from the incoming conductor's car report, while the outgoing record is taken from the yardmaster's record of the cars despatched, thus giving the arrival and departure of all through cars. The local record represents every movement the car makes in the yard. This information is taken from a conductor's report, which gives the detailed movement of every loaded or empty car handled during the day.

It may seem that the matter of economy has not been taken into account in the organization and operation outlined, but comparisons made with other yards handling a similar class of business, have shown that the cost per car passing through the yard is a few cents less than where the organization is less extensive and the car records are not so systematically maintained. While the cost per car over the hump is low in comparison with other points, it is no doubt largely due to the fact that by systematically operating the advance tracks, the classification yard is kept free, thus enabling the hump to perform a maximum amount of business each day. Another factor in the economical operation of humps is a car checker located on each hump, whose duty it is to record the man on each draft of cars over the hump throughout the day. This checks each car dropper in the proper performance of his duty. In addition it locates responsibility for any damage to cars in the classification yard which has not been reported by the car dropper.

Another economical feature of the operation is that all switches on the humps (of which there are four, two in either direction), are equipped with electro-pneumatic direct-movement push-button machines, as well as fog horns or air whistles of different tones located in each one of the receiving yards, which enables shifting operations to be continued during foggy weather. Because of the efficient lighting of the yard at night, there is little difference in the amount of business handled and the cost of operation night and day. In the hump yard for empties, where the maximum volume of business per day is slightly in excess of 3,000 cars, a searchlight with diffusing lens is so located that the rays cover the entire classification yard of 31 tracks, without the annoyance or inconvenience of changing the position of the lamp at any time. The installation of this lamp increased the efficiency of the hump about 12 per cent, which brings it almost up to the efficiency of the same hump in daylight.

The selection of yardmasters and their assistants is carefully made from men who have been trained in yard work and who have displayed special ability, not only in yard operations, but in handling men and supervising the work. One of the most valuable features of the organization is the harmony existing throughout, there being no disposition on the part of any yardmaster or conductor to shift responsibility or unload work from one yardmaster's district to another. This may sound peculiar among railroad men, but nevertheless it is a fact. I don't mean to say that this harmony is voluntary in all cases, but it is insisted on by the officers directly responsible for the organization and operation of this particular yard.

British Rails Abroad.—The external demand for British rails has been scarcely maintained this year, the exports to November 30 having only amounted to 419,125 tons, as compared with 459,870 tons in the first eleven months of 1913, and 377,878 tons in the first eleven months of 1912.

The Bankers and Equipment Trust Certificates

The Investment Bankers Recommend More Stringent Restrictions on the Issue of Equipment Trust Certificates

The following report on railroad bonds and equipment trusts was presented by one of the committees at the annual meeting of the Investment Bankers' Association, held on November 12.

When the committee on railroad bonds and equipment trusts was first formed in 1912, the committee as then constituted took up, by correspondence with the principal trust companies in New York, Boston, Chicago, Philadelphia, etc., who had acted as trustees under indentures securing equipment trusts, what was the general practice of these trustees to provide for the maintenance by the railroads of the equipment pledged under such trusts, for the replacement of equipment worn out, lost or destroyed, and what steps these various trust companies took to keep themselves advised as to the condition of the equipment pledged under the trust. At that time it was found that there was no general course of action common to all the trust companies. In some cases the trust companies used definite forms for periodical reports on the condition of the equipment, but the amount of responsibility assumed by the trustees varied from an honest effort to protect and maintain the value of the security pledged for the equipment trust, to a position assumed by one company that it had no responsibility whatever for the security underlying these equipment obligations, and that it did not consider it part of the duty of the trustee to see that the covenants of the trust were carried out. On the whole, however, it was clear that the trust companies were using their best efforts to protect the investor in equipment trust obligations, and that the difficulties which they had to overcome were largely due to the fact that the banking houses who originally purchased the equipment trust had not been insistent that specific agreements be included in the indenture which would enable the trustees to obtain the necessary information from the railroads as to the condition of the equipment pledged; and secondly, if it was found that the railroad was not maintaining the equipment properly, the trustees had no power to force the railroad to maintain or replace the equipment by declaring a default under the indenture.

The whole question of equipment trusts and the sufficiency of equipment as security for an equipment trust is one which goes into the very heart of the theory and the practice of railroad accounting, bringing with it questions as to what is adequate maintenance and what is the true value from time to time of equipment through its depreciation year by year.

While conditions affecting the management, auditing and financing of the corporations of this country have undergone many changes during the past few years, all of which changes tend to safeguard and protect the interest of the investor in the securities of these corporations, and while there has been a growing realization of the obligation of the trustee to the public, yet the development of the indenture securing railroad bonds and equipment trusts has been along lines to make these indentures more and more flexible and more and more of a character to enable the borrowing corporation to best serve its own ends rather than to protect the interest of the investor. The whole theory of the equipment trust which was based on an original cash payment of 20 per cent with a loan maturing in not more than 10 annual instalments and with the title to the equipment remaining at all times in the hands of the trustee or banker making the loan has changed till now we have equipment trusts running 15 years or longer with 10 per cent cash paid in instead of 20 per cent, with the title of the equipment being held by a corporation or by individuals who are nothing else but the railroad itself acting under a different name; and, in one case an equipment trust has been issued by one of our most important railroads, over $1,000,000 of which are outstanding at the present time in the hands of the investor, where the title to the equipment has reverted back to the railroad against each instalment of principal paid, which vitiates the fundamental principle of equipment trusts.

PROVISIONS TO BE INCORPORATED IN THE EQUIPMENT TRUST INDENTURES

The principal matters which need to be especially considered in the drawing of equipment trust indentures, group themselves under the following heads:

I. *The Proper Vesting of Title in the Trustee to the Equipment Pledged under the Equipment Trust.*—This problem is one of the most important, and no matter how well the actual indenture may be drawn, if it does not sufficiently cover this important detail, the safety of the investor is not fully provided for. The trust has to be protected against three classes of persons: (a) Attachments and judgment creditors of the railroad company. (b) Purchasers for value and subsequent mortgagees of the railroad company. (c) Prior mortgages which contain the usual after-acquired property clause covering rolling stock.

As to the first two, the existing special rolling stock recording acts which have been passed in practically every state and in Canada, protect the trust against these classes of claimants if the trust agreement is properly recorded; but here we run into a difficulty, inasmuch as cars are moved all over the United States and Canada in the ordinary course of business, while the company which owns the cars may have lines only in one or two states. It is not the custom to record the agreement of a company whose line is solely in New York for instance, in every state, and the question arises as to whether title to these cars will be properly protected in other states in case they were sold there to a purchaser without notice, or caught through attachment.

With regard to prior mortgages containing the after acquired property clause, the important thing is to make perfectly sure that the title to the equipment vests in the trustee of the equipment trust before the railroad acquires any title whatever thereto; for it is obvious that if, for instance, a railroad company constructs or acquires cars and thereafter, by arrangement with bankers and a trust company, goes through a form of then making a conditional sale or lease to the railroad, the transaction instead of being a real conditional sale—in which case the title to the equipment comes to the railroad subject to the prior lien of the equipment trust—is rather in the nature of a chattel mortgage, and being made subsequent to the railroad's existing mortgages, gives to the trustee of the equipment trust only a junior lien and not a first lien on the cars pledged. It is therefore extremely important always to provide that no part of the equipment to be covered by the trust shall be delivered to the railway company prior to the execution and filing for record of the agreement, and in your committee's opinion also, the agreements for the construction of the cars should be made directly between the car manufacturers and the bankers or the trustee of the equipment trust.

Of recent years a great deal of laxity seems to have become prevalent with respect to these details, due largely to the fact that it is usually extremely inconvenient to the railroad company to go through the necessary steps which are involved in the process of preventing the title from vesting prior to the execution and recording of the trust. In addition various schemes have been prepared by which individuals or car companies acquired cars from time to time for the uses of a particular railroad, arranging for leases of the same to the railroad and thereafter selling equipment leased certificates to bankers. Although this practice has become quite common, these arrangements are open to question on the ground that these individuals are usually either the railroad itself in a different form, the stock of the

car company usually being owned by the railroad company, and the individuals being agents of the railroad company and not representing anybody else.

We do not refer here to the so-called form of equipment trust issued under what is commonly known among bankers as the Philadelphia plan, but to certain other forms of trusts in which individuals appear as the lessors. We have gone into this question at great length because we feel that while the investor has, up to the present time, been fortunate in the very few defaults which have occurred under equipment trusts, with the changing conditions now confronting the railroad industry, it is of the utmost importance that in the future more than usual care be taken in the drawing of these indentures and in the protection of the investor. Through long practice and a feeling of false security arising from the fact that there have been so few defaults of equipment trust in the past, both the investment banker and the investor has become careless in his investigation as to the form of the indenture, under which the equipment trusts which he purchases have been issued.

II. *Maintenance of Equipment.*—The maintenance of equipment pledged under the indentures at all times in good workable order and the replacement of worn-out, lost or destroyed equipment, appears to the committee to be a phase of this question which should receive much more careful attention than has been accorded to it in the past. While we realize that almost all equipment trusts have provision in the indenture requiring that equipment shall be maintained or replaced, it has unfortunately not been the practice of many trustees or of the banking firms handling equipment trusts to require of the railroads that these provisions in the indenture shall be lived up to, and to insist that the railroads officially perform the obligations that they originally agreed to. During the past year a number of situations have arisen where when a railroad has got into or was facing financial difficulties we have found that the equipment pledged under the equipment trusts has become so depreciated in value as to seriously impair the security of the trust certificates issued against it. When cars were lost or destroyed, new equipment has not been added. When cars have been withdrawn from service owing to their bad condition, these cars have not been repaired and their value maintained. New equipment has been bought by means of the issuance of additional new equipment trusts, while needed repairs on equipment already owned have not been made, which repairs, if they had been made, would not have made the purchase of additional equipment necessary.

The necessity of a road making as good a showing as possible of net earnings in order to preserve credit for additional borrowing has tempted roads to resort to capital expenditures rather than to maintenance charges, which being charged to operating expenses would in turn be reflected in their statement of net earnings. In order to prevent such practices, your committee deem it wise to have regular reports made to the trustee by the railroads, covering the condition of the equipment pledged, and we strongly urge that the investment banker face the responsibility accruing to him when he handles equipment trusts to see that these reports by the railroads are made to the trustees; that the trustees keep accurately informed as to the value of the equipment from time to time, and that in case the value of the equipment is not maintained by the railroads, the trustees be placed in a position to take such action that shall conserve and protect the interest of the investor.

III. *Handling of Payment of Principal and Interest.*—One of the fundamental principles of an equipment trust is that each six months or each year a certain proportion of the certificates outstanding shall be paid off and retired, so reducing the amount of indebtedness against any given amount of equipment pledged. In this manner the depreciation of the equipment is offset as far as the security of the loan is concerned by a reduction in the amount of the indebtedness against such equipment. The committee has found, in looking into a number of these indentures, that no provision has been incorporated in the indenture to prevent the extension of such maturing obligations, and we strongly recommend that a clause be included in indentures which will prevent such extension. In order to safeguard against this practice we believe that the necessary funds sufficient to pay the principal and accrued interest of notes as they may become due should be deposited with the trustee to be used for the payment of such notes, and that when such notes are paid they should be canceled and no notes in substitution of them issued. It is of the utmost importance that no purchase or sale of notes or advances upon the same shall operate to keep equipment notes alive after maturity, nor should the railway company extend or consent to the extension of the time of the payment of the principal or interest of any equipment trust.

IV. *Enforcing Clause.*—In order that the trustee may be placed in a proper position to protect the investor, it is necessary that an enforcing clause be included in the indenture, which will enable the trustee to declare a default if the provisions of the indenture are not lived up to by the railroad company.

The committee also strongly recommends that when an equipment trust is drawn, provision be made that the trustee shall be given full and complete drawings describing the equipment pledged so that in case of default the trustee may have a full record and complete information to enable it to effect sale of the equipment or to take such other steps as it may deem wise for the protection of the trust.

THE OBLIGATION OF THE INVESTMENT BANKER

The committee feels that it is necessary to enlarge on one most important phase of this question which must be self-evident to all. The value of the collateral under any loan and the maintenance of the value of such collateral can be safeguarded to a certain extent by the terms of the indenture, and by establishing through the pressure of well directed public opinion an active oversight by the trustee of the methods pursued by the railway company in living up to the terms and spirit of the indenture.

This, however, is but a means to the desired end. Eagerness to do business bred by over-keen competitive conditions has led many of us in the past into situations where securities have been bought and sold before sufficiently careful intelligent investigation was made of the terms of the indenture, and perhaps what is of even greater importance, without thoroughly considering the moral risk involved in the loan arising from the methods and character of the management of the borrower.

The responsibility of the investment banker does not cease with the sale of the equipment trust certificates to his clients. It is the part of wisdom to investigate at regular intervals whether his and his clients' interests are being properly safeguarded both by the railway company and by the trustee. "A stitch in time saves nine" says the old adage and the investment banker could many times have prevented the difficult and unpleasant situation confronting his client and himself if he had followed the useful course of doing what he could to prevent the loss by consistently and regularly keeping himself advised as to the true situation and value of the equipment pledged from the time he assumed the responsibility of the loan by placing it with his client.

The greatest evil today in connection with the problem of equipment trusts, the investment banker and the investor is this neglect of investigation and regular oversight. If our members will make themselves familiar with what provisions should be included in a properly drawn indenture securing equipment trusts, if they will refuse to handle equipments unless the indenture be properly drawn, and if they will continue to guard their clients' interests regularly and systematically after they have placed the issue by seeing to it that both the trustee and the railway company live up to the terms of the equipment trust agreement that both entered into, then, they will make it difficult for many of the evils to exist which are now confronting our profession of investment bankers.

GERMAN IRON ORE PRODUCTION.—Germany's iron ore production for 1913 is given by Stahl und Eisen as 35,941,285 metric tons, having a value of 3.71 marks (88.2 cents) per ton, as compared with 33,711,142 tons in 1912 with a value of 3.73 marks (88.7 cents) per ton.

A Study of Combustion in Locomotive Fireboxes

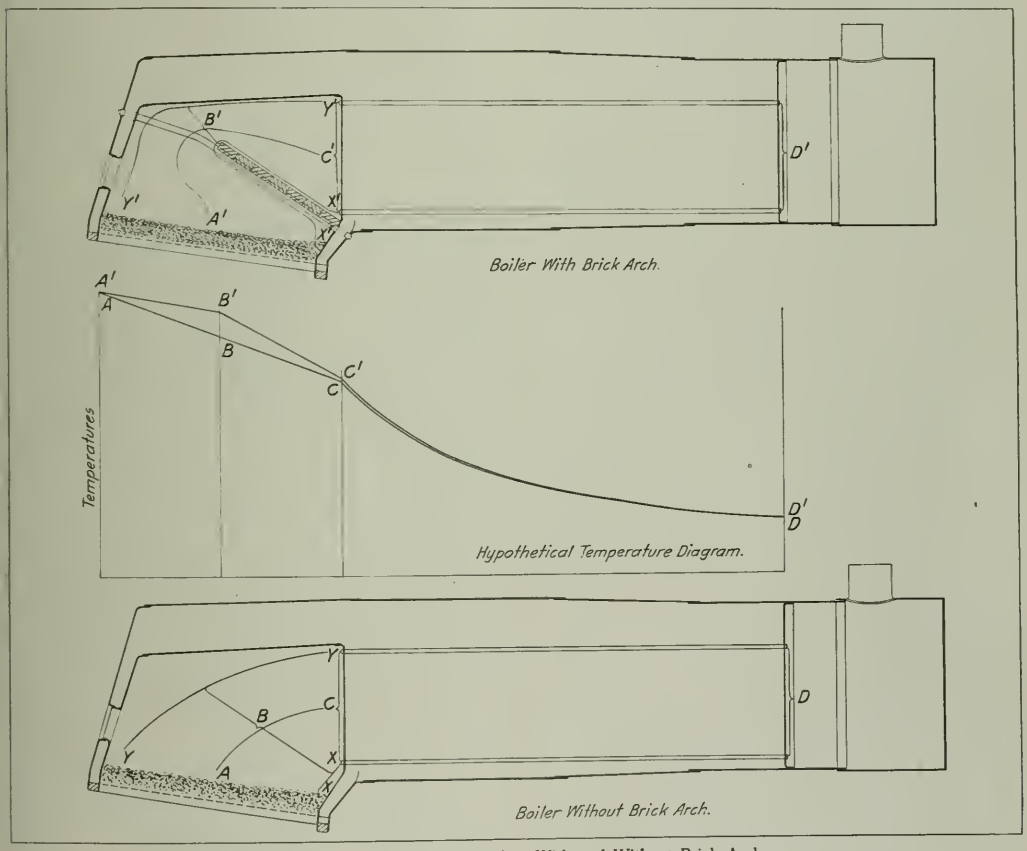
Effect of the Brick Arch and Its Supporting Tubes; Factors Which Should Be Considered in Firebox Design

At the railroad session of the annual meeting of the American Society of Mechanical Engineers, held in New York, December 2, 1914, J. P. Neff, vice-president, American Arch Company, New York, discussed the Brick Arch and Circulating Arch Tubes, and J. T. Anthony, manager of the service department of the same company, read a paper on Firebox Design. These papers are presented in abstract below:

THE BRICK ARCH AND CIRCULATING ARCH TUBES

J. P. Neff.—About ten years ago, when I began devoting my whole attention to the subject of locomotive brick arches, a somewhat careful canvass of the situation in regard to this subject on American railroads revealed that a very few roads were consistently using brick arches; a much larger number were tolerating them in a very small percentage of their engines, and a still larger number had discarded them entirely. Many of the mechanical officers of those roads tolerating arches in a few locomotives expressed themselves in terms unfavorable to the arch, but admitted that they were forced to use them on certain engines; that is, on engines handling the important trains in exacting service or on hard schedules. This was in order to have available all the boiler capacity possible.

All modern locomotives, or at least practically all those built in the last few years, have been built to haul heavy steel passenger trains on hard schedules or to meet exacting conditions in other kinds of service. As the locomotive itself has been greatly improved and refined in the last ten years, so has this special device, to the end that it has been shorn of many of its original faults, leaving its never disputed virtues standing out all the more prominently. The brick arch insures more nearly complete combustion. The combustion of high volatile coal at the rapid rates necessary to meet the demands for large hauling capacity today is fraught with considerable losses due to incompleteness. That represented by the CO content in front end gases is only a part of it. The losses from the incomplete combustion of hydro-carbons may easily be four times that represented by the CO per cent in the gas analysis. Anything that will mitigate these losses without introducing too high air excess reflects at once in higher furnace temperatures. The introduction of the combustion chamber helps by lengthening



Temperature Diagram for Firebox With and Without Brick Arch

the flame travel, a very important thing, but the introduction of the arch, especially the arch on water tubes, not only doubles the average length of the flame travel, but in addition possesses the more important virtue of being a mechanical mixer.

The eminent authority, Dr. Breckenridge, says in his treatise entitled A Study of 400 Steaming Tests: "Mere length of combustion chamber counts for little compared with some device for thoroughly mixing the gases of the flame stream; one good mixing wall or baffle is probably worth many feet of undisturbed flow." A study of the full text of the work of Dr. Breckenridge impresses one with the thought that the above-quoted statement was not made with the intention of belittling the importance of combustion chamber length or flame length, but with the idea of emphasizing the importance of mechanically mixing and jumbling the different strata or ribbons of the gas stream.

By fostering or enhancing combustion above the fuel bed in this way considerably more heat is evolved and higher firebox temperatures result. Authentic tests have shown that with certain coals this increase in firebox temperature may be 15 per cent; yet, as a rule, these higher firebox temperatures are not accompanied by higher front end temperatures. This is explained by the fact that the tube supported arch by virtue of its position performs another important function, that of forcing these higher temperature gases to sweep or brush at considerably increased velocity a considerably greater area of evaporating surface; not only the added area of the arch tube surface, but much surface of hitherto unswept firebox plate, so that the double result is accomplished, of creating more heat, and causing to be absorbed this increased amount of heat, giving a net result of increased boiler output for the same amount of coal consumed, a distinct advance or rise in the boiler efficiency. The illustration for fireboxes with and without the brick arch gives a hypothetical temperature diagram.

The circulating tubes or arch pipes play no small part in this. Not only do they present by far the most effective heat-transmitting surface, but the circulating effect in itself is very important, especially at high rates of evaporation. Just as the particles of gases must quickly touch the heat absorbing surface and give way instantly to other particles, so must the water, or steam film, on the opposite side of these surfaces give way quickly to other particles of water, if a high rate of heat transfer is to be accomplished. Expedited circulation will insure this favorable condition. A locomotive boiler can no more give high duty per pound of weight or square foot of heating surface when the gases move leisurely over its surfaces and through its tubes than can the locomotive as a whole give high horsepower in a slow turning of the wheels.

Arch tubes, as they are now, give much aid, but there is still more to be done in this direction. Arch tubes or circulating water tubes through the firebox may be used in still greater number with good results, if properly arranged and disposed, so as to aid in mechanically mixing and in circulating without too quickly lowering the temperature of the gases. We have information from three different authentic sources that the locomotive brick arch, together with its circulating water tubes, can be counted on to produce an increase in maximum boiler capacity of approximately 15 per cent. The four 3-in. arch tubes reported on from one of these sources of information were held to be responsible for one-third of this increase. It is fair to assume that further progress is possible in one or the other, or both, of these features.

FIREBOX DESIGN

J. T. Anthony.—The boiler is the power plant of the locomotive, and the firebox, in addition to its furnace function, is also responsible for a large part of the evaporation, this varying from 30 to 50 per cent of the total. The principal points to be considered from a furnace point of view are grate area, flameway or volume, firing clearance and air supply. From the boiler point of view, we must consider the extent and location of the heating surfaces.

In order to secure high efficiency, the grate area should be sufficient to keep the maximum rate of combustion below 100 lb. of coal per square foot per hour at full boiler capacity, as the losses, due to imperfect combustion, cinder discharge, front end gases, radiation and those unaccounted for, increase rapidly above this rate, with a corresponding decrease in boiler efficiency.

The Master Mechanics' Association, in 1897, recommended a ratio of heating surface to grate area of 60 for bituminous coal locomotives; but this ratio on the modern superheater locomotives ranges from 70 to 80, or even higher. This is due in part to the decrease in coal consumption brought about by the introduction of the superheater, and in part to the prevailing idea that large grates in addition to requiring more coal for firing up waste more coal when standing idle. It is possible, however, that the higher efficiency due to the large grate and low rate of combustion will more than offset the larger amount of coal used when firing up and standing idle.

The high efficiency at lower rates of combustion is due not only to a reduction in the heat losses enumerated above, but also to the relatively large proportion of the total evaporation that takes place around the firebox. Most of the heat received by the firebox heating surfaces is radiated directly from the fuel bed and luminous flames, only a small amount being due to convection or direct contact. The amount of heat received by radiation depends on the area of the radiating surfaces and the difference in temperature between the radiating and cooling surfaces.

The tubes receive their heat by convection, and the amount of heat so received, other things being equal, depends on the weight of the gases going through the tubes. This varies with the rate of combustion, and as the rate of combustion increases, the tube evaporation increases. Under the same conditions, the firebox evaporation increases to some extent, due to the slightly higher temperature and the increase in the mass of flames, but not nearly so fast as the tube evaporation.

High firebox evaporation means high boiler efficiency, for the high heat absorption by the firebox reduces the temperature of the gases entering the tubes; and for any one boiler, the temperatures of the gases entering and leaving the tubes are directly proportional when reckoned above steam temperature. Hence a lower temperature of entering gases means lower front end temperatures and an increase in efficiency.

A large percentage of the bituminous coal burns above the grate as gas. The rapidity and completeness of the combustion of these gases depends on the amount of oxygen present and the thoroughness of the mixing. In a firebox with 60 sq. ft. of grate, with a rate of combustion of 60 lb. of coal per square foot of grate per hour, an air supply of 20 lb. per pound of coal and an average firebox temperature of 2,000 deg., the volume of the gases evolved is about 1,200 cu. ft. per second. A firebox of this size would have a capacity of about 200 cu. ft., and would have to discharge and be refilled with gases about six times per second. The average time available for combustion of each particle of gas would then be about one-sixth of a second, and this is insufficient for complete and proper mixing by diffusion. With the short time allowed, it is necessary to mix the gases by mechanical means, and this is generally accomplished by an arch or baffle which forces the gases to pass through a restricted area, this area being not less than the net tube area.

It is evident that mere firebox volume is not sufficient of itself, and it is necessary to have a flameway of such cross section and length as to intimately mix the gases and provide sufficient space for burning before the gases reach the tubes. In an ordinary firebox, without baffle or combustion chamber, the average length of flameway is only 5 to 6 ft. By the introduction of baffles and combustion chambers, this length can be increased to from 10 to 15 ft., which results in not only more complete combustion but also in increased radiating surface, with a corresponding increase in firebox evaporation and a lowering in temperature of the escaping gases.

A Pacific type locomotive with 55 sq. ft. of grate area, a tube-

supported arch and an average flameway of 8 ft. had an average firebox temperature, covering a range of 25 tests, of 2,100 deg. This temperature was taken at the center of the firebox at about the end of the arch. The temperature of the gases entering the tubes showed an average of 1,725 deg., or a drop in temperature of 375 deg.

Another Pacific type locomotive with the same size grate and a tube-supported arch, but with a combustion chamber 3 ft. long, giving an average flameway of 11 ft., showed over the same range of tests an average firebox temperature of 2,185 deg. with the temperature of the gases entering the tubes of 1,485 deg., or a drop of 700 deg. between the center of the firebox and the tube sheet.

We obtain high efficiency at low rates of combustion in spite of the large air excess which generally accompanies. This is due to the fact that at low rates the firebox absorbs a larger percentage of the total heat evolved, and the amount so received for any one firebox depends primarily on the temperature of the fuel bed. It is possible that this temperature is higher with large air excess than with the lower, as the temperature is due to the rapidity of combustion which in turn depends upon the scouring and cutting action of the air blast.

The firing clearance, or the vertical distance between the fuel bed and the lower tubes, or arch, has been materially increased by the introduction of modern types of locomotives with trailing trucks, as this has permitted the firebox to be placed behind the drivers and the grates dropped lower. This one step has probably offset to some extent the high ratios between heating surface and grate area which are found in modern locomotives. The extent of the firebox heating surface is determined largely by the size and location of the grate; but there is no fixed relation between heating surface and grate area, or between firebox and boiler heating surface.

As stated above, the firebox evaporation depends primarily upon the extent and temperature of the radiating surfaces and not on the extent of the firebox heating surface. Increasing the firebox heating surface without increasing the grate area or flameway will result in very little increase in evaporation. Its only effect is to reduce the amount of heat absorbed by each unit of surface, with a slight reduction in the temperature on the fire side of the surface. An evaporation of 60 lb. of water per square foot of firebox heating surface per hour requires a difference of less than 100 deg. between the water and the fire side of the sheet, and if sufficiently high firebox temperatures or sufficiently large radiating surfaces could be obtained, it would be possible to materially increase even this high rate of evaporation without forcing the heating surface to its capacity.

In the Coatesville tests, conducted by Dr. Goss, the two fireboxes gave an evaporation as high as 58 lb. of water per square foot of heating surface per hour; but there was practically no difference in the total amount of water evaporated by each of the fireboxes when working at the same rate of combustion and with the same grate area, notwithstanding the fact that one of them had 12 per cent more heating surface than the other.

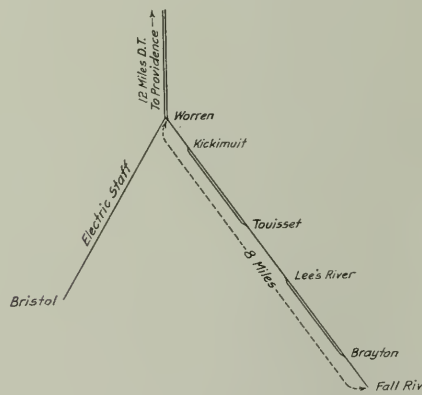
Judging from the past, we are not apt to see any radical departures from the present type of firebox in the near future, unless the nature of the fuel is materially changed, and the writer believes that any improvement in the efficiency of this part of the locomotive will be obtained by paying particular attention to and making ample provision for grate area, firing clearance, gas mixing, flameway or combustion chamber space, and air supply.

Russian (White Sea) Railway Connection.—It has been decided by the Russian government to commence the construction of a railway between Petrozavodsk and Kem. It is proposed to extend the line to the port of Alexandrovsk to connect the White Sea with the main Russian railway system. The line is to be completed in a year, and to be entrusted to the Olonetz Railway Company, which will build a railway connecting Petrosavodsk with Zvanka on the Northern Russian Railway system.

THE SIMPLE TRAIN STAFF*

The reader interested in train-operation will have noticed in our issue of December 18, 1914, an account of what may be called a simplified block system, in use on the Ligonier Valley and of the use of the electric train staff, on a busy suburban section of the Long Island, without station attendants. While both of these installations lack certain elements which are essential in a complete block system, they are decidedly interesting as examples of ready adaptation of facilities to conditions surrounded by undesired limitations. In neither of these cases can we speak of block *signals*, as in neither of them do we find fixed visual signals, using that term in its ordinary sense. Semaphores and green and red lights they can get along without, indefinitely.

But in commending simplified railroading in these two instances we have told an incomplete story. An officer of the New York, New Haven & Hartford, to whom the article was shown, reminds us that on that road they have used the staff system, pure and simple; no electric wires, no semaphores, no disks, no telegraph and no telephone. This use was temporary, on the occasion of heavy holiday traffic; but it deserves to be recorded (if for no other reason) because this simple and efficient preventive of butting collisions seems not to be properly appreciated in this country. An electric road in North Carolina and a short freight track of the Lackawanna road are the only places that we can recall where it is used regularly. It was used



for some time about 1890 on a short section of the New Haven road.

The simple train staff was used in England a half century ago. In regular use the system provides for sending two or more trains, following one another, on the authority of the one and only staff, by means of "staff tickets," kept in a cavity in the staff and given out, to preceding trains, by the engineman of the last train, who carries the staff and the unused tickets. With this arrangement the system affords, of course, no protection against rear collisions. In the use of the simple staff today there is available one important advantage which was unknown when the system was in most extensive use in England, namely, the telephone. In case a train finds that the staff is at the wrong end of the staff-section measures can be taken to get the right to the road by wire. In the old days a man was sent on horse back, or on foot; or possibly a hand car could be used.

On the New Haven a speeder was provided, so as to make the

*For the benefit of non-railroaders it may be said that the train staff system is a method of regulating the movements of trains, on a single track line, which takes its name from the fact that originally a stick of wood, 22 in. long, was the staff. An engineman, running a train over a section of road, say from A to B, derives his right to use the track over that section not by a timetable, or a signal, as in ordinary practice, but by the possession of the staff. This is given to him by the station attendant at the entrance of a section, and at the outgoing end of the section he delivers it to the attendant at that station. It may then be used for a train running in the opposite direction.

service independent of the telephone and telegraph. It was used once in the course of three heavy days, on the occasion of the failure of an engine.

The use now recalled was in connection with summer excursion traffic on the line between Providence, R. I., and Fall River. The plan of this part of the railroad is roughly indicated by the sketch. The sections on which the staff was used were those between Warren and Kickimuit; between Touisset and Lee's River, and between Brayton and Fall River. On the first of these sections the staff was colored red; on the next one yellow and on the last one blue. On the days in question the number of passenger trains during the hours between 7 a. m. and 9 p. m. was about 116; and during the busiest period as many as ten trains an hour were run. The speed limit for all trains over the switches at Kickimuit and Lee's River was 15 miles an hour; and, aside from this reduction in speed, there were practically no delays due to the use of the staff. With so many extra trains there were, of course, some cases of waiting at one end or the other of a single track section; but this was not due to the method of operation.

WESTERN ASSOCIATION OF SHORT LINE RAILROADS

Officers of a dozen short line railroads of the states of Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington and Wyoming met in San Francisco in November last and organized the Western Association of Short Line Railroads. Their main purpose is to secure more equitable compensation for carrying the mails, but the association will take up other matters of common interest. A letter, signed by the president and secretary, has been sent to every member of congress setting forth the bad features of the present laws regulating mail carriage and of the proposed changes now before Congress. This letter says in part:

"House bill 17042 changes the basis of mail transportation rates from a weight to practically a space basis and invests the Postmaster General with autocratic power in regulating the compensation, character of service and form of equipment, even to compelling the use of steel cars for mail carrying, and gives him the power to impose a fine of $5,000 per day for refusal of a railroad to carry the mail at the rates of compensation and in the manner specified by him. . . . The short line railroads operating in the states of Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington and Wyoming most earnestly protest against the enactment of either H. R. 17042 or S. 6405 as being grossly unfair to such railroads. Their mail revenue, which at present is entirely inadequate for the service rendered, will be arbitrarily reduced. . . .

"The rates of compensation provided for are based on averages obtained all over the country. . . . The short line railroads west of the Rocky Mountains, due to the sparsely settled condition of the country, the heavy mountain grades and long hauls between stations, are operating under conditions far more expensive than those existing in other parts of the United States. The majority of these railroads operate but one mixed train per day each way, so that it should be apparent that no such average can be fairly applied. . . . An exclusive space basis would give the employees of the postoffice department absolute control over the amount of compensation to be paid railroads, according to their opinions or inclinations, and might be used for personal advantage or political gain.

"The Bourne bill further provides that the Postmaster General shall not have authority to authorize payment for more than seven lineal feet of space, for closed pouch service, in any one train. It is immaterial how much space the postal matter delivered to the railroad for transportation will occupy, be it 10, 15 or 20 ft.; only 7 ft. will be paid for, and when the railroad operates but one train a day, it has no opportunity to equalize this burden.

"Radiating from the termini and from points on the line of most of the short line railroads of the states mentioned, numerous Star Routes carry the mail by wagon or motor to the small towns and ranches not reached by the railroad. These Star Routes are a continuation of the railroads in so far as the mail is concerned, and the retail merchants of the communities off the railroad are profiting by this fact because the parcel post rates, including wagon haul, are less in many instances than even the freight rates on the railroads; consequently the wagon haul from the railroad to destination is accomplished at no cost to the shipper. In this manner immense shipments of foodstuffs and other matter, in the aggregate running into tons and carloads in each consignment, and consisting of flour, bran, canned goods, cement, coal, pressed brick, etc., are sent by parcel post, the government paying out for the team haul alone in many instances more than the total sum received by it for the entire haul by rail and team, and the railroad receives little or nothing for a tonnage that legitimately belongs to it and for the transportation of which, as freight or express, it was formerly paid.

"Since the last quadrennial weighing of the mail in the West, the packers have reduced the standard weight of merchandise packages to about 48 pounds. Mail contractors, builders and merchants have been quick to take advantage of this, which has not benefited the consumer, and as a consequence the railroads are hauling a tonnage of postal matter for which they receive no pay whatever.

"It is a matter of common knowledge that most of the short line railroads in the western states are struggling for a mere existence and if the carrying of the United States mail is to become a heavy burden, it will mean that freight and passenger rates will have to be advanced. . . .

"The short line railroads in the states named urge that the present law regulating railroad mail pay be amended so as to provide for annual instead of quadrennial mail weighing, pay for apartments in cars used as traveling post offices, and relief from carrying the mail between railroad stations and post offices.

"In the event that Congress shall not deem it advisable to amend the present law as suggested, we then urge that the entire matter of fixing rates for carrying mail be placed in the hands of the Interstate Commerce Commission with full power to act."

The president of the association is D. M. Swobe, traffic manager of the McCloud River, and the secretary is C. M. Oddie, general counsel of the Nevada Central, and the office is in the Mills building, San Francisco, Cal.

American Companies to Supply Ties and Fuel for the Egyptian State Railways.—The Cairo correspondent of an English contemporary, states that the efforts being made by American manufacturers and producers to procure Egyptian railway and engineering orders are remarkable. Only a short while ago a British steamer sailed from California loaded with ties for Port Sudan; and this is stated to be the first business of this kind which has ever been done between the American Pacific coast and the Red Sea ports. Considerable assistance is being given to tie representatives by the fact that most of the ties hitherto used by Egyptian railways have been of Turkish oak or Karamanian wood or of Baltic creosoted pine, none of which are now obtainable. The contract for the supply of coal for use on the Egyptian state railways during the next 12 months has now been let. Of the total quantity required—190,000 tons—a London company has received an order for 120,000 tons and the balance—70,000 tons—or over one-third of the supply, has been placed with American companies as follows: 60,000 tons from the Fairmont region of West Virginia, 5,000 tons of New River coal and 5,000 tons of Greek Island coal.

What the Stoker Has Done for the Locomotive

Data as to Increase in Capacity and Effect on Coal Consumption; Stoker Should Do 100 Per Cent of Firing

In the issue of December 11, 1914, page 1079, we published part of the discussion of the report on "Steam Locomotives of Today" at the annual meeting of the American Society of Mechanical Engineers, held in New York, December 2. In taking up that part of the committee report dealing with mechanical stokers for locomotives some interesting data were presented by C. F. Street, vice-president of the Locomotive Stoker Company, New York, and E. A. Averill, engineer of operation of the Standard Stoker Company, New York.

DISCUSSION BY C. F. STREET

The most important accomplishments of the mechanical stoker as applied to locomotives, are the increasing of the earning power of existing locomotives, and the removal of all limitations, from a fuel quantity standpoint, on the size of locomotives.

The locomotive designer should always keep in mind the fact that every dollar earned in the operation of a railway must be earned by its locomotives, and, therefore, I have, in the above, given first place to the increase in the earning power of existing locomotives. I could cite many instances to prove this statement, but as an illustration, will take one:

A locomotive having about 54,000 lb. tractive effort when running with saturated steam, had a tonnage rating over a certain division of 4,750 tons. Superheaters were applied to this locomotive, and the tonnage increased to 5,000; stokers were applied, and the tonnage increased to 5 250; then 5,500; tben 5,750, and finally 6,000 tons. In the meantime, the tonnage rating of the shovel-fired, superheated steam locomotives was increased to 5,500 tons. This shows an increase of over 20 per cent in the tonnage rating of this locomotive after the stokers were applied, and the locomotive today, stoker-fired, is hauling 10 per cent more tonnage than when shovel-fired.

The increase in the tonnage rating of the shovel-fired locomotives is very interesting, and brings out strongly one of the indirect advantages of the stoker. It shows very clearly that before stokers were applied, the shovel-fired locomotives were not doing anywhere near what they should do, and as soon as the stoker came into use, it increased the earning power, not only of locomotives to which it was applied, but to all others on the division.

The stoker is making it possible to come much nearer to theoretical conditions in regular operation. We all know that there is a wide difference between the earning power of a locomotive under test conditions and under average road conditions. I have in mind one case, in which, under test conditions, it was found that a certain locomotive could haul 4,000 tons comfortably over a certain division. When this locomotive was put in regular service, however, it was found impossible to operate it with more than 3,500 tons over this same division. With the stoker, these locomotives can easily haul 4,000 tons in regular road service.

The fact that the stoker has removed limitations in the size of locomotives can be brought out by reference to several of the locomotives referred to in the committee's report.* The Mountain type locomotives referred to were fitted with stokers when they were built, have always been stoker-fired, and no attempt has ever been made to shovel-fire them. One of the locomotives referred to would never have been built had it not been known that a stoker could be secured which would fire it. There are 30 of the locomotives of one class referred to now in regular operation, and they would never have been built had it not been known that a stoker could be secured which would fire them. A number of other locomotives, notably the most powerful Pacific type as yet built, are now in regular operation, and would never have been contemplated without a stoker.

In another paragraph, the report says "It is now possible to fire six tons and more of coal per hour in a locomotive firebox." As high as eight tons has been put in a firebox with an existing machine, and without working it to its capacity. There is no reason why any desired quantity of coal cannot be fired by the use of a stoker, and this limitation is entirely removed in connection with the designing of new locomotives.

The stoker, as yet, has not progressed far enough to bring forth definite figures regarding its efficiency. Wherever it has been introduced, the question of increased tonnage has been more important than that of fuel economy, and the latter has therefore been given very little consideration. This, of course, is only a temporary condition, and as more stokers are applied, the question of fuel economy will become more and more important. We have, however, gone far enough with the stoker to definitely determine two points, which have a bearing on this feature:

First, the stoker will burn a much cheaper grade of coal than it is possible to use with hand firing.

Second, it will give a more uniform rate of fuel consumption on locomotives performing the same service.

It is well known that there is a difference of from 25 to 50 per cent in the amount of coal burned by different firemen for performing the same work. The stoker is eliminating this great variation, and making the results more uniform. The stoker is to the locomotive what the automatic feed is to a machine tool. It means increased capacity, more uniform output, and in addition the elimination of inaccuracies and wide variations in results.

There are today, very few, if any, shovel-fired locomotives in this country having a maximum tractive effort of 50,000 lb. or over, which are being worked to their full capacity. Wherever stokers have been applied, the earning power of the locomotives on which they have been placed has been increased from 10 to 20 per cent. There is no instance where stoker-fired and shovel-fired locomotives are being operated under identical conditions. The stoker-fired locomotives are, in every case, hauling increased tonnage, or using a cheaper fuel, or working at higher average speeds than the shovel-fired locomotives, and are, therefore, earning more money for the railroads on which they operate.

DISCUSSION BY E. A. AVERILL

Although the proper firing of a locomotive by hand has reached the stage of a skilled operation and some remarkable records have been made in certain instances, the progress of locomotive development has now almost entirely passed the point where skilled manual firing can properly do the work if the full capacity of the locomotive is to be used.

At a speed in miles an hour equal to about one-half (.476 to .636) the diameter of the drivers in inches, the capacity of most modern freight locomotives is fixed by the boiler capacity. In a report of a test on a large locomotive at the Altoona test plant of the Pennsylvania Railroad, it is stated that the results indicate that the capacity of the boiler was limited by the ability to burn the coal on the grates and not by any failure of the heating surface to absorb the heat supplied. While in this case the limit was marked by the impossibility of supplying sufficient air through the grates to properly burn the fuel, there are a reasonably large number of locomotives operating in this country today which are running at less than full boiler capacity because of the physical inability of the fireman to supply the amount of fuel that can be burned. These locomotives are giving to the drawbar the pull the man can supply but not what

*Railway Age Gazette, November 20, 1914, page 947.

the locomotive is capable of supplying at the desired speed.

I have selected at random ten classes of locomotives built during the past three years which are typical of the general size and capacity of all the larger freight engines built in that time. These are shown in the accompanying table. The American Locomotive Company's standard practice in connection with steam per horsepower hour and evaporation per pound of coal has been used; also the percentage of tractive effort and maximum horsepower at various piston speeds and the evaporation per square foot of heating surface for the firebox and tubes. It is assumed that each locomotive is working at the speed indicated on a .5 per cent grade, and that the cars in the train each weighs with lading 70 tons.

When delivering the power each of these locomotives is easily capable of giving, if in good condition, it will be seen that they require from 4,900 lb. to over 8,000 lb. of good quality coal an hour. Similar calculations for grades of less rise will show a higher speed and greater coal requirements per hour.

It is evident that these engines, with the possible exception of the last one, are not being supplied with this amount of coal, although they could use it if they were. They are actually getting from 4,500 to 5,000 lb. an hour and handling trains of a proportional size. The last one on the list is included to show the size that lies near the dividing line between hand and stoker-firing. These ten examples are typical of the ones referred to as giving the drawbar pull the man can supply, but not what the locomotive is capable of supplying.

A number of locomotives like these, all of the same class and operating on the same division, will have a tonnage rating in proportion to the ability of the average poorest fireman that is assigned to them rather than of the average best fireman. While there may be a few firemen on the division who are capable of developing the full boiler capacity, the group of engines as a whole may be daily working much below their actual capacity. The acceptance of the opportunity to supply the desired quantity of coal at all times to these locomotives, that is offered by the stoker, will have the same practical effect on operating expense as would a new order of more efficient, larger locomotives. A reduction in the cost of conducting transportation follows this increased locomotive capacity in a number of the principal items when presented on a ton-mile basis. The stoker itself offers an opportunity for further saving, particularly in the cost of fuel, reduced claims for damage or accident, and the recruiting of men of higher caliber for locomotive service.

An instance of the possible savings in the cost of conducting transportation through increased locomotive capacity following the application of a stoker, is found on a certain division where ten tonnage trains are sent one way over the road each day with hand-fired locomotives. Application of stokers has permitted an increase of over 11 per cent in the tonnage of a train. The return movement is largely empties. The application of stokers will give a direct saving in wages and train supplies alone of about $100 per engine a month on this division. If advantage is taken of the increased capacity of the division for tonnage without the addition of more locomotives, the saving will be considerably larger.

Naturally one of the first features to be investigated by a railroad considering the application of stokers, is the cost of maintenance. In general, the machine of any kind with the fewest parts, if they are properly designed, will cost the least for maintenance, inspection or repairs. This rule holds good for stokers. During the past year and a half there has been a distinct advance made in connection with the simplification of the stoker apparatus. The latest type of locomotive stoker consists of a comparatively few strong, heavy parts and a few wearing surfaces. This is progress in the right direction, not only for the cost of repairs when overhauling but for reliability of operation in regular service and ease of thorough inspection.

There has been much discussion of the amount of coal consumed on stoker fired locomotives. In some cases they do burn more coal per trip and the mistake of making the comparison on pounds of coal consumed per 1,000 ton-miles, has led to the deception of some investigators. Accurate tests permitting the comparison of shovel and stoker-firing to be made on the basis of pounds of coal per indicated horsepower, or pounds of equivalent evaporation per pound of coal, however, have shown widely varying results with different designs of stokers. Some carefully conducted evaporative tests with the most recent design of stoker are very encouraging in this particular. These tests were made with the locomotive in regular service. Comparing the average of five hand-fired runs and four stoker-fired runs on the basis of actual pounds of water evaporated per million B. t. u. supplied, the stoker gave an increase of nearly 7½ per cent. No data from which the horsepower or the drawbar pull could be accurately determined was taken, and hence no comparison can be made on those bases.

These tests showed an actual economy of coal and were well checked by later individual runs where the evaporation per 1,000,000 B. t. u. supplied was considerably larger than that just mentioned. In one case the increase in evaporation with the stoker was nearly 12 per cent. From these figures, as well as observations in regular daily service, it would appear that some saving in coal can be expected from this stoker. These tests were made with run-of-mine coal.

A stoker should successfully handle the coal in any condition it may be put on the tender. It should make no difference if it be all dust or clean lumps of larger size, soaking wet, slightly damp, or bone dry. It should take the coal as it finds it the same as a fireman does. The development of stokers in this direction during the past year or two has been particularly satisfactory and ordinary run-of-mine coal is now being used with complete success. The use of lower and cheaper grades of coal is quite general on the stoker locomotives of a number of roads, which report a net saving from the practice.

Calculations that have been made of the movement of the gases in a firebox equipped with a brick arch, show that velocities of over 180 miles an hour, or 265 ft. a second, will occur over the end of the arch when burning 6,000 lb. of coal an hour on 70 sq. ft. grate area. The velocity decreases as the fire bed is approached and at a point 2 ft. above the grate the gases have an average velocity of about 33 ft. a second, or 22.5 miles an hour. This clearly indicates the importance of injecting the fuel charge as low down in the firebox as possible to reduce the loss by partially burned fine coal passing through the tubes.

The opportunities for economy in connection with the reduction in damage claims follow the better lookout from the locomotive by the fireman because of being left free to watch signals, crossings and the operation of the machinery on the left side.

One of the essentials in this connection is noiseless operation. The stoker should not prevent free conversation across the cab nor make any noise that can be heard when the locomotive is running. The development of the past year or two has shown a wonderful improvement in this particular and stokers are now being applied which are essentially noiseless in their operation.

The stoker should be 100 per cent efficient; it should do all the firing, handle all the coal from the tender with the minimum attention and not require alteration of the distributing means after it is once properly adjusted. The fireman should be free to attend to the duties mentioned above and should be able to control the stoker operation from a position on the seat box.

It is well established in manual firing that small quantities of coal fed frequently and distributed by the "cross fire" method give the most perfect combustion. The stoker should follow this method but perform the operation more exactly than it can be done by hand. Recent development shows a full appreciation of this requirement, and at the same time provides a flexibility that allows the stoker to exactly meet the conditions of combustion at the various parts of the grate. If 70 per cent of the coal is being burned on one side of the grate, the stoker should discharge that proportion of the fresh fuel on that section. If more fuel is being burned in front than at the back, the stoker should distribute to suit. This flexibility is essential for 100 per cent stoker work.

There is another feature of improvement in the most recent of the scatter type stokers that has been particularly appreciated by designers and by enginemen. I refer to the absence of any part of the stoker on the boiler head or in the cab. There are stokers now being applied which show practically nothing in the cab and thus allow the best arrangement of the many instruments and appliances required on a modern locomotive. This, especially in connection with the reduction of noise, is one of the most important developments of the recent past, as it is in the direction of greater safety of operation and reduced strain on the mental and physical energy of the engineer. The absence of apparatus at this point also permits the proper inspection of all the staybolts and their renewal if necessary without the removal of any part of the stoker.

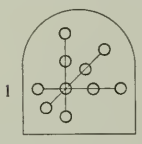
BEAM-LIGHT SIGNALS ON THE PENNSYLVANIA

The Pennsylvania Railroad, in connection with the introduction of electric traction on its main line from Philadelphia westward will introduce, in place of semaphore block signals, a novel arrangement of lights, uncolored, by which both motion and color will be done away with, the lamps being used day and night. Mr. Rudd, the signal engineer, has given us the following description of the new signals:

"We have developed what we call, for lack of a better name, the 'beam-light' signal, and are to install it between Overbrook and Paoli, about 16 miles of four-track road with five interlockings. The signals will give three-block indications, and will be located approximately 3,500 ft. apart. If the scheme proves satisfactory it will be useful especially where A. C. track circuits are installed, as with it the only moving part in the system is the control relay, which is necessary with any system. As designed each unit is generally arranged as shown in Fig. 1. Four fixed lights in a row, one light being common to all three rows. The containers for the lamps, lenses, etc., are clamped to steel tubes diverging from a center casting, a suitable background being attached to the center support but back of and separate from the tubes supporting the lamps.

"The lamps are spaced 18 inches apart, center to center, and are 12-volt, 4-candlepower, 5-watt Mazda; concentrated filament with adjustable base, burning at 11-volts in bright daylight or in fog, 6-volts at twilight and 3-volts at night. The current consumption will average up about ten watts for the four lights. Special inverted 5⅜ in. lenses and very light yellow cover glasses are placed in front of the lamps; and a reflecting mirror above the cover glass to throw some of the rays down for close range. There will be a hood over each unit. These lights are readily seen in brightest sunlight at 4,000 ft. or more. Scareheads of newspapers can be read by them at night 1,000 ft. away if the full day voltage is used; hence the necessity of dampening down at night.

"The voltage will be controlled from the nearest signal cabin by the signalman. The entire arrangement is immovable, the rows of lamps being lighted as conditions require. Two units will be used on all signals—equivalent to two semaphore arms—thus making a uniform system, the aspects corresponding to the position of the arms as in standard practice, but at interlocking signals the bottom (low-speed) arm will not be displayed in the stop position at all. When it is required two short-range lights will be shown, diagonal or vertical, in addition to the two upper arms horizontal. This is a decided advantage, as the engineman will know that unless two full size beams appear, the signal is improperly displayed. No permissive aspect



will be required, but if needed it can be shown by a row of lights diagonal (45 deg.) in *lower* right-hand quadrant.

"The staggered light effect to distinguish stop and proceed signals from stop and stay will be produced by having the bottom horizontal beam moved to the left one light, as shown in Fig. 2, the difference being required only in the stop indication.

"For dwarf signals, which cannot be hooded lest close range reading should be obscured, frosted white cover glasses and higher candlepower lamps will be used.

"This arrangement will eliminate all failures due to moving parts of signals and mechanisms (except the relays), and all chances of freezing or sticking clear. From our records it appears that this should reduce all failures, with their consequent delays, at least 10 per cent, and all dangerous failures 40 per cent. The scheme solves the colored-light problem for night indications completely, by eliminating all colors and establishing signaling by position only.

"With current supplied from a power line generation of current is cheaper, as there is no 'peak of the load' to be provided for as in motor signal work. This reduces the cost of operation. The initial cost of installation is less; the cost of maintenance, aside from necessary policing should be less and the cost of delays will undoubtedly be reduced. The risk to employees is reduced as all their work will be on the ground, except occasional inspection of wires, adjustment of lights, renewal of lamps and cleaning the lenses."

Electrification of a Portuguese Railway Line.—A decree has been signed by the president of the Portuguese Republic for the electrification and lease of the railway connecting Lisbon with Cascais. The line is about 16 miles long and is owned by the Portuguese Railway Company. It is double-tracked, of broad gage, and rock ballasted. There are practically no grades. The line serves the so-called Riviera of Portugal and should be a paying investment. In the summer season 40 trains each way are operated, and in winter 26. Expresses make the entire distance in from 35 to 40 minutes, with 3 stops; the locals, stopping 19 times, take 1 hour and 8 minutes. It is proposed to operate electric trains every half hour and to make the entire run in 25 minutes.

Instructions for the Federal Valuation Parties

An Abstract of the Regulations Governing the Field Engineers, Showing the Data They Are to Secure

The Interstate Commerce Commission, Division of Valuation, has issued a second tentative draft of instructions for the guidance of roadway and track parties in the conduct of their field work. The following is an abstract of those portions of these instructions of interest to railway men:

Each roadway party will be provided with right-of-way and track maps, station maps and profiles of the property to be inventoried. They will also be provided with such ballast, rail and fence charts, and culvert, bridge and building lists, and other records of property which the carrier may be able to supply, and which will assist in identifying the property.

Wherever it can be so arranged the carrier will place with each roadway party a representative who is familiar with the property. He will be permitted to observe in detail the methods used, and the records of fact made by the roadway party, provided a co-operative agreement with regard to said notes has been executed.

Field Corps.—A field corps shall consist of three or more roadway parties directed by a field engineer. The field party of the roadway and track departments shall generally consist of three groups: A chaining group, a cross-section group, and one computing group. The chaining group shall generally consist of a recorder in charge, a head chainman, and a rear chainman. In general it shall be the duty of this party to chain the track and locate by station and plus all structures and property, and to inventory ties, rail, track material and fastenings, culverts, small bridges, fences, signs, crossings, small buildings, pavings, etc. The cross-section group shall generally consist of an instrumentman in charge, a rodman and a tapeman. In general it shall be the duty of this group to measure the grading, ballast, tunnels and subways. There shall generally be two computers with each party.

Condition of Property.—The assistant field engineer shall make notes on the condition of all property which it is his duty to inventory. The notes shall generally be made in accordance with the following outline:

(*a*) *Age.*—Ascertain, where practicable, the year of construction, installation or purchase of the property, and whether at that date the property was new or second-hand. If used prior to its present service, give such facts as may be obtained as to length and nature of service elsewhere. State source of data.

(*b*) *Wear and Decay.*—Record such facts as to wear and decay as may be practicable from field observations.

(*c*) *Maintenance.*—Record whether maintenance is normal. If the maintenance is above or below normal, give facts on which the conclusion is based. Where extensive or unusual repairs are needed to put the property in serviceable condition, note such facts in detail.

(*d*) *Probable Service Life.*—Record any local conditions which many operate to shorten or lengthen the service life of the property as compared with average service life of similar property elsewhere. Record any evidence which may be ascertained in the field as to the inadequacy or obsolescence of the property. Where any definite field evidence can be ascertained as to the probable remaining service life of units of property, note shall be made of same.

Abandoned Property.—Abandoned property, in so far as the work of the roadway party is concerned, may be considered as fixed physical property which has been acquired or created by the carrier and used for transportation purposes, and which subsequently the carrier has permanently ceased to use or hold for any of its purposes as a carrier. The commission has directed carriers to file detail schedules and claims of property abandoned. Where such claims and schedules are furnished by the carrier, and records supplied which will enable the roadway party to identify the property in whole or in part, it shall make such a general check of the claims and identify the property to the extent practicable in the field. Where carriers file no claims on account of abandoned property, the roadway party shall not attempt to locate or ascertain the quantity of such property, unless specifically instructed to do so. All notes of abandoned property shall be kept entirely separate from those of property in use.

Base Line.—Unless otherwise instructed the base line will be as follows:

1. On single-track roads, including side tracks, midway between the rails of the main track.

2. On double-track roads, midway between the two main tracks.

3. Where the carrier has a base line already defined on the ground it may be used. Structures shall all be located by their station and plus on the base line.

The base line shall be accurately chained with a steel tape.

Cross-Section Instruments.—The instruments to be used in cross-section work will depend on the character of the grading. Where the cuts and fills are less than 8 ft. in height, hand level, rod and tape shall generally be used. For cuts and fills of greater height a hand level, Wye level or other instrument may be used.

Land for Transportation Purposes.—The external boundaries of the right of way, as shown on the right of way and track maps, shall be verified on the ground by measurements to fences, monuments or other evidences of right of way limits, and if no such evidences exist the fact shall be recorded in the notes. When the maps show the right of way to be of uniform width, it will be sufficient to measure and record the width at each tenth station. Where a change of width or other irregularity occurs, note and give station of same. For irregular parcels make sketches where necessary to show boundaries and dimensions measured.

Grading.—The grading inventory shall include all work classified under this account, and in addition thereto, separately recorded, grading work done for buildings and structures where, in the judgment of the assistant field engineer, such work can best be measured by the cross-section group. Cross-section measurements shall be made of the roadbed as it now exists in such manner as will permit an accurate ascertainment of the quantities therein. In general, cross sections shall be made at each 100-ft. station and at such intermediate points as the conditions demand for calculating the grading quantities and their classification. The station and plus of all grade points shall be noted.

Following the specific instructions of the assistant field engineer, the instrumentman will make notes as to classification of excavated materials, recording when possible the lines of demarcation between the different classes of materials in excavations in order that such lines may be platted.

Unless otherwise instructed, all material excavated shall be classified by the assistant field engineer as "solid rock," "loose rock" or "common excavation." Where the lines of demarcation in excavations are not plain, the use of the pick and shovel shall be resorted to and every effort made to secure cross-section notes which will permit the calculation of quantities of classified material. Where evidence on the ground indicates that the determination at the present time of quantities which have entered into the grading could not be done with the proper degree of precision, the carrier's cross-section notes of original construction, where these exist, shall be utilized to assist in establishing the original ground surface, and where so used the notes shall clearly indicate it.

Notes shall be made where evidence exists of the acres of clearing and grubbing required for the original construction of the roadway. Notes shall be made of the character and quantity of materials entering into retaining walls, riprap, cribbing, artificial sodding, dams, mattresses, bulkheads and similar construction used for supporting or protecting the roadbed. Sketches shall be made where necessary, giving sufficient dimensions and description to enable the computation of materials.

Tunnels and Subways.—Tunnels shall be measured between portal faces and the station and plus of each face recorded. Sketches shall be made of cross-sections, giving dimensions. Note all changes in cross-sections and the length of the varying sections. Portals shall be measured and sketched with sufficient detail to permit a calculation of quantities. The character and thickness, where practicable, of lining walls, invert, etc., shall be noted: also note character of ventilation, drainage, amount and character of back filling, and other similar information pertaining to the actual construction of tunnels as fully as can be obtained in the field. A description, supplemented with sketches in the absence of plans, shall be made of shafts, drains, ducts, etc., sufficient to permit the quantities and materials of construction to be calculated and full notes made of the special conditions affecting the cost under which the tunnel was built. If the present section is an enlargement of the original section, this fact should be stated with such notes regarding the original section as can be ascertained from records or from railroad employees and others familiar therewith. As far as practicable classify and ascertain the quantities of materials encountered in excavating the tunnels.

Bridges, Trestles and Culverts.—The roadway party shall locate by station and plus all bridges, trestles and culverts, but shall inventory in detail only those structures which are less than 12 ft. in span, unless otherwise instructed. Bridges of 12 ft. span and over shall generally be inventoried by the bridge department.

Ties.—The kind of ties, whether treated or untreated, and whether oak, pine, cedar, fir, etc., together with the dimensions, class and average number per mile, shall be noted. The ties in main lines and sidings shall be listed separately and note made of the kind and class of ties in each track. Note shall be made whether ties were obtained locally or shipped in, and from where.

In order to estimate the number of ties per mile the ties shall be counted in not less than 600-ft. sections, two sections per mile. The station and plus of sections counted and details of the tie count shall be noted. Note length of track occupied by each set of switch ties or crossing timbers. Observations for noting condition data of track ties in main line shall generally be made on these 600-ft. sections.

Switch ties shall generally be inventoried by sets. Where the carrier has standard turnouts note shall be made of the number of switch sets of each type or standard of turnout. The kind of timber, and if treated or untreated, shall be noted in each case. Where there are material variations from the standard turnouts the exact number of switch ties shall be counted. Note shall be made of all special switch and crossing timber in sufficient detail to permit of estimating cost.

Rails.—Note the weight of all rail and give the station and plus wherever the weight changes in either main or side track. The lengths of individual rails shall be measured only at sufficient intervals to determine the standard rail lengths in use. Note if rail is Bessemer, or open hearth, or special steel. Where a carrier has no standard drawings showing sections of rail make dimensioned sketches where necessary of sections of different weights of rail. Where obtainable the brand of rail shall be noted from time to time as information as to age, weight and source. Particular attention shall be paid to rails in both main and side tracks to secure information as to where the rail was obtained, and whether when laid, it was new or re-lay.

Other Track Material.—In general, rail joints, bolts, spikes, nut locks, tie-plates, etc., in main line shall be obtained and noted by determining the various track materials in the same 600-ft. sections as the ties, and from the data thus obtained estimate such material in the mile. For rail joints, show kind, weight, maker's brand and number, number and kind of bolts required, and number and kind of nut locks used, if any. If carrier has no plan showing types of rail joints in use make sketches where necessary of the different types.

For spikes, note size, average number used per tie, and total per mile. For tie-plates, note kind, dimensions and weight. It is not necessary for the field party to count the number of each kind of tie-plates in a mile, but only to obtain and note as above for a mile of main line or a siding, with the notation that they are mixed kinds. If practicable an estimate may be made of the percentage of each kind. For rail braces make notes in same maner as for tie-plates.

For other track material not specifically mentioned, use such methods to ascertain the inventory as will give substantially accurate results without a detail count of each small item. Other track material in sidetracks shall be listed separately for each track.

Switch points shall be inventoried complete by standard points of different kinds and weights unless there are missing parts which materially affect the cost of the switch. Missing parts shall be taken into consideration in noting on "condition." Frogs shall be classified by kind, i. e., rigid, spring, movable point, etc.; number and weight of rail. Also note when special alloy steel is used. For switch stands, obtain and show kind, i. e., high ladder, high, low or ground throw; kind of lamp used, if any; name of manufacturer and index number.

For materials of this account in sidetracks, but not specifically mentioned, ascertain the amount and kind in a way consistent with the importance of the items involved. Note extra spiking on curves and switches, or elsewhere. Special fixtures which can not be described by number or otherwise, so that they may be identified by catalogue or plans of carrier, shall be measured and a dimension sketch made, where necessary. Note station and plus of all main-line switch points; also give switch leads, length of crossovers, length of slip switches, etc. Length of sidetracks shall be determined from point of switch to point of switch or to end of track.

Ballast.—Notes for ascertaining ballast shall be made as follows: Excavation sufficient to determine the cross-section of ballast shall be made at intervals of not greater than 1,000 ft. where the ballast is of one kind and the section apparently uniform, and a dimensioned sketch of said section shall be recorded. Such sketches shall also be made at points where the kind of ballast changes or where there are material variations in the ballast sections. The station and plus of sections taken shall be noted.

Notes shall show the kind of ballast, and where two or more materials are encountered in a cross-section the dimension sketch shall clearly show the extent of each kind; the quality of the ballast; the location from which ballast was secured, and if off the line of the carrier, the length of haul to the nearest point on the line of the carrier under inventory; and also information as to conditions of handling and loading, where these facts can be obtained in the field.

Where ballast is of a depth in excess of the standard section of the carrier; or, in the absence of such a standard, greater than 18 in. below base of rail, a separation of the excess ballast material shall be made in the computation of quantities. Ballast quantities shall be summaried by miles, and notes shall show what deduction was made for displacement of ties. The quantities of ballast in main and side tracks shall be shown separately.

Track Laying and Surfacing.—This is a labor item and can not, therefore, be inventoried, but the assistant field engineer shall note any unusual conditions, if any, which would affect the cost of doing the work.

Right of Way Fences.—This item shall include right of way fences, cattle guards, wing fences, aprons and hedges. Other fences around station buildings, shop grounds, stockyards, etc., shall also be inventoried, but shall be classified with the par-

ticular building or structure to which they apply. Record shall be made of the length and location of each kind of fence, giving the average number, kind and spacing of posts per unit, number and kind of wires, size of plank where used, character of bracing, etc. The number and type of all gates shall be noted. Fence charts will be furnished where these exist, and their accuracy checked and reported. In the absence of these, sketches shall be made by the recorder, using conventional signs, if desired, for different kind of fencing. The length of fencing, including wing fences, must be shown in the record.

The location and kind of all cattle guards shall be noted, whether surface or pit, and if surface the kind of material and name of the guard or type of construction shall be indicated.

LOCAL FREIGHT BY PARCEL POST

The photograph illustrates in a striking manner the extent to which the railways are being called on to carry local freight on passenger trains under the guise of United States mail. The boxes shown are part of a shipment of 250 cases of condensed milk sent by wholesale grocers of El Paso, Tex., to Mogollon, N. Mex., about 80 miles inland from Silver City. These cases weighed 42 lb. each or a total of 10,500 lb. They were delivered to the Atchison, Topeka & Santa Fe at Deming, N. Mex.

One of the most flagrant abuses of the parcel post in the southwest lies in the shipping of groceries from the larger towns to outlying points. One illustration is shipments of this nature moving over the Santa Fe from Albuquerque to Los Cerrillos, the final destination being Cuba, N. Mex., and other inland points. On April 28 a ton of flour was shipped in 50-lb. sacks; on May 21, half a ton of oats, 50 lb. of potatoes and a box of canned goods were handled; on May 23, 1,100 lb. of

Handling 242 Boxes of Condensed Milk by Parcel Post

flour was taken; on May 27, 1,400 lb. of sugar and potatoes, and on May 30, 2,620 lb. of sacked wheat.

As a further illustration, there was shipped from Deming to Mogollon on March 12, 70 sacks (3,500 lb.) of beans by parcel post, at a postage rate from Deming to destination of $1.04 per 100 lb. The freight rate for this same business is 30 cents from Deming to Silver City and $1.25 from Silver City to Mogollon by team, or $1.55 per 100 lb. through.

The reason for this traffic going by parcel post is evident. The freight rate from Albuquerque to Los Cerrillos is $1 per 100 lb. while the parcel post rate is $1.08 to destination. The star route carrier having the contract for handling the mail to Cuba and two or three other inland towns receives $2,600 a year. Prior to the establishment of parcel post he made two or three trips a week with a light buggy, but since the parcel post has come into action he is now required to make extra trips with a wagon.

The movement of fruit in this territory from Farmington, N. Mex., to points west of Albuquerque has been referred to previously in these columns. However, as a further example, on October 31 Santa Fe train No. 7 received at Lamy, N. Mex., 301 boxes of apples of 50 lb. each, or a total of 15,050 lb. It was necessary to transfer this to train No. 9 at Albuquerque, causing delay at both points. On November 3 train No. 7 loaded 179 boxes of apples at the same point, and on November 5, 213 boxes. These illustrations are typical of many of the abuses of the parcel post for which the railway company not only loses the freight or express revenue, but is obliged to carry the goods on its fast passenger trains at a very material actual loss.

"N. A. S. O." FIRST AID JAR

M. W. Alexander, West Lynn (Mass.), secretary of the National Affiliated Safety Organizations, announces that the Conference Board, composed of representatives of the constituents of this organization—large associations of manufacturers—has agreed on a standard first aid jar, made of glass, which contains a considerably larger number and variety of medicines and appliances than are generally found in railroad first-aid kits. An illustrated circular has been issued describing the jar. It is 9½ in. in diameter, 6 in. high and, complete, with contents, weighs about 12 lb. Besides the usual appliances and tools it contains eight two-ounce bottles of approved remedies. The bottles are ingeniously arranged in the jar so that their labels are visible through the sides of the jar, and any one bottle can be taken out without disturbing the others. These bottles contain aro-

First Aid to the Injured

matic spirits of ammonia, aqueous boric acid, alcoholic iodine, white wine vinegar, castor oil, burn ointment and Jamaica ginger. The jar has been made strong by special annealing treatment, and its walls are plain, so that the jar may easily be kept clean.

The Conference Board has issued a circular of brief instructions to laymen for first-aid treatment of common injuries and disorders, which includes illustrated directions for resuscitating persons who have suffered electric shocks; the inside of the cover of the jar is also filled with printed instructions.

It is the intention to furnish the jars and their contents at cost price, and they can be had from the National Founders' Association, 29 South La Salle street, Chicago, and the National Association of Manufacturers, 30 Church street, New York.

General News Department

The hearing at Chicago before the board of arbitration on the demands of the enginemen on the Western railroads was resumed on January 4.

E. T. Howson, engineering editor of the *Railway Age Gazette*, will address the Detroit Engineering Society on January 8, on "Heavy Railroad Construction Work."

The Lake Erie & Eastern, a new road, eight miles long, giving the New York Central lines access to large industries in Youngstown, Ohio, has been opened for business.

The new line of the Louisville & Nashville from Winchester, Ky., to Irvine, was opened for business December 28.

On December 21 the machine shops of the Lake Erie & Western at Tipton, Ind., were destroyed by fire. Much machinery was also damaged. The estimated loss is $20,000.

An officer of the National Railways of Mexico is reported as being in Dallas, Tex., for the purpose of leasing 1,000 box cars from the Texas & Pacific. It is understood that the Mexican lines need large numbers of freight cars for use during the next three months.

The large shops of the Baltimore & Ohio at Baltimore resumed work January 4 in every department, about 2,000 employees being put at work. The shops of the Big Four at Beech Grove, Ind., which had been closed for some time, resumed work January 1, with about 2,400 men.

Within the past few years, through the co-operation of the livestock and agricultural departments of the Nashville, Chattanooga & St. Louis, more than 2,000 head of pure bred cattle have been placed in the territory served by the road, many of them in counties where before few such animals could be found.

The Pennsylvania Railroad reports no passenger killed in a train accident in 1914 on the entire system, east and west of Pittsburgh; 16,303 miles of road. The number carried was 188,411,876; passenger train miles, 67,389,381. The lines east of Pittsburgh in the past two years carried 311,675,794 passengers and not one of them was killed in an accident to a train.

The California State Railroad Commission has sent to the Senate committee on post offices, at Washington, a letter recommending a reasonable adjustment of the compensation to be paid to railroads for carrying parcel post matter. The commission acts on the request of the Western Association of Short Line Railroads, and endorses the railroads' statement that if they are forced to carry certain traffic at unremunerative rates the remaining traffic must bear an undue share of the burden.

Chairman Adamson, of the House Committee on interstate and foreign commerce, has introduced in Congress a bill designed to strengthen the commodities clause of the interstate commerce law so as to more completely divorce interstate carriers from all industrial operations. After two (or three) years he would make it unlawful for any railroad subject to the act to regulate commerce to transport any commodity in which at that time, or in the past, it had an interest, or which had been mined or produced from lands owned or controlled by it.

The Pennsylvania Railroad has issued a statement to the effect that in the year ending June 30 last, the road paid one dollar for personal injuries for every 1,579 car miles, and that the average that year for 44 railroad systems for which statistics have been compiled was 740 car miles per one dollar paid. In other words, for each 1,000 miles run by cars the Pennsylvania paid out in damages 63 cents, while the average for 44 roads was 135 cents, more than double the Pennsylvania's burden. The cost to 40 of the principal railroad systems in this country for personal injuries for the year ending June 30 was $29,996,617. There were fewer accidents in 1914 than in 1913, but the amount paid for personal injuries was greater by $3,593,179. It has been estimated that the cost per year for personal injuries on all of the railroads in the country is not less than $57,000,000.

Finley Yard, the new gravity classification yard of the Southern Railway, near Birmingham, Ala., containing thirty miles of track, with a capacity of 2,000 cars, has just been placed in service. The buildings include a 25-stall roundhouse of reinforced concrete with a 90-foot electrically-operated turntable; a concrete coaling station with an overhead storage capacity of 1,000 tons, and water, sand and cinder handling facilities. Electric lights and a complete system of fire protection have been provided. The road will concentrate at Finley work which has been done at four different points scattered over a territory of ten miles.

The Mail Pay Committee calls attention to the fact that since the outbreak of the war in Europe the government has shipped nearly 200 tons of gold, worth about $99,000,000, from Philadelphia to New York without cost for railroad transportation. The gold was sent by parcel post. It was packed in canvas sacks, each containing $5,000 and weighing a trifle under 19 lb., and 19,800 such sacks were carried. The postage required, at the ordinary parcel post rates, was $4,554, but this was merely a shifting of funds from one department of the government to another. The railroad furnished, altogether, four special cars. As an extra precaution, requested by the postal authorities, the cars were detached from the regular trains some miles from destination and hauled the remainder of the way by special locomotives. Round trip transportation was provided for more than 100 postal clerks and inspectors who accompanied the gold as guards and for each of whom the railway company was obliged to assume the same liability as for a passenger paying full fare. All of this was done without any compensation to the railroad beyond the regular monthly payment for the routine mail service. In similar manner, $5,000,000 was sent from New York to Boston and $840,000 from New York to Ottawa.

"By passing Chairman Moon's railway mail pay rider in the Post Office appropriation bill, the House of Representatives has voted authority to the post office department to confiscate the facilities of the railroads." This fact is brought to the attention of the public in a circular from Ralph Peters, chairman of the Committee on Railway Mail Pay. Unless the Senate bars its final enactment, the Moon rider will force the railroads, under penalty of $5,000 for each refusal, to carry the mails for whatever the postmaster general chooses to pay. "Even should he in all cases allow the maximum rates permitted by the Moon rider," says Mr. Peters, "railway mail pay will be heavily cut and the present underpayment and injustice to the railroads greatly increased." It will be recalled that Chairman Moon told the House, during debate, that his rider would enable the post office department to "save" $8,000,000 annually out of the already inadequate payments to the railroads for carrying the mails. "The greatest wrong would be done in the case of the parcel post, for the carrying of which the railroads are today underpaid not less than 50 per cent. Chairman Moon apparently wishes to make this underpayment 100 per cent, for he announced in the House of Representatives that his rider would provide the post office department with machinery whereby railroad transportation could be obtained for *all the parcel post* 'probably without any additional compensation.'"

Toronto Terminal Company

This is the name of an organization which has been formed by the Canadian Pacific and the Grand Trunk to build the extensive new terminal facilities in the city of Toronto which have been under consideration for two or three years past. The plans include a passenger station and large freight station. It is understood that each of the two companies will

take one-half of the stock, and be responsible for one-half the financial burden. The appointment of J. W. Leonard, of the Canadian Pacific, as the head of the terminal company was announced in our last issue.

Valuation of the Pere Marquette

The Pere Marquette Railroad has a reproduction value of $96,962,771. This is the announcement on the completion of an appraisal completed by Dean Mortimer E. Cooley, of the University of Michigan, and submitted to the receivers of the road and the State Railroad Commission. The reproduction cost, less depreciation, is given by the report as $78,545,241. Dr. Cooley, with a staff of assistants, has been at work on the appraisal during the last eight months. The cost of the road a mile is figured at $45,392, or $36,770 less depreciation. There are 2,586.73 miles of track in Michigan and 2,965.87 miles in five states and Canada.

Progress in Rogers Pass Tunnel

During the month of December the pioneer tunnel at the west end of the five-mile double track tunnel of the Canadian Pacific now being driven at Rogers Pass, B. C. (see *Railway Age Gazette*, December 11, 1914), was driven 852 ft. and the pioneer tunnel at the east end 544 ft. The center heading in the west end of the main tunnel proper was driven 686 ft. and in the east end 523 ft. Work is now being started on the enlargement of the center heading in the east end to the full section. From these figures it can be seen that the unusual records made in the early months of this construction are being continued.

Passenger Suffocated in New York Subway

As a result of a small fire in a manhole at the side of the Interborough Subway at Broadway and 53d street, Manhattan, New York City, on the morning of January 6, two train-loads of passengers were thrown into a panic and nearly two hundred persons, largely women, were partly suffocated or injured by being trampled on; and the injuries of one women were fatal. The fire was caused by a short circuit in power cables at the connection with the power house, and the chief trouble was from dense volumes of smoke from burning insulating material which gradually filled the tunnel for a considerable distance. The two trains were stalled (by the cutting off of the power because of the accident to the wires) a few hundred feet away, and their rear ends were not far from an emergency exit; but there appears to have been considerable delay in reaching and using the means of escape. Passengers who were prompt to try to escape seem to have got out safely. No trains were run for about eight hours, and the excitement in the city was the greatest in the ten years' history of the subway.

Safety on the Cumberland Valley

M. C. Kennedy, president of the Cumberland Valley Railroad, a part of the Pennsylvania System, has addressed a letter to employees congratulating them on the almost total absence of accidents of all kinds during the year 1914. He says:

"During the year just closed the Cumberland Valley Railroad transported approximately eight and a quarter million tons of freight and two million passengers without the loss of life of a passenger or one of its 2,100 employees, and without injuring a passenger.

"While there have been minor accidents to employees, not so much as a finger or a toe has been amputated, and with the exception of one fractured ankle, not a leg nor an arm broken.

"Without taking into consideration the few slight accidents on industrial sidings and in yards there has not been a wreck, in the general acceptation of that term. The wreck crew has only been called seven times during the year and the total cost of wrecking has been insignificant.

"This splendid record, of which I feel justly proud, and which I do not believe has been equaled by any railroad of its size and same density of traffic, is not attributable to any one man but to the hearty co-operation of every officer and employee in their untiring efforts to make the Cumberland Valley the best and safest railroad in the United States.

"I congratulate you and ask a continuance of that loyal support without which such a record could not have been made; and I extend to you one and all my best wishes for a happy and prosperous New Year."

The Cumberland Valley operates 164 miles of road; receipts, by last annual report to the Interstate Commerce Commission, one year, $3,521,447; train miles, 1,515,138.

Presidents' Conference Committee on Valuation

Thomas W. Hulme, general secretary of the Presidents' Conference Committee on the Federal Valuation of Railways, has just issued a statement reviewing the work of this committee for the past year. After reviewing the orders of the Interstate Commerce Commission and the various circulars which have been issued by the government, the report states that the inventory has been practically completed on four roads, the Norfolk Southern; the Atlanta, Birmingham & Atlantic; the Texas Midland, and the New Orleans, Texas & Mexico; and that it will be completed in the near future on the Kansas City Southern and the San Pedro, Los Angeles & Salt Lake. Tentative prices have been applied by the local government engineers, but these are subject to review at Washington. Both the government and the railway organizations are gathering cost data to aid in this review. It is realized that before these prices are applied and the valuation is made some fundamental questions must be decided, some general principles established, and some terms in the valuation act defined. It is probable that there will be a general hearing on these matters during the later part of the winter, and preparation is being made for their full consideration by the government and the railways.

The report also contains a list of all the communications issued by the committee for the guidance of the railways in the preparation of the information required by the government.

Dr. Hadley on the New Haven Situation

President Arthur T. Hadley, of Yale University, speaking before the Twentieth Century Club of Springfield, Mass., this week, on the railroad situation, with special reference to the New York, New Haven & Hartford, of which company he is a director, said, in part:

"The present condition of the New Haven road was brought about by a combination of some unwise finance with a great deal of unwise operation and unwise politics.

"In 1913 the road paid $9,000,000 more for wages and fuel than would have been the case at the prices which prevailed ten years earlier, and received no more for its services. . . . Methods of handling freight had become more economical as the volume of traffic increased. Methods of handling passengers became more expensive under the same conditions. The authorities of New York state compel the New Haven road to do its commutation passenger business at rates which mean a direct loss of nearly $1,000,000 a year. The United States government penalizes the road an equal amount for the carriage of the mails. These three things, taken together, would have involved a serious reduction of the dividend even if there had been no outside purchases of any kind. . . .

Loss and Damage Claims

The Central Safety and Efficiency Committee of the San Pedro, Los Angeles & Salt Lake on January 1 issued a circular urging a special campaign among the employees to reduce the amount of loss and damage claims. It is pointed out that in the last four years payments of such claims have totaled nearly $250,000 on this road, which means that out of every dollar received for the handling of freight one cent is paid back to the shipper or consignee in the form of claims for merchandise lost or damaged. The circular gives the figures for the past five years, and also the amount of claims paid on various commodities during the last six months of the fiscal year 1914. The following suggestions are given as to how the various employees may help to reduce the amount of such claims:

"The receiving clerk may help by seeing that he receives all the freight he signs for. He is the man to reject consignments improperly prepared for shipment.

"The trucker may help by careful trucking, and by being sure that the freight is loaded in the proper car.

"The stevedore or loader may help by careful stowing and bracing, and by supervising the work of the loader.

"The warehouse foreman may help by choosing suitable cars

for loading, and by seeing that cars selected are free from nails and other projections, and from oil or other refuse which may injure the lading.

"The switchman may help by avoiding unnecessary movements of the car, by careful signaling, and by making smooth couplings.

"The engineer may help by prompt and careful observance of signals, and by avoiding sudden and hard applications of the air brake.

"The conductor and brakeman may help by unloading and loading freight as though it were their own property, being cautious to see that it is put off at its correct destination, and by reporting instances of improper loading."

Automatic Train Stops

The New York State Public Service Commission, First District, has notified the Interborough Rapid Transit Company to proceed at once to equip its elevated lines with apparatus capable of preventing collisions. The resolution of the commission is as follows:

"Resolved that it is the sense of the commission that the elevated railroad lines of the Interborough Rapid Transit Company should be equipped with a signal system which will prevent collisions, and that the company be required to make an investigation and report to the commission within sixty days on such speed control, cab signaling or other improved signaling devices that will allow the minimum headway on the elevated railroads and provide the greatest factor of safety."

At present the rule for trains on the elevated lines is to run at all times with speed under control, except on certain curves, where automatic block signals are provided. Throughout the lines the stations are usually not more than one-quarter mile apart, limiting the speeds to a low rate.

The New York Central Railroad

Under the reorganization of the consolidated New York Central Railroad Company, two grand divisions will be established, the eastern under W. J. Fripp, general manager, with headquarters at Albany; and the western under D. C. Moon, general manager, with headquarters at Cleveland. Under Mr. Moon will be two general superintendents, Albert S. Ingalls in charge of lines between Buffalo and Toledo, and Frank H. Wilson, in charge of lines between Toledo and Chicago. Under Mr. Fripp will be three general superintendents, T. W. Evans in charge of lines between Buffalo and Syracuse, and between Montreal and Clearfield, Pa.; E. J. Wright, in charge of lines between Syracuse and the electric zone at New York; and Miles Bronson, in charge of the electric division.

Abraham T. Hardin will have general charge of operation, maintenance and construction as vice-president. Patrick E. Crowley will be in general charge of transportation on the consolidated lines between Chicago and New York as assistant vice-president.

The road will be divided into five operating districts: First, between New York and Syracuse; second, between Syracuse and Buffalo; third, between Buffalo and Toledo; and fourth, between Toledo and Chicago. The New York electrified zone constitutes a separate (fifth) district.

Chicago is called the western terminus of the road, but there are really three western termini, the other two being Zearing, on the former Chicago, Indiana & Southern, 96 miles west of Chicago, and Danville, on the same road, 128 miles south of Chicago. (See operating officers.)

Proposed Railway Legislation in Kansas

C. W. Kouns, general manager of the Atchison, Topeka & Santa Fe and chairman of the Kansas Committee on Relations of Railways to Legislation, has addressed two circular letters to the people of Kansas on proposed railway legislation in the state, requesting, on behalf of the 12 railway companies operating in Kansas, that a thorough investigation be made of proposed legislation having to do with railroad business. The letter states that the legislature this winter will have before it the so-called "full crew" bill which, the circular states, if enacted into the law would force the railways to spend approximately $2,000,000 every year for extra brakemen on freight trains without any compensating benefit to anybody except the men who want jobs as brakemen. There are other similar bills, one of which prohibits the running of trains of more than 50 cars, and another requires extensive changes in cabooses, cars, etc. One part of the letter is devoted to demonstrating that the full crew bill is not a safety measure, and that as far as safety is concerned a third brakeman would be of no more value on a freight train than would an extra man on a corn planter, or a load of hay, or at the pump as a means of safety.

The letter says: "As a matter of fact the Kansas railway workers who have jobs have never made application to the roads for a third brakeman for the freight train service. The full crew agitation is carried on wholly by, and in the interest of, those who want to force the railways by law to give them employment." Regarding the bill limiting the number of cars in a train to 50, the circular says: "This is a double-edged sword with a poisoned tip, not only providing for a superfluous man on every train, but in many instances for an additional or unnecessary train and engine crew, with an additional engine at heavy expense to the roads and their patrons. For example, if 51 cars of stock are offered for shipment an engine with one engineer, one fireman, one conductor and two brakemen at full pay would be required to move the fifty-first car, regardless of the capacity of the engine handling the 50-car train; or the fifty-first car would have to be declined or delayed, no matter how important the shipment."

I. C. C. Report on Derailment Near Bigelow, Minn.

The Interstate Commerce Commission has just issued a report, prepared by H. W. Belnap, chief of the division of safety, on the derailment of passenger train No. 2 of the Chicago, St. Paul, Minneapolis & Omaha near Bigelow, Minn., on February 9, 1914, which resulted in the death of one pasesnger and one express messenger, and the injury of 11 passengers and 6 employees. This train, which consisted of 1 mail car, 1 express car, 1 buffet car, 2 sleeping cars, 1 chair car and 1 smoking car, all of wooden construction except the mail and chair cars, was en route from Omaha to Minneapolis. It was derailed at a point about 2½ miles east of Bigelow while running at an estimated speed of 45 miles an hour. This portion of the line is single track and was tangent for more than a mile in each direction from the point of accident with a 1 per cent descending grade. It was laid with 80-lb. rails supported on 18 oak and cedar ties per rail in 18 in. of gravel ballast.

In the derailment the engine broke away from the cars, coming to a stop about 1,650 ft. from the point of derailment. The forward pair of engine truck wheels and the rear pair of tender truck wheels were derailed, as were all the cars in the train.

The accident was caused by a broken rail weighing 80 lb. per yard, rolled by the Carnegie Steel Company in September, 1899. It was broken into a large number of pieces, 74 of which were recovered. A detailed study of this rail showed that the failure resulted from a split head which had developed during service. The steel was a very coarse-grained Bessemer steel of about normal carbon content, without excessive segregation about the split; but the inner portions had a carbon content considerably above the maximum specified for rails of this type and weight. The metal was decidedly unhomogeneous, badly streaked and laminated, especially in the web, and contained microscopic fissures.

Because of the frequency with which split rails are encountered, James E. Howard, engineer physicist of the commission, prepared a lengthy discussion of this type of failure which is included with the report.

Grand Trunk Orders Pay Reduced

Employees of the Grand Trunk belonging to the unions, said to number 14,000, have been notified by Howard G. Kelley, first vice president, that on account of the falling off in business they will be asked to accept a reduction of wages dating from April 1 next. Employees on the Grand Trunk Pacific have received a similar notice. These notices have been sent to the men through the chief officers of the respective labor unions. The men are said to have replied that on no account will they accept a reduction. Mr. Kelley's letter reads:

"In view of the serious contraction in business and the consequent alarming decrease in earnings, the company is confronted with a situation which must be relieved as quickly as possible. The general downward tendency of rates, both passenger and freight, without any compensating reduction in cost of operation,

has narrowed the margin of receipts over expenses to such an extent that with any further continuation of the present conditions this company will be confronted with a deficit.

"It, therefore, becomes necessary, much to the regret of the management, to notify you that the company will ask for a reduction in the rates of pay, beginning with April 1, 1915. The extent of the reduction will be based upon the results of operation for the half-year ending December 31, 1914, and will be communicated to you after January 1, 1915."

The G. T. P. letter is the same, save that the cut is to take effect at once instead of three months hence. On the Grand Trunk there are approximately 1,500 enginemen, 1,500 firemen, 1,500 conductors, 3,500 brakemen and baggagemen, 1,500 telegraphers and 4,500 sectionmen, making a total of 14,000, all said to be members of the international unions. On the Grand Trunk Pacific it is understood that only the enginemen, firemen, conductors and brakemen are embraced in the proposed reduction.

Nothing is made public as to what, if any, contracts are in force between employer and employee, or, if in force, for how long a time.

Summary of Revenue and Expenses of Steam Roads

The Bureau of Railway Economics' summary of revenues and expenses and comments thereon for October, 1914, are as follows:

Railways operating 228,233 miles of line are covered by this summary, or about ninety per cent of all steam railway mileage in the United States. Their operating revenues for the month of October, 1914, amounted to $266,793,865. This amount includes revenues from freight and passenger traffic, from carrying mail and express, and from miscellaneous sources connected with rail and auxiliary operations. Compared with October, 1913, these operating revenues show a decrease of $29,507,027. Total operating revenues per mile averaged $1,169 in October, 1914, and $1,314 in October, 1913, a decrease of $145, or 11 per cent.

Operating expenses, which include the cost of maintaining track and equipment, operating trains, securing traffic, and of administration, amounted to $179,431,409. This was $21,562,782 less than for October, 1913. These operating expenses per mile of line averaged $786 in October, 1914, and $891 in October, 1913, a decrease of $105 per mile, or 11.8 per cent.

Net operating revenue, that is, total operating revenues of rail and auxiliary operations less operating expenses amounted to $87,362,456, which was $7,944,245 less than for October, 1913. Net operating revenue per mile of line averaged $383 in October, 1914, and $423 in October, 1913, a decrease of $40 per mile, or 9.4 per cent.

Taxes for the month of October amounted to $11,522,028 or $50 per mile, a decrease of 1.6 per cent over October, 1913.

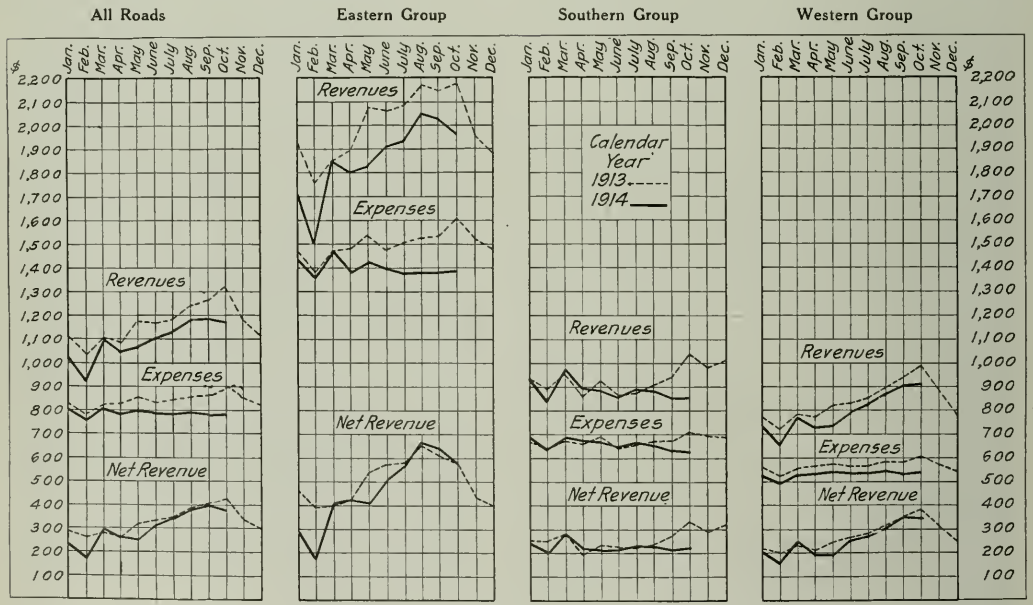
Operating income, which is net revenue from rail and auxiliary operations, less uncollectible revenues and taxes, averaged $332 per mile of line, and in October, 1913, $371, thus decreasing $39, or 10.6 per cent. Operating income for each mile of line for each day in October averaged $10.71, and in October, 1913, $11.98. Operating income is that proportion of their operating receipts which remains available to the railways for rentals, interest on bonds, appropriations for betterments, improvements, new construction, and for dividends.

The railways of the Eastern district show a decrease in total operating revenues per mile of line as compared with October, 1913, of 10.1 per cent, those of the Southern district a decrease of 17.3 per cent, and those of the Western district a decrease of 9.3 per cent.

Operating expenses per mile decreased 13.9 per cent in the East, decreased 10.7 per cent in the South, and decreased 9.1 per cent in the West. Net operating revenue per mile increased 0.2 per cent in the East, decreased 31.6 per cent in the South, and decreased 9.6 per cent in the West. Taxes per mile show a decrease of 3.9 per cent in the East, and increases of 0.4 per cent in the South and West. Operating income per mile increased 0.8 per cent in the East, decreased 35.6 per cent in the South, and decreased 10.9 per cent in the West.

The operating ratio for October, that is, the per cent of total operating revenues absorbed in operating expenses, was 67.3 per cent, which is comparable with 67.8 per cent in October, 1913, and 63 per cent in October, 1912. The operating ratio in the Eastern district for October was 70.5 per cent, as compared with 73.6 per cent in 1913; was 73.7 per cent in the Southern district as compared with 68.3 per cent in 1913; was 61.9 per cent in the Western district as compared with 61.8 per cent in 1913.

Comparison of returns for four months of the current fiscal year with the corresponding months of the previous fiscal year reveals a decrease in total operating revenues per mile of 6.9 per cent, a decrease in operating expenses per mile of 8.6 per



Monthly Revenues and Expenses per Mile of Line in 1914

cent, and a decrease in net operating revenue per mile of 3.2 per cent.

This net operating revenue per mile increased 1.6 per cent in the East as compared with the corresponding period of the previous year, decreased 15 per cent in the South, and decreased 3.9 per cent in the West.

When the returns for the ten months of the calendar year 1914 are compared with the corresponding months of 1913, they show a decrease in total operating revenues per mile of 6.7 per cent, a decrease in operating expenses per mile of 6 per cent, and a decrease in net operating revenue per mile of 8.6 per cent. This net operating revenue per mile decreased 10.8 per cent in the East as compared with the corresponding period of the previous year, decreased 8.9 per cent in the South, and decreased 6.3 per cent in the West.

The diagram shows the variations in operating revenues, operating expenses, and net operating revenue per mile for the separate months of the calendar year 1913, and of the calendar year 1914 to date.

The following table shows the per cent of operating revenues consumed by such class of expenses:

PER CENT OF TOTAL OPERATING REVENUES

	October, 1914				Four months of the fiscal year 1915
	United States	Eastern district	Southern district	Western district	
Freight revenue	70.8	69.9	72.8	71.3	67.9
Passenger revenue	20.2	20.2	19.6	20.3	23.2
Mail revenue	1.9	1.5	1.7	2.2	1.8
Express revenue	2.2	2.3	2.3	2.1	2.2
All other revenues	4.9	6.1	3.6	4.1	4.9
Maintenance of way and structures	12.6	12.1	13.7	12.6	13.0
Maintenance of equipment	16.5	17.7	20.1	14.1	16.6
Traffic expenses	1.9	1.6	2.6	1.9	1.9
Transportation expenses	33.5	36.1	34.4	30.8	33.2
General expenses	2.3	2.3	2.7	2.2	2.3
All other expenses	0.5	0.7	0.2	0.3	0.5
Total operating expenses	67.3	70.5	73.7	61.9	67.5

Disastrous Collision on the Great Eastern

A press despatch from London, January 1, reports a collision on the Great Eastern, near Ilford, on the morning of that day, in which ten persons were killed and many others injured. Ilford is five miles from London and the trains appear to have been suburban passenger trains running toward the city.

American Electric Railway Association

The mid-year meeting of the American Electric Railway Association and the joint dinner with the American Electric Railway Manufacturers' Association, will be held at the New Willard Hotel in Washington on January 29. At the meeting proper at 10 a. m. addresses will be made by Dwight W. Morrow, of J. P. Morgan & Company, who will discuss electric railways from the banker's standpoint; N. C. Kingsbury, vice-president of the American Telephone & Telegraph Company, who will speak on publicity, and T. S. Williams, president of the Brooklyn Rapid Transit Company, who will consider the code of principles adopted by the association at its last convention. At 2 o'clock the delegates will be received at the White House by President Wilson. At 7 p. m. there will be the annual dinner. The speakers for this dinner have not yet been announced, but among others Arthur S. Williams will announce the winner of the Anthony N. Brady medal for the electric railway which has done the most during the year to conserve the life and health of its passengers and employees, and C. L. Henry, president of the Indianapolis & Cincinnati Traction Company, will speak from the railways' standpoint. Arrangements have been made for a special train leaving New York on the night preceding the dinner for the convenience of the New York delegates.

Nominations for A. R. E. A.

The nominating committee of the American Railway Engineering Association has recommended for election the following members: President, Robert Trimble, chief engineer, maintenance of way, Pennsylvania Lines, Northwest System; first vice-president, A. S. Baldwin, chief engineer, Illinois Central; second vice-president, J. D. Sullivan, chief engineer, Canadian Pacific Lines West; secretary, E. H. Fritch; treasurer, G. H. Bremner, assistant district engineer, Interstate Commerce Commission, Division of Valuation, Chicago.

New England Railroad Club

At the regular monthly meeting of the New England Railroad Club at the New American House, Boston, Mass., on Tuesday evening, January 12, a paper will be presented by Roy V. Wright, managing editor of the *Railway Age Gazette*, entitled "Making Friends."

MEETINGS AND CONVENTIONS

The following list gives the names of secretaries, dates of next or regular meetings, and places of meeting of those associations which will meet during the next three months. Hereafter the full list of meetings and conventions will be published only in the first issue of the Railway Age Gazette for each month.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

AMERICAN SOCIETY OF ENGINEERING CONTRACTORS.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

Traffic News

The "Far Western Travelers' Association" will have its annual banquet at the Hotel Astor, New York City, February 9.

The White Audit System of checking passenger train collections was adopted on January 1, by the Pere Marquette, the Atlanta & West Point, the Georgia, the Toledo, St. Louis & Western and the Virginian.

Representatives of the passenger departments of the principal railroads operating in Indiana have held a number of meetings with business men's organizations in the larger cities of the state, asking their support for the plan to have the legal passenger fare advanced from 2 to 2½ cents per mile.

The principal railways of Virginia have joined in an application to the State Corporation Commission for authority to make a general advance of 5 per cent in freight rates throughout that state. The commission is giving public hearings on the question this week. The application does not cover coal and coke, nor iron ore and limestone used in making pig iron.

Shipments of anthracite coal are reported for the calendar year 1914 as amounting to 68,302,961 tons, which is 766,667 tons less than in 1913. The total output, including an estimated 3 per cent sold to local trade and to employees, was over seventy millions, and in addition to this an estimated quantity of eight millions was used in operating the mines.

A meeting of the Fiber Container Conference Committee, consisting of the chairmen of the Official, Southern and Western Classification Committees and the Uniform Classification Committee, will be held in Chicago on January 14, to consider subjects relating to fiberboard containers and the rules regulating them in the various classifications which have been presented since the last meeting of the committee.

The people of Pittsburgh now receive nearly or quite all of their milk in the latest designs of refrigerator cars, and the Department of Agriculture has issued a circular telling how the agents of the department have been chiefly instrumental in bringing about this improvement; much of the milk having formerly been brought in ordinary baggage cars where its quality was much impaired by the heat. The inspectors of the government had found that some of the milk contained 22,800,000 microbes (or other animals) per cubic centimeter.

According to the Des Moines Register and Leader, the Iowa Railroad Commission has reached an understanding with the state executive council, authorizing the commission to draw on the council until the legislature meets in January for expenses to be used in opposing before the Interstate Commerce Commission the proposed advances in freight rates on the Western Trunk Line roads. It is said that no limit is placed on the amount to be thus expended, but that the agreement takes the place of an appropriation of $5,000 which the commission had asked for, and that it is understood that the expenses are to be held as close to $5,000 as possible.

On January 4, a daily through package car service was established from Chicago to Havana, Cuba, by the Illinois Central, Nashville, Chattanooga & St. Louis, Central of Georgia, Atlantic Coast Line and Florida East Coast railways, in connection with the Florida East Coast car ferry service from Key West to Havana, on the new steamer Henry M. Flagler. For the first time freight can be carried from this country to Cuba without transfer of any kind. Trains leave Chicago at 10:30 p. m. daily, except Sunday, arriving at Atlanta at 12:05 p. m. the third day, Jacksonville at 12:30 p. m. the fifth day, Key West at 6:30 p. m. the sixth day, and Havana at 6 a. m. the seventh day. The through rates from Chicago and other northern and western points are based on the combination on Key West. A new tariff covering the rates from Key West to Havana has been published by the Gulf Foreign Freight Committee, effective January 1, and the rates include marine insurance from Key West to Havana. On shipments to Cuban points other than Havana arrangements can be made for the Cuban railway representatives to handle the entry papers and trans-ship at that point to through cars for the principal destinations beyond.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Examiner Eddy held a hearing at Chicago on January 4, on the adjustment of lake-and-rail rates to Chicago, Duluth and Minneapolis and St. Paul.

The commission has suspended from January 1 to April 30 tariffs of the Alabama & Vicksburg, the Chicago & Eastern Illinois, the Louisville & Nashville and other carriers containing increased rates on coal from mines in Alabama, Illinois, Kentucky and Tennessee to Memphis, Tenn., and other points.

Transit Privileges on Grain Products at Pittsburgh

Grain & Hay Exchange of Pittsburgh v. Pennsylvania Company et al. Opinion by the commission:

The commission finds that the refusal of defendants to provide certain transit arrangements on grain and grain products at Pittsburgh is not unreasonable or discriminatory. It is also found that the proposed withdrawal of certain features of respondents' present transit arrangements on grain and grain products at Pittsburgh is justified. (32 I. C. C., 409.)

Switching Charges at Baltimore

Opinion by Commissioner McChord:

In May, 1912, the Public Service Commission of Maryland entered an order by which the switching limits of Baltimore were extended and maximum rates prescribed upon a per car basis for interchange, yard, industrial and general switching on the lines of carriers in that city, these charges being as follows: $1 per car for "yard" switching and $5 per car for "industrial" switching. The commission's order prescribed these rates as maximum rates, but did not include the proviso that existing rates should not be increased. The various carriers at Baltimore have now issued tariffs establishing these rates and the commission finds that it is reasonable that they be applied on interstate business. (32 I. C. C., 376.)

Mississippi River Case

In its original decision in this case, given in 28 I. C. C., 82, and abstracted in the *Railway Age Gazette* of August 8, 1913, page 247, the commission held that the class rates between New York and the upper Mississippi river crossings, including Keokuk, Fort Madison, Burlington, Muscatine, Davenport, Clinton and Dubuque, in Iowa, ought to be no higher than between New York and the lower Mississippi river crossings. It refrained from fixing such equality of rates, however, because of the material reductions in the carriers' revenues which would thus be caused. It now appears that the findings in Revenues of Rail carriers in Official Classification Territory, and Rate Increases in Official Classification Territory, cannot reasonably be carried out without some change in the former order, or else some serious disturbance in the relationship between commercial cities. It is therefore ordered that the carriers file on not less than 10 days' notice rates applying on traffic between New York and the upper crossings, which shall not exceed the class rates contemporaneously maintained between New York and St. Louis. In other respects the order of June 17, 1913, shall remain in full effect.

Hearings on Western Rate Advances

The Interstate Commerce Commission has announced that hearings will be held in Chicago beginning on February 15, on the proposed increases in freight rates west of Chicago that have been filed by the roads in Western Trunk Line and Southwestern Tariff Committee territories. The hearings will be conducted by Commissioner Daniels. February 15, 16, 17 and 18 are to be devoted to the presentation of evidence by the railways supporting in general their claims for increased rates, but not including evidence in support of increases of particular rates. Beginning Monday, March 15, opportunity will be given for the

presentation of evidence in rebuttal of such general testimony. In addition, dates have been set for hearings on the rates on particular commodities involved, as follows: February 19 to 24, grain and grain products; February 25 to 27, livestock, fresh meat, packing house products and fertilizer; March 1 and 2, hay, straw and broom corn; March 3 to 5, cotton piece goods; March 6 to 9, coal and coke; March 10, salt; March 11 and 12, fruit and vegetables; March 13, rice and rice products.

Shipments on Packing-House Products in Peddler Cars

In re rules governing shipments of packing-house products and other freight shipped in peddler cars. Opinion by Commissioner Clements:

The commission finds that the carriers have not justified a proposed increase from 10,000 lb. to 12,000 lb., in the minimum weight applying on packing-house products and other commodities shipped in peddler cars between western trunk line territory. The commission states in its decision: "It appears that the service rendered in connection with peddler cars is generally not greater, and in some instances less, than the service rendered in connection with less-than-carload traffic handled through the freight houses; that for the peddler-car service the user pays the regular less-than-carload rates, guarantees the carrier a minimum per car earning, saves the carrier the expense of refrigeration, reduces loss and damage claims, and gives to the carrier a volume of traffic which could not be satisfactorily transported in its own equipment." The record also does not carry out the carriers' contention that the service is conducted at a loss. (32 I. C. C., 428.)

Stoppage in Transit to Finish Loading of Livestock Shipment

Hoyt & Bergen v. Chicago & North Western. Opinion by Commissioner Meyer:

The commission having made an investigation of the practice throughout western classification territory of stopping livestock shipments in transit to finish loading finds that the Chicago & North Western and other carriers are justified in refusing to provide for such stoppage. It is found that not more than three or four per cent of all shippers of livestock over defendants' lines availed themselves of the privilege when it was in effect, and it is held that the need for expeditious service distinguished the transportation of livestock from that of other commodities for which a stoppage service is provided. It is also found that the carriers' rule which makes applicable on mixed carloads of livestock, the rate prescribed for the highest graded class of stock in the car, subject to the highest minimum weight for any class of stock in the car is reasonable. (32 I. C. C., 319.)

The Tailboard Cases

Philadelphia Team Owners' Protective Association et al. v. Philadelphia & Reading et al. Opinion by Commissioner Harlan:

These proceedings represent an effort on the part of team owners in Philadelphia, New York and Cincinnati to bring about a change in the rules governing the receipt and delivery of less-than-carload freight. It is alleged that the carriers do not perform their full duty as common carriers in that they do not make a proper and complete delivery of freight at their terminals, and that they discriminate between persons and places. The relief prayed for is an order directing defendants to establish a rule providing for a so-called tailboard delivery and a tailboard receipt. By tailboard delivery is meant that the defendants shall make the goods really accessible, either by permitting the complainants to back their trucks to the place at the station where the goods have been placed or, if the arrangement of the platform or pier renders that impracticable, that the defendants, by their own employees, shall truck the goods to the tailboards of the wagons. By tailboard receipt is meant that the defendants shall promptly receive outgoing merchandise at the tailboards of the wagons, without requiring the complainants to remove the goods previously unloaded at that point by other shippers and that the complainants shall not be required to unload their shipments at more than one location upon the station platform.

The legal duties of common carriers in connection with the delivery of package freight have been clearly stated in numerous decisions of the courts. It appears that when the goods have been so placed in the warehouse at the point of destination as to be reasonably accessible to the consignee, open to his inspection, and permitting of their safe and convenient removal by the consignee or his agent, common-carrier liability ceases and the responsibility thereafter is that of a warehouseman only. Goods are not regarded as being ready for delivery if they are so placed as not to be obtainable by the person to whom delivery is to be made or if they are so mingled with or covered by other goods that the consignee cannot inspect or remove them without himself undertaking their selection and separation from the heap.

It is by no means conclusive that the carriers have willfully refused or neglected to effect the full delivery contemplated by law. On the contrary, the evidence shows that they are ready at all times to render any assistance that may be necessary to locate, uncover, and place in an accessible position any package that is called for, and will even assist in loading it if it is too bulky or heavy to be loaded by the consignee. The law requires no more than this, and to require of the carriers an additional movement of the freight from the floor of the warehouse to the trucks of the consignee or drayman would be unwarranted and arbitrary.

It is true that at Cleveland, Buffalo and a few other places a modified system of tailboard delivery is in effect, having grown up largely through competitive influences or peculiar local conditions. But even where this system is provided the teamsters are not excluded from the platforms, nor do the majority of them take advantage of it.

The teamsters in one city are not in competition with those of another, and it does not follow that because a form of tailboard delivery is maintained at a few places under peculiar and special conditions an order would be justified imposing this duty upon the carriers at all places.

In order to expedite the handling of the freight, as well as to conserve the floor space, the carriers have adopted the practice of segregating the shipments intended for the consignees or teamsters who receive daily a considerable volume of freight and who undertake to remove it early each morning. There is no discrimination in this practice, for any consignee or teamster who is able and willing to observe the requirements as to volume of traffic and prompt removal of goods may have his freight so segregated if he desires. This is held to be a reasonable practice, resulting not only to the advantage of the defendants through efficiency of station operation, but also to the general public and the teamsters who, under the prevailing system, are obliged to go upon the station platforms to obtain their goods.

The complaints respecting the defendants' methods of receiving outbound package freight refer particularly to the so-called "peddling system," in operation at a few of the stations. It appears that outbound freight is despatched on trains operating on regular schedules and departing soon after the published closing time of the station; the plan of partial segregation complained of has been found necessary in order that such freight may be forwarded the same day that it is received. The necessity for some such arrangement is obvious, for the record indicates that during the last hour and a half of the day more than 50 per cent of the outbound freight is received at the stations, the greatest rush being from 4 to 4.30 in the afternoon. If freight for all destinations were dumped indiscriminately at every receiving doorway, it would be manifestly impossible for the carriers at some of their stations to separate and load it into the proper cars between the time it is received and the time the trains depart.

The commission, therefore, finds that the methods which have been adopted by the defendants for the receipt and delivery of package freight are reasonable and non-discriminatory, and have been formulated through the experience gained in the operation of each individual station. It would appear that the teamsters and shippers are themselves responsible for much of the delay, in that the hauling to and from the stations is not more uniformly done throughout the day. The practice of hauling inbound freight in the early morning hours and outbound freight during the late afternoon results in congestion that would be greatly relieved if the hauling were distributed more evenly.

"In view of these conclusions the jurisdiction of the com-

mission and the power of the complainants to invoke that jurisdiction need not be discussed at length. It is sufficient to call attention to the fact that the complainants, acting in the capacity of draymen, have no interest in the goods transported nor in the payment of the transportation charges."

STATE COMMISSIONS

The Ohio Public Utilities Commission has issued a decision holding that the Lorain & Southern Railroad, which is owned by the Ohio Quarries Company, is a common carrier, and is entitled to divisions of through freight rates.

Representatives of eight western state commissions, including accountants, have been holding meetings at Des Moines, Iowa, preparing statistics to be used in opposing the proposed advances in freight rates on the western roads at the hearings before the Interstate Commerce Commission to be held in February.

COURT NEWS

The Supreme Court of the United States has dismissed an appeal of the Louisville & Nashville from a decision of the United States District Court, sustaining the Kentucky Railroad Commission's order reducing rates on grain and other supplies for Kentucky distilleries.

The Supreme Court has declared void the city ordinance of Covington, Ky., providing that street cars crossing the Ohio river to Cincinnati shall carry only a certain number of passengers (above their seating capacity). The court held that the ordinance was a burden on interstate commerce.

The Supreme Court of the United States this week set aside a judgment of the Court of Appeals, which had awarded to Sarah E. Holbrook and five children $25,000 for the alleged negligent killing of their husband and father, a bridge carpenter on the Norfolk & Western. The trial court had instructed the jury that little children were entitled to greater damages than adult dependents.

The question of the employment of alien labor in the construction of subways in New York City was the subject of a recent decision by the Appellate Division of the New York Supreme Court, in which it reversed the decision of the lower court and declared the right of contractors to employ laborers whether citizens or not. The court held without a dissenting vote that the State had no more right to impose the test of citizenship on the men employed in such operations than it would have if the entire enterprise was that of private citizens or corporations. In a long decision by Justice Scott and concurred in by all the members, the court says: "The subway is a business enterprise of the city through which money may be made or lost, the same as if it were owned by an ordinary railroad corporation. It is built and belongs to the city as a proprietor and not as a sovereign."

Immunity Only for Unwilling Witnesses

Judge William I. Grubb, in the United States court at New York, January 4, overruled the immunity pleas of John L. Billard, James S. Elton and William Skinner, directors of the New York, New Haven & Hartford, who are under indictment, accused of having conspired to control the transportation facilities of New England. They contended they were immune to indictment and prosecution because they had testified before the Interstate Commerce Commission concerning the matter in which the indictments were found. Judge Grubb says:

"My conclusion is that the immunity act was intended only to make available testimony compulsorily given and only to reward the unwilling giver of such evidence; that testimony given without the assertion of the constitutional privilege, or declined to be given upon any other ground than that of its incriminating tendency, is not compulsory testimony under the fifth amendment, and has always been available without new remedial legislation; and so, there being no necessity for conferring immunity on the giver of it, Congress will not be construed to have done so, where its language may be reasonably otherwise construed. . . ."

Railway Officers

Executive, Financial, Legal and Accounting

A. P. Cassile has been appointed auditor of the Pascagoula-Moss Point Northern with office at Moss Point, Miss.

A. W. Newton, chairman of the Valuation Committee of the Chicago, Burlington & Quincy at Chicago, has been appointed assistant to president with headquarters at Chicago.

Abraham Tracy Hardin, who has been appointed vice-president of the New York Central Railroad in charge of the operating department, embracing transportation, construction, roadway and equipment, with headquarters at New York, as has already been announced in these columns, was born in 1868, in South Carolina, and graduated from the University of South Carolina with the degree of civil engineer in 1894. Previous to graduation, he had been a telegraph operator in 1882, on the Richmond & Danville, and from 1882 to 1890 he was agent and stenographer on the same road. He attended college from 1890 to 1894, and then for four years was in the maintenance of way department of the Southern Railway. From 1898 to September, 1899, he was supervisor and division engineer of the Eastern division of the New York Central & Hudson River. He was then promoted to engineer of track, and from February, 1903, to July, 1905, he was engineer of maintenance of way, and then for about one year was assistant to the general manager of the same road. From June, 1906, to April, 1912, he was assistant general manager; he was then apponted assistant vice-president, and in April, 1913, became vice-president of the same road, which position he held until his appointment on January 1 as vice-president of the New York Central Railroad, which is the name of the new company which has taken over the New York Central & Hudson River and the Lake Shore & Michigan Southern.

P. E. Crowley, general manager of the New York Central & Hudson River, at New York, has been appointed assistant vice-president of the operating department in charge of transportation and equipment maintenance, of the New York Central Railroad, with headquarters at New York. He was born in August, 1864, at Cattaraugus, N. Y., and began railway work with the Erie as messenger boy in 1878. The following year he was promoted to telegraph operator, and was later station agent and then train despatcher on the same road. In 1890 he entered the service of the New York Central & Hudson River as train despatcher on the Rome, Watertown & Ogdensburg division, and was promoted to chief train despatcher in 1891. The same year he was made trainmaster, and in September, 1900, was appointed chief trainmaster of the Pennsylvania division. He was promoted to superintendent of the Pennsylvania division in August, 1901, and was made assistant general superintendent in December, 1904. Mr. Crowley was appointed general superintendent of the same company in June, 1905, and was promoted to assistant general manager in March, 1907, remaining in that position until April, 1912. He was then general manager of the same road until January 1, when he was appointed assistant vice-president of the New York Central Railroad which has taken over the New York Central & Hudson River and the Lake Shore & Michigan Southern.

P. E. Crowley

Grant Hall, general manager of the western lines of the Canadian Pacific at Winnipeg, Man., has been appointed vice-president and general manager, with headquarters at Winnipeg, of lines west of Port Arthur, and C. E. Stockdill has been appointed assistant to the vice-president and general manager with office at Winnipeg, in place of J. Manson, who has been appointed assistant to vice-president, with office at Montreal, Que.

It has now been announced that on October 23, 1914, Luis Cabrera was elected president of the National Railways of Mexico, succeeding E. N. Brown. Alberto J. Pani was elected vice-president and Charles R. Hudson was elected vice-president in charge of operation, all with headquarters at Mexico City, Mex. D. P. Bennett, vice-president, with office at New York, resigned on December 31.

Troy Pace, assistant attorney of the Missouri Pacific system, has been appointed general attorney for the Northern district of Arkansas, with headquarters at Little Rock, his territory consisting of all counties north of the Arkansas river, except the territory in the jurisdiction of General Attorney Thomas B. Fryor. E. B. Kinsworthy, with headquarters at Little Rock, remains general attorney for Pulaski county and all counties of the Arkansas river, and has jurisdiction over all matters in the state before the Arkansas Railroad Commission. Effective January 1.

As announced in our issue of December 25, Francis T. A. Junkin, general attorney of the Atchison, Topeka & Santa Fe system, has resigned, effective December 31, in order to be able to devote more time to his personal affairs and to study and travel. He will engage in private practice in Chicago and New York, giving special attention to matters involving the united corporate action of railroads where the interests of all are identical. His close personal relationship with the management of the Santa Fe system will continue and he will remain a director of Santa Fe subsidiary corporations. Mr. Junkin was born in Virginia on February 3, 1864. He was graduated from Kenyon College in 1884, from the Law School of Columbia University, New York, in 1887, and had conferred upon him the degree of LL.D. in 1913 by Kenyon College and also by Washington and Lee University. He was admitted to the New York bar in 1887, practiced law in Wall street from 1887 to 1898, and since that time has been with the Santa Fe as general attorney of the entire system. Mr. Junkin, during his whole professional life, has made a specialty of railroad and general corporation law. He is the author of many pamphlets on political subjects and the author of many addresses which he has given on various occasions.

F. T. A. Junkin

Operating

W. J. Warnick is appointed trainmaster of the Toronto, Hamilton & Buffalo with office at Hamilton, Ont.

J. F. Withrow, trainmaster of the Toledo Terminal Railroad, of Toledo, Ohio, has been appointed superintendent, and the former position is abolished.

A. M. Whiteford has been appointed trainmaster of the Lehigh and Susquehanna division of the Central of New Jersey with office at Mauch Chunk, Pa.

J. H. Patterson, acting assistant trainmaster, has been appointed assistant trainmaster of the Toledo division of the Pennsylvania lines west of Pittsburgh, with office at Toledo, Ohio.

B. B. Greer, assistant to general manager of the Chicago, Burlington & Quincy for the lines east of the Missouri river, at Chicago, has been appointed assistant general manager of the same lines with headquarters at Chicago.

W. H. Fogg, superintendent of the Northern division of the Chicago, Indianapolis & Louisville, with headquarters at La-Fayette, Ind., has had his jurisdiction extended over the Southern division, succeeding J. M. Baths, resigned.

W. J. Fripp, assistant general manager of the New York Central & Hudson River at Albany, N. Y., has been appointed general manager (east of Buffalo) of the New York Central Railroad, which is the name of the new company which has taken over the New York Central & Hudson River, the Lake Shore & Michigan Southern, and the Chicago, Indiana & Southern. Mr. Fripp will have his quarters at Albany; D. C. Moon, general manager of the Lake Shore & Michigan Southern at Cleveland, Ohio, has been appointed general manager of the new company in charge of the lines from Buffalo to Chicago, with headquarters at Cleveland; and the following general superintendents have been appointed: T. W. Evans, in charge of the lines between Buffalo and Syracuse, and from Montreal, Que., to Clearfield, Pa., with office at Syracuse, N. Y.; E. J. Wright, in charge of the lines between Syracuse and the electric zone in New York, including the line into the Adirondacks and the Harlem division, with office at Albany, N. Y.; Miles Bronson, in charge of the electrical division, with headquarters at New York; Albert S. Ingalls, in charge of the lines between Buffalo and Toledo, Ohio, with headquarters at Cleveland, and Frank H. Wilson, in charge of the lines between Toledo and Chicago, with headquarters at Chicago. (See an item in General News.)

W. J. Fripp, assistant general manager of the New York Central & Hudson River, at Albany, N. Y., has been appointed general manager of the lines from New York to Buffalo, inclusive, of the New York Central Railroad, with headquarters at Albany, and the position of assistant general manager has been abolished. He was born on August 25, 1863, at Albany, N. Y., and graduated from the high school of his native town in 1880. In July of the same year he entered the service of the New York Central & Hudson River at West Albany as a yard clerk, and eight years later was transferred as clerk to the office of C. M. Bassett, superintendent of the Mohawk division. In 1892 he was promoted to general despatcher in the freight yard at West Albany, and the following year was made freight trainmaster, becoming passenger trainmaster in 1898 on the Mohawk division, and in 1902 he was made assistant division superintendent. In 1906 he was division superintendent of the West Shore Railroad at Weehawken, N. J., and was subsequently assistant general superintendent and then general superintendent of the Boston & Albany at Boston, Mass. He returned to Albany in 1910 as general superintendent of the Eastern district of the New York Central & Hudson River, and in April, 1912, he was appointed assistant general manager at Albany of the same road, which position he held at the time of his recent appointment as general manager of lines from New York to Buffalo of the New York Central Railroad which has taken over the New York Central & Hudson River and the Lake Shore & Michigan Southern.

W. J. Fripp

J. E. Maun has been appointed acting assistant superintendent of the Montpelier, Barre and Williamstown lines, including Montpelier Junction, of the Central Vermont, in charge of passenger transportation, with headquarters at Montpelier, Vt.

J. M. Baths, division superintendent of the Chicago, Indianapolis & Louisville at LaFayette, Ind., has been appointed assistant division superintendent of the Chicago Great Western, with headquarters at Red Wing, Minn., in place of W. B. Harrison, resigned.

B. C. Cooper, trainmaster of the Vandalia at Logansport, Ind., has been appointed acting superintendent of the Michigan division, with headquarters at Logansport, in place of F. L. Campbell, superintendent, who has been granted a leave of absence on account of ill health.

D. C. Coleman, general superintendent of the Alberta division of the Canadian Pacific at Calgary, Alta., has been appointed assistant general manager of the western lines in charge of maintenance and operation, with headquarters at Winnipeg, Man. (See Executive, Financial, Legal and Accounting.)

Receiver E. B. Pryor of the Wabash announces that the resignation of Henry Miller as general manager for the receiver has been tendered and accepted. All business heretofore handled by the general manager will until further notice be handled by S. E. Cotter, general superintendent, St. Louis, Mo.

J. McCraw, superintendent of the Southern division of the Central Vermont at New London, Conn., having been assigned to other duties, E. J. Guthrie has been appointed superintendent of the Southern division, succeeding Mr. McCraw. Mr. Guthrie has been appointed also superintendent of the Central Vermont Transportation Company in charge of steamers operating between New London and New York, with office at New London.

Traffic

D. M. Rea has been appointed commercial agent of the Louisiana & Arkansas at New Orleans, La.

Peter Birrel, commercial agent of the Pere Marquette at Pittsburgh, Pa., has been transferred to Detroit, Mich., in a similar capacity.

M. J. Powers has been appointed general passenger agent of the Delaware & Hudson, with office at Albany, N. Y., vice A. A. Heard, resigned.

R. P. Buckingham, Jr., traveling passenger agent of the Missouri, Kansas & Texas, with headquarters at Houston, Tex., has been appointed commercial agent at Waco, Tex.

C. L. Thomas, freight traffic manager of the Baltimore & Ohio Southwestern and the Cincinnati, Hamilton & Dayton, with office at Cincinnati, Ohio, has been appointed also general traffic assistant of the Baltimore & Ohio.

F. A. Bell, general agent of the freight department of the Atchison, Topeka & Santa Fe Coast Lines at San Francisco, Cal., has been appointed assistant general freight agent, with headquarters at San Francisco, and the former office is abolished.

Engineering and Rolling Stock

N. M. Barker has been appointed master mechanic of the Copper Range, with office at Houghton, Mich., in place of J. A. Berg, assigned to other duties.

Norman Bell has been appointed master mechanic of the Minnesota and Iowa divisions of the Illinois Central, with headquarters at Waterloo, Iowa, succeeding Frank W. Taylor, resigned to go to another company.

E. E. Griest, assistant master mechanic of the Pennsylvania Lines at Fort Wayne, Ind., has been appointed master mechanic at that place, succeeding B. Fitzpatrick, deceased. F. T. Huston, assistant master mechanic at Pittsburgh, Pa., succeeds Mr. Griest.

OBITUARY

Thomas L. Chapman, formerly superintendent of motive power of the Chesapeake & Ohio, died on December 30, at the home of his son in Caldwell, N. J., at the age of 71.

Charles A. Thompson, formerly superintendent of motive power and equipment of the Central of New Jersey, died on January 4 at Jamaica, N. Y., at the age of 81.

William S. Napier, Sr., general baggage agent of the Sunset-Central Lines, died at his home in Houston, Tex., on December 24, aged 65 years. Mr. Napier had been connected with the Houston & Texas Central, one of the roads comprising the Sunset-Central Lines, since 1880, and had been general baggage agent of those lines for 24 years.

N. Parker Shortridge, who had been a director of the Pennsylvania Railroad since March, 1874, and a director of other Pennsylvania lines, died on January 3, at his home in Wynnewood, Pa., at the age of 85. Mr. Shortridge was born in Portsmouth, N. H., and was educated at Dover Academy. He was for many years in the wholesale drygoods trade in Philadelphia, but retired from active participation in the business of his firm in 1877. He was an important figure in other business and financial enterprises in Philadelphia; but during the whole of his term as a director of the railroad he had given to the road the greater portion of his time. He was active in the organization and promotion of the United States Centennial Exposition of 1876.

Lucian J. Irwin, president and general manager of the Louisville, Henderson & St. Louis, died at Louisville, Ky., on December 31, as a result of an operation for appendicitis. Mr. Irwin was born at Abbeville, Miss., on May 5, 1867, and had been in railway service since 1883. He held various clerical positions with the St. Louis, Arkansas & Texas, the Illinois Central and the Louisville & Nashville, until May, 1891, when he became agent for the Cumberland Gap Despatch at Louisville, Ky. He remained with that line until December, 1889, successively as traveling freight agent, western agent at Kansas City, Mo., and agent at Chicago. On the latter date he was appointed general freight and passenger agent of the Louisville, Henderson & St. Louis; in April, 1908, he was promoted to general superintendent, and the following September he was elected president and general manager.

A Swiss Solution of the Grade Crossing Problem.—The Zurich Sea Left Bank Railway, the grade crossings of which are soon to be eliminated, is crossed by the surface or grade crossings of 14 streets and 3 tram lines. Since surface crossings by tram lines are forbidden, the passengers are now compelled to step out of the tram cars at the railway crossings, walk across the tracks, and board tram cars waiting on the opposite side.

English Railwaymen Killed in the War.—Replying to applicants for accidental death benefit from branches, on behalf of members killed in the war, the executive of the National Union of Railwaymen announced, on December 17, that they had decided the union funds could not be charged with liability. Their reasons were: (1) The scale of contributions and benefits was not arranged to meet the liability of soldiers and sailors in war; (2) as war was an act of the nation for the nation's benefit, the consequence of war should be met by the government from state funds. The executive also assured members that they would press the government to make adequate provision to meet these cases.

New Railway in Brazil.—A railway has recently been opened between Itapuru, on the Rio Parana, and Porta Esperanza, near Corumba, which is the most important city of the state of Matto Grosso. Communication between Porto Esperanza and Corumba, both of which towns are on the Rio Paraguay, is effected by means of ferryboats. The new line is of considerable importance, since it puts the southern part of the state of Matto Grosso in direct railway communication with the state of Sao Paulo. The journey between Rio de Janeiro and Corumba by rail will occupy some six days, whereas previously the only means of communication between the two cities was by water, a voyage of from six to eight weeks.

Armored Trains in Warfare.—Something was said in a recent issue concerning the use of armored trains in the present European campaigns. One of the first and possibly the first armored train was that used during the Egyptian campaign of 1882. The train was put in service during the reconnaissance in force against Arabi Pasha's troops on August 5 of that year, and was employed on the Aboukir-Lake line. The train was in charge of Lord Charles Beresford, then commander, R. N., who shared in the conception of the idea if he did not originate it. The car employed was a truck protected by boiler plates, and armed with a 6-in. Armstrong rifled gun and a couple of Gatlings. This armored vehicle preceded the locomotive, the reverse of present practice, but it is not stated whether the locomotive was protected as well.

Equipment and Supplies

LOCOMOTIVE BUILDING

THE ILLINOIS CENTRAL has ordered 25 Mikado type locomotives from the Lima Locomotive Corporation.

THE DETROIT UNITED RAILWAYS have ordered 1 50-ton electric locomotive from the Westinghouse Electric & Manufacturing Company.

CAR BUILDING

SWIFT & Co. will build 300 beef cars in its own shops.

THE CHICAGO & MILWAUKEE ELECTRIC is in the market for 300 40-ton all-steel passenger cars.

MORRIS & Co. have ordered 250 34-ft. refrigerator cars from the Haskell & Barker Car Company.

THE PRUDENTIAL OIL COMPANY, New York, is in the market for 200 tank cars.

THE PENNSYLVANIA RAILROAD is said to be contemplating the purchase of a large number of freight cars.

THE BALTIMORE & OHIO has ordered 1,000 hopper cars from the Cambria Steel Company, and 1,000 box cars from the Mount Vernon Car Manufacturing Company.

IRON AND STEEL

THE LOUISVILLE & NASHVILLE has ordered 38,000 tons of steel rails from the Tennessee Coal & Iron Company.

THE ATCHISON, TOPEKA & SANTA FE ordered 500 tons of steel for its freight house at Los Angeles, Cal., from the McClintic-Marshall Company.

THE DELAWARE, LACKAWANNA & WESTERN has ordered 20,000 tons of steel rails, the order being divided among the Pennsylvania Steel Company, the Lackawanna Steel Company and the Bethlehem Steel Company.

PENNSYLVANIA RAILROAD.—Official announcement was made on January 5 by the Pennsylvania Railroad that the steel rail requirements for the Lines East and West of Pittsburgh for the current year will amount to 170,000 tons, and that bids are now being requested and orders placed for early delivery for 150,000 tons of 100-pound section, in accordance with revised specifications of 1915, the balance of 20,000 tons to be ordered later. The total quantity of steel rails ordered by the company last year was 132,432 tons.

RAILWAY CONSTRUCTION IN NORWAY.—The Norwegian Storthing passed in the year 1908 a complete plan for railway construction for the ensuing 12 years, till 1920. It was intended that a new plan for continuing the development should be ready in good time. As the original plan has been abandoned in some respects, as for instance, in the building of the Rauma Railway and the Thelemark Railway, the drawing up of a new plan has now become a necessity. The preparatory work in this connection is progressing, and the railway authorities expect that they can get the new program ready to be laid before the legislature in the year 1918.

BRITISH RAILWAYS AND WAR RISKS.—Arrangements have been completed for insuring in the London market the railway property of Great Britain against all risks of war, including bombardment and damage by aircraft, but it is understood that these have now been cancelled and that other plans have been made for meeting the contingencies. The London Times reports that the insurance, which had been placed subject to confirmation, provided that the insurance companies should pay the cost of any damage in excess of $2,500,000 up to $5,000,000. Should, therefore, damage have been done to the extent of $7,500,000 the railways would have borne $2,500,000 and the insurance companies $5,000,000. The premium agreed upon was $62,500.

Supply Trade News

Harry C. Quest, for a number of years in the railway supply business, has been made general manager of the railway department of the Nubian Paint & Varnish Company, Chicago.

The Henry Giessel Company, Chicago, has appointed Frank N. Grigg, 1201 Virginia Railway & Power Building, Richmond, Va., as its southeastern sales agent. Mr. Grigg will represent the company in all territory south of the Ohio river and east of the Mississippi river.

J. B. Berry and S. S. Roberts announce the dissolution of the firm of Berry, Howard & Roberts and the continuance of business, in the general practice of civil engineering, under the firm name of Berry & Roberts, with offices in the Transportation building, Chicago.

C. B. Yardley, Jr., has been appointed representative of the Wm. C. Robinson & Son Company, Baltimore, Md., manufacturers of high grade lubricating oils and greases. Mr. Yardley will make his headquarters at the New York office, 12 Coenties Slip, and his territory will include the eastern railroads.

Arthur G. McKee, conducting an engineering and contracting business at Cleveland, Ohio, has formed an incorporation with Robert E. Baker and Donald D. Herr, his business associates for a number of years past, under the name of Arthur G. McKee & Company. The firm will have offices in the Rockefeller Building at Cleveland, Ohio.

The incorporation is announced of the National Brass Company, Houston, Tex., with the following officers: G. F. Cotter, president; J. W. Cain, vice-president and treasurer, and F. H. Littrell, secretary. The company will specialize in the manufacture of car and locomotive bearings, as well as general railway castings. It has been appointed, also, general sales agents for the National Brass Company.

E. H. Hinkens, superintendent of the Baltimore & Ohio reclamation plant at Zanesville, Ohio, has left the service of that road to enter the sales department of the Ingersoll-Rand Company and will be connected with the latter's Philadelphia office. Mr. Hinkens served his apprenticeship with the Westinghouse company and later entered Purdue University. He afterwards became a machinist on the Baltimore & Ohio and held various positions, including that of general foreman, assistant master mechanic and superintendent of the reclamation plant, as noted above.

Of the recent order for rails placed with the Lackawanna Steel Company by the New York Central Lines 2,000 tons of open hearth rails are to be treated with .10 titanium. Although the New York Central Lines have had several small tonnages of titanium treated open hearth rails for which the Titanium Alloy Manufacturing Company, Niagara Falls, N. Y., has furnished the Ferro Carbon-Titanium free of charge for experimental purposes, this is the first bona fide order for titanium treated open hearth rails placed by the New York Central Lines and is the result of a long series of experiments which have been carried on under the general supervision of Dr. Dudley. The New York Central formerly used considerable titanium in the treatment of its Bessemer steel rails, the use of which has been practically abandoned during the last two or three years, and it has now gone over to open hearth rails almost entirely.

TRADE PUBLICATIONS

RAIL LOADER.—An 8-page pamphlet recently issued by James C. Barr, 30 Church street, New York, illustrates and briefly describes the Brown rail loader, and also gives a list of railroads using it.

VENTILATION APPARATUS.—The American Blower Company, Detroit, Mich., has recently issued a booklet describing an installation of the "Sirocco" heating, ventilating and cooling system in the plant of the Ford Motor Company at Detroit.

Railway Construction

Atlantic Harbor.—This company plans to build a railroad from Ft. George Island, Fla., and St. John river, in a northerly direction to a crossing of Sisters creek, thence westerly to a point located at or near Plummer, Duval county, with a branch from the main line to the northerly limits of the city of Jacksonville, in all about 30 miles. Application has been made to the War Department for permission to build a bridge over Sisters creek. The incorporators include A. H. Broderick and G. Washburn, Boston, Mass.; E. G. Phinney; R. G. Ross; P. D. Cassidey and F. B. McGarry, Jacksonville, Fla.; W. M. Wright, St. Augustine, and G. J. Percival, Atlantic City, N. J.

Canadian Northern.—The Canadian Northern and the Canadian Northern Ontario have applied to the Canadian parliament for an extension of time in which to build proposed branch lines as follows: From Strathcona, Alta., to Calgary, from near Swan river to the Saskatchewan river, from Regina, Sask., to Red Deer river, from Regina to Elbow, from Winnipeg, Man., to the eastern and southern boundaries of Manitoba; in Ontario, from Washago to Kincardine, Arnprior to Gananoque, Pembroke to Cobourg, Frenchman's bay to Owen sound, Niagara river to Goderich, Hawkesbury to Leeds or Lanary county, Parry sound to North bay, Berlin to Toronto, Berlin to Woodstock, Sarnia to Chatham and Orillia to Goderich.

Canadian Northern Ontario.—See Canadian Northern.

Erie & Ontario.—See Toronto, Hamilton & Buffalo.

Kansas City, Kaw Valley & Western.—Plans have been prepared for the extension of this line from Bonner Springs, Kan., to Linwood, 10 miles, and from Linwood, Kan., to Lawrence, 10 miles. This work will require excavation amounting to about 10,000 cu. yd. a mile. The maximum grade will be 1.5 per cent and the maximum curvature 4 deg. Three bridges of 100 ft., 120 ft. and 130 ft. lengths will also be required. Contracts will be let about March 1, 1915.

Northern Pacific.—An officer writes that the North Yakima & Valley, building from Spitzenburg, Wash., to the mouth of Cowiche canyon, 2.8 miles, with a branch to Tieton City 6.6 miles, during 1914 completed track laying on 2.93 miles between Spitzenburg and Weikel.

North Yakima & Valley.—See Northern Pacific.

Oregon-Washington Railroad & Navigation Company.—Announcement has been made by this company that on December 15, 1914, the new Point Defiance line, which is a portion of its Puget Sound route between Portland, Tacoma and Seattle, was opened for service. This line completes the double track between Portland, Ore., and Tacoma, Wash.

Toronto, Hamilton & Buffalo.—The Erie & Ontario, building from Smithville, Ont., via Dunnville to Port Maitland, has track laying finished to Dunnville on 14.9 miles, and is now making surveys on a section of 3.12 between Dunnville and Port Maitland.

RAILWAY STRUCTURES

Siloam Springs, Ark.—The Kansas City Southern will build a new passenger station at Siloam Springs in the near future. The building will be 24 ft. by 148 ft. in area and one story high, and will be of brick construction with a tile roof. The estimated cost is $10,000. C. E. Johnston, Kansas City, Mo., is chief engineer.

The Dalles, Ore.—The proposed freight terminal of the Oregon-Washington Railroad & Navigation Company at The Dalles will include six switching yard tracks, each 4,000 ft. long, a 12-stall roundhouse, a machine shop 40 by 40 ft., a power house 40 by 60 ft., a storehouse 40 by 80 ft., a water tank, coaling plant, cinder conveyor, turntable, etc. There will also be approximately two miles of new track. The excavation will amount to about 109,400 cu. yd., and 236 tons of steel will be needed. The estimated cost is $200,000. Work has not yet begun.

Railway Financial News

Chicago, Milwaukee & St. Paul.—The directors have authorized an issue of $29,141,300 5 per cent convertible debenture bonds, to be offered to the stockholders at par to the extent of 12½ per cent of their holdings. The bonds are secured by the new general and refunding mortgage of 1913, under which the present issues of 4 per cent debentures and 4½ per cent convertible debentures, are secured. The bonds will be underwritten by Kuhn, Loeb & Co. and the National City Bank.

Chicago, Rock Island & Pacific.—On Wednesday, January 6, the court confirmed the sale of the Railway company stock which is deposited under the Railroad 4 per cent collateral bonds, which now permits the distribution of the Railway stock to bondholders under the plan of the Wallace committee, which bought in the stock.

Delaware & Hudson.—This company has declared the regular 9 per cent dividends, to be paid at the regular quarterly periods in 1915.

Delaware, Lackawanna & Western.—Henry R. Taylor, who recently resigned as a director of the Delaware, Lackawanna & Western Coal Company, has been elected a director of the Delaware, Lackawanna & Western Railroad Company, succeeding H. C. Fahnestock, deceased. There is now one vacancy on the board of the railroad company caused by the death recently of Henry Marcellus.

St. Louis & San Francisco.—The 4 per cent refunding mortgage bondholders' committee, of which Frederick Strauss is chairman, announces that 87½ per cent of the outstanding bonds under this mortgage have been deposited with the committee and that the committee is advised that default will again be made by the receivers in the payment of interest. The last interest payment was due on January 1, 1915. The committee has arranged, in accordance with the agreement under which it asked deposits of bonds, to buy the coupons and claims for registered bond interest of January 1 and also those due July 1, 1914, some of which have not already been bought by the committee.

Toledo, St. Louis & Western.—The federal district court has ordered the receivers to pay the interest due January 1 on $9,500,000 prior lien gold 3½ per cent bonds.

The Cape to Cairo Railway.—The Cape to Cairo Railway project, naturally, is at rest at the present time. There was a piece of German territory through which the line would have to pass, or rather which blocked the line, but the English are hoping that this will be wiped out after the war. The railway has reached the heart of the Belgian Congo, a district which some of the railway officers believe will prove to be one of the greatest copper yielding countries in the world.

Russian Railway Bath Train.—Something was said in a recent issue about the bath train which the Russian government has equipped for the use of its troops at the front. It is stated that this bath train has met with the hearty approval of the men. This is to some extent surprising, because the Russian peasant has not always enjoyed the highest reputation for personal cleanliness. He is, however, greatly in favor of the steam vapor bath, which is said to be as much a feature of Russian village life as the public bathing establishments are characteristic of Japan. The train itself is a veritable Turkish bath on wheels. It is composed of 20 cars, and its accommodation comprises two steam bath-houses, each of which can accommodate 50 men at a time, shower baths, drying rooms for uniforms and underwear, a barber shop and even a tea car, where the men can refresh themselves after they have bathed and get into dry clothing. It has, of course, been proposed already that the idea be adopted for the men in Belgium and northern France, it being particularly true that the hot bath is one of the comforts of life most missed in the trenches.

Railway Age Gazette

PUBLISHED EVERY FRIDAY AND DAILY EIGHT TIMES IN JUNE BY THE
SIMMONS-BOARDMAN PUBLISHING COMPANY
WOOLWORTH BUILDING, NEW YORK

CHICAGO: Transportation Bldg. CLEVELAND: Citizens' Bldg.
LONDON: Queen Anne's Chambers, Westminster

E. A. SIMMONS, *President*

The Need for a Surplus

In an editorial in its issue of November 27 entitled "What Is the Matter with the Railways and Regulation?" the *Railway Age Gazette* presented data showing that the main trouble with regulation has been that it has been predicated on experience indicating that railway profits tend to increase, whereas since effective regulation was begun in 1906 economic forces have been at work which have tended to cause profits to decline. The same point is made in an entirely different way by John E. Oldham in his very interesting and able paper on "Railway Profits from the Investors' Point of View," most of which is published elsewhere in this issue. Not only does Mr. Oldham's paper show the tendency of railway profits to decline relatively, even when total earnings increase, as in 1913, but it is an extraordinarily clear, logical and convincing exposition of the need for railways to earn a surplus, and of the effects produced on their credit when their surplus earnings decline. Mr. Oldham's paper is a remarkable and highly original study of the relations between railway earnings, expenses, return to capital, surplus and credit, and will be read with interest and profit by every person who takes a serious and intelligent interest in the subject of railway economics.

Comparative Locomotive Tests

An interesting point brought out in the comparative dynamometer tests made between Consolidation and Mikalo type locomotives on the Chicago & North Western, as described elsewhere in this issue, is the fact that with a small number of tests the true efficiency of a locomotive is not shown by comparing the ton-miles per pound of coal. In this instance the Consolidation tests were made with an average resistance of 4.091 lb. per ton, while the average for the Mikado engines was 3.817 lb. per ton in Test II and 4.006 lb. per ton in Test III, a difference of about 5 per cent. In computing the tonnage rating for locomotives when dynamometer cars are used, if this difference is not allowed for it may result in underrating the engines. No matter how much care is exercised in making comparative tests there are factors in train resistance that cannot be maintained constant. For this reason it is evident that when dynamometer cars are not used and ton-miles per pound of coal is taken as the comparing item, a large number of tests should be made so that any of the variable features will be more nearly an average for the two locomotives.

Storage of Coal By Railroads

There are so many reasons why a railroad should store coal for its own individual use and why it should influence the dealers and consumers to store coal for their use that it is impossible to carefully cover the subject in a single editorial. Therefore, our effort here will be merely to point out briefly the advantages that may be obtained from the storage of coal by the railroads themselves. In the spring and summer months the demand for screenings, or the cheaper grades of fuel, greatly exceeds the demand for the larger sizes, which of course must be mined in order to get the screenings. In the fall and winter months the large sizes are in greater demand, which gives a surplus of the screenings. The actual cost of hauling coal is very much less in the warm weather than in the cold, and at that time there is much less coal purchased. In the colder months the coal traffic is very heavy, as the demands of the consumers then increase, and at the same time the actual cost of transportation increases. From this it is apparent that with the same rates the railroads can save money by hauling their own coal in the warm weather. It is also evident that if the railroads haul their coal when the traffic is light they can devote their equipment to the hauling of other revenue tonnage when the traffic is heavy. If a large part of the coal were moved when other traffic was light the car shortages which so often develop in the fall and winter months would be reduced or avoided, and the roads would find it possible to haul their annual traffic with a smaller number of cars. In connection with the question of the storage of coal arises the question of the deterioration of the coal in storage and the cost of rehandling. The deterioration that takes place in storage is believed to be over-estimated. Many roads have stored coal with success, while others have not. There is no question that the coal will slack and crumble to a greater or less extent, depending on the kind of coal, but with the opportunities of purchasing the larger coal at the storage seasons at a reduced price this trouble may be very largely avoided. The cost of handling is, of course, a subject that must be considered, but if all the conditions be taken into consideration it is believed that a method could be adopted that would not show a loss.

The coal producer will be benefited by coal storage, as it will enable him to have a more uniform market throughout the year, which in turn will reduce the cost of production and the price of coal. The private consumer will be benefited, as there will be less periodical congestion at the mines, the car shortage will not be so great and he will be able to get coal more readily when he needs it most. This subject was very thoroughly considered at the sixth annual convention of the International Railway Fuel Association, the papers and discussion being published in the proceedings of that association for this year. Other papers regarding the weathering, deterioration and spontaneous combustion of storage coal have been published from time to time by the University of Illinois and the Bureau of Mines.

THE SUSPENSION OF ADVANCES IN RATES

THE discussion which recent developments have started, of the exercise by the Interstate Commerce Commission of its authority to suspend advances in rates, will not be fruitful of the best possible results, unless it be carried on in the light of the history of our federal railway rate legislation. It should also be carried on with careful reference to the letter and spirit of the provisions conferring on the commission the authority to suspend rates. In view of the history of our rate legislation, and of the language of the provisions giving the suspension power, it can hardly be seriously denied that the commission has been abusing this power—and this regardless of its formal procedure in dealing with suspensions.

Those who have participated in the discussion of rate regulation since President Roosevelt started his agitation on that subject will recall that in the controversy preceding the passage of the Hepburn act it was always conceded, in the most express way, by the leading advocates of the act, that both as a matter of right and as a matter of public expediency the initiative in making rates should be left with the carriers. The railways rendered a public service, but their ownership was private. Therefore—so this reasoning ran—the managers for the owners had a right to determine what they would charge for the services they rendered, subject to interference by public authorities only when the rates fixed were excessive or unfairly discriminatory. Furthermore, it was conceded, the traffic managers of the railways, located in all parts of the country, and in touch with its multifarious conditions, would ordinarily know, better than any body of men at Washington could know, what rates ought to be made; and the competition between different railways and territories, and the desire to develop the largest possible traffic, ordinarily would impel the managers to make rates that were reasonable and best adapted to develop the country's industry and commerce, while at the same time securing for the railways fair profits. The Hepburn act was framed in conformity with this reasoning. It gave the commission only the authority to reduce rates already fixed by the railways after it had specifically found them to be unreasonable.

In 1910 the railways tried to make general advances in rates. The Mann-Elkins act, giving the commission power to suspend advance, was hurried through to head them off. Even in the excitement of the controversy preceding the passage of that act, however, the right of the railways ordinarily to initiate their rates, and the public expediency of permitting them ordinarily to do so, were not forgotten or ignored. The commission is not required by that act to suspend all proposed advances; in fact, it has never been required by the law to suspend the advance of a single rate. The law simply gives it the authority, *in the exercise of a sound discretion*, to suspend proposed advances. In addition, the Mann-Elkins act provides that in the case of an attack on any rate advanced after January 1, 1910, the burden of proving that the rate is reasonable shall be on the carrier. Many people think that the law requires the railways to prove the reasonableness of every *advance* made after January 1, 1910. This view is entirely erroneous. The law does not require them to prove the reasonableness of any *advance* whatever. It merely requires that when they have advanced a rate since January 1, 1910, or propose to advance one, they must show that the higher rate is or would be a reasonable rate; and if it is a reasonable rate—if it is not unfairly discriminatory or excessive per se—it is a lawful rate, whether it represents an advance of 5, or 100, or 1,000 per cent.

Manifestly, the commission should not exercise its power of suspension arbitrarily or capriciously. It should exercise it with a due regard to the developments which led up to the granting of the power, and to the avowals and intentions of those who drafted and passed the legislation conferring it as to the purposes which it was meant to accomplish and the way in which it should be administered. Now, nothing is made plainer by the discussions both inside and outside of Congress than that it was not the thought of those who advocated and passed the Mann-Elkins act that it would, to a great extent, reverse the policy of the Hepburn act and deprive the carriers of the initiative in fixing rates. Their right of initiative was to be abridged, but only to the smallest extent that might be clearly necessary to protect the rights of the public. The power of suspension was to be somewhat analogous to the power of the courts to issue injunctions, and was to be exercised only when failure to do so might cause irreparable harm to some interest. That the officers of the railways were ordinarily inspired by right motives, that it was ordinarily to the interest of their companies for them to make reasonable rates, and that they would ordinarily know a great deal better than anybody else what rates ought to be made, was still recognized and conceded. Furthermore, it was clearly recognized that to limit narrowly the initiative of the carriers in making rates would do them great and irreparable harm. As was repeatedly pointed out, if the carrier filed an unreasonable rate, and the commission let it go into effect, a shipper could complain and show its unreasonableness, and get reparation for all the time it was in effect. On the other hand, if the railway should publish an advanced rate, and the commission should suspend it, and the carrier should subsequently establish its reasonableness, the carrier could get no reparation, but would lose absolutely the difference between the old rate and the advanced rate during the period of suspension.

The spirit and intent of the law were and are plain. Have they been carried out by the commission? It seems clear that they have not been. The commission adopted a principle for its guidance which it stated in its annual report for 1912. This principle is, in brief, that when tariffs are filed carrying advances in rates which are of small consequence and which evidently have been made in the course of the minor readjustments of rates upward and downward which constantly become necessary in the ordinary course of business, the tariffs will not be suspended. But when tariffs are filed the evident purpose of which is to effect substantial advances they will be suspended. The law assumed that changes in rates initiated by the responsible managers of the railways, whether advances or reductions, would ordinarily be allowed to go into effect on the regular thirty days' notice, but the commission has adopted the practice of suspending practically all tariffs carrying material advances, thereby curtailing the carriers' right of initiative to an extent never contemplated by the law. The law, and those who advocated and passed it, assumed that the power of suspension would be exercised according to the sound discretion of the commission after careful deliberation in each case; but the commission has set up for the exercise of the suspension power, a purely arbitrary rule, the application of which constantly deprives the owners of railways of property rights that the law intended to recognize. What becomes of the recognized right of the managers of railways ordinarily to initiate their charges if every really *substantial* advance in rates is to be suspended? What becomes of the law's recognition of the fact that the officers of the railways ordinarily are prompted by good motives and ordinarily are the best judges of what rates they should make, if months of labor of numbers of the ablest railway traffic men in the country may be nullified by the mere stroke of a

pen at Washington? When, how and by whom are the railways to be compensated for unjust losses sustained by them as a result of the application of this arbitrary rule?

