Before the inauguration of this system, the inspection of rails by this company followed general practice covering such mechanical standards as section, weight, length, straightening, sawing and finishing of the ends, drilling of the holes, etc., in addition to an examination of all rails for the appearance of flaws and physical defects, such as pipes,

seams, laps and other conditions made manifest by the drop test. Necessarily much of the work of an inspection of this character was limited, for as mill work proceeds both day and night, while the inspectors worked only in the day, there was a possibility that through carelessness a substitution, for example, of drop test pieces might occur before the inspector arrived in the morning. Under the "special" inspection both day and night supervision is established at all parts of the mill, and all of the operative mills in the country can now be covered in this way if a road ordering rails desires it. The normal force of special inspectors includes 97 men, divided approximately as follows: 20 open hearth furnace inspectors, 6 Bessemer furnace inspectors, 27 blooming mill inspectors, 23 rail mill inspectors and 21 drop test inspectors. The men at each mill are under the supervision of a chief inspector, who in many cases has a clerk and a well-equipped office.

This special service has now been in operation long enough to demonstrate many of its advantages, although, of course, it is too early to determine the final effect upon the wear and breakage of rails in the track. Any improvement in the quality of the rails which is effected by this inspection is not due to any change in the mixing, blowing, pouring or rolling, but to the careful watch which is kept on the minor details of these processes, with a view to eliminating any bad practices that may be adopted by employes to increase the output or to make the work easier for them. In general, the mill executives and superintendents are co-operating with the inspectors, as they appreciate the beneficial effect on their men of such an inspection. In reality these inspectors perform a service equivalent to that of additional foremen, although they have no direct authority over the employes in the mill.

A very common phrase in rail specifications covering the mill work is that the "manufacture of the steel and its subsequent treatment shall be according to the best current practice." This absence of definite clauses covering the processes of manufacture makes it very difficult to enforce any absolute rules, and the inspectors accomplish their purpose by suggestions to the men or the foremen and by reporting, both verbally and in writing, on any practices of which they do not approve. Such reports are generally so timed as to permit the mill to divert the steel or the rails to some other use in preference to having the evidence collected by the inspector presented to the road for which the rails are being rolled. A card record is started of each heat by the open hearth or Bessemer inspector, who turns it over to the blooming mill inspector after he has seen the ingots stripped. This man keeps up the record until the blooms are rolled and sheared, after which the rail inspector's duties begin. The drop test inspector also receives the card when the tests are to be made, so that a permanent and complete record of the manufacture and treatment of each heat of steel is provided.

A few examples of practices discovered and corrected by these inspectors will illustrate the possibilities of this system. During the blowing of several Bessemer heats the converters "spit" badly, obviously reducing the amount of metal contained. Without regard for this, however, the customary amount of recarburizer was added in each case, producing steel with high carbon and high manganese. A report on this occurrence resulted in the superintendent of the Bessemer department being disciplined, and he later left the company's employ. After an open hearth heat is tapped and most of it is in the ladle, the melter may suddenly decide that it is too low in carbon and add coal to the metal as it rises to the top of the ladle. Under favorable conditions the carbon will diffuse itself evenly throughout a heat, but when conditions are not the most favorable it is likely to segregate, and the chemical test might fail to show this segregation, although some of the rails would be adversely affected.

If an ingot is rolled very cold in the blooming mill the heater at the reheating furnaces may open up his furnace to its full capacity in order to heat the bloom a little quicker, with the result that the top corners become too hot, and if the top part of the bloom is rolled into the flange of the rail, a weak flange may result. While it may look all right, the quality will probably not be equal to that in the remainder of the rail section. The superintendents in some mills have watched the timing of the ingots in the soaking pits more carefully at the suggestion of the special inspectors, with the result that the ingots have been more evenly heated and better rolling secured. At a large mill where a number of heats are being cast at the same time, or where Bessemer and open hearth plants are using the same soaking pit, the heats may sometimes become mixed. In one instance 16 ingots were reported cast in one heat and the blooming mill inspector noticed that 17 were charged into the soaking pit. Investigation showed that one ingot from a 0.16 per cent carbon heat had been mixed with the high carbon ingots. If this ingot had been rolled, eight very soft rails would have resulted.

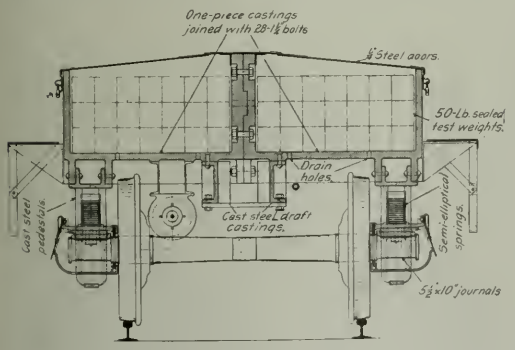
A NEW 80,000-LB. TRACK SCALE TESTING CAR

A new track scale testing car weighing 80,000 lb. has recently been designed by the Fairbanks Company, New York, superseding the 60,000-lb. car formerly made and used by this company. The old car, which was built up of structural steel, was not rigid enough for the heavy load which it carried, it required a great many test weights, as its tare weight was only 20,100 lb., and its total weight 60,000 lb. was hardly considered heavy enough for testing scales on which freight cars with a maximum weight of 80 tons are weighed. The new car has some additional advantages over the old one, which are brought out in the following description:

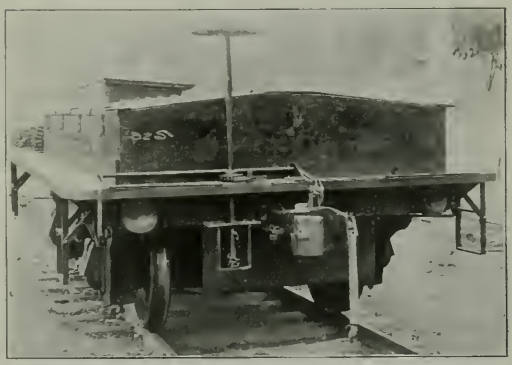
The car is of the rigid wheel base type with a cast iron body, having a total length of 14 ft. 11 in., a width over the platform of 9 ft. 10 in. and a wheel base of 7 ft. The car is designed to offer a very slight wind resistance, and its center of gravity is low, both of which are important features in securing an accurate test. The underframe, body and weight compartments are formed by two one-piece castings, accurately machined where they connect and provided with a recess and a projection to relieve the shear on the connecting bolts. They are connected by 28, 1¼-in. bolts, the nuts having spring washers to prevent their loosening due to the vibration of the car. Recesses are provided for the heads of the bolts and for the nuts in order to preserve straight surfaces inside the test weight compartments. The



Cross Section of Scale Testing Car, Showing Details of Construction.

castings have sockets at the corners to form push pole pockets. There are eight weight compartments, each 3 ft. 4½ in. by 3 ft. 2½ in., with drain holes in the bottom, each compartment being closed by a hinged door of ¼-in. steel plate opening toward the center of the car and held closed by a padlock.

The draft castings are of cast steel riveted to the main castings. The car is equipped with the Westinghouse friction draft gear, standard M. C. B. couplers and coupling device, Westinghouse air brakes and a hand brake, the wheel of which is arranged to be detached easily to allow the end compartment doors to be opened, cast steel journal pedestals riveted to the main body castings, semi-elliptical pedestal springs, M. C. B. standard journal boxes, bearings, axles and wheels. The car is provided with a platform extending around all sides which is 8 in. wide at the end and 14 in. wide at the sides. This platform is built up of ¼-in. checkered steel plates reinforced with angles on the edges and supported by pressed steel brackets attached to the main casting. A tool box is attached to the under side of the car which is built up of ¼-in. plates and steel angles, having a door on each side of the car and a sliding tray which provides a means for sealing the car to an exact weight. A ⅛-in. steel plate is attached to the under side of



A New Type of Scale Testing Car Weighing 80,000 lb.

the car and extended back to the tool box to prevent the accumulation of snow and ice on the projection under the car.

The car is designed to have a tare weight of as near 38,000 lb. as possible. This may vary within a few hundred pounds either way, but if it does, this weight may be adjusted by means of the tray mentioned above and the car sealed to the nearest 100 lb. It is designed to carry 42,000 lb. of 50-lb. test weights, making the total weight 80,000 lb. The object in having the test weights greater than the tare weight of the car, is to provide a means for verifying the weight of the car on any track scale in good working condition. The test weights used with this car are of high grade close grained cast iron arranged with a pipe handle which furnishes a ready means for handling and also contains the sealing material. This is held in position inside the pipe by a screwed plug which is sealed by means of a lead cap forced into a dove-tailed recess, thereby furnishing evidence that the weight has not been tampered with after final sealing. The weights are painted with a special non-absorbent paint, which prevents as far as possible the absorption of moistnre. While the government tolerance of these 50-lb. weights is 20 grains, the weights with which this car is equipped are sealed to a tolerance of 2 grains.

FOUR-CYCLE GASOLINE ENGINE FOR HAND OR PUSH CARS

The Kalamazoo Railway Supply Company, Kalamazoo, Mich., has recently produced a new gasoline engine of the two-cylinder, four-cycle type designed especially for application to hand or push cars. The principal features of this motor are similar to those used in the engine of the No. 30 car which has been in satisfactory use for some time, the principal change beiug in the mounting of this engine on a sub-base. It is built up as a complete unit with the gasoline tank rigidly attached to the top of the crank case and carrying the control levers for the spark and throttle. It

can be equipped either with a pulley or chain and sprocket drive, the engine sliding on its sub-base to tighten the belt in the former case. When a chain drive is used a friction clutch is furnished for application to the drive axle.

The engine is air-cooled and reversible. The cylinder has a 4-in. bore and a 6-in. stroke. It is lubricated by forced feed lubrication, the crank shaft and connecting rod being lubricated by a combined splash and ring bearing lubrication. The engine uses either magneto or battery ignition and is equipped with a heavy fly-wheel having fan blades for spokes. It normally develops about 8 hp. The company can also furnish this engine applied to a motor car in which case it is known as the No. 50 car.

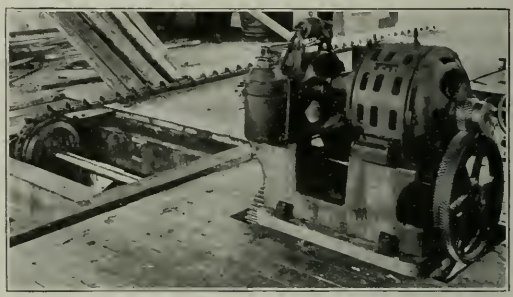
INCLINED ELEVATOR FOR FREIGHT HOUSES AND DOCKS

The Pere Marquette has recently installed an inclined elevator in its terminal warehouse at Third and Congress streets, Detroit, Mich., similar to those which have been successfully used for some time at docks along the seaboard for handling freight between the warehouse and

Handling Freight to the Upper Warehouse Floor of the Pere Marquette Station in Detroit on an Inclined Elevator.

vessels. The construction of this elevator, which consists briefly of a moving ramp and an endless chain with lugs which engage the axles of the ordinary two-wheeled trucks was described in the Railway Age Gazette of April 11, 1913. The elevator in the Pere Marquette house is arranged to operate either up or down and has replaced three hydraulic elevators with platforms approximately 10 ft. by 10 ft., having a capacity of 4,000 lb. at a speed of 50 ft. per minute. This elevator handles all of the overflow of the incoming freight from the first to the second story of the warehouse. By its use the freight can be removed from the car directly to its place of storage on the upper floor without transferring the load.

While it is too early to determine the exact economy effected in the Detroit installation, the experience previously gained with these elevators indicates that such economies can be effected. For instance, at the Weehawken docks of the New York Central it is reported that the labor cost with these machines is reduced from two to three cents per ton, and the time of unloading lighters is decreased by an amount equivalent to increasing the capacity of the marine equipment from 20 to 40 per cent, depending upon conditions. At the New York and Norfolk terminals of the Old Dominion Steamship Company the inclined elevators are reported to save the labor of four longshoremen for periods of approximately five hours per day. The Merchants & Miners Transportation Company, which has two of these machines at its Savannah, Ga., terminal, four at its Mystic Wharf terminal in Boston, and

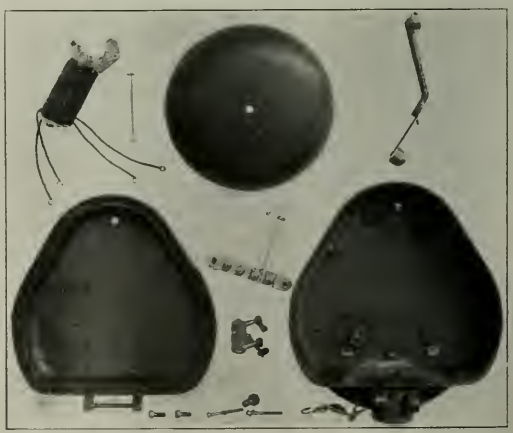


The Operating and Control Apparatus of the Inclined Elevator at the New York Central Dock at Weehawken, N. J.

six at its new city terminal in South Boston, estimates savings of 13 to 15 per cent in the cost of handling freight by the use of these elevators. At another installation it has been stated that the inclined elevators save nine cents in the cost of transferring a ton of freight, the cost of power in this case being about $0.001 per ton.

DIRECT CURRENT CROSSING BELL

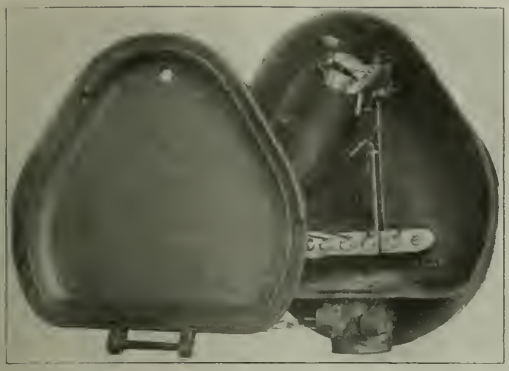
The Union Switch & Signal Company, Swissvale, Pa., has developed a new design of d. c. crossing bell which complies with R. S. A. specifications throughout, and in which the most notable feature is simplicity. Coils and contacts are readily removed or replaced without disturbing or changing the adjustment of other parts of the mechanism, and the operating mechanism may be readily exposed for inspection



Direct Current Crossing Bell Details.

without the removal of the gong or in any way interfering with the operation of the bell.

The coils are wound to 10 ohms resistance for a normal operating battery of 6 volts. The bell, however, will operate satisfactorily on less than 4 volts. Special features are the removable arcing tips which protect the circuit controller



Direct Current Crossing Bell, Complete.

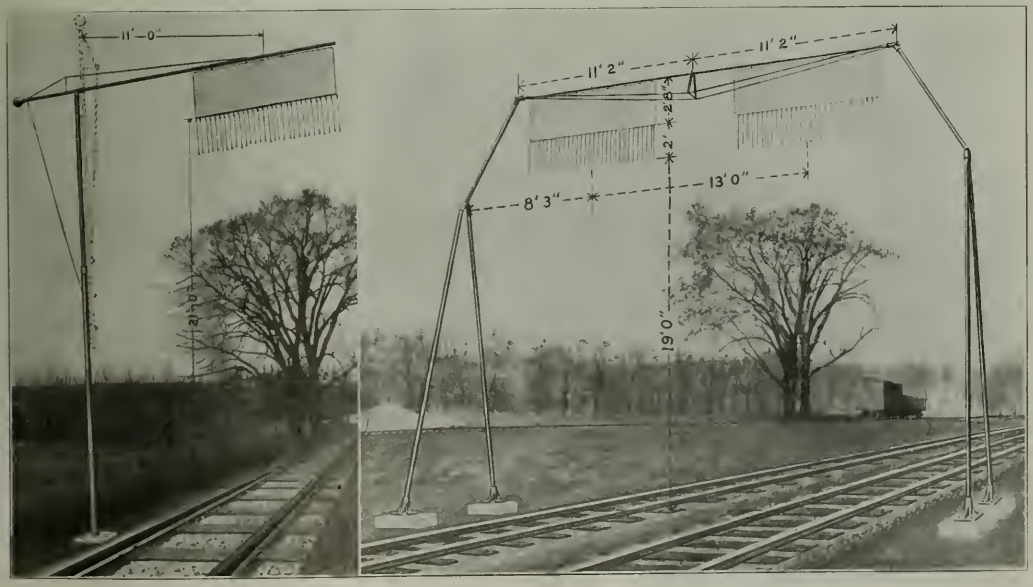
contacts from injury, and a simple circuit controller adjustment which permits the contact opening to be varied without bending the springs or loosening the terminal posts.

TWO NEW TYPES OF BRIDGE WARNING SIGNALS

The Chicago Railway Signal & Supply Company, Chicago, has recently placed on the market two new styles of bridge warning signals which use the same form of screen and "tickler" cords but differ in the design of the supporting structure. The style A signal shown at the left in the accompanying illustration is a single-track warning made of heavy steel pipe so arranged that the cross arm can be folded down out of the way when necessary. To accomplish this purpose the horizontal pipe is counterweighted on one end and is stiffened by a truss rod and an anchor rod connecting it to the vertical post. The wire screen is 8 ft. long and 2 ft. 8 in. deep, being made of extra heavy wire with 1-in. mesh connected to an endless rim. The screen serves to keep the cords in position at all times and is supported from the horizontal pipe by closed hook bolts which allow it to be swung without danger of unhooking. The cords are chemically treated to increase their life. They are wired to the screen and their lower ends are wound with marline to prevent fraying. Unless otherwise specified, this warning is furnished with a clearance of 21 ft. to the bottom of the screen and 8 ft. from the near rail to the supporting pole. Sufficient cord, wire and marline are furnished for 33 drop cords, each 24 to 36 in. long.

The same type of warning signal is furnished for spanning two to ten tracks, the only differences in construction being that the screens are supported by a heavy galvanized steel cable on which they are hung by galvanized slip links and are held in place laterally by flexible galvanized wire rope, the ends of which are left long to allow the screens to be pulled to either side without removing them from the supporting cable. Each pole is anchored by two steel guy rods equipped with long turnbuckles which permit of adjustment and alinement of the signals and with anchor rods having an anchor plate and nut suitable for fastening to the foundation and on the other end an eye for attaching to the guy rods. The interchangeability of the parts of the single and multiple track warnings make it possible to utilize a single track signal when additional tracks are built by erecting a second supporting pole and substituting the cable for the cross pipes. For warnings spanning from 3 to 10 tracks, heavier and longer poles are used with a curved messenger cable above the supporting cable to strengthen the construction.

The style D warning of which the double-track form is shown at the right in the accompanying illustration, is also of metallic construction throughout using the same screen and cords described above. Unless otherwise specified these warnings are made with a clearance of 19 ft. below the lower ends of the tickler cords and 8 ft. 3 in. from the center line of the track to the supporting posts. The cords are usually furnished 2 ft. long but can be made any desired



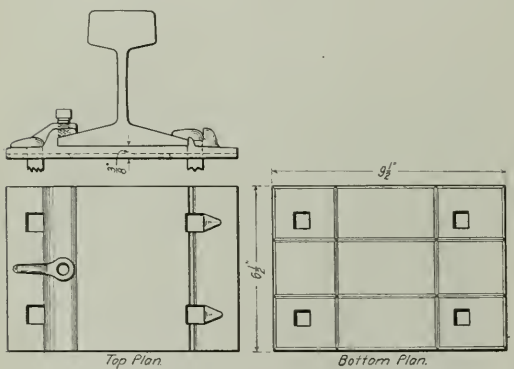
Single-Track, Style-A Chicago Bridge Warning.