The situation would be bad enough if, after having thus abused its authority, the commission rendered decisions promptly in cases involving rates under suspension. But in many cases, especially those of importance, it does not do so. It disposed of the rehearing of the 5 per cent case with commendable promptness. But, as the public well knows, exactly the opposite must be said of its handling of the rate advance cases four years ago and the original 5 per cent case. And there are unconscionable delays in deciding other cases of which the public hardly hears at all. General statements regarding such matters are less instructive than specific examples, and, therefore we shall give one of the latter. The coal originating railroads leading into St. Louis and East St. Louis gave notice in January, 1913—just two years ago now—of an advance in coal rates from Illinois territory to the St. Louis group, effective on April 1, 1913. The commission suspended the tariffs until July 30, 1913, and later to January 30, 1914, when its statutory authority of suspension expired. The case was heard on December 1, 1913, and argued in February, 1914; and, at the request of the commission, on the ground that it was as yet unable to dispose of the case, the rates were further suspended until March 31, 1914. Then, on the ground that it could not decide the case before the summer recess the commission asked that the rates be further suspended until November 1, 1914, which also was agreed to. On still another request from the commission the rates were still further suspended until January 1, 1915; and now the commission has asked for another postponement to November 1, 1915! The railways are in no position to refuse such requests of the commission for the voluntary postponement of advances as were made in this case, and as are made in many others. If the commission should decide that these advanced coal rates are reasonable, the railways, because of its incapacity to keep up with its work, will have been deprived for three years of their right to charge reasonable rates, and will have suffered an irreparable loss amounting to many hundreds of thousands.

While rates are under suspension, while the commission delays to decide the cases involving them, not only the railway industry, but a large part of all the industries in the country wait upon it. And one of the worst features of the situation is that the commission does not seem to realize the results its delays are causing, and is therefore not asking Congress to grant it the means imperatively needed for facilitating its work and putting it on a businesslike basis.

The *Railway Age Gazette* opposed the provisions giving the commission authority to suspend advances in rates because we apprehended—and predicted—that it would lead to the very abuses and results to which it has led. It is still our opinion that the provision is indefensible on any sound ground whatever—that it imposes a restriction on the exercise of the railway manager's right to initiate rates, which is wholly unjust and inexpedient. Bad as the law is, however, the intention of those who passed it was not so bad, and if the commission would use in its administration the businesslike methods and sound discretion it was intended it should use, the harm done would be comparatively small. Unfortunately, the commission has thus far exercised its discretion in disregard of the intent of the law, and with the greatest injustice and unwisdom; and the effects on the railway business and business in general have been what might have been expected.

Perhaps if railway officers will present the conditions to the commission in its true light, and insist on a modification of its policy it will do something to relieve the situation. There is evidence that some members of the commission realize that the policy it has been pursuing is wrong. If the railways cannot secure a great change in the administration of the suspension provision they should appeal to the courts or begin a nation-wide campaign for its entire repeal. The law gives the commission no authority to order an advance, or to suspend a reduction in any rate; it is thus a wholly one-sided law; and as long as this is the case, for the commission to exercise its authority to order reductions in rates, and go on exercising its power of suspending advances proposed by the carriers as it has been doing, can spell only injustice and disaster. "This power (of suspending rates)" said the chairman of the commission in his dissenting opinion in the 5 per cent case, "is exercised, in my judgment, with unnecessary frequency, in view of the opportunity that shippers have of testing the reasonableness of increased rates, upon formal complaint filed with the commission; and, in my judgment, the Congress never intended so free a use of it when the power to suspend rates was granted to us." Let us hope that the other members of the commission will also come to see this subject in its true light.

THE ALL-AROUND SUPERINTENDENT

THE ambitious young man who believes that he is fit for promotion, but who sees others placed ahead of him, does some energetic thinking. He has forced upon his mind an important subject which cannot be thrust aside. Some thinking of this kind which a correspondent has put on paper, is printed in another column. He has not gone into the subject very deeply, and the brief essay that he has sent is laid before the reader in this way as a suggestion for further study.

Everybody knows about the evils of nepotism; the only remedy for that little vice is to engage in fasting and prayer for the enlightenment of the manager who pursues such a shortsighted policy. The other difficulty, the bringing in of men from other roads, is not so easily disposed of. A manager who does this from a mere selfish desire to save himself work is about as bad as the nepotist; but if, on the other hand, his fault is defective judgment of men, the only recourse of the aggrieved despatcher is to make his own merits so plainly apparent that the dullest or most distant manager will hear of them. This means hard work; assiduous study of superintendents' problems day and night—especially night. In other words, the study of the application of general principles to particular questions arising on your own division, balancing the relative virtues of one superintendent's way of solving such questions against another's way, deciding what you yourself would do, and how you would convince your boss that you were right—these things are enough to absorb all of one's surplus energy throughout the waking hours of the day.

Our friend's letter has little or nothing to say about other qualifications than experience. But experience does not always blossom out in versatility. One of the most noticeable mistakes among superintendents is the habit of continuing to live mostly in the department from which they came. A master mechanic sometimes retains such an absorbing love for locomotives that, when dealing with roadway matters or public relations, he makes a poor superintendent. The superintendent who has been trainmaster at a freight terminal sometimes seems to ignore his duties in relation to fastidious passengers in parlor cars. Cannot the anxious despatcher take a hint from these examples? If he has got well saturated with train-operation ideas, let him question himself as to his qualifications in other lines; as an after-dinner speaker at a meeting of aldermen, for instance. The superintendent who knows how to interview a congressman, successfully, has a great advantage, at times. The train despatcher who wishes to qualify for such a function must do something besides perfect himself as an efficient lieutenant to the superintendent *on the road*. Off the road, perhaps at a farmer's house, ten miles away, may be at times an important field.

In short, the despatchers are sometimes left behind for what, to the manager, seem very good reasons. They are competent to handle men and to manage trains, but they are not all-around men. The manager may, indeed, have poor success in going outside for new men; but the best way to cure him of this bad habit will be to convince him that he will be successful inside his own organization. The efficient despatcher, aspiring to advancement, must constantly study outside his own immediate field. Dealing

with men—and women—of all sorts is an important art for the superintendent, and one in which it is scarcely possible to become too skilful.

Another common mistake of men who are promoted to a superintendency, with a 50 per cent increase above their former pay, is in raising the standard of their hats and their neckties faster than they improve the things under their hats and cravats—their brains and hearts. The superintendent must, indeed, be a gentleman, and we mean no slur on new hats or neat clothes; but a sudden transition in those outward things, when, at the same time, observers notice a far less marked improvement in the quality of the man's work, is likely to make an unfavorable impression. Perhaps the idea may be better put by saying that the despatcher should cultivate the qualities of a gentleman very carefully for some years before he gets his promotion. Not that he should wear a silk hat to the office, or run in debt for better coats than he can afford; but there is real sense in Napoleon's idea of the marshal's baton in the private soldier's knapsack. The division superintendent's job is in some senses the biggest one on the road, and the man who aspires to fill such a job well during the first year, should do a good deal of rehearsing, in the privacy of his own breast, for a long time beforehand—and a great variety of rehearsing.

The foregoing paragraphs cannot be called a sure rule for success; there is no such rule, for despatchers, any more than for other classes; but the despatcher who follows the suggestions will have the satisfaction of having taken a good step toward doing *his* part.

MISSOURI, KANSAS & TEXAS

UNTOWARD and extraordinary circumstances decreased the Missouri, Kansas & Texas' revenues by about $775,000 in the fiscal year ended June 30, 1914, and increased operating expenses by $1,281,000. In addition, reductions in passenger and freight rates caused a further loss in revenue of $841,500. The company finished the year with but $539,000 over and above expenses and interest charges, which is a decrease from the previous year of $1,778,000; but had it not been for the extraordinary circumstances and the reductions in rates, the year's operations would have shown a substantially larger net income than in 1913, the net instead of being a little over $500,000 would have been something over $3,000,000. The untoward circumstances were severe droughts during growing time for grain and forage crops and unprecedented floods about the time of the maturity of the cotton crop.

Notwithstanding the disheartening interference with the freight business and the serious and costly interruption of train movement, operating results show up so remarkably well that it is easy to imagine how bitter the disappointment was that these operating results could not be reflected in net available for dividends.

The 40 Mikado locomotives which the Katy bought in 1913 were in service during the entire year under review. The total ton-miles of revenue freight handled amounted to 1,851,000,000 in 1914, an increase over 1913 of 1.1 per cent. The floods, the interruption to the seasonal movement of traffic and the movement of foreign cars empty being returned to their home lines, which latter was general all over the country, caused an increase in the empty car mileage of 5.4 per cent. Nevertheless, the trainload increased from 287 tons to 316 tons, or 10 per cent, and the tons per locomotive from 271 tons to 304 tons, or over 12 per cent. To accomplish this gain in average trainloading in the face of the larger empty car movement, the average number of empty cars per train north and east increasing by 10.5 per cent, and south and west by 21.3 per cent, is an accomplishment worthy of note. The gain in work done by locomotives is therefore greater than the 12 per cent indicated by the increased trainloading.

The Missouri, Kansas & Texas operates 3,825 miles of road, of which more than 1,000 miles is in Texas. One serious drawback to the economical operation of the system as a whole has been the attitude of the Texas public and the Texas laws in regard to the portion of the system operated in that state. Various suits had been brought against the company in connection with the ownership of the Texas company's stock, the lease of other lines in Texas, etc.; but in February, 1914, an agreed judgment was arrived at between the attorney general of Texas, the company and the courts, which disposes finally, it is thought, of the question which had been raised by the Texas authorities and permits a consolidation of operations which should be of lasting benefit both to the company and the public served.

Even in the difficult year ended June 30, 1914, considerable progress was made in the program which the present management of the Missouri, Kansas & Texas is engaged on of betterment of the property. The expenditures for additions and betterments, exclusive of new equipment, amounted to $1,232,000. Of this amount $291,000 was spent for ballast, new ballast being applied to 143 miles of track. In this connection, although, of course, it is a maintenance expenditure and not chargeable to capital account, it should be mentioned that 146 miles was reballasted. The condition of the Texas lines in regard to ballast two years ago was far from satisfactory. Considerable expenditures will be required to put sufficient ballast on these lines to make them meet in this particular the general standard which has been adopted. During the year 100 miles of new 85-lb. rail was laid to replace lighter rail in main line. Included in the additions and betterments is an expenditure of $246,000 for station buildings and fixtures. This, of course, is indicative rather of the efforts which are being made to please the communities served by the road than of progress in the policy of strengthening the plant to permit of more economical operation, but it is none the less interesting.

A detailed study of expenses in 1914 is not indicative of what might be expected under normal conditions. Total operating expenses amounted to $22,722,000, a decrease, as compared with 1913, of $86,000. The following table shows the proportion of each class of operating expenses to total operating revenues:

	1914	1913
Maintenance of way and structures	14.52	14.33
Maintenance of equipment	12.48	12.68
Traffic expenses	2.34	2.33
Transportation expenses	38.89	37.90
General expenses	3.86	3.27
Total	72.09	70.51

Maintenance of way cost $4,575,000, or very slightly less than in the year before, a large decrease in the cost of tie renewals being offset by increases in the expenditures for roadway and track labor, bridges, roadway tools and maintenance of joint facilities.

Maintenance of equipment cost $3,934,000 in 1914, $167,000 less than in the previous year. The decrease is accounted for by a large decrease in the amount spent for repairs of locomotives and smaller amounts spent for repairs of passenger cars, and of smaller amounts charged for depreciation. For one thing, of course, the addition of the new locomotives, with the retirement of light locomotives, would have reduced the cost of repairs in any case; but apparently also considerable work was deferred, since at the end of the year 18.48 per cent of the total number of locomotives owned were undergoing or awaiting heavy repairs. It is quite possible that larger charges will be made next year for depreciation. The company was engaged at the end of the year on rewriting its equipment records, and a new policy will be adopted which will probably be considerably more liberal in regard to charges for depreciation and will be in accordance with the Interstate Commerce Commission's requirements that sufficient be charged each year to write off the total cost of equipment by the time it is ready for the scrap heap.

Transportation expenses amounted to $12,258,000, or practically the same as in the previous year; but if it had not been for the economies effected by heavier trainloading, transportation expenses under conditions of operation existing in 1914 would have run up very much over the 1913 figures.

Taxes in 1914 amounted to $1,500,000, an increase over the

previous year of $212,000, or 16 per cent. This is a drain on the company's earnings which it is out of the power of the management to control, and it is a serious one.

The total tonnage of revenue freight carried by the Katy in 1914 was 9,122,000 tons. Of this total 39.13 per cent was furnished by products of mines, 22.24 per cent by products of agriculture, 15.19 per cent by manufacturers, 8.99 per cent by lumber and forest products, and 6 per cent by l. c. l. merchandise. The principal changes from the previous year were an increase in the tonnage of petroleum from 58,000 tons in 1913 to 199,000 tons in 1914, and an increase in the tonnage of forest products and lumber of 40,000 tons, the total in 1914 being 820,000 tons. This increase in lumber and forest products is very important, since this traffic is drag freight moving north, and if it can be developed will give the Missouri, Kansas & Texas what it so badly needs—a slow northbound tonnage.

At the end of 1914 the Missouri, Kansas & Texas had cash on hand of $1,459,000, with loans and bills payable amounting to $3,281,000. The company has $19,000,000 notes maturing May 1, 1915. The financing, therefore, which will have to be done in the immediate future presents a problem of considerable proportions.

The $19,000,000 notes are held, it is understood, in strong hands. In the five months since the close of the fiscal year the Missouri, Kansas & Texas has been making a remarkably fine showing. Net in these five months, after the payment of all fixed charges, was $1,118,000. The transportation ratio in these five months was 34.60, as against 37.90 in 1913, a normal year; 41.32 in 1912 and 39.25 in 1911. With this good showing it would appear to be the best interests of everybody to tide things over until the notes can be permanently financed. The fact that the notes are held in strong hands should facilitate such a solution of the problem to a very marked extent.

The following table shows principal figures for 1914 and 1913:

	1914	1913
Average mileage operated	3,825	3,677
Freight revenue	$20,228,337	$20,912,978
Passenger revenue	9,105,242	9,402,967
Total operating revenues	31,521,188	32,346,258
Maint. of way and structures	4,574,726	4,637,748
Maint. of equipment	3,934,119	4,100,819
Traffic expenses	737,766	755,120
Transportation expenses	12,258,499	12,255,845
General expenses	1,217,009	1,058,880
Total operating expenses	22,722,119	23,808,412
Taxes	1,499,521	1,287,903
Operating income	7,299,548	8,249,942
Gross income	7,516,827	7,966,160
Net income	539,227	2,316,985
Dividends	261,429	521,052

NEW BOOKS

Proceedings of the International Railway General Foremen's Association. Compiled and published by William Hall, secretary-treasurer of the association, Winona, Minn. 193 pages, 6 in. by 9 in. Bound in paper.

The tenth annual convention of the International Railway General Foremen's Association was held at the Hotel Sherman, Chicago, Ill., on July 14, 15, 16 and 17, 1914. This book contains the complete report of the proceedings, including committee reports, papers and discussions. The association is to be congratulated upon the shortness of the time which has elapsed between the publication of the proceedings and the closing of the convention.

Proceedings of the American Society for Testing Materials. Part I, Committee Reports; Part II—Technical Papers. Size 6 in. by 9 in., 484 pages and 678 pages, respectively. Illustrated. Published by the society at the office of the secretary, University of Pennsylvania, Philadelphia, Pa. Price $5.

For the first time the proceedings of the American Society for Testing Materials are published in two volumes, the constantly increasing size of this annual publication having made this advisable. Last year's volume contained 1,141 pages, and the combined volumes this year contain 1,162 pages. The division of the material has been made along natural lines, Part I containing the summary of the proceedings and all committee reports, and Part II, the technical papers. These proceedings cover the seventeenth annual meeting of the society and include many specifications, papers and discussions of interest to railway men.

Letters to the Editor

THE POSTOFFICE "SURPLUS"

CHICAGO, Ill.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I note in your issue of December 18, 1914, that the statement is made that there is an alleged surplus in the postoffice department of $3,600,000 for the last fiscal year. The only information available, to the humble voter, is such as an administrative head of a department may choose to give out. Calling a given item a surplus does not of course make it one and I have been curious, since this item has been given out for public consumption, as to the proper definition of the word surplus. Instead of surplus isn't this "net operating revenue?"

I have never seen a government report which gave a statement as to the amount of money invested in land, buildings and other similar facilities which must be utilized in the conduct of the business. The government must pay interest on money borrowed the same as anyone else and as long as we pay interest on a national debt, the item should appear as a charge against the so-called profits of operation. It is difficult to say how much money has been invested in postoffices, but I presume that such items are just as available for valuation as any other kind of property. Is there an item showing interest on capital invested?

There are a great many statesmen who will doubtless say that, as the property is used for the public benefit, this item should not be included. This sounds very well, but will not hold water. A public benefit is something in which all are or can be *equally* interested. When a public utility does not pay for itself the deficit is raised by taxation. This taxation has nothing whatever to do with the amount of service the utility gives to the person taxed. If the postoffice is not self-supporting, including the item of interest, then the many are being taxed for the benefit of the few. The extensive users of the mails, such as mail order houses, etc., are the largest beneficiaries, while the man with considerable property who gets 10 letters a week foots the bill.

PAUL M. LABACH,
Assistant Engineer, Rock Island Lines.

WHY DO NOT CHIEF DESPATCHERS RECEIVE MORE RECOGNITION?

KANSAS CITY, Mo.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

When a superintendent is required for a certain division a few employees on the line may be considered; but in many instances men from other railroads are brought in or possibly the position is given to some favored friend or relative. In either case a certain length of time is required for the new man to get his bearings. But who is the man most fitted for the place?

The chief despatcher is more closely associated with the detailed operation of the line than any one on it. He is in constant touch with the superintendent in all problems concerning transportation propositions—the handling of men, and of power, maintenance of way, distribution of cars, prompt movement of cars and trains. He is held personally responsible for all delays and overtime, and for efficient work on the part of the men handling the every-day business out on the line.

When there is an obstruction to traffic he is the man who is looked to to arrange detours, to see to the care of injured persons and of damaged freight, and to arrange for the quick clearing of the track. When a proposition comes up which demands an immediate display of executive ability he is the one to act. Often, of course, he can converse personally with the super-

intendent, but many times this is impossible, and he is obliged to act alone.

A chief requisite in a superintendent is ability to build up and maintain a good organization. Another is to be able to figure out the every-day operating expenses and analyze the items. Who on the staff would be better qualified to do this than the chief despatcher? His long association right by the side of the superintendent gives him a training and knowledge to fit him to handle the situation alone. In handling the men and dealing with the unreasonable demands of the labor organizations, who is better adapted to the task than the chief despatcher? His long experience along that line has been greater than that of the average man on the line. His experiences as a telegraph operator, agent, clerk and trick despatcher have given him an inside view of supervision which cannot be obtained from any other source.

After a man has mastered the telegraphic education and has reached the position of chief despatcher; and has served in that capacity five or six years, and sees no chance of advancement, he naturally loses the ambition kindled in him years before; and concludes very likely to try some other avenue of employment. He may take a small agency on the road, a position as trick despatcher, or may leave the railroad business entirely. But in that case has not the railroad lost many years of valuable experience which could be utilized to good effect? When a chief despatcher is promoted it inspires the entire rank of telegraphers and clerical force with new energy. The failures made by promoted chief despatchers are few and far between. All they want is a chance to demonstrate their ability. C. L. J.

THE INTEREST OF THE RAILWAYS IN A PROTECTIVE TARIFF ON STEEL

Columbus, Ohio.

To the Editor of the Railway Age Gazette:

To produce a ton of rails requires the digging of ore, the quarrying of stone, the burning of coke, the making of brick, etc., and the assembling of these materials at some convenient place, before the first operation of making steel rails can commence. The item of assembling—including largely the transportation charges—and the freight to place of consumption is more than one-third of the total cost. What is true of iron and steel is relatively true of every article included under the protective tariff.

In all discussion of the protective tariff, all the arguments have been in relation to the cost of producing steel after the materials have been assembled, and are ready for the furnaces; while sufficient prominence has not been given to this cost of assembling and the effect on the railroads and steamship lines. Not only must the transportation companies be protected in their rates, but they must be assured as to the volume of business, otherwise the cost of transporting every pound of freight in this country will be increased. For example, to make one ton of pig iron requires approximately:

Ore	1.85 tons
Coke	1.12 tons
Limestone	.50 tons
	3.47 tons

Freight charges for assembling this amount of material at Pittsburgh would be as follows:

Mesaba Range to Duluth	1.85 tons ore at $0.60 per ton	$1.11
Duluth to Lake Erie ports	1.85 tons ore at .55 per ton	1.02
Lake Erie to Pittsburgh	1.85 tons ore at .88 per ton	1.63
Connellsville to Pittsburgh	1.12 tons coke at .75 per ton	.84
One-half ton limestone, at approximately	.65 per ton	.32
		$4.92

To make one ton of rails requires one and one-fifth tons of pig iron.

Freight charges for assembling sufficient material to make one ton of rails at Pittsburgh	$7.77
Freight Pittsburgh to St. Louis, one ton rails	3.42
Freight Pittsburgh to New York, one ton rails	2.60

Using St. Louis as a central distributing point, the result would be as follows:

The transportation companies would receive on every ton of rails delivered at St. Louis from first to last	$11.19

If these rails were purchased abroad, they could be brought to St. Louis by way of New Orleans, and the railroads would receive about $1.50 per ton as their proportion of the through rate, so that there would be an actual loss to the transportation companies, as a whole, of about $9.15 per ton on every ton of steel rails purchased abroad and used in St. Louis and vicinity. Using New York as the point of distribution, the transportation companies would receive on every ton of rails made in this country and delivered at New York, $10.37 per ton.

This does not take into consideration the freight on refractories and miscellaneous material used by the furnaces, nor the miscellaneous freight required by communities where iron ore and coal are mined and where coke and steel are manufactured, which supplies would not be transported or consumed here if our steel were made across the water. In either case this would show a great loss to the transportation companies in this country, all of which would accrue to the benefit of the foreign railroads and manufacturers.

These figures, vast in themselves when considering the production of steel rails in this country alone, are small when compared with the total production of pig iron from which steel rails are made, which amounted in 1907 to 25,781,361 tons, the direct transportation charges amounting to the vast sum of approximately $200,000,000.

Can this country afford to have its material made abroad at such an enormous loss to American railroads, workingmen, farmers and manufacturers? It is impossible to employ men in any legitimate way without benefiting them and the community far more than their employers. Any individual, community or nation is wealthier each day only by the excess of what it produces over what it buys, and any individual in a nation that produces nothing, or less than what he consumes, is a burden on the nation to that extent.

A protective tariff must protect the nation as a unit; the division of the benefits among the individuals being an entirely different subject, to be treated absolutely apart and aside from any consideration of tariff schedules; but the benefits must practically all be eventually distributed, in the operation of the affairs of an enterprising community.

J. G. Battelle,
President, Columbus Iron & Steel Company.

ON TIME TWENTY WEEKS

Seattle, Wash.

To the Editor of the Railway Age Gazette:

I notice in your issue of December 11 an item to the effect that the Chicago, Burlington & Quincy, running 93 passenger trains from Denver to Chicago (1,034 miles) during the month of October brought in 92 of them exactly on time.

The "Oriental Limited" train of this company [the Great Northern], running between Chicago and Tacoma (a distance of approximately 2,400 miles), over two ranges of mountains, has arrived at Seattle and Tacoma—up to and including December 16—141 consecutive days on time. Schedule running time 72 hours, 11-car train.

J. H. O'Neil,
General Superintendent.

Railway Construction in Sweden.—In view of the war, attention has been directed to the improvement of transport facilities between the United Kingdom and Russia via Sweden. It is stated that the board of the Swedish State Railways has decided upon the best route for the proposed railway from Stockholm to Kapellskär, and Immingham Docks are mentioned as a suitable connection on the English side, although apparently nothing is settled as yet. The routes for traffic across Sweden to Russia are of special importance now, as the Baltic is practically closed. New regular lines have been started between Stockholm and Gefle and Finland, while the Björneaborg authorities are anxious to obtain a connection with Sundsvall. It is evident that Sweden, owing to its geographical position, will play an important part in the development of Russian trade with various countries.

St. Paul and Oregon-Washington Joint Terminals in Spokane

Extensive Grade Separation Work Required to Reach Passenger and Freight Stations in Heart of City

Although the transcontinental line of the Chicago, Milwaukee & St. Paul passes more than 25 miles south of Spokane, Wash., all of that company's through passenger trains are now run through Spokane over tracks used jointly with the Oregon-Washington Railroad & Navigation Company. This project, which enables the St. Paul to reach Spokane, involved the construction of about 20 miles of new line from Plummer Junction, on the main line 41 miles southeast of Spokane, to Bell Junction on the O.-W. R. & N., 21 miles from Spokane, as well as the work of building a new line through the heart of the city to reach the new joint passenger station. The through trains now run over the new line from Plummer Junction to Bell Junction, the old O.-W. R. & N. line to the Northern Pacific crossing in Spokane, the new St. Paul line to the union station, and the new O.-W. R. & N. Spokane-Ayer line as far as Marengo Junction, 61 miles. This route is about 14 miles longer than the main line and in places contains considerably higher grades than the older line, so that it is not expected that any freight traffic

Beginning at the Northern Pacific crossing the new St. Paul line extends east on a level grade as far as Erie street, all intermediate streets being carried under the railroad. A timber bridge about 750 ft. long carries the new line over Ivory street, Erie street, and the tracks of the Spokane & Inland Empire. West of Erie street the grade is 1.2 per cent, descending as far as the Trent avenue subway, the line skirting a bend in the Spokane river on a 200,000 cu. yd. rock fill made in 47 ft. of water. At the west end of this fill the line enters a solid rock cut with a maximum depth of 27 ft. A double track subway 850 ft. long was built in this cut to carry the Northern Pacific and Great Northern transfer tracks and Trent avenue.

From the west end of the Trent avenue subway the passenger tracks continue on a slight descending grade under Market street, which carries a double track line of the Spokane & Inland Empire and then under Division street, carrying a double track street railway line. From Division street the main line rises on a maximum grade of 1.24 per cent to the station, crossing Center

Typical Reinforced Concrete Street Subway Near the East End of the Work

except local business will move over the new loop. As the new O.-W. R. & N. line from Spokane to Ayer was described in the *Railway Age Gazette* of May 31, 1912, and the new joint passenger station in the issue of October 31, 1913, the present article will refer principally to the St. Paul construction work between the junction with the old O.-W. R. & N. line on the east side of the city and the new station.

The new joint line through the city was financed in three sections; one from the Northern Pacific crossing to Center street, built and paid for by the St. Paul; one from Center street to Monroe street, including the station building, paid for by both companies on an equal basis, and one extending from Monroe street to the western city limits, built and paid for by the O.-W. R. & N. The cost of the terminals and approaches in Spokane is about $7,500,000. The new station, built at a cost of about $600,000, and opened on September 15, is shown in one of the accompanying illustrations. The principal feature on the O.-W. R. & N. section is the high steel bridge spanning the falls in the Spokane river and crossing over the Monroe street concrete arch bridge.

street on an overhead structure. The tracks branch out from a point just west of Center street to eight station tracks. These station tracks are supported on a steel and reinforced concrete structure.

At the west end of the Trent avenue subway the yard tracks leave the main line, one team track being built to the north of the main line on an ascending grade to the west, crossing the Spokane & Inland Empire at grade in Market street and extending on the street level to Division street. The switch lead leaves the main line on the south and extends west to Division street on the grade of the main line, dropping from Division street to Center street, which is crossed at grade. At Division street four team tracks lead off from the switch lead extending to Center street. A warehouse track also leaves the switch lead near the west end of the subway and extends on the grade of the switch lead to Division street. West of Division street the switch lead descends, crossing Center street at grade and branching out to form two additional team tracks and three house tracks serving the freight house, which is located between Center and Washington streets. The house tracks and the two team tracks, as well

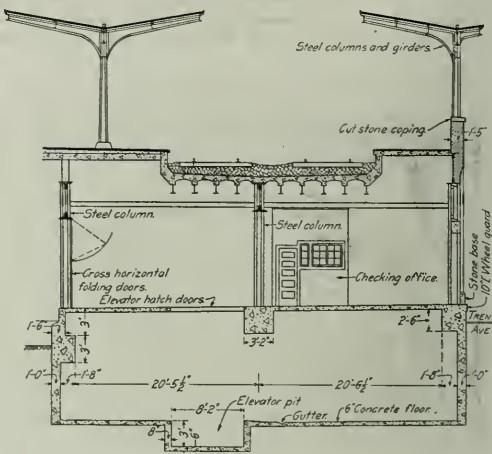
as a portion of the freight house, extend under the structure supporting the high level passenger tracks.

On the section east of the river fill, five reinforced concrete subways of the girder and slab deck type supported on four-post arch bents at the curb line and center line of street, were built to carry streets under the tracks. The reinforced counterfort abutments on these subways were poured continuously with double shifts to improve their appearance and to do away with the horizontal construction joints. One of these typical bridges is shown in an accompanying illustration. There are also four permanent alley crossings of reinforced concrete of the slab type on this section of the work. The slabs are supported by vertical barrel walls strutted at the base with cantilever type wing walls. Five timber bridges were also built east of the river, where the conditions at the present time are unfavorable to final construction.

The river fill was made from material excavated west of the Trent avenue subway which was hauled with 18-ton dinky engines and 4-yd. cars. The cars were dumped from two-post pile trestles constructed in the river. As this fill was built across the main channel of the river, there was a question as to the effect of the change of the current on the opposite bank. This led to the adoption of a plan to build the fill up to the elevation of low water and then build a timber trestle on this fill for the permanent work. When the low water level fill was completed and the river had reached its high stage, it was found that the current had been materially improved and instead of cutting diagonally across the river was now following the line of the fill parallel with the bank to the north.

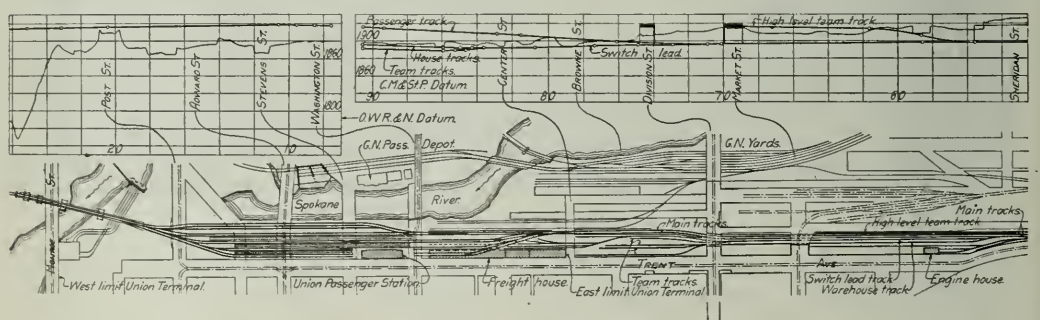
The bridge carrying the Great Northern-Northern Pacific transfer track which is contiguous with the Trent avenue subway, consists of side and center reinforced concrete walls supporting an I-beam deck encased in concrete. The subway, which is of the slab type construction has a span varying from 29 ft. to 45 ft. The walls are 12 to 22 in. in thickness. The excavation for the subway amounted to 46,000 cu. yd. of solid rock, the depth averaging about 22 ft. On account of the proximity of this work to the building of the Schade Brewing Company, a great deal of care was required and considerable expense involved in avoiding damage to the building. A powder inspector was kept constantly in sight, who noted on a plat furnished him each day, the location, size and depth of each hole, the charge and the type of shot, and the mat and timber protection.

A 24-in. sewer extending down the center of the cut was relocated on the south side of the excavation as far as the Northern Pacific-Great Northern transfer bridge, at which point it was dropped into a manhole and carried under the subway to the river on the east. At the intersection of Trent avenue and Sheridan street, it was necessary to keep the street open for its entire width on account of the Washington Water Power Traction Company's line and the exceptionally heavy street traffic using this main artery of travel from the business section to the east side of the city. This was accomplished by driving a cut 16 ft. wide, which was spanned with 32-ft. stringers covered by a plank deck. After this narrow preliminary cut was finished, a timber bent was erected under the center of the stringers, which were then pulled out on each side of the bent with their ends butting. It was then possible to widen the cut without delay to the street



Cross Section of West End of Milwaukee Freight House Showing Passenger Tracks and Platforms Supported on Roof

cars or team traffic. The concrete for the subway was poured from a single plant located in the center of the work, consisting of a ¾-yd. Smith mixer which was fed from a 30-yd. hopper. The material was loaded by a clam shell bucket from cars and the concrete was handled from the mixer in hopper cars dump-



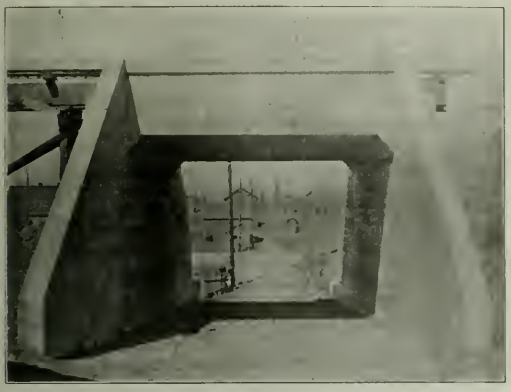
Plan of Milwaukee's Entrance to Spokane and Union Passenger Station Property

ing directly into the forms. As this work was done during the winter all of the material was heated, the forms were covered with canvas and the temperature was raised by steam.

A considerable length of retaining wall was built along property lines and between high and low level tracks in the territory west of the Trent avenue subway. The wall separating the main line and the northerly team track, the one along the Trent avenue property line from the subway to Center street, and the walls on both sides of the main line tracks between Division street and Center street, are of Cyclopian concrete, utilizing the stone removed from the cut. The wall along the team track is of a special section with a narrow base increasing in width up to approximately the mean height of the wall, from which it assumes the ordinary section. This design was adopted in order to re-

duce the amount of concrete and also the amount of rock excavation as the wall is founded directly on the solid rock. The other Cyclopian walls are of standard gravity section.

The Market street bridge is of the through girder type, the deck being encased with concrete. The rails of the Spokane & Inland Empire tracks are attached directly to the structure with cast iron dogs. The street over the bridge is paved with wood blocks. The west abutment is of Cyclopian concrete, poured flush against the rock at the back to the level of the bridge



One of the Standard Reinforced Concrete Alley Subways

seat. The east abutment consists of a face wall not more than 18 in. thick with a footing at the top of the abutment 2 ft. deep. This footing was anchored to the rock with 1-in. split rods set in poles in the rock. This type of construction was made possible by the fact that the rock at this point breaks in practically a vertical plane.

In order to avoid a grade crossing at Division street it was necessary to raise the street grade 11 ft. at its intersection with

higher than the finished street grade. A temporary street was also built across railway property from Browne street northeast to the Great Northern bridge. This temporary street, consist-

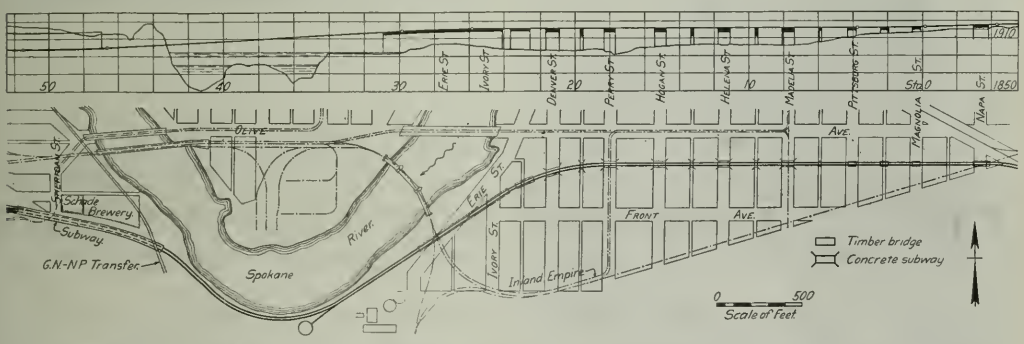
Making the Fill Across the Bend of the Spokane River

ing of a 40-ft. roadbed, was also carried on a timber trestle.

The regrading necessitated the raising of four water mains; one 12-in., one 16-in., one 24-in. and one 30-in. pipe. The 12

A Portion of the Temporary Trestles Carrying Street Cars and Team Traffic During the Regrading of Trent Avenue

and 16-in. mains were of cast iron and were raised by being jacked up as a unit and supported on small timber bents during



Plan of Milwaukee's Entrance to Spokane and Union Passenger Station Property

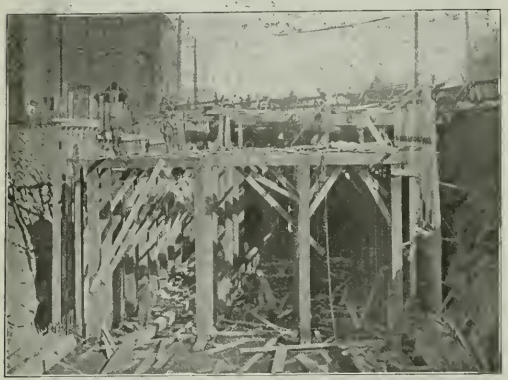
Trent avenue. As Division street is the main artery of travel from the business section of the city to the large and populous north and northeast sections, and as there was absolutely no other route by which travel could be diverted, it was necessary to handle this traffic throughout the construction work satisfactorily to the public and the Public Utility Corporations. This was done by building a double track standard timber trestle on railway property parallel to Trent avenue from Market street to Browne street, and on Division street from the south property line to the Great Northern bridge. These trestles were for the exclusive use of the street railways and to facilitate construction of the permanent work they were built approximately 10 ft.

the process of filling. The 24-in. and 30-in. mains were high pressure pipes supplying the south side of the city and business center. They required a great deal of special work. New pipe was placed in a permanent location over the right of way, the connections between the old and the new mains were made in five hours, and the old main was then salvaged.

Reinforced concrete walls of the cantilever type were built along all property lines in the regrade district. The fill was made of rock from the right of way excavation, a dirt and gravel pad being placed on top to receive the pavement. The buildings were raised to meet the new grade by the property owners, the railroad being assessed damages. The Division

street bridge is similar to that at Market street, with the exception that the abutments are of the reinforced counterfort type.

The St. Paul's new freight house is located along Trent avenue, between Center street and Washington street. It is 778 ft. long and 46 ft. wide with a full basement excavated in solid rock. A two-story office building 126½ ft. long separates the inbound and outbound sections of the house. The foundations



Trent Avenue Subway, Showing Wall Forms

and the street level floor are of reinforced concrete, the floor being of the girder and slab type construction. Above the street floor the walls are of a dark building paving brick. The house is of the continuous door type, horizontal cross folding doors being installed. Access is had to the basement for freight serv-

Front View of Recently Opened Union Passenger Terminal in Spokane

ice by four hydraulic elevators. The roof is of reinforced concrete carried on steel columns and girders. West of the office building the roof of the freight house carries two of the passenger tracks and one platform adjacent to the passenger station. The troughs in which these tracks are laid are waterproofed and protected by sand mastic. The platforms are finished with 1½ in. of asphalt mastic and are covered by butterfly sheds.

The following quantities show the amounts of materials used in construction:

Timber	2,114,885	ft. B.M.
Piling	32,053	lineal ft.
Bridge iron	81,949	lb.
Reinforced concrete	24,328	cu. yd.
Cyclopian concrete	21,803	cu. yd.
Plain concrete	2,219	cu. yd.
Rubble masonry	422	cu. yd.
Reinforcement	2,179,361	lb.
Paving asphalt	3,113	sq. yd.
Paving brick	4,476	sq. yd.
Paving vitrified block	12,635	sq. yd.
Excavation	230,400	cu. yd.
Structural steel	3,571	tons

The concrete work east of Center street, including the Trent avenue subway was built by the Bates & Rogers Construction Company, Chicago; the excavation west of the subway was made by Guthrie, McDougal & Company. The brick work and interior finish in the freight house was contracted to the Hurley, Mason Company. The concrete work west of Center street and all paving was handled by company forces, and all structural

Concrete Mixing Plant and Distributing Tracks for Placing Concrete in Trent Avenue Subway

steel was erected by company forces under Ed. Howell, general foreman, of steel bridge crews. The work was in charge of A. G. Holt, division engineer, until February, 1913. Upon his promotion to assistant chief engineer, with headquarters at Chicago, George M. Rice, division engineer, took charge, reporting to E. O. Reeder, assistant chief engineer at Seattle, and to C. F. Loweth, chief engineer, who handled all designs direct. Lyman M. Chase, who had charge of the field construction throughout the work, furnished a large part of the foregoing information.

Swedish-Russian Railway Built.—Press despatches report that on January 6 the railroad circling the Gulf of Bothnia, the northern extension of the Baltic Sea was virtually completed. Up to the present time there has been a gap of 10 miles over which passengers from Stockholm to Petrograd had to drive. Now this distance has been reduced to half a mile. The Russian line now runs to a point opposite the Swedish station at Karungi. Here passengers leave the train and go half a mile over the frozen river Tornea. This is instead of the previous journey between the towns of Tornea and Haparanda, a distance of 10 miles. The new arrangement is said to be working well. Between 500 and 800 passengers make the trip daily, the uncertainties of steamship travel between the Swedish coast and Russian ports near Petrograd having, of course, influenced many travelers to select the land route. Heavy freight also is being moved over land with little delay.

Railroad Rates from Investors' Point of View*

Relation That Should Obtain Between Gross Earnings and Various Kinds of Outgo for Satisfactory Credit

By John E. Oldham
Of Merrill, Oldham & Company, Investment Bankers

In the recent proceedings before the Interstate Commerce Commission in connection with the petition for an increase in railroad rates in Official Classification territory, there were submitted certain figures and statements bearing upon the earnings and capitalization of a group of standard railroads.

The purpose of these statements was:

First, to show the financial conditions which surrounded railroad securities of the highest grade during the period 1900 to 1909, when confidence in railroad investments of the better class was very general and capital was readily obtainable by roads of high credit.

Second, to determine whether the high credit which these roads had enjoyed was founded upon any well-defined economic principles or conditions which must be recognized in making fair and reasonable rates.

Third, to ascertain as far as possible, by a comparison of the financial statements of these railroads for the 10-year period above referred to with similar statements for 1913, whether these conditions had changed sufficiently to justify a weakening of confidence in the securities of these roads, and to account for the difficulty of obtaining new capital to meet their requirements.

To this end, examination was made of the financial affairs of several important railroads which were considered as having high credit. These included practically all the roads whose bonds had been admitted to savings bank investment under the general provisions of the laws of New York and Massachusetts, a few exceptions being made of companies which showed features not regarded as normal. It was believed that the companies finally chosen, if their operation were merged into an average, would form a concrete illustration of the kind of property in which investors formerly had confidence.

The following are the 19 roads from which the average property was made up: Atchison, Topeka & Santa Fe; Baltimore & Ohio; Buffalo, Rochester & Pittsburgh; Chicago, Burlington & Quincy; Chicago, Milwaukee & St. Paul; Chicago & Northwestern; Chicago, St. Paul, Minneapolis & Omaha; Delaware & Hudson; Delaware, Lackawanna & Western; Illinois Central; Lake Shore & Michigan Southern; Louisville & Nashville; Maine Central; Michigan Central; Nashville, Chattanooga & St. Louis; New York Central & Hudson River; Norfolk & Western; Northern Pacific; Pennsylvania.

An analysis of the average financial statement made by these roads for the period 1900 to 1909 shows that there was then outstanding an amount of capitalization—representing funded debt, rentals capitalized at 5 per cent, and capital stock—equal to $5.40 for every dollar of gross earnings. Or, in other words, for every $100,000 of gross earnings there was $540,000 of capitalization.

The statement also shows that every dollar of gross earnings received was so employed as to be divided into two parts, one representing the cost of service, including maintenance and taxes, incurred in earning the dollar, and the other the amount available for the capital employed in earning the dollar. For every $100,000 earned, this division was as follows:

Cost of service	$67,400
Available for capital	32,600
	$100,000

To the amount of $32,600 available for capital, there was added $4,200 income from outside operations and investments, which made a total of $36,800. Of this amount available for distribution, a part was used to pay fixed charges in the form of interest and rentals; another part was paid to stockholders in the form of dividends; and a third part was retained by the company in the form of surplus. This disposition of the $36,800 was as follows:

Fixed charges	$16,300
Dividends	10,900
Surplus	9,600
	$36,800

As there was $36,800 available for return on capital and as the capitalization was $540,000, the maximum which could have been paid would have been the entire $36,800, and this would have amounted to about 6.8 per cent on the amount of capitalization. It will be seen, however, that only $27,200 was actually paid, and that this amount was equal to about 5 per cent on the capitalization.

It may be inferred from these figures that the investors of the $540,000 were satisfied with the payment of 5 per cent on their investment at that time, and that, for actual purpose of distribution, the railroads needed to have available only $27,200. The existence of the surplus, however, instead of being a matter of indifference, as might be inferred, was actually a matter of the greatest consequence.

Necessity for the Maintenance of a Surplus

The railroads in the years 1900 to 1909 were growing rapidly, and in order to meet the requirements of this growth were constantly demanding new capital. The amount required could be raised permanently only by the issue of bonds or stocks to permanent investors. In order to attract these investors it was necessary for the railroads to show that investment in their bonds and stocks meant safety of income. The only way in which this safety of income could be demonstrated was by proving the existence of a margin of safety which the investor would consider sufficient to meet contingencies.

A company which made a financial showing equal to the average of the 19 companies could offer bonds to investors with the statement that all fixed charges were earned about two and one-quarter times over. It could offer stock to the public with the statement that its dividends were earned nearly twice over. Under these circumstances investors showed themselves satisfied with the terms offered, as is evidenced by the fact that high-grade bonds of these railroads sold at times during this period at prices which yielded less than 3½ per cent, and that, except for short periods of financial disturbance, standard issues seldom sold below a 4 per cent basis. Similarly, in the years 1900 to 1909, many of the best railroad stocks sold at times as high as a 4 per cent basis and, except in the periods of disturbance mentioned above, seldom sold below a 4½ per cent basis.

If the average company had paid, as has been shown, $16,300 for interest and $10,900 for dividends, but had had no surplus, it would have had to sell bonds on the strength of a statement showing the fixed charges earned only about 1.67 times over, instead of two and one-quarter times. This would have meant more expensive financing.

If the stock could not be sold at par or thereabout, and if it be assumed that, with good properties, capitalization should represent actual value, and that stock issued at a discount means over-capitalization, then bonds would have to be depended upon entirely, and as the amount of bonds grew while the stock remained stationary, the fixed charges would require an increasing

*Abstract of paper presented at the Third Annual Convention of the Investment Bankers' Association, at Philadelphia, November 13, 1914.

share of the amount distributed to security holders, the margin over fixed charges would gradually decrease, and the company of good credit would inevitably become a company of poor credit.

MAINTENANCE OF CREDIT

If it was desirable that these railroads should have the credit which they enjoyed in this period, it would seem also desirable that this credit should be maintained. And this leads to some consideration of what is meant by the maintenance of credit. In commenting on this point in its rate decision in 1911, the Interstate Commerce Commission used the following language:

> The general rate of interest has advanced and the price of a bond bearing a given rate has, therefore, declined. This by no means indicates an impairment of railway credit. There is no reason to suppose that railroad bonds bearing a proper rate of interest might not readily be disposed of today.

It appears to be a sound contention that a higher interest rate does not necessarily imply a loss of credit, and it would seem to be beyond question that a 5 per cent bond should be as desirable as a 4 per cent bond from the standpoint of security if it is equally well protected. This latter point, however, is of the greatest importance.

In order to maintain an equal credit over a period of years a company must maintain substantially the same ratio between net earnings and fixed charges. It is plain, therefore, that if the fixed charges increase, the protection in the form of surplus must increase proportionately if the same degree of protection is to be maintained. Generally speaking, the same consideration holds true as to dividends and their protection.

Consequently, it will be seen that the requirements of a company in the way of fixed charges and dividends cannot be considered independently of the surplus which is required to protect them. It has been shown in the figures for 1900 to 1909 that the capitalization of the average property received 5 per cent and that investors were satisfied with it. But it has also been shown that an additional 1.8 per cent was earned on this capitalization, and it may be assumed that the 1.8 per cent was necessary to keep the holders of the capitalization satisfied with the 5 per cent.

If it is true that the surplus is necessary in order to give investors assurance of protection to their income, and that a lack of surplus leads to a cessation of investment, it must be granted that a surplus is as much a part of the cost of capital as the part which is actually paid to the investors in charges and dividends. As charges and dividends must come from the current yearly earnings of a property, the surplus must also come from this source as surely as must the payments for the current operation of the property.

There has been in the past some lack of agreement as to the functions of a surplus, which has come from confusion between the ultimate disposition of a surplus and its reason for existence. As recently as the rate case decided in 1911, it was contended on the one hand that surplus earnings were needed to provide funds for improvements, and on the other hand that the users of the railroads ought not to be called upon to pay higher rates in order to provide the railroads with money which should properly be raised from new capital.*

The apparent lack of agreement, however, arises from the fact that the disposition of the surplus is merely an incident arising from its existence. The fundamental fact is that the railroads must prove to the investors that they are earning every year a sufficient surplus to serve as protection to the investors' income. When this surplus has once been earned it may be used to improve the property, or to reduce by means of sinking funds the obligations of the corporation, or to purchase additional property.

It may be assumed, then, that the investors will assess upon the railroads, as the cost of the capital which they supply, a fair return upon this capital in the form of annual payment, and a further amount by way of protection which, when earned, is left at the railroads' disposal. There is no assurance, however, that these requirements will remain the same over a period of years, because there is no assurance that the rates for money will remain stationary.

The tendency of rates of investment to fluctuate makes it inevitable that a return which was satisfactory to investors in the period from 1900 to 1909 may not be equally satisfactory in a different period. Where 5 per cent on the capitalization was at one time satisfactory, investors may at another time require 5½ per cent or 6 per cent, and may require this 5½ per cent or 6 per cent to be as well protected against contingencies as the 5 per cent had been.

Applying such a supposition to the case of the railroads, a demand by investors for 6 per cent instead of 5 per cent in the way of actual payment and a surplus proportionate to that which protected the 5 per cent payment would considerably increase the requirements of the railroads; and if added to the cost of service the total might amount to more than the available gross revenue. For instance, on the basis of $540,000 capitalization, and with the same allowance for other income as actually received in 1900-1909, a 6 per cent payment would result in bringing the cost of capital and service incurred in earning $100,000 up to $106,900, as follows:

Cost of capital	$39,500
Cost of service	67,400
	$106,900

The cost of service is, of course, liable to fluctuation from the effect of changes in wages, prices and other operating conditions. If either cost of service or cost of capital, or both factors, increase, while the revenue remains stationary, a case may be presented similar to that suggested, where $106,900 is required and only $100,000 is earned; and the railroads are put in the uncomfortable position of being unable to meet their requirements out of their earnings. Consequently, if relief from this impossible situation is to be had, it must come in one or another of two ways.

1. The cost of service, or the cost of capital, or both, must again be decreased to a point within the $100,000, or—

2. The $100,000 must be increased to a point which will cover the increased costs of service and capital as, for example, to $106,900 in the case shown above, after which each factor will resume its place as a proportionate part of the gross earnings and the parts will once more be in adjustment.

It appears, however, that under the conditions which actually existed in the period from 1900 to 1909, the $100,000 was sufficient to meet the demands upon it, and that the cost of service and cost of capital were adjusted in a manner which was satisfactory for that period, the test of successful adjustment being that capital flowed freely from the investors to the railroads, and the investors were apparently satisfied with the conditions surrounding their investments.

THE SHOWING FOR 1913

After the foregoing consideration of the figures for the years 1900-1909, and the conclusions which may be drawn from these figures, namely, that the various factors which determined the financial showing of the 19 companies appeared to be correctly proportioned according to the conditions then existing, reference may be made to similar figures for the year 1913, showing the operations of the same 19 companies in that year.

These figures show that for every $100,000 of gross earnings there was outstanding in 1913 $505,000 capitalization as against $540,000 in the period 1900-1909. Each $100,000 was divided as follows:

Cost of service	$74,300
Available for capital	25,700
	$100,000

To the $25,700 there was added $6,600 income from other in-

*Decision, February 22, 1911, p. 265.

vestments, making $32,300 in all, and this was disposed as follows:

Fixed charges	$14,200
Dividends	12,000
Surplus	6,100
	$32,300

The bearing of these figures will perhaps be better appreciated if placed in comparison with the figures for the period 1900-1909.

	10-Year Period	1913
Gross	$100,000	$100,000
Cost of service	67,400	74,300
Available for capital	32,600	25,700
Other income	4,200	6,600
Total available for capital	36,800	32,300
Fixed charges	16,300	14,200
Dividends	10.900	12,000
Surplus	9,600	6,100

The cost of service incurred in earning $100,000 in 1913 had considerably increased over that for the 10-year period. This increase was the final result of the increased cost of wages and materials and other operating factors in the face of the efforts of the railroads to obtain more economical operation.

It is assumed that the 19 railroads, being among the best in the country, commanded the services of managers who used their best efforts toward counteracting rising costs by increased efficiency. In fact the records of these companies show a greatly increased efficiency of operation; and in the absence of evidence that these railroads were burdened with lax and inefficient management, it may be assumed that the rise in cost of service from $67,400 to $74,300 was inevitable, and took place in spite of every reasonable effort on the part of the railroads to offset it.

This increase in the cost of service left a smaller amount available for capital, so that even with a slightly larger revenue from outside investments, the total amount available was $32,300 as compared with $36,800 for 1900-1909.

It has been shown above that there was in 1913 $32,300 available for capital as against $36,800 for the 10-year period. There were indications, however, that the requirements for capital in 1913 might be somewhat reduced from those of the 10-year period. In the first place the total capitalization was only $505,000 as against $540,000 for the earlier years. Of this capitalization, fixed obligations were only $320,000 as against $340,000 in 1900-1909, and the ratio of charges paid on these obligations was even less, the amount paid being only $14,200 in 1913 as against $16,300 in the earlier period. This would seem to indicate that the cost of capital would be less burdensome as there was a smaller amount on which to pay a return, and that the credit of the railroads should also be improved by the fact that fixed charges were somewhat reduced. A further apparent indication of the good treatment of capital came in the fact that while the amount of stock decreased from $200,000 to $185,000, the amount paid out in dividends increased from $10,900 to $12,000.

No conclusion can be drawn from these facts otherwise than that they have greatly assisted the railroads to exist on the revenue which they have been receiving at a time when costs for service were constantly increasing. No other conclusion is sought to be drawn from them. In order, however, to place them in their proper light as bearing on the present inquiry, it must be understood under what circumstances these facts came about.

The entire capitalization over the period was shown to have decreased somewhat, and this might be assumed to indicate a lower initial cost of financing the railroad business. It is necessary to remember, however, that the existence of substantial amounts of surplus has led to expenditures for improvements without increase of new capital issues, *first*, by the expenditure of the surplus itself, and *second*, by funds derived from premiums on stock made possible by high credit due to the existence of the surplus.

To the extent to which this can be carried out, the railroads are able to improve their position somewhat, as has in fact been done; but as normal growth of traffic leads to constant capital expenditures it should be plain that in years when substantial amounts of surplus are not available, recourse must be had to new capital for the entire expenditures required. The expense of financing the railroad business in order to gain $100,000 gross earnings is not stationary, any more than the cost of operation, and in view of the higher prices in recent years of labor and materials, and the increasing demands for improved service, the conclusion should not be hastily drawn that, because the face value of the capitalization was less, it required less actual investment to obtain $100,000 revenue in 1913 than in earlier years. The conclusion should perhaps rather be drawn that the necessary surplus earnings demanded by the investors have enabled the railroads to meet the requirements of their growth without incurring the fixed charges which would have been required by the issue of the entire amount in the form of new capital if the surplus had not existed. Expenditures for additions and improvements from surplus or premiums on stock are invested capital, as well as the amounts represented by the face value of capital obligations.

With regard to the lower rate paid in fixed charges, this would appear to be contrary to the tendency of the period under consideration as officially recognized by the Interstate Commerce Commission in the quotation already cited, and as evidenced by known facts. Some study of the obligations of these railroads will show, however, as a factor bearing upon this situation, that at the beginning of the period 1900-1909, the railroads were paying the cost of capital raised many years before, when money rates were high and railroad credit lower. Between 1900 and 1913 over $300,000,000 bonds bearings rates of 5, 6, 7 and even 8 per cent were refunded by these companies, and the replacing of these in a large measure by bonds bearing a much lower rate at a time when circumstances were more favorable than in the past or than now existing, provided a further means by which the railroads were enabled to offset higher costs of operation.

With regard to the higher dividends, the fact that the rate for 1913 was higher than that for the period 1900-1909 might seem at first glance to show that the stockholders had had their dividends raised in the face of rising costs of operation, and in a period when the railroads were actually asking relief in the way of higher rates for service. Consideration of the rates of dividend paid, however, shows that there has been very little change in the last few years and that the difference between 1913 and the 10-year period lies in the fact that during the earlier part of the 10-year period some of the 19 roads, in order to improve their credit and financial standing, were paying very low dividends, or none at all.

When these facts are properly understood and given their true value, they may be taken to show, as has been suggested above, that they permitted the railroads to have an easier task in meeting the higher cost of service than would have been the case if the conditions of the earlier period affecting capital had still been operative. The effect of these conditions was reflected to some extent in the figures for 1913, which showed that on $505,000 of capitalization there was an amount available for interest and dividends of $32,300, or 6.4 per cent. This compares with 6.8 per cent in the earlier period. Of this $32,300, $26,200 was actually paid out in interest and dividends, amounting to 5.2 per cent as against 5 per cent in 1900-1909. And this left a surplus of $6,100, or 1.2 per cent on the $505,000 as against 1.8 per cent surplus in 1900-1909. This may be more easily followed in the form of a table:

	1900-09	1913
Earned on capitalization	6.8 per cent	6.4 per cent
Paid on capitalization	5.0 per cent	5.2 per cent
Surplus on capitalization	1.8 per cent	1.2 per cent

It would not appear, in view of this statement, that the security holders of these railroads taken as a whole were worse off in 1913 than in the earlier period by way of return actually received on their investment. They were, in fact, receiving a

little more on the face value of their securities than the average received in the period 1900-1909. Owing to the reduction of fixed charges the railroads could still offer bonds with the statement that fixed charges were earned about two and one-quarter times over, and while the amount of margin over dividends was not so large as it formerly was, there was still a substantial margin.

It has been shown, however, in the period 1900-1909, that the test of the successful adjustment of revenue between cost of service and cost of capital was the fact that securities flowed freely from the railroads to the ultimate investors. If this test is applied to the conditions of 1913 it will be found that this feature was lacking. Instead of long-term bonds and stocks being taken readily by investors, it appears that the investors showed little enthusiasm for railroad securities. When bond issues were discussed the investors would only offer prices yielding a rate at which the managers of the roads thought it imprudent to finance permanently; and at the same time railroad stocks which had formerly sold well above par, now sold so near par, although receiving the same rate of dividend, that new offerings of stock at par no longer bore the character of bargains and were rejected as impracticable.

Accordingly, the flow of securities from the railroads to the investors was checked. And this showed itself by the appearance of a quantity of short-term notes representing temporary financing.

The failure of this test which was applied successfully to the earlier period indicated that some part of the delicate financial adjustment of the railroads was out of order; and a summary of the facts seemed to indicate that while these railroads were paying as large a return to capital in 1913 as in the earlier period, there was some question as to whether they should not be paying a still larger return in order to attract the necessary new funds.

To illustrate: In July, 1901, a Chicago, Milwaukee & St. Paul general mortgage 4 per cent bond due 1989, which is a fair sample of a high-grade railroad bond, sold at about 110, at which price it yielded about 3.62 per cent. In July, 1905, it sold at 111, yielding about 3.58 per cent. In July, 1909, it sold at 104, yielding 3.84 per cent. Whereas in July, 1913, it sold at 91, yielding 4.41 per cent.

Similarly, Pennsylvania Railroad stock, a standard investment, paying 6 per cent in each of the years named, sold in 1901 at 152, yielding about 3.95 per cent; in 1905 at 140, yielding about 4.30 per cent; in 1909 at 136, yielding about 4.40 per cent; and in 1913 at 111, yielding about 5.40 per cent.*

It is not necessary to multiply instances. The facts are plain that the yield which investors required from their investments was considerably in excess in 1913 of what it was in the period 1900-1909. Neither is it necessary to discuss whether this was more particularly true of railroad securities than of other forms of investment. Its application to the present inquiry comes in the fact that while the rate required by investors had advanced ½ per cent to ¾ per cent on bonds and 1 per cent to 1½ per cent on stocks, the advance in payment by the railroads on their capitalization had risen only from 5 per cent to 5.2 per cent, and in the further fact that it had been necessary to cut down the surplus which existed as protection from 1.8 per cent to 1.2 per cent.

It may be mentioned at this point that capital is perfectly independent. It will go into enterprises which appeal to it, and stay out of enterprises which do not. In order that it should be attracted its requirements must be met. In this particular instance, if it were necessary to figure 1 per cent on the entire capitalization of these railroads, as the measure of additional payment required by investors as the result of the tendencies noted above, the conditions would exist which were outlined at an earlier point in this discussion, where, instead of 5 per cent paid on capitalization, 6 per cent must be paid. As applied to $505,000 capitalization this would lead to a total cost of railroad service in 1913, which may be shown as follows:

Cost of service	$74,300
Cost of capital	34,300
	$108,600

It has previously been shown in a similar instance that if the gross revenue can be advanced to meet the $108,600 the component parts will take their proper proportion and the adjustment will again be satisfactory. In this case, however, the investors are confronted with the fact that the railroads are prevented from raising their revenue from the $100,000 to the $108,600. If this revenue cannot be raised, the machinery must stay out of adjustment until some forces bring about a lessening of the cost of service or the cost of capital. Pending such a readjustment, the investors prefer to withhold their capital, or invest it in other kinds of enterprise.

In attempting to look toward an adjustment, proper attention should be given to the fact that the accumulated capital expenditures made by the railroads in the last few years still await financing, existing at present in the form of short-term notes. Proper attention must also be given to the fact that the railroads, having for the most part issued mortgages on their properties, have in many cases exhausted the authorization of these mortgages and must pay for new capital on a basis of general and refunding mortgage bonds, which will be more expensive than that required by the high-grade bonds which have been sold in the past.

It must also be given proper consideration that the foregoing figures and conclusions relate not to railroads in general, but to a few selected roads of the highest credit, and represent, moreover, the conditions and problems of these roads as they existed in the year 1913. If there had been no unfavorable developments in the present year, it still appears certain that readjustments would have had to be made in order to bring the affairs of these railroads into a condition where capital would be readily obtainable. The events of 1914, and their effect upon the market for capital, intensify the conclusions reached as to 1913, and indicate that a sufficient readjustment to meet the conditions of that year would still fall short of meeting the conditions existing at the present time.

In noting the fact that these conclusions are drawn from the position of only the best railroads, it must be remembered that the readjustment necessary to maintain credit for these roads would still fail to give satisfactory credit to the average roads. Hence, such a readjustment must be regarded as a minimum for the railroad situation in general. In view of the conclusions reached, it would seem that this minimum would probably involve readjustment to a point where the return on capital—assisted by amounts of other income such as have been received in recent years—would require from 30 to 35 per cent of the gross earnings, and the cost of service from 65 to 70 per cent, as compared with an actual cost of service for 1913, as shown above, of 74.3 per cent.

It is believed that the events of 1914, following the tendencies shown in recent years, have made it possible to expect a return within any short period to the more favorable conditions of the years 1900-1909; and in view of these circumstances the railroads should seek a readjustment of rates to meet these conditions.

*Figures as of June 30 of each year.

Repairs to Damaged Railways in Argentina.—The Argentine government has presented to Congress a project authorizing the executive power to spend $1,700,000 in the repair of damage caused to government lines by recent floods and a further $850,000 to make up the deficit in operating these railways during the present calendar year. Rains and floods have destroyed many bridges and other railway properties in the provinces of Santa Fe, Catamarca, Tucuman, Salta and Jujuy. In the province of Santa Fe, where large tracts of land were under water and stations isolated, railway service on government lines is still irregular.

Locomotive Tests on the Chicago & North Western

Comparative Performance of Consolidation and Mikado Over 126-Mile District with 0.7 per cent Grade

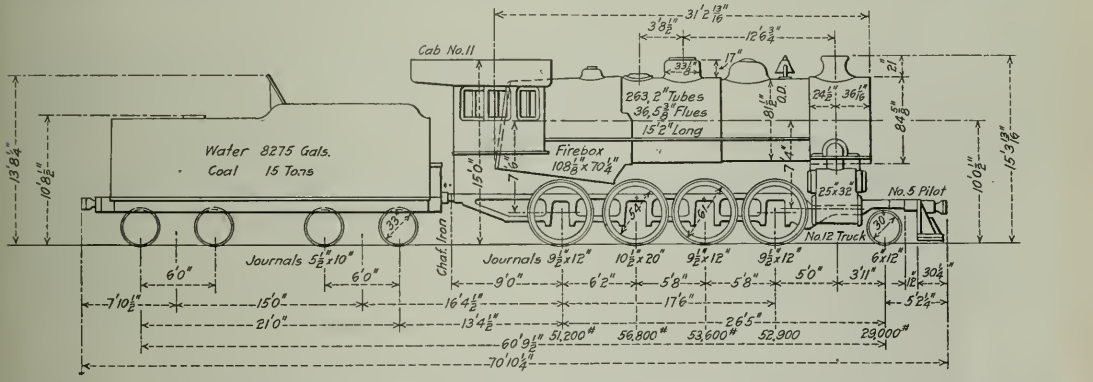
The Chicago & North Western has conducted comparative tests of Consolidation and Mikado locomotives in regular service, which showed the advantages of the Mikado locomotives for through freight service. Both types of engines carried the same boiler pressure, had the same diameter of drivers and length of piston stroke, the difference in power being obtained by a 2 in. larger cylinder for the Mikado locomotives. Two Consolidation engines and two Mikados were used in the tests, the Consolidations weighing 243,500 lb., with a tractive effort of 47,500 lb., and the Mikados 302,000 lb. with a tractive effort of 55,300 lb. The locomotives were built by the American Locomotive Company. The tests were made on the Galena division between Proviso, Ill., and Clinton. Every effort was made to have them as comparable as possible, and as will be noted in the table of results, the elapsed and running times were very nearly the same, and the mileages were practically identical.

The purpose of the tests was to determine the saving that could be made in hauling tonnage trains over this division with the Mikado type locomotive. The longest and heaviest grade going west is reached at La Fox, Ill., about 30 miles from Proviso. It is 1.7 miles long and has a grade of 0.7 per cent. Eastbound the hardest pull is encountered at Creston, Ill., for about five miles, the maximum grade being 0.7 per cent. A dynamometer car was used to record the speed and drawbar pull of the locomotive. Three sets of tests were made; the first, with two Consolidation engines hauling an average of 2,283.88 tons; the second, with two Mikados hauling an average of 2,804.96 tons; and the third with the same two Mikados hauling an average of 2,919.13 tons. The engines used in the respective tests made two round trips, and the tonnage hauled on each of the runs varied but little from the average as given above. The following table gives the average results obtained:

	Test I	Test II	Test III
Type of engine	Consolidation	Mikado	Mikado
Tonnage	2,283.88	2,804.96	2,919.13
Mileage	126.09	126.62	126.15
Time elapsed, hours	7.79	7.74	7.36
Time running, hours	6.15	6.28	5.87
Average drawbar pull, lb.	9,342.6	10,706.5	11,694.5
Average drawbar pull per ton of train, lb.	4.091	3.817	4.006
Coal used, tons	9.864	9.464	10.328
Water used, gal.	14,325	15,516	16,486
Average rate of working, hp.	512.14	577.57	671.33
Ton-miles	287,976	355,163	368,237
Coal used per drawbar hp. hr., lb.	6.254	5.203	5.237
Water used per drawbar hp. hr., lb.	37.96	35.77	35.03
Ton-miles per lb. of coal	14.81	19.26	18.12
Ton-miles per gal. of water	20.11	22.93	22.36

It will be noted that in the second series of tests the Mikado locomotives hauled 22.82 per cent more tonnage than the Consolidations, and in the third series the Mikados hauled 27.81 per cent greater tonnage. It will also be noted that the average drawbar pull per ton of train varied in each set of tests, although every effort was made to have conditions as nearly comparable as possible. For convenience, we will call the tests with the Consolidation locomotives, Test I; the first series of tests with the Mikado locomotives, Test II, and the second series of tests with the Mikado, Test III, as noted at the head of the columns in the table. Comparing Test II with Test I it will be seen that 4.06 per cent less coal was used, and at the same time a saving in the amount of coal per horsepower-hour of 16.81 per cent was obtained. In regard to the water, 8.31 per cent more was used, but a saving of 5.77 per cent was realized in water per horsepower-hour.

Comparing Test III with Test I it will be seen that 4.70 per cent more coal was used, but with a saving of 16.25 per cent in the coal consumption per horsepower-hour. At the same time



Consolidation Locomotive Used in Comparative Tests on the Chicago & North Western

15.09 per cent more water was used, although a saving was made of 7.72 per cent in the water per horsepower-hour.

Comparing Test II with Test III it will be seen that 4.07 per cent greater tonnage was hauled in Test III with an increase in the amount of coal and water used of 9.13 per cent and 6.25 per cent respectively. The coal per horsepower-hour also increased 0.65 per cent, but there was a decrease or a saving of 2.12 per cent in the amount of water per horsepower-hour. The following table gives in further detail the saving made by the Mikado type locomotive over the Consolidation:

PERCENTAGE INCREASE IN TESTS

	II over I	III over I	III over II
Pounds of water evaporated per pound of coal	12.94	10.08	*2.63
Average drawbar pull, lb.	14.60	25.17	9.23
Drawbar pull per ton of train	*6.72	*2.08	4.95
Average rate of working, hp.	12.78	31.08	16.23
Ton-miles per pound of coal	30.00	22.36	*5.87
Average drawbar-pull-miles per pound of coal	19.8	19.6	*0.19
Ton-miles per gallon of water	14.02	11.17	*2.50
Average drawbar-pull-miles per gallon of water	6.25	8.81	2.42

*Decrease.

The evaporation, the horsepower, and the ton-miles per pound of coal and water show a substantial saving for the Mikado locomotives. It will be noted that there is considerable difference between the percentage increase in ton-miles per pound of

coal of Test II over Test I, and Test III over Test I, which is all the more interesting when it is considered that the same engines made Tests II and III. This difference can be accounted for to a certain extent by the differences in the average drawbar pull of the train, or, in other words, the average train resistance. Therefore, if, instead of comparing ton-miles, the drawbar-pull-miles are compared, it will be found that the increase of Test II over Test I in drawbar-pull-miles per pound of coal is only 19.8 per cent, and in Test III over Test I the increase is 19.6 per cent, which shows less variation on account of the increase in tonnage.

Another important item shown in the second table is the percentage increase of the average drawbar pull of Test III over Test I, the amount being 25.2 per cent. Since there is only a difference of 16.2 per cent in the rated tractive effort of the two types of locomotive, this may be explained by the difference in their boiler capacities. According to the American Locomotive Company's method of calculation, the Consolidation has a 97.5 per cent boiler, while the same calculation for the Mikado gives 103 per cent, showing that the Mikado has a relatively larger steaming capacity. Further evidence that the Consolidation engines had more difficulty in generating the required amount of steam is shown by the fact that an average of 47.8 lb. of coal was burned per square foot of grate area per hour during the elapsed time in contrast to the Mikado locomotives burning

Ratios		
Weight on drivers ÷ tractive effort	4.52	4.12
Total weight ÷ tractive effort	5.13	5.45
Tractive effort × diam. drivers ÷ equivalent heating surface*	730	610
Equivalent heating surface* ÷ grate area	75	87.6
Firebox heating surface† ÷ equivalent heating surface,* per cent	6.1	5.49
Weight on drivers ÷ equivalent heating surface*	54	41.1
Total weight ÷ equivalent heating surface*	61.4	54.6
Volume both cylinders, cu. ft.	18.16	21.18
Equivalent heating surface* ÷ vol. cylinders	218.5	261
Grate area ÷ vol. cylinders	2.92	2.98
Cylinders		
Kind	Simple	Simple
Diameter and stroke	25 in. by 32 in.	27 in. by 32 in.

Mikado Type Locomotive Used in the North Western Tests

38.8 lb., and 44.5 lb. in Tests II and III respectively. The pounds of water evaporated per square foot of heating surface per hour for the elapsed time shows substantially the same difference.

In comparing the ton-miles per pound of coal and per gallon of water of Test III with Test II it will be seen that the hauling of the increased tonnage in Test III was accomplished at a sacrifice of efficiency in the amount of coal and water used. However, this decrease in efficiency will not be as large if the difference in the train resistance or average drawbar pull per ton of train is considered. Making a correction in this case, as was done before, the loss would be only 0.19 per cent in the drawbar-pull-miles per pound of coal, and there would be an increase in drawbar-pull-miles per gallon of water of 2.42 per cent.

The principal dimensions and ratios of the two locomotives tested are given in the following table:

General Data		
Type	Consolidation	Mikado
Service	Freight	Freight
Fuel	Bit. coal	Bit. coal
Tractive effort	47,500 lb.	55,300 lb.
Weight in working order	243,500 lb.	302,000 lb.
Weight on drivers	214,500 lb.	227,500 lb.
Weight on leading truck	29,000 lb.	28,000 lb.
Weight on trailing truck	.....	46,500 lb.

Water capacity	8,275 gal.	8,275 gal.
Coal capacity	15 tons	15 tons

*Equivalent heating surface = total evaporative heating surface + 1.5 times the superheating surface.

CHRISTMAS RAILWAY TRAFFIC IN BERLIN.—The elevated and underground railways of Berlin carried on Christmas eve and during the Christmas holidays, in round numbers, 750,000 paying passengers against 1,028,000 last year.

RAILWAY SERVICE IN BELGIUM.—The German government in Brussels has announced that from the beginning of January railway traffic in Belgium will be greatly improved. Several new trains have already been added and traffic between Antwerp and Brussels is regular, though the journey still takes two hours. The Belgian railway lines have been exploited by the German authorities since November 19.

CAR POOLING ARRANGEMENT ON INTERNATIONAL & GREAT NORTHERN AND SUNSET-CENTRAL LINES

An interesting arrangement was entered upon on October 1, 1914, by the Sunset-Central Lines and the International & Great Northern under which the freight cars of both railways are used in common, for the purpose of increasing car efficiency and decreasing operating expenses. The plan was adopted experimentally and after a two months' trial it was found that it had equalled, if not exceeded, the expectations of both parties, to the extent that it is now deemed advisable to include other carriers. At least three others have expressed a desire to join in the plan, and it is likely therefore that an expansion for trial purposes will shortly take place. A joint statement outlining the working out of the arrangement during the months of October and November has recently been prepared by J. B. Heafer, superintendent of transportation of the International & Great Northern, and O. C. Castle, car service agent of the Sunset-Central Lines.

The agreement between the two roads provides that each may use as its own the freight cars of the other; that, is those bearing the initials of the International & Great Northern, the Galveston, Harrisburg & San Antonio, the Houston & Texas Central, the Houston, East & West Texas, the Houston & Shreveport, the Iberia & Vermillion, the Louisiana Western, Morgan's Louisiana & Texas and the Texas & New Orleans. The agreement also provides that such cars may be loaded in any direction without regard to the car service rules and without incurring penalty under per diem Rule 19 of the American Railway Association. Either subscriber may include as its own, cars which do not bear its initials by filing with the other subscriber the authority of the owning road.

Each road undertakes to supply an equal number of cars under this agreement. When a road has provided an excess of cars equal to 10 per cent more than the other subscriber, the creditor road may make demand by telegraph or telephone upon the designated officer in charge of car distribution of the debtor road for an equalization within seven days, the demand to be confirmed by letter. The debtor road may then equalize by delivering to the creditor the requisite number either of the creditor road's cars or the debtor road's serviceable cars.

Failing to equalize within the prescribed period the debtor is to pay to the creditor $2 per car per day for the excess number of cars then or thereafter in the possession of the debtor, beginning after midnight of the sixth day following the date of the written demand, and continuing until equalization is made. This rate is to be in addition to the regular per diem rate.

If the records of the creditor and debtor subscribers differ as to the number of cars necessary to the equalization, it is to be made on the basis of the average of the statement of the two subscribing roads. Payment is to be made within 30 days after the close of each month, based on actual figures ascertained by joint check. The agreement provides that it may be terminated upon 30 days' advance notice in writing served by the subscriber desiring to terminate the agreement. Misunderstandings which cannot be promptly settled are to be referred to the per diem rules arbitration committee of the American Railway Association, as provided in the case of disputes under the regular per diem rules.

The joint statement prepared by Mr. Heafer and Mr. Castle is in part as follows:

"As illustrative of the cars involved at the commencement of the plan, namely October 1, and at the close of November, the following figures are presented:

	Nov. 30, 1914	Sept. 30, 1914
I. & G. N. cars on Sunset-Central	469	117
Sunset-Central cars on I. & G. N.	394	123
Bal. vs. I. & G. N.	..	5
Bal. vs. Sunset-Central	75	..

"The balance is kept account of daily. Each road furnishes figures showing the number of the other road's cars on its line. This maintenance of a practical balance throughout the two months' trial has been automatic, no demand for or offer of equalization having been made.

"From time to time local exceptions have been made to accomplish an economical distribution of cars for the two systems. For instance, at Houston the I. & G. N. received from the Sunset-Central Lines, coal cars loaded with gravel, stone, etc., for local delivery, which cars were not needed at or near Houston by the I. & G. N., and were needed by the Sunset-Central Lines. The I. & G. N., therefore, honored orders from the Sunset-Central Lines for a number of empty coal cars daily equal to the number of I. & G. N. and Sunset-Central coal cars delivered under load by the Sunset-Central Lines to the I. & G. N., at Houston, for local switching. At San Antonio the situation is reversed, coal cars being delivered by the I. & G. N. to the Sunset-Central Lines in switching service, and returned to the I. & G. N. empty on open orders. These empty returns, brought about by the local arrangements referred to, would have occurred even though the two lines had constituted one single system. These open orders are filled with cars of either ownership, which makes for economy in switching.

"As illustrative of cars interchanged in September, the month immediately preceding the inauguration of the plan, and November, under the agreement, the following figures are presented:

	November, 1914			September, 1914		
	Loaded	Empty	Per cent Empty	Loaded	Empty	Per cent Empty
I. & G. N. cars received by S.-C. L.	534	207	27.9	570	126	18.4
I. & G. N. cars delivered by S.-C. L.	472	189	28.6	217	465	68.1
S.-C. L. cars received by I. & G. N.	765	194	20.2	268	42	13.5
S.-C. L. cars delivered by I. & G. N.	521	382	42.3	103	176	63.1

"It will be noted that a striking reduction has taken place in the percentage of empty cars to the total deliveries. The delivery by the I. & G. N. of Sunset-Central empties dropped from 63.1 per cent to 42.3 per cent, and the delivery by the Sunset-Central Lines of I. & G. N. empties dropped from 68.1 per cent to 28.6 per cent.

The instructions issued by the Sunset-Central Lines governing the handling of International & Great Northern cars on the Sunset-Central Lines, signed by O. C. Castle, car service agent, with the approval of F. M. Lucore, assistant general manager, illustrate some of the details of the operation of the plan. They include the following:

1. Cars for Loading: Any I. & G. N. car may be placed for loading under the same conditions that govern the use of Sunset-Central cars. This includes loading to foreign lines when necessary.

2. Empty Cars: Good order I. & G. N. cars, when empty, will be handled the same as system cars. They will not be returned to owner unless so ordered by the car service agent, and when they are not needed for loading they will be stored at the nearest available point.

3. Bad Order Cars: Bad order I. & G. N. cars may be given the same attention as system cars, except when otherwise ordered by the mechanical department, but repair bills will be made under the M. C. B. rules the same as heretofore.

4. Acceptance from Foreign Connections: I. & G. N. cars not routing home via the Sunset-Central will be accepted from other foreign lines on special instructions from car service department.

5. Home Route Cards: The use of Form 4005, home route cards, will be discontinued on I. & G. N. cars.

6. Sunset-Central Cars Offered for Home: We will not receive our cars empty from the I. & G. N., unless they are moving under M. C. B. home route cards, for equalization or on orders for cars to load, advice of which must be received through the car service department.

7. Equalization: The car service department will keep a record of the car balance, and, when necessary to equalize, it will order the delivery or receipt of a given number of cars via various specified junctions. When such instructions are received equalization may be made in cars of either ownership or of any class, unless instructions provide otherwise.

LOCOMOTIVE SUPERHEATERS

The discussion of the report on "Steam Locomotives of Today" before the December meeting of the American Society of Mechanical Engineers brought out some interesting data on superheaters. Extracts from the discussion follow:

DISCUSSION BY GEORGE L. BOURNE

Geo. L. Bourne, vice-president, Locomotive Superheater Company: The locomotive boiler, when considered for the application of a superheater, presented many limitations that necessarily have an important bearing on the design and construction of the superheater. These limitations are more readily appreciated when it is remembered that the development of the locomotive, within certain fixed side and overhead clearances, has been dependent on the size of the boiler; that is, as the size of the locomotive has grown, each pair of wheels has been added to obtain proper weight distribution in order to accommodate increased boiler sizes. As a natural consequence of these conditions, the boiler is no larger than is absolutely necessary; in fact, in the majority of cases it is insufficient in evaporating surface and we have what is commonly termed a locomotive that is overcylindered.

The application of the superheater to this boiler, frequently inadequate as to heating surface, necessitates a reduction of about 15 or 20 per cent in the tube heating surface. This is occasioned by the use of the large flues in which the superheater units are located. Furthermore, a certain percentage of the gases which formerly were all available for evaporation of the water must now be used for superheating the steam, since the superheater does not provide for any increase in the maximum rate of combustion. Taking this boiler with

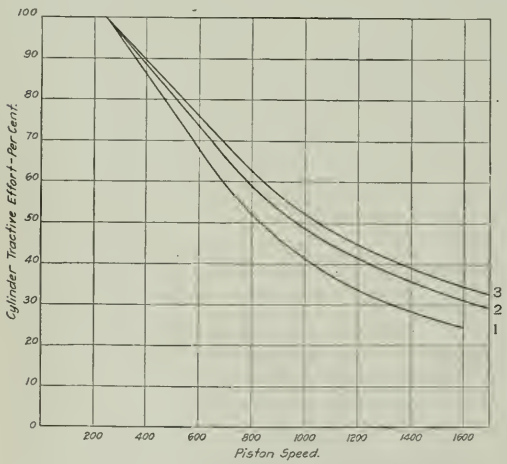

Diagram Showing Possibilities of Superheating

its deficiencies, the superheater designer has been able to produce an economy of 25 per cent in fuel, as a direct result of saving one-third of the total water evaporated per unit of power developed. As a result of this fuel economy, greater capacity of the locomotive has resulted.

As an illustration of this fact, the accompanying diagram is presented. It shows cylinder tractive effort in per cent plotted against piston speed. The lowest curve, No. 1, very fairly represents the speed factor for an average saturated steam locomotive. Curve No. 2 similarly represents the average modern superheated steam locomotive, using between 200 and 250 deg. of superheat. The greater tractive effort available is due to the fact that a longer cut-off is possible with the superheater engine at comparative speeds. The limiting factor at the usual speeds is the ability of the boiler to furnish steam.

These results have been accomplished in the face of boiler limitations, parts of the locomotive not adaptable to the use of highly superheated steam, and lack of experience in the organization which must handle the locomotive. The problems incident to these conditions are rapidly being worked out, and results shown by the superheated steam curve will soon be as basic as the saturated steam locomotive curve was a few years ago. The future then holds a possibility for further saving by increasing the degree of superheat.

The superheater engineer has only made use, thus far, of the same variety of flue sizes as was used by the locomotive designer for tube sizes. If the superheater designer is permitted the use of a size different from the two present standards, it is possible to obtain in a superheater boiler an evaporating surface practically as great as in the saturated steam boiler. The superheating surface in this case will be a net gain to the heat absorbing surface of the boiler. With a boiler and superheater thus arranged, greater capacity may reasonably be expected, and a curve approximately that shown as No. 3 may be confidently looked forward to in the near future.

Where the operation of superheater locomotives has become as much the standard practice as the operation of saturated steam locomotives was a few years ago, and where the question of coal economy is of vital importance, consideration of the possibility of reaching locomotive power to the amount represented by curve No. 3 cannot be refused. For some time past large passenger locomotives have been operated very successfully with steam chest temperatures running between 750 and 800 deg. F. Curve No. 3 is representative of locomotives using this degree of steam chest temperature, which means 350 to 400 deg. of superheat.

DISCUSSION BY C. D. YOUNG

C. D. Young, engineer of tests, Pennsylvania Railroad, stated: It has been proved that economy due to superheating increases almost directly with the degree of superheat, and the usual type of fire tube superheater produces its maximum superheat only when it is forced close to the limit of boiler capacity, these facts having been developed and recently published by the Pennsylvania Railroad in bulletin No. 24, entitled "Superheater Tests." This condition is not altogether desirable, as the maximum economy should be obtained when the locomotive is working under moderate or average conditions and at an economical cutoff. A superheater that would give a uniform superheat under all conditions of working would apparently produce ideal results.

If our materials in valves, cylinders and packing, as well as the lubrication, will withstand a certain high degree of superheat, there is no reason why we should not furnish this degree of superheat, regardless of the boiler rate, in order to effect the greatest economy in steam. With the usual Schmidt superheater we have observed steam temperatures as high as 670 deg., corresponding to a superheat of 291 deg. at the steam chest pressure, which was 180 lb., while the boiler pressure was 206 lb. With these conditions the steam rate per horsepower hour was 19.3 lb., the speed 47 miles per hour and the cut-off 50 per cent. With this superheat and a cut-off of 25 per cent it is reasonable to suppose that a water rate approximating 15 lb. could be obtained. For this reason, I am pointing out the desirability in future designs of superheaters to produce, if it is possible, a superheater that will give us a uniform superheat, regardless of the evaporation of the boiler, and until such a superheater has been produced, the maximum economy and capacity from the boiler cannot be obtained under all working conditions.

Arbitration of Engineers' and Firemen's Demands

Witness for the Employees Attempts to Show That Productive Efficiency Has Increased Faster Than Wages

The hearing before the board of arbitration on the wage demands of the engineers and firemen employed on the railroads west of Chicago, which had been adjourned over the holidays, was resumed at Chicago on January 4, and the principal witness throughout the week was W. J. Lauck, statistician for the engineers and firemen. Mr. Lauck's testimony was based mainly on a series of elaborate statistical exhibits. He said the engineers and firemen never have conceded that the settlement of 1909 and 1910 was full, complete or satisfactory. "It was simply the best we could get at that time under the existing conditions," he said, "and without resorting to the drastic measures of a strike, so that the question before this board today is not an arbitration of the conditions of 1914 over 1910, but of questions that have been in dispute since 1890."

Warren S. Stone, grand chief of the engineers, said it was proposed to show by these exhibits that during the past 24 years the western railroads have made remarkable gains in productive efficiency, which have been followed by a threefold effect upon engineers and firemen, increasing their labors and rsponsibilities, increasing their productive efficiency, and reducing their earning capacity even at the increased rates of payment. He said that the tendency is to add still further to the trainloads and make still further increases in the labor and responsibilities of the engineers and firemen, and that the revenue gains arising from the advances in efficiency have been sufficiently great to pay all increases in operating costs, as well as reasonable returns on additional capital investment, and in addition to leave an ample surplus to remunerate engineers and firemen. He said it was expected to show also that the increased operating costs have not been due to additional outlays for labor, and that as a matter of fact labor costs of operation have actually declined.

The witness first introduced three exhiibts entitled "Increased Work and Productive Efficiency of Locomotive Engineers and Firemen," for the periods 1890 to 1913, 1900 to 1913 and 1909 to 1913. The comparative statement for 24 western roads from 1890 to 1913 showed that freight ton miles had increased 343 per cent, ton miles per freight train mile 163 per cent, freight train miles 68.8 per cent, and coal consumed 305 per cent, while the ton miles for each $1,000 of outlay for engineers, or their "productive efficiency," had increased 161 per cent, and for firemen 141 per cent. The number of engineers and firemen in freight service had been obtained by dividing the total number in freight and passenger service on the revenue train mile basis. Comparing 1900 with 1913 the exhibit showed that the ton miles per $1,000 compensation to freight engineers had increased 18 per cent and to firemen 14 per cent, for 40 representative western roads. Comparing 1909 with 1913 the exhibit showed that the ton miles per $1,000 compensation to freight engineers had increased 4.68 per cent, and in the case of freight firemen had increased 4.55 per cent, for 78 representative western railroads. "This exhibit shows," he said, "that freight train, freight locomotive and total revenue train mileage have not increased proportionately with other factors. As a consequence, although the rate of pay per locomotive mile may have increased, the earnings of employees are smaller now than formerly because of the impossibility of making more mileage."

Mr. Lauck was questioned at considerable length by members of the board of arbitration as to his views as to how wage increases should be related to the "productive efficiency" of the men and of the roads. He thought the men ought to share in the increased productivity of a road, and that in the case of "an economic advancement" labor should participate in the productive gain, even though it may be an unearned increment, but in the case under discussion he thought increased requirements had been placed upon the men and that they have a reasonable ground for requesting to participate further in results of the productive efficiency which had grown out of the co-operation of both labor and capital. He said he did not believe in leveling up people by the force of bargaining power, but that if standardization were based on the size of the engines and applied to average conditions a man would be required to perform the work required by the size of his engine, that the railroads should see to it that they do not have men below the average of competency, and that an unusually efficient man should be compensated in some way for his increased efficiency.

James B. Sheean, attorney for the General Managers' Conference Committee, asked if there should be some consequent reduction in the pay of men because of decreased efficiency in the passenger service. Mr. Lauck replied that he did not think the engineers should be held responsible for the lack of productive efficiency, if the railroads through competition ran too many passenger trains. That was a condition over which the engineer had no control.

Mr. Lauck's exhibits also gave figures for individual roads and groups of roads as to increases in efficiency, but by applying the same methods to the operations of the Chicago, Rock Island & Pacific it was shown that notwithstanding the increased efficiency of the road the ton miles per $1,000 outlay for engineers and firemen had decreased. Mr. Sheean asked many questions in the effort to bring out why this condition existed, and the witness said he was unable to give any satisfactory explanation, except that there was something the matter with the financial management. The Rock Island for the period 1890-1913 showed an increase in freight trainload of 106 per cent, an increase in ton mileage of 302 per cent, handled by an increase in freight train miles of only 73.27 per cent, but there was a decrease in the number of ton miles hauled per $1,000 of outlay for engineers and firemen.

In an exhibit on "Revenue Gains Arising from Increased Productive Efficiency," Mr. Lauck gave figures to show, for 24 representative western railroads, the increased cost of engineers and firemen and revenue gains per revenue train mile from 1890 to 1913. These showed that while the cost of engineers had increased 2.20 cents per train mile and firemen 1.59 cents, and the total cost of engineers and firemen 3.79 cents, total operating expenses per revenue train mile had increased 68.53 cents, and total operating revenue 95.4 cents, making a net gain in operating revenue of 26.87 cents per revenue train mile. "The increased productive efficiency of labor and capital engaged in conducting transportation on these railroads, therefore," he said, "not only reimbursed the company for added costs but also yielded a handsome profit. It is at once evident that reasonable wage increases to enginemen would absorb only a very small portion of the net gain realized during the period under consideration." In an exhibit giving similar figures for the period 1900 to 1913, he showed an increased outlay per revenue train mile for locomotive engineers and firemen of 4.08 cents. During the same period there was an increase in total operating expenses of 57.46 cents, and in operating revenues per revenue train mile of 73.48 cents, leaving a net gain in operating revenue over and above all additional expenses of operation for 48 representative western roads of 16.02 cents. Mr. Byram commented on the fact that in these tables he had figured increases in cents instead of in percentages. Another exhibit gave the same comparisons for 1909 to 1913.

Three exhibits entitled "Increased Operating Costs of Western Railroads Not Due to Wage Payments to Locomotive Engineers and Firemen," covered the periods 1890 to 1913, 1900 to 1913, and 1909 to 1913. The first exhibit showed that the ratio of total

cost of engineers and firemen to total operating expense in 1890 was 9.89 per cent. In 1913 the proportion was 8.06 per cent. Mr. Sheean showed, however, that there had been a considerable change in the accounting methods affecting operating expenses during the period. The exhibit comparing the years 1909 and 1913, showed that total labor costs constituted a larger proportion of operating expenses in 1913 than in 1909, but Mr. Lauck said that the advance was not due to added outlays during this period for engineers and firemen. The ratio of the cost of engineers and firemen to total operating expenses was given as 7.85 per cent in 1909, and 7.94 in 1913. Moreover, the ratio of the cost of engineers and firemen, as well as the ratio of the total labor cost of transportation to the total labor cost of operation, he said, was less in 1913 than in 1909. The advance in labor costs, he said, has been primarily due to additional payments to labor engaged in maintenance work.

Mr. Lauck was asked both by Mr. Sheean and by Mr. Nagel whether, on account of the increased efficiency of a road, employees should receive additional compensation, whether or not they were employed in the department in which the increased efficiency was shown, or whether or not they personally contributed to the increased efficiency. He cited the case of the Ford Motor Company as one of remarkable productive efficiency developed by managerial ability, in which a large part of the profits were distributed among the employees, although he said, they probably did not contribute very much to the increased efficiency. "If we are going to have industrial progress," he said, "we ought to give participation to the worker after a fair remuneration has been given to capital for risk and managerial ability."

One exhibit was made up of quotations from the article published in the *Railway Age Gazette* of April 10, 1914, on "The Possibility of Future Increases in Train Loads," which the witness said was to show that the railroad presidents expect a further increase in freight trainloads.

An exhibit entitled "Revenue Gains by Representative Western Railroads Available to Compensate Locomotive Engineers and Firemen for Increases in Work and Productive Efficiency," showed that for 43 representative western roads the average gross corporate income per year had increased for the five years ending with 1913 over the five years ending with 1908, by $122,321,295, and that after subtracting $26,116,487 for "deductions except interest on funded debt and appropriations for reserves, etc.", there was left $96,204,808 a year, which the witness called "net amount available for distribution to capital because of additional investments; to labor because of increased efficiency, and to reserves for emergency purposes." Of the $96,000,000 the witness allowed 48 per cent, or $45,663,679, "for a fair return to capital for additional investment, at 4 per cent," but in obtaining the "additional investment" he subtracted from the expenditures for road and equipment the amount appropriated from income, which was $89,912,702. The remaining 52 per cent of the $96,000,000, or $50,541,120, the witness said was the "balance remaining to compensate increased labor efficiency and to appropriate for reserves." If an advance of 10 per cent be allowed on the total labor costs for engineers and firemen on these railroads during the year ending June 30, 1913," he said, "it would amount, approximately, to only $6,748,600; an advance of 15 per cent to only $10,122,900; of 20 per cent to $13,497,200; and of 25 per cent to only $16,871,500. It is, therefore, clear that even if capital, including commitments made from earnings during the five years, 1908-1913, were allowed a much larger return than 4 per cent, there would still be an ample amount of net revenues remaining to grant reasonable advances to engineers and firemen and other classes of labor."

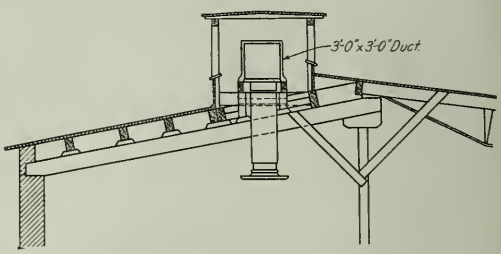
Mr. Byram asked how much of the $50,000,000 the witness thought should go to the engineers and firemen, in view of his statement that their productive efficiency had increased about 5 per cent in 1913 over 1909. Mr. Stone interrupted and said that there "would still be plenty for the board to divide up after allowing for necessary reserves."

SMOKE EXHAUSTER FOR THE ST. PAUL ENGINE HOUSE AT CHICAGO

By W. S. Lacher

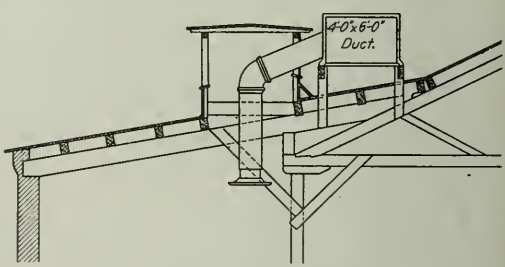
Office Engineer, Chicago, Milwaukee & St. Paul, Chicago, Ill.

The Franklin boulevard engine house of the Chicago, Milwaukee & St. Paul is located, as the name suggests, on a boulevard of one of the park systems in the city of Chicago and within a short distance from a high grade residence district. The house



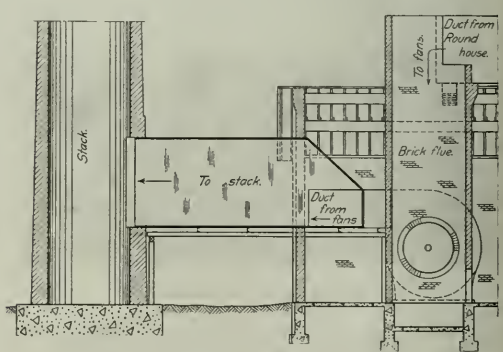
Section Through New Part of Roundhouse

contains 35 stalls and is used almost exclusively for passenger locomotives, the smoke from which is greatest in the early hours of the afternoon when the engines are being fired-up for through and suburban trains departing from Chicago between 5:00 and



Section Through Old Part of Roundhouse

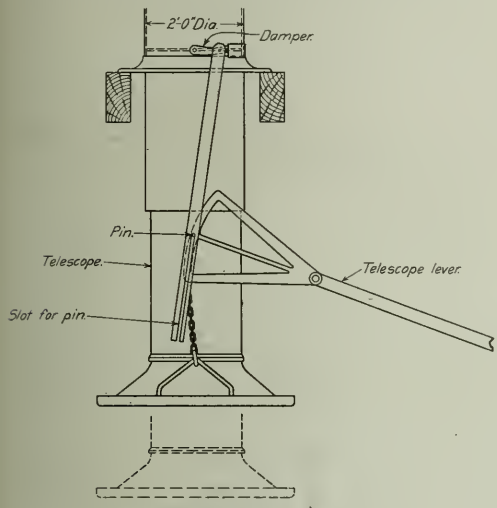
7:00 p. m. In order to overcome this nuisance it was decided to install a plant for diluting the smoke by means of steam and air, at the same time retaining the soot within the plant.



Section Through Fan House and Chimney

The equipment consists of a system of ducts for collecting the discharge from the various smokejacks, two exhaust fans, a chimney to discharge the gases at a good height above the street,

and dampers for all smokejacks so that they may be shut off when not in use, thereby reducing the load on the fans. Non-corrosive material was adopted for all parts of the apparatus where practical. The ducts are of cast iron, the blades of the fan are made 50 per cent thicker than the standard and the chimney and smoke flues are of brick. The fans and chimney are located outside of the roundhouse, about equi-distant from each end, which made it necessary to have two branches of



Automatic Damper for Smoke Jack

ducts. These vary in size, diminishing as they get farther from the stack. The roundhouse consists of an old section, with a new section added to each end. It was necessary to place the smoke ducts for the old section on the roof, as indicated in the drawing, but in the new sections they are placed in the monitors. It has been found that the cold winter air will condense the steam conducted through the exposed ducts, and the water

Smoke Ducts on the Roundhouse Roof

mixing with the soot will form a black fluid which leaks through the joints of the ducts to the roof; on account of this it is planned to house them in.

Various materials were considered for the construction of the ducts, including steel sheets or plates, reinforced concrete, vitrified pipe, metal lath and plaster, asbestos boards and cast iron. The latter was adopted, the considerations affecting the selection being permanence, first cost, strength and weight to be carried. The ducts were manufactured and erected by the Paul Dickinson Company, Inc., Chicago, from its own detail plan, based on the general plan supplied by the railway company. They are provided with expansion joints at proper intervals. These ducts terminate in a brick structure, as shown in the photograph, which is provided with two flues, one for each branch of the ducts. The partition between these flues extends below the level of the fans, one fan being connected to each flue. Dampers are arranged in the flues so that the fans may be used either together or alone.

The fans were made by the New York Blower Company and have a rated capacity of 46,000 cu. ft. per min. at a speed of 206 r. p. m. They discharge into a duct which leads to a radial brick chimney, 10 ft. in diameter and 100 ft. high. Above this duct a 1¼-in. steam pipe, which feeds a perforated coil with live steam, is tapped into the chimney. This has been found necessary in order to sufficiently dilute the smoke. Automatic dampers, as shown in one of the illustrations, are provided at each of the smokejacks; these open and close automatically with the raising and lowering of the jack. The damper will open with 3 in. initial downward travel of the jack, the mechanism being so arranged that it will not interfere with the lowering of the jack to its full travel.

The plant was placed in operation about a year ago, and experience has shown that it is quite necessary to have the dampers closed when the jacks are not in use in order to properly catch all the gases from the smoking engines. The nature of the discharge from the chimney varies with the number of engines smoking and the quantity and density of the smoke from each. In winter it has the appearance of white or dirty-white steam. As there are still some complaints from the residents in the neighborhood it has been recently decided to install a smoke-washing device in the chimney, the details of which are still in a preliminary state. As anticipated, there is an accumulation of soot in the ducts, but as yet it has not been found necessary to remove it. Manholes are provided in the ducts at each stall for this purpose. No deterioration of any part of the plant has been noted thus far. The engineering department of the Chicago, Milwaukee & St. Paul, under the direction of C. F. Loweth, chief engineer, designed the plant and supervised all of the construction work.

REPORT OF THE DIVISION OF SAFETY, I. C. C.

The Interstate Commerce Commission has issued a pamphlet of 44 pages containing the annual report of H. W. Belnap, chief of the division of safety. The inspectors of the division during the last fiscal year inspected 790,822 freight cars, 26,746 passenger cars and 32,761 locomotives. The percentages found not complying with the laws in regard to safety appliances are exceptionally low. The usual tables are given showing the percentages of each class of defect; and roads on which 500 or more cars were inspected during the year are shown in a separate table, giving the number of defects of each kind found on each road. A similar table, by roads, gives the results of terminal tests of air brakes, in trains. A fifth table shows the amounts of penalties paid, since the enactment of the safety appliance laws, and up to October 1, 1914, by all roads, for violation of the safety appliance laws. These amount to $643,844. This list names about 275 roads.

The inspectors find that many roads are not diligently fitting their cars, as required by law, so that by July 1, 1916, they will conform to the safety standards prescribed by the commission. The report recommends that all carriers be required to report the condition of their cars, in this respect, every three or six months.

The report discusses difficulties at points where freight cars are interchanged between roads, and intimates that the inspectors at these places do not always have a sufficiently thorough knowledge of the safety appliance acts and of the orders which

the commission has issued concerning their administration. The use of conductors' valves and air gages in cabooses is increasingly important, because of the increasing length and weight of trains. This part of the report ends with the declaration that the railroads generally have manifested "an admirable spirit of co-operation which has contributed immeasurably to an effective administration of the law."

The division of safety investigates automatic train stops and other inventions presented to the commission, following the plan that was in vogue during the life of the Block Signal and Train Control Board, which was abolished in 1912. Out of a large number of devices presented the Division has examined 184, and opinions regarding them have been transmitted to the proprietors. Of these devices 22 were held to possess merit sufficient to warrant experimental tests, provided the proprietors should present installations prepared free of cost to the government. Of these 22 devices, seven are automatic stops presented by the following: Willson-Wright Safety Appliance Company, Spokane, Wash.; Automatic Train Control & Signal Company (Gray-Thurber), Pittsburgh, Pa.; A. D. Pond, New Britain, Conn.; Railway Automatic Safety Appliance Company, Philadelphia, Pa.; Jones Safety Train Control System Company, Baltimore, Md.; Gollos International Automatic Train Control & Recording Co., Chicago, Ill.; B. F. Wooding, Denver, Colo. Automatic train pipe connectors were presented by J. R. Cobb, Los Angeles, Cal.; Furbin Automatic Train Pipe Connector Company, St. Louis, Mo.; W. C. White, Baltimore, Md. Other inventions in the list are a car coupler, a gasket for hose coupling, an air-brake system, a rail brace, a side-clearance telltale, etc. The Division has made favorable reports on the Gray-Thurber automatic stop and the Robinson connector. The automatic stop of the Jones Signal System Company of Atlanta, Ga., was tested, but without favorable results. The Miller automatic stop on the Chicago & Eastern Illinois was inspected last March.

The report includes a dozen pages of matter which has already been published, in the annual report of the commission.

ELECTRIC TRAIN STAFF ON THE CANADIAN PACIFIC

By E. S. Taylor

Assistant Signal Engineer, Canadian Pacific, Montreal

The Canadian Pacific has in service a number of installations of electric train staff on single-track sections where traffic is heavy, notably on the Lake Superior division, which is not completely double-tracked and where the staff system was installed on all single-track portions in order to eliminate the delays and inconveniences due to the use of train orders. On other sections, for the purpose of providing for certain junctions and intermediate sidings, several modifications have been devised.

The staff instruments are type S miniature instruments, made by the Railway Signal Company, of Liverpool, England. Metallic circuits are used, and to prevent the possibility of a careless maintainer reversing the polarity, current for the operation of the instruments is furnished by magneto-generators equipped with two tapper keys, so that one magneto provides current for the block on either side of the station. These keys are mechanically interlocked to prevent the current from being sent in both directions at the same time. Each instrument is equipped with an indicator showing "staff out; line blocked," when a staff has been withdrawn from either instrument, and "staff in; line clear," when no staff is out. The train staffs are made in such a manner that it is impossible for the staff belonging to one block to be inserted in the instrument of an adjoining block. Permissive movements are made by means of a staff which is divisible into two parts. These parts must be screwed together before the staff can be replaced in the instrument. The capacity of each instrument is 40 staffs, and at stations where the permissive feature is used, 20 of these are divisible. Each station has a telephone, which is worked over the staff line wire.

On staff sections where there are few train movements at night, an "automatic operator" has been installed. A stick relay, the armature of which is balanced and on which there is one

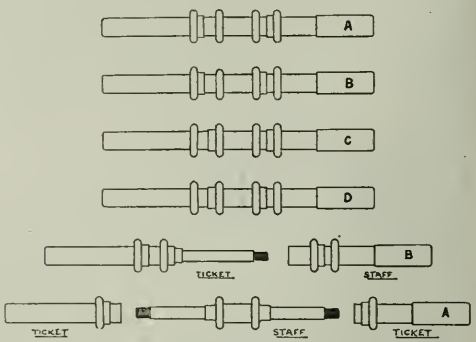


Fig. 1—Divisible Electric Train Staff

normally closed and one normally open contact, the other members of these contacts being on pivoted weights, provides the automatic feature. When the relay is energized the armature is rotated in a direction to cause it to lift the weight

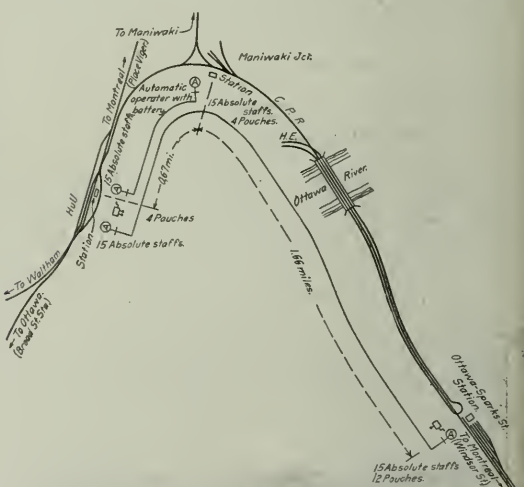

Fig. 2—Hull-Ottawa Staff Section

on which the normally closed contact is fixed, and when current is broken, the weight causes the armature to rotate in the opposite direction a sufficient distance to close the

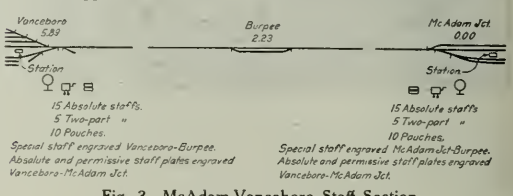

Fig. 3—McAdam-Vanceboro Staff Section

other contact and cut in a local battery which energizes a coil to release the staff at the opposite end of the block. It is possible to operate a staff block without an operator at either station, by using this attachment at both ends.

In a staff block between Hull and Sparks street station, Ottawa, it was necessary to install an auxiliary pair of instruments at Manawaki Junction on account of a branch line connecting at that point. The four instruments are alike and a staff from one may be deposited in any other; and a train obtaining a staff for this block may move between any two of the instruments. When all staffs are in the instruments one or the other of the two pairs of instruments is out of phase, and a staff can be obtained only from the pair which is in phase. Thus when a train starts from one block instrument, having taken a staff out of the only pair which is in phase, this throws the remaining pair of instruments out of phase at the opposite end of the block so that no staff can be obtained at that end. This arrangement could be used with a greater number of auxiliary pairs.

A special staff block has been installed at Burpee, between McAdam Junction, N. B., and Vanceboro, Me. When it is desired to have two trains meet at Burpee, special staffs are used. At McAdam, which is the initial station, a special instrument is provided, having two drawers. The top drawer, containing the special "passing staff," is mechanically locked in the closed position, while the bottom drawer is normally open and cannot be closed until a regular staff has been inserted. At Vanceboro, a similar instrument is provided, but the top drawer is normally open. This is called the dummy drawer, as it is used only for the operation of the circuit controller and no staff is ever placed in it. The bottom drawer contains the special passing staff and is mechanically locked in a closed position.

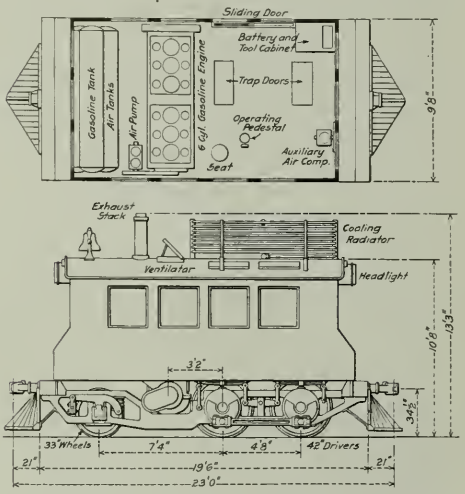
To obtain the special passing staff McAdam, the "initial" station, first withdraws an ordinary staff and inserts it in the bottom drawer of the special instrument at that station. The drawer can then be closed, which mechanically unlocks the top drawer, from which the special passing staff can then be taken. Opening the top drawer operates the circuit controller which connects one of the keys of the magneto-generator to the line wire, operating Vanceboro's special instrument. Vanceboro then closes the dummy drawer, which operates the circuit controller on that instrument, cutting in the lock-coil which releases the drawer at McAdam containing the special passing staff. McAdam then unlocks the bottom drawer at Vanceboro by turning the handle of the magneto. Both special staffs and a regular staff have now been withdrawn from their respective places, but the regular staff is locked in the drawer of the special instrument at McAdam. The special passing staffs are then delivered to the trains which are to pass at Burpee. These staffs confer right only to that station. When the two trains reach Burpee, they exchange staffs, and proceed. The special staffs are thus always returned to the stations from which they were originally issued.

A pusher staff is provided for the use of an engine assisting a train through a portion of a block. The instrument provided for this purpose has two drawers, one of which is open and the other, containing the special pusher staff, mechanically locked in the closed position. The regular staff is withdrawn and deposited in the open drawer of the pusher attachment and the drawer closed, which mechanically releases the other drawer. After the pusher staff is withdrawn, the regular staff is again withdrawn. The opening of the pusher staff drawer opens the line circuit; and when the pusher returns and replaces the pusher staff and closes the drawer, the line circuit is closed; and the regular train, continuing on to the instrument at the opposite end of the block, inserts the regular staff at that point.

Oil for Railway Fuel in Honduras.—The Vaccaro Bros. & Company Railroad, operating from Ceiba into the banana lands, has equipped one locomotive for burning oil instead of coal, the present fuel, to ascertain the desirability and economy of oil as a fuel. If the experiment proves a success, it is possible that not only the locomotives but the shops and various kindred enterprises controlled by this company will be equipped for the use of fuel oil.

GASOLENE SWITCHING LOCOMOTIVE

The Motley County (Tex.) Railway recently purchased a 300-horsepower gasolene switching locomotive from the McKeen Motor Car Company, Omaha, Neb., to be used in freight and switching service between Roaring Springs Junction, on the Quanah, Acme & Pacific and Matador, Tex. It has a tractive effort of 12,000 lb. at a speed of six miles an hour, and is mounted on six wheels, four of which are driven by a six-cylinder, Type C,



Gasolene Switching Locomotive of 12,000 lb. Tractive Effort

gasolene engine, having cylinders 11 in. by 15 in. The frames are of cast steel, and the cab is an all-steel structure extending the entire length of the locomotive. The usual locomotive type of spring suspension with equalizers is used to transfer the weight to the wheels.

The engine bed is attached to the side frames, acting as an efficient brace and reinforcement. It is of the company's latest

McKeen Gasolene Switching Locomotive for the Motley County Railway

model, being provided with an increased water circulation around the valves and cylinder head, tungsten steel valves, triple piston rings and water-jacketed intake pipes. Special provision has been made to enclose the flywheel, crank case, cam shaft, water and air pump driving mechanism. The engine is lubricated by a combination splash and automatic lubricating system.

All the gears are of the herringbone type. The engine is equipped with an air-reversing mechanism and straight air brake, and is also provided with a Gregory brake valve by which the automatic brakes on a train may be operated. Compressed air is provided by two 5-in. air compressors attached to the engine crank shaft. In addition to this there is an auxiliary air compressor in the cab for emergency service.

The forward and intermediate wheels form the driving unit, being connected to each other by side rods, as shown in the illustration, counterbalance crank disks being applied to each pair of drivers. The power from the engine is transmitted by a Morse chain to a sleeve which runs free on the rear driving axle. This sleeve is connected to a sprocket wheel by a multiple-disk friction clutch, also provided with a Morse chain for driving the forward axle, where, by means of an octoroon clutch, the power is increased through gears to produce the heavy tractive effort required for starting. After starting the gears are cut out and the power is delivered direct to the driving wheels. The clutches are operated by compressed air.

Locomotives of this type have a field in many locations on a railroad where but little switching is required. With a gasolene switching locomotive, the cost of fuel will be in direct ratio to its time in use. Its availability for the 24 hours will not cost any more than its availability for six hours, whereas it would be necessary to maintain steam pressure on steam switching locomotives in most cases at an excessive cost. Following is the table of dimensions of the gasolene switching locomotive:

Gage	4 ft. 8½ in.
Driving wheels, diameter	42 in.
Driving wheel base	4 ft. 8 in.
Total rigid wheel base	12 ft.
Length over bumper beams	19 ft. 6 in.
Length between pulling faces of couplers	22 ft. 5½ in.
Length over-all	22 ft. 11½ in.
Height, rail to top of exhaust pipe	13 ft. 3 in.
Height, rail to top of cab	10 ft. 8 in.
Width over cab	9 ft. 8 in.
Width over cab eaves	10 ft.
Center to center of frame	6 ft. 9 in.

A FORMER RAILROAD COMMISSIONER'S VIEWS ON PASSENGER FARES

C. V. McAdams, of Lafayette, Ind., who was a member of the Indiana Railroad Commission before that body was succeeded by the Indiana Public Utilities Commission, and who aided in drafting the two-cent passenger fare law now in effect in Indiana, has written a letter to the Indianapolis News giving reasons why he believes the passenger fares in the state should now be advanced. The letter is, in part, as follows:

"I hold no brief for the railroads. I was never and am not now employed by any railroad. I am under no obligations to them nor they to me. I spent three years in the state's service (at too low rates) trying to do my duty as a railroad commissioner, not only to the state, but to the railroads. Most of these three years was devoted to rates and rate conditions. During this time I came to some definite conclusions about passenger rates on steam railroads in this state. Time has not changed, but has more deeply impressed the conclusions at which I had then arrived. I think I should now speak and I do so with the same sense of responsibility that I was then under, although I voluntarily quit the state's service.

"First, I am thoroughly convinced that the passenger rates on steam railroads should be increased by some reasonable and appropriate legislation. Second, that they should not be increased in the manner and method pursued in the 2-cent fare act of 1907.

"The reasons justifying increased rates are numerous, well founded, and for many of them the public, who must pay the increase, is directly responsible. Almost all the recent improvements forced upon the railways by state legislation came about from a consideration of the passenger traffic as viewed by the public. Each collision or other accident tends to arouse the public, and this is so because they look to the safety of the public when traveling. The public generally, does not concern itself greatly about the safety of train crews or their movement, other than as it affects passenger traffic.

"The public, therefore, has, and justly so, demanded greater safety, and this demand has been met and is being met by the railroads, partly voluntarily in response to the public demand, and partly in response to legislation enacted at the demand of the public.

"These things have all come to pass in the last 10 years, and during that time the rates were reduced notwithstanding these additional burdens. In addition to these added expenses, during the same time economic changes and the action of labor bodies have added other burdens, namely, the wages of all railway employees have been greatly increased, and the cost of railway equipment has also largely increased and there has been a tremendous advance in the cost of the millions of dollars' worth of materials which the railroads must buy annually to maintain their ways and structures in a safe and usable condition. These latter, increased costs of labor, equipment and supplies, are the direct result of economic changes which have affected all the industrial and producing life of the country during this period.

"Although I aided in drafting the 2-cent fare law now in effect, I can truthfully say that, in my judgment, as I now and for years have seen things, a more crude, inelastic and unsuitable piece of legislation was never enacted. It was a misfit from the start. The passenger service of a railroad is indicative, so to speak, of the aristocracy of the line, while its freight service is the barometer whereby you determine its efficiency as a railroad, and its capacity as a dividend payer to the people who own it.

"The measure of a railroad's opportunity is the density of its available traffic. The measure of its responsibility is an efficient service to move that traffic. The efficient service is due to all communities and on all the lines. It can be and is enforced by law. The density of the traffic is controlled by the state's development. It can not be added to nor taken from by law or the action of the commission. If the road operating in a sparsely settled country has an efficient service and is given an income upon its property, the same as a like efficient road operating in a densely settled community, then there must be a different rate adjustment on these two lines and these two communities. Nothing in economics can be more simple and plain than this proposition.

"The railroads many years ago did things that don't look well in print. They were manipulated for the private gain of the officers and to help their especial friends over the line. That day has passed in Indiana. They are now under absolute control and are managed by a class of honorable and conscientious men who are doing their best, under distressing conditions, to weather the business depression, preserve their properties and perform the public service. It is suicidal to badger or buffer them about. The railroad interests in the state constitute its greatest enterprise which is controlled by legislation. Their every act is subject to the control of the Public Service Commission, a body created by law and constituted of able, honest and hard working men in whom the public and the railroads have confidence.

"In view of these conditions, the assembly, without a dissenting vote, should enact a law permitting an increased passenger rate on steam lines in Indiana. This law, however, should provide that after a petition is filed, notice given and a hearing had the Public Service Commission should have authority to authorize rates in advance of those created by the act and reduce those created by the act. Such a law would be in keeping with the law of the federal government and of the state which regulates the freight rate business, which is of vastly greater volume and importance, and such laws have proven effective and are satisfactory.

"Under such a law the short and poorly patronized line can have a remedy to meet its situation and if times again become prosperous and business grows and people travel the public can also go before the commission and ask to have the trunk line

rates reduced. All that has ever been said in favor of a tariff commission can be truthfully said in favor of such a law. It should be elastic and subject to changes to meet different situations and changing conditions.

"Another view of the passenger service is worthy of consideration. There is a continuous demand for a finer, safer and better equipment; a more speedy service, with fewer stops; Pullman cars, electric lights, diners, observation cars, barber shops, bathrooms, drawing rooms, valets and servants. This demand is being met. Mobile hotels dart across the state in a stream of light at aeroplane speed on a nonstop schedule. The people who demand this service should be and are willing to pay for it. It can not in reason be furnished for all the business of the line. It has come to meet a demand. The demand should respond to the service. I can see no reason why authority should not be given by the commission to operate an excess fare train or trains on any of the trunk lines where conditions and the service warrant it.

"It is a rule of commerce and business the world over to pay in accordance with what you get. The hotel, the restaurant, the merchant, the doctor, the lawyer, the barber and candlestick maker all charge you for what you get in merchandise or accommodation or service—why not the railroad? Those who demand should pay for the extra service.

"I should make the public pay extra for what it demands in the shape of excess speed, nonstop trains, elegant equipment and high cost modern refinements. He who wants the Twentieth Century Limited must have the twentieth century price or take a slower train; then why not make him who jaunts with the White City special he white with the railroad? Why not make him who joy rides on the Royal Palm come along with the revenue to pay for it? Why not make him who glides with the Hoosier limited put up something for the elegance, comfort and speed of his journey? Why not bring the twenty-four-hour St. Louiser across with something to make him remember that he has been safely, elegantly and speedily carried from Terre Haute to Richmond? Why should the Continental limited speeder object to a limited charge for his limited ride? Why should the Knickerbocker knock on being held up for extras?

"Yet all these folks travel at the same price under our senseless law and regulations as the man pays who bumps and bangs from Attica to Covington and he who is jerked into Corydon on the B. & O., or he who rides the chute-the-chutes on a hundred different spur and branch lines in this good state.

"There is no sense or justice in it, and it should be stopped."

THE BOSTON & MAINE SITUATION

The following is an abstract from the inaugural address of Governor Walsh of Massachusetts in regard to the Boston & Maine:

The condition of the Boston & Maine is the gravest question in our ever-present transportation problem. That railroad system still remains in its unstable state, whereby the stockholders of the Boston & Maine have but a small equity in the whole Boston & Maine system. The fluctuations in railroad prosperity thus fall with crushing weight upon a very small portion, when, with a sound financial structure, the weight would be borne equally by the whole. About 80 per cent of the Boston & Maine system is comprised of roads leased to the Boston & Maine upon terms out of proportion to its present financial condition. For several years past it has been paying dividends without earning them. During the year ended July 1, 1914, it paid no dividends and failed to earn the amount of its fixed charges, showing a deficit of $2,044,742.

It is obvious to any intelligent citizen that all of these losses cannot continue to fall upon the stockholders of the Boston & Maine without precipitating an undesirable disintegration of our distinctively New England transportation system. The disjoining of this railroad system would not only be harmful to the public interest of New England, but would be especially harmful to the component parts of the system itself. I know it is claimed by some of those interested in subsidiary roads that the owners of these leased lines could take their property and successfully operate it separately. But it is not probable that this claim is either sound or ingenuous. Certainly such an attempt would be difficult if the public should decline to render any assistance to these now debilitated roads. And if by insisting upon their pound of flesh they ignore the public interest, refusing to participate in a reorganization of the railroad system in a spirit of compromise and concession, they cannot expect the assistance of the public either through increased rates, a loaning of public credit or otherwise.

I have reason to believe that many of the parties directly interested in this situation realize their responsibility and are now working out a plan of reorganization which may put this railroad system upon firmer ground. The five trustees who now control the Boston & Maine, may confidently be expected to meet the situation if they are properly supported by those most concerned in it. I conceive it to be the duty of the general court this year to help the Boston & Maine whenever and wherever the greater public interest will permit us so to do. It is peculiarly a New England institution, and the business morale and prestige of New England have been greatly harmed by its present condition. Its real interests are not different from the interests of the New England public, and recent railroad misfortunes are teaching investors that when those who manage their property propose to do anything harmful to the general public interests they are proposing something that is also harmful to the real interests of the railroad. It is to be hoped that the realization of this fact now forced upon railroad investors will tend to make the relation between the active railroad managers and the faithful public servants much easier. We all fervently hope that the five trustees who really represent the public will be able to work out the salvation of this railroad.

CAB SIGNALS IN ENGLAND

At the meeting of the Institution of Mechanical Engineers, London, December 18, papers on cab signals were read by W. C. Acfield, Midland Railway; L. P. Lewis, Caledonian; V. L. Raven, North Eastern; W. A. Stanier, Great Western, and W. Willox, Metropolitan.

Mr. Acfield treated the subject mainly from a theoretical standpoint. The Midland has fitted two engines with the system in use on the Great Western, and has had satisfactory results from this experimental use. This road has made some experiments with the "railophone," a wireless or inductive telegraph or telephone used for communicating with moving trains; but no results are given.

Mr. Lewis also discussed the subject from a theoretical point of view. Mr. Raven, who is chief mechanical engineer of the North Eastern, described his cab signal which has been in use to some extent on that road for several years. The latest form of this apparatus is now fitted to 36 locomotives. Mr. Raven's system was briefly described in the first annual report of the Block Signal and Train Control Board, November, 1908, and also in the *Railroad Gazette* of February 21, 1908. He says that "the design of the apparatus is such as to give the fullest possible indication of failure of the equipment."

The Great Western Railway signal is well known to the readers of the *Railway Age Gazette*. Mr. Stanier's paper indicates that the brake-applying apparatus is now considered a regular feature of the system. For several years it was a cab-signal only. The description has five pages of drawings. In his conclusion the author says that "the device has proved so satisfactory in service that about 180 miles and 90 engines, up to the present time, have been equipped; and its use is rapidly being extended." This cab signal has been giving satisfactory service on the Fairford Branch, 22 miles long, for about eight years.

Mr. Willox's paper described the mechanical trip train stop in use on the Metropolitan, which is similar to that in the Interborough tunnels, New York City.

General News Department

The engineers who made preliminary surveys for a government railroad in Alaska have returned and have made an informal report to President Wilson.

Senator Pomerene, of Ohio, has introduced in Congress a bill for federal regulation of railway securities, patterned after a bill on the same subject which was discussed last year, but consideration of which was abandoned. It does not appear that Mr. Pomerene expects to have his bill passed at this session of Congress.

G. D. Lankford, of Dallas, Tex., a car inspector of the Trinity & Brazos Valley, has received from the Carnegie Hero Commission a bronze medal, and $1,000 in cash, for bravery in saving the life of Conductor L. A. Dozier in June, 1913. Dozier fell from the platform of a car to the rails and Lankford snatched him from in front of a moving train.

The South Jersey Commuters' Association has presented to the New Jersey legislature a petition, from citizens of 44 cities and towns, asking that the Public Utilities Commission be granted ample power to regulate fares to Camden, Hoboken and Jersey City. The petitioners declare that they suffer injustice in being obliged to buy season tickets to New York and Philadelphia when they desire to stop on the New Jersey side of the river, in both cases.

The Atchison, Topeka & Santa Fe has put in the field ten engineering parties to make a complete survey of one million acres of land which the road owns in the state of Arizona. This land is situated along the main line of the railroad, lying in alternate sections of 640 acres each. One purpose of the survey is that application for patenting the lands may be made. It is reported that steps will be taken for the agricultural development of parts of the land.

The House Committee on Interstate and Foreign Commerce has reported to the lower House of Congress the Stevens bill for the regulation of matters of safety on railroads. This bill was introduced on May 27 last and was noticed in the *Railway Age Gazette* of June 12, page 1343. The report of the committee is a pamphlet of eleven pages giving a summary of the arguments for the general introduction of the block system; for the use of automatic train stops as an additional safeguard for passenger trains, and for the use of steel cars and high power headlights.

At Altoona, Pa., petitions have been circulated asking the legislature of Pennsylvania to repeal the full crew law of that state. It is said that 90 per cent of the employees of the Pennsylvania Railroad in the shops at Altoona have signed the petition and have done so freely; but those who do not sign are making loud complaint. The language of the petition is the same as that in the letter of President Rea of the Pennsylvania road, in his recent appeal to the citizens of the state to abolish this oppressive law. At Harrisburg, Pa., the leaders of the brotherhood have announced that they are going to oppose the repeal of the full crew law.

The New York State Public Service Commission, First district, following its investigation of a collision on one of the elevated lines in Manhattan in December, and of the suffocation of passengers in the subway last week, has ordered the Interborough Rapid Transit Company to take measures to have only steel cars in the subway from December 1 next. At present there are between 400 and 500 cars used in the subway which have wooden bodies with metal sheathing. In the discussion between the commission and the officers of the Interborough there has been a proposal to use these wooden cars on the elevated lines; but there are some obstacles to this plan and the matter seems to be still unsettled.

Senator LaFollette on Monday of this week introduced in Congress a resolution aiming to nullify the action of the Interstate Commerce Commission in its recent order allowing a general increase of 5 per cent in freight rates. The resolution declares that the commission did not make sufficiently thorough inquiry, and that the increase was made without good reasons. It appears to be the general opinion in Washington that the resolution will not be adopted; but that its discussion will probably bring out questions as to the fitness of Interstate Commerce Commissioner Hall, whose nomination for another term is now pending before the Senate. This nomination has been reported favorably, but Senators La Follette, Cummins and Clapp had voted against it in committee.

The Alfalfa Route

The Alabama, Tennessee & Northern, known as the "Alfalfa Route," has made a trackage agreement with the Southern Railway by which trains will be run over the Southern tracks into Mobile, Ala., beginning February 1.

The main line of the Alabama, Tennessee & Northern extends from Reform, about 80 miles west of Birmingham, southward 185 miles to Calvert, on Mobile bay. At this point connection is made with the Southern Railway. In Mobile the A. T. & N. has its own terminal grounds, owning extensive water-front property on both sides of the bay. Terminal tracks aggregating about 7 miles in length have been built to connect with other railroads and with industrial sections.

Better Inspection of Freight Trains

Following the suggestion of one of its employees, C. F. Rudolph, telegraph operator at Stafford, N. Y., the Lehigh Valley has issued the following order:

"When freight trains are pulling out of sidings, or away from inspection points, or water stations where a stop has been made to take water, the engineer will move the train not to exceed six or eight miles an hour to permit a member of the crew to make a running inspection of the entire train.

"At such points, one or more members of the train crew must be at the head end of the train before it starts and inspect the train as it passes, watching closely for bent axles, broken flanges, brake riggings down, defective brake riggings, defective arch bars, defective drawheads, wheels sliding, brakes sticking, loose wheels, hand brakes applied, car doors loose, or any other defects that can be detected."

Prosecutions Under Cattle Laws

The Department of Agriculture reports the following convictions for violation of the 28-hour live stock law during the month of November: Baltimore & Ohio Southwestern, fines and costs, $200; Cleveland, Cincinnati, Chicago & St. Louis, $975; Pittsburgh, Cincinnati, Chicago & St. Louis, $100; Chicago & North Western, $200; Pennsylvania, $125; Philadelphia, Baltimore & Washington, $1,800; Cincinnati, Lebanon & Northern, $100; Baltimore & Ohio (21 cases), $4,250; Chesapeake & Ohio, $100; Chicago, Milwaukee & St. Paul, $150; Chicago, Burlington & Quincy, $100; total (48 cases), $8,100.

Under the quarantine law the following fines were reported during the month of November, most of the convictions involving additional payments for costs: A. D. and John Clemant, $200; Galveston, Harrisburg & San Antonio Railway, $300; Houston & Texas Central, $100; Louisville & Nashville, $100; Chicago, Rock Island & Pacific, $100; Mobile & Ohio, $200; San Antonio & Aransas Pass, $100; Vicksburg, Shreveport & Pacific, $200; total (12 cases), $1,300. All of these 12 convictions were for interstate shipment of cattle infested with Texas-fever ticks.

Block Signal Mileage

The statement of mileage of road block signaled, as of January 1, 1915, as made up for the Southern Railway, did not reach us in time to be used in the table published January 1, page 29.

The figures, showing a large increase in the mileage of road equipped with automatic signals, are as follows:

	Single track	Double track	Total
Automatic	6.3	286.8	293.1
Manual	1,803.1	156.0	1,959.1
Total	1,809.4	442.8	2,252.2

Forty-one miles, automatic, double track, represents a line used jointly with the Atlantic Coast Line; and 154 miles of manual—114 single track and 40 double track—also is to be classed in the same way; a total of 195 miles of road used jointly with the Atlantic Coast Line. The total mileage of road operated for passenger traffic by the Southern is 6,929 miles. The plans of the Southern for the current year include 142 miles of road to be equipped with automatic block signals.

On the Chicago, Milwaukee & St. Paul, the mileage of road block signaled, double track, manual, should be 145 miles, instead of 245, as given in the annual statement.

American Society of Mechanical Engineers

The Chicago Section of the American Society of Mechanical Engineers held a "railroad night" at the La Salle hotel, Chicago, on January 8, 1915, papers being presented on Locomotive Superheaters and Locomotive Stokers by R. M. Ostermann, Locomotive Superheater Company, and Clement F. Street, Locomotive Stoker Company, respectively. Mr. Ostermann gave an illustrated description of the locomotive superheater and quoted from tests showing how the steaming capacity of a locomotive boiler may be increased by the use of the superheater. As a rough average a coal saving of 25 per cent and a water saving of 35 per cent can be obtained from a superheater engine as compared with a saturated engine of the same class. He stated that there were 32,000 locomotives equipped with the top-header type superheater, of which there are nearly 12,000 in use on this continent.

Mr. Street clearly showed the importance of the locomotive to the earnings of a railroad and how by the use of the stoker on large engines their capacity may be increased 10 per cent. He also briefly discribed the different types of stokers in general use on American railways, and stated that there were nearly 1,000 locomotive stokers in use today. These two papers were discussed by R. Quayle and H. T. Bentley of the Chicago & North Western.

Willard A. Smith of the Railway Review gave a talk on Railway Economics, in which he questioned the policy of some of the railways in adopting the modern heavy rolling stock before their traffic demanded such equipment. He stated that the general adoption of this policy has led to an increase in maintenance of equipment costs which has become a serious burden to the railways of this country. He attributed the increase in operating ratios mainly to this cause. As another reason for increased maintenance costs he mentioned the lack of proper shop facilities, stating that in many cases equipment was purchased by roads that did not have the proper facilities for maintaining it. He believed there is a more fruitful field in developing the efficiency of the locomotive than its size. He also advocated a bureau of railway engineering, which could be created by the government, private institutions or the railways themselves, for the purpose of studying scientifically and experimentally railway problems that are now being threshed out individually by the railways with necessarily an economic loss.

American Society of Engineering Contractors

The annual meeting of the American Society of Engineering Contractors will be held in the United Engineering Societies Building, 25 West Thirty-ninth street, New York, on January 15, 1915. The annual reports of the officers will be presented and a number of important questions will be brought before the society for consideration. The annual banquet will be held in the evening. Mr. Roland, of the metallurgical department of the National Tube Company, will present an illustrated lecture on the manufacture of "National Pipe."

American Association of Railroad Superintendents

At a recent meeting of the executive committee of the American Association of Railroad Superintendents it was decided to postpone the 1915 convention of the association to be held in San Francisco, Cal., from May 20 and 21, the date previously arranged, until August 19 and 20. Saturday, August 21, will be American Association of Railroad Superintendents' day at the Panama-Pacific International Exposition.

MEETINGS AND CONVENTIONS

The following list gives the names of secretaries, dates of next or regular meetings, and places of meeting of those associations which will meet during the next three months. Hereafter the full list of meetings and conventions will be published only in the first issue of the Railway Age Gazette for each month.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

AMERICAN SOCIETY OF ENGINEERING CONTRACTORS.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August. Windsor Hotel, Montreal, Que.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meetings, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St. New York.

NATIONAL RAILWAY APPLIANCES ASSOCIATION.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15-19, 1915, Chicago.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—C. Marlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa. Next meeting, March 15, 1915, Chicago.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. R. R., Atlanta, Ga. Next regular meeting, January 21, 1915, Atlanta, Ga.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEWARK.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, Newark.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month except June, July and August, Waldorf-Astoria, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic News

It is reported that the Canadian railways are preparing to make an application to the Board of Railway Commissioners for Canada for authority to make a general five per cent advance in freight rates east of the Great Lakes.

The Pennsylvania and the Philadelphia & Reading have begun proceedings in the County Court at Harrisburg, Pa., to contest the recent order of the Pennsylvania State Commission reducing by 40 cents a ton the freight rate on anthracite coal from the mines to Philadelphia.

Passenger officers of the Ohio railroads who appeared at meetings before commercial associations last week at Cleveland, Columbus, Youngstown and Toledo, asking support for the proposed repeal of the two-cent passenger fare law in Ohio, plan to continue their conferences with commercial associations at Ashtabula, Kingsville, Elyria, Sandusky, Norwalk, Fremont, Wauseon and Bryan in northern Ohio, and a number of other cities and towns in southern Ohio.

Representatives of the railroads and the grain shippers have decided to refer to the Interstate Commerce Commission the controversy regarding the payment of demurrage charges at Galveston, Tex., on grain shipments which were held up at that port in August on account of the difficulty in getting ships to take the grain away. An amount estimated at between $125,000 and $150,000 in demurrage charges is in dispute. The grain men and ship agents claim that demurrage should be waived because the European war rendered it impossible to get ships promptly.

The western railways have appointed a committee of five lawyers to prepare their case for advances in interstate freight rates on a number of commodities. Hearings are to begin before Commissioner Daniels in Chicago on February 15. The committee consists of C. C. Wright, general solicitor of the Chicago & North Western; T. J. Norton, general attorney of the Atchison, Topeka & Santa Fe; W. F. Dickinson, general attorney of the Chicago, Rock Island & Pacific; C. S. Berg, commerce attorney of the Missouri, Kansas & Texas, and A. P. Humburg, commerce attorney of the Illinois Central.

Effect of Panama Canal on Rail Traffic

Railway and Marine News of Seattle, Wash., publishes an interview with a railroad man, stating that recently he saw on the side tracks at Huntington, Ore., 11 cars of Idaho wheat bound for Portland, to be sent from there by way of Panama canal to the Atlantic seaboard. This, he said, was the first shipment of Idaho wheat ever carried by the Oregon Short Line to tidewater bound for another seaport. He also mentioned that dried fruits are now moving from the Pacific coast to Atlantic ports at a rate of 26 cents per 100 lb., and canned goods at 30 cents; and large shipments of salmon from Alaska, which have gone principally by rail to Chicago and the eastern seaboard are now going by way of the canal. He also mentioned the case of a piano manufacturing concern in Chicago that has found out that it can ship in carload lots to New York and then by the canal to the Pacific coast cheaper than by rail from Chicago to the same point of destination; and that shipments of household furniture from Rockford, Ill., have moved to Pacific coast points by the same route.

The same publication reports an enormous demand for cold storage space on boats running through the canal, from the fruit and vegetable shippers along the Pacific coast. The steamer Ohioan of the American Hawaiian fleet, which sailed from San Francisco on December 23, was offered 8,000 tons of fruit and vegetables, fish and other products, which are best carried in cold storage rooms. The boat only had a capacity of 1,500 tons in its refrigerating rooms, and apples and fish had been offered at the Puget Sound ports which would fill this space. F. A. Hooper, district freight manager of the American Hawaiian Steamship Co., is quoted as saying that he has never seen anything to equal the demand for refrigerating space for the New York trade, and that it has been necessary to allot the available space to the various districts to avoid complaints of discrimination.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The Dallas (Texas) Chamber of Commerce Freight Bureau and the Fort Worth Freight Bureau have filed a joint petition with the Interstate Commerce Commission charging discrimination in the rates from St. Louis and Kansas City to Shreveport, La., as compared with the rates to Texas points.

Rating on Live Poultry in Western Trunk Line Territory

Opinion by Commissioner Meyer:

For many years live poultry in carloads has been rated second-class in the western classification, but under exception to the classification the traffic has moved in western trunk line and trans-Missouri territories under fourth-class rates. The commission finds that the carriers have justified a proposed increase from these fourth-class rates to third-class rates. Live poultry should move under a higher rate than many other similar commodities because the traffic is light and requires equipment constructed especially for its movement, which equipment cannot be used for any other traffic, so that the empty car movement is at least equal to the loaded car movement. (32 I. C. C., 380.)

Rates on Lumber from Memphis to New Orleans

Bellgrade Lumber Company et al v. Illinois Central et al. Opinion by Commissioner McChord:

The commission reaffirms its decision in Lumber Rates from Memphis to New Orleans (27 I. C. C., 471), that the carriers were justified in increasing the rates on lumber of all kinds from Memphis, Tenn., to New Orleans, La., from 10 cents to 12 cents in order that the rates on hardwood lumber and gum should be the same. It is found, however, that the present rates on hardwood lumber, other than gum, from points south of Memphis to New Orleans are unreasonable, and the carriers are ordered to maintain a rate not in excess of 11 cents from the territory north of the Southern Railway and 10 cents from the territory south of the Southern Railway to New Orleans. (32 I. C. C., 403.)

Switching Charges on Coal within the Chicago Switching District

Opinion by Commissioner Clark:

The Chicago & North Western, having proposed to cancel tariffs which grant the Chicago rates on coal and coke in carloads from mines in Ohio, Pennsylvania, Virginia and West Virginia to Greenwood street, Weber, Crawford avenue, and Peterson avenue, stations on the carrier's "Mayfair cut-off," which change would increase the charges 25 to 30 cents per ton, the commission holds that the increase is not justified. It is found, however, that the rates to Peterson avenue and Crawford avenue may reasonably exceed the rate to Chicago by not more than five cents a ton, minimum $2 per car, and to Weber and Greenwood street station not more than ten cents a ton, minimum $4 per car. (32 I. C. C., 444.)

Rates Between Points in Minnesota Via Interstate Routes

In re freight rates between points in Minnesota via interstate routes and between points in Minnesota and other states. Opinion by Commissioner Harlan:

The commission finds that the carriers have justified proposed increased class rates and increased commodity rates except on cement, lime and plaster between Duluth, Minn., and related points on the one hand, and St. Paul and Minneapolis, Minn., and related points on the other, except in so far as violations of the long-and-short-haul rule of the fourth section would result from such increased rates. The commission states that it is evident from the record that the proposed class rates are more nearly in line with the class rates in effect generally throughout this territory than are the present rates, and that no good reason has been suggested why the rates between Duluth and the twin cities should be lower than rates in other parts of the same territory. (32 I. C. C., 361.)

Rates on Cotton in Round Bales

American Round Bale Press Company v. Atchison, Topeka & Santa Fe et al. Opinion by Commissioner Daniels:

Cotton shipped from gin points in Arkansas, Oklahoma and Texas to Houston, Tex., and the ports of Galveston and Texas City, Tex., and New Orleans, La., is usually compressed in transit, for which service the railroads pay to compress companies 10 cents per 100 lb. Upon cotton which is already compressed when offered to the carriers for transportation, and will, therefore, cost them nothing in the way of compress charges, they make a rate 10 cents per 100 lb. less than that upon cotton to be compressed in transit. The net revenue to the carriers is the same in both cases. Complainants, however, who are interested in the manufacture of machines for the compressing of cotton at the gin into bales of especially high density, and shippers of cotton so compressed, attack the existing any-quantity rates as unreasonable and discriminatory when applied to bales of high density which will load 50,000 lb. to a car, and ask that carload rates with a 50,000 lb. minimum be established.

The commission finds that the existing any-quantity rates on cotton are not unreasonable nor discriminatory, even when applied to bales of high density. It is also held that the cotton industry in the southwest is so organized that the existing any-quantity rates are best suited to its needs, and that the establishment of carload rates, though they might effect some economies in transportation cost, would tend unduly to concentrate the cotton-producing industry, especially in the light of the facts that the average product of a cotton farm of this region is not over 11 bales, and that a carload of cotton represents an investment of several thousand dollars. (32 I. C. C., 459.)

Supplementary Order in the Five Per Cent Case

The commission has entered an order in the eastern rate advance case, directing the railways to maintain their existing grouping in the eastern rates and to grade all the rates in accordance with the measure of the New York-Chicago and Montreal-Chicago rates, even though by so doing some rates are increased slightly more than five per cent.

The order states in part: "It is further ordered that in establishing the said rates approved in the said reports the rates from Chicago, to New York and Montreal, and from New York to Chicago may be increased five per cent, and those increased rates may be scaled to or from percentage points or groups upon the established percentage groupings and percentages; that the rates via ocean-and-rail and established all-rail differential lines may be made the same differentials under the standard all-rail rates as now exist; and that the established groupings or points of origin or of points of destination under common rates may be preserved; even though so doing results in increasing some rates slightly more than five per cent."

Rates on Livestock from Points in Arizona

American National Live Stock Association et al. v. Southern Pacific et al. Opinion by Commissioner Clark:

In American National Live Stock Association v. Southern Pacific Company (26 I. C. C., 37) the commission prescribed a schedule of distance rates on live stock in carloads from points in Arizona to points in California. It was found that the rates on stock cattle and on sheep for feeding should not exceed 85 per cent of the rates on beef cattle and fat sheep respectively, and that there might be added to these rates not to exceed $5 per car for a two-line haul of 500 miles or less, and $2.50 per car for a branch-line haul. The commission now finds in addition that the defendants should establish through routes and joint rates on live stock in carloads from all points in Arizona on their lines from which joint rates are not now in effect to all feeding and slaughtering points on their lines in California, whether the haul be over two lines or three lines. It is provided, however, that the Southern Pacific shall not have to join in any through route or joint rate permitting the Santa Fe to participate in the transportation of live stock from points on the Arizona Eastern or the El Paso & Southwestern to points reached by the Southern Pacific over its own rails. It is also provided that the Santa Fe shall not be required to join in through routes via Phoenix and Maricopa from points on the Santa Fe main line. The rates prescribed as to be the same as before, $5 per car for a two-line haul and $2.50 per car for a branch-line haul, with that exception that the requirement that the $5 rate apply over a two-line haul of 500 miles or less is omitted in order to avoid higher charges for 500 miles than for 525 miles over the same route in the same direction. (32 I. C. C., 438.)

Switching Charges at Baltimore

Merchants' & Manufacturers' Association et al. v. Pennsylvania Railroad et al. Opinion by Commissioner McChord:

In its original report in this case, given on May 14, 1912 (32 I. C. C., 474) the commission found that the charges for the interchange of interstate traffic in carloads in Baltimore, Md., should not exceed the flat Baltimore rate by more than five cents per 100 lb. on first and second classes, or by more than two cents on third, fourth, fifth and sixth classes. It was also found as to commodities not moving under class rates that the charges should not exceed the flat Baltimore rate by more than two cents per 100 lb. An extension of the switching limits and the fact that intrastate switching charges have been placed on a per car basis, both in accordance with decision of the Public Service Commission of Maryland, having changed the situation to some extent since the previous decision and with a view to uniformity of switching charges the commission now finds that the charge for interline switching movements in Baltimore in no case should exceed the flat Baltimore rate by more than two cents per 100 lb. as applied to commodities moving under either class or commodity rates and that any higher charge would be unreasonable. (32 I. C. C., 434.)

Rates on Grain from Kansas City to Memphis

Board of Trade of Kansas City, Mo., v. St. Louis & San Francisco et al. Opinion by Commissioner Meyer:

The commission finds that the proportional rates from Kansas City to Memphis, of 14 cents per 100 lb. on wheat and products of wheat, and 13 cents per 100 lb. on coarse grain and products are not unreasonable per se, nor discriminatory as compared with rates from Omaha to Memphis one cent per 100 lb. higher than from Kansas City, thus following the decision in Kansas City Transportation Bureau v. Atchison, Topeka & Santa Fe (16 I. C. C., 195) where the same rates were attacked.

The commission notes in its decision that the changes asked for would affect not merely the grain traffic from Kansas City and Omaha to Memphis and the southeast, but would also have a bearing upon the traffic from numerous competing markets to the destination territory here involved, as well as to other destinations.

It is also noted that the proportional rates are such that when the total charge from the grain fields to Memphis via Kansas City and via Omaha is considered, the former is not at an undue disadvantage. In this connection reference is made to the statement in the previous case that "A proportional rate means a part of or a remainder of the through rate, or it means nothing at all; and in a case of this kind there must be an examination and consideration of the entire rate from point of production to ultimate destination. It is not sufficient to consider the rates to an intermediate market nor alone the rates from such market, if the question of discrimination between such markets is to be determined."

With reference to the statement that there has been a decline in the shipments from Kansas City to Memphis and through Memphis to the Mississippi valley and southeast during recent years, it is noted that a large part of this change is due to the increase in corn production in the southeastern states. The commission quotes from a former decision to the effect that it is not within the power of this commission to equalize economic conditions or to place one market in a position to compete on equal terms with another market as against natural advantages. It has the power to require railroads in the face of varying trade conditions, to adjust their rate schedules in such manner as to insure to a market the continuance of a trade it has once enjoyed." (32 I. C. C., 297.)

STATE COMMISSIONS

The Railroad & Warehouse Commission of Minnesota has issued an order calling for the abolition of switching charges on extensive freight traffic at Minneapolis and at Minnesota transfer. A charge of $1.50 a car on grain taken to elevators is the principal feature that will be changed by the order.

In connection with the application of the roads for authority to make a general increase of 5 per cent in freight rates, the Virginia commission has directed the chambers of commerce of the different cities to file, within ten days from January 7, any objections which they may have to offer. It is expected that objections will be received from Richmond, Petersburg, Norfolk and Alexandria.

The State Corporation Commission of Virginia has authorized the railroads of the state to make, in Richmond and Lynchburg, a "track storage" charge, on bulk freight, in addition to the usual demurrage charge. The track charge, in addition to the demurrage charge will be for the first two days after the expiration of the free time, one dollar a car each day; and thereafter two dollars a car each day.

The Minnesota Railroad & Warehouse Commission has ordered the Chicago, Rock Island & Pacific to limit the speed of passenger trains in Minnesota to 30 miles an hour. This order appears to have been a result of the investigation of the derailment at Northfield, on December 13, in which a passenger was killed. The commission holds that the tracks of the company are not in sufficiently good condition.

The New York State Public Service Commission, Second district, has authorized all railroads operating under its jurisdiction to make a 5 per cent advance in freight rates, on ten days' notice, to correspond with the advances which have been authorized in interstate traffic by the Interstate Commerce Commission. None of these advances affect coal, coke or iron ore. The Pennsylvania commission, to which a similar application on the part of the roads appears to have been made, decided not to permit any increase in less than the statutory thirty days' notice.

The New Orleans, Mobile & Chicago has been fined $13,000 by the Mississippi railroad commission for discontinuing certain trains after a petition for permission to do so had been refused. After the commission's refusal W. F. Owen, receiver for the railroad, took the matter to the federal court and was granted permission to discontinue the trains both in Mississippi and Alabama. The commission, in assessing the fine says that the road failed to obtain an injunction against carrying out the commission's order before the federal court acted on the case and that it still had jurisdiction in the matter. The company was fined $500 for each day the commission's order was violated.