Style-D Metallic Bridge Warning Signal, Spanning Two Tracks.

length. The screens are hung directly from the top supporting pipe by closed hook bolts, the truss rods shown in the illustration being omitted in the single-track warning. These warnings are assembled complete at the company's plant before shipment and can be erected in the field without fitting, threading or pipe cutting. Each of the supporting pipes is equipped with a base casting which is calked to the pipe before shipment and is accompanied by the necessary anchor bolts for attaching to the foundation. The warnings of these types in the standard dimensions illustrated are being kept in stock to allow immediate shipment.

THE THOMAS RAIL ANCHOR TIE PLATE

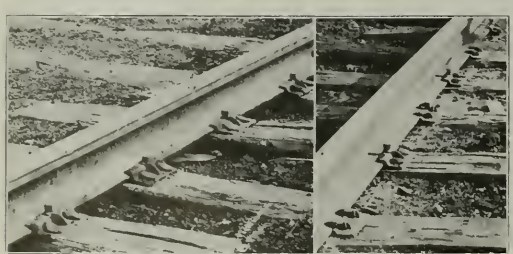
The Thomas rail anchor tie plate has been in use on the Kansas City Terminal for the past four years, is now installed on a curve and a turnout of the Union Pacific in Kansas City and is being tested by a number of other roads. This device



Section and Plans of the Thomas Rail Anchor Tie Plate.

consists of a plate 6½ in. by 9½ in. by ⅜ in., with a shoulder along each edge of the rail base, a lug back of each inside spike hole to heel in the spikes and a rib on the outside edge of the plate extending up over the shoulder, through which is placed a ⅝-in. diameter set screw bearing against the upper surface of the rail base. The under side of the plate has small corrugations at right angles to the edges.

The edges of the plates are strengthened against buckling or breaking by the shoulders, lugs and rib and the rail is



Two Views of the Rail Anchor Tie Plate in Track, One Showing the Plates Reversed on Alternate Ties.

retarded from creeping by the grip of the set screw and the friction of the outside overhanging shoulder and the inside spike. This anti-creeping feature is operative for traffic in either direction. The set screw is cup-pointed and made of tempered steel. It is inserted perpendicularly and when screwed down against the rail the threads of the screw become meshed forming a lock which prevents it from loosening. One engineer maintenance of way reports that he has noticed that within three or four months the set screws become rusted sufficiently to make them immovable to any pounding by traffic. In the Kansas City Terminal test the set screws are said to have remained tight for the entire four years. In addition to the action of this device as a tie plate and rail anchor one general roadmaster who has tested it finds that by reversing the plates on alternate ties they can be used on sharp curves to prevent the rails from turning and spreading.

The rail anchor tie plate is made from the best grade of Bessemer and charcoal malleable iron, each cast being analyzed in the laboratory and each heat subjected to physical test. These plates are manufactured by the Chicago Malleable Castings Company, West Pullman, Chicago, Ill.

TWO SCHERZER ROLLING LIFT BRIDGES FOR THE DELRAY CONNECTING RAILROAD

The Solvay Process Company, in making general improvements on its subsidiary railroad, the Delray Connecting, found that it would be advisable to replace a center pier swing bridge, over the River Rouge at Detroit, Mich., with

Two Scherzer Rolling Lift Bridges Operated from One Controller House.

Scherzer rolling lift bridges to facilitate the increasing traffic between the company's plant and the railway yard. The government requires a 120-ft. clear opening between fenders on this river, and as the two bridges were to be within 150 ft. of each other, plans were approved for two single-track rolling lift bridges at diverging angles from the south bank.

The east bridge has a movable span of 210 ft., a track girder span of 40 ft. on the south bank and an approach span of 20 ft. on the north end, while the west bridge has a movable span of 141 ft., a track girder span on the south of 34 ft. and an approach girder span of 20 ft. at the north end. Both bridges are designed for Cooper's E-60 loading and under the American Railway Engineering Association specifications. In addition to the railway traffic, the short span is used by highway bridge and has 4-ft. sidewalks carried on brackets on the outside of the trusses. A roadway of 15 ft. between curbs and 26 ft. 5 in. between sidewalk railings is provided. The movable span is of the Warren through truss type, 16 ft. 3 in. center to center of trusses with parallel chords 29 ft. center to center. The span is equipped with a 37-hp. a. c. motor and

with means for operating by hand when desired. It operates through an angle of 81 deg. 10 min. The 210-ft. span has the same general details with the following exceptions: It is strictly a railway bridge with trusses 18 ft. center to center and a sloping top chord. The bridge is operated through an angle of 76 deg. 23 min. and is equipped with two 30-hp. a. c. motors and also with means for operating by hand. Both bridges are operated from one house, which is supported on brackets on the west side of the track girder span of the long bridge. Each has a separate control and one operator can move them together or separately as desired.

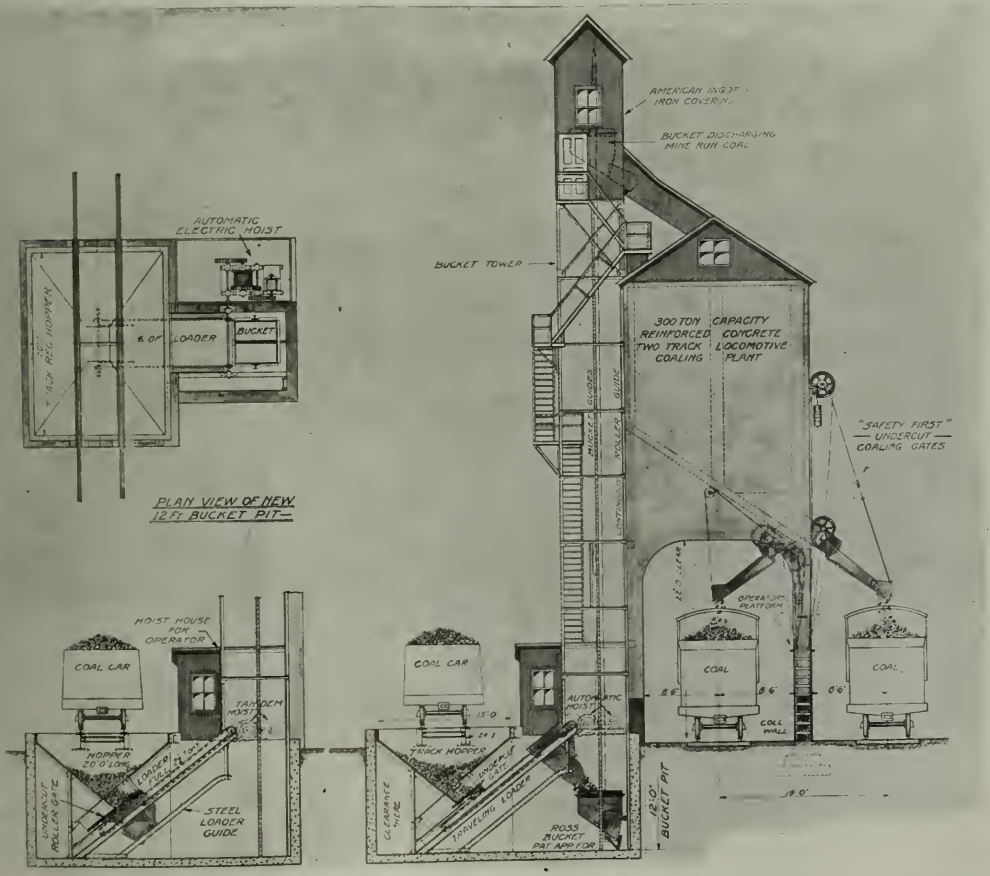
Rapid progress was made on both of these bridges. On the longer one the first steel was raised on May 20, 1914, erection was completed on July 19, the bridge was operated on July 27 and on August 15 it was opened to traffic. On the 141-ft. span erection was started on October 6 and was completed on November 7, the bridge was operated on November 14 and traffic was placed on it December 3.

The Scherzer Rolling Lift Bridge Company, Chicago, furnished the designs, plans and specifications of the superstructure, operating machinery and power equipment for these bridges and also maintained a consulting engineering supervision during the manufacture and erection. The engineering department of the Solvay Process Company designed the substructures. The Pennsylvania Steel Company manufactured and erected the superstructures and Messrs. Ginzel and Towler, Detroit, Mich., were the contractors for the substructures.

A SHALLOW PIT LOADER FOR A COALING STATION

A new type of pit loader for use at locomotive coaling stations that requires a depth of pit of only 12 ft. has recently been designed by the Roberts & Schaefer Company, Chicago. This loader is intended for use with the "Holmen" type of elevating bucket, which is also installed by this company. The loader consists of a large, heavy steel receptacle with a capacity of 2½ tons of mine-run coal which operates on an inclined track of heavy channels from its unloading position under the track hopper to its dumping position over the elevating bucket. A continuous roller guide is provided for the loader discharge apron to keep it positively in the closed position except when loading the elevating bucket. A ¾-in. steel undercut gate mounted on rollers controls the flow of coal from the receiving hopper and is actuated by the traveling loader.