The California Railroad Commission has rendered a decision holding that the Standard Oil Company, the Associated Oil Company, the Producer Transportation Company, the Associated Pipe Line Company and the General Pipe Line Company of California, are common carriers and public utilities, and subject to the public utilities act of California. The commission finds that these companies are controlled by five interests, which together control 95 per cent of the entire oil production of the state. The pipe lines are held to be public utilities in the transportation of crude oil, petroleum or the products thereof by means of pipe lines from the San Joaquin valley oil fields.

COURT NEWS

The sixth court of civil appeals at Texarkana, Tex., has rendered a decision holding that the International & Great Northern has violated its contract with the city of Palestine, Tex., in moving its general offices and shops from Palestine to Houston, after it had been given a bond issue of $160,000 to locate at Palestine. Officers of the road say that the case will be appealed to the supreme court of the state.

In the Federal Court at Philadelphia, January 6, the grand jury returned three indictments against the Philadelphia & Reading concerning irregularities in the transportation of coal. On 51 counts the road is charged with having engaged in transportation of coal without having filed tariffs. The transportation was in part by the Philadelphia & Reading Transportation line of barges, owned by the Reading between Philadelphia and New England points. Another indictment of 50 counts charges the road with granting concessions to certain shippers by holding their coal at Woodlane yard, eight miles from the Port Richmond coal piers, when it was destined to Port Richmond, and then not charging demurrage for such detention. The third indictment of 25 counts charges failure to collect demurrage on 25 shipments from the mines to Port Richmond.

Railway Officers

Executive, Financial, Legal and Accounting

F. B. Sheldon has been appointed vice-president of the Toledo & Ohio Central and the Zanesville & Western, with headquarters at Columbus, Ohio, succeeding J. J. Bernet.

R. N. Hudson, general manager of the Louisville & Atlantic at Versailles, Ky., has been elected president, general manager and a director of the Louisville, Henderson & St. Louis, succeeding L. J. Irwin, deceased.

R. E. M. Cowie, manager of the American Express Company at Denver, Colo., has been appointed vice-president and general manager of the eastern department, with headquarters at New York, succeeding H. S. Julier, resigned. Mr. Julier, who is 73 years old, has been with the American Express Company for 56 years.

C. F. Daly, who was vice-president in charge of the traffic department of both the New York Central & Hudson River and the Lake Shore & Michigan Southern retains his same duties with the consolidated company, the New York Central Railroad, with headquarters at New York; and Albert H. Harris, who was general counsel of the New York Central Lines east of Buffalo and vice-president of the lines west of Buffalo, has been appointed vice-president of the New York Central Railroad with headquarters at New York. Mr. Harris also retains the vice-presidency of those lines west of Buffalo which are not affected by the consolidation. The other executive officers of the New York Central & Hudson River, except those recently mentioned in these columns, retain the same duties with the consolidated company.

A. W. Newton, whose appointment as assistant to the president of the Chicago, Burlington & Quincy, was announced in our issue of January 8, was engaged in general engineering practice from 1892 to 1900, and entered the service of the Chicago & Alton in 1900 as assistant engineer, with headquarters at Kansas City, Mo. He was transferred to Bloomington, Ill., in 1902, and in March of the following year he went to the Chicago, Burlington & Quincy as engineer of construction on lines in the Missouri district. In 1904 he was transferred to the Illinois district as assistant engineer, returning to the Missouri district as district engineer in December of that year. In 1907 Mr. Newton was appointed general inspector of permanent way and structures on the staff of the vice-president at Chicago. On January 1, 1914, he was appointed chairman of the committee on Federal Valuation, and in connection with these duties was appointed on the Engineering Committee of the Presidents' Conference Committee on Valuation. He now becomes assistant to the president, as above noted, having, in addition to his duties pertaining to federal valuation, such other duties as may be assigned.

A. W. Newton

Albert Hall Harris, general counsel of the New York Central Lines East of Buffalo, N. Y., and vice-president of the New York Central Lines West of Buffalo, with office at New York, has been appointed vice-president of the consolidated company, the New York Central Railroad, with headquarters at New York; he also retains the vice-presidency of those lines west of

Buffalo, which are not affected by the consolidation. Mr. Harris was born on July 4, 1861, at Rochester, N. Y., and graduated from the University of Rochester in 1881, with the degree of A.B. In April, 1905, he was appointed general attorney of the New York Central & Hudson River, and since December, 1906, has been general counsel. In December, 1906, he was appointed also vice-president of the Michigan Central; the Lake Shore & Michigan Southern; the Cleveland, Cincinnati, Chicago & St. Louis; the Lake Erie & Western, and the Pittsburgh & Lake Erie.

Operating

E. V. Brogan, assistant division superintendent of the Lake Shore & Michigan Southern at Buffalo, N. Y., has been appointed assistant superintendent of the Buffalo division of the New York Central Railroad.

F. M. Thomson, assistant engineer of the Houston & Texas Central at Ennis, Tex., has been appointed assistant superintendent of the El Paso division at El Paso, Tex., of the Galveston, Harrisburg & San Antonio, succeeding C. R. Morrill, promoted.

C. R. Morrill, assistant superintendent of the El Paso division of the Galveston, Harrisburg & San Antonio at El Paso, Tex., has been appointed superintendent of the Second division of the Houston & Texas Central, with office at Austin, Tex., succeeding W. L. Bisbee, resigned on account of ill health.

R. N. Hudson having resigned to accept service with another company, the office of general manager at Versailles, Ky., of the Louisville & Atlantic, a subsidiary of the Louisville & Nashville, is discontinued, and all duties heretofore assigned to that office will, in future be performed by J. R. Pates, superintendent, at Richmond, Ky.

W. A. Mather, superintendent of the Manitoba division of the Canadian Pacific at Kenora, Ont., has been appointed superintendent, with office at Medicine Hat, Alta., in place of J. M. Cameron, promoted, and J. N. Murphy has been appointed trainmaster, with headquarters at Medicine Hat, in place of A. F. Hawkins.

J. L. McCollum, superintendent of the Atlanta division of the Nashville, Chattanooga & St. Louis, at Atlanta, Ga., has been appointed general agent of the operating department; J. A. Baldwin, assistant superintendent at Atlanta has been appointed acting superintendent, and J. Q. Bowden has been appointed assistant superintendent, all with headquarters at Atlanta.

Arthur Hatton, superintendent of car service of the Canadian Pacific at Winnipeg, Man., has been appointed general superintendent of car service, with office at Montreal, Que., in place of George S. Cantlie, who, at his own request, has been granted leave of absence for an extended period, in order that he may take command of the Montreal unit to be organized for service with the third contingent of the Canadian expeditionary force.

The following officers of the Lake Shore & Michigan Southern, which is now consolidated with the New York Central Railroad, have had their jurisdiction extended over the Illinois division of the New York Central, formerly the Chicago, Indiana & Southern; F. H. Wilson, general superintendent, Chicago; H. J. Merrick, superintendent of freight transportation, Cleveland, Ohio; S. T. Gage, superintendent of passenger transportation, Cleveland, and F. F. Riefel, superintendent of telegraph, Cleveland.

J. M. Daly has resigned as general superintendent of transportation of the Illinois Central and the Yazoo & Mississippi Valley, to engage in other business. J. F. Porterfield, general superintendent of the lines south of the Ohio river at New Orleans, La., succeeds Mr. Daly; L. W. Baldwin, superintendent of the Kentucky division, succeeds Mr. Porterfield; L. A. Downs, superintendent of the Minnesota division, succeeds Mr. Baldwin at Louisville, Ky.; William Atwill, trainmaster of the Minnesota division, at Dubuque, Iowa, succeeds Mr. Downs at Dubuque; H. G. Duckwitz succeeds Mr. Atwill; J. M. O'Day, superintendent of transportation, has been appointed car accountant, and will report to the controller at Chicago.

B. B. Greer, whose appointment as assistant general manager of the Chicago, Burlington & Quincy lines east of the Missouri river, has already been announced in these columns, was born in Chicago in 1877. He attended Armour Institute 1893-97 and Dartmouth College 1897-98. He began railway work in 1899 with the Great Northern, and remained with that road until 1908, filling various positions, including roadmaster's clerk, chief clerk to superintendent, roadmaster and assistant superintendent. Mr. Greer then became connected with the Chicago, Burlington & Quincy as transportation inspector on the general manager's staff, and has since been consecutively superintendent of terminals at St. Louis, Mo., division superintendent at Hannibal and St. Joseph, and assistant to the general manager of the lines east of the Missouri river. From the latter position he was on January 1 promoted to assistant general manager, with headquarters at Chicago, as above noted.

Edward J. Guthrie, whose appointment as superintendent of the Southern division of the Central Vermont, also as superintendent of the Central Vermont Transportation Company, with headquarters at New London, Conn., has already been announced in these columns, was born on March 1, 1866, at Erie, Ont., Canada, and was educated in the country schools of western Ontario. He began railway work on October 1, 1889, with the Grand Trunk as a switchman, remaining in that position for a year and a half. He was then telegraph operator for nine years; agent at various places on the Grand Trunk for nine and one-half years, and in 1907 entered the service of the Central Vermont as freight agent at St. Albans, Vt. Three months later he was transferred to Palmer, Mass., and subsequently served at Brattleboro, Vt. He was then appointed general agent of the same road at New London, Conn., four months later he was transferred to New York as agent of pier 29, East river, and now becomes superintendent of the Southern division of the same road, also superintendent of the Central Vermont Transportation Company, in charge of steamers operating between New London and New York, with headquarters at New London, Conn.

E. J. Guthrie

Traffic

William Warner has been appointed general agent of the San Pedro, Los Angeles & Salt Lake at Chicago, succeeding George M. Sargent, deceased.

R. L. McKibben has been appointed general baggage agent of the Sunset-Central Lines, with headquarters at Houston, Tex., succeeding W. S. Napier, deceased.

Albert K. Curts has been appointed district passenger agent of the Union Pacific at Des Moines, Iowa, vice J. W. Turtle, traveling passenger agent, deceased. William R. Alexander has been appointed general agent at Detroit, Mich., succeeding J. C. Ferguson, resigned.

W. H. Cundey, general agent, passenger department, of the Denver & Rio Grande, the Western Pacific, the Missouri Pacific and the St. Louis, Iron Mountain & Southern, at Colorado Springs, Colo., has been appointed assistant general passenger agent, with headquarters at Denver, Colo. A. C. Wilson, commercial freight agent at Colorado Springs, has been appointed general agent at that place.

B. H. Hartley, commercial agent of the Seaboard Air Line, at Atlanta, Ga., has been appointed general agent of the Seaboard Air Line and the Carolina, Atlantic & Western, with office at Charleston, S. C., in charge of freight and passenger traffic in Charleston territory, and D. P. Hartley has been appointed commercial agent of both roads, with office at Charleston, S. C. J. F. Cheney has been appointed commercial agent of the Seaboard Air Line, with office at Atlanta, Ga., succeeding B. H. Hartley. W. A. Fulwiler, commercial agent at Oklahoma City, Okla., has been appointed general agent at Tampa, Fla., in charge of freight and passenger interests at Tampa and at

points in the Tampa territory, and J. T. Baird has been appointed commercial agent, with office at Oklahoma City, Okla., succeeding Mr. Fulwiler.

Engineering and Rolling Stock

J. P. Dolan has been appointed master mechanic of the Apalachicola Northern, with office at Port St. Joe, Fla., succeeding R. A. Billingham.

W. Malthaner has been appointed master mechanic of the Baltimore & Ohio, with headquarters at Newark, Ohio, succeeding O. J. Kelley, assigned to other duties.

F. G. White has resigned as signal engineer of the Chicago Great Western, and the duties of that office have been assumed by G. O. Perkins, superintendent of telegraph, with headquarters at Chicago.

Frank W. Taylor, division master mechanic of the Illinois Central at Waterloo, Iowa, has been appointed superintendent of machinery of the International & Great Northern, with headquarters at Palestine, Tex., succeeding C. H. Seabrook, resigned.

Joseph Keller has been appointed to the new position of general fuel inspector of the Lehigh Valley, with office at South Bethlehem, Pa. Mr. Keller was previously a member of the board of examiners for enginemen on the Lehigh Valley at South Bethlehem.

The following officers of the Lake Shore & Michigan Southern, which is now consolidated with the New York Central Railroad, have had their jurisdiction extended over the Illinois division of the New York Central, formerly the Chicago, Indiana & Southern. D. R. MacBain, superintendent of motive power, Cleveland, Ohio; G. C. Cleveland, chief engineer, Cleveland.

F. J. Barry, general inspector of air brakes, steam heat and lighting of the New York, Ontario & Western, with office at Middletown, N. Y., has been appointed master mechanic, with office at Mayfield Yard, Pa., vice W. H. Kinney, resigned, and his former position has been discontinued. Matters relative to steam heat and lighting will in future be in charge of A. Kipp, general car inspector, and matters relative to air brakes will be in charge of B. P. Flory, superintendent of motive power.

E. Ben Carter, whose appointment as chief engineer of the Florida East Coast, with headquarters at St. Augustine, Fla., has already been announced in these columns, was born on June 11, 1853, at Branford, Conn. After leaving high school he was a student at an academy and then took up special engineering studies. He began railway work in June, 1871, with an engineering corps making surveys for the Chicago, Decatur & St. Louis, and subsequently was engaged in making miscellaneous surveys and in construction work in Illinois, Wisconsin, Michigan, Nebraska and Missouri on the Kansas City extension of the Chicago & Alton, also in Ohio. From 1881 to 1887 he was locating and construction engineer of the Jacksonville, Tampa & Key West, now a part of the Atlantic Coast Line on the Jacksonville-Tampa division. From 1887 to 1892 he was engaged in miscellaneous engineering work in Florida, and since that time has been in the service of the Florida East Coast; for two years as division engineer on construction until April, 1894, then engineer and general roadmaster until January, 1909, and as superintendent of maintenance of way until January, 1915, when he was appointed chief engineer of the same road. From 1894 to 1915 Mr. Carter performed the duties of chief engineer.

Special

E. E. Pettibone, real estate agent of the Lake Shore & Michigan Southern, which is now consolidated with the New York Central, has had his jurisdiction extended over the Illinois division of the New York Central, formerly the Chicago, Indiana & Southern.

Purchasing

E. G. Goodwin has been appointed fuel agent of the Southern Railway, the Virginia & Southwestern and the Northern Alabama, with headquarters at Knoxville, Tenn., and subsidiary offices at Birmingham, Ala., and Princeton, Ind.

The following officers of the Lake Shore & Michigan Southern, which is now a part of the New York Central Railroad, have had their jurisdiction extended over the Illinois division of the New York Central, formerly the Chicago, Indiana & Southern. G. R. Ingersoll, purchasing agent, Cleveland, Ohio; J. P. Murphy, general storekeeper, Cleveland.

OBITUARY

Samuel M. Inman, formerly a director of the Southern Railway, died on January 12, at Atlanta, Ga.

Edmund P. Henderson, formerly a master mechanic of the Southern Pacific, died at San Antonio, Tex., on January 4, aged 75 years.

Chauncey Ives, formerly chief engineer of the Cumberland Valley Railroad, and later engaged in construction work on the tunnels in New York City, died on January 4, at Hood River, Ore.

A. B. Hinkle, assistant to division engineer of the Chicago division of the Baltimore & Ohio, died at his home in Albion, Ind., on January 2. Mr. Hinkle had been continuously in the service of the B. & O. since 1885.

William J. Young, formerly for many years commercial agent of the Illinois Central at Chicago, died at his residence in Evanston on January 11, aged 73 years. He was retired three years ago under the pension rules of the Illinois Central, having reached the age of 70 years.

Sidney B. Liggett, secretary of the Pennsylvania Lines West of Pittsburgh, died on January 9 at his home in Pittsburgh, Pa., at the age of 65. He entered the services of the Pennsylvania company in 1871, as a clerk in the auditor's office, and since February, 1881, was secretary of the Pennsylvania Lines West of Pittsburgh.

Alphonse Feldpauche, who was formerly chief engineer of the Philadelphia, Wilmington & Baltimore, and later secretary of the Association of Transportation Officers of the Pennsylvania Railroad, died on January 5, at Philadelphia, Pa., at the age of 66. Mr. Feldpauche remained in charge of the engineering department of the P. W. & B. for some years after the road came under the control of the Pennsylvania. He was appointed secretary of the transportation officers' association in 1903.

Joseph McCabe, formerly from February, 1898, to June, 1906, vice-president and general manager of the Washington & Columbia River, now a part of the Northern Pacific, died recently at the age of 59. He began railway work in 1870 with the Chicago, Milwaukee & St. Paul, and was consecutively telegraph operator and agent on that road. He subsequently served as train despatcher and chief train despatcher on different roads, until 1888, when he was appointed superintendent on the Northern Pacific, and in February, 1898, he became vice-president and general manager of the Washington & Columbia River.

Thomas C. Keefer, one of the most prominent civil engineers of Canada, died at his home in Ottawa, January 7, at the age of 94. He commenced his career as an engineer at the age of 17 on the Erie canal. He was engaged for several years on the Welland canal, and had a prominent part in the improvement of the Ottawa and St. Lawrence rivers. He took part in the preliminary surveys for the Grand Trunk between Montreal and Toronto, and in the preparation of plans for the Victoria bridge at Montreal. Besides being an eminent engineer, he was a capable writer, and his "Philosophy of Railways," published in 1849, had a marked influence on the policy of the Canadian government. He had been a president of the American Society of Civil Engineers, and was one of the founders of the Canadian Society of Engineers in 1887.

Christopher S. Gadsden, second vice-president of the Atlantic Coast Line, with headquarters at Charleston, S. C., died at Summerville, S. C., on January 12. He was born on August 15, 1834, at Summerville, and was educated at the South Carolina Military Academy. He began railway work in 1853, as rodman in an engineer corps of the New Orleans & Great Northern, now a part of the Illinois Central. He was subsequently engineer on the Franklin & Warren, now a part of the Erie, and later was in the service of the Port Royal & Augusta, in South Carolina, now a part of the Charleston & Western Carolina, and of the Charleston & Savannah. He was superintendent of the Charleston & Savannah until October, 1900, when he became president of the same road. Mr. Gadsden was also third vice-president of the Atlantic Coast Line to November, 1902, and since that time was second vice-president of that road.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Cleveland, Cincinnati, Chicago & St. Louis has ordered 5 Pacific type locomotives from the American Locomotive Company.

CAR BUILDING

The Mather Stock Car Company has ordered 500 stock cars from the Haskell & Barker Car Company.

The Chicago & Milwaukee Electric is in the market for 15 all-steel passenger cars instead of 300 as reported last week.

The Long Island has ordered 20 steel passenger cars from the Standard Steel Car Company, for use on its Atlantic Avenue division.

The Interborough Rapid Transit has ordered 12 all-steel passenger cars from the Pressed Steel Car Company for operation in the Steinway tunnel.

IRON AND STEEL

The Nashville, Chattanooga & St. Louis has ordered 3,000 tons of steel rails from the Tennessee Coal, Iron & Railroad Company, for use in the improvement of the roadway of the Western & Atlantic.

The Khedive and the Mariout Railway.—It is stated that one of the last efforts of the ex-Khedive was an attempt to sell, to an Italo-German syndicate, his private railway through the Mariout district, with the intention that it should be connected up with a new line from Benghazi on the Tripolitan coast. There would thus have been direct railway communication with Alexandria, and it was the hope of the promoters that the Indian and Australasian mails would be sent by this route because the distance by sea from Brindisi to Benghazi is a little more than half that from the former port to Alexandria, while it was also believed that tourists would take advantage of the saving of time in the journey between Europe and Egypt. Lord Kitchener, however, strongly opposed the scheme, and the Mariout Railway was bought by the Egyptian government, chiefly in consequence of military considerations.

Indian Railway Operation.—A narrow-gage line about 30 miles in length, from Broach to Jambusar, has recently been opened for passenger traffic, and is now incorporated in the Bombay, Baroda, and Central India system. At the close of March the South Indian Railway was operating 1,753 miles of line, viz.: broad gage, 446 miles; metre gage, 909 miles; narrow gage, 99 miles; and meter-gage lines, other than state lines, 299 miles. A connection established between India and Ceylon by the South Indian Company is now in operation. A viaduct establishes communication between the mainland of India and the Island of Rameswaram, and a Scherzer rolling-lift bridge carries trains over the Pamban Pass. Passenger traffic over the new lines is now in full operation, but there has been some delay as regards goods traffic, and the Ceylon government still restricts despatches to three days a week, and refuses altogether the carriage of live stock. In consequence of a heavy and abnormal fall of rain, the main line of the meter-gage section was recently washed away between Capper Quarry and Coleroon. The normal rainfall of the district is about 49 in. per annum, but in one month alone rain fell to the extent of 41 in., of which 25 in. fell in 48 hours. The consequence was that numerous canals and tanks burst their banks, and all the rivers, of which there are four in the district affected, overflowed their banks. The railway was breached almost continuously for 10 miles; none of the bridges was seriously damaged, and only one culvert was carried away. The damage, however, was so extensive that all traffic over the 10 miles had to be suspended for a month, and the restoration of communications cost nearly $33,500.—*Engineering.*

Supply Trade News

Benjamin G. Fernald has been appointed district manager of the New York office of the Kerr Turbine Company, Wellsville, N. Y.

R. M. Nicholson, advertising manager of the Kimberly-Clark Paper Company, Neenah, Wis., has been placed in charge of the advertising of the Berger Manufacturing Company, Canton, Ohio, succeeding G. P. Blackiston.

C. P. Howard, formerly a member of the firm of Berry, Howard & Roberts, which was recently dissolved, announces the opening of an office as consulting engineer in the Transportation building, Chicago. He will specialize in railway work.

The item in this column last week announcing the incorporation of the National Brass Company, Houston, Tex., was incorrect in that it omitted to state that the G. F. Cotter Supply Company, Houston, Tex., had been appointed general sales agents for the National Brass Company.

The Beaver Dam Malleable Iron Company has been reorganized and incorporated under the corporate name of the Western Malleable Company, and continues the operation of the plant at Beaver Dam, Wis. The officers are: Lawrence Fitch, president and treasurer, with headquarters at Milwaukee, Wis.; E. E. Smythe, vice-president and general manager; M. A. Jacobs, secretary, and A. W. Wilbrandt, assistant secretary.

In a recent decision handed down by the Honorable Learned Hand, justice of the United States district court of the southern district of New York, in the suit of the Chadeloid Chemical Company, New York, against the Wilson Remover Company and John MacNaul Wilson, it is held that the varnish remover made by the defendant company is an infringement of Ellis patent No. 714,880, controlled by the Chadeloid Chemical Company.

Joseph T. Ryerson & Son, Chicago, are offering a prize of $100 in gold for the best trade name for the line of tool steel which the company is selling. The company has been selling a complete line of tool steel for many years, but has had an outside manufacturing connection for the steel, and in consequence adopted the name used by the manufacturer. It has since been found necessary to either manufacture or control the manufacture of the steel, which the company has now been doing for some time. In addition to the $100 first prize, those who send in the 100 next best names will be given a copy of a loose-leaf leather reference book of steel and engineering data, and for the next best 200 names bound volumes of the same book will be given.

Charles Silverman Price, for many years general manager of the Cambria Steel Company, and later its president, died at his home at Westmont, Pa., on Sunday, January 10, of heart disease. Mr. Price was born at West Chester, Pa., on August 27, 1852. He was educated in the private schools and received the degree of Bachelor of Civil Engineering from Cornell University in 1872. After graduating from college he was first employed by the Detroit Bridge & Iron Works, Detroit, Mich., as a draftsman. Shortly after, he was elected city engineer of Lock Haven, Pa., serving for three years. In June, 1876, he entered the service of the Cambria Iron Company as a draftsman in the engineering department. He supervised the construction of the first open-hearth plant of the company, and after its completion became turn foreman, serving as such from 1878 to 1881. He was promoted successively to the positions of superintendent of the open-hearth works, 1881-84; superintendent of the Bessemer, open-hearth and blooming departments, 1884-86; superintendent of the metallurgical department, 1886-90, and general superintendent of manufacture, 1890-92. He subsequently became general manager, vice-president, and on March 15, 1910, was elected president of the Cambria Steel Company. He remained in that position until September 26, 1912, when he resigned on account of ill health.

A decision has just been rendered by the United States Circuit Court of Appeals for the Seventh circuit in the suit of The Rail-

road Supply Company versus the Hart Steel Company and Guilford S. Wood, appealed from the United States District Court for the Northern district of Illinois, Eastern division, reversing the decision of the District Court and deciding in favor of The Railroad Supply Company. This case has been stubbornly contested in the courts for six years and has attracted a great deal of attention because of the principles at issue. The suit involved the validity of three patents covering the designs of tie plates issued to B. Wolhaupter in 1895, 1902 and 1903 and assigned to The Railroad Supply Company, the essential features of these patents being combined in the design of one tie plate. The claims outlined in the patents cover a railway tie plate with flanges more or less sharpened on the under side to penetrate and engage the wood fibres of the tie and with a series of corrugations on the upper surface supporting the rail. This design not only provides a bond between the tie plate and the tie, but the corrugations on the upper surface give increased strength for the amount of metal employed. The evidence introduced in this case showed that the merits of this design have been recognized by many railroads as indicated by the fact that they are being used in large quantities. In sustaining the validity of these patents this decision of the Circuit Court of Appeals ordered an accounting on the claims of the first and primary patent and ordered an injunction and an accounting on the second and third patents containing supplementary features of design later included in this tie plate. This decision is of special importance to the railway supply field, establishing as it does a further precedent for the sustaining of the validity of patent claims against infringements.

TRADE PUBLICATIONS

FORGING PRESSES.—The Mesta Machine Company, Pittsburgh, Pa., has issued bulletin L, descriptive of the Mesta quick-acting, steam-hydraulic flanging press, with single lever control.

ASBESTOSTEEL.—The Asbestos Protected Metal Company, Beaver Falls, Pa., recently issued bulletin No. 54, a 32-page booklet, devoted to a description and illustrations of the use of Asbestosteel for roofs and walls. It gives in detail the uses to which this product may be put and the method of application, also specifications for roofing, slabs, etc., and tables showing safe loads in lb. per sq. in., and sizes of purlins required for various spans. The illustrations show typical cases where the material has been used.

THE STORY OF LA CARTE.—This is the title of an attractively illustrated booklet recently issued by the passenger department of the United Fruit Company to indicate the excellencies of the á la carte dining service on the steamships Pastores, Tanadores and Calamares of the Great White Fleet. The booklet contains several varicolored views of ships of various ages. It also gives a brief outline of the methods of supplying food to those "who went down to the sea in ships" from early times to this, the story being supplemented with interesting items relating to a number of famous dinners on sea and land.

BOILER CIRCULATION.—The Q & C Company, New York, has recently issued a catalog descriptive of the Ross-Schofield System of Circulation for Locomotive Boilers. The bulletin is gotten up in a very attractive manner and on the whole is somewhat out of the ordinary, it being illustrated with both photographs and colored engravings. This system, formerly controlled by the Ross-Schofield Company, has recently been taken over by the Q & C Company. It has been installed on stationary boilers on the Philadelphia & Reading, as well as on locomotive boilers on that road and on the New York, Ontario & Western. A full description of the system was given in the *Railway Age Gazette* of December 18, 1914, page 1131.

ELECTRIC APPLIANCES.—The General Electric Company has recently issued the following bulletins descriptive of some of its electrical appliances. Bulletin No. 42,010, entitled "Small Turbo-Generator Sets," 7 kw. to 300 kw., illustrates and describes in considerable detail the horizontal turbine sets of small capacities manufactured by the company. These machines are largely used for supplying light and power in mills, machine shops and other places, as well as for train lighting. Bulletin No. 42,300 describes the General Electric Company's line of small direct connected generating sets of sizes ranging from 2½ kw. to 75 kw. Bulletin No. 45,602 deals with the subject of the protection of series lighting circuits by lightning arresters.

Railway Construction

ALBERTA CENTRAL.—See Canadian Pacific.

BLACK MOUNTAIN & EASTERN.—We are told that under this name a logging road is being built from Combs in Madison county, Ark., south to Cass in Franklin county, 18 miles. The line is being built for the Phipps Lumber Company, Fayetteville, and 16 miles of track has been laid. The general contract has been given to the Burke Construction Company, Fort Smith. (March 27, p. 767.)

CANADIAN PACIFIC.—The Alberta Central has asked the Canadian Parliament for an extension of time to build lines as follows: from Rocky Mountain House, Alta., to the Grand Trunk Pacific, near Yellow Head Pass, also for three branch lines of 30 miles each, and two branch lines of 35 miles each, to be built into the Big Horse range and along the Brazeau river. (September 25, p. 587.)

The Kootenay Central, which is operated as the Kootenay Central Sub-division of the Canadian Pacific, has completed the section between Edgewater, B. C., and Fort Steele, and the line is now in operation from Golden to Colvalli, 166.7 miles, where a junction is made with the main line of the Crowsnest route. Additional second track was opened for operation in December, 1914, between mileage 0.4 and 24.8 on the Shuswap-sub-division between Revelstoke, B. C., and Taft, making the double track mileage of the British Columbia division 139 miles.

CAROLINA, GREENVILLE & NORTHERN (Electric).—This company plans to build about 75 miles of railway, it is said, from Newport, Tenn., northeast via Greenville to Kingsport. There are to be three bridges on the line. Bids for the work will probably be asked for about May 1. H. S. Reed, president, Los Angeles, Cal.; J. L. Callanan, vice-president, New York; E. R. Eaton, treasurer, Greenville, Tenn., and F. A. H. Kelly, chief engineer, Greenville.

FLORIDA ROADS.—According to press reports a railway is to be built from Green Cove Springs, Fla., on the Atlantic Coast Line west across Clay county to Starke on the Seaboard Air Line in Bradford county, about 30 miles. The Dowling-Shands Lumber Company, Green Cove Springs, is said to be interested.

ILLINOIS CENTRAL.—The construction of the 2.6 miles of spur track extending south from Oak Ridge, Ill., and serving the Peabody Coal Company, has been completed.

KANSAS & OKLAHOMA SOUTHERN.—Financial arrangements are being made for the completion of the 61-mile extension from Caney, Kan., to Vinita, Okla. It is planned to resume construction work about April 1, 1915.

KOOTENAY CENTRAL.—See Canadian Pacific.

LULA HOMER.—This company, which was recently organized in Georgia to build from Lula, Ga., southeast to Homer, about 14 miles, has plans about completed, it is said, and construction work will be started at once. D. G. Zeigler & Sons, Lula, may be addressed. (November 27, p. 1029.)

MARIETTA-PARKERSBURG INTERURBAN.—Application has been made for a charter in West Virginia, it is said, by this company, with a capital of $10,000. The plans call for building an electric line from Parkersburg, W. Va., north to Marietta, Ohio, about ten miles. J. Kaiser and M. M. Rose, Marietta; K. B. Stephenson and H. H. Archer, Parkersburg, W. Va., are interested.

MASSACHUSETTS ROADS.—The Walworth Manufacturing Company has asked for authority to build two miles of railway along the South Boston (Mass.) waterfront from the freight yards of the New York, New Haven & Hartford on West First street, through that street to a point between F street and Dorchester street, thence along East First street to Marine Park.

MONROE & TEXAS.—Incorporated in Louisiana with a capital of $40,000, it is said, to build or lease a railroad from Monroe, La., southwest through Ouachita, Jackson, Winn, Natchitoches and Sabine parishes to a point on Sabine river, about 125 miles.

Authority is also given to build branch lines and to extend the railroad outside of Louisiana. F. R. Pierce, president, St. Louis, Mo.; L. Brandt, vice-president; C. S. Chesbro, secretary; and A. B. Pierce, treasurer.

Montana Waumandee.—Surveys are being made for the proposed line which is to extend from a point on the Chicago, Burlington & Quincy, through Waumandee, Wis., to Montana, Buffalo county, Wis. The exact route has not yet been determined and no contracts for construction have been let. A few small pile trestles will be required. A charter was granted this company November 13, 1914. H. G. Hawley, Waumandee, Wis., is chief engineer.

Montreal & Southern Counties (Electric).—This company has asked the Canadian Parliament for an extension of time in which to build from Montreal, Que., via. St. Lambert to Granby and other points south of the St. Lawrence river. The line is now in operation from Montreal to St. Cesaire, 35 miles, and construction work is now under way between St. Cesaire and Granby, 15 miles. (July 3, p. 39.)

Palm Beach & Everglade.—Under this name a company has applied for a charter in Florida to build a railway from Palm Beach, Fla., west to Lake Okeechobee, about 45 miles. The projected route is along the West Palm Beach canal for some distance, thence southwest to Lake Okeechobee. The line may eventually be extended to a point on the west coast of Florida. C. H. Baker, president, New York; H. G. Geer, vice-president; J. A. Moore, general manager; W. H. De Camara, secretary, and T. J. Campbell, treasurer, West Palm Beach, Fla.

Tennessee Roads (Electric).—Plans are being made, it is said, to build an electric line from Knoxville, Tenn., northeast via Newport to Bristol, about 120 miles. M. K. Bell, Knoxville, represents eastern capitalists who are interested in the project. Some of the right of way has been secured. S. E. Hodges, Knoxville, is the attorney.

RAILWAY STRUCTURES

Buffalo, N. Y.—The city officers of Buffalo have approved the contract entered into between the city of Buffalo and the Lehigh Valley for the construction of this railway's new terminal in Buffalo. This removes the last obstacle to the carrying out of this improvement. The railway company is now preparing the specifications for the new terminal. (July 17, p. 148.)

Camden, N. J.—An officer of the Atlantic City Railroad writes that the company has not yet decided on the plans for a new terminal to be built at Camden to replace the structure which was recently destroyed by fire.

Connersville, Ind.—The Cincinnati, Hamilton & Dayton has just completed a $12,000 brick passenger station at Connersville.

Galveston, Tex.—The grain elevator of the Southern Pacific Terminal Company at Galveston, Tex., which was destroyed by fire November 17, will be replaced by a new elevator of reinforced concrete construction, and supported on a concrete mattress over piling. The work house will be 98 ft. long and 47 ft. wide, with a capacity of 212,000 bu., and will be equipped with the most modern grain handling facilities. The storage annex will consist of 48 bins, 15 ft. inside diameter and 98 ft. high. The total capacity of work house and storage annex will be 1,004,000 bu.

Michigan City, Ind.—The Michigan Central is preparing plans for a new station at Michigan City, to replace the one recently destroyed by fire.

Springfield, Ill.—A committee consisting of representatives of the various railroads entering Springfield, Ill., with H. T. Douglas, Jr., chief engineer of the Chicago & Alton as chairman, has been formed and is now making a study of the railroad situation at Springfield. The separation of grades and a union station have been proposed by the Springfield Commerce Association as a means of improving the situation. A belt line has also been suggested. The committee has drawn up some preliminary plans, but as yet nothing definite has been decided upon.

Virginia, Neb.—The Chicago, Rock Island & Pacific, it is said, will build a new station at Virginia, Neb., at once to replace the one destroyed by fire on December 23.

Railway Financial News

Buckhannon & Northern.—See Monongahela Railroad.

Chicago, Milwaukee & St. Paul.—The Railroad Commission of Wisconsin has approved of the issue of $29,141,300 additional stock to provide for conversion at par of a like amount of convertible bonds which the directors have authorized, as recently announced in these columns.

Kansas City, Ozark & Southern.—F. C. Braden, of St. Louis, has been appointed receiver of the Kansas City, Ozark & Southern on the application of two officers of the company. The road runs from Ava, Mo., to Mansfield, 16 miles.

Monongahela Railroad.—Stockholders have approved a consolidation with the Buckhannon & Northern.

Nashville, Chattanooga & St. Louis.—This company has declared a semi-annual dividend of 2½ per cent, payable February 1. This reduces the annual rate from 7 per cent to 5 per cent.

National Railways of Mexico.—A special general meeting of stockholders has been called for February 20 at the offices of the company in Mexico City.

Southern Railway.—The last payment was made on January 4 by the Southern Railway to the state of Georgia for the line which runs from Athens to Lula. The state had guaranteed the bonds of the old Northeastern Railway Company, which originally built the line, and the state came into possession of the road through its inability to earn its fixed charges and sold it to the Southern Railway for $307,000, payments being made $50,000 annually.

Peat Used as Insulating Material on the Berlin Elevated.—The construction of the Berlin elevated railway, which in places had to pass through blocks of houses, necessitated the use of sound insulating material, and several experiments proved that compressed peat-litter possessed exceptionally good qualities for this purpose. It was applied in plates 1 in. thick, weighing 1.3 lb. to 2.5 lb. a sq. ft., according to the degree of compression (the more firmly compressed, the more efficient it is). As such peat plates can withstand a pressure of from 280 lb. to 1,400 lb. per sq. in., according to the method by which they have been made, they are also suitable as sub-layers for asphalt in gateways, for linoleum, and even for machinery foundations, and can be used to reduce expensive cork plates (peat plates cost barely 50 cents per square yard). These plates have also proved most efficient insulation material for heat and cold. The plates are protected against damp and insects by means of molten asphalt, which is used for attaching them to each other.—*Engineering.*

New Electric Railway for Bolivia.—The representation from the Department of La Paz to the Bolivian Chamber of Deputies has submitted to the consideration of that body a project for the construction of an electrical railway from the city of La Paz to the Yungas district of the department. The project has been reported on favorably by the committee on highways and finance, and it appears as though it would be voted on favorably by a large majority. The district through which the proposed line is to pass is probably the richest agricultural part of the department of La Paz under actual cultivation, producing very large quantities of coca-leaves, fine woods, coffee, cocoa, sugar cane and many other valuable crops, besides being wealthy in minerals. The roads leading from La Paz to the district are good and the territory, which will be served by the railway, is well provided with large amounts of water power. The maximum cost of the line is calculated at $2,500,000 United States currency. The work is to be directed by the Public Works Department of the Bolivian government, its cost being defrayed from the treasury of the Department of La Paz. Surveys have been made by the Bolivia Railway and by the public works office, and the work is to be carried out in accordance with their surveys and plans.

Railway Age Gazette

PUBLISHED EVERY FRIDAY AND DAILY EIGHT TIMES IN JUNE BY THE
SIMMONS-BOARDMAN PUBLISHING COMPANY
WOOLWORTH BUILDING, NEW YORK

VOLUME 58 JANUARY 22, 1915 NUMBER 4

Contents

MAINTENANCE OF WAY SECTION

*Illustrated.

One of the most interesting and significant facts disclosed by the reports of the Interstate Commerce Commission is that recently the commission has been causing more prosecution of patrons of the railways for violating the laws than of railways themselves. The commission's annual report for 1913 shows that between December 1, 1912, and the time it compiled its report it had caused the return of 61 criminal indictments for violations of the Act to regulate commerce and of the Elkins Act, and that of these 34 were against shippers for misbilling shipments, securing rebates, etc., and against passengers for violations of the anti-pass provisions. Between the same dates 72 prosecutions for similar offenses were concluded, and of these 46 were against patrons of the railways. We understand that the complete report for 1914 will show an even larger proportion of indictments and prosecutions against patrons of the railways in that year, and that of 25 indictments returned between October 1 and December 1, 1914, no less than 21 were against shippers. These statistics seem to indicate two important points. One is, that the railways are abiding by the law much better than the shipping and traveling public—for in many cases the violations of law by their patrons are of such a nature that the railways cannot prevent them. The other point is, that the commission is showing a commendable disposition to enforce the law impartially as well as vigorously. It has been urged as an objection to the present system of regulation that it makes the commission a prosecutor as well as a judge of the railways. It has been often overlooked that the commission occupies exactly the same dual relation to law-breaking patrons of the railways as to law-breaking railways; and doubtless its knowledge of the offenses of the latter class tends to prejudice it as much against them as its familiarity with the misdeeds of the former tends to prejudice it against them. This, of course, is not to say that the general principle of having the commission act as both prosecutor and judge is not a bad one.

Enforcing the Law Against Railway Patrons

We publish in another column a letter from a railroad officer who criticizes the detail into which the Interstate Commerce Commission is going to make an inventory of the properties of the railways for its valuation, and also criticizes valuation as a basis for rate making. We agree with most of the exceptions which our correspondent takes to valuation as a basis for rate making and also with most of what he says regarding the needlessness of going into minute details in making an inventory in connection with valuation. But criticisms of this kind should not be directed against the Interstate Commerce Commission. They should be directed against the courts and Congress. It is the courts which have established the principle that the fair value of the property is the chief basis for determining the reasonableness of rates. In thus holding, the courts have not indicated all the factors which should enter into a valuation or how much weight should be given to each of them. They have, however, indicated that much weight must be given to the original cost of construction and the probable cost of reproduction, and have in so many cases criticized valuations for not going into enough detail regarding these matters as to have justified the Interstate Commerce Commission in thinking that it must go into a very great deal of detail in order to make a valuation which the courts will uphold. Furthermore, Congress in the legislation requiring that the valuation be made, directed the commission to collect an enormous amount of information of various kinds. It is quite true that Congress did not fully realize what it was doing when it passed the law, but that is no good reason why after Congress has passed the law the commission should not carry it out. In the main, the commission is handling the valuation as well as it probably can in

Criticism of Valuation Methods

view of the instructions under which it is acting and the resources which have been placed at its disposal, and those who criticize the use of valuation as a basis for the regulation of rates or the general plan which the commission is following should have recourse to Congress and not to the commission.

A COMPARISON THAT IS SLIGHTLY INACCURATE

WHEN one stops to think how marvelously perfect the operation of the Interborough Rapid Transit's system must be to handle the enormous crowds which jam into the subway and elevated trains at rush hours, a certain amount of enthusiasm is permissible. When, however, the Interborough's statistician bursts into half-page newspaper advertisements with a comparison of one passenger killed in 842,620,000 carried, on the Interborough, as against one killed by the steam railroads in 2,610,000 passengers carried, with the implication that the Interborough handles its passenger business something over three hundred times as safely as the steam railroads, statistical enthusiasm has reached the point of intoxication.

The Interborough's figures for its own record are for the five years, six months and twelve days ended January 12, 1915. The figures for the steam roads are for the five years ended June 30, 1913. The Interborough's statistician gives the number of fatal accidents to passengers on steam roads, excluding trespassers, for the five years, as 1,862. The Interstate Commerce Commission's records show 1,534 of all classes of passenger train passengers killed by all sorts of accidents, including falling off cars and engines, getting on or off cars or engines, being struck or run over by cars and engines, etc., and including probably a few victims of accidents on station platforms and stairs. The Interborough's figures for steam roads probably include passengers on freight trains. The mere fact, however, that the Interborough does not operate freight trains is a bagatelle compared with the other factors which make the comparison wholly misleading. Since it is impossible to get from any disinterested source the Interborough's figures down to the minute of the accident week before last, it is fair to compare the records for the latest year for which there is officially published information.

The annual report for 1912 of the New York Public Service Commission, First district, shows 37 passengers (which term, of course, excludes trespassers and employees) killed on the Interborough Rapid Transit's lines. During that year 607,244,697 passengers were carried by the Interborough. There was, therefore, approximately one passenger killed in 16,410,000 carried. Of course it is not number of passengers, but passenger miles which should be compared to measure varying degrees of safety. There are no figures available for the average length of haul on the elevated, but in 1912 the average length of haul on the subway was 5.75 miles. The elevated probably has a shorter average haul than the subway.

In 1912 the average passenger journey on steam railroads was 33.18. To be quite liberal to the Interborough, assume that the steam railroad journey was five times as long as the Interborough journey. The steam railroads in 1912 carried 1,004,081,346 passengers, with a total of 270 passenger-train passengers killed. This figure again excludes trespassers and employees, but includes passengers run over in crossing tracks, falling under trains, etc. This makes one passenger killed in about 3,720,000. Since the average journey was five times that of the Interborough, the two figures that should be compared are one passenger in 16,410,000 for the Interborough and one passenger in 18,600,000 for the steam railroads. Of course the Interborough's figures include suicides, which are accidents which cannot be avoided by any imaginable vigilance on the part of the company; but some of the people killed by steam railroads undoubtedly also were suicides. The above figures are not meant to show that the Interborough is not a safely operated road, but simply to show the low esteem in which the Interborough's statistician must hold the public intelligence in making a comparison between steam roads and the Interborough such as that appearing in the advertisements which it has issued this week.

It is obvious enough what the Interborough was trying to get at insofar as the figures for *their own number killed* is concerned; that is, passengers actually killed in train accidents. Both the figures showing 37 passengers killed on the Interborough and 270 killed on the steam roads include persons not killed in train accidents. If a correct comparison were made including only persons killed in train accidents, undoubtedly the Interborough would show up very much better than the steam roads, but conditions of operation on the Interborough are widely different from on the steam roads.

"PRODUCTIVE EFFICIENCY" AND WAGES

THE foundation for the arguments for an increase in the wages of the engineers and firemen of western roads which have been advanced before the arbitration board sitting at Chicago by the spokesman of the employees, is the claim that there has been an increase in the "productive efficiency" of the railways; that as a result the "productive efficiency" of the engineers and firemen has increased; that there have been additions to the engineers' and firemen's labors and responsibilities; and that they should benefit accordingly.

If this "productive efficiency" theory is a valid argument for higher wages for engineers and firemen, it is an equally valid argument for advances in the wages of all classes of railway employees. It is easily demonstrable that there has been an increase in the traffic units moved, not only for each engineer and fireman, but also for each conductor, brakeman, station agent, section foreman and track laborer—not to mention general managers, vice-presidents and presidents. Therefore, on this theory, the wages of all who work for any railway on which there has been an increase in the traffic units handled per employee should be increased.

But what if there are certain classes of employees who have contributed to the increase in "productive efficiency" unwillingly and under protest? What if some of them have made demands the granting of which would have prevented an increase in "productive efficiency"? What if, when these demands have been refused by the managements, they have gone to regulating commissions, legislatures and Congress, to get orders or legislation the purpose and effect of which would be to prevent the increase in "productive efficiency"? Would it be entirely logical for such employees, after these efforts of theirs had been defeated, to come in and base demands for advances in wages on the very increase in productive efficiency which had been made in spite of all their protests to the managements and in spite of all the lobbies they had maintained at the state capitals and at Washington?

We are not discussing an imaginary case. This is exactly what has happened. The firemen have demanded that the managements put two firemen on large engines. They are making this demand in the arbitration proceeding now pending. In some states they have sought legislation on the subject. But is it not obvious that the "productive efficiency" of each fireman—in other words, the ton-miles moved per fireman—will be less when a train is pulled by an engine having two firemen than when it is pulled by an engine having only one? If the firemen should get an advance in wages in this case based on their increased productive efficiency, would their leaders go off at once to the state legislatures to get legislation requiring two firemen on an engine—in other words, legislation to abolish the very productive efficiency on which had been based their advance in pay?

And, then, there is the demand for more men in a train crew. If a freight train hauling 1,000 tons is manned by five men, the productive efficiency of each man is greater than if it were manned by six men. Therefore, to seek legislation to require the railways to put on a sixth man is to seek legislation to re-

duce the productive efficiency of each man in the crew. Yet this is just what the Brotherhood of Railroad Trainmen has done in its agitation for "full crew" legislation. The Brotherhood of Railroad Trainmen recently has been meeting bad success in its campaign for train crew legislation. It has therefore taken a new tack. It is now agitating for legislation to restrict the number of cars in a freight train to 50. Suppose that a railway had been hauling 75 cars in a train, and that such a law were passed. This would reduce by 33 1/3 per cent. the productive efficiency of every employee in the train crew—engineer, fireman, conductor and brakemen. The engineers and firemen claim that where there is an increase in productive efficiency they are entitled to benefit by it. It is a poor rule that won't work both ways. If legislation were passed reducing the productive efficiency of each man 33 1/3 per cent, would the engineers and firemen agree to a reduction of 33 1/3 per cent. in their wages?

That would be logical. But the engineers and firemen are not logical. This is shown by the nice distinction which they draw between "productive efficiency" in freight service and "productive inefficiency" in passenger service. The statements they have introduced all relate to freight service. This is because there has not been the same increase, or perhaps any increase, of "productive efficiency" in passenger service. Nevertheless, they are asking for advances in the wages of engineers and firemen in passenger as well as freight service. Manifestly, on their own theory, logically applied, there should be no advance in wages in passenger service. But, their spokesmen say, the failure to increase productive efficiency in passenger service has been the fault of the management, and employees should not be made to suffer for it. But if the failure to increase productive efficiency in the passenger service should be debited to the management, may it not be that the success attained in increasing productive efficiency in the freight service should be credited to the managements? And if, on the other hand, both the managements and the employees deserve credit and compensation for the increase in productive efficiency in the freight service, why should not the employees participate with the owners of the railways in the unprofitableness of the passenger service?

Again, as the employees have shown, some western roads are prosperous. But it can also be quite conclusively demonstrated that some other western roads are not prosperous; indeed, a number are bankrupt. The theory of "productive efficiency" would seem to require that if the employees should share in the prosperity of the more successful roads they should go into "hock" with those which are bankrupt. But this reasoning does not appeal to the employees. On their theory, they should share in the profits of the prosperous roads, but only the stockholders and bondholders should go "broke" with the railways which fail.

The principle of the relation between productive efficiency and wages being advanced in this case is practically a principle of profit-sharing; and it does not appeal to a rational mind as wholly logical for those who advance and advocate such a principle to contend that they should be allowed to share to a very large extent in the results of the progress of an industry, but should not be expected to share at all in its reverses.

However, it is gratifying to find that the engineers and firemen have at last discovered that there is a relationship between productive efficiency and wages. Labor of all kinds has been remarkably slow to learn that in the long run there can be no increase in real wages for labor as a whole which does not result from increases in productive efficiency; and that there can be no increase in real wages for any class of labor which does not result either from an increase in the productive efficiency of that class or from the imposition of a burden on all other classes of the public for the benefit of that class. When one class of labor gets an advance in wages which is not counterbalanced by an increase in productive efficiency in the industry in which that class is employed, it must be offset by an increase in rates or prices which must be paid by those who buy the services or commodities produced in that industry. The trouble with the railway industry today is that there already have been large increases in wages which have not been offset by increases in the productive efficiency of labor. If the union labor leaders of this country will actually study the relationship between productive efficiency and real wages, profits and prices, instead of merely jockeying with it, as the leaders of the engineers and firemen are doing, they will learn some things which it will be greatly to the interest of their followers and society for them to learn. Perhaps, then, they will quit encouraging their followers to "make" work, to secure train crew legislation, and to adopt other methods intended to prevent increases in productive efficiency. When labor finds out that it cannot eat the cake of productive efficiency, and at the same time prevent it from being baked, labor and everybody else will be much better off.

ST. LOUIS & SAN FRANCISCO

THE St. Louis & San Francisco has been in the hands of receivers since May 27, 1913. At the time the receivers took charge the physical property was suffering from the results of economies in maintenance so rigid as to make some of the lines of the system barely safe for operation. While it was no part of the receivers' duties to add anything to the property except additions and betterments needed for preservation of earning power, it was imperatively necessary to bring the physical condition of the plant up to a point which would permit of reasonably economical and safe operation. This the receivers have succeeded in doing very largely from earnings. There have been $3,000,000 receivers' certificates issued and sold, and at the end of June, 1914, there was $4,570,000 interest and rents in default, and cash on hand amounted to $1,535,000 as against $4,430,00 on June 30, 1913. But, on the other hand, loans and bills payable had been reduced from $5,784,000 on June 30, 1913, to $1,385,000 on June 30, 1914, and outstanding equipment trust obligations had been reduced from $13,469,000 on June 30, 1912, to $8,406,000 on June 30, 1914. In the short period from May 27 to June 30, 1913, the receivers could, of course, only make a start in their program of rehabilitation, so that the fiscal year ended June 30, 1914, shows the results obtained during the early part of the period of the work of rehabilitation, and it will not be until the results of operation in the 1915 fiscal year are available that any comprehensive record will have been made of the effect of the receivers' policy on expenses and earnings.

Notwithstanding this fact, however, the comparison between the 1914 and 1913 fiscal years is quite striking in the change shown in expenditures on maintenance and economies in transportation expenses.

Total operating revenues in 1914 amounted to $44,924,000, a decrease of $1,127,000, or 2.4 per cent, from the previous year, the revenue ton-mileage in 1914 being 3,028,000,000 as compared with 3,127,000,000 in 1913, a decrease of a little over 3 per cent, and the passenger miles being 535,000,000 in 1914 as compared with 490,000,000 in 1913, an increase of over 9 per cent. Total operating expenses amounted to $33,271,000, an increase of $2,560,000, or 8.3 per cent; but, whereas maintenance of way expenses increased 35 per cent and maintenance of equipment 23 per cent, transportation expenses decreased 4.5 per cent. The following table shows the percentage of each class of expenses to total operating revenues in 1914 and 1913:

	1914.	1913.
Maintenance of way and structures	17.28	12.50
Maintenance of equipment	16.68	13.23
Traffic expenses	2.07	2.18
Transportation expenses	35.08	35.84
General expenses	2.95	2.94
Total	74.06	66.69

In 1914 $1,476 per mile was spent for maintenance of way, comparing with $1,095 in 1913 and $977 in 1912. In 1914 3,269,000 ties were used in renewals as against 1,600,000 in the previous year; there were 13,082 tons of 90-lb. rail put in track as against 16,146 tons in the previous year, and 186 miles of track was ballasted as against 296 miles in the previous year. Total figures for money spent on maintenance of way fail entirely, of course, to give any indication of the effectiveness of each

dollar spent, and even figures showing the quantity of material used in renewals give an indication of only the probable betterment of track conditions.

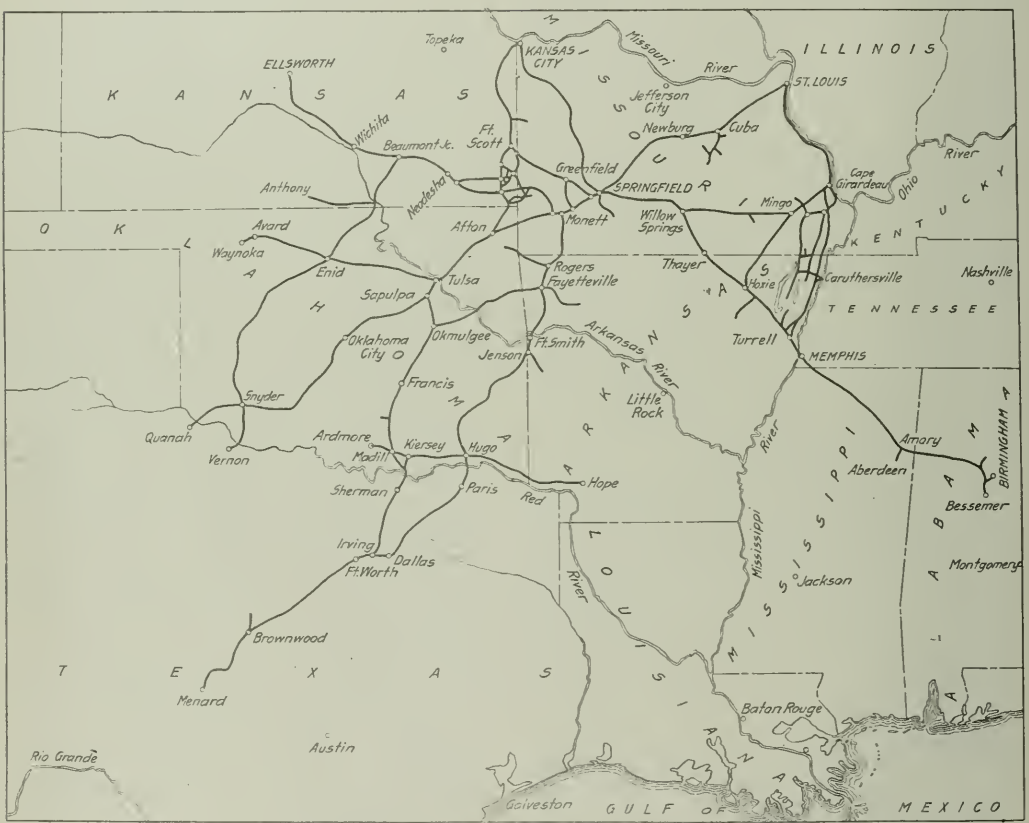
In 1914 $2,518,000 was spent for roadway and track labor, an increase of 29.8 per cent over the previous year. Steps have been taken which will undoubtedly greatly increase the efficiency of track labor for the fiscal year 1915. Early in 1914 the policy was inaugurated of having the engineering officers and the roadmasters meet in conference to discuss the details of carrying on the work. At the spring meeting, when considerable expenditures were to be made for improving the track and roadway, the greater part of the meeting was given over as to a discussion of how the expenditure might be utilized to

The average expenditure per unit of equipment in 1914 and 1913 is shown in the following table:

	1914.	1913.
Repairs per locomotive	$2,578	$2,460
Repairs per passenger car	774	728
Repairs per freight car	107	64

The increased expenditure on repairs of freight cars is striking. The total for repairs, renewals and depreciation of freight cars spent in 1914 was $3,655,000, an increase over the amount paid in the previous year of $1,365,000, or 59.6 per cent.

Total transportation expenses amounted to $15,761,000 in 1914, which is $744,000, or 4.5 per cent, less than in 1913, and was, of course, affected by the 5 per cent smaller ton-mileage and 9 per cent greater passenger mileage. With the decrease of 5



Map of the St. Louis & San Francisco, Including the North Texas Lines, Which Lie South of Paris, Tex., and Sherman, and Are Under a Separate Receivership

the best advantage. At a meeting held this fall the problem was more of how the individual efficiency of the men might be increased to secure the greatest returns for the money expended for labor. One very radical step has been taken which promises to greatly increase the efficiency of the section forces. A minimum force, consisting of four men and the section foreman, has been established and will be maintained throughout the entire year. This will make it possible to keep the roadway up to a high standard throughout the year as compared with the previous practice, where the forces were cut during certain seasons of the year and special gangs were required to do extra work at other times.

per cent in ton-mileage the mileage of freight locomotives was decreased by 861,000, the total in 1914 being 10,176,000 and the percentage of decrease being 7.8. With the increase in passenger mileage of 9 per cent, passenger locomotive mileage was reduced by 353,000, totaling 9,762,000 in 1914, the percentage of decrease being 3.5. Receivers are generally a little less at the mercy of state commissions in respect to unprofitable passenger trains than are railroad officers representing the owners.

The average total trainload, including company freight, was 351 tons in 1914, an increase of 27 tons over 1913. The ways in which this increase in trainload was obtained were considered at length in an article in the *Railway Age Gazette* of

March 13, 1914, page 501. The improvement is largely due to an educational campaign which was started in September, 1913. It is expected that the developments in this campaign will insure an even greater increase in the 1915 figures as compared with 1914 than was true of those of 1914 as compared with the previous year.

The two items in transportation expenses showing the largest reduction in 1914 as compared with 1913 are fuel for road locomotives, the cost of which in 1914 was $2,768,000, or $361,000—11.5 per cent—less than in 1913, and injuries to persons, which was $355,000 in 1913, or $238,000—40 per cent—less than in 1913. Of course the fuel economy was partly the result of a smaller locomotive mileage, but the cost of fuel per mile run in 1914 was 12.69 cents as compared with 13.53 cents in the previous year. A description of the methods used to effect these economies in the use of fuel appeared in the *Railway Age Gazette* of November 7, 1913, page 874.

The reduction in payments for injuries to persons is particularly noteworthy. Of course payments on this account on the Frisco, as well as on other lines operating in the Southwest, have been entirely too high, partly the fault of public opinion, which led juries to award preposterously high amounts in damage suits, and partly to the recklessness of employees and to physical conditions. The Chicago, Rock Island & Pacific, which operates about 50 per cent more mileage than the Frisco, spent $1,046,000 for injuries to persons in transportation service in 1914. Probably the best convenient unit of comparison for expenditures for injuries to persons is the total, including maintenance of way, maintenance of equipment and transportation per employee. On this basis the St. Louis & San Francisco spent $22 in 1914, and the Rock Island $36.

In the reorganization of the St. Louis & San Francisco there will, it would appear, have to be a quite radical scaling down of fixed interest charges. The present policy which is being pursued by the receivers will result in further very considerable economies in transportation costs per unit of business handled, and the present expenditures on maintenance are probably a little higher than will be found necessary after the property is once gotten into good shape; but in 1914, despite the fact that payment was unnecessary on the trust certificates of the Chicago & Eastern Illinois, which payments amounted in 1913 to $1,121,000, nor did the Frisco have to bear the loss on the New Orleans, Texas & Mexico, which loss in 1913 cost the Frisco $1,214,000; nevertheless, the Frisco had a deficit, after making interest charges, of $2,828,000 for the year 1914.

As has been so often demonstrated in American railroad history, the best operating officers in the country can only do a certain amount toward making the business as a business profitable, and the future of the Frisco will depend very largely on the wisdom, conservatism and courage which is shown when the time comes to put forward a reorganization plan by those who will formulate this plan.

The following table shows principal figures for 1914 and 1913:

	1914.	1913.
Average mileage operated	5,259	5,255
Freight revenue	$30,202,499	$31,272,807
Passenger revenue	11,563,844	11,651,258
Total operating revenues	44,923,569	46,050,290
Maint. of way and structures	7,762,324	5,755,477
Maint. of equipment	7,492,700	6,091,069
Traffic expenses	929,037	1,007,326
Transportation expenses	15,760,663	16,505,019
General expenses	1,325,876	1,352,202
Total operating expenses	33,270,600	30,711,094
Taxes	2,149,215	2,057,440
Operating income	9,503,754	13,281,756
Gross income	10,253,665	14,660,779
Deficit	2,828,142	667,348

NEW BOOKS

Power and Power Transmission. By E. W. Kerr, professor of mechanical engineering, Louisiana State University. Third edition, revised. 373 pages, 6 in. by 9 in. Illustrated. Bound in cloth. Published by John Wiley & Sons, Inc., New York. Price $2.

This book is primarily designed to be used as a text book by students of mechanical engineering and the treatment of the subject is elementary throughout. The book was published in 1901, a second edition appearing in 1907. In the present edition the entire text has been resct and much of it rewritten. It contains 24 more pages of matter and 61 more illustrations than the previous edition. The text is divided into three parts. Part I is devoted to machinery and mechanics. The first chapter contains definitions of the fundamental terms used in mechanics and descriptions of elemental forms of machines. Other chapters are devoted to descriptions of various means of transmitting motion, the section closing with a short chapter on pipe fittings. Part II, on steam power, covers the whole field of steam generation and its use in power plants as completely as could be expected in so limited a space. The treatment is largely descriptive of steam power plant equipment and appliances, with brief analyses of the principles of operation. Rotary engines and steam turbines, as well as the various types of reciprocating engines and valve gears, are described. A chapter of valve diagrams is devoted entirely to the Zeuner diagram, which the author prefers on account of its simplicity and adaptability. Part III deals with pumps, gas engines, water power, compressed air and hot-air engines. The treatment is the same as used in Part II. Several short tables on the properties of saturated steam, the flow of compressed air through pipes, etc., are grouped together at the close of the book, for use in solving the problems given at the close of a number of the chapters.

Statistics of Common Carriers, Preliminary Abstract, 1914. 187 pages, 9¼ in. by 11½ in. Issued by the Interstate Commerce Commission, Division of Statistics; copies to be had of the Superintendent of Documents, Government Printing Office, Washington, D. C., at 25 cents each.

This is the usual preliminary abstract, made up from reports of the principal operating railway companies but with no aggregates for the country as a whole. The pamphlet contains also a preliminary statement of income account and profit and loss account of the principal express companies, and one of the Pullman Company.

Railway Development Association Proceedings. Published by the association, H. O. Hartzell, assistant general industrial agent, Baltimore & Ohio Railroad, Baltimore, Md., secretary. 62 pages. Bound in paper.

This book contains the proceedings of the semi-annual meeting of the Railway Development Association held at the LaSalle hotel, Chicago, on November 10, 11 and 12, 1914. The first 15 pages are devoted to the report of the business meeting, and the remaining pages, designated as Section 2, are devoted to the papers presented at the meeting and the addresses presented at the banquet by W. L. Park, vice-president of the Illinois Central, and Samuel O. Dunn, editor of the *Railway Age Gazette.* Some unusually interesting papers discussing various phases of railway development work along the lines of industrial, agricultural and immigration development are included in the proceedings, most of which have been abstracted in the *Railway Age Gazette.* The papers include: "Personal Work with Farmers," by M. V. Richards, industrial and agricultural commissioner of the Southern Railway, and H. M. Bainer, agricultural demonstrator, Atchison, Topeka & Santa Fe Railway; "Diversified Farming and its Relation at this Time to the Cotton Grower," by J. C. Clair, industrial and immigration commissioner of the Illinois Central, and J. F. Jackson, Central of Georgia Railway; "Ways and Means to Increase a Railroad's Agricultural Tonnage," by H. B. Fullerton, agricultural director, Long Island; "The Railway Terminal and Its Relation to Industrial Development," by F. A. Spink, traffic manager, the Belt Railway of Chicago; "The Effect of the European War on American Industries," by R. W. Cooke, industrial agent, Pennsylvania Lines West; "Getting City People Back to the Country," by F. H. LaBaume, agricultural and industrial agent, Norfolk & Western; "Securing Desirable Immigration," by L. J. Bricker, general immigration agent, Northern Pacific; "Efficient Marketing of Farm Produce," by D. G. Mellor, manager of the food, order and commission department, Wells, Fargo & Company, and William Gourlay, general traffic agent, American Express Company.

Letters to the Editor

POETRY ON THE B. & O.

Baltimore.

To the Editor of the Railway Age Gazette:

In connection with your editorial of November 20 on "Safety First for School Children," you will be interested in the results which we have obtained by the use of some rhymes by Edward Tinker called "Nevers for Children," which we reprinted from Leslie's Weekly, in our Baltimore & Ohio Magazine.

I called the particular attention of the magazine correspondents, one on each division of the road, to these verses, and suggested that they might be used. In response to numerous calls we had about 2,000 copies distributed at various points; and as a result of this I am informed that they have been read to hundreds of thousands of school children in day schools, Sunday and parochial schools, and children's courts. In some of these courts the sheet has been posted up. I also note that the verses have been reprinted in dozens of papers in smaller towns on our lines.

R. M. Van Sant.

NEVERS FOR CHILDREN

Never cross the tracks by night or by day,
Without stopping to listen and look each way.

Never walk along the railroad ties—
You can't always trust your ears and eyes.

Never hop a freight, for nothing quite heals
The wound received under grinding wheels.

Never, on a hot or sunny day,
Sit beneath a box car to rest or play.

Never crawl under a car of freight,
When the crossing's blocked—play safe and wait.

Never board, or alight from, a train that is moving,
Accidents daily its dangers are proving.

Never play games 'round the tracks at the station—
There are much safer places to seek recreation.

Never leave on the rail any spikes or bars,
Because, in this way, you may wreck the cars.

Never a railroad bridge should you cross,
A train may come and result in your loss.

Never pick up coal 'round the railroad yard,
A train may catch you off your guard.

A "REASONABLE" VALUATION

Fort Worth, Tex.

To the Editor of the Railway Age Gazette:

Director Prouty of the department of valuation of the Interstate Commerce Commission says that it will probably cost $50,000,000 to complete the federal valuation, 70 per cent of which must be borne by the railroads directly, in adidtion to their share of the taxes to pay the other 30 per cent. It is understood that certain items, such as real estate, location, good will and securities, must be estimated, comprising possibly between 20 and 30 per cent of the total valuation. It may be five or more years before the work is completed, and when done it will be nothing more than a stupendous estimate, made at such a heavy expenditure that if Congress had even expected it to cost half as much as it will, the bill never would have been passed. With the present conditions existing—the railroads starving, the tax payers paying income or war taxes, and with the imperative need of economy, it is advisable to abandon the costly methods of surveys which can only be considered approximate estimates and resort to a method of estimates which will give very nearly the same results as surveys. Enough surveys have been made or can be finished on typical roads to form a basis or guide. The present office organizations should be maintained, but all field work should be discontinued. Two of the government district engineers and one man appointed by each railroad can make as close and honest an estimate based on data which can be furnished by most railroads as final surveys and estimates of value now being made by the government's present methods.

Including actual personal inspection of conditions, a final report could be made by about 20 engineers for the commission. Two engineers could be assigned to the New York Central, and two more to the Pennsylvania Lines for a year's work; the Southern Pacific and Santa Fe Lines could be assigned to another staff, and the lesser lines could be divided on a basis of about 25,000 miles to each board. There are many miles of lines where records are full and complete, requiring little more than auditing to get a close valuation. When such a board will have finished its work it will not vary materially from a detailed careful survey. By this plan the work can be completed in one year.

The assumed reason for making the valuation is to get data for regulation of rates and securities. It will be of no value for rates, because the four track, $250,000 per mile, road can charge no more or less than the $25,000 per mile road, between common points for the same service. There are very few roads on which the value of the securities can be measured by a survey of the track. Possibly it might be well to complete surveys of lines that have become notorious for financial conditions, to satisfy the public. The Panama canal will influence transcontinental rates and the value of railroads has no influence whatever. The Interstate and State Commissions have never considered the cost of a road for one minute, when they suspended a rate.

The only value of the results of this $50,000,000 job will be a figure showing the size of the debt incurred if the government takes over the roads. It is very easy to see what a fright these figures will give the tax payer. The valuation is not going to be worth $50,000,000. When first proposed it was to cost comparatively little, but are we now sure that $50,000,000 will be final cost? Therefore, under present conditions, why not apply the rule of reason and measure the valuation by a cheaper method equally effective?

Railway Officer.

THE FIRST ARMORED TRAIN

New York.

To the Editor of the Railway Age Gazette:

In a short note in the *Railway Age Gazette* of January 8, page 76, it is stated: "One of the first and possibly the first armored train was that used during the Egyptian campaign of 1882." I know of at least one armored train which was in use at least 20 years earlier. This train had two cars; the principal one being built of heavy timbers on a flat car in the Atlantic & North Carolina shops at Newberne, N. C., in 1862, about two months after the city had been captured by the Burnside expedition. The armor consisted of old rails spiked on the outside of the planking composing the sides and front of the car. It was provided on the sides with slits for musketry fire, and at the front end was a port hole covered with a shutter behind which was mounted a gun from one of the field batteries. The second car was similarly constructed, but armed with a naval howitzer. These cars were run ahead of the engine and were used in reconnoitering along the railroad line west of Newberne. On one occasion, at which I was present, the two cars were run up the railroad within a few miles of Kinston, 22 or 23 miles from Newberne. For that distance, the Confederates had not injured any of the track, the only portion destroyed having been a small bridge near Newberne.

I was quite familiar with these cars, having assisted in the construction and design of both. The officer in charge was a captain in the Twenty-third Massachusetts Regiment, whose name I cannot now recall, but who had been in the motive power department of the Boston & Providence. I was, at that time, in the Ninth New Jersey Regiment and was detailed for some months in the railroad service of the Department of North Carolina.

I do not know whether any other cars of this description were built or used during the Civil War; at any rate, I never saw any.

Frederick Hobart.

Associate Editor, Engineering and Mining Journal.

Large Steam Locomotives, Present and Future

Possibilities in the Use of Three Cylinders; Compounding; Effect of Trailer Trucks on Boiler Capacity

Several of those who discussed the subject of "Steam Locomotives of Today" at the annual meeting of the American Society of Mechanical Engineers, held in New York, December 2, 1914, dealt with the large locomotive. Parts of this discussion follow:

LARGE STEAM LOCOMOTIVES

J. B. Ennis, chief mechanical engineer, American Locomotive Company.—The large steam locomotive of the future will probably not be the locomotive of the past. Today we can see possibilities toward further refinement in design; further economies that may be obtained so that the locomotive designer is not yet ready to acknowledge that all has been accomplished that can be.

For freight and pushing service on heavy grades past performances show the adaptability of the articulated compound locomotive. This type is still in the course of development and it will, without doubt, be the generally accepted type for these conditions for some time to come. With the exception of one experimental articulated locomotive, locomotives recently built for the Virginian Railway are the largest of the type. A few particulars of their performance may be of interest. Designed originally for pushing service on grades of over two per cent and normally rated at 115,000 lb. tractive effort, working compound, these engines have proved themselves capable of hauling on a grade of .6 per cent, a train load of 7,180 tons, requiring a drawbar pull of approximately 110,000 lb. On lighter grades and at higher speeds indicated horsepowers of over 3,000 have been recorded. Work of this magnitude necessitates locomotives of exceptional weight and power, and yet the possibilities of this type have by no means been exhausted. As conditions arise in the future in which more power will be required, the use of the articulated engine can yet be extended.

For freight service on easy grades where the capacity of the articulated type is not required, we already have exceptionally large locomotives of the six, eight and ten-coupled types. Simple cylinders operating at 200 lb. pressure have reached a diameter of 30 in., and in order to transmit this power a main axle 13 in. in diameter has been used. Main crank pins, connecting rods and other details are of enormous size. With the increase in the diameter of cylinders, the cylinder centers have gradually been increasing, and frame centers decreasing. This has resulted in higher stresses than those caused by piston thrust only. The weight of revolving and reciprocating parts has reached the point now where, in some cases, proper counterbalancing becomes very difficult. It is doubtful whether much more capacity can be obtained in these types if designed along the present lines, and here it would seem that attention could profitably be given to refinement in design and its relation to the careful selection of materials.

The modern passenger locomotive has reached a high state of development, but there is one problem still to be solved that has been recognized for many years, that of the effect on the rail of the vertical unbalanced forces in a two-cylinder engine. At present, our largest and most powerful passenger locomotives have two simple cylinders, 27 in. to 29 in. in diameter, giving maximum piston thrusts of approximately 117,000 lb., with static wheel loads higher than ever before and, with few exceptions, reciprocating parts of much greater weight. The four-cylinder balanced compound was introduced about ten years ago as a possible solution, and for a few years large numbers of these locomotives were built. There is no doubt as to the results obtained, as far as balancing is concerned, but recently very few have been constructed. Four-cylinder simple locomotives have also been tried out, but in both of these types the capacity is limited on account of the available space between the frames, making it practically impossible to provide the power now given by the largest simple two-cylinder engines.

Little consideration has been given to the advantages of the three-cylinder arrangement, although a few locomotives of this type are in successful service today. As compared with the four-cylinder engine, either simple or compound, the three-cylinder type offers the possibility of increased power. With one cylinder located between the frames ample room is provided for a properly designed crank axle and main rod which cannot be arranged for in the four-cylinder type beyond a certain limit. As compared with the two-cylinder engine, the advantages are, briefly, a more even turning moment, an ideal counterbalance condition, and the opportunity to furnish maximum power with the minimum destructive effect on the rail. The power obtained in a two-cylinder engine with cylinders 27 in. in diameter and a maximum piston thrust of 117,000 lb. can be obtained in a three-cylinder engine with cylinders 22 in. in diameter and a maximum piston thrust of 78,000 lb. This decrease of 33 per cent in thrust means a corresponding reduction in the individual weights of all of the machinery, particularly the weights of reciprocating parts.

It is true that considerable progress can yet be made in the two-cylinder engine toward reducing the weights of reciprocating parts by the careful selection of materials and proper design. The three-cylinder engine, however, offers advantages possessed by no other arrangement, and it would seem that for high speed passenger service, at least, this type is well worth considering for the future.

COMPOUNDING

C. J. Mellin, consulting engineer, American Locomotive Company.—When the first Mallet compound to be used in the United States was built for the Baltimore & Ohio, it was generally considered that it was too large an engine and far in advance of its time, but hardly had its success been established before inquiries came in for even greater power, and since that time practically all locomotives of this class (except for narrow gage roads) are larger than the original Baltimore & Ohio engine. At present 115,000 lb. in tractive effort in compound and 138,000 lb. in emergency are being produced in very successful service and plans are worked out, ready when required, for engines of this type giving 140,000 lb. tractive effort in compound and 168,000 lb. in emergency power.

The next step for heavy power, where road conditions permit, is triple articulation, using the tender as the third unit. One locomotive of this type has been built, though without any emergency power, having a tractive effort of 160,000 lb., but as yet it may be considered as experimental. On account of the limitation in the boiler capacity on such engines it may be necessary to make the tender engine independent of the two other units, subject to regulation at will, in order to get the maximum amount of steam for fanning the fire, as the exhaust from the tender engine has little effect by the time it reaches the stack and may therefore be carried direct to the atmosphere. As a further means of increasing the boiler capacity at the slow speeds at which such an engine would naturally operate, mechanical draft could probably be applied to advantage. By this means a tractive effort of over 200,000 lb. could be obtained.

The superheater has proved to be of great advantage in compounding, still further promoting its economy, since

practically all the superheat in the steam can be utilized before its final exhaust, besides eliminating condensation during the latter part of its extended expansion. This combination of compounding and superheating, when proper cylinder proportions have been observed, affords the greatest economy in locomotive operation, especially in freight service. It is also probable that mechanical draft in combination with a feed water heater will be an additional feature in the direction of economy and improvement of the locomotive, because of the possibility of working the boiler to its required capacity regardless of the speed of the engine. It also removes the unavoidable loss of power caused by the back pressure in the cylinders, which loss increases with the size of the engine.

THE USE OF TRAILER TRUCKS

H. V. Wille, Baldwin Locomotive Works.—In sketching the development of the locomotive with respect to increase in capacity, sufficient stress is not laid on the development of the trailer truck locomotive with the attendant possibilities of improvement in boiler design. It is now generally recognized that the use of trailer trucks has permitted the use of boilers of great capacities. Were it not for the development in boiler design rendered possible by the use of trailer trucks, there would be a very limited use of superheaters in the modern locomotive because of the restriction in boiler capacity; and yet when the first trailer truck locomotive was built, but a short decade ago, it was received with a storm of criticism and the builders stood almost alone as the advocate of this type. The use of the trailer truck is a logical development of the use of wide fireboxes.

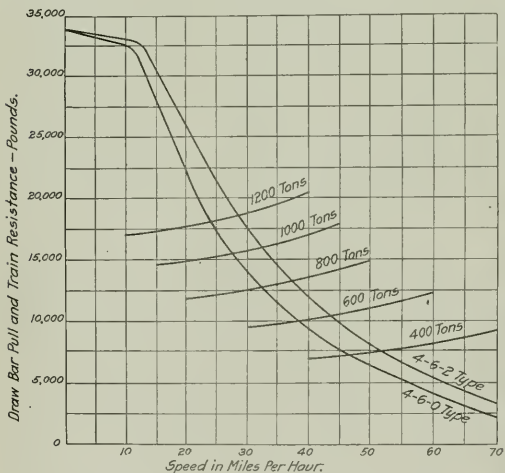


Diagram Illustrating Hauling Capacities of Ten-Wheel and Pacific Type Locomotives at Various Speeds

The mother of the trailer truck locomotive is probably the engine "Columbia" designed by the Baldwin Locomotive Works and exhibited at the Columbian Exposition in 1892, as a novel type of construction, but this design was in advance of the times. The Atlantic (4-4-2) type was accordingly designed in 1895, and the first one was employed by the Atlantic Coast Line, and derived its name therefrom. While at first the design was received with criticism, the advantages of the type for the development of large fireboxes and large boilers were so manifest that it was rapidly followed by the design of a 2-6-2 or Prairie type engine for the Burlington. The Pacific (4-6-2) type was naturally developed from this type. This engine was designed in 1901 for the New Zealand government railways to burn inferior fuel. The development of the trailer truck engine logically followed that of the wide firebox and renders possible the wonderful performance and great capacity of the modern American locomotive.

POSSIBILITIES OF THE FUTURE

G. R. Henderson, Baldwin Locomotive Works.—There is one subject which has not been referred to except by the committee, and that is the question of powdered coal. I think in a few years we will have largely extended its use. Powdered coal will also assist in lengthening the firebox and give a greater amount of evaporative surface in that way. These things must be considered as increasing the length of the locomotive. In increasing the length, fortunately, we can put a heavier engine over our present bridges without having to remodel their construction. By lengthening we do not put any more unit load on tracks and bridges, and I think in that way it is possible to build a locomotive of 250,000 to 300,000 lb. tractive effort.

RAILWAY AFFAIRS IN OTHER COUNTRIES

The British railways have supplied a number of ambulance trains for carrying wounded men from the sea coast to the various inland hospitals, as has been noted previously in this column. The illustration herewith is an interior view of a train supplied by the Midland Railway. While the railways have almost vied with each other in the provision of these hospital and ambulance trains, the necessity for such ameliorations of warfare has not been lost sight of by other large organizations. The flour millers of the United Kingdom, through their association, are about to present two hospital trains to the British Red Cross. These trains are for service in France and Belgium, respectively, and are the last word in hospital trains. Their equipment consists of kitchen and stewards' stores cars, an infectious diseases car, a dispensary car, complete with operating room, a staff car which will accommodate three doctors, four nurses and an interpreter, and five ward cars, each of which will take 20 "lying-down" cases. Altogether, each train will accommodate 108 such cases, while the five French coaches which are to form an additional part of the equipment will provide accommodation for a total of 250 "sitting-up" cases. Each train will also have attached to it two baggage cars and two French coaches for the staff, etc.

An Interior View of the Ambulance Train Used for Transporting Wounded Soldiers on the Midland Railway

Arbitration of Engineers' and Firemen's Demands

Employees' Case Concluded, Attorney Sheean Makes Opening Statement Outlining Position of Railways

The evidence presented on behalf of the engineers and firemen before the board of arbitration at the hearing in Chicago was concluded on Monday, January 18, and James B. Sheean, attorney for the General Managers' Conference Committee, presented his opening statement outlining the case for the railways. Mr. Sheean said in part:

"At the outset it should be made clear that the conference committee of managers recognize fully that the engineers and firemen perform important and responsible duties. They heartily concur in the view that men selected for these positions should measure up to the responsibilities which their duties impose upon them, and that their scale of wages should be commensurate with and give due recognition to the importance of those duties and responsibilities. The conclusion was reached by the Conference Committee of Managers that either by comparison with employees in other trades, or by comparison with their brethren of other districts, there was no good ground for complaint on the part of the western engineers and firemen. In making that statement I appreciate that the question may be asked as to why it should be that certain rules found in a majority of schedules may not be made of universal territorial application. When standardization is proposed, the party purportedly offering standardization must enable standardization to be made, not upon a basis of retaining the high points given by some other method of computation, entirely inconsistent with the one now in vogue, but in order to standardize must be willing to proceed along the line of wiping out the high points incident to that standardization, as well as the lower points that are incident thereto."

Mr. Sheean then proceeded to enumerate briefly the way in which it is proposed to present the proof of the railways. First, he said, an analysis would be offered of the railroad schedules of the United States so that the board will be able to see at a glance on just what roads and in just what territory and on what percentage of the mileage there are rules which bear relationship to the different requests that have been made. Secondly, he said, "we shall present statements showing what these demands mean in money to the railroads involved. This exhibit shows that during the month for which it is presented, the railroads involved paid their engineers and firemen under existing schedules over $7,200,000 in wages, and if the proposals had been in effect during that month the railroad would have been required to pay over $11,000,000, or an increase of about $3,700,000 in that one month, an increase of approximately 51 per cent. The total payroll of the railroads involved for engineers and firemen for the fiscal year ending June 30, 1913, amounted to over $75,000,000, so that if the same rate of increase applied to the year's operation the proposals would mean an added burden to the companies involved of nearly $40,000,000."

"We shall present," he continued, "statements of revenues, expenses and income during the fiscal years 1910, 1913 and 1914, going back to the last adjustment, in order to ascertain what has been the actual operation upon the productive efficiency or revenue theory during this period of time, and these show a constantly declining net revenue and a constant increase in taxes. Although over 8,000 more miles were operated in western territory in 1914 than in 1910, the net income from operations in 1914 was $15,000,000 less than in 1910, while in 1914 the net operating revenue from operations was nearly $40,000,000 less than in 1913.

"In 1914 there was declared $22,000,000 less in dividends than in 1910, and in 1913 $14,000,000 less than in 1910. In 1914 there was carried to surplus $24,000,000 less than in 1910, while the surplus in 1913 was $12,000,000 less than in 1910. In five months of the current fiscal year there has been a drop of $29,000,000 in gross revenue.

"We face this situation as to the income of the railways involved, although in three years to June 30, 1913, they spent over $660,000,000 in improvements and extensions to property, and out of this devoted over $220,000,000, or practically one-third, toward the purpose of increasing efficiency and safety and expediting train movements.

"Our next exhibit will summarize various legislative enactments and orders of railway commissions which affect railway operations, all necessitating expenditures of large sums of money, and will also show proposed legislation in many western states which if enacted into law will limit economical and efficient operation and render impossible economies which should be legitimately brought about as a result of elimination of grades and curves, the improvement of roadbed and the purchase of larger and better power. The board should be advised in connection with a wage movement seeking to have wages based upon the proposition of 100 per cent efficiency in tractive effort, that at the same time it is also proposed and urged in legislative circles that there shall be a legislative limit placed upon the length and size of the trains hauled, no matter how level the road or how high the power.

"Our next exhibit was prepared to ascertain whether there was justification for the claim that large power and increased tonnage have retarded the movement of traffic and thereby kept the men longer on the road. This exhibit shows that with the elimination of grades and curves, the improvement of roadbed and motive power, the employees have been able with the larger power, and therefore with higher rates of pay, to haul heavier trains at the same speed as in previous years. In October, 1910, about 76 per cent of the mileage was made at a speed greater than 10 miles per hour, and in October, 1913, this had increased to over 77 per cent. In October, 1910, the average length of time on the road in through freight service was 9.41 hours on runs averaging 113.2 miles in length, while in October, 1913, the average length of runs was 112.6 miles, and the average time of making the run in through freight service was 9.31 hours.

"Confirmatory of the exhibit introduced by the men that the instances of employees being on the road longer than 16 hours are of rare and exceptional occurrence (averaging once in every 18 months per employee) an exhibit has been prepared that shows for the year ending December 31, 1913, only .59 per cent of the trains run exceeded the 16-hour limit, and only 0.6 of one per cent of the total trains run were tied up on account of the 16-hour law.

"Another exhibit has been prepared to show the payments under present schedules to engineers and firemen for which no actual service either in miles or hours was rendered by the men, and by this exhibit it is shown that for the fiscal year ended June 30, 1913, these payments on the roads represented aggregated over $1,000,000. An exhibit will also be introduced which shows the comparison between the eastern, southern and western districts, and from this comparison it is shown that the average freight train load and the average tractive power in both eastern and southern districts are higher than in the western district. This, notwithstanding the fact that rates of pay and compensatory rules are generally higher in western districts than in any other part of the United States.

"We shall also lay before the board the actual payroll figures as to what the men can and do earn in each class of service, so as to give the board as best we can, not simply state-

ments of hypothetical men, but actual earnings of actual men, of all the men for the entire month for which the claims are presented, as well as actual payroll figures for the entire fiscal year of about 5,000 typical men covering each class of service on every seniority district in the territory, and these payroll figures show that in the month in which the demands were presented engineers in regular passenger service earn from an average of $185 to a maximum of $341.60 per month, and in freight service from an average of $170 to a maximum of $358.70 per month; that firemen in regular passenger service earn from an average of $115.54 to a maximum of $209.89 per month, and in freight service from an average of $110 to a maximum of $221.05 per month; that other firemen in combination freight and passenger service earn even higher than this.

"Of about 5,000 men whose wages for the entire year to June 30, 1913, will be shown, there is a maximum of $3,725.20 for passenger engineers; $3,342.30 for freight engineers; $1,752.20 for passenger firemen and $1,890.32 for freight firemen. Against these maxima, the governors of seven states receive $3,000 or less per year, while those of seven other states receive $4,000, or only slightly above the engineers' maximum earnings.

"As against the maximum earnings of the firemen, Sunday's newspapers state that at the final session of the association of American Colleges held on Saturday, it was stated 'For $1,500 a year a college can get a fairly good professor, not a well of wisdom, it is true, but a fairly good man.'

"A careful investigation into the increased cost of living in the West shows that prices have not advanced so fast as have the wages of engineers and firemen under the schedules awarded in 1910.

"Comparison of their wages with those of any other craft, or of any other railway employees, or of engineers and firemen in other parts of the country, show that they are receiving already a higher compensation in both rates of pay and rules.

"Through the elimination of grades and curves and other improvements, the employees have been able with the larger engines, and consequently with higher pay, to haul trains at the same speed as light trains were formerly handled. With heavier power there has been constant improvement in labor-saving devices such as automatic stokers, automatic doors, coal pushers, sloping tanks, power grate shakers and automatic ash pans operated by compressed air, which relieve the firemen of the danger of going beneath the locomotive.

"It is the intention that the chairman of the Conference Committee of Managers will take up on the witness stand article by article, the requests submitted, and explain from an operating standpoint the practical effect of splitting the working day into numerous arbitrary divisions, and for purposes of compensation segregating each of these items so as to produce arbitrary and punitive payments on every run, to show the inequity of imposing punitive payments in matters which cannot always be controlled in transportation service, and of attempting to impose inflexible rules of universal application, the conditions which must of necessity vary widely in a territory so vast as the one involved, in which there are over 50,000 men working as locomotive engineers and firemen, and 64,000 men on the seniority list, who would be directly or indirectly affected on the over 148,000 miles of railroad main lines.

"Nor should the board be under the impression that assent is given to the suggestion that there is any element of piece work payment in the wage schedules of engineers and firemen. The unit of output of regularly assigned men in road service is the runs or trips covered by their assignments. The units of output the engineers and firemen (unlike the piece worker) do not regulate or control, either as to the number or as to the time of production. These units of production, the run or trip covered by the assignment, are all that bear resemblance to the 'piece' of the piece worker. And for this unit, conveniently measured for purposes of compensation by its mileage, payment is made at an agreed mileage rate. But more fortunate than the piece worker, whenever this unit is not produced within the limits of a working day, the engineer and firemen have an added guarantee, both of a minimum daily wage of a minimum hourly rate for every hour they are on duty, whether productive or non-productive for his employer."

Cross-examination of W. J. Lauck, statistician for the engineers and firemen, whose testimony before the board of arbitration at Chicago was abstracted in last week's issue, was taken up on January 11, by J. B. Sheean, attorney for the General Managers' Conference Committee and occupied two days. He showed that in most of the statistics presented by Mr. Lauck to show great increases in the efficiency of the railroads from 1890 to 1913, on which Mr. Lauck mainly based his arguments for increased wages, no consideration had been given to the change in mileage of the roads or the amount of investment or changes in accounting methods. The witness said he did not claim his statistics to be strictly accurate, but simply developed the tendency by the best available means.

Mr. Sheean asked a number of questions to bring out the efficiency of firemen, as measured by tons of coal shoveled instead of ton miles of freight, and from one of Mr. Lauck's exhibits showed for 19 roads that have no oil-burning locomotives that in 1909 the tons of coal consumed were 15,140,994, for which the firemen received $6,651,373, or 2,280 tons of coal per $1,000 paid to firemen. In 1913, on the same roads, the total coal consumed was 19,136,488 tons, for which the firemen received $8,774,150, or 2,180 tons per $1,000 of compensation. Mr. Lauck said he was at a loss to understand these figures because of the increase in fuel consumption per locomotive mile. Mr. Byram and Mr. Sheean said that it was explained entirely by the increase in the firemen's wages in 1909.

"If, during this time," said Mr. Sheean, "in addition to the actual increase in money there had been improvements in the way of automatic stokers, automatic fire doors, sloping tanks, provisions for breaking coal to proper size, automatic shakers, power coal pushers, and other things, that would simply show not only that less coal was consumed, but that it was done with less physical effort, would it not?" "If that could be shown, yes," said Mr. Lauck, "but I do not know anything about that."

Mr. Lauck had said that the men's pay should not be affected by decreased productivity in passenger service, because it was not their fault that there were no more passengers in a train.

Mr. Byram observed that on the larger engines which are producing the greater number of ton miles, a higher rate is paid to the engineers and firemen, and that the fact that the increase in productive efficiency of the men per $1,000 in the period 1909 to 1913 was less than in the former period might be due to the fact that the instrumentalities which produced the greater efficiency are already compensating the men by paying a higher rate. Mr. Lauck said he was not trying to establish any definite relation between the increased productive efficiency and rates of pay, but that he was simply trying to show the tendency that because of the increased productive efficiency there should be some increase in pay.

A. H. Hawley, general secretary and treasurer of the Brotherhood of Locomotive Firemen and Enginemen, testified regarding accident statistics of the firemen. He said that 47 per cent of the deaths of members of the organization in the 10 years from 1904 to 1913 were the result of railroad accidents while the men were in service. Of the 5,026 deaths in 10 years, 1,292 were engineers, 2,663 were firemen, 105 were hostlers and 866 classed as others, which he said means men who have passed out of the railroad service, or at least out of the engine service. In 10 years the organization has paid on 2,360 claims a total of $3,270,169 for railroad accidents. Mr. Hawley said that the percentage of increase of railroad accidents was not so great as the increase in the membership, for the reason that a large pro-

portion of the membership is drifting from the railroad service. He also gave figures to show that there had been decreases in accidents of certain classes brought about by the safety appliance laws. This, he said, was to show that the purpose of the men was not frivolous in agitating for the passage of the laws. Cross-examination by Mr. Sheean showed that the mortality rate in the organization was decreasing; that in 1904, with a membership of 4,434, there were 453 deaths, and that in 1913 with a membership of 91,108, there were 589 deaths; in 1904 there were 236 deaths on account of railroad accidents, and in 1913, 243 deaths on account of railroad accidents.

Dr. Henry J. Harris testified regarding a large number of statistical exhibits showing the hazard of the engineer's occupation, based on figures taken from various insurance companies' records and other actuarial records. He said that the engineer in many respects is a select risk, in that he is a man who has passed a rigid physical examination, and in other respects is above the average, but that many insurance companies will not insure engineers at all, and others do so only at a higher rate than normal. He said that the New York Life Insurance Company charges locomotive engineers a rate based on eight years more than the actual age, and that insurance companies estimate that the risk in the case of engineers is 160 per cent of the normal. He presented various statements to show that engineers have a higher accident and death rate than many other occupations, and classed them as a risk with coal miners and structural iron workers. He said that the average working life of an engineer was from 11 to 12 years. In the railroad service, he said, the brakemen have a higher accident and death rate than engineers.

W. E. Futch, president of the Locomotive Engineers' Mutual Life and Accident Insurance Association, which is connected with the Brotherhood of Locomotive Engineers, testified that the association is now carrying $145,590,750 of insurance, and last year paid out in claims $3,063,318. All of the members are now required to carry insurance. He said his records showed that 11 years and 7 days was the average working life of an engineer. Asked regarding the number of men affected by the pension system, he said that on December 31, 1911, the association had 92 members 72 years of age, and 1,781 out of a total membership of 63,647, between the ages of 60 and 70. The average age of all members was 41 years. Out of a total of $3,424,213 paid in claims in two years, he said only $2,146,213 was paid on account of natural causes, and $870,750 was paid on account of death caused by railroad accidents.

G. N. Deguire, a fireman employed on the Chicago & North Western, described the physical examination required of engineers and the elaborate application blanks they are required to fill out, and said that it was not intended to object to the rigid requirements, but to show what a high class of men the railroads require for engineers and firemen. He did object to what he called "black-listing," saying that the information secured by the roads from other roads was improperly used. On cross-examination as to what changes he would make in the application blanks the chief objection seemed to be that they gave the roads an opportunity to find out whether a man had left the service of another road on account of a strike, and he said that a man might be discharged for insubordination simply for losing his temper on account of the action of some minor official, and would then be deprived of an opportunity of working on another road. Many men, he said, are working under assumed names because they left the service on account of a strike or some minor offense. He thought sufficient information could be obtained by an examination and investigation into whether a man was in the habit of using intoxicants. "So far as we are concerned you cannot go too strong on Rule G," remarked Mr. Stone, "but I would like to see it applied to officials as well as employees."

Mr. Deguire also introduced an exhibit based on information furnished by the local chairman of the firemen's organization to show the effects of larger engines and the business depression on the firemen. Eighty per cent of the chairmen had reported 6,312 firemen who had been taken off the firemen's list, and were either out of work or had gone into some other work, and he read various letters showing the condition of distress many of them and their families were in.

David B. Robertson, vice-president of the Brotherhood of Locomotive Firemen and Enginemen, presented an exhibit made up of quotations from the proceedings of the Master Mechanics' Association, the Traveling Engineers' Association, the *Railway Age Gazette*, Locomotive Engineering and the Railway World. These included statements by leading railway authorities as to the effect of the introduction of larger engines and superheaters in the way of producing a greater tonnage at a less wage cost per ton mile for crews, and included statements by W. L. Park, vice-president of the Illinois Central, who is a member of the board of arbitration, as to the increased responsibility and efficiency of engineers with the larger engines.

W. S. Stone, grand chief of the engineers, introduced correspondence he had had with the Interstate Commerce Commission regarding a statement made by Mr. Park which Mr. Stone said indicated that the Interstate Commerce Commission favored surprise tests. He and Mr. Carter had written to the Interstate Commerce Commission enclosing a copy of the testimony bearing on surprise tests and asking for a statement of the commission's position. The reply written by Commissioner McChord said in part: "The commission does not attempt to interfere directly or indirectly with the railroad companies or their officials in the exercise of their discretion affecting the personnel of their employees. The commission is absolutely without the authority of law to interfere between the railroad company and its employees in any matter affecting the physical fitness, competency or discipline of such employees, nor has the commission ever attempted to exercise any such jurisdiction."

Mr. Stone also presented evidence regarding a number of surprise tests which he considered unfair and also a large amount of testimony regarding the moving of terminals which had compelled the men to move their homes, often at a great sacrifice, he said.

D. H. Bremerman, of the Chicago, Burlington & Quincy, testified regarding an exhibit consisting of 326 large pages comparing schedule rates and rules of engineers and firemen in the west, east, and southwest, in detail, together with 16 articles comprising the men's demands which showed that western rates generally were higher than those in the east.

LOCOMOTIVE HEADLIGHTS IN VERMONT

The Public Service Commission of Vermont has issued an order, effective April 1, 1915, concerning the use of headlights on locomotives and also the providing of cab lights to illuminate the air, water and steam gages and to permit the reading of orders. After hearings and a study of the problem the commission came to the conclusion that a headlight with power sufficient to project light plainly 450 ft. in front of the locomotive would be amply sufficient to perform the following functions of a headlight:

1. Marker to designate the front end of the train.
2. Warning to the public and employees of the approach of a train.
3. Illumination of numbers on the headlight case.
4. Illumination of the track ahead of the locomotive sufficient to allow the engineman to readily perform his duties while operating in and out of terminals, siding, switching, and to pick up the various signs and signals on the run. Also illuminate the track for a fair distance ahead.

The commission, however, was of the opinion that the specification for such a light should be more definite than merely stating that the light should show plainly for 450 ft. in advance of the engine and arrived at the conclusion that a headlight producing not less than 2,500 apparent beam candle-power when measured with the aid of a reflector, the rating being in accordance with the average of the center readings between 500 and 1,000 ft. ahead and upon a reference plane 3 ft. above the

rails, will produce a sufficient light to illuminate the track for at least 450 ft. ahead of the locomotive and to properly perform the functions above enumerated.

No evidence whatever was adduced at the hearing in any way referring to cablights.

It is ordered that every railroad corporation doing business within the state shall equip, maintain and use upon its locomotives operated within the state, excepting locomotives used exclusively in yard service and locomotives operated exclusively during the period from one hour before sunrise to one hour after sunset, headlights of not less than 2,500 apparent beam candle-power when measured with the aid of a reflector, rated in accordance with the average of the center readings between 500 and 1,000 ft. ahead and upon a reference plane 3 ft. above the rails; and shall equip, maintain and use upon all locomotives operated within the state cablights of sufficient intensity to plainly illuminate the air, water and steam gages and to permit the reading of orders thereby.

TRAIN ACCIDENTS IN DECEMBER[1]

The following is a list of the most notable train accidents that occurred on railways of the United States in the month of December, 1914:

Collisions

Date	Road	Place	Kind of accident	Kind of train	Kil'd	Inj'd
9.	Phila. & Reading	Royersford	xc	P. & F.	2	2
24.	Southern Pacific	Imlay, Nev.	rc	P. & P.	0	16
26.	Pere Marquette.... K. L. S. & C.....	Hartford, Mich.	xc	F. & P.	0	6

Derailments

Date	Road	Place	Cause of derailm't	Kind of train	Kil'd	Inj'd
10.	St. Louis & S. F.	Joplin	.....	P.	0	19
†13.	C., Rock I. & P.	Northfield	b. rail	P.	1	22
17.	Baltimore & Ohio	Weston, W. Va.	.....	F.	0	2
17.	Western Maryland	Thomas, W. Va.	runaway	F.	1	3
†18.	Southern	Jetersville	d. track	P.	1*	20
19.	Pennsylvania	Dotter	ms	P.	0	3
19.	Western & Atlantic	Emerson	.....	P.	2	9
26.	Gulf C. & S. F.	Blum	b. rail	P.	0	2

The trains in collision at Royersford, Pa., on the 9th were the Williamsport express and a freight train headed in the same direction. The freight was moving out of a side track to the main line, and its engine was struck by the passenger engine. Both engines were overturned. Both enginemen were killed and two other employees were injured. This collision occurred in the night. The men in charge of the freight assumed that the passenger train had passed by when in fact the train which had passed was another; and it appears that they moved their train from the siding to the main track in the face of an indication in the switch indicator showing that the main track was occupied by an approaching train.

The trains in collision at Imlay, Nev., on the 24th were the first and second sections of westbound passenger No. 19. The second section ran into the rear of the first, and eight passengers in the observation car of the leading train were injured. The collision was due to disregard of distant and home automatic block signals. Besides this the engineman entered the yard not under control and the flagman of the leading train used neither torpedoes nor fusees.

At the crossing in Hartford, Mich., on the evening of December 26 a freight train of the Pere Marquette ran into a passenger train of the Kalamazoo, Lake Shore & Chicago, and the rear car of the passenger train was overturned and fell down a bank. Six passengers were injured.

The train derailed near Joplin, Mo., on the morning of the tenth was westbound passenger No. 9; three passenger cars were ditched. Seventeen passengers and two trainmen were injured.

The train derailed near Northfield, Minn., on the 13th was southbound passenger No. 68; and five cars fell down a bank. One passenger was killed and twenty passengers and two trainmen were injured. The cause of the derailment was a broken rail.

The train derailed near Weston, W. Va., on the 17th was an eastbound freight and 27 cars were wrecked. Two trainmen were injured. The train became uncontrollable on a steep descending grade because of trouble with the air brakes on account of intense cold weather, and the engine ran off the track at a curve.

The train derailed at Thomas, W. Va., on the night of December 17 was a westbound freight and the engine and 10 cars fell down a bank. The train became uncontrollable on a steep descending grade and the engine jumped the track at a curve. One brakeman was killed and the engineman and two other trainmen were injured. It appears that on this grade, which is 3 per cent, the rule is to limit the speed by the use of the hand brakes; that this was not effectively done, and that in addition to this the engineman lost control of the air, presumably by a slow leak.

The train derailed near Jetersville, Va., on the 18th was southbound passenger No. 13, which, however, was running backward, having exchanged passengers with a northbound train because of a blockade on the road. The engine of No. 13 was running backward, and the tender was the first vehicle to leave the track. One passenger was killed and 13 passengers and seven trainmen were injured. The immediate cause of the derailment was a soft spot in the road bed.

The train derailed at Dotter, Pa., on the 19th was northbound passenger No. 73 and the baggage car and mail car were overturned. Three trainmen were injured. The cause of the derailment was a misplaced switch and failure to flag. Work train Extra 6323 took the siding at Dotter to clear for train No. 73. The conductor instructed his brakeman to go ahead and couple the engine onto some cars, stating that he would attend to the main track switch. This conductor reported his train clear of the main track with switch closed and locked before actually doing so, it being his intention to do this afterwards. He continued his conversation with the operator relative to the work he intended doing after No. 73 had passed, and allowed No. 73 to run into the open switch. On account of the weather conditions, the engineman and fireman of No. 73 failed to notice the position of the main track switch target.

The train derailed near Emerson, Ga., on the 19th, was southbound passenger No. 93, and the engine and two cars fell down a bank. Two firemen were killed and three trainmen and six mail clerks were injured. The cause of the derailment was a loose rail.

The train derailed near Blum, Tex., on the morning of the 26th, was passenger No. 16, and five cars left the rails. Two passengers were injured. The cause of the accident was a broken rail.

Electric Roads.—Of the accidents to electric cars reported in December, two were notable, one at Leith, Pa., where a trolley car with 54 passengers was overturned in a creek (15 persons injured), and the other in New York, where, in a rear collision of passenger trains on the Sixth avenue elevated line, December 9, one passenger and one trainman were killed and 15 or more passengers were injured. This accident was reported in the *Railway Age Gazette* of December 18, page 1158.

Canada.—In a rear collision of freight trains of the Wabash, on the Grand Trunk, at Darling Road, Ont., December 10, three trainmen were killed.

[1]Abbreviations and marks used in Accident List: rc, Rear collision——hc, butting collision——xc, Other collisions——b, Broken——d, Defective——unf, Unforeseen obstruction——unx, Unexplained——derail, Open derailing switch——ms, Misplaced switch——acc. obst., Accidental obstruction——malice, Malicious obstruction of track, etc. ——boiler, Explosion of locomotive on road——fire, Cars burned while running——P. or Pass., Passenger train——F. or Ft., Freight train (including empty engines, work trains, etc.)——Asterisk, Wreck wholly or partly destroyed by fire——Dagger, One or more passengers killed.

Protected Railway to the Suez Canal.—It is reported from Copenhagen that advices have been received from Berlin to the effect that the Turks, under the direction of German engineers, are constructing a military railroad from Maan to the Suez canal.

Are You Making Friends for Your Railroad*?

An Appeal to Every Employee Concerning the Vital Necessity of Directing His Efforts Toward This End

By Roy V. Wright
Managing Editor, *Railway Age Gazette*

President Rea, of the Pennsylvania Railroad, in an address before the New York Chamber of Commerce last month, made this statement: "The railroads, as an act of self-preservation, will always endeavor to make their service and facilities satisfactory and rates reasonable, because only in this way can they *make friends*, encourage business and earn profits."

Senator Root, in addressing the Pan-American Congress at Washington, February 11, 1911, said: "The basis of all intercourse, commercial as well as social, necessarily lies in a genuine good understanding that cannot be simulated; people trade with those with whom they have sympathy; their disposition is to *trade with their friends*, the basis of all permanent commercial intercourse is benefit to both parties—not that cut-throat relation which may exist between enemies, where one is trying to take advantage of the other—and a relation based upon mutual respect, good understanding, sympathy and friendship."

In speaking before the National Association of Corporation Schools at its annual convention in Philadelphia last June, A. E. Corbin, assistant sales manager of the Packard Motor Car Company, said: "It is necessary for the Packard, as any other manufacturer, to sell goods in the right place, to the right man, under right conditions. You can't buy salesmen clever enough to overcome a sore customer, and the basic principle of our sales organization is to earn the good will and confidence of our patrons."

The business of the railroads is to sell transportation, and to carry on this work effectively they must follow the same fundamental principles that have made for the success of any other business which depends upon successful salesmanship. In studying the problem of salesmanship one cannot but be surprised at the very outstart by finding that in spite of the large proportion of our people who are engaged in this occupation and the tremendous amount of capital which is involved, the psychologists have almost entirely overlooked the field and are only just beginning to seriously turn their attention to it. We do know, however, something of the general principles which have been responsible for the success of our leading business concerns. Walter Dill Scott, in his "Psychology of Advertising," makes this observation: "The modern business man does his utmost to minister to the pleasure of the customers in his store. He knows that they will place a larger order if they are feeling happy than if they are feeling otherwise. . . . The merchant attempts to please the customer by the appearance of the store, by courteous treatment and by every other possible method."

Stated in another way, the successful salesman realizes the necessity of having the prospective purchaser in a proper mental attitude, and to this end does everything he can to gain his interest and friendship. If you will stop a moment and try critically to analyze the feelings and conditions which cause you to give your trade to the various concerns with which you deal, you can gain some idea of the way in which you are specially attracted by those that seem to take a personal interest in you and have gained your good will and, to a certain extent, your friendship.

The railway's sole business is to give service to the public, and with its forces scattered over hundreds or thousands of miles, it must depend on the good will and friendship of the people along the line to even a greater extent than does the department store or other commercial business; and this is true even where there is no competition. The politician, for instance, stands ever ready to push himself into the limelight, and where the attitude of even a small part of the community is antagonistic to the railway, and the others are largely indifferent, untold damage may be done almost thoughtlessly by the promotion of unwise legislation or regulation. We all know also of the unreasonable and often ridiculous jury awards which have been made against the railways in unfriendly communities.

It therefore behooves railway executives to bend every energy toward making friends with the public. This is a stupendous task—a man's job—and yet not an impossible one; nor can it be accomplished in a brief period of time. Every employee who comes at all in contact with the public in the discharge of his duties—and practically all of them do to a greater or less extent—must be made to feel a broad and, at the same time, intense interest in the work of the road and must realize the necessity of dealing courteously with those with whom he comes in contact, thus doing his part to develop a friendly feeling toward the road. If the employee is unaccommodating or too busy to be courteous, or, as is true in some cases, is willing to criticise and abuse his employer, then the public is sure to develop a feeling of indifference and antagonism toward the road. We may express this in even stronger terms and say that ordinary acts are sure to cause friction unless courtesy is used as a lubricant. The public knows the spirit of the railroad only as it is reflected through the actions and attitude of its employees. It is a realization of this that has inspired the railway employees' magazines to unceasingly preach courtesy and to draw attention to especially noteworthy acts of thoughtfulness or courtesy on the part of employees.

COURTESY A REAL ASSET

Who can estimate the value to the Pennsylvania Railroad of the following item which appeared recently in its employees' bulletin under the head of "Making Traveling a Pleasure?":

> This letter tells its own story: "Permit me to call your attention to the courtesy of your clerk, J. C. Simpson, at Scottdale, Pa., in forwarding to me my spectacles, which I carelessly left in the waiting room on Tuesday. His thoughtfulness, in obtaining my name and address from Mr. Blank, with whom he saw me talking, is, in my opinion, commendable. It is such incidents as this that tend to make Pennsylvania Railroad traveling a pleasure."

In the same bulletin, under the title of "Making Friends for the Railroad," the story of a courteous performance of duty on the part of Conductor Frank Burns, of the Erie division, is introduced with this paragraph: "The kind of treatment passengers and shippers receive in the ordinary day-to-day affairs from those on the railroad with whom they come in contact largely determines the number of friends made for the railroad that day."

Every employee in every department can help make friends for the railroad, and the examples which follow are intended to be suggestive to that end. The field, however, is entirely too broad to be covered in any single article or discussion. My only hope is to bring out not so much the concrete methods which should be followed by the members of each department, as the spirit which should dominate every one of the employees of a progressive railroad.

The other morning, while crossing the Hudson River on the ferryboat, I met a friend who is in business in New York City and receives a large amount of material in carload lots. He has always impressed me with his good business judgment and broad-minded views. Much to my surprise when the question came up as to the railway situation, he expressed himself strongly as being entirely out of sympathy with the roads. Questioning soon developed the reason for this. Much of the material which he receives is shipped in standard size packages which are practically

*From an address on "Making Friends," before the New England Railroad Club, January 12, 1915.

uniform in weight. Because of errors which have been made in the past in the freight bills, it is the custom before accepting a car to check over the bill carefully. If there is an overcharge it is the practice to refuse to accept the car, because if it is accepted and the freight is paid it requires many months, possibly more than a year, to secure the rebate, and even then it is not always paid. If the car is refused, someone higher up gets busy and has the weights checked at once and the freight bill is corrected accordingly. Can you blame the merchant for looking at things as he does?

Contrast this with the practice of handling loss and damage claims on another road. The agents are authorized to pay such claims up to $50 from the cash drawer. I happened to make an inspection trip with the general manager of the road several months ago, when he was informed of a bad freight wreck in which 20 cars had been derailed, the contents of all of them being more or less damaged. Several men were at once put to work in listing up the freight shipments in the cars, and the parties to whom they were consigned. The agents were immediately notified to advise the consignees that their shipments had been delayed because of the wreck, but would be forwarded as quickly as possible. They were also advised to go over each shipment with the consignee when it was received and determine the exact amount of damage and pay for it in cash.

The practice of having special traffic representatives solicit business in the territory served by the road and give promises of performance and delivery is not always conducive to the best interests in making friends among shippers. At least one road, realizing this, has placed the solicitation of business in the hands of the operating department. The station agent is given additional help so that he can devote a considerable part of his time to keeping in touch with the business men of the community. He reports to the division superintendent on all matters concerning operation and traffic, and is regarded by the community as the railroad's representative at that place. Because he understands the conditions of operation he is able to deal more satisfactorily with the shippers and receivers of freight, and the co-operation which he receives from the other members of the operating organization makes it possible to give the very best service possible.

THE DEVELOPMENT DEPARTMENT

The remarkable work which has been done on a number of roads in attracting desirable immigrants and industrial establishments to the territory served, and in demonstrating the advantages of better agricultural, horticultural and dairying methods, and developing market bureaus, has been a most important factor in making friends for these roads. Here is a striking instance of this: The fence along the right-of-way of a certain railroad became defective and a cow strayed out on the track and was killed. The station agent who was authorized to settle the claim interviewed the owner. It is the practice on this road in this particular district to settle with the farmers on the basis of $75 a head for cattle thus killed. Much to the surprise of the agent, the farmer made this proposition: He said that two or three years before he had had the opportunity of buying the cow at a big bargain, and that while he considered it to be worth from $75 to $100, he would be glad to call the deal square if the railroad would pay him $50, or the amount he had paid for the cow in the first place; this because the demonstrator for the railroad had assisted him greatly in securing better results from his land, and he felt that it was only fair to deal with the road in the same spirit. The railroad must, of course, exercise proper care in making settlement for damage of this sort, in order that it will not be imposed upon; but there is little excuse for the haggling and unbusinesslike methods which are sometimes employed.

A certain railway advertises a natural wonder on its lines so thoroughly that it is known almost the world over, and Americans as well as foreigners make a point of visiting it if they have occasion to pass anywhere within a few hundred miles of it. The passenger station at this point, through which thousands and thousands of travelers from home and abroad pass each year, is old and usually in an untidy condition. Naturally while visiting this place for a few hours you want to check your hand baggage and be free of its care. Twice when I have done this I have been forced to miss my train because, although I allowed a generous amount of time in which to secure the baggage, the check room was being handled by ridiculously inefficient help. The contrast between the magnificent scenery which one had left a few minutes before and the filthy, ill-kept waiting rooms is such as to disgust the traveler and put him in anything but a good humor toward the corporation which operates the station.

On the other hand, consider a railroad which runs through a sparsely settled territory and has a large number of small stations to maintain. It awoke to the realization that if it wished to attract newcomers and business it would be a good idea to make the stations and the station grounds as attractive as possible. Usually the district around the railroad station is the least attractive part of a town or city. It was remarkable how quickly the movement on the part of the railway seemed to influence the industries located near the station, and the resulting improvement was soon commented on most favorably by the commercial men who had occasion to visit the towns. More than this, the stations themselves, and particularly the toilet rooms, were so improved and maintained that the commercial travelers began to talk about the better service and thus boost the railroad.

THE TIMID TRAVELER

Railroad men become so accustomed to traveling that it is difficult for them to realize the timidity and fear with which the occasional traveler starts out on a journey. The chief operating officer of one of the large systems, in speaking to a group of his subordinates, emphasized the necessity for keeping a lookout for these timid people, both in the stations and on the trains, and trying to make them feel at home. A pleasant word or a little friendly advice to travelers of this kind may often be returned many times over in the friendly interest which may be created toward the railroad. A surly conductor or a grouchy station employee may often needlessly drive business away by a simple act of discourtesy—business which the traffic representatives can only regain at a considerable expenditure of time and energy, if at all. It is difficult to train and coach the thousands of employees scattered over hundreds of miles of railroad to be courteous. It can only be done by making it a distinct matter of policy and having it religiously observed from the highest officer down. The employee in trying to deal courteously with the public often has his good nature strained near the breaking point, let alone the elastic limit. He must remember, however, that there are many small people in this world and that he cannot afford to let himself drop to their level.

Handling personal injury claims is one of the most troublesome problems of railway operation. Listen to the advice given by H. B. Bull, chief claim agent of the Illinois Central, in his address at the convention of the National Association of Railway Claim Agents, held in St. Paul last May:

> I know but one rule that may be safely followed in the adjustment of personal injury claims—that negotiations should be conducted upon the high plane of openness and fairness. A railroad company, with its property constantly exposed and subject to attack, must for its protection and defense rely upon its own reputation for fair dealing with its employees, its patrons and the public. The deportment of its claim agents, who are constantly in touch with the public, has much to do with placing the reputation of a railway company. If they go about their work inspired by high and honorable resolutions, their efforts will not only be rewarded as they go along, but will assist most materially in establishing for their company a good name, which is the most valuable asset a railway company can have and which, when once enthroned, is as immutable as virtue and truth. A corporation can only act through its agents, and unless their acts are scrupulously correct it deserves to be condemned.

For the claim agent to preserve this attitude and at the same time prevent his company from being imposed upon by sharp practices is not an easy or a simple task.

The "safety first" movement has done much to secure the interest of the public generally, and this is particularly true in connection with the campaigns which some of the roads have waged to educate the school children and the employees of shops and factories near the tracks, to the necessity of keeping off railroad property and in using reasonable intelligence in guarding against accidents.

One way in which the operating officers can do much to hold the confidence of the public is to be very jealous of anything which interferes with the giving of good service. Fast freight train schedules are all well enough, but they are a detriment in that they cause disappointment and friction if they are not strictly lived up to. Regular dependable service, even if slower, usually keeps the patrons in a much better frame of mind.

SELECTION OF EMPLOYEES

Far greater care should be given to the selection and training of employees. In the first place, men should be selected from the immediate territory served by the railroad. Every employee should be carefully trained and his qualifications and progress should be a matter of record, so that he can have every opportunity for advancement and not be pushed aside to make way for a newcomer from some other road. This will accomplish two things: Not only will it encourage the best type of young men to enter the service and strive for advancement, but the communities from which they come will watch their progress with constant interest and will naturally be more friendly to the railroad.

Welfare work as it is promoted by many of the roads means much to the communities served, as well as to the men. The railroads were among the first of our industrial concerns to establish old age pensions and relief funds. Untold benefit has been done to many communities because of the establishment of railroad Y. M. C. A.'s at the terminals. These, in addition to providing clean, comfortable and inspiring surroundings for the men at their lay-over points, have meant much to the communities in which they have been placed because of their influence for good upon the immediate neighborhood. Saloons, cheap and uncomfortable rooming houses and other evils have been driven out with the advent of institutions of this sort.

Railroads have been known to place their medical staffs at the disposal of communities in efforts to drive out infectious diseases. We know also of their generosity when floods, earthquakes or fires have come, in rescuing the imperilled people and their goods and bringing them to places of safety. All of these things have been influential in making good friends.

Railroads sell transportation for cash. Unfortunately they do not all pay for the material which they purchase in the same way. I have in mind one road which has lost some very good friends because of long and apparently inexcusable delays in paying bills.

The purchasing agent is an important factor in making friends of the manufacturers on the system which he serves, by as far as may be consistent ordering material from them rather than from foreign concerns. I have seen a chief purchasing officer go into a manufacturer's plant, after explaining to him that the cost of his product was too high, and show the manufacturer how he could design and produce his device in a way which would bring it within the reach of the railroad.

Nothing is more annoying to a merchant than to receive a shipment of goods in a damaged condition, and this even if his claim is paid immediately and in cash. Much of this damage is caused by the carelessness of employees in handling and loading the freight, rough handling in switching, or the use of defective cars. What a wonderful thing it would be from the standpoint of making and keeping friends for the road if all the employees would co-operate to better these conditions. The St. Louis & San Francisco has already started a movement for the prevention of freight claims along the lines of the safety first campaign. I am wondering whether the actual saving in money, much as it may be, will not be of less importance than the satisfied patrons who will be protected from the annoyance of useless delays and damage.

Very little has been said in the foregoing as to how the employees of the maintenance of way and mechanical departments may lend their aid in making friends for the railroad. This does not mean, however, that these men cannot give very valuable service in that direction. For instance, the division engineer, roadmasters, section foremen and section men continually come in contact with the people along the line and by their attitude can do much to encourage a friendly feeling on the part of the public. This is true also of many of the employees of the mechanical department. Cleanliness and tidiness of yards, engine terminals and shop plants may exert a strong moral influence upon the immediate neighborhood and set a higher standard for the community. Too much care cannot be taken to prevent or minimize nuisances, such as excessive smoke, unnecessary noise and things of that sort. Railway employees should also be encouraged to take an active interest in the welfare and upbuilding of the community in which they work and live.

Have you ever had a glow which warmed you up all over when the man behind the stamp window at the postoffice said, "Thank you," or really acted as if he were human? Government employees can possibly afford to act like autocrats, but railway employees cannot. What a shock it would be to some railroad officers if they could disguise themselves and drop into the reception rooms of their offices and try to call on themselves or secure information from their clerks and door tenders.

During the course of a recent trip on a certain railroad, I had occasion to take breakfast in the dining car. When the waiter handed me the menu card, he also placed a small cup of coffee before me. I explained that I had not ordered it. His reply was "That's all right, boss, we furnish each guest with a demi-tasse free of charge. People seem to enjoy it while waiting for their breakfast." It was a small courtesy, costing practically nothing, and yet unconsciously it raised that road to a much higher place in my estimation. Does it pay? Do you like to be treated like a human being? The public, distant and cold as it may seem, is made up of individuals, each one of whom likes to be treated with consideration and courtesy, and is usually quick to respond to the spirit of such treatment.

IN A NUT SHELL

In July, 1911, a large group of distinguished representatives of the iron and steel industry from all over the world met in Brussels to consider the formation of an organization to discuss the economical, ethical and sociological problems connected with their business. Judge Elbert H. Gary, chairman of the United States Steel Corporation, was asked to preside over the meeting, and in an address in which he advocated the very highest ideals in business, *and as a matter of business*, he said: "There should be established and continuously maintained a business friendship which compels one to feel the same concern for his neighbor that he has for himself. It is no less in principle than the Golden Rule applied to business."

This is very different from the homely philosophy of Dave Harum—"Do unto the other fellow the way he'd like to do unto you, an' do it fust"—and yet if we study Dave's actions closely we find that except as they related to horse trading, he lived far more nearly in accord with the ideals expressed by Judge Gary than his modesty allowed him to admit. One thing we must realize, and that is that the day of sharp practice in business is fast passing away—in fact is already a matter of history with many of our better class institutions and commercial organizations. There can be no question as to the handwriting on the wall. To my mind the really vital problem of our railroads today is a full realization of the necessity for "making friends" of the public by inspiring each one of the employees to follow the spirit of the slogan "The Public Be Pleased," which after all is only a literal application of the Golden Rule to the transportation business.

True Theory of Railroad Operating Records

Slow Progress Made in Railroad Statistical Science; the Importance of Educating Railroad Statisticians

By F. Lincoln Hutchins

To be efficient records must be true to facts; they must cover all needed facts; they must be in hand as soon as the condition of transmission permits; and they must be of low cost. To be true to facts they must be of simple units; to cover all the facts they must be prepared for all units separately; to be available they must be aggregated daily; to be of low cost they must be under the supervision of one competent man.

A simple unit is any exactly defined element, a knowledge of which may be had by simple sorting and counting. Records must be self-proving, that is, the number of subordinate units must agree with the number of general elements of which they are parts. Money units cannot be used to measure physical operation, as they contain too many variables. Physical operation can only be known by units of physical elements.

Judged by these laws railroads have few, if any, satisfactory records; while they are staggering under a mass of reports which give little basis for correct judgments and cause great waste of revenue in needless expenditure.

The attention of American railroad officers should be directed to the most important thing in connection with their efforts to secure efficient operation. Proper management of records would result in a better knowledge and hence in better control of operation, as well as a greater saving of money now wasted in clerical work and report forms. Efficient operation cannot be measured by the amount of expenditures; money units contain too many variables to satisfy a stable "bench mark"; a difference in wage scale seldom affects the efficiency while greatly changing the costs; a reduced pay-roll may be, and often is, accompanied by a much greater loss in efficiency, as when a low-priced man is cut off requiring a higher-priced man to do the work. On the other hand an increased pay-roll may result in increased efficiency and lessened cost, through effective supervision and the relief of high-priced men from cheap work through the employment of lower-grade assistants; in both of these cases a money unit would produce a mistaken judgment.

An increase in revenue should not, per se, justify an increased cost. A change in the character of traffic, or in rates received for the same traffic, should cause no change in cost. An increase of revenue caused by acquisition of new traffic flowing in a direction opposite to that already in hand should result in a decreased cost per unit, and does not call for an increase in total expense. On the other hand a diminution in revenue does not justify neglect of proper maintenance, or even of operating costs per unit. A large part of the cost is entirely independent of revenue, being in the nature of a fixed charge having no relation to the amount of the revenue.

Genuine efficiency depends upon the proper use of accurate records. No efficient action in human affairs is knowable until records of results determine what is efficient. The art of railroading is too recent to have accumulated a fund of exact records. Only in the most superficial sense can it be said to have any records. The progress of rail transportation has been too rapid to permit of careful attention to securing records; the emphasis has been placed on doing the work immediately in hand as best it could be done under the personal direction of those having more or less experience to guide them; there has been no thought of seeking records of others' experiences, or of making records for the guidance of others in similar work.

Again, the men who have developed the art of rail transportation have not been statisticians; their training and inclinations have been antagonistic to statistical information; there still exists among railroad managers a veiled contempt for any statistical determination of the efficiency of operation. This attitude results, in part, from their knowledge of the multiplicities and ever-changing conditions of operation, in part from their experience with current practice in report-making, through which partial, complex, and misleading conclusions are drawn, unless they are supplemented by personal observation and knowledge.

No railroad in the United States has a comprehensive, adequate statistical method by which to control its operations. The reason is obvious, for in the days of short lines, over which the superintendent could make daily trips, thus keeping in personal touch with all of its details, there were few other than the financial reports. As lines became extended and the new combinations lengthened the jurisdiction of the manager, information supplementing personal observation was found necessary, and this was secured through reports made upon blank forms sent out to the party upon the ground to be filled in and returned. Such report blanks were hastily prepared, to cover the particular need then in mind, by men who had no statistical training; and by different departments independently, leading to duplication and conflicting reports; no attempt was made to correlate or co-ordinate these report forms to fit them for other use; such reports were often continued long after the particular need had passed, or was better supplied in other ways, lumbering up the files and entailing needless clerical costs. Such reports, being unscientifically prepared and lacking the exact definitions needful to inform the makers as to just what was to be included, failed to convey exact information, and when new information was needed the effort to secure it led to the formation of new blanks, prepared in the same illogical manner, until to such an extent has this grown that the roads in the present day are staggering under a tremendous accumulation of reports, of which many are worthless so far as the giving of exact and reliable information is concerned.

It may be observed that the railroads are in an exceptionally favorable situation to obtain ideal statistical records. The units are few and simple, so that they may be exactly defined. The power to secure accurate figures of such units is ample and complete. These two fundamentals comprise the main requisites of scientific statistics, which require only the correct application of statistical methods to produce accurate results. Railroads are manufacturing entities producing a service; this product is passengers and merchandise transported; the units are passengers and freight tons carried one mile; the efficiency is determined by the time and effort expended to produce the results, not by the money received for that service, which varies through causes entirely unconnected with the ratio of effect produced to the energy expended in producing it.

It follows, then, that performance records must be divorced from financial reports; bookkeepers, accountants, and auditors make poor statisticians, because their training is wholly along the line of monetary values, and this becomes too ingrained in their natures to permit them to think in other terms; they are also too much involved in watching financial results to enable them to take a broad view of purely operating statistics. From the absolute fact that with every increase in efficiency there follows a lessened cost per unit, even when the total cost is increased, it is seen that to compare costs is entirely misleading. This is a thing that the financial man has great difficulty in realizing.

Point of view is perhaps the most important thing in the establishment of statistics. To the president and directors the single point of view is net earnings. Not so to the operating man, whose point of view should be focused upon operating methods which will directly affect the net earning result. Hence

the present tonnage records are very defective in that they do not induce the proper point of view for the operating man. For instance, credit for gross tonnage, including resistance allowances, has no direct relation to earnings, for it is only the paying load which yields earnings. Revenue tonnage is the only business which affects earnings, and hence should be the unit view point. A superintendent having this as his goal will be intensely interested in the efficient loading of cars and in his revenue train-loading, to avoid all light hauls so far as possible.

He will, if encouraged, criticize the direction of the transportation office in the matter of moving empties and routing loads, which criticisms may show that damaging practices are prevalent. Another correlative viewpoint is the tractive power used to haul that earning tonnage within the time in which it is in use. A railroad has a very heavy overhead expense dominated by the element of time, and this expense should be brought home to the operating man. With his viewpoint fixed upon the greatest possible number of revenue tons, with the least possible tractive power time, the operating man would work toward the goal of the president, namely, increased net earnings.

To obtain accurate statistical knowledge it is necessary to obtain the facts by means of an individual unit record, which may be counted; this means that the unit must be so exactly defined as to enable the illiterate to comprehend it, and the record must be the number of times that it occurs in time and space. Such a unit record aggregated gives the basis from which any deductions may be obtained; combined with other aggregates, similarly obtained, results may be obtained to answer any inquiry that may be made. Such unit records suffice for all needs, hence it is possible to abolish all duplication by any department and simplify the statistical effort. To be exact records must be made currently with the performance, by the party intimately associated with the work; such records should carry notations of any abnormalities, or unusual situations, to the end that it may never be necessary to make inquiry as to the cause of any departure from normal results; this feature would afford great relief to all departments that are now so burdened with efforts to explain past occurrences.

The post-mortems, now so largely indulged in, are costing the roads a prodigious and unappreciated amount of money, with no resulting benefit; further than that, they divert the minds of the supervising officers from attention to the immediate pressing problems of operation and thus detract from their efficiency. It is doubtless true that at some points there is great efficiency as regards some unit of performance; unit records would bring this into view and a study of causes would serve to raise the efficiency of this element upon every part of the system.

Competent arrangement of records upon the statistical plan makes all records self-proving; that is, each group of records must be arranged in a descending order from the most general to the particular, wherein the total of the particulars must agree with the total of the general if the records are correctly made; here is a current proof of accuracy, and with daily aggregations, errors would be immediately discovered and corrections applied.

With proper unit records it is as simple and easy to aggregate the particulars separately, as to first mix up incongruous elements as is now done; having aggregates of each particular permits of every possible combination from which to deduct the answer to any question; not only so but the aggregates still remain to furnish the answer to any other question arising at any time, without seeking new information by means of special reports.

The accumulation of all data should be by means of simple sorting and counting; the facility with which sorting may be done is evidenced by the rapidity and accuracy with which mails are handled by the United States postal department. In postal cars with 80 separations the average is 25 sortings per minute, in post offices from 45 to 50 pieces of matter per minute when making primary separations. With uniform records of railroad data it would be much more rapid because of the absence of irregular addresses and puzzling writing.

Having fixed the units the next step is to determine what information is necessary for an adequate and effective control of operation. Care must be taken to eliminate all reports which simply satisfy curiosity, an element which is quite dominant in many of the reports now in use. Doing away with these would materially reduce the cost and make more efficient the unit data obtained. The original record having been made it should pass immediately out of the hands of the party making it into a record bureau, and all subsequent use of that record should be developed by the record force, trained to the efficient handling of it; having no incentive to blur or misuse it, a condition that now vitiates some reports. Relieving the operating department of all record work would liberate more clerks than would be required by a record department performing the same functions. Record bureaus, conveniently placed, could make efficient use of mechanical devices to expedite and cheapen the work, the co-ordination of records making it possible for the bureau to answer any inquiry with the least time and expense. This method would abolish all petty reports now made by the departments, divisions and localities; relieve local parties from all report making, now so indifferently performed, and—which is most important—would save the mass of correspondence, now indulged in, to clear up doubtful points, correct errors and to obtain explanations. The ultimate aim would be to have daily recourse concurrently aggregated so that accurate results may be available as soon after performance as the time for the transmission of the data permitted.

Substituting scientific records for the present unscientific reports may be made a very gradual process during which the present official routine may be least disturbed. After the complete scheme has been worked out, with a definite unit place provided for every possible refinement in records, it only remains to gradually introduce the new as the existing reports are exhausted or become obsolescent. Only when the plan has been sufficiently instituted will there be a necessity for the creation of a distinct record bureau. It is plainly evident, however, that a competent man must be given supervisory control of all records in order that co-ordination may be secured and a gradual approach made to the ideally efficient method.

An important part of a statistical method is the adoption of adequate symbolization. Provision against duplication is secured by using mnemomic letter symbols for verbs of action, such as—Ad for adjust, Av for advise, Ap for approve, Cl for classify, Cm for communication, Dm for demand, Es for establish.

Differentiation of function is secured by using Roman numerals, such as (1) organization, (2) financial, (3) construction, (4) maintenance, (5) procuring business, and (6) transportation.

Division between the three classes of service may be secured by using a following letter, such as H for personal service, M for material service, C for capital service.

These symbols may be continued down to the last refinement so that simple sorting of the individual units produces an exact result upon which accurate judgment may be obtained.

RAILWAY CONSTRUCTION IN CHILE.—The Chilean government, despite the stringency of its financial resources, has resolved to proceed with the construction of the following new lines: Paine to Talagante; a line to connect the Traiguen branch with the main line; the Iquique and the Antofagasta extensions to the Longitudinal Railway; a line from Melpilla to Las Cabras; Valparaiso to Casablanca; San Vicente to Perallilo and Parronal; Valdivia to Los Canelos; Freire to Cunco; Los Angeles to Santa Bárbara and Quillaco; San Clemente to Colorado, with a branch to Queri; San Bernardo to Puente Alto; Quilpe to Melipilla; San Carlos to San Fabian; Artificio to Quincolmo; El Alamo to Molina; Cauquenes to Chanco; Quirihue to Coelemu; Yumbled to Rio Claro; Bulnes to San Ignácio and thence to El Recinto.

PACIFIC AND MIKADO TYPE LOCOMOTIVES FOR THE NEW ORLEANS & NORTHEASTERN

In order to obtain the greatest economy in the maintenance of motive power much attention has been given during the last few years to interchangeability of the detail parts. A majority of the parts subject to wear may very frequently be made interchangeable on locomotives differing widely in type. This is evidenced by a lot of five Pacific and three Mikado type locomotives recently built by the Baldwin Locomotive Works for the New Orleans & Northeastern. With these two types it is not difficult to arrange the wheel base so that interchangeable boilers may be applied. By using driving wheels of suitable diameter duplicate cylinders may also be applied and the proper ratio of adhesion maintained in both types. Among the important details which have been made interchangeable on the New Orleans & Northeastern locomotives are the boilers and accessories, the cylinders, cylinder and valve chamber heads, cross heads, pistons and rods, piston valves, driving boxes, trailer trucks, foot plates and cabs.

The boilers, which are of the straight top type, are equipped with the Gaines locomotive furnace. A combustion chamber is used in combination with a brick arch supported on water tubes. The superheater is made up of 24 elements and provides a superheating surface of 564 sq. ft. The fittings include power operated fire doors and grate shakers.

The cylinders on both types are simple with a diameter of 22 in. and a stroke of 28 in. With 68 in. driving wheels on the Pacific and 57 in. on the Mikado type, tractive efforts of 33,880 lb. and 40,420 lb., respectively, have been obtained with but slight variations in the factor of adhesion. Piston valves 13 in. in diameter are used, being driven by Walschaert gear.

Vanadium steel has been used in the frames, driving axles and engine truck axles of both types. This material has also been used in the main and side rods of the Pacific type locomotives. All rods for both types are rectangular in section. The rear truck is of the improved Hodges type so arranged as to give a maximum amount of clearance under the ash pan.

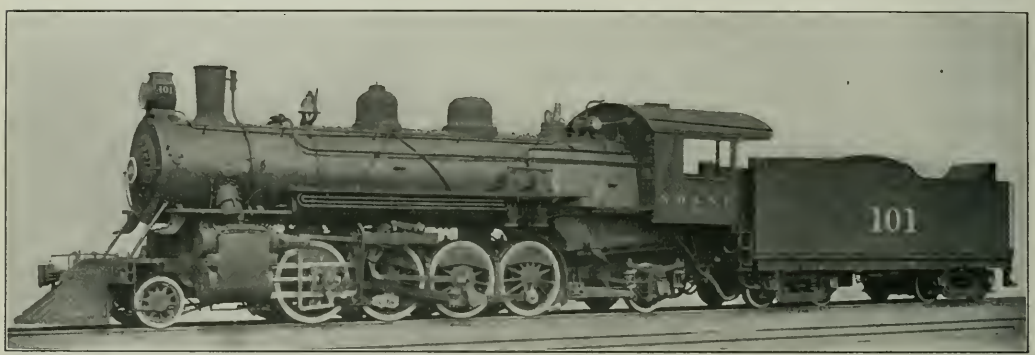
These locomotives are built to operate on 75 lb. rails. The grades and curves are generally light, the steepest grades on the main line being 1 per cent. and the sharpest curve 6 deg. The principal dimensions and ratios of both types are given in the following table:

General Data

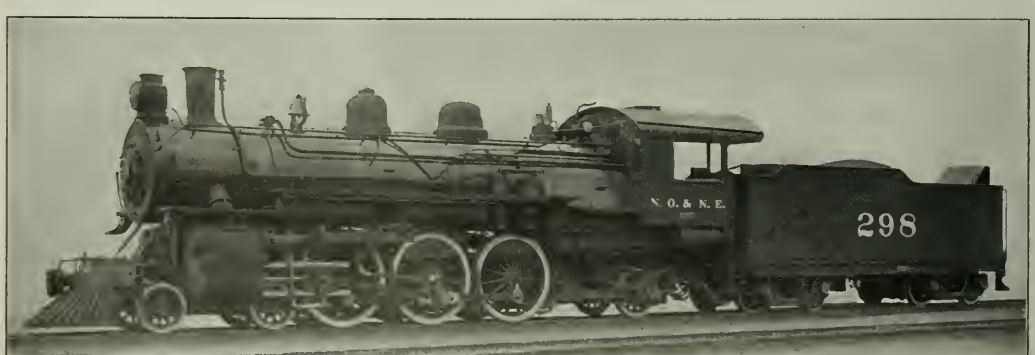
	Pacific	Mikado
Gage	4 ft. 8½ in.	4 ft. 8½ in.
Service	Passenger	Freight
Fuel	Bit. coal	Bit. coal
Tractive power	33,880 lb.	40,420 lb.
Weight in working order	206,700 lb.	209,500 lb.
Weight on drivers	130,500 lb.	160,000 lb.
Weight on leading truck	43,800 lb.	19,700 lb.
Weight on trailing truck	32,400 lb.	29,800 lb.
Weight of engine and tender in working order	352,000 lb.	355,000 lb.
Wheel base, driving	12 ft. 0 in.	15 ft. 0 in.
Wheel base, total	32 ft. 11 in.	33 ft. 6 in.
Wheel base, engine and tender	67 ft. 0 in.	67 ft. 7 in.

Ratios

Weight on drivers ÷ tractive effort	3.84	3.96
Total weight ÷ tractive effort	6.14	5.18
Tractive effort × diam. drivers ÷ total equivalent heating surface†	679.2	679.2
Total equivalent heating surface† ÷ grate area	73.7	73.7
Tube equivalent heating surface† ÷ firebox heating surface	19.8	19.8



Mikado Type Locomotive, Many Parts of Which are Interchangeable with the Pacific Type



New Orleans & Northeastern Pacific Type Locomotive

Weight on drivers ÷ total equivalent heating surface†	38.5	47.2
Total weight ÷ total equivalent heating surface†	60.9	57.6
Volume both cylinders	12.3 cu. ft.	12.3 cu. ft.
Total equivalent heating surface† ÷ vol. cylinders	275.3	275.3
Grate area ÷ vol. cylinders	3.7	3.7
Cylinders		
Kind	Simple	Simple
Diameter and stroke	22 in. x 28 in.	22 in. x 28 in.
Valves		
Kind	Piston	Piston
Diameter	13 in.	13 in.
Lead in full gear	¼ in.	¼ in.
Wheels		
Driving, diameter over tires	68 in.	57 in.
Driving, thickness of tires	4 in.	3½ in.
Driving journals, main, diameter and length	9½ in. x 11 in.	9½ in. x 11 in.
Driving journals, others, diameter and length	9 in. x 11 in.	9 in. x 11 in.
Engine truck wheels, diameter	33 in.	33 in.

THE NEW ERA FOR RAILROADS*

By Daniel Willard
President, Baltimore & Ohio Railroad

The two decisions in the Eastern rate case, taken as a whole, may be truly said to mark the beginning of a new era for the railroads, and I believe that the decisions, when they become better understood, will have, and justly so, the support of all men who think carefully concerning matters of that kind and desire only that fair and reasonable treatment and consideration shall at all times be accorded, with equal impartiality, to all individuals and interests.

While the commission in its two decisions fully recognized the needs of the railroads in Official Classification territory for additional net revenue, and while the chairman of the commission specifically stated that in his opinion the needs of the carriers were even greater than the full amount to be obtained from a 5 per cent increase as requested, it should be kept in mind that the increase immediately granted was, approximately, only one-half of the amount asked for; but other findings and suggestions contained in the decisions are of great potential value, provided the railroads are enabled by the co-operative and affirmative action of the various state commissions, as well as of the federal commission, to put the changes and the reforms suggested into effect. The federal commission, for instance, admitted the contention of the carriers that their expenses had become inelastic, due largely, as shown in the record, to the effect of legislation, such as full crew bills, hours of service laws, increased taxes, etc., and that it was not possible now, as in the past, for the carriers to keep their expenses in harmony with their gross earnings. They found also that it was not true, as claimed by some, that the railroads had spent unduly large amounts in recent years upon maintenance; on the contrary, they expressed the view that the amount so spent was perhaps even less than it might well have been, and definitely stated that they would view with disfavor efforts to increase net earnings by keeping maintenance charges lower than they ought to be.

They approved the principle of a small uniform and general increase as urged by the railroads, by permitting such an increase to become effective on approximately half of the freight earnings in the Eastern territory. The commission also found that the higher rates of interest which the carriers would undoubtedly be required to pay in the future because of conditions brought about by the European war would be an element which should be considered in determining a fair and reasonable basis of rates. In other words, the commission clearly recognized all the contentions of the carriers concerning the general railroad situation, and specifically stated that it was the duty and the purpose of the commission to assist so far as it properly might in the solution of the whole problem. In furtherance of that thought the commission pointed out various ways in which it expressed the belief that assistance might be looked for, and if our political structure had been developed along the lines that were later on followed in the Dominion of Canada—that is to say, if the federal power had been all-embracing, except as limited by special restrictions, instead of being just the contrary—it would be possible, I believe, with the assistance and support of the federal commission to work out without unreasonable delay a solution of the railroad problem along the lines suggested by the federal commission.

It should be remembered, however, that each one of our forty-nine states, or, more specifically, each one of the eighteen states located in what is known as Official Classification territory, has its own policy concerning the regulation of railroads. In some of the states it is not possible to advance local freight rates, for instance, without the consent of the railroad commission in that state, and in many of the states there are laws limiting passenger fares generally to two cents per mile, although it was very clearly shown by the able counsel retained by the Interstate Commerce Commission to assist it in the development of the rate case that a two-cent passenger rate was clearly unremunerative under most circumstances.

In order, therefore, that the policy outlined by the Interstate Commerce Commission in the Eastern rate case, and which I believe is a broad and constructive one in its possibilities, may be given effect and that the railroads may without undue delay obtain the relief proposed, it will be necessary to have also the friendly and affirmative co-operation of the several states, and this, in view of the searching and prolonged investigation of the federal commission into the whole subject, I think we may fairly expect to be forthcoming. If this is done, I believe the future outlook for the railroads is distinctly more promising than it has been at any time during the last decade.

Undoubtedly, in the actual working out of what may be called a large reformatory program such as is presented, it may, and no doubt will, come about that certain of the carriers as well as certain localities will be required, in the general good, to give up special advantages which may have accrued to them under conditions such as have existed in the past, and this it is to be hoped they will consent to do, having in mind the larger interest of all, and also the certainty that a policy based upon a recognition of the principle of fair and reasonable treatment for all will in the long run and in some way assure to all the rights and privileges to which they are justly entitled.

It has been a source of constant satisfaction to me that the press generally should have taken the attitude it did toward the question as a whole, and while what is said in this letter is simply a personal expression of my own views, I believe that railroad managers generally feel very largely as I do concerning the matters above referred to, and I hope now

*From a letter to the New York Times, published in its issue of January 20, 1915.

that the public, because better informed, has come to appreciate more clearly the necessities of the railroads, as well as the intimate relationship which exists between the prosperity of the railroads and the prosperity of all others, that we may be able to so work out the problems of the future as to perpetuate the friendly understanding which now seems to be established.

THE FARMING CODE

A harassed railroad officer has sent us the following, showing that he at least might be willing to share his blessings with other classes of citizens. It is rumored that Congressman Whackem may not introduce this bill in the near future.

ARTICLE ONE

Charges and Prices

Sec. 1. Only one price for a given commodity shall be lawful. A farmer desiring to change a price shall file a schedule thereof with the commission hereby created, which shall go into effect thirty days thereafter unless suspended by the commission at the instance of any consumer.

Sec. 2. No prices shall be increased, however, except upon due proof, the burden whereof shall be upon the farmer, that existing prices are confiscatory of his goods and gear. In its discretion, the commission may refuse to permit any such increase until a valuation by its engineers and accountants shall have been taken. In such valuation, the farmer shall have no credit for past profits invested in new fields or improved structures, but shall be allowed only original cost plus borrowed money invested.

Sec. 3. "Commodity," as used herein, includes all grains, vegetables, livestock, dairy articles, excepting sand, gravel and manure.

ARTICLE TWO

Conduct of Operations

Sec. 4. Every hired man shall work eight hours only per day, not including the Sabbath, and shall not recommence work unless he has completed a period of not less than eighteen hours of absolute rest and quiet. He shall not work on the Lord's Day, nor on legal holidays, nor on Jack Love's birthday.

Sec. 5. Every farmer shall hire one more hired man than his work requires.

Sec. 6. The only permissible exceptions to the two foregoing sections shall be periods of stress resulting from earthquake, Halley's Comet or European invasion.

Sec. 7. All wagons, and all poles and double-trees, shall be provided with couplers, coupling by impact, so that the hired man need not go between the wheels of the wagon and the heels of the horses.

Sec. 8. All wagons shall be supplied with suitable brakes, grab-irons, stirrups and platforms of standard dimensions to be fixed by the commission.

Sec. 9. All bulls, when moving on the highway or in unfenced areas, shall be equipped with a bell of not less than fifty pounds weight, a steam whistle and an electric headlight of at least 1,100 candle power.

Sec. 10. Sheds shall be built over all fields where hired men have to work in summer.

Sec. 11. All field engines and machinery shall be fenced in; all belting shall be encased in metal housings; and all grindstones, churns, hay-cutters, bulls' horns and other moving parts shall be strongly encased in sheaths for the protection of the hired men.

Sec. 12. All barns, sheds and other outbuildings shall, in cold weather, be adequately heated, and at all times shall be well lighted and policed.

Sec. 13. If a calf is delayed in arriving or is born dead, the farmer shall instantly provide another cow whose calf shall be born that day.

Sec. 14. The commission's inspectors shall weekly inspect all gasoline automobiles. If a cylinder is missing, the farmer must find it before he runs on the road again.

Sec. 14a. The right to mortgage real estate is a franchise reserved to the state. No farmer shall make any mortgage nor incur any indebtedness extending for a period of more than one month, without the written approval of the commission, obtained upon petition and hearing, and upon paying the state treasurer 10 cents for each $100 of such indebtedness. Indebtedness incurred without such consent shall be void.

ARTICLE THREE

The Commission

Sec. 15. To enforce this act, a commission of five persons shall be selected by the governor with a view to placating as many shades of political opinion as possible. No commissioner shall, however, be deemed disqualified by lack of previous political or other experience.

INTERLOCKING AT NORTH PHILADELPHIA

By W. M. Post,

Supervisor of Signals, Pennsylvania Railroad, Jersey City, N. J.

The Pennsylvania recently added four tracks to its four-track line at North Philadelphia, making eight tracks through the station, and also increased its station facilities, which made it necessary to replace the old electro-pneumatic interlocking plant at that point. A 47-lever type F electric interlocking machine, furnished by the Union Switch & Signal Company, was installed, 43 working levers controlling 41 switches and 58 signals east and west of the station. At the same time the automatic block signal sections in the immediate vicinity were shortened from an average

North Philadelphia Passenger Station and Interlocking Plant—Looking East

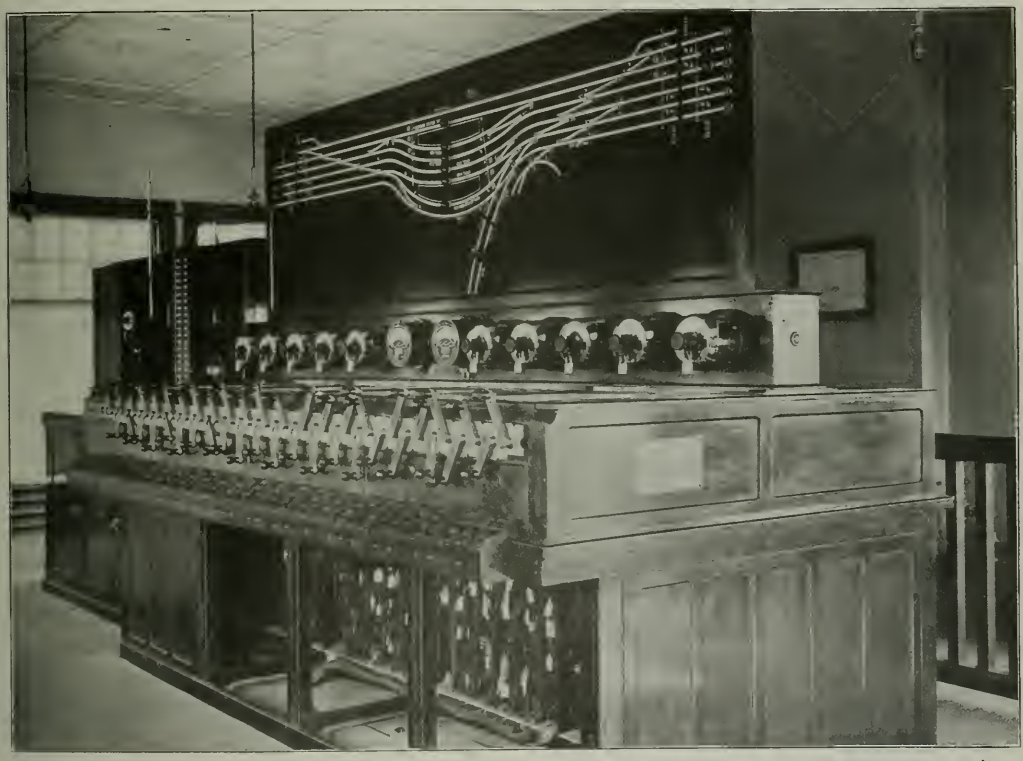
of 4,088 ft. to 3,052 ft. to enable trains more quickly to get away from this congested district; and the automatic signals were changed from two-arm, lower-quadrant, two-position, to one-arm, upper-quadrant, three-position. The distant indication was carried back two blocks, the first distant signal indicating "proceed, prepared to stop at next signal," and the second distant signal indicating "proceed, prepared to pass next signal at medium speed." The interlocking station is a two-story brick building 38 ft. by 20 ft. outside dimensions, with red tile roof, and brick walls covered with concrete, the design harmonizing with the appearance of the bridges and the station surroundings. The relay and indicator rack is directly under the interlocking machine, on the ground floor.