The loader is operated by an automatic electric hoist which also controls the elevating bucket. This hoist has a diffen-



A Holmen Coaling Station Equipped with 12-ft. Bucket Pit. Loader Filled, Gate Open and Elevating Bucket Discharging at Left, and Bucket Loading with Hopper Closed at Right.

tial action with a ratio of travel of 7:1 for the pit loader and the coal elevating bucket. The loader is geared directly to the hoist. The entire equipment, being automatic, is under the control of the operator in the hoist house by means of an electric push button.

A COMPARISON OF TITANIUM TREATED AND STANDARD OPEN-HEARTH RAILS

In bulletin No. 170 of the American Railway Engineering Association dated October, 1914, there appears a report by M. H. Wickhorst, engineer of tests of the Rail Committee on "The Influence of Carbon on the Properties of Rail." This report covers an extended series of tests made at the plants of the Carnegie Steel Company and the Maryland Steel Company. The blooms from which these rails were rolled were selected from stock and no effort was made to locate the position of each rail in the original ingot. It is fair to assume, therefore, that these samples were in general representative of the average run of steel rails of approximately the same analyses as reported.

In Mr. Wickhorst's report he presented a formula for the tensile or ultimate strength

$$T = 40{,}500 + 1{,}250\ C$$

T being the tensile strength in pounds per square inch and C being the amount of carbon in 0.01 per cent.

Mr. Wickhorst states that, "this is for open-hearth steel with about 0.03 per cent phosphorus and about 0.70 per cent. manganese in test specimens of ½-in. diameter and 2-in. gage length and between limits of 0.30 and 0.80 per cent carbon."

On another page he presented a formula for the calculation of elongation as related to the tensile strength

$$E = 52 - \frac{T}{3300}$$

He stated that, "this formula applies for tensile strength of 80,000 to 130,000 lb. per sq. in. It gives the average elongation and individual results may fall above or below this average."

Previous to the appearance of this report the Titanium Alloy Manufacturing Company, Niagara Falls, N. Y., had issued seven bulletins covering detailed studies of 17 standard and 17 Titanium treated open-hearth rails.

Following the appearance of the A. R. E. A. report the Titanium Alloy Manufacturing Company applied these formulæ to the results secured in the tests reported in their bulletin. On two of the samples of each set chemical analyses were not taken from points identical with those from which the tensile test specimen pieces were taken and it was therefore possible to make a comparison on only 15 of the 17 samples of each class of rails.

The accompanying table shows the results of this comparison, samples 6 and 7 of each class being omitted for the reasons just stated. Columns 2 to 6 inclusive, show the analyses of carbon, manganese, phosphorus, sulphur and silicon, respectively, in the center of the head of each sample. Column No. 7 shows the theoretical tensile strength calculated by Mr. Wickhorst's proposed formula. Column No. 8 shows the actual tensile strengths of the various samples as reported in the manufacturer's bulletins. Column No. 9 shows the theoretical elongations according to Mr. Wickhorst's formula, while column No. 10 shows the actual elongations as previously reported in the bulletins. Column No. 11 shows the percentage of the actual to the theoretical ultimate strength while column No. 12 shows the percentage of the actual elongations to the theoretical. The last column shows the "merit" of the various specimens obtained by multiplying the percentage figures in column 11 by those in column 12.

From this comparison it is seen that the average ultimate strength of the Titanium-treated rails is 95 per cent, of the theoretical strength computed by the Wickhorst formula as compared with 90 per cent. for the untreated rails while the Titanium-treated rails showed an average elongation of 98 per cent. of that computed by the formula as compared with 83 per cent. with the untreated rails. The average "merit" for the Titanium-treated rails is seen to be 94 per cent. as compared with 75 per cent. for the untreated rails, or over 20 per cent. greater. As the amount of Titanium remaining in the steel is very slight, these results would indicate that the logical explanation for this improvement lies in the greater uniformity of the treated steel.

COMPARISON OF SAMPLES FROM 15 UNTREATED OPEN HEARTH A-RAILS AND 15 TITANIUM TREATED OPEN HEARTH A-RAILS AS REPORTED IN OUR BULLETINS 1 TO 7 INCLUSIVE, AND SUMMARIZED ON PAGES 4 AND 5 OF BULLETIN No. 7.

Standard Open Hearth A-Rails		C	Mn	P	S	Si	Theoretical Wt. Str.	Actual Wt. Str.	Theoretical Elongation	Actual Elongation	Percentage Actual to Theoretical: Ultimate Strength	Elongation	Merit

Railway Age Gazette

DAILY EDITION

Vol. 58. CHICAGO—MARCH 18, 1915—NEW YORK No. 11c.

PUBLISHED DAILY FOR FOUR DAYS, MARCH 16 TO 19, INCLUSIVE, BY Simmons-Boardman Publishing Co., Transportation Bldg., Chicago, Ill., on the occasion of the annual convention of the American Railway Engineering Association and the stated meeting of the Railway Signal Association.

NEW YORK: Woolworth Bldg. CLEVELAND: Citizens Bldg.
LONDON: Queen Anne's Chambers, Westminster.

EDWARD A. SIMMONS, *President.*
L. B. SHERMAN, *Vice-President.* HENRY LEE, *Sec'y & Treas.*
The address of the company is the address of the officers.

EDITORS:

SAMUEL O. DUNN, *Editor.*
ROY V. WRIGHT, *Managing Editor.*
B. B. ADAMS
E. T. HOWSON
W. E. HOOPER
H. F. LANE
H. H. SIMMONS
K. L. VAN AUKEN
R. E. THAYER
A. C. LOUDON
C. B. PECK
F. W. KRAEGER
C. W. FOSS
E. G. ZACK

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico.....$5.00
Canada 6.00
Foreign Countries (excepting daily editions)..... 8.00
Single Copies .....15 cents each

Engineering and Maintenance of Way Edition and the four Maintenance of Way Convention Daily issues, North America, $1.00; foreign (excepting daily editions), $2.00.

Application made at the Post Office at Chicago, Ill., for entry as mail matter of the second class.

WE GUARANTEE, that of this issue 6,744 copies were printed; that of those 6,744 copies, 5,840 copies were mailed or delivered by messenger to regular paid subscribers; 821 copies were distributed among members and guests of the American Railway Engineering Association and at the Coliseum; 133 copies were mailed to advertisers; and 150 copies were set aside for office use.

The RAILWAY AGE GAZETTE and all other Simmons-Boardman publications are members of the Audit Bureau of Circulations.

CONTENTS

A Well Organized Committee

The adoption of three new rail sections and specifications for carbon and heat-treated angle bars within five minutes after their presentation and without any discussion or objections from the floor of the convention yesterday afternoon illustrated the well-oiled machinery within the Rail Committee. Including within its members nearly all the leading authorities on rail matters within the association, it was evident the differences of opinion were all adjusted before the report was presented to the convention. These recommendations were adopted with as little commotion as if they referred to only a minor change in wording of some specification.

Reports on Substitute Ties

In view of the continually increasing cost of wooden cross ties and the resulting agitation for the substitution of ties of other materials, the Tie Committee is performing a valuable service in compiling information from year to year regarding the design and the service results secured from the numerous experimental installations of substitute ties. Not only is this report of value because of the information given concerning the particular designs referred to, but a study of the different failures reported reveals many points to be avoided in later designs. The duty of the subcommittee on Substitute Ties is not to attempt the design of a tie, but rather to observe the results secured with the many designs already in service. The report this year is of more than usual value, as it contains an index to the reports made previously on the various substitute ties, enabling one to ascertain the history of any special tie in so far as the committee has reported on it. It is to be hoped that this index as well as the report will be continued from year to year.

The Importance of Drainage

It is axiomatic that water is the greatest enemy of track and that most of the ills from which a track suffers are the result of an excess of moisture. At the same time it is only in recent years that it has been considered advisable to increase the expenditure for original construction to eliminate future water trouble. In many cases the funds for these increasing expenditures have not been available previously. One of the subjects on which the Roadway Committee reported yesterday was "The Prevention or Cure of Water Pockets in the Roadbed," and it mentioned several precautions which may be taken to prevent them. Closely connected with this same subject is that of sodding of slopes to prevent the washing down of the embankment material into the drainage ditches. The Roadway Committee also reported on this, describing the practices of a number of roads and presenting specifications for this work. While relatively expensive, the sodding of embankments is becoming more general at those points where trouble is expected and many instances may be cited where such precautions have saved their first cost many times over in reduced maintenance expenditures, all of which shows that we are gradually adopting higher standards and building more permanently for the future.

President Robert Trimble

Robert Trimble, who was elected president of the American Railway Engineering Association, is chief engineer maintenance of way of the Pennsylvania Lines West of Pittsburgh, Northwest System, with office at Pittsburgh, Pa. Mr. Trimble was born at Butler, Pa., and was educated at the Western University of Pennsylvania during the years 1872 to 1875. He entered railway service in the latter year as chainman for the Pennsylvania Company, and until 1903 occupied various positions in the engineering department, including that of principal assistant engineer. In 1903 he was appointed chief engineer maintenance of way, which position he still holds. Like most Pennsylvania officers, his entire service has been with that one road. A very interesting piece of information in connection with Mr. Trimble's career is the fact that he was the resident engineer in charge of construction of the present Union Station at Chicago, which was completed and put in service on April 4, 1881. Thomas Rodd, who is now chief engineer of the Pennsylvania Lines West of Pittsburgh, was then principal assistant engineer. Mr. Rodd is now chief engineer of the Union Station Company, which is about to replace the present structure with a magnificent new one, and Mr. Trimble is the chairman of the board of advisory engi-

neers, to which has been committed the study and supervision of certain of the construction features in connection with the work. Mr. Trimble has been first vice-president of the Association during the past year, and during the previous year was second vice-president.

An Increasing Knowledge of Paint

Not many years ago the railways bought their paints almost entirely on the recommendations and reputations of the manufacturers. This condition existed because the paints were all mixed by secret formulas, which the manufacturers protected vigilantly. During the past two years reports on the subject of paint have been presented before the American Society for Testing Materials, the American Railway Bridge & Building Association, and the Maintenance of Way Master Painters' Association, and the report of the committee on Iron & Steel Structures of the American Railway Engineering Association, presented yesterday, also contains an elaborate and valuable discussion of this subject. Thus the railways are themselves securing a greater knowledge of paints and paint materials, and they are therefore able to discriminate more carefully between the various brands on the market. In fact, one or two roads have prepared detailed specifications for the paints they desire to use, and call for bids from the various manufacturers on the basis of the specifications outlined. Equal attention is also being given to methods of application of the paint. Instead of allowing any mechanic to be employed in a painting gang, there is coming to be a greater realization of the fact that this is a trade in itself and that the best results can only be secured by employing skilled workmen.

The Fiscal Year

At various times during the past year we have called attention in these columns to the serious effect of the present limits of the fiscal year on the track department. President Storey emphasized the importance of the same idea in his annual address. The Track Committee yesterday repeated its recommendation of a year ago that the American Railway Engineering Association, strongly urge upon the American Railway Association the adoption of December 31 as the end of the fiscal year, and the president stated that the Board of Direction was now giving this subject its attention. No other single action would have as great a beneficial effect on maintenance of way work. The railways have the means within their own power to make this change, for the only other party concerned, the Interstate Commerce Commission, would undoubtedly offer no objection to changing from June 30 to December 31. The beneficial results which would be obtained by this change are so obvious to every maintenance of way officer that he has difficulty in understanding why the railway executives do not make it. He should not, however, become discouraged with the lack of support, because many important reforms are secured only by prolonged agitation. That progress is being made is shown by the fact that the Erie has decided within the past month to change from the fiscal year ending June 30 to the calendar year in making its annual report to its stockholders. If a few more roads follow this example, the movement may become general. That the calendar year is not unpractical is proven by the fact that two of the largest railway systems in the country, the Pennsylvania and the New York Central, have operated for many years on the calendar rather than the fiscal year.

ENLARGING THE CLEARANCE DIAGRAM

No subject brought out a more vigorous discussion yesterday than that with reference to the clearance diagram proposed by the committee on Iron and Steel Structures. The diagram previously approved and now published in the Manual provides for a minimum horizontal clearance of 14 feet. The diagram presented by the committee increases this to 15 feet. The purpose of the committee in increasing the horizontal clearance was essentially one of safety. The employes' organizations and numerous state commissions have been demanding increased clearances frequently in recent years. As a result a number of states now require clearances considerably greater than those specified by the standards of the association. In opposing the change, Mr. Schall pointed out the effect it would have on the eastern roads built in the more congested centers where any changes are correspondingly expensive. The adoption of an enlarged clearance diagram permitting the operation of larger cars by one road soon affects every other road in the country, for with the present free interchange of equipment the cars of one road may be expected to move over any other line. Representatives of several western roads joined in the opposition to this measure, but on different grounds. Attention was called by several members to the fact that the adoption of increased clearances would soon result in the design of larger cars and locomotives by the mechanical department. Conditions would then soon again be as they now are. In reply to this the chairman of the committee called attention to the fact that any measure which will increase the ultimate returns to the railways are justified. If an increase of the clearances with the resultant revision or rebuilding of the structures will permit the operation of larger equipment and thereby reduce the cost of transportation sufficiently to increase the ultimate net revenue, such changes are justified. The rejection of the proposed diagram by a majority of only five votes indicates the closeness of the decision.

MR. GLEED ON THE HUMAN MIND

Charles S. Gleed is not a politician or in any sense a candidate for the favor of the public. He is a business man, a lawyer, a scholar, a philosopher and a lover of his fellow men. These facts explain the address entitled "About the Human Mind," which he delivered at the dinner of the American Railway Engineering Association last night. He had the courage to make the speech because he is not a candidate for public favor and apparently never intends to be one. He had the knowledge of human nature which enabled him to prepare it because he is a business man, a lawyer, a scholar and a philosopher. And he got up out of a sick-bed to prepare it and came to Chicago to deliver it because he felt that it is the duty of one who loves his fellow-men to take advantage occasionally of good opportunities to tell them a few plain truths about themselves.

Mr. Gleed's address, which is published elsewhere in this issue, is a severe arraignment of human nature, especially of human nature in masses. Dean Swift himself was not more caustic or pessimistic; and one who considered both the substance and the literary attractions of Mr. Gleed's remarks, might regard him as a real, modern Swift. But that would be to fly wide of the mark. For while Swift both castigated and hated human nature, and was hated and deserved to be hated, by most of those who knew him, Mr. Gleed, as we have intimated, is a lover of his kind, and is also one of the gentlest, kindest and most generous of men.

Why, then, does he thus whip mankind with scorpions? Probably he has recently been brooding over the awful catastrophe which has lately befallen Europe and over the recent course of politics and business in his own country. He has for years taken an intense interest in the public regulation of railways and other business concerns; and any intelligent and honest man who is familiar with the kind of legislation regarding business matters which the public during the last ten years has permitted, approved and even demanded, finds it difficult to repose or express much confidence in either the

fundamental intelligence or the fundamental honesty of human nature in the mass.

But there is another side. Somehow, in spite of the imperfections of the human mind and of human character, we do manage to muddle along. We seem to go backward as often as forward, but the cumulative effects of the advances are greater than the cumulative effects of the retreats. The public soon tires of real statesmen and turns them out, but it also soon tires of the demagogues and turns them out, and they are less likely to be called back than the statesmen. When times are good the public, like Jerushun, waxes fat and kicks, the result being foolish attacks on business enterprise; but publicity, discussion and the pinch of hard times soon bring the public around to another point of view. It is seldom possible to appeal successfully to the mere intellect of the public on important questions; but most important questions have to be determined on moral as well as logical considerations, and at bottom the public is honest, and therefore in the long run usually decides important questions right. Of course, as Mr. Gleed indicates, sometimes it is a terribly long run.

Mr. Gleed's speech was fine as far as it went. But we don't think he finished it. He was most eloquent in his pessimism. But we think he could say some more things on his subject, which would be as eloquently optimistic. We hold no brief for the human mind. We think that any lawyer who took its case would have difficulty in getting it acquitted, if Mr. Gleed appeared, as he did last night, as attorney for the prosecution. But nevertheless, we think that a pretty good case could be made out for poor, old, befuddled human nature.

TO-DAY'S PROGRAM

The convention will be called to order at 9:30 this morning. The following reports will be presented:

XVII. Wood Preservation.
Special. Stresses in Railroad Track.
VIII. Masonry.
VII. Wooden Bridges and Trestles.
Special. Grading of Lumber.
XVIII. Electricity.
XIV. Yards and Terminals.
II. Ballast.
New Business.
Installation of Officers.
Adjournment.

N. & W. ELECTRIC LOCOMOTIVES

In his discussion of the electrification which the Norfolk & Western has recently completed west of Bluefield, W. Va., C. S. Churchill, assistant to the president, stated before the Western Society of Engineers on Tuesday night that they had been able to replace 33 steam locomotives by 11 electric engines. These figures were inadvertently transposed in our report of this discussion in yesterday morning's Daily. The context explains the ability of the electric power to perform this increased service through the elimination of many of the delays incident to steam locomotive operation.

NEW A. R. E. A. OFFICERS

The result of the election of officers of the American Railway Engineering Association for the coming years, as reported for the tellers by the secretary just before the close of the afternoon session yesterday was as follows:

President, Robert Trimble, chief engineer maintenance of way, Northwest System, Pennsylvania Lines West, Pittsburgh, Pa.; first vice-president, A. S. Baldwin, chief engineer, Illinois Central, Chicago; second vice-president, John G. Sullivan, chief engineer, Western Lines, Canadian Pacific, Winnipeg; treasurer, George H. Bremner, assistant district engineer, division of valuation, Interstate Commerce Commission, Chicago; secretary, E. H. Fritch, Chicago; directors for three years, H. R. Safford, chief engineer, Grand Trunk, Montreal, Que.; C. F. W. Felt, chief engineer, Santa Fe System, Chicago, and A. N. Talbot, professor, municipal and sanitary engineering, University of Illinois, Urbana, Ill.; members of the nominating committee: Paul Didier, principal assistant engineer, Baltimore & Ohio, Pittsburgh, Pa.; Hadley Baldwin, assistant chief engineer, Cleveland, Cincinnati, Chicago & St. Louis, Cincinnati, O.; C. E. Smith, assistant chief engineer, Missouri Pacific, St. Louis, Mo.; F. E. Turneaure, dean, college of engineering, University of Wisconsin, Madison, Wis., and D. J. Brumley, valuation engineer, Illinois Central, Chicago.

PENNSYLVANIA ALUMNI HERE

A number of the alumni of the University of Pennsylvania in attendance at the convention and exhibit took lunch together yesterday at the Hotel Stratford.

LOST—RAILROAD PASSES

C. C. Hill, engineer of construction, Michigan Central, reports the loss of a sole leather case containing his Michigan Central and foreign road passes in the Coliseum on Tuesday. Finder please return to room 1162, Congress Hotel.

B. & B. ASSOCIATION COMMITTEE MEETINGS

The Executive Committee of the American Railway Bridge and Building Association held a meeting at 4 o'clock yesterday afternoon in the Congress hotel. The committee on reinforced concrete bridge work also held an informal meeting for the discussion of its work.