The machine is of the electro-pneumatic design modified for use with electric power apparatus. Each signal lever controls several signals by means of selection over contacts on switch levers, and through other devices. Both ends of a crossover are controlled by one lever and if one is a slip, the slip and movable point frogs are included in the control of the lever.

Indication lights located directly under the levers in the machine show whether the track circuits which control the electric switch locking and the automatic feature of the signals, are occupied. Electric lights on the track model, on which is painted a diagram of the track layout, indicate the approach of trains and also which one of the station tracks is occupied. Clockwork slow releases, ground detectors and ammeters are mounted in a cabinet over the machine. Mercury slow releases are connected to levers controlling all dwarf signals which are less than 100 ft. from facing-point switches. At one end of the machine there is a telephone test board.

The switch mechanisms are Union B 3 electric type. The switch is operated through a worm gear direct connected to the operating motors by reduction gears of 25 to 1 for single switches, and 45 to 1 for slips and movable-point frogs. The indication circuit is alternating current and was developed by the Pennsylvania signal department to eliminate the possibility of false indication. All signals are electrically lighted with two 2½-watt 12-volt Mazda bulbs, connected in multiple.

Power is supplied by the Philadelphia Electric Company at 220-volts, 60-cycle, single-phase a. c. Two sets of Edison storage batteries, 100 cells each, of 300 ampere-hours capacity, supply the direct current for the signals, switch motors and indicators. These sets are charged alternately by two mercury arc rectifiers of 30 amperes d. c. capacity, connected in multiple.



Electric Interlocking Machine at North Philadelphia

The alternating current for track circuits, switch indication circuits and electric lights is transformed from 220 to 110 volts at the interlocking station and is conducted through the plant on No. 6 feeders. Transformers located at convenient points step down the current again.

All wires were put underground in cypress wood conduit and the wires surrounded with R. S. A. Parolyte (petroleum asphaltum) to protect the insulation and guard against damage by rats and mice. The boards were covered with ⅜ in. of this material before the conduit was built; the cables and wires were then pulled through, and Parolyte heated to about 200 deg. F. was poured in until the wires were covered.

The interlocking is completely equipped with approach, route and electric switch locking. It is nearly a mile from the farthest east to the farthest west interlocked switch and a large share of the operations in the cabin have to be carried on without hav-

ing a good view of the trains that are being dealt with; that is to say, wholly by observing the indication lights in the interlocking machine. The plant was designed by the signal department of the Pennsylvania, A. H. Rudd, signal engineer, and the installation was made by the New York division forces.

STATE COMMISSION REPORTS

The New York, New Jersey and New Hampshire public service commissions have this week completed their annual reports. As yet only that from New Hampshire has been published in complete form, however, and our reports of the others are made up from advance notices which have been issued. There have been added notices of two special reports from Massachusetts.

NEW YORK

The New York State Public Service Commission, First district, has presented its eighth annual report to the legislature. The principal activities of the board have to do with the construction of new subway and elevated railroads in New York City, and during the 12 months of 1914, the commission awarded 24 construction contracts, which aggregated in value about $52,000,000. This is more than double the amount of the contracts given out in 1913. Payments by the city and by the operating companies for new lines aggregated in 1914 about $26,000,000. The contracts on which work is now in progress total about $142,000,000. The commission has 2,100 employees and its running expenses for the year were about $3,000,000. Of this amount $2,500,000 was chargeable to rapid transit, the preparation of plans, supervision of construction, etc. For the fiscal year ended June 30, 1914, the total number of passengers carried by all street railroads in the First district, that is, elevated, subway and surface lines, was 1,813,204,692, an increase of 43,328,184 over the previous year. The total receipts of such companies for the year were $94,153,673, an increase of $2,012,068. Estimating the population of the greater city at 5,400,000, this is $17.43 per capita for street car fares.

The New York State Public Service Commission, Second district, sent its annual report to the legislature January 15. A detailed account is given of the volume of work which has been done by the commission during the past year, and it is estimated that 25 per cent more work has been done than during any similar period in the past. The number of hearings held during the year was 630, occupying 298 whole days, and 2,195 formal and informal cases have been settled since March 16, the day when the present personnel of the commission was organized.

The commission recommends legislation to give it further authority to suspend proposed rates; a law to amend the long and short haul clause of the railroad law and one to require carriers to furnish shippers with a written statement of rates when called for. The commission has granted 142 certificates of public convenience and necessity for auto-bus lines on the highways. The commission believes that the highway department could attend to this matter, which takes the time of the members from more important things.

The commission also recommends a more businesslike and economical management of the contributions made by the state to the abolition of highway grade crossings. No appropriation for this purpose has been made by the state legislature for three years past, and cases are now pending where the state (which usually pays 25 per cent of such improvements) ought to contribute $1,000,000. Of the 8,679 grade crossings in New York State, a large share are on state and county highways, and some of the money for abolishing crossings can be taken from the highway funds. The commission strongly recommends the adoption of a definite program of appropriations in order that this great problem may be systematically dealt with.

MASSACHUSETTS

The Public Service Commission of Massachusetts, in a special report to the legislature, estimates that the amount invested in the electric railroads of the state is $226,253,407, including the sum of $25,982,695 for subways built by the city of Boston. The order of the legislature in this matter was the result of a discussion of proposals to have the electric lines taken over by the state, the cost of which, it will be seen, would be about two hundred millions, plus an annual return of 10 per cent on the investment, which is stipulated in the laws under which most or all of the companies were organized. To get an accurate estimate of the value of the roads, says the commission, it would be necessary to have first a physical valuation of the property, which would cost $230,000 or more. The commission gives a negative answer to the proposal broached in the legislature, to assess the property adjacent to existing street railway lines for the purpose of raising money with which to purchase them.

NEW JERSEY

The Board of Public Utility Commissioners of New Jersey has issued advance sheets of that part of the board's annual report which includes its recommendations. During the past year the board has approved issues of stocks, bonds and other securities in 59 cases, the par value of these issues amounting to $88,106,750. The report gives an outline of the rules under which the commission acts in cases of this kind so as to avoid giving any approval which may be taken as a guarantee of either stocks or bonds to the investor. The number of complaints submitted to the board during the year was 606, and hearings have been held in 456 proceedings. The action of the commission has resulted in numerous reductions in freight rates, but most of these proceedings have been of an informal nature.

Plans have been made for the elimination of 30 grade crossings, and hearings have been held in 21 of these cases. The Pennsylvania during the past year has eliminated 13 grade crossings at Rahway, in connection with its extensive elevation of tracks through that place. The West Jersey & Seashore has begun work which will abolish 11 crossings in Camden. The Lackawanna has eliminated seven crossings in Chatham and is doing similar work in South Orange and other places which will cost nearly $500,000. Ten crossings are to be abolished in Madison.

The board has ordered automatic bells at some crossings where the cost of maintaining an attendant was deemed unwarranted; and action has been taken looking to the erection of uniform signs at all crossings which are not attended by flagmen throughout the 24 hours. The Central of New Jersey has put in the hands of its crossing watchmen warning disks bearing the word "Stop" and reports satisfaction from their use. They have been obeyed without question by travelers on the highway. In a conference between the commission and different roads, with a view to making this plan universal throughout the state, opposition developed; though the board believes that the experience of the Central of New Jersey has answered all of the criticisms which were made by the other roads.

The board recommends the amendment of the law empowering it to fix rates, so as to clearly define the policy of the state as forbidding the commission to value the franchise of a utility in excess of the sum which has been legitimately spent in procuring it, and repeats a number of recommendations which were made to the last session of the legislature, but which were not adopted by that body.

NEW HAMPSHIRE

The New Hampshire Public Service Commission has sent to the governor and the legislature its report for the two years ending August 31, 1914. The scope of the activities of the commission has greatly broadened during these two years, and the commissioners feel that this has been one of the most useful departments of the state government. They believe that if there should never again be a single reduction in the price of public service, the cost of the commission would be justified by the single item of the reduction in the price of gas in four principal cities; and in three of the four cases the reduction was accomplished by adjustment without any public hearing.

Of the 1,031 grade crossings in the state, 826 were unprotected when the commission took up the work of investigating them; and of these, 469 have been improved by cutting down trees and brush, 15 are to be protected by flagmen, 30 will have automatic gongs and lights, and 25 will be made safer by restricting the speed of trains. For the first time in the history of the state there has been a reasonably thorough inspection of steam and other power boats carrying passengers on inland waters.

The commission has recommended to town and city officers to erect uniform signs at the approaches to highway grade crossings, fixed at a standard distance from the track; and somewhat more than half of the towns in the state have adopted the recommendation and have ordered over 900 signs. Other towns have declined to take action, some of them because crossings are already protected by signs put up by a maker of automobile tires. The commission condemns these signs as being inadequate. The advertising matter obscures the words of warning. They are not at uniform distances and are placed at only a few crossings.

The commission reports its expenditures for the past year, and in connection with this statement gives some information received from other states most of which is summarized in the following table (the figures being, presumably, in each case for twelve months):

	Cost of State Commissions			
	No. of commissioners	Salaries of commissioners	Expenditures*	Total cost of department
New Hampshire	3	$10,700	$14,851	$25,551
California	5	40,000	270,066	310,066
Connecticut	3	15,000	35,000	50,000
Illinois	5	50,000	130,000	180,000
Indiana	5	30,000	75,763	105,763
Kansas	3	12,000	33,856	45,856
Maine	3	14,000	44,000	58,000
Maryland	3	16,000	58,995	74,995
Massachusetts†	8	54,500	147,752	202,252
Missouri	5	27,500	83,100	110,600
Nebraska	3	9,000	40,920	49,920
Nevada	3	11,500	20,863	32,363
New Jersey	3	22,500	147,500	170,000
New York (both districts)	10	150,000	783,563	933,563
Ohio	3	18,000	180,000	198,000
Oklahoma	3	12,000	52,281	64,281
Pennsylvania	7	70,000	.....	.....
Rhode Island	3	11,000	8,000	19,000
Vermont	3	5,600	12,700	18,300
Washington	3	14,000	71,391	85,491
Wisconsin	3	15,000	170,204	185,204

*Appropriations given when expenditures are not known.
†Gas and Electric Light Commission included.

WESTERN MASSACHUSETTS TRANSPORTATION COMMISSION

The report of the Western Massachusetts Transportation Commission, L. C. Hyde, chairman, a special commission appointed by the governor last year, has submitted its report to the legislature of the state. A large part of the report is devoted to highways. That part which deals with railroads recommends the construction of a line from Williamsburg westward to Hinsdale, about 20 miles, the estimated cost of which would be $1,200,000. This route is through a very hilly section, and traverses the center of the largest single region in the state which is not already supplied with railroad facilities. There are in the state 36 towns without either steam or electric transportation facilities; and 33 of these towns are in the five wesern counties, which is the territory dealt with in the report.

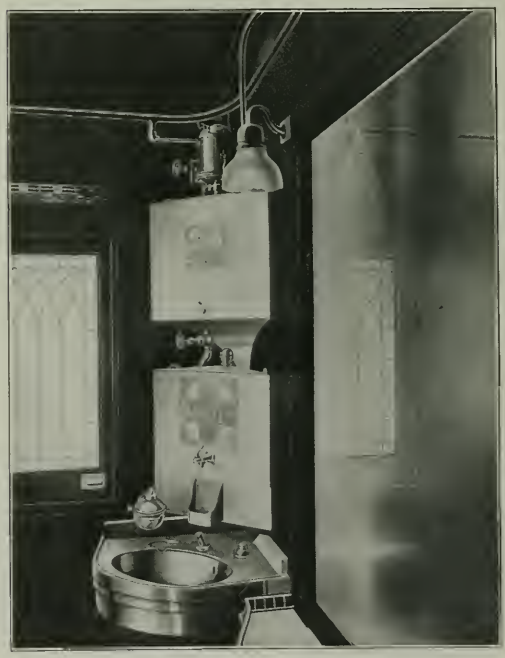
The commission recommends that the Public Service Commission be authorized to order the extension of street railways into adjoining towns which have no street railways; also to order street railways to carry freight and express. From Huntington westward to Lee, about 25 miles, there is an electric road, built last year and nearly finished; the commission asks that this road be required to begin operation by May 15

GERMAN CONTROLLED RAILWAYS.—According to Amsterdam advices the Cologne papers state that seven Russian, nineteen Belgian and three French railway lines are now managed by German railway boards.

SANITARY DRINKING FOUNTAIN

A new type of drinking fountain which provides filtered water for passenger cars has been developed by Henry Giessel & Co., Chicago, and has given good service on one of the western roads. It is known as the "North Pole" sanitary drinking fountain, and consists of a filter, a storage tank for the filtered water, a cooling pan and an ice box. The fountain occupies a space 14 in. by 17 in. by 48 in., and all parts are accessible for inspection. Water from an overhead tank flows to the filter at the top of the fountain and is filtered through Tripoli rock, passing to the storage tank directly below. From this tank it passes to the cooling pan in the ice box, which is a water-tight vessel of small capacity. The ice surrounding the cooling pan lowers the temperature of the drinking water to a desirable degree without permitting any of the ice water to become mixed with the drinking water.

The metals used in the construction of the fountain are noncorrosive. The filter case is made of galvanized malleable iron and heavy tinned sheet brass. The storage tank and cooler are



"North Pole" Sanitary Drinking Fountain for Passenger Cars

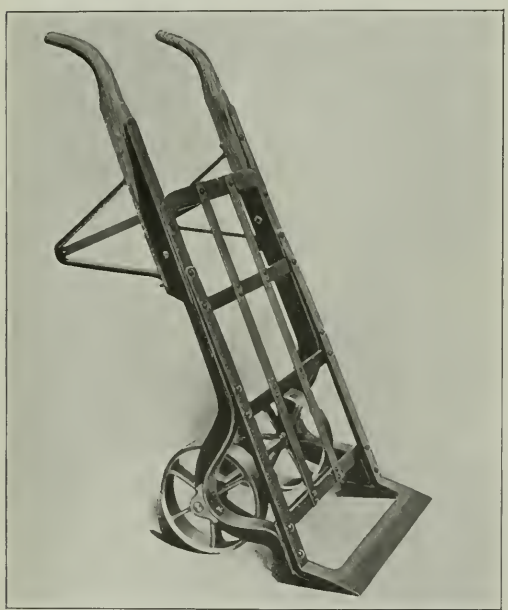
made of heavy galvanized iron sheets. The cooling pan is made of galvanized gray iron. All the pipes and fittings are also galvanized and the parts exposed to view are finished in German silver. The filter is in the shape of a cylinder with its core removed; the water seeps through from the outside to the inside and passes directly to the storage tank. The filter material does not absorb the impurities of the water, and may readily be cleaned by scrubbing in water with a stiff brush. It may easily be removed and cleaned in about five minutes and should be cleaned every few days.

The principal features of this drinking fountain are its sanitary characteristics and the cheap grade and small quantity of ice that may be used. Comparative tests made with it and an ordinary water cooler in passenger cars between Chicago and Kansas City showed a saving of 73.6 per cent in the amount of ice used and 80 per cent in the cost of the ice in favor of the

filtered water, the temperature of the drinking water averaging 49 deg. for the filtered water and 38 deg. for the ordinary water cooler. Less care is required in the maintenance of this cooler than of the ordinary cooler, a general cleaning being necessary only when the cars are shopped. Provision is made for draining the entire system when the car is not in use and not supplied with heat in the cold weather.

STEEL FRAME TRUCK

The freight handling truck shown in the illustration has recently been developed by the Edwards Manufacturing Company, Cincinnati, Ohio. The frame is made from 2½ in. by 2½ in. by 3/16 in. angle bar, the two sides and top crossbar being formed in a continuous piece. The side bars are dropped at the axle boxes, which are small castings bolted to the frame. This forms an especially rigid construction by reducing the height of the axle boxes and the leverage on the bolts. The crossbars are of 1½ in. by 1½ in. by 3/16 in. T-section, and are riveted to the



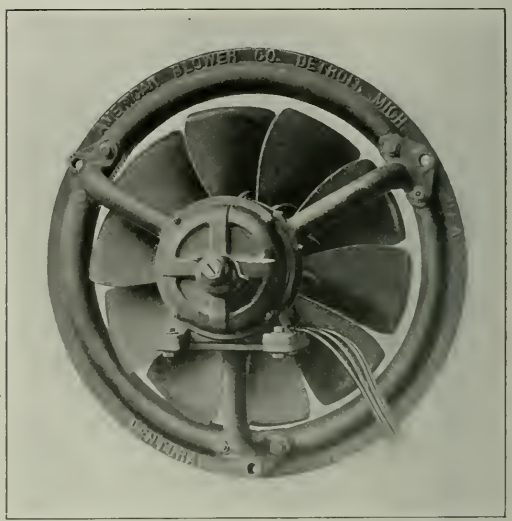
Freight Handling Truck with Structural Steel Frame

frame. The handles are of wood, reinforced with angle bars, and are readily detachable. Rivets are used in the construction throughout with the exception of the handles and axle bearings which are secured by bolts. The truck illustrated is designed for general purpose work, but the same construction is used in trucks of several other styles designed for handling special classes of freight.

Electrification of an Italian Railway.—Electric traction has just been introduced on the Turin & Savona Railway, for passenger traffic only, on the section of the line across the Apennines, between the latter town and Coval, a distance of 29 miles. This section, which is the heaviest part of the line, includes the Belbo tunnel, about 3 miles in length, with maximum gradients of 1 in 40. The maximum speed is 31 miles per hour. Savona, after Genoa and Venice, is the principal coal port in Italy; it is also an important manufacturing town, with large steel works.

VENTILATING FAN

A type of ventilating fan which is claimed to be especially effective has recently been placed on the market by the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa. The distinctive features are the wide central disk upon which the blades are mounted and the unusually large number of blades used. The ends of the blades are abruptly turned up causing the air to be thrown straight forward at a high velocity instead of being widely spread out, and the design of the



Ventilating Fan with Center Designed to Prevent Back Flow

fan at the center prevents a back flow of air at this point which often takes place with other designs.

The motor is specially designed for fan service. Being entirely enclosed it is protected from dust and moisture; it has a high overload capacity in order that no difficulty will be experienced in driving the fan against strong back pressure should it be located where affected by the wind. The motor is designed to run for long periods without attention and is claimed never to require more than an occasional inspection and lubrication. Power may be obtained from the electric light circuit.

An English Classification Scheme.—The Machine Tool and Engineering Association, Ltd., of London, has issued an alphabetically arranged list showing the railway classification of freight primarily shipped by its members. The list is a summary of the General Railway Classification of Goods, and it contains some very useful information relating to the carriage of machinery, etc., by rail.

Technical Schools in the United States Navy.—Technical schools maintained by the navy, wherein instruction and training are given in trades that are useful both in the service and in civil life, include the following: The machinists' school at Charleston, S. C., in which men are fitted for the duties of machinists, ashore and afloat; the electricians' (radio and general) schools at New York and Mare Island (graduates of these institutions are ready to perform the many duties that fall to the lot of those charged with the care of the dynamos and radio plants used in the service); the artificers' school at Norfolk, which gives instruction and training in carpentry, blacksmithing, painting, plumbing and shipfitting.—*American Machinist.*

Maintenance of Way Section

It is the experience of practically all associations that it is difficult to secure concise but complete committee reports. A committee will frequently go at length into the discussion of one phase of a subject to the neglect of other equally important phases. While this may be permissible, or even advisable when the committee is to be continued for several years, most committees exist for only one year. One cause for the defect in reports referred to is the improper selection and wording of the subjects assigned. Officers are prone to choose topics which are too broad to be covered in the work of a single year or are not sufficiently specific to indicate to the committees the scope and limits of their investigations. This is very likely, especially with inexperienced committeemen to result in the preparation of incomplete reports. The first step in the preparation of a committee report is the proper selection of a subject.

Efficient Committee Work

While not primarily a railroad organization, the American Wood Preservers' Association bears an important relation to the railways, as they are the largest users of treated timber. Its proceedings are therefore receiving more attention from railroad officers from year to year. This association is somewhat unusual, in that its membership is composed very largely of two groups of men, those in charge of commercial treating plants whose largest customers are the railroads, and those connected with the operation of plants owned directly by the roads. As a result the commercial operators are meeting with railway men who include their principal customers and competitors. Considering the narrowness of the field few associations have made as great a growth in membership or in the strength of programs presented as has this one in the 13 years of its existence. The wide range of subjects in its field covered by it is indicated by the program for its convention this week at which papers were presented by the engineers connected with commercial and with railway treating plants, consulting timber engineers, government experimental officers, a professor of pharmacology and efficiency experts. The association occupies a special field in railway maintenance of way work for, with the continually expanding uses of treated timber and the changing conditions in methods of preservation, there is a growing demand for expert knowledge on this subject.

The American Wood Preservers' Association

While there has been a great deal of independent study regarding the adaptability of various woods for treatment, the most practical methods of seasoning timber and the relative merits of the different timber treating processes for use in various parts of the country, there has been little concerted study of any extensive nature by any representative group of men, with the result that there is a wide diversity of practice and much money has been expended unwisely for timber treatment. This problem has been accentuated by conditions existing within the industry. The advocates of the different processes have in some cases urged the merits of their respective methods unwisely, while numerous commercial plants have been committed to certain processes to the exclusion of others which were better adapted to the needs of some of their clients. The American Railway Engineering Association and the American Wood Preservers' Association have endeavored to assemble the results of these different studies and to collect further information to determine the merits of disputed points from the standpoint of the user. While only a start, the report of the committee of the American Wood Preservers' Association on Specifications for the Purchase and Preservation of Treatable Timber presented at the convention this week contain much valuable data regarding the merits of the different timbers and processes of treatment for varying local conditions of climate and service. Such information is of direct value to the railroad engineer endeavoring to determine the relative adaptability of different timbers and methods of treatment for local conditions which he has to meet. The work of this committee should therefore become of increasing importance and value as it is continued from year to year.

Standardization of Timber Treating

One of the broadest fields for the exercise of engineering ability lies in the working out of economical and expeditious plans for the handling of bridge work. Every problem has characteristics of its own which influence the selection of the best method. In renewing a span, the character and depth of the stream, the prevalence of floods, the design of the structure, the density and distribution of the traffic and the amount and kind of construction equipment available are among the conditions which must be considered. Variations in these conditions make numerous methods possible. We publish two interesting descriptions of bridge work elsewhere in this issue, which, while perhaps local in their application and possibly not even unique, are examples of methods of general interest. Many other ways of handling various problems involved in the construction, maintenance or reconstruction of bridges, including the renewal or strengthening of spans, the building, rebuilding, strengthening or protection of piers, etc., are of equal or greater interest. It is our desire to publish descriptions of the manner in which problems of this nature have been handled. We therefore announce a contest on "Bridge Construction Methods" to cover descriptions of methods not generally used or known for handling any feature of bridge construction, maintenance or reconstruction work on steel, concrete, or masonry bridges, including substructures. Contributions should describe in detail the methods employed and be accompanied by sketches or photographs to make the operations clear to the reader. We will pay $25 for the best and $15 for the second best articles contributed, the awards being based on the practical value and originality of the methods adopted. All contributions should be sent to the Engineering Editor, *Railway Age Gazette*, 608 South Dearborn street, Chicago, and must be received not later than March 10.

Contest on Bridge Construction Methods

THE EFFECT OF HEAVY WHEEL LOADS ON TRACK

A FEW years ago locomotives with wheel loads of 30,000 lb. would have been considered impracticable, but today they are used in considerable numbers and the indications are that they will meet with increasing favor. Their adoption brings up a question of live interest to the maintenance of way department, especially since these locomotives are designed to operate at as high speeds as those they have replaced. The problem may be further complicated by the introduction of heavier cars, such as the 90-ton cars of the Norfolk & Western, with wheel loads of 21,950 lb., and the 70-ton cars of the Chesapeake & Ohio, with wheel loads of 26,310 lb. None of this equipment has been in service long enough for the full effects on the track to be evident.

Many men now believe that we have gone beyond the reasonably safe limit of wheel loads with present-day track construc-

tion, while others are of the opinion that these increased loads need cause no concern on a properly maintained track. Viewing the problem from another angle, there is a wide difference of opinion between those who believe that the saving resulting from the reduced cost of transportation will be more than offset by the increased cost of maintenance of the track and structures; and those who believe that, while the cost of maintenance will necessarily increase somewhat, it will consume but a small proportion of the reduction in operating costs.

The question of safety requires careful consideration. Our accident statistics show a condition far from favorable, which is not exhibiting a tendency to improve. At the same time, it is doubtful if there is any cause for alarm on properly maintained tracks, and only such tracks should be considered in the discussion of this question, for if the tracks are not properly maintained, the error lies in the installation of these heavy locomotives. From the standpoint of ultimate economy it is evident that any increased service required of the track will necessitate increased expenditures. However, it is difficult to see how on properly constructed and maintained track, these expenditures should show any marked inclination to rise. In fact, on the Norfolk & Western, where heavy locomotives and the 90-ton cars have been operated in solid trains, the track has not been observed to require any unusual increase in cost of maintenance. There is a distinct need for the collection of accurate data showing the relation between increased wheel loads and maintenance of way expenditures. Such data would be of great value to a road considering the advisability of purchasing heavier locomotive and equipment.

ORGANIZATION FOR EMERGENCIES

RAILWAY work is largely associated with the heroic in the popular mind and many stories have been built about the methods by which various emergencies have been met. In no department do such special conditions arise more frequently, or require more radical treatment than in the maintenance of way department. When a line is washed out, all other work must be sacrificed for that of getting the destroyed line back into service. Material must be secured with seeming indifference to cost and every measure taken to restore the tracks and bridges to a condition for operation.

No better examples of this nature can be offered than the records of the forces participating in the reconstruction of the roads involved in the floods in Ohio and Indiana in 1913. In view of the magnitude of the destruction, the manner in which these unusual and extreme conditions were met by the roads involved and the rapidity with which the lines were returned to service were highly creditable to the organizations of those roads. Almost equally severe conditions are created by heavy snow storms. Men and equipment must be concentrated in the blockaded area and every effort be exerted to reopen the lines, entirely disregarding hours of service and physical comfort. Although generally less serious because of the possibility of detouring traffic over other lines, wrecks require similar concentration of all energies of the maintenance forces to the clearing of the line and in a smaller way call for the same thorough organization and knowledge of the work.

While any or all of these conditions are not met with every day, they do develop with sufficient frequency to form a part of the regular routine of railway operation which must be expected at any time. Therefore, the maintenance of way forces must be so organized that they will respond to any such emergency without delay or confusion and work with the greatest efficiency, for an hour saved under these conditions is worth several hours at any other time. The maintenance of way forces of the Long Island are so organized that every man from the engineer maintenance of way down to the signal maintainer or track laborer knows where he is to go and what he is to do at the approach of every winter storm. A gang foreman of the Pennsylvania has so organized his men that none of them leaves the headquarters when off duty without reporting to him, so that they can be reached immediately if needed. These organizations are typical of those existing at many other points, although they are by no means universal or even common.

Of equal importance with thorough organization in the meeting of emergencies is the proper maintenance of the necessary equipment fully fitted with tools and other necessary supplies at all times at certain definite and well established points. The unusually severe snow storms in western Kansas two years ago found a number of the roads with snow fighting equipment in bad repair or incompletely fitted with tools and other supplies, with the result that entirely unnecessary and serious delays followed in the opening of these lines to service. It would seem evident that if the dangers of blockades are sufficiently important to justify the purchase of equipment they are also of sufficient importance to cause the equipment to be kept in the best possible condition, even though it may not be needed for several years at a time.

The results of a thorough organization of forces and equipment for emergencies are not confined to the handling of such work, but are reflected as well in the conduct of the ordinary routine duties. It may be argued that it is difficult to organize maintenance of way forces to such a degree, and it must be admitted that this is a serious problem. At the same time the fact that such organizations have been perfected with the average class of employees shows that it is possible. Also, such organizations are not confined to any one road or group of roads, but are to be found on different divisions on many roads, indicating that they result largely from the attention given to this subject by the supervising and local officers. The roadmaster or supervisor who feels that he cannot take the necessary time from the details of signing payrolls and requests for transportation is overlooking one of his most important duties, for the thorough organization of his forces will aid materially in developing a class of foremen who will require less attention on his part, giving him more time for the larger problems.

NEW BOOKS

Preservation of Structural Timber. By Howard F. Weiss, director, Forest Products Laboratory, United States Forest Service. Size 6 in. by 9 in., 312 pages, illustrated by 23 plates, 32 figures and 43 tables. Bound in cloth. Published by the McGraw-Hill Book Company, New York City. Price $3.

The "Preservation of Structural Timber" will doubtless receive special attention from railway men and those engaged in other industries using large quantities of timber since it represents the first attempt to discuss this increasingly important subject in a comprehensive manner. In connection with his work in the Forest Products Laboratory, the author has had an excellent opportunity to come in touch with all phases of the wood preserving industry. While a great deal of the material is original discussion, the book includes a large amount of data previously published in technical journals and society proceedings which are here conveniently grouped for reference. The book is designed for use as a text as well as a reference book and the fact that it is compiled in large part from notes used in a lecture course given to students in civil engineering at the University of Wisconsin, shows that it can readily be adapted to instructional work. A complete enumeration of the chapter headings would include many subjects of direct interest to railway men, among which are the following: Factors Which Cause the Deterioration of Structural Timber; The Effect of the Structure of Wood Upon Its Injection with Preservatives; The Preparation of Timber for Preservative Treatment; Processes Used in Protecting Wood from Decay; Preservatives Used in Protecting Wood from Decay; The Construction and Operation of Wood Preserving Plants; Prolonging the Life of Crossties from Decay and Abrasion; The Protection of Timber from Fire; The Strength and Electrolysis of Treated Timber, and The Use of Substitutes for Treated Timber. In addition, the appendices include references to the minor wood preserving processes and the patented and proprietary preservatives, lists of the manufacturers of zinc chloride and of creosote.

Letters to the Editor

A CROSSING OF STANDARD AND NARROW GAGE TRACKS

PERRYVILLE, Md.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Without detracting from the utility of the ingenious scheme developed by T. C. Herbert and described in the *Railway Age Gazette* of December 18, I would suggest that the spacing of the switch points 5 ft. apart does not give the best alinement possible. These points take the place of movable point frogs and manifestly should not be farther apart than twice the distance of the actual from the theoretical point of switch. The smoothest curve will be secured by establishing a tangent line between the heel of the end switches, or, if preferred, between the points where the planing of the switch points terminates. This line will be fixed by the switch angle, and the distance heel to heel shown as A B on the accompanying sketch will be equal to the difference between the two gages plus twice the heel distances, divided by the tangent of the switch angle. The sketch shows the dimensions as worked out for No. 6 frogs with 10-ft. switch points and for No. 8 frogs with 18-ft. points on the above basis.

"SUPERVISOR."

ORGANIZATION FOR TRACK MAINTENANCE

HAILEYVILLE, Okla.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

It occurs to the writer that the ground was not entirely covered in the article in the *Railway Age Gazette* of December 18, entitled "A Suggested Organization for Track Maintenance." There are many other things to be taken into consideration which will work against the economy of such a gang. The time lost in going to and from the work each day, by 20 men on a 25-mile territory, will more than offset the increased supervision on a 6-mile section, even if motor cars are used. Also, the efficiency of the gang will be reduced, since a foreman and an assistant foreman with 25 men will not secure as much work per man as a foreman with 6 men, as they are unable to devote as much time to the supervision of each man. Again, in case of accident, there will be a greater delay at times in locating and securing the assistance of a large gang, which might be 25 miles away, while a small gang could not be more than 6 miles distant. There is also a great deal of other work which is taken care of by section men, such as transferring bad-order cars at stations, unloading fuel, loading cotton, bedding stock cars, etc. Under the large gang system the greater part of the gang would have to be employed on other work, possibly 15 miles away, as only a few men are required for such work.

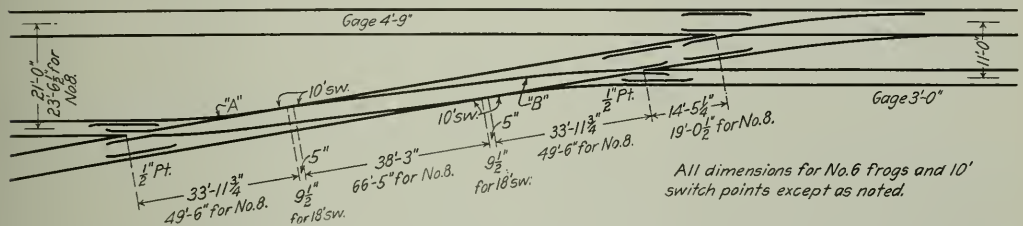
A foreman with six men and six miles of dirt track will be able to maintain his section in first class shape during the open season, do the odd jobs of station repairs, and keep up right of way fences, farm gates, etc. When the work has been advanced to the proper point, or when bad weather sets in, the gang may be reduced and the foreman will still be in charge of a territory with which he is more familiar than a man could be with 25 miles. In a gang of 20 men there is more chance for dissatisfaction and a greater tendency to create disturbances of various kinds. The large amount of traveling to and from the work on a 25-mile territory on motor cars with 20 men adds to the chances for personal injuries. The larger the gang, regardless of the supervision, the greater are the chances for the men to shirk their work. If the physical condition of the line requires it, an extra gang with boarding cars may be moved about to handle heavy ballasting or to renew ties, etc., on any particular section, the number of men in the gang being governed by the amount of extra work in sight.

From an economical standpoint I believe the small gang is the better for all purposes.

J. L. COSS.

ABSTRACT OF ENGINEERING ARTICLES

The following articles of special interest to engineers and maintenance of way men, to which readers of this section may wish to refer, have appeared in the *Railway Age Gazette* since December 18, 1914:



Dimensions for the Best Arrangement of a Narrow Gage and a Standard Gage Crossing Using No. 6 and No. 8 Frogs

Apportioning Grade Separation Cost.—An editorial commenting on the tendency of state commissions to apportion grade separation costs more equitably between the railways and the municipality benefiting from the work was published in the issue of December 25, page 1167.

Methods of Handling L. C. L. Outbound Freight.—A discussion of the relative merits of two-wheel, four-wheel and motor trucks including cost data gathered in an exhaustive study of this subject by E. H. Lee, vice-president and chief engineer, Chicago & Western Indiana, was abstracted on page 1181 of the issue of December 25, from a bulletin of the American Railway Engineering Association.

Pennsylvania Coal Docks at Sandusky.—The design and methods of construction of a new dock and coal handling machine for loading coal on lake vessels were described and illustrated in the issue of December 25, page 1189.

The Influence of Carbon on the Properties of Rails.—The effects of varying carbon contents on the physical properties of rails was made the subject of an investigation by the Rail committee of the American Railway Engineering Association and the result was published as an appendix to the report of that committee. An abstract of this report was published in the issue of December 25, page 1196.

Railway Construction in 1914.—The annual statement of new mileage reported built during 1914 showed a startling decrease, this figure being less than for any year since 1895 and less than one-half of the amount built in each of the three preceding years. The details of the new mileage completed in 1914 with a summary of the construction figures for each year since 1893 were published in the issue of January 1, page 23. An editorial commenting on these figures and the general tendency in construction was published in the same issue, page 3.

Instructions for Federal Valuation.—An abstract of the second tentative draft of instructions for the guidance of roadway and track parties engaged in the valuation of railway property recently issued by the Interstate Commerce Commission was published in the issue of January 8, page 62. An editorial commenting on the amount of detail required in this work and raising the question whether in some cases the records already kept by the carriers would not suffice, was published in the same issue, page 44.

New Chicago & Alton Shops at Bloomington, Ill.—An illustrated description of the new locomotive shops, blacksmith shops and storehouse recently completed by the Alton as an enlargement to its Bloomington shops was published in the issue of January 8, page 49.

St. Paul and Oregon-Washington Joint Terminals in Spokane.—The Chicago, Milwaukee & St. Paul and the Oregon-Washington Railroad & Navigation Company have recently completed a joint terminal in Spokane in connection with which new entrances to the city were built by both roads, involving heavy grade separation work. An illustrated description of the grade separation problems on the Milwaukee entrance was published in the issue of January 15, page 85.

Methods of Handling Snow on Northern Roads

Discussions of Precautions to Be Taken in Fall and Ways to Keep Tracks Open During Winter Storms

On account of the importance and the present timely interest to railway men of the subject of handling snow and ice to keep the tracks open during the winter, we publish below three discussions of the various phases of this problem by men experienced in this work. Mr. Lewis has been actively engaged in maintenance work in the northern part of the United States for the last 10 years, being division engineer of the Michigan Central at Bay City, Mich., for six years and assistant to the general manager of the Duluth, South Shore & Atlantic in charge of maintenance for the last three years. On both of these lines snow fighting is a serious problem. Mr. Whitney is roadmaster on the Canadian Pacific at Medicine Hat, Alta., a point suggesting bad weather in the mind of the average man. Mr. Clough is a supervisor of track on the four-track main line of the New York Central & Hudson River in northern New York, a locality noted for the number and severity of its winter storms.

THE WINTER'S CAMPAIGN

By E. R. Lewis

Assistant to General Manager, Duluth, South Shore & Atlantic, Duluth, Minn.

In localities where frost is little known, track work is a continuous performance with only the wet season to interfere with the excellent results obtainable, insofar as weather is concerned. Railways in colder climates are not so favored. There is no doubt that winter will bring to them snow and ice in plenty. The long snow campaign is a foregone conclusion and it is anticipated, prepared for and fought to a finish. In localities further south there is the gambler's chance of getting through the winter without a snow fight. There is the tendency after a mild season or two, to neglect organization and equipment, to forget to repair tools, to fail to buy what is needed to fight snow; with sooner or later the inevitable costly result of hiring large, untrained emergency forces, of trains stalled and tracks blockaded, of damage to perishable freight and loss of connections, of congested yards and the wide-spread chaos which it takes so long to wholly overcome.

PRECAUTIONS

Preparations for the winter's snow fight should be made in advance. Thorough organization and rigid discipline enter very largely into the successful program. A preliminary early autumn meeting of all the officers concerned, at which a program is discussed and definitely detailed, is of primary value. Standards of equipment and tools needed in the work may then be definitely adopted. Each officer and man should understand exactly where he is expected to be, and when, and what tools are to be in his direct charge. He should know what he is expected to do in every emergency. To this end meetings of supervisors and their subordinates may be held before snow falls, when the orders necessary to carry out the officers' program are explained, and the employees and their foremen receive instructions in detail.

Equipment on hand should preferably be inspected and repaired in the early fall. After repairs have been made it should be re-inspected and tested by the men who are to actually use it. Small tools and spare parts should be given in direct charge of the employees who will be concerned in their use. Experience has proven that spare tools put into a snow plow in summer get away before winter, that fuel and cylinder oil, bell cord and wood alcohol are better kept in the roadmaster's locker than in a Russell plow until winter comes. Experience has also proven that flanger shoes are not always set at exactly the right height and that air brake equipment is not always in order after disuse. Therefore tests are necessary preliminaries. The locations of snow plows and flangers, not merely the stations, but the tracks where they are to be found, and the position of the plows on the tracks, should be prescribed. It is often of the utmost importance to know which way a plow is headed and whether it is first out on a certain siding.

Not only the track employees and officers need organizing, but the intelligent co-operation of the entire staff is necessary to the success of snow and ice handling. The heads of other departments should be organized so thoroughly and so early, that they may transmit to their subordinates uniform instructions for taking precautions against the common enemy in advance of the campaign. Every division engineer and supervisor in charge of snowy territory should be required to make minute inquiry into the matter of tools and equipment for snow and ice handling, and to present, as a result of his investigations, his recommendations of the most suitable types for use.

Quantity is as important as quality in the matter of tools and equipment. That which is on hand should be put in the best condition early. Sections should be supplied with suitable substitutes for worn-out tools returned. Additional tools of proper quality should be requisitioned at such time and in such quantity as will insure that at the beginning of winter each foreman will have a reasonable supply and no more in first class condition for use. Someone should be detailed to examine each carhouse in turn, and to take account of quantities and conditions of tools. When resulting requisitions have been filled, a second inspection should be made to make sure all is in readiness, and especially that the condition of tools is as formerly ordered.

The tools and equipment used necessarily vary on railways in different localities, but some or all of the following equipment is used probably by all companies whose lines traverse territory subject to freezing temperatures: Flangers, pilot plows, push plows, snow crabs, rotary plows, levellers and spreaders. Tools and auxiliary equipment in common use include matched plank housing over locomotive tenders, tarpaulins for locomotive gangways, rubber coats for locomotive crews in snow service, hose attachment to steam dome and hose for clearing snow and ice from locomotive trucks and running gear; snow sheds, snow fence, track shims, rattan brooms with chisel end handles, salt, sand, hand car brooms and broom holders, spud bars, snow shovels, picks, mattocks, spades, lanterns and wood alcohol.

The proper setting of snow fence, both portable and permanent, is of importance and requires constant vigilance and periodical changes. Improperly placed snow fence may cause obstructions to traffic where no trouble would exist if the fence were removed. In early winter, before snow or frost comes, the snow fence should be placed to best advantage according to the experience of former years. It will probably be found necessary to remove the planks from farm and highway crossings to prevent heaving due to frost.

EARLY WINTER OPERATIONS

In early winter, snow at first gives little or no trouble. If pilot plows or even Priest flangers are used on locomotives the rail may be kept clear during the first few storms. Trouble begins when there is no more room for new snow; when the tracks in places become grooves through deep snow banks; when the new, light snow drifts swiftly into rail flangeways and behind switch points. Then "winging back" becomes the order of the day. Oftentimes snow must be shoveled away from around switchstands and from about buildings located close to the track, to make room in advance of impending storms. Old snow packs hard and some of it turns to ice or is ice covered. The frequent use of flangers leaves a high ridge of unmoved snow in the track center. This becomes hard or freezes after a thaw

unless thoroughly removed by a snow plow. High center snow track is one of the dangers to be treated with great respect in early winter. If plowed out quickly no danger ensues. If neglected, anyone of several weather conditions may tie up the road. Winging back snow from the sides of the track before it becomes hard is quite as necessary.

After the snow drifts of early winter have formed in front of portable fence panels, the fence may be moved to a new position and made to do double duty, usually behind its first location. Stakes may be driven for fence anchors with the aid of frost bars, or the fence may be dug into the drifts. Tracks in yards, and at track and other tanks, should receive special attention on account of accumulations of ice due to locomotives dripping while taking water, and to locomotives and coaches dripping while switching in yards. Salt and sand play an important part in preserving the safety of persons about platforms and crossings. It is possible to construct a flat car snow plow flanger strong enough and weight it down sufficiently to nose ice from frozen track centers. Such a flanger should, of course, have extra heavy steel shoes which should be raised and lowered by means of air, and should be very heavily weighted and skillfully manipulated.

MIDWINTER OPERATIONS

"As the days begin to lengthen" and "the cold begins to strengthen" the troubles of the snow fighter multiply. It is imperative that section forces get shims in the track to avoid slow orders. The sharpest lookout must be kept for broken rails. Snow accompanied by high wind fills switches and rail flanges faster than they can be cleared. It is well that permanent employees are seasoned to cold weather and out-of-doors work. Their number must be augmented by temporary forces of laborers when the long continued, severe midwinter storms strike. Then the battle is on in earnest. With shovel and pick, with salt and sand and broom, by day and by night, the struggle continues. In times of direst stress, freight trains are abandoned and all efforts directed to keeping the lines open to passenger traffic. Snow plows are run ahead of each train. Locomotives are double headed behind the big plows. Occasionally a rotary or a Russell plow has three or even four locomotives behind it. Between storms the struggle goes on in preparation for the next blizzard. Wherever a car stands idle it is snowed in. A string of flats becomes only a long snow bank in a few hours. When the storm subsides there is weary work with shovel and switch engine to get the cars out, preparatory to plowing the snow off the track. Here, as always, judgment counts. One or two or three cars at a time may be cleared and moved, when a longer string could not be handled.

Turntables now give trouble. The pits blow full of snow. This snow and that which drifts in between the table and roundhouse is ordinarily loaded on trains and thus removed from the yards. Some turntable pits are covered with planked decks which revolve with the tables, while stoves set half through the decks keep the pits warm and melt the snow. A better device is a concrete floored turntable pit into which water of condensation flows from the roundhouse steam plant. A steam pipe also furnishes exhaust steam to heat the water which flows into the pit to a level of a few inches below the center. When full of hot water, snow from the surrounding tracks is shovelled into the pit, melted and carried off through an overflow pipe to the sewer system. Success depends on having the pit full of hot water before any snow is added.

The small hose connected to the steam domes of freight locomotives may be used to thaw ice from water-tank spout connections as well as to clear the locomotive running gear of snow and ice. If snow plow wings are manipulated by air, efficiency is more than doubled over hand-worked wings. It is necessary to run fast to throw snow. Wings must be taken in and extended quickly when traveling at 40 to 50 miles an hour to avoid obstructions and to do the necessary work, without leaving long stretches of unmoved snow at grade crossings and passing tracks.

Clearing yards of snow is often best done with a leveller that will push snow sidewise from track to track till all are finally cleared. It is, of course, necessary to clear at least two adjacent parallel tracks of all cars before such a process is started, and to proceed in the same manner, shifting cars to the cleaned tracks as each string is moved from the tracks yet to be cleaned of snow. The snow ridges between parallel tracks, if allowed to accumulate, soon become hard. Handling it onto cars by shovel and carrying it from the yard by train is often necessary and always expensive. When necessary to handle by train, the unloading should be done by plowing off a nearby bridge if possible.

LATE WINTER OPERATIONS

Shimming is usually continued during late winter, as everyday conditions alter the track level in places. Replacing snow fence is often imperative during the later months of winter. A second line of movable fence is sometimes placed on top of, or further from the tracks than the first line of fence, when the first fence has been completely drifted over. Brush and snow cakes are sometimes made to serve this purpose when additional panels of movable fence are not at hand. Hard snow in narrow cuts may most readily be plowed onto the track with the snow crab, from thence to be cleared from the cut with the rotary plow. Rotary plows are expensive machines. They are of value only in very heavy snow drifts. Therefore only those railways which have to combat the severest snow conditions are equipped with them. Blizzards are occasionally encountered which blow the snow so fiercely that a rotary plow must be quickly turned to avoid being snowed in itself.

SPRING OPERATIONS

The warm middays and the cold nights and mornings of early spring produce alternate thawing and freezing, which result in conditions peculiarly dangerous to track. Water from melting snow banks fills the rail flanges at midday and freezes solid over night. Drains dug to carry off snow water freeze, overflow and flood the space between the rails. Under extreme conditions many miles of track have been known to be under water at sundown and under a glare of solid ice next morning, with a resultant tie-up of traffic and extraordinary expense for pick and shovel work. Diligent winging back, spreading and draining of snow banks will prevent or minimize this danger. In early spring, track conditions alter hourly and demand more frequent track patrol and alterations of shims. The safe lowering and final removal of shims in spring is even more difficult than placing them in winter. Traffic should proceed with great caution, the engine and trainmen realizing that in an hour the weather may heave a hundred miles of track, making it impossible to re-shim the whole length in any short space of time.

Thorough and prompt co-operation and utmost caution is necessary to carry a railway through a severe northern winter without serious accident. Railways exist primarily for the purpose of transporting persons and property from place to place safely and expeditiously. If climatic conditions so alter that it becomes unsafe to maintain in winter the speed of trains prescribed in summer schedules, the schedules should be changed. It is important to keep track in such condition that trains will be on time, but it is of vastly greater importance that trains be kept on the track. No person is so competent to judge of the safety of track as the maintenance officer and foreman. It is therefore the first duty of these men to know and to give warning of track conditions incompatible with safety to traffic under existing weather conditions and schedules.

THE SNOW PROBLEM AT ITS WORST

By H. O. WHITNEY

Roadmaster, Canadian Pacific, Medicine Hat, Alta.

In this part of the country where snow and wind combine to make trouble and expense for railroads we have learned from past experience to be prepared in time, and with this end in view snow fighting begins in September. An extra gang is started out repairing permanent snow fences and putting up portable

fences that have been removed in the spring to allow land to be cultivated. Each winter careful note is made of points where improvements can be effected by the building of additional fences or the relocation of old ones, these changes being made by the repair gangs. To avoid moving fences in the spring and fall and also to protect them from cattle, this company is buying additional right of way, moving the fences back and building permanent snow fences. This reduces maintenance charges for fence repairing and moving and allows the building of stronger fences, thereby not only affording better protection, but also improving the appearance of the right of way. A few years ago tree-planting for snow protection was started. This will in time be a great assistance, although not entirely taking the place of snow fences.

During the summer, snow plows, flangers, ice cutters, etc., are overhauled in the shops and by September are in their assigned stations, spotted on spurs of their own where they will be easily accessible when needed. As this is considered a bad district for snow trouble, not so much for the depth of snowfall as for the wind that accompanies it, we have three snow plows, besides flangers and spreaders, one at each end of the sub-division and one at an intermediate point. All new plows are of solid steel, operating both wings and nose points by air, and are equipped with electric headlights. I equipped each plow with a set of tools, lanterns, two mattresses and blankets. I also have a chart made and framed which is hung in front of the man operating the plow which shows all crossings, bridges and other obstacles which fail to clear wings or flanges. At points where the plows are stored, an experienced section foreman is stationed who is familiar with the district. He is sent over the road on the locomotive of a passenger train to refresh his knowledge of all obstacles and to note any new ones.

At the first signs of snow all private crossings that are not used during the winter months are taken up. As a rule no regular extra gangs are kept on this district during the winter months. However, to be prepared for any emergency we have a set of boarding cars and tools fitted up ready to take care of men at a minute's notice. These cars are the best of our boarding equipment, the bunk cars being sheeted and floored and containing stoves, good bunks and other necessary fixtures. Cook, dining and store cars are also fitted up for winter service.

Experience has taught us the value of snow fences, and with this in view we try not to allow them to become filled with snow. When this condition occurs, the line of portable fence is moved back. This can generally be done with section crews, but if necessity demands, an extra gang is put at this work. Snow walls can be built if conditions become acute, but where possible it pays to move back fences. This will mean a saving in expense for running the snow plow, and the longer this can be put off the better. Running the plow when not absolutely necessary should be discouraged, as it will form snow cuts and increase the number of places needing protection. Snow plows should always be run with the wings opened to prevent making a trough which each succeeding storm renders more difficult to widen. When snow cuts begin to gain such a height that it is difficult to operate a plow they should be widened out. There are several methods of doing this work. One of the cheapest is to run a drag through the cuts. This drag operates by air at the rear of a car and throws the snow into the center of the track, the rotary then following to throw it out. This operation is repeated until the cut is the desired width.

Clearing out snow and ice in yards and terminals makes a large item of expense. Mechanical means of late have been employed and labor charges reduced to a great extent. At two of our terminals, natural gas is used to clean switches and the cost is reduced thereby to a minimum. It has been found that a flame from crude oil and residue of Pintsch gas with a blower is economical and satisfactory for cleaning snow from interlocking plants and switches. Salt is supplied and in the larger terminals ice cutters are also furnished. Spreaders are used for cleaning tracks of snow and it has become the exception rather than the rule to use labor for these purposes.

IMPORTANCE OF ORGANIZATION IN FIGHTING SNOW

By A. M. Clough

Supervisor of Track, New York Central & Hudson River, Batavia, N. Y.

Although conditions in different parts of the country no doubt have something to do with the different methods of handling snow on various railroads, the preparations should be the same whatever method is used. Our first care is to see that plenty of good equipment is provided, that it is thoroughly repaired and tested, and placed at required points and on tracks so as to be easily available at any moment. The repairing and testing are done at the division car shops, where equipment is all assembled during the summer months, but in addition to the car department men testing it, a representative of the maintenance of way department oversees the repairs and tests, and again after it is returned to the supervisor's headquarters it is tested by a work train crew to make doubly sure that it is in perfect condition. This refers to snow plows with wings and flangers, rotary plows, flangers, cars and roadbed spreaders—all equipment used with power for handling snow.

We organize the men who are competent to handle the different equipment with special reference to their knowledge of the territory they are to run over, sending these men over the different lines to familiarize themselves with the different marks and obstructions before the winter sets in. We also have a thorough understanding with the division superintendent's office and despatchers in regard to furnishing locomotives and crews with the least possible delay when called upon to man our snow fighting equipment.

Our next care is to see that all obstructions to flangers—such as crossing plank, temporary guard rails, or anything not needed between the rails—are removed during the winter months and to properly mark all places that would interfere with the operation of flangers or the wings of snow plows. These marks are specially designed targets, made of wood, painted black and white and placed in permanent metal sockets where needed or placed for the winter and removed in the spring.

We then prepare for emergency where men are needed for handling snow either by keeping a foreman and a small force of men at division headquarters as a nucleus of a larger force when needed, or by having a foreman who knows where to find men when wanted. The necessary tools and boarding cars are provided to take care of laborers and provisions made for feeding them when working long hours away from home. In this way a very heavy storm can be handled promptly and economically.

As the switches and the signaling apparatus are the most vital parts of a railroad, it is always to those that the regular track forces give their immediate attention at the first sign of a storm, being reinforced by a number of extra men at times. Formerly, when switches were operated on the ground by hand, one man, sometimes the switch tender, could care for a number of switches, cleaning them as they were needed for train movements, but this is entirely changed by the advent of the central control of switches from a tower, either by hand or power, so that it now requires a man at nearly every switch to keep them clean at all times. This is a most important part of handling a severe storm, as the free and uninterrupted movement of trains from one track to another at interlocking plants helps materially to prevent trains from having to stop at block signals in outlying cuts, where they might be stalled and would have to be dug out.

The use of hydro-carbon is gradually coming into favor in large terminals for melting the snow around slip switches and large layouts, and is now being very successfully used on our lines, but the old method of the snow shovel and broom is still most widely used. It is a very essential duty of foremen in charge of men to choose the very best men to do this work and to protect them while doing it. Apart from cautioning them to look out for train or locomotive movements, a foreman should, if possible, have other men working close to the actual switch cleaners to call to them to get out of the way.

The hardest part of the fight with any snowstorm is to dig

trains out that have become stalled. The snow plow with a good force of men should be run as close up to the stalled train as possible, the men should be unloaded to commence digging out the train and the snow plow taken back to the nearest spur track. When the snow plow crew returns, a portion of the train will be ready to be pulled out of the snow. The cars released should be drawn to the nearest siding and the operation repeated until the whole train is released. The men should shovel out the snow in such cuts until the banks are sufficiently widened so that the wing of the snow plow will have full play.

Immense benefits can be secured by properly placing snow fences at troublesome cuts where snow drifts badly, and a small sum for the privilege of placing portable snow fence 50 ft. or more from the top of the cut on adjacent property will pay for itself many times over during a severe winter.

In the dead of winter when storms follow each other closely, the snow which has accumulated in large quantities in yards should be hauled away immediately, all drains opened up and everything made ready for another storm. Sometimes it looks unnecessary when the weather is mild and the sun shining, but to be prepared is half the battle.

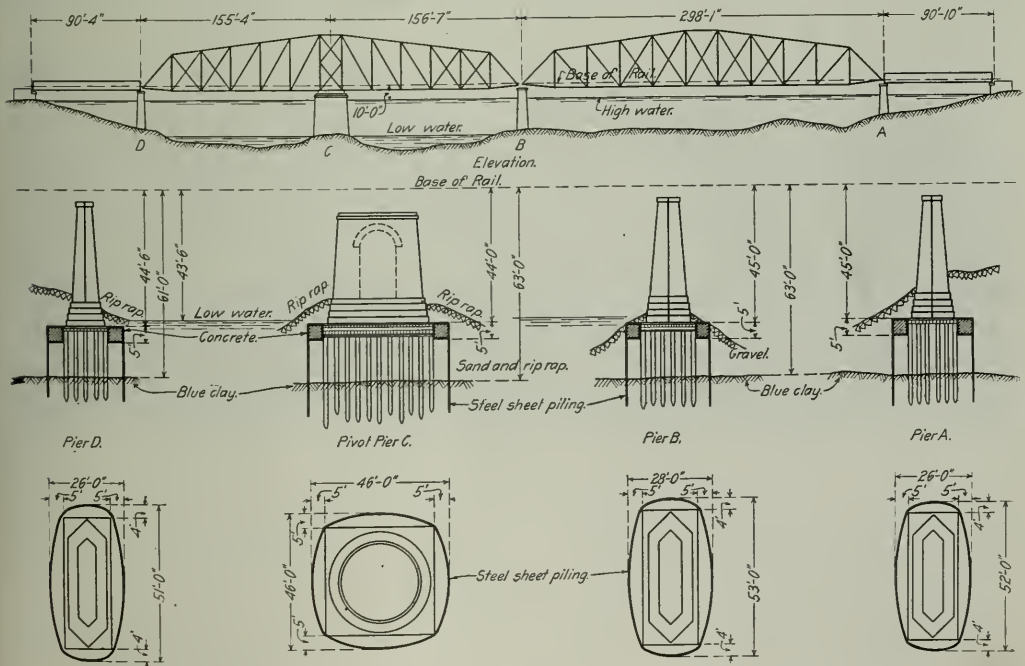
AN INTERESTING PIER PROTECTION PROBLEM

The St. Louis, Iron Mountain & Southern has just completed the protection of the bridge piers at its crossing of the Red river at Fulton, Ark., which involved several features of special interest. This bridge consists of a swing span 311 ft. 11 in. long, a through truss span 298 ft. 1 in. long and two 90-ft. approach girder spans. The piers are of masonry supported on timber grillages on piles, and, although the superstructure has been replaced once since the construction of the bridge about 1879, the piers are still in excellent condition to carry any load which may be placed on them for some time to come. The bed of the river at this point is of alluvial material which scours easily. Within the past two or three years levees have been constructed on both sides of the stream, reducing the flood channel from 10 or 12 miles in width to about 1½ miles, and as a result the river now scours badly. While this condition has not endangered the piers up to the present time, it has been owing to the absence of high floods since the construction of the levees. However, such floods may be expected at any time and trouble might result.

To eliminate any danger of failure of the bridge through the scouring of the foundations a caisson of steel sheet piling was driven entirely around each pier, as shown in the drawing, the caisson being sealed to the grillage with a 5 ft. layer of concrete. In the construction the piling was first assembled and completely interlocked before driving. It was then driven one or two feet at a time, the hammer moving from pile to pile around the pier. When the piles had been driven some distance into the bed of the river, but while the tops were still above water forming a cofferdam about the pier, the interior was pumped out, riprap and other material excavated 5 ft. below the top of the grillage and a 5-ft. layer of concrete placed with tar paper between it and the piling. Any sand which ran out of the grillage was also replaced with concrete, but no attempt was made to force concrete into the grillage or to strengthen it as it had ample support. After this concrete had set properly, the piling was driven down to its final position, extending several feet into a hard, blue clay.

After the piling had been driven to place for the two shore piers light puddle cofferdams were erected around the walls, the water was pumped out and the piling was cut off with a Blau-gas flame. Because of the increased depth of water a light timber cofferdam was erected at the center pier, and at the pivot pier, which was driven last, the piling was cut off, before driving, to the desired length as determined by information secured in driving the caissons at the other piers.

Thirty-five pound Lackawanna and United States steel sheet piling was used. The driving was started with a drop hammer which was replaced with a No. 2 Vulcan steam hammer as soon as sufficient room was secured. This work was done under contract by the Kansas City Bridge Company, Kansas City, Mo., under the direction of C. E. Smith, chief engineer, Missouri Pacific System, and F. L. Wonson, bridge engineer.

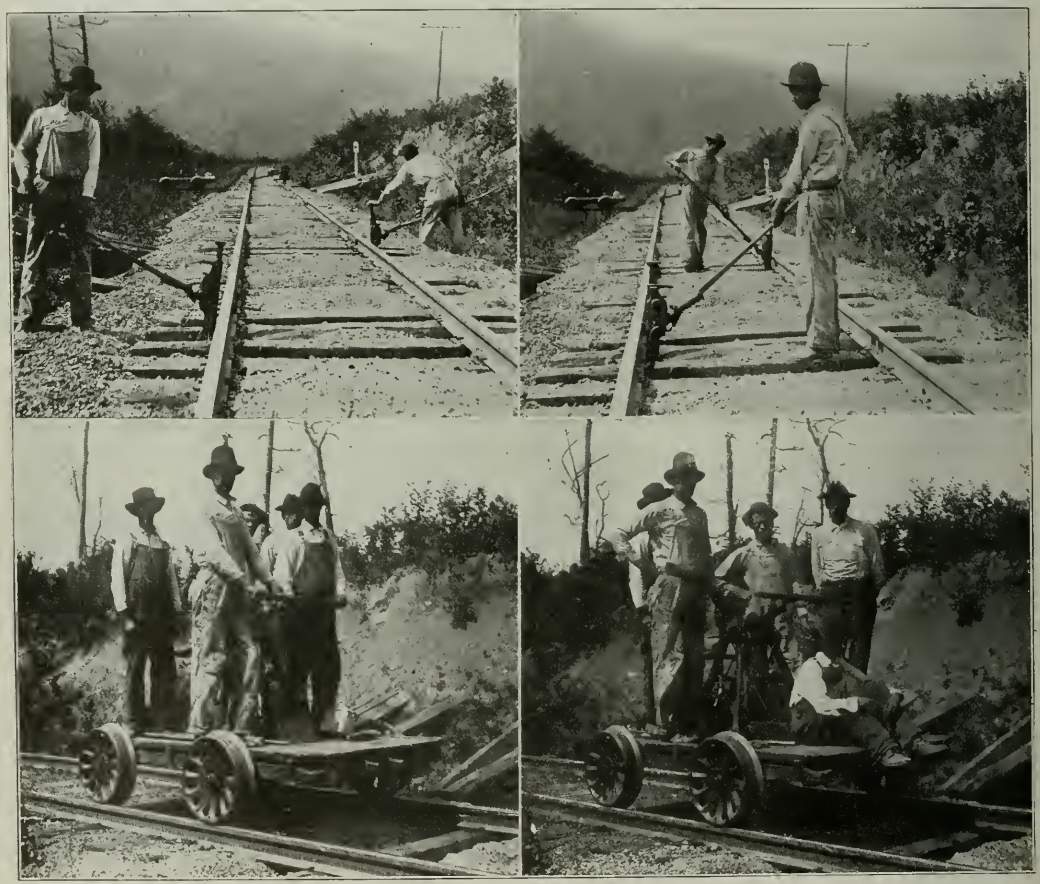


Method of Protecting Four Piers from Scour in the Iron Mountain Bridge Over the Red River at Fulton, Ark.

Promoting Safety in the Maintenance Department

Some Methods That Have Given the Best Results in Reducing Injuries to Track and Bridge Employees

The success of any attempt to increase the safety of railway employees depends largely on the effort and tact with which the movement is pushed in the departments having the largest number of employees and in which the work performed involves the greatest hazard. Since nearly one-fourth of all employees of American railways are in the maintenance of way department, the number aggregating somewhat over 400,000, and since the hazard connected with track, bridge and other maintenance work is at least as great as that in most other departments, it is evident that an active safety campaign must pay special attention to maintenance department employees.



Pictures Used by the Carolina, Clinchfield & Ohio in Emphasizing Safe and Unsafe Methods for Trackmen. Above—the Use of Jacks; Below—the Arrangement of Men on a Hand Car

It is difficult to arrive at the exact hazard in any branch of railway service on account of the manner in which the official accident figures of the Interstate Commerce Commission are classified, but it can be shown that the number of fatal accidents to maintenance men bears as high a ratio to the total number of fatal accidents to all employees as the number of men in the maintenance department does to the total number in all departments. In some cases the hazard connected with maintenance work has been considered higher than the average for all railway employment, as in 1912 when the Pennsylvania found that a large proportion of the fatalities to its employees were in the track forces, and in England some years ago when a royal commission placed track work among the three most hazardous occupations on a railway after a careful study of the general problem of safety to employees. In England, where the hazard is accurately determined, the latest figures, those for 1913, show that one track man in 611 was killed and one in 19 injured during the year. The nearest comparable figures for accidents on American roads show a hazard practically the same as that found in England.

APPLICATION OF GENERAL SAFETY CAMPAIGNS TO MAINTENANCE MEN

The safety departments of a number of roads are carrying on active campaigns in the maintenance department, but in gen-

eral, this work has followed that in the train service and shops and in many cases is still only partly developed. It was natural that when the promotion of safety became of active interest to railway officers a few years ago the first and most vigorous effort should be directed at the classes of employees among which the best results could be expected and where the number of accidents was the greatest. The train and shopmen could be easily reached in large numbers at the terminals and numerous methods of presenting safety cautions to them were devised, including lectures, stereopticon pictures, posters, safety committee meetings, etc. The excellent results that followed the agitation among these men on the roads that have taken up the matter seriously soon prompted the officers in charge to extend the efforts to cover employees in the maintenance and other departments.

On terminal roads or other lines with small mileage somewhat similar methods of agitation among the track men have been employed successfully, but on the larger systems it is at once evident that safety work among maintenance men is accompanied by numerous difficulties. These men are scattered over the entire line in small groups, often at isolated points, and can rarely ever be congregated in large bodies. The other difficulties are practically all caused by the type of men which predominate among these employees. The work of educating track men either by printed matter or by personal contact, is hampered by the fact that a majority of these employees on many roads cannot read or understand English. Many of these foreign laborers are ignorant to a surprising degree, as illustrated by a section man on the Grand Trunk, who found a torpedo, placed it on the rail and hit it with his pick to see what would happen. Further, a large number of laborers in the maintenance department are transient. This applies not only to foreign-born laborers, but also to hobo extra-gang men who never conquer the desire to move on continually. This makes it necessary for the roads that are pushing the safety work to direct their appeals to a constantly changing force, a large part of which has previously been employed on other roads where little is done along safety lines, so that there is not the cumulative effect of repeated agitation.

CAUSES OF ACCIDENTS AND METHODS OF PREVENTION

The measures necessary to promote safety vary with the causes of accidents. The causes of avoidable accidents to maintenance men can be classed roughly as defects of equipment, structures, or track, which the company alone is responsible for; wrong methods of performing work, which both the company and employees should strive to correct; and carelessness, thoughtlessness or indifference on the part of the employees. A very large proportion of all accidents fall in the last group. The Chicago & North Western, for example, has determined that over 75 per cent of all accidents to employees on duty are caused by carelessness of the individual or a fellow employee. The Pennsylvania found that in 1912 about 80 per cent of the fatalities to track men were due to being struck by trains, and the Interstate Commerce Commission accident reports show that on the average about 85 per cent of the maintenance men killed and 37 per cent of those injured are struck or run over by cars or engines. Practically all such accidents are due to carelessness, thoughtlessness or indifference, as the men are violating the rules when they fail to clear the tracks on the approach of a train. It has been repeatedly shown that the hazard to track men increases in much greater proportion than the number of main line tracks, on account of the tendency of the men to step from one track to another rather than to clear all tracks. In England, where a board of trade rule requires a "lookout man" to be provided when there is special danger of men being struck by trains, the accident statistics show that a majority of all those killed and injured in the track force were struck while working on the right of way, or walking, crossing or standing on the tracks. While this class of causes accounts for a large majority of the accidents, it is at the same time the most difficult to eliminate, because improvement in this respect can be made only through the

Safety Cautions for Trackmen

Don't take chances. Think what "Safety First" means to you and to your family. Do your work the safe way and be careful to avoid injury to yourself and others.

Always be on the watch for trains in both directions and when you step from one track to another, ALWAYS LOOK IN BOTH DIRECTIONS FIRST. Do not stand close to rail of track while train is passing.

When your foreman signals you to step from track do so AT ONCE. Don't wait. Don't try to remove an extra shovelful of dirt first. That last shovelful of dirt may cost you your life.

Never stand or walk upon the tracks except when necessary in the performance of your work, and then watch for trains in both directions, as trains are liable to be run against current of traffic or run in either direction at any time.

Never use tools that have battered heads or are otherwise defective or unsafe for use. As soon as you discover a tool that is defective, put it away and call it to the attention of your foreman and get a good one in its place.

Always put tools or material of any kind where it cannot be struck by a train. Be particular about cleaning up rubbish you find lying near the track and never leave anything lying about for other men to stumble over.

Never overload handcars either with material or men. In operating handcars be sure you afford yourselves all the protection that is required by the rules.

Never get on and off moving cars or trains Your duties do not require it, you are not accustomed to it and it is a dangerous practice.

Always play safe. Think about what you are doing and don't forget that you are working on a railroad.

Obey the rules. They were made for the protection of yourself and others and they should be observed to the letter.

Safety Poster Printed by the New York Central in Sixteen Languages

active effort of the men themselves, and the necessity for this effort is difficult to impress on them for the reasons explained above.

The promotion of safety by the correction of wrong methods of performing work is less difficult than through the eradication of carelessness because methods are largely controlled by the foremen and to change them it is only necessary to reach this smaller and more intelligent body of men. Improved methods that are being emphasized on a number of roads at present, include the proper use of hand and motor cars, the observance of a safe distance in piling material along tracks, greater thoroughness in cleaning up scrap and debris in yards and along the line, the spurring out of bunk cars, or the protection of such outfits by derails, and the requirement that bunk car doors face in the opposite direction from the main line. In any successful safety campaign, the men in the ranks must be encouraged to make suggestions freely as to methods that ought to be changed in the interest of safety, and constant vigilance is required on the part of the maintenance officers after a change in practice has been ordered to see that the foremen understand and enforce it.

Of the three classes of accidents, those caused by defects of equipment, structures, etc., are most easily eliminated, as an order from the management is sufficient to correct an unsafe condition existing on this account. The most necessary safety measures of this kind, such as the placing of foot guards in frogs and refuge niches in tunnels, have become almost universal, and on the roads which are devoting the most attention to safety numerous steps are being taken to correct conditions involving much less danger. On at least one road, the Chicago Great Western, special care has been taken to provide bridge gangs with standard sizes of timber for scaffolding, and this road has also provided handholds on motor cars to prevent the men falling off when the car is derailed. The practice of placing footwalks and railings on deck bridges is becoming more general and partially on account of the added safety secured, machines are being used on many roads to handle rail, frogs, ties and other heavy materials wherever possible. There is also a growing tendency to secure better tools and to keep them in better repair, thus partially eliminating a fruitful source of accidents. The function of the safety department in the correction of unsafe conditions of this kind is to encourage the men to report such conditions freely, to provide an organization for considering such reports properly and for putting into effect the adopted suggestions.

A safety organization should work along several different lines in its endeavor to reduce the number of accidents to maintenance employees. It must first educate all employees as to the necessity for co-operation in the prevention of accidents, impress on them the results of carelessness, thoughtlessness and indifference, secure suggestions for improved methods, see that the suggestions adopted are carried out properly, induce the men to report unsafe conditions of equipment, structures, track, etc., and see that such reports receive the attention they deserve. In addition to these lines of effort which directly affect the maintenance men, the safety movement in other departments can be furthered materially by enlisting the hearty co-operation of maintenance department employees in reporting unsafe conditions that might endanger other men, such as insufficient clearances, defective brake rigging, hot boxes, etc., on the cars of trains that pass them. The latter practice is required on the Southern Pacific, partly to discover the defects and partly to insure closer attention to trains by the track men, thereby reducing the likelihood of their remaining in position to be struck by a train.

The system of promoting safety, adopted extensively on American roads, is to place a special officer or a committee of general officers in charge of the safety campaign, under whom are organized various district, division, or local committees composed of employees representing all departments. The principal distinction between the forms of this system used on various roads is that in some cases the committee members are appointed and in others they are elected by the employees with certain restrictions to insure a full representation of all departments. On the Baltimore & Ohio the central committee is composed of seven men devoting full time to this work, one of whom is a former supervisor and division engineer, representing the maintenance department.

Southern Pacific Section Men Watching a Passing Train for Defective Parts and a Typical Attitude of a Gang on the Approach of a Train Before This Order Was Issued

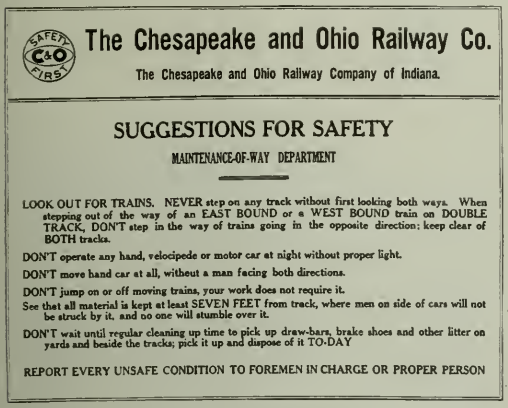
The officer in charge of the safety work or the central committee usually issues all safety literature for the road, distributes pictures, conducts meetings, etc., in the general campaign of education. Every member of all the committees is supposed to keep the safety campaign constantly in mind and strive to eradicate carelessness by any method possible. The discussions brought out in the local committee meetings are relied on to furnish suggestions both as to methods and equipment which should be changed in the interest of safety, and these suggestions are in turn reported to the higher committees until the best and most feasible are sorted out and adopted. On some roads postcards are also furnished the men on which to report any unsafe conditions which they discover, and on the Baltimore & Ohio, in order to overcome the reluctance of the men to report infractions of the rules and other matters involving safety, each track supervisor, master carpenter and signal supervisor has been appointed chairman of a sub-committee composed of his men. The discussions

at these sub-committee meetings have helped materially to draw out the desired reports. As an example of the number of suggestions received and acted on by the safety committees of the large roads, the Chicago & North Western has adopted nearly 10,000 suggestions in the last two years.

On roads where no safety committees are organized the safe condition of equipment, structures, track, etc., is made a matter of special observation on the regular inspections of the engineering department, and an effort is made through the regular officers to impress the men with the necessity for taking care and to insure the observance of all safety rules.

LITERATURE, PICTURES AND SPECIAL METHODS

Whether safety committees are used or not, some form of printed matter is usually found the most effective in presenting



The Chesapeake and Ohio Railway Co.

SUGGESTIONS FOR SAFETY

MAINTENANCE-OF-WAY DEPARTMENT

LOOK OUT FOR TRAINS. NEVER step on any track without first looking both ways. When stepping out of the way of an EAST BOUND or a WEST BOUND train on DOUBLE TRACK, DON'T step in the way of trains going in the opposite direction; keep clear of BOTH tracks.

DON'T operate any hand, velocipede or motor car at night without proper light.

DON'T move hand car at all, without a man facing both directions.

DON'T jump on or off moving trains, your work does not require it.

See that all material is kept at least SEVEN FEET from track, where men on side of cars will not be struck by it, and no one will stumble over it.

DON'T wait until regular cleaning up time to pick up draw-bars, brake shoes and other litter on yards and beside the tracks; pick it up and dispose of it TO-DAY

REPORT EVERY UNSAFE CONDITION TO FOREMEN IN CHARGE OR PROPER PERSON

Safety Poster Conspicuously Displayed on the Chesapeake & Ohio

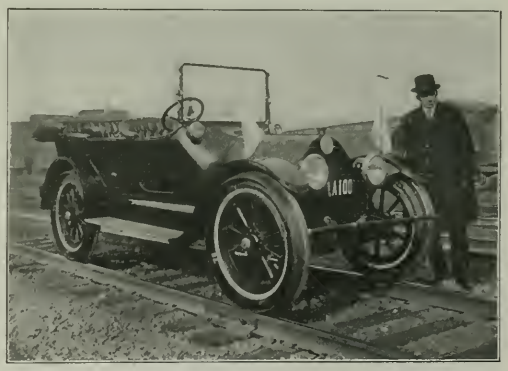
safety messages to the men, particularly those in the maintenance department who cannot be reached in person by the higher officers. Ingenious minds have discovered innumerable ways of keeping the idea of "safety first" before all employees until now one reads the slogan on pay checks, coat lapel buttons, tool houses, telegraph poles, bulletin boards, hand cars, lead pencils, etc. Other methods applying in general or specifically to the maintenance department include courses of instruction in safe methods, articles in employees' magazines, the publication of special safety papers or regular bulletins, special safety rule books and cards to be presented to every new employee warning him to be careful. It is frequently necessary to publish such literature in several languages in order to reach the foreign-born laborers. At least one road, the Queen & Crescent, requires the foremen to post all circular letters in their tool houses so the men may have a chance to read them. This road also issues statements of all injuries, showing those among the men of each track and bridge supervisor, thus creating a healthy competition. The general manager of the San Pedro, Los Angeles & Salt Lake issues a monthly bulletin calling attention to causes of accidents and their prevention, and the Chicago & North Western issues circular letters to the division superintendents at intervals, each taking up all recent accidents of a certain class and showing how each could have been prevented. Several companies have issued special rule books covering the operation of motor cars.

The use of pictures either framed or projected from a lantern is an important feature of safety work, especially with foreign-born laborers who are often difficult to reach in any other way. The Southern Pacific shows stereopticon pictures in its examination car, traveling over the entire system, covering safety methods in the maintenance and other departments. The El Paso & Southwestern, in attempting to reach the Mexican laborers on its lines, framed a series of pictures showing right and wrong methods of handling work and hung these pictures in every tool house and in every extra gang commissary car on the road.

The Atchison, Topeka & Santa Fe recently undertook to present safety talks in Spanish to Mexican track men by means of phonographs, which many of them own and all are fond of listening to. The commissioner of safety on this road plans to travel over the system in a motor car giving this talk to every gang he meets. If a phonograph is found, extra cylinders are to be left for the repetition of the talk, these records being returned later to be used again.

The Chicago, Burlington & Quincy has converted a passenger car into a lecture car for the use of the "safety" department. This car is equipped with a stereopticon lantern and screen, while numerous quotations relative to the work of this department with statistics are posted on the sides. During the past summer this car and lecturer were assigned to work in the maintenance of way department. The car was set out on a siding with the camp cars of an extra gang and a lecture was given in this car in the evening. During the following day the car was moved to the next camp and the lecture repeated. In this way the car covered several divisions during the past summer.

In the campaign against carelessness a number of special methods have been worked out. On the Elgin, Joliet & Eastern one man is selected, called a "departmental safety man," from each gang, to give special attention to safe practice on the part of his fellow workmen. He is instructed carefully by the foreman and serves as a check on any careless men. The Pennsylvania uses a system of efficiency checking to see that the safety rules are being obeyed. Several roads, including the Queen & Crescent, discharge a man immediately who has been injured several times through carelessness and also instruct foremen to dismiss men even before injuries occur if they show themselves to be habitually careless. The Baltimore & Ohio instructs the officer next above



Car Used on the Santa Fe to Take the Safety Message to the Maintenance Forces

the injured man to talk over the injury with him as soon as he returns to work, so that both may have the result of carelessness impressed upon them. Whistles to warn men are used by foremen on a number of roads, including the Lehigh Valley, the Pennsylvania, the Baltimore & Ohio, and the Chicago & North Western. These whistles are found to be more efficient in attracting the men's attention than a call. As an illustration of the methods used to encourage the men to make suggestions, the foreman on the Lehigh Valley who suggested the use of a special type of whistle for this purpose was placed on the year's honor roll, consisting of one man from each department, and was given a month's leave with pay.

Some special forms of safety work undertaken by various roads are the investigation of sanitary conditions in bunk cars and lodging houses on the Baltimore & Ohio; the special weekly cleanup days instituted in the yards on the Belt Railway of Chicago; the special man detailed on each section to pick up obstructions from

the tracks of the Chicago Junction, a short terminal and switching road, and the provision of goggles by the New York Central for men engaged in chipping rails or other work endangering their eyes.

RESULTS

The results of the safety campaign already undertaken in the maintenance department are certain but difficult to measure accurately. The accident statistics of the Interstate Commerce Commission do not indicate any marked decrease in the number of accidents to maintenance employees, but as stated above, these figures are subject to question and the best indication of work so far done and the possibilities of future work along this line is furnished by the reports of individual roads that have carefully studied this subject. The following typical examples are not necessarily the record performances, even on the roads quoted, but indicate in a general way what results are being secured. On the Baltimore & Ohio the number of injuries to maintenance men reported to the Interstate Commerce Commission during the first half of 1914 was reduced 66 per cent as compared with the same period in 1913. On the Chicago & North Western the reduction in accidents during the fiscal year 1914 as compared with the fiscal year 1910, when the safety work was started, amounted to 39.3 per cent in deaths to track men, 27.7 per cent in injuries to track men, 33.3 per cent in deaths to bridge men and 38.8 per cent in injuries to bridge men. The average decrease in accidents to all employees was 41.1 per cent, showing that the effectiveness of the movement in the maintenance department has been very nearly up to the average. On the Chicago Great Western the safety work in the maintenance department has decreased accidents until the maintenance men sustain only 29 per cent of the accidents, although they form 43 per cent of the total number of employees. The El Paso & Southwestern safety department has succeeded in reducing the number of fatal accidents to track men 37.5 per cent and the injuries 16 per cent during the fiscal year 1914 as compared with the previous year. Similar figures on the Wabash show a decrease of 46 per cent in fatal and 11 per cent in non-fatal injuries.

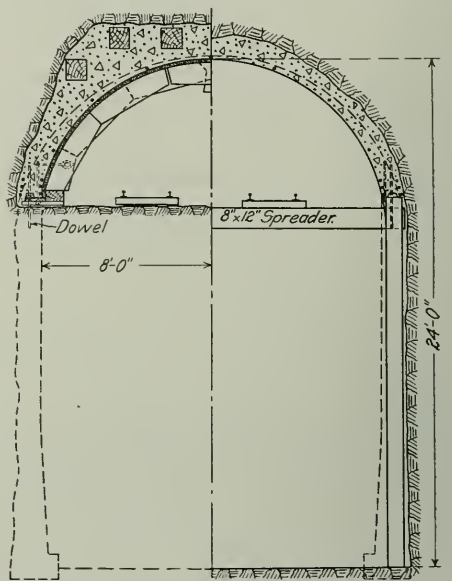
LINING THE SNOQUALMIE TUNNEL

In the construction of the Snoqualmie tunnel through the summit of the Cascade mountains about 60 miles east of Seattle, Wash., the Chicago, Milwaukee & St. Paul is placing the concrete lining for the arch section before excavating the bench material, for a distance of about 3,000 ft. near the east end. The general details of construction of this 2¼-mile tunnel were described in the *Railway Age Gazette* of May 29, 1914. The greater portion of the tunnel was driven from the west portal where the European or bottom-heading method was adopted. At the east end the approach cut was not completed at the time it was desired to start the heading and a top center heading was driven at this end. This heading was then widened out on each side to the full arch section.

The rock at the east end is badly stratified in many places, the seams being filled with talc, and the tunnel bore requiring immediate support. The reason for placing the permanent lining before the removal of the bench was to save the expense of the customary timbering under such conditions and to provide additional safeguards for the men. Sectional forms were built, the concrete was brought in in ½-yd. cars which were dumped into boxes between the tracks, and it was then shoveled into the forms. In some instances the character of the material made it necessary to support the roof temporarily with crown bars which were concreted in place.

After the arch ring was completed, shafts were driven to grade along one side of the tunnel at intervals of 1,000 ft. and connected with a 9 ft. by 8 ft. drift on grade. The drift was then provided with temporary stoping timbers and the remaining bench material was removed by cars, after which the side walls were poured in the usual manner through a chute. The closure between the side walls and the arch was made as far as possible by placing the concrete by hand and before the forms were removed the joint was grouted, the grout gaining entrance to the joint by means of a 2-in. pipe placed in the arch lining. For a part of this work a Ransome grouting machine was used and on the remainder a small gun was employed which was built on the job.

All of this bench has now been removed below this arch without any settlement or indication of cracks and the lining has



Sections Showing Method of Placing Concrete Arch Lining Before Removing Bench Excavation

been completed within the past week. It has, therefore, resulted in a considerable saving in timber and in cost of construction. The tunnel was placed in service for the regular passage of trains on January 15. In common with other details of this project, all of which are being handled by company forces, this method was developed by J. I. Horrocks, engineer and superintendent of construction, under the general supervision of E. O. Reeder, assistant chief engineer, and C. F. Loweth, chief engineer, of the St. Paul.

EARLY CAST IRON.—At a recent monthly meeting of the Ipswich Engineering Society, of England, an interesting lecture was delivered by Robert Buchanan, of Birmingham, on "The Origin and Development of the Foundry Cupola." Mr. Buchanan said that he owned what he believed was the oldest piece of iron in the world, a portion of a gully grate from the floor of some ruins at Ephesus, which still showed the iron crystals. The first record of cast iron being used was in 1543, when in Sussex a man named Hogg made cannon. Personally he believed that the system must have been discovered before, because in 1595 it was stated that cannon of 6,000 lb. weight were made, and he did not think such progress could possibly have been made in 50 years. The first record of a cooking-pot being made of cast iron was 160 years after cannon were first cast, so that it seemed that in those days armaments led the metallurgical world as they did in a great degree at the present day.—*Engineering.*

Development of P. R. R. Track Inspection System*

Narrative of Consecutive Steps Taken to Secure an Equitable Method of Judging the Track Conditions

By Joseph T. Richards†
Consulting Engineer Maintenance of Way, Pennsylvania Railroad, Philadelphia, Pa.

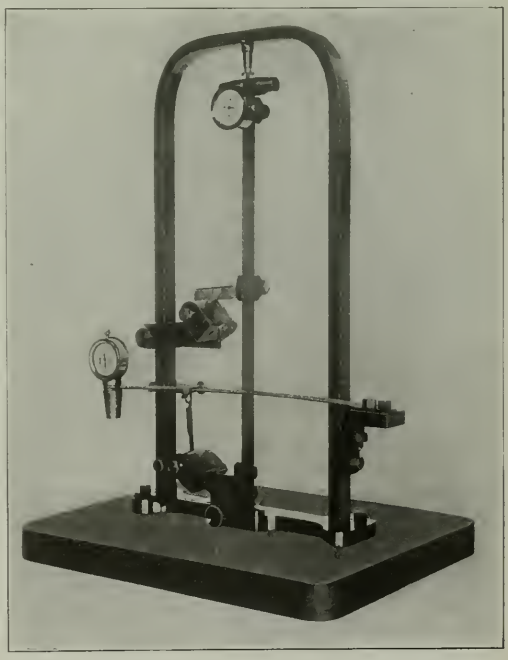
As far back as 1873, when Thomas A. Scott was president and A. J. Cassatt was general manager, the Pennsylvania Railroad had inaugurated "the General Manager's Annual Main Line Track Inspection." At first the inspecting party was limited to employees of the maintenance of way department, but in later years it was made to include invited guests from all the other departments. It was an occasion well suited to bring together a large company of track men, and was more or less of a social and educational event, making for good fellowship, and at the same time gave a favorable

The Track Inspection Car on the P. R. R. Which Is Intentionally Made Hard Riding

opportunity for the discussion of track subjects by all the experts in that line. Thus the inspection, lasting nearly a week, was found to be a model method of teaching that which was not found in books. It had a tendency to broaden the views of the men and prevented them from becoming localized; it gave them a knowledge of the geography of the road; it brought them to know each other, it aided largely to create an *esprit de corps;* it introduced the men of lower rank to the higher officers, and it furnished the opportunity for one member to tell something about a good practice on his division in exchange for what his companion could tell of his discoveries and practice. This exchange of views, in many cases, continued throughout the year by correspondence, and in all it established a devotion to the common cause which made interested and painstaking men and soon convinced the management that a large inspection once a year was money well spent.

The annual inspection was made in the fall after the summer's work had been done and the year's appropriation spent, to bring the track up to its best, as it should be, at the beginning of the winter season. It was the practice in the early years of the inspection to assemble the entire party at the New York end of the line and for the first day to make a fast run west to Pittsburgh, the train consisting of first-class Pullman cars and coaches for the purpose of testing the riding qualities of the track under high speed and also for trying out the staying qualities of the best class of locomotives on a long run. There was considerable merit in this fast, one-day run, but after some years it was abandoned.

The second day the party started east in improvised inspection cars made by building tops or shelters over ordinary gondola cars, with seats, one raised above the other in gallery style, each car seating about 35. These cars were pushed ahead of locomotives at a slow speed to allow the inspectors to see the good and bad features of the roadbed, track, station grounds, ditches, etc. They were divided into committees, each having the task of marking on cards the grades for as many features as they had time to observe. One committee was for line and surface, one for switches and signals, another for ditches, ballast and spacing ties, and another for sidings, road crossings, station grounds and policing. The inspection occupied one day on each superintendent's division



The Present Type of Device Used for Measuring Horizontal and Vertical Movement of a Car

or four days in all from Pittsburgh to New York. From the marks turned in on the inspector's cards each supervisor's section received its rating and the premiums were awarded accordingly.

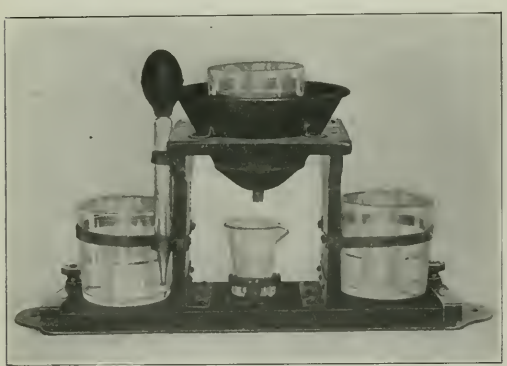
SPECIAL TRACK INSPECTION COMMITTEE

Each year there were naturally some changes made in the method of inspection, following changes and improvements

†Mr. Richards has been intimately connected with the maintenance of way department of the Pennsylvania Railroad almost continuously since August, 1869, holding the position of engineer maintenance of way for ten years, and chief engineer maintenance of way for ten years, before his appointment as consulting engineer maintenance of way in 1913.

made in the track standards. The old popular annual inspection of 1873 had been in practice for about a quarter of a century; the amounts paid for meritorious work had increased year by year, and a feeling had grown among the maintenance of way men that more frequent inspections should be made, for various reasons, and that a small committee of experts on line and surface, acting frequently, would produce better results than a party of, say, 300 making an inspection but once a year, and, furthermore, that the inspections should be made at times unknown in advance to the track men. This was about 1897, when Frank Thomson became president. Mr. Thomson had been perhaps the most critical general manager on track that the road ever had and when he became president he lost very little of his sensitive touch which made him an expert in detecting rough tangents or swinging curves as his car would pass over the line.

In order to advance the efficiency of the service and meet the views of various officers, the president, in 1897, requested the general manager to appoint a special committee for the purpose of inspecting the track periodically, to be done about once a month or not less than once in seven weeks. After careful consideration it was decided that the committee was to inspect and report as to the riding of all of the cars of the train, not merely of their inspection car, but noting the



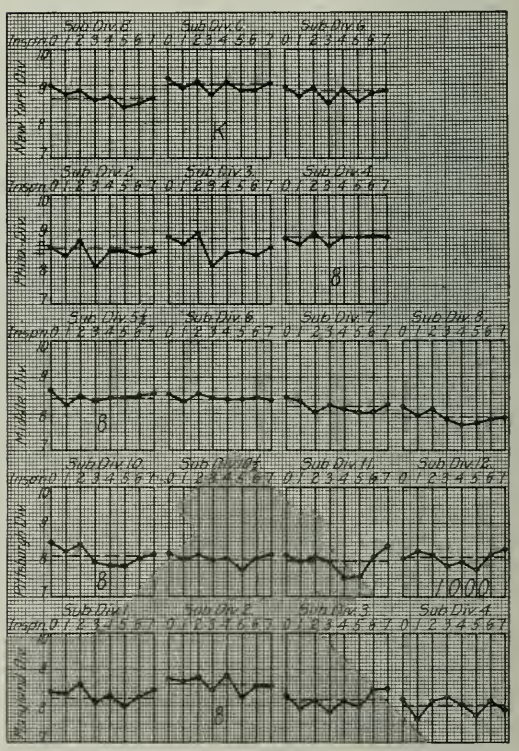
The Present Improved Form of Water Spiller Arranged with a Basin to Catch the Spill and a Graduated Measure to Determine Its Amount

differences, if there were any, between the cars in the front end of the train, those in the middle, and those in the rear. While track work belonged entirely to the maintenance of way department the committee could with propriety criticize the riding of a car and take up and discuss with the motive power department any defect in the car, wheels, trucks, springs, gaging of wheels, etc., that they thought necessary.

The committee consisted of the chief engineer maintenance of way as chairman, with the engineer of maintenance of way and three division superintendents of branch roads, who, having started in the service as rodmen in the maintenance of way department, had passed through the grades of supervisor and division engineer to superintendent. This service well qualified them as judges of track and train and made them efficient and critical members of the committee. Furthermore, as this committee's work was confined wholly to the main line tracks, those superintendents, being from branch lines, were naturally impartial in their judgment, as they were not called upon to criticize their own divisions.

The committee soon organized for business and adopted a working program which still continues. For a tour of inspection on a western run, starting from Jersey City, they pick up the division engineer and take him along over his division from Jersey City to Philadelphia. It is his duty to take notes of the riding of the cars on each section of his track and particularly note any jar or unusual motion given to the cars, recording the exact location. Upon arriving at the end of his division he is allowed to return to get in touch with his supervisors and track men to remedy the defects promptly, so that at the next inspection the committee may expect to find the track improved and the uneven riding of the train eliminated. It is to be noted that the responsibility for defects in track is placed where it properly belongs, upon the division engineer and his supervisor, just as the president had placed the responsibility on the special inspection committee and expected them to bring him the results he was asking for, supplementing the resident officer's experience by their own larger and wider training.

Each division engineer in turn is taken on the inspection



A Typical Chart Showing the Special Inspection Committee's Marks at Each of the Seven Inspections for One Year, Indicating Also the Prize Winning Supervisor's Divisions

car with the committee to ride over his division. On the return run, the eastbound track is inspected in the same manner so as to cover both passenger tracks, and frequently a run is made on the freight tracks to determine their relative condition. The members of the special track committee also take notes carefully and rate the various divisions, using marks of merit ranging from 1 to 10—10 denoting perfect condition; 5 medium, and 1 very bad. This record is kept in a book, with numerous side notes and comments made for each inspection, and a comparison shown of each supervisor's division. There is also a chart made to show graphically the rating given for each inspection.

Upon the result of these inspections the committee awards the annual prizes to the supervisors having the best line and surface on their respective superintendents' divisions. These prizes and the honor attached are sufficient to create competition and a healthy rivalry among the supervisors. In addition, for the division having the best track of all during the entire year, a prize of $1,200, termed the "Klondike," is awarded, $800 going to the supervisor and $400 to the assistant supervisor of that division, together with a complimentary letter from the general manager. For the division having made the greatest improvements during the year $1,000 is awarded, $700 going to the supervisor and $300 to the assistant supervisor. The award on each superintendent's division amounts to $800—$600 going to the supervisor and $200 to the assistant supervisor. The general manager, through this inspection committee, distributes annually $5,400 to the trackmen as the result of these main line inspections. This amount, however, is only about one-half of the premiums paid to track men on the P. R. R. system, including 21 other divisions operating under the general manager of Lines East of Pittsburgh and Erie.

DEVELOPING MECHANICAL AIDS FOR JUDGING TRACK CONDITIONS

The awarding of these premiums placed a serious responsibility upon the special inspection committee, which from the beginning made the members extremely anxious that the prize should not go amiss, as it would be manifestly unfair for a supervisor to receive the prize when not entitled to it, and just as unfair for a supervisor to miss the prize who was entitled to it. It was recognized that there must be an unmistakable way of determining the movement of the car, both horizontally and vertically. A good judge of track by observation and through the sensibilities can very well determine when something is radically wrong in the swing of a car, but it was important that the number of vibrations on each division and the degree of same should be told with the greatest of accuracy, so the committeemen busied themselves in finding aid through some mechanical means. This idea was not a new one, but none of the mechanical inventions had quite filled the requirements.

The latest production had been in use on the Pennsylvania for some years, and, in fact, it was still in existence—a small car called the track indicator car, which was made specially to inspect track. It weighed 25,100 lb. and cost about $5,000. Somewhat similar cars have been made and used by other railroads. In its use a special run was made over the road at slow speed with several attendants in charge, and through mechanical contrivance would, if operated at a speed to suit its purpose, detect and register the rough places in the track such as badly worn rail or low joints in the surface; it was also supposed to give the elevation of the curve, the width of the gage, etc. This car turned out a paper ribbon of great length on which, by means of a fountain pen, those features of the track were registered, being located with reference to mile posts. The ribbon was taken off in sections, given to the division engineer as a guide for his supervisors and from the supervisors to the track foremen. But it was quite annoying to the ordinary track man to take this ribbon, marked with curve elevations, width of gage, low joints, etc., and attempt to apply it to the right spot on the track, so they generally condemned it. Like all things, it was fallible and the possibility of error with its annoyance made it very unpopular. The track foremen stated that after all they had to find the defect in the track in their usual way and could not depend upon the ribbon reports turned out for them by the track indicator car. The car was given several years of patient trial, but, besides annoying the practical track men, it created no incentive for good work. It was too far removed from the conditions governing a passenger car at the speed of a scheduled train. It had a slow speed of its own at which there was no means of telling how a curve suited the passenger trains using it every day. Its report was confined to its own irregular movements, and was of little consequence. It was a "wet blanket" everywhere it appeared and when it finally got into a wreck and was broken up all the track men were happy.

The members of the committee were quite willing to cut out the ribbons, but they recognized that it was no easy task to tell always whether the defects were in line or surface, on curves or tangents, etc. So they started with some other old principles that had been used. At first they suspended a hammer by a flexible steel stem fastened to the roof of the car. They watched the track for defects and the steel hammer for oscillations. When it was steady it showed that the track was good; when it would swing violently the track was bad and the car was riding roughly. They then put a bell on each side of the two-faced hammer and counted the number of bell taps on each supervisor's division. The division having the fewest number would get the best mark. The committee also filled glasses with water to within a quarter of an inch from the top, placed one on each side of the car on a window sill and counted the number of water spills. After this the committee had the distinctive appellation of "the water spillers." There were many errors in the water spills, but the track men would work very hard to get a report showing as few as possible. It was amusing and had some points of merit.

These contrivances, however, were poorly developed and did not tell nearly enough. They may have been better than the judgment of a sensitive committeeman, depending upon his eyes and nerves, but something better was looked for and the committee soon abandoned the long suspended heavy hammer and made a small one on a vertical flexible steel stem, and fixed it in a wooden base. This they placed on the floor of a car, with the usual bell on each side of the hammer, and counted the bell taps. This device was criticised, however, because the bells were a fixed distance from the hammer and the hammer had to swing the whole distance to give a bell tap, and it was noticed that the hammer would vibrate on its stem very many times without striking a bell. It was then decided to abandon the bells and put a pedometer on the hammer stem, near the top, which would count the number of vibrations. This was quite an improvement over the bells. Besides, it relieved the committeemen of the work of counting the bell taps. This arrangement was criticised because the number of vibrations is not as important as the distance the hammer stem travels. One section of track might be in fairly good condition and yet have a great number of small vibrations registered against it, while another section in poor condition would get larger vibrations, but not so many of them. Therefore, it was decided to get the distance that the hammer stem traveled per division or per mile of track, and for this purpose a cyclometer was added, with a ratchet attachment to wind up and give the distance the hammer stem traveled, while the pedometer remained to count the number of vibrations. Thus the committee was gradually closing in on a method to tell the actual condition of the track from the movements of the car.

In the next analysis of the mechanical contrivance it was found that the pedometer and cyclometer on a vertical stem would give the swinging movement of the car, but the vertical movements were not yet registered. A car might go up and down very quickly and a vertical hammer stem almost stand still, so to get the vertical movement of the car on the same instrument, a horizontal stem and hammer were added to the frame and equipped like the vertical one with pedometer and cyclometer. Thus the committee now has a small compact instrument of the greatest simplicity with but few parts, weighing about 22 lb., that can be picked up, easily carried about and placed with its wood base on the floor of any car.

RATINGS AND PRIZE AWARDS

After taking the reading of the two pedometers, two cyclometers and two water spillers, the committee considered

several methods of getting a figure that would represent the condition of the track, and finally adopted the easy formula of taking the sum total of all of the readings and dividing by the miles traveled. The result may be called the vibrations per mile of track. From these figures the divisions are rated, and the committee, taking them as a guide, makes a chart to record the several inspections of the year and from which the prizes are awarded. By a reference to this chart it will be seen that the division marked "K" is the best, and consequently entitled to the "Klondike" prize of $1,200; that those marked "8" are the best on each of the superintendent's divisions and are entitled to the $800 prize, and the one marked "1,000" takes the $1,000 improvement prize. In this case the graphical method does not indicate so clearly all the conditions which affect the result and on which the awards are based.

While the original plan of a general inspection once a year is still adhered to, the markings do not determine the prize winners. These tours are held in high esteem by all departments. The influence is far reaching, extending to all classes of employees and their neighbors as well. On this day schools in villages adjacent to the railroad give a recess to the children for the hour of the passing of the several inspection trains, flags are waved and men and women stand in groups at the stations to greet and cheer the railroad men as they pass. The first day's run ends at Harrisburg, and the prizes are announced and delivered soon after the arrival. Up to this time no one outside of the general manager and his staff officers are supposed to know who are the successful men in the year's competition. The announcement is made at a meeting of the entire party by the chairman of the special inspection committee, representing the general manager. The successful supervisors and assistant supervisors are invited to come forward to the platform and receive checks for the money and complimentary letters from the general manager. The letter is much appreciated, for it is looked upon as conveying as much honor and distinction as the money—besides, it is found to stay with the men longer than gold.

This in brief tells the story of the development of one item in the maintenance of a reliable track standard. Although this is one of the smallest subjects in the maintenance of way department, its history is written from a mental library of the work of a quarter of a century in the Pennsylvania Railroad service, with the hope that it may be of possible interest to the outsider, including the traveling public, to see how much study, vigilance and care is expended by railroad men to insure smooth riding cars to carry them with the greatest comfort and safety.

A UNIQUE METHOD FOR THE REPLACEMENT OF TRUSSES

A unique method for the replacement of several through truss spans was adopted recently in the renewal of the Ponniar bridge on the South Indian Railway. This bridge was renewed in the dry season when, in common with other streams in this country, there was little or no water in the river. This condition permits the laying of temporary tracks across the river bed for construction purposes and even in some instances for main line operation during reconstruction.

In the replacement of the Ponniar bridge the trusses were assembled in a yard near one end of the bridge. To convey them to their position in the structure, a device known as a river trolley was employed, two being required for each span. Each trolley consists of two six-wheel trucks running on parallel tracks and carrying a framework of steel girders supporting a timber platform, as shown in the accompanying photographs. These parallel tracks extend from the place of erection of the span out across the river bed to a point opposite their final location. The top of the framework corresponds in height with the elevation of the piers of the bridge.

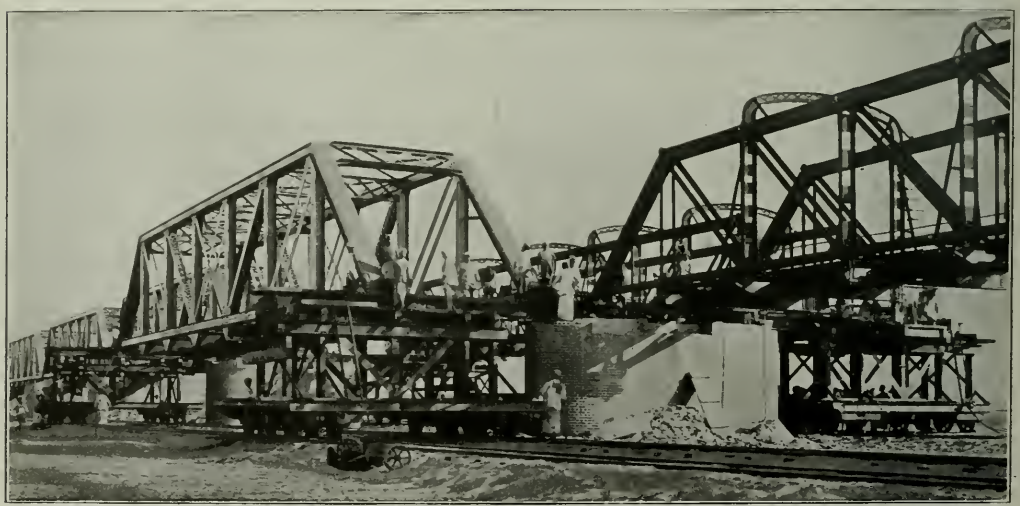


Fig. 1—River Trolley on the Left to Transfer New Span to Pier. The One on the Right to Receive the Old Span

The principal point of interest lies in the method employed to raise the completed spans from the level at which they were assembled to the deck of the river trolley. To accomplish this two ramp trolleys were employed for each span. They are built up similarly to the river trolleys with steel girders carried on eight wheels. Within this framework is gearing that engages with a rack railway. Outside the trolley is located a worm gear which consists of two worm wheels with corresponding worms on a shaft which is turned by eight men, four of whom sit between the worm wheels and two at each end, as shown in Fig. 2. The framework is inclined to the angle of the ramp

with the upper deck horizontal, to maintain the span in a vertical position during its transference to the river trolleys. Cables lead from each end of the ramp trolley to a winch to serve as brakes.

After being transferred the span is drawn along the track to its required position at the bridge by two gangs of men. Prior to the arrival of the new span at the structure, the old span is run onto river trolleys laid on a track on the opposite side of the bridge, as shown in Fig. 1, preparatory to its removal to the banks for dismantling. The old span is lowered to the ground by means of the ramp trolleys.

Fig. 2—Raising and Moving a New Span onto the River Trolleys

RESULTS OF ANNUAL TRACK INSPECTIONS

THE ROCK ISLAND

The Rock Island Lines have awarded prizes to those roadmasters and section foremen whose track showed the greatest improvement during the past year. A prize of $100 was awarded to one roadmaster on each division and a prize of $50 to one section foreman on each roadmaster's division. The names of the successful roadmasters and their divisions are as follows: Illinois division, J. L. Jensen, Bureau, Ill.; Iowa division, J. B. Pugh, Atlantic, Ia.; Missouri division, E. Sullivan, Washington, Ia.; Cedar Rapids & Des Moines Valley division, C. Linehan, Cedar Rapids, Ia.; Minnesota division, C. H. Gruver, Manly, Ia.; Dakota division, T. W. Brown, Dows, Ia.; St. Louis division, V. B. Simpson, Eldon, Mo.; Kansas division, J. G. Hutchinson, Clay Center, Kan.; El Paso division, J. H. Logan, Pratt, Kan.; Nebraska division, W. E. Brown, Fairbury, Neb.; Colorado division, J. D. Sullivan, Colorado Springs, Colo.; Arkansas division, D. B. Griffin, Booneville, Ark.; Indian Territory division, James Bolton, Haileyville, Okla.; Louisiana division, R. T. Gollehon, Eldorado, Ark.; Pan Handle and Amarillo divisions, George Woods, El Reno, Okla.; Oklahoma and Southern divisions, J. O'Connor. In addition, 48 prizes were awarded to section foremen on as many roadmasters' districts.

THE LEHIGH VALLEY

The Lehigh Valley has recently completed a report of its annual track inspection made on November 4, 5 and 6. This inspection was made by two committees, one of which observed the condition of line, surface, guide posts, anti-creepers and insulated joints, while the other observed the condition of ties and tie spacing, ballast, sod line, drainage and general appearance. While no prizes were awarded, the results of the markings of the committees were compiled on a sheet giving the rating of each section, subdivision and division. Supervisor J. Sheehan on the New York division received the highest rating of 97.51 and Supervisor M. J. Greeney on the Buffalo division was second with a rating of 96.69. The highest rating given any section was that at Oak Island on the New York division which received a mark of 97.83.

THE LACKAWANNA

The annual track inspection of the Delaware, Lackawanna & Western was made in November, 1914. The results of this inspection, which have just been made public, show that J. Sexton, roadmaster on the Morris & Essex division at Hopatcong, N. J., received the highest rating of 91.16, while P. Quinlivan, roadmaster on the Buffalo division at Buffalo, was second with a standing of 90.19. The average for the entire road was 88.6. The ratings were made by a committee of three experienced engineers not connected with the Lackawanna.

English Railway Plans to Encourage Beet Sugar Production.—The London & South Western is taking steps to encourage sugar beet culture in its territory. That sugar beet could profitably be cultivated in Great Britain has long been an article of faith with the up-to-date agriculturist, and it is felt that the present time is very opportune for the establishment of the industry on a practical basis. What the South Western has done is not only to make an extensive survey in Surrey, Wilts, Hants, Somerset, Dorset, Devon and Cornwall, and to ascertain which areas are suitable, but also to secure co-operation between farmer, carrier and manufacturer. A large meeting of Wiltshire farmers and land owners has already been held at Salisbury for the explanation of the scheme, and similar meetings are to be held early this year at such typical centers as Yeovil, Winchester and Basingstoke. An English contemporary remarks: "Hitherto, one of the stumbling blocks in the way of the British beet sugar industry has been the difficulty of raising sufficient local capital in the various districts when it was impossible to guarantee an adequate permanent output, but that difficulty is now believed to have disappeared, and it will certainly be possible to obtain all the capital required. Experience on the other side of the Atlantic shows that the policy of helping the farmer benefits the railways as well as the agriculturists, and there is no reason to doubt the mutual advantage that will result from the South Western's patriotic scheme."

American Wood Preservers' Convention at Chicago

Report of the Eleventh Annual Meeting Held This Week Including Abstracts of Papers and Discussions

The eleventh annual convention of the American Wood Preservers' Association was held in the Congress Hotel, Chicago, January 19, 20 and 21, 1915. Steady progress in all the affairs of the association has been shown during the year under the leadership of the executive committee composed of George E. Rex, manager treating plants, Atchison, Topeka & Santa Fe, president; Carl G. Crawford, general manager, American Creosoting Company, first vice-president; R. S. Manley, president, Creosoted Wood Block Paving Company, second vice-president; F. B. Ridgeway, third vice-president, and F. J. Angier, superintendent of timber preservation, Baltimore & Ohio, secretary-treasurer. The registration of 120 members was the largest in the history of the association.

BUSINESS SESSIONS

A business session was held at the opening of the convention on Tuesday morning at 10 o'clock and another at the close on Thursday.

In his opening address President Rex called attention to the effect of the European war on the wood preserving industry and the opportunity which is now presented to the Association to meet the problems presented by this calamity through conservative and unanimous recommendations as to the best practice in the treating business. He urged the members to lay aside personal considerations in the adoption of standard specifications and emphasized the importance of concerted efforts on the part of committee members in making the committee work of the greatest possible value.

The secretary's report showed an increase in membership during the past year of 90 This brings the total membership up to 265, the increase over last year amounting to more than 50 per cent. There are now 38 railroads represented in the association by 75 members.

A committee on Constitution and By-Laws recommended a number of changes in the constitution. The most important changes were the addition of a junior membership grade with an entrance fee of $5 and annual dues of $3, the extension of the list of those eligible for corporate membership to include city engineers, professors and instructors in institutions of learning, railroad, consulting, forestry, county, highway, contracting and inspecting engineers, engineers of tests and city chemists; the change in associate membership eligibility to "any person interested in the sale of material or equipment used in the wood preserving industry"; the addition of five members to the executive committee in addition to the five officers making a total of ten members, and the specification that the annual meeting shall always be held in Chicago.

The annual banquet was held on Wednesday evening. On Thursday afternoon a trip was made to the Field Museum and on Friday a number of the members went to Madison, Wis., for an inspection of the Forest Products Laboratory.

TIMBER TREATING PLANT OPERATION

Four sessions were held for the presentation of committee reports and individual papers and their discussion. General topics for these four sessions were: Plant Operation and Miscellaneous; Preservatives and Specifications; Ties, Timber, Piling, Crossarms and Wood Block Paving. In addition to the papers abstracted below the program included a number of papers and committee reports of general interest to railway men which are briefly mentioned.

The committee on Plant Operation, composed of H. M Rollins (Gulfport Creosoting Company, chairman; C. D. Batson (Republic Creosoting Company); F. H. Stewart (Central of Georgia), and A. M. Smith (Ayer & Lord Tie Company), presented a list representing standards of practice in plant operation. This included statements of the methods of determining the amount of oil injected, the specific gravity of creosote, the fractionation of creosote, the preparation of zinc chloride and the proper seasoning of the various classes of timber before treatment.

The recommendation in the committee's report that a minimum of one-half pound of zinc chloride be injected per cubic foot of timber aroused considerable discussion. F. D. Mattos (Southern Pacific) stated that the Southern Pacific secures 10 years of life from timber treated with from 0.25 to 0.3 lb. of zinc chloride per cubic foot of timber using a two and one-half per cent solution and treating to refusal. The timber used is mainly Douglas fir with 85 per cent heart wood. The Atchison, Topeka & Santa Fe injects 0.4 lb. of zinc chloride per cubic foot of timber, using a 3.5 per cent solution for long leaf yellow pine. The Chicago & North Western injects 0.5 lb. of zinc chloride per cubic foot. This road recently inspected one lot of ties after nine years of service, and found that 98 per cent were still in the track. An analysis showed that these ties still contained .23 lb. of zinc chloride per cubic foot of timber. They had been treated by the Wellhouse process. It was the consensus of opinion that the amount of zinc chloride used should depend upon the class of timber being treated and the section of the country where it was used.

Several members reported that they had had trouble with wooden tanks lined with lead for holding concentrated solutions of zinc chloride. Steel tanks were reported as giving satisfactory service at several plants where they had been painted inside with coal tar. J. B. Card stated that he had found paint unnecessary. Zinc chloride attacks steel only when it is heated, and if some spelter is placed in the bottom of the tank the action is concentrated on the spelter leaving the steel immune.

The "Economical Use of Steam in Connection with Wood Preserving Plants" was discussed by A. M. Lockett, president, A. M. Lockett & Co., New Orleans, La. This paper called attention to the desirability of paying some attention to the steam economy in a plant, which in many cases will increase the output and reduce the cost per unit. He suggested a number of practical methods of increasing steam economy, some of which are not generally practiced in wood preserving plants. All steam pipes should be covered by a suitable non-conductor and radiation from the retorts should be reduced in the same way. By the use of an ample quantity of water to condense the vapor in a retort after the steam is blown down, a material saving in the steam required to operate the vacuum pump can be effected, as in this way the pump is not required to bail out the steam and vapor by actual displacement. Steam traps should be used on all heating coils; live steam should never be used for heating oil in tanks or for heating the plant and offices when exhaust steam can be secured from air compressors, pumps or engines. The water supply used in the condenser need not be elevated to the storage tank if a low service pump is operated in connection with the condenser in starting; long steam lines supplying hoisting engines in the yard must be very carefully insulated; the condition of all pumps must be carefully watched to economize steam; by the use of a storage tank for feed water, exhaust steam can be used for heating it when available.

A series of experiments for determining the temperature changes in wood under treatment was described by George M. Hunt, chemist in forest products, Forest Products Laboratory, Madison, Wis. The tests were made on sawed maple, red oak, loblolly pine and hemlock ties, representing ring-porous and diffuse-porous hardwoods and slightly resinous and highly resinous conifers. The treatments were made in

the laboratory cylinder, 3½ ft. wide by 11 ft. long, the heat being applied by saturated steam at atmospheric pressure, saturated steam at 20 lb. pressure and hot creosote at atmospheric pressure. The heating was continued until the rise in temperature, as shown by a thermometer, inserted in a 1¼ in. hole 26 in. long along the axis of the tie, was not more than 1.8 deg. F. in 10 minutes. At the conclusion of the heating period the vacuum of 26 in. was applied for one hour. These tests showed that during the first 30 or 40 min. heating there was very little rise in the temperature in the interior of the tie. After the heat penetrated through the interior a steady rise in temperature began, most rapid at first and gradually becoming slower, but in no case reaching the temperature of the heating medium. The average time required to bring the ties to a temperature of 212 deg. F. was 4 hr. 20 min. with the 20-lb. steam treatment. The rate of increase of the interior temperature was greatest with this treatment and least with the creosote.

TREATMENT OF RED OAK TIES

The committee on Miscellaneous Subjects, composed of J. H. Waterman (Chicago, Burlington & Quincy), chairman; M. K. Trumbull (National Lumber & Creosoting Company), A. G. MacIntyre (McGill University) and S. B. Lindley (Western Wood Preserving Company), presented a discussion of the treatment of red oak ties. A list of questions was sent to the membership and from the replies to these questions the following conclusions were drawn:

1.—Red oak ties can be treated satisfactorily, when air seasoned for ten months, if the summer months are included.
2.—Red oak ties may be treated satisfactorily when air seasoned for six months, provided artificial seasoning is employed as an adjunct.
3.—For practical reasons the period of seasoning should govern, in determining whether red oak ties are ripe for treatment: If a boring test is used, the core withdrawn with an increment borer should appear dry for a depth of two inches; if weight is used, the weight per cubic foot should not exceed 52 lb.; if moisture determination is resorted to, a test should indicate not to exceed 22 per cent of moisture in the ties.
4.—Artificial seasoning of red oak ties apparently has not been sufficiently developed to justify a conclusion from the replies.

The committee did not feel, however, that the above conclusions were satisfactory, and therefore, drew up the following list, which they felt would better represent the judgment of the members and the practice of the association.

1.—Red oak ties should be air seasoned for at least one year before attempting to treat them.
2.—It is practically impossible to season a red oak tie so as to render it dry throughout.
3.—For practical reasons the period of seasoning, to determine whether red oak ties are ripe for treatment, should govern.
4.—Artificial seasoning of red oak ties fails to give the desired result.
5.—Penetration of the heart wood of red oak ties can be secured practically with the same success as in the sap wood.
6.—The use of an increment borer in determining the penetration of an antiseptic treatment in red oak ties fails to give conclusive results. A tie showing insufficient penetration when inspecting the core which is withdrawn by an increment borer, will in the majority of cases show satisfactory penetration when the tie is sawed and then split.
7.—Red oak ties may be treated satisfactorily with any standard process.

L. B. Moses reported the results of a test conducted at Madison, Ill., in which eight red oak ties were weighed monthly, beginning in February, and showed the greatest seasoning at the end of six months. Another member stated that in Arkansas it was necessary to season red oak ties one entire summer regardless of the time of cutting.

C. M. Taylor (Philadelphia & Reading) read a paper advocating cutting off the ends of ties and piling not bored or adzed, to be sure that there was no internal rot, this being particularly necessary with pine. The idea was heartily approved by the convention.

The Committee on Preservatives and Specifications presented a report consisting of a review of the specifications for materials previously adopted by the association. In discussing the report E. B. Fulks, of the American Tar Products Company, condemned the present hysteria regarding the present shortage of creosote, stating that although all the nations at war had placed an embargo on the exportation of creosote when the hostilities began, this embargo has since been raised from all countries except Germany, and only 15 per cent of our creosote comes from Germany. Seven cargoes of oil have been imported into this country since the war began. The present difficulty is lack of boats and it is expected that in a few months these conditions will be normal except for the embargo on German oil, as the American producers are making increases in domestic production which will offset the German shortage. S. R. Church, of the Barrett Manufacturing Company, stated that a revival of the steel industry will increase the production of coal tar from which more creosote can be produced.

TOXICITY OF CREOSOTE FOR MARINE BORER

Experiments to determine the comparative toxicity of creosote and its constituents for the marine wood borer, xylotrya, were described by L. F. Shackell, M.D., assistant professor of pharmacology, St. Louis University School of Medicine. The creosote used was distilled from coal tar between the temperature limits of O deg. and 400 deg. C. The characters of the fractions distilled from this creosote, as shown by the Forest Service reports, are as follows:

Fraction 1—Light oils .....Up to 205 deg. C.
Fraction 2—Naphthalene solids .....205 deg. to 250 deg. C.
Fraction 3—Deal oil or golden oil.....250 deg. to 295 deg. C.
Fraction 4—Anthracene solids .....295 deg. to 320 deg. C.
Fraction 5—Residue .....Above 320 deg. C.

A series of tests made with 1 per cent gum arabic emulsions of the creosote and of each fraction tested showed fraction 1 to have the greatest toxicity and the others to stand in the following order: Fraction 2, fraction 3 and creosote practically equal, fraction 4 and fraction 5. Experiments with undiluted aqueous extracts of creosote and of fractions 1 and 5 showed the same order of toxicity obtained as with the emulsions. The high toxicity of fraction 1 in connection with the present published observations of C. H. Teesdale, who found that experimental piling treated with 18 lb. of fraction 1 per cu. ft. lost practically 35 per cent of the oil by volatilization in two months and were severely attacked by the borers in 13 months, led to experiments to determine to what extent the loss of the more volatile constituents would affect the toxicity of creosote and its fractions. These tests showed that the volatilization of fraction 1 definitely lessened its toxicity and similar, although less noticeable, results were secured with the residue and with fraction 3. Addition tests showed that the light oils of creosote, such as benzene and its congeners, are very toxic for xylotrya, that naphthalene and anthracene are only very slightly, if at all, toxic and that the tar acids are toxic in varying degrees. One of these, alphanaphthol, which is highly toxic, is manufactured at relatively low cost from the abundant but practically non-toxic naphthalene.

Clyde Teesdale (Forest Products Laboratory) stated that tests made at the Forest Products Laboratory showed that the toxicity was exactly reversed from that reported by Dr. Shackell, and that in the tests fraction 1 apparently lost toxicity, while fraction 3 retained it indefinitely.

ANNUAL CHARGES FOR TIES

A paper by Harrington Emerson and T. T. Bower discussed a "Method for Finding the Annual Charges for Ties." The various assumptions upon which the investment in ties could be charged off before renewals were discussed and a diagram was presented showing graphically the effect of these various assumptions. A diagram was also included showing the annual charge per tie, the life of the tie and the original cost plotted from the formula

$$A = \frac{C}{Y} + C\ (I + T)$$

in which A equals the annual maintenance charge and C the first cost of the tie and track, Y the average life, I the rate

of interest on the investment and T the tax rate on the investment. In discussing methods to reduce the annual expense for ties the following five rules were suggested:

Buy the ties carefully.
Spend all on protection that the gain in life justifies.
Use them at once.
Do not take them out before they are used up.
Assort them for proper use.

It was stated that careful buying insures a price reduction of about 10 per cent and a quality increase of about 20 per cent. To allow ties to lie for two years before placing in the track adds about $0.14 to the first cost.

LIFE OF TREATED TIES

J. H. Waterman, superintendent of timber preservation, Chicago, Burlington & Quincy, presented some observations he has made during the past year on the service of treated ties. Out of 550 red oak ties treated with zinc chloride which were placed in the Burlington experimental track near Mystic, S. D., in 1900, 50 were taken out at the last inspection on October 7, 1914, on account of decay. Previous to this time three had been taken out for the laboratory and 18 on account of decay, making a total of 71 removed or a little less than 13 per cent. These ties are laid on a 3 per cent grade and a 12 deg. curve. All gave a life of 12 years, 87 per cent will certainly give 15 years' life and there is reason to believe that 50 per cent will be in track at the end of 18 to 20 years. In the two mile section between Sidney, Neb., and Peetz, Colo., 6,354 ties were laid in the fall of 1900 and the winter of 1900-1901. These ties were also treated with zinc chloride and are laid on a tangent in gravel ballast. Up to and including 1913, 285 of these ties had been removed on account of decay, and at the last inspection on October 6, 1914, 103 additional were removed, making a total of 388. This means that 94 per cent of these ties have already given 14 years service in a dry western climate.

On the Chicago & Eastern Illinois 24,271 red oak ties treated by the Wellhouse process using zinc, glue and tannin, were inserted in 1900 between Cypress, Ill., and Joppa. A count of these ties in June, 1914, showed 18,045, or practically 75 per cent still in the track. Mr. Waterman also reported that he had observed that ties treated with creosote or with a mixture of creosote and zinc chloride show less mechanical wear under the rail than ties treated with zinc alone on account of the action of the oil on the surface which lubricates the tie and the rail and results in less rail cutting and surface wear.

H. E. Horrocks (Pacific Creosoting Company) read a short paper protesting against the conclusions reached in bulletin 101 of the forestry department entitled "Relative Resistance of Various Conifers to Injection with Creosote," in which it was stated that Douglas fir is not suitable for creosote treatment. He cited the success in treating this material for more than 20 years as proof that such treatment is feasible.

Howard Weiss, director of the United States Forest Products Laboratory, took exception to Mr. Horrock's criticism of bulletin 101.

SPECIFICATIONS FOR TREATABLE TIMBER

The committee on specifications for the purchase and preservation of treatable timber, consisting of E. A. Sterling (consulting engineer), chairman; Carl G. Crawford (American Creosoting Company); Hermann von Schrenk (consulting engineer; C. T. Winslow (Forest Products Laboratory); William A. Fisher (A. C. L.); Lowry Smith (N. P.), and A. C. Becker (G. T.) reported on five subjects: A, The Purchase of Treatable Wood; B, Preparing Timber for Treatment; C, Preservatives and General Methods of Application; D, Summary of the Fundamental Principles Underlying Efficient Treatment, and E, Regional Consideration.

Under the first heading they recommended the new grading rule of the Yellow Pine Manufacturers' Association for yellow pine and the specifications of the American Railway Engineering Association for general requirements. A number of suggested modifications from these specifications were given. With the exception of the requirements as to heart wood, the A. R. E. A. specifications for size, form and manufacture of track ties were approved. Modifications in regard to heart wood and a few other points were included. The A. R. E. A. specifications for piles were approved with the exception of the requirements for sap wood for which suggested modifications were given, particular attention being called to the necessity for selecting piles with a view to the service for which they are required.

Under the second heading a discussion of the best practice in air-seasoning ties and timber was presented, in which it was recommended that hardwood track ties be given a minimum of eight months' seasoning and preferably 12 months; yellow pine seasoned in the south, 4 to 6 months; and hemlock, tamarack and jack pine, 12 months. The use of steaming or boiling was also referred to for artificial seasoning when there is not sufficient time for proper air seasoning. Under the head of preservatives, creosote and zinc chloride were discussed, it being recommended that a full cell treatment with the former be used for piling and marine timbers where subject to the attacks of teredo and other marine borers, in permanent structures not subject to mechanical wear, when conditions of moisture, climate or humidity are favorable to wood-destroying fungi, and particularly where the cost of renewals or replacements would be high. The empty cell creosote treatment was suggested for all track ties used in moist climate or under such conditions that the mechanical life is limited to 11 to 15 years, also for structures of a limited life or subject to superficial mechanical wear and elevated so as to be exposed to the wood-destroying influences of weather conditions. A full impregnation of zinc chloride was recommended for arid and semi-arid regions, particularly on track ties and other material with mechanical life limited to 11 years; also for wood resistant to creosote. It should not be used when mechanical wear is eliminated nor in situations where the treated timber is in permanent or intermittent contact with either stagnant or flowing water.

The summary of fundamental principles included the following: Preservative treatment should be limited to kinds of wood which are not in themselves resistant to decay, thus making timber available which otherwise would be useless and which is obtainable at low cost as compared with durable species. The moisture content of the wood before treatment should be reduced, preferably by air seasoning, to not more than 20 per cent of its oven-dry weight or to a constant weight basis. The efficiency of treatment should be based primarily on the extent of distribution of a stated amount of preservative rather than on the final retention of cubic foot.

A SPECIFICATION FOR A COAL TAR CREOSOTE SOLUTION*

By Hermann von Schrenk and Alfred L. Kammerer
Consulting Engineers, St. Louis, Mo.

The results of some tests made with mixtures of refined coal tar and creosote were presented last year which indicated that when such mixtures consisted of about 20 per cent coal tar and 80 per cent creosote, an oil was produced which could be successfully used for the impregnation of ties. It was found that such an oil penetrated timber to the same extent as the usual heavy creosote oils, provided the mixture or solution was kept at about 180 deg. F. It was recommended that the mixture be made at the treating plants.

During the past year it has become somewhat difficult to obtain the usual supply of high grade foreign creosotes, and there have been increased inquiries for the mixture of coal tar and

*By courtesy of the Committee on Wood Preservation, A. R. E. A.

creosote. It was suggested that the solution of the two substances could be more readily achieved at the plants where the creosote was made than at the treating plants, because it was easier to filter the mixture and thereby reduce the carbon percentage. This brought up the question of a specification for the finished product to make it possible for a prospective consumer to buy the mixed oil. In co-operation with the Barrett Manufacturing Company, a number of tests were made by the writers to determine distilling points, specific gravities and viscosities of various mixtures. Several coal-tars were selected and these were mixed in different proportions with various light creosote oils.

As was to have been expected the specific gravities and viscosities gradually rose as the percentage of coal tar was increased. Based on these and similar determinations, the following specification was submitted:

"The oil shall be a pure coal-tar product, consisting only of coal-tar distillates and oils obtained by the filtration of coal tar. It shall contain no admixture of crude tar. Water shall not exceed 2 per cent. Specific gravity at 38 deg. C. shall not be less than 1.06 or more than 1.10. Matter insoluble on hot extraction with benzol shall not exceed 2 per cent. Viscosity (Engler) at 82.3 deg. C. (180 deg. F.) shall not be more than 59 for 200 cc. No variation above 59 seconds shall be allowed. On distillation by the standard method of the A. R. E. A., it shall yield the following fractions, based on dry oil: Not more than 1 per cent at 170 deg. C.; not more than 5 per cent at 210 deg. C.; not more than 30 per cent at 235 deg. C. The residue at 355 deg. C. shall not exceed 26 per cent."

In presenting this specification it should be understood that we regard it by no means final. It is a frank attempt to describe in as few words as possible an oil made up of coal tar creosote, with a certain percentage of coal tar. The writers have had occasion to examine a number of samples purchased under this specification, and found that they came within the prescribed limits. The justification for such a specification lies in the fact that a mixture of the two substances was being prepared for general use and sold in large quantities. This has previously passed more or less as creosote oil. The present specification states in so many words that a mixture is contemplated. It is hoped that the writing of this specification will bring forth suggestions as to improvements.

Discussion.—This paper caused a discussion between the advocates of coal tar creosote mixtures and straight creosote. A. L. Kuehn, of the American Creosoting Company, advocated less secrecy in the manufacture of creosote and especially recommended an inspection of the manufacture of creosote by representatives of the railroads or other consumers. The consensus of opinion was that the industry demanded the abandonment of the present secretive attitude of the creosote manufacturers and commercial treating plants.

THE MECHANICAL LIFE OF TIES AS AFFECTED BY BALLAST

By E. Stimson

Engineer Maintenance of Way, Baltimore & Ohio, Baltimore, Md.

The wooden cross tie, transmitting the heavy axle loads from the rail to the ballast is subjected to mechanical wear not only from the action of the rail on top of the tie, but also from the action on the sides and bottom of the tie of the ballast which supports it. Tie destruction from mechanical wear of ballast seldom occurs to any appreciable extent excepting in occasional stretches of crushed stone, or other forms of hard ballasted tracks where a soft roadbed or a sink requires continual raising of track and tamping of ties in order to maintain good track surface. The wearing away of ties by ballast is the result of tamping the ballast under the tie and the action of the tamping tool striking the side and edge of the tie rather than the action of the tie bearing upon and working in the ballast under trainloads. There is but little mechanical wear due to the tie working in the ballast.

After ties are first put in the track and tamped to surface on hard ballast, the necessity for retamping to surface and consequently the wear of the ties by ballast depends largely on the nature of the sub-grade. Good surface and sub-surface drainage usually insures a solid road bed where the normal bearing value of the material qualifies it for heavy loading. Where such conditions prevail, track surface is maintained with a minimum amount of tamping and the mechanical effect of the ballast on the ties is negligible.

Ties which are removed after service in hard-ballast tracks are found to be pitted or indented on the bottom and sides from contact with the stone or other material. These indentations are a valuable factor in holding the track in line and surface as long as they are not increased by frequent tamping. The continual tamping of the ballast under the tie soon rounds off the edges of the ties, leaving little or no flat bearing surface for support. When this happens the tie acts as a wedge and tends to force the ballast out into the cribs instead of receiving full support from it. The greatest wear occurs from 6 to 8 in. either side of the rail and there is practically none directly under the rail. In track maintenance the best practice is to tamp the tie for its full bearing upon the ballast outside of the rail and for an equal distance inside. In spite of close supervision, however, this is not always done but instead, the trackman expends his efforts toward tamping solidly as near the rail as he can work with a tamping pick. This wears off the edge of the tie for some distance each side of the rail and leaves a short unworn edge directly under the rail. When a tie becomes rounded on the bottom at the most essential tamping point and becomes difficult to maintain to surface, it is then found more economical to replace it with a new tie having a flat bottom that will necessitate less tamping. The average trackman feels little hesitancy about removing a tie for this cause when he has difficulty in keeping it tamped. Even in cases of most excessive tamping, wear from ballast does not become objectionable until the tie has been in service from 50 to 75 per cent of its normal life. The kinds of ballast and ties used and the standard at which a track is maintained, are all important factors. Slag and stone when crushed, form hard, sharp, angular fragments that appear from observation, to be more destructive when tamped under wooden ties than gravel, burnt clay, cinders, granulated slag or other similar forms of ballast. Ballast of the last named materials has little or no effect in wearing down the sides and bottoms of the ties nor is the tamping of this kind of ballast so destructive to the ties, as the particles are smaller, generally of softer material and rounded in form. There is a perceptible difference in the resistance offered against mechanical wear by ties made from the different kinds of wood. Hard wood ties of rough texture withstand the action of the rail cutting and of excessive tamping much longer than ties of soft wood. It has been observed that these ties which are most durable under the mechanical wear of the rail also last longer under the wear of ballast; for instance—white oak, chestnut oak, black walnut, maple and beech are more suitable than yellow pine, fir, catalpa, cedar and red wood.

It is important to mention the extent to which some forms of ballast increase the abrasive action of the rail upon the tie. Granulated slag, gravel, cinders, chatts and other forms of ballast carrying fine gritty particles contribute largely to this action between the rail and the tie or between the tie plate and the tie thus greatly accelerating the mechanical wearing away of the wood. It has been observed that the cutting of the rail into the tie is much greater where fine ballast is used than where coarse hard ballast is employed. This trouble has been largely overcome by the use of flanged bottom plates which become embedded in the tie, and by plates fastened directly to the ties by lag screws, independent of the rail spiking, thus reducing the movement between the plate and tie to a minimum. However, many ties are removed from track each year because of deterioration from rail wear and a large amount of this deterioration can be assigned to the effect of the fine particles of ballast grinding under the rail.

Regarding the use of treated ties where extraordinary wear by ballast is known to exist; the same rule might apply that is observed when the mechanical wear under the rail limits the life of the tie. Treatment to prevent decay does not give the tie in-

creased resistance to abrasion, and ballast abrasion that is so severe as to wear out an untreated tie would preclude the possibility of any benefit from the use of treated ties at locations where such abrasion occurs.

AIR SEASONING OF CROSS TIES

By A. H. Noyes

Ayer & Lord Tie Company, Chicago

The ever increasing shortage of oak timber of all species makes the adoption of softwoods for ties a necessity. As the character of this timber requires careful handling to insure the delivery of sound material to the treating plant, and thereby a serviceable tie to the consuming road, the proper methods of handling such ties, particularly of beech and gum, are worthy of consideration.

Owing to the structure of the timber, beech ties are nearly always sawed. They are too hard to hew, and on seasoning, get rough or scaly. On the other hand, gum timber hews easily and makes a smooth, pretty tie. When gum or beech ties are produced tributary to a railroad, it is advisable that they be shipped into the treating plant as promptly as possible, after being made, and seasoned at the plant in preference to seasoning on the line of the road, as, in this event, the ties can be stacked for seasoning under more satisfactory conditions, and can be loaded for treatment at the proper time; in fact, the entire process kept under more complete supervision and control than under other conditions and in this manner avoid the possibility of damaged timber reaching the treating plant.

It is an accepted fact that all ties, softwood especially, should be carefully piled, never on the ground, but on sound stringers, and either with spacing strips between layers, or that they be piled so that the faces do not have full bearing against each other, as experience has shown that ties piled too close soon show damage.

Experience on river territories shows that it is not safe to buy softwood ties while the sap is up, no matter how carefully the ties are piled for proper seasoning, as transportation during the summer is not to be counted on with any amount of security and ties are liable to be damaged before they are loaded for shipment. Besides this, softwood ties piled on river landings are, in some cases, in deep shade, or, where in the open, are frequently surrounded with a rank growth of weeds, that tends to hold the moisture, creating conditions favorable to rapid damage. For this reason, the practice of buying softwood ties at small landings should be avoided, and ties should be hauled to such landings only where they are handled in large quantities, where the timber will be exposed to sunlight and free air currents, where landings are free from weed growths and where shipments can be made by date rather than by appearance of the timber.

SILL TIES

By F. J. Angier

Superintendent Timber Preservation, Baltimore & Ohio, Baltimore, Md.

Seasoning conditions in tie storage yards vary considerably. One yard may be nicely drained and ballasted, another may harbor conditions which are conducive to the decay of timber. It is fair to assume that there can be found in all tie yards more or less decayed timber, and, generally speaking, this decayed timber will be in direct contact with the ground. To reduce this useless waste of good material ties should be seasoned on sills that will not decay. These sills may be of wood chemically preserved, or they may be of concrete.

To compare the cost of the various kinds of sill ties, the following data has been prepared for the tie storage yard of the Baltimore & Ohio at Green Spring, W. Va. The present trackage provides for the storage of approximately 600,000 ties. This is calculated on a basis of cribbing ties in lots of 100, making four cribs to a pile and 1,500 piles. This will require 12,000 sill ties to season the maximum number of 600,000 ties. Every sill tie is in direct contact with the ground.

Approximately 75 per cent of all ties received for treatment at this plant are purchased as No. 1 and 25 per cent as No. 2 ties. The cost varies in different localities, but we can assume that the average price paid for No. 1 ties is 60c and for No. 2 ties 40c. We believe it conservative to say that 10 per cent of the untreated sill ties check or are damaged to such an extent that they can be used only as No. 2 ties and 2 per cent of all sill ties are broken or decayed to render them practically worthless. Using the above estimate as a basis, we may obtain the following comparisons:

Cost of Untreated Sills

10% of No. 1 ties, or 900, are made No. 2 at a loss of 20c each.		$ 180.00
2% of all sill ties are made worthless.		
180 No. 1 @ 60c each		108.00
60 No. 2 @ 40c each		24.00
Labor of turning over 12,000 sill ties and cleaning for treatment at ½c each		60.00
Restacking yard for locating sill ties		30.00
Disposing of worthless ties		6.00
Cost for six months		$ 408.00
Cost for one year		$ 816.00
Interest and taxes one year on 12,000 sill ties ($6,600.00 @ 7%)		462.00
Total cost for one year		$1278.00
Or, per sill per year		0.1065

Cost of Treated Sills

No. 2 ties each	$0.40		
Cost of treating and laying	0.18		
	$0.58		
Interest and taxes (6% plus 1%)		$0.0406	
Renewal cost (assuming 20 years life)		0.0290	
Annual cost per sill		$0.0696	
Total cost for one year			$835.20

Cost of Concrete Sills

12,000 at an estimated cost of 80c each	$9,600.00		
Labor, installing	300.00		
Total cost 12,000 sills	$9,900.00		
Cost per sill	$ 0.825		
Interest and taxes (6% plus 1%)		$	0.05775
Renewal cost (25 years' life)			0.03300
Annual cost per sill		$	0.09075
Annual cost (12,000 sills)			$1,089.00

These estimates show an annual saving in using treated sills over untreated of $443.00, and over concrete of $252.00. The cost of concrete sills may vary, but the estimate shown above is believed to be conservative.

An indirect saving should be credited to the treated and concrete sills on account of the following: (a) no infection of sound ties from contact with decaying untreated sill ties; (b) less injury to valves and pumps by cinders and other foreign matter carried into the retorts on ties that have been in contact with the ground, and (c) untreated sill ties that have been in contact with the ground are not as well seasoned as other ties in the same pile; therefore, when loaded in same charge they may be under-treated and their life shortened.

The cost of ties and their treatment will vary. Some plants may use cull ties, which cost practically nothing. The Baltimore & Ohio will not purchase cull ties at any price; and, therefore, sill ties must be made from the ties in stock, and these must be charged to stock account at the prices paid.

DESTRUCTION OF TIMBER BY MARINE BORERS

By E. S. Christian

General Manager, Norfolk Creosoting Company, Norfolk, Va.

It is conceded that marine borers do not thrive in foul water, and that they prefer the uncontaminated water of the ocean, hence, Hampton Roads, which is an arm of the Atlantic, offers an ideal environment for the growth of the teredo and its kindred borers. I have frequently seen specimens of xylotrya and other teredo, 3 ft. long and ⅝ in. in diameter, although the more destructive borer is much smaller and by far more numerous.

In this connection, the history of the Chesapeake & Ohio pier No. 6, formerly No. 1, at Newport News, Va., on Hampton Roads, just below the mouth of the James river, is interesting, not only because it tells the story of how timber treated with 12 lb. of dead oil per cu. ft. has withstood the attacks of marine borers for

32 years, but it also relates that in these same waters timber not creosoted was destroyed in two years. This pier is 800 ft. long and 200 ft. wide, requiring about 4,000 piles. It was first built in 1879 on charred pine and cypress piles. Charring at that time was thought to make timber immune from all marine borers, but upon examination one year later the piles were found to be damaged to such an extent as to make the pier unsafe. After wasting much time and money experimenting with patented substitutes, a contract was entered into with E. R. Andrews, of Boston, a protege of the Bethels, of Becton, England, to move his experimental creosoting plant from Boston to Money Point and to supervise the construction of a new plant at that place. This plant was completed in the early autumn of 1882 and the first creosoted piles used on the Atlantic coast were treated there and used in rebuilding this pier in October of the same year, the construction being completed in February, 1883.

The writer was appointed inspector on that work, probably for the same reason that many young men are now appointed, but he obeyed his orders, which were to see, as far as possible, that every cubic foot of each of the 4,000 piles absorbed 12 lb. of oil. One of the tests made to determine this was to bore each pile in six places and if any boring showed a penetration of less than 1½ in., the pile was rejected and treated again.

The oil was bought by the railroad company under the following specifications: "It must be distilled from the coal tar derived from Newcastle coal, and must be of a greenish yellow color when liquefied. It shall not contain any water, not over 8 per cent of tar acids, not less than 60 per cent of naphthalene, not less than 20 per cent of anthracene and anthracene oil. Not less than 5 per cent shall remain in the flask after it has been heated to a temperature of 320 deg. C."

This pier is today in daily use as one of the 14 units which comprise the terminals of this road at Newport News, 32 years after it was rebuilt on creosoted piles.

Analysis of test pieces of a pile taken from this pier in 1912 showed that after 30 years' service, there remained 10½ of the original 12 lb. of oil, and of this quantity, 55 per cent was naphthalene. All of these pieces were taken from the pile between the high water and the mud lines.

I have recommended 16 lb. of oil per cu. ft. for marine work in Hampton Roads because of the difficulty in obtaining oil with more than 35 per cent of naphthalene. I know that I am at variance with a great deal of expert opinion, but my experience tells me that I am right. I believe, however, that in the treatment of cross ties and bridge timbers, the naphthalene fraction may be lowered providing that the percentage of pitch is increased. It is well to note that piles not creosoted, when used in Hampton Roads or its adjacent waters, will be destroyed by marine insects in two years. I have known of untreated piles driven in April near the Virginian Railway piers, to be entirely destroyed at the low water mark by the following September. It is, however, a well known fact that the destructiveness of the teredo will vary from one year to another.

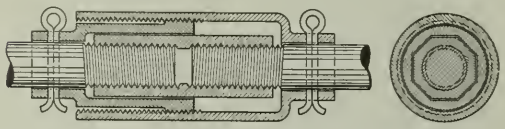
An illustration of the value of timber treated with oil containing over 50 per cent of naphthalene, is found in the Manatee river bridge on the west coast of Florida, built by the Seaboard Air Line in 1900. The chief engineer consulted me as to the advisability of using creosoted piles, and at the same time warned me that the Government engineer in command in that district who had had a great deal of experience in the use of creosoted timber on the west coast, advised against using it and stated that it would not last three years. Knowing, however, that his experience was based entirely on long leaf pine indifferently treated, I assured Col. Gwathmey that sap pine treated with 25 lb. of oil per cu. ft. would stand, and now, after 14 years, I am told that these piles are in perfect condition.

CLOSING BUSINESS

It was decided to hold the next annual meeting, beginning the third Tuesday in January, 1916, at Chicago.

A NEW TURNBUCKLE FOR SWITCH ADJUSTMENT

One of the minor but nevertheless important details of track work is the maintenance of the proper head and switch rod adjustments. To simplify this work, The Hardick Locked & Covered Turnbuckle Company, 14 East Jackson boulevard, Chicago, has devised a turnbuckle for insertion in these rods by the use of which it is claimed that the attention required will be materially reduced. This device consists of a long octagonal nut or turnbuckle proper enclosed in two separate casings, making three distinct parts. The inner bore of the inside casing



A Cross Section of the Hardick Locked and Covered Turnbuckle

is also octagonal to engage the nut or turnbuckle while the outer casing or sleeve is threaded on the inside to correspond with the outside surface of the inner casing. Both sleeves are also slotted at the ends to permit cotter pins to pass through the casings and the rod, locking them into one unit. In this way the turnbuckle is encased to protect it from corrosion. To adjust the turnbuckle, the cotter pins are removed, the outer casing unscrewed from the inner one, the casings pushed back out of position and the turnbuckle adjustment made in the ordinary manner. The outer end of each casing is hexagonal in shape to permit the use of a wrench if desired. As small an adjustment as 1/48 in. can be secured. To further simplify the switch con-

A Head Rod on the G. R. & I. Equipped with the Hardick Locked and Covered Turnbuckle

nections, the switch and head rods are made in one piece, having simple connections with the switch rails, which reduces the number of bolts and the connections ordinarily required.

One of these turnbuckles was removed from a track of the Grand Rapids & Indiana at Grand Rapids, Mich., after 14 months and although the outer casing was marred, showing that it had been struck by picks in cleaning ice and snow from the track, the threads on the inside showed no deterioration and the oil which was put on at its installation was still evident. The accompanying photograph shows a complete head rod which has now been in service on the same road for four months.

RAILWAY GATES AT ANTWERP TO BE MADE INTO SHELLS.—According to reports, the German authorities have taken the great bronze gates of the Central Railway station at Antwerp in order to make ammunition.

General News Department

The Missouri Bankers' Association has appointed a special committee to study conditions affecting the Missouri railroads.

Telegraph operators and station agents on the Texas & Pacific have filed a demand with the management for an increase of 15 per cent in pay and certain changes in working conditions.

The Snoqualmie tunnel through the Cascade mountains on the Chicago, Milwaukee & St. Paul, was formally opened for traffic on January 15, and the transcontinental passenger trains, the Olympian and the Columbian, passed through the tunnel on that day.

Two bills have been introduced in the legislature of New York to repeal the full crew law, which was passed in 1913. This is the law concerning which a copy of a letter was published in the newspapers wherein William Sulzer, afterward elected governor virtually promised beforehand to give the act his approval.

The new electric interlocking plant at Aulon, Tenn., near Memphis, at the crossing of the Nashville, Chattanooga & St. Louis, the Louisville & Nashville and the Illinois Central was put in service this week. In connection with the interlocking an "automatic flagman," made by the L. S. Brach Supply Company, of New York, was installed at the Poplar Boulevard grade crossing.

A bill has been introduced in Congress by Mr. Goeke, of Ohio, H. R. No. 17,894, to amend the Boiler Inspection Act of February 17, 1911, so as to provide for the inspection by government inspectors of all parts of the locomotive and tender; and it has been passed by the House. A law of this nature was recommended by the Interstate Commerce Commission. In the Senate the bill was referred to the committee on interstate commerce.

The New York State Public Service Commission announces the conclusion of an agreement for the purchase of the easement under the property of the New York Central, at the northwest corner of Lexington avenue and Forty-second street, New York. This easement is required for the construction of the diagonal subway which is to connect the existing subway in Park avenue with the new subway in Lexington avenue. The consideration for the grant is $902,500, of which $500,000 is for the easement, and the remainder for the construction of the subway underneath the New York Central property. This part of the new subway is to be finished in about three years.

The Farmers' Union has given out a signed statement by President W. D. Lewis and Peter Radford, national lecturer, urging opposition to the passage of a full crew law by the Texas legislature. The article says "there is no payroll in civilization that does not rest upon the back of the farmer. He must pay the bills all of them." The article goes on to argue that the farmer in the long run pays a large part of the expenses of the railroads, including any unnecessary expenditures, whether caused by laws or by errors of the management. The full crew law is cited as an example of one of the unnecessary expenses which have been saddled on the railroad managements in various states.

The question when the Grand Trunk Pacific shall begin operation of the National Transcontinental Railway, the new Canadian line between Winnipeg and the Atlantic seaboard, has been under discussion between the government and the officers of the Grand Trunk during the past week, but it is said that no agreement has been reached. The road was mostly finished last autumn, and it is said that, according to the contract, the G. T. P. should have begun its operation on November 1. It is believed that the railroad officers are demanding a change in the terms of the contract, on the ground that the exorbitant cost of the new line has made a capital charge which will be greater than the traffic of the line can be made to pay.

Charles S. Whitman, the new Republican Governor of New York, has endorsed a proposition to consolidate the two public service commissions of the state and to reduce the salaries of the members from the present rate of $15,000 a year. A bill has been introduced in the legislature by Mr. Green of Kings county, designed to effect the proposed consolidation. Mr. Green would have the commission consist of an electrical engineer, a civil engineer, a "practical" railroad engineer, two attorneys experienced respectively in corporation and financial law, and two business men. Three members of the proposed new commission would be chosen from the political party casting the second highest number of votes at the last election. The terms of office would be reduced from five to two years.