STRESSES IN TRACK

A meeting of the joint committee on Stresses in Track of the American Railway Engineering Association and the American Society of Civil Engineers was held in the Florentine room after the afternoon session Tuesday, at which methods of procedure were discussed and an instrument with which certain preliminary tests have been made was examined.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION

The chairman and many of the members of the standing committees of the Roadmasters' and Maintenance of Way Association met at the Auditorium Hotel yesterday morning. The committee subjects and committee work for 1915 were discussed and suggestions given. The meeting was for the purpose of reviewing the work already done on the reports for the annual convention. A meeting of the executive officers was also held. The attendance was 25.

VISITORS AT THE COLISEUM

H. E. Speaks, general superintendent of the New York Central at Columbus, was an interested spectator at the exhibit yesterday.

Henry Baker, general manager of the Queen & Crescent Route, attended the exhibit yesterday and evinced considerable interest in automatic train control, cab signals, and automatic stops.

C. C. Hubbell, purchasing agent of the Delaware, Lackawanna & Western, visited the Coliseum yesterday and spent a good deal of time in the signal exhibits. Among the purchasing officers who attended the exhibit yesterday are J. F. Marshall, manager of purchases and supplies of the Chicago & Alton, and F. D. Reed, assistant to vice-president and purchasing agent of the Chicago, Rock Island & Pacific.

Proceedings of Railway Engineering Association

Abstract of Eight Reports, Including Iron and Steel Structures, Rail, Roadway, Ties, Building and Track

The Wednesday morning session of the American Railway Engineering Association was called to order at 9:30 a. m. by President Storey in the Florentine Room of the Congress Hotel, Chicago.

ROADWAY

The Board of Direction assigned the following subjects for consideration:

(1) Continue the study of unit pressures allowable on roadbed of different materials, conferring with committee on Ballast and with special committee on Stresses in Railroad Track.

ROBERT TRIMBLE, President-Elect.

J. G. SULLIVAN, Second Vice-President-Elect.

(2) Submit specifications for the protection of slopes by sodding or otherwise.

(3) Recommend means for the prevention or cure, as the case may be, of water pockets in roadbed.

(4) A petition signed by ten members of the Association, addressed to the Board of Direction, requesting the appointment of a special committee to investigate and report on the subject of separating the grades of roads and streets with railroads, was referred to this committee for such further investigation as might be deemed necessary or desirable.

REVISION OF MANUAL.

A number of changes in the Manual were suggested, most of which were in wording only and did not affect the meaning to any great degree.

UNIT PRESSURES ALLOWABLE ON ROADBED OF DIFFERENT MATERIALS.

The chairman of the sub-committee, J. R. W. Ambrose, has designed and tried out an apparatus for measuring under traffic the pressure at any point exerted by the ballast on the roadbed, which, when calibrated, gives promise of furnishing valuable information. No actual results in pounds per square foot have as yet been obtained.

An air-tight box is placed under the track in any desired position, the upper side of the box having a movable diaphragm. The spring within the box is to keep the diaphragm in the extended position after the load is removed. This box is connected by a pipe or hose to a similar box placed on edge, and having a thin rubber diaphragm; to the center of this diaphragm a connection is made to the side of a small mirror; thus any deflection of the diaphragm is multiplied by the mirror. A ray of light is passed on to the mirror, which in turn is deflected according to the magnitude of the impulse given this transmitter, onto a sensitized film moving at a constant speed, recording the movements of the light ray. In these experiments the transmitter was 12 in. under the tie, covered with gravel ballast; the recording mechanism was located 300 ft. from the track.

During the past year we have endeavored to make a preliminary classification of soils preparatory to investigating the allowable unit pressures thereon. This question has been handled quite exhaustively by the United States Department of Agriculture, and in Bulletin No. 84, Messrs. Fletcher & Bryan describe the apparatus and method of making a mechanical analysis of soils and give seven subdivisions into which soils, excluding gravel, stone and rock, may be divided, namely:

	Material.	Size.	
No. 1	Fine gravel ..... 2.	— 1.	mm.
No. 2	Coarse sand ..... 1.	— 0.5	mm.

No. 3	Medium sand	0.5	— 0.25	mm.
No. 4	Fine sand	0.25	— 0.10	mm.
No. 5	Very fine sand	0.10	— 0.05	mm.
No. 6	Silt	0.05	— 0.005	mm.
No. 7	Clay	0.005	— 0.0000	mm.

The committee feels that since the first five of the above materials may be determined by screening, that we should define and adopt the following screens as standards:

	Material.	Screens—Pass Through	Retained On
No. 1	Fine gravel	No. 10	No. 18
No. 2	Coarse sand	No. 18	No. 32
No. 3	Medium sand	No. 32	No. 70
No. 4	Fine sand	No. 70	No. 160
No. 5	Very fine sand	No. 160	No. 230

By the number of sieve is meant the number of meshes per linear inch in the wire cloth, woven from brass wire, having the following diameters for

Sieves Nos. 10 and 18	0.0165	inches diameter
Sieve No. 32	0.0112	inches diameter
Sieve No. 70	0.0045	inches diameter
Sieves Nos. 160 and 230	0.0024	inches diameter

The mesh should be regular in spacing and the cloth should be mounted on the frame without twisting. The last two subdivisions, silt and clay, are more difficult to determine, but the method is fully set forth in the Bulletin, No. 84, of the Bureau of Soils, Agricultural Department, above referred to. If the above subdivisions are adopted, we can then classify various soils by giving the percentage of the materials contained. The percentage of water contained in each sample of soil should also be determined by weighing, drying and reweighing, as the moisture content has a decided influence on the bearing power of many soils.

W. M. DAWLEY,
Chairman Committee on Roadway.

SPECIFICATIONS FOR PROTECTION OF SLOPES BY SODDING OR OTHERWISE.

A general letter was sent to all roads, and 124 replies were received. Sixty-eight had nothing to offer, while 83 practiced sodding to a limited extent and 15 to a much larger extent. Out of the 124 replies, only 6 specifications for sodding and 1 for seeding were received.

Seeding does not appear to be in much favor, as only 4 advocated seeding. Protection by tiling or otherwise met with light response; a few favored tiling. Several advocated cinders, while others advocated honeysuckle or willows on wet slopes. Perhaps the reason for the light response was that the Roadway committee made a report on draining banks, with recommendations covering the ground for drainage in quite a thorough manner. Roads in arid countries point out the fact that sodding is useless on account of lack of water, while others in wet countries state that sodding is unnecessary, as the slope soon becomes sodded naturally. The principal points to be covered by the specifications for sodding are as follows:

Nearly all agree that there should be some preparation of the slope, and there should be a dressing of good soil on top. There is a difference of opinion as to manure dressing, the objection being that it introduces objectionable weeds. There is a wide difference of opinion on the limit of slopes that can be successfully sodded, but it is evident that steep slopes can be sodded by pinning the sod until it is well rooted. The difference of opinion on the cutting of sod is largely on account of the different kinds of sod used. For Bermuda and all running plants, it is evident that the sod should be set out in small pieces, so as to grow a new sod. For grasses that do not have creeping stems, this, of course, would not be true, and in that case all the slope should be sodded.

The letters do not show what kinds of grasses require full sodding. All agree that the sod should be well watered until firmly rooted. Most of the replies advocated staking the sod, but this does not appear to be necessary on slopes that are not steeper than 2 to 1.

There is a great difference of opinion regarding settling banks before sodding, but for Bermuda grasses with creeping stems there appears to be no necessity for waiting for banks to settle. For other grasses this is an open question. The correspondence does not show much interest in seeding. We have only one specification for seeding, which appears to be quite complete. On banks that are wet and springy at the toe of the slope, such as steep hillsides or reservoir banks, the planting of willows or other trees should be looked into more fully.

If, in the opinion of the Engineer, pins longer than 8 in., but not exceeding 12 in., or more than two pins per square yard are required, they shall be furnished by the contractor and used without extra compensation.

Sod shall be paid for as measured in place.

Any defects that may appear in the sod or in the work for a period of six months after the work is completed, shall be made good by the contractor at his own expense, and if not attended to promptly after notice from the Engineer, the defects will be remedied by the company and the cost of doing the work will be deducted from payments due the contractor.

The following specifications for sodding with Bermuda Grass are recommended for adoption and inclusion in the Manual:

The slopes should be graded to a uniform surface and all depressions should be filled in with suitable material and padded down firmly with shovel.

Sodding Banks at Toronto.

If the material of the slope is not fertile it should be given a dressing of 6 in. of good rich loam. If good loam is not available a dressing of manure should be placed on the surface and well raked in. Care, however, should be taken against the use of such manure as have seeds of objectionable grasses or weeds. Before placing the loam the surface of the slope should be loosened up roughly to insure a good bond. Lay out the surface of the slope to be sodded in shallow horizontal trenches 12 in. apart and 3 in. deep. Separate the Bermuda sod into tufts or small pieces not more than 4 in. square and apply in trenches at intervals of 6 in. to 1 ft. apart, according to the quality of the sod and the character of the soil, the object being to place only sufficient old sod to furnish enough creeping stems to cover the slope in a reasonably short time, thus creating a new sod on the slope in pref-

erence to the old sod. The top of the sod should not extend above the surface of the slope, and if the season is advanced so that it is liable to have hot or freezing weather the sod should be depressed just below the surface and a covering of loam placed over the soil. Loose earth should also be packed firmly around the sod.

All sod laid during the day should be thoroughly watered as soon as practicable after laying, and no sod shall be left over night not laid without water. All sod shall be watered daily for 20 days after laying. On slopes steeper than 2 to 1 the sod shall be in narrow strips 3 to 4 in. wide and 3 ft. long, and shall be staked to the bank with small stakes 8 in. to a foot long, stakes being placed every 1½ ft. apart. After the slope has been filled, sod should be rolled or firmly padded down with a shovel to a smooth uniform surface. All sod must be taken from good, rich soil, be uniform in texture, free from objectionable grasses or weeds and in healthy condition, with no signs of decay, and must contain sufficient moisture to maintain its vitality during transportation.