A "Square Deal to Railroads" meeting was held by the Springfield Club of Springfield, Mo., on Friday, January 15, which was attended by 300 members of the civic and commercial organizations of the city and officers and employees of the railroads running through Springfield. All three of the receivers of the St. Louis & San Francisco, J. W. Lusk, W. C. Nixon and W. B. Biddle, were present, while the Missouri Pacific was represented by E. J. Pearson, vice-president, and Alexander Robertson, assistant to the president. Short speeches were made by these and other railroad men, by officers and members of the Springfield Club, and by W. C. Turner, vice-president of the Order of Railway Conductors; and the keynote of the entire meeting, as indicated in the speeches, was that under present legislative regulation the railroads are unable to make a reasonable profit, that in the prosperity of the carriers is bound up the prosperity of the American people, and that the best interests of both will be served by a more liberal treatment of the railroads. H. B. Hornsby, vice-president and general manager of the United Iron Works, was chairman of the committee in charge of the dinner.

Efficiency; the Very Latest

At Sayre, Pa., an important division terminal of the Lehigh Valley, a stranger, whiling away a half hour in a moving picture house, was surprised, following a western photo drama, to see thrown on the screen an announcement like this:

"James Brown, Thomas Jones, William White and John Black boarded for 10 p. m."

This announcement apparently did not cause the least ripple of curiosity in the house, unless it was on the part of the visitor. The men named were members of a freight train crew. The division superintendent at Sayre has made an arrangement with the moving picture theatre men so that freight crews can be called on their screens at any time. Thus the men can amuse themselves when they are in Sayre without fear of causing trouble for the call boys.

Proposed Additional Accident Statistics

The Interstate Commerce Commission has issued a tentative draft of revised rules governing monthly reports of railway accidents, and at Washington, last Monday, held a hearing to receive criticisms and suggestions. The forms prescribed for use in giving the details of individual accidents have been rearranged, calling for additional details; and there are three new forms: one for locomotive accidents, another for "non-train" accidents and a third for reporting cases where persons reported injured have subsequently died. The term "train accident" is amplified to include all accidents to persons happening in connection with the movement of cars or engines. Industrial accidents, so-called, which now are reported only in a single item, giving the total for the month, will have to be reported in detail, like those more closely connected with train operation. Each monthly statement must include a summary of train accidents compared on the basis of locomotive miles and a summary of industrial accidents compared on the basis of man-hours of employees. No general summary is required; the commission will attend to that in its own offices.

In place of the present four-page sheet of instruction, there is a pamphlet of 16 pages. Persons involved in accidents, whether causing accidents or injured by them, must be de-

scribed so that the statistician at Washington can assign them to the right one of 80 classes; 68 classes for employees, 1 for employees not on duty and the other 11 for passengers and outsiders. Accidents to men in shops, etc., are to be divided into 12 classes, according to causes and the injury to the person,

Operating Revenues and Expenses of Express Companies for September

The following statement, which is subject to revision, has been compiled by the Interstate Commerce Commission from the monthly reports of operating revenues and expenses of the principal express companies for September, 1914. (The express companies have three months in which to make reports.)

A—For the Month of September

Item	Adams Express Co.		American Express Co.		Canadian Express Co.		Globe Express Co.		Great Northern Express Co.

* Indicates deficit. † Indicates loss. ‡ Includes previous year's returns of United States Express Co.

which must be reported in detail. For example, paragraph 38 says:

"In reporting any nontrain accident, the accident should be clearly described and the cause shown wherever practicable. In case of any permanent injury to arm or hand, state whether right or left arm or hand; in case of loss of any part, state exact extent, as, e. g., tip of index finger on right hand, two middle fingers to second joint on left hand, right arm to elbow, loss of sight in right eye, etc. If the accident was due to any defect in structure or machine, state what steps have been taken to correct the defect; if due to lack of guards over rapidly moving parts of machinery, state that fact. . . ."

It is proposed to apply the new rules to all accidents occurring since the beginning of 1915. In addition to bodily injuries heretofore reported, the commission, according to the new rules, would call for reports of cases where the injury disables the man for only two or three days.

At the hearing on Monday the railroads were represented by Messrs. J. Kruttschnitt, W. W. Atterbury and W. G. Besler, a sub-committee of the executive committee of the American Railway Association, and by W. C. Wilson of the Lackawanna, F. V. Whiting of the New York Central, and others. After brief statements on the part of the commission and of the railroads it was decided to defer action until a conference could be held, probably within a month, between the railroad representatives and W. J. Meyer, statistician of the commission. A representative of the federal bureau of labor statistics and one or more from the railway employees' unions will probably take part in the conference. It is expected that Mr. Kruttschnitt's committee will keep the railroads informed of all developments.

The United Engineering Society

The trustees of the United Engineering Society, representing the American Institute of Mining Engineers, the American Society of Mechanical Engineers and the American Institute of Electrical Engineers, and with the co-operation of the American Society of Civil Engineers at a meeting to be held in the auditorium of the Engineering Societies building, New York, on Wednesday, January 27, at 8:30 p. m., will inaugurate the Engineering Foundation. This foundation, inaugurated by the United Engineering Society, is a fund to be "devoted to the advancement of the engineering arts and sciences in all their branches, to the greatest good of the engineering profession and to the benefit of mankind." The speakers at the meeting will be as follows: Gano Dunn, president of the United Engineering Society and past-president of the American Institute of Electrical Engineers; Dr. Henry S. Pritchett, president of the Foundation for the Advancement of Teaching; Dr. Robert W. Hunt, past-president of the American Institute of Mining Engineers, and Dr. Alexander C. Humphreys, past-president of the American Society of Mechanical Engineers.

The Railway Club of Pittsburgh

At the regular meeting of the Railway Club of Pittsburgh, to be held at the Monongahela House, Pittsburgh, Pa., on Friday evening, January 22, an illustrated address will be given by H. T. Herr, vice-president and general manager of the Westinghouse Machine Company, dealing with recent developments in

steam engineering, and more especially with turbines for driving electric generators and as used for marine propulsion.

MEETINGS AND CONVENTIONS

The following list gives the names of secretaries, dates of next or regular meetings, and places of meeting of those associations which will meet during the next three months. Hereafter the full list of meetings and conventions will be published only in the first issue of the Railway Age Gazette for each month.

American Association of Passenger Traffic Officers.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Next meeting, March 2-3, San Francisco, Cal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August. Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lyiton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meetings, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

National Railway Appliances Association.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15-19, 1915, Chicago.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Railway Signal Association.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa. Next meeting, March 15, 1915, Chicago.

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

Salt Lake Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Signal Appliance Association.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. R. R., Atlanta, Ga. Next regular meeting, January 21, 1915, Atlanta, Ga.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

Toledo Transportation Club.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of Newark.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, Newark.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Transportation Club of Detroit.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except, June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

Traffic News

The Grand Trunk and the Canadian Pacific have taken off each one train in each direction between Montreal and Ottawa, on account of the shrinkage of business.

The Michigan railroads have announced their intention of urging a repeal of the state two-cent fare law and the substitution of a law which will permit fares on the basis of 2½ cents a mile.

The railways of Illinois have definitely decided to ask the legislature to make a change in the law so as to allow an increase of passenger fares to the basis of 2½ cents a mile, and have appointed a committee to conduct a campaign, of which S. G. Hatch, passenger traffic manager of the Illinois Central, is chairman.

The commissioner of agriculture of Virginia is this week running an instruction train over the New York, Philadelphia & Norfolk, stopping at Oak Hall, Bloxum, Onley, Nassawadox and Cape Charles.

The Chicago, Burlington & Quincy has announced that during the calendar year 1914 it carried 24,445,911 passengers without a fatality to a passenger for which the railroad could be held legally responsible.

A bill has been introduced in the legislature of North Carolina to repeal the long and short haul clause of the intrastate freight rate act which was passed last year. A number of short railroads complain that the enforcement of the long and short haul provision has deprived them of important competitive traffic formerly enjoyed.

The Illinois Central has given out a statement that during the two years ending January 1, 1915, it carried 26,271,000 passengers without a fatality to a passenger. In its Chicago suburban trains, which carry 40,000 passengers a day the company says it has not killed a passenger for 53 years, or since the beginning of the suburban service, and it is also stated that no revenue passenger has been killed on the Illinois Central proper, exclusive of the Yazoo & Mississippi Valley, since March 6, 1910.

It has been estimated this week that the grain in cars at New York and Jersey City terminals awaiting trans-Atlantic shipment amounts to more than 7,000 carloads; and the Pennsylvania is said to have 3,000 cars awaiting vessels at Baltimore. That road has been obliged to place an embargo on grain for export through Baltimore. The road is holding 1,379 cars of export freight in yards west of Altoona. Ocean freight rates to Europe are said now to be three or four times the normal rate prior to the war. Many shiploads of grain are lying in English ports waiting to be unloaded. The scarcity of ships is attributed to the unusually large quantity of grain being offered for export and also to the detentions due to the strict regulations of the British government in regard to contraband goods.

The receivers of the Pere Marquette have addressed to the Michigan legislature a petition for a repeal of the state two-cent passenger fare law and the substitution of a law allowing rates of 2½ cents a mile. The petition states that during the last fiscal year the average rate per passenger mile on the Pere Marquette was 1.89 cents, while the actual cost of handling passenger traffic was 2.2 cents. The application says that this road asks no favors for itself that are not granted to all roads in the state on an equitable basis. It is claimed that the freight rates on this road are as low as any in the United States. The receivers declare that they have carried economy to the limit. It is reported that a majority of the members of the Michigan legislature are willing to advance the passenger fares of the Pere Marquette, but that they do not wish to advance rates on certain other roads. Senator Kelley has advocated the passage of a law to require that fares for passenger transportation be made different on the different roads, according to their earnings per mile.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission has set March 14 as the date for the hearing on the proposed order authorizing the railroads to divide their primary accounts so as to meet the requirements of the different states. Briefs are to be filed before February 27.

It is announced that hearings will be held by Examiner Attorney Brown on the proposed charges for trap car service, which have been filed by the railroads and have been suspended by the commission, as follows: Detroit, March 1; Cleveland, March 3; Buffalo, March 5; Philadelphia, March 8; Pittsburgh, March 11; Cincinnati, March 15; St. Louis, March 18; Kansas City, March 22, and Chicago, March 25.

Class and Commodity Rates to and from Quincy, Ill.

Opinion by Commissioner Clements:

The carriers having proposed to increase class and commodity rates between Quincy, Ill., Hannibal and Louisiana, Mo., and points taking the same rates, on the one hand and points in trunk line and central freight association on the other, the commission finds that such increase is not justified. In the Mississippi River case (28 I. C. C., 47) the commission held that there was no reason why all the crossings from St. Louis to Dubuque should not be on the same basis with respect to traffic from seaboard territory. For reasons stated in the opinion in that case the rates to the upper crossings were not reduced to the St. Louis basis. To increase rates now to Quincy, Hannibal and Louisiana, to the upper crossing basis, leaving St. Louis the only crossing taking lower rates, would not benefit the upper crossings and would have a serious effect on the business interests of the three cities involved and would redound only to the benefit of St. Louis. (32 I. C. C., 471.)

Rates on Cement from Points in Illinois

Opinion by Commissioner Harlan:

The commision finds that the carriers have justified an increase from eight cents to 10 cents per 100 lb. in the rate on cement in carloads from Chicago group points to St. Paul. A similar increase of 8.5 cents to 10.5 in the rates from St. Louis to St. Paul is likewise found justifiable. An increase in the rate on cement from Mason City, Ia., to St. Paul from 5 cents to 7 cents is held to result in an unreasonable rate, but the commission allows an advance to 6 cents. In the case of the rate from Des Moines to St. Paul the commission refuses to allow an advance from 7 cents to 9 cents, but will permit the carriers to make an advance to 8 cents. A proposed increase from 15 cents to 17 cents in the rate from Iola, Kan., to St. Paul is not justified. (32 I. C. C., 369.)

Transcontinental Commodity Rates to San Jose, Santa Clara and Marysville, Cal.

Opinion by Commissioner McChord:

The commission in Santa Rosa Traffic Association v. Southern Pacific (24 I. C. C., 46, and 29 I. C. C., 65) found, with respect to the physical condition surrounding the delivery of transcontinental freight, that there was no dissimilarity sufficient to justify the defendants in giving "terminal" commodity rates to San Jose, Santa Clara and Marysville and at the same time denying such rates to Santa Rosa. The defendants were therefore required, so long as they applied "terminal" commodity rates to San Jose, Santa Clara and Marysville, to apply no higher rates to Santa Rosa, it not being stated, however, whether similar rates should be granted to Santa Rosa or withdrawn from the other three points. The carriers elected to withdraw the terminal privileges granted the other three points. The commission now finds that the carriers have not justified this proposed change, it being held that the withdrawal of terminal commodity rates to San Jose, Santa Clara and Marysville which are not directly reached by Atlantic-Pacific ocean lines while continuing such rates to other interior California points not directly reached by said ocean lines would subject these three points to discrimination. The commission in its decision states that there can be no question about the great commercial advantages which accrue to the towns having these terminal rates and that in the contest for the new factories and industries looking for locations on the Pacific coast the town with these rates has an advantage which cannot be overcome by its rivals without them. "In one sense, the competition between towns for new factories and industries is more important than the competition between factories and industries already in those towns for trade. New factories mean more workers, more money, more houses and more people in general, and, after all, the struggle between these Pacific coast cities is essentially one for population." The rule is laid down that when the question of freight rates enters into the competition of cities and towns in any respect whatsoever, whether that competition is one for trade, factories, or people, complaints alleging unjust discrimination will be entertained by the commission. (32 I. C. C., 449.)

Rates on Lumber from Anoka, Minn.

In re rates on lumber from Anoka, Minn., and other points to stations in South and North Dakota. Opinion by Commissioner McChord:

The commission finds that the Chicago, Milwaukee & St. Paul has not justified proposed increased rates on lumber in carloads from Anoka and other points in Minnesota to points in South Dakota and North Dakota. "The justification offered for the proposed increased rates is hardly more than an expressed desire to secure uniformity in the rate relationship. There are doubtless cases where increased rates may be proper for this purpose, but it is to be remembered that uniformity may be secured in many cases by reduced rates as well as by increased rates. The mere fact that a relation of rates requires readjustment in the interest of uniformity is not proof that rates increased to the level of the relatively higher rates are reasonable." (32 I. C. C., 494.)

STATE COMMISSIONS

New Mexico.—See Court News.

The New Jersey Public Utility Commission has issued an order looking to the abolition of 15 highway grade crossings in Paterson.

The Railway Commission of Canada has notified the railways that changes in schedule time of passenger trains must be announced at stations ten days in advance.

The Southern Pacific, the Atchison, Topeka & Santa Fe and the Western Pacific have notified the California Railroad Commission that they will abolish all switching charges on cars delivered from or taken to industry tracks, when incidental to a line haul.

J. M. Atkinson, chairman of the Missouri Public Service Commission, has issued a statement saying that if the Missouri legislature seeks to pass a bill increasing the state passenger fare from 2 cents to 2½ cents a mile the state commission will put no obstruction in the way.

The Colorado Public Utilities Commission has summoned six railroads to appear on February 16, to show cause why the intrastate rates on coal should not be reduced. The same roads also have been ordered to appear on February 8, to show cause why certain of their passenger fares between mountain points should not be reduced.

The Railroad Commission of Louisiana has authorized the Tremont & Gulf to take up the track of its Pyburn branch, extending from Menefee, La., to Pyburn, 11 miles. The commission has examined the track and says that it is in such bad condition as to be unsafe for the operation of trains. It is estimated that the rails are worth $26,000.

Although the Minnesota Railroad & Warehouse Commission issued an order limiting the speed of passenger trains on the main track of the Chicago, Rock Island & Pacific in Minnesota to 30 miles an hour on the recommendation of an inspector of the commission, as stated in our issue of January 15, an inspection of the track by the commission itself showed that this order was unnecessary and it was annulled immediately after this in-

spection. The commission found the track to be safe for the speed at which trains were being run over it.

PERSONNEL OF COMMISSIONS

John H. Roemer has resigned as a member of the Wisconsin Railroad Commission, effective February 1.

Nathaniel S. Ketchum, a member of the Board of Railroad Commissioners of Iowa, died at his home in Marshalltown, Iowa, on January 17, aged 75 years.

Carl D. Jackson, of Oshkosh, Wis., former district attorney of Winnebago county, has been appointed a member of the Wisconsin Railroad Commission, to succeed John H. Roemer, resigned.

COURT NEWS

The Supreme Court of Virginia in a case involving the transportation by express of liquors from Virginia into North Carolina holds that the carrier cannot refuse to transport when the goods are intended for personal consumption and not for sale.

The Texas Cattle Raisers' Association has filed suit in the Federal Court at Kansas City, Mo., against 10 railroads, to recover alleged excess freight rates paid by shippers on cattle shipments from 1903 until the rates were reduced by the Interstate Commerce Commission in 1908.

The Wisconsin Supreme Court last week rendered a decision holding unconstitutional the local taxation of property of the Minneapolis, St. Paul & Sault Ste. Marie, consisting of ore docks and freight terminals in Douglas county, on the ground that this property cannot be separated from the other property of the railroad in the state and be subjected to local taxation at a higher rate than the rate applied by the state tax commission. The court said that terminal facilities constitute property necessarily used in the operation of a railroad and hence become part of the entirety.

The Supreme Court of the United States has affirmed the judgment of the Supreme Court of Georgia, sustaining the railroad commission of that state in imposing a fine of $1,000 on the Wadley Southern for discrimination in the distribution of shipments of freight which were to go beyond its own line. Certain shippers had complained that the Central of Georgia was favored, as against the Macon & Dublin. The statute authorizing the commission to punish disobedience of its orders by a fine, allows cumulative fines in such a large sum that the defence argued that this law, in effect, denied the railroad due process of law, as carriers would obey an unreasonable order rather than take the risk of an excessive penalty. The federal court held, however, that the law was not unconstitutional, as another statute of Georgia provides for a hearing before the imposition of a fine.

Judge Putnam, in the United States Circuit Court of Appeals, at Boston, last week, decided in favor of the Boston & Albany Railroad in its suit to be exempted from the provisions of the Federal corporation tax law. The court holds that the road's property being leased to the New York Central, it does not come within the terms of the law imposing a corporation tax for "doing business." The road receives an annual income of $2,000,000 from the New York Central; but the receipt of this money and the payment of dividends are not to be understood as "doing business" within the meaning of the statute.

The Supreme Court of New Mexico, in a decision by Chief Justice Roberts, has sustained the corporation commission of that state in dismissing a complaint of the New Mexico Woolgrowers' Association, asking that the Atchison, Topeka & Santa Fe be required to maintain scales, on which to weigh livestock, at five principal points on the line of its road in that state. The commission held that as livestock is carried by the carload, and not by actual weight, the weighing of the animals is not a feature of transportation and therefore the railroad is not called upon to maintain scales for that purpose. At all of the places which figured in the complaint scales are available on which animals can be weighed for a small fee. It appears that the shippers desire free scales, not in connection with transportation, but to enable them to ascertain actual weights for use in making out the bills to be paid by the buyer.

Railway Officers

Executive, Financial, Legal and Accounting

E. L. Parker has been appointed treasurer and paymaster of the Texarkana & Ft. Smith, with headquarters at Texarkana, Ark., succeeding I. C. McGee, resigned.

I. C. McGee, treasurer of the Texarkana & Ft. Smith, has been appointed treasurer of the Kansas City Southern, with headquarters at Kansas City, Mo., succeeding H. Visscher.

C. J. Kulp, assistant treasurer of the Lehigh Valley, with headquarters at Philadelphia, Pa., has been elected treasurer. J. M. Baxter, who retires as treasurer, has been in poor health for the past two years and requested that he be not re-elected. Mr. Kulp was born in Philadelphia, Pa., and has lived there all his life. He has been connected with the Lehigh Valley for 28 years, having entered the accounting department as a clerk in the disbursing office under Isaac McQuilkin, who was auditor of the railroad at that time. In 1903, when the treasury department of the Lehigh Valley was reorganized, Mr. Kulp assisted in that work and was selected as teller for the reorganized department, in which position he remained for four years, when he became chief clerk of the department. In 1910 he was elected an assistant treasurer, with office at Philadelphia, Pa., which position he held at the time of his recent election as treasurer of the same road, as above noted.

C. J. Kulp

Operating

Frank Hanning Wilson, whose appointment as general superintendent of the New York Central, in charge of the lines between Toledo and Chicago, with headquarters at Chicago, has already been announced in these columns, was born at Indianapolis, Ind., on November 12, 1873. He was educated in the public schools at Indianapolis and began railway work when 14 years of age as a messenger for the Indiana, Bloomington & Western. Subsequently until 1894 he was clerk to the trainmaster and to the superintendent of that road and the Cincinnati, Indianapolis, St. Louis & Chicago, and then until December, 1902, was secretary and chief clerk to the general superintendent of the Cleveland, Cincinnati, Chicago & St. Louis, successor to the Cincinnati, Indianapolis, St. Louis & Chicago, and trainmaster of the Peoria & Eastern division. Mr. Wilson became connected with the Lake Shore

F. H. Wilson

& Michigan Southern in January, 1903, as special representative to the general manager. In February of the following year he was appointed trainmaster at Toledo, Ohio; in February, 1905, he was advanced to assistant division superintendent at Chicago, and in November of that year he was promoted to superintendent of the Western division, with headquarters at Chicago. He was made assistant general superintendent at Cleveland in January, 1910, and is now promoted to general superintendent of the New York Central and the Lake Shore & Michigan Southern, as has been previously stated in these columns, having become a part of the consolidated New York Central Railroad.

J. F. Tracy, trainmaster of the Northern Pacific at White Bear, Minn., has resigned, and the position is abolished.

W. E. Welch, assistant superintendent of the Fort Smith & Western and the St. Louis, El Reno & Western, has been appointed superintendent of those roads, with office at Fort Smith, Ark.

J. H. Curry, assistant trainmaster of the Lehigh Valley, at Delano, Pa., has been promoted to trainmaster of the Seneca division, with headquarters at Sayre, Pa., succeeding John Pickley, who has been transferred to the Board of Examiners of Enginemen and Firemen, and T. J. Burke, division engineer at Hazleton, Pa., has been appointed assistant trainmaster of the Mahanoy & Hazleton division, with headquarters at Delano, succeeding Mr. Curry.

J. F. Porterfield, whose appointment as general superintendent of transportation of the Illinois Central and the Yazoo & Mississippi Valley, with headquarters at Chicago, has already been announced in our columns, was born at Pulaski, Ill., on February 23, 1871. He was educated in the public schools and began railway work in May, 1883, with the Illinois Central, with which road he has remained ever since. He was successively messenger boy, telegraph operator, and agent, until 1890, and the following seven years was chief clerk on various divisions. From 1897 to 1905 he was trainmaster on different divisions, and from that date until May, 1912, was division superintendent at Vicksburg, McComb, Miss., at Memphis, Tenn., and at Carbondale, Ill. Mr. Porterfield was then appointed general superintendent of the lines south of the Ohio river, with headquarters at New Orleans, La., from which position he is now promoted to that of general superintendent of transportation, as above noted.

J. F. Porterfield

Engineering and Rolling Stock

James F. Donovan, supervisor of the Lehigh Valley at Delano, Pa., has been appointed division engineer, with headquarters at Hazleton, succeeding T. J. Burke, transferred to the operating department.

B. F. Beckman, superintendent of the Fort Smith & Western and the St. Louis, El Reno & Western, has been appointed engineer of those roads, with headquarters at Fort Smith, Ark.

J. K. Brassill, general master mechanic of the Northwestern Pacific at Tiburon, Cal., has been appointed superintendent of motive power and marine equipment of the Northwestern Pacific lines, with headquarters at Tiburon.

E. T. Reisler, division engineer of the Lehigh Valley at Buffalo, N. Y., has been transferred in the same capacity to Auburn, and L. P. Rossiter, assistant engineer of the Chicago, Rock Island & Pacific, at Manly, Iowa, has been appointed division engineer of the Lehigh Valley, with office at Buffalo, N. Y., succeeding Mr. Reisler.

Traffic

R. C. Campbell, agent of the Georgia Railroad at Athens, Ga., has been appointed general agent, with headquarters at the same place.

C. M. Swan has been appointed assistant general freight and passenger agent of the Mississippi River & Bonne Terre, with office at Bonne Terre, Mo.

W. S. Mitchell, commercial agent of the Missouri Pacific, the St. Louis, Iron Mountain & Southern, the Denver & Rio Grande and the Western Pacific, at Portland, Ore., has been appointed general agent at Seattle, Wash., succeeding J. M. Norton, deceased. E. B. Duffy succeeds Mr. Mitchell.

Michael J. Powers, whose appointment as general passenger agent of the Delaware & Hudson, with headquarters at Albany, N. Y., has already been announced in these columns, was born on June 9, 1882, at Albany, N. Y., and graduated from the Albany Business College in 1899. The following year he entered the service of the Delaware & Hudson as a clerk in the office of the auditor of revenue. Six months later he became a stenographer to the chief clerk in the office of the general passenger agent. In 1905 he became stenographer to the assistant general passenger agent, and was also given charge of the ticket room and the advertising department. Mr. Powers was promoted in January, 1910, to chief clerk, which position he held at the time of his recent appointment as general passenger agent of the same road, with headquarters at Albany, N. Y., as above noted. Mr. Powers' entire service has been with the Delaware & Hudson.

M. J. Powers

OBITUARY

John B. Laurie, purchasing agent and general storekeeper of the Central Vermont, with headquarters at St. Albans, Vt., died on January 16, at his home in that city after an illness of many months. Mr. Laurie was born on February 22, 1862, at Sarnia, Ont., and began railway work with the Grand Trunk. He served as storekeeper on the Grand Trunk at London, Ontario, until September, 1899, when he left that road to enter the service of the Central Vermont and since that time until he was compelled on account of poor health to give up active work had been purchasing agent and general storekeeper of the Central Vermont, with headquarters at St. Albans, Vt. Mr. Laurie is survived by one sister, who is a resident of St. Albans.

J. B. Laurie

John M. Brewer, freight claim agent of the Southern Pacific at San Francisco, Cal., died in that city on January 18.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Servian Government is reported to have ordered 7 small locomotives from the American Locomotive Company.

The Illinois Central, as has been noted in these columns, has ordered 25 Mikado type locomotives from the Lima Locomotive Corporation. These locomotives will have 27 by 30 in. cylinders, 63 in. driving wheels, a total weight on drivers of 217,000 lb., a total weight of 280,000 lb., and a tractive effort of 51,700 lb. The diameter of the boilers will be 82 in. at the smallest ring. The boiler will be built to carry a working pressure of 200 lb., but will be operated at a pressure of 175 lb.

CAR BUILDING

The Illinois Central is in the market for 5 gondola cars.

The Interborough Rapid Transit is in the market for 478 steel car bodies.

The Union Pacific is asking bids on 750 40-ton capacity steel underframe stock cars.

The Minneapolis, St. Paul & Sault Ste. Marie is in the market for 3 postal cars.

The Grand Trunk is reported to be planning to build a number of freight cars in its shops at Chicago.

The Delaware, Lackawanna & Western is in the market for 5 combination passenger train cars with mail compartments.

Stang, Chalfant & Co., Pittsburgh, Pa., are asking prices on ten 150,000 lb. capacity flat cars and six 80,000 to 100,000 lb. capacity hopper cars.

Swift & Company are reported to have ordered 250 freight cars from the Haskell & Barker Car Company. This item has not been confirmed.

IRON AND STEEL

The New York Central has ordered 20,000 tons of steel rails, the total being divided among the Steel Corporation, the Bethlehem Steel Company and the Lackawanna Steel Company.

The New York, New Haven & Hartford has ordered 20,000 tons of steel rails, the total being divided among the Maryland Steel Company, the Lackawanna Steel Company and the Bethlehem Steel Company.

The South Manchurian Railway Retrenches.—The South Manchuria Railway because of the present war has so retrenched as far as new construction is concerned that contractors are all suffering from depressed business. Several of them are reported to be planning to go to Korea.

A Bill to Further Railway Construction in Argentina.—A bill recently presented by the public works committee of the Argentine senate proposes to authorize railways to undertake or continue under the most economical conditions possible, with due regard to security of traffic, branch lines already approved or to be approved. The project would permit postponement of construction of stations and other permanent equipment and employment of used or lighter materials than those prescribed for main lines. Facilities for operating such lines would also be granted, such as stopping between stations, observance of only such measures of safety as are necessary to meet local requirements, and extension of delays for carrying passengers and merchandise. The project would also suspend periods stipulated for surveys and construction of lines already authorized until such time as the executive power considers the financial situation normal. The difficulty of securing capital has made railway extension impracticable in most instances, and in a number of cases additional delays have already been granted by the government for the construction of lines.

Supply Trade News

W. H. Arkenburgh, for a long time publicity manager of the Union Switch & Signal Company, has joined the sales department of the National Carbon Company, Cleveland, O., and will have charge of railway and signal work in Canadian territory.

R. M. Nicholson, former advertising manager for the Kimberly-Clark Paper Company, Neenah, Wis., and also former space buyer for the Cramer-Krasselt Company, Milwaukee, has been placed in charge of the advertising of the Stark Rolling Mill Company, Canton, Ohio.

A fire on the night of January 18 totally destroyed the insulated wire department of the John A. Roebling's Sons Company, Trenton, N. J., at an estimated loss of $1,000,000. No part of the wire mills or wire rope works was damaged, and the work performed by the plant destroyed will be taken care of in other shops.

H. H. Seabrook, formerly district manager of the Westinghouse Electric & Manufacturing Company in Baltimore, has been appointed district manager of the company at Philadelphia, succeeding J. J. Gibson, who has become manager of the tool and supply department at East Pittsburgh. Owing to a consolidation of territories the Philadelphia offices will hereafter embrace that previously covered by the Philadelphia and Baltimore offices.

Announcement is made that on January 1 the John Seaton Foundry Company and the Locomotive Finished Material Company, Atchison, Kan., were consolidated, and that they will hereafter continue the business of both companies under the name of the Locomotive Finished Material Company. The directors of the consolidated companies are as follows: John C. Seaton, H. E. Muchnic, Clive Hastings, W. S. Ferguson and G. L. Seaton.

TRADE PUBLICATIONS

Cork Insulation.—"At War with Heat" is the title of a little booklet issued by the Armstrong Cork & Insulation Company, Pittsburgh, Pa., describing the company's Nonpareil Corkboard Insulation for refrigerator plants and similar facilities.

Railway Buildings.—The National Fire Proofing Company, Chicago, recently published a 24-page booklet describing the use of the Natco hollow tile in railway structures. Numerous buildings are illustrated in which this fireproof material is used.

Lumber.—The Gum Lumber Manufacturers' Association, Memphis, Tenn., has issued a 16-page booklet discussing the use of Red Gum lumber as a cabinet wood. It describes the structure of the wood and illustrates the uses for which it is adapted.

Fuel Oil Burners and Equipment.—The Production Engineering Company, Philadelphia, Pa., has recently issued pamphlet O, entitled "Facts About Fuel Oil," which treats of the company's Peco Oil Burner, and names its advantages for various kinds of service.

Heat Treating Furnaces.—The Quigley Furnace & Foundry Company, Springfield, Mass., has recently issued bulletin No. 7, an illustrated folder illustrating and describing the company's underfired accurate temperature heat-treating furnaces using gas or oil fuel.

Screw Cutting Tools & Machinery.—The Wiley & Russell Manufacturing Company Division, Greenfield Tap & Die Corporation, Greenfield, Mass., has issued catalog 36, containing illustrations, sizes and price-lists of the company's "Lightning" and "Green River" screw cutting tools and machinery.

Valve Gears.—A booklet recently received from the Southern Locomotive Valve Gear Company, Knoxville, Tenn., contains some interesting data regarding the Southern valve gear. A number of indicator cards are included, taken from locomotives fitted with this type of gear as well as data taken from the results of tests of locomotives to which this gear has been applied. Illustrations of the gear itself as well as locomotives fitted with it are included.

Railway Construction

CANADIAN NORTHERN.—The Railway Commission of Canada has authorized this company to open for traffic, its line from a junction with the Battle River subdivision north of Camrose, Alta., to a junction with the Canadian Northern Western near Strathcona (South Edmonton) a distance of 46 miles.

ELECTRIC SHORT LINE.—The laying of steel and ballasting on the 22 miles of new road of this company is nearly completed, and it is expected to be ready for service by February 10, 1915. This stretch will complete the line from Minneapolis, through Stubbs Bay, Lyndale and Watertown to Winsted. The first 18 miles from Minneapolis to Stubbs Bay have been under operation since May, 1914.

HORSE CREEK LAND & MINING COMPANY'S ROAD.—An officer writes that a contract has been given to Board & Duffield, Charleston, W. Va., for building the first section of three miles from Woodville, W. Va., on Horse creek up Peter Cave Fork. About 10 per cent of the work will be rock work, and there will be about 10,000 cu. yd. of cut and fill to the mile. The maximum grade will be 4 per cent and the maximum curvature 12 deg. The line is being built to carry coal, and when completed will be operated by the Chesapeake & Ohio. W. L. Ashby, president; L. E. Poteel, general manager, and Romaine & Snyder, chief engineers, Charleston, W. Va.

HOUSTON & TEXAS CENTRAL.—A strip of land was recently purchased by this company at Hempstead, Tex., to provide room for removing of some unnecessary curvature in yard tracks at that point.

KANSAS CITY, MEXICO & ORIENT.—The cities of Cristobal, Tex., and Sonora have agreed to give bonuses amounting to $315,000 to the Kansas City, Mexico & Orient upon the completion of the branch line from San Angelo, Tex., through Sonora to Cristobal. It is said that this line will eventually be extended to Del Rio, 175 miles from San Angelo.

PENNSYLVANIA LINES WEST.—Improvements are to be carried out at Midland, Pa., to double the capacity of the yards at that place. The work at Midland will include the building of an entirely new yard, and laying additional tracks leading to the yard, a new freight terminal, two overgrade crossings, culverts, water stations and passing sidings.

PENNSYLVANIA ROADS (Electric).—According to press reports from Chambersburg, Pa., a company will ask for a charter in Pennsylvania to build a line from McConnellsburg, Pa., east to Fort Loudon, about eight miles. It is understood that preliminary surveys for the line will be started soon. E. J. Post, H. A. Duffey and D. H. Patterson are said to be interested.

According to press reports New York capitalists have secured an old right of way between Youngsville, Pa., and Sugargrove, 9 miles, and will build an electric line between these two places. Surveys are now being made and it is expected that construction work will be started in the spring.

SOUTHERN RAILWAY.—We are told that bids for grading work were asked for recently, and that this company will at once revise and double track the 28.7 miles of its Washington-Atlanta line between Orange, Va., and Charlottesville. The work will be heavy and will cost $1,500,000. The revision work between Orange and Charlottesville will eliminate 1,303 deg. of curvature, and will give a maximum grade northbound of 0.9 per cent and southbound of 1 per cent as against 1.41 per cent in both directions at present. On the completion of this work, together with other work now under way, the Southern will have a total of 338.7 miles of double track between Washington and Charlotte, leaving only 41.3 miles of single track between these places.

UNITY RAILWAY.—Under this name a company has recently been incorporated at Harrisburg, Pa., with a capital of $190,000 to operate a steam railway in Allegheny and Westmoreland counties, Pennsylvania. The incorporators are all residents of Pittsburgh, and Boyer, Jones & Morton, Pittsburgh, are attorneys for the company.

VIRGINIA-BLUE RIDGE.—This company, which projected a line last year from Tye river, Va., which is on the Southern Railway, north via Lowesville to Massies Mill, about 22 miles, has started construction work, it is said, with its own forces. J. W. Dwight, president, Ithaca, N. Y.; A. K. Murrell, chief engineer, Tye river, Va. (June 19, p. 1565.)

WISCONSIN & NORTHERN.—A proposed new line, extending from Van Ostrand, Wis., north through Lily to Crandon, is being built by this company. The new road will be 30 miles long and will connect existing portions of the main line. Grading will amount to about 16,000 cu. yd. a mile. Six miles have been graded. The maximum gradient will be 0.8 per cent and the maximum curvature 5 deg. One bridge with a span of 70 ft. and about 1,100 lineal feet of pile bridging will be required. Peter Nelson & Co., Minneapolis, Minn., have been awarded the contract for grading. C. H. Hartley, Oshkosh, Wis., is general manager.

RAILWAY STRUCTURES

CHICAGO, ILL.—Following a meeting of the directors of the Union Station Company, last week, a statement was given out that suggestions were made at the meeting as to procuring funds, which make it probable that sufficient money can be obtained to make an early start on the work on the Pennsylvania Company's freight terminal, and that it is proposed to start work as soon as possible on the passenger terminal. Plans for beginning work on the Pennsylvania freight terminal have been delayed by negotiations for some property owned by the Baltimore & Ohio Chicago Terminal, which is involved in an ordinance pending before the council committee.

FALSE CREEK, VANCOUVER, B. C.—In accordance with a contract with the city of False Creek, the Great Northern will construct terminal facilities at that point. Plans, however, have not yet been formulated.

HARRISBURG, PA.—We are told that the Cumberland Valley will start work soon on a new arch bridge over the Susquehanna river at Harrisburg, to replace the present steel deck truss bridge which is a single track structure of 25 spans on stone piers. The new bridge is to carry two tracks; it will have 46 spans and will be 4,000 ft. long. The present piers will be utilized and a number of additional ones built. The work will cost about $750,000. The railroad's forces have already completed the foundations from bed rock to an elevation of about one foot above the normal elevation of the water, and the rest of the work will be placed under contract within a short time. In connection with this improvement the railway will build undergrade crossings at Front and Second streets in Harrisburg. The grades of these streets have been depressed and concrete abutments constructed to support solid floor steel bridges, which will be covered with concrete. This work will eliminate all the grade crossings of the Cumberland Valley in Harrisburg.

JACKSONVILLE, FLA.—We are told that a contract has been given to Hillyer & Sperring, Jacksonville, for building a viaduct which is to carry Duval street over Hogans creek and the tracks of the St. Johns River Terminal Company and the Seaboard Air Line. The viaduct is being built jointly for the St. Johns River Terminal Company and the Seaboard Air Line. It is to be of reinforced concrete construction on pile foundation and is to have a 30-ft. roadway with two 6 ft. sidewalks. There will be 31 spans, varying in length from 18 ft. to 41 ft. each; the length of the viaduct, not including approaches, will be 800 ft., and the fill and approaches 1,335 ft.

SPARTANBURG, S. C.—In connection with its modern export coal terminal, now under construction at Charleston, the Southern Railway announces that on February 1 it will begin work on important additions to its Spartanburg yards and will also extend a number of passing tracks between Spartanburg and Charleston. It is expected that the terminal will be completed by May 1 and the additional track facilities will also be ready by that time. Two additional receiving tracks will be constructed at the Spartanburg Junction classification yard and two at East Spartanburg. Passing tracks will be extended at Carlisle, Alston and Herbert on the Spartanburg division, and at Riley and Fort Motte on the Charleston division.

Railway Financial News

Baltimore & Ohio.—A semi-annual dividend of 2½ per cent has been declared, payable March 1. This reduces the annual rate from 6 per cent to 5 per cent. In making this announcement President Willard commented on the directors' decision as follows:

"When in July last consideration was given to the question of dividend then to be declared we had been hopeful that the railroads in the eastern territory might at an early date be permitted to generally increase their freight rates full 5 per cent as requested, in which event with normal conditions as to business, the Baltimore & Ohio in my opinion should and could with its present facilities, pay 6 per cent on its common stock with a reasonable surplus over.

"Just what the ultimate effect of the recent decision may be cannot now be stated, but it is estimated that with the direct increases allowed, which will largely become effective by February 1, the Baltimore & Ohio should realize an increased net income, based on business of 1914, of from $2,225,000 to $2,500,000 a year, or a sum equal to about 1½ per cent on the common stock.

"Having in mind the effect of these increases on the future revenue of the company, even should the volume of business continue for a time to be only on the basis of the past six months, it is felt that the results in the future, with a proper consideration of the interests of the company's more than 35,000 shareholders, will justify the action taken at this time in declaring a 2½ per cent dividend, although the earnings for the first six months fell somewhat short of the amount necessary for this purpose."

See also President Willard's comments on the general situation printed elsewhere in this issue.

Chicago, Milwaukee & St. Paul.—Kuhn, Loeb & Company and the National City Bank, both of New York, have underwritten the offer of $29,141,300 5 per cent convertible bonds of the Chicago, Milwaukee & St. Paul which was made to stockholders at par.

Chicago, Rock Island & Pacific.—Former Judge Walter C. Noyes has been appointed receiver of the Chicago, Rock Island & Pacific Railroad, the Iowa holding company, maker of the collateral trust mortgage bonds under which the Railway company stock was deposited. This is one of the final steps in the winding up of the affairs of the holding companies.

The bondholders' committee has sent a notice to depositing bondholders reading in part as follows:

In order to carry out the purchase of 713,535 shares of Chicago, Rock Island & Pacific Railway stock, the committee has borrowed the entire amount of the cash requirements under the plan, for which the committee has pledged the stock required, as well as all deposited bonds and coupons.

Bonds in excess of $61,354,000 have been deposited with the committee under the plan so that if no additional bonds are deposited with the committee and if none of the undeposited bonds avail themselves of the right of exchange given by the court order, the amount of excess stock cannot in any event reach $10,000,000. The entire amount of stock available for distribution under the plan is distributable among depositors againts payment of their pro rata share of the cash requirements of the plan.

The committee deems it of the utmost importance to depositors that, so far as practicable, distribution of stock should be made as soon as possible so that depositors may exercise the rights of stockholders at the annual meeting, which now stands adjourned to March 15, 1915, and in the meantime be in a position to take such action looking toward their mutual protection as they may deem wise. The committee, therefore, proposes at once and Central Trust Company is now ready to make distribution of stock equal at par to the face amount of the deposited bonds against payment by depositors of their pro rata of the costs of foreclosure and the expenses of the committee ($4.45 per bond), leaving the excess stock to be distributed as soon after March 15, 1915, as possible. The excess stock available for distribution to depositing bondholders will be distributable at the price of $10.42 per share (which includes interest and cost of federal and state transfer stamps). The amount realized from such distribution, together with the payment by depositing bondholders of $4.45 per bond and the amounts to be received from non-depositing bondholders under the court order of December 21, 1914, will, in the aggregate, suffice to meet the cash requirements of the plan.

Missouri, Kansas & Texas.—One of the provisions of the agreed judgment by which the affairs of the Missouri, Kansas & Texas, of Texas, was adjusted with the state of Texas was that joint auditors should be appointed to investigate the charge that the Texas company had been unfairly treated by the Kansas company.

This report has just been filed in the district court. O. H. Bowers, auditor of the company, was selected to represent the railroad, and W. S. McFarland, a chartered accountant of Nashville, Tenn., was appointed by Attorney-General B. F. Looney to represent the state of Texas. These two auditors are unanimous in their findings that the Missouri, Kansas & Texas of Texas has never at any time been made to bear an undue or illegitimate burden for the benefit of its parent company; on the contrary, the Texas property has been favored in several important respects, particularly in the matter of using the cars of the Missouri, Kansas & Texas of Kansas, the latter making no rental charge for such equipment. As to division of earnings, the report says they were found to have been fair and in accordance with the best practices. The joint expenses of the two properties are prorated on the basis of gross earnings, which the report says is fair. The Missouri, Kansas & Texas of Kansas furnishes its Texas subsidiary supplies at actual cost. The joint auditors say that the Missouri, Kansas & Texas of Texas owes the Missouri, Kansas & Texas of Kansas $23,000,000 on open account. This is a just claim, the report says.

Missouri Pacific.—The Wall Street Journal published an article last week stating on what was said to be the best authority that the Gould family and Gould estate had practically sold all of their stockholdings of Missouri Pacific, various members of the family retaining only sufficient stock to qualify as directors.

A committee has been formed which is asking for proxies for the annual meeting. The committee consists of Alexander J. Hemphill, chairman of the board, Guaranty Trust Company, New York; Otto H. Kuhn, of Kuhn, Loeb & Company; Seward Prosser, president, Bankers' Trust Company; James N. Wallace, president, Central Trust Company, all of New York, and Robert Winsor, of Kidder, Peabody & Company, Boston.

New York, New Haven & Hartford.—The Connecticut superior court has overruled demurrers filed by the defendants in the suit by the New York, New Haven & Hartford against John L. Billard and others to recover $3,825,147 claimed to be the profit in the transfer of the Boston & Maine stock to and from the Billard Company.

Pennsylvania Railroad.—The company has published notices that it is prepared to dispose of its surplus real estate holdings. The surplus real estate holdings in New York alone are estimated to be worth in the neighborhood of $10,000,000, and the company has large quantities of valuable real estate in other cities.

West Jersey & Seashore.—A special meeting of stockholders has been called for February 4 to authorize the issue of $3,000,000 additional stock and the creation of a mortgage to secure $13,000,000 bonds. Sufficient bonds under the new mortgage to retire $6,373,000 first consolidated mortgage bonds now outstanding will be reserved.

Travel to Switzerland and Italy.—Daily railway service is now in operation between Paris and Switzerland and Italy, by way of Basle. First, second and third-class through cars run between Paris and Basle, dining cars from Bologna to Florence and vice versa, and from Milan to Venice and Bologna to Milan, and sleeping cars from Rome to Florence and Brindisi to Milan.

Fuel Economy on the Great Western

An interesting feature of the fuel economy campaign being conducted on the Chicago Great Western, a description of which is published elsewhere in this issue, is the success attained in determining the amount of coal used by each engine crew. In contrast to the results obtained on some roads the automatic recording scale for weighing the coal delivered to locomotive tenders has given satisfactory service. The method of estimating the amount of fuel left on the tenders on arrival at terminals by means of metal strips on the sides of the coal space is also giving good results. This estimating is done by one man at each roundhouse, who becomes sufficiently experienced to give a close estimate. The secret of the satisfactory use of the scales is in their periodic inspection and careful maintenance. Another thing in favor of the plan adopted by this road for the economical use of fuel is its organization. The superintendent is supreme on each division over every department. He is held responsible for the fuel record on his particular division; and because of his absolute authority he is in a position to enforce the proper co-operation between the different departments. The economical use of fuel is a live issue all over the road, and the enginemen display a friendly rivalry in seeking to head the published list each month. The fuel potential is not placed so high but that it may be beaten by some of the more careful crews, with the result that the crews have faith in the figures and know that the management desires to give them a fair chance. The success of any system is dependent largely on the faith the men concerned have in it, and from all reports the one in effect on the Great Western has the confidence of the enginemen as well as of the officers of the road.

An Achievement by Private Ownership

On Monday of this week Mayor Mitchel of New York talked by long distance telephone directly with Mayor Rolph of San Francisco. This inauguration of direct long distance telephone service between the Atlantic coast and the Pacific coast is the result of a successful achievement by private ownership of a public utility unaided by government and in spite of restrictive legislation. To get a telephone connection with a number in London from anywhere outside of a radius of 25 miles takes fully half an hour, and when the connection is at last obtained it is so bad, 50 per cent of the time, and so interrupted, as to try the patience of a saint. In England, as in France and other European countries, the telephones are operated by the government. The establishment of direct telephone service between New York and San Francisco cannot help but stir the imagination even of a people who have become casehardened to the achievements of modern science. As a matter of fact, however, it is no more of an achievement and no more deserving of admiration and praise than is the perfection of the kind of telephone service that is given in a single city like New York or Chicago. If it were possible to make a statistical compilation showing the percentage of avoidable annoyances in telephone connections to the total possibilities of annoyance through some slight error or carelessness on the part of operators, the minuteness of this percentage would be striking. The perfection of training of the telephone operators generally in a city like New York is a stupendous task and its successful accomplishment is undoubtedly in very large measure due to the will of one man impressing on the minds of subordinate officers that courteous service by telephone operators must be attained. Such a result under government ownership is inconceivable.

The Long Island and the Pennsylvania

Dick Brothers, a brokerage house of New York, after having offered to sell to the Pennsylvania their holdings of the minority stock of the Long Island at par, which offer was, of course, refused, have sent out a circular to Long Island minority stockholders charging the Pennsylvania with mismanagement of the Long Island. In an attempt to show that this is not an ordinary case of holdup, Evans R. Dick has drawn attention to the fact that in 1900 the Long Island was prosperous, and in 1913 showed a deficit of more than $1,000,000. As a matter of fact, 1900 happened to be one of the most prosperous years in the history of the Long Island and in that year it earned $59,000 above interest and fixed charges, or half of one per cent, on its $12,000,000 stock; and even in that year, after crediting this $59,000 to profit and loss, it was carrying a debit balance in the profit and loss account of $844,000. The charges against the Pennsylvania should be dismissed without mention were it not that they call attention in a rather interesting way to the inadequacy of passenger rates at a time when this subject is particularly interesting to the Interstate Commerce Commission and rail-

road managers all over the country. The Long Island is dependent for more than half of its total gross revenue on passenger business. The road does a very large commutation business, but its commutation rates are generally higher for short distances than on the other roads doing a large commutation business out of New York City. The road is particularly well managed, Mr. Thornton's "call" by England being a commentary on the management of the Long Island. Passenger business is dense and in some respects analogous to the business on English railroads. Nevertheless, the Long Island has been adding, almost without exception, each year to its deficit, the Pennsylvania really standing the losses. The particular minority stockholders who have raised the protest are not in need of sympathy, but railroad stockholders generally, and also the Interstate Commerce Commission and especially the state commissions, should carefully study the Long Island situation. The Interstate Commerce Commission has shown in various ways that it is aware of the inadequacy of passenger rates, but state commissions are still either wilfully or ignorantly unaware of the facts.

WHAT SHALL BE DONE REGARDING THE VALUATION?

SOME people believe and allege that the railway managers are opposed to the continuance of the federal valuation of railways. They are mistaken. The leading railway managers are divided in opinion on this subject. Some of them believe that the valuation should be discontinued at once, on the ground that it would not afford a practical basis for the regulation of rates, and that therefore to carry it to a completion would be a waste of both the railroads' money and the public's money. Others advocate making a valuation of only some group of roads, to determine the practicability of using valuation as a basis for the regulation of rates.

Still others favor carrying the project through to completion. No railway manager regards valuation as a desirable or practicable basis for regulating all rates. But a large part of the public still believes that the railways as a whole are overcapitalized, and that a valuation of their properties should be made to determine whether their net earnings and rates in general are reasonable. The railway managers who favor completing the valuation are confident that as to a large majority of individual roads it will exceed their capitalization, and that as to the railways as a whole it will greatly exceed their capitalization; and they wish to see it finished as a means of confuting those who charge that the railways are overcapitalized, and of establishing their right to larger net earnings and advances in rates.

A highly interesting discussion of the question of the continuance of the valuation work was contributed to the *Railway Age Gazette's* annual review number, published January 1, by Charles A. Prouty, director of valuation of the Interstate Commerce Commission. Mr. Prouty makes a very able and persuasive argument for the continuance of the valuation. He points out that, regardless of anybody's opinion concerning the practicability of using valuation as a basis for the regulation of rates, the courts have held that it is the chief standard for measuring their reasonableness as a whole. He concedes that it would be folly for the Interstate Commerce Commission to hold that it could not act on petitions of the railways asking for advances in rates until after the valuation is done; and he also concedes that after the valuation is finished the commission probably should not restrict the railways to a return on their valuation so low as barely to avoid confiscation. But, he argues, the commission and the courts should have a valuation to serve as a guide in the regulation of rates as a whole, and the problem of regulating them will never be solved until a valuation is made.

While we recognize the force of Mr. Prouty's argument, we believe that there is much force also in the contention that instead of trying to make a valuation of railroads in all parts of the country at once, as the commission is now doing, it would be best for it to confine its work for the present to some one group of railways, and, if a valuation of all is to be made, to take them up group by group. Suppose that it goes on making simultaneously valuations of one road in the East, of another in the South, of another in the Northwest, of another in the Southwest, and so on, as it is now doing. It has been estimated that it will take ten years to finish the appraisal of all the lines in the country. If so, by pursuing its present policy, in ten years from now the commission will report a valuation for all railways which will not be as of the same date for any two roads in the same group. It will report a valuation as of one date for the Baltimore & Ohio and as of another date for the Pennsylvania. It will report a valuation as of one date for the Great Northern, and as of another date for the Chicago, Milwaukee & St. Paul. This procedure, it would seem, would render it impossible to regulate the rates in any territory with reference to the valuation until it was entirely finished, because rates must be regulated, if they are to be fairly regulated, on groups of railways, and not on individual railways. Another result might be, it would seem, that it would be impossible to use the valuation as a basis for the regulation of rates at all because of the differences between the dates on which it would be finished on different railways in the same group. Suppose that the valuation on the Baltimore & Ohio were finished in 1916, and that on the Pennsylvania in 1924. Could valuations of these two roads finished eight years apart be used as bases for the regulation of their competitive rates? It is true that it is planned after the valuation of a road is made to keep it up to date by accounting methods, but the courts hold that the measure of the reasonableness of rates fixed by public authority is the value of the property at the time they are fixed, and it is very questionable whether a valuation made five or ten years ago and kept up merely by bookkeeping methods would be accepted as a satisfactory valuation today.

Suppose, on the other hand, that the commission should take the railways a group at a time. There would be no serious difficulty in dividing them into groups. The New England lines naturally fall into one group, the Eastern Trunk lines into another, the Central Freight Association lines into another, the Trans-Missouri lines into another, and so on. It would take nowhere near as long to make a valuation of one group as to make a valuation of all groups. Under this plan the valuation of all the railways in a group would be made as of the same date. When the valuation of one entire group was finished the commission could at once begin to regulate rates with reference to it. The legal questions which the making of the valuation, and the attempt to use it as a basis for the regulation of rates, are sure to raise can be raised just as well in respect to the valuation of a single group of roads as in respect to the valuation of all the railways. If the valuation of a single group were begun now and pushed to completion these legal questions might be raised and settled before the valuations of most of the other groups were finished, or perhaps even begun. The settlement of these questions would be of immense value to congress and the commission in dealing with the valuation of the other groups.

Furthermore, if the commission should evaluate the roads group by group it would be only a comparatively short time until some practical use could be made of the valuations of one or more groups—assuming that the valuation will be of any practical use at all; whereas, if the commission continues its present policy of making valuations of roads scattered all over the country, little or no use, it would seem, can be made of the results until the entire work shall be finished, and all the legal questions shall be fought out in the courts, which would be years in the future.

The argument in favor of taking up the railways group by group seems overwhelmingly strong, and it is to be hoped that this plan will be given early and serious consideration by the commission. It seems to be the right plan, whether the matter be viewed from the standpoint of those who question the desirability and practicability of valuation as a basis for the regulation of rates, or from the standpoint of those who, like Director Prouty, have no doubt of its desirability and practicability. If

valuation is undesirable and impracticable, then the valuation of the railways by groups will prove this sooner than the policy now being pursued. If valuation is desirable and practicable, then valuation by groups will prove this sooner, and produce results which will be of practical use sooner, than the policy now being followed.

THE WORK OF THE BOARD OF MEDIATION AND CONCILIATION

THERE is a fundamental difference between the work which can be done by the Board of Mediation and Conciliation and that which can be done by an arbitration board. The United States Board of Mediation and Conciliation can never arbitrate any question. If it does its usefulness has begun to be impaired on the claim that it has taken sides. Neither can the Board of Mediation and Conciliation be concerned solely with abstract justice. A sound judgment of expediency and an absolute impartiality are more important to it than a theoretical knowledge of abstract justice.

The board appointed by President Wilson, of which Judge Chambers is the commissioner, Judge Knapp the other member and W. W. Hangar the assistant commissioner, has held office for a little over a year. Its first annual report was made public recently and an abstract of it is given elsewhere in this issue. On the whole the working of the new law has been a material improvement over that of the Erdman act, and the board's work may fairly be considered a success. Few railroad men, however, really understand the nature of the work of this board, and there is nothing in the board's report describing what this work is. The procedure of the board in a dispute is in most cases substantially as follows: One or both sides to the controversy call on the board to intervene. The board then goes first to one side and then to the other, becoming the confidant of both. Of course neither side is willing to show its hand to the other side, but is willing to indicate to the mediation commissioner the nature of the concessions which it is prepared to make and the points on which no concessions will be made. It then becomes the duty of the commissioner to decide whether or not there is any possibility of agreement short of arbitration. If there is his work lies in getting the necessary concessions from each side so as to make the two parties to the controversy approach a common level, each one, however, being kept in ignorance of how far it is necessary for that side to go and how far the other side has already gone. Shrewd judgment, impartiality, a knowledge of human nature and of the prejudices and idiosyncrasies of labor leaders and employers are essential, and with all must go great firmness. Both the employer and the labor leader are often engaged in playing a game partly with the backing of the cards which they actually hold and partly on the strength of their ability to bluff. It is no part of the commissioner's duties to help either side win this game. His duty consists in preventing a deadlock.

If a Board of Mediation and Conciliation were once to arbitrate a particular question it would have made a ruling amounting to a precedent on which one or the other side would bank in a future controversy, while one or the other side would refuse to accept mediation because their point had already been decided against them.

In this connection the board's report says:

"In not a few instances the parties have requested and even urged the board to settle their controversies as if in arbitration, but this the board has declined to do; because, in the first place, in its opinion, the language of the law did not confer such authority, and, secondly, because it would jeopardize if not destroy mediatory efficiency of the board. The board advises, and makes rulings, but always without binding the parties to accept the same."

It will readily be seen, therefore, that the Board of Mediation and Conciliation can never make public either the justice or the injustice of the position taken by either party to a controversy.

The annual report of the present board is almost, if not quite, unique among recent reports of government administrative bodies in that it specifically asks that no further powers be conferred on the commission. The very thought must be positively stunning to the great majority of state and federal commissions. However, in this particular case, although the board is unquestionably right in asking that no further powers be assigned to it, there is a function in connection with labor disputes, the exercise of which should be productive of much good, but which is not provided for in the Newlands act. The Board of Mediation and Conciliation can attempt to bring together two parties to a controversy. If it fails an arbitration board can decide the specific points at issue; but only incidentally does the public hear an impartial exposition of the merits of the whole controversy. What is there to keep railroad officers, on the one hand, from refusing arbitrarily an obviously just demand of employees, or labor leaders, on the other hand, from making preposterous and utterly indefensible demands, trusting that in the case of bluff which follows they may gain something, having nothing to lose. With impartial publicity given to the merits and demerits of both sides of a controversy, public opinion would act strongly to deter either side from taking an indefensible position. Since the Board of Mediation and Conciliation is entirely barred from giving away the secrets of either side, there might be some commission or commissioner whose duty it would be to make a thorough, impartial investigation of the merits of any controversy which was serious enough to lead either to open hostilities, a call for arbitration or a call for mediation; and after such an investigation had been made to make public the facts in an entirely impartial and non-partisan statement.

ONE EFFECT OF RETRENCHMENT IN MAINTENANCE OF WAY EXPENDITURES

IT is common knowledge that the past year has been one of severe retrenchment for the railroads. When reductions in expenditures are necessary, the maintenance of way department suffers particularly, for almost invariably it is felt that retrenchment can be effected here without the detrimental results becoming evident as quickly as elsewhere. While no one believes that such a reduction results in ultimate economy, there are times when it becomes absolutely necessary to cut expenses somewhere. In addition to the fact that the detrimental effects are not evident at once, the impression frequently exists that the results of retrenchment in maintenance of way expenditures are confined to the track and structures themselves. But, there is an increasing realization of the fact that the neglect of maintenance of way is reflected directly in increased transportation expenses arising from increased delays to trains and ultimately in a decrease in trainloading, etc.

Deterioration in the condition of the track also contributes to increased charges for the maintenance of equipment. The figures given below show the expenditures for maintenance of way and for maintenance of equipment and the gross earnings of 15 representative roads with over 77,000 miles of line for the first three months of the present fiscal year, and for the same periods of the two preceding years.

EARNINGS AND EXPENDITURES, JULY 1–SEPTEMBER 30

	Maintenance of way per mile of line	Maintenance of equipment per mile of line	Gross earnings per mile of line	Cars in shop (all roads)	Per cent of cars in shop to total (all roads)
1912.....	$528	$645	$3,951	157,090	6.84
1913.....	574	688	4,042	177,114	7.50
1914.....	511	688	3,966	212,930	8.84

Thus, while the expenditures for maintenance of way for the first three months of the fiscal year 1914 were 3 per cent *below* those for 1912, the charges for the maintenance of equipment have *increased* 7 per cent, with practically the same business handled, while the number of cars in the shops increased almost 56,000. Comparing 1913 with 1914 maintenance of way expenditures decreased 11 per cent and gross earnings 1 per cent, while the charges for maintenance of equipment remained

stationary, although the number of cars in the shops increased almost 36,000.

Since it is to be assumed that the same policy of retrenchment is being followed in the mechanical as in the maintenance of way and other departments, as in fact is shown by the accumulation of bad order cars, it is evident that it would require an even greater expenditure to maintain the equipment in its normal condition.

It is entirely reasonable to assume that there is some definite relation between this *increase* in the expenditures for maintenance of equipment and the *decrease* in charges for maintenance of way. Although many items entering into the cost of maintaining equipment, such as the painting of cars, are entirely independent of the condition of the track, other items, such as the cost of locomotive maintenance, the repair of broken trucks, etc., are dependent to a certain extent upon the condition of the track.

Railway managements can well afford to analyze their maintenance of equipment charges to ascertain to what extent these fluctuate with the condition of the track. Such a study may show that severe retrenchments in expenditures for maintenance of way do not secure even an immediate economy, owing to their effect upon other accounts, and that it might be more economical to make reductions in expenditures in other departments. Such a study would be most instructive if made at a time like the present, following an extended period of retrenchment.

THE SITUATION IN NEW ENGLAND

PEOPLE often speak of the "railway situation." There are really several "railway situations" in this country. The railways naturally divide into groups, and the conditions with which they are confronted vary from group to group.

One of the most complex, puzzling and difficult situations is that in New England. The roads formerly comprising the New Haven system, the principal of which, of course, are the New York, New Haven & Hartford and the Boston & Maine, were in some ways badly mismanaged during the regime of Charles S. Mellen. The worst feature of his administration was the abuse of the road's credit. The management of the operating and traffic departments was generally efficient; but the use made of their financial resources was unwise and even scandalous. There is a lesson here for stockholders in railways generally. This is, that it is most unsafe to turn over the running of their business to a board of directors, and then pay no attention for years to what the directors do. The stockholders have their responsibility for what happened in New England as well as the directors and Mr. Mellen.

However, the stockholders, the directors and Mr. Mellen are all paying pretty dearly for their parts in the business. Mr. Mellen has been retired in disgrace. The directors have been denounced and are being prosecuted for many things they did and for some things they did not do. The stockholders are paying for their more or less guilty quiescence and acquiescence through the loss of their dividends.

But, though justice may require that the stockholders shall suffer for what the managers of their properties did, it does not impoes on them also the penalties for developments for which neither they nor the managers were in any way responsible. And, as a matter of fact, the present position of the New Haven and the Boston & Maine, while largely attributable to the faults of the Mellen regime, is also largely due to the peculiar conditions in New England, and to a series of developments which have affected all the railways of the United States, but which, because of the conditions in New England, have affected the railways in that section with special force.

One respect in which New England differs from practically all the rest of the country is that its population and industry have reached a stage of development comparable to that reached in the leading countries of Europe. Because population and industry have reached this stage there they do not grow as fast in proportion as in most other parts of this country. It results, of course, that railway traffic, and especially freight traffic, does not grow as fast in proportion as in other territories. Furthermore, the traffic of the New England lines is of a character unique in the United States. The proportion of high-grade to low-grade freight is much greater than in other sections, and the ratio of passenger to freight traffic is also much greater.

Now, every one of these conditions renders it especially difficult to make physical improvements in railways except at great cost, or to introduce economies in operation. In a territory where the population is so dense, where towns and cities are so close together, the real estate is extremely valuable, and the cost of acquiring the property needed to enable a railway to expand its facilities is especially great. Furthermore, a traffic which grows relatively slowly, and which is composed to so very large an extent of high-grade freight and passengers, does not yield readily to those methods for increasing carloads and trainloads which are the most effective means—where they can be adopted—of bringing about operating economies. For these and other reasons the difficulties in the way of making physical improvements and economies in operation on the railways in New England have been in the past, are now, and will be in the future, greater in proportion than those encountered in other parts of the country. Whatever tends to make necessary increases in capital investment or in taxes, in the wages of employees or the prices of material, must, therefore, increase both the capital cost and the operating cost of handling each unit of traffic more in proportion in New England than elsewhere.

Now, the New England lines have not been and will not be immune from those influences which render it necessary for the railways to increase their property investment in order to handle their business satisfactorily or from those which cause large increases in wages, taxes, and so on. President Hustis of the Boston & Maine, in a statement before the Public Service Commission of Massachusetts on January 6, said that during the five years 1910-1914, inclusive, $3,000,000 was spent on this property for betterments and charged to operating expenses; and he estimated that during the next five years $16,000,000 should be spent for necessary improvements. He also stated that between 1901 and 1914 the operating expenses of the road had been increased $5,000,000 a year by increase in wages.

These figures illustrate the trend of things, not only on the Boston & Maine, but on the New Haven, the Boston & Albany and other lines in New England. They must make investments in improvements; they must meet increases in wages and taxes as the other railways of the country must; but, for reasons already indicated, their physical conditions are such that they cannot offset the increases in expenses by the introduction of more economical methods to the same extent as most of the other railways of the country can.

But the very same conditions in New England which make it very difficult to introduce extensive economies in railway operation also make it imperative that that section shall have good railway service; for, of course, the larger the extent to which the traffic of a section is composed of high grade freight and passengers, the more imperative is it that every practicable measure shall be adopted to put and maintain its railway service on the highest plane. Furthermore, if New England's factories, which are the very foundation of her prosperity, are to continue to live and meet the competition of the factories of other parts of this country and of the world, good railway service they absolutely must have. All the conditions have conspired to make necessary important readjustments and increases in rates.

The people of New England and their railroad commissions have, in the main, shown a remarkable appreciation of the situation confronting them. The New Haven scandal was enough to disgust and enrage any intelligent community. But as soon as the New Haven and the Boston & Maine were turned over to new managements, and the new managers began to take the

public into their confidence, the people and most of the commissions began to give them a sympathetic hearing and hearty support. Plans have been worked out and accepted for general readjustments of both freight and passenger rates. But, as often occurs in such matters, a snag has been struck. The Massachusetts commission has held up an advance in passenger rates in that state which has been allowed in other states. If the advance were disallowed in the state of Massachusetts this might interfere with advances in all the other New England states.

It is to be hoped that the public and regulating authorities of New England will continue to take an intelligent and sensible view of the situation with which they and the railways are confronted. Doubtless the investors in the railroads should pay for the mistakes made and offenses committed by the old management of the New Haven. But the old management is gone. The New Haven and the Boston & Maine are now in the hands of men who deserve and should receive the unqualified confidence and support of the public. New England wants and needs good transportation more than almost anything else. The new managements of the New Haven and the Boston & Maine want to give this, and they are competent to do so if properly supported by the public which they serve. But they cannot do for New England what New England wants them to do for it unless New England backs them up.

New England is confronted, not with a theory of abstract equity, but with a condition of industry which presents a problem of the hardest and most practical kind. It may be that still other advances in rates besides those already asked and granted will have to be made in order to put its transportation system in the condition that it ought to be in. It will pay New England to inform itself fully as to the facts, and then to act accordingly. New England's future depends on this.

NEW BOOKS

Poor's Manual of Railroads for 1915. Published by Poor's Railroad Manual Company, 535 Pearl street, New York. 2,046 pages.

The 1915 Poor's Manual of Railroads is the forty-eighth number of this standard compilation of railroad statistics. It contains abstracts from the statements of all of the 1914 annual reports which have been issued, and the general information contained in it is revised to December, 1914. Poor's Manual has had an enviable reputation for accuracy for nearly half a century and in the last few years more effort has been put into getting it out as soon after the close of the year as is possible. The 1915 number is gotten out earlier in the year than any previous number. The Manual is, of course, an indispensable part of all statistical libraries and if a railroad executive officer were to have only one book in his library that book ought to be Poor's Manual.

Brass Furnace Practice in the United States. By H. W. Gillett. 287 pages, illustrated, 5¾ in. by 9 in. Bound in paper. Published as bulletin No. 73 of the Department of the Interior, Bureau of Mines, Washington, D. C.

This bulletin is issued as a contribution to the increase of safety and efficiency in the preparation and utilization of the mineral resources of the United States. The object of the investigation of brass furnace practice was to find out the melting and fuel losses in brass melting as practiced at present and to indicate as far as possible the methods by which the losses may be reduced. The investigation deals with the general types of furnaces in use and gives the result of the investigation in detail. General factors affecting the operation of brass furnaces are carefully considered and considerable space is devoted to remarks on furnace types and parts. Possible improvements in furnaces and accessories are discussed as well as some furnace problems which are awaiting solution. The latter part of the book is devoted to various causes of disease and danger and essentials for health and safety.

Letters to the Editor

OPPORTUNITIES FOR TRAIN DESPATCHERS

WARREN, Ark.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Referring to C. L. J.'s article in the issue of January 15, asking why chief despatchers do not receive more recognition, I would like to say that I believe I am making a low estimate when I say that 75 per cent of the presidents, general managers, general superintendents, superintendents and trainmasters on the railroads of this country were once chief despatchers. If I am right, where is there any cause for complaint?

W. S. HOBBS,
General Manager, Warren & Ouachita Valley Railway.

[Certainly, a very large percentage of railroad operating officers gained their early experience in the telegraph and despatching service. The following is a list picked out at random of the names of 25 prominent railroad officers who have been despatchers: F. C. Batchelder, president, Baltimore & Ohio Chicago Terminal; H. A. Boomer, general manager, Lake Erie & Western; S. M. Braden, general superintendent, Chicago & North Western; F. H. Britton, president, St. Louis Southwestern; D. L. Bush, vice-president, Chicago, Milwaukee & St. Paul; E. E. Calvin, vice-president and general manager, Oregon Short Line; E. H. Coapman, vice-president and general manager, Southern; W. S. Cooper, general superintendent, Chicago, Milwaukee & St. Paul; H. O. Dunkle, general manager, Erie; A. J. Earling, president, Chicago, Milwaukee & St. Paul; H. B. Earling, vice-president, Chicago, Milwaukee & St. Paul; J. A. Edson, president, Kansas City Southern; T. J. Foley, general manager, Illinois Central; F. C. Fox, general manager, Atchison, Topeka & Santa Fe; W. A. Gardner, president, Chicago & North Western; Marvin Hughitt, chairman, Chicago & North Western; C. W. Kouns, general manager, Atchison, Topeka & Santa Fe; D. C. Moon, general manager, New York Central; H. U. Mudge, president, Chicago, Rock Island & Pacific; G. L. Peck, fourth vice-president, Pennsylvania Lines; W. B. Scott, president, Sunset-Central Lines; Milton H. Smith, president, Louisville & Nashville; W. S. Tinsman, chairman, General Managers' Association of Chicago; J. J. Turner, vice-president, Pennsylvania Lines; Frank Walters, general manager, Chicago & North Western.—EDITOR.]

A PRACTICAL CAR POOLING PLAN

HOUSTON, Tex.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I have read J. S. Marvin's article entitled "Shipper Advocates Car Pooling," which appeared in the January 1 issue of the *Railway Age Gazette*. It is a thoughtful article, and the ideas advanced are clearly brought out. It is probably true that generally speaking Mr. Marvin has accurately stated the shippers' point of view the country over in this matter of car handling, and it occurs to me that the carriers owe it to the shippers to state at this time what has been done recently to meet their views in a concrete way.

On October 1 of the year just closed, the roads comprising what is known as the Sunset-Central Lines have, by written agreement, permitted their cars to be used in common by a direct connection, which is in keen competition with the Sunset-Central Lines. The road which has been given this permission has, in turn, extended to the Sunset-Central Lines, a like privilege. Under the terms of the agreement, the provisions of the car service rules of the American Railway Association, which rules are pointed out by Mr. Marvin as imperfect both in times of car surplus and of car shortage, are waived. Both parties to this agreement were prompted to act in the matter in a de-

sire to please their patrons, and in the hope of decreasing operating expenses. For fear it might not work out satisfactorily, the public has not been informed of the experiment. Knowing as we do how directly concerned the shipping public is in any move of this kind, and knowing also how anxious the public is that the carriers shall make progress in the matter, we should perhaps have made this experiment public from the outset. Even if it had not worked out well, the public would at least have known that an active effort was being made.

For the further encouragement of those who feel that "the shipping public is entitled to have the railroads make a definite start," I will state that on the very day the January 1 issue of the *Age Gazette* reached us, our people executed a formal agreement with another direct connection, which also is an active competitor, whereby cars of that line and of the Sunset-Central Lines will be used in common by both parties to the agreement.

It will be of further interest to know that in waiving the provisions of the car service rules of the American Railway Association, which is done in arranging the pooling plan, both parties are guarding against any unfairness on the part of either.

It is not an unregulated car pool, such as exists all too generally.

A copy of the agreement follows, and there is no reason why the public should not be made entirely familiar with its contents.

Car Equalization Agreement

Each subscriber to this agreement may use as its own, box, stock, flat and coal cars of each other subscriber, the initials of which hereinafter appear and are made a part of this agreement. Such cars may be loaded in any direction, without regard to the Car Service Rules, and without incurring penalty under Per Diem Rule 19 of the American Railway Association.

A subscriber may include, as its own, cars which do not bear its initials by filing with the other subscribers the authority of the owning road.

Each subscriber shall undertake to supply an equal number of cars under this agreement. When a subscriber has provided an excess of cars, equal to 10 per cent more than another subscriber, the creditor subscriber may make written demand upon the transportation officer in charge of car distribution of the debtor subscriber for an equalization within seven days.

The debtor subscriber may equalize by delivering to the creditor subscriber the requisite number of

(a) Creditor subscriber's cars, or

(b) Debtor subscriber's serviceable cars.

It is agreed that the Sunset-Central Lines will, upon demand made by the S. A. & A. P., return within seven days to the S. A. & A. P. as many S. A. & A. P. special fruit and vegetable cars needed for loading fruit or vegetables, which may be in the possession of the Sunset-Central Lines, as may be called for by the S. A. & A. P.

Failing to equalize within the prescribed period, the debtor subscriber shall pay to the creditor subscriber $2 per car per day for the excess number of cars then or thereafter in the possession of the debtor subscriber, commencing after midnight of the sixth day following date of written demand, and continuing until equalization is made. This rate shall be in addition to the regular per diem rate.

If the records of the creditor and debtor subscribers differ as to the number of cars necessary to the equalization, it shall be made on the basis of the average of the statements of the two subscribing roads. Payment shall be made within thirty days after the close of each month, based on actual figures ascertained by joint check.

This agreement shall become effective January 1, 1915. It may be terminated upon thirty days' advance notice in writing, served by the subscriber desiring to terminate the agreement, upon the subscriber with which the agreement is to be terminated.

Misunderstandings, which cannot be promptly settled, shall be referred to the Per Diem Rules Arbitration Committee or the American Railway Association, as provided in the case of disputes under the regular per diem rules.

The essential difference between the plan described, which we hope will eventually bring substantial relief to shippers as well as to carriers, is that the car owner is at all times assured of a square deal; in other words, is protected by an iron-clad agreement.

And this move to afford shippers substantial relief in car handling is not confined to Texas, even though it has chanced to take more concrete form here than elsewhere. An advance sheet from the minutes of the Association of Transportation and Car Accounting Officers, just at hand, which association is composed of representatives of railroads of the United States and Canada, shows that at the regular fall meeting held in Richmond, Va., on December 8, 1914, the matter was discussed fully, both from the standpoint of the car pooling plan, already started, and from the standpoint of creating "conference committees," some half dozen all told, to cover the various sections of America, to promote improvements in car handling. It is understood the conference committee plan has been passed to the American Railway Association within the last few days.

It is obvious, therefore, that real progress is now being made, and it is gratifying to find how fully it meets the views of the shippers. Possibly it will be found expedient to expand the conference committee idea to include the representatives of shippers. At any rate the carriers realize the public's intense interest in such matters, and are trying to meet their view. It is barely possible that the public has, in a way, mistaken the silence of the carriers as an evidence of indifference. The carriers are extremely anxious to make progress, and it is a little unfortunate that they have not advertised their attempts to improve this phase of the service, even though the attempts have not been particularly fruitful, except possibly within the last few months.

F. M. Lucore,
Assistant General Manager, Sunset-Central Lines.

LEGISLATION AND RAILWAY DEVELOPMENT

Globe, Ariz.

To the Editor of the Railway Age Gazette:

After serving for over twenty years as a railroad employee in the mechanical, accounting, engineering, construction and transportation departments, I have been engaged for the last three years by a civic organization composed of the taxpayers of Gila county. Among the duties required of me is that of making annual inspections of the various industries throughout the county, which contains 4,525 sq. mi. of mineral, grazing, agricultural and timber lands; and no better illustration can be given of the railroad situation today than this county presents.

The resources of Gila county can best be judged by a comparison of the assessed valuation in 1911 and 1914. This figure in 1911 was $6,900,000, and in three years had increased to $36,300,000. During this period, however, there was scarcely ten miles of railroad built in the county. This is not alone applicable to Gila county, but to the entire state of Arizona with an area of over 113,000 sq. mi. and an assessed valuation of over $411,000,000. In the last two years there has been less than 20 miles of railroad constructed in the state, and the sole cause is attributed to federal and state legislation unfriendly to the railroads.

There are thousands of acres of the finest tillable land in Gila county that is now being used for stock raising, which if it were reached by railroad facilities would afford homes for hundreds of families. Our state laws have made it almost prohibitory to operate the few miles of railroads within the county, and there is therefore no incentive to railroad capital to construct further mileage. Until the rank and file of the electorate of Arizona are educated to their own best interests and give the railroads a square deal, we have no hope for any further railroad construction in this state.

I certainly believe the time has arrived when the country should adopt a more liberal attitude toward railroads, and in fact in the new western states all encouragement possible should be given to the railroad capitalist in order that our large, sparsely settled areas can be settled, and our wonderfully rich mineral wealth can be developed.

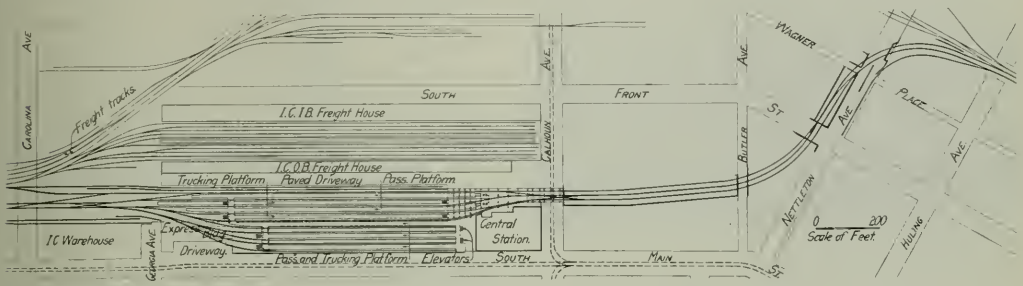
W. H. Keegan,
Secretary, Globe (Ariz.) Chamber of Commerce.

Dutch Railroads Aid Relief Work.—The representatives of the American Commission for relief in Belgium at Rotterdam report that the Dutch government has given the commission permission, when the canals are frozen to send by rail, for which they will make no charge, the full quantity of supplies needed, amounting to 3,000 tons daily. In addition, it has refunded the amounts previously paid by the commission for freight sent over the railroad.

New I. C. Station and Track Elevation at Memphis

Passenger Terminal for Four Railways and Elimination of Six Grade Crossings Have Cost Over $1,400,000

An important passenger terminal improvement has recently been completed by the Illinois Central at Memphis, Tenn., including the construction of a new central station and office building and the elevation of about ¾ of a mile of line, part of which is on a new location. The Illinois Central has maintained two stations for its trains and those of its subsidiary, the Yazoo & Mississippi Valley, one located at Poplar street, near the river front, just north of the main business section of the city, and the other at Calhoun street, about one mile south, the latter being used also by the St. Louis & San Francisco and the Chicago, Rock Island & Pacific. Under the old arrangement, engines were changed on through trains and all breaking up was handled at the Poplar street station, only a passenger stop being made at Calhoun street. The Y. & M. V. trains, all of which terminate at Memphis, ran through to Popular street. Since the completion of the new station, which replaces the old one at Calhoun and Main streets, all switching of cars and changing of engines are handled at the new station, the Y. & M. V. trains terminate there, and I. C. trains only make a passenger stop at Poplar street. All Rock Island trains terminate there, as well as a portion of the trains of the Frisco, and those of the latter road which pass through Memphis, make a reverse movement, entering and leaving the south end of the terminal. The combined traffic of the four roads amounts to about 45 trains per day, of which more than two-thirds terminate there. The old line from Calhoun street north to a connection with the freight line at Huling avenue was a single track and crossed all streets at grade, while the new line has three tracks part of the way and two tracks for the remainder, elevated above the streets. Just south of the station the Rock Island and the Frisco connect by wyes with the east and west line of the latter road.



Location of New Illinois Central Line Through Memphis, Tenn., Reaching New Central Station at Calhoun Street

In order to handle traffic during construction work a temporary station was built west of the old one, fronting on Calhoun street. The old baggage facilities were used for a time, but later new temporary quarters for baggage were provided south of the temporary station and west of the old building. The old station was then demolished and the new one started. The west wall to support the new fill on which the station tracks were to be laid was built first, then the tracks were brought up to the new level in stages, always keeping a sufficient number of tracks open for service. At times during

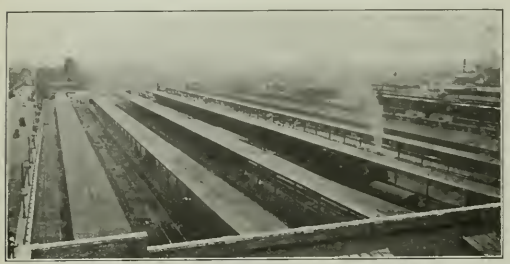
New Central Station and Office Building Recently Completed by Illinois Central in Memphis, Tenn.

Main Concourse of the New Memphis Station, Looking Toward Train Concourse

the work some of the operated tracks were on the upper level and some on the lower. Temporary platforms and sheds were built on the new grade in the position of the permanent ones and will be used during the life of the timber.

STATION BUILDING

The new building is rectangular in shape, 208 ft. by 141 ft., exclusive of the express quarters. The first two floors are occupied by the public rooms, the third, covering only a portion of the total area along the two street faces, is occupied by offices, as are the five floors above this, which cover only the Main street side of the building. Structurally, the building is



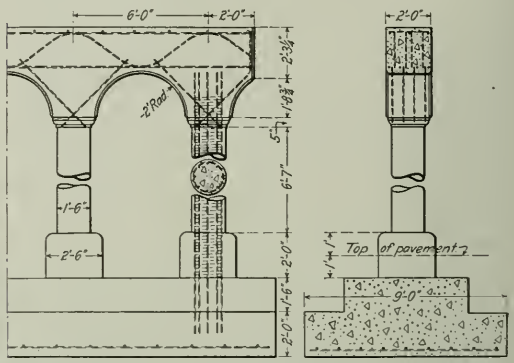
The Station Tracks and Train Sheds from the Top of the New Station

a steel frame with Bedford stone walls up to the fourth floor and brick trimmed with stone and terra cotta above that level. The face of the third story is treated as a broad frieze, supported by a colonnade of fluted pillars extending the full length of the street faces of the building. The upper stories are severely plain in treatment, but this effect is relieved by the rich cornice and parapet which surmount the office building.

Two main entrances are provided, one for white passengers from Main street and the other for colored passengers from Calhoun street. A cab entrance on the west side of the building is reached from Calhoun street. The lobbies just inside each

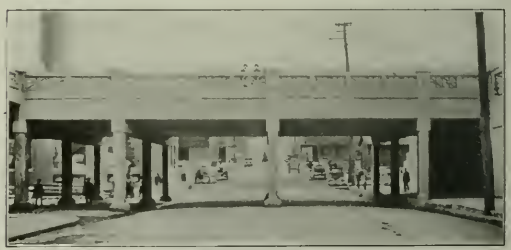
Cantilevered Retaining Wall Along Main Street Adjacent to the New Station

entrance connect directly with the white and colored ticket lobbies, separate baggage-checking counters and separate lunch rooms. These lobbies are finished with mosaic tile floors, Tennessee marble wainscot, plaster walls and ceilings. The main waiting room is located on an intermediate level between the ground floor and the track level. Stairways leading up from the respective entrance lobbies provide easy access to this room from opposite sides. The main concourse is 75 ft. by 100 ft., and the roof, which is carried on steel trusses, is 35 ft. above the floor. The finish is practically the same as that on the lower floor. A portion of this room along the west side is railed off to form a passage for colored passengers from the main stairway to the passenger concourse, which extends across the south end of the waiting room and can be entered directly from the main waiting room by white passengers. A broad



Details of Reinforced Concrete Columns and Arched Girders Used in Front Street Viaduct

stairway leads from this concourse up to the track level, providing direct access to the platforms between the stub tracks and a passageway extends from the passenger concourse under the through tracks west of the building to stairways which



The Calhoun Street Subway Adjacent to the New Station

lead up to platforms between these tracks. A separate exit to Main street opens from the east end of the passenger concourse and another exit is provided along the west side of the building leading down to the cabstand.

Three general waiting rooms fitted with seats adjoin the

The Steel Encased Structure Carrying the Tracks Over Nettleton Avenue and Wagner Place

main concourse and are reached from it by short flights of stairs. These rooms are assigned to white, colored and immigrant passengers and have a combined seating capacity of about 400. The usual toilets, rest rooms and smoking rooms are con-

nected with these waiting rooms. The equipment of the station includes 15 clocks on the two lower floors and about 20 more on the office floors, controlled by a master clock, wiring for 48 Musalophones for train announcing, and eight telautograph stations.

The first office floor has an area of about 15,000 sq. ft., and the five floors above that about 7,000 sq. ft. each. The building is designed to allow the extension of the upper stories over the Calhoun street wing if the added space is needed. Two stairways and two Standard Plunger Company's elevators provide access to the office floors.

The baggage and mail facilities are located on the ground floor of the main station building and the express companies occupy quarters in a separate building at the south end of the train shed facing on Main street and Georgia avenue. The old express building, which occupied a similar location, was moved out into the space to be used for a drive in the new layout and was continued in service during the construction of the new building. This building is one story in height and about one-third of it is located under the station tracks. It has a concrete foundation, a concrete floor, steel columns, brick walls on the street faces and wall-bearing beams supporting a concrete slab roof. The north and west walls of the building are of concrete, serving also as retaining walls for the fill under the station tracks. A trucking tunnel of reinforced concrete, 16 ft. wide and 12 ft. high, extends from the baggage room to the express building under the tracks, connecting with two cross tunnels, one near each end of the station platforms. Baggage, mail and express matter can be brought through these tunnels to seven hydraulic elevators which raise it to any desired platform, thereby eliminating most of the trucking at the track level. The pressure pumps for these elevators and other equipment needed for the station plant are located in a power house across the tracks from the station, the pipes and conduits being carried to the station in a tunnel under the tracks.

The station track layout consists of nine tracks used exclusively for passenger trains and one jointly for passenger and freight. Five of these are stub and five are through tracks. The umbrella sheds are supported on pedestals set on creosoted piles driven in the fill. The tracks are laid with 90-lb. A. R. A. type A rails, creosoted pine ties, and rock ballast.

TRACK ELEVATION

Under the ordinances authorizing this improvement, four streets were closed and six carried under the new tracks in subways. The railway paid the entire cost of this work, in addition to that of the station, including damages, changes to mains, street conduits, etc., aggregating more than $1,400,000, exclusive of property. The track elevation required the handling of about 165,000 cu. yd. of embankment, the placing of 30,000 cu. yd. of concrete in retaining walls and subways, the driving of about 1,500 creosoted piles and the laying of 10,000 sq. yd. of paving. The average raise in grade was between 10 and 15 ft., giving a clearance of 12 ft. at streets, except at Calhoun street, where 14 ft. headroom was provided. Where the right of way was limited, retaining walls were built to contain the fill, these being of gravity section where space for a toe was available, and of the counterfort reinforced type where the space necessary for the former design was lacking. A cantilever wall with a four-foot overhang was built along Main street between the station building and the express building.

The subways are not uniform in design, owing to the varying conditions at the different streets, but include no essential features that differ from those commonly adopted. In general, supports are provided at the curbs and in the centers of the streets. When the spans were short enough to make a reinforced concrete deck economical, slabs were used. In some cases these were cast in a yard and handled into place by a derrick car and a wrecker, and in a number of cases the slabs were cast in place. The heaviest slab handled weighed about 65 tons. Where concrete slabs were not feasible, I-beam decks encased in concrete were adopted, placed transversely and supported on through girders where the length of span required. Reinforced concrete columns and cross girders were used for two of the bridges and built-up steel columns and cross girders encased in concrete for the other subways. Spread footings in sandy clay were obtained in most cases, although at Calhoun street, piling was driven under the pedestals. Little depression of the streets was required, except at Carolina street, where the grade was lowered about 12 ft., with approaches of four per cent. This necessitated the underpinning of the Illinois Central warehouse on the north side of this street, just east of the tracks, and the cutting of new doors through the basement walls at the new street level.

The details of the circular reinforced concrete columns and the arch girders used at Front street, illustrated in the accompanying drawing, are among the most interesting features of the bridge work. These columns and girders were cast in Blaw steel forms purchased by the railway company and turned over to the contractor during the time the work was in progress. Another minor feature of interest is the type of base casting used to support the pipe railings along the parapets of subways and on retaining walls in order to bring the center line of these railings out to the face of the concrete and thereby increase the clearance alongside the track. These castings are secured by bolts extending into the concrete through horizontal and vertical projections. After the railing was lined up the castings were grouted in place through a hole left for that purpose. A reinforced concrete balustrade of ornamental design was placed on the Calhoun street subway. The posts were cast in place, the mullions and panels were cast in a yard and set in place, after which the top rail was cast over the assembled parts.

The entire improvement in Memphis was carried out under the direction of A. S. Baldwin, chief engineer of the Illinois Central, and F. L. Thompson, assistant chief engineer. The bridge designs were prepared under the supervision of Maro Johnson, engineer of bridges and buildings, and the construction work in the field was in charge of F. R. Judd, assistant engineer. The design for the station was prepared by Graham, Burnham & Co., architects, Chicago. The contract for the building was handled by the Alexander Construction Company, Memphis, and George B. Swift & Co., Chicago, built the power house and express building. The fill was made by railway company forces, the steel work was erected by the Strobel Steel Construction Company, Chicago, and the general masonry and excavating contract was executed by the Bates & Rogers Construction Company, Chicago.

THE SUPERINTENDENT—PAST, PRESENT AND FUTURE*

By E. H. DeGroot, Jr.
Superintendent Transportation, Chicago & Eastern Illinois

The superintendent of the past looms large in the history of the American railroad. He was a pioneer, and if his chips seem crude in comparison with the shavings of today, let us not forget that, figuratively speaking, the axe and the adze were the tools for his work and that he can neither be judged with fairness nor properly appreciated other than in the setting of his own day.

The country was new, the roads short, poorly constructed and meagerly equipped, the methods experimental. Each little line was being developed according to the ideas of its own management, with scant regard for what was being done by its neighbors. Co-operation was an unheard of theory and there were no associations like this for the exchange of ideas. There was no attempt at uniformity, even in signal codes, and men changing employment were not infrequently expected to ascribe to hand and lantern movements, and ball and target displays, meanings

*An address delivered before the American Association of Railroad Superintendents, New York City, August 21.

diametrically opposed to those with which they were familiar. Writing of this condition in 1878, Kirkman, in his Railway Service: Trains and Stations, the modest forerunner of his excellent series, The Science of Railways, says, "Are any of these disasters brought about by an improper understanding of the meaning of particular signals, or by employees getting the rules and regulations of different companies confounded? Who can tell? The lamp raised and lowered upon one road says back up; upon a parallel line, not ten feet away, it may, and very likely does, mean, go ahead." And commenting on the joint use of a track by two companies whose rules were different, making it necessary for the trains of the tenant line to be governed by the rules and signals of the owning road, he writes, "These employees must, therefore, at a particular place, be it day or night, lay aside the rules and regulations that they are familiar with by study and practical use, and adopt in their stead other rules dissimilar in form and application."

The little volume from which these quotations are made was given to me by my father who bought it many years ago. As a boy, I read it with eagerness, long before I had come into contact with the genus superintendent, and I am sure that you will pardon me for this personal reference when I add that this book was largely responsible for the awe with which I regarded that official during the first years of my own service. You will scarcely wonder at this when I quote from Chapter One, for example: "They (the employees) know that there is hidden away somewhere in the dark unoccupied recesses of the superintendent's apartments, a mysterious chart, whereon at intervals he works. They have had surreptitious glimpses of this wonderful chart through partly closed doors, but their view has been obstructed and their mental processes deadened by the form and austere presence of the superintendent, as he paced the room with measured stride, or bent over his work, pencil in hand, with absent air and corrugated brow, like one who sought in vain for the solution of some difficult problem," etc. Truly, to have been a superintendent in those days must have been worth while!

As has been suggested, the superintendent of the past was largely isolated. Frequently, his superior, the president, was not versed in operating matters, and there is evidence that the operating officer was quite generally left to work out his own salvation. Byers mentions this in the preface to his Economics of Railway Operation, where he says, "The railroads were small, the traffic was not dense, and the official in charge headed his forces in much the same manner as King Henry of Navarre at the celebrated Battle of Ivry."

It was, then, the superintendent's business to operate, and operate he did with a courage and a fervor which compel admiration. It is not strange that under these conditions he was autocratic, or that he had scant patience with those changes which have come with recent years.

And now he is no more! To me the tragedy of railroad development lies in the fact that so many of these men who had builded well in the past were unable to adapt themselves to the world of today. Their labors and those of their predecessors form the foundation upon which has risen the superstructure of our present day operating organization. All honor to the superintendent—past! Verily there were giants in those days. It is, however, with the superintendent of the present that we are chiefly concerned. His problems are ours and they are before us for solution. The small roads have been united in larger units and systems—competition is keen—the demands for economy becoming more and more insistent and the work of the superintendent correspondingly exacting. The extensive work of the pioneer has given place to intensive development. Standards are higher, more is expected, a wider outlook required; the question of the limits of true economy is still pressing for an answer. Well has Major Hine put it in one of his letters, "You can never get beyond watching the company's dollars and cents, any more than a successful musician can omit practice."

Then, too, the public relations of the railroad are at last receiving some of the attention which, if given a few years ago, might have prevented much of the flood of vindictiveness which has been so costly to both railroads and people. As Morris strikingly says in his Railroad Administration, "There cannot be the smallest doubt that a persistent condition which may be described as corporate bad manners was in large measure responsible for the exceedingly bitter attack upon railroads which characterized the so-called Granger period in the seventies, and more recently, in Roosevelt's administration." Then he adds, "General harmony, from day to day, is best promoted by the watchfulness of division officers, and they are sure to be watchful if the president and general manager really want them to be."

Watchfulness, however, to be effective must be intelligent watchfulness, active as well as passive, and there is much error abroad concerning railroads which all railroad men should understand and refute. With this in mind I want to recommend two books which I believe every superintendent should read carefully. These are, Dunn's American Transportation Question, which treats of rates, service and financial return as three vital and related factors, and his Government Ownership of Railroads, the title of which is self-explanatory. These books are comprehensive without being too lengthy for the busy man and will provide reliable ammunition for the needed campaigns of education.

With all these and other important matters claiming his attention, it will be clear that the superintendent can no longer head his forces after the manner of King Henry. He must work through an organization whether he wants to or not. This is especially true under the divisional plan which makes him responsible for maintenance of equipment and maintenance of way results, as well as for those of transportation.

The superintendent, then, must select men, train them, vest them with authority commensurate with their responsibility, and supervise their work. This requires time and the exercise of good horse sense, applied psychology, knowledge of men. Call it what you will; when your boy comes home from school talking about H_2O, and you tell him to try a little on his hands and face, you are both talking about water. And, by the way, the efficiency of an organization is more often limited by failure to delegate adequate authority, than by the granting of too much. Further, supervision and meddling are not synonymous.

But the superintendent must not only be an organizer; he must be a diplomat, too; a diplomat of the American type, fairminded and direct, a man of convictions and with the courage thereof, but withal considerate of others both employees and public. So much for the superintendent of the present. He is, perhaps, too close at hand for an accurate estimate of his contribution to railroad development, although we know that that contribution is a substantial one.

And now just a word as to the superintendent of the future. He will, of course, like his predecessors, be a logical answer to the transportation requirements of his times, and a survey of the past and present for prophetic purposes discloses a trend toward what we hope will prove to be more wholesome economic conditions as well as the development of railroad operating practices along scientific lines. The superintendent now has, and will have in greater measure hereafter, a generous share in bringing about and maintaining better public relations and an enviable opportunity to work out important operating betterments. Unless all signs fail, costs are destined to play an important part in the work of the very near future and the superintendent who is wise will, in bulletin language, be governed accordingly.

What kind of men will our successors be? High grade, without doubt. They will build on the cumulative results of both past and present, and, like the men who precede them, will be clean, competent and confident—a fine type of American citizenship, contributing their share toward the common weal of our beloved country.

Government Regulation of Railway Operation*

To Be Successful Regulation Must Be Carried on in a Broad Spirit of Cooperation with the Railways

By Samuel O. Dunn

It is, to regulation of what we ordinarily understand as operation, namely, the construction, equipping and maintaining of railways and the moving of their engines, cars and trains that I shall confine myself.

There are some phases of this subject which it would be a waste of time to discuss. It would be a waste of time to discuss whether the government has power to regulate operation. It has been settled by the courts that both the states and the nation have that power. It would be a waste of time to discuss whether there should be some regulation of operation. There is already much of it, and everyone agrees that, so long as the railways are owned by private companies, there always will be and always ought to be a good deal of it. In fact, it is one of the advantages of private ownership that under it the government can regulate the management of railways, and one of the disadvantages of public ownership that under it the government cannot do so, simply because under public ownership the government is the manager. The large questions as respects regulation of operation which remain to be settled are, what its purposes should be, how comprehensive its scope should be, what form it should take, and by whom the regulating should be done.

A good many people have done little else for some years but evolve theoretically complete and perfect schemes for the regulation not only of railway operation, but of all parts of the business of all kinds of public service corporations; and the less experience they have had in connection with the business of such concerns the more assurance they have shown in setting forth how they should be regulated. We shall never get very far by following such people. A satisfactory and helpful policy of regulation can be developed only by a painstaking study of the conditions to be dealt with by both railway officers and regulating authorities, and by co-operation between them in cautiously trying out regulatory measures until experience shall show what ought to be done and what ought not to be done, what can be done and what cannot be done. But frank discussion of the problem may, at least, tend to help bring about the needed study of the conditions and the needed co-operation between railway officers and the regulating authorities; and, therefore, frank discussion may do good, even though those participating in it may, as I do, express their views with many inward questionings and with the reservation of the privilege of changing them if they are shown to be wrong.

Some Shortcomings of Railway Plants and Service

The great requisites of good railway service are reliability, convenience, comfort and safety. Our railway service has many shortcomings as respects all these matters. This is not saying that it is all bad; that it is worse than that of other railways; or that its shortcomings are due to any particular class or classes of persons. The service of some of our railways is better than that of others; in many respects our service is better than that of any other railways; and many of the shortcomings which it has are due to the special conditions under which it has been developed and is carried on. But after all, it must be conceded that we have much poor track, much defective equipment, many lines that are without block systems, many whose trackage, terminals and equipment are not adequate in normal times to the demands of their business, numerous unprotected grade crossings, many employees who have not been properly trained and disciplined or on whom training and discipline have been lost. In consequence, we have many trains that ride uncomfortably, many that are late, congestions and delays to traffic when business is good, and an accident record that is discreditable. This is but an incomplete enumeration of our railways' shortcomings of plant, personnel and service. It is desirable from the standpoint of all that these things shall be improved. If government regulation will help improve them, then government regulation is desirable. But if government regulation is to do this it must courageously and effectively attack the primary causes of the unsatisfactory conditions. What, then, are some of these primary causes, and how may the government effectively attack them?

Causes of Unsatisfactory Railway Conditions

The primary causes of the defects of plants and service are numerous and various. Among them is excessive competition. Many assume that competition always is wholesome and regard it as the specific for all commercial and industrial ills. But, in the railway business at least, its effects are mixed, some being good and some bad. Competition between railways often tends to stimulate them to improve their track, equipment and train service. But when the competition in service becomes unequal because, for one reason or another, the financial resources of the competitors are unequal, it often does harm which largely offsets its good. The stronger lines are able to put and keep their track, structures and equipment in relatively good condition; to build second tracks where they are needed; to install block systems, and so on. The weak roads are not able to do all these things, and in the effort to get and hold business they are likely to do the things which attract the most favorable notice from the public and neglect those things failure to do which attracts the least unfavorable notice. The ordinary traveler judges railways chiefly by their passenger equipment and train schedules. Therefore, not a few railways are tempted in the competitive struggle to neglect their track, to refrain from installing block systems, and at the same time to buy and operate heavy modern passenger equipment and to publish as fast schedules for their trains between competitive points as are published by rival lines with better track and structures. Among the results are numerous late trains; running that is too fast for the track, with all its attendant discomforts and dangers, and contributions to the statistics of collisions and derailments published by the Interstate Commerce Commission, and especially to those regarding derailments, which within recent years have shown alarming increases.

Unrestricted competition in other lines of business may not so plainly have bad effects. In other businesses it results in the long run in the elimination of the weaker; and whether one regards that as good or bad depends on his economic philosophy. But unrestricted competition between strong and weak railways always has some bad effects, because in the railway business the weaker competitor never is and never can be entirely eliminated. The ultimate result of unrestricted competition is to reduce the weaker lines to a position where they will go on indefinitely rendering a service which is unprofitable to their owners and managers and unsatisfactory and unsafe to the public.

The most important reason for the shortcomings of the physical properties, and for many of the resulting defects of the service, of the railways of the United States is their relatively small earnings; and their relatively small earnings are due partly to their relatively light traffic, but more to their low rates. The railways of Germany earn over $22,000 gross per mile; those of Great Britain almost $27,000; those of Belgium over $22,500; those of Switzerland $15,000; those of France over

*Address delivered before the Railway Club of Pittsburgh, September 18, 1914.

$14,500; while the average for our roads has never been $13,000. Now, everything a railway buys must be paid for, directly or indirectly, from gross earnings. Furthermore, our railways have to pay wages twice as high as those of European railways. As the railway dollar of the United States will not go nearly as far as the railway dollar of Europe, and as the number of dollars earned per mile here is somewhat less than in France and Switzerland, only a little more than one-half as great as in Belgium and Germany, and less than half as great as in England, the opportunities our railways have had for putting their properties in good shape have been relatively much smaller than those of the other railways named. In their earlier history their earnings were small because most of them were built into undeveloped territory where the traffic was sparse, and as soon as a competing road was built they began destructive rate wars. Their earning capacity has continued to be too small because just when they very sensibly began to make traffic arrangements or community of interest arrangements to increase and maintain their rates and earnings government regulation stepped in and destroyed the arrangements or forbade the increases in rates.

Another important cause of the relative want of safety and other defects of our railway operation and service is the shortcomings of their personnel. We have been told by an authority whose views carry great weight with the public, viz., the Interstate Commerce Commission, that "The most disquieting and perplexing feature of the problem of accident prevention is the large proportion of train accidents caused by dereliction of duty by the employees involved." To the lamentable tendency of employees to disregard operating rules and take risks is also attributable a great majority of the casualties and fatalities—other than those to trespassers—which result from accidents other than train accidents. For example, while the application of automatic couplers to practically all engines and cars has largely reduced the accidents occurring in connection with coupling and uncoupling, there are still many of them; and their continuance is due mainly to the risks carelessly or recklessly taken by employees. The many accidents resulting from employees stepping in front of moving cars, engines and trains are due to the same causes. Probably the blame for such accidents should not be visited entirely on the employees. It is the duty of the managements to use all available disciplinary and educational means to instruct and train employees so that they will not be careless or reckless. But the employees individually, and their organizations also, owe a duty to themselves and others; and the state has its duty; and few who are familiar with the conditions would say that the employees, their organizations and the various governments have done as much in proportion to reduce this fatal carelessness and recklessness as have the railway managements.

The same laxity which causes so many accidents is responsible for numerous other defects of service. While the frequent lateness of trains is often due to the policy of managements in publishing schedules which cannot be maintained, it is also often due to delays at stations which can be stopped only by greater alertness and celerity on the part of the station and train employees.

The statistics which constitute the worst feature of the accident reports of the Interstate Commerce Commission are those regarding fatalities to trespassers, which every year number more than one-half of all the fatalities reported. While the deaths of trespassers are charged up against the railways, as a matter of fact, the municipal and state governments, which do not make and enforce proper laws against trespassing, and not the managements of the roads, are responsible for them. They are not really railway accidents at all; and, therefore, the statistics regarding them should not be included under that head.

What has government regulation already done?

What has government regulation done about the various defects of the physical properties, of the operation and of the service of our railways? What can and should it do about them? And what form should the regulatory legislation be given, and to whom should its administration be entrusted?

There have been many laws passed by state legislatures and Congress, and many orders issued by state commissions and the Interstate Commerce Commission, for the regulation of operation. These relate to numerous and varied subjects, including safety appliances on locomotives and cars, drinking cups on trains, locomotive headlights, block systems, the drinking of intoxicating liquors on trains, the frequency with which employees must be paid their wages, the number of hours they may be kept on duty, the number of them that must be employed on trains, the elimination of grade crossings, the speed of live stock trains, the clearances between tracks and overhead and lateral structures, and so on *ad infinitum*. At almost every session of a state legislature some new kind of law, and at almost every session of some state commissions some new kind of order, for the regulation of operation is produced. It would be astonishing if all this mass of regulatory measures did not contain some that were good. But those which have been conceived in intelligence and public spirit and brought forth in justice are so few compared with the total that you will have great difficulty in finding them. Having found them you are apt to think they are adventitious and not the result of deliberate thought and choice. Of all the subjects to which our law-making and law-administering bodies have applied themselves, to none have they devoted more stupidity, ignorance and unfairness than the regulation of railway operation. In most cases they have not tried to ascertain the conditions to be dealt with, the real evils to be remedied or the results their laws or orders probably would produce.

The character and the fruits of their labors have corresponded. If a bonfire were made of every state regulation in existence the operation of our railways would be made more economical and their service better and safer; and there are some federal regulations which might well be added to the conflagration.

I have referred to excessive competition as one of the causes of the shortcomings of our railway service. Have the regulators perceived this and acted accordingly? On the contrary, the various anti-trust laws, and especially the federal anti-trust law, have been applied to railways in all their rigor. Every consolidation, agreement or arrangement designed to moderate the fury of competition has been treated as a crime. Some such arrangements, as, for example, that regarding differential passenger fares between Chicago and New York, under which the fares charged are adjusted to the service and schedules of the different roads and trains, have been tolerated. But the general tendency of regulation has been to encourage fierce competition, whereas the public welfare demands that such competition shall be discouraged. It would be to the interest of both the railways and the public for the roads to be permitted to make binding and enforceable agreements regarding both competitive rates and competitive service subject to the supervision of competent regulating bodies. The spirit of our laws is hostile to such action.

In some cases when railways with bad track have been running trains at unsafe speeds to meet the competition of roads having better track, state commissions have fixed maximum speeds to be observed until their tracks were improved. Such action is justifiable and desirable. But the need for it is created chiefly by excessive competition. Why continue to stimulate the cause while trying to nullify the effect?

Furthermore, such action by the commissions merely substitutes one kind of poor service for another, and does not go to the root of the evil. It is better that trains should be slow than that they should be unsafe, and our accident record would be better if some railways had fewer trains with schedules too fast for their track and facilities. But a reasonably fast service is desirable on all railways; and when the passenger trains of a railway cannot make good speeds safely the primary evil consists, not in their attempts to run their trains fast, but in the conditions of track, structures, equipment, signals and so on, which make it unsafe to do so. In that case the true function of regulation is, not merely to fix some low maximum speed, but to ascertain the causes of the unsatisfactory physical conditions and stimulate and co-operate with the railway management in removing them. So as to all other deficiencies of roadway, equipment and service.

Now, while there has been much regulation purporting to be intended to cause physical improvements in railways, there has been very little which has been adapted to that end. Probably the best legislation for the regulation of railway operation ever passed was the safety appliance law enacted by Congress in 1893, together with the subsequent amendments to it. This law required the railways to equip their trains with power brakes, automatic couplers, secure grab irons and other safety appliances. But it did not require them to do anything which the investigations of their own officers had not shown was practical, or which the practice of many of the more progressive lines had not indicated was desirable; and it gave the Interstate Commerce Commission a broad discretion in administering the law, which made it possible for the railways and the commission closely to cooperate. Such co-operation was secured, and the result has been a steady improvement of the safety appliances on equipment of all kinds from the passage of the law until the present time.

In this case it was right and desirable that the legislation passed should apply uniformly to all roads, because, as freight cars circulate freely throughout the country, it would be dangerous to have those of different roads equipped in different ways. But in many cases to apply the same provisions to large groups of roads or to all of them is unjust and injurious. The needs and deficiencies of different roads may be wholly different. One may have bad track and a good block system; another, bad track and good equipment; another good track, but neither good equipment nor a good block system. Evidently if the same requirement, as for steel cars or block signals, is imposed on all, the results to the roads themselves and to the public will be widely different. If a road has bad track a law requiring it to install heavy steel equipment is almost certain to increase the number of accidents on it. Similarly, there is not the same need or justification for requiring the elimination of grade crossings on a road operating through a sparsely settled district as for requiring it on one operating through a densely populated territory.

In the preparation of most of the regulatory legislation such points have not been considered. The same requirements have been imposed on many, or even all, roads without reference to their differences in conditions. Railways have been required to use high power headlights regardless of whether they did not have greater need for block signals. They have been required to increase their clearances regardless of whether it would not have been more in the interest of safety for them to have spent the money on their tracks. They have been required to waste millions in employing useless men in train crews, when they needed the money to properly maintain their equipment. Even when improvements which were needed have been required the legislation regarding them often has been wholly unjust. In the city of Chicago the roads are being forced to bear the entire cost of elevating their tracks, which it is estimated will be $150,000,000, and this in spite of the fact that many more of their grade crossings have been created by streets being opened across their tracks than by their tracks being opened across streets.

REGULATION OF OPERATION LARGELY A FINANCIAL QUESTION

Finally, law-making bodies and commissions are disposed to require all kinds of expensive improvements, while persistently ignoring the fact that it will be impossible to put the railways of this country in satisfactory condition without increases in their rates and net earnings. When the roads ask for increases in rates an attempt always is made to show that they are earning enough on their *present* investment. The Interstate Commerce Commission in its decision in the Eastern rate advance case conceded that this was not true of the eastern railways. But even if it were true of all the railways, this would not show that there ought not to be general advances in rates. If the roads are now earning barely a reasonable return on their present investment, clearly they cannot, with present rates and earnings, raise the billions which must be invested if block systems are to be generally installed, grade crossings to be eliminated, tracks to be strengthened, better equipment to be provided and so on. Most of the investment for such purposes would add nothing to their earning capacity. But a return must be paid on the additional investment; the means of paying it cannot be obtained except by increasing earnings; and the necessary increase in earnings can be gained only by increases in rates.

The question of regulation of railway operation is chiefly a financial one. The railways would gladly make every kind of improvement which the public demands. But the various regulating bodies control what they may earn, and, therefore, what funds they can raise. Therefore, the financial problem of regulation of operation is squarely up to the regulating bodies. As long as the earning capacity of the railways is limited as it is now, to require many of them to make one improvement is in effect to forbid them to make others which may be more needed, simply because they have not enough money and cannot raise enough to make all the improvements that are needed.

Besides regulation to compel the railways to make improvements in their tracks, structures, and equipment, there has been a good deal affecting their relations with their employees. The federal government and many of the states have passed laws fixing the maximum hours that certain classes of employees may be kept on duty. Many of the states have passed laws requiring increases in the number of men employed in train crews. All of the legislation affecting the relations of railways and their employees has tended to increase expenses, and most of it has purported to be in the interest of safety. But a large majority of the so-called "safety" laws have been promoted by the brotherhoods of railway employees, and usually their real purposes have been to increase the number of men that must be employed by railways, and to promote the political interests of the lawmakers passing them. The enactment of the provision prohibiting employees from being kept on duty more than 16 hours was justifiable, although the number of accidents traceable to the overworking of employees always has been negligible. The provisions of the federal and the various state laws prohibiting telegraphers concerned with the operation of trains from being kept on duty more than from eight to nine hours, regardless of the extent to which they are concerned with train movement are, as safety measures, indefensible. The same thing is true of the train crew laws.

It is notable that while government regulation has meddled with matters of this sort it has been conspicuously careful to abstain from taking any steps to deal with those derelictions of their duty by railway employees to which the Interstate Commerce Commission attributes a large majority of train accidents. When a railway employee in England or Germany is guilty of an infraction of duty which causes an accident he is pretty sure to be taken in hand by the government itself. Not so here. The noble and disinterested patriots who regulate railways and enforce laws in this country seldom forget for a moment the voting power of organized labor.

Why has past regulation of operation been what it has been? Too much of it has been inspired by prejudice and vindictiveness. Too much of it has been inspired by the representatives of labor brotherhoods seeking to promote the supposed interests of their members at the expense of the railways and the public, and adopted by lawmakers and commissioners who were thinking very little about the rights of the railways and the welfare of the public and very much about the votes they hoped to get by showing subservience to the labor brotherhoods. Too much of it has been inconsistent or conflicting because the several states and the nation have dealt with the same subjects in wholly different ways. Too much of it has been adopted in ignorance or disregard of whether the railways were able to bear the financial burdens imposed. Finally, most of the regulatory legislation has not been either drafted, adopted, or administered by persons possessing any expert knowledge of the matters with which they were dealing.

HOW REGULATION SHOULD BE REFORMED

Lawmaking bodies are more likely than commissions to be inspired by prejudice and political motives. They are less able

than commissions to adapt their regulation to circumstances and conditions, for laws must be broad and sweeping in their terms. The commissions are more likely to act with knowledge, for their members have opportunity to study the conditions to be dealt with and to consider the probable effects of their measures, while lawmakers have not. Therefore, as far as is constitutional and practicable, the regulation of operation should be delegated to commissions. So long as the various states and the nation attempt to regulate operation independently, there will be inconsistencies and conflicts between the regulations adopted by the states, and between those adopted by the states and the nation. Therefore, either the states should be divested of their regulating authority or its exercise should be made subject to the control of the central government. Most of our regulation of railway construction, maintenance or transportation causes an increase in railway expenses, and, therefore, such regulating should be either done or controlled by the body which chiefly controls railway earnings in order that a proper relationship between income and outgo may be maintained. For all these reasons, and for others that might be mentioned, the Interstate Commerce Commission should be given paramount authority to regulate, not only interstate operation, but all operation.

The Stevens bill, now pending in Congress, apparently would confer on the commission the large discretionary authority over operation which it seems desirable it shall be given in order that the railways and the public may escape from still worse evils. It would, however, be folly to assume that the mere passage of this or some similar measure would solve the problem. The way laws are administered is as important as their provisions; and the character of their administration depends on the characters, attainments and abilities of those who administer them. Now, as to the personal character and ability of the present members of the Interstate Commerce Commission there is no question. But as to their fitness to administer a law giving them extensive authority to regulate railway construction, maintenance and operation there is serious question. The problems with which they would have to deal would be highly technical and extremely difficult. They are problems with which many men of great experience in railway affairs and of great ability have grappled for years with only partial success. They are problems of which no man can get even a fairly good working understanding without living in the closest touch with them for years. Now, the commission contains only one man who has had experience in the operation of a railway, and he was not a railway officer. Two of its members were economists in our universities; and the other four were lawyers. Men with their training and experience cannot know enough about railway mechanical engineering, maintenance and transportation matters to regulate them intelligently; and it is hard to believe that anybody ever could learn enough about them to regulate them merely by serving on a commission.

THE COMMISSION'S ORGANIZATION FOR REGULATION

It would seem, therefore, that if the commission is to be given this extensive authority over operation a great effort should be made to secure the appointment to it of men with official experience in the operating departments of railways. As the commission deals with a diversity of subjects doubtless it is not desirable that it should be composed entirely of such men, but certainly at least two of its members should be railway experts, one being, perhaps, a technical man of the caliber of chief engineer or superintendent of motive power, the other an operating man of the caliber of general superintendent or general manager. The British Railway and Canal Commission never has more than three members sitting at once, but the law requires at least one of these to be "of experience in railway business." The Railway and Canal Commission is merely a court which passes on rate cases. How much more important it is that a body such as the Interstate Commerce Commission should have members of railway experience!

Besides having members of railway experience the commission, if it is to regulate operation extensively, probably should have a subordinate body composed of experts in railway engineering, mechanical, maintenance and transportation matters to look after the details of this part of its work. It already has some subordinate bodies which devote themselves to such details. There is a chief locomotive boiler inspector with two assistants and district boiler inspectors throughout the country. There is a chief inspector of safety appliances with inspectors throughout the country. Unfortunately, almost all of these men have been selected because they were members of and were backed by railway labor brotherhoods. Very few of them have received a technical training, and almost none has risen in railway service above the rank of employees. This does not demonstrate that some of them are not men of ability and of special fitness for their duties. A large proportion of the operating and executive officers of our railways have risen from the ranks. A good many even of the technical experts of the railways, including chief engineers and superintendents of motive power, have done so. And there is no reason why men taken from the ranks by the Interstate Commerce Commission should not likewise demonstrate the possession of more than average ability and develop into experts. In fact, some of them have done so. But plainly, if the commission should organize a board to deal with the problem of regulating construction, maintenance and operation, it would be preposterous for it to fill it with locomotive engineers, conductors and mechanics. Those appointed to such a board should have demonstrated their fitness beforehand; and men who had not risen in the railway service above the rank of employees would not have done this.

When the commission was directed to undertake the stupendous task of making a valuation of all the railways it did not organize an engineering board composed of railway employees. It organized one composed of the president of the American Railway Engineering Association, of the chief engineer of one of the state commissions, of a man who was both a professor of civil engineering in one of the state universities and chief engineer of the railway commission of his state, and of two consulting engineers. In completing the engineering organization of its valuation department it has drawn men of recognized ability and expertness from the official ranks of railways all over the country. The example the commission has set itself in organizing the engineering branch of its department of valuation should be followed if it should ever organize a board to have direct charge of its work of regulating operation. It should likewise be followed in selecting the men who doubtless would be employed in making inspections and investigations for it. Its inspectors and investigators should be chosen solely because of their special fitness to do their work fairly and intelligently, and not because they may happen to have the backing of some politician or labor organization.

THE VARIOUS STEPS IN REGULATION

When the commission shall have thus formed its organization, how should it proceed with its work of regulation? It would seem that it should lay the foundation for it by causing careful investigation to be made as to the conditions of railway plants or service which may be at fault and as to the causes of them. For example, if the statistics of the commission continue to show an increase in the number of derailments it would obviously be the function and duty of the commission to make or cause to be made an investigation to determine whether this was due to general or local causes and what remedy or remedies should be applied. If the Brotherhood of Railroad Trainmen should petition the commission for an order requiring increases in the number of brakemen employed on trains, or if the state legislatures should continue to pass so-called "full crew" laws, it would obviously become the duty of the commission to make or cause to be made a careful and comprehensive investigation of the question whether a general increase, or local increases, or any increase at all, in the number of men employed on trains was required by the public welfare.

When the commission believed that it had found bad conditions which demanded some action it would seem that its next step should be to arrange for conferences between its members or representatives and officers of the railways to ascertain whether the proper remedies could not be agreed upon and

then applied by the managements of the railways themselves without the commission issuing any formal order. The commission in the past has had such conferences with representatives of the railways and of the railway labor brotherhoods regarding the administration of the safety appliance, hours of service and other laws. And in most cases they have led to agreements which were measurably satisfactory to the parties most directly concerned and have secured better results than would have been obtained by the issuance of arbitrary, formal orders which might have and very likely would have resulted in protracted litigation. It is probable that in a large proportion of all cases the railway managements and the commission could agree as to what each of them ought to do, if they would confer more frequently, more frankly, more fairly and with a minimum of suspicion of each other's good faith. If after investigation and conference the commission could not get any individual road or all roads to do what it thought should be done it would not follow that it must needs immediately issue some mandatory order. It would in a good many cases, if it exercised a salutary self-restraint, simply make public the facts, and then, for awhile at least, await developments. Publicity seems to many persons not to be a very sharp or heavy weapon, but, with all due respect to the Interstate Commerce Commission, the publicity which its hearings and reports have given to facts about the railway business which were previously unknown has, in my judgment, done a great deal more to raise the economic and moral standards of railway management in this country and to improve railway service than the formal orders it has issued. The power of common sense exercised by making public facts and drawing suitable conclusions from them "does not," as A. T. Hadley has said in discussing the subject of railway regulation, "seem as strong as statutory power to prosecute people and put them in prison, but in the hands of a man who really possesses it it is actually very much stronger." Only when other resources fail will a wise regulating body resort to the issuance of mandatory orders. And when it does so it will take the greatest pains to make them as little arbitrary as possible and as well adjusted to the special conditions of each case as possible.

When the commission shall have completed its organization and set it to work it will be necessary, if its regulation of operation is to be fair and successful, for it to consider every time it issues an order whether the earnings of the lines affected are sufficient both to bear the additional expense its order will cause and to enable them to expend all the money in the maintenance and improvement of their properties which they would have needed to have spent if it had not issued the order. It will not be sufficient for the commission merely to inspect, to find fault and to issue orders. The managers of most railways know the defects in their properties and service as well now as the commission will ever know them. And most roads whose earnings are sufficient go ahead as fast as is practicable remedying these defects. Most railway managers are as anxious as the public or any railway commission to see their properties put and kept in the best conditions. Their great problem is to find the necessary money; and this is the greatest problem which the commission will have to face and help the managements solve, when it undertakes the extensive regulation of operation; and if the commission does not face that problem courageously and co-operate intelligently with the managements in solving it its regulation of operation will be a failure or worse.

WILL REGULATION BE SUCCESSFUL?

Suppose state regulation is entirely subordinated to federal regulation. Suppose federal regulation is placed entirely in the hands of the commission. Suppose the commission is given a large enough appropriation by congress properly to perform its functions. Will regulation of operation then be made fair, constructive and beneficent? Will the politicians let the commission alone so that it can do its work right, and will the commission prove big enough for the job? These are questions no one can answer. The only way to find out will be to try the experiment, as we are now trying that of making a valuation as a basis for the regulation of rates. If it is tried, like the experiment of valuation it will cost the public and the railways large sums; and the new burdens of the commission, together with its present burdens, will give it the heaviest duties and responsibilities ever imposed on any body of men in this country. If the commission tries merely to regulate the railways and not to manage them the experiment may succeed. If it tries to manage them, as it now seems to be trying to manage them under the guise of regulating rates, the results of the experiment will be widely different. In its regulation of rates the commission, instead of confining itself to the duty imposed on it by law, that of determining the reasonableness of rates in view of the actual situation of the railways, is trying to tell their managers all about how they can do their work better so as to change the situation and thereby effect savings that will make unnecessary advances in rates, which, under present conditions, are conceded to be needed. Now, while the commission may be able by purely corrective measures to protect the public from abuses which arise in connection with the financing of railways, the making of their rates and the rendering of their service, it never will be practicable for any single body of men, however able they may be and however much expert knowledge they may have, successfully to control the policies and direct the management of all the 250,000 miles of railways in this country.

Let us, therefore, hope that the more authority the commission is given the more self-restraint and the more disposition to confine itself to its proper functions it will show. Let us hope that it will avoid letting its judgment be warped by the egotistical assumption that because it possesses superior power it must also possess superior wisdom—an assumption which seems rapidly to destroy the sense of proportion of every bureaucracy and which in the long run always has made every form of paternalistic government a failure and a curse to mankind. The commission might do a great deal more good with its present powers if it would exercise them with a somewhat franker recognition of its own limitations and in a broader spirit of co-operation with the railway managements. And it may do very little good and much harm with much larger powers unless it shows the greatest patience, forbearance, expertness and courage in exercising them. Wisdom is demonstrated, not by the possession, but by the manner of the use of power; and the success of government regulation of railway operation will not be determined by the amount of power conferred on the commission, but by the way in which the power that is conferred is exercised.

ECONOMY IN SIGNAL OPERATION

One large system has found that despite the higher first cost, as compared with direct current, it is cheaper to use alternating current for automatic block signals on its steam lines through the western desert country, and that this type of apparatus would still be the most economical, even were the cost of maintenance and operation more, under ordinary conditions, than would be the case were direct current used. The reason for this is that there is little water in the country, and water is essential to the life of any kind of battery. It costs less to transmit alternating current than it does to transport the same amount of energy confined in a storage cell from a central charging plant to the point of application. Labor of all kinds, and skilled labor especially, is scarce, and it is hard to make men stay in the country; therefore, wages are high. One man can look after a much greater mileage of alternating current than of direct current signals, as there are no batteries to be renewed and changed and the lamps can be electrically lighted, at very little cost, with metallic filament lamps. This arrangement eliminates lamp maintenance entirely, and provides a much more reliable and satisfactory type of illumination.—W. H. ARKENBURGH, in *The Signal Engineer*.

NEW CAR FERRY OF THE FLORIDA EAST COAST RAILWAY

It was the ambition of Henry M. Flagler to establish an "all rail" route between the United States and Cuba whereby freight could be handled between points in the United States and the interior of the adjacent island without the necessity of transfer from cars to boats. The first step in this project was completed by the opening of the Florida East Coast Railway to Key West on January 20, 1912. Although Mr. Flagler has since died, the second and final step in this project was completed on January 7, by the inauguration of regular service by car ferry between Key West and Havana.

To provide this service the Florida East Coast has built a car ferry, the Henry M. Flagler, which is said to be the largest boat of its type in the world. It will make the trip between Key West and Havana, a distance of about 100 miles, in a scheduled time of eight hours. The Henry M. Flagler was built at the yards of the William Cramp & Sons Ship & Engine Building Company, Philadelphia, Pa., from plans and specifications prepared by M. C. Furstenau, consulting naval architect for the road, under the supervision of Robert W. Parsons, assistant to the president of the Florida East Coast. The keel for this boat was laid on April 20, 1914, and it was launched on September 22.

This ferry is 360 ft. long and 57 ft. wide on the car deck. There are four standard-gage tracks on this deck with a capacity of 26 41-ft. or 30 36-ft. cars. In addition to this there are three cargo holds which may be loaded directly either from the cars or through cargo ports at the side of the vessel. Each hold is served by an independent Williamson double-drum electric cargo hoist of two tons capacity. The dry cargo capacity of the ferry is about 3,000 tons.

The vessel is divided into watertight compartments, 10 of which are known as "deep tanks" and are used for ballast purposes, having a water capacity of 3,000 tons. They are connected by a system of pipes for filling and discharging which are served by two 12-in. centrifugal pumps with a capacity to discharge 3,000 tons of water in 75 minutes. In this way the steamer can be loaded to its load draft although no cargo is carried. One of the forward ballast tanks has been provided with the necessary apparatus for filling and discharging so that it is capable of carrying a cargo of molasses.

The power plant consists of two triple-expansion engines with cylinders of 20-in., 32½-in. and 54-in. diameter by 36-in. stroke. These engines are designed to develop 1,500 indicated hp. each at 100 revolutions per minute under 170-lb. steam pressure furnished by a battery of four Scotch marine boilers 13 ft. 2 in. in diameter by 12 ft. long, fitted with two 48-in. Morrison corrugated furnaces operated under the Howden system of forced draft. Complete auxiliary equipment, including feed, circulating and ballast pumps and an electric plant, is provided in duplicate. Running hot and cold fresh water is furnished in each room in the quarters for the officers and the crews, with four individual baths for the officers and four shower baths for the crews' quarters, which may also be supplied with cold salt water.

The New Key West-Havana Car Ferry of the Florida East Coast Railway

THE CHANNEL TUNNEL.—A letter from the Deputy M. Goubhier de Clagny has recently appeared in several Paris papers, making an appeal to the British nation in favor of the construction of a tunnel under the English Channel. M. de Clagny emphasizes the advantage such a tunnel would be to the Allied armies at the present moment, owing to the increased facility of communications between the two countries which it would afford, and in conclusion urges that the work should be begun at Dover and Calais before the signature of peace.

Electric Towing Locomotives for the Panama Canal

Designed for Operation on a Rack Rail and Grades of 44 per cent. Between Locks; Four Engines for Each Boat

After a thorough study of the problem of maneuvering ships through the locks of the Panama canal, it became evident that they should not proceed under their own power, and that a substitute for the ship's power should embrace the following requirements: Ability to place the ship in proper relation to the lock; capability of keeping the ship to its course; accelerating and retarding the ship without breaking the lines; all the electrical apparatus for operating the locks, were built by the General Electric Company, Schenectady, N. Y.

In passing through the canal from the Atlantic to the Pacific a vessel enters the approach channel in Limon bay, which extends to Gatun, a distance of about seven miles. At Gatun it enters a series of three locks in flight and is raised 85 ft. to the level of Gatun lake. It may then steam at full speed through

United States Submarine Tender "Severn" in the Middle East Chamber of Gatun Locks, with Four Towing Locomotives Ready for the Lowering of the Water

the lines when once attached should be used without change for lockage in flight; a small number of skilled operators rather than a large number of unskilled men to co-ordinate.

The towing system employed was designed and patented by Edward Schildhauer, electrical and mechanical engineer of the Isthmian Canal Commission; and the 40 towing locomotives and the channel in this lake, for a distance of 24 miles, to Bas Obispo, where it enters the Culebra cut. Passing through this cut, which has a length of nine miles, it reaches Pedro Miguel, where it enters a lock and is lowered 30 ft. It then passes through Miraflores Lake for a distance of 1½ miles until it reaches Miraflores, where it is lowered 55 ft. through two locks, to the sea

Electric Towing Locomotive Used at the Locks of the Panama Canal

level, after which it passes out into the Pacific through an 8½ mile channel.

The main features of all the lock sites are identical and a brief description of the layout and methods at Gatun Locks will give an idea of the docks in general. There are two ship channels, one for traffic in each direction. The channels are separated by a center wall, the total length of which is 6,330 ft. There are two systems of tracks, one for towing and the other for the locomotive when returning idle; this, however, refers only to the outer walls. For the center wall, there is only one return track in common for both the towing tracks. The towing tracks are naturally placed next to the channel side, and the system of towing utilizes normally not less than four locomotives running along the lock walls. Two of them are opposite each other in

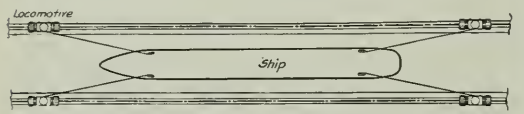

Diagram Showing the Relation of the Towing Locomotives to the Ship

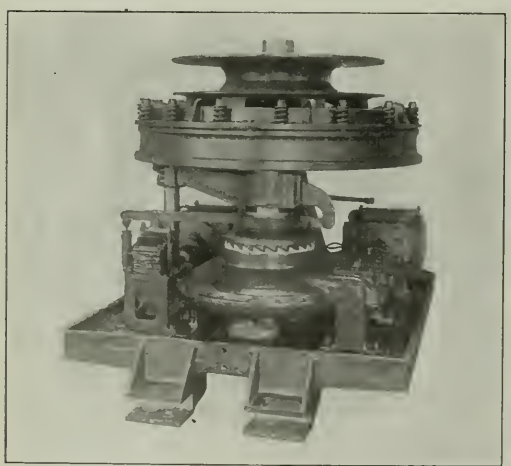
advance of the vessel, and two run opposite each other following the vessel, as shown in the diagram. The number of locomotives is, however, increased when the tonnage of the ship demands it.

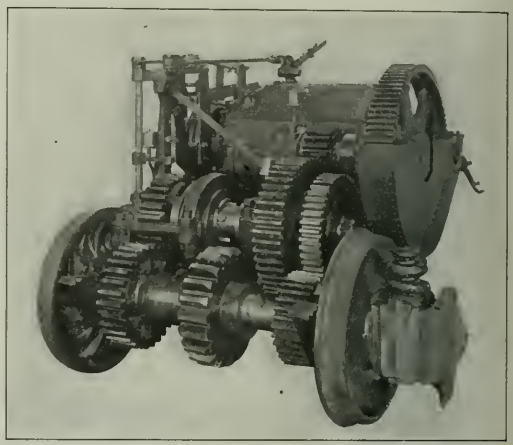
Cables extend from the forward locomotives and connect with the port and starboard sides respectively of the vessel near the bow, and other cables connect the rear locomotives with the port and starboard quarters of the vessel. The lengths of the various cables are adjusted by a special winding drum on the locomotive to place the vessel substantially in mid-channel. When the leading locomotives are started, they tow the vessel, while the trailing locomotives follow and keep all the cables taut. By changing the lengths of the rear cables, the vessel can be guided; and to stop the vessel, all the locomotives are slowed down and stopped, thus bringing the rear locomotives in action



Arrangement of the Windlass and Base on the Towing Locomotives

to retard the ship. Therefore, the vessel is always under complete control quite independent of its own power, and the danger of injury to the lock walls and gates is very greatly lessened.

The towing tracks have a specially designed rack rail extending the entire length of the track and located centrally with respect to the running rails. It is through this rack rail that the locomotive exerts the traction necessary for propelling large ships and climbing the steep inclines. A rack rail is also provided on short portions of the return track so as to lower the locomotives safely from one level to the next. The steepest slope is 26 deg., or 44 per cent, hence the need will be seen for a



Front View of Traction Motor Unit, with Journal Box in Place

rack rail even on the return track, it being noted that any traction locomotive with the usual wheel drive, even with the brakes set, would begin to slide on a 16 per cent grade, and therefore could not be controlled. With a rack rail, however, traction is limited only by the capacity of the driving motors and not by the adhesion of the wheel treads on the rails. The rack rail is

Locomotive Ascending the Incline Between Locks

made with an approach section that can be depressed on the approach of the rack pinion of the locomotive. The teeth of the approach section are undersize and shaped off at the extreme end so that the teeth of the pinion will mesh properly and prevent excessive strain on the pinion and the axle. A spring restores the approach to the proper position after the locomotive has passed over. The rack rail is of the shrouded type, and

each tooth space has a drain hole cast in the bottom so as to carry off water and other accumulations to suitable drain pipes or ducts set in the concrete of the walls. A further feature is projecting edges, which permit thrust wheels attached to the locomotive to run along the under side and prevent overturning of the locomotive, in case some unforeseen operating condition should produce an excessive pull on the towline. These thrust wheels serve to counteract the lateral component of the towline pull and the flanges act for emergency only, as the weight of the locomotive is sufficient to prevent overturning with a normal pull of 25,000 lb. on the towline.

Three-phase, 25-cycle, 220-volt alternating current is used for operating the locomotives, and the current is supplied to the locomotives through an underground contact system. Two T-rails form two legs of the three-phase circuit and the third leg is formed by the main track rails. A specially designed contact plow slides between the two T conductors and transmits the power from the rails to the locomotive. This contact plow also passes through a slot opening in the conduit cover and is flexibly connected to the locomotive in such a manner as to follow all irregularities in the tracks and crossovers.

The working parts of the locomotive are supported by two longitudinal upright side frames of cast steel, connected by transverse beams. These frames are in effect deep rigid trusses, having upper and lower members connected by posts and diagonal braces. The middle portion of each frame has its upper and lower members parallel and horizontal, but the end portions have their lower members inclined upwardly towards the ends of the frame. The pedestals for the wheel axles are located at the junction of these end portions with the middle portion, and are of the usual locomotive type, having vertical parallel jaws between which the journal slides. The locomotive is mounted on four wheels, the wheelbase being 12 ft. and the over-all length about 32 ft. Each axle is driven by its own motor, independent of the other and the construction is identical at both ends.

The motors are of the three-phase, slip-ring type, enclosed, and are geared by a pinion and spur gear to the countershaft, which carries a pinion meshing with a spur gear keyed to the jack shaft. On the outer side of the spur gear are formed clutch teeth which co-operate with similar teeth on the adjacent side of a gear, which is sleeved upon the jack shaft and can be slid lengthwise thereon to engage and disengage the clutch teeth. The means for sliding this gear consists of a disc secured to the gear and having a central hub fitting over the end of the jack shaft. A pinion is keyed to the axle and is wide enough to mesh always with the gear, so that when the clutch teeth are engaged, the motor will propel the locomotive by the adhesion between the wheels and the rails of the track, and this only when running without load and between inclines.

When the locomotive, however, reaches one of the inclines between the locks, the grade of which may be as much as 44 per cent, or when it is towing a ship, the cog rail system is utilized to enable the locomotive to climb the grade and exert the traction necessary for pulling large ships. The cog or rack rail is laid between the track rails; and the locomotive is provided with a cog wheel or rack pinion secured to or integral with a sleeve, which rotates freely on the axle.

In connection with each motor a powerful brake is installed; and, as during operation the motors are at all times geared either to the axles or to the cog wheels, the truck wheels are not provided with any brake rigging. In addition to this automatic brake, means are provided for applying the brakes manually in order to supplement the action of the automatic feature, if necessary, when descending a grade or where approaching a rack rail.

Each of the two main traction motors has a rating of 75 hp., and is of the slip ring induction type, operated by a system of contactors with a master controller in each cab. The motors, by means of the change in gearing from straight traction to rack rail towing, drive the locomotive at a speed of 2 miles an hour when towing and 5 miles an hour when returning idle. These motors act as induction generators running above synchronous speed when the locomotive is passing down the steep inclines and thereby exert a retarding brake effect to keep the speed uniform.

The locomotives are provided with a windlass which will pay out or wind in the towing cables at the low rope speed and at the full tow line pull of 25,000 lb., either when the locomotive is running or at rest.

These locomotives have a net weight of 86,300 lb. During the first three months of commercial operation of the canal, from August 15 to November 15, 1914, the cargo transported through the canal and towed through the locks by the locomotives amounted to 1,079,521 tons. During the fiscal year ending June 30, 1914, the Panama railroad carried 643,178 tons of through freight between the two seaboards, and in the preceding fiscal year 594,040 tons. From this it is seen that between six and seven times as much cargo is passing over the isthmus now as passed over the route when goods were transshipped by rail.

B. L. WINCHELL ON PERSONAL EFFICIENCY

B. L. Winchell, director of traffic of the Union Pacific System, addressed his New Year's greeting to traffic department employees, including officials, in the form of a circular letter on "Personal Efficiency." He said in the letter that his purpose in issuing the circular was to ask every person employed in the traffic department of the system "to give earnest and honest consideration to his own habit of thought and life; to make a simple self-test of efficiency and to start the new year determined to reach higher levels of effort and accomplishment." "Self-examination is usually profitable," he said, "and but few of us do enough of it." The circular included a "personal efficiency test" taken from an article by Edward Earle Purinton, published in The Independent of November 30, 1914, which included a series of 30 questions on personal efficiency, with a space in which to record the percentage of efficiency after a self-analysis. Some of the questions are as follows:

"Do you like your work?

"Have you learned the best, quickest and easiest way of doing it?

"Do you know where your greatest power lies?

"Have you a fixed goal, in line with your supreme talent?

"Do you believe absolutely in your own future?

"Have you learned how to get well and keep well?

"Have you made an inventory of your mental and moral traits?

"Are you correcting your own weaknesses; mental, financial, social or spiritual?

"Have you discovered which foods, baths and exercises increase your energy and heighten your mentality?

"Are you independent, fearless, positive?

"Are you tactful, cautious, courteous?

"Have you secured the best possible advisers and associates?

"Do you wish your rivals well, and never speak ill of them?

"Do you work harder than anybody else in the business?

"Have you learned the science of planning your day ahead?

"Can you relax entirely in your leisure hours?

"Are you saving money systematically?

"Do you enjoy art, music, literature and the presence of little children?

"Does your highest ambition include some real service to humanity?"

The letter continued: "I do not ask or expect that the result shall be shown to any officer or employee of these companies. I do recommend that you show it to your wife or mother, if, fortunately, you have one or both. If the result of this taking stock shows that you can do better (as it will show to any man of good conscience) will you?"

United States Board of Mediation and Conciliation

The Annual Report of a Commission Which Specifically Asks That No Further Power Be Conferred on it

The following is a very full abstract of the report of the United States Board of Mediation and Conciliation:

The immediate cause for the passage of the present law [the Newlands act] grew out of the demands of the conductors and trainmen in "Eastern territory" which had been presented, in a concerted movement, some months previously to 42 eastern railroads in what is known as eastern associated territory. The 22,752 conductors involved in this movement were represented by the Order of Railway Conductors, A. B. Garretson, president, and the 69,697 trainmen were represented by the Brotherhood of Railroad Trainmen, W. S. Lee, president. The 42 railroads were represented by a conference committee of managers of which Elisha Lee, of the Pennsylvania, was chairman. The direct negotiations between the parties resulted in a refusal by the railroads to grant the demands of the men on the ground that the rates of wages then prevailing were adequate and that the employees were working under favorable conditions. A strike vote had been taken resulting in some 97 per cent of the employees voting to withdraw from the service of the railroads unless their demands were complied with. The situation was an aggravated one and reached an acute stage early in July, 1913, which threatened a complete tie-up of all the railroads in that territory to the serious detriment of the public interest, incalculable losses to both parties to the controversy, and widespread financial disaster to the country. The public mind was excited and the bill which had been pending in Congress for some months was, upon the advice of the President, promptly enacted into law to meet the emergency.

Immediately upon the appointment of the officers as authorized by the act the services of the United States Board of Mediation and Conciliation were tendered to both parties to the controversy and promptly accepted. As all of the parties to the controversy were assembled in New York City the mediation conferences were opened there on the day following the appointment of the mediators.

The mediators met the representatives of the two parties in separate conferences and early in these sessions ralized that the only method of amicable adjustment would be through arbitration, and thereupon directed their efforts to induce the parties to submit their controversy to a board of arbitration, in accordance with the provisions of the act. This was done and the award of the board was rendered on November 10, 1913, and went into effect upon the entry of judgment thereon by the district court of the United States for the Southern District of New York ten days thereafter, and subject to certain interpretations by the reassembled board, has since been in practical application throughout the affected territory.

During the pendency of the foregoing arbitration the services of the Board of Mediation and Conciliation were requested in 10 other cases. In seven of them amicable settlements were secured by the Board through mediation. In two of the remaining cases many of the points in controversy were settled by mediation, the points remaining unsettled going to arbitration. while in one case all of the matters in controversy were settled by arbitration.

Case No. 2 was a concerted movement by the engineers, firemen and trainmen against the Chicago & Western Indiana and the Belt Railway of Chicago. The application in this case was made by the railroads and the services of the board were promptly accepted by the employees; mediation was conducted in Chicago beginning August 4, 1913, and the unsettled points of the controversy were submitted to arbitration, the award of the arbitration board being rendered September 17, 1913.

Case No. 4 was a concerted movement by the engineers, firemen, conductors and trainmen against the Southern Pacific (Pacific system) the request for mediation coming from the railroad on July 31, 1913. Mediation conferences were held in San Francisco, Cal., and resulted in the settlement of all points of difference save one. This question—the determination of what constitutes street car service as distinguished from suburban electric service—both parties agreed to leave to the decision of an independent board of three umpires of which Hon. John F. Davis of San Francisco was selected chairman. Their decision was rendered October 17, 1913.

Case No. 6 was a concerted movement on the part of the conductors and trainmen against the Chicago, Burlington & Quincy, with 150 points of difference between the employees and the railroad. The application to the board was made by both parties. Mediation conferences were begun in Chicago on August 21, 1913, which resulted in the amicable settlement of 111 of the contentions, and the remaining 39 disputed points were submitted to arbitration November 3, 1913. This was an exhaustively contested case. A board of six arbitrators was demanded by the parties, the railroads choosing as their representatives on the board Fairfax Harrison, president of the Chicago, Indianapolis & Louisville, and P. H. Morrissey, assistant to the vice-president of the Chicago, Burlington & Quincy. The employees named as their arbitrators E. R. Curtis, vice-president of the Order of Railway Conductors, and E. L. Harrigan, general chairman of the grievance committee of the Brotherhood of Railroad Trainmen of the Northern Pacific. The Board of Mediation and Conciliation appointed Hon. Gerrit J. Diekema, of Holland, Mich., and Hon. Henry S. Boutell, of Washington, D. C., as neutral arbitrators. The arbitration board organized with Mr. Boutell as chairman and appointed H. S. Milstead secretary. Pending the arbitration Mr. Harrison was elected president of the Southern Railway which necessitated his removal from Chicago and his residence in Washington, and Hon. Pierce Butler of St. Paul, Minn., was chosen as his successor on the arbitration board. The award of the board was rendered on February 19, 1914. The history of these cases, which arose in the early workings of the law, has been given in some detail to briefly indicate the methods adopted by the board in the adjustment and settlement of controversies.

In all there have been 28 cases similar in character and importance to the foregoing brought to the attention of the board during the year by one party or the other, or jointly in some instances, in each of which the controversy was of such a nature that a tie-up or suspension of train movements would have resulted except for the settlements which were reached through the services of the board. In all of these cases, with the exception of two, strike votes had actually been taken before the services of the board were requested. In three of the most serious cases the services of the board were tenderd, without the request of either party, resulting in amicable adjustment in two cases by mediation and the other by arbitration.

There have been only two cases since the passage of the law where the strike votes became effective. In one of these cases the request for mediation services was not received until late in the evening and the strike already set for 6 o'clock the next morning. Previous to the request the board had no knowledge of the situation. The controversy in that case was between the engineers, firemen, conductors, trainmen and telegraphers and one of the heaviest traffic roads in eastern territory, serving a densely populated industrial section with terminals in several of the largest cities of the country. It was practically impossible to get in touch with the officers of the railroad and the general officers of the labor organizations in charge of the strike during

the night, and the strike went into effect as ordered, resulting in a complete tie-up of train movements. By 11 o'clock, within five hours of the inception of the strike, all the parties representing the contesting interests had been reached by telegraph and met in conference with one of the mediators at the headquarters of the railroad company, and before the close of that day, within twelve hours of the commencement of the strike, full train movements were resumed and the question in controversy were promptly adjusted through mediation.

In the other case the application for mediation was received from one of the parties to the controversy but mediation was declined by the other a few hours before the hour set for the strike. The controversy in that case was a peculiarly difficult one for the board to handle because it involved the refusal of the railroad company to meet the representatives of the five organizations connected with transportation, acting in concert, and it was not until this impediment was removed through the services of the board that the parties were brought together. In the meantime the strike had become effective and the interruption of transportation was practically general throughout the system for three days. In connection with the agreement to meet the representatives of the labor organizations, both parties agreed to refer to future mediation any of the matters in controversy which they were unable to settle by direct negotiations, agreeing to the condition, required by the board, that uninterrupted train movements should be resumed in the meantime. This was done promptly and an amicable adjustment in this case was reached, without any destruction of property and with comparatively slight detriment to the public interest.

It is interesting to know that of the 28 cases in which the board's services were required, 21 were wholly adjusted through mediation; two by arbitration after many of the points in dispute had been disposed of through mediation; while in only five cases was it necessary to submit all the matters in controversy to boards of arbitration.

The list of cases herewith furnished embraces only the classes of controversies that threatened to interrupt, or were actually interrupting, the business of the railroads to the serious detriment of the public interest, and is therefore but a partial statement of the labors of the board.

A custom has grown up among both employers and employees to refer their controversies of a less serious nature also to the board, and while the board has not unduly encouraged this practice it has readily, as far as practicable, employed its services wherever by so doing it was considered in the public interest. Such services, perhaps, are not strictly within the letter of the organic law but are undoubtedly within its spirit, and the readiness with which both parties invoke the services of the board is a very high testimonial to the wisdom of the law and the benefits resulting from its administration. Controversies of this nature generally involve the interpretation of schedules and contracts which cover both rates of pay and conditions of service; and, in some instances questions of discipline, notwithstanding the generally recognized principle that the railroads reserve and exercise the undisputed right of discipline. In matters of discipline purely, the customary course, before the passage of the Newlands act, was by way of appeal through the employees' committees from an unsatisfactory decision of a minor official to officials of higher grade of the railroads, and in case the decision was sustained the brotherhood organizations had no recourse except through a strike or a threatened strike. Since the passage of this act, however, while either of the parties could refuse a proposal from the other to submit a controversy growing out of a matter of discipline to the board on the ground that it was not a subject of mediation in the contemplation of the law, it is a significant fact that questions of discipline are not infrequently brought to the board by the requests of both parties, and in such cases, as well as in many other controversies, involving interpretations of schedules and working contracts, the board has yet to learn of an instance where its advice has not been accepted and amicable settlement reached.

Mediation is wholly a voluntary procedure in the contemplation of the law. Both parties, even, may decline to invoke it, and where the services of the board are requested by one of the parties the other may decline to accept them, and both may decline where the board tenders its services in the absence of application. There have been, however, only three instances so far where the conditions were such that the board exercised its authority to volunteer its services without request from either party, and there has been no case in which either party has refused to accept the services of the board when requested by the other. In eight cases the requests have been the joint action of both parties; in six cases application was made by the roads and services accepted by the employees and in 11 cases application was made by the employees and services accepted by the roads. Notwithstanding, therefore, the fact that mediation of disputes is a voluntary procedure and that the board has only advisory authority, the law has been administered so as to meet substantially all the conditions that the advocates of a compulsory arbitration law demand. In fact, it is questionable whether a compulsory mediation law would operate as satisfactorily as the present law, which depends primarily for its success upon the voluntary action of the parties to a controversy.

In not a few instances the parties have requested and even urged the board to settle their controversies as if in arbitration, but this the board has declined to do; because, in the first place, in its opinion, the language of the law did not confer such authority, and, secondly, because it would jeopardize, if not destroy, the mediatory efficiency of the board. The board advises, and makes rulings, but always without binding the parties to accept the same.

Perhaps the most difficult work the board has encountered has been in the execution of that provision of the law which requires it to "at once endeavor to induce the parties to submit their controversies to arbitration" when its "efforts to bring about an amicable adjustment through mediation and conciliation shall be unsuccessful." When all mediation and conciliation efforts have failed, arbitration is the only recourse for a peaceful settlement of the controversy, and both of the parties feeling equally the justness of their cause naturally hesitate to submit their contentions to an arbitration board, because it is an arbitration board and not the Board of Mediation and Conciliation that has authority to render an award which, under the terms of the law, becomes the judgment of a court. The law requires the filing of the award, on the day of its rendition, in the district court of the United States for the district in which the arbitration is held, and if not successfully appealed from within ten days judgment is entered thereon.

There has been only one appeal from an award during the year, and in that case the award was successively affirmed by the district judge and by the circuit court of appeals.

The operations of the board both in its mediation features and in arbitrations brought about through its advice, have directly affected every railroad east and several of the largest systems west of the Mississippi river. Perhaps three-fourths of the railroads of the country in capital and trackage have been involved in these controversies, in which the organizations representing the engineers, firemen, conductors, trainmen, switchmen, telegraphers and maintenance-of-way men, aggregating 124,503 employees, have been concerned, in some cases in single movements and in other cases in concerted movements.

The administration of the law, it is believed, has demonstrated the wisdom of its enactment. Through its salutary influences, as a federal statute, it has evoked popular approval and the sympathetic co-operation of the railroad managers and the vast army of their employees, without which approval and support the efforts of those to whom its administration has been intrusted would have been far less successful.

The first federal law providing for the mediation and arbitration of controversies between the railroads and their employees (Act of October 1, 1888) was practically a dead letter. It was invoked only once during its existence, and in that case by the

President of the United States acting without the request of the parties; and this notwithstanding the fact that during the years 1881-1898 there were an average of 22 strikes affecting an average of 29 railroads each year.

The second enactment of Congress (June 1, 1898, commonly known as the Erdman law) undertook to correct the defects of previous legislation. Although it was the result of long agitation and embodied the proposals largely of the railroads and labor interests immediately concerned, its provisions during the first years of its existence were rarely availed of. The records of the department of commerce and labor (report of the commissioner of labor, 1906) show that from the year 1901 to 1905 there were 329 strikes affecting railroad transportation, while during that period there was only one instance in which the provisions of the Erdman law were invoked, and in that case the request for mediation made by the employees was declined by the companies, and the record of the department does not show how the controversy was finally disposed of.

From 1906 down to the enactment of the present law there were in all 48 cases settled on request of the parties either by mediation under the Erdman law or by arbitrations in accordance with its provisions. Seven of these cases were concerted movements, involving many of the various classes of employees and involving in each instance a large number of railroads, in one case as many as 64 roads. Of these 48 cases coming under the Erdman law during the fourteen years of its existence, 20 were settled through mediation, eight were settled by mediation and arbitration, and four by arbitration alone. In the remaining 16 cases the services of the mediators, requested by one of the parties, was either refused by the other, or direct settlements were reached between the parties after the services of the mediators were invoked without employing them or resorting to arbitration.

It is, perhaps, too early in the administration of the law to suggest amendments, and no action has been taken by the board either in support of or in opposition to various amendments that have been suggested, some of which have been introduced in Congress. The policy of the board has been to let well enough alone until time and longer experience should demonstrate the necessity for changes in the law. Complaints and criticisms of the law, so far as the board is advised, do not relate to the methods of mediation or to arbitration procedure, but relate to the application of awards. Complaint is urged by the employees that the application of an award, being wholly within the control of the employer, they have no recourse except through an appeal which in effect brings the subject-matter again back to mediation. The attitude of the employees in this connection is that while mediation and arbitration under the law are properly voluntary movements, the application of an award when the court's judgment has been rendered thereon should be compulsory, and that some method should be provided, through legal machinery, for its prompt and proper application by the railroads. On this subject the board feels that it is relieved from making any remedial suggestion except that in no event should methods of application of an award or its enforcement be committed to or imposed upon the board. Its duties have been wisely confined to mediation and conciliation, and those remedies failing, to use its best endeavors to induce the parties to arbitrate their controversies, and the duty of the board in future, as now provided by law, should be confined exclusively to these fields of operation.

The organic act carried an appropriation of $25,000 which was found to be about sufficient to cover the salary of the commissioner and the assistant commissioner, office employees, office rent, cost of traveling, and general miscellaneous administrative expenses. The expenses incident to arbitrations are all borne by the government, and as these increased during the year it became necessary for Congress to provide additional funds, and two deficiency appropriations, one of $10,000, and another of $40,000 were granted. Of these appropriations aggregating $75,000 there was expended in the eleven and one-half months from the organization of the board to the close of the fiscal year the sum of $20,567 for salaries and for what may be termed purely administrative purposes, and the sum of $33,645 for expenses of arbitrations. The present law provides for either three-member or six-member boards of arbitration, as the parties may desire, and the policy of the Board of Mediation and Conciliation to limit an arbitration board to three members where the controversy is between one class of employees and a single road has generally been agreeable to the parties. In the concerted movements where more than one class of employees or a number of roads are involved an arbitration board of six members is employed. The expenses of arbitrations are carefully guarded by the Board of Mediation and Conciliation, and while the amount in the aggregate may appear large the work in reality has been accomplished on economical lines. The surplus of $20,788 of appropriations over expenditures which was conveyed back into the treasury at the end of the fiscal year, resulted from the fact that certain arbitrations which were anticipated at the time the last appropriation of $40,000 was granted, did not take place before the expiration of the year. An appropriation of $50,000 has been granted for the year 1914-15 and may or may not prove sufficient, depending upon the number and cost of arbitrations held during that period. The normal administration expenses will continue through the year without material change.

A COMPARISON OF THE OLD AND NEW LINES OF THE CANADIAN PACIFIC AT ROGERS PASS, B. C.

In our issue of December 11 the location and construction of the five-mile tunnel which the Canadian Pacific is driving through the summit of the Selkirk mountains, at Rogers Pass, B. C., was described. Since the publication of this article a comparison of the operating characteristics of the old and new lines has been made available in an article by J. G. Sullivan, chief engineer of the Canadian Pacific, in the Cornell Civil Engineer for December, 1914. The following data are taken from this article:

The line on the present location is 23.1 miles long, and on the revised location 18.68 miles. The grades for westbound traffic on the present location consist of 16.65 miles, ascending on a maximum grade of 2.2 per cent, 6.45 miles of down grade with the same maximum, and with a total rise of 1,726 ft. and a drop of 692.1 ft. with 1,860 deg. of curvature on the up-hill and 1,288 deg. on the down-hill portion of the line. The revised location consists of 16.77 miles of up-hill grade, with about 5 miles of 2.2 per cent pusher grade, the balance of 1 per cent and a down-hill run of 1.91 miles with a maximum of 2.2 per cent grade; a total rise of 1,178.2 ft. and a drop of 144.3 ft., with 635 deg. of curvature on the up-hill grade and 66 deg. down-hill. The average traffic for the years 1912 and 1913, which is made the basis of calculations, was 1,342½ passenger trains in each direction, and the average weight of the passenger trains, exclusive of locomotives, was 443 tons. Pusher engines were required for 980 of the passenger trains. The weight of the passenger and pusher engines for passenger trains was 175 tons each. There were 1,738½ freight trains in each direction per year; the average weight of the freight trains eastbound, exclusive of locomotives, was 950 tons; and westbound 898 tons. All freight trains had to be pushed in both directions, and the weight of freight locomotives and pushers was 181 tons each. The tonnage eastbound and westbound was as follows:

Eastbound

1,342½	trains @ 443 tons each	594,727.5	tons
2,322	locomotives @ 175 tons each	406,350.0	tons
1,738½	freight trains @ 950 tons each	1,651,575.0	tons
3,477	locomotives @ 181 tons each	629,237.0	tons
	Total	3,281,889.5	tons

Westbound

1,342½	trains @ 443 tons each	594,727.5	tons
2,322	locomotives @ 175 tons each	406,350.0	tons
1,738½	freight trains @ 898 tons each	1,561,173.0	tons
3,477	locomotives @ 181 tons each	629,237.0	tons
	Total	3,191,487.5	tons

Comparison of Comparable Factors Affecting the Cost of Operating Over Rogers Pass, via Present Line and via Tunnel Line, Now Under Construction, Average Traffic for the Years 1912 and 1913

Eastbound tonnage per year, including weight of engines, 3,281,890 tons.

Resistance to overcome, on present line

Actual rise, 692.1 ft.	692.1 ft.	
Curve resistance, 1,288 deg. × .04 ft.	51.5 ft.	
Friction resistance, 6.45 mls. × 15 ft.	96.7 ft.	
Total		840.3 ft.

Resistance to overcome, tunnel line

Actual rise, 144.3 ft.	144.3 ft.	
Curve resistance, 66 deg. × .04 ft.	2.6 fe.	
Friction resistance, 1.91 mls. × 15 ft.	28.6 ft.	
Total		175.5 ft.
Difference		664.8 ft.

3,281,890 tons × 664.8 ft. equals 2,181,800,472 foot tons.

Westbound tonnage per year, including weight of engines, 3,191,488 tons.

Resistance to overcome, present line

Actual rise, 1,726 ft.	1,726.0 ft.	
Curve resistance, 1,860 deg. × .04 ft.	74.4 ft.	
Friction resistance, 16.65 mls. × 15 ft.	249.7 ft.	
Total		2,050.1 ft.

Resistance to overcome, tunnel line

Actual rise, 1,178.2 ft.	1,178.2 ft.	
Curve resistance, 635 deg. × .04 ft.	25.4 ft.	
Friction resistance, 16.77 mls. × 15 ft.	251.5 ft.	
Total		1,455.1 ft.
Difference		595.0 ft.

3,191,488 tons × 595 ft. equals 1,898,935,360 foot tons.

Total work done (extra)	2,181,800,472 foot tons
	1,898,935,360 foot tons
Total	4,080,735,832 foot tons

One thousand foot-tons equals approximately 1 horse-power-hour. Assuming that 5 lb. of coal is consumed in doing 1 horse-power-hour of work and that coal on a locomotive costs $4.60 per ton, the saving in fuel will amount to:

$$\frac{4{,}080{,}736 \times 5 \text{ lb.} \times \$4.60}{2{,}000 \text{ lb.}} = \ldots\ldots \$46{,}928.46$$

Extra wages, train and engine crews.

Present line

6,162 trains for 23.1 miles,	142,342.2 train miles.
5,437 push. engs. for 23.1 miles,	125,594.7 push. eng. miles.

Tunnel Line

6,162 trains for 18.68 miles,	115,106.2 train miles.
5,437 push. engs. for 13 miles,	70,681.0 push. eng. miles.

Amount saved { 27,236.0 train miles. / 54,913.7 pusher engine miles.

27,236 train miles at 22 cents	$ 5,991.92
54,913.7 pusher miles at 25 cents	13,728.40
(25 cents to cover engine crew wages, cost of repairs to pusher locomotives and extra cost of maintenance account of running pushers.)	
Extra cost maintenance of way, 4.42 miles at $200 plus 27,236 train miles at 20 cents	6,331.20
Extra cost of maintenance of way, on account of extra number of degrees of curvature, assuming that 400 deg. of curvature per mile would increase rate at 20 cents per train mile for maintenance by 30 per cent.	
6,162 trains × 2,447 deg. × 1/40 cents	3,769.60
Special maintenance on account of 4½ miles of snow sheds	85,000.00
Extra cost of maintenance of equipment 27,236 train miles at 21 cents	5,719.56
Extra cost of maintenance of equipment, on account of the extra number of degrees of curvature, assuming that 400 deg. of curvature per mile would increase rate of 21 cents per train mile by 40 per cent.	
6,162 trains × 2,447 deg. × 21/1000 cents	3,166.47
Total annual saving in cost of operation	$170,635.61

The rate at which traffic has been increasing would indicate that shortly after the work of constructing the tunnel was completed the traffic would have doubled. In this case, if no further economies were made in methods of operating this section of track, the annual saving on account of operating over the tunnel line would be,

$$\$85{,}635.61 \times 2 \text{ plus } \$85{,}000.00 = \$356{,}271.22$$

In arriving at the above figures no account is taken of whether the line was single or double track, and for comparative figures it was assumed that the methods of operation would be the same. As a matter of fact, the present single-track line with double the present traffic would make the business too congested for economical single-track operation. Therefore, it was apparent that it was time to study the question of double-tracking the present line or seeking a new line for double track. It was decided to double track on the five-mile tunnel location. Now to operate successfully a five-mile tunnel we will require the installation of an electric plant and the purchase of electric locomotives. All the details of the proposed electrification have not as yet been worked out, but even if they were, the reader is not interested in the details of cost. He can see at once that the problem was to find out if the cost of operating and maintaining the tunnel line, taking into account the extra cost of operating on account of having a short section of electric operation and extra cost of maintaining tracks in the tunnel, plus the interest on the cost of building the new double-track line, including the cost of electrifying the tunnel, would be less than the cost of operating and maintaining a double-track line on the present location plus the interest on the cost of building the second track. The figures would not have been very decisive one way or the other were it not for the fact that there is now 4½ miles of wooden snow sheds on the present location which will be all eliminated on the new location. The maintenance and costs of renewals of these sheds amounts to between $85,000 and $100,000 per year. To maintain and renew a double-track wooden shed would probably cost at least 50 per cent more than the above, so that with a saving of about $125,000 per year in maintenance and renewals of snow sheds and a calculated saving in operation and maintenance of $171,271.22 on a traffic that surely will be reached in the near future, there was no doubt as to the proper course to pursue.

FUEL ECONOMY ON THE GREAT WESTERN

The Chicago Great Western in effecting economies in fuel has attempted to consider every phase of the subject. The most economical fuel is determined from analyses and the results obtained from actual tests and the prices quoted, all being reduced to show the cost per ton-mile. An analysis once agreed on and made a matter of contract is not permitted to become a dead letter. The coal from each shipper is carefully sampled about twice a month and sent to the railroad company's laboratory for analysis. The aim is to contract for the fuel for each division

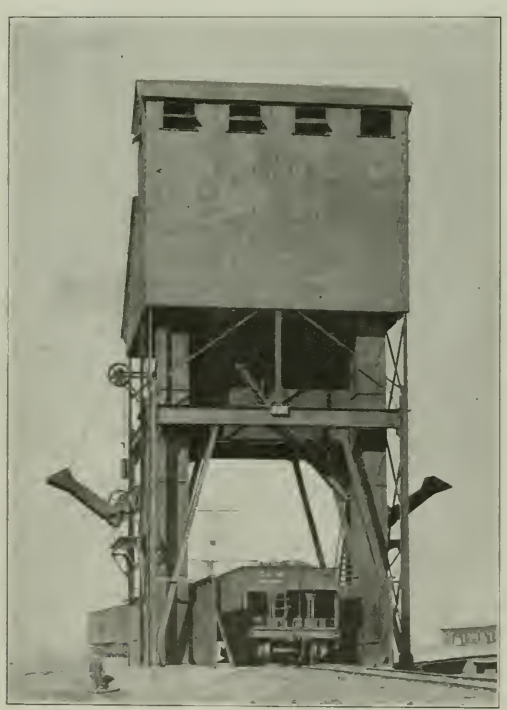
Post Card for Reporting Excessive Smoke and Popping of Locomotives

from one mine in order that the engineers and firemen on that division may become familiar with the fuel and therefore be better able to get the best possible results from it. This is an important feature, and is appreciated by the engine crews.

Each superintendent employs a field inspector who puts in all of his time at the mine, carefully watching the preparation of the coal. After the coal is received at the point of consumption, a certain number of cars are examined each week by the division superintendent himself, or by some of his subordinates, and any items of unsatisfactory preparation are taken up with the shippers

and with the superintendent's own inspector at the mine. Each division is required to check-weigh a certain number of cars each week and report the result to the general manager. The monthly performance of each fuel station is recorded in the general manager's office on the form here reproduced, which shows in detail the results of operation. The type of cars in which the coal is delivered is included in the form so that the general manager may know that the coal is being delivered in the right kind of cars for each particular station. Excessive costs for handling may be readily noted also, and indicate where investigations are necessary.

Within the past five years modern coaling stations have been erected at 12 points of greatest fuel consumption, and by their use the cost of handling has been reduced from an average ranging between 9 and 12 cents per ton to an average ranging from 2 to 4 cents. Illustrations of the coaling stations at Sycamore, Ill., and Carroll, Iowa, are shown. The new coaling stations are all equipped with scales so that the amount of coal delivered to each engine may be determined. These scales have given very satisfactory service; they are tested regularly by the scale inspector and are carefully maintained. An automatic device is used for recording the weights on two coal tickets, one for the



Chicago, Great Western Coaling Station at Sycamore, Ill.

engineman and one for the station attendant. Recognizing that fuel is one of the largest items in the cost of transportation, a systematic programme is being followed out as to equipping engines with superheaters and brick arches to reduce fuel consumption. At the present time the company has 71 engines equipped with superheaters and 224, or over 75 per cent, with arches. Mechanical stokers have not yet been applied, but work has been started to equip some of the heaviest freight engines with them.

A form known as 380, here illustrated, is compiled daily in the train despatcher's office, showing the pounds of coal used by each locomotive for hauling 100 tons one mile. Three separate sheets are used, one for passenger trains, one for through freight trains and one for way freight trains. The form is valuable, not only because it shows the fuel consumption, but also because it shows the percentage of the potential tonnage actually hauled. It records only the performance of individual enginemen and firemen and individual engines while in service. Care is therefore taken not to charge thereon any coal consumed at terminals. When an engine leaves the initial terminal the despatcher is

Coaling Station of the Chicago, Great Western at Carroll, Iowa

immediately informed by the engine house foreman of the amount of coal on the tender. As the train progresses the amount of coal taken on at intermediate stations is wired in promptly. At the destination the first duty of the engine house foreman is to advise the despatcher of the amount of coal remaining in the tender, metal measuring strips being applied to all tenders to enable the men to estimate the coal accurately. The despatcher, having already calculated the ton-miles, is able to compute at once the coal consumed per 100 ton-miles, and an explanation is immediately sought when an undue amount of coal has been consumed.

The engineman and fireman may not be responsible for a poor fuel performance. When a high fuel figure is obtained it is the duty of the master mechanic and his assistants to examine the engine carefully for mechanical defects tending to increase fuel consumption. It may be found that the engine has insufficient draft, worn cylinder packing, defective valve rings, etc., and the defect is remedied before the engine is again sent out. The company's policy is to maintain locomotives in first class condition. An engine not in good condition is a fuel waster, an enemy to good train loading and a producer of overtime.

The company has five classes of locomotives in freight service. The tonnage potential (the assigned rating over ruling grades multiplied by the mileage made) and the fuel potential (the pounds of coal required to move 100 tons one mile) have been determined for each class by mathematical calculations, combined

with actual tests conducted by representatives of both the transportation and mechanical departments. These tonnage potentials are reduced for unfavorable weather conditions to:

92 per cent for temperatures between 45 deg. and 25 deg. or heavy winds;
84 per cent for temperatures between 35 deg. and zero;
75 per cent for temperatures below zero.

The officer analyzing form 380 is, of course, familiar with the runs and makes due allowance for the engines on passenger trains making frequent stops as against through trains, and for time freights as against drag freights, etc. The road foreman of engines devotes special attention to men who regularly turn in worse records than their fellow employees in the same class of service. Superintendents issue bulletins each month showing the rank of individual engineers and firemen. The average fuel performance is calculated from these bulletins for the respective divisions, and the divisions as a whole are given a rank according to the results achieved. This produces a friendly spirit of emulation productive of much good.

To guard against the wasting of fuel as indicated by annoying black smoke and popping off the company distributes to the employees in all departments a postal card on which a memorandum is to be made of such instances observed. This is mailed to the division superintendent, who promptly does what is necessary to bring about improvement. It is well understood that this form is not to be used by employees for the purpose of getting their fellow workmen into difficulties, and, as a matter of fact, it is not used in this spirit.

PERFORMANCE OF FUEL STATIONS ON ______ DIVISION, MONTH OF ______

Despatcher's Report for Showing Tonnage and Fuel Consumption

Western Engineers' and Firemen's Arbitration

Consideration of Railroads Side of the Case, Including Accurate Data as to Increased Cost Due to Demands

D. H. Bremerman, of the Chicago, Burlington & Quincy, was the principal witness for the railroads at last week's hearing before the board of arbitration in Chicago on the engineers' and firemen's demands. Mr. Bremerman testified regarding present schedule provisions in the East, West and Southeast, as compared with the demands made by the western engineers and firemen, to show that, although they already are more highly compensated in the West than in any other part of the country, the western engineers and firemen are demanding changes which virtually pick out the most favorable rules on some individual roads in the territory and ask to have them made of universal application.

In analyzing the men's demands Mr. Bremerman introduced an exhibit comprising 326 pages, 17 in. by 24 in., which compared, first, the present schedule rates and rules for locomotive engineers and firemen on western roads with those on roads in the East and Southeast, and then compared in detail each phase of the 16 articles submitted by the men with the present schedule provisions existing on practically every important railway in the United States.

Eastern passenger and freight engineers, he testified, are practically on a flat basis of pay for all sizes of locomotives, while in the West there is more graduation in rates according to the size of the engine. Passenger engineers in the West receive now from $4.30 a day for engines under 80,000 lb. on drivers to $5 or over on larger engines, against $4.25 on all engines in the East, the western minimum thus being above what is paid for all in the East. Yet the western men demand a new range from $4.50 to $5.60 per day. Freight engineers in the East, he said, receive $4.75 for nearly all sizes of locomotives, whereas western freight engineers now receive from $4.35 for engines under 80,000 lb. to as high as $5.65 on the larger engines, exclusive of Mallets. The men demand from $5 to $6.40. Thus, although already generally on a higher rate than that prevailing in the east, the men demand a new scale in which the minimum would be 25 cents higher, and the maximum from $1.35 to $1.65 higher than is paid in the East under the 1912 award by the eastern arbitration board. Although the men have claimed that they demand nothing which is not granted by some road already, they have simply attempted to show the number of roads that have proposed rules in effect, without reference to their mileage or importance. The railroad exhibit classified the railroads on a mileage basis, and showed that where some of the proposed rules exist they apply often for peculiar reasons of local importance on so small a mileage compared with the total of 140,000 miles of the western roads involved as to be virtually negligible.

Mr. Bremerman occupied the witness stand for three days, Tuesday, Wednesday and Thursday, giving detailed testimony regarding the facts brought out in the exhibit. The 10 per cent differential for way freight service over the through freight rate demanded by the men, he testified, exists only on five per cent of the mileage of the western roads, while time and one-half for overtime in freight and switching service prevails now for no class in transportation service in any section of the United States and would be an entirely new departure. On no railway in any territory is the switching service based on weights on drivers of locomotives as the men demand. The continuous 10-hour day with 30 minutes for lunch under pay was shown to exist on no western road, with the exception of two small terminal companies, all others paying for 10 hours actual work. The 10 per cent differential for way freight service over through freight was shown to exist on only one road, while a 10 per cent differential is generally higher than now exists in any section of the country. The witness also showed the arrangement now made for compensating the increased labor and hazard in mountain service. The men ask for a 10 per cent increase over the proposed valley rate where the grade is 1.8 per cent or over. This now applies on only one road and in limited mountain districts, but the proposal would make it universal. On account of certain local conditions some roads pay differentials as high as 30 per cent for some grades. How cumulative are the men's demands was shown in their demands for narrow-gage service, which would be subject under the proposed articles, not only to a five per cent increase for narrow-gage service, but in some cases also to the 10 per cent increase on account of grades. Only 9 per cent of the western railways now pay for terminal delays in actual minutes as the men demand. Only 8.5 per cent of western roads now pay an arbitrary allowance for preparatory time. Only two roads in the western territory, and none at all in the East or Southeast have the proposed "automatic release" rule, which provides that when a man arrives at a terminal at the end of his run if required to perform any other service a new day automatically begins. The exhibit showed, in fact, a great mass of rules and present schedules which are absolutely contrary to the automatic release principle.

Under the proposed rule dead-heading engine crews would be paid not only the increased rates of pay proposed for the working fireman and engineer of the train, but would receive as well all the extras for incidental services which the men demand be paid to the working crew. Mr. Bremerman showed that only six per cent of the western roads now pay the same rate to dead-heading crews as to the working crews.

Presentation of the facts in the first exhibit was concluded on Thursday and Mr. Bremerman was cross-examined by representatives of the engineers and firemen. Judge Pritchard, chairman of the board of arbitration, asked for an explanation of turn-around service. "If a crew runs out of Chicago 60 miles, turns around and comes back the 60 miles," said J. B. Sheean, counsel for the railroads, "many railways claim that pay for 120 miles is equitable. The men, however, demand pay for 100 miles out and 100 miles back."

W. S. Stone, grand chief engineer of the Brotherhood of Locomotive Engineers, subjected the witness to a severe cross-examination, dwelling upon the scattered portions of mileage in western territory, on which because of local conditions certain rates or rules are in effect, the universal application of which is demanded by the men. "In securing such local variations," asked Mr. Stone, "do the men generally get all they ask for?" "If they don't," rejoined the witness, "I notice they usually come back for more."

What the demands in the way of rates and rules made by the engineers and firemen mean to the railroads in dollars and cents was explained, on January 22, by J. H. Keefe, assistant general manager of the Gulf, Colorado & Santa Fe, who presented figures based on the actual payrolls and the individual time slips of every engineer and fireman on the western roads affected for the month of October, 1913, the month in which the demands were made upon the railways. Each of the railways affected, in order to determine the cost of the men's demands, kept a separate set of accounts for the month. That there might be uniformity in the interpretation placed upon the proposals of the men and to secure the data as to the costs involved in such shape that it could be concentrated into an exhibit for all of the lines, a blank was prepared and sent to the railroads to be used by them in reporting both the expense under the present conditions and what it would have been had the men's proposals been in effect. These forms were introduced as Exhibit 2. Mr. Keefe described in detail the methods used in compiling these figures to show clearly that no arbitrary or radical construction was placed upon the requests of the men. The operating ex-

pense of the roads, he said, would have been increased by $40,888,665 in the fiscal year ending June 30, 1914, had the proposed rates and rules been in effect. For the month of October, 1913, engineers would have received in added compensation $1,759,008 and firemen $1,653,391, while the additional payments for hostlers, motormen and helpers would have brought the total increase for the month up to $3,885,971. This is an increase of 51 per cent. It was admitted that October, 1913, was a period of heavy traffic, but the total increase of $40,000,000 a year was not obtained by multiplying the increase for one month by 12, but by applying the percentages of increase to the actual payments for the year. Of the total increase for the year, Mr. Keefe said, $2,172,110 would have been required to engage additional help to relieve engineers and firemen of work which has always been considered a part of their regular duty, while $38,716,555 would have gone as increased compensation to the men themselves.

Mr. Keefe also presented an exhibit, No. 3, taking up each one of the 16 articles of the men's demands and stating what each would have meant to the roads in money for the month of October, 1913. A synopsis of this exhibit follows:

Article 1.—Changing the basis of a day's pay and overtime would bring about an increase of $75,298 or 458.24 per cent in the cost of passenger service, while in the freight service there would be an increase of $222,574 or 54.18 per cent.

Article 2.—The increased rates of pay alone would bring about an increase in the passenger service payrolls for engineers and firemen of $158,168 or 9.19 per cent, while in all other classes of service, except passenger and switching service, the increase would be $253,552 or 9.23 per cent. The higher rates of pay for Mallet type locomotives in all classes except switching service would be $25,416 or 29.91 per cent. The application of through freight rates to pusher, helper, mine run, work, wreck, belt and transfer service, and all other unclassified service, would increase the expense of operation $91,808, which is 18.58 per cent above the actual amount paid in the test month for these kinds of service.

An increase of $62,391 or 293.72 per cent would be effected by the demand for a 10 per cent increase over the valley rates on divisions having a grade of 1.8 per cent or greater. In the narrow-gage service, the increase in rates of 5 per cent would amount to a new expense of $1,225. Increases demanded in rates of pay for electric or gasolene motor cars would raise passenger service expenses on these cars from $19,931 to $22,410, an increase of $2,479, or 12.44 per cent. The expenses of electric and gasolene motor cars in all other classes of service except passenger and switching would be increased from $1,249 to $1,456 or $206, or 15.55 per cent.

Article 3.—The demands for a greater differential in local or way freight service over the through freight service rates would place upon the railroads affected an additional expense of $46,511. The differential paid for through or irregular freight service because of the requests that engineers and firemen be granted added compensation for performing part of their regular duties would bring about an increase of $78,000 or 319.32 per cent.

Article 4.—The increased rates of pay for switching service demanded would cause an increase of $219,453 or 18.02 per cent. The demand for a differential for night work over day work represents a totally new expenditure of $31,617. Another new expenditure is represented by the demand that 10 continuous hours or less shall constitute a day and that overtime thereafter shall be paid for on a basis of time and one-half. The added cost from this source alone would be $168,943. Another totally new expenditure of $42,380 would be caused by the demand that road rates be paid when road engines are used in switching service regardless of the circumstances.

Article 5.—The demand for a 30-minute arbitrary preparatory time rule would cause an increase in expenditures for this purpose alone from $19,291 to $410,317 or $391,026, which is equivalent to an advance of 2,026.96 per cent.

Article 6.—An increased expenditure of $78,931 or 525.35 per cent would be caused by the proposed requirements for payment for initial terminal delay in passenger service, which represents the added cost to the roads for compensating the engine crews for failure of trains to depart promptly on leaving time. Payment for final terminal delay in passenger service, as proposed, would cause an increase of $54,611 or 410.73 per cent, while in freight service compensation for initial terminal delay would be increased $111,934 or 150.14 per cent, and for final terminal delay in freight service the increase in expenditures would be $75,550 or 198.94 per cent.

Article 7.—The greatest single addition to operating expenses is involved in the demand for an "automatic release and tie up" rule. Under this rule, no matter how short the division, when the crew would arrive at the end of its run, it would be automatically released and if used again at all would be considered as starting a new day. A similar rule would apply to using a crew after it had been tied up under the federal hours of service law. This would represent a totally new item of cost amounting to $621,128. The requirement for payment of continuous time when crews are tied up between terminals would effect an increase in payments for this purpose of $28,858 or 1,324.04 per cent.

Article 8.—Under the requirement that crews held at other than their home terminals after the expiration of 15 hours shall receive continuous time, the railroads would have to increase these payments for this purpose from $1,492 to $151,307; an increase of $149,815, or 10,038.29 per cent.

Article 9.—The proposed new rule as to the basis of pay for dead-heading would mean an increase of $25,722 or 54.75 per cent for this purpose, and for this sum absolutely no productive service would be rendered.

Article 10.—If hostlers are placed as the men demand at points where an average of six or more locomotives are handled within 12 hours, there would be an additional expenditure of $25,374 and the increase in rates of pay for hostlers would increase the payroll by $210,603 or 96.22 per cent. In other words, over $25,000 would represent new labor which must be employed, while almost $211,000 would represent the increase in pay to present employees.

Article 11.—This article provides that the practice of conducting surprise tests in certain ways shall be eliminated, and involves no additional expense.

Article 12.—A totally new expenditure would be involved in complying with the demands that coal be kept where it can be reached by the firemen from the deck of the locomotive where one fireman is employed in freight service, and on all locomotives in passenger service. The new cost would be $59,750.

Article 13.—To place two firemen on coal-burning engines of 185,000 pounds or more on drivers, in freight service, the roads would have to increase their payroll for this purpose from $1,575 to $423,896, or 26,811.18 per cent.

Article 14.—The increase of $18,826 would be involved in relieving engineers and firemen of duties which they are now required to perform incidentally to their regular labor, in the way of setting up wedges, filling grease cups and cleaning headlights. To relieve the engineers and firemen of other duties in the way of placing tools and supplies on locomotives or removing them therefrom, or filling lubricators, flange oilers, headlights, markers or other lamps, would mean an additional increase of $21,613.

Article 15.—This article provides that railroads shall post bulletins showing accurate service weights of locomotives.

Article 16.—To relieve engineers and firemen of the duty of throwing switches or flagging would involve an additional expenditure of $80,381, an entirely new item of cost.

The effect of these increases in the various classes of service, Mr. Keefe said, is shown by a comparison of the classes of service. On passenger trains the engineers' proposal would mean an increase for them of 37.5 per cent in compensation, while the firemen would receive a 42 per cent increase—a total for both classes of 39 per cent. In through freight service, the

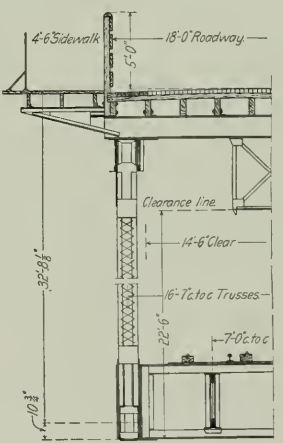
engineers would receive an increase of 41.2 per cent in compensation, while the firemen would receive an 85 per cent increase—a total for both classes of 58.5 per cent.

On locomotives in way freight service the engineers would receive an increase of 56 per cent and the firemen 67 per cent, or a total for both of 60 per cent. In pusher, helper, mine run, gravel, wreck, belt line, transfer and other unclassified service, the engineers' increase in pay would be 31 per cent and that of the fireman 35 per cent, or for both an increase of 33 per cent.

Engineers in switching service would enjoy an increase in compensation of 38 per cent, while the firemen would receive a greater proportion of increase; their advance in wages being 51.5 per cent, or for both classes, 53 per cent. In all classes of service, the increase in pay for engineers would amount to 41 per cent, while the firemen would receive an increase of 61 per cent and hostlers, 108 per cent.

NEW BRIDGE ACROSS THE MISSISSIPPI RIVER AT KEOKUK

The Keokuk & Hamilton Bridge Company has let a contract to the Stroebel Steel Construction Company for the construction of a new bridge to replace its present structure across the Mississippi river at Keokuk, Iowa, at an estimated cost of $325,000. The new structure will consist of a draw span 377 ft.

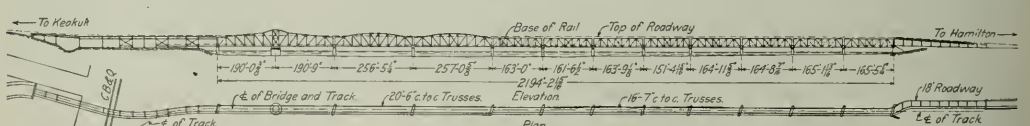


Half Section Showing Relation of Two Decks

1½ in. long, two spans 254 ft. 5¼ in., one 160 ft. 5¼ in., one 159 ft. 4⅛ in., one 161 ft. 4⅝ in., one 148 ft. 11⅞ in., and four spans 162 ft. 8⅜ in. long, the total length of the main structure is 2,194 ft. 3 in. In addition there will be steel approaches for the upper deck at each end.

The old structure, which was built in 1869, carried both railway and highway traffic on the one deck, the Toledo, Peoria & Western and the Wabash reaching Keokuk over this structure. This structure had become too light for the present traffic. In designing the new bridge the highway and railway traffic is separated and the highway placed on an upper deck. The new structure is designed for Cooper's E-50 loading with the highway deck designed to carry a 20-ton motor truck. As shown in the drawing, this structure is designed as a through bridge for the lower tracks and as a deck structure for the highway. The upper level will provide for an 18-ft. roadway, while a 4 ft. 6 in. sidewalk will be carried by cantilever supports on the downstream side. The roadway will be paved with wood blocks carried on 3-in. tongue-and-grooved planks protected from the engine exhaust on the lower level by galvanized iron plates.

This bridge will be built on the site of the old structure with only slight modifications of the piers. It is expected that the work will be completed during this year. This structure has been designed and will be built under the direction of Modjeski & Angier, consulting engineers, Chicago.



Plan and Elevation of New Bridge Across the Mississippi at Keokuk, Iowa

A STANDARD HOME ROUTE CARD FOR FREIGHT CARS

By J. E. Campbell
Freight Agent, Pittsburgh & Lake Erie.

Formerly the duties of the superintendent of transportation or of the officer performing the duties which are usually performed by the person holding that title, were but little more than those of a car accountant. The work was largely of a clerical nature, and had no great bearing on the success and prosperity of his road. Conditions have changed, and now this officer is one of the most important on the modern railroad. The problems with which he is required to deal at different times or under different conditions vary greatly. During prosperous times the great problem is to furnish sufficient and proper equipment to meet the wants of the patrons of the road. In times of depression, however, this problem vanishes and the main question then is how to dispose of surplus equipment and get off the line foreign cars, on which the road is compelled to pay per diem.

During the past year the foreign car question has been one of the most perplexing and troublesome with which the railroads of the United States have had to deal. Under the old system, car hire was paid by mileage. When times of business depression came, cars were side-tracked wherever they might be, and were allowed to remain in storage until such a time as there was a demand for them. This condition was entirely changed under the per diem arrangement, and every line is now anxious to get foreign cars off the road as soon as possible when they are no longer needed, in order to save per diem. They also endeavor to get as many of their own cars on foreign lines as possible, in order that they may earn per diem.

During the past year terminals in all parts of the country have been deluged with empty cars, which were returned empty for movement home. Under normal conditions, the empty car mileage of this country is about 33⅓ per cent of the total movement. This mileage undoubtedly has been 10 or 15 per cent greater during the past year. Some of the more important systems have taken advantage of car service rule 3-B, and have refused to receive their own cars except at the junction at which they were delivered. This has often compelled other lines to haul these cars hundreds of miles and pay per diem on them for some weeks before they could be finally returned to the owners. The spectacle has been witnessed continually during the past few months of empty cars belonging to the southern lines whose terminals are at the Virginia and Ohio river gateways moving north and west toward Cleveland and Chicago, while cars belonging to the western lines have been moving empty to

the eastern seaboard and southeastern gateways. Many of these cars are hauled hundreds of miles in the opposite direction from home in order to be returned home via the routes which they had traveled under load.

At the time the American Railway Association discontinued its car performance bulletins in November, the surplus cars of the country were hovering about the quarter-million mark. If the number of cars which were in transit for home could have been added to this number, the actual surplus probably would have been twice that number. As the surplus increased during the months of November and December, 1914, it is reasonable to believe that about 25 per cent of the entire freight equipment of the country is idle.

The problem of the foreign car is largely one of how to reduce empty mileage and equalize per diem. Per diem adds nothing to the total income of the railroads of the country. A credit in favor of one road is a debit against another road. The road with the most enterprising officials, from superintendent of car service down to yardmasters, and wide-awake employees in all departments, will come out ahead with the balance on the right side of the ledger for car hire. Under present conditions, the road with the more efficient officials in its operating department will have a decided advantage over the road which is weak in that direction.

Various plans have been suggested for handling surplus equipment. It has been proposed to pool a certain proportion of the cars of the various lines and store surplus cars until such time as needed. Per diem then would cease while cars were in storage. This arrangement has been carried out in some instances between connecting lines with special equipment. The plan, however, presents many difficulties in its practical application. The most plausible solution of the problem seems to be a standard home route card which shall be adopted by all of the railroads of the country and a system of short-routing cars home. This, of course, would mean the waiving of car service rule 3-B. Many individual lines have their own systems of home route cards in use, which have been productive of great benefit in times of depression when there was a surplus of cars. These various systems have been neglected in times of prosperity, and much inconvenience is experienced when times again become dull, and it is necessary to dispose of surplus equipment. Last spring, when cars began to accumulate throughout the country, one of the eastern trunk lines had 2,000 foreign cars in one yard which had been sent there from all over the system without any definite information as to how they should be routed home. In order to dispose of these cars it was necessary to haul many of them several hundred miles empty, and it required much clerical labor and a whole month of time to clear up this surplus. Home route cards have usually failed of their purpose through the roads becoming negligent in carrying out instructions governing their use. However, rules governing the use of these cards have been enforced vigorously during the past year, and it is safe to say that every road is in better shape at the present time than for a long time past.

Last August the New York Central Lines adopted a standard home route card, which, if adopted by all roads, and with liberal short-routing rules, would greatly reduce empty mileage and simplify the whole question. The card which has been adopted as a standard by these lines is a yellow card, 3⅞ in. by 10 in. in size. On its face is the proper heading and the name of the road issuing it, underneath which are the spaces for the car number and initials. The rest of the card is ruled off in blank spaces, numbered from 1 to 10 consecutively. On the reverse side are 14 more blank spaces, also numbered consecutively 11 to 24, inclusive. When a foreign car is first received by a road a party to this system, one of these cards is issued and the junction agent stamps in the first space the name of the receiving road, the junction point and the date. Dating stamps are provided for each interchange point for this purpose.

The card is then attached to the waybill, card or revenue, and it accompanies the car on each movement it makes while on the road. When the car passes to a second road, party to the arrangement, that road applies its stamp in the next space, and so on, in case the car should pass to a number of different roads, all parties to the arrangement. If the car is returned via the same route, the agent of the receiving line on its return applies a stamp in the next blank space just as was done when the car was received on its initial movement. This is done until the car finally reaches the junction at which it was first received from a foreign line. When the car finally reaches the interchange point at which the card was issued and is returned to its owners or to the delivering line, the card is taken up and returned to the car accountant of the issuing road. In case the car goes to a road not a party to the arrangement, the card is held by the agent at the junction point for its return. If it is not returned in a reasonable time (60 or 90 days), the car accountant of the delivering line may order disposal of the card if it is deemed best.

When an empty car is received from a foreign or non-participating line for home and the receiving agent has no card on file, he wires his car accountant for the home route and on receipt of the information issues a card showing the road from which the car was reecived and the date. The car can then be forwarded to the road from which it was received, or if placed for loading will be accompanied by a proper home route card when under load. Cars received by any road a party to this system traveling under home route cards belonging to direct connections, can, if desired, be returned to the owners direct and the cards can be taken up. This should always be done if the home junction involves a shorter haul than to the junction at which the car was received by such a road.

The advantages of the system are numerous. Each car carries with it a full record of its movement while on lines participating in the plan and is given more prompt handling. If all lines were to adopt this card or a similar card, every car would carry with it a full record of its movement from the time it left home until its return; agents and yardmasters would be relieved of the necessity of writing for the home route, and delay and much needless switching at interchange points would be prevented. The car accountant would be relieved of the necessity of looking up home routes on hundreds of cars, and there would be a greater likelihood of cars being loaded in the direction of home in accordance with the car service rules.

Its greatest advantage would be in saving empty mileage if all roads would agree to short-route cars home. As an example of what could be accomplished in this way, let us suppose that an Atlantic Coast Line car is delivered to the Norfolk & Western. The car moves to Shenandoah Junction and is delivered to the Baltimore & Ohio; thence to Columbus; then to the Cleveland, Cincinnati, Chicago & St. Louis, and then to Cleveland; to the Erie road to Youngstown; to the Pennsylvania Lines to Pittsburgh. Under the present arrangement, the only way the car could get home would be via the route by which it came. If short routing was permitted, the car would be delivered to the Baltimore & Ohio at Pittsburgh and moved back direct to Shenandoah Junction. The haul via the Pennsylvania Lines to Youngstown, the Erie to Cleveland and the Big Four to Columbus would be avoided. The Baltimore & Ohio would have a shorter haul to Shenandoah Junction. The saving of empty car mileage that would be effected in time of car surplus would be enormous. The wear and tear of equipment, which is often greater under empty than under loaded movement would also be reduced. Under present rules, it may be necessary actually to haul a car across the continent twice empty, in order to get it home. The flood of empty equipment which has deluged terminals and interchange points in the last few months has resulted in much additional clerical expense to secure records and disposition of cars. This would all be saved with a common-sense home route card adopted by all lines. Much empty mileage would also be saved and great expense in handling empty equipment. Often where the movement is light, empty cars are handled in regular or scheduled trains, but where

there is a heavy movement it is frequently necessary to despatch full trains of empties. On some lines which have important terminals and connections at both ends, it frequently happens that trains of empties are moving in opposite directions at the same time; each train representing additional operating expense.

The rules to make such a system effective should be as few and simple as possible. To weigh it down with details would do much toward defeating its efficiency. No car should be permitted to move loaded or empty except on the home road without a home route card. A failure to comply with this rule should be made a subject for discipline.

The adoption of a standard home route card and a short-routing arrangement by the American Railway Association will do much to remove a serious drain upon the revenues of the railroads of this country.

ENFORCING THE LAWS AGAINST TRESPASSING

Stricter laws and stricter enforcement for the prevention of trespassing upon railways are urged upon the state legislatures in "The Deadly Toll of Trespass on Railways," a bulletin of the Railway Business Association.

"There were," the bulletin declares, "33,000 persons under 21 years of age killed or injured while trespassing on railways of the United States from 1901 to 1910, enough to make a mile post for every mile around the world."

Progress toward enactment of laws providing effective penalties and toward conviction and sentences for those who wilfully expose themselves to danger is said to be slowly spreading, while loss of life and damage as affecting railways is increasing. France punishes trespassers by fines up to $579 and jail up to a month; Germany, by fines up to $25; Canada by fines up to $50 and imprisonment up to two months. In the United Kingdom persons other than passengers or employees found on railroad property are fined $10 for each offence.

"In the United States laws are few, and even where penalties are prescribed, magistrates hesitate to impose them, as local authorities dislike to feed and lodge convicted tramps." Trespassers, however, "include little children and wage earners living in the vicinity, whose death or disability often leaves families destitute.

"Elevation of track in Chicago was resorted to at an expense of 70 millions, which is expected to reach 150 millions. Trespassers leap over a city ordinance and climb up on to the elevation in their conscientious devotion to the pursuit of being killed and maimed. In three months 339 arrests were made on the elevated right of way of four systems. Only 67 of the offenders were punished.

LACK OF STATUTES

"Thirty-five states have no laws specifically prohibiting persons walking on railroad right of way. Thirteen states by statute prescribe penalties ranging from $5 fine to 10 days in jail in Maine to $500 fine or one year in jail in New York. These states are New York, Wisconsin, Maine, New Hampshire, New Jersey, Massachusetts, Virginia, Missouri, Rhode Island, Delaware, Georgia, Minnesota and Washington. Missouri has a law which protects the railroad from damage suits, for the purpose of which trespass is a defence for the railroad, but the law in defining the act a trespass for that purpose specifically says "but not otherwise."

Activity on the part of many railroads to lessen the number of fatal accidents on their lines is bearing fruit. The New York Central Lines took the question up with justices of the peace and police court magistrates armed with statistics. Newspapers were urged to give the campaign publicity. Warnings in several languages were posted, while manufacturers and public school teachers were enlisted. The railroad's police department made arrests systematically. During May, June and July, 1914, there were 4,545 arrests and 4,015 convictions. In seven months ended April 30, 1914, there was a reduction in those killed over the corresponding period one year previous from 136 to 98.

"Minors and children, following the example of their elders, flock upon the tracks, engines, cars and turntables and are ground to pieces or crippled for life. Tramps and yeggmen travel around the country in 'side-door Pullmans,' robbing box cars and burning ties, stations, bridges, and timbers, and robbing farmers, country banks, stores and postoffices.

"It would probably cost the states and municipalities less to enforce a law against trespassing, than it does to pick up and bury the dead and care for the cripples."

BUY A MAXIMUM CAR LOAD

O. C. Smith, superintendent of transportation of the Missouri, Kansas & Texas, has issued the following circular letter addressed to "Mr. Shipper and Consignee, Everywhere, U. S. A.": "According to good authority, 1915 will be accompanied by our old friends, 'Confidence,' 'Prosperity' and 'Opportunity,' and it is our intention, with your assistance, to give them a rousing reception. This seems to be an assured fact, as their baggage has preceded them in the shape of improvements in many ways all over the country.

"In the past few months we have heard a lot of talk about 'Buy a Bale of Cotton.' Many bales have been bought and much has been done throughout the South, as well as the North, to relieve the situation. It is a good work. We wish to start the slogan 'Buy a Maximum Car Load,' whether it be coal, lumber or whatever commodity you are dealing in.

"In the eastern rate case it was determined that only 58 per cent of the capacity of cars are used for tonnage that could be handled in the average car. In the West this average, no doubt, is even less.

"From a bulletin sent out by the traffic committee of the Lumber Association, of Chicago, I quote the following: 'The importance of heavier loading is being shown more and more, particularly with the new financial difficulties with which the carriers have to contend. Increasing your loading 25 per cent per car will increase the carriers' revenue the same amount and will not increase the operating expense over 5 per cent. That makes a 20 per cent increase in earning, which is just four times as much as the 5 per cent advance asked for. Bear that in mind whenever possible and load heavily; talk heavy loading to mill men as well as customers, and soon lumber will show a big increase.'

"The railroads have to face (in a bigger way) the same problem that confronts all dealers who have to count on transportation as part of their business. Imagine the fix you would be in, if you should keep on hand during normal and dull times wagons and drivers enough to take care of rush business. How long would your income stay on the right side of the ledger? An increase in the net weight of the car load is just as essential at a time when there is a surplus of cars as when there is a car shortage.

"The Milwaukee Western Fuel Company says, when no cars are to be had, 'You suffer, your customer suffers, we suffer, the railroads suffer.'

"Much is to be gained by all, by shipping and buying a 'Maximum Car Load.'"

Replacing German Goods.—In order to satisfy the demands of the many French inquirers who desire to replace German goods by their British equivalents, the British Chamber of Commerce, Paris, has decided to publish in French a trade index of British manufacturers, merchants, and producers, which will be largely distributed among French firms. After careful consideration, it has been found that this is the most practical method of responding to the demand for British goods in France. The index in question will be confined to firms of undoubted British nationality.

General News Department

A bill to increase the passenger fare in Arkansas from two to three cents a mile was defeated by an almost unanimous vote, after receiving two readings in the Arkansas House of Representatives on January 15.

The Oklahoma railroads have issued a circular letter to the public giving arguments against a number of anti-railroad bills which have been introduced in the legislature, including the full crew law and the car limit law.

The shops of the Canadian Pacific and the Grand Trunk Pacific at Winnipeg, have orders for making shell jackets for the British government, and it is said that between them they will make thirty millions of these jackets.

The Pennsylvania Railroad announces that at the end of this month the sale of liquors will be discontinued in its restaurants at New York and Philadelphia. This means the end of liquor selling throughout the company's lines, both in stations and on trains.

A bill has been introduced in the Utah legislature forbidding all public officers to use railroad passes. Another bill has been introduced prohibiting the issuance of railroad passes to any person included in the list of those prohibited from using them in the other bill.

The bondholders of the Buffalo & Susquehanna are understood to have made arrangements by which they will continue the operation of that road beyond February 1, the date on which, according to an order of the court, trains were to have been discontinued because of insufficient income.

Representative Henry Brady, of Dallas, Ia., has announced his intention of introducing a bill in the Iowa legislature to repeal the long and short haul law, in order to allow railroads to meet competition regardless of their mileage, without being obliged to make corresponding reductions in the intermediate rates.

In the United States District Court at Memphis, Tenn., January 25, the Illinois Central was held blameless for a collision of one of its trains and a street car, September 17 last, in which 11 persons, passengers on the street car, were killed. The jury also awarded damages of $4,000 to the railroad to reimburse it for damage to its equipment as a result of the wreck. Suits aggregating probably $200,000 have grown out of the wreck.

The board of directors of the American Society of Civil Engineers has adopted a resolution and sent it to President Wilson, declaring its opinion that "it would be unfortunate for the present Alaskan Railway Commission to be superseded, and that the interest of the public demands that the present commission be allowed to carry out the construction as well as the location of the proposed line." The commissioners are William C. Edes, Lieutenant Frederick Mears and Thomas Riggs, Jr.

Index to Classification of Operating Expenses

The Interstate Commerce Commission has issued a pamphlet of 297 pages, containing a very full and apparently complete and useful index to the classification of operating expenses of steam roads as issued by the accounting department of the commission. It is printed in large clear type and in the careful and tasteful manner characteristic of the government printing office. A work of this kind has long been needed. If it has any faults, they can be detected only by using the book; but it is safe to say that railroad accounting officers everywhere will welcome the book as a great convenience.

M. K. & T. Officers Asked to Study Public Relations

President C. E. Schaff of the Missouri, Kansas & Texas has issued the following circular to the officers and agents of the system: "It is desired that constant attention should be given to the question of public relations between the Missouri, Kansas & Texas lines and the communities which they serve. Many disagreements which have occurred in the past were caused for the most part by municipal authorities, town councils, business organizations or individual citizens not having a full understanding of the railroads' position in matters of common interests, or by misunderstanding on the part of the railroads' officers who were not in possession of sufficient information to act with intelligence and judgment.

"It is the desire of the Missouri, Kansas & Texas lines to avoid this, and to keep in intimate touch with matters of state and municipal government, as well as the activities of business organizations, in order that its management may work along co-operative lines with the communities upon which it depends for revenue; and all officers, agents and other representatives are urged to closely follow such matters and to be present at meetings of town councils, trade organizations or citizens so that where railroad questions are involved the company may secure a hearing when propitious for it to do so. Agents and others should keep the heads of their departments informed in matters of local interest in their communities affecting the interests of the Missouri, Kansas & Texas directly or indirectly, and also keep themselves informed through the medium of the local press and forward any articles of interest to the proper officer in charge."

New Haven Road 92 Per Cent Block Signaled

Another road whose statement of block signal mileage failed to reach us for inclusion in our annual table was the New York, New Haven & Hartford; which road in 1914 increased by nearly a thousand miles the length of line on which the manual system is in force. The statement (miles of road) follows:

Automotic Block Signals		
Single track	1.6	
Two or more tracks	344.6	
		346.2
Non-Automatic		
Single track	1,033.8	
Two or more tracks	388.2	
		1,422.0
Totol, both kinds		1,764.4
Total passenger lines operated		1,923.6

The apparent discrepancy of 3.8 miles in the final total is on account of two sections of four-track road where 2 tracks are automatic and 2 tracks non-automatic.

Fixed Audible Signals in Place of Hand Motions

In the large freight yard of the Southern Railway at Inman, Ga., near Atlanta, "Klaxon" horns, like those used on automobiles, fixed on posts alongside the track, are used to give signals to the men on long strings of freight cars being pushed over the hump for distribution. In this yard the receiving tracks are about 3,000 ft. long, and to make sure that the signals, to start or to stop or to set back, shall be quickly understood by the engineman and by all of the brakemen, ten Klaxons are distributed at distances of about 300 ft. apart. All of these noise-makers are sounded, simultaneously, by the closing of a circuit in the signal cabin, and the instructions of the man in charge of the switching are thus conveyed in unmistakable terms, simultaneously, to all concerned.

This arrangement is, of course, equally efficient by day or by night and regardless of dense fog or anything which might obscure visual signals.

These signals have been in use since last March, with much satisfaction, and a similar installation is being put in at Finley, the Southern's large new yard near Birmingham, Ala.

Canadian Northern Track Through to Pacific Coast

The Canadian Northern has laid the last rail on its line from Lake Superior to the Pacific coast, the lines from the east and from the west having been connected January 23, at Basque, a village on the North Thompson river, 200 miles east of Vancouver. It will require three months more to ballast the road-

bed, and the official ceremony of driving a golden spike is expected to take place about May 1. This event marks what may be called the final stage of the picturesque struggle of Sir William Mackenzie and Sir Donald Mann, to expand their group of local lines into a coast-to-coast railway. The enterprise had its birth in 1896, when Donald Mann bought the charter of the Lake Manitoba Railway & Canal Company and, with Mackenzie's assistance, built and operated 125 miles of line between Gladstone, Manitoba, and a point beyond Dauphin. By rapid additions of new and old charters and a vigorous construction policy, the promoters, within eighteen years, gridironed the prairie country with Canadian Northern lines, reached the head of the Great Lakes and finally passed across the ridge of Lake Superior and built lines connecting Toronto, Ottawa, Montreal and Quebec. The Canadian Northern lines of today reach practically all of the important traffic-producing centers in the Dominion.

The Engineering Foundation

At a meeting held in the Engineering Societies building, New York, last Wednesday evening, the Engineering Foundation was inaugurated and it was announced that Ambrose Swasey, designer and builder of the Lick, Yerkes and United States Naval Observatory telescopes, and an engineer, scientist and astronomer of distinction, had given $200,000 to promote engineering research.

Mr. Swasey is a member of the firm of Warner & Swasey, Cleveland, machine tool builders and manufacturers of telescopes, in which branch they are among the largest in the world. Mr. Swasey is 69 years old, a past president of the American Society of Mechanical Engineers and of the Cleveland Engineering Society, a member of the Institution of Mechanical Engineers of Great Britain and of the British Astronomical Society. He is a Fellow of the Royal Astronomical Society. In 1900 he received from the French government the decoration of the Legion of Honor for his work on astronomical instruments.

The administration of the fund will be conducted by the Engineering Foundation Board elected by the trustees of the United Engineering Society, and composed of nine members from the American Society of Civil Engineers, the American Society of Mechanical Engineers, the American Institute of Mining Engineers, and the American Society of Electrical Engineers, with two members to be chosen at large.

American Wood Preservers' Association

At the closing session of the American Wood Preservers' Association convention, held at Chicago on Thursday afternoon of last week, officers were elected as follows: President, J. H. Waterman, superintendent timber preservation, Chicago, Burlington & Quincy, Galesburg, Ill.; first vice-president, H. S. Loud, chief engineer, United States Wood Preserving Company, New York; second vice-president, Lowrie Smith, superintendent tie plants, Northern Pacific, Brainerd, Minn.; third vice-president, F. D. Beal, superintendent, St. Helens Creosoting Company, Portland, Ore.; secretary-treasurer, F. J. Angier (re-elected), superintendent timber preservation, Baltimore & Ohio, Baltimore, Md. Members of executive committee are as follows: George E. Rex, superintendent timber preservation, Atchison, Topeka & Santa Fe, Topeka, Kan.; G. M. Davidson, engineer of tests, Chicago & North Western, Chicago; J. B. Card, manager, Chicago Creosoting Company, Chicago; John Foley, forester, Pennsylvania Railroad, Philadelphia; E. A. Sterling, forest and timber engineer, Philadelphia, and C. M. Taylor, superintendent of treating plants, Philadelphia & Reading, Port Reading, N. J.

American Society of Civil Engineers

At the sixty-second annual meeting of the American Society of Civil Engineers, held on January 20, in New York, the following officers were elected: President, Prof. Charles D. Marx; vice-presidents, Daniel Bontecou and Clemens Herschel; treasurer, Lincoln Bush; directors, J. V. Davies, G. A. Harwood, J. E. Greiner, J. F. Coleman, J. B. Hawley and H. S. Crocker. The annual convention is to be held in San Francisco on September 15.

The Traffic Club of New York

At the January meeting of the Traffic Club of New York to be held at the Hotel Astor, on Friday evening, January 29, Martin B. Madden, Congressman from Illinois, will address the club on the subject of the Panama Canal. Woods Hutchinson will also address the club on the same evening.

MEETINGS AND CONVENTIONS

The following list gives the names of secretaries, dates of next or regular meetings, and places of meeting of those associations which will meet during the next three months. Hereafter the full list of meetings and conventions will be published only in the first issue of the Railway Age Gazette for each month.

American Association of Passenger Traffic Officers.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Next meeting, March 2-3, San Francisco, Cal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York, Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual Meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meetings, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

National Railway Appliances Association.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15-19, 1915, Chicago.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Railway Signal Association.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa. Next meeting, March 15, 1915, Chicago.

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

Salt Lake Transportation Club.—R. F. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Signal Appliance Association.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

Toledo Transportation Club.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of Newark.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, Newark.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Transportation Club of Detroit.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

Traffic News

The railways west of Chicago are planning to file tariffs with the Interstate Commerce Commission about February 1, advancing interstate passenger fares to a basis of approximately 2½ cents a mile.

The Rocky Mountain National Park, in Colorado, is to be established, by virtue of a law which has just been passed by Congress. This will be the seventh large national park and will have an area of 230,000 acres. The six national parks already established are said to have had in the past year about 250,000 visitors.

The Seaboard Air Line has made an arrangement with the Atlanta, Birmingham & Atlantic by which S. A. L. passenger trains, two each way daily, except Sunday, will be run through between Savannah, Ga., and Brunswick, 87 miles. The junction is at Thalman; from there east to Brunswick by the A. B. & A., the distance is 21 miles.

The Atchison, Topeka & Santa Fe last week lifted its embargo on export grain for shipment through the port of Galveston, Tex., which has been in effect since December 10. When the embargo was lifted there were about 2,500 cars on the tracks near Galveston, which will be rushed into the city as fast as the ships can take the grain.

The Atchison, Topeka & Santa Fe has announced that a new passenger train will be put in service on February 7, between Chicago and Los Angeles and San Francisco, to be known as the "Missionary." On the same date a new train will be put on between New Orleans and California, to be known as the "California Special," running over the Frisco lines from New Orleans to Houston.

The University of Illinois has announced a short course of two weeks on the diseases of plants as related to their keeping quality during transportation and storage, to be given under the personal supervision of Dr. F. L. Stevens, professor of plant pathology, assisted by George L. Peltier, pathologist of the university department of horticulture. The course will begin on February 8, and close February 20.

The committee of representatives of western state railway commissions that is making preparations for opposing the proposed advances in freight rates by the western roads at the hearings to begin at Chicago, on February 15, has announced its intention of asking for an extension of time in which to prepare for the case. It is reported that the committee has estimated its expenses as about $30,000 for the preliminary preparations and about $45,000 more for the completion of the case should the commission grant the extended time.

The Pennsylvania Railroad, in a leaflet issued to inform the public concerning the company's efforts to safeguard the health of passengers, tells of some of the rules prescribed for this purpose. The water coolers in the passenger cars are sterilized with steam once a week. Water from all sources used by the road is analyzed frequently, 600 analyses having been made in one year. Samples of water are taken from every source of supply and examined at least once every thirty days. The men who handle ice for drinking water wear rubber gloves and do not touch the ice with their hands. In cleaning 22,000 passenger cars (the number at New York in one month) the amount of cotton waste used was 1,700 lb.; of liquid soap 300 gal.; linseed oil soap, 1,380 lb., and the list includes a great lot of other things. The company's passenger cars are fitted with ventilating apparatus which supplies each passenger with 1,000 cubic feet of fresh air each hour, with all windows and doors closed. The ventilating apparatus costs $265 per car, which means $795,000 for the 3,000 steel passenger cars owned by the road. Every person having anything to do with the preparation or serving of food has to undergo a physical examination every 30 days. About 1,100 men are employed in the dining cars and the restaurants of the road. Medical examiners inspect every dining car and every restaurant at least once each month.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The St. Louis Coal Operators' Traffic Bureau has filed a complaint with the Interstate Commerce Commission against the rates on coal shipped to St. Louis from the Illinois bituminous fields.

Switching Charges at Milwaukee

Opinion by Commissioner Clark:

The commission finds that the Chicago, Milwaukee & St. Paul has justified proposed changes in the switching charges applicable in the switching district of Milwaukee, Wis., changing the rate on interstate shipments from $2, $2.50 and $4 per car, dependent upon distance to 1 cent per 100 lb., minimum 60,000 lb. for reciprocal switching; and from $5 and $6 per car to 1½ cents per 100 lb., minimum 60,000 lb., for movements between industries. An analysis of the actual cost of switching charges at Milwaukee shows that the proposed charges are not unreasonable. (32 I. C. C., 509.)

Rates on Cotton to St. Louis

St. Louis Cotton Exchange v. Missouri, Kansas & Texas et al. Opinion by Commissioner Harlan:

The commission finds that the rates on cotton from producing points in Oklahoma to St. Louis are not unreasonable or discriminatory. The record indicates that St. Louis is losing ground as a cotton market. The evidence shows, however, that this is due to changes in economic conditions. Shippers find it better to send their cotton through the ports. By far the greater proportion of cotton received at St. Louis is through cotton which if stopped at all in transit is stopped at that point only to be transferred from car to car. Another cause of the decline is that there has been in the last few years a change in the method of handling. Formerly it was consigned to factors at St. Louis and there sold; now the buying is largely done in the field, the cotton being purchased from the farmer or storekeeper direct and the transaction financed by local banks. (32 I. C. C., 501.)

Class and Commodity Rates to Salt Lake City and Other Points

Opinion by the commission:

It is found that the carriers have justified proposed increased class and commodity rates from Missouri river points and Mississippi river points, Chicago, and intermediate territory on the one hand, and Utah common points on the other. The present class rates, in both directions, and some 210 commodity rates, westbound, as also a few eastbound were prescribed by the commission in *Commercial Club, Traffic Bureau of Salt Lake v. A. T. & S. F.*, the so-called Salt Lake case. They became effective November 15, 1911. The class rates are on the scale per 100 lb., first class, of $2.45 from or to Chicago, $2.27 from or to Mississippi river points, and $1.90 from or to Missouri river points. The respondents have revised the class and commodity rates with a general upward trend. The first-class rates to Utah common points will be $2.65 from Chicago, $2.47 from Mississippi river points and $2 from Missouri river points.

The present commodity rates, where not prescribed in the Salt Lake case, are those voluntarily established by the carriers, subject to observance of two alternative clauses, one fixing the Spokane rate as maximum, and the other fixing the Montana common-point rate as maximum. The proposed tariff eliminates these clauses and states the specific rate in each instance. It revises the descriptions and restores differential adjustments from different territories of origin in effect for many years prior to the order in the Salt Lake case, by taking as base the proposed commodity rates from Chicago and adjusting with relation thereto the proposed rates from Mississippi river territory, Peoria, St. Paul, Memphis and Duluth. In this adjustment commodity rates from Chicago to Spokane and Montana common points still operate as maxima to Utah common points,

and rates from Missouri river territory are generally held at 80 per cent of the Chicago rate, following the relation prescribed in the Salt Lake case. (32 I. C. C., 551.)

Hearing on Spotting Charges

A hearing on the tariffs filed by the railways east of Chicago, imposing a charge for spotting service, was begun before an examiner for the commission at Chicago on Tuesday, January 26. The first witness was Eugene Morris, chairman of the Central Freight Association, who testified regarding the provisions of the tariffs, but declined to be drawn into a discussion as to their interpretation or the reasonableness of the charge, saying he would leave that to the witnesses for the individual roads.

Mr. Morris gave the following definition of spotting service as provided in the tariffs:

"Spotting service is the service beyond a reasonable convenient point of interchange between road haul or connecting carrier and industrial track as defined below and includes:

"(a) One placement of a loaded car which the road haul or connecting carrier has transported, or

"(b) The taking of a loaded car from a particular location in the plant for transportation or road haul by connecting carrier.

"The tracks of an industry which are made use of for an intra-mill service which is a part of the operation of a plant will be considered industrial plant tracks.

"The spotting charge on the loaded car includes the handling of the empty car in the reverse direction."

The proposed charge for spotting service is 5½ cents per ton, net or gross, as classified, of 2,000 pounds or fraction thereof, with a minimum charge of $2 per car.

Mr. Morris was followed by a number of operating officers who testified regarding various local conditions to which the charge would apply.

The Tap Line Cases

The commission has issued a third supplemental order in the tap line cases, which provides that the maximum allowances or divisions of the through rates fixed in the commission's order of July 29, 1914, shall apply to the tap lines which were dismissed as parties to this proceeding prior to July 29, 1914. Allowances or divisions in conformity therewith may be paid to such tap lines by their respective trunk line connections on shipments moving between May 1, 1912, and the effective dates of the orders respectively dismissing the tap lines from the effect of orders entered prior thereto. The order also modifies that of July 29, 1914, so as to permit trunk lines to make settlement with tap lines named therein, as well as those previously dismissed as parties, on the basis of allowances therein prescribed as maxima. Trunk lines party to the case are required to file with the commission copies of their tariffs showing divisions with each of their tap line connections. Tap lines are required to file their distance tariffs or tables of distances from all shipping points to the junctions with the connecting carriers.

Hearing on Embargoes

Commissioner Daniels of the Interstate Commerce Commission held a hearing at Chicago on January 20, in a general investigation by the commission of the subject of embargoes. T. M. Bowers appeared as attorney for the commission. Arthur Hale, general agent of the American Railway Association and chairman of the Committee on Relations Between Railroads and of the Arbitration Committee, was the principal witness, and described in a general way the various kinds of embargoes and the necessity for them.

Mr. Hale said that embargoes are necessary because there is no limit to the number of shipments that may be made by anyone anywhere, while the railway facilities are to a certain extent fixed. While it is impossible to improvise delivery sidings the shipper may greatly increase his shipments over night, and an embargo is the best kind of regulation the railroads have been able to work out to prevent congestion. He said the railways do not like embargoes because they cause them to lose revenues, or at least postpone revenues for some time. They are a necessary evil. They represent a measure of self-defense on the part of the railroads against the monopolization of railway facilities by one shipper or class of shippers, and are in the interest of the general public. Some embargoes are precautionary, for the purpose of stopping shipments that cannot be handled, and for the purpose of regulating congestion which the shippers ought to regulate. Mr. Hale said that fully half of the embargoes now in effect are on account of various governmental regulations, such as the embargoes on account of the hoof-and-mouth disease. Some embargoes are caused by floods and accidents; others have been caused on account of the war because certain steamship lines cannot go to certain points. Embargoes also are based on the closing of navigation, but he said the embargoes in which the commission is probably most interested are those on account of accumulations of cars.

Probably from 15 to 20 per cent of the embargoes now in effect are on this account. These occur, he said, when the facilities of the railroads cannot accommodate a sudden increase of traffic, sometimes on account of the disability of connecting railroads or the inadequacy of interchange facilities. Sometimes they are due to the failure of the railroads to make a sufficient charge for the use of their facilities; as, for example, the free storage and demurrage allowed at ports. Facilities that are free are liable to be overtaxed and result in embargoes. Many accumulations of cars arise from the lack of facilities on the part of consignees and because the demurrage rules are imperfect. Mr. Hale said that embargoes are not so frequent as they were prior to 1906, when they were very frequent, but since that time the demurrage rules have been improved and their administration has been improved. It is not unusual, he said, for a big road to put an embargo a week, where it used to be about one every day. "If we could absolutely perfect our demurrage and storage system," he said, "there would be very few embargoes necessary. Many trades that thought they could not regulate their freight found out under the pressure of demurrage rules that they could regulate it better than the railroads could. The railroads used to try to regulate it and often made mistakes."

As to the misuse of embargoes, Mr. Hale said he had known of mistakes being made and had made them himself when he was a superintendent of transportation, but that all roads try to limit embargoes as much as possible. The greatest difficulty is encountered with perishable freight, because one consignee may easily monopolize the facilities and hold refrigerator cars under demurrage for a long time. This, he said, demonstrated that the demurrage rate was too low, so an agreement was reached with the representatives of the perishable fruit trade, providing for an increase in the demurrage rate to $3 for each day after three days, and to $5 for each day after five days. Similar questions arise, he said, in connection with automobile shipments. Cars are sometimes held as long as two months, because it is cheaper to pay $1 a day than to unload and store the freight.

As to giving notice to the Interstate Commerce Commission of embargo notices, Mr. Hale said he saw no reason why roads should not send the commission a copy of every embargo notice, but that it was absolutely impracticable to send prior notice to the commission or to shippers, because it is necessary to act promptly in such cases; and because to notify shipper would result in an immediate overshipment to the points affected, which would vitiate the purpose of the embargo. Moreover, he said, it is impossible to notify everybody. The roads try to notify those most affected.

Mr. Hale's testimony was followed by that of several superintendents of transportation who testified regarding the practices in issuing embargoes on their own roads. It was agreed that there was no objection to filing copies of embargo notices with the Interstate Commerce Commission, but that they would do no good, because in many cases the embargoes would be withdrawn by the time the notice would reach the commission, and that it would be impracticable to give prior notice to the commission or to shippers.

STATE COMMISSIONS

The Public Utility Commissioners of New Jersey have ordered the Pennsylvania Railroad to restore three passenger trains which were taken off in September. These trains ran between Long Branch, Trenton and Camden.

The Public Service Commission of Pennsylvania, by general order No. 12, forbids the practice, said to have been indulged in by certain public service companies, of sending out written or printed notices to patrons attributing to the commission alleged rulings or orders which have never been made, or which if made, are not correctly quoted. By this unauthorized practice a considerable amount of misunderstanding, confusion and inconvenience has been occasioned. Henceforth, no public service company may send out any such utterance of the commission unless it be printed in full from an official copy.

The Public Utilities Commission of Ohio, on complaint of the American Steel & Wire Company, has decided that the Newburgh & South Shore, the freight belt line serving important industries in the southern part of Cleveland, is a common carrier, and has ordered the railroads which connect with the belt line to cease and desist from eliminating the Newburgh & South Shore as a common carrier when they compute demurrage charges against the Steel & Wire Company and other industries. When these other roads deliver cars to the Belt for placement for loading or unloading the demurrage rules of the Newburgh & South Shore, and no other, must be applied.

The Pennsylvania is contesting the recent order of the New Jersey Board of Public Utility Commissioners requiring the road to restore three seashore trains which it had discontinued. The commission's order will be reviewed by the Supreme Court in certiorari proceedings during the February term of that tribunal. The action of the railroad in appealing to the court will operate as a stay of the order of the board, which was to go into effect this week. The trains taken off (last September) were locals running from Long Branch and other shore resorts to Freehold, Jamesburg, Trenton and Jersey City. According to F. L. Sheppard, general superintendent of the New Jersey division, the running of these trains during the five months which the company did not intend to run them would involve an expenditure of $20,400. He stated that in his opinion this would be an entire loss, as it is not probable that the running of the trains would induce any additional travel.

The Virginia State Corporation Commission declares constitutional the statute passed at the last General Assembly in regard to taxes on cars and engines. Under the old law, the rolling stock tax went to the cities in which are situated the principal state offices of the railroad companies, while under the present decision, the counties, towns and cities traversed by the lines will receive a proportionate share of the total money collected. Every steam and electric line in Virginia is subject to the new ruling, and all were joined as defendants in the action, which was brought by the City of Richmond. The enforcement of the new law will cause Richmond a loss of $266,000 annually. The rolling stock act was passed by the General Assembly in 1914, when it amended and re-enacted the then existing law. The act provides for the distribution among the several counties, cities and towns through which the roads pass, the assessment of rolling stock for taxation in the proportion that the assessed value of the right of way, roadbed, track and all other property, except rolling stock, bears to the total assessed value of such property, except rolling stock. The railroads, while named as defendants, took no part in the proceedings, taking the ground that they are not materially affected. As the rates of assessment are not uniform in the various counties, cities and towns, it is believed that there will be considerable saving to the roads.

Demurrage in California

The Railroad Commission of California has issued a decision (No. 1994) in the matter of applications for changes in demurrage rules on intrastate traffic, giving its conclusions on numerous questions presented by E. E. Mote, manager of the Pacific Car Demurrage Bureau, on behalf of the carriers, and by certain shippers' organizations.

Mr. Mote proposed that the Reciprocal Demurrage rule be modified in four particulars, namely:

1. That shippers desiring to avail themselves of the privilege of reciprocal rules shall give written orders for all cars wanted for loading.

2. That such orders, in addition to specifying the character of the freight and its destination, should also specify the routing.

3. That when cars are required at an agency station the notice shall be given to the agent at such station, and if required at a non-agency station notice shall be given to the next agent on either side of such non-agency station.

4. That Section "C" of this rule be so amended that carriers may not hereafter be required to notify every shipper, who does not have on file a reciprocal demurrage bond, when applying for cars, of the provision of the reciprocal demurrage rule to relieve it from liability for reciprocal demurrage.

These modifications were all granted except the third. As to this the commission holds that it is entirely practicable for the carrier to transmit the order for the car or cars to the agent at or near the loading point. Moreover, in actual practice, most orders for cars will undoubtedly be placed with the agents at the point of loading or the nearest agency station.

The commission rejected a number of rules proposed by certain organizations which appeared at the hearing, among which was one to amend the holiday rule so as to include all legal holidays, National, State and Municipal; one to extend the free time allowed to load and furnish billings; to extend free time on cars stopped in transit; one to modify the weather rule, eliminating charge for demurrage on each inclement day until final release of car; one calling for notification by first-class letter, instead of by postal-card, and a credit rule providing for the payment by carrier to shipper or consignee of $1.50 for each car loaded or unloaded within the first 24 hours and $3 in case the same car is unloaded and reloaded within the first 24 hours.

It will be noted that no objection was raised to the three-dollars-a-day demurrage rate prevailing in California.

PERSONNEL OF COMMISSIONS

Joseph B. Eastman has been appointed a member of the Massachusetts Public Service Commission, in place of George W. Anderson, resigned.

Howard N. Ogden, member of the Public Service Commission of West Virginia, died suddenly at his home in Charleston, January 27.

Judge J. A. Guiher of Winterset, Iowa, has been appointed a member of the Board of Railroad Commissioners of Iowa, succeeding N. S. Ketchum, deceased.

Walter Alexander, heretofore district master mechanic of the Chicago, Milwaukee & St. Paul, at Milwaukee, has been appointed a member of the Wisconsin Railroad Commission, succeeding David Harlow.

Henry C. Hall, nominated some time ago to succeed himself as a member of the Interstate Commerce Commission, was confirmed by the Senate, on Tuesday of this week, by a vote of 38 to 13. There was strong opposition to this confirmation, based on criticism of the commission's recent action in authorizing a general increase of freight rates throughout the eastern states.

COURT NEWS

L. D. Puterbaugh, special commissioner for the supreme court of Illinois, in the controversy between the Illinois Central and the state auditor regarding the method of taxation of the Illinois Central, has filed a report in which he finds that the Illinois Central was assessed by $2,100,000 too much in 1913, and that the road was taxed in an arbitrary way. The state auditor, in January, 1914, made a tax levy against the Illinois Central's charter lines in Illinois which the railroad company protested was arbitrary and discriminatory. The special commissioner was appointed to hear the evidence.

Condemnation Proceedings—Speculative Damages Disallowed

In North Carolina a railroad company instituted a proceeding for the condemnation of a right of way through the defendant's mill village, on which was its manufacturing plant and cottages occupied by its workmen. The right of way was at a greater distance from the defendant's principal buildings than a pre-existing line. The defendant claimed that its measure of damages was the difference in the value of its entire plant and premises before the taking and afterwards, and that, in determining the difference, the annoyance to its employees by the maintenance of the railroad close to their homes and the danger to their children should be considered, as well as the fact that

such dangers would tend to drive away the better class of operatives, and necessitate the payment of higher wages. The court held that, as the owner of property condemned for a public use is entitled to compensation only to the actual and direct damages which he may sustain, which consist in the actual value of the property taken and the direct physical injuries to the remaining property, the damages claimed by the defendant were too speculative; there being no evidence that the actual operation of its mills was interfered with by the plaintiff's railroad, or that it suffered damages different from others whose land was near the railroad.—Raleigh C. & S. v. Mecklenburg Manufacturing Company, North Carolina Supreme Court, 82 S. E. 5.

Hours of Service Law—Unavoidable Accident

A railroad company's violation of the federal hours of service law resulted from having to feed the locomotive with impure water from a creek, while the train was being moved over a temporary logging road, causing the injectors, which were in good order, to fail to work properly. In an action for violation of the statute it was held that the delay was the result of an unavoidable accident which could not have been foreseen and prevented by the use of ordinary care, and hence the company was not liable for a penalty.—United States v. Chicago, M. & St. P., 212 Fed. 574.

Employer Sustained in Excluding Union Men

The Supreme Court of the United States, in a decision by Justice Pitney, handed down January 27, declares unconstitutional the statute of Kansas making it unlawful for any individual or corporation to coerce or influence any person to enter into an agreement not to join or remain a member of a labor organization as a condition of such person securing or continuing in the employment of such individual or corporation. The decision is of the first importance in the labor world. It was in the case of T. B. Coppage, a superintendent of the St. Louis & San Francisco at Scott, Kan., convicted of violating the law in threatening A. R. Hedge, a switchman, with discharge if he did not sign an agreement to withdraw from the Switchmen's Union.

"The court intimates nothing inconsistent with the right of individuals to join labor unions," said Justice Pitney. "Nor is the legitimacy of such organizations questioned, so long as they conform to the laws of the land, as others are required to do. But the individual has no inherent right to join the union and still remain in the employ of one who is unwilling to employ a union man, any more than the same individual has a right to join the union without the consent of that organization.

"Just as labor organizations have the inherent and constitutional right to deny membership to any man who will not agree that during such membership he will not accept or retain employment in company with non-union men, and just as a union man has the constitutional right to decline proffered employment unless the employer will agree not to employ any non-union men, so the employer has the constitutional right to insist that the employees shall refrain from affiliation with the union during the term of the employment. There cannot be one rule of liberty for the labor organization or its members and a different and more restrictive rule for employers.

"The employee's liberty of making contracts does not include a liberty to procure employment from any unwilling employer or without a fair understanding. Nor may the employer be foreclosed by legislation from exercising the same freedom of choice that is accorded to the employee. To ask a man to agree in advance to refrain from affiliation with the union while retaining a certain position of employment is not to ask him to give up any part of his constitutional freedom. He is free to decline the employment on those terms, just as the employer may decline to offer employment on any other; for 'it takes two to make a bargain.' And having accepted employment on those terms the man is still free to join the union when the period of employment expires or, if employed at will, then at any time upon simply quitting the employment. And, if bound by his own agreement to refrain from joining the union during a stated period of employment, he is in no different situation from that which is necessarily incident to contracts in general.

"For constitutional freedom of contract does not mean that a party is to be as free after making the contract as before; he is not free to break it without accountability. Freedom of contract, in the very nature of the thing, can be enjoyed only by being exercised; and each particular exercise of it involves making an engagement which, if fulfilled, prevents for the time any inconsistent course of conduct."

Dissenting opinions were filed by Justices Day, Hughes and Holmes. Justice Day said that this question was up for settlement in fourteen states and that the right of contract had been seriously limited in a number of states for public policy, as, for instance, where miners were not permitted to contract to work longer than eight hours a day. "If an employer could refuse to employ a man for the simple reason that he belonged to a labor union, could he not also demand agreements that an employee should not join the National Guard? . . . Could not the state strike down agreements not to join a certain political party?"

Other laws which, according to Justice Day, are invalidated by today's opinion are those of California, Colorado, Connecticut, Indiana, Massachusetts, Minnesota, New Hampshire, New Jersey, New York, Oklahoma, Oregon, Pennsylvania, Wisconsin and Porto Rico.

Justice Pitney, in announcing the majority's opinion, explained that the court did not consider "actual coercion" as beyond the power of the states to prohibit. He declared the decision was not only based on reason, but was supported by the decision of the court several years ago in the Adair case, in which the Federal act of 1898, prohibiting an interstate railroad from discharging an employee because he belonged to a union, was annulled as unconstitutional.

Decision in Great Northern Hours-of-Service Suit

The United States Circuit Court of Appeals, seventh circuit, in a decision by Judge Baker, concurred in by Judge Seaman and Mack, reversing the district court for the Western district of Wisconsin, in a suit brought by the government against the Great Northern, to recover penalties for violation of the hours-of-service act, holds that the separating of a train into two parts because of a broken coupler or a bursted hose may not be a sufficient excuse for disregarding the rule of the law limiting the working hours of trainmen to sixteen hours, especially if it be shown that there had been a succession of accidents due to those causes.

In this case, the government sought to show that during the three months prior to the accident which caused the delay that led up to the suit, trains had broken in two on the line in question from two to seven times a day, because of the pulling out of draw-bars or the bursting of hose; but the trial court would not admit this testimony. The government claimed that it should not be presumed, in the absence of any proof, that the company's equipment was in good condition; the mere statement that the delay to the train was the result of a pulled out draw-bar should not, by itself, be sufficient excuse for violation of the rule. The lower court refused to accept this view and it is now reversed; and a new trial is ordered.

The report of the decision gives the following details:

"Two train crews of five men each were involved. As the delay in both instances came from substantially identical causes an outline of the story of one train will suffice. This road carries iron ore from Kelly Lake, Minn., to docks at Allouez, near Superior, Wis., a distance of 100 miles. Rails, cars, and engines are of the heaviest types. From mines to docks the grade is slightly downhill. So heavy is the traffic that from 100 to 125 loads are taken in one train, and the trains, following each other less than an hour apart day and night, and progressing at an average speed of little over six miles an hour, usually consume nearly the whole of the 16 permitted hours in making the run.

"On June 18, 1912, the crew of train 1981 began service at 7:45 p. m., and remained on duty for more than 20 consecutive hours. When this train had covered about 70 miles the seventh train ahead of it pulled out some drawbars and broke into five pieces. The cripple and the six intermediate trains were put in on sidings and the crews were relieved. But no siding ahead was available for train 1981. It could not back up, either on account of its weight or obstructing other down trains; it could not cross over to the other main track without blocking the stream of returning empties, and the men in charge were required or permitted to proceed on the main track to destination. Delay in the other instance was caused by the bursting of air hose. . . ."

Railway Officers

Executive, Financial, Legal and Accounting

J. W. Wardlaw has been appointed assistant to president and purchasing agent of the Central Vermont, with office at St. Albans, Vt.

Mrs. Elizabeth T. Bliss has been elected president of the Lake Tahoe Railway & Transportation Company, with headquarters at San Francisco, Cal., succeeding her son, W. D. Bliss, resigned.

B. C. Hightower, chief clerk in the chief accountant's office of the Rock Island Southern at Davenport, Iowa, has been appointed auditor of the Muscatine North & South, with headquarters at Muscatine, Iowa.

I. C. McGee has been appointed assistant treasurer of the Kansas City Southern, with headquarters at Kansas City, Mo., vice C. A. Peabody, assigned to other duties. It was erroneously stated in our issue of January 22 that Mr. McGee was appointed treasurer, succeeding H. Visscher.

The jurisdiction of H. H. Downs, who was chief claim agent of the New York Central & Hudson River, at New York, has been extended to include all of the road in the state of New York, of the consolidated company, the New York Central Railroad, with headquarters at New York.

S. H. Church, assistant secretary of the Pennsylvania Company and the Pittsburgh, Cincinnati, Chicago & St. Louis, at Pittsburgh, Pa., has been elected secretary to succeed S. B. Liggett, deceased, and J. W. Orr, assistant controller, has been promoted to controller to succeed J. W. Renner, retired under the pension rules of the company.

O. H. Nance, secretary, treasurer and auditor of the St. Louis, Brownsville & Mexico at Kingsville, Texas, has been elected president of the Maryland & Pennsylvania, with headquarters at Baltimore, Md., succeeding John W. Brown, resigned. Mr. Nance has been elected also general manager of the Maryland & Pennsylvania Railroad, and president and general manager of the Maryland & Pennsylvania Terminal Company, effective February 1.

Ira A. Place, who was vice-president of the legal department of the New York Central & Hudson River, has been appointed vice-president in charge of the law department, and of the land and tax department of the new consolidated company, the New York Central Railroad, with headquarters at New York. Albert H. Harris, whose appointment as vice-president of the New York Central Railroad has already been announced in these columns, has been appointed also general counsel in general charge of legal matters, with headquarters at New York; and Edward T. Glennon, who was assistant vice-president of the Lake Shore & Michigan Southern, has been appointed assistant vice-president of the new consolidated company, the New York Central, with headquarters at Chicago. Mr. Glennon will have charge of such matters as may be referred to him by the vice-president in charge of the law department or by the general counsel.

Traffic

H. V. Dinniene has been appointed acting Pacific Coast agent of the Traders Despatch at San Francisco, Cal., vice H. C. Ewing, who has been appointed general agent of the Lehigh Valley at San Francisco.

F. L. Wemple, acting general freight and passenger agent of the Mexico North Western at Ciudad Juárez, Chih., Mexico, has been appointed general freight and passenger agent, with office at Ciudad Juárez.

G. J. Mitchell, commercial agent of the Carolina, Clinchfield & Ohio, has been transferred from Columbia, S. C., to Charlotte, N. C., succeeding J. I. Sabiston, and J. E. Scott has been appointed commercial agent, at Columbia, succeeding Mr. Mitchell.

L. H. Landis has been appointed traffic manager of the Fresno Interurban Railway, with office at San Francisco, Cal. Mr. Landis is also assistant to president and traffic manager of the Tidewater Southern and president and general manager of the San Jose Terminal Railway.

Operating

Wilbur Oglesby, acting superintendent of the South Georgia, has been appointed superintendent, with office at Quitman, Ga., succeeding Z. W. Oglesby, deceased.

William H. Neff, formerly general superintendent of the St. Louis Southwestern at Tyler, Tex., recently has been appointed general superintendent of the Northwestern Pacific, with headquarters at San Francisco, Cal.

J. W. Roberts, superintendent of car service of the Vandalia Railroad, with office at Terre Haute, Ind., has been promoted to general superintendent of passenger transportation of the Pennsylvania Lines West of Pittsburgh, with office at Pittsburgh, Pa., succeeding Charles Watts, retired under the pension rules of the company.

John M. Daly, whose resignation as general superintendent of transportation of the Illinois Central and the Yazoo & Mississippi Valley, has already been announced in our columns, has been in railway service since 1874. He began railway work as a clerk in the car accountant's office of the Toledo, Peoria & Western, and subsequently was employed consecutively as switchman on that road, clerk for the Wabash, St. Louis & Pacific, the Atchison, Topeka & Santa Fe and the Chicago & North Western, until 1883. He was then for four years car accountant and trainmaster of the Chicago, St. Paul & Kansas City, and from 1887 to 1891, car accountant of the New York, Chicago & St. Louis. Mr. Daly was then with the Illinois Central until May, 1899, successively as car accountant and superintendent of transportation, leaving that road to go to the Delaware, Lackawanna & Western as superintendent of transportation. He was engaged in special work for the Intercolonial Railway of Canada from June, 1901, to December of that year, when he became general manager of the Cape Breton Railway. He returned to the Illinois Central in April, 1902, and was superintendent of transportation until June, 1904; car accountant from the latter date to 1910; superintendent of transportation the next two years, and since 1912, general superintendent of transportation, his jurisdiction also extending over the Yazoo & Mississippi Valley. Mr. Daly now leaves the service of the Illinois Central to engage in other business.

J. M. Daly

OBITUARY

A. W. Montague, superintendent of terminals of the Houston & Texas Central at Fort Worth, Tex., was shot on January 20, while in his office, by a discharged switchman, and died within a short time.

W. D. Scott, general manager of the Spokane, Portland & Seattle, the Oregon Trunk, the Oregon Electric and the United Railways, died at his home in Portland, Ore., on January 21, aged 56 years.

Lorenzo S. Coffin, formerly a member of the Iowa Board of Railroad Commissioners, died at Fort Dodge, Iowa, on January 17, aged 91 years. Mr. Coffin will be remembered by older railroad men, and especially by the older members of the railway brotherhoods, by reason of his activity, in the early nineties, in the propaganda for the federal safety appliance laws. Later he was an apostle of temperance among railroad men and a promoter of the "white button" movement.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Missouri, Kansas & Texas is preparing specifications on a number of locomotives.

CAR BUILDING

The Atchison, Topeka & Santa Fe is in the market for 700 box cars and 500 refrigerator cars.

The Russian Government.—A letter from the Imperial Russian consul to the Seattle Chamber of Commerce contains the following statement: "It gives me pleasure to inform you that an order for 15,000 railway cars has been placed by our government with a Seattle company."

IRON AND STEEL

The Paducah & Illinois ordered 253 tons of steel for several small bridges near Paducah, Ky., from the Kenwood Bridge Company, Chicago.

The Chicago & North Western has ordered 1,050 tons of steel for miscellaneous bridge work for 1915, from the Chicago Bridge & Iron Works.

The Chicago, Milwaukee & St. Paul has ordered 151 tons of steel for its Clinton street subway, at Milwaukee, Wis., from the Milwaukee Bridge Company.

The Chicago, Burlington & Quincy has ordered 15,000 tons of rails from the Illinois Steel Company. This order is in addition to one for 15,000 tons placed some time ago with the Colorado Fuel & Iron Company.

SIGNALING

The Southern Railway has begun the installation of automatic block signals on its line between Pelham, N. C., and Denim, 36 miles, where the line is being double tracked.

Railway Construction in Uruguay.—The Uruguayan government is planning to proceed with the construction of a new short line of railway from Tablada, to connect with the already existing line owned by the Uruguayan Central Railway.

Standardizing Australian Railway Gage.—The conflict in Europe has brought to the front the question of standardizing the gage of the Australian railways, and it is of interest at this time to review some of the points pro and con. In favor of the idea it is said that in case of invasion the present different gages of the various commonwealths would interfere with the speedy transportation of men and supplies and that if retreat should be necessary, it would be almost impossible to move the railway rolling stock to places of safety as was done when the Belgian equipment was sent to the south of France. It is argued, however, that the present would be a bad time to make extensive changes of gage. Great Britain's control of the seas makes invasion of Australia seem unlikely. The service of the Australian railways for the time being, therefore, will be to transport troops to the ports where they will board ships which will carry them to the fields of war. Extensive reconstruction will handicap the service and the carrying of troops and supplies will be done only at great cost and with exasperating delay, and, in addition, even if invasion were possible, reconstruction work would certainly prove a decided disadvantage from the standpoint of the defenders. Opinion is not unanimously in favor of the 4 ft. 8½ in. gage. If that gage were made standard, Australia would perhaps be able to purchase locomotives and cars at short notice, but on the other hand if some other gage were adopted, an enemy attempting to invade Australia possibly at some future time could not use its own equipment without alteration.

Supply Trade News

Berry Brothers, Detroit, Mich., have recently opened a new branch at Savannah, Ga.

The Asbestos Protected Metal Company has removed its head office from Beaver Falls, Pa., to the First National Bank building, Pittsburgh, Pa.

W. P. Mellon has been appointed railway sales manager of the southeastern district of the Flint Varnish Works, with headquarters in New York.

Samuel Higgins, formerly general manager of the New York, New Haven & Hartford, has been elected president of the Standard Heat & Ventilation Company of New York and Chicago.

L. H. Mesker has recently become associated with the sales department of the Kearney & Trecker Company, Milwaukee, Wis., and will represent that company in Ohio after February 1.

Earl F. Scott has been appointed representative of the Terry Steam Turbine Company, Hartford, Conn., for the state of Georgia. He will have offices at 702 Candler building, Atlanta.

William Bayliss & Co., Ltd., 240-241 Dashwood House, London, England, have been appointed exclusive European sales agents for the Chicago Railway Signal & Supply Company, Chicago.

The directors of the United States Steel Corporation at their meeting on Tuesday passed the dividend of 50 cents a share quarterly on the common stock, after having reduced it from $1.25 a share to 50 cents a share three months ago. The regular dividend on the preferred stock was declared.

David A. Wright, who for several years past has been connected with the Yale & Towne Manufacturing Company, New York, as district manager in the west, has opened an office for himself as manufacturers' agent at 140 South Dearborn street, Chicago, Ill. He will specialize on labor saving and pneumatic machinery, cranes, etc.

M. A. Sherritt, for several years associated with Manning, Maxwell & Moore, Inc., New York, as manager of the company's Philadelphia branch, resigned this position on January 25 to become vice-president and general manager of Sherritt & Stoer Company, Inc., dealers in machine tools and railway and machine shop equipment. The company will occupy its new offices in the Finance building, Philadelphia, on February 1.

William Penn Evans, general inspector for the Baldwin Locomotive Works, died at Philadelphia on January 16. Mr. Evans was born in Bridgeport, Pa., and received his technical education in the Polytechnic College at Philadelphia. His first work was with R. S. Newbold & Son, the Eagle Iron Works, Norristown, Pa. In September, 1872, he left the latter company to accept a position in the drafting department of the Baldwin Locomotive Works, and he continued in the service of that company with the exception of a brief interval, until the time of his death. In 1876 he obtained leave of absence to act as assistant superintendent of the Philadelphia & Reading Terminal at the Centennial Exposition, and in 1879 left the locomotive company to become mechanical engineer on the Missouri, Kansas & Texas at Sedalia, Mo. After one year's service he returned to the Baldwin Locomotive Works, being appointed, in 1885, chief draftsman, which position he held until 1903. In 1904 he was placed in charge of the exhibit of the Baldwin Locomotive Works at the Louisiana Purchase Exposition in St. Louis, and upon his return to Philadelphia at the termination of the exposition was made general night superintendent. In 1905 he was given charge of the exhibit of the Baldwin Locomotive Works at the Lewis & Clark Exposition at Portland, Ore., and when this exhibit was closed was appointed northwestern agent, with headquarters at Portland. He occupied this position until 1910, when he returned to Philadelphia and was appointed general inspector, which position he occupied until the time of his death. Mr. Evans was a member of the American Society of Mechanical Engineers, the Franklin Institute, the Engineers' Club of Philadelphia, and the Historical Society of Pennsylvania.

Railway Construction

Athabasca Northern.—The Canadian parliament has been asked to continue this company's corporate existence, and to grant an extension of time in which to build from Edmonton, Alta., to Athabasca Landing. The provisional directors named at the time of incorporation, in 1905, were F. H. Markey, Montreal, Que.; J. K. McKenzie, Selkirk, Man., O. E. Fleming, Windsor, Ont., and M. Burton, Barrie, Ont.

British Columbia Southern.—See Canadian Pacific.

Canadian Pacific.—This company will apply to the Canadian parliament for an extension of time in which to build the following lines: From a point on the Kleinberg-Sudbury branch between Bolton Junction, Ont., and Palgrave, to a point at or near Campbellville and from Asquith, Sask., north and northwesterly about 20 miles. The following subsidiary lines will also ask for an extension of time in which to build new lines: Manitoba & Northwestern, from a point at or near Theodore, Sask., west to a point between Govan and Lanigan, about 100 miles; South Ontario Pacific, from a point at or near Hamilton, Ont., to a point on the Niagara river, at or near Niagara Falls, Ont., and British Columbia Southern, to build from Michel, B. C., to Kananaskis.

Carolina, Atlantic & Western.—This company, which completed track laying last year on an extension from Andrews, S. C., south to Charleston, 57 miles, is planning to build another extension, it is said, from Charleston southwest to Savannah, Ga.

Chicago, Burlington & Quincy.—Work on the extension of the Chicago, Burlington & Quincy from Guernsey, Wyo., to Wendover, will be resumed on February 1. All the outfits that were taken off last fall will be put back, and it is expected that this work will be completed during the coming fall. This line will be 8.5 miles long, including three tunnels, the longest being 3,500 ft., and will be carried across the Platte river on a steel girder bridge. It is estimated that the cost of completing this work will be approximately $1,000,000.

Florida Roads.—Surveys have been made and the right of way is secured, it is said, for a line to be built from Fort Myers, Fla., south along the west coast of Florida via Marco bay and Naples to Everglade, thence east across the southern part of Florida to Miami, on the east coast, about 150 miles. Capitalists of Baltimore, Md., are said to be back of the project.

Florida Roads (Electric).—Construction work has been started on an electric line, it is said, from Jacksonville, Fla., southwest to Middleburg, about 25 miles. A. W. MacKinlay, general manager and chief engineer, Jacksonville.

Hudson Bay, Peace River & Pacific.—The Canadian parliament has been asked for an extension of time in which to build this projected line from Winnipeg, Man., to Hudson Bay, thence west to a point on the Pacific coast. Application has been made also to change the name of the company to Winnipeg & Hudson Bay. Lewis & Smellie are solicitors for the company, Winnipeg, Man.

Jackson & Eastern.—See Meridian & Memphis.

Jellico, Capuchin & Western.—According to press reports from Jellico, Tenn., surveys are being made for a 30-mile line, to be built through the mountain section west of Jellico, Tenn. The new line is to be built to open up coal and timber fields, and grading work will be started soon. The names of the incorporators are not given.

Kankakee & Urbana Traction Company.—An extension of this line from Ludlow, Ill., north is being contemplated. There will be no curves and the maximum grade will be 0.05 per cent. Cuts will amount to about 5,470 cu. yd., and fills to about 43,500 cu. yd. per mile. All grading will be done by company forces. One 70-ft. deck girder will be required. No contracts have been let. T. W. Shelton, Urbana, Ill., is chief engineer.

Kettle Valley.—This company will apply to the Canadian parliament for an extension of time in which to build lines in British Columbia as follows: From Summer creek or One Mile creek to Copper mountain, and to Voiget mining camps; from Vernon to Kelowna via Penticton; extension of branch line to Otter Summit; also to build from a point near Tulameen up the Tulameen river, about 50 miles; from Penticton to Osoyoos lake; from Summer creek to Allison or Princeton, and thence to Granite creek coal sections; from Grand Forks to a point 50 miles up the North Fork of Kettle river; also from Midway to Hedley and from Penticton to Nicola.

Manitoba & Northwestern.—See Canadian Pacific.

Meridian & Memphis.—An officer writes that grading work is now under way on the Jackson & Eastern building an extension of the Meridian & Memphis which operates a 32.6-mile line from Meridian, Miss., northwest to Union, where connection is made with the New Orleans, Mobile & Chicago. The extension is being built from Union, Miss., west to Sebastopol, about 13 miles, and the company expects to develop a traffic in lumber and general merchandise. The line will probably be extended later to Carthage, about 30 miles from Union. S. A. Neville, Meridian, Miss., is in charge of the work, and J. M. T. Hamilton is the chief engineer. (February 13, 1914, p. 345.)

Montana Roads.—E. W. Davis, Bozeman, Mont., is raising a bonus for the building of a railroad from Three Forks district up Madison valley to Yellowstone, Mont.

Norwich, Colchester & Hartford Traction.—Under this name a company is to be organized in Connecticut, it is said, to build an electric line through Norwich, Bozrah, Lebanon, Colchester and East Hartford. F. Cronin, A. Manning and W. Strickland are interested.

Ozarks Railway.—A new railroad extending from Springfield, Mo., through Mountain Home, Ark., up along the Buffalo river, then south to Little Rock, Ark., 210 miles, is proposed by this company. No contracts have been let. T. J. Murray, Mountain Home, Ark., may be addressed.

Palm Beach & Everglades.—We are told that this company plans to build a line from a point near West Palm Beach, Fla., west to a point near Lake Okeechobee, thence skirting the shore of the lake to a point on the west shore near Lake Hicpochee, in Desoto county. Construction work is to be started as soon as the necessary arrangements are completed, and the promoters expect that the line will develop a traffic in vegetables and tropical fruits. Charles H. Baker, New York, president. (January 15, page 116.)

Pennsylvania Roads (Electric).—Residents of Monaca, Pa., will organize a company, it is said, to build an electric line from Monaca south to Coraopolis, about 20 miles. J. W. Reid, D. J. Mitchell, J. J. Allen and H. L. Grimmell, all of Monaca, are said to be interested.

South Ontario Pacific.—See Canadian Pacific.

Southern Railway.—Contracts for grading work in connection with the revision and double tracking of the line from Orange, Va., to Charlottesville, have been let by the Southern Railway, as follows: From Orange to Burnley, 15 miles, to the Morrow Construction Company, Atlanta, and from Burnley to Charlottesville, 13.7 miles; to C. W. Lane & Co., Atlanta. (January 22; page 171.)

Southwestern Traction & Power Company (Electric).—Plans are being made for the construction of an electric railroad from New Iberia, La., to St. Martinville, a distance of 10.5 miles, also from Jeanerette, La., through Franklin, Baldwin and Patterson, to Berwich, a distance of 50 miles. No contracts have been let, but it is expected that work will be completed during the present year. W. S. Henning, New Iberia, La., is chief engineer.

Tennessee & Alabama.—Bids will be asked for building this line about May 1, it is said, from Fayetteville, Tenn., south to Huntsville, Ala., 34 miles. There will be one bridge on the line about 1,000 ft. long. J. E. Hurd, chief engineer, Fayetteville. (December 25, p. 1208.)

Virginia-Blue Ridge.—An officer writes that construction work is now being carried out by company forces on the line from Tye River, Va., northwest, via Lowesville to Massies Mill, 22 miles. There will be a number of trestles and one 500-ft. tunnel on the line. J. W. DeWight, president; A. K. Murrell, chief engineer, Tye River. (January 22, p. 171.)

Warren, Johnsville & Saline River.—Work on the five-mile extension of this line from Johnsville, Ark., to Peter's lake, is 50 per cent completed. Grading will amount to approximately 4,000 cu. yd. a mile. The maximum grade will be 1 per cent, and the maximum curvature, 3 deg. There will also be four short bridges on this line.

West Pennsylvania Traction.—This company will build a seven-mile line, it is said, between Leisenring, Pa., and Uniontown.

West Virginia Roads.—According to press reports the Superior Black Coal Company is developing mines in Lincoln county, W. Va., and has started work on a new railway. The line is to connect the Coal River branch of the Chesapeake & Ohio with the coal lands controlled by the coal company. John Anderson, general manager, Beckley, W. Va.

Winnipeg & Hudson Bay.—See Hudson Bay, Peace River & Pacific.

RAILWAY STRUCTURES

Bridgeport, Okla.—Bids have been asked by the Chicago, Rock Island & Pacific for the construction of two new pneumatic piers and a through truss bridge for single track, over the South Canadian river, near Bridgeport, Okla. The span will be 200 ft. long and will replace the old bridge which was destroyed by a flood last spring. The old approaches will be used, but will be raised to meet the higher new span. Work is to begin early this spring. The total estimated cost of this improvement will be $200,000.

Chicago, Ill.—President Daniel Willard of the Baltimore & Ohio, went to Chicago on Monday and held conferences with the Chicago Railway Terminal Commission and the local industries committee of the city council on the ordinance which the Baltimore & Ohio Chicago Terminal has requested to permit the road to transfer its coach yards to the vicinity of Western avenue and Sixteenth street. The company has made arrangements to sell the land now occupied by its coach yards at Harrison street to the Pennsylvania Company, to be used in connection with the latter's proposed freight terminal. It is expected that as soon as the ordinance is passed preliminary work can begin for the Pennsylvania freight terminal, which must precede the beginning of work on the proposed new Union passenger terminal.

Macon, Ga.—A contract which transfers certain lands and makes other grants to the Central of Georgia in consideration of the latter building a union station at Cherry and Fifth streets, in Macon, has been signed by the railroad company, it is said, and the city officers will at once sign the contract. It is expected that work will be started in the near future on the new station. (August 7, p. 269.)

Memphis, Tenn.—The Arkansas & Memphis Railway Bridge & Terminal Company has just completed the construction of the piers for its new bridge across the Mississippi river at Memphis, Tenn. Financial arrangements have been completed whereby the Pennsylvania Steel Company, which has the contract for the fabrication and erection of this structure, will proceed at once with its erection. The Arkansas & Memphis Railway Bridge & Terminal Company was incorporated by the Chicago, Rock Island & Pacific; the St. Louis, Iron Mountain & Southern, and the St. Louis Southwestern to build a double track bridge across the Mississippi river to provide an independent entrance into Memphis for these three roads.

Milwaukee, Wis.—A small new terminal will be built by the Milwaukee Northern Electric, at Fifth and Wells streets, Milwaukee. The contract for the steel and iron work has been awarded to the Milwaukee Bridge Company, Milwaukee, Wis.

Pine Hill, Ala.—The Gulf, Florida & Alabama has given a contract to the American Bridge Company for building a steel bridge over the Alabama river near Pine Hill. The bridge is to have 12 spans, including a draw span of 292 ft.

Temple, Okla.—The Chicago, Rock Island & Pacific has awarded a contract to George B. Swift, Chicago, for the construction of a small frame depot at Temple, Okla. Work is to begin at once.

Railway Financial News

Boston & Maine.—The trustees of the majority stock have sent a bill to the Massachusetts legislature, which when it becomes a law will permit the stockholders of the Boston & Maine and of the leased lines to reorganize or consolidate their properties, and attached to the bill is an outline of the three plans, one of which will be adopted if the bill is passed and the consent of the stockholders is obtained. Two of these plans provide for reorganization or consolidation without receivership, and the third outlines the plan to be followed if the road is put into the hands of receivers. All three plans provide for the merger of the leased lines with the parent company and the reduction of the drain on the parent company of the guaranteed dividends on the leased lines' stock.

Chicago, Rock Island & Pacific.—A committee has been formed which asks for proxies for the next meeting of stockholders and for the regular annual meeting of stockholders. This committee consists of Edward W. Sheldon, president of the United States Trust Company, New York; William Woodward, president of the Hanover National Bank, New York; Charles G. Dawes, president of the Central Trust Company of Illinois, and J. Horace Harding, of Charles D. Barney & Co., New York.

Cincinnati, Hamilton & Dayton.—The receivers have brought suit to compel the appointment of a separate receiver for the Cincinnati, Indianapolis & Western, which has been operated as a part of the Cincinnati, Hamilton & Dayton, and its operation, it is claimed, has been at a loss.

Delaware, Lackawanna & Western.—The company has sold $5,000,000 Morris & Essex 3½ per cent refunding bonds to Kean, Taylor & Company and Robert Winthrop & Co., both of New York. The bonds were sold by the railroad company, it is understood, at a price which will cost the railroad company interest 4.30 per cent. The proceeds of the bond sale will be used to pay in part the $11,577,000 Morris & Essex 7 per cent consolidated bonds when they fall due, the remainder required to retire these bonds being paid from current funds.

New Jersey & Pennsylvania.—The vice-chancellor in the New Jersey court has ordered the sale of the New Jersey & Pennsylvania, which road has not been in operation for a good part of the last two years during its receivership.

New York Central Railroad.—Wood, Struthers & Company, New York, have made an analysis of the present security for the New York Central refunding and improvement 4½ per cent bonds as affected by the recent consolidation. The analysis is quite comprehensive, including a consideration of the lien, earnings, surplus and income from investment.

Ozark Valley Railroad.—This is the name of a new corporation which has taken over the property of the Williamsville, Greenville & St. Louis, which runs from Williamsville, on the St. Louis, Iron Mountain & Southern, northeast through Wayne county, 35 miles. The new company is incorporated for $350,000.

Pennsylvania Railroad.—Kuhn, Loeb & Company, New York, have bought $49,000,000 consolidated (now first) mortgage 4½ per cent bonds of the Pennsylvania. The bonds are to be offered publicly at a price expected to be about 103, and the bonds sold on the curb when issued at prices from 105 to 105⅞.

Wabash.—The joint protective committee syndicate has bought $1,545,000 receiver's certificates to provide for the payment of maturing equipment notes.

Williamsville, Greenville & St. Louis.—See Ozark Valley Railroad.

Russia Establishes Direct Railway Service with Galicia.—The Russian government has established a direct passenger and freight service connecting all the Russian railways with Lemberg in Galicia, via Radziviloff and Volochisk.

VOLUME 58 FEBRUARY 5, 1915 NUMBER 6

Contents

*Illustrated.

That the railroads of America have 49 masters—one at Washington and one at each of 48 state capitals—is an observation which, as a vague generality, is very familiar. Mr. Hustis, president of the Boston & Maine, has had occasion to consider the fact in the concrete. Speaking before the Massachusetts Public Service Commission in Boston the other day, which commission has suspended the road's new passenger tariffs raising all fares to 2½ cents a mile, he said that similar tariffs, filed at the same time, had been approved in Maine, New Hampshire, Vermont and New York, and by the Interstate Commerce Commission. There is state sovereignty with a vengeance! That careful observer who said that most of our state commissioners are "conspicuously deficient" in some of the essential qualifications needed in commissionerships may not have been precisely accurate in his statement; but that our system as a whole is conspicuously efficient, in blocking the wheels of business, is quite apparent in many places. The four states mentioned may have many interests which are diverse; but the general fact that most passenger fares are too low is true of all of them. It was only a few months ago that the commissioners of five states met in Massachusetts, with Federal Commissioner Prouty, and a statement was given out endorsing the view that passenger fares generally were too low; but that was only theory; now we have practice. Mr. Prouty is in Washington, five hundred miles away, but the fact that some Massachusetts citizens will have to pay a little more money for fare is right under the commissioners' noses. In Philadelphia, where the people were aroused recently by an advance in fares, one of the most conservative papers, one which supports the general proposition that the railroads need more money, quickly brought up the doctrine that freight traffic may rightfully bear a part of the burden of the passenger service The Interstate Commerce Commission, supporting the doctrine that each branch of the traffic should bear its own burdens, will need to get a louder trumpet, if it is to prevail.

State Commissions' Divergent Views

The Pennsylvania's annual report for 1914 does not come out until March, but the preliminary figures for December and for the calendar year ended December 31 for all the Pennsylvania lines were given out on Monday of this week. It was the Pennsylvania Railroad itself and the Pennsylvania Company (northwest system of the lines west) which were particularly hard hit. Total operating revenues for all Pennsylvania lines, both east and west, amounted to $353,239,000 in the 1914 calendar year, a decrease from the previous year of $37,823,000, or 12 per cent. Total operating expenses amounted to $287,090,000, a decrease of $32,597,000, or 13 per cent. The very heavy cut in expenses prevented a seriously smaller net revenue, the net in 1914 being $66,149,000, or $5,226,000 less than the previous year. The saving in expenses was about equally divided between transportation expenses and maintenance expenses. On the Pennsylvania Railroad a saving of $7,158,000 was made in maintenance and $6,000,000 in transportation; on the southwest system, $5,157,000 in maintenance and $4,258,000 in transportation. The Pan Handle—the Pittsburgh, Cincinnati, Chicago & St. Louis—suffering proportionately with the other lines in loss of revenue, succeeded in making even deeper proportionate cuts in expenses, the saving in maintenance being $4,149,000 and in transportation $2,531,000. Maintenance costs do not decrease in anything like the ratio of loss of freight business. The Pennsylvania's figures, therefore, quite surely show deferred maintenance. This means just that much more material and supplies used in maintenance to be bought as soon as increased earnings warrant it.

The Pennsylvania in 1914

The Railway Business Association recently has issued a bulletin regarding "The Deadly Toll of Trespass on Railways," which has forcibly brought up this subject for public attention again. As its bulletin shows, over 50,000 trespassers on railway property are killed every 10 years in this country, this being more than one-half of all the fatalities on our railways; and this long death roll is due to the fact that the governments will not pass and enforce laws to suppress the evil. The railways have sought such action year after year, but in vain. Why will not the legislatures do something? An address made by J. A. Culp, at the meeting of the Illinois Legislative Board of the Brotherhood of Locomotive Firemen and Enginemen, held at Springfield, Ill., on September 28, 29 and 30, 1914, throws light on this question. We quote

Railway Employees and the Trespass Slaughter

the following from Mr. Culp's remarks, as published by the brotherhood's legislative board:

Trespassing. That was another bill that was a very innocent looking bill. Prevented trespassing of anyone upon the company's property, and provided a heavy fine and imprisonment. If the boys would "walk out" and go down to the roundhouse or on the company's property and one of the fly cops would see you, they could send you to jail from thirty days to six months, and fine you anywhere from $1 up. So that bill didn't look good to us and we killed it, and one of the senators told us, "You boys could come down here and ask to have the rails nickel-plated on the railroads and we would do it for you, but when the railroad company asks for a little bill like that you boys object to it." And why shouldn't we?

Was ever a more cynical and outrageous statement made? Because some of the "boys" might possibly get arrested, while on strike and out of the railway's service, good and vitally-needed legislation must be defeated, and 5,000 men and women must be killed each year. And the same legislative board was daily button-holing members of the legislature for train crew and other similar legislation in the alleged interest of "safety" on railways! "You boys," said the senator quoted by Mr. Culp, "could come down here and ask to have the rails nickel-plated on the railroads, and we would do it for you, but when the railroad companies ask for a little bill like that you boys object to it." And Culp's comment is: "And why shouldn't we?" "The public be d——," one of the Vanderbilts is reported to have said. And likewise the spokesman of the railway brotherhoods say: "Sure! to h—— with the public, and law, and order, and good government, and the safety of human lives, rather than that there should be any possible police interference with us!"

A "PRIVATE" MANAGER FOR GERMAN RAILWAYS

A CABLEGRAM from Berlin announces that Herr Ballin, director-general of the Hamburg-American Steamship Company, has been placed in charge of the operation of all the railways of Germany. This is an extraordinarily interesting and significant piece of news. A large majority of the railway mileage of Germany is owned and managed by the governments of the various states. The state railways of Germany, especially those of Prussia, are recognized by every intelligent student of the subject as the best managed government railways in the world. If it should be assumed that anywhere there could be found a state railway system which had developed officers and an organization that would be able to cope with any situation or emergency, every student of the subject would say that the state railway system of Prussia was that system. And yet, in the crucial test to which the state railways of Prussia and the other German states are being put by the great war, the government passes over the heads of all the men in its civil service, in its army and in its navy, and takes for the manager of the railways during the war the head of a great private company.

The German Hamburg-American Steamship Company, however it may have been subsized and encouraged by the government, is a private enterprise which has been developed and managed on commercial principles by private business men. The Hamburg-American is the greatest and best managed steamship line in the world, and Herr Ballin in its management has demonstrated the possession of those qualities of foresight, initiative, enterprise, resourcefulness and driving power which are the great essentials to success in all practical affairs. It is doubtless because he has demonstrated their possession that he, rather than some man developed in the Prussian civil service, has been selected to manage the railways. Is it possible that these qualities cannot be developed to the highest degree even in a civil service like that of Germany? If so, how can they be expected to be developed in the civil service of any other nation?

One of the many arguments that have been used in favor of government ownership of railways is that of military expediency; yet, in this great crisis it has been found a matter of military expediency and necessity to go outside of the government railways and get a private business man to run them. Highly significant also was the frank acknowledgment made by Colonel Goethals in his address before the Chicago Engineers' Club last week of his indebtedness to the railway engineers, John F. Wallace and John F. Stevens, who preceded him on the Panama canal. Without the organization and construction methods which they had worked out and which he inherited, his labors, Colonel Goethals said, would have been unsuccessful. This statement illustrates the bigness of Colonel Goethals, and it also tends to nullify the arguments in favor of government ownership which have been based on his success in building the canal.

UNEMPLOYMENT ON RAILROADS

NEVER has the problem of unemployment been brought more forcibly to the notice of the people of the United States, or been given greater attention by the more intelligent of them, than during the present winter In every part of the country thousands, and even hundreds of thousands, of men and women have been unable to get work. Some of them are undeserving; but a very large majority are honest and industrious people who are willing and able, and whose failure to get anything to do has not been attributable to any fault of their own. They are victims of industrial and economic conditions which they have had practically no part in producing.

The situation this winter has been especially bad. But the problem presented is not a new or ephemeral one. There is chronically too much unemployment in this country. Its result is an amount of mental and physical suffering and degradation which cannot be contemplated by any intelligent and humane person without the deepest commiseration for the victims, or profound misgivings regarding the future of the nation. Unemployment, aside from the immediate suffering it causes, is an inevitable and prolific breeder of industrial and social unrest. The more intelligent and prosperous classes should co-operate in investigating its causes and remedies, and in applying the latter. If they do not the condition is quite certain to be attributed to wrong causes and to be attacked by people whose intentions are good, but who are ignorant, or by demagogues who are ignorant, but whose intentions are not good, with remedies that will aggravate the disease or engender others.

The course of events in the railway business from season to season and period to period is one of the most prolific of all causes of unemployment in the United States. Because of the desire of the managements to make a good paper showing on roads which are financially in bad shape it is a common thing to postpone needed maintenance work until after the ending of the fiscal year on June 30, and then to plunge into it vigorously to make up for lost time. This causes a wide fluctuation in the demand of the railways for unskilled labor, and furthermore, causes a large increase in their demand just at the time when there is a maximum demand for such labor on farms. The economic disadvantages of this to both labor and employers, as well as to the public in general, are evident. If the railways generally would begin their maintenance work earlier in the year the reduction in the fluctuations in the demand for unskilled labor, and the improvement in respect to seasonal unemployment would be considerable.

Again, in those months of the year when the weather is warmest, the days are longest, and all other conditions are most favorable for railway operation, the freight traffic is comparatively light and there is a reduction in the number of men employed in connection with train operation. On the other hand, when the season of short days and severe weather comes and conditions become most unfavorable for railway operation, coal, lumber, grain and other kinds of bulky freight are poured on the railways in a flood, and there is a large increase in their demand for employees directly concerned in the movement of trains. The only way to reduce the fluctuations in the number of employees produced by this cause is to mitigate the cause by regularizing the movement of traffic. There is no good reason why so much of the coal and lumber, for example, should move in

the fall and winter. The movement of such commodities in the spring and summer could be increased, and the movement of them in the fall and winter reduced, by co-operation between the railways, the shippers, the consignees and the consumers.

Far worse in their effects than the seasonal fluctuations in the demand for labor are the fluctuations in the demand for it from year to year and period to period. How great these are may be illustrated by the following statistics showing the number of men employed on June 30 of the years from 1902 to 1913, inclusive:

1902	1,189,315	1908	1,436,275
1903	1,312,537	1909	1,502,823
1904	1,296,121	1910	1,699,420
1905	1,382,196	1911	1,669,809
1906	1,521,355	1912	1,716,380
1907	1,672,074	1913	1,815,239

It is probable that on June 30, 1914, the number did not exceed 1,650,000, and on December 1, 1914, there may have been 250,000 fewer employees on our railways than there were 18 months before.

While the change between 1913 and 1914 was big, it was not without precedent, for between 1905 and 1906, it will be noted, there was an increase in the number of employees of 140,000, while between 1907 and 1908 there was a reduction of 236,000; and variations upward or downward of 100,000 in a year are not uncommon. In other words, variations between the numbers employed by railways in two successive years amounting to from 6 to 15 per cent have occurred constantly within the last 15 years.

These fluctuations from year to year in the number of employees on railways have been due to correspondingly great fluctuations from year to year in traffic and earnings. But is there any good reason why the number of employees should vary in proportion to earnings and expenses? Improvements can be made more economically in years of bad business than in years of good, and if the policy of making them then were adopted the extent of unemployment in the bad years would be greatly reduced. The reason why most railways make improvements in the good years and do not make them in the bad ones is that they do business on such a narrow margin of profit that it is only in the good years that they have the financial means with which to make improvements. If they were allowed to earn larger surpluses in the good years to carry over to the bad ones they would be able to make more improvements in the latter and the fluctuations in the number of employees could be greatly reduced.

The policy of the labor brotherhoods aggravates the situation. Most of them insist on provisions in the wage schedules requiring the managements to give regular employees a minimum number of days' work in each month. The result is that when it is necessary for the roads to reduce their forces they must give this minimum number of days' work per month to the employees that they retain, which makes it necessary to lay off many employees entirely. If agreements could be made between the railways and the brotherhoods that in such bad times as the present the railways could give a smaller number of days' work to each employee, it would be possible to retain a larger number on the payroll, although each of those kept on the payroll would work a smaller number of days per month, and therefore earn a smaller average in a month than is the case under existing arrangements. Instead of the entire loss and suffering falling on some, it would then be divided among practically all, and the results would be far less bad.

While much attention is now being given to the problem of unemployment, business conditions doubtless will soon improve and the situation will then become less aggravated: It is greatly to be feared that when this turn for the better comes, the problem will again be neglected. But business will become poor again, and if, while it is good, nothing is done to solve the problem, the situation will again recur. It is to be hoped, therefore, that no effort will be spared to bring about co-operation and concerted action by public officials, economists, employers and labor organizations in reference to this most serious matter. As the condition of seasonal and periodical unemployment is met with in such aggravated form in the railway industry, it is to be hoped that special efforts to deal with it will be made by railway managers and the railway brotherhoods. It has been demonstrated that the managements and the employees can co-operate whole-heartedly and effectively in the interests of "safety first." Cannot similar methods and a like spirit be developed to deal with unemployment?

THREE-CYLINDER LOCOMOTIVES

In speaking at the annual meeting of the American Society of Mechanical Engineers in December last, J. B. Ennis, chief mechanical engineer of the American Locomotive Company, dwelt on the possibilities of the use of three cylinders in overcoming some of the difficulties that have developed with the large dimensions which the American locomotive has reached. Mr. Ennis' remarks on this subject were published on page 123 of our issue of January 22, 1915. J. Snowden Bell, in a paper on the three-cylinder locomotive, read at the 1913 convention of the American Railway Master Mechanics' Association, brought out the possibilities of the increase in power to be obtained by the use of this type, as well as the greatly improved balancing conditions. This latter feature is of particular importance, when we consider the high wheel loads in use on modern locomotives and the added effect on the rail pressure caused by the conditions obtaining in counterbalancing.

A great deal of progress has been made within the past two or three years toward reducing the weight of reciprocating parts by means of careful designing and the use of heat-treated and alloy steels. Unquestionably more can still be accomplished along these lines, tending toward improved balancing in the two-cylinder locomotive, but there is a limit to the possibilities of improved counterbalancing when the two-cylinder type is retained. As stated by Mr. Ennis, the power obtained in a two-cylinder engine having cylinders 27 in. in diameter and a maximum piston thrust of 117,000 lb., can be obtained in a three-cylinder engine with cylinders 22 in. in diameter and a maximum piston thrust of 78,000 lb. This is a decrease in piston thrust of 33 per cent and permits a corresponding reduction in the weight of the individual parts of the machinery, but particularly in the reciprocating parts. Neglecting, then, the fact that the three-cylinder arrangement gives an almost ideal balancing condition, it will be seen that considerable improvement is possible because of the reduced weight of the reciprocating parts alone.

The greatest objection raised against the three-cylinder locomotive is the necessity of the employment of a crank axle; and where simplicity of construction and ease of inspection and maintenance are given the prominence that they receive in American railway practice, such an objection is serious. There are crank axles in considerable number in regaular service on American railways, principally on four-cylinder balanced compounds, but all things considered, it cannot be said that they give entire satisfaction. The dangers of failure in an axle of this type are greatly increased over those of the plain axle and the conditions which might develop from such a failure, particularly on a four-cylinder engine where there are two inside connected main rods, need no enlarging upon to bring out the seriousness of the accident that might result. While the same arguments apply to the crank axle for a three-cylinder locomotive, they do not do so to the same extent because of the fact that in this type there is but one main rod inside connected, and the designer has, therefore, much broader limitations to which he can work.

With the increase in the amount of radiating surface with the use of the three-cylinder arrangement there would undoubtedly be an increase in the amount of condensation. Just what effect this would have on the steam consumption is problematical, but it does not seem unreasonable to expect, in a three-cylinder locomotive, some increase in steam consumption over a two-cylinder locomotive of equivalent power. The use of a superheater, however, would probably overcome this. All things

considered, the crank axle seems to offer the main objection to the adaptation of the three-cylinder locomotive to American practice, but the ability and courage characteristic of American designers, which have developed and perfected the Mallet compound, the superheater and the mechanical stoker should also be capable of producing a satisfactory crank axle. The three-cylinder locomotives which have been in service on the Philadelphia & Reading for some years, have, on the whole, done excellent work, and have proved satisfactory in many respects; and the application of this principle to a large Pacific or Mikado type locomotive would make it possible to determine just how valuable this type of locomotive could be made in American railway service and would also be watched with considerable interest.

SOME RECORD-BREAKING CONSTRUCTION PROJECTS

IT is somewhat anomalous that records should be broken in the magnitude of construction projects under conditions causing extreme financial depression, such as those that have prevailed in the transportation industry in recent years, and reached their culmination, it is to be hoped, at the outbreak of the European war. The effects of universal retrenchment, as reflected in reduction in mileage of new lines completed last year, tend to overshadow the record-breaking work now under way or recently completed. It may therefore be of interest to recall a number of such instances.

Doubtless the best known of the projects under way which are establishing precedents is the Quebec bridge, which is to carry the new National Transcontinental Railway over the St. Lawrence river, about seven miles above the city of Quebec. As will be recalled, the length of the main span in this structure, 1,800 ft., is 100 ft. greater than that in the Firth of Forth bridge in Scotland, which now has the distinction of having the longest span in the world.

Second in interest only to the Quebec bridge is the 1,000-ft. steel arch of the New York Connecting Railway over Hell Gate in the East river, New York City. The longest span of this type now in service is the highway bridge crossing the Niagara river, about 1,000 ft. below the falls, which has a length of 840 ft. The contrast between this structure, notable as it is, and the new Hell Gate arch is emphasized when it is remembered that the latter will carry a four-track railroad on a concrete ballasted deck. The magnitude of the entire project of which this crossing forms a part makes it unusual in new railway construction.

In the revision of old lines, which has become increasingly common as the volume of traffic has increased, it is impossible to compare projects as accurately as in the case of bridges, but in respect to cost, character of work and importance of the improvement, it is probable that two of the cut-offs now under construction surpass all previous work of this kind. These are the Baltimore & Ohio Magnolia cut-off between Orleans Road, W. Va., and Little Cacapon, one track of which was placed in service December 6, 1914, and the Delaware, Lackawanna & Western Summit cut-off between Clark's Summit, Pa., and Hallstead, which will be finished next summer. The former is 12 miles long and on the average each mile will cost $500,000, require the handling of nearly 300,000 cu. yd. of material and the placing of 6,000 cu. yd. of concrete. The latter is 40 miles long, its cost is estimated at $300,000 per mile, and the earthwork and concrete yardages are 336,000 and 10,000 per mile, respectively. The Baltimore & Ohio line is double-tracked, while the Lackawanna is for three tracks, with the exception of two short sections. The Lackawanna cut-off includes one six-mile section, costing $4,000,000, in which is located the Tunkhannock viaduct, described elsewhere in this issue. This reinforced concrete structure will have a greater total yardage, length and height than any of similar design, although the 180-ft. spans, while long, are not of record length. The concrete yardage is 167,000, the length 2,375 ft., and the height 300 ft. from bottom of foundation to top of coping.

The above work is all located in the east, but the west is not lacking in projects of nearly, if not quite, equal interest. For instance, the largest freight classification yard in the country, and therefore in the world, is now being completed at Chicago. Clearing yard has a standing capacity of 12,400 cars, a handling capacity of 10,000 cars per day and direct connections to two belt lines, intersecting every one of the 24 trunk line roads entering the city. On the lower Ohio and Mississippi rivers two big bridges are being constructed, one at Metropolis, Ill., by the Chicago, Burlington & Quincy and the Nashville, Chattanooga & St. Louis, and one at Memphis, Tenn., for the Chicago, Rock Island & Pacific, the St. Louis, Iron Mountain & Southern, and the St. Louis Southwestern. While these will not establish new records for size, they are of unusual length. Work on the former is temporarily postponed, and on the latter the substructure has just been completed.

In the far west the Snake river steel viaduct of the Oregon-Washington Railroad & Navigation Company, placed in service late last summer, is notable as to height and length, being second only to the Lethbridge viaduct of the Canadian Pacific in the combination of these dimensions. The length of the new structure is 3,920 ft. and the base of rail is 270 ft. above low water. Records in tunneling have also been broken by a western project, the Canadian Pacific five-mile tunnel at Rogers Pass, B. C. This is 1,400 ft. longer than the longest railway tunnel in America at present, the Hoosac tunnel of the Boston & Maine. The work had not progressed far in driving the heading of the pioneer tunnel from which the main bore is being excavated, when the world's record for progress in driving was broken, and subsequently the contractors bettered their early performance in this respect, completing an average of 27 ft. per day at one face for the last two months.

NEW BOOKS

Drake's Telephone Handbook. By D. P. Moreton. 286 pages, 4¾ in. by 6½ in. Illustrated. Bound in cloth. Published by Frederick J. Drake & Co., Chicago. Price $1.

This book is described on the title page as "a book for the practical man"; and it appears to be very full and satisfactory in the scientific and theoretical field as well. The author is associate professor of electrical engineering in the Armour Institute of Technology, and the work gives evidence not only of his ability as a writer, but of his practical acquaintance with the subjects on which he writes. The circuits of the Bell Telephone Company are described, with drawings. Any telephone maintenance employee, whether indoor or outdoor, will find the details of his work dealt with in great fullness.

Installing Efficiency Methods. By C. E. Knoeppel. 258 pages, 6¾ in. by 10 in. Illustrated. Bound in cloth. Published by the Engineering Magazine, 140 Nassau street, New York. Price $3.

There have been so many books published within recent years dealing with the principles of scientific management, that when a new one is brought out it arouses but little interest. In this book, however, Mr. Knoeppel endeavors to avoid the matter of a mere declaration of principles and tells what the methods are that are known to increase the efficiency of a manufacturing plant and also how they are put into use. The introduction to the book states that the purpose has been to give wholly frank and thoroughly practical working instructions and explanations, covering the entirety of efficiency practice as tested and proved in many important and successful undertakings carried out by the author, and this purpose, it would seem, has been carried out. As originally prepared, the material in the book appeared in a series of articles published in the Engineering Magazine during 1914, but this is expanded and changed to a considerable extent in this volume. The chapter on the efficiency clearing house has been considerably enlarged and chapters added on costs and on auxiliary devices for the planning department. A considerable number of charts, diagrams and illustrations have also been added.

Letters to the Editor

DESPATCHERS' CHANCES OF PROMOTION

New York.

To the Editor of the Railway Age Gazette:

I have been reading the letter in your issue of January 29 signed W. S. Hobbs, taking issue with an earlier correspondent in regard to the question whether or not train despatchers are getting a square deal in the matter of promotion nowadays. It seems to me that neither Mr. Hobbs, nor the Editor, in his note subjoined to the letter, gives a satisfactory answer to the despatcher who complains that he is overlooked when competent men are wanted for higher positions in the operating department. It is true, as you say, that a large number of managing officers now in active service began their careers as telegraphers and worked for considerable periods as train despatchers; but the trouble is that, so far as present day problems are concerned, these facts do not throw much light on the question. These general managers, presidents and other officers who presided at the train sheet did so from twenty to forty years ago. May it not be that quite radical changes have taken place since those days? It is a well-recognized fact that civil engineers are better appreciated by railroad presidents now than they were twenty years ago, and this appreciation leads to their more frequent promotion. The same is in some measure true in regard to mechanical engineers. Quite likely, also, the average traffic officer is a bigger man now than was the average traffic officer of 1890, and if that is the case the traffic officer deserves more consideration in the matter of promotion than he did at that time. An extreme view would be that in former years the despatcher had better chances than he deserved: the college educated men were at that time not adequately appreciated.

However this may be, it is plain that today the fact is, and there is no unfairness about it, that the despatcher, as suggested in your editorial, must take his chances with other men who have done well in their respective departments and who aspire to be all-around railroad experts. The despatcher, being at the superintendent's side, has the first chance, but not the only chance. E. N. H.

RAILWAY CREDIT

Chicago, Ill.

To the Editor of the Railway Age Gazette:

It is to be regretted that the value of John E. Oldham's analysis of the "relation that should obtain between gross earnings and various kinds of outgo for satisfactory (railway) credit," in your issue of January 15, is impaired by the inclusion of other (non-operating) income in his computations. When he says, "As charges and dividends must come from the current yearly earnings of a property, the surplus must also come from this source as surely as must the payments for current operation of the property," he places the problem that confronts the railways on its only safe basis. This makes the inclusion of "other income" in the fund available for fixed charges, dividends and surplus surprising and confusing.

Surely as eminent a banker as Mr. Oldham knows that the "other income" that figures so prominently in railway statistics comes mostly from interest and dividends paid from one railway treasury into another. Thus the dividends of the Lake Shore & Michigan Southern went to swell the fund out of which the New York Central paid its interest and dividends.

Let me illustrate the point I wish to make by presenting Mr. Oldham's figures comparing the relation of the named items, per $100,000 earned, for the period 1900-1909 and 1913 for the 19 dividend-paying roads he names, adding thereto figures for the same roads in 1914 and omitting "other income."

	Ten-year period— 1900-1909	1913	1914
Gross earnings	$100,000	$100,000	$100.000
Cost of service	67,400	74,300	75,200
Available for capital	32,600	25,700	24,800
Other income	4,200	6,600	.....
Total available for capital	36,800	32,300	24,800
Fixed charges	16,300	14,200	11.000
Dividends	10,900	12,000	12,600
Surplus	9,600	6,100	1,200

Here it will be seen that the balance for surplus has dwindled almost to the vanishing point. This would be alarming save for the fact that both fixed charges and dividends are unduly swelled by duplications, mostly through stock ownership. On the other hand, a sum equal to $2,800 per $100,000 of gross earnings should be added to the fixed charges for the capital item of rental for leased lines. This, however, would have necessitated a distribution of a larger sum than was available for capital.

The items as they stand represent a return of 3.82 per cent on the funded debt of the roads represented and 5.98 on capital stock—both figures being more or less fictitious.

The true relation of earnings to outgo of these 19 railways is best revealed by the third line of the table, $32.60 out of every $100 earned available for capital, reserves and surplus, for the 10-year period to 1909; $25.70 in 1913 and $24.80 in 1914. Thirty dollars is the line of safety and security for the average American road.

There are facts behind these figures that have a definite bearing on railway credit. As a result of the disproportionate "cost of service" in 1914 no less than 7 of the 19 railways selected by Mr. Oldham had to draw on surplus to meet their capital demands, and only 4 of them appropriated anything out of current income for additions and betterments.

Mr. Oldham's interesting paper would have been more enlightening as to the railway situation in the United States had it included the ninety-and-nine other roads that hew wood and carry water for the American people and declare no dividends, as well as the favorably situated 19 that do. The problem of railway credit is a vast one which is not to be judged by dividend-paying samples any more than by the unfortunate examples in receivers' hands. Slason Thompson.

THE TRAIN DESPATCHER—WHO HAS NO GRIEVANCE COMMITTEE

Whitefish, Mont.

To the Editor of the Railway Age Gazette:

More consideration should be given to the train despatcher. The methods used by some managements are often discouraging. Occasionally a young despatcher, who has within himself the making of a good man, is curtly dismissed for some error or delay which did not result in hazard, and he loses confidence in himself and is timid about taking hold of another job.

There are more changes in despatchers' forces on western roads than on eastern lines, in proportion to the number of men employed. Some of these vacancies are caused by promotions, but more generally by despatchers resigning to go to another company in the same capacity. But quite often this is a jump from the frying pan into the fire, and then as soon as another situation can be secured there is another change.

To certain offices in the western states the sobriquet of "a boomer job" has become attached. Few of the railroads west of the Mississippi river promote operators to be despatchers, and will hire as despatchers only experienced men. Eastern roads, as a rule, employ the direct opposite of this and "make their own men."

Certain of the western roads have learned at last that it costs much money in the long run to be changing despatchers so frequently, and have, of late, become more disposed to encourage men in the telegraph department to look forward to promotion. That they are having success in this method is shown by the fact that there are less changes in their despatching forces than

formerly. The newly promoted man is working with his might and main to make good. He accepts advice from his superior officers more readily than the average "old head." And, in most cases, these new men do make good.

The trainmen and enginemen have their labor organizations, and when a member of those organizations is disciplined, a grievance committee waits upon the superintendent, whether the man disciplined was in the right or in the wrong. Train despatchers have an organization for the exchange of ideas as to the best methods of train despatching, which enjoys a considerable membership of prominent railroad officers; but if a despatcher is discharged, he has no redress and no grievance committee to take up his case. In some cases the dismissed employee may take the matter up with the general superintendent, the general manager or the vice-president, in the order named, if he thinks he has been unjustly disciplined. In the majority of cases, however, a discharge is final, the higher officers taking it for granted that the discharging officer exercised good judgment. But many despatchers are dismissed from the service on account of some serious delay to trains, and, apparently, division officers receive less criticism from their higher-ups when they advise that "the despatcher responsible for the delay has been dismissed" than if they undertake to explain the delay and keep the man in service.

Trick despatchers often feel that they are being imposed upon, or nagged, through the practices of chief despatchers, in some offices, of taking exception to every trivial delay. Quite often a meet is a "stand-off," and one or the other of the trains must suffer a little delay; or some unforeseen complication arises and breaks up the "combination" and things "go all to pieces," through no fault of the train despatcher. The majority of train despatchers do not object to answering "bullets" or "torpedoes," as we call them, relative to legitimate delays, but when a man finds three or four notes awaiting him every day as he goes on duty, it tends to create a feeling of unrest and dissatisfaction. If the despatcher knows that he did the best that anybody could have done under the circumstances, and that it was not "poor work" upon his part that caused the delays, he has a grievance which it takes a long time to obliterate.

A despatcher, like a switchman, can get as much money in one job as another, and if he feels he is being "nagged" on one job, he begins to look around for another opening. Occasionally an absolutely first-class train despatcher runs into a "bunch of hard luck" for which he is not responsible. Those in position above him should guard against hasty judgment of a man's work in a case of that kind.

A certain general superintendent of a western road, who had several divisions under his supervision (and who has not risen from the ranks), had considerable mileage upon which the telegraph offices were few and far between. There were a couple of fast passenger trains over his district, and the despatchers had strict instructions to avoid "saw-bys" with these particular trains. The trick men would "stake 'em out" (meaning the freight trains), so there would not be two at the same place for either one of those fast trains; but occasionally something would go wrong, and a "saw-by" would ensue which would result in more or less delay to one of those fast trains. This general superintendent, seeing the delay upon his morning reports, would wire the division superintendent: "Fire the despatcher who sawed No. ——." This general superintendent was a very strong-minded man; and the superintendents would rather hire a new man than fight to keep the despatcher whom the general superintendent had held responsible for delay. Despatchers changed so often in the offices in that district that it became hard to get new men to take the places, the despatchers who left advising their friends that they were "boomer jobs," and that nobody stayed in them. A new man would, naturally, hesitate to enter into service under the supervision of that officer. Afterwards, that general superintendent was promoted to a higher capacity, and a division superintendent, who had been a despatcher himself for many years, took his place; and almost from the first day conditions in that district began to improve; and, today, you will find no more loyal bunch of train despatchers anywhere than are working on that district.

No matter how careful the despatcher may be, nor how far ahead he may figure, he will sometimes slip up, and overlook the need of issuing instructions to a train to do certain work; or may put out a "bum" order; but whether the bad results are small or great that man is usually conscious of his error the moment it occurs, and it stings him to the core. His own conscience and judgment sting more than a "butterfly" or a chief despatcher's note, and he profits by his mistake.

Trick despatchers should be under the control of the superintendent, rather than of the trainmaster or chief despatcher, though reporting, of course, to the chief train despatcher. A new despatcher should be approved by the superintendent before being hired, and only the superintendent should finally discharge a train despatcher.

The superintendent should take a personal interest in his despatchers. The opinion is rapidly spreading that the person who issues train orders should be authorized to sign them with his own signature. The superintendents' and the train despatchers' associations will recommend to the American Railway Asso-tion, in their report upon the proposed revision of the Standard Code, that the train despatcher issuing the train-order be authorized to do so over his own initials. Several large railways adopted this practice some time since, and it is found that the despatcher's greater pride in his work and increased sense of responsibility render him more ambitious to excel in the performance of his duties. The orders are the product of his brain, and no other. And, as Mr. Forman points out in his recent letter in the *Railway Age Gazette*, it would save considerable trouble in searching old records to find who authorized a certain order. Further, their names should be printed on the Time Tables, as is done now by certain lines. This tends to make a despatcher feel that he is, in a way, an officer of the company, which he is; and he should be thus recognized.

Where possible, every train despatcher should spend at least two days out on the road, every month, without loss of pay. He should ride the way-freights. Their frequent stops would allow him time to look around and familiarize himself with the location of every station, train-order signal, interlocking plant, sidings, industry tracks, etc.

It is the custom with a few roads to give their despatchers annual passes over the system, and one in favor of wife and children good over the division. Despatchers always appreciate little courtesies like this, and it cements the feeling of loyalty to the management. Some other lines give their despatchers only trip passes, either for personal or company business, and those men feel tied down. . . . Passes in favor of train despatchers and their immediate family should not be restricted to certain trains, unless the excluded trains are excess fare trains. The passes in favor of the despatchers themselves should be also endorsed "Good on Engines and Parlor Cars." I understand one southern road also includes the privilege of employees' rate in dining cars.

In conclusion, I wish to repeat that many a young man who starts out with a highly optimistic outlook as a train despatcher is often discouraged during his earlier years by sharp or sarcastic criticism on the part of those in position above him; whereas, if dealt with kindly and with a little patience, he would reward his superiors by doing high-grade work.

William E. Watts,
Train Despatcher, Great Northern Railway.

Nigerian Railway.—The line was opened to Bukuru on the Bauchi Light Railway section on December 10 for passengers and freight. A through train from Zaria to Bukuru, 140 miles, will be run in connection with the main line boat from Iddo, on which a dining car will also be provided so that passengers need take nothing with them after arrival at Zaria.

Tendencies Toward Inefficiency in Legislation*

Legislatures Neither Refrain from Passing Doubtful Statutes Nor Make Adequate Investigation of Them

By Roberts Walker

Criticism and rejection of eastern views are sure to be voiced by Oklahomans. But do not misunderstand me: there is no fundamental basis for differences of opinion, as between New York and the Southwest. Our points of view are, today, not the same. Yours may be better than ours. It is certainly as much fresher, as ours is older. But in time the two will become not greatly dissimilar. You are making some experiments that we might well copy. From our successful experiments you can borrow and have borrowed much of value. And our failures have taught you what to avoid. For example, New York still has on its statute books a law, whereof the legislative purpose remains an utter mystery, prohibiting billiard tables on steamboats. Oklahoma, being better versed in elementary physics, can be relied on never to reproduce this attempt to make a misdemeanor out of what no sane man would think of doing.

INEFFICACY OF STATUTES

We need not pause to philosophize upon that trait of mankind which reposes so implicit and childlike trust upon legislative enactments. History teems with examples of this unreasoning faith. Yet it is our commonest experience that laws are not self-enforcing; that the courts emasculate many of them; that the legislatures repeal or alter many others; and that the great popular will prevents many another from ever being enforced. Prohibition only partly prohibits; a tax law does well if it collects a tithe; and the oldest profession continues to recruit its excommunicated priestesses in spite of savage statutes seeking its total destruction.

There are, however, certain realms wherein statutes are efficacious, and always enforceable if not too obnoxious. It is a familiar tenet of comparative jurisprudence that it is alike easier to pass and easier to enforce laws dealing with commercial transactions than laws governing domestic relations. Instead of a uniform divorce law—so obvious a need in our 48 states—we remain almost exactly where we began: in South Carolina even the legislature may not sunder whom God hath joined, while in Nevada (at least until recently) divorce was included among the stop-over privileges on your railroad ticket. In sharp contrast is the steady progress made by the standard negotiable instruments law, sales act and bills of lading law through the various legislatures. These and others exemplify the area within which statutory regulation may be at once efficacious and efficient, namely, the area of commerce, including many, if not all, of the functions of production, distribution and consumption.

But the very feasibility of enacting laws to regulate business has resulted in the obscuration of the proper aims and limits of such legislation. Like joy-riders, we forget the safety of passengers and pedestrians and exult only in the speed and the ease of operating the machine. The warning upraised hand of the traffic policeman is needed on the legislative speedway. For the common welfare, conviction of mistakes must be brought home to the voters and their representatives. Once given the evidence, cannot the voters be trusted? Witness the recent crushing defeat by referendum in Missouri of what is charitably described as the full-crew law, and more accurately characterized as the law to compel railroad companies to pay men for riding around doing nothing.

To a few, then, of the current legislative practices that tend toward inefficiency or even disaster, your attention is now directed.

*From an address before the Oklahoma Bar Association, December 28, 1914.

WORKMEN'S COMPENSATION LAWS

Some noveltist once said that while there are two ways to begin a chronicle, neither way relieves you from telling your whole story. One gambit is to start with John Applegreen in 1660, recount his ancestry, surroundings and descendants, and arrive, 200 years later, at the characters of your tale. The other way starts thus: "'Good riddance!' yelled Roger Stone, as he kicked his grandmother out of the third-story window." This latter method catches the attention quicker, but necessitates going back to explain the earlier history of the Stone family and why Roger could feel so gratified at hurting his grandame through space.

Our American legislatures vastly prefer this second method. Time and again has vehement retaliatory legislation been enacted to meet current clamor, only to have its incompleteness become almost instantly apparent, thus requiring the addition of substructure and side-bearings, until the statute became relatively coherent and equitable. The intolerable spoliatory granger legislation had its valuable residuum in the establishment of principles for the control of public service corporations, based, in theory at least, on the mutual and interdependent relations between the public and the utilities.

And hence, is it not pertinent for us to inquire: Are we not now in the earliest or vindictive stage of employer's liability and workmen's compensation legislation? With most of us, I am sure the answer will be "yes." In a land where, thank God! workmen have more initiative and intelligence than anywhere else on earth, and because whereof the defenses of contributory negligence, assumption of risk and fellow service were at first (and in many a trade still would be) abstractly equitable and right, we have at a stroke of the governor's pen stricken down those defenses and have given the employer what in return? Nothing; absolutely nothing! Nay more, we do worse; we abolish the whole question of fault, fix a scale of prices for casualties *per se*, and send the whole bill to the employer. The propriety of charging the product with some portion of the cost of industrial accidents is not here discussed. But it is a most obviously proper question whether it was just or even defensible to free the worker from all the consequences of his own acts and saddle his employer with the whole burden. The instant result is that the employer passes that same burden on to the consumer, if he can, and thus the worker may blunder *ad libitum*, knowing that the consumer foots the bill.

Such legislation is inefficient for at least three reasons: (1) It demoralizes the worker by depriving him of his last reason for being careful; (2) it forces the employer, by physical examination and other tests, to cull out many men otherwise unexceptionable; and (3), it necessitates all the "safety first" methods, which the rich, large employers can install, but which the less fortunate manufacturers and contractors can supply only with difficulty, if at all, thus adding to the oligarchical power of wealth by hampering or even obliterating the small producers. How infinitely fairer it would be to treat this subject in its entirety; to include sick benefits and pensions for old age and incapacitation, to create an insurance fund to carry the load in a given trade so that a run of bad luck would not sink a single employer, and to have not only master but employees pay premiums to sustain this fund, the workmen's share in the premium to be greater for sickness and pensions, the employer's portion to be greater for casualties. This is no imaginary scheme that I am so roughly sketching; Germany has had it in use for over 30 years. Nor are excuses offered because it is socialistic. Granted that it is, what less can be said of the present workmen's compensation acts?

The whole idea of making commerce carry directly, instead of in haphazard man-to-man fashion, the cost of industrial accidents is intrinsically socialistic. My plea is that, being embarked upon this economic adventure, we should master and apply *all* the precepts of such manœuvres.

It is regrettable, also, that the passage of such lop-sided, jug-handled laws of employers' liability and workmen's compensation cannot fail to have a demoralizing effect on the laborer class. They are bound to conclude that their voting power, or the fear of their using it, can get them further largesse from the state. Thus pauperized and morally debilitated, they become a genuine risk. It is for the highest welfare of society that all grades of endeavor be constantly invigorated and incited. Any contrary tendency is a menace. Unless we manage workmen's compensation with more comprehensive wisdom, the present inefficient laws will fester into cancerous growths requiring extensive and painful surgery.

LIMITATIONS OF GOVERNMENT BY COMMISSIONS

For many years I have been on the point of writing an essay to be entitled "Democracy and Taxidermy," to revolve around the one and only inviolable principle recognized by the executive and the judicial branches of our federal government, namely: "We will not skin any skunks for Congress." In our unique three-headed form of government, the temptation to "pass the buck" is all but irresistible. Congress passes a law fixing hours of labor for railroad telegraphers, but giving the Interstate Commerce Commission power to suspend its operation for cause shown. The commission, despite due cause shown, recalls that it knew some laboring men itself once, detects a mephitic aroma in this delegation of congressional power, declines to flay the varmint, and flays the petitioning railroads instead! Again, the Sherman law is enacted by a Republican Congress anxious to glorify competition and denounce monopoly, always provided that the former must not become so energetic as to result in the latter. These benevolent intentions are expressed in nice, plain, inclusive copy-book language. Do the courts whittle down this sweeping import, even though every dictate of horse-sense would justify them in so doing? They do not. Instead, they vie with one another in squeezing situations into the scope of the act, perhaps in the hope of persuading Congress that the "eloquently silent" little animal ought to be skinned, but by Congress itself. Then, as if alarmed at possible results to flow from these interpretations, the Supreme Court devised the "rule of reason," telling us, however, what *doesn't* fall within it, not what *does*. Congress has now enacted another such statute, containing the words "to substantially lessen competition." And do I not detect, in that word "substantially," a pretty kitten-like creature with lovely black fur and a white stripe down its back? 'Pears like I do. At any rate, keep your eye on that word "substantially" for the next few years.

This sailing on the River of Doubt as a faunal naturalist is so entertaining that I am loth to step ashore. But let's discuss some defects in reposing too great reliance upon commissions.