Sod should preferably be cut 3 ft. or more long and 18 in. to 2 ft. wide and not less than 2½ in. thick, large pieces of sod being preferable on account of retaining their moisture and standing transportation better than small pieces. Sod should be as fresh as possible and received on the work daily. Any sod to be left over night should be thoroughly watered. Any sod that is heated will not be accepted. All sodding must be finished before the continued frost sets in.

Sod shall be paid for as measured in place, and shall include the entire surface sodded—this price to include the furnishing the sod and handling it. Transportation of sod, men and material, also to include stakes where it is necessary to take the sod. The entire work shall be done in a thoroughly workmanlike manner so that the appearance after completion shall be as nearly as possible that of good natural growth in place.

All objectionable grasses and weeds shall be removed from time to time to prevent shading the grasses until such time that the sod has taken hold or the creeping stems have covered the entire slope. Where springs have developed on the slope a blind drain of cinders or broken stone should be laid from the spring to the top of the stone should be laid from the spring to the toe of the slope.

MEANS FOR THE PREVENTION OR CURE OF WATER POCKETS IN A ROADBED.

A circular letter, containing a list of 8 questions on this subject, was addressed to those members of the Association directly in charge of maintenance work, or who were supposed to have a detailed knowledge of the treatment of water pockets. Fifty-three replies to this letter were received.

From a consideration of the data now in hand, it is concluded that our knowledge of water pockets in the roadbed is yet in its experimental stage, and it is so related to other questions now being investigated by the Association that it would be inadvisable at this time to attempt any recommendations on the subject.

In reporting progress it is the purpose of the sub-committee to give a resume of its investigation to date, in order that individual members of the Association may further continue the investigation during the forthcoming year and be prepared to assist the committee in reaching its conclusions.

Briefly, a water pocket may be defined as "a depression in a roadbed of variable extent, with ballast or other porous material, wherein water collects and is confined." From opinions expressed, it appears to be well established that the underlying causes of water pockets are the absence of adequate drainage in roadbed; the deformation of the original roadbed prior to ballasting; and an insufficient depth of ballast and heavy wheel loads and the action of frost on the roadbed in climate where the frost line extends below sub-grade. It is also the opinion there is an increased tendency towards the formation of water pockets on old operated lines, which might naturally be expected to follow a neglected track drainage and improper ballast requirements for the increased wheel loads on such lines. The committee's assignment requires two lines of investigation: The prevention of water pockets and the cure of water pockets. It is our conclusion that the prevention of water pockets is the more important subject to be dealt with, and since our investigation will naturally lead to a consideration of the proper depth of ballast and unit allowable pressures on roadbed surface, we must await the conclusion of other committees now handling these subjects.

Prevention of Water Pockets.

Many descriptions of methods tried by various members to prevent water pockets in newly constructed or ballasted track have been reported, but there appears to bo no uniform practice. One reply to our circular advises that extreme care should be exercised prior to ballasting to remove all deformation and to properly shape the roadbed surface so as to quickly shed all water. In this connection it is stated that more water pockets are formed in one day by permitting engines and cars in rainy seasons to use track laid on a flat sub-grade without full ballast, or with no ballast at all than would be formed in years with a sufficient depth of ballast, as in every case where tie beds itself into the roadbed surface a deformation occurs, which collects and holds water and gives foundation for a water pocket, regardless of the amount of ballast afterwards applied.

One of the two lines reported that it is their practice in opening up new track to traffic to spread over the entire roadbed, prior to ballasting, a layer of sand, sandy loam, granulated furnace slag, screenings from stone crushers of certain impervious materials which have been found will shed water. When this material has compacted, ballast is applied, and no trouble is experienced from water pockets.

Bridge-filling methods on some operated lines have been found to be responsible for water pockets in embankments. We are informed by one member, who has made a special study of bridge-filling methods, that where a new fill is permitted to settle before the deck and stringers are removed, water pockets invariably appear, and the amount of trouble experienced in the upkeep of the track varies in proportion to the length of time the stringers and deck remain. He advises that in the past eight years he has made it a practice to remove the deck and stringers when banks are not filled to over 10 or 12 ft. wide on top, and in 12 linear miles of bridges filled, water-pocket trouble was absolutely eliminated.

In climates where the frost line extends below the sub-grade, when the frost is leaving the ground, thawing from the top downward, that part of the soil which has thawed, retaining all its moisture, on account of the impervious frozen layer of soil beneath it, becomes almost liquid, thus losing its supporting power, and it is readily displaced from beneath the ties under traffic. On account of slight variations in the character of the soil, this displacement is not uniform, and the resulting inequalities leave depressions in which water accumulates. The methods suggested for the prevention of water pockets formed in this manner are to carry the ballast below the frost-line, adopt some method of raising the frost-line (soil in extreme cold weather freezes but a few inches deep under a good sod), or to construct the upper portion of the roadbed of frost-resisting materials.

We are indebted to H. T. Porter, chief engineer, and F. R. Layng, engineer of track of the Bessemer & Lake Erie, for the following description of an unusual method of preventing water pockets in new track:

"Between Keepville and Albion, 2.4 miles, the Bessemer & Lake Erie was a single-track road on the towpath of the Erie and Pennsylvania canal, the towpath being approximately 8 ft. above the canal bed. In 1910 it was decided to double track this line and the material was excavated by steam shovel at Albion, hauled on flat cars, plowed off with a side plow and spread with a Jordan spreader. The material consisted of shale and clay of such character that it was unfavorable to good drainage. With the idea of consolidating this material and forming a crust at sub-grade so that the ballast would not punch holes into the sub-grade, a 10-ton Kelly-Springfield roller was used to roll the sub-grade behind the spreader. If the roller developed soft spots they were replowed and rolled again, with the result that before track was laid we had a hard crust formed at the top of the grade. The rolling for the 2.4 miles cost $300, or at the rate of $125 per mile. The track was then laid and ballasted with screened slag and has not been given a resurfacing since. On this entire stretch there is not a single indication of the formation of a water pocket. This new track is the northbound main, and during nine months of the year carries from 24 to 30 freight and three regular passenger trains daily. As a matter of fact it has hardly been necessary to set a jack under this track, and no lining has been done except in a few spots. It is remarkable the way the track has stood up, and it is our belief that the rolling of the sub-grade is in a large measure responsible for the results obtained."

No methods of preventing water pockets in old-operated track have as yet been reported, evidently for the reason it has not yet been possible to tell where and when a

pocket may develop. Every one admits that adequate drainage of the ballast and roadbed surface is essential to prevention, but it does not seem that anything but the usual maintenance methods are followed prior to formation.

In conclusion, the Committee asks the members of the Association to further study the prevention of water pockets along the following lines: (1) In new track, single and multiple. (2) In old-operated tracks, single and multiple. (3) Filled bridges and (4) yards and terminals.

Cure of Water Pockets.

Water pockets have been known to some of our members for 20 years or more, and it is quite natural that methods of cure should be generally known, but, nevertheless, there appears to be a wide difference of opinion as to the most practicable and economical methods. In cuts it is the prevailing opinion that tile drains give the most satisfactory relief from water pockets, but the kind of tile and in what relation to the end of the tie it should be laid is a problem yet unsolved. It appears to the committee that only vitrified socket pipe of a diameter not less than 6 in. should be used for draining cuts, but we are not yet prepared to recommend any specifications for laying or its position in relation to the track.

In embankments, water pockets are prevalent at the ends of the cuts at low points in grade, at trestles replaced by embankments along multiple tracks, and many other points where drainage has become impaired. Relief in such places is secured by opening the pockets and restoring drainage. The methods of restoring drainage to pockets in embankments are many, but the one most widely used consists of cross-draining or tapping the pockets with trenches back-filled with porous material. In many cases drain tile is laid in the trenches, but it is not always beneficial, on account of the tendency to shift its lines and grade under pressure of the load from above or the distortion of the walls of the trench.

The life and efficiency of cross-drainage depends largely upon the depth of the trench and the character of the material used in back filling. Where a proper outlet can be obtained, present experience would seem to indicate that the bottom of the trench should be placed at least 12 in. below the lowest point of the pocket to be drained. Material for back filling consists of cinders, furnace slag, gravel, crushed stone or riprap. It, however, does not appear to the committee that any of these materials alone, with the possible exception of furnace slag, will make an efficient and permanent drain, but that any of the materials mentioned in combination with cinders will give better results. This statement is based upon experience with drains composed of crushed stone or gravel, where in the course of one or two years' life they have been found completely filled by the material from the walls of the trench forcing its way into the voids.

Somewhat similar experience has been had with cinder-filled trenches, except that, instead of the voids being filled, the walls of the trench have become distorted under pressure from loads on track, and have so compressed the cinders as to render them useless for purpose of drainage. It appears that an ideal material for back-filling is one that will prevent the distortion of the walls of the trench and at the same time permit water to filter through. It is believed that a mixture of stone and cinders or slag and cinders will best fulfill these conditions, but a definite conclusion will depend upon further investigation.

Other methods of curing pockets which have been reported consist of driving old boiler tubes into pockets from the side of the embankment, the plowing away of the shoulder to a considerable depth below the base of the tie and restoring the slope with sand, ballast and other pervious material, widening banks and increasing depth of ballast, etc.