Confronted with a problem of regulation of a complicated subject, there are only two practical courses for a legislature to pursue: either to refrain from passing a statute, or to have the subject exhaustively investigated by a committee and to pass a statute based on its findings. Legislatures are too prone to do neither, but to borrow or adapt a statute from some other state or nation and create a commission to carry it into effect. Whereupon some three or five or seven men, perhaps without experience in or peculiar qualifications for the subject matter, are plunged into a maze of detail under an ill-digested statute and left to work out their own salvation and the public's. The inevitable results are delay, confusion, mistakes, abuse of power—in a word, inefficiency. I know one state commission which requires papers on security issues to be filed with it at least three weeks before it acts. The papers are a rehash of the corporation's own periodical figures; the commission's decision is a simple yes or no. Any experienced banker's clerk could reach a decision over night, deciding moreover what the commission does not decide, to wit, the *price* the securities should bring.

With the abstruse and diversified problems of gas, trolley, electric light and power, steam railroad and other utilities and their rates, services and stock and bond issues, the commission soon finds itself unequal to its task and cries for a larger appropriation. Because this is a democracy, wherein lots of jobs are preferred to real expertism, a larger appropriation means only more clerks, most of them unskilled, few of them capable of becoming experts, all of the developed experts subject to hire at better pay by private enterprises as soon as their qualifications become manifest. Then ensues administration by clerks. Even that would not be completely bad, if the other fellow ran his business by clerks; but he doesn't. He hires the best men he can afford and plenty of them. Not alone the utilities employ wide-awake experts, but so do the large shippers, the chambers of commerce, the boosters' clubs and all the other agencies that propound or incite cases for the commissions to decide. With the great number of these utilities, the ramifications of their services and the questions agitated by all these ingenious intellects, the commissions and their clerks are utterly unable to keep abreast.

In the nature of things, the Interstate Commerce Commission is so great an offender that the state commission seems almost blameless by sheer force of contrast. The commissioners themselves, most of whom I hold in high and affectionate regard, are not to be held wholly responsible; much of their difficulty arises from the magnitude of their task and from the failure of Congress to insist upon and provide funds for a competent staff of experts.

Clerks sift evidence and compose many rulings. And the worst of the matter is that the commission is nowhere near caught up with its work. The country has recently had proof of the time consumed upon a transcendently important subject. What the public does *not* know is how other matters, fully as important to the participants, drag their weary way along. And, let me repeat, such faults are not entirely the commissions'. In the last analysis, the responsibility is upon the legislature or Congress for improvidently overloading a small group of ill-paid men with duties that they could not humanly perform, even if provided, which is not the case with an adequate staff and ample funds. Indeed, we ought not to admit that a commission may further delegate its powers. The maxim *delegatus non potest delegare* is as stern upon the legislative as upon the judicial side. The summary of the whole subject must be that the legislature should never endow a commission with authorities impossible of vigorous and effective exercise.

DISREGARDING GROSS INCOME

On December 19 the newspapers state that Secretaries McAdoo and Redfield are to investigate the rise of ocean freights since the European war broke out. From personal knowledge I foretell that they will report increases all the way from 50 per cent to 200 per cent. And the reason is plain. These rates have merely responded to the inexorable compulsion of the law of supply and demand.

Now contrast shipping with railroads. Here was a huge, instant emergency. It arose July 30. Not till December 16 was any measure of relief even promised, and then only to a small extent and with patent hesitation.

All the statutes affecting public utilities must be held up to the light. Scarce one of them will stand the test of reciprocal justice to the securityholders, as well as to the shippers. Our entire fabric of regulative law (excepting possibly the laws governing banks) proceeds on the theorem that expenses may be piled up indefinitely to meet the needs or policies of the times, but that revenues must not increase unless a narrow, difficult, tedious and technical demonstration shall first have been made. The alternative, on the revenue side, is to leave the matter to free and unrestricted competition, of the sort those stalwart Republicans fit, bled and drew their salaries for on July 2, 1890.

Neither method can succeed when used conjointly with regulation—meaning thereby *increase*—of operating costs.

In railroads, our process has been the same as in coal mining. I need not bore you with a list, as long as Homer's list of the ships, of statutes that have added to the cost of railroad operation. Yet the Interstate Commerce Commission asks Congress for more. Its annual report (December 10, 1914) begs for these laws:

> Compulsory use of steel passenger train cars;
> Penalties for violating hours-of-service act;
> Control of railway capitalization;

but contains never a word of request for power to stop railroad losses, to put its fingers on leaks, such as, for instance, the regulation of wages as fully as rates are regulated, nor for power to initiate rate schedules. The result of heaping up costs and not controlling wage expenditures, nor protecting adequate gross revenue, is eloquently proclaimed by these Rock Island figures. Of every dollar paid by passengers and shippers, there was disbursed upon payrolls†

> in 1900 34 cents,
> in 1907 40 cents and
> in 1914 43.9 cents;

while out of the same dollar there was paid for interest and dividends

> in 1900 21.3 cents,
> in 1907 20.1 cents and
> in 1914 19.6 cents.

Labor, that is to say, gathered unto itself 29 per cent more during the 14-year period, while capital had to be content with 8 per cent less.

While under ideal conditions, wage increases would be zealously scrutinized, no one would grudge the railroad employees their steady gain in pay if the gross resources were steadily growing to match. But they are not. On the contrary, the railroads are where a crippled $1,000 annuitant would find himself if his living expenses were increasing $100 per year, or where the farmer would be if he had to pay today's wages out of 40-cent wheat. If the various commissions are to continue holding down rates, they should also hold down taxes, the cost of supplies, wages and the money market. But if they are to meet actual conditions, the gross incomes need solicitous attention, that they may readily respond to growing demands. Wise legislation must include both sides of the income account, or neither.

REGULATION OF SECURITY ISSUES

Here, to my mind, is one of our finest illustrations of misdirected energy. About all it amounts to is the entering of records that nobody ever consults. The state assumes no responsibility as guarantor. Its investigations, prescribed and circumcribed by wooden statutes, are such as to make a skilled bond-broker weep at their pathos. So the investor gets nothing out of the red tape; from his viewpoint, the securities might as well be sniffed over by an experienced hound-dog. "But," say the champions of these statutes, "the public has to pay fares and tolls to provide interest and dividends, and this regulation prevents watering and minimizes the burden the public has to carry." There is one slight defect in this claim, namely: it is not true. Did you ever hear of a commission—even in Texas, where this legislation was born and raised—asking about a carrier's securities when engaged in fixing rates, heating waiting-rooms or running stub-trains? Did you ever know of a railroad charging higher rates because it had more fixed charges to pay? You never did; and in the old rate-cutting days it was always the water-logged railroad that did the rate-cutting. Did you ever hear of a commission ordering the Burlington, capitalized at $35,000 per mile, to charge lower rates than the Alton, capitalized at $128,000 per mile? Don't you know that any such fool order would route all the business over the road that needed it least? Is the public overtaxed when roads, such as Frisco or Pere Marquette, are neither earning nor paying fixed charges, as at present? especially when you consider that their more successful neighbors are both earning and paying larger amounts of interest and dividends? Are you not aware that, for weal or woe, the respective capitalizations of the various carriers have been pretty permanently established for some decades, so that the sound and prosperous roads sell fewer securities at or above par, while the staggering ones must suffer huge discounts and pile up their funded debts; and hence that any attempts to protect the public, at this late date, by holding down fixed charges is a futile waste of the taxpayers' money?

There is a fallacy beneath the regulation of securities. It is the notion that the public is benefited by paying the lowest possible rates today, while the carrier borrows, for collection in the future from the descendants of the present shippers, huge sums of money represented mainly by bonds and to a small extent by stocks. Even tomorrow's shippers are paying interest on these borrowings. How much better to follow the example of the far-sighted farmer or manufacturer, and build improvements, buy equipment and even construct new mileage, out of surplus earnings. Such expenditures involve no awful debt to be paid in the future and no millstone of interest payments on the carrier's neck.

Pudd'n'head Wilson—I refer to the character in fiction—says: "Put all your eggs in one basket *and watch that basket!*" I think we make a sad mistake in all our regulation. There is just one basket to watch: the surplus. Rates should be high enough to produce a surplus. The better the surplus, the better new securities will sell and the less the public will be "burdened" —if you like the word—with fixed charges. The emission of securities should be a matter of free bargaining; the money rates and the carrier's financial condition will fix the nature and price of the bonds or stock. Let the state, through its commission, step in only when the surplus is being wasted in too high dividends or otherwise. Let the state insist that surplus earnings, above a suitable maximum, be used in new work or in reduction of debts previously incurred for new mileage or improvements. Keep the carriers frugal and provident. Turn them into self-respecting men of business who run their plants with moderate incomes for themselves and with the least possible cost to present-day shippers and to posterity—the latter being no less important than the former.

A BETTER LEGISLATIVE VIEWPOINT

Such results as I have cited flow from being so zealous for the rights of man as to forget the due protection of property rights; yet the best safeguard to human life and liberty is the enforcement of respect for man's possessions.

If the legislative trend is to be improved, the first essential is the stoppage of class antagonism, the abatement of those feelings which cause legislation to be conceived in a destructive and bitter spirit. Never was a better time to pause and take our bearings. On the continent of Europe, the nations are locked in a titanic struggle, arising out of what? Largely out of the desire of each of the two chiefest nations for the commercial hegemony of the world, to wit, the advancement of its property interests. To gain this pre-eminence, each of them is destroying its property and treasure at the rate of millions per day. No matter what the outcome, they will emerge from the war impoverished, and the winner will have to take years to earn enough to purchase the hegemony that the victory entitles him to. Is commercial supremacy, at such a price, worth having?

The classic philosophical division of property is between property for *use* and property for *power*. This terrible war is the madness of property employed for power. It ought to fix us neutrals in the conviction that our sedulous end and effort must be to enhance property "for use" and the uses of property, thus inspiring real conservation and stimulating the acquisition of private possessions by every citizen in the state.

Observations of a Traveling Editor.—A prize which might safely be offered in any amount would be a reward for the discovery of a man who looks happy while he is trying to hog two seats in a crowded railway train.—*The Continent.*

STANDARD TESTS FOR COLOR BLINDNESS

In a report presented at the last annual meeting of the American Medical Association, Section on Ophthalmology, three prominent railroad physicians, acting as a committee of the association, have given the results of their studies in the latest practices, throughout Europe and America, in the examination of railroad employees and others for color vision and in the most advanced requirements in this matter. The report is to be found in a pamphlet printed by the American Medical Association, 535 North Dearborn street, Chicago. It is by Doctors Charles H. Williams, of Boston; Nelson M. Black, of Milwaukee, and J. Ellis Jennings, of St. Louis. The report contains descriptions of the latest model of Williams' lantern, of the anomaloscope (recently noticed in the *Railway Age Gazette*) and other apparatus used in tests.

To obviate some of the objections found in using Holmgren's worsted test, Dr. Jennings has devised a scheme for testing with yarns without handling them, and the colors are arranged in a box or frame in such a way that a person who is tested makes a permanent record of his color sense. This arrangement consists of a square box divided into an upper and a lower half, each half having a lid—virtually two shallow boxes with bottoms joined together. The upper side of the box is marked "Test No. 1 Green," and contains a color-board made up of all the different colors, shades and tints likely to be mistaken by the color-blind for green. The lower side of the box is marked "Test No. II Rose," and contains a color-board made up of all the different colors likely to be mistaken by the color-blind for rose. The color-boards, like the box, are absolutely square and each contains 64 patches of worsteds ¼ and ½ in. in size, of various colors and shades, making a total of 128 colors used in the test.

In close proximity to each patch of colored worsted is a circular opening in the color-board which is for the purpose of registering the particular patch of color chosen by the candidate. This he does by inserting a pointed pencil of wood or metal through the opening and punching a hole in the record sheet which had previously been placed beneath the color-board. The position of the patches of color and the circular openings have been arranged in an absolutely symmetrical design, so that when the box is turned in any one of four positions the same appearance is presented and it is impossible to say which is top or which is bottom. The openings in the boards are so arranged that the records of both the green and rose tests are made on a single sheet.

Method of Testing.—The cover marked No. 1 is removed, the color-board lifted out, a record blank inserted and the color-board replaced. Care must be taken to see that the mark "TOP" in the box, "TOP" on the back of the color-board and the top of the record blank all correspond. The box is now turned around several times until all sense of direction is lost.

The green test skein fastened to the inside of the box cover is placed at a distance of 2 ft. and the candidate is given the pointed pencil and requested to look along each row of colored patches and when he sees the test color or one of its lighter or darker shades, he is to place the point of the pencil in the opening opposite and punch a hole in the paper beneath. Having completed Test No. I, the cover is replaced and the box turned over, exposing Test No. II, the Rose. The corresponding record blank having been inserted and the Rose skein displayed, the test proceeds as before.

It will be seen that the subject is obliged to decide by color alone. There are no odd and even numbers to give a clue. The patches of color are small enough so that cases of color scotoma may be discovered.

RECOMMENDATIONS

The results of the studies of this committee are summarized in the recommendations which they present at the end of the report, which are as follows:

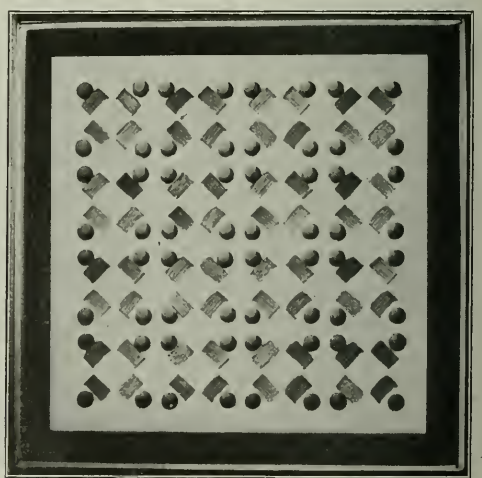
1. In every case the color-sense should be examined by the Holmgren worsteds exactly according to the directions given. As some cases of defective color-sense may occasionally pass the Holmgren test it is necessary that another test with a lantern should be used in every case to determine the color-sense of the macula region where the colors of signal-lights must be quickly recognized.

2. (*a*) Those who pass the test with the worsteds and with the lantern, without making a mistake, should be classed for signal purposes, as normal.

(*b*) Those who make the characteristic mistakes in selecting colors which look like the green, or the rose test skein, of the Holmgren worsteds, or, who make mistakes in naming the colors of the lantern, should be classed as abnormal.

(*c*) Of the abnormal cases: Those who select with the green test skein some greens and also some grays, browns, rarely a red, or, who select with the rose test skein some rose or red colors, and also blues, purples, grays or greens, or with the lantern test call a red light green or white, a green light red or white, or a white light red or green, should be classed as dangerously defective in their color-sense.

Those who make other mistakes than the foregoing, or who are very hesitating in their selection or naming of colors, should be classed as having a weak color-sense. If these



Jennings' Self-Recording Worsted Test

persons wish to work where they will use colored signals, they should be re-examined under medical supervision by repeating the tests with the Holmgren worsteds, and the lantern; and in addition with Stilling's plates (Fourteenth edition, 1913), and also with some form of spectroscope test to determine the extent of the visible red end of the spectrum, and, if possible, with Jennings' self-recording worsted test, and with the Nagel anomaloscope.

3. Cases of appeal from the original examination should be re-examined as provided in the foregoing paragraph.

4. Some plan should be adopted to ensure a proper and uniform standard in the colors of the worsteds, especially the green and the rose test skeins, and in the colors of the lantern.

5. On large railway systems, and in the marine service, there should be some central point where a complete equipment can be maintained in charge of a competent medical examiner, for the re-examination of doubtful or appealed cases. There should also be a periodic examination by such examiner of all the equipment used in these tests over the whole system, to be sure that it is kept in proper condition and renewed when necessary.

6. Reports of the examinations should be kept on file at some central point and should be supervised by some competent medical authority to see that the tests are made according to the instructions.

7. The Section on Ophthalmology should adopt some standard form of instruction and record blanks which may serve as a guide for those who make the tests.

It will be noted that in the foregoing recommendations no mention is made of red-blind, or green-blind, or blue-blind. The border-lines between the various forms of defective color-sense are not sharply marked, and with the means at the disposal of the examiner in making the routine tests of large numbers of men, it is not possible for him to determine with certainty the exact quality of the defective color-sense, nor is it essential. It is sufficient if he can pick out those who are dangerously defective in their color-vision, or who need a further special examination, and the committee believes that a careful study of its report, and a strict compliance with the methods and standards there explained, will enable the examiner to make these tests for color-vision fairly and accurately.

THE WAR AND PENDING RAILWAY FINANCE

By George A. Clark

The railroads of the United States, Canada and Mexico have approximately three-quarters of a billion dollars of bonds and notes now outstanding, which mature during the next five years, 1915 to 1919, inclusive. Approximately $450,000,000 will fall due during 1915. In these totals no account is taken of equipment trust obligations, of the new capital which must be raised to perfect pending reorganizations of a large amount of mileage now in receivers' hands, nor of the new capital expenditures which are absolutely necessary during this period. A most conservative estimate would place the requirements for these purposes at not less than $250,000,000.

The task of raising a billion dollars even in normal times for an industry which has largely passed the period when the inducement of large profits may be held out to investors, is a fairly sizable one. The fact that a large part of the total amount required during the period is already invested, and that in the process of refunding the actual amount of new capital brought into the industry is relatively small, does not lessen the seriousness of the situation. Because of the abnormal conditions prevailing as a result of the war a considerable part of the money represented by the maturing obligations will be diverted to other classes of security. The wide extent of the war and the consequent enormous waste of capital with resultant influence on interest rates has brought about a situation more serious than the railroad industry has ever faced before.

Those companies which are under the necessity of refunding maturing obligations in 1915 and to a slightly less extent during the subsequent three or four years are confronted with a situation more pressing than the problems which they have been struggling with during the past few years. For the time being the necessity of raising new capital upon such terms as will permit a continuance of the corporate existence of the companies involved overshadows problems of increased operating efficiency, higher rates and combatting labor demands. The money to refund these obligations must be raised or the inevitable receivership faced. Fortunately, the obligations maturing in 1916, 1917, 1918 and 1919 are relatively small in amount, both for the individual companies and in the aggregate, for the several years.

The statement in the accompanying table sets forth the principal obligations matured and maturing during 1915, including equipment trust obligations, arranged in order of maturity.

It is generally conceded that, as a result of the war, higher interest rates will be the general rule for some time to come. It is possible that long-term money will cost more than it has at any time since the Civil War. During the progress of the war, not only have the processes of production been stopped, but an enormous sum is being consumed by the operation of the hostile armies and navies. Modern warfare is so costly that the European conflict may deplete the world's surplus of capital almost to the point of exhaustion. Possibly during the progress of the war, and certainly following its conclusion, the principal governments involved will endeavor to float loans. It is conceivable that the necessity for money will be so pressing on the part of the combatants that interest rates unknown in modern times will prevail. Such a development could have but one result upon the market for railroad securities. The income return of-

fered and the safety of the investment must be comparable with the investment features offered in the obligations of foreign governments.

Although the aggregate amount of capital which must be raised for refunding purposes bulks large in a situation like the present, there is cause for congratulation that such a large amount of permanent financing was successfully completed during the first half of 1914. During this period a number of the leading companies have been successful in substituting on a favorable basis long-term obligations for short-term notes. In addition the capital requirements of these companies were anticipated sufficiently to provide for pressing immediate needs. The Southern Pacific, the Northern Pacific, the Chicago, Milwaukee & St. Paul and the New York Central & Hudson River Railroad raised $165,000,000 for this purpose. A number of companies, including the Southern Railway, the Maine Central and the Chesapeake & Ohio, raised large sums by means of three and five year note issues. Two important companies, the Erie and the Baltimore & Ohio, both of which, according to reports, have been working on a general and refunding mortgage, refunded their maturing obligations through the sale of one year notes. The latter company has $35,000,000 maturing June 1, 1915.

Generally speaking, the situation is as sound, if not better, than at any time since 1907. Many extensive programs of improvements have been largely completed. A part of the

expenditure represented by these improvements has already been permanently financed. This is particularly true of the Chicago, Milwaukee & St. Paul and the New York Central & Hudson River.

It is particularly fortunate in view of the probable investment conditions that more than half of the obligations which mature are those of companies enjoying the very strongest credit and whose securities are held in high regard by the investing public. The Pennsylvania Railroad Company with $86,827,000 3½s, the largest single maturity, maturing in October, has long been considered the premier American railroad in investment stability and this company has just sold $49,000,000 consolidated mortgage bonds at a very good price.

In spite of these encouraging features, and there are many, there still remains for a number of important companies the difficult task of refunding maturing obligations in such a manner as to avoid excessive charges for the capital required without incurring undue risks in further refunding at some future date.

The uncertainty among investors as to the probable trend of investment conditions will make it difficult to sell long-term obligations on a satisfactory income basis. In such a time it is not feasible to raise any large sum through the sale of capital stock. Of necessity most of the companies will be forced to fall back upon short-term notes.

In again resorting to this type of finance on a general scale the fiscal representatives of the companies will have the benefit of the experience of the past six or seven years in this form of financing. If nothing else, this experience has demonstrated the danger of too short maturities, particularly when the issue is a large one. Short-time notes in large amounts maturing in less than two years should only be issued by companies enjoying the very best credit. For companies not so favored as to credit, it would seem as though the adoption of the principle used in refunding equipment trust notes might be used to advantage. The Minneapolis & St. Louis affords an interesting illustration of the possibilities in retiring a part of an issue at a time. Short-time notes maturing serially might be used to good advantage at this time.

A short-time note is essentially nothing less than the promise of the issuing railroad company to pay the amount named in the course of a few years. In the past a number of companies have attempted to improve the investment standing of their issues by securing them with collateral which has frequently consisted of mortgage obligations of the same company. Investors have not found in practice that the presence of the collateral has more than a sentimental value. If a company reaches a position where payments of either interest or principal upon a short-time obligation must be defaulted, the general refunding obligations of the same company when secured by third, fourth or fifth mortgages are at best of doubtful value.

If the assumption is correct that following the war capital will be difficult to secure, this condition has come about at a most fortunate time in the history of the railroad industry in this country. The process of construction, of system building and intensive development has been about completed. True, large amounts of capital will be required in the future for the further enlargement and improvement of existing facilities. For the time many of these betterments can be postponed without irreparable injury. An expenditure which will pay its way in increasing operating efficiency is always to be desired, but when the capital for such an improvement must be secured upon terms which involve a serious risk as to the ability of the company to refund the obligation at maturity, it should be deferred to a more favorable time. Rigid economy, a high degree of personal efficiency and a conservative refunding policy as to additional financing would appear to be the most logical program for the present.

ANNUAL REPORT OF MASSACHUSETTS COMMISSION

The Public Service Commission of Massachusetts has sent to the legislature its second annual report. It is made up largely of statistics; and these go back ten years or more, including the records of the former railroad commission, which was superseded by the Public Service Commission in 1913.

With the enlargement of the functions of the commission under its new organization several new departments have been established. The rate and tariff bureau is one of these; this bureau received up to the end of the year 5,176 tariffs, which have been filed and indexed. The commission has aimed to keep down the expense of this work and the report says that the system adopted is much simpler than that used for similar work in other offices. In complying with this new law, and filing all tariffs with the commission, the railroads found many questionable and improper rates in force, and these have been cancelled.

The report recounts the action of the railroads during the past year in making advances in passenger and freight rates, and contains a full copy of the standard mileage schedule of class rates for freight on which were based the new freight tariffs of the Boston & Maine. The other two principal roads, the Boston & Albany and the New York, New Haven & Hartford, have adopted a similar basis; and this uniformity throughout the state is looked upon by the commission as a great public benefit.

The chief of the inspection department is George W. Bishop, who assumed the duties of that office August 1 last. The report gives a summary of the work of this kind done during the year ending June 30 last, some of the items of which are:

	Examinations	Reported Faulty
Frog and switch blocking	.....	918
Bridge guards	.....	401
Passenger stations (971)	5,222	112
Locomotives (2,625)	3,929	492
Spark arresters and ash-pans (additional to above)	655	...
Passenger cars	13,004	1,446
Passenger cars (street railways)	3,257	786

During the year 16 collisions, 40 derailments and 429 fatal accidents to individuals were investigated. The inspectors of the commission attended 362 inquests. Of the ten passengers killed during the year all were reported as having been the victims of their own imprudence or negligence.

The engineering department is in charge of Henry W. Hayes; L. E. Moore is engineer of bridges and signals and W. J. Keefe assistant engineer of signals. This department has made a large number of examinations of properties, both steam railroads and electric lines, in connection with improvements to the property and applications for authority to issue new stock or bonds. The report includes a detailed statement of railroad signals, like that issued by the Interstate Commerce Commission; and also a list, made up in somewhat the same way, showing signals on electric lines. In this list of electric lines there are 39 companies. The automatic signals on these electric lines are classified as "counting" and "non-counting," the mileage of road entered under the head of counting being 72.15.

The telephone and telegraph department of the commission is in charge of W. H. O'Brien. The report names 15 features in which the commission has brought about improvements in telephone service.

The general discussion at the close of the report is very brief, and it is stated that certain important matters, which are now pending, will be made the subject of special reports to the legislature.

Hospital Train for Egypt.—A hospital train has been placed at the disposal of the military authorities in Egypt through the generosity of the Egyptian Red Crescent Society, which has contributed the sum of $8,000 for this work. The train was equipped in the Egyptian state railways work shops, and will accommodate 12 officers and 96 wounded men.

Recent Additions to Union Pacific Freight Equipment

Steel Automobile Car, and Box Car With Underframe, Roof and Ends of Steel; Both of 100,000 lb. Capacity

There were placed in service a short time ago by the Union Pacific 4,000 steel underframe box cars, 2,000 of which were built by the American Car & Foundry Company, and 2,000 by the Western Steel Car & Foundry Company, and 600 all-steel automobile cars built by the Western Steel Car & Foundry Company.

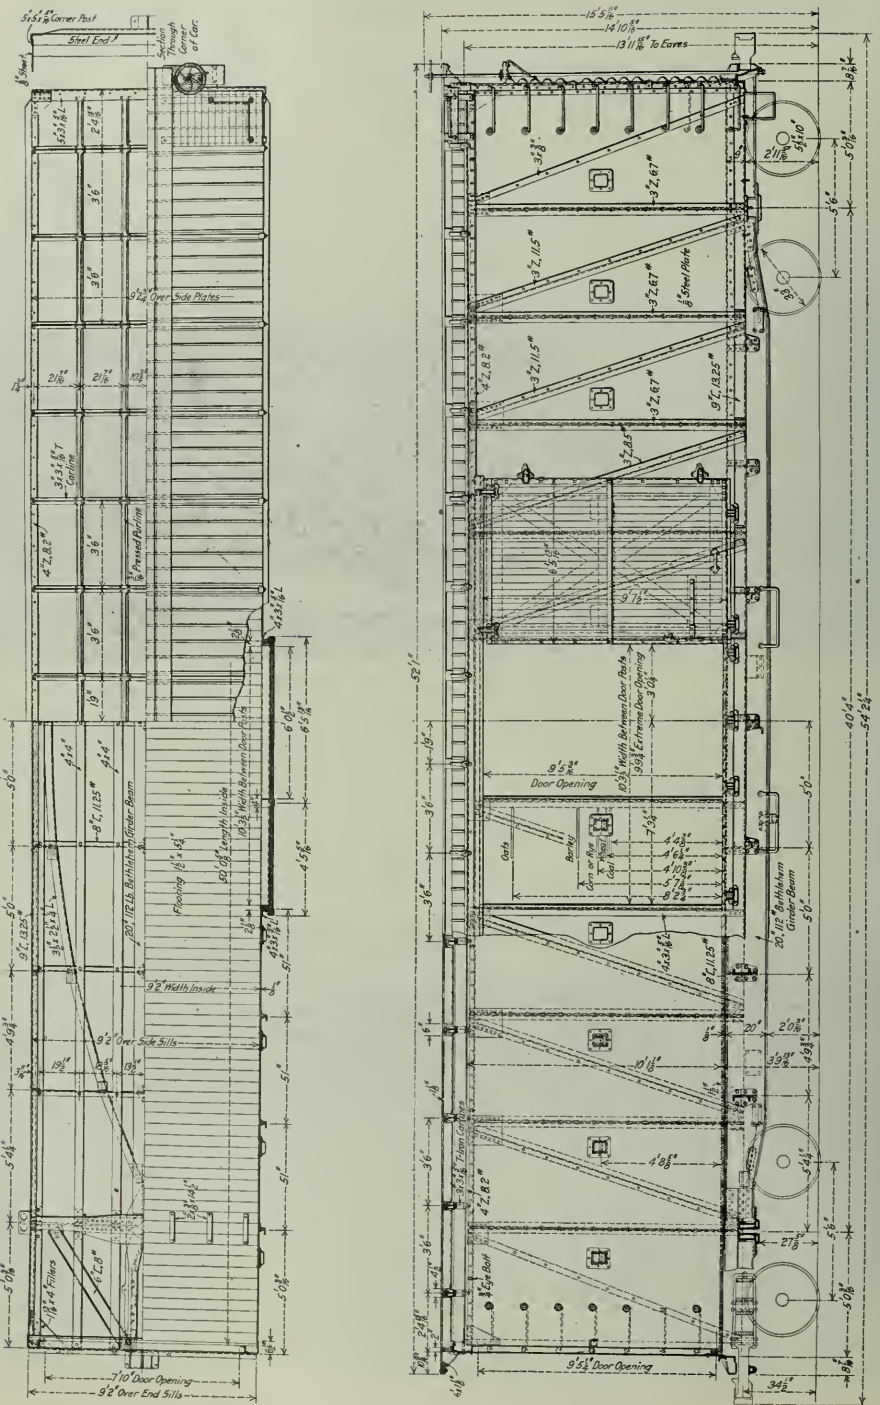
Union Pacific Steel Car for Automobile Traffic

AUTOMOBILE CARS

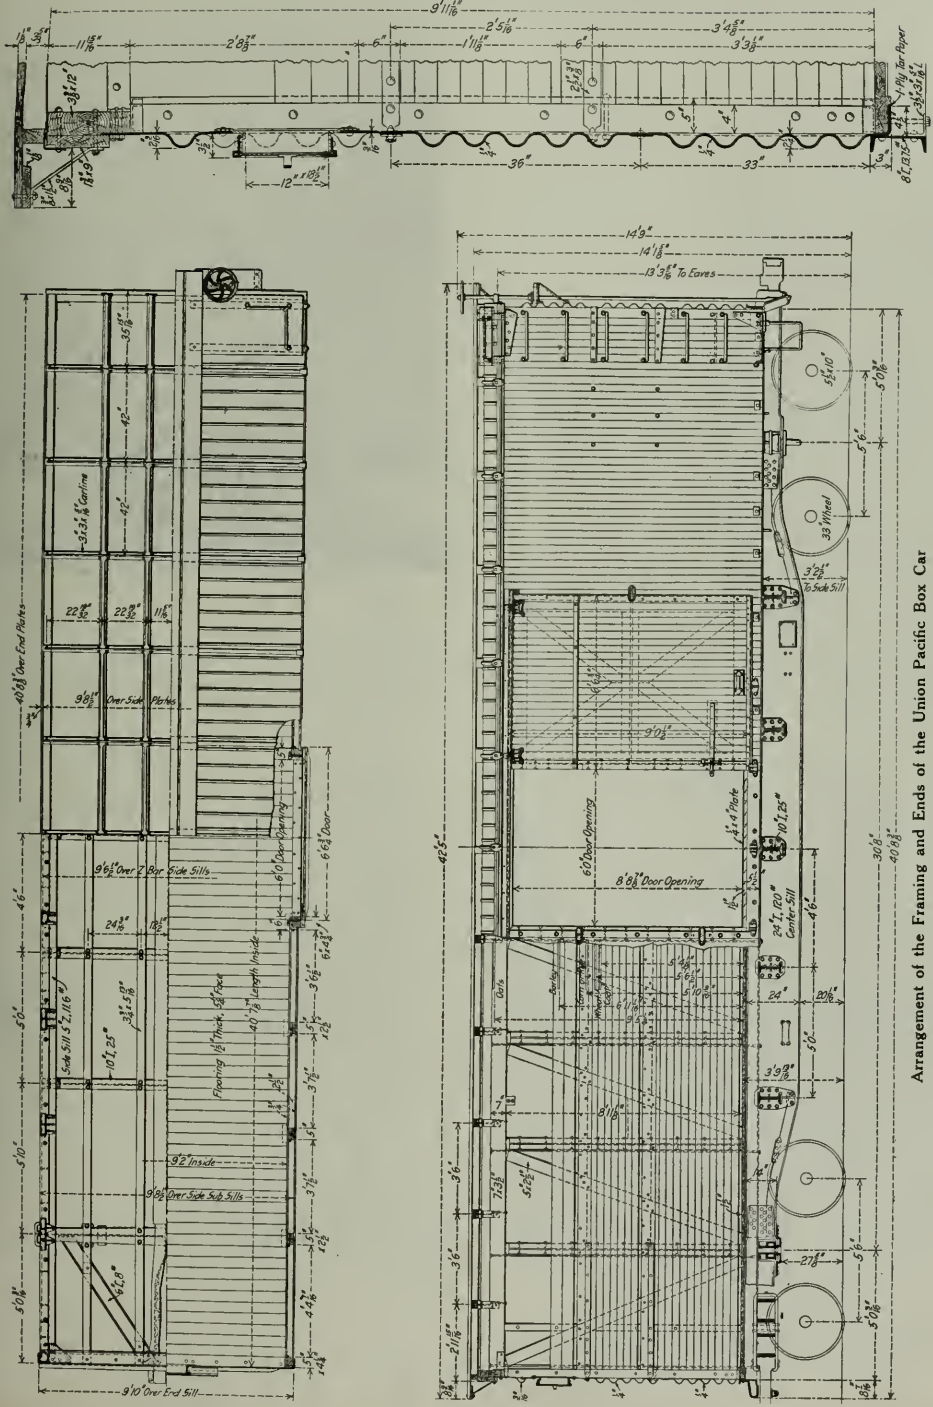
The automobile cars are of 100,000 lb. capacity and weigh 51,900 lb. They are 50 ft. 6¾ in. long over end sills and are 50 ft. long inside. The height from the top of the floor to the bottom of the carlines is 10 ft. 1⅛ in., and the cubical capacity is 4,630 cu. ft.

The underframe is of the Bettendorf type, the center sills consisting of a 20 in., 112 lb. I-section girder, while a cast steel body bolster is used. The end sills are 8 in., 13.75 lb. channels and 6 in., 8 lb. channels are used as diagonal braces between the end sills at the center sill and the body bolster near the side sill. The side sills are 9 in., 13.25 lb. channels and the crossties which extend between the center sill and the side sill are 8 in., 11.25 lb. channels. A 3½ in. by 2½ in. by ¼ in. angle extends in the form of a bow between points on the center sill just back of the draft arms, the top of this arch being at the side sill on either side of the car. There are 4 in. by 4 in. wooden stringers used for supporting the floor and these are carried on the 8 in. channel crossties. The trucks are spaced 40 ft. 4 in. between centers and have cast steel side frames of the Vulcan type. One end

Steel Underframe Box Car for the Union Pacific



Arrangement of the Framing of the Steel Automobile Car

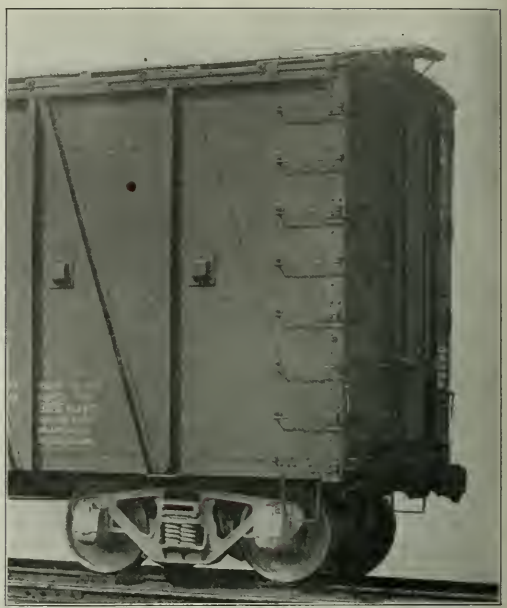


Arrangement of the Framing and Ends of the Union Pacific Box Car

of the car is fitted with steel doors swinging to either side, while double side doors of wooden construction are used. These side doors give an extreme door opening of 9 ft. 9¾ in., the width between the door posts being 10 ft. 3½ in.

The steel body framing is made up of 3 in., 6.7 lb. Z-bar side posts and 3 in., 11.5 lb. Z-bar braces, the framing being outside the ⅛ in. steel plate sheathing. The side plates are 4 in., 8.2 lb. Z-bars and the end plates are 5 in. by 3 in. by 5/16 in. angles. The sides of the car are fitted with stringer pockets as shown in one of the illustrations. These pockets are used to carry the ends of transverse stringers for supporting an upper deck in the car when this is required, and it will also be readily seen that they can be of material assistance in securing miscellaneous lading in place. The Murphy corrugated steel end is used as well as the Murphy radial type of roof, the strength of the end construction being made to meet the Master Car Builders' Association recommendations. This end is made in three sections, the two lower being of ¼ in. plate, while 3/16 in. plate is used in the upper section. The carlines are 3 in. by 3 in. by 5/16 in. tees, while there are two 3/16 in. U-section pressed steel purlines on either side of the car, spaced 27 7/16 in. between centers, the inner one being 10¾ in. from the center line of the car.

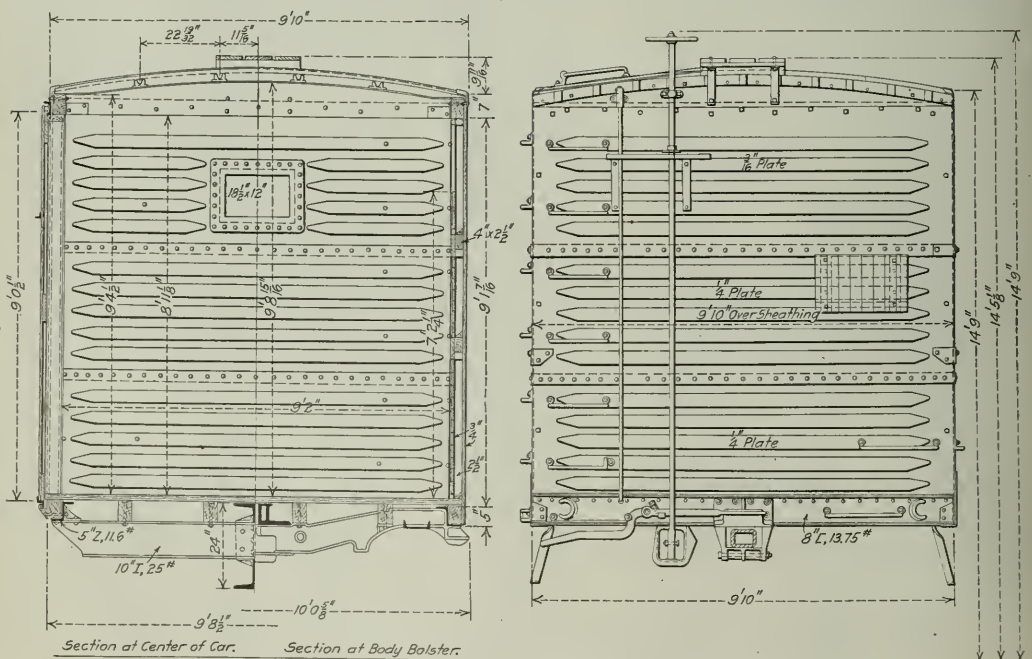
The special equipment includes New York air brakes, Western angle cock holders, Acme automatic brake adjusters, Scullin-Gallagher body bolsters, Creco brake beams, Climax couplers, Carmer coupler relief rigging, Camel door fasteners, Miner draft rigging, National malleable journal boxes, Buckeye cast steel truck bolsters, Miner gravity truck side bearings and Barber truck roller device.



End of the Automobile Car Showing the Steel Doors

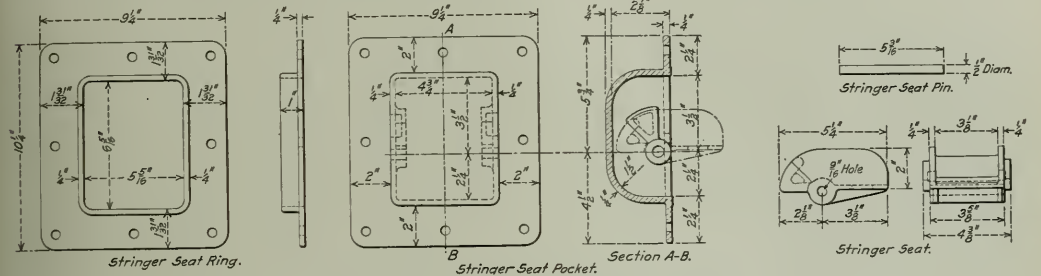
BOX CARS

The box cars are of 100,000 lb. capacity and are also equipped with the Bettendorf steel underframe. Cars of this type having a steel underframe, steel end construction and a steel roof have met with distinct favor in some quarters. In point of strength it would seem that they should give almost as good results as the steel frame inside sheathed car while retaining the advantages of the vertical sheathing. These cars are 41 ft. long over ends and 40 ft. 8 in. long inside, the cubic capacity being 3,500 cu. ft., and the height from the top of the floor to the bottom of the carlines 9 ft. 4½ in.; the weight of the car is 42,900 lb.



End Elevation and Cross Sections of Union Pacific Steel Underframe Box Car

The center sill consists of a 24 in., 120 lb. I-section girder while the body bolsters are of cast steel. It will be noticed that this center sill is heavier in the box car than in the automobile car, the reason for this being that the center sill in the box car was designed to carry the greater proportion of the lading, while in the automobile car it was the intention of the designer that a considerable portion of the weight of the lading should be carried by the side frames of the car. The end sills are 8 in., 13.75 lb. channels and the side sills are 5 in., 11.6 lb. Z-bars. There are 6 in., 8 lb. channel diagonal braces between the ends sills at the center and the body bolsters at the side sill; the crossties are 10 in., 25 lb. I-beams. The superstructure of the car is of wood, but the ends are of the Murphy corrugated steel type, there being an 18½ in. by 12 in. door opening in one end. The roof is of the Murphy radial steel type with pressed steel U-section purlines and 3 in. by 3 in. by 5/16 in., T-section carlines, each 42 in. between centers. There are two purlines on either side of the car, spaced 22 19/32 in. between centers.



Upper Deck Stringer Pocket Used on the Automobile Car

The special equipment on the box cars includes Climax couplers, Barber truck roller device, New York air brakes, Creco brake beams, Carmer coupler release rigging, Vulcan cast steel truck side frames, Camel door fixtures, Miner draft rigging, National malleable journal boxes, Buckeye cast steel truck bolsters and Miner gravity truck side bearings.

RAILWAY CONSTRUCTION IN THE NETHERLANDS.—It is reported that the Netherlands Minister of Waterways, Railways, etc., has granted to the Geldersche Stroomtramweg-Maatschappij a concession for a railway from Dieren to the Prussian frontier in the direction of Isselburg.

RIVERS AND RAILROADS IN THE UNITED STATES*

By William W. Harts

In most of the progressive countries of the world, especially in those where population is dense and production large, the improvement of the waterways by the government, for better communication in the interior, and the protection and deepening of harbors, have gone on at a rate which, as a general rule, has kept pace with the increase in population and production. Of late years, however, this progress has been strongly affected, both in America and in Europe, by the development of railways—sometimes favorably and sometimes otherwise.

In the United States the improvement of rivers by federal appropriations extends far back into the early history of the nation, long before the era of railways.

With the coming of the steamboat, the government's interest in canal and highway work was soon expanded to include the improvement of rivers and the deepening and protection of harbors as the necessity therefor grew, so that, by a natural process of development, the duty of designing and constructing the enormous waterway projects which have since come into existence was the logical inheritance of the army engineer.

The very early records of public money expended are so incomplete that they can scarcely be used to illustrate the enormous growth of these works, but between 1875, a comparatively recent date, and 1914, the annual appropriations increased from $5,218,000, in round numbers, in 1875, to $53,000,000 in the proposed act of 1914, or more than eightfold in about 40 years. These large sums are appropriated and expended in accordance with projects prepared by the army engineers and approved by Congress. The responsibility, therefore, must be shared between these two in some proportion, however unequal.

Very few people realize the amount of river and harbor improvement already adopted or under construction. Projects which have already received the sanction of Congress and are under process of construction now amount to more than $200,000,000. About $86,500,000 in new work has been reported favorably by the engineer department, but has not yet been adopted by Congress. In addition, there are projects amounting to more than $2,500,000, which have been favorably considered, but not yet accepted by the engineer department. Thus, there is a total of work costing more than $289,000,000, which is either in progress, or approved by Congress, or soon to be brought before the country.

It has been officially reported that in the 100 years, from 1802 up to December, 1902, there had been spent by the United States Government $221,869,759 for rivers, $147,448,903 for harbors, and $33,237,857 for canals, or a total of more than $400,000,000. From 1814 to 1900, France spent $449,000,000 on new works and in the maintenance of those already built. Similarly, Belgium spent $101,000,000 between 1831 and 1903. Between 1813 and 1906, Prussia spent $129,000,000 for new construction alone, and her maintenance charge in the single year, 1905, was $4,000,000. The United States is about 18 times as large in area as either France or Germany, and has about four times the length of navigable streams. Although the density of population in the United States is much less, being only about one-half that of all Europe, and about one-twelfth that of Germany, it can be seen that the United States has more than kept pace with other progressive nations, when density of population is considered.

The first question that will be asked the river engineer is, to what extent are these facilities used, and do they pay in public service for the enormous cost of construction and maintenance? When we begin to study the economic features connected with works of this character, we are struck with surprises. The advent of the light-draft, inexpensive steamboat made our rivers and waterways of great value as commercial carriers at a very early date. Too much praise cannot be given to this simple means of developing a great region. The hazards of this sort of transportation, however, were very great, and the steam railroad was beginning to be a fierce competitor after the Civil War. Railroads found a fertile field in those areas where the rivers had already induced a new prosperity. As these railroads were developed throughout the country into that intricate network which is the pride of the nation today, little by little the freight formerly handled by river was taken over by the railway lines, until now it is found that practically all the rivers of the great Mississippi Valley are dwindling in commerce in spite of the large expenditures for better channels that have been and are still being made. This falling off in usefulness is in the face of an enormous expansion in production of all kinds and a development of commerce that is unsurpassed in our history.

The Mississippi valley is one of the richest and most productive areas in the world. The volume of commerce originating there is enormous, and has been rapidly increasing during the past 15 or 20 years, but, notwithstanding this growth, less and less is being carried by the rivers, and only those few streams which are not paralleled by railroads are still managing, with many a struggle, to maintain their former value to the public. Nowhere are the products of the farm more valuable; nowhere are the mines more productive, and nowhere are the energy and capacity of its people excelled in all those various pursuits of wealth which are so numerous in this great area. If, therefore, the rivers anywhere might be expected to show increased usefulness as the country develops, it would certainly be in this region. It is, therefore, with keen disappointment that the opposite tendency is found to be growing more than ever apparent. Rivers in this valley were teeming with steamboats and barges within the memory of men still living. The arrival and departure of the large packets were events of much interest in the various towns where steamboat landings were scheduled, and boating was a well recognized industry, employing many men. Today, however, the passenger traffic by river boat has almost disappeared, and bulky and slow freight forms the main part of what is left of a once flourishing business.

The explanation of this is not far to seek. The railway of today is well able to compete with the waterways at every turn. Combinations of many small and weak lines into through routes, and the extension of rail lines into every region where it seemed reasonable to expect a financial return, have developed what was a disconnected and feeble collection of roads into a systematized network of enormous value. The unfeeling and unrelenting competition which commenced first between river and rail lines and then continued among the various rail lines themselves, has forced an economy of operation and administration which has made the rail lines a giant in power and a miracle of usefulness. Within little more than a generation, the average cost of moving a ton of freight a mile in the United States has diminished from 7½ cents to about 7½ mills, a reduction of 9/10ths, and some of the coal roads having easy grades and flat curves boast that their tonnage cost has been cut to 2.3 mills per ton-mile. This is the harsh competition that rivers must meet. Railroads can be changed in location, and terminals can be placed wherever needed; cars can be switched from one line to another; spurs can lead to the point of destination without transshipment or breaking bulk, and distribution is simplified. On the other hand, waterways are fixed in location, require numerous expensive terminals, need constant improvement, and require steamboats and other craft of considerable cost. River lines have the advantage that their roadbed is provided by the government. Railroads require large sums for general administration; for employees in yards and at stations; for maintenance of way and equipment; for interest on their capital invested, and taxes. As the steamboat has no maintenance-of-way expense, it has a great advantage over the railroad in regard to fixed charges. Its interest on its cost has been estimated at 5 per cent, insurance 8½ per cent, and maintenance at 7½ per cent, whereas the railroads must pay interest on the cost of the entire road, estimated at 5 per cent.

*From a paper presented before the American Society of Civil Engineers, February 3, 1915.

maintenance estimated at 2 per cent, interest on the cost of equipment 5 per cent, maintenance of equipment 10 per cent, and insurance 3 per cent. Notwithstanding this unequal burden, railroads have out-distanced the river in economy of administration, and on most roads the fixed charges for interest on capital and maintenance are much less per ton-mile than those on a river packet. This indicates clearly the reason for the decline of the river commerce of St. Louis in 30 years from 2,120,825 tons in 1880 to 191,965 tons in 1910, a loss of about 9/10ths. During the 17-year period, from 1890 to 1906, the river commerce of that city dwindled from about 1,260,000 tons to about 317,000 tons, but in the same period the rail business increased from 15,000,000 to about 45,000,000 tons, or about 200 per cent, according to the reports of the St. Louis Merchants' Exchange. As a competitor, the Mississippi river has fallen from a position of pre-eminence to almost a negligible quantity.

Furthermore, of late years, a great decrease in the cost of handling freight on railroads has taken place, notwithstanding increases in cost of materials, labor and taxes. On the other hand, an increase of at least 50 per cent in steamboat operation costs has taken place, due to these same advances, but this has not been offset by reduced operating expenses. The river steamboat has not changed much in late years, and river terminals have nowhere been improved to a marked degree; certainly these improvements have not kept pace with the improvement of the channels by the government. It has been stated that the stock in the largest company plying between Louisville and Cincinnati has fallen from a high premium to less than par within the last 25 years, a loss of more than 80 per cent.

The realization of the one-sidedness of this unequal struggle has of late years brought with it to river engineers a feeling that we are now far ahead of the demands of the present in many of our inland streams, and henceforth expenditures should be restricted to the barest necessities until the commercial development of the neighboring regions brings with it new demands. It seems not too strong a general statement to make that the navigational facilities on every stream on which commerce is now diminishing is far in advance of the present necessities, and that additional improvement at public expense should be withheld until such time as the economic pressure for additional transportation facilities becomes plainly manifest.

It seems reasonable to suppose that these tendencies toward diminution of river commerce are not necessarily permanent everywhere, for the commercial development of the areas contiguous to transportation lines is nearly always conspicuous, and frequently brings a need for additional facilities. New railroads are not being built so rapidly as a few years ago, and some day some of the interior streams may be expected to handle an increasing commerce in bulky freight where time of transit is not of great importance. This need for meeting the demands of expanding production may bring back some rivers to a new usefulness that cannot now be safely predicted.

Nor must we conclude that all our rivers are losing their value as commerce carriers, or that all are even diminishing in usefulness. Many streams outside the great central valley of the country, particularly those that empty in the harbors along the coast, and allow ocean-going vessels or coastwise ships to reach interior points, are showing very encouraging results. Some of those entering New York harbor, for example, in the regions where population is dense, are very valuable and carry large quantities of commerce. In 1905 Arthur Kill had a commerce of 11,700,000 tons, valued at $265,000,000; and in 1911 it had a commerce of 30,500,000 tons, valued at $515,400,000.

In looking over the history of some of our rivers, it appears that they pass through several more or less indistinct stages of usefulness. First, while the country is comparatively undeveloped, and before the construction of railways has been begun, the rivers are found to be the best and cheapest lines of commerce. At such times the steamboat enterprise thrives and river commerce multiplies. In some cases new land is opened to profitable cultivation, or new industries are encouraged. Later, towns spring up, and a whole region often receives a new impetus from its greater accessibility. Next comes the period when the results of this enterprise have brought about such a prosperous condition that the extension of railways is induced in the same territory. They, with their many advantages, then absorb most of the river transportation business. River commerce dwindles during this period, even though increase in production is noticeable on every hand. At such time discouragement may be felt by river advocates, because it seems that the rivers are not performing their wonted part in the upbuilding of the country through which they pass, for the part played by the streams is lost sight of in the economic progress of the neighborhood.

This discouragement might be justified but for the third stage, which seems to be within the range of safe prediction for some of our internal waterways, especially if one judges by the rivers emptying into New York harbor and those rivers like the Rhine flowing in congested communities. This third stage comes when the population and production have increased to such an extent that all lines of traffic are insured a large part in the transportation business of the locality. At such times the rivers again become useful and efficient. If we have proceeded too rapidly in the improvement of our interior rivers, there is still this hope of ultimate usefulness after the second stage has passed.

On the other hand, however, our harbors have had no such vicissitudes. Economy of ocean transportation has gradually forced ship-owners to adopt deeper draft for their vessels. With the advent of steam, the depth of hull has steadily increased until now the largest ships are limited to few ports. The expansion of the railways throughout the interior, in many cases, has led directly to the greater development of the seaports.

The harbor, by its very nature, is a sort of terminal where products are exchanged between rail and water. Thus the railway, which is now having such an adverse effect on some of our interior rivers, has at the same time brought about a corresponding necessity for improvement in many of our harbors, and has contributed enormously to their value.

For example, in 1892, in New York harbor, the exports and imports of foreign trade alone amounted to about 5,000,000 tons. In 1912, it totaled more than 14,000,000 tons, an increase of nearly 200 per cent. The total commerce by water was estimated in the 1906 census report at 114,000,000 tons. The harbor at Norfolk in 1892 had a commerce of 3,427,000 tons, whereas in 1912 it was more than 22,000,000 tons, an increase of nearly sixfold. Savannah in 1892 had about 2,000,000 tons of commerce, and in 1912 more than 3,120,000 tons, an increase of more than 50 per cent. Galveston in 1892 had a tonnage of 1,134,326 tons, and in 1912 a total of 3,224,367 tons. These cases are probably the more conspicuous ones, but it may be accepted as a general rule that all the larger harbors have amply justified the expenditures made in providing better channels.

On the whole, our expenditures for waterways have been of immeasurable benefit to the country at large. Never in our history has the volume of domestic and foreign commerce been so great, and never has the outlook for future increases been brighter. Our over-sea exports and imports are now growing enormously, and the prosperity of the land requires that there should be no restriction anywhere on account of inadequate channels. A practical test, almost infallible in its application, that will show whether a waterway project can be economically considered for further improvement, is a progressively increasing commerce, and the measure of saving in cost of transportation will always be a guide as to the extent of work that is justified.

Thoughtful observers of our system of channel development have been impressed with the tendency of the government to overliberality in many instances, but the signs are multiplying that, in the near future, the public will demand a more rigid adherence to economic laws in the adoption of new projects.

Germans and the Belgian Railways.—It is reported that the entire Belgian railway system was put into operation on January 1, about 8,000 employees of German railway administrations, including 1,100 railway employees from Bavaria, having left for Belgium recently.

Western Engineers' and Firemen's Arbitration

Continuation of Railroads' Statistical Evidence. Payrolls Showing Actual Earnings of 64,000 Men Presented

J. H. Keefe, assistant general manager of the Gulf, Colorado & Santa Fe, occupied the witness stand throughout all of last week in the hearing at Chicago before the board of arbitration on the western engineers' and firemen's demands, continuing his testimony on statistical exhibits introduced in behalf of the railways. On Monday, January 25, Mr. Keefe presented testimony to show what would be the effects of the proposed automatic release rule as applied to "turn-around" runs, as in suburban service. The rule provides that when a crew reaches the end of its run or a terminal and is then required to perform any other service, a new day shall begin. "An engineer in actual service on one of our mixed trains," said Mr. Keefe, "now earns $202.74 per month for working 8½ hours per day on one of these 'turn-around' runs. With the demanded rules in effect this man would have earned actually in October, 1913, $1,435.75. His increase in pay would equal 608 per cent. The fireman on this run actually earned $119.04, and it was on an oil-burning engine on which no coal was shoveled at all. This fireman would have been paid $937.79 for his month's work under these rules. His increase would be 688 per cent."

In the cross-examination of Mr. Keefe, Warren S. Stone, grand chief of the engineers, tried to show that it was not fair to compute the cost of overtime on the basis of the present amount of overtime, because, he said, the rule of time and one-half was intended as a penalty and that the roads would manage to reduce the overtime. The same argument he applied to the automatic release and tie-up rules, saying that the effects of the rules would be avoided by a rearrangement of operating methods or terminals, and that the figures compiled to show their cost were "purely imaginary."

At the conclusion of Mr. Keefe's testimony as to the cost to the railroads complying with the demands, which was summarized in last week's issue, Mr. Stone insisted that the railroads furnish the basic information from which the exhibit was made consisting of time cards, train sheets, delay reports and the time slips of the engineers and firemen on all the roads for the month of October, 1913. He said he was satisfied that there was "something wrong" with the figures and that he had no other way of checking them. Mr. Sheean said that the roads would furnish anything the board desired, but he pointed out that they had already presented the detail reports furnished by the individual roads on the forms submitted to them for that purpose, and certified to by the proper officers, with the understanding that each company should be fully prepared to defend any figures reported regarding which any controversy might arise. Mr. Park asked Mr. Keefe how many trainloads of train sheets it would be necessary to bring to Chicago. Mr. Keefe said it would take 30 train sheets for each of the 544 districts, making 16,320 train sheets; also the individual time slips for 64,000 men for 30 days, or 1,820,000 time slips, in addition to delay reports and roundhouse records.

After consideration Chairman Pritchard announced that the board had decided to grant the request, feeling that the law required it to do so, but he suggested a conference with the hope that some plan might be adopted by which time and labor might be saved. An agreement was finally reached that these records would be furnished for only five roads.

Mr. Keefe presented as Exhibit 4 a statement of the revenues and expenditures of the roads parties to the arbitration for the fiscal year 1914, as compared with 1913 and 1910. This showed that the total operating revenues increased from 1910 to 1914 by $106,430,973, while the operated mileage increased 8,500 miles, and the operating income decreased $15,652,533. The decrease in operating income from 1913 to 1914 was $39,128,875. The decrease per mile from 1910 to 1913 was $312, and from 1913 to 1914 was $335. Taxes increased from 1910 to 1914 by $18,687,060, and from 1913 to 1914 by $8,219,000. The increase per mile in 1914 over 1910 was $119, while in 1914 as compared with 1913 it was $58 per mile. The expenditures per mile for maintenance of way and structures were $1,409 in 1910, $1,387 in 1913, and $1,367 in 1914. For maintenance of equipment the expenditures per mile in 1910 were $1,333; in 1913, $1,525, and in 1914, $1,529. The cost of conducting transportation per mile in 1910 was $3,246; in 1913, $3,538, and in 1914, $3,417.

In Exhibit No. 5 Mr. Keefe presented the income accounts of the roads involved for 1910, 1913 and 1914. This showed that the interest payments on funded debt in 1910 amounted to $166,873,921; in 1913, to $194,070,135, and in 1914, to $193,731,080. The dividends declared out of income amounted in 1910 to $168,150,945, in 1913 to $154,341,750, and in 1914 to $146,155,706. Appropriations from income for additions and betterments in 1910 amounted to $10,633,797, in 1913 to $19,757,874, and in 1914 to $11,648,314. The amount carried to surplus amounted in 1910 to $57,826,381, in 1913 to $45,955,296, and in 1914 to $33,355,906.

Exhibit No. 6 showed that during the three-year period ending June 30, 1913, the roads had expended $1,058,386,502.81 for additions, extensions, betterments and improvements to property. From this was deducted a total of $391,855,197, as the cost of road purchased, to avoid the possibility of duplication, leaving a balance of over $660,000,000.

Exhibit No. 7 showed that substantially one-third of this expenditure, or over $221,000,000, was devoted to increasing efficiency and safety and to expedite train movements, the various classes of expenditures being grouped under 15 heads. For instance, it was shown that $21,920,345 was expended for grade reduction and the elimination of curves; $15,000,000 for yard improvements; $6,500,000 for block signals, and $17,971,000 for heavier rails.

Exhibit No. 8, introduced by Mr. Keefe, showed that 3,251 orders of state railway commissions in the territory involved have been issued since July 1, 1910, and 1,115 bills have been introduced and 208 laws enacted in state legislatures, relating to railway operation, during the sessions of 1911, 1912, 1913 and 1914. Mr. Sheean said that the exhibit was introduced to show the general tendency of increasing burdens placed by commissions and legislatures upon the funds of the railroad companies, and that as to the bills introduced it was proposed to show that the same organizations which base their claims on the theory of increased productive efficiency are seeking to have passed laws which make impossible the carrying out of the efficiency and economies that would result from the purchase of heavier power and the elimination of grades. He said that no attempt had been made to compile the cost of the various laws and orders, because it would be difficult to do so accurately.

Mr. Park remarked: "On the proposition that you can only run half a train it would be almost impossible, under certain conditions, to estimate the loss." Chairman Pritchard asked if there is a law of that character. Mr. Keefe said that train limit bills have been, or will shortly be, introduced in the legislature of Arkansas, California, Illinois, Kansas, Missouri, Montana, South Dakota, Utah, Washington, Colorado, Idaho, Ohio, Minnesota, Nebraska, Nevada, Oklahoma, Oregon, Wyoming and Texas, or 19 out of the 24 states embraced in this movement, and that there is a law in Arizona, passed in 1912, limiting the length of freight trains to 75 and of passenger trains to 14 cars. The proposed limit to the number of cars in a train ranges from 35 to 50 freight cars, and from 9 to 12

passenger cars. Mr. Sheean showed that on the Virginian Railway, where 100 cars of coal may be hauled on the level or down grades from the coal fields to tidewater, with one engine crew and one train crew, the effect of such a law would be to necessitate two engines, two engine crews, and two train crews to move the same traffic. Chairman Pritchard asked if helpers were not now employed on grades. Mr. Sheean replied in the affirmative, but said that whereas a helper crew may help all trains over a certain grade, which may be loaded to the tonnage rating on other parts of the line, the proposed law would increase the number of trains throughout the entire line.

Mr. Stone said it had not yet been decided whether to support the train limit bill in Congress, but when asked if all four railroad organizations are not supporting the bill in the states he said he did not think there was concerted action, except in some states, and that the engineers and firemen were not making an aggressive campaign, but that they would not oppose the bill if the other organizations wanted it. Mr. Sheean said the exhibit showing the number of laws and orders against railroads was not introduced in a spirit of criticism, but simply to advise the board of the situation, "that after the productive efficiency of labor and capital has produced some money, the public, through the legislature, reaches out immediately for a part of that money before there is either right or power to distribute it as between labor and capital."

Exhibit No. 9 was a comparison of freight and passenger traffic density. In 1910 the freight density was 735,828 ton-miles per mile of line, and in 1913 it was 820,851. In 1910 the passenger traffic density was 116,463 passenger miles per mile of line, as compared with 111,214 for 1913.

Exhibit No. 10, which was introduced in answer to the claim of the men that longer trains required them to put in longer hours in getting a train over the road, showed that in October, 1910, 77.24 per cent of the train-miles in through freight service were paid for on the mileage basis, that is, they were operated at a speed greater than 10 miles an hour, while in October, 1913, the percentage was 78.3. In the local freight service in October, 1910, 31.42 per cent of the train-miles were on a mileage basis, while in October, 1913, 30.62 per cent were on a mileage basis. Similar figures for other classes of service showed that in general the speed of the trains was greater in October, 1913, than in October, 1910. Therefore, Mr. Keefe said, if the men are handling heavier traffic and are operating larger engines which take a higher rate of pay than the smaller engines, they are receiving a larger sum of money for a slightly decreased number of hours than in 1910.

Exhibit No. 11 showed the reduction in time on the road.

Exhibit No. 12 showed that for the calendar year 1913, of the 2,277,749 passenger trains run, 910, or .04 per cent, were on the road for more than 16 hours. The "other trains" run during the year numbered 3,671,886, and of these 33,978, or .93 per cent, were on the road for more than 16 hours. Of the total of 33,978 "other trains" that exceeded the 16-hour limit, 19,910 were on the two Canadian roads, which are not affected by the 16-hour law and on which there is no limitation other than the desire of the men as to when they shall tie up. For all roads 540 passenger trains were tied up on account of the 16-hour law and 34,951 other trains.

Exhibit No. 13 showed the extent to which the railways are now making payment to engineers and firemen for which no actual service, either in miles or hours, is given by the men, because neither the hours nor the miles called for by the schedule can be required of the men in practical operation, as where an engineer runs 80 miles in 7 hours, and is allowed 100 miles as a minimum. In 1913, $269,303 was so paid in passenger service, $1,084,373 in freight service, and $49,362 in work train service, making a total of $1,403,038 paid to engineers and firemen for no equivalent in miles or hours.

Exhibit No. 14 showed the number of locomotives of various weights on drivers in service in 1910 and in 1913. This showed a decrease in percentage of the smaller class of engines, also a decrease in engines between 80,000 and 100,000 lb. on drivers, a slight decrease in engines between 100,000 and 140,000 lb., and a general tendency to increase the size of locomotives only in the intermediate classes between 140,000 and 225,000 lb. This exhibit also showed that in 1913 there were 2,908 more locomotives than in 1910, an increase of approximately 12 per cent, and an increase in the number of oil-burning locomotives from 3,048 to 4,148, or 36 per cent, and that in 1913 the percentage of oil-burning locomotives to the total was over 15 per cent. The exhibit showed that about 15 per cent of the engines would require two firemen under the request. In 1910 there were 456 locomotives, weighing from 200,000 to 225,000 lb. on drivers, and in 1913 there were 1,577. In 1910 there were 167 locomotives, weighing from 225,000 to 250,000 lb., and in 1913 there were 423. In 1910 there were 82 locomotives, weighing from 250,000 to 300,000 lb., and in 1913 there were 89. In 1910 there were 163 locomotives, weighing from 300,000 to 400,000 lb., while in 1913 there were 304. In 1910 there were 7 locomotives, weighing 400,000 lb. on the drivers, and in 1913 there were 67. Mr. Stone asked that figures be presented showing locomotives ordered or received during the past year, saying he thought they would show a larger increase in the heavier engines.

Exhibit No. 15 showed that of a total of 27,221 locomotives, on November 1, 1914, 4,272 were oil-burners, 4,852 were equipped with superheaters, 9,512 with brick arches, 1,033 with power coal pushers, 4,098 with hopper bottom tenders, 50 with power stokers, 3,597 with automatic door openers, 192 with power grate shakers, 1,613 with power reverse gears, and 22,941 with improved ash pans. Mr. Keefe said that the exhibit showed that the larger locomotives are the ones on which the labor-saving devices are more generally being applied.

Exhibit No. 16 was presented to show that the density of population per mile of railway is less in the Western district than in the East, and that the density is increasing faster in the East than in the West and Southeast.

Exhibit No. 17 showed the proportion of single track, main track, and sidings to the area of the country served, for the roads involved.

Exhibit No. 18 showed the proportion of branch line mileage, ranging from 7.6 per cent to 59.95 per cent. The total was 43.65 per cent of branch line mileage, with 19.34 per cent of the total train-miles operated over branches, and 7.7 per cent of freight ton-mileage operated over branches.

Exhibit No. 19 showed that in 1910 the average freight train-load in the Western district was 325.9 tons, while in the Eastern district it was 459.8 tons, and in the Southern district it was 324.2 tons. In 1913, taking the trainload in the Western district as 100 per cent, the East was 140 per cent and the South 102 per cent.

Exhibit No. 20 compared the tractive power of locomotives.

Exhibit No. 21 was a comparison of the wages of engineers and firemen with those of employees in the marine service of the railroads and of steamship lines. Mr. Stone asked a number of questions regarding the conditions of employment for men in marine service. He said he had noticed that the captain of a boat usually sat at the head of the table, and that the most beautiful woman passenger had the seat of honor on his right. He asked the witness: "Do you know of any of the beautiful women passengers on these Overland Limited passenger trains that are riding in the cab with the engineer?"

Exhibit No. 22 presented a comparison of the wages paid engineers and firemen with those of other employees in transportation service. This was prepared during the hearing in response to a request by Mr. Nagel, who said that "in considering what should properly be paid to engineers and firemen we must have regard for what ought to be paid to other employees." Mr. Nagel expressed great interest in the figures for telegraphers.

Exhibit No. 23 presented similar comparisons for shop employees.

Passenger engineers for the month of October, 1913, were shown to have earned an average of $7.80 per day of seven hours, or $1.12 per hour. Engineers in through or irregular freight service averaged $7.54 per day and $170.02 per month, while engineers in local or way freight service earned $7.16 per day and $172.40 per month. Firemen in passenger service averaged $4.96 per day and $115.53 per month, while those in through or irregular freight service averaged $4.99 per day and $110.25 per month, and those in local or way freight service averaged $4.80 per day and $105.59 per month. One engineer in this month earned $341.60 in passenger service, while another in freight service earned $358.70. One fireman in passenger service earned $209.89, while in freight service one fireman earned $221.05. Mr. Keefe said that there were a number of engineers and firemen, as well as hostlers, who could have earned even more had they availed themselves of the opportunity presented by the companies for earning wages. He said he had not undertaken to show whether or not the men were actually available for duty the entire day. Of all the engineers in passenger service in the month of October, 1913, the summary showed that 4,478 earned $170 or over per month, and of these 2,842 earned $200 or over. Of all engineers in through or irregular freight service 5,560 earned $150 or over, while of this number 1,430 earned $200 or over per month. Of all engineers in all services 18,197 earned $150 or more, of which 4,019 earned $200 or more. Three engineers were shown who earned from $358 to $366.65 in a single month. In comparison with these figures Mr. Keefe showed that captains of steamers in the trans-Atlantic or trans-Pacific service are paid a maximum of $275 a month, and a minimum of $140. The chief engineers of these steamers, he said, averaged about $150.

Mr. Stone objected to average figures, although his witnesses had done a good deal of "averaging." "Averages do not mean anything," he said. "If one man can eat five meals a day, the second four meals and the third three meals the fourth man cannot be made to believe he has had three meals because that is the average eaten by four men."

A controversy regarding the employment of negro firemen on the Yazoo & Mississippi Valley was interjected into the hearing by W. S. Carter, president of the Brotherhood of Locomotive Firemen and Enginemen. The railroads, in Exhibit No. 3, had presented no figures regarding wages of firemen on the Yazoo & Mississippi Valley, saying that most of the firemen on that road were negroes and were not members of the brotherhood or parties to the arbitration proceedings. Mr. Carter made a heated speech, demanding that any arbitration award be applicable to the Yazoo & Mississippi Valley, and presented a petition signed by 132 firemen of that road, most of whom were negroes, asking the brotherhood to represent them. He said the roads were seeking to evade the application of any award that might be made to that road. Mr. Sheean said that this was an effort on the part of the brotherhood to "root the negro fireman out of his job" by forcing the same wages for negroes as for white men. Mr. Carter admitted that the probable result of any application of the award to the road would be to replace the negro firemen with white men, but insisted that that would be the fault of the road and not of the organization, "because they only hire negroes because they are cheaper."

"Then how did you induce the negroes to sign this petition?" asked Mr. Nagel. "What actuated the negro to sign this petition when he knows that will deprive him of his job?" "I do not think he knows it," replied Mr. Carter. C. V. McLaughlin, vice-president of the brotherhood, later testified that he had secured the negroes' signatures to the petition without explaining that they might thereby lose their jobs. Mr. Carter offered, however, to join in a petition to the officers of the Yazoo & Mississippi Valley not to discharge the firemen. "If the railways raise the question of the right of the brotherhoods to represent all, whether or not members of the organization," said Mr. Carter, "we shall be forced to demand a closed shop."

In response to a request from the engineers' and firemen's organizations, the railways produced W. W. Thompson, formerly an engineer on the Chicago, Rock Island & Pacific in Oklahoma, who denied on oath any recollection of having ever jumped from his locomotive under a surprise test and breaking his collar bone. Fireman Modenbach, working on the Rock Island in Oklahoma, testified several weeks ago that one of these tests resulted in his engineer, W. W. Thompson, and himself jumping from the engine, the engineer breaking his collar bone and being laid up for several weeks. After a long search the roads finally located Thompson, and, as requested by the two organizations, brought him to Chicago to testify. Mr. Sheean read the Modenbach testimony and asked the witness if he had any recollection of the things described, which the witness swore he had not.

On Friday, January 29, the railroads introduced in evidence an exhibit consisting of 18 sets of 3 volumes each, resembling enlarged editions of the unabridged dictionary, containing a duplication of the payrolls of the 64,000 engineers, firemen and hostlers on 98 Western railways involved in the arbitration for the month of October, 1913, and giving information as to the kind of service in which each man was employed, the terminals between which he ran, the number of days he worked, the number of trips he made, the miles he covered and the hours he spent on duty, with the exact amount of wages he received. It was shown that engineers in regular passenger service earn from an average of $185 to a maximum of $341.60 per month; in freight service from an average of $170 to a maximum of $358 per month. Firemen in regular passenger service earn from an average of $115 to a maximum of $209.89 per month, and in freight service from an average of $110 to a maximum of $221 per month, while other firemen in combination freight and passenger service earn even higher than this. The volume contained the records of 28,446 engineers, and page after page of the exhibit was shown on which the majority of engineers were reported as earning in excess of $200 a month. Records were also presented of 32,321 firemen and 2,688 motormen, helpers and hostlers.

PULLMAN UPPER BERTHS

[From the Rock Island Employes' Magazine]

Many travelers are prejudiced against upper berths in Pullman sleepers, and many of our ticket agents thoughtlessly assist in keeping alive this prejudice. This is done, to some extent, by stating to travelers to whom a lower cannot be assigned, "There is nothing left but an upper," or "I can only give you an upper," leaving an impression in the traveler's mind that an upper berth is inferior or undesirable.

Would it not leave a better impression, in case the passenger's wish for a lower berth cannot be complied with, to say, "The lowers are all taken, but I can assign you a choice upper berth. The rate is 20 per cent cheaper than the lower." The traveler may at once see that, considering the differences in the rate, an upper berth has perhaps an advantage over the lower. Then a few words of explanation as to other advantages of the upper berth may decide the matter favorably with the prospective passenger.

In the more recently constructed Pullman sleepers, upper berths are now furnished with protection guards, precluding the possibility of falling out of the berth. Reading lamps are also provided in uppers, as well as lowers, and the aisle lamps are under individual control, doing away with the annoyance of unnecessary light. The ventilation in upper berths is also of the best, and for that reason alone many travelers prefer them.

As only a limited number of passengers can be accommodated in Pullman sleepers, every effort should be made to dispose of the uppers, as well as the lowers.

Progress on Summit Cut-Off of the Lackawanna

A Description of the Present Stage of Construction of World's Largest Concrete Bridge and a 3,630-ft. Tunnel

It is expected that the new three-track line of the Delaware, Lackawanna & Western between Clark's Summit, Pa., and Hallstead, on which some unusually heavy work has been under way for the last three seasons, will be ready for operation by December 1 of this year. This cut-off of 39.6 miles is being built at a cost of about $12,000,000 to reduce the distance 3.6 miles, the maximum grade eastbound from 1.23 per cent uncompensated to 0.68 per cent compensated and westbound from 0.52 per cent uncompensated to 0.237 per cent compensated; and the maximum degree of curvature from 6 deg. 22 min. to 3 deg., to eliminate 327 ft. of rise and fall and 2,440 deg. of central angle,

A General View of Martin's Creek Viaduct Which Is Now Completed

to add a third track and to abolish all grade crossings. As the maximum train loading is fixed by the grades on the remainder of the engine district, no increased tonnage will be made possible by the improvement, but an important saving in mileage of helper engines and in running time over this portion of the line will be effected. The reasons for this work were fully covered in the *Railway Age Gazette* of April 25, 1913, and November 14, 1913.

GENERAL

The construction of this line required the excavation of 13,318,000 cu. yd. of material. The interesting methods of handling this heavy grading work were described in the second article referred to above. The grading is now about 85 per cent completed and about 25 per cent of the track has been laid.

The small bridge work is practically completed, and the last concrete in the Martin's creek viaduct, one of the two large structures, was poured on November 14. The 12-span concrete arch bridge over Tunkhannock creek, which is the largest structure on the line, will probably be the last work completed. This double track viaduct consists of ten 180-ft. and two 100-ft. arches with a total length of 2,375 ft., and a height of 242 ft. from stream bed to top of coping. These dimensions with the concrete yardage of 167,000 make it the largest structure of its type in the world.

The method of sinking the piers to rock at a depth of 10 ft. to 95 ft. below the ground line and the construction of these piers above the ground to the top of the umbrella section 37 ft. above the springing line were described in the *Railway Age Gazette* of December 5, 1913. At present all of the substructure has been finished except pier 5, which has been delayed by serious difficulty with quicksand. A comparatively slight delay was caused by a pocket of quicksand at one corner of pier 4, but as the material at the other end was solid, it was possible to divide the area, finish one end and then brace against the concrete to hold back the pressure of the soft material.

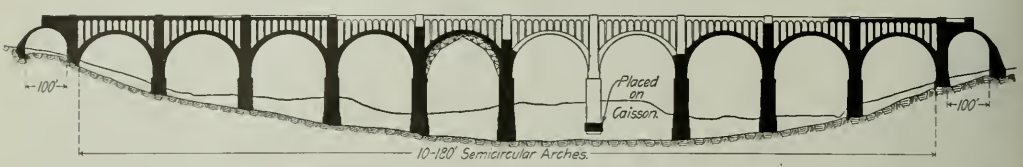
In pier 5, a stratum of quicksand extending over the whole area of the cofferdam was encountered about 75 ft. below the surface and 20 ft. above the rock. An attempt was made to drive sheeting inside the caisson to divide the area into 24 parts, each of which could be finished separately, but this sheeting was bent and displaced by boulders overlying the rock, making this method impracticable. It then became necessary to use a pneumatic caisson which was built in two chambers with two locks in each. The caisson was constructed with the cutting edge 27 ft. above rock; air was turned on December 13, and the caisson had been sunk 10 ft. on December 21.

A General View of the Tunkhannock Creek Viaduct Under Construction

DESIGN OF CONCRETE ARCH VIADUCTS

As stated in the previous article, the substructure in reality includes the piers and the umbrella tops forming the skew-

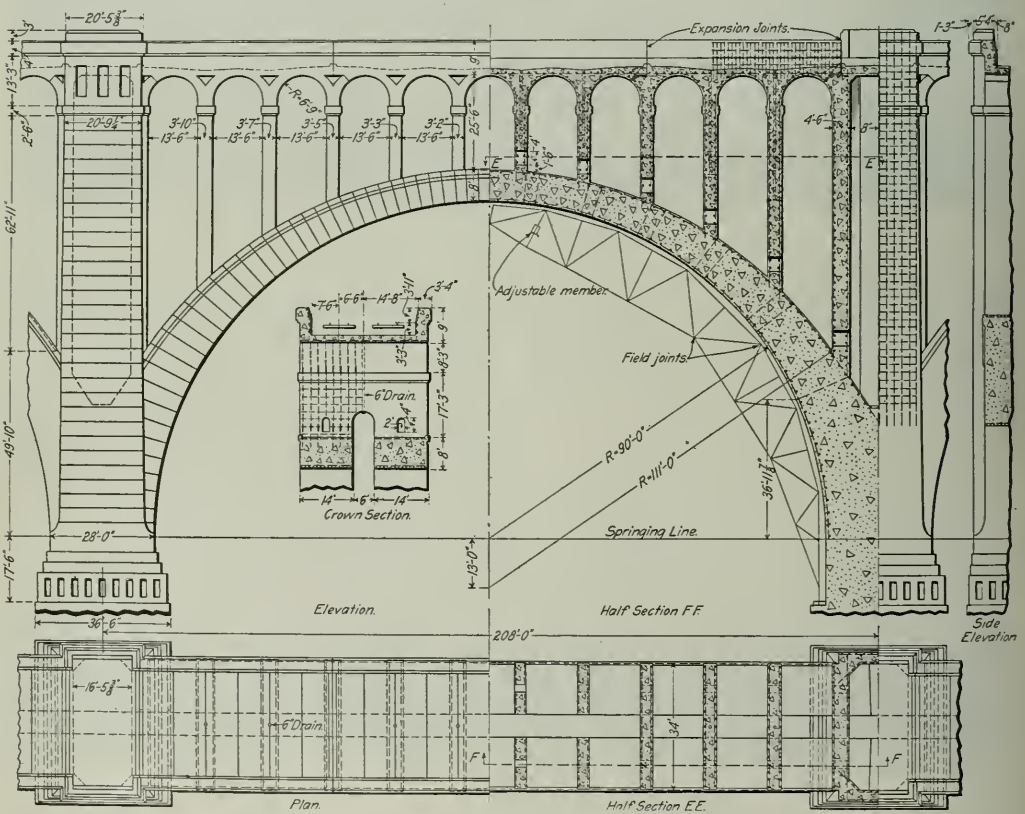
backs for the arch rings. The superstructure differs somewhat in the 100-ft. and the 180-ft. arches. The former are located at the ends of the structure and are termed abutment spans, as they are completely buried by the approach fill. In these spans the two arch ribs are 5 ft. 6 in. thick at the crown and 12 ft. wide. They are spaced 22 ft. center to center leaving a 10-ft. opening between the ribs and are tied together by four reinforced concrete struts. The ribs support reinforced transverse walls on which is carried a floor slab from 1 ft. 9 in. to 2 ft. 6 in. thick. An 18-in. curtain wall along each outside face closes the opening between the arch ring and the floor slab.



Outline Elevation of Tunkhannock Creek Viaduct Showing Progress up to January 1, 1915

In the 180-ft. spans the arch ribs are 8 ft. thick at the crown and 14 ft. wide, the intrados being semi-circular; the extrados is segmental with a radius of 111 ft. The arch ribs are spaced 20 ft. center to center, leaving a 6 ft. opening between them. They support transverse walls varying in thickness from 3 ft. 2 in. to 4 ft. 6 in., which span the center opening. These walls are connected at the top by spandrel arches of 6 ft. 9 in. radius with a crown thickness of 1 ft. 9 in. Belt courses on the walls 1 ft. 6 in. below the springing line of the spandrel arches provide seats for the centers used in building these arches. The two walls over each pier are connected at the ends by pilasters 3 ft. thick, which stiffen the spandrel system and give the appearance of a solid pier.

The floor is pitched 6 in. to the center of the transverse walls, the drainage being carried down through 6-in. pipes in these walls and discharged in the space between the arch ribs. The minimum depth of ballast is 12 in. over the expansion joints of which there are four on each span, two at the piers and one over the third transverse wall from each pier. These joints consist of a ¼-in. open space covered by a copper plate bent to project down into the joint slightly and with its edges turned down into grooves parallel with the joint, where it is held in



The General Elevation and Cross Section of the Tunkhannock Creek Viaduct

place by a mastic filling. The waterproofing is carried continuously over this plate. A parapet wall with an overall width of 3 ft. 4 in. extends 7 ft. 3 in. above the floor at the crown of the spandrel arches and the pilasters extend 3 ft. above the top of the parapet.

The general design of the Martin's creek viaduct is similar to the Tunkhannock creek bridge, except that it will carry three tracks and that seven of the eleven are 150 ft., three-centered arches, consisting of two ribs 17 ft. 6 in. wide with an open space of 12 ft. between ribs. The spandrel arches are flattened to conform with the appearance of the main arches. The total length of this structure is 1,600 ft., the base of rail is 150 ft. above the stream and 78,000 cu. yd. of concrete were required in its construction.

CONSTRUCTION OF CONCRETE ARCH VIADUCTS

The contractor's methods adopted in building the superstructures of the two large viaducts were practically the same, so that a description of the work on the Tunkhannock bridge will apply in general to the Martin's creek structure as well. As mentioned in the article on the substructures referred to above, all form material and concrete at Martin's creek were handled by derricks, while at Tunkhannock a combination of

The Abutment Span Before Completion and the Two Short End Spans of the Martin's Creek Bridge

derricks and a double cableway is being used. The center tower of this cableway was 260 ft. high for the early stages of the work and was later raised by a 40-ft. addition in accordance with its design. Two duplicate concrete mixing plants at Tunkhannock and one at Martin's creek, each with a capacity of about 40 cu. yd. per hour, were provided.

With the exception of the abutment spans in both structures, for which wooden centers supported on wooden towers were used, the arch rings were built on self-supporting steel arch centers. These were seated on benches on the sides of the piers, which in the Tunkhannock bridge are 4 ft. 3 in. wide and 17 ft. 6 in. below the springing line. The spandrel arch centers and all forms are of wood. Five sets of arch centers are used, each of which supports a single main arch rib. After the construction of one rib in a span the centers are moved over under the other rib in the same span and used again without dismantling. In order to utilize both material cables at the same time, the centers are erected on alternate sides in adjacent spans.

Each set of steel centers consists of four three-hinged arches spaced 3 ft. 10 in. center to center and thoroughly braced. The assumed loading on these centers, including the weight of the trusses, lagging and forms, is 1,370,000 lb., which produces a maximum horizontal reaction at the lower skew back pins of 261,100 lb. During the lateral movement of the centers the thrust resulting from the weight of the trusses and lagging is taken by two 1 in. rods connecting these pins. The wind load on the forms is taken by four 1¾-in. anchor bolts extending into the concrete bench on each side of the pedestals. As an added precaution, the contractor used two ¾-in. steel cable guy lines from the crown of the centers.

The four arch trusses in each set are supported by a pedestal 16 ft. 7 in. long. In order to provide for the side movement from one arch rib to the other, the base plate under this pedestal is provided with a guide rib ½ in. by 2½ in. which engages the shoulders of 6-in. rollers running on a bottom grillage. This grillage is 35 ft. 6 in. long, consisting of four 8-in. I-beams with top and bottom cover plates, the former having a guide plate to engage the rollers similar to the one on the pedestal.

The 3½-in. lagging is carried on planks set on edge over each rib with their outer edges curved to conform to the intradosal line. As the top pin is 6 ft. below the crowd of the arch, the lagging for one panel length on each side of the crown is carried on a rigid triangular frame above the top chord sections. The adjacent members of these frames over the pin are about 2 ft. apart at the crown, an oak block being supported in this space by bracket angles to carry the lagging over the joint.

The adjustment of the height of the centers necessary to strike them before removal is accomplished by changing the length of the diagonal members of the two panels adjacent to the crown. Pin connections are used in these panels to make this possible and the diagonals are each made in two pieces connected by bolts with left and right handed threads.

The centers, which have a total weight of about 200 tons, are erected by the cableway, each rib being handled in four pieces. The lower half of each semi-truss is erected first and held in position on the skewback pins by two temporary bolts through gas pipe sleeves in the concrete of the umbrella tops which bear on washer plates at the upper ends of the pipes and support a short I-beam yoke under the upper chords of the trusses. The upper halves are then erected and bolted to the lower sections, the entire semi-trusses being supported as cantilevers from the piers until the crown connections are made, converting them into three-hinged arches.

After the completion of the first rib, the centers are struck and are then jacked over on the grillage, a distance of 20 ft., to bring them under the second rib. After this rib is concreted and set, the centers are again struck and rolled into the space

between ribs where the segments can be removed one at a time by the cableway for erection in another span.

Each arch rib consists of 11 vouissoirs and the necessary connecting key sections. The corresponding vouissoirs on opposite sides of the arch are concreted simultaneously, and after the last one is placed a set of seven days is allowed before the keys are put in. Separate forms are provided for the vouissoir blocks and the key sections allowing the former to be removed for use on another span while the keys are being placed.

The End Span of the Tunkhannock Viaduct Showing the Pilasters at the Piers and the Spandrel Arches Partially Completed

All the concrete is handled in bottom dump buckets by the cableway from cars pulled by dinkey engines from the mixing plant. In most cases these buckets are dumped directly into the forms, but in the case of the spandrel walls for example, where the width of forms is not great enough to permit this, dumping platforms are used. A stiff-leg derrick was erected on the finished floor as soon as one section was completed and is moved out as the work progresses to handle the spandrel

Erection of the Steel Centers for One Span at Martin's Creek in Progress Showing Details of Crown Connection and Adjustable Members in the Top Panel of Each Semi-Truss

arch forms from under the completed floor at the sides of the bridge, thus obviating the necessity for using the cableway for eccentric loads. In hot weather each floor section is kept flooded until it has set, and in cold weather a tarpaulin cover is provided and a steam pipe run in to heat the surface. The lower section of the parapet walls up to the first offset on the

A Construction View at Tunkhannock Creek Showing Forms in Place for Spandrel Walls, Arches and Pilaster

outer surface is cast with the floor in order to avoid the appearance of a construction joint.

THE NICHOLSON TUNNEL

The excavation in the double track tunnel 3,630 ft. long near Nicholson, amounting to 146,000 cu. yd. was completed about the first of November, and work is now in progress on the lining of this bore, 1,600 lineal ft. of lining having been

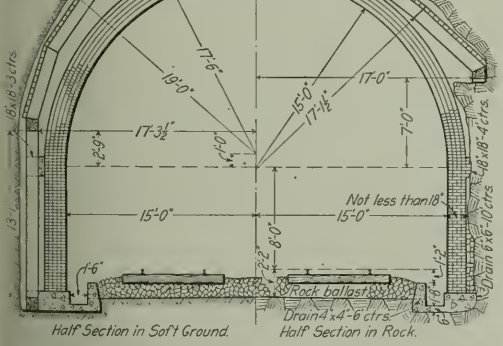
Two Spans of the Tunkhannock Viaduct in Each of Which One Rib Has Been Finished and the Centers Are Now in Place Under the Second Rib

completed. As mentioned in one of the previous articles, two shafts were driven at the third points in order to advance the work before the completion of the portal cuts, which are about 100 ft. deep, and one of which contains over 1,000,000 cu. yd. of material.

Center top headings 9 ft. by 12 ft. were driven in both directions from each shaft and also in from the west portal as soon as the cut at that end had progressed far enough to

make this possible. These headings were later widened to allow the placing of the wall plates and the 12 in. by 12 in. roof timbers, which were spaced 4 ft. center to center. The remainder of the section was excavated by a single pass of a 40-ton Marion shovel operated by compressed air. The material was shot down ahead of the shovel in two benches, the upper having a face of about 6 ft. and the lower about 12 ft. The shovel loaded the material into 6-yd. cars operated in trains of 10 by dinkey engines burning hard coal.

Two tracks were provided in the tunnel for this narrow gage equipment with a switch about 200 to 300 ft. from the working face. A train of empty cars would be pushed up to this switch on one of the tracks and the loaded cars collected by another engine on the other track. The first engine would push in two empty cars to the shovel, run back of the switch, the second engine would come up and pull out the two cars as soon as loaded, and the first engine would then set in two more. By the time the loaded train was ready to leave, another train of empty cars would arrive and the process be continued, always having two engines at the shovel to switch the cars. The haul varied from ½ mile to one mile from the portal. The shovel completed the excavation in 350 days elapsed time,



Typical Cross Section in Earth and Rock of the Nicholson Double Track Tunnel

making a progress of about 12 ft. per day of actual working time.

Three compressors located in a plant at the west end supplied air for the shovel and drills, the 10-in. air main being carried for a maximum distance of about one mile. A generator located in the compressor plant furnished electricity for lighting the tunnel during the placing of the lining, although large carbide torches and individual gasolene lights were used until the completion of the excavation.

The tunnel is being lined with vitrified brick which has been shown in extensive tests to have a high compressive strength and resistance to corrosion. The estimates showed that a concrete lining could be placed for about 60 per cent less per cubic yard than the brick, but the yardage is decreased by using the brick so that the comparison of the total costs does not show as great a difference. The proximity of unusually good supplies of brick was a factor considered in this case. The side bricks are obtained in Corning, N. Y., and the arch bricks, in Scranton, Pa. The bricks are of two sizes, those in the side walls being 2¼ in. by 4 in. by 8¾ in., and those in the arch 2¾ in. by 4 in. by 8 in. The lining is four courses thick, except in the short section of earth near the east end, where a fifth course is added.

The brick lining is carried on a concrete footing which is extended toward the tracks to form an open drain 18 in. wide and 12 in. deep. The thrust of the arch is taken by 18 in. square thrust blocks of brick at the springing line, spaced 4 ft. center to center. The space above the ring and behind the side walls is back-filled with selected rock, and 6 in. by 6 in. drains through the concrete footings at intervals of 10 ft. afford an outlet for any water collecting behind the lining. In the east approach cut where the grade is descending toward the tunnel, a vitrified pipe line for drainage will be laid with a grade sloping away from the tunnel. So far no difficulty has been encountered with water, and none is anticipated.

The concrete footings are built in 15-ft. form sections, the concrete being mixed at the top of one of the shafts and lowered by a derrick. A crusher was installed here to supply crushed stone for this concrete, using the rock removed from the tunnel. The output of the crusher was also used for the concrete in a small culvert near by.

The brick arch is being built on four 32-ft. sections of centering which are moved forward on wheels. Bricks are laid in 1:2 cement mortar mixed by an electrically operated Ransome mixer in the tunnel. A motor-driven conveyor is also used to elevate the bricks and the mortar to the working platform of the centering. The mason gang employed at present on this work can average 1,500 to 2,000 bricks per man in an eight-hour day.

The plans for this cut-off line and the construction work have been handled under the supervision of G. J. Ray, chief engineer. The designs for the large concrete arch viaducts were made by A. B. Cohen, concrete engineer. All field construction work is directed by F. L. Wheaton, engineer of construction, the residency including the Tunkhannock viaduct, the Nicholson tunnel being in charge of C. W. Simpson, resident engineer.

LAFAYETTE YOUNG ON GOVERNMENT OWNERSHIP

[From the Des Moines Capital]

The railroads are out of politics. In a political sense they are boycotted. Prove that a man is subservient to railroad influence and his defeat is certain. The conditions are much better because these achievements have been had.

Therefore, we cannot agree with Dr. Frank Crane in his desire to put all the corporations into politics. He wants the railroads, tramways, telephone and telegraph lines, and all other systems of transportation; all water-ways, all electricity, gas and the like put under the ownership of the government.

The editor of The Capital has been in nearly every country in the world, and we can say truthfully that the telegraph and telephone lines, also the railway lines, are better managed in the United States, and give better service than in any country in the world where government ownership prevails. The charges in the United States are not excessive.

In a republic where the majority rules, and the majority are in the government employ, what are the other people going to do? We very much fear that under universal government ownership American politics would become so corrupt that the government itself would go down under the weight.

Government ownership is justifiable only when private ownership everlastingly fails. Some arguments could be put up for government slaughter and packing houses; even for flouring mills. But when the transportation business is well managed, why put millions into it?

We venture the statement that very few businesses in America have been destroyed by transportation charges.

Dr. Crane points to higher conditions morally, and anticipates an appreciation of responsibility upon the part of everybody, which is not at present warranted by the facts.

The Practical Problems of Terminal Operation*

Some Seemingly Unimportant But Nevertheless Vital Considerations in Successful Yard Management

THE PROBLEM OF THE OLD YARD

By G. G. Butler
Southern Railway, Washington, D. C.

Success in yard operation cannot be secured in a day, neither does it come overnight, but rather it is the reward of concentrated thought and study of all the multifarious conditions which exist and arise between the two yellow boards which mark its geographic limits. While it has been the tendency in later years to spend much time and thought in planning the layout of new yards, into which many mechanical innovations and new ideas have been introduced, the vast majority of yards throughout the country still retain their original characteristics with new tracks and facilities added from time to time. It is in these yards of meager and inadequate facilities that the greatest personal effort is required and most generally the least credit or glory to the yard organization is given, for it seems to be the rule that as viewed from the chief despatcher's table or the chief clerk's desk, the yard that handles the greatest bulk of traffic and does not become actually blocked in so doing, regardless of the disparity in its facilities, is the better conducted yard. Yet a careful study of conditions and a fair comparison of merits and values might cause a reversal of opinion.

However, the essential qualifications of the yardmaster in either yard are measured by the same rule. Each must serve his employer, the public. The public employs the company and the company employs the yardmaster, and so the latter has a dual responsibility in all that he does. The yardmaster is one of the closest mediums of contact between the company and the public and he therefore has it in his power to do much for or much against either one, or both. When he fails or neglects his service to the patron he may expect a complaint, which usually means his appearance on the "carpet," and of course, an excessive number of attacks of that malady are not conducive to his continued signing of the payroll.

The man who has never come in close contact with the whines and complaints that can and do arise in a busy industrial yard has missed an education in itself. It therefore behooves the yardmaster to make the personal acquaintance of every patron enjoying private siding facilities and of his underlings who have any control over that part of the business. The yardmaster will therein find much to his advantage and the patron will benefit likewise. But the essential qualification of a man in charge of any yard is that he know his business and that he have the moral courage to insist upon that which is right. He then commands the respect of all with whom he deals, from the most exacting patron to the junior call boy. He must have substantial authority over his men and be a firm but just disciplinarian. He must co-operate closely with the other departments, especially the mechanical and the despatching. Much is to be accomplished by a pleasant working relationship between these two. I have found that when the yard men make an honest effort toward co-operation they are usually met half way, but when they fail to switch the store house cinder pit, sand house or coal pocket, it is not to be marvelled that a regular engine is shopped and an old "scrap heap" is furnished to worry through a day's work. Too much cannot be said of co-operation with the despatcher, for the two departments are more frequently at odds than working harmoniously, the yardmaster striving to get trains out and the despatcher trying to get trains in.

Of primary importance is the watching of yard expense. With a heavy and favorable run of business it is of course less difficult to make a "showing" than under conditions of the reverse nature. The fixed expense of the yard, including the yardmaster, his assistants, clerks, etc., will generally remain the same and superior officials are less inclined to ask a reduction in this expense then they are to want an engine discontinued. While regular switch engine schedules, with regular crews, are conducive to the best general economic results, there are times when the yardmaster would be extremely derelict were he to allow them all to work. He should closely watch the prospective movement and arrange his forces in such a way as experience has taught him will cover all requirements and at the same time permit of no waste of power. Whether he has done this conscientiously or not can be detected quickly by the superintendent in an examination of the "cost per car handled" and "cars handled per engine." In scheduling yard engines, it is well, if compatible with traffic requirements so to arrange their departing time from the engine house that at least one engine will be on duty at all times. I have never seen the yard so up-to-date but that it could not find something to keep the locomotive employed and there is thus always an engine ready to protect any emergency.

OPERATING EXISTING YARDS A PRACTICAL NECESSITY

By M. A. Mulligan
Trainmaster, Lehigh Valley, Jersey City, N. J.

As a general rule railroads have been compelled to utilize the same yards and terminals to take care of the increased business, although the rolling stock and equipment have been greatly increased and improved, and operating methods have been revolutionized to meet the intense tonnage and time requirements. The fact is, the relocation or radical reconstruction of yards and terminals involves too great an expenditure to be considered by the already overburdened railroads. Therefore, we must disregard the theorist, with his ever-ready suggestions for ideal yard and terminal layouts, and turn to the practical railroad man for a solution of the difficulties which beset the operation of our existing yards. The importance of the part played by yard and terminal facilities cannot be overestimated, as they are not only the distributing points for a railroad's equipment, but also a controlling factor in the prompt movement of its tonnage. Present conditions demand that these facilities produce the maximum efficiency at a minimum cost.

The keystone of efficiency is organization. Therefore, careful consideration must be given to the selection of the officer charged with the duty of securing proper organization and infusing the proper *esprit de corps*. Unquestionably, he must be an experienced and practical man, familiar with railroad methods, and with a faculty of applying them to the best advantage. He must be able not only to plan a detailed organization that will fit all local requirements but must be qualified to instruct each man in his duties and to know when every man is doing his duty. He must also be a strict, but just disciplinarian. He should be qualified to go into a terminal and quickly grasp the details of its classifications and methods of working, discover any weak points in its organization and be capable of either educating or reorganizing the force, making such changes in rules and methods as may be necessary to insure a smooth-running machine, not only performing its own work promptly and economically, but operating efficiently and smoothly with connecting points.

A yard, and particularly an intermediate yard, is a necessary evil on a railroad, inasmuch as it produces no revenue. To reduce the item of yard expense to a minimum, for it cannot be eliminated, it is essential to keep cars moving, avoid unnecessary switching to enable all possible reductions in engine service

*Abstracts of several of the papers received in the Contest on the Operation of Terminal Yards.

and overtime, and facilitate the movements of inbound and outbound trains to prevent congestion.

A yardmaster should keep himself familiar at all times with the trains in transit, as a guide for ordering power to handle the following day's business. All yards should classify their outbound freight, to avoid unnecessary switching and delays at other yards. If this is done it will only be necessary to switch and classify the cars originating at the intermediate yard, cars requiring shop attention and those brought in by pick-up trains. These can be assembled in one section of the yard and made up in properly classified trains, without delay. This will not only avoid delay to local cars, but will also keep foreign cars moving and thereby reduce per diem charges. Sufficient road power must always be furnished to take away the cars promptly and keep the yards open properly to do their work. Similarly, yards should not be compelled to receive trains from one division in close succession and then be forced to wait for power to arrive from the connecting division.

Yardmasters should make arrangements with the roundhouse foremen to have engines furnished with proper supplies during the meal hour. In the case of double-crewed engines this can also be done at the meal hour, but the time of boarding should be arranged so that crews are spaced one hour apart night and morning, dividing them to conform with the roundhouse organization. This will avoid paying a crew while the engine is being supplied. An emergency yard engine should always be kept available at a convenient point in the engine yard, to take the place of any regular engine that may have an accident or be disabled.

THE CAREFUL CARDING OF CARS

By James M. Fox

Yardmaster, Southern Railway, Winston-Salem, N. C.

The first step toward the successful operation of a yard consists in maintaining complete and accurate records in the office. A record of all waybills covering carload shipments of freight received should be made before the waybills are passed into the agent's office. A record of all home route cards should also be kept, and the cards filed. This record will eliminate delay in preparing a duplicate card should one become lost. Cards showing initial and number, contents, consignee and date of arrival should be placed upon all cars as soon as received, and weigh-cards upon such cars as require scaling.

Loads on which the freight is not prepaid, also those billed "shipper's order," should be carded "hold" and placed on a track set aside for that purpose. The agent's office should notify the yard office when any of these cars are ready to be placed for unloading and a clerk can then apply the proper carding. The "hold track" should be switched as often as business demands, but not less than once a day.

When billing for outbound loads is delivered to the yard office, a list (or lists) should be made, showing the initial and number of each car with the contents, location and destination, and such lists should be furnished to the foremen working in the territory where the cars are located. Cards showing the same information should be placed on each car, and where weights are necessary, cards indicating this also should be applied.

Loaded cars bearing bad-order tags should never be placed on a repair track, if in the opinion of the yard foreman, the defect is such that it will not interfere with the movement of the car to the industry to which it is consigned. This is particularly true of shipments of livestock, merchandise and perishable freight. However, in a case of this kind, all parties should be instructed not to reload the car. Preferred handling in the placing of this high class freight should never be deviated from; other freight should be placed as promptly as possible.

All cars consigned to the same industry should be kept together, and the oldest loads placed first, unless other instructions are issued. This is an easy matter where a perfect carding system is in vogue, and the foremen observe it. In the placing of cars on team or industry tracks, care should be used to push them in as far as possible in order that any available space remaining will be adjacent to the main line. This will prevent disturbing any loading or unloading of cars on this track in case another delivery has to be made during the day.

A great saving is effected by keeping a close check on the number of crews necessary to properly handle current work. Forces should never be reduced so that industries will suffer for want of attention, but on holidays and days when the industries are idle, the number of crews may often be reduced. The matter of overtime should also come in for close attention and be reduced to a minimum.

All concerned should understand that the public is entitled to courteous treatment, and should act accordingly. The yardmaster should make it a point to visit each industry as often as possible, keeping in close touch with those in charge, and seeing that their wants are being satisfactorily attended to. An exhibition of such interest goes a great way towards keeping down complaints which otherwise arise, and gives the yardmaster the opportunity to keep in close touch with every angle of his work.

FREIGHT SOLICITORS A FACTOR IN YARD OPERATION

By O. C. Hill

Assistant Superintendent, Chicago, Burlington & Quincy, Kansas City, Mo.

Freight solicitors should be selected with care and should be thoroughly familiar with all the operations of the terminal in which they are located. They are securing business on the basis of service performed, and to be performed. They work so closely with the operating department that it is hard to tell where the traffic department ends and the operating department begins, as all operating men are virtually traffic men. The general agent should receive a consist of all freight destined for his terminal from the preceding terminal. This should be given to his different solicitors, so that they in turn can take up with the consignee and obtain a prompt release on all shipments so that the cars can be carded direct from the train to the road or switching line that is to handle them to destination. By this means the handling will be direct and the cars will be kept in a regular channel.

The yardmaster must work closely with the roadmaster or general track foreman and must see that his assistants give the roadmaster and his foremen an opportunity to keep up the physical condition of the terminal to a high standard, as the length of time and the amount of work that can be turned out depends upon the condition of the tracks.

The secret of a successful yardmaster is having all of regular work well in hand at all times and then, when the necessity arises, he can deliver as the needs demand without affecting the movement of the regular business.

THE PUBLIC AND THE TERMINAL

By G. B. Schrand

Trainmaster, Chicago & North Western, Chicago, Ill.

Being public utilities, the railroads must be operated to the mutual advantage of the shippers and the owners. The public is continually demanding new concessions and greater rapidity in the handling of its business and naturally a freight terminal must conform to those demands and must adapt itself to their fulfillment. To accomplish the desired results, and to satisfy the public, we must have suitable facilities, able supervision and a balanced, experienced and loyal organization.

Granted that facilities are adequate, supervision and organization are next in importance. Supervision should be properly taken care of first and then we must work for a proper organization. In this organization we must not lose sight of economy and the proper distribution of forces, manual and clerical.

To facilitate car movements our company has adopted and is now carrying out successfully an embargo system which is controlled by an embargo bureau located in and operated in harmony with its Chicago freight terminal. The establishment of this bureau solved a big problem for our company.

General News Department

The receiver of the Buffalo & Susquehanna has been authorized by the court to continue the operation of the road until March 1.

A press despatch from Vera Cruz, Mexico, February 2, announced the re-opening of the railroad between that place and Mexico City, with a passenger train running through for the first time since November 19.

A petition was presented last week to the Kansas legislature, signed by several hundred persons in Labette, Coffey, Woodson and Sedgwick counties, asking that the legislature, during the present session, be lenient in the matter of anti-railroad legislation. "Drastic legislation will work no benefit to the traveling public," the petition stated, "and bills of this nature should be defeated."

Foley Brothers and the Northern Construction Company have begun suits at Toronto, in mechanics' lien proceedings against Mackenzie, Mann & Company to recover $4,276,667 balance alleged due on a $17,578,637 contract for the building of the Port Arthur-Sudbury section of the Canadian Northern Railway. Foley Brothers are incorporated under the laws of Minnesota.

The general offices of the National Railways of Mexico were recently moved from the City of Mexico to Torreon. All of the records of the company were moved, and the new offices are occupied by the full working force of clerks. There is some talk that the change may be made permanent, irrespective of the outcome of the revolutionary troubles, as Torreon is considered the logical operating center of the government-owned system.

The Secretary of the Interior has recommended to Congress an appropriation of $2,000,000 for the use of his department in the work of building the proposed government railroad in Alaska. An appropriation of $1,000,000 was made at the last session of Congress. The secretary has not yet reached any decision as to the purchase of the Copper River & North Western or the Alaska Northern, both of which roads may be included in the proposed government system.

Representatives of engineers', firemen's, conductors and trainmen's brotherhoods have been holding conferences with the management of the San Antonio, Uvalde & Gulf, protesting against a proposed reduction in the wage rates of employees on the road, which the road had announced would become effective February 1. The road proposed to reintroduce the scale which was in effect about a year ago. Since that time most of the employees have received advances which the road now says it is unable to pay on account of decreased revenues.

The American Museum of Safety, William H. Tolman, director, will make its annual award of medals next Wednesday evening, February 10, at 8:30 o'clock, at the United Engineering Societies Building, 29 West Thirty-ninth street, New York City. The E. H. Harriman Memorial medal for the American steam railroad, which during one year has been the most successful in protecting the lives and health of its employees and of the public, goes this year to the New York Central. The Anthony N. Brady medal, for a similar purpose, awarded to an electric railway, goes to the Boston Elevated.

The Baltimore & Ohio, the Erie and the Pennsylvania, and presumably all of the other principal eastern roads have put in effect the revised tariff of demurrage charges on refrigerator cars containing perishable freight, which has been under consideration for several months. The usual free time is allowed, two days; for the next three days the regular rate, one dollar a day; for the next three days $3 a day, and thereafter $5 a day. The new charge has received the endorsement of the National Industrial Traffic League, the National Poultry, Butter and Egg Association, Western Fruit Jobbers' Association, International Apple Shippers' Association, North Pacific Fruit Distributors and New York State Cold Storage Association.

Thomas W. Hulme, general secretary of the Presidents' Conference Committee for the Federal Valuation of Railroads, has issued a statement showing the manner in which the information required by the government regarding the acquisition of lands has been prepared in three separate instances in conformity with those requirements, as an example of the manner in which such information should be prepared. The three instances, all of which are on the Northern Pacific, include a 68-mile extension of a branch line in western North Dakota, where land was cheap and the road was desired by the residents; the acquisition of terminal property for a passenger coach yard in St. Paul, where about half of the land was secured before the identity of the purchaser became known; and an extension into a community in eastern Montana, which was already served by railway facilities and where the road was not desired by the farmers.

Theodore P. Shonts, president of the Interborough Rapid Transit Company, New York City, and also of the New York Railways Company, operating surface street railways in New York, has issued a pamphlet showing the unfavorable aspects of motor bus traffic in large cities; the purpose being to induce the authorities of New York to refuse franchises to operate motor omnibuses in the street. About two years ago applications were made for such franchises, and at once Mr. Shonts sent two of his men to London and Paris to study the transportation facilities of those cities, with particular reference to omnibuses and their effect on the fortunes of the city. This report is the result of the investigations thus made. The investigators declare that unlimited motor-bus competition in New York would seriously impair the traffic and income both of the subways and the street railways, while at the same time it would mean greater congestion in the streets, more street accidents and serious financial losses to the city, which owns the subway; and without commensurate benefit to the people.

Illinois Roads Begin Campaign for Increased Passenger Fares

The railroads of Illinois are going to try their case for an increase in passenger fares in the state in the court of public opinion, with "a campaign of candor." As a first step in the campaign, a committee of railway presidents called on Governor Dunne at Springfield on Wednesday to submit to the governor the intention of the roads to ask the people and their representatives for an amendment to the law of 1907, which reduced the maximum passenger fare from three cents to two cents a mile, so that the maximum rate may be restored to 2½ cents.

President Markham of the Illinois Central issued the following statement as to what the railroads want and how they propose to go frankly to the public to get it from the legislature:

"Everybody knows there has been an increase in the cost of railway operation, without a corresponding revenue increase to offset it. President Wilson has indorsed the interest of the whole public in the proper maintenance and complete efficiency of the railroads.

"The Interstate Commerce Commission, after searching investigation, has found that a serious defect in the railroad situation and a drag upon proper maintenance and complete efficiency is the inability of the railroads to get a sufficient return from their passenger service. Citing the advance in passenger fares in New England, the commission has also expressed a belief that the public will acquiesce in similar action wherever it is shown to be necessary; that the people are willing to pay for the improved service they demand; and that an effort should be made, where two-cent laws are in effect, to secure an advance. As evidence of its own attitude toward passenger fares, the commission has recently accepted interstate passenger tariffs based on a rate of 2½ cents a mile in Illinois.

"The relief suggested by the commission can be had in Illinois only by consent of the people through their representatives in the state legislature, with approval by the governor.

"In consequence of this situation and of the commission's find-

ings, the railroads of Illinois have decided to present their case directly to the people. As the first step the presidents of Illinois railroads will call upon Governor Dunne, who has kindly consented to give them a hearing. Later, the railroads will try to get all the facts of this passenger fare question before all the people. Railway officials will appear before commercial, industrial, labor and civic organizations and public meetings throughout the state, wherever such meetings can be arranged, to make clear to the public just what the railroads need and why they should have it, and to answer fully and frankly all questions asked.

"In due time a bill will be presented in the legislature for restoration to the railroads of half of what was taken away from them in 1907 by legislative action, or for a maximum rate of 2½ cents per mile. The railroads believe the people will endorse this bill after they have learned all the facts in the case, and the purpose of the railroads is to give the people 'the truth, the whole truth and nothing but the truth.' Already arrangements have been made for meetings beginning next week at Galena, Rockford, Freeport, Joliet, Ottawa, Polo, Mendota, Sterling, Dixon, DeKalb, Belvedere, La Salle, Peru, Peoria, Monmouth, Galva and Galesburg.

Chicago Railway Equipment Company Annual Dinner

At the annual dinner of the Chicago Railway Equipment Company, held at the Union League Club, in Chicago, on Tuesday evening, February 2, the subject for discussion was "The Business Man and the Future, His Duties and Opportunities."

Papers on various phases of the subject were read by E. B. Leigh, president of the Chicago Railway Equipment Company; Samuel O. Dunn, editor of the *Railway Age Gazette;* J. R. Chapman, vice-president of the Continental & Commercial National Bank; C. S. Gleed, chairman of the Missouri & Kansas Telephone Company; A. H. Mulliken, president of the Pettibone & Mulliken Company, and W. A. Smith, editor of the Railway Review. The meeting was attended by the officers and directors of the Chicago Railway Equipment Company and by numerous persons connected with other large interests, and after discussion resolutions were adopted setting forth several reasons for the need of concerted action by the business interests of the country regarding legislation and expressing the view that the Chamber of Commerce of the United States seemed to be the only great business organization from which could issue a movement for organizing the business men of the country. A telegram to this effect was therefore sent to the Chamber of Commerce of the United States in session at Washington urgently requesting it to give careful consideration at its meeting to this suggestion and to appoint a committee to devise ways and means for mobilizing the entire business forces of the country to the end that business may speak and act as an intelligent and forceful unit on the many questions which so vitally effect it.

Proposed Railway Legislation

A bill has been introduced in the Alabama legislature to require all locomotives in the state to be equipped with electric headlights.

* * *

The Iowa railroads have announced that they have appointed a committee to petition the legislature to repeal the state two-cent fare law and substitute for it a law allowing a fare of 2½ cents a mile.

* * *

The Minnesota railroads have asked the legislature to amend the state passenger fare law to empower the state railroad and warehouse commission to authorize increases in passenger rates, if, after an investigation, it finds that increased rates would be reasonable.

* * *

A bill has been introduced in the Oklahoma legislature to require each railroad company operating in the state to maintain a hospital for employees within the state. Other bills before the legislature are the full crew bill and the car limit bill. Petitions have been received by the legislature from the commercial clubs of several towns protesting against the enactment of any anti-railroad legislation.

Representative Clark of Florida has introduced in Congress a bill to require the provision of separate cars for negroes by all transportation companies in the district of Columbia. The bill has been reported favorably by the committee on the District of Columbia, but there seems little chance that it will be acted on seriously at the present session of Congress.

* * *

A bill has been introduced in the Arizona legislature for the purpose of encouraging the construction of railroads. The law exempts from taxation for a period of 10 years all the property of any company which shall, during 1915, after having filed notice with the secretary of state of its intention to do so, begin the construction of a line of railroad or street railroad in the state, provided work shall be started within six months after such notice and that not less than 2 miles of track shall be laid during each 30 days.

* * *

A bill has been introduced in the Senate of Virginia which, if adopted, will more than double the taxes now paid by the steam railroads in Virginia. The purpose of the measure is to make uniform assessments and taxation and to abolish the state franchise tax. The franchise tax is repealed outright and all property of the roads, of all kinds and descriptions, is subjected to state, city, county and district taxes. The supporters of the measure allege that the value of the railroad property in Virginia was reduced from $304,327,509 to $121,530,081, because the State Corporation Commission, in ascertaining and assessing the value of property, reduced the value by capitalizing the franchise tax on the basis of 35 cents on $100, and then deducting this sum from the actual valuation. This is claimed to be an injustice to the other taxpayers of Virginia.

Locomotive Spark Arresters

The Railway Commission of Canada proposes to prescribe the use of special spark arresters for locomotives burning non-coking coals, and has issued a circular (No. 141) calling for suggestions. The circular says that during the past two years, numerous complaints have been received as to fire danger resulting from the use as locomotive fuel of certain classes of western coals. It appears from analyses that the coals in question are not lignites, but that in each case where such trouble has occurred the coal has poor coking properties, or is non-coking. It is considered essential that some steps be taken to reduce to normal proportions the fire hazard resulting from the use of such coals, and to meet this situation, the board has under consideration the advisibility of amending Regulation 2 of General Order 107 by adding the following:

(c) There shall be such special spark-arresting device, other than the above, as may be approved by the board, on every engine burning coal which has poor coking properties or is non-coking, the use of which, as locomotive fuel, is not prohibited by Regulation 7 of this order.

All parties interested are requested to submit their comments to the board, in writing, not later than February 20.

Railway Business Association

The general executive committee of the Railway Business Association for 1915 is announced as follows, being made up of the elected president, treasurer and vice-presidents and the appointed executive members:

President, George A. Post; treasurer, M. S. Clayton; vice-presidents, S. P. Bush, Alba B. Johnson, H. G. Prout, W. G. Pearce, W. H. Cottingham, W. B. Leach, E. B. Leigh; executive members, J. C. Bradley, W. E. Clow, J. S. Coffin, O. H. Cutler, Henry Elliot, Irving T. Hartz, F. T. Heffelfinger, H. H. Hewitt, J. M. Hopkins, A. M. Kittredge, Robert P. Lamont, F. J. Lanahan, W. H. Marshall, Stephen C. Mason, A. H. Mulliken, Rudolph Ortmann, S. F. Pryor, W. W. Salmon, Justus H. Schwacke, G. W. Simmons, Geo. T. Smith, James S. Stevenson, H. H. Westinghouse, W. W. Willits.

National Association of Scale Experts

The eleventh semi-annual meeting of the National Association of Scale Experts was held in the Fort Dearborn hotel, Chicago, February 1, 2 and 3. Five business sessions were held, at which papers were presented on various phases relating to design, installation and maintenance of scales. Among the pa-

pers of interest to railway men were the following: "Installation, Maintenance and Care of Track Scales," by A. Malmstrom, chief scale inspector, Santa Fe System; "Test of Railroad Track Scales," by D. J. McGrath, scale expert of the state of Minnesota; "Weighing and Recording of Weights," by L. M. Allen, district superintendent, Western Weighing & Inspection Bureau, Omaha, Neb., and "Recording Weights," by F. C. Maegly, assistant general freight agent, Santa Fe System, Chicago.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

American Association of Demurrage Officers.—A. G. Thomason, Demurrage Commissioner, 845 Old South Bldg., Boston, Mass. Annual convention, April, 1915, Richmond, Va.

American Association of Dining Car Superintendents.—H. C. Boardman, D., L. & W., Hoboken, N. J. Next meeting, October, 1915.

American Association of Freight Agents.—R. O. Wells, Illinois Central, East St. Louis, Ill. Annual meeting, May 21-24, 1915, Richmond, Va.

American Association of Passenger Traffic Officers.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Next meeting, March 2-3, San Francisco, Cal.

American Association of Railroad Superintendents.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next meeting, August 19-20, 1915, San Francisco, Cal.

American Electric Railway Association.—E. B. Burritt, 20 W. 39th St., New York. Annual convention, October, 1915, San Francisco, Cal.

American Electric Railway Manufacturers' Association.—H. C. McConnaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

American Railroad Master Tinners, Coppersmiths and Pipefitters' Association.—W. E. Jones, C. & N. W., 3814 Fulton St., Chicago. Annual meeting, Chicago.

American Railway Association.—W. F. Allen, 75 Church St., New York. Next session, May 19, 1915, Atlantic City, N. J.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 19-21, 1915, Detroit, Mich.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June 9-11, 1915, Atlantic City, N. J.

American Railway Safety Association.—L. F. Shedd, C. R. I. & P., Chicago.

American Railway Tool Foremen's Association.—Owen D. Kinsey, Illinois Central, Chicago. Annual meeting, July, 1915.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York, Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York.

American Wood Preservers' Association.—F. J. Angier, Supt. Timber Preservation, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 18-20, 1916, Chicago.

Association of American Railway Accounting Officers.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Piedmont Hotel, Atlanta, Ga.

Association of Manufacturers of Chilled Car Wheels.—George W. Lyndon, 1214 McCormick Bldg., Chicago.

Association of Railway Claim Agents.—C. W. Egan, B. & O., Baltimore, Md. Annual meeting, May 19, 1915, Galveston, Tex.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual meeting, October, 1915.

Association of Railway Telegraph Superintendents.—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 22-25, 1915, Rochester, N. Y.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York. Next meeting, June 23-25, Niagara Falls, N. Y.

Bridge and Building Supply Men's Association.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

Freight Claim Association.—Warren P. Taylor, R. F. & P., Richmond, Va. Annual meeting, June 16, 1915, Chicago.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

International Railway Fuel Association.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago. Annual meeting, May 17-20, 1915, Hotel La Salle, Chicago.

International Railway General Foremen's Association.—Wm. Hall, 829 W. Broadway, Winona, Minn. Next convention, July 14-17, 1915, Sherman House, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, C. H. & D., Lima, Ohio. Annual meeting, August 17, 1915, Philadelphia, Pa.

Maintenance of Way and Master Painters' Association of the United States and Canada.—T. J. Goodwin, C. R. I. & P., Eldon, Mo. Next meeting, October 19-21, 1915, St. Louis, Mo.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May 26 to 28, 1915, Chicago, Ill.

Master Car and Locomotive Painters' Association of the United States and Canada.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 14-17, 1915, Detroit, Mich.

Master Car Builders' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June 14-16, 1915, Atlantic City, N. J.

National Railway Appliances Association.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15-19, 1915, Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

Railroad Master Tinners, Coppersmiths and Pipefitters' Association.—U. G. Thompson, C. & E. I., Danville, Ill. Annual meeting, May, 1915.

Railway Business Association.—Frank W. Noxon, 30 Church St., New York.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Railway Electrical Supply Manufacturers' Association.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

Railway Fire Protection Association.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Next meeting, October 5-7, 1915, Chicago.

Railway Signal Association.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa. Next meeting, March 15, 1915, Chicago. Annual meeting, September 21-24, 1915, Salt Lake City, Utah.

Railway Storekeepers' Association.—J. P. Murphy, L. S. & M. S., Box C, Collinwood, Ohio. Annual meeting, May 17-19, 1915, Hotel Sherman, Chicago.

Railway Supply Manufacturers' Association.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders and Master Mechanics' Associations.

Railway Telegraph and Telephone Appliance Association.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill. Annual meeting, September 14-16, 1915, Chicago.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

Salt Lake Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Signal Appliance Association.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

Society of Railway Financial Officers.—Carl Nyquist, C. R. I. & P., La Salle St. Sta., Chicago. Annual meeting, September, 1915.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. R. R., Atlanta, Ga. Next regular meeting, January 21, 1915, Atlanta, Ga.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

Toledo Transportation Club.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of Newark.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, Newark.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meetings last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimontbly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7122 Stewart Ave., Chicago. Annual meeting June 15, 1915, Minneapolis, Minn.

Transportation Club of Detroit.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, September, 1915, Chicago.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

Traffic News

The formal opening of the Panama Canal has been postponed from March to July.

The Chicago Transportation Association will hold its eighth annual dinner on Thursday, February 11, at the Hotel Sherman, Chicago. Luther M. Walter will be the principal speaker.

Examiner Brown of the Interstate Commerce Commission began a hearing in Cbicago on Tuesday, on the discontinuance of the absorption of tunnel and lighterage charges by the trunk line railroads.

An embargo on transportation of livestock was again imposed at Chicago last week, a case of foot-and-mouth disease having been discovered. It was expected that the interruption to business would be of short duration.

The Louisville & Nashville Railroad has withdrawn its request lately presented to the Alabama Railroad Commission to allow an increase in the passenger rate from 2½ cents to 3 cents a mile, on all branch lines. Action has been postponed by the commission indefinitely.

The New York Central reports having taken a whole train load of Argentine Republic exhibits from New York destined to the Panama Pacific Exposition, San Francisco. This is one of the largest exhibits from any foreign country. The Central reports also that the inquiries for information as to fares, routes, etc., are now of record breaking proportions. The passenger department estimates that if a tenth of the people who make such inquiries go to the Exposition the travel will far eclipse anything that was expected two months ago.

J. B. Ford, assistant general freight agent of the Cincinnati, New Orleans & Texas Pacific, has issued a circular to local agents and to interested shippers telling in detail of a large number of opportunities for foreign trade, the information being set forth after the fashion which is followed in the circulars of the Department of Commerce at Washington. Mr. Ford's circular dated January 26 fills five pages, and gives names and addresses, with details, more fully than does the government. A whole page is taken up with descriptions, including dimensions, etc., of cotton mill machinery wanted by Ramon Sosa, of Asuncion, Paraguay.

The railroads in the Western Passenger Association, operating through the territory west of Chicago and St. Louis to the Rocky mountains, have filed tariffs with the Interstate Commerce Commission to become effective on March 1, increasing their interstate passenger fares from a basis of approximately 2 cents to a basis of approximately 2½ cents a mile. These tariffs are similar to those filed by the eastern railroads, which became effective in December without suspension by the Interstate Commerce Commission. The following table shows the increases from Chicago to various important cities:

	Present rate	Proposed rate
St. Paul	$8.05	$10.00
Omaha	10.15	12.25
Kansas City	10.15	12.50
Duluth	9.29	11.43
Sioux City	10.30	12.75
Des Moines	7.17	9.00

Meanwhile the western roads, as well as those in Ohio, Indiana and Michigan, are preparing to push actively their campaigns to secure a repeal of the 2-cent fare laws and the substitution of laws allowing 2½ cents a mile in the several states.

Like Old Times

The Baltimore & Ohio and other railroads in trunk line territory have been authorized by the Interstate Commerce Commission to establish immigrant rates from New York, Philadelphia, Baltimore, Boston, Providence and New Bedford, to points in Canada west of and including Winnipeg, on the Grand Trunk Pacific, lower than the fares to intermediate points in Minnesota and South Dakota. Authorization was given also to roads in the same territory to make rates of the same kind to points in British Columbia on the Great Northern lower than to intermediate points in the United States.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

New York Dock Railway Refused Joint Rates

New York Dock Railway v. Baltimore & Ohio et al. Opinion by Commissioner Clark:

The commission finds that the trunk lines need not establish through routes and joint rates with the New York Dock Railway on traffic between complainant's stations on the Brooklyn (N. Y.) water front and points on defendants' lines in and west of trunk-line territory. The New York Dock Railway at the present time receives for its services to defendants 4½ cents per 100 lb. on all freight, except grain in bulk for track delivery, originating at or destined to points west of the western termini of the trunk lines; three cents per 100 lb. on all freight originating at or destined to points on and east of the western termini, and three cents per 100 lb. on all grain in bulk for track delivery.

The railway has trackage at the Fulton, Baltic and Atlantic terminals of the New York Dock Company. It has been operated separately as a railway since October 1, 1912. Its capitalization is $500,000, $450,000 preferred stock, and $50,000 common stock, but the only stock that has been issued is $3,000 preferred stock, all of which is owned by the dock company. Only the common stock, none of which has been issued, has voting power. Most of the directors of the railway are officers of the dock company, and the principal officers of the two organizations are the same.

The property of the New York Dock Railway is adjacent to the Jay Street Terminal, the Brooklyn Eastern District Terminal and to freight stations of the Lackawanna and the Pennsylvania railroads, and there seems to be no public demand for the joint rates requested. The commission feels that where the general public involved is adequately served, where there is no apparent necessity or demand on the part of shippers for the establishment of joint rates, and where there are no absolutely unreasonable rates, practices or discriminations, the commission cannot view with favor an effort to require the establishment of such routes and rates merely to enable a carrier to wrest from its connections or an agent to wrest from its principal greater compensation. (32 I. C. C., 558.)

Hearing on Spotting Charges

A hearing at Chicago before Examiner Pattison on the tariffs filed by the eastern railways imposing charges for spotting cars was concluded in Chicago last week, and it was announced that further hearings had been arranged to be held at Cincinnati on Monday, at Cleveland on Saturday of this week, at Pittsburgh on February 11, at Boston on February 19, and at New York on February 25. The Chicago hearing was confined to tariffs applying to industrial plants in Indiana, Michigan and Illinois. It was announced by the carriers that they would not at the Chicago hearing introduce any testimony as to the fairness or reasonableness of the charge, but that such testimony would be offered later. Eugene Morris, chairman of the Central Freight Association, in addition to his testimony as reported last week, told of a meeting of the Central Freight Association at which the Interstate Commerce Commission's decision in the industrial railway case was discussed, and said that as a result of that opinion the spotting tariffs had been filed. Mr. Morris explained that, as provided in the tariffs, the charge for spotting would apply in the following typical cases:

"1. Upon tracks of industries where plant service has been performed by the industrial or plant facility having its own power and an allowance has heretofore been made therefor but canceled, and the connecting or road-haul carrier may hereafter be called upon to perform such plant service, and it is practicable to do so.

"2. Upon tracks of industries upon which the engines of the road-haul or connecting carrier and power of the plant have heretofore performed the service and divided the cost as between the plant and the carriers.

"3. Upon plant tracks in cases where two or more carriers

reach the industry, and for operating reasons each carrier contributes a certain number of engines and prorates the actual cost.

"4. Industrial plant tracks upon which the engines of the road-haul or connecting carrier have performed the service at their expense, or when one carrier has performed the service and divided the expense among two or more carriers reaching the tracks of the plant."

The other witnesses were operating officers who described in detail the physical conditions at the various plants. They were cross-examined by John S. Burchmore, attorney for the National Industrial Traffic League, and by other attorneys representing the shippers.

STATE COMMISSIONS

The Massachusetts Public Service Commission has again suspended, until March 1, or until further orders, the proposed advances in passenger fares filed with the commission by the principal railroads of the state several weeks ago.

The Railroad Commission of Louisiana has issued an order, No. 1,856, forbidding the railroads to charge "car rental" on cars containing freight "transported from one point to another within prescribed switching limits at published switching rates, or elsewhere in the state of Louisiana." Apparently the car rental charge is something that has been collected by railroads in addition to the usual demurrage charge.

The Public Service Commission of Pennsylvania on complaint of residents of East Berlin holds that the East Berlin Railroad Company must before February 1 resume the running of freight and passenger trains; and this notwithstanding the fact that the company has become virtually bankrupt because of the small volume of traffic. It is held that the charter of the road is a contract between the state and the company, and until the charter has been surrendered or the state has declared it forfeited the contract must be carried out. The line of the road is seven miles long from East Berlin to a connection with the Western Maryland.

The New York Public Service Commission, Second district, has suspended new regulations, proposed by the principal railroads, by which they would make shippers of bulk freight pay for the bulkheads or temporary doors needed in shipping bulk commodities, such as fruit, vegetables and salt. It has hitherto been the custom of the railroads to supply these doors, or, where the shippers supplied them, to make an allowance of fifty cents each, not exceeding two dollars a car. The commission will shortly set a date for a hearing. The railroads had furnished this service to shippers under an order of the commission made in 1909 on the complaint of the New York State Shippers' Association, which order expired this month.

COURT NEWS

The Supreme Court of the United States has declared void, as an interference with interstate commerce, an order of the Louisiana Railroad Commission, requiring the railroads of that state to establish switching tariffs, to apply on both interstate and intrastate freight.

The Supreme Court of Appeals of West Virginia has held a consignor responsible for charges on freight refused by the consignee. It was in the suit of the Baltimore & Ohio against the Luella Coal & Coke Company. The court says that in the absence of a special contract, a shipper of coal in carload lots to a consignee who declines to receive it is liable to the carrier for the freight charges and also for demurrage accruing after he had notice of the consignee's refusal.

The Supreme Court has this week held that local commerce between the mainland of a state and an island belonging to it is subject to state regulation. The decision was announced in a suit brought by the Wilmington Transportation Company to enjoin the California Railroad Commission from regulating rates between San Pedro, on the mainland, and Avalon, on Santa Catalina Islands, 27 miles away. The transportation company claimed the commerce was carried on the high seas and thus was subject only to federal regulation.

The Supreme Court of the United States has declined to review the decision of the Fifth Circuit Court of Appeals in a test case involving claims for damages against the Louisville & Nashville on alleged forged bills of lading issued to Knight, Yancey & Company, Alabama cotton brokers, who failed. The lower court held the railroad not liable. The claims against carriers which were presented for losses in connection with fraudulent bills of lading, issued by connivance or negligence on the part of the station agents, at or about the time of the Knight-Yancey failure, amounted to more than $2,500,000.

The supreme court of Arkansas has rendered a decision under the full crew law of that state, deciding in favor of the state in a case which had been appealed by the St. Louis & San Francisco, which had been fined for violation of the law. The railroad appealed on the ground that the act, which applies to railroads operating lines more than 50 miles long, does not apply to it because it does not have 50 miles of continuous mileage in Arkansas. The court held that the act applies to all railroads of more than 50 miles that enter Arkansas, no matter what portion of the tracks may lie in the state. Attorneys for the railroad announced that the decision would be appealed to the United States Supreme Court.

The New York State Court of Appeals, in the case of the Public Service Commission against W. H. Mendel, proprietor of the parcel checking room at the Grand Central terminal in New York City, has decided against the commission. This proceeding was begun some time ago on a complaint charging that the fees collected (ten cents) were exorbitant. Mr. Mendel before the commission, refused to give certain testimony, whereupon the commission carried the case to the courts. The courts decline to compel Mr. Mendel to testify as to the financial condition of his business; they hold that it is a private business and that the accident of location does not put him under the jurisdiction of the commission. The Mendel family has had this "concession" at the Grand Central for more than 40 years.

Fencing Statute Applies to Live Stock Only

The Supreme Court of Montana holds that the statute, Rev. Codes, §4,308, requiring railroads to fence their tracks and maintain cattle guards, and making them liable for killing stock on their roads in case they do not maintain fences and guards, protects live stock only. Failure to maintain a fence does not render a road liable for the death of a child who had entered on the unfenced tracks and was run over. (Nixon v. Montana, W. & S., 145, Par. 8.)

Federal Employers' Liability Act

In an action under the Federal Employers' Liability Act for the death of a switchman, it appeared that the deceased was employed by the defendant in its yards at Oelwein, Iowa, making up a train destined for Minnesota, some of the cars to be set out at stations in Iowa, and some carrying local freight to be unloaded on the way. Some of the cars, destined for points in Iowa, originated in Iowa, and some came from points in Illinois. These cars, some intrastate and some interstate, were being made into the Minnesota train. The deceased was run over by an intrastate car and the negligence found was in respect of the brake-step of an intrastate car. It was held that the defendant was at the time engaged as a common carrier in interstate commerce and that the deceased was employed by it in such commerce, and that the Federal Employers' Liability Act applied. (Crandall v. C. G. W., Minnesota Supreme Court, 150, N. W., 165.)

Construction of Statute Fixing Passenger Fares

By Minnesota laws 1913, C. 536 (Gen. St., 1913, §§4,286, 4,287), no railroad company shall charge for transporting any passenger any sum in excess of the following prices, viz.: For a distance not exceeding five miles, three cents a mile; for all other distances, two cents a mile. Construing this act, the Minnesota Supreme Court holds that the language of the act is ambiguous. It is uncertain whether the legislature intended to authorize a railroad company, when the distance exceeds five miles, to charge three cents a mile for the first five miles, and two cents a mile for the additional distance, or only to charge the lower rate for the entire distance. The act is therefore open to construction.

Considering the probable object of the legislature in granting the three cent rate, and the absurd result of the last-named construction, which would allow the carrier to charge 15 cents for five miles, and only 12 cents for six miles, and 14 cents

for seven miles, and that this would be in direct violation of the state statutes prohibiting unequal or unreasonable transportation charges, the act is construed to mean three cents a mile for the first five miles and two cents a mile for the additional distance. (State v. Chicago, M. & S. P., 150 N. W., 172.)

Eminent Domain—Extent of Interest Acquired

The Supreme Court of North Carolina holds that in condemning a right of way, under ordinary proceedings, a railway acquires an easement in the property, to be held and used as the necessities and well-ordered management of the road may require; and the officers of the company are made the judges of the extent and necessities of this use.

To the extent that the land covered by the right of way is not presently required for the purpose of the road, the owner may continue to occupy and use it in a manner not inconsistent with the full and proper enjoyment of the easement. It is very generally held that, while a railroad company may not use or license the use of its right of way or station grounds for purposes strictly individual or private, it may erect thereon any and all buildings reasonably required for the convenience of the company as a corporation and a promotion and furtherance of its corporate business, and what it may do for itself and for like purposes it may permit or license to its patrons to the extent that it does not hinder or interfere with the proper performance of its duties to the public. It was held that a railroad company could lease a part of the land condemned for its station grounds to a party who erected thereon a warehouse used for receiving and shipping freight in his wholesale business and who covenanted to make the railroad company his preferred line for the transportation of merchandise to and from such warehouse. Coit v. Owenby, Wofford Co., North Carolina Supreme Court, 81 S. E., 1,067.

Construction and Maintenance of Private Side Tracks; Powers of Legislature and Railroad Commission

The Michigan Railroad Commission, in a recent decision, held that railroad companies agreeing to construct and maintain private side tracks should not insert in their contracts requirements providing (a) that the railroad company shall have priority of right to the use of the side track when constructed upon the shipper's premises and at his expense, or when, after construction by the railroad company, it has been paid for by such shipper; (b) that during the time such side track remains the property of the shipper the railroad company may extend the track through the shipper's premises without his permission; (c) that the railroad company may, at its option, if the shipper fails to comply with the contract, discontinue the service and remove the track; (d) that the shipper on whose premises and at whose sole expense the side track was constructed must route his freight over the operating line; (e) that the shipper must assume risk of fire and release the railroad from all liability for loss or injury by fire; (f) that the shipper maintain a clearance as to said side tracks to exceed 22 ft. overhead and 6 ft. from the rail on either side thereof. The Supreme Court of the state holds that this decision is invalid, because, though the duty to maintain and operate side tracks is absolute, no universal rule governing the conditions under which the duty shall be performed can be made. The reasonableness of an order requiring performance of the duty depends upon the peculiar circumstances of each case; the decision is a practical denial of a hearing in each case where one is desired, and a prejudgment of the rights of railroad companies.

What the commission did, the court said, was, not to administer, but enact, a law. The legislature alone can impose upon railroads the duty to construct private side tracks. When the complaint was made, it had imposed no such duty. Having the right to construct or refuse to construct or maintain a particular track, the complainant had the right to impose the terms upon which it would construct and maintain it. After the complaint was made, and before the decision of the commission was handed down, the legislature imposed upon railroads the duty to build spur tracks to and upon the grounds of shippers on certain terms and subject to certain contingencies. (Michigan Public Acts, 1909, Act No. 300, §6, subd. "b.") Even if that legislation should be held invalid, it was nevertheless an expression of legislative opinion that the commission had no such powers as it had assumed in the matter. (Grand Rapids & Indiana v. Railroad Commission, 150 N. W., 154.)

Railway Officers

Executive, Financial, Legal and Accounting

W. A. Webb, general manager of the Missouri, Kansas & Texas, has been appointed vice-president, with headquarters at Dallas, Tex.

Colonel J. J. Slocum has been elected president of the Tennessee, Alabama & Georgia, and E. C. Osborn has been elected treasurer, both with headquarters at New York.

B. B. Young, chief clerk to the first vice-president of the Pennsylvania Company and the Pittsburgh, Cincinnati, Chicago & St. Louis at Pittsburgh, Pa., has been promoted to assistant secretary.

L. J. Brinkman has been appointed freight claim agent of the Michigan Central, the Chicago, Kalamazoo & Saginaw, the Detroit & Charlevoix, and the Detroit Terminal, with office at Detroit, Mich., to succeed J. M. Eedson, resigned.

D. D. Curran, president and general manager of the New Orleans & Northeastern, the Alabama & Vicksburg and the Vicksburg, Shreveport & Pacific, with office at New Orleans, La., has been elected chairman of the board of directors. Larz A. Jones, vice-president and controller at New Orleans, has been elected president and general manager, succeeding Mr. Curran, and T. F. Steele, freight traffic manager at New Orleans, has been elected vice-president and traffic manager.

G. S. Waid, whose appointment as general manager of the Sunset-Central Lines, with headquarters at Houston, Tex., has already been announced in these columns, was elected vice-president and general manager of the Galveston, Harrisburg & San Antonio, effective December 1, 1914; also of the Houston & Texas Central, the Houston East & West Texas, and the Texas & New Orleans, effective January 12, 1915, and of the Houston & Shreveport, effective January 13. Prior to December 1, 1914, Mr. Waid was assistant general manager of the companies named and on that date was appointed general manager succeeding W. G. Van Vleck, deceased, who was vice-president and general manager, the vice-presidency in each case remaining vacant from the date of Mr. Van Vleck's death on November 10, 1914, until the election by the several boards of directors of Mr. Waid as his successor, as above noted.

Albert H. Harris, general counsel of the New York Central, announces the appointment of the following seven officers in the legal department with assigned territories as indicated, with slight exceptions: Alexander S. Lyman, general attorney, New York (states of New York, Pennsylvania and New Jersey); Frank J. Jerome, general counsel, Cleveland (Ohio and portions of New York and Pennsylvania); Robert J. Cary and Bertrand Walker, general counsel, Chicago (Illinois, Indiana and Michigan); Samuel H. West, general attorney, Cleveland (Ohio and portions of New York and Pennsylvania); Charles C. Paulding, solicitor, New York (in charge of legislative matters in New York and New Jersey); Frank V. Whiting, general claims attorney, New York, in charge of claims for injury to persons and for loss and damage to property, except such as are subject to the jurisdiction of the traffic or accounting departments.

Operating

W. E. Williams, general superintendent of the Missouri, Kansas & Texas, has been appointed general manager, with headquarters at Parsons, Kan.

A. E. Pistole, trainmaster of the Texas & Pacific at Marshall, Tex., has been appointed superintendent of terminals at Fort Worth, Tex., succeeding A. W. Montague, deceased.

H. McCall, division superintendent of the Grand Trunk Pacific at Edson, Alberta, has been transferred to Melville, Sask., in a similar capacity, succeeding G. S. Cooke, resigned. A. Kilpatrick succeeds Mr. McCall.

W. R. Dawson, assistant superintendent of the Pocahontas division of the Norfolk & Western, at Bluefield, W. Va., has been appointed assistant to the general manager, with office at Roanoke,

Va., succeeding G. W. Merrell, deceased. L. C. Ayers, assistant superintendent of the Scioto division, at Portsmouth, Ohio, succeeds Mr. Dawson, and H. T. Reinicker, roadmaster at Shenandoah, Va., succeeds Mr. Ayers.

C. O. Jenks, superintendent of the Lake district of the Great Northern, with office at Superior, Wis., has been appointed general manager of the Spokane, Portland & Seattle, with headquarters at Portland, Ore., succeeding W. D. Scott, deceased.

Amos G. Manahan, special agent of the operating department of the New York, Philadelphia & Norfolk, at Cape Charles, Va., was retired on January 1, under the pension rules of the company, after a service of 57 years and 9 months on the Pennsylvania system.

C. E. Crosby, transportation superintendent of the Carolina & North Western at Chester, S. C., has been appointed superintendent in charge of transportation, maintenance of roadway and equipment, with headquarters at Chester, and his former position has been abolished.

R. C. Andrews, superintendent of the Eastern division of the Texas & Pacific, with headquarters at Marshall, Tex., has been appointed assistant general superintendent, with office at Dallas, Tex. William Lynch, superintendent of the New Orleans division, at New Orleans, La., succeeds Mr. Andrews, and J. H. Elliott succeeds Mr. Lynch. H. F. Bickell has been appointed inspector of transportation, with headquarters at Dallas, Tex.

A. M. Marion, chief clerk to the general superintendent of freight transportation of the Pennsylvania Company and the Pittsburgh, Cincinnati, Chicago & St. Louis at Pittsburgh, Pa., has been promoted to the newly created position of assistant to the general superintendent of freight transportation, and S. M. Rankin, chief clerk to the general superintendent of passenger transportation at Pittsburgh, has been promoted to the newly created position of assistant to the general superintendent of passenger transportation.

Lewis Warrington Baldwin, whose appointment as general superintendent of the Illinois Central and Yazoo & Mississippi lines south of the Ohio river, with headquarters at New Orleans, La., has already been announced in these columns, was born on February 26, 1875, at Waterbury, Md. He was graduated from Lehigh University in 1896, and began railway work in July of that year with the Illinois Central, with which road he has remained ever since. He was consecutively chainman, rodman and assistant engineer until June, 1898; the following three months assistant engineer on maintenance work, and from September, 1898, to January, 1900, assistant engineer on location and construction. He was then for one year supervisor of track; from February, 1901, to September, 1904, roadmaster, and from the latter date to April, 1906, trainmaster. The succeeding four years Mr. Baldwin was superintendent, being appointed engineer maintenance of way at Chicago in May, 1910. In April, 1913, he became superintendent of the Kentucky division, which position he held at the time of his recent promotion to general superintendent of the lines south of the Ohio river, as above noted.

L. W. Baldwin

Traffic

The office of H. E. Arnold, commercial agent of the New York Central, at Lowell, Mass., has been removed to Boston.

E. S. White has been appointed general freight and passenger agent of the Illinois Southern, with office at St. Louis, Mo., succeeding W. H. Ogborn, resigned.

M. B. Wilburn, traveling freight agent of the Gulf, Colorado & Santa Fe at Houston, Tex., has been appointed commercial agent at that place, succeeding Drew Head, promoted.

Ted W. Krein, assistant general freight and passenger agent of the Fort Dodge, Des Moines & Southern, has been appointed traffic manager of the Muscatine North & South Railway, at Muscatine, Iowa, in place of H. B. Holbert, resigned.

K. B. Hannigan, commercial agent of the Southern Railway, at St. Louis, Mo., has been appointed assistant general freight agent, with headquarters at St. Louis, and C. F. Lauer, freight soliciting agent, at St. Louis, succeeds Mr. Hannigan.

F. M. Steele, commercial agent of the Fort Dodge, Des Moines & Southern at Des Moines, Iowa, has been appointed assistant general freight and passenger agent, with headquarters at Chicago, succeeding Ted W. Krein, resigned. Charles W. Welch succeeds Mr. Steele.

R. B. Robertson, general agent of the Chicago, Indianapolis & Louisville at Chicago, has been appointed division freight agent with headquarters in that city, and the former position is abolished. Henry Warner, assistant general agent at Chicago, has been appointed commercial agent at that point, and the former position is abolished.

Engineering and Rolling Stock

D. M. Neer has been appointed roadmaster of the Missouri, Kansas & Texas at Smithville, Tex., succeeding A. B. Crook, resigned.

D. E. Barton has been appointed acting master mechanic of the Atchison, Topeka & Santa Fe, with headquarters at Argentine, Kan., in place of E. E. Machovec.

H. Selfridge, general foreman of the Oregon Short Line, at Salt Lake City, Utah, has been appointed master mechanic of the Nevada Northern, with headquarters at East Ely, Nev.

J. H. Cooper, assistant supervisor of the Pennsylvania Railroad, at Tyrone, Pa., has been appointed assistant supervisor of division No. 2 Philadelphia division, with office at Paoli, succeeding F. H. Bentley, promoted.

W. C. Burel, district foreman of the Oregon Short Line, at Montpelier, Idaho, has been appointed general foreman of the Utah district, Utah-Montana division, with headquarters at Salt Lake City, Utah, succeeding H. Selfridge.

T. W. Fatherson, assistant engineer of the Rock Island Lines at El Reno, Okla., has been appointed engineer maintenance of way of the Chicago Great Western, with headquarters at Des Moines, Iowa, succeeding C. Millard, resigned.

J. W. Fletcher, roadway superintendent of the Carolina & North Western, at Chester, S. C., has been appointed engineer in charge of valuation, construction, betterment, inspection, tests and standards, with headquarters at Chester, and his former position has been abolished.

H. G. Sparks, division engineer of the Chicago & Eastern Illinois at Evansville, Ind., has been appointed division engineer at Salem, Ill., succeeding J. W. Hunter, who has been transferred to Danville, Ill., as division engineer in place of W. A. Van Frank, resigned. C. Brannon, assistant division engineer at Chicago, succeeds Mr. Sparks at Evansville.

The following officers of the Lake Shore & Michigan Southern, which is now consolidated with the New York Central Railroad, have had their jurisdiction extended over the Illinois division of the New York Central, formerly the Chicago, Indiana & Southern: Robert O. Rote, assistant chief engineer, Cleveland, Ohio; H. B. Reinsagen, principal assistant engineer, Cleveland; B. R. Leffler, bridge engineer, Cleveland, and F. B. Wiegand, signal engineer, Cleveland.

OBITUARY

John B. Gillett, formerly general freight agent of the Boston & Maine, until about 1871, died on February 2, at his home at Malden, Mass., at the age of 85.

Ellery S. Allen, formerly for many years general agent of the Cromwell Steamship Company, at New York, died of pneumonia on January 31, at his home in New York, at the age of 78. Mr. Allen retired from active work in 1907.

Equipment and Supplies

LOCOMOTIVE BUILDING

The French Government has ordered 7 locomotives from the Baldwin Locomotive Works.

The Grand Rapids & Indiana has ordered three Mikado type locomotives from the Lima Locomotive Corporation.

The Chicago, Burlington & Quincy is in the market for from 30 to 35 freight locomotives and 15 passenger locomotives.

The Louisiana Railway & Navigation Company has ordered 3 ten-wheel locomotives from the Baldwin Locomotive Works.

The Illinois Central has ordered 25 Mikado type locomotives from the Lima Locomotive Corporation in addition to the 25 similar locomotives ordered of the same company, reported in the *Railway Age Gazette*, January 8, and 25 switching locomotives ordered of the American Locomotive Company and reported in the issue of January 1.

CAR BUILDING

The Chicago, Burlington & Quincy is in the market for 1,200 box cars, 300 stock cars and 200 gondola cars.

The Baldwin Locomotive Works is figuring on several inquiries for a large number of trucks for export.

The Illinois Central has ordered 900 40-ft. 40-ton capacity refrigerator cars from the American Car & Foundry Company.

The Grand Trunk is building five freight cars in its shops at Chicago. These cars will replace some that were recently destroyed.

The Richmond, Fredericksburg & Potomac is reported to be preparing specifications for six all steel passenger cars. This item has not been confirmed.

The Pennsylvania Tank Car Company has received an order for 50 10,000 gal. capacity and 50 8,000 gal. capacity tank cars for an Oklahoma oil producer.

The Siamese Royal Railway Department invites bids for 40 bogies (trucks) and frames and fittings for 20 railway carriages, and for one steel bridge, 5 by 40 M.; separate specifications and drawings may be had from the Siamese Legation, Washington, D. C., upon payment of fees of $4 or $2 respectively.

IRON AND STEEL

The Siamese Royal Railway Department.—See item above under Car Building.

The Chicago & North Western has ordered 27,000 tons of steel rails from the United States Steel Corporation.

The Southern Pacific is said to have ordered 30,000 tons of rails from the Tennessee Coal, Iron & Railroad Company.

The Erie has ordered 22,000 tons of steel rails from the Carnegie Steel Company, 6,000 tons from the Illinois Steel Company, and 2,000 tons from another manufacturer.

The Denver Union Terminal Railway Company has ordered 152 tons of steel for its approach to the Twentieth street viaduct, Denver, Colo., from the Patterson Burkhardt Company.

The Seattle Terminal Company has ordered 292 tons of steel for its building at Seattle, Wash. The order was divided between the National Steel Construction Company, the Vulcan Iron Works and the N. & S. Foundry Company, all of Seattle.

SIGNALING

The Federal Signal Company has taken an order for the material for a mechanical interlocking plant on the Wilkes Barre Connecting Railroad, at Wilkes Barre, Pa.; 29 working levers and 3 spare spaces.

Supply Trade News

Leonard W. Kent, formerly eastern sales agent of The P. & M. Company, with offices in New York, died suddenly at his home in Westwood, N. J., on January 24.

The Hewitt Company, Chicago, Ill., has succeeded to the business and assumed the contract obligations of the Hewitt Supply Company, effective January 1, 1915. C. M. Hewitt is president.

C. B. McElhany, assistant general manager of sales of the Cambria Steel Company, has been appointed general manager of sales, succeeding J. Leonard Replogle, who has resigned to enter the service of the American Vanadium Company.

Effective February 15, the Cleveland office of the Ayer & Lord Tie Company, Chicago, Ill., at 801 Swetland building, will be placed in charge of B. S. McConnell, who will succeed F. A. Weaver, resigned. R. W. Slaney will succeed Mr. McConnell in Chicago territory.

James S. Llewellyn has been elected secretary, and Paul Llewellyn treasurer of the Chicago Malleable Castings Company. James S. Llewellyn will continue to hold the office of works manager at the West Pullman works.

J. Leonard Replogle, vice-president and general manager of sales of the Cambria Steel Company, since September, 1912, has resigned, effective March 1, to accept the position of vice-president and general manager of sales of the American Vanadium Company. Mr. Replogle has been in the service of the Cambria Steel Company for approximately 26 years. He was born in Bedford County, Pa., on May 6, 1876, and was educated in the public schools of Johnstown. He entered the employ of the Cambria Steel Company as an office boy when he was but 13 years of age and served successively as clerk, shipper, assistant superintendent of the axle department, superintendent of the forge, axle and bolt departments, assistant to the assistant general manager, superintendent of the order department, assistant general manager, assistant to president, and vice-president and general manager of sales. In his new position Mr. Replogle will have offices at New York and Pittsburgh.

J. L. Replogle

H. Bortin, formerly engineer in charge of the valuation department of the Union Pacific and a member of its valuation committee for four years, and lately assistant to the general secretary of the Presidents' Conference Committee on Federal Valuation of the Railroads, has opened an office as consulting valuation engineer, at 149 Broadway, New York City.

Charles E. Poyer has been appointed assistant general sales manager of the Edison Storage Battery Company, Orange, N. J. Mr. Poyer has been with the Edison interests for about four years, having served first on the personal engineering staff of Mr. Edison in the development of special applications of the alkaline battery, and later as assistant advertising manager. For the past two years he has been manager of the house lighting department.

The corporate name of the W. W. Herron Lumber Company, Mobile, Ala., has been changed to the Walker-Johnstone Lumber

Company, Inc., effective February 1. The officers of the company will be R. D. Walker, president; C. A. L. Johnstone, vice-president and treasurer, and D. R. Forman, secretary. This company has specialized since 1902 in furnishing yellow pine railroad tie and car material to the railroads and car companies. There will be no change whatever in its policy.

Lyndon F. Wilson, vice-president of the Railway List Company, Chicago, has resigned to become vice-president of the Bird-Archer Company, New York, effective April 1, 1915. Mr. Wilson was born at Rush Lake, Wis., November 4, 1883. He was educated at Ripon College, Lawrence University, and the University of Wisconsin. Before entering college, however, he was an operator in the office of his father on the Chicago, Milwaukee & St. Paul. Later, after having had considerable machine shop and power plant experience, he became an engineer in the Department of the Interior of the United States government, after having passed examinations in steam, electricity and heating and ventilating. After one year in this service, he joined the engineering department of the Western Electric Company, and remained with the latter until the fall of 1908, when he became mechanical department editor of the Railway Review. In the spring of 1909 he became editor of the Railway Master Mechanic, and was subsequently given editorial charge of Railway Engineering, both being published by The Railway List Company, Chicago. He was promoted to the vice-presidency of this company in the summer of 1913. After April 1, Mr. Wilson will be located in the Chicago office of the Bird-Archer Company.

L. F. Wilson

J. A. McFarland has been appointed southwestern district manager of the Bird-Archer Company, Chicago, with headquarters in the Frisco building, St. Louis, Mo. Mr. McFarland was born on October 23, 1880, at Mendota, Ill. After finishing his common school education he entered the University of Illinois, from which he graduated in 1903, having specialized in chemistry. He began railway work in May of the same year in the chemical department of the Atchison, Topeka & Santa Fe, at Topeka, Kan. On January 1, 1904, he became assistant in the testing department of the Chicago & North Western. In February, 1905, he became chief chemist of the Missouri Pacific, in which position he remained until May, 1909, when he took charge of the St. Louis office of the Dearborn Chemical Company, Chicago, looking after the latter's railroad business in that territory. In July, 1911, he left that company to become chemist and engineer of tests of the Frisco System, and was later connected with the Standard Railway Equipment Company, New Kensington, Pa., until his recent appointment to the position of southwestern district manager of the Bird-Archer Company, as above noted.

J. A. McFarland

The Canadian Car & Foundry Company, Ltd.

Although the declaration of war did not have a relatively great effect on the operation of the Canadian Car & Foundry Company, Ltd., for the fiscal year ended September 30, 1914, the combined output of this company and its associated companies, the Canadian Steel Foundries, Ltd., the Pratt & Letchworth Company, Ltd., and the Rhodes, Curry Company, Ltd., was approximately $11,000,000 in value as compared with $27,000,000 for the previous fiscal year, a reduction of no less than 59 per cent.

The combined profit, after charging all expenditures for the maintenance and renewal of plant and equipment was $673,036. From this there was deducted provisions for depreciation and bond sinking funds of $278,077, leaving a total of $394,959. Interest on bonds was $556,205, and there was deducted from the latter amount $95,437 charged to property account and representing interest on the cost of construction of the new Fort William plant, thus leaving a total of $460,768. There was, therefore, a deficit for the year, after the payment of bond interest, of $65,809. The combined surplus of the associated companies on September 30, 1913, was $2,224,579, thus leaving a surplus available for dividends of $2,158,770. Dividends of $526,500 were paid, so that the surplus on September 30, 1914, was $1,632,270.

The associated companies now have capital assets, including real estate, buildings, machinery, patents and good will of $19,297,122; $1,012,859 having been added during the year chiefly by the expenditure on the Fort William works. The current assets amounted on September 30 to $5,920,748, of which $3,245,710 was inventory of manufactured and partly manufactured products, materials and supplies, and $163,855 cash. The company's capital stock is now $10,975,000, and there are bonds outstanding of $9,303,429. The current liabilities on September 30 amounted to $1,595,187, of which $706,593 was accounts and bills payable.

The annual report is published in an unusually attractive manner and contains several views of freight and passenger cars turned out at the various works.

TRADE PUBLICATIONS

Chicago, Rock Island & Pacific.—The passenger department has issued a 48-page folder containing numerous illustrations showing points of interest at both San Francisco and San Diego, in connection with the Panama expositions. It describes these places as well as telling how to reach them.

Portable Machine Tools.—The Pedrick Tool & Machine Company, Philadelphia, Pa., is now distributing its 1915 catalog of portable machine tools. The catalog contains views and illustrations of portable cylinder boring bars, portable turning machines, milling machines, pipe bending machines, etc.

Tools.—The Verona Tool Works, Pittsburgh, Pa., has issued catalog No. 11, a 64-page book, devoted to the description and illustration of its various forms of track tools. It also shows a view of the laboratory where each lot of steel is analyzed. The illustrations clearly show the detail of construction of the tools.

Telephones.—The Western Electric Company, New York, has issued a folder containing an article entitled "The Transcontinental Voice Highway" describing the opening of the direct connection by long-distance telephone between New York and San Francisco on January 25, together with a brief history of the development of long-distance telephone operation in this country.

Curtain Fixtures.—Bulletin No. 182, issued by the Dayton Manufacturing Company, Dayton, Ohio, describes and illustrates the Dayton curtain for railway car windows. This curtain is fitted with friction shoes bearing in grooves which hold the curtain in position and retaining strips prevent accidental displacement. A guide for convenience in ordering is given on the last page.

Hoists and Derricks.—The Minneapolis Steel & Machinery Company, Minneapolis, Minn., has issued a 110-page catalog which illustrates and describes fully the design and construction of the various types of Twin City hoists and the machinery necessary for their operation. The book also describes the construction and action of various kinds of coal hoisting and dredging buckets, pile drivers, grab hooks, etc.

Railway Construction

Carolina & Yadkin River.—Surveys are to be started soon, it is said, for an extension to be built from Denton, N. C., southwest to Troy, about 25 miles.

Grasse River.—This company has track laying finished on a line from Childwold, which is on the New York Central, in St. Lawrence county, N. Y., west via Conifer to Cranberry Lake, about 15 miles. The maximum grade is 2.3 per cent, and maximum curvature 14 deg. The company expects to develop a traffic in lumber, wood products and general merchandise on the new line. The organization of the company has not yet been completed. William T. Turner, Utica, N. Y., is interested.

Jellico Coal & Railroad.—Surveys are being made, it is said, for the line projected last year from a point near Pine Knot, Tenn., on the Queen & Crescent Route, to Jellico, about 20 miles. There are to be two tunnels and three small bridges on the line. W. E. Wheelock, superintendent of terminals of the Cincinnati, New Orleans & Texas Pacific at Chattanooga, Tenn., is president of the new company, and D. C. Barker, chief engineer, Jellico. (September 18, p. 549.)

Mexican Roads.—Plans have been made by a syndicate of Americans to build a railroad in the state of Puebla to provide an outlet for coal that was recently discovered in the southern part of the state. The syndicate has bought the coal deposits, and it is said will spend about $4,000,000 gold in developing the property and constructing the proposed railroad. The line is to be built from Zautla to a connection with the Teziutlan branch of the Interoceanic Railroad.

Official announcement is made at the City of Mexico of the cancellation by the Conventionist government of Mexico of the concession granted to a Belgian syndicate for the construction of an extensive system of railways to cost about $40,000,000. Considerable preliminary work had already been carried out and some of the routes had been surveyed. The cancellation of the concession was made upon the application of the syndicate, it is said, as present conditions in Belgium make it impossible for the contract to be fulfilled.

Ocilla Southern.—Work is to be started soon, it is said, on the extension which was projected over a year ago from the present northern terminus of the road at Rochelle, Ga., north to Macon, about 80 miles. The company has secured an amendment to its charter, and the stockholders have acted favorably upon a proposed increase in capital stock of from $1,000,000 to $3,000,000.

Ottawa & St. Lawrence Electric.—This company was organized in 1912, to build 275 miles of electric railway in eastern Ontario out of Ottawa. Contracts for some of the work have been let, it is said, and work will be started next spring on the section between Perth and Smith's Falls, about 15 miles. H. W. Pearson, Confederation Life building, Toronto, is secretary. (December 18, p. 1166.)

South Carolina Roads.—Under the name of the North Charleston Corporation, plans are being made, it is said, to build a belt line to connect North Charleston industrial plants with the yards of the Southern Railway, the Atlantic Coast Line and the Seaboard Air Line. R. G. Rhett, president, Charleston.

Right of way has been secured, it is said, to build a line from timber lands on the Congaree river to a point near Columbia, S. C., 12 miles. J. C. Brewerton, Fayetteville, N. C., is back of the project.

Waushara County.—An officer writes that work on the construction of the proposed line between Red Granite, Wis., and Poysippi will be begun as soon as the frost leaves the ground.

RAILWAY STRUCTURES

Dallas, Tex.—The Stone & Webster Engineering Corporation is preparing plans for the construction of extensive terminal facilities for its interurban railway system.

Macon, Ga.—An officer of the Central of Georgia writes that the contract entered into with the city officers of Macon, for the construction of the union station at Macon is only a preliminary step. No detail plans for the station or for other improvements have as yet been made. The company has not yet decided when bids for this work will be asked for, or when construction work will be started. (January 29, p. 212.)

New Orleans, La.—The Louisiana Railway & Navigation Company has negotiations under way for the building of a large grain elevator on the river front.

Paterson, N. J.—An officer of the Erie writes that nothing definite has been determined upon to carry out the removal of 15 grade crossings on the Erie in Paterson. The Board of Public Utilities Commissioners recently acted favorably on the application of the city officers of Paterson for the elimination of these grade crossings.

Pen Argyl, Pa.—An officer of the Lehigh & New England writes that contract for a new shop and storehouse to be built at Pen Argyl has been let to F. D. Hyde, New York City. The shop will be a one story structure 164 ft. 9¼ in. by 264 ft. outside dimensions, and the machinery will be operated by electricity. The shop will have steel columns, roof trusses and purlins, reinforced cinder concrete roof slabs, waterproof roof covering, steel sash, concrete foundations and Natco hollow tile walls with stucco covering; the storehouse will be 40 ft. by 150 ft., and there will be a boiler house 34 ft. by 40 ft., and an oil house 20 ft. by 21 ft. The contract also includes a foundation 40 ft. 7 in. by 310 ft. for a transfer table. The work will probably be started early in February, and will cost about $95,000.

Pittsburgh, Pa.—An officer of the Baltimore & Ohio writes that bids have been asked for building a steel viaduct 1,900 ft. long, which will be 35 ft. at its greatest height, to cost about $700,000. The improvement is being carried out to eliminate the grade crossing at Liberty avenue and Thirty-third street, Pittsburgh.

Salt Lake City, Utah.—The San Pedro, Los Angeles & Salt Lake has submitted plans to the city council for a proposed new passenger station to be built on Seventh street. The building is to be 90 ft. by 162 ft., and two stories high, and is to be of reinforced concrete construction. The company will file formal application for permits and privileges at once, and states that the building will be completed in six months. The estimated cost is $260,000.

Guatemala and Southern Mexico.—It is reported that the Guatemala Central has been extended westward to Mariscal on the Pan-American, on the border line between Guatemala and Mexico; but it is expected that several months must elapse before through traffic can be established between the two countries, because of the disturbances caused by the revolutionists. Depredating bands have recently destroyed bridges along the line of the Pan-American and have torn up long stretches of track. The line between the Tehuantepec Railroad and Vera Cruz is also in bad shape and no regular through trains are being run.

The Needs of the Railways of New Zealand.—The new general manager of the New Zealand State Railways has recently made a report on the organization and equipment of the system, in which there are proposed a large number of important changes. The erection of new locomotive construction works is contemplated at Newmarket, and the standardization of engine types and the abolition of the small type of engine hitherto extensively used on the New Zealand railways is engaging attention. Among other contemplated changes and extensions the following may be briefly indicated: rail motor service for suburban traffic in the larger cities; substitution of electric lighting for gas on main through trains; reorganization of the present system of car cleaning; extension and re-modeling of existing building and repair shops, and the erection of new stations. The various improvements entail a total estimated expenditure of $16,250,000 spread over a period of five years and comprise: terminals, $7,850,000; double tracking, $2,425,000; grade elimination, $1,250,000; new engine house and approach lines at Auckland, $700,000; additions to shops, $300,000; new lines, $1,875,000; signaling and interlocking, $1,250,000; warning signals for grade crossings, $100,000; bridge strengthening, $250,000, and 10 new locomotives, $250,000.

Railway Financial News

Chicago, Rock Island & Pacific.—A suit has been filed in the New York Supreme Court by the First National Bank of Ridgefield, N. J., the People's National Bank of Hackensack, N. J., N. L. Amster, of Boston, and nine other stockholders of the Chicago, Rock Island & Pacific Railway Company to recover from the directors of the company of December, 1909, $7,500,000 alleged to have been unlawfully paid out by the Railway company. The specific grounds for the suit are the allegations that in December, 1909, the Railroad company—the Iowa holding company—sold $28,940,300 stock of the St. Louis & San Francisco, held as collateral under $17,364,180 bonds of the Railroad company, for 37.50 per cent of par, an aggregate of $10,852,612, and that in order to release the collateral it was necessary for the Railroad company to raise $7,500,000 in cash in addition to the proceeds of the sale of the collateral. The individual defendants being in control of the Railroad company, the complainant alleges, and being heavily interested in the stock of the New Jersey company, caused the Railway company to borrow $7,314,661 and to pay $185,339 as expenses of raising the money and to turn over the $7,314,661 to the Railroad company in exchange for $7,500,000 5 per cent unsecured debenture bonds, and that this purchase by the Railway company was fraudulently and unlawfully accomplished. The individual directors named are D. G. Reid, Richard A. Jackson, H. S. Cable, F. L. Hine, Ogden Mills, G. G. McMurtry, W. T. Graham, W. H. Moore, G. T. Boggs, E. S. Moore, J. J. Mitchell, J. H. Moore and H. U. Mudge.

Another suit has been filed against individual directors by Sadie E. Hiddon in behalf of herself "and other bondholders" to recover sums claimed to have been paid as campaign contributions and in excessive salaries.

D. G. Reid has resigned as a director of both the Railway company and the holding company, and E. S. Moore, Roberts, Walker and John J. Mitchell, whose terms expire this year, have announced that they do not seek re-election.

Erie.—This company has notified the New York Public Service Commission that an offer had been received from J. P. Morgan & Co., to purchase $13,000,000 bonds of the Erie & Jersey and the Genesee River Railroads, roads owned by the Erie, at 98½ per cent and 97½ per cent, provided an increase on the interest of the bonds from 4 to 6 per cent is approved by the commission. These 4 per cent bonds are now pledged as security for the Erie's short term notes, which it sold in 1905, when the two railroads were incorporated and the lines constructed to reduce grades of 1 per cent to grades of ½ per cent, so that the Erie might compete with other trunk lines. The offered price, is net and without commission.

Evansville & Indianapolis.—The protective committeee representing the first mortgage 6 per cent bonds of 1924 and the first consolidated mortgage 6 per cent bonds of 1926, of which Frederick H. Shipman, treasurer of the New York Life Insurance Company, is chairman, has fixed February 15 as the last day on which bonds can be deposited with the Farmers' Loan & Trust Company as depository for the committee.

Illinois Central.—The company has sold to Kuhn, Loeb & Company, New York, $10,000,000 Illinois Central and Chicago, St. Louis & New Orleans division joint first refunding 5 per cent bonds.

New York Central Railroad.—Judge Hough, in the United States district court, has upheld the complaint of John Scott Boyd, Jr., representing certain minority stockholders of the New York & Harlem, preventing the merger of the New York & Harlem with the New York Central & Hudson River. The following is a brief abstract of the decision:

(1) That the New York Central desires and intends to consolidate with the New York & Harlem.

(2) That this consolidation would be a violation of the contract rights of the minority stockholders of the Harlem Company, and that such stockholders are entitled to an injunction restraining consolidation during the term of the lease of 1873, namely, until the year 2274.

(3) That no testimony is necessary to establish the right of the minority stockholders to such an injunction, but that they are entitled now to an injunction during the pendency of the action and will become entitled to a permanent injunction at the trial, or by waiving the additional claims made in the complaint, the minority stockholders will become entitled now to a permanent injunction restraining the consolidation.

(4) The allegations of the plaintiffs to the effect that the control of the Harlem road by the Central is a violation of the Sherman act sets forth a good cause of action which, if proven, may entitle the plaintiffs to additional relief in order to maintain the present status and prevent any increase of the existing illegal control until such time as the attorney-general chooses to act.

Justice Keogh has denied the Continental Securities Company an injunction to restrain the merger of the Lake Shore and the New York Central on the ground of the issue of 4 per cent bonds in place of 3½ per cent bonds. Justice Keogh holds that this does not violate the New York Public Service Commission law.

New York, New Haven & Hartford.—A bill is to be introduced into the Rhode Island legislature providing that the New York, New Haven & Hartford be permitted to issue preferred stock, and it is said that a similar bill will be introduced in the Connecticut general assembly. President Elliott is quoted in the Providence Journal as saying:

"One very desirable method of raising the money needed [to refund maturing short term indebtedness] would be for the stockholders to buy new issues of common or preferred stock. . . . The showing made by the property and the complications surrounding it during the past two years are such that an increase of common stock at this time is out of the question.

"The issue of preferred stock is a desirable method when practicable, but it is not clear that the right exists under the present law. . . . It is now important, therefore, to have the laws made clear so that steam railroad companies can issue preferred stock as a means of raising money if market conditions justify.

"Although there are no mortgage bonds outstanding on the main line of the railroad from New York to Providence, and from New Haven to Springfield, except $750,000 between New London and Providence, nevertheless the company cannot pay its obligations by an issue of bonds secured by a mortgage because of limitations and conflicts in the laws of the states of Massachusetts, Rhode Island and Connecticut. Massachusetts permits the issue of a mortgage to twice the amount of capital stock and premiums actually paid in, while Connecticut limits the amount of mortgage to one-half the amount actually expended on the railroad. Under this limitation no mortgage could be issued which would take care of the outstanding obligations necessary to be included, to say nothing of the floating debt and additional necessities of the railroad. As the general laws of Rhode Island do not specifically authorize railroad mortgages, there is some doubt of the New Haven's right to mortgage property in that state.

"Under existing Massachusetts laws any mortgage made by the New Haven company must secure the bonds of other railroad companies now a part of the New Haven system, which are already amply secured by first mortgages on the property of those roads and manifestly should not have the additional security of any mortgage on the now unmortgaged main line of the New Haven.

"Doubt exists as to the actual amount of outstanding capital stock recognized by the state of Massachusetts, owing to the fact that when the New Haven securities were validated by the report of the validation commission in 1911, a stock issue was authorized and subscribed for, but only paid in part, and only the amount then paid in was validated. Legislation to validate the total amount paid in is obviously necessary."

Pennsylvania Railroad.—The offering price to the public of the $49,000,000 consolidated (now first) mortgage bonds which Kuhn, Loeb & Company, New York, bought from the Pennsylvania was 103¾, yielding approximately 4.31 per cent on the investment. The issue was subscribed for five times over.

The Pennsylvania has asked the New Jersey Board of Public Utility Commissioners for permission to take over the Philadelphia & Long Branch, the Pemberton & Hightstown and the Kinkora & New Lisbon. These are branch lines which the Pennsylvania owns and has been operating.

Railway Age Gazette

PUBLISHED EVERY FRIDAY AND DAILY EIGHT TIMES IN JUNE BY THE
SIMMONS-BOARDMAN PUBLISHING COMPANY
WOOLWORTH BUILDING, NEW YORK

CHICAGO: Transportation Bldg. CLEVELAND: Citizens' Bldg.
LONDON: Queen Anne's Chambers, Westminster

E. A. SIMMONS, *President*
L. B. SHERMAN, *Vice President.* HENRY LEE, *Sec'y & Treas.*
The address of the company is the address of the officers.

Contents

*Illustrated.

New York Central New Bond Issue

After the approval of the stockholders and public service commissions concerned has been obtained, stockholders of the New York Central Railroad Company, the new consolidated company, are to be offered the privilege of subscribing for an issue of $100,000,000 6 per cent 20-year debenture bonds at par. The bonds are convertible into stock after 1917 and up to May 1, 1925, at 105. J. P. Morgan & Co. are to form a syndicate to underwrite the issue. The arrangements for the sale of these bonds marks the end for the New York Central and the Lake Shore of a long period of financing by short term notes. The New York Central has $20,000,000 notes falling due in 1915, and at the end of 1913 $44,868,000 loans and bills payable, and the Lake Shore at the end of 1913 had $23,768,000 one-year notes falling due in 1914, which have been temporarily extended. The proceeds of the debenture bonds sale will, therefore, just about pay off all of the maturing short term notes. By selling 6 per cent debentures to its stockholders at par the New York Central, in effect, gives its stockholders rights, which apparently are worth from $3 to $6 a share; by issuing debentures for refunding purposes instead of mortgage bonds secured by the new improvement and refunding mortgage it would appear to strengthen the position of the bonds which have already been issued under this mortgage, and by making the debentures convertible into stock it indirectly increases the total amount of bonds which can be issued under the improvement and refunding mortgage by $300,000,000, the limitation in the improvement and refunding mortgage as to the amount of bonds which can be issued under it being contingent on the amount of stock issued. The high rate of interest on the debentures is probably thought by the directors to be fully justified by the gain which is made in strengthening the improvement and refunding mortgage bonds which may later be issued either for refunding underlying obligations or for additions and improvements.

Blocking Development at St. Louis

The Terminal Railroad Association of St. Louis is again seeking authority to enlarge its terminal facilities in that city. Seven years ago it acquired a tract of 26 acres in the heart of the railway district to supply greatly needed storage tracks, but the city authorities refused to let it cross some streets and alleys which really had never been opened, and it has been denied the use of its property to the present time. In consequence, it has become crowded so badly in the yards adjacent to the Union Station that local freight facilities have had to be taken over for the storage of passenger equipment. St. Louis has a new city charter, which confers upon its local public service board the exclusive right to permit railroad tracks to cross or occupy public streets and alleys. A month ago the Terminal Association asked permission of this board to cross some unused streets to make use of part of its tract in order to prevent a serious congestion in its main yards which was threatened. The board promptly filed its application, and then apparently forgot about it. Now the shippers are taking a hand in the matter and are demanding some action without further delay. The Business Men's League and the various railroads serving St. Louis all maintain industrial organizations that work to bring new factories to the city; and to make any headway in this sort of endeavor it is essential that the prospective newcomers be guaranteed switch tracks to their factories. One of the arguments in favor of the new charter was that the transfer of the switch-giving power from the aldermen to the public service board would insure quicker action and thereby aid in the campaign to get more industries for St. Louis. One of the first applications under the new code was that of the Terminal. The shippers who have come to its support are the biggest in St. Louis, and some interesting sessions between their committee and the service board are expected. If the board is going to sidetrack switch applications in this way the city will hardly be able to compete for new industries with other cities where switch tracks are allowed to be built almost as a matter of course.

The Price of Rails

For the first time since 1901 steel rails are now being quoted openly at less than $28 per ton. This basic price was established for Bessemer rails at the time of the formation of the United States Steel Corporation and has been maintained by the corporation and independent mills alike since that date. Very recently the Algoma Steel Company, a Canadian corporation, has entered the market in this country, quoting open hearth rails at $25 per ton on board cars at the mills, or $27.60 on board cars at Chicago, as compared with $30 at the mills quoted by the manu-

facturers in the United States. This creates a very interesting situation in the steel market, and at least three roads, the Pere Marquette, the Big Four and the Toledo & Ohio Central, have given this company rail orders at these prices. The reasons why the Algoma Steel Company is able to quote this price on rails are evident. The European war has created a business depression in Canada much more acute than in the United States, with the result that the rail requirements of the Canadian railways are materially reduced. The steel company is therefore seeking new business at a reduced price to prevent the closing down of the mill. The fact that there is no tariff on ore moving from the United States into Canada, and the recent removal of the tariff on steel products into the United States now enables that company to direct its attention effectively to this country. Situated as it is on Lake Superior, it is in a position to deliver rails by water at any of the lake ports, and it may therefore become a serious competitor of the mills in this country. While as a business matter it may be expedient to reduce the price on the rails delivered in this country to maintain the output, it will be interesting to note whether the Canadian roads do not demand a similar reduction. It will also be interesting to observe the attitude that the steel companies in this country will assume toward this new competition and the extent to which the roads in this country will avail themselves of this reduction in price, and the effect, if any, on prices in this country.

THE LAW, AND THE RAILWAYS AND THEIR PATRONS

WE referred in a recent issue (*Railway Age Gazette*, January 22, page 117) to statistics showing that in 1913 the Interstate Commerce Commission secured more indictments and caused more prosecutions of patrons of the railways than of the railways themselves for violating the Interstate Commerce law and the Elkins act. The complete figures for 1914 show that the same thing was true in that year. The number of indictments of railways secured in 1914 was 21, while the number secured against other persons and concerns was 37. The number of prosecutions under these laws carried to success in 1914 against railways was 23, while the number against other persons and concerns carried to success was 45.

Combining the figures for 1913 and 1914 we get the following results:

Total number of indictments, 119.

Number against railroads, 48, or 41 per cent.

Number against other persons and concerns, 71, or 59 per cent.

Total number of successful prosecutions, 119.

Number of successful prosecutions of railways, 42, or 35 per cent.

Number of successful prosecutions of other persons and concerns, 77, or 65 per cent.

The laws under which these indictments were secured and these prosecutions were conducted were passed primarily to regulate railways. If these figures have any significance it is that the railways are now obeying the laws much better than the people who travel and ship goods over their lines. The *Railway Age Gazette* repeatedly has contended that the standard of morality in the railway business is higher than in other lines of commercial and industrial enterprise in the United States, and the statistics cited support this contention.

The offenses committed by the patrons of the railways are of various kinds, and include misdescription of contents of packages; false billing; making fraudulent claims against carriers; soliciting unlawful discriminations; making unlawful use of free passes; using false weights; conspiring to violate the Hepburn act in connection with the transportation of theatrical goods; obtaining unlawful concessions on shipments; inducing agents of the railways to discriminate by issuing bills of lading prior to the receipt of shipments; accepting rebates outright; soliciting and receiving information concerning shipments consigned to other parties, and so on. The variety of the offenses committed is great, and it will be noted that in a majority of cases they not only violate the law but rob the railway.

Regulation of railways, especially that which has been done by the Interstate Commerce Commission, has tended powerfully to raise and maintain the standard of morals in the railway business. This effect was expected. The influence which it is exerting in raising the standard of morals in other lines of business by compelling concerns in other lines of business to quit trying to defraud the railways is unexpected, but is none the less beneficent on that account.

It is hard to resist the temptation to suggest, in conclusion, that as the evidence shows, men in many lines of business who have devoted a large part of their energies to denouncing the evils in railway management might have been more usefully employed in denouncing the evils in their own lines of business, and perhaps in even correcting forms of crookedness prevailing in their own concerns. As long as 65 per cent of the successful prosecutions under the Interstate Commerce act and the Elkins act are directed against shippers and other patrons of the railways we shall hope to hear less than in the past from representatives of business concerns regarding the failure of the railways to clean their houses.

BUSINESS INTERESTS AND THE GOVERNMENT

AT the recent annual dinner of the Chicago Railway Equipment Company, which was attended by a number of prominent business men, a resolution was adopted on the motion of E. B. Leigh, president of this company, expressing it as the sense of those present that the Chamber of Commerce of the United States should appoint a committee to devise ways and means for mobilizing the entire business forces of the country to the end that business may speak and act as an intelligent and forceful unit on the many public questions which so vitally affect it.

This resolution expresses one of the great needs of the present day in the United States. For ten years the business interests of the country have been constantly under fire. The fire has come from the professors of economics in the universities, from advocates of socialism, from leaders of organized labor, and from public men. It has also come from business men themselves, some classes of them attacking others. It has consisted not only of agitation and denunciation, but of an enormous amount of municipal, state and national legislation. At first the attacks affected only insurance companies, railway companies and large combinations. They now directly or indirectly affect all business men and businesses, big and little.

Practically every provision, state and national, which has been enacted during this period for the regulation of business has been a piece of class legislation. The general purpose has been to promote a different, and what it has conceived would be a more equitable, distribution of wealth. None of the legislation passed has been intended or adapted to increase efficiency in production. But it is very difficult to frame legislation so that it will affect the distribution of wealth without so framing it that it will affect the production. And the legislation intended to influence distribution has influenced production. Whatever other effects it has had on distribution, one effect it clearly has had. It has reduced production and thereby curtailed the amount available for distribution. Whether distribution is or is not more equitable than ten years ago, the absolute amount being distributed to all classes—to the working class, the middle class and the more wealthy class—has been substantially reduced.

Organized labor has had a potent part in shaping the legislation for the regulation of business. The American Federation of Labor, the various state federations of labor, the railway brotherhoods, with their large voting strength through their legislative agents at the state capitals and at Washington, have largely determined the tone and the speci

provisions of many of the laws which have been passed. On the other hand, as a class, business men have exerted but little influence on legislation. As classes, rather than as a single class, they have influenced it. The shippers have got a large part of the legislation which has been applied to railways. The direct effect has been to curtail the earnings and hamper the development of the railroads, and its indirect effect has been to stimulate a tendency to apply to industrial and commercial concerns the same kind of regulation which has been applied to railways. The bankers exerted an influence on the federal reserve legislation, but they received little support, from other classes of business men. And so it has been all along the line. While labor has acted unitedly the business men have split up into a dozen camps and spent more time trying to get legislation that would profit one part of them at the expense of another than in trying to prevent legislation which would hurt all of them.

The shrewdness and skill which organized labor has shown in carrying on its campaign for regulation which it has conceived would benefit it has been equaled only by the short-sighted selfishness and stupidity which the business interests have shown in dealing with questions vitally affecting them. Where is the business organization which corresponds to the American Federation of Labor? Where is the business organization in any state which corresponds to the various state federations of labor? Where are the legislative representatives of business at Washington and at the various state capitals who correspond to the legislative representatives that labor has in those places? When a state legislature or Congress meets there usually are lobbies on hand representing business interests, but they are usually not there lobbying to protect the interests of business as a whole, but to enable some classes of business interests to get advantages, fair or unfair, over other classes of business interests.

The consequence is that organized labor, representing, it is understood, about seven per cent. of the people, is dictating legislation and regulation in every state and in the nation, while the business interests, instead of securing fair treatment from the government and its co-operation and support in developing commerce and industry, are securing almost no legislation favorable to them and are being constantly victimized by legislation which injures them and the entire nation.

When are business men going to awaken to their true interests? When are they going to recognize the fact that every time one class of business interests gets legislation for the regulation of some other class of business interests it establishes a precedent for the application of some form of government interference to its own business? When are they going to recognize the fact that by splitting into factions, as they do now, they play into the hands of the leaders of organized labor, and the agitators for state socialism.

We have a Chamber of Commerce of the United States, and it ought to be loyally supported by the business interests of the country and so organized and constituted that it may become a potent representative and spokesman of business interests as a whole at Washington. But ought there not to be a similar organization of business interests in every state, an organization including all classes, which would regularly be represented at the legislatures by spokesmen competent to fight effectively for good legislation and to fight effectively against bad legislation? Business men are constantly crying out about the way the national government is dealing with business. But the state governments are, in many cases, doing business far more harm than the national government. In the case of railroad regulation the work of the Interstate Commerce Commission and of Congress, about which so many business men complain, is perfection compared with the work of many state legislatures and state commissions. Ought there not to be not only a Chamber of Commerce of the United States, but also a chamber of commerce of New York state, a chamber of commerce of Pennsylvania, a chamber of commerce of Illinois and a chamber of commerce of every other state through which the manufacturing, the railway, the commercial, the mercantile, the agricultural and all other business interests might act and speak as a unit at their respective state capitals? Business needs to sit at the feet of organized labor and learn from it.

THE CAMPAIGN FOR ADVANCES IN PASSENGER RATES

EIGHT years ago an agitation for the reduction of the railway maximum passenger fare from three cents to two cent a mile swept over the United States. How it was started would be difficult to say. It was merely a part of the general movement for a reduction of railway rates. The railways resisted it, but unsuccessfully. Two-cent fare laws were passed in most of the states and the relationship between state and interstate rates compelled the reduction of interstate rates to the same basis.

It was inevitable that sooner or later there should be vigorous efforts made by the railways to get advances in the rates fixed at that time. There was no evidence that a maximum fare of two cents a mile was reasonable. The Wisconsin Railroad Commission, which made the most thorough investigation of the subject, held that even on the Chicago, Milwaukee & St. Paul and the Chicago & North Western, which had the densest traffic in the state, a rate of less than 2½ cents would be unreasonably low. Nevertheless, the railways let the two-cent fare laws go into effect in many states in order to avoid the heavy penalties prescribed for their violation, and to satisfy the public demand that they should be given a trial.

Even the advocates of the two-cent fares practically conceded that on the basis of the traffic existing at that time they would be unremunerative, but they argued that the reduction in fares would so greatly stimulate the growth of the traffic that the railways would make more money on the lower fares than they had on the higher. Experience has conclusively answered this argument. The growth of passenger traffic has been lower since the two-cent fare laws were passed than it was before. The Illinois lines have shown that in that state in the four years prior to July 1, 1907, on which date the two-cent fare law went into effect, the number of passengers carried one mile increased 22.31 per cent, while in the four years ending June 30, 1913, the increase was only 17.43 per cent. The reduction in fares did not retard the growth of traffic, but it did not increase it. Whether a reduction in rates will cause an increase in traffic depends entirely on the nature of the traffic to which, and the conditions under which, the rates apply.

Not only was the two-cent fare unreasonable when the legislation prescribing it was passed, but it has steadily become more unreasonable ever since. There have been enormous increases in railway expenses and taxes since the years 1906 to 1908, in which the most of this legislation was passed. It has been possible largely to offset, in the freight service, this increase in expenses by the introduction of economies, but passenger traffic does not lend itself to this kind of treatment to the same degree as freight traffic. The greatest economies in the handling of freight are effected by increasing the tons hauled per car per train. Proportionate increase in the number of passengers hauled per car and per train cannot be made for perfectly obvious reasons. Therefore the increase in the ratio of passenger service expenses to passenger earnings has been much greater than the increase in the ratio of freight service expenses to freight earnings. Louis D. Brandeis, special counsel for the Interstate Commerce Commission, brought this point out very clearly in his argument in the original five per cent rate case. For example, as he showed, between the fiscal year 1911 and the fiscal year 1913, the ratio of freight expenses to freight earnings on the Baltimore & Ohio was actually reduced from 68.16 per cent to 66.44 per cent, while the ratio of passenger expenses to passenger earnings increased from 82.39 per cent to 106.23

per cent. The experience of the Baltimore & Ohio was similar to that of almost every other road in eastern territory, and convinced not only Mr. Brandeis, but the Interstate Commerce Commission that even on the eastern roads, with their relatively dense passenger traffic, the two-cent fare was entirely unremunerative. If it is unremunerative in the eastern states, it must be very much more unremunerative in other states, such as Ohio, Indiana and Illinois, and especially Iowa, Missouri, Kansas, Nebraska, Arkansas and Oklahoma.

The evidence as to the unremunerativeness of the two-cent fare is ample to convince any reasonable man. It is sometimes pointed out that the average passenger fare in other countries is lower than in the United States. But in the first place the passenger fare in the United States is lower than in any other country in the world for similar service, the low average fares in such countries as Germany and France resulting from the charging of low rates for third- and fourth-class services so poor that no class of people in America would use them. In the second place, in the countries where these low average passenger fares obtain the wages paid to railway labor are only one-half as high as the wages paid in the United States. Finally, the passenger traffic on the railways of the leading countries of Europe are from three to five and one-half times as dense as it is on the railways of this country. Therefore, to compare the average passenger rates of Germany and France, for example, with the average passenger rate in this country is to compare things that are not comparable.

The difficulty is not in producing evidence that the two-cent fare is unreasonably low, but in getting it before those who will finally determine what the maximum fare should be. Public opinion demanded the two-cent fare legislation of seven to ten years ago. Public opinion will also determine whether one-half of what was then taken away from the railways shall now be given back to them. Therefore, through public addresses, pamphlets, newspaper articles and advertisements, the railways of Illinois and other states are taking their case for higher passenger rates directly to the public. In Illinois, for example, a committee of presidents first got a hearing with the governor, and now officers of the roads are conducting a state wide campaign of public education. Later, they will go before the legislature.

By following this procedure the railway managements are showing great good sense. Regulation has been unfair to the railways in the past because the public has been misinformed, and, being misinformed, has been prejudiced. The public will give the railways a square deal if they will give it a chance. That it has not given them a square deal in the past has been largely due to the fact that the railways have not made enough efforts to get the facts regarding their business before it.

THE WAR AND RAILWAY NATIONALIZATION

THE Railway Gazette of London observes that many of those who favor the nationalization of British railways are so eager that any argument is seized upon to support their case, and that they have taken the success of the government control of the British railways during the war, for the purpose of securing closer co-operation of the railways and the military authorities, as a proof of the success which would attend actual government ownership and operation. But, as our English contemporary shows, any such argument ignores the most vital facts in the case. The government, while practically managing the railways to the extent that they are used for military purposes and that all other considerations are made subordinate to the military requirements, is exercising that control through a committee of twelve of the general managers of the railways themselves, appointed long before the war, who work in conjunction with the War Office and the Admiralty. Moreover, the efficiency with which this committee has done its work, and the fact that it is practically the only department concerned with the military preparations which has done its part almost entirely without criticism, is pointed to as the best possible proof of the superiority of private over government management. The work of the War Office, the Home Office, the Foreign Office and the Admiralty has received a large amount of public criticism, whereas the railways, which in ordinary times are constantly condemned, have received nothing but praise since the war began.

One of the reasons given as to why government operation of the roads would be less successful than private management is that the government would not pay sufficiently large salaries to retain the services of the kind of men that now comprise the committee. Instead of the operation of the railways during the war serving as an argument for British railway nationalization it is quite likely that the war will give a quietus to the discussion of the question for many years, because the British government for some time after the war is over will have its hands full of work which is more properly the function of a government than railway operation, and will hardly be in a position to add to the financial obligations caused by the war, the burden of investment in the railway system.

WABASH

THE details of the reorganization of the Wabash when the property is taken out of the receivership will be the result, as in all railroad reorganizations of a compromise between the various conflicting interests of the security holders and creditors of the company. The basis for any reorganization, however, must be the earning power of the plant, and the results of operation of the Wabash in the fiscal year ended June 30, 1914, while not utterly hopeless, appear to show something vitally wrong either with the rates received or with the cost of operation.

The Wabash operates 2,515 miles of road, of which 507 miles has second track, and of the total mileage operated 2,035 miles is owned, the remainder being almost entirely joint trackage rights. After the payment of expenses and maintenance and of hire of equipment and joint facility rents, the receivers had a balance of $2,609,000. This is at the rate of about $1,280 per mile of road owned and at 5 per cent would pay the interest on a capitalization of approximately $25,600 per mile of road. The old Wabash company had a funded debt alone of over $53,600 per mile of road, and there are outstanding in addition to the bonds of the old company $15,000,000 receiver's certificates, not to mention the $92,400,000 of Wabash stock. A reorganization which would scale down mortgage indebtedness from $124,000,000 to $50,000,000 is inconceivable and would be, of course, wholly unjust. The Wabash by no stretch of imagination could be valued as low as at $25,000 a mile. Either, therefore, rates are so low as to result in confiscation, or there is something the matter with the plant itself or the way in which it is operated which makes its operating cost entirely too high, or there is a combination of these two things.

There is no road so situated as to be wholly fairly comparable to the Wabash. The Cleveland, Cincinnati, Chicago & St. Louis has some points, both from a traffic situation and physical location, in common with the Wabash, as has also the Chicago & Alton and the Chicago Great Western. Since these four roads compete one with another on various classes of traffic and therefore must charge the same rates on the competitive traffic, if the other three roads were blooming with prosperity, to paraphrase Mr. Brandeis' diagnosis of general business conditions, it would be pretty good evidence that the trouble was not with the rates received by the Wabash, but with its cost of operation. But no one of the other three roads is in a state even of moderately healthy prosperity. The Big Four had a deficit, after the payment of fixed charges, in the calendar year 1913 of $2,698,000; the

Alton, a deficit in the fiscal year ended June 30, 1914, of $2,762,000, and the Great Western—for all it only recently went through receivership and was reorganized—had a surplus of only $896,000 after interest charges. While this is not, of course, conclusive evidence that rates obtained by the Wabash are too low, it is certainly strongly corroborative of this assumption.

The Wabash got an average rate per ton per mile before the Interstate Commerce Commission 5 per cent rate advance order was made of 6.081 mills; the Big Four, 5.47 mills; the Alton, 6.06 mills, and the Great Western, 7.29 mills. The Wabash received 1.888 cents per passenger per mile; the Big Four, 1.893 cents; the Alton, 1.889 cents, and the Great Western, 2,001 cents. If the character of traffic was such as to permit of very low cost of handling, and the nature of the grades, other facilities and of weather conditions were also such as to facilitate very low operating costs, a 2,000 mile railroad might operate profitably with a six mills per ton mile rate for freight and a two-cent per mile rate for passengers. The less than two-cent per mile rate on the Wabash is undoubtedly unremunerative and lower than American railroad conditions anywhere warrant.

Nature of traffic and characteristics of plant on the Wabash do not permit of very low operating costs per unit of freight and passengers handled. Of the total tonnage of freight, which in 1914 amounted to 14,261,000 tons, 35.65 per cent was furnished by products of mines, 22.24 per cent by manufactures, 18.25 per cent by products of agriculture, 7.40 per cent by products of forests and 6.72 per cent by products of animals. With only 36 per cent of its total tonnage coal and ore, and with 22 per cent of its tonnage manufactures, and, furthermore, with just a third of the tonnage of manufactures l. c. l. freight, an average ton-mile rate of a little over six mills makes a return on anything like a fair valuation of the Wabash an impossibility.

Even with a rate adjustment, however, something will probably have to be done to lower the unit cost of operation of the property to insure future solvency, even if a drastic reorganization is carried through.

The following table shows the percentage of each class of expenses to total operating *expenses:*

	1914	1913
Maintenance of way and structures	16.51	17.54
Maintenance of equipment	23.11	21.59
Traffic expenses	4.23	4.15
Transportation expenses	52.72	53.51
General expenses	3.43	3.21

Transportation expenses are obviously out of line with maintenance expenses, and while maintenance expenses are apparently fairly ample, they are by no means large, with the exception of maintenance of equipment. Maintenance of way in 1914 cost $1,611 per mile of road, and in 1913, $1,722. Repairs of equipment per unit of equipment were as follows:

	1914	1913
Locomotives	$3,589	$3,520
Passenger cars	910	926
Freight cars	72	72

Another serious problem with the Wabash is the very high debit balance which it has to pay for hire of equipment—$1,114,000 in 1914 and $1,083,000 in 1913. In addition the company had to pay $1,576,000 for joint facility rents in 1914 and $1,522,000 in 1913.

The Wabash has a particularly hard problem in regard to its debit balance for equipment. In 1914 there were on an average 14,714 foreign freight cars on the Wabash per day. This compares with 18,593 in 1913 and compares with a total number of freight cars owned by the Wabash of 23,114.

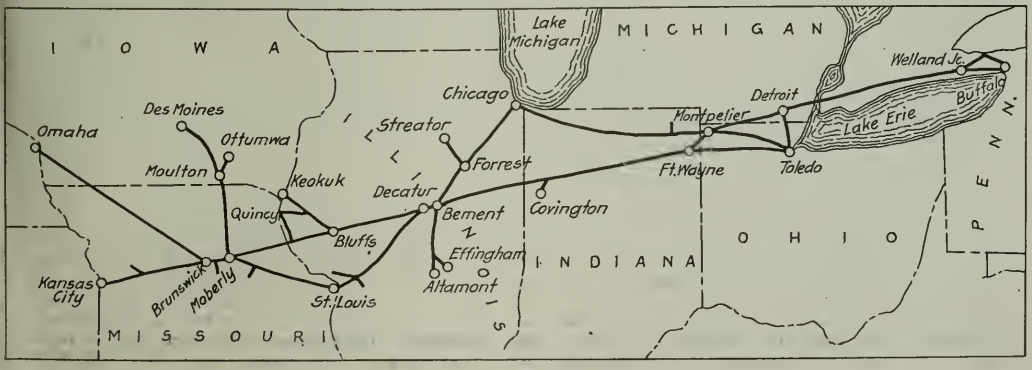
The average revenue trainload on the Wabash in 1914 was 394 tons, and in 1913, 395 tons. There is quite a heavy tonnage of company freight, so that the total tonnage per train mile was 429 tons in 1914 and 435 tons in 1913. The freight density on the Wabash was 1,041,000 tons one mile per mile of road. This is a fairly heavy density for a road with the comparatively small proportion of second track which the Wabash has and with a comparatively high percentage of manufactures and merchandise.

The Big Four has 426 miles of second track as against the Wabash's 507 miles of second track, with about the same mileage of first track operated, and the Big Four has a freight density of 2,178,000 tons one mile per mile of road; but of the Big Four's total tonnage approximately 50 per cent is products of mines, as against 35 per cent for the Wabash. The Big Four's average total trainload in 1913 was 515 tons. The Wabash averaged 21 loaded cars per train and 11 empty cars; the Big Four, 24 loaded cars and 10 empty cars. This matter of empty car mileage is one largely beyond the control of the operating department.

The following table shows the principal figures for operation on the Wabash in 1914 as compared with 1913:

	1914	1913
Average mileage operated	2,515	2,515
Freight revenue	$20,212,828	$21,777,896
Passenger revenue	7,202,169	7,269,914
Total operating revenues	30,035,750	31,685,584
Maint. of way and structures	4,021,782	4,298,862
Maint. of equipment	5,637,985	5,317,665
Traffic expenses	1,028,463	1,002,685
Transportation expenses	12,799,619	13,079,378
General expenses	834,846	780,767
Total operating expenses	24,322,695	24,479,357
Taxes	1,044,309	907,457
Operating income	4,612,966	6,244,087
Gross income	5,383,236	7,005,371
Rentals and hire of equipment	2,774,261	2,688,536
Interest accrued*	4,002,136	3,888,532
Deficit	1,393,161	428,302†

*Including interest on underlying bonds and on receiver's certificates and obligations.
†Surplus in 1913.



The Wabash

Letters to the Editor

"STATISTICS"

Chicago, Ill.

To the Editor of the Railway Age Gazette:

The superintendent of the Uppannattit division arose leisurely at 9 a. m. After an invigorating cold shower he donned an immaculate morning suit carefully laid out by his valet, and engulfed a hearty breakfast of ham and eggs. Strolling down to the office he cheerfully greeted the force of industrious clerks who had been absorbed in their duties since early dawn.

Upon his rosewood desk he found, among the many business and social communications, a set of large and costly prints covered with minute figures purporting to show the result of his mental and physical efforts at some previous period. For the superintendent of the Uppannittit division was in direct charge of 500 miles of railroad valued for taxation purposes at $100,000 per mile and for political pyrotechnics at but $1,000 per mile, and his responsibilities were, indeed, great.

Deftly flicking the ashes from his imported cheroot he reached for his magnifiers and glanced complacently up and down and hither and thither on and across the aforesaid sheets. Then with an exclamation of impatience he drew from a drawer a miniature transit and taking his bearings on line 102 sighted across in an easterly direction to a point. Registering great surprise and perturbation he pushed a button and his chief scribe instantly stood trembling at his side.

"What, ho, varlet!" cried the superintendent of the Uppannattit division, "didst thou not tell me and seek to prove by figures cunningly devised that the operation of my division for the month shown hereon was the best ever?"

"Even so, my lord."

"What then meaneth this item which indicateth a decrease in the trainload and eke in the loading of cars?"

"Thou hast thy finger upon the wrong line, sire. Owing to an eccentricity of the apparatus used in preparing these great and good statements, one must needs look closely to observe that the figures upon this sheet have in places crept up a notch; but nevertheless it is as thou sayest: the Uppannattit division is in disgrace."

"Off with thy head, as thou explain it not!"

"It may not be done to thy satisfaction, sire, as the ways of those who prepare these prints in a far off city are devious and past understanding. But thus it seemeth to me: Business, as thou art aware, was good in this month of March—but, as thou wilt recall, in the month preceding was it simply rotten."

Here the door of the sanctum was cautiously opened and a menial tiptoed in with a message reading:

Jonathan Jones,
Superintendent, Uppannattit division.

It falleth to my lot to inform thee that the general manager is sorely grieved because of the defection on thy division in the month of March, and hath been taken to task by the vice-president, and the president hath been desired by the chairman to forward due explanation instanter to the stockholders. Let me have thy strong reasons in detail.

Jasper Jenks, General Superintendent.

The menial and the c. s. lifted the superintendent from the floor, dusted his Prince Albrecht trousers and reseated him in the Henry VIII chair. Holding his throbbing brow he murmured "Go on; proceed."

"Yea," continued the c. s., "verily the month of February was rotten, especially the last portion thereof, and (behold the cunning of the distributors of accounts), they have, I am credibly informed, taken away the tonnage for the last part of March, which was great, and substituted therefor the last part of February, which was poor, but the train mileage and all other things incident to the heavy business left they unchanged. Ergo, the many train miles and car miles into the few ton miles maketh thy showing bum and to appear exactly as it was not."

"Give me my bonnet!" bellowed the superintendent of the Uppannattit division, "and I will away to the distant city and put a head upon those who do thus play fast and loose with my reputation."

"Mayhap they do need such an appendage, most noble chief, but I beg thee stay thy hand, and it may perchance be that if thou canst retain thy proud position yet another moon, fate will turn the tide in thy favor."

And it was even so.

A month later the superintendent of the Uppannattit division approached his desk in fear and trembling, in sackcloth and ashes, for the report covering the gentle month of April (now far gone) was due, and he felt that his efforts had been without avail.

Feverishly he inspected the figures, and a glow of pride overspread his countenance. Summoning his c. s. he spake:

"Hie thee instantly to the nearest apothecary and bring hither a magnum of his choicest vintage, for verily I have excelled myself and have administered the affairs of this great corporation passing well!"

But the c. s. replied, "Say not so—for thou wast asleep at the switch in the April month. Tonnage slumped and thou didst not get on the job with sufficient promptitude in cutting down thy train miles, and also there were many cost items that thou mightest have reduced."

"How then can it be, base churl, that my trainload has increased over last year, and my expenses per hundred ton miles are much less?"

"Hast thou forgotten, O Chief, the lesson of the last month? Behold the heavy tonnage omitted from that statement is included in this month, and hath offset the train mile fault, and hath also helped diminish the ton-mile cost. But didst thou note the item of casualties, for which Providence and not thou art responsible? Last year it was ten thousands of dollars greater than this for the same month."

"Methinks thy words have weight, but seest thou this item of rails for which I spent but 10 cents this April against $8,000 a year ago, which is creditable surely, and for ties, which last year cost me $17,000.01 there showeth this year a credit of $3,247. Can one do better than expend $3,247 less than nothing for ties in one month?"

"It is even the opposite of what thou supposeth, sire. More ties and rails were used this year than last, but those entrusted with thy good name have discovered various credits to place in these accounts which worketh in thy favor now but next year will go grievously against thee. Also there have occurred in previous months divers errors which it hath been essayed to 'correct' by likewise distorting the figure of another month."

Thus argued the superintendent of the Uppannattit Division and his c. s. long and steadfastly, and at the end thereof the superintendent wept bitterly and wailed:

"How, then, is it possible for one to make a fair showing? Verily I perceive it resteth not with me but with those afar off who know me not nor my travailings. Might not these sheets be prepared in such wise that those to whom they should be most useful might find benefit therefrom and avoid the grievous embarrassment of criticism and needless explanation?"

"All things are possible, O Chief, but 'there are three things which are too wonderful for me, Yea, four which I know not: The way of an eagle in the air; the way of a serpent upon a rock; the way of a ship in the midst of the sea,' and the way of an accountant with operating statistics."

And the superintendent of the Uppannattit Division moralized:

"Lo, it seemeth to me that a tender infant spanked when innocent of wrong doing feeleth the hurt as greatly as doth his justly chastised brother; and the pink tinge endureth as long. It mattereth not that the punisher later realize his injustice, because, forsooth, the memory of punishment inflicted and received remaineth long after the merit thereof hath been forgotten."

C. C.

The "Campaign of Candor" for Higher Passenger Fares

Railroads in Illinois and Other States Appeal Direct to People for Restoration of Half of Reduction

As has been briefly noted in previous issues, the railroads have recently undertaken a campaign, by means of a direct appeal to the people, for increased passenger fares in the states of Ohio, Indiana, Michigan, Illinois and Iowa, and in Nebraska and Missouri efforts are being made to get an increase in fares through the state railroad commissions.

The campaign in Illinois was inaugurated on Wednesday, February 3, when a committee of railroad presidents, with C. H. Markham, of the Illinois Central, as chairman, held a conference with Governor Dunne at Springfield, and asked his co-operation. The plan was outlined to the governor in a statement signed by Mr. Markham, H. U. Mudge, of the Chicago, Rock Island & Pacific; W. J. Jackson, receiver of the Chicago & Eastern Illinois; W. G. Bierd, of the Chicago & Alton; E. P. Ripley, of the Atchison, Topeka & Santa Fe; H. R. Kurrie, of the Chicago, Indianapolis & Louisville; S. M. Felton, of the Chicago Great Western; Hale Holden, of the Chicago, Burlington & Quincy; A. M. Schoyer, vice-president, Pennsylvania Lines; W. A. Gardner, of the Chicago & North Western; A. J. Earling, of the Chicago, Milwaukee & St. Paul, and E. B. Pryor, receiver of the Wabash. The statement to the governor was in part as follows:

For some years the railroads have been facing a condition of stationary or declining rates for their service, and of steadily increasing cost of operation, due to advances in wages, material and supplies, to regulatory legislation, to installation of safety devices, and to heavier and more expensive equipment necessitated by public demand for better service and accommodation. It is unnecessary to discuss this situation in detail. The whole country knows of it. Disaster has overtaken some roads on account of it; others have suffered heavily, and all have been affected.

An important factor in these results has been a 33⅓ per cent reduction in maximum passenger fares made by the passage of the two-cents-a-mile law in Illinois and in several other states.

Application to the Interstate Commerce Commission for acceptance of rate amendments to relieve the situation resulted in the most searching inquiry into the subject of railroad operation and revenues ever undertaken in this country. In this inquiry the generally unprofitable character of railroad passenger service was emphasized to a degree that impelled the commission to give it special consideration, although the question of passenger fares was not specifically or officially before that body. The findings of the commission in respect to passenger fares, together with comments by Louis D. Brandeis, its counsel, and by Commissioner Daniels, are attached hereto.

Therefore it is at the direct suggestion of the Interstate Commerce Commission that we are now presenting the facts in this situation to the people of Illinois and requesting action by their elected representatives with a view to securing the relief recognized and virtually recommended by the commission.

When the two-cents-a-mile law went into effect in 1907, the railroads of Illinois accepted it and made a sincere attempt to live under it without impairment of passenger service. The law has not worked out as some of its advocates expected. The contention that reduction in fares would stimulate travel, and thereby make up the revenue lost, has not been borne out by experience.

From June 30, 1903, to June 30, 1907, being the four-year period preceding the passage of the two-cents-a-mile law, the number of passengers carried one mile in Illinois increased 22.33 per cent; while for the year ending June 30, 1913, compared with the year ending June 30, 1909, which is the latest four-year period for which statistics have been published, the increase in the number of passengers carried one mile was only 17.43 per cent.

The passenger revenues in the year ended June 30, 1913, increased 62.47 per cent over the year ended June 30, 1903. Total revenues in Illinois increased 81.66 per cent for the year ended June 30, 1913, over the year ended June 30, 1903; while operating expenses and taxes increased 98.58 per cent.

The result of this was that, notwithstanding the large investment of railroads in new lines, improvements to existing lines and investments in additional and improved equipment, the net railroad revenue in Illinois increased only 42.25 per cent.

The average distance traveled per passenger in the state of Illinois for the year ended June 30, 1907, before the two-cents-a-mile law went into effect, was 28.10 miles, and the average fare paid was 54 cents. The average distance traveled per passenger for the year ended June 30, 1913 under the two-cents-a-mile law, was only 25.16 miles, and the average fare paid was only 44 cents.

The number of employees of railroads in Illinois in 1903 was 103,385 and in 1913 167,886, an increase of 62.39 per cent. To these Illinois employees the railroads paid $63,674,627 in 1903 and $122,158,824 in 1913, an increase of 91.85 per cent.

These figures are from the reports made by the Railroad and Warehouse Commission of the state of Illinois, the figures for the year ended June 30, 1913, being the latest official figures which are available.

Railroads operating in Illinois, as well as other states where the maximum rate of fare is fixed at two cents a mile, are at a disadvantage in comparison with many states where passenger revenue opportunities are greater. And this, too, has a bearing on the contention that the reduction of fares in Illinois would stimulate travel and make up the loss. Density of population makes volume of railroad travel. The greater the volume the lower the cost of handling. This is a law of trade. Passenger fares, therefore, ought to be lowest in the more densely populated states. But they are not. In the eastern states of Pennsylvania, New York, Massachusetts, Rhode Island, Connecticut, New Jersey and Maryland, density of population is considerably greater than in Illinois, yet maximum fares are higher in all of those states than in Illinois, and not through public indifference to the question. Within a recent period, and since the beginning of the general inquiry undertaken by the Interstate Commerce Commission, this subject has had careful consideration in the New England states, where population is more dense and travel greater than in any other part of the country, and in consequence maximum legal rates have been restored to 2½ and 3 cents a mile.

In presenting this situation to the people of Illinois, the railroads operating in the state are acting in direct response to the suggestion of the Interstate Commerce Commission (which has already approved tariffs providing for increase of interstate rates to a 2½-cent basis), and in accordance with the commission's expressed belief that the people of this state will cheerfuly acquiesce, as the people of New England have done, in reasonable increases, and that the necessary legislative authority will be promptly given.

We propose to present our case to the people of the state frankly and without reservation. Representatives of the railroads are prepared to go before commercial and civic organizations of every kind, and before public meetings, to discuss every phase of the question that can be raised.

In due course a bill for an amendment to the existing passenger fare statute will be presented to the general assembly for consideration and action. We look forward to making the equity and justice of our request so clear to the people of Illinois that the general assembly will not hesitate to enact the proposed amendment, and that it will receive your favorable consideration.

On the following day Governor Dunne replied to the committee of presidents by letter, as follows:

In answer to your communication of this date, presented in person, I would respectfully state that I favor a full and fair hearing upon your application to increase passenger rates from 2 cents to 2½ cents per mile, and I have no doubt the legislature will give you such a hearing.

Whether the prayer of the petition should be granted is dependent upon many facts which can only be developed by a painstaking investigation. I do not believe there is any disposition on the part of the people of the state of Illinois to insist upon confiscatory rates or rates unfair to railroads.

The present 2-cent rate, however, has been in force in this state, without any vigorous protest on the part of the railroads, for nearly eight years, and if the rate is to be increased you must be prepared to satisfy the representatives of the people that the present 2-cent rate is clearly unfair and unremunerative. You should be given ample opportunity to be heard fairly and fully upon the question, and I shall keep myself fully advised of all the facts brought out in such hearing. Should the matter reach me for official consideration I shall endeavor to act fairly and justly to both the people and the railroads of this state, without favoring either unremunerative or extortionate charges.

The Illinois campaign is in charge of a committee of which S. G. Hatch, passenger traffic manager of the Illinois Central, is chairman, and E. E. MacLeod, chairman of the Western Passenger Association, is secretary. This committee has made elaborate preparations for the campaign and has collected statistics and arguments to be presented at the various proposed meetings with commercial clubs and to be given to the press.

This committee made arrangements for meetings with commercial organizations on Tuesday of this week at Galena, Freeport, Rockford and Joliet; on Wednesday at Polo, Dixon,

Mendota, Belvidere, DeKalb and Sterling; on Thursday at Peru, La Salle and Peoria, and on Friday at Monmouth, Galva and Galesburg. Other meeting are arranged for next week. One of the lines at each point where meetings will be held was appointed chairman of a sub-committee on arrangements, consisting of the representatives of the initial lines at those points. Officers, both of the passenger department and of the operating department, were present at each of these meetings, and various individual lines have arranged for other meetings to be held at local points on their lines, at which officers of the roads will present the case of the railroads for the increased fare.

The railroads have not yet taken up the question with the legislature and propose first to conduct a popular campaign. Newspapers have been furnished with statements by railroad men outlining the reasons for seeking a restoration of half of the reduction made by the legislature in 1907, and with copies of the address to the governor and his reply, and beginning on February 5, a series of large display advertisements were published in a large number of newspapers throughout the state. Other somewhat similar advertisements will be published later.

A petition to the Illinois legislature has also been prepared and sent out by the chief executive of each line to its agents and representatives, for the purpose of obtaining the signatures of as many of the local citizens as may be interested in the matter, and believe the railroads entitled to increased revenues to meet increased expenses. The petition circulated quotes from the Interstate commission's remarks on passenger fares in the five per cent case, including the following statement: "The traveling public is giving expression to its demands for better service, better accommodations and for the adoption by carriers of all the devices that make for safety. A public that demands such service cannot reasonably object to the payment of a reasonable compensation therefor." The petition itself is as follows:

Believing it to be to the interest of the public as a whole that the transportation industry, second in importance only to agriculture, should receive a reasonable compensation for its services, we hereby petition the legislature of the state of Illinois to so amend the laws as to fix the maximum rates of fare for passengers traveling in Illinois at two and one-half cents per mile, thus restoring to the railways one-half of the reduction which was made in their passenger fares when the present law, effective July 1, 1907, was enacted, reducing such fares from three to two cents per mile.

A pamphlet containing arguments on the question of passenger fares in Illinois has also been prepared to be distributed to agents and representatives along the line of every railroad in the state. Supplies are to be kept on ticket counters at the more important towns to be handed out to the public, and copies will be furnished to the newspapers. This pamphlet is headed "Why the Illinois Railroads Are Asking for 2½-Cent Passenger Fares" and besides including some of the statements already referred to in the address to the governor, and various other arguments, also includes the previously mentioned quotations from the Interstate Commerce Commission, Mr. Brandeis and statements by Commissioners Daniels and Clark. The pamphlet concludes as follows:

The Illinois railroads are frankly stating the case to the public. Every citizen is urged to give it careful thought and to ask of his legislature favorable consideration.

A similar pamphlet has been circulated in Ohio and Indiana.

The campaign which has just been started in Illinois is in many ways similar to those which had previously been started in some of the other states, especially in Ohio and Indiana. In Indiana a committee of passenger officials first called on Governor Ralston and members of the Indiana Railroad Commission and presented their case, following which a large number of meetings were arranged and held with commercial organizations in the principal towns throughout the state. The same procedure was followed in Ohio, and many commercial organizations have adopted resolutions favoring the position of the railways, while others have taken the stand that the railroads ought to present more conclusive figures to show the exact cost of performing passenger service in relation to the revenues.

In Michigan the roads have announced their intention to ask for an increase in fares and railroad officers have addressed various meetings. The receivers of the Pere Marquette first submitted a petition to the legislature, asking for an increase of fares to 2½ cents, and it was reported in the newspapers that the petition was regarded with some favor by many of the legislators. Later a bill was introduced providing for an increase in fares on all roads, and it was reported that the legislature was less inclined to grant an increase for all roads than to the Pere Marquette alone. One member has introduced a bill providing that fares on railroads whose passenger earnings were less than $3,000 a mile in 1914, shall be 3 cents a mile, and on roads that earned over $3,000 a mile in 1914, the fare shall be 2½ cents a mile. It is reported that the governor has suggested that a special committee be appointed to make investigations to present facts and figures to the legislature before that body takes any action.

In Nebraska the Missouri Pacific asked the Nebraska commission to allow an increase in passenger fares from 2 to 3 cents per mile. The commission said that it had no jurisdiction to do so, and the case is now pending before the supreme court of the state in which the Missouri Pacific is arguing that the constitutional provision giving the commission power to fix just and reasonable rates takes precedence over the specific statute authorizing the 2-cent fare. A bill has been introduced in the Nebraska legislature providing for an increase in the legal state fare from 2 to 2½ cents a mile.

LABORATORY TESTS OF STEEL

At the November meeting of the Canadian Railway Club the characteristics of the materials used in railway service were considered. While the paper and the discussion were more or less elementary some important points were brought out in connection with laboratory tests on metals. Attention was called by Professor Keay of McGill University, to what he termed the most abused expressions in engineering, namely, the elastic limit and the yield point. The yield point is commonly considered as being approximately one-half of the tensile strength, but in experiments with the Martens or mirror type of extensometer it has been found with ¾ in. flange steel that the true elastic limit is in general about two-thirds of the yield point. For this reason it is believed that greater care should be exercised in the use of these two terms.

M. D. Hayes of the Midvale Steel Company also called attention to the difference in the value of the elastic limit of a material when the extensometer was used and when the reading was taken at the drop of the beam. In one case the extensometer showed the elastic limit to be 49,000 lb., while the "drop of the beam" method showed an elastic limit of 61,000 lb. Unless the method of test is included in the specifications the manufacturer will have an excessive amount of leeway. Another point also brought out by Mr. Hayes was the importance of a microscopic examination of the structure of steel in addition to a test of its physical and chemical characteristics. By making this examination a much better idea of the way in which the steel is made is obtained, and while the chemical analysis of two pieces may be the same, the microscopic examination will insure that they are of a correct structure.

Railway Construction in Salvador.—In the Republic of El Salvador some successful surveys have been made for a new railway from Metapan to Ahuachapan. This line, when completed, should open up a valuable and particularly rich tract of country which until now has been very much neglected and held back for lack of transportation facilities.

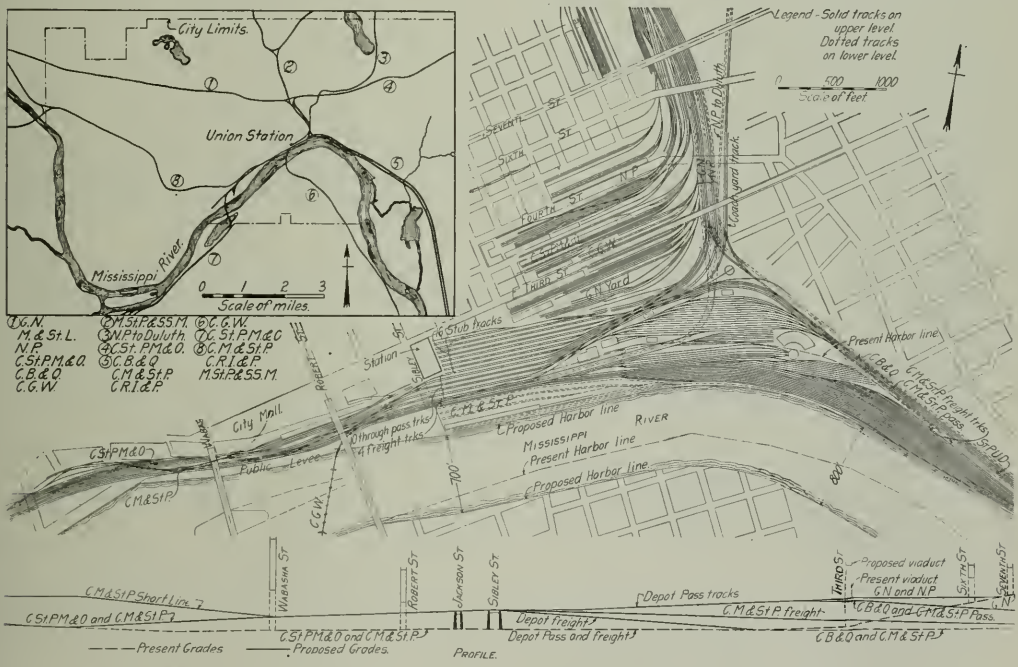
Plans for the New Union Station at St. Paul, Minn.

A $15,000,000 Passenger Terminal Development Is Proposed to Serve the Nine Roads Entering the City

The general plans for a new union station have been completed by the St. Paul Union Depot Company, and were recently submitted to the city council in asking for the ordinances which are necessary before the work can be undertaken. While the need for more adequate passenger terminal facilities at this point has been realized for some time, action was made imperative when the old station was destroyed by fire on October 3, 1913. The location of the terminal property between the Mississippi river and a well-developed commercial section of the city has made the problem of locating an enlarged terminal very difficult, and the necessity for considering the numerous and somewhat conflicting interests of the various roads has also prevented an earlier completion of the plans.

This terminal is used by all of the nine roads entering the St. Paul, Minneapolis & Omaha's Chicago and Duluth trains make a reverse movement in the station, entering from and leaving for the northeast. The Chicago, Burlington & Quincy trains also reverse, entering from the southeast and leaving for the northeast or vice versa. The Chicago, Milwaukee & St. Paul and the Chicago, Rock Island & Pacific trains make a through movement between the west and the southeast approaches. The Chicago Great Western, the Minneapolis, St. Paul & Sault Ste. Marie trains to and from the east and the Chicago, St. Paul, Minneapolis & Omaha's Kansas City trains make a through movement between the west and the northeast approaches.

These operating requirements are met in the proposed plan by a combination stub and through terminal with flexible track



Map of St. Paul Showing Entrance of the Nine Railways and Location Plan Showing Proposed Union Station

city, the Northern Pacific, the Great Northern, the Chicago, Burlington & Quincy, the Chicago, Milwaukee & St. Paul, the Chicago, Rock Island & Pacific, the Chicago, St. Paul, Minneapolis & Omaha, the Chicago Great Western, the Minneapolis, St. Paul & Sault Ste. Marie, and the Minneapolis & St. Louis. There are three main approaches to the station, from the west, the northeast and the southeast. The operation of the trains of the various roads can be divided into seven classes. The Great Northern, the Minneapolis & St. Louis, and the Northern Pacific main line trains terminate their runs at St. Paul, entering the station from the northeast. A few Chicago, Burlington & Quincy suburban trains terminate there, entering from the southeast, and the trains of the Minneapolis, St. Paul & Sault Ste. Marie from the northwest enter from the west. The Northern Pacific's Duluth trains and the Chicago, connections to the three main approaches, and a 218-car coach yard conveniently placed for the rapid switching of equipment in remaking the numerous through trains which break up at this point. A further improvement is effected in the new plan by the separation of grades at street crossings and between freight and passenger tracks in-so-far as this is possible. All passenger tracks in the terminal will be elevated, the through station tracks being carried past the station building on a viaduct. In general the freight tracks will remain as at present on the lower level.

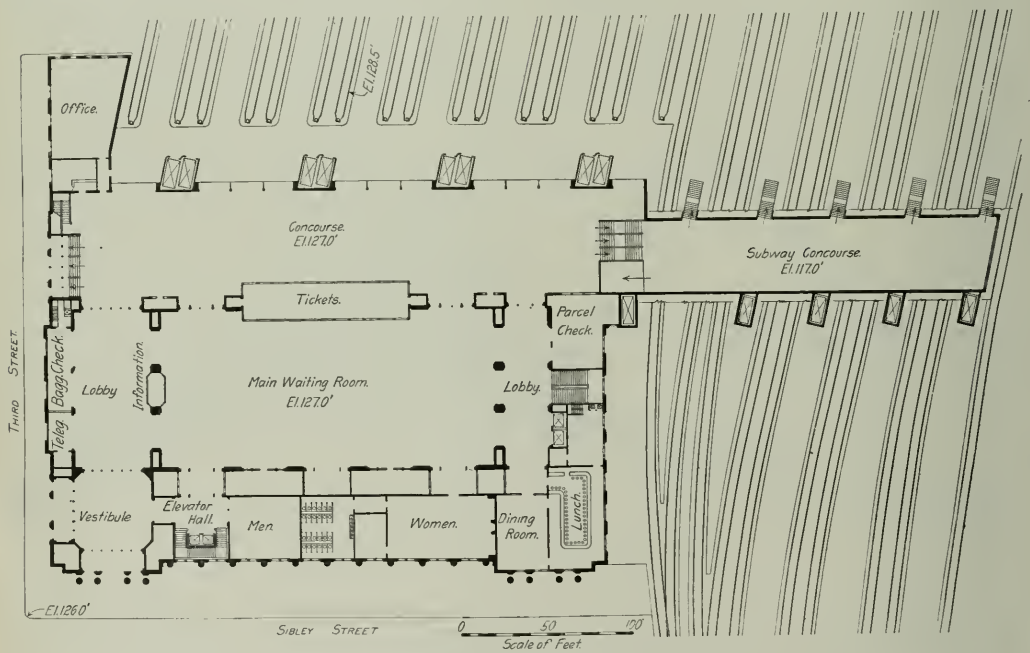
In order to secure the needed property for the enlargement outlined in this plan, it is proposed to move the channel of the Mississippi river towards the south a maximum distance of about 400 ft. As the property adjoining the river on the south which will be destroyed by this move is relatively cheap, this plan was

considered preferable to an expansion to the north involving highly developed property. Under the proposed plan the area of terminal property will be increased from 17.2 acres to 54.2 acres, the mileage of tracks from 9.2 to 24.9, the number of passenger tracks from 14 to 26, the number of freight tracks from 2 to 4, and the capacity of the coach yard from 100 to 218 cars.

The new station building will be located on the same site as the old one with a 315-ft. front on the east side of Sibley street and 220 ft. on the south side of Third street. The station will have three main levels. The middle one, at the track level, will contain the main waiting room, concourses, etc., and will connect at grade with the streets at their intersection. Sibley street is to be carried down toward the river, passing under the through passenger and freight tracks to reach the Milwaukee's freight house and the public levee. The carriage concourse will be entered directly from this street near the southwest corner of the building. Third street will descend toward the east so that an entrance for baggage, mail and express wagons can be provided Sibley street side of this main waiting room will be located additional telegraph and telephone booths, news-stands, etc., and opening directly from it will be a room for women, 35 ft. by 60 ft., and one for men with the barber shop, bath and toilet rooms directly below.

The main waiting room will be joined on the south by a wide corridor with stairs and elevators connecting it with the carriage entrance below and the rest and emergency rooms above. Adjacent to this stairway will be a parcel check room 30 ft. by 40 ft. providing checking facilities both on the main floor and at the basement level. The ticket office, 200 ft. by 100 ft., will be located between the waiting room and the train concourse, with windows opening on both, and will be surmounted by a gallery from which trains will be announced.

The train concourse, which is to be 60 ft. wide by 350 ft. long will be entered from Third street at the north end, or from the main waiting room and lobbies on the west, the aggregate door openings on this side amounting to 130 ft. in width. The 16 stub tracks will be reached directly from the concourse, through



Main Floor Plan of Proposed Union Station at St. Paul, Minn.

on the basement level opposite Wacouta street. The base course of the new building will be of rough pointed Minnesota granite, the exposed portions of the walls of Bedford or similar stone, and the waiting room, which is exposed to view, of brownish-red tile.

The majority of the passengers will enter the station from the main entrance on Third and Sibley streets, which will open into a vestibule 45 ft. by 45 ft. This entrance will connect on one side with a stair and elevator hall, and on the other with a lobby 45 ft. by 90 ft. leading directly to the main waiting room and to the train concourse. The information bureau, baggage checking room and telephone and telegraph offices are to be located around this lobby. The main waiting room will be 90 ft. by 200 ft., occupying the central portion of the building. It will have a penetrated, vaulted ceiling furnishing ample direct lighting and will be finished with marble floors and wainscoting and sufficient architectural decoration to harmonize with its dimensions. On the gates equipped with train indicators. At the south end of the concourse a wide staircase will lead down to a subway concourse 40 ft. wide and 200 ft. long under the 10 through tracks, from which stairways will give access to the station platforms serving these tracks. It is estimated that a person entering the station, purchasing a ticket and checking baggage will walk 450 ft. from the main entrance to the average train location.

The baggage will all be handled in one baggage room on the basement floor adjacent to Third street, with an area of 20,000 sq. ft., this relatively large area being needed on account of the unusual amount of transfer business which will be handled. The baggage will be trucked to trains through a subway extending to the extreme ends of the train platforms, where it can be raised to any of the platforms by one of the 25 elevators. Mail and express matter will be handled in a similar manner from the rooms under the north side of the train shed. The area provided for mail and express matter will aggregate 46,000 sq. ft.

In addition to the baggage, mail and express quarters, and the carriage entrance mentioned above, the basement floor will contain the immigrant quarters and various mechanical equipment. The upper story of the building will contain offices, meeting rooms, kitchen, emergency room and women's room.

All of the large rooms in the station will be lighted indirectly by electricity, and will be equipped with the indirect heating and ventilating system. The power for lighting, heating and ventilating the station will be supplied from a power house located in the terminal yard.

The plans for the new station have been prepared by an engineering committee composed of Ralph Budd, assistant to the president, Great Northern, chairman; C. W. Johnson, consulting engineer, Chicago, St. Paul, Minneapolis & Omaha, and C. F. Loweth, chief engineer, Chicago, Milwaukee & St. Paul. It is estimated that the new terminal will cost between $15,000,000 and $20,000,000, that the work of changing the river channel will require about 15 months, and that the entire project will consume approximately four years.

RATE ADJUSTMENTS IN SOUTHEASTERN TERRITORY

The carriers in southeastern territory are now engaged in making extensive adjustments in their freight rates to make them conform with the findings in the case entitled Fourth Section Violations in the Southeast (30 I. C. C., 153).* In connection with this work they have recently issued a statement bearing the date January 29, 1915, addressed "To the People Served by the Railroads of the South," and signed by presidents J. R. Kenly of the Atlantic Coast Line, W. A. Winburn of the Central of Georgia, M. H. Smith of the Louisville & Nashville, W. J. Harahan of the Seaboard Air Line, and Fairfax Harrison of the Southern.

The statement follows:

An order of the Interstate Commerce Commission, pursuant to requirements of federal law, compels a general revision of southern freight rates. It is proper that the people of the south should be informed as to the reasons for this revision and the principles upon which it is being made.

Excepting the Norfolk & Western, Chesapeake & Ohio and Virginian Railways, which lie in official classification territory, the railroads of the southeast receive virtually no part of the 5 per cent increase in rates recently acquiesced in by the Interstate Commerce Commission. While the need of the carriers of the south for increased revenue is certainly no less than is that of the northern and eastern roads, that need is in no way related to the revision of rates now in progress which arises solely from the necessity of more nearly conforming to the so-called "long and short haul clause" of the law as amended in 1910, and as now construed by the Interstate Commerce Commission.

The original Act to Regulate Commerce forbade the making of lower rates for a longer than for a shorter distance within the same line or route under substantially the same circumstances and conditions. The carriers were free to meet competition as they found it and were required to answer only upon complaint as to the reasonableness of their acts.

The amendment of 1910 deprived the carriers of the right to initiate departures from the long and short haul requirement, and they may no longer meet competition as they find it if the long and short haul requirement of the law is involved, unless they can first obtain the approval of the Interstate Commerce Commission.

They were furthermore required, by this change in the law, to apply to the commission for authority to continue in force rates existing at the time of its passage which contravened the long and short haul principle.

The existing rate structure of the south is not the creation of traffic managers of this generation. It is an inheritance from those who built the roads, and finds its explanation largely in the geography of the south, and in a public policy which encouraged its creation. The changes now in progress are not of the carriers' choice.

Water competition, the most important factor in bringing about departure from the long and short haul principle of the law, has been peculiarly influential on the rate adjustments of the south, surrounded as it is on three sides by navigable water and penetrated by navigable streams. Termini of the first roads were on navigable waters and rates between those termini were from the beginning depressed because of this water competition. When, subsequently, railways were extended to the interior, distributing points were thereby created, where there arose competition of two or more markets, or of two or more carriers, resulting in depressions in rates, even when there was no direct water competition.

These conditions undoubtedly contributed to the commercial and industrial development of the interior south, and, while they resulted in more frequent departures from the long and short haul principle of the law, the carriers had every reason to believe that their practice had the approval of the public, even when it was not directly the result of public demand.

Now, the Interstate Commerce Commission, pursuant to the requirements of an amended law, has concluded an enquiry into rates from the eastern seaboard, including the Virginia cities, from south Atlantic and Gulf ports, and from Ohio and Mississippi river crossings, into the southeast and Mississippi valley territory. As a result the commission has in large measure condemned existing departures from the long and short haul requirement, except where justified by competition beyond the control of the rail carriers, a phrase which came to be restricted to mean direct or indirect water competition.

Obviously, the removal of inequalities condemned by the commission, by reductions only, would result in disaster to the carriers. This fact is recognized by the commission, which, in its review of the situation, stated:

> It is entirely clear that the revenues of a large percentage of the lines in the southeastern territory would be so impaired by such a procedure as to make it impossible for them to meet their operating expenses, taxes and fixed charges and leave their stockholders even a moderate return.

It is equally obvious that it would be unfair to punish the carriers, in conforming to a changed public policy, for acts which at the time of commission were approved by public opinion.

Hence in working out the order of the commission such elevation of rates to the depressed points must accompany reductions to the much larger number of intermediate points as will at least preserve the revenues of the carriers.

The task of revision is no easy one. It has been undertaken in loyal effort to conform to the law, as now interpreted, and to be fair to all.

Departures from the long and short haul principle in the south are not confined to interstate traffic. There are in the south a great many intrastate rates that do not conform to the principle. If undue discriminations are to be avoided, these intrastate rates must be brought into harmony with the revised interstate adjustment being made under the direction of the Interstate Commerce Commission. It is the purpose of the railways of the south to take up each intrastate revision with the several state railroad commissions.

British Railwaymen and the War.—In a review of the labor conditions in the United Kingdom during December, which has been issued by the British Board of Trade, it is stated that as regards railways, the companies have been compelled to apply to the war office for permission to put pressure on their employees not to enlist, and the number who have joined the forces has therefore only risen slightly since the last report, and is now about 60,000 out of some 600,000 employed. In view of the abnormal pressure of Christmas and the demands of the government for transport, the companies have been compelled temporarily to fill places to some extent.

*An abstract of the decision was given in the *Railway Age Gazette* of May 15, 1914, page 1067.

Arbitration of Engineers' and Firemen's Demands

Testimony on Actual Earnings of Enginemen; Mechanical Improvements; Stop-Watch Check on 2,000 Firemen

The statistical testimony concerning the actual wages received and work performed by engineers and firemen on the western railways, which was presented in connection with elaborate exhibits introduced by J. H. Keefe, assistant general manager of the Gulf, Colorado & Santa Fe, at the hearing in Chicago before the board of arbitration on the demands of the western engineers and firemen, was concluded on February 3, and Mr. Keefe was followed by W. J. Tollerton, general mechanical superintendent of the Rock Island Lines, who testified regarding the decrease in work required on account of the introduction of improvements and labor-saving devices on modern locomotives.

EARNINGS LOST BY LAY-OFFS

In Mr. Keefe's testimony engineers and firemen were held responsible themselves for a loss of one-third to one-tenth of their possible earnings through voluntarily laying off a great part of the time. To show what the engineers and firemen could have earned if they had not laid off a large part of the month, Exhibit 30 placed before the board the number of assigned men, the total miles they ran, their hours on duty, their total earnings, their average earnings, and the name of the engineer who received the highest wages in each assignment as well as the amount and name of the engineer who received the lowest wages paid to one man who worked the full month during the month. Coupled with this was a showing of the actual time in which each man's assigned service was performed by someone else showing that he had laid off.

"About three-quarters of the railway service," said Mr. Keefe, "is what is termed 'assigned service.' This means an engine run is assigned to one crew or several crews, and the definite earnings are there for them to take, or to leave for someone else as they choose. Every passenger engineer in assigned service could have earned an average of $197.79 for a month of 184 hours—an average of only six hours a day if he had earned all that the company offered. The only reason they did not earn this was because they had laid off a considerable portion of the time."

Out of 5,412 passenger engineers, the exhibit shows that only 2,876 worked the full month. Of their total assigned mileage of 22,849,739 miles, they left for someone else to perform 2,410,000 miles, thus losing about 10 per cent of their possible earnings. Similar information given for engineers in local or way freight service showed that these men laid off and lost their pay for 20 per cent of their possible service; engineers in mixed train service for this reason lost 15 per cent of their possible wages; engineers in helper or pusher service lost 25 per cent of their possible earnings; those in yard service, 20 per cent, and those in through or irregular freight service 22 per cent.

Turning to the firemen, it was shown that those in assigned passenger service laid off and lost their pay for 17 per cent of the work offered to them; those in way freight service 22 per cent; those in mixed train service, 27 per cent; those in helper and pusher service, 25 per cent; those in yard service, 25 per cent, and those in through or irregular freight service, 30 per cent.

Lay-offs were shown to range from one day to several months' time in the year, with yearly earnings ranging from $1,900 to over $3,000. One engineer laid off 106 days in the year and earned $3,239. Another, off four months in the year, earned $2,000. Another who laid off 38 days earned $3,088 for the year. The average time on duty of engineers in the service covered by these men was about seven hours per day.

These figures include simply the days provided in the assignment, which might be 21, 25, 27 or 31 days, on which the men did not work, and the lay-offs do not include days off which might be provided for in the assignment, such as Sundays.

As a striking example of the high wages now earned by firemen on oil-burning engines, the case of Fireman A. Richardson on the Gulf, Colorado & Santa Fe was cited. He received $209.89 in the month of October, 1913, for firing an oil-burning locomotive. "The rate now paid of $3.75 per day is unreasonable, " said Mr. Keefe, "when applied to oil-burning locomotives in the passenger service having cylinders of 24 inches or over. This rate was the result of an arbitration so unfair that most of the railways took it out after a year's time limit had expired. Some roads still have the rate, but intended to bring this excessive rate up as one of the wrongs to be remedied in the present arbitration proceedings. They are prevented, however, by the fact that the roads are excluded in this arbitration from bringing forth any of the injustices under which they are working, leaving open for arbitration only the demands of the men. This fireman's earnings of $3.75 compare with $4.40 for the engineer, although his position compared with the coal fireman's is a 'snap.' The oil fuel is fed through pipes and regulated by a valve in the cab, the fireman not being required even to leave his seat, except three or four times in an entire 100-mile run, and then only to pour a scoop of sand through the door of the firebox to clean out the flues, which is done by suction."

Charges made by Grand Chief Stone of the engineers' brotherhood that some of the high earnings shown in the exhibit for individual engineers were the result of excessive hours on duty were promptly met by the railways. An investigation of some of the cases pointed out by Mr. Stone was made immediately by telegrams sent to the divisions on which the men worked. One engineer on the Canadian Pacific for whom the exhibit showed an average of 23 hours per day for 19 days to earn $211 in a month was found to have worked actually 15 hours a day, but to have been paid for 23 hours. Another engineer on the Chicago, Milwaukee & St. Paul who was shown as running 5,090 miles in one month, which Mr. Stone thought excessive, was found to be working on a run of 36.6 miles, for each of which runs he was paid for 100 miles under the minimum day rule. The actual mileage run was only 1,537, consuming 5 hours a day, for which the engineer was paid $329.65 in one month.

W. S. Carter, president of the Brotherhood of Locomotive Firemen and Enginemen, remarked that there were many more firemen shown than engineers. This, Mr. Keefe, said, was partly because firemen laid off more than engineers and were more inclined to leave the service for some other occupation. "Is it not a fact," asked Mr. Carter, "that the work of the fireman is so hard that he gets so tired that he has to lay off frequently?" "I should think not," said Mr. Keefe, "in view of the fact that the figures for firemen on oil-burning locomotives show the same proportion of lay-offs." Charles Nagel, one of the arbitrators, asked if the fact that the fireman is usually a younger man than the engineer and is not so likely to have "settled down" might not have something to do with the number of lay-offs.

Exhibit 30-a introduced by Mr. Keefe showed that the high earnings of engineers and firemen in October, 1913, were exceeded frequently in other months of the fiscal year ended June 30, 1914. Representatives of the brotherhood had claimed that the October figures were abnormal because they applied to a busy month. When the new exhibit was introduced W. L. Park, vice-president of the Illinois Central and one of the arbitrators, remarked that figures for some of the men showed even higher wages than for October, 1913.

WEIGHTS OF LOCOMOTIVES

In connection with the discussion of engineers' and firemen's wages Mr. Stone told the board that some time after the last award to the firemen, providing for a rate of $3.75 a day for

firemen on certain classes of engines with cylinders over 24 in., on some of the Santa Fe lines a sleeve or bushing was put in some 25-in. cylinders to make them 23½ in., and the engines were superheated, for the purpose of avoiding the higher rate. He also said that after the award to the engineers, which included an additional payment of 25 cents a day for locomotives weighing over 215,000 lb. on drivers, some roads that had engines stencilled for 217,000 or 218,000 lb. on drivers had them restencilled to show 214,000 lb. For this reason, he said, the demands included a provision for bulletining the exact weights of locomotives. In reply to questions by Mr. Sheean he admitted that he had no direct knowledge as to which of the weights was correct.

Exhibit 31 was a reprint of an exhibit filed by the firemen, to show the earnings of firemen who had just been promoted to engineers, and had been demoted on account of a falling off in traffic, with additional figures inserted to show the earnings of these men while acting as engineers. The original exhibit took no account of earnings of the same men while working as engineers for part of the month, and whereas the brotherhood had stated the average in February, 1913, as $82.62 for each man, the actual average earnings were $108.21. This exhibit aroused a heated controversy in which Mr. Carter insisted that he had been furnished the figures by the Conference Committee of Managers. Mr. Keefe replied that the managers had furished exactly the information asked for and had not known for what purpose it was to be used.

Exhibit 32 showed the length of time pool freight, unassigned or "chain-gang" engine crews were held away from their home terminals during the month of October, 1913, and June, 1914, on each road, including the legal rest period. Mr. Sheean said that this exhibit showed in some cases an extreme length of time which ought to be paid for. The exhibit showed that there were 49,194 crews in June, 1914, whereas there had been 72,000 in October, 1913. In October, 8,085 crews were held away from their home terminals nine hours, and in June, 5,192 crews had been held away for nine hours. One road showed one man away from his home terminal for 100 hours, one man for 84 hours and another for 80 hours.

Exhibit 33 showed the age limit beyond which many of the roads will not employ engineers and firemen. This showed that in most cases roads will not hire an experienced man over 45 years of age, nor an inexperienced man over 35 years of age. "If a man is dismissed from service for some trivial fault after he is 45 years of age he can go and eat snowballs," said Mr. Stone. Mr. Keefe said he could go to some of the roads that do not have an age limit.

SOME EXAMPLES OF HIGH EARNINGS

Exhibit No. 34 gave a comparison of the total payroll for the various months of the fiscal year 1914, to show their relation to the figures for the month of October, 1913, for which the detail figures were given for 64,000 men. This exhibit also showed the total earnings for the entire year of those men who were shown in Exhibit 30 to have earned the highest wages in assigned service for the month of October, 1913. Mr. Keefe explained that this was not necessarily the maximum paid during the year, but that no check had been made for the other months. This exhibit showed one engineer who ran a local freight train between Helper and Green River on the Denver & Rio Grande for 27 days in one month and earned $246.86 for this service, and also made one round trip of 354 miles in passenger service one day and earned $16.10 additional. Another engineer on the Great Northern, working 27 days, made a round trip mileage of 2,444 miles in 353 hours, or 13.1 hours per day, 6.8 hours per trip, and earned $291. An engineer on the Atchison, Topeka & Santa Fe whose average earnings per month throughout the year were $239.65, in one month earned $264, and for the year earned $2,875.77, although he laid off for 25 days of his assignment during the year. During his "high month" he made a round trip mileage of 4,320 miles in 6.3 hours per day, 3.1 hours per trip. Mr. Stone said that this man leaves Topeka at 7:30 a. m. and gets back to Topeka at 10:10 p. m., and that he is not compensated for the large amount of time he is idle at St. Joseph between trips, "although he has sold the company all that he has to sell—his time." Mr. Stone and Mr. Carter tried to show that in order to earn the wages mentioned the men had to work overtime, and that most of the layoffs were on account of sickness or exhaustion, also that the mileage run would depend on the amount of traffic, and that a man would not have the opportunity to work his full assignment in a period of traffic depression. Mr. Stone also objected to figures showing what a man would have earned if he had worked full time, saying that was treating a man as a machine.

FIREMEN WORK 31 PER CENT OF TIME ON DUTY

A feature of the testimony of W. J. Tollerton, general mechanical superintendent of the Rock Island Lines, was an exhibit compiling the results of over 2,000 actual stop watch tests, showing the exact amount of time spent by the fireman in performing his various kinds of work. This showed that more than two-thirds of the time was left available for viewing the scenery along the right of way.

"These stop watch tests," said Mr. Tollerton, "were made on 20 representative western roads by traveling engineers who remained in the cab of the locomotive and recorded every move of the fireman. If he was engaged in any duty at all, either shoveling coal into the firebox, shoveling down coal, sweeping the deck, shaking the grates, or doing anything other than sitting still on the seat box or standing in the gangway idle, he was credited with the performance, which was classified and timed by the stop watch. The average of these 1,556 trips on locomotives of all kinds shows that the fireman was engaged in supplying coal to the firebox 1 hour and 40 minutes, less than one-fifth of the time he was paid for. For 12 per cent more of the time he was either sweeping the deck, shoveling down coal, shaking the grates, hooking the fire or operating the injector. In all he was occupied at some work just 31 per cent of the time, while for 6 hours and 5 minutes, or 69 per cent of the time, he had absolutely nothing to do but look at the scenery.

"On engines of 185,000 lb. or over on which two firemen are demanded, 474 tests were made on 16 roads. On these locomotives the fireman spent 23 per cent of his time shoveling coal into the fire and 10.5 per cent more at other duties, while he had nothing whatsoever to do for 66.5 per cent of the time.

"An accurate count was kept of the number of scoops of coal thrown into the fire. By this means it was determined that in the 1,556 tests made only 1,975 pounds of coal, less than one ton, was thrown into the fire each hour."

"Is this within the capacity of a single fireman?" asked James M. Sheean, counsel for the railroads. "Yes," replied Mr. Tollerton, who had testified to having been a fireman himself for a short time; "4,000 or 5,000 lb. is well within the capacity of one man. On all of these tests the fireman used only about one-half of his capacity to handle coal. On over 2,000 observations the fireman spent less than one per cent of his time shaking the grates and less than one per cent more in breaking coal. This indicates there is really no serious room for complaint, and if complaints do exist, they should be handled locally. The railroads have improved conditions in a number of ways."

Mr. Tollerton stated that the test trains were 10 per cent heavier than the average trains in the busiest months and were one per cent longer on the road than the average in the 30 days of heaviest traffic.

"From these observations do you consider two firemen necessary?" asked Mr. Sheean, attorney for the roads. "Absolutely no," replied Mr. Tollerton.

IMPROVEMENTS IN LOCOMOTIVE DESIGN

Improvements in locomotive design which have cut one-third from the physical labor formerly required of firemen were described by Mr. Tollerton. "Two new inventions alone, the

superheater and the brick arch," he said, "have effected a saving of 30 per cent in the amount of coal shoveled. These improvements," said he, "render it possible to get the same results with a great deal less coal, correspondingly relieving the fireman. Conservatively speaking, the superheater saves 20 per cent of the fuel."

"Do I understand that with two engines, one equipped and the other not equipped with superheater and performing the same work, the amount of coal shoveled by the fireman on the former will be 20 per cent less?" asked Mr. Sheean.

"Yes, sir," replied Mr. Tollerton, "this has been determined by actual tests and is conservative. There is not only a great saving in fuel but also in water, so that the fireman is bound to save some of his physical effort. Addition of the brick arch effects another saving of 10 per cent in the fuel consumption, so that with these two appliances alone 30 per cent of the fireman's labor is eliminated."

To apply these two devices, it was pointed out, costs over $3,000 per locomotive. Yet, because 4,000 pounds are thereby added to the engine's weight, the roads would have to pay a higher wage to the fireman under the new demands, although relieved of one-third his shoveling.

Another exhibit introduced by Mr. Tollerton consisted of a reprint of Exhibit No. 51 introduced by the engineers and firemen, containing a number of articles and statements made by prominent railway authorities and various railway and other technical publications, with additions printed in red to show parts of sentences or paragraphs left out in the original exhibit which greatly qualified, and in many cases absolutely contradicted the effect of the parts left in the employees' exhibit.

"These statements," said Mr. Tollerton, "were comments on the great fuel economies and other labor-saving developments which have taken place in spite of the growth in power, but in every instance all reference to the increased fuel economy of the larger locomotives and their savings in labor for engineer and fireman was cut out and only the partial statements presented to the board of arbitration."

Mr. Stone took up cross-examination of Mr. Tollerton on his testimony as to labor-saving devices on modern locomotives. He attacked Mr. Tollerton's defense of the present cylinder basis of compensating engine crews.

"In the eastern arbitration you were satisfied with the cylinder basis, were you not?" Vice-President H. E. Byram of the Burlington, one of the arbitrators, asked Mr. Stone.

"Yes," replied Mr. Stone, "but that water has gone over the dam."

Turning to the labor-saving devices Mr. Stone asked if they had been introduced out of consideration for the engineers and firemen.

"They are the natural results of improvement in railway work, from which both the men and the railways derive benefits," replied Mr. Tollerton.

"Did you not testify," asked Mr. Stone, "that the engineer has been relieved of everything except opening and closing the throttle?"

"That is still one of his duties," replied Mr. Tollerton, "of which I hope we won't have to relieve him. I claim that the evolution of engines has steadily relieved the engineer and fireman of many duties. The large engines have brought increased pay to their crews, but we have never been able to use them to above 75 per cent of their capacity."

"Whose fault is that?" asked Mr. Stone.

"It is the fault of western conditions," said Mr. Tollerton. "The traffic is so light the tonnage is not there except in a few months of the year, and then generally in one direction."

President Carter then took up cross-examination on the stop watch tests, which showed for over 2,000 observations that only 31 per cent of the fireman's time is occupied.

"On your figures," said Mr. Carter, "I compute that the fireman would shovel about 170 pounds of coal one minute and then rest four minutes. Wouldn't he need a rest?"

"Your own figures show him to be resting 80 per cent of his time," said Mr. Tollerton.

THE DEMANDS APPLIED TO ELECTRIC SERVICE

How the granting of the same wages and rules to motormen and helpers in electric service as to engineers and firemen in steam service would hit the Southern Pacific on its electrified terminal and suburban lines in Oakland, Cal., was placed before the board by R. E. Hewitt, master mechanic of the Southern Pacific electric lines at Oakland, who qualified the engineers and firemen for electric service when the New York Central electrified its terminal in New York.

"These men are now paid $5 for an 8-hour average day, the minimum for engineers," said Mr. Hewitt. "It makes no difference to the motorman whether he has one or three motors working, as they are all operated from the master control, and there is no more labor in running a 10-car train than a single car. On the tractive power basis every motor car in the train would mean so much more tractive power. If the train of cars had three motors in it, as is common, the tractive power would be multiplied by three and the necessary wages would be greatly increased with absolutely no more labor."

Mr. Hewitt testified that the only labor asked of the motorman aside from running the train was to carry a small kit of tools to his car. All oiling, lubricating and repairing are done at the shops.

"Do you know of any place in the country where two men are used to run a multiple unit train?" asked James M. Sheean, counsel for the roads.

"I have never heard or read of such a thing," replied Mr. Hewitt. "Even a trolley tender is unnecessary, as the 'pantagraph' trolley takes care of itself. If the motorman became suddenly sick, fainted or otherwise became incapacitated, the controller mechanism would automatically shut off the power and set the brakes."

The difficulties of running a roundhouse with hostlers who would refuse to perform the ordinary roundhouse duties were described by H. Clewer, supervisor of locomotive operation of the Rock Island Lines. "If the hostlers are recruited from the enginemen, as demanded," said Mr. Clewer, "the result would be decreased efficiency, increased compensation and increased expense to the companies in providing additional men at the terminals to perform the labor now performed by the present hostlers. These hostlers are now recruited from roundhouse forces and occasionally from engineers and firemen incapacitated for road service. At the present time the hostlers can be used as general utility men and it is necessary that they be so. If these positions are given to firemen or engineers protected by all the provisions of their schedules, they would refuse absolutely to do anything but handle the locomotive, and for this would receive a higher wage. Due to the seniority rules there would also be a constant change in personnel, resulting in our having men inexperienced at the terminal, which would be disastrous at busy points."

Mr. Carter stated that hostlers' wages should be paid to every man doing any hostler work whatever.

"If the hostler handles an engine 10 minutes and for the rest of the day does odd jobs about the roundhouse, would he have to receive hostler pay for the entire day?" asked Mr. Sheean.

"Yes," replied Mr. Carter.

"At Bureau, Ill.," the witness then testified, "there is a man who moves the engine daily 150 feet. The rest of the day he shovels cinders or does any other work at hand. Yet because of handling the engine 150 feet, he would have to be paid hostler's wages for the day."

Russian Railway Projects.—It is reported that the opening of the Amur Railway throughout its whole length is expected to take place in the year 1916. In addition, during the five years 1915-19 the Ministry of Ways of Communication has in view the construction of a considerable number of important new railways, totaling approximately 21,000 miles.

The Possibility of Fire from Locomotive Sparks

Data Obtained from Tests on the Chicago, Indianapolis & Louisville; Greatest Danger Within 50 ft. of Track

At the December meeting of the Western Railway Club Prof. Lawrence W. Wallace, of Purdue University, presented a paper on the possibility of fire from locomotive sparks. In the summer of 1913 he and Professor Young, also of Purdue, conducted some spark tests on the Chicago, Indianapolis & Louisville, just north of Lafayette, Ind., where there is a 0.77 per cent grade. In preparation for the tests a plot of ground was marked on each side of the track. Five rows of stakes 20 ft. apart, were set at right angles to the track. The stakes in each row were spaced 20 ft. apart, starting from 25 ft. from the center of the track and extending to 125 ft. Beyond this distance the stakes were located 150 ft., 200 ft., 250 ft., 300 ft. and 350 ft. from the center of the track. Pans 12 in. square by ¾ in. deep were placed at each stake. The pans in three or four rows contained paraffine, while

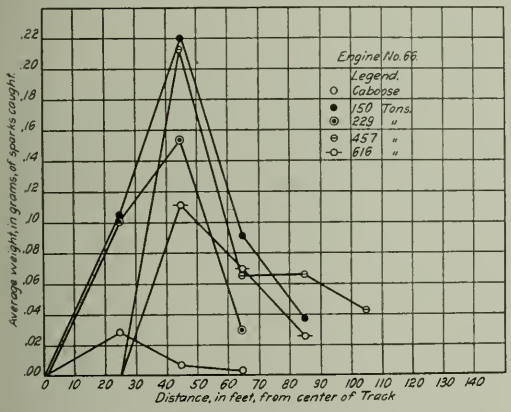


Fig. 1—Average Weight of Sparks Caught from the American Type Locomotive

those in the remaining rows contained cotton fleece. An American type locomotive (No. 66) and a 6-wheel switching locomotive (No. 9) were used in the tests, the former having 18-in. by 24-in. cylinders, 67-in. drivers, a total weight of 100,000 lb., and a tractive effort of 15,800 lb. The switching locomotive had 18-in. by 22-in. cylinders, 45-in. drivers, a total weight of 88,000 lb., and a tractive effort of 20,100 lb. An anemometer was used for obtaining the velocity of the wind.

In conducting the tests the locomotives were run by the field containing the pans at four different speeds varying from a low speed to the maximum that could be obtained under each load hauled. Tests were made with the engine and caboose alone, and tests were then made for each increase in tonnage until the full tonnage was obtained. For each test the direction of the wind and its velocity, the temperature, the condition of the weather, the number of cars, the weight and speed of the train, the position of the reverse and throttle levers, the draft and the character of the smoke were taken.

Fifteen tests were made with the American type engine, a summary of the results being shown in Fig. 1, the chart showing the average weight of sparks caught in each pan for the tests made with the different tonnages. From this it will be seen that the greatest number of sparks fell within 50 ft. from the center of the track. No sparks were caught beyond 150 ft., and in only one test were there sufficient sparks caught at 150 ft. to weigh. It was also found that the quantity of sparks ejected was not materially affected by an increase of tonnage. It was evident, however, that as the tonnage increased the range over which the sparks were spread increased. Of the total weight of sparks caught, 71 per cent was within 45 ft. of the center of the track and 85 per cent within 55 ft.

The tests with the switching locomotive were made in the same manner as those with the American type. Fig. 2 shows similarly the results obtained. These curves have the general characteristics of those illustrating the other tests. No sparks were caught further than 65 ft. from the track when the caboose alone was attached. With a full loading of 630 tons a comparatively large amount were caught at 150 ft., but at the next station beyond there was no trace found. Sixty-two per cent by weight of all the sparks caught from this locomotive was within 50 ft. of the center of the track, and 81 per cent was caught within 65 ft.

There were 613 sparks from both locomotives in all tests caught in the paraffine pans, that were warm enough to stick or to melt into the paraffine. Of these, 83 per cent were caught within 45 ft. of the center of the track, and 96 per cent within 65 ft. In Fig. 3 the total number of sparks that stuck in the paraffine for each locomotive is shown plotted against the distance from the center of the track.

One of the purposes of the test was to determine, if possible, to what extent the possibility of fire from locomotive sparks was influenced by the velocity of the wind, but as the wind velocity during these tests did not exceed nine miles an hour definite results were not obtained. It is intended, however, to continue the tests some time in the spring when the wind is much stronger.

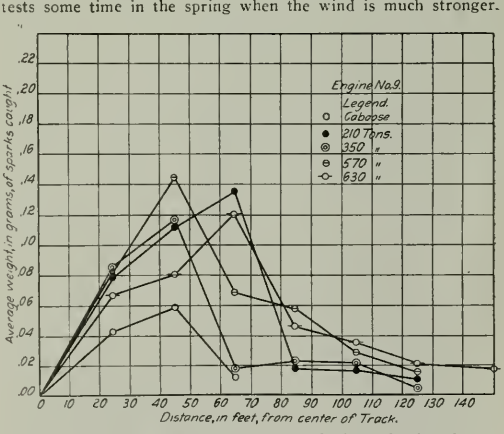

Fig. 2—Average Weight of Sparks Caught from the Switching Locomotive

From a study of the information obtained under these conditions no fixed law was found as to the influence of the wind on the sparks.

Paraffine and cotton fleece were used in the pans in order to determine as far as possible the temperature of the sparks when they reached the ground. The sparks sticking to the paraffine were closely studied and compared with similar sparks at known temperatures placed in paraffine in the laboratory, and in this way the sparks caught in the tests were assigned temperatures. Laboratory tests were made for the purpose of determining the temperature at which locomotive sparks of different sizes would set fire to various combustible materials and to obtain data whereby the temperature of the sparks falling in the paraffine pans in the

tests might be gaged. In preparation for this several hundred pounds of sparks were sifted. The sieves used were carefully made and were of 5/8-in., 1/2 in., 7/16 in., 3/8 in., 1/4-in. and 3/16-in. mesh, the sparks being passed through the sieves in the order named. One or more of each of the several sizes of sparks was placed in a small crucible and heated in a furnace until a temperature of 100 deg. F. was reached, and for a few minutes thereafter to insure that the sparks were of an equal temperature. Then one spark of each size was dropped on each of the combustible substances prepared, namely, cotton fleece, dry grass, excelsior and paraffine, and was closely observed in order to discern what took place. These tests were repeated for all sizes of sparks and for all temperatures up to and including 1,800 deg. F., the increment of increase of temperature being 100 deg. F.

The conclusions drawn from these laboratory tests are: First, that it requires a spark larger than 1/4 in. at a temperature greater than 1,000 deg. F. to ignite so inflammable a material as cotton; second, it requires a spark larger than 3/8 in. at a temperature greater than 1,400 deg. F. to burn either excelsior or dry grass, and for the latter even higher temperatures may be required. From the information obtained in the laboratory tests with the paraffine pans, the 613 sparks that were hot enough to stick to the paraffine in the field were studied and only one gave evidence of having been at a temperature of 1,200 deg. F.; this spark was caught 25 ft. from the center of the track. Only three sparks were graded as having been 1,000 deg. F., and of all the sparks

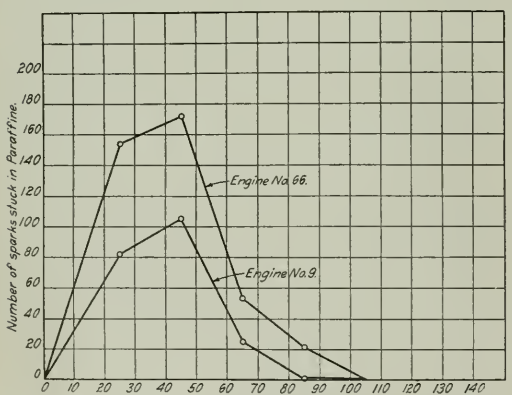

Fig. 3—Total Number of Sparks That Stuck in the Paraffine, for Both Locomotives

that were 800 deg. or more, there was only one that was caught in the pans as far away from the track as 85 ft. Of all the sparks graded as being 200 deg. F., and there were a large number, only two were found as far as 105 ft. from the center of the track. Out of the 32 tests with the two different locomotives worked at their greatest capacity and with the wind velocity as high as 8.7 miles per hour, only four sparks having a temperature of 1,000 deg. F. or over, were caught, and they fell within 65 ft. of the track. Even then it was shown by the laboratory tests that a spark must be hotter than 1,000 deg. F. to set fire to so combustible a material as cotton.

From these tests it was found that the greatest danger of fire from locomotive sparks is within 50 ft. from the center of the track; and that it is unlikely that any sparks over 1,200 or 1,300 deg. F. will reach the ground from a locomotive stack. For a locomotive spark 3/8 in. or less to set fire to so inflammable a material as cotton fleece it must reach the ground at a temperature of 1,300 deg. F. For excelsior the temperature must be 1,600 or 1,700 deg. F., and to set fire to dry grass it must be 1,700 to 1,800 deg. F. The largest sparks caught during the road tests were less than 3/16 in. Professor Wallace stated that the subject had not been fully covered, and the influences of wind of higher velocity and of heavier working conditions are yet to be determined.

LIMITING LENGTH OF TRAINS BY LAW*

By M. W. Potter

President of the Carolina, Clinchfield & Ohio

A bill before the South Carolina legislature makes it a misdemeanor to run trains containing more than fifty cars, whether loaded or empty. The Clinchfield Railway never could have been justified as a sound business proposition and never would have been built, as a fifty-car railroad. More than $15,000,000 was expended to increase its capacity to upwards of 100-car trains. The application of a fifty-car limit would double operating costs and actually destroy at least $15,000,000 of our investment. If adopted in South Carolina the bill would prevent construction of new high-class roads and the revision of present lines. The measure would be an impregnable barrier against the progressive development of the state and permanently prevent the lowering of rates. . . .

With the completion of the Clinchfield extension to Elkhorn City, Ky., shortly to be put into operation, our line, in connection with the lines north, will constitute a practically level railroad from an operating point of view. All that will then remain to give South Atlantic ports a line to the Middle West equal to or better than the lines from the northern ports will be new construction from the Clinchfield to Charleston, or a revision and improvement of the present lines. This subject is now receiving the consideration of the lines interested.

The enactment of the proposed measure by South Carolina would build up and strengthen the railways of other states at the expense of your own.

"While such measures are prompted by a desire to create more jobs, the promotion of safety is given as a pretext. The statistics of the lines handling long trains conclusively prove that operation with long trains is safer than with short. A given tonnage can be handled over a line in a given time with a few long trains with much less danger than with a greater number of short trains. The reason is obvious. . . . By handling a given tonnage in fifty-car trains, instead of 100-car trains, there is four times the danger of erroneous train orders and signals; four times the danger of switches being left open; four times the sudden jars and wear and tear; four times the danger of the flagman not properly warning approaching trains; four times the danger of congestion and collision, and four times the general complexity of operation.

Upon a hearing before the committee of the Virginia legislature, which last winter rejected a similar measure, statistics were furnished by the Norfolk & Western showing that the longer trains were the safer; and similar statements were presented by the Chesapeake & Ohio. It appeared that in the case of both these railroads the mere length of the train was negligible as a cause of accidents. The figures given as the actual experience on those railways harmonize with the universal experience of all railroads. The Clinchfield, which has been operating trains of from 60 to 135 cars in South Carolina for more than five years, has never seriously injured an operative in such service. We handle from 60 to 100 loads into Spartanburg and from 100 to 135 empties out.

Sound state policy would be to encourage development to the highest point of efficiency and the best possible service, with proper regulation of the compensation to be received for such service. The citizens of South Carolina should take this matter up as an important public question, which in its bearing upon the future of your state may, I believe, become as far reaching as any problem you have ever had.

*From a letter printed in the Spartanburg (S. C.) Herald.

National Association of Scale Experts' Convention

Abstract of Papers Presented at the Eleventh Semi-Annual Meeting Held February 1-3, at Chicago, Ill.

The National Association of Scale Experts held its eleventh semi-annual meeting at the Fort Dearborn hotel, Chicago, Ill., on February 1-2-3, at which papers of interest to railroad men were read and discussed on the subjects of: Automatic Scales and Their Mechanical Construction, by F. E. Kaeppel, sales agent, Fairbanks, Morse & Company; Test of Railroad Track Scales, by D. J. McGrath, scale expert of the state of Minnesota; Board of Trade Weighing, by J. A. Schmitz, editor, Scale Journal, and Weighing and Recording of Weights, by L. M. Allen, district superintendent, Western Weighing & Inspection Bureau, Omaha, Neb.

On Tuesday morning the delegates visited the Fairbanks, Morse & Company shops, where the fitting and sealing of levers was demonstrated, returning in time for the association dinner at the Fort Dearborn hotel at 1 o'clock.

FOUNDATION, CONSTRUCTION AND CARE OF TRACK SCALES

By A. Malmstrom
Chief Scale Inspector, Atchison, Topeka & Santa Fe.

There is an crroneous conception in regard to a track scale foundation. We usually call the square concrete box made to receive scale metals, structural steel or timbers, the foundation, whereas the real foundation is the underlying strata on which this concrete box is placed. In deciding upon the location of a scale, if rock is accessible within a reasonable depth a little additional expense and material or labor should not be spared to reach it. If rock, dry sand or gravel cannot be reached conveniently, artificial support must be secured by driving piling. It is impossible to issue any general rules in regard to the location or construction of foundations for track scales, for this must be left to the judgment of the engineering department and the scale experts to use.

For example, on the Santa Fe, nearly every kind of earth formation is found, including the damp and swampy condition on the gulf and Pacific coasts, the sandy and volcanic formation on the desert of Arizona, the black soil, clay and gumbo in the East, and the rocky formation in the mountains. In nearly every instance different treatment has to be resorted to.

In placing a track scale at San Francisco, where the foundation consisted of filled ground on sloping rock, 36 piling were driven to a depth of 60 ft. to reach the rock. Then a footing of concrete 3 ft. thick was built, in which was imbedded 1,625 lineal feet of light rails placed longitudinally and crosswise. The concrete box was then placed on this footing. Until about two years ago the scale had moved 4 in., but had maintained its compactness. In September, 1913, a slight quake jarred it out of level 2½ in., which condition was temporarily remedied by shimming, and later it was permanently remedied. In spite of all these difficulties the concrete box remained absolutely intact.

Another peculiar problem in the construction of a scale foundation was encountered at Galveston, where the bottom of the pit extended down 3 to 4 ft. below the level of the Gulf of Mexico. On one foundation 49 20-ft. piling were driven. A cement footing 10 in. thick was then placed on it, on which the outside form was built. During all this performance the water was seeping in as fast as a No. 8 Knowles steam pump could carry it away. To be able to work it was necessary to extend the excavation 2 ft. in every direction, forming a ditch from which the water could be pumped out. Five layers of tarred roofing paper were placed on top of the 10 in. footing and on the inside of the outside form each layer and its seams being glued with pitch tar. Then 10 in. more concrete was put in, after which the inside form was built. The concrete was then carefully poured against the paper, so as not to penetrate it. After the inside form was removed a heavy coat of ironite and two ½ in. layers of water-proof plaster were applied. This plaster consisted of a mixture of 4 lb. of soft soap and 4 lb. of powdered lime to 50 gal. of water, to which was added enough clear sand and cement, in equal parts, to make it of proper consistency. The pit was then filled with water to prevent the plaster from setting too quickly and cracking. This foundation has proved very tight.

In selecting the location of a track scale the following conditions should receive careful consideration: A scale should be located where cars can be handled the cheapest, usually ahead of the lead on a separate track, it should be convenient to the building in which the weighmaster is located, and, if possible, it should be located where a good gravity drain can be placed. In the actual construction of the scale proper after the foundation is completed there are three principles that should be kept in mind—plumb, level and square. All connections must be plumb; frames, levers, beam and beam shelf must be level; and the coping, structural steel and frames must be square. The levers must also be square with each other.

After the scale is in operation frequent tests and inspections should be made. With proper management the scale men can be greatly assisted by the agent at track scale points. On the Santa Fe each general manager issues a rule to agents at such points, to make an end-to-end test once a week, and make reports thereof to the district scale inspector. By this arrangement the inspector can immediately tell if there is anything wrong with the scale on receiving the report of such tests.

In examining or testing a scale the bearings should not be disturbed unnecessarily by jacking up the scale girders, because in the wear of a scale each bearing seeks its own location, and if this natural position of the bearing is disturbed the scale will show a bad test immediately after such examination is made, while in a short time it will again seek its natural bearings. Of course in case of a breakdown or displacement of levers or bearings the jacking up of the weighing bridge cannot be avoided.

If grease is applied to the bearings it should not be disturbed and air should not be admitted to the steel after it is once covered. After the bearings are badly worn it will be shown by the application of the test car, which is run onto the scale from opposite directions. If there are unreasonable variations, and if each application shows different results and the scale does not readily respond to adjustment, then it is time that levers should be renewed or their metals repaired.

Cleanliness is the most essential detail in the care of the track scale and should be insisted upon at all times. The most effective scheme that we have yet found to prevent corrosion, and to lubricate and keep the bearings clean is to fill all loops and bearings with a grease that will maintain its body at all temperatures. The loops should be filled flush on both sides, covering the pivots completely without touching the body castings of the levers. Applied in this manner it will not impede the movement of the scale in the least, but will exclude all dampness, dirt, dust, corrosion or paint, besides acting as a lubricant. This method also eliminates the frequent scraping and repainting of metal pipes. The best preparation that we have found is No. 4 Mephisto brand Arctic cup grease. No grease should be applied to the bearings above the platform, because in the higher multiplication levers the grease will have some effect. On the shelf lever and beam pivots a very thin covering of "Vaturdrip," or some other good rust preventive, should be applied.

RECORDING WEIGHTS—CALLING EVERY WEIGHT BY ITS RIGHT NAME

By F. C. Maegley
Assistant General Freight Agent, Atchison, Topeka & Santa Fe, Chicago, Ill.

One of the cardinal factors of commercial integrity is accuracy, and with respect to many commodities the scale and the recorded weight is the medium by which the prevailing measure of accuracy is determined. There are innumerable methods of recording weights, ranging from the sublime to the ridiculous. If any one underestimates the value of accurate means of recording weights, let him try to carry the information around in his mind for a time before recording it, and then by any practical method of testing his accuracy, see how many mistakes will result. One of the primary causes of weight discrepancies is the failure of the weigher to have or to utilize a reliable recording device. Many of the checking and recording systems have valuable safeguards against mental errors, or transposition of figures. Constant attention should be given to these features.

The record of first entry of weights recorded should be held sacred and permanent, and under no circumstances, should the weigher or other person destroy this record, however crude it may be, and substitute therefor copied scale tickets or copied weight records. The weigher should make suitable and complete notations on the original record, thereby establishing positive evidence of its integrity and completeness. In recording weights the record should show all circumstances which are essential to the full knowledge of the conditions and manner in which the weights were determined. This record should be so complete as to leave no room for doubt, and it should identify each weight with the particular transaction, car or vehicle to which it belongs. For example, at a recent annual convention of an extensive trade shipping organization a member took the floor and lamented the fact that public weighers' weights so frequently were unreliable because the weighers who were called upon to furnish affidavits of their weights could not say from their own knowledge whether the weights certified by them had reached the particular car or vehicle intended in every instance.

Every local agent should be made to become interested so that each in turn may labor with the customers of the railroad for weighing betterments. The strict attention to the detail of recording weights is one of the main reasons why the Chicago Board of Trade weighing department has obtained such high standing for the prevailing accuracy of its weights.

Simultaneously with the campaign for improved accuracy in the recording and transmission, and the application of weights there should be started another campaign entitled, "Calling Every Weight by Its Right Names." Whenever a weight is not called by its right name there is some underlying cause for hiding the identity of the weight, this cause being deception. If Bill Jones, the individual, weighs a commodity for purchase, sale or transportation, that weight should be known and designated as Bill Jones' weight. If Bill Jones, the employee of a firm or industry, performs a like weighing service such weight should be known as that firm's industry weight, per Bill Jones. If Bill Jones is hired as the accredited weigher of goods, sold, purchased or transported for individual firms or corporations, let that weight be designated as the weight of the institution for which Bill Jones is the bona fide employee. Or, if Bill Jones is employed by an impartial tally check weighing department, let such weight be known and designated as that impartial tally check weighing institution's weight, per Bill Jones, tally check-weighman; so that others at a distance interested in the particular transaction may be in a position to judge as to the character and quality of the weight recorded and transmitted.

Why should the weight of a shipper or receiver of freight by rail be designated as a railroad weighing association weight or as a board of trade weight, if in fact it is the weight of the shipper or receiver? Also, the record of first entry, and likewise any record that is transmitted or reported should show the original true and real author thereof and responsibility therefor, and every weight should stand squarely upon its own bottom and not be allowed to sail under false colors.

In practically every commercial transaction there is an agreed controlling basis as between buyer and seller of commodities sold by weight. Either the seller's weight, the buyer's weight, or the weight of some weighing department is the one upon which the commodity is bought and sold. Where the seller parts with his commodity on the basis of the buyer's weight or the weight of others, he naturally is anxious to have the controlling weight basis protected by every reasonable safeguard. Where the transaction involves the commodity thus shipped the buyers and sellers are usually situated at considerable distances from one another so that they must, in a measure, depend upon such cooperation as may be reasonably employed to insure the accuracy and integrity of the service performed. Certain shipping organizations are now conducting a campaign calling upon their membership for closer attention to the scales used and a prompt written declaration or certificate of weights at the time cars are loaded, so that the same may be used by the destination agent when delivery is made and the controlling weight reported by the consignee. The importance of calling every weight by its right name cannot be too strongly emphasized.

LOCOMOTIVE FEED WATER HEATING

In discussing the report on "Steam Locomotives of Today" at the recent meeting of the American Society of Mechanical Engineers, several references were made to feed water heating. An abstract of this part of the discussion follows:

DISCUSSION BY H. H. VAUGHAN

H. H. Vaughan, assistant to vice-president, Canadian Pacific, stated that considerable has already been heard as to the experiments made on feed water heating by Mr. Trevithic on the Egyptian railways, in which he used not only exhaust steam heaters, but waste-gas heaters in the front end. With the latter he has been able to put the water into the boiler at 230 deg. and obtain 22 per cent economy. In this country the Central Railroad of Georgia has done a little feed water heaters, as well as the New York Central, the Canadian Pacific, and the Central Railroad of New Jersey.

"On the Canadian Pacific we have been experimenting with feed water heating for six years. We have tried open heaters in a tank with fairly good satisfaction. We also applied exhaust steam injectors, and got fair results. We have since been advised by the manufacturers that our troubles were because of our having applied too large size an injector for ordinary work on the engine. However, I am of the opinion that while the exhaust steam injectors would work fairly well under certain conditions, yet there would be some difficulties where the amount of water consumed is large. We found on experiments with an open heater that the temperature obtained was due to the exhaust steam from the feed pump, so, assuming a temperature of 200 deg. in the feed water, it would really be the equivalent of 160 deg. when the water was put into the boiler by an injector with 100 per cent efficiency. By heating the water at the injector suction to 120 deg., we got 6 per cent economy, and used injectors as against 10 or 12 per cent economy with the feed water heater, and using a pump. We thought 6 or 7 per cent with the injector was preferable to 10 or 12 per cent with the pump, and we have been experimenting on that in recent years with reasonable results. Lately we have experimented with an ordinary closed feed water heater, and it is giving fair results.

"This is a subject which American railroad people have largely neglected. It has the advantage of not only saving in coal, but increasing the capacity of the boiler. In careful experiments we found an economy of 12 per cent in the use of the heater, and we feel that that jutsifies our going into the device more thoroughly. I feel that we will see feed water heating coming into larger use, not only with exhaust steam, but with waste gas."

DISCUSSION BY F. F. GAINES

F. F. Gaines, superintendent of motive power, Central of Georgia, stated in part: Feed water heating in this country is confined to a limited number of cases, and cannot be said to be generally recognized as a factor in fuel economy. Experiments made on several engines by the author show that about 10 per cent economy can be expected; there have been, however, offsetting difficulties in maintenance.

The feed water heater in question was made up of two elements. The first consisted of a pair of condensers in the form of long drums applied underneath the running boards. The steam from air pumps, boiler feed pumps, and some of the main exhaust was condensed in them and the heat taken up by the feed water. The second element consisted essentially of a double nest of tubes in the smokebox, similar to a Baldwin type superheater. The feed water from the tank was forced through the condensers and smokebox heater, and from the heater through the regular boiler checks to the boiler itself.

Some trouble was experienced with operation of the pump, and it was also found that the type of pump used was not altogether suitable for the purpose, wearing very rapidly and having considerable slippage. The smokebox heater tubes were objectionable from the standpoint of obstructing draft and filling up with soot and cinders between the tubes, also cutting out very rapidly by the action of the exhaust. There was a further objection due to the fact that the condensed steam from the air pumps and boiler pump exhaust was still at a temperature that, in cold weather, would give off considerable clouds of steam, and as this water had to be wasted, the result was a cloud of steam around the engine, which was objectionable because of obscuring the view of the engineman in looking back over the train.

These heaters were used some two or three years, however, and tests were made which showed them to have a fuel economy somewhere in the neighborhood of 10 per cent. On account of the mechanical difficulties mentioned they were finally abandoned, more especially in view of the fact that very much greater economy can be obtained by using the smokebox for superheating steam, and if this is done, this form of feed water heater, of course, must be abandoned. That eventually, however, we will succeed in developing a satisfactory type of feed water heater seems to me almost a certainty.

It would appear that the most feasible plan for such ultimate development would be a type of open feed water heater which would be located between the frames of the engine and underneath the boiler, which space is now available on account of the elimination of inside valve gear, using as before, the exhaust from the air pumps, boiler feed pumps and part of the main exhaust. In doing this, however, it is thought that ultimately, instead of using the present form of exhaust draft to effect combustion, with its consequent back pressure due to restriction of the nozzle, a form of forced draft of the blower type will be used. Under these conditions the exhaust openings from the cylinder to the atmosphere can be made without any restriction whatever and in this manner greatly reduce the back pressure, so much so that the steam required for operating the auxiliary and forced draft would use but a small proportion of the horsepower gained in so doing. Previous experiments would also indicate that a type of centrifugal pump would be much more effective and positive for boiler feeding than one of the reciprocating type used heretofore.

While American railroad practice is averse to adding any complicated apparatus to the locomotive, it seems that the demand for the utmost economy will eventually bring about a satisfactory method of feed water heating so that in connection with superheating, liberal firebox heating surface and possibly compounding we can obtain the maximum possible economy from the fuel used.

NEW YORK CENTRAL AWARDED HARRIMAN SAFETY MEDAL

The American Museum of Safety held its annual exercises and award the museum's medals on Wednesday evening, February 10, at the United Engineering Societies building in New York City. On this occasion the E. H. Harriman memorial gold medal awarded annually to the American steam railroad which during the year has been the most successful in protecting the lives and health of its employees and of the public, was awarded to the New York Central for the record made during the fiscal year 1914 by the New York Central & Hudson River. This is the second annual award of the medal given by Mrs. E. H. Harriman, which was awarded last year to the Southern Pacific.

The medal was awarded on the decision of the committee on award, composed of Arthur Williams, president of the American Museum of Safety, chairman; E. E. Clark, member of the Interstate Commerce Commission; Charles P. Neill, formerly United States Commissioner of Labor; Dr. Alexander C. Humphreys, president of Stevens Institute of Technology, and Samuel O. Dunn, editor of the *Railway Age Gazette*.

The medal was received by A. H. Smith, president of the New York Central. The silver replica of the medal goes, not to an individual officer, but to a department, the operating department. The bronze copy of the gold medal goes to Dennis J. Cassin, a locomotive engineman, who was retired last September on a pension, after 53 years' service for the company. Mr. Cassin had been an engineman since 1867, and had run the most important trains. The management recommended him for this honor because of his excellent record, and of the intelligence and spirit with which for many years he has sought "safety first."

Nineteen railroads competed for the medal by sending to the committee their accident statistics for the fiscal year 1914. In making the award consideration was given to various factors, including the relation between the number of locomotive miles run and the number of accidents, the improvement in safety made during the year, the conditions under which traffic is handled, and any especial effort made to bring about improvements in safety, including physical improvements, such as block signals and the attention given to a "safety first" campaign. The greatest consideration was given to the relation between the number of locomotive miles run and the number of persons of all classes killed and injured, which were considered on the basis of a weighted scale, the greatest weight being given to passengers, and the least to trespassers. Great consideration was also given to the reduction shown during the year as compared with the previous year in the number of killed and injured, having in mind the relation between the reduction in the number of casualties and in the volume of traffic handled.

The New York Central & Hudson River, it was considered by the committee, made a most remarkable record, not only considered by itself, but especially in comparison with the results of the previous year. While there was an increase in the number of passengers carried one mile, and a reduction of only 5½ per cent in the total number of locomotive miles, the total reduction in fatalities from all causes was 68 per cent. The reduction in locomotive miles was attributable to the decrease in freight traffic. This road in the fiscal year 1914 carried a total of 1,983,885,428 passengers one mile, without a fatality to a passenger in a train accident. There were 12 fatalities to passengers in other than train accidents. In 1913 524 people were killed and 15,569 were injured, while in 1914 the number killed was reduced to 212 and the number of injured to 7,317. Moreover, there was a reduction both in fatalities and in casualties in every class of persons, passengers, employees, etc.

In making the award to the New York Central the various conditions under which its traffic is handled and the operating difficulties experienced by a road such as this, one of the greatest passenger carrying roads in the country, were taken into con-

sideration. The road has shown a steady decrease in casualties since the beginning of the safety first campaign in 1910. For the past four years there has been a continual reduction in fatal accidents to employees on duty, excluding industrial accidents. In 1911 the number was 165, in 1912, 154, in 1913, 140 and in 1914, 99. In 1914 no road trainman was killed in a train accident, whereas during the previous year 12 were killed in such accidents.

The list of roads which competed for the award is as follows: Arizona Eastern; Chesapeake & Ohio, including the Chesapeake & Ohio of Indiana; Corvallis & Eastern; Illinois Central; Long Island; New York Central & Hudson River; New York, Chicago & St. Louis; Queen & Crescent; Rock Island Lines; St. Louis Southwestern; St. Louis Southwestern of Texas; Southern Pacific Company; Sunset-Central Lines; Toledo, St. Louis & Western; Union Pacific System; Vandalia; Western Maryland; Oregon-Washington Railroad & Navigation Company; Oregon Short Line. An excellent showing was made by all of them. Of the 19 roads there were 16 that during the year did not kill a passenger in a train accident.

Other medal awards made at this time include the Scientific American medal for the most efficient safety device presented within a certain number of years and exhibited at the American Museum of Safety, awarded to the Shurloc Elevator Safety Company, Inc., New York; the Travelers' Insurance Company medal, awarded to the American employer that has achieved greatly in protecting the lives and limbs of workmen, awarded to the Commonwealth Edison Company of Chicago; the Louis Livingston Seaman medal, awarded for progress and achievement in the promotion of hygiene and the mitigation of occupational disease, awarded to Surgeon-General William C. Gorgas of the United States Army; and the Anthony N. Brady memorial medal, awarded to the American Electric Railway Company, which for the year of the award shall have done most to conserve the safety and health of the public and of its employees, awarded to the Boston Elevated Railway Company.

"NATIONAL" TRAIN INDICATORS AT KANSAS CITY

Two of the train indicators in the new union station at Kansas City, a description of which was published in the *Railway Age Gazette*, October 30 last, page 799, are shown in Fig. 1. These two indicators show the next two trains that are to leave from track No. 6 and are placed, as shown, at the left and the right of the door leading from the main waiting room to the stairway by which passengers go down to platform No. 6.

These indicators were described in the *Railway Age Gazette*, February 14, 1913, page 296, in connection with the installation of three different designs of indicators in the Grand Central Terminal and the Pennsylvania stations in New York City. To the passenger these indicators are notable for the simplicity and good taste of their design and arrangement; and they commend themselves to the station man by reason of simplicity and ease of operation.

In the Kansas City station, where the architect has designed surroundings which afford a very effective setting to the indicators, the arrangement is different from that with the same style of indicator in New York, in that all of the operations of the attendant are performed on the back side, out of sight. At New York, the putting in of one train-notice in the place of another is done in full view of the passengers.

These indicators are made of steel and iron, copperplated. Those here shown are 32 in. wide and 6 ft. high. The lettering is painted on a curtain made of strong "leather-cloth" painted a flat black. This cloth is attached to a roller like that of a common window shade. The roller is inserted at the bottom of the indicator space, and, by means of chains and guides at the sides, the upper end of the curtain is pulled upward and fastened at the top, the whole change being made in less than half a minute. With the flat color and the neat arrangement of all parts of the frame-work and apparatus, the lettering appears to the observer to have been painted on the solid wall. A curtain

Fig. 1—Train Indicators in Kansas City Union Station

is prepared for each train and, when rolled up on its roller, is kept in a convenient drawer and, the sizes being uniform, a curtain can be displayed at any doorway in the station.

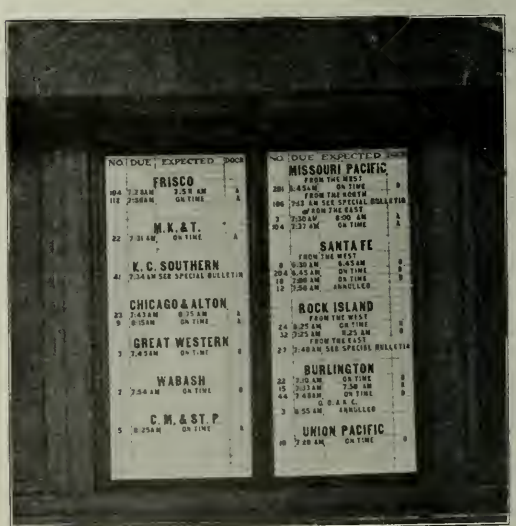

Fig. 2—Bulletin of Arriving Trains, Kansas City Union Station

In connection with these indicators for departing trains, the reader will be interested in the bulletin which is provided in the Kansas City station for arriving trains, shown in Fig. 2. This

bulletin is posted above one of the doors at the side of the grand lobby, and is hung on hinges so that it can be swung around into the station master's office, where the changes in announcements are made. Each half of the bulletin is 27 in. wide and 65 in. high.

This bulletin is made up of slats about 1¼ in. wide covered with white enamel metal. These are fastened into wooden frames. The information shown on the bulletin is made up of separate letters and characters, printed in black on the same white enamel metal; the tops of the characters being bent in the form of a hook to enable them to be hung on the slats. Certain phrases, such as "ON TIME," "ANNULLED," etc., are made in one piece. Thus any changes desired can be made on any slat, and any character can be used.

It has been found that with the large number of trains and the number of changes consequently required, the use of separate characters takes up a good deal of time, and logotypes will probably be made, showing train number and arriving time on one piece of metal. The names of the roads as shown in the picture are made in logotype style. Each of these covers two

Fig. 3—Train Indicators in Memphis Union Station

slats. Its position on the board can be changed readily in case more room is needed for that particular road.

This device is patented and was furnished by the Commercial Sign Company of Ashtabula, Ohio.

Fig. 3 shows the arrangement of "National" indicators in the Union station at Memphis, Tenn., which differs from those at both New York and at Kansas City, in that the indicators for six different trains are grouped in one place; that is, on a balcony above the main doorway leading from the main waiting room to the train-concourse. The clock placed above the indicators serves to draw attention to this side of the room, and a passenger anywhere in the waiting room can thus at a glance secure all of the principal items of information about his train in this one place; and also inform himself concerning all of the trains scheduled to depart within the next hour or two. Each of the six indicators can be used in connection with any one of the platform tracks, the numbers at the top being changeable. These Memphis indicators are narrower than those at Kansas City, being 24 in. wide. They are operated from the rear, the same as those before described.

The indicators are made by the National Indicator Company, Long Island, N. Y. The same company has installed indicators in the Camden station, Baltimore; Windsor street (Canadian Pacific), Montreal; Minneapolis (Great Northern); Detroit Union station; Central of New Jersey terminal, Jersey City, and Long Island Railroad, Brooklyn, N. Y.

LOCOMOTIVE FRONT ENDS AND DRAFT APPLIANCES

The following extracts are taken from the discussion of the report of the railroad committee of the American Society of Mechanical Engineers, presented at the annual meeting in New York, December 2, 1914:

DISCUSSION BY C. D. YOUNG

C. D. Young, engineer of tests, Pennsylvania Railroad, said in part:

Front End Design.—The general use of the Schmidt type of superheater has had an influence in effecting a certain uniformity in the arrangement of the smokebox. The one-piece lift pipe connected directly to the outside stack forms a very desirable and simple arrangement and requires a short exhaust column so that the advantage of a long stack may be obtained. The use of the petticoat pipe, with its adjustable features, is not so desirable as the internal single lift pipe, as the adjustable features are a source of annoyance in that people not properly qualified to make the adjustments are continually tampering with the arrangement, which results in an improper draft in the front end. It is most desirable that the gases have a free passage through the smokebox, and all points of possible restriction between the tube sheet and stack should be carefully investigated as to their areas. Care should be taken to provide a passage through the superheater damper which is equal, at least, to the area of the boiler and superheater tube outlets above the damper.

The use of a damper in connection with the superheater should be optional. On railroads where there is little or no drifting, there would seem to be no necessity for a damper. However, where a moderate amount of drifting is done, or where the locomotives are interchanged between divisions with low and moderate grades and others with heavy grades requiring a large amount of drifting, the automatic damper is a most essential feature for the protection of the superheater unit elements.

There has been a tendency of late to use exhaust nozzles having other than circular openings. The plain circular nozzle forms a steam jet which is too nearly cylindrical, or the shape of the stack, and the use of such a shape as the rectangular appears to break up the continuity or the form of the jet and cause it to draw out a larger volume of gases. Both rectangular nozzles and nozzles of the dumb-bell shape have been used with success, and with an increase in evaporation over that with the circular form. There has recently been developed on our locomotive testing plant a nozzle having four internal projections which appears to be more satisfactory than some of the irregularly formed nozzles. With these nozzles, having other than a circular outlet, an increase in the evaporative capacity of the boiler or from 15 to 25 per cent has been obtained and in recent tests on a large Pacific type locomotive a nozzle with four internal projections has given a maximum capacity in equivalent evaporation from and at 212 deg. of 87,414 lb. per hour. In the locomotive in question, this is an evaporation of 18.0 lb. of water per square foot of heating surface per hour and with this quantity of steam an indicated horsepower of 3,184 was obtained; whereas, the circular nozzle on this same locomotive developed a maximum equivalent evaporation of but 62,719 lb. of water per hour, resulting in an indicated horsepower of 2,501. It should be understood that no change was made in the locomotive other than in the exhaust tip.

Ashpan Air Inlets.—It has been the practice on the Pennsylvania to require that the air openings into the ashpan be at least 15 per cent of the area of the grate, and when the openings are of this size, the ashpan vacuum will be considerably less than one inch of water at the maximum evaporative rates. We have found, however, in the case of some switching locomotives, that this area of 15 per cent of the grate

area has been too large for the requirements of their service and to provide for this condition upon shifting locomotives, ashpan dampers have been installed along the air inlets at the mud ring. This arrangement very nicely takes care of these locomotives, which stand a great deal of the time, and if the air inlets in the ashpan were not reduced, it would be difficult for the firemen to prevent a large amount of steam from escaping from the safety valves.

DISCUSSION BY C. E. CHAMBERS

C. E. Chambers, superintendent of motive power, Central Railroad of New Jersey, said in part:

Locomotive Front Ends.—I presume there is no part of a locomotive that has had as much experimenting done on it as the front-end. We have had long and short stacks, rectangular and oblique, and single and double nozzles. Personally I think the single type exhaust nozzle will give satisfaction if other things are right. The height of the exhaust pipe should be not more than one-quarter to one-third of the diameter of the smokebox.

The netting arrangement does not make much difference. The arrangement of the diaphragm in the front end has a lot to do with the cleaning of the front end. It should be kept 6 to 9 in. away from the sheet to give a clearance.

Two or three years ago we had a new type of locomotive which gave us some trouble. After a number of trials of various expedients it occurred to me that the stack might be too small, so I took up with the locomotive builders the question of the relation of the diameter of the stack to the diameter of the cylinder, and it was admitted by them that the stack was smaller than it should be. We increased the diameter from 15 in. to 18 in. at the choke. We had perhaps one hundred or more engines with the same size stack, and about the same cylinder volume, but not in the same kind of service, so that they did not give us much trouble. But after making these changes on this particular type we made the change on the other engines and found a great difference, including a decreased consumption of coal.

One small improvement we have made in smokebox fronts where there is trouble from overheating is the placing of a liner about 4 or 5 in. away from the smokebox door, and filling the space with asbestos. This did away entirely with the difficulties from overheating.

ANTI-FULL-CREW LAW CAMPAIGN

The Pennsylvania, the Philadelphia & Reading, the Baltimore & Ohio, and ten other railroads in Pennsylvania and New Jersey have appointed a committee to make a comprehensive appeal to the public, to repeal the "full crew" laws. This is a problem in the solution of which the public is vitally interested, and it is proposed frankly to present all the facts, coupled with plain statements as to exactly what the railroads feel to be right, and the reasons therefor. The railroads recognize the fact that the interests of the public stand superior to those of either the corporations or their employees, and they feel that the public, by its greater interest, may be trusted to exert its dominating influence for what is best.

Statements are being prepared and will soon be given wide publicity. Space will be taken in daily and weekly newspapers in Pennsylvania and New Jersey, and the whole proposition will be put squarely before the people. The preliminary statement says:

"In no sense do the railroads war upon their trainmen. This law forces waste—not less than $1,500,000 a year in Pennsylvania alone. It means in all such cases employment without service. That is a defiance of economic law. It makes a proposition which organized labor hurts itself in upholding. It throws an improper cost upon the railroads. This ultimately rests upon the public as a burden and makes a charge which transportation service should not be called upon to bear, because it is productive of nothing good, neither in improved service nor increased operating safety. On the contrary, it makes it impossible for the railroads to do many things for the public which the money now so wasted could be expended for.

"If there shall be evidence that without such laws the railroads would under-man trains, to the hardship of employees or the detriment of the public; or that the present public service acts do not give to the commissions ample powers to determine what crews are necessary on different trains and to compel the railroads to man trains as ordered, we will support such amendments to the present acts as may be necessary to give such assurance."

This is signed by Samuel Rea, president of the Pennsylvania; Theodore Voorhees, president of the Philadelphia & Reading, and Daniel Willard, president of the Baltimore & Ohio, as a committee for the thirteen roads.

A committee of subordinate officers has been appointed to take charge of the work, of which R. L. O'Donnel, general superintendent of the Pennsylvania, is chairman. The other members are: C. H. Ewing, general superintendent, Philadelphia & Reading; F. Hartenstein, assistant to general manager, Lehigh Valley; Robert Finney, general agent, Baltimore & Ohio, and J. S. Fisher, solicitor, New York Central. Other roads represented are the Erie, the Lackawanna, the Delaware & Hudson, the Buffalo, Rochester & Pittsburgh, the Pittsburgh, Summerville & Clarion, and the Cumberland Valley.

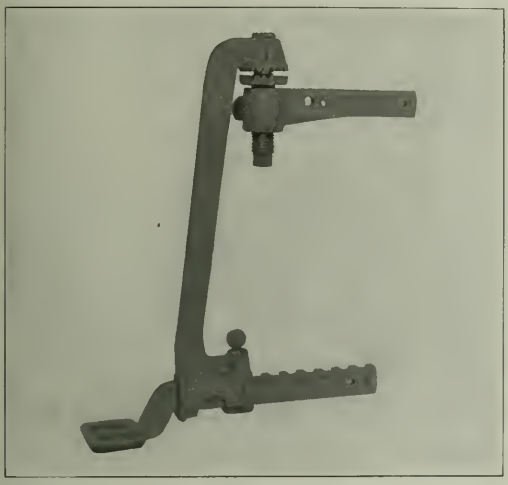
ADJUSTABLE PNEUMATIC FIRE DOOR PEDAL

An adjustable operating pedal for use in connection with pneumatic fire doors, which has recently been developed by the Franklin Railway Supply Company, 30 Church street, New York, is shown in the illustrations. The tread is mounted in a hanger

Adjustable Pedal Attached to the Franklin Butterfly Door

in which it has a sliding adjustment that permits it to be located at a distance from the boiler head suitable for either a tall or a short fireman. The adjustment may also be changed to suit the

position of the fireman as the coal is used back from the coal gates. A lock is provided which holds it in any position. The hanger is mounted on a rigid hanger bolt about which it may be swung in either direction by raising it to clear the teeth in the face of a shoulder on the bolt. When swung to the desired position it is secured by dropping it into place, the teeth in the hanger engaging those in the shoulder. The hanger may be adjusted vertically so that in case of a warped deck the treads may be raised to provide the proper clearance without the necessity of taking the hanger to the blacksmith shop. This adjustment is made by turning the rigid hanger bolt, which is threaded in the fulcrum. One side of the fulcrum is slotted and when the proper adjustment has been made it may be locked in place by means of a bolt provided for that purpose.



Adjustable Pedal Removed from the Fire Door

AN INTERVIEW WITH DANIEL WILLARD

[New York Times]

"What is the problem that this company has to face? What is your chief apprehension as to the future?" Daniel Willard was asked.

"As I view the matter," replied Mr. Willard, "the most serious problem now confronting the railroads is the demand —present and prospective—of labor. The two decisions of the Interstate Commerce Commission in the eastern rate case may be said, when taken as a whole, to comprise a bill of rights for the railroads in so far as the relations between the railroad and the public are concerned, and I for one believe that if the principles recognized and outlined in the decisions above referred to are fairly carried out the future of the railroads from that point of view is more encouraging than it has been in many years past.

"Unfortunately, the same cannot be said with reference to the labor question. The arbitrators who in 1912 passed upon the demands of the locomotive engineers employed by the eastern railroads said that owing to the fact that a railroad was a semi-public institution the employees become by virtue of that fact semi-public servants, and as such it was the duty of the public to see, first of all, that they were fairly paid and properly treated; but also by virtue of that same fact railway employees were under certain obligations to the public which must be recognized; that their service was affected by a public use.