Interesting information regarding the difficulties experienced in curing a section of track of water pockets is found in the following quotation from a letter from a member of the Association:

"A section of high-speed main track 4,000 ft. long required constant attention on account of water pockets. We started to overcome this condition by cleaning out the water pockets and running out short sub-ditches from them each year for several years. This became a perpetual nuisance, however, and we made little if any, improvement in track conditions. A little later on we dug the sub-ditches reasonably deep and cleaned out the ballast in quite a thorough manner to permit of the free flow of water from the roadbed through the ballast in the sub-ditches. This afforded excellent relief for the first year, a reasonable degree of relief during the second year, and fair relief during the third year. We observed, however, that we were gradually getting back into the same condition that we were in originally. We then laid a line of pipe between each of the four tracks, and also a larger line of pipe in the outside ditch, with cross drains leading from the lines of pipe between the tracks to the main side pipe. These pipes were laid with the flow line about 34 in. below the top of the rail, because of local conditions, and we filled over them with ashes to the top of the sub-grade. We then cleaned the ballast thoroughly to sub-grade, making what was practically a newly constructed piece of track with ample provision made for drainage. This piece of track was renewed about two years ago.

"Since this improvement was made very little attention is given to this section of track. Both rail and tie conditions have been improved. In former years, when we had a severe storm, the tracks were submerged and water ran from them for several days afterwards. Now, in a few hours after a storm has abated, the pipes are practically dry. During the course of a storm no water is seen on the roadbed, but a large volume is discharged from the mouth of the main pipe, being fed by the smaller pipes between the tracks. We have established manholes just below the ballast surface every 500 to 600 ft. to provide for cleaning out, if necessary, although no such attention has been required. We feel that we have been amply repaid many times over for the expense that we have gone to in connection with this particular piece of track."

CONCLUSIONS.

(1) That the classification of soils be adopted and included in the Manual.

(2) That the specifications for sodding with Bermuda grass be adopted and included in the Manual.

W. M. Dawley (Erie), chairman; J. A. Spielmann (B. & O.), vice-chairman; J. R. W. Ambrose (G. T.), A. F. Blaess (I. C.), Ward Crosby (C. C. & O.), W. C. Curd (M. P.), Paul Didier (B. & O.), R. C. Discussion on Roadway.

Chairman Dawley presented the report.

Chairman Dawley: The subject of Unit Pressures Allowable on Roadbed on Different Materials should have further consideration. The committee has drawn no conclusions, and would ask the Association to follow up the subject along the lines of, first, prevention and cure of water pockets in new track, single and double; second, in old operating tracks, single and multiple; third, in field bridges, and, fourth, in yards and terminals, giving the committee the benefit of their experience during the coming season.

John G. Sullivan (C. P. R.): There is one point in paragraph 23, under the specifications for the formation of the roadway, that has caused some trouble, and that is the latter part. It says: "The classification of the material shall be in accordance with its conditions at the time of removal, regardless of prior conditions." In overbreak in rock cuts, if you classify that as loose rock, most specifications do not specify how it shall be measured. We know that loose rock will measure more than the space it occupies as solid rock in the cut. In order to avoid disputes I have inserted in our contracts that the measurement shall be the original space occupied by the material regardless of classification. That may be wrong or may not be, but it is definite and a man knows when he is taking a contract how he is going to be paid. I will move that there be added to that paragraph that the measurement of this material shall be the original space occupied, regardless of the classification.

J. E. Willoughby (A. C. L.): The objection to classifying it when it is softer than it was in its original position is that it is not quite fair. It is entirely feasible to cross-section a slide, after it has come into a cut.

Mr. Sullivan: I have no objection to making it that way, but make it something definite.

W. H. Courtenay (L. & N.): One objection to Mr. Sullivan's suggestion is that certain slides cannot be met. They frequently extend four or five hundred feet in the roadbed, and come down gradually, and as you take them out they develop. The ground crumbles up gradually, slides down a little at a time. In many cases they occur where it is impracticable to measure the space occupied by the slide. It is a difficult question any way you look at it.

A. W. Carpenter (N. Y. C.): I would offer as an amend-

ment to insert in the last sentence of the paragraph, after the word "classification," the words "and measurement."

Mr. Sullivan: I can see that we are going to have the same trouble here that we are having with all the specifications. You have your measurements on the building of the line, and the material comes down, broken down probably, or a slide. You must recognize that we can't build a railroad without having an overbreak, or else use a channel and cut out in a straight line. Where you divide the classification between solid and loose rock, or give it all loose rock, how are you going to measure it? It all goes out at the same time. You can't possibly measure during construction. I have had no trouble in doing work with the specifications I have mentioned, and I have had trouble when I did not have that clause in. The only possible way in construction work, when you are taking out rock cut, to measure overbreak, is the solid contents of the cut.

J. R. W. Ambrose (Toronto Term.): I will second Mr. Sullivan's motion. The work that has been done on the Grand Trunk within the last year or two has not had a great deal of solid rock. But they have had some work in the West where there is a great deal of solid rock taken out and considerable overbreak, resulting from, perhaps, carelessness. The question of measurement, it seems to me, is independent of the classification.

J. L. Campbell (E. P. & S. W.): I agree with the impracticability of determining the volume of this broken material other than by proper cross-section after the excavation has been completed. Moreover, I believe the space originally occupied is the fair basis for determining what shall be paid for the work on the classification, and I believe in the case of rock the proper classification would be loose rock.

(The President put to vote the amendment offered by Mr. Sullivan, and it was adopted.)

In 48-a, the second sentence in the fourth paragraph was changed to read, "The compensation to be rendered therefor shall be determined by multiplying the *excavation* yardage, etc."

Mr. Campbell: I would offer this as a substitute for paragraph 59: "The contractor shall, without loss or liability to the company, construct all roads necessary for his use in the execution of this contract."

Chairman Dawley: The committee is willing to accept that amendment.

Mr. Sullivan: In paragraph 60, "where designated" is quite broad. Would not the committee be willing to put some limit to that distance? I would say that we change that wording to read, "Where designated, within limits agreed upon."

Chairman Dawley: The committee will accept that.

Mr. Campbell: In paragraph 5, under "General Contract Requirements," I believe this part of the contract requirement should be referred back to the committee for consideration of the specified width of the roadbed. I do not believe the width stated Class A, 20 ft.; Class B, 16 ft., and Class C, 14 ft., are wide enough. I do not think they are as wide as the roads are now finding it necessary to build. I notice that the Committee on Ballast has recommended a width of 26 feet for ballasting tracks.

The President: It seems to me to be advisable to refer this paragraph back to the committeee.

Hunter McDonald: I do not know whether the committee has been in touch with the committee which has been appointed by the American Society of Civil Engineers on the question of soils. I understand that committee is making a very extended, thorough and scientific research into this question. I think the adoption of this matter at the present time would be premature and I should oppose it being done.

A. M. Talbot (U. of Ill.): I would like to bring up a question concerning the terms used in the list under unit pressures allowable on roadbed of different materials. I understand these refer to the sizes and the grades of these different classifications. We have to look out in regard to bearing upon other lines of work, as, for example, mortar and sand, where the largest grains are the grains which would be compared with the terms used here. By the classification of sand for mortar purposes adopted by the Association, the size of sand may run up to one-quarter of an inch particles, passing an opening one-quarter of an inch in diameter. The term "high in gravel" used here is for the largest size. The term coarse sand; while this is given as very fine sand, it is mastandard Ottawa sand used in testing cement; not a very coarse sand; while this is given as very find sand, it is material which we would hardly consider as available for such things as mortar-making purposes. I would like to suggest two things in this: That some word be added after these terms, like size or grain, to distinguish between this mortar classification, that which is used for mortar-making purposes, and instead of the words "fine gravel" the term "very coarse sand" be employed. Personally, I should be pleased to see these sizes made somewhat larger than they are, but I don't think that is an important point.

(Conclusion (1) was referred back to the committee and Conclusion (2) was accepted.)

RECORDS AND ACCOUNTS

The following subjects were assigned:

(1) Make a comprehensive study of the forms in the Manual, adopted a number of years ago, and bring them up to date.

(2) Continue the study of reports required by Federal and State railway commissions.

(3) Continue the study of a feasible and useful subdivision of I. C. C. classification account No. 6, with a view to securing uniformity of labor costs.

The sub-committee appointed to deal with revision of the Manual and the study of the forms in the Manual suggested a few minor changes.

In connection with reports required by State and Federal Commissions, the committee feels that there is a diminution of the activities of the state commissions in connection

W. A. CHRISTIAN,
Chairman Committee on Records and Accounts.

with the valuation of railway property and a tendency on their part to await the valuation now in progress by the Interstate Commerce Commission.

SUB-DIVISIONS OF I. C. C. CLASSIFICATION ACCOUNT.

Since this subject was assigned to the committee, the Interstate Commerce Commission has issued a new classification of operating expense accounts, which went into effect on July 1, 1914. In that new classification former account No. 6 has been divided into two parts—No. 202, Roadway maintenance, and No. 220, Track laying and surfacing. The splitting of this account into two parts perhaps reduces the necessity of further sub-dividing the two new accounts. However, in the event that this further sub-division is desired, the following sub-divisions are submitted for consideration of the Association:

Account 202, Roadway Maintenance:
(A) Care of Roadbed;
(B) Bank Protection;
(C) Clearing and Cleaning Roadway and Track;
(D) Watching Roadway and Track;
(E) Flood Damage;
(F) Work Train Service.

Account 220, Track Laying and Surfacing:
(G) Renewing Track Material;
(H) Maintenance of Line and Surface;
(I) Other Expenses;
(J) Work Train Service.

The application of the sub-divisions above mentioned to the various divisions of these two accounts, as shown in the I. C. C. Classification, would be as follows:

No. 202. Roadway Maintenance.

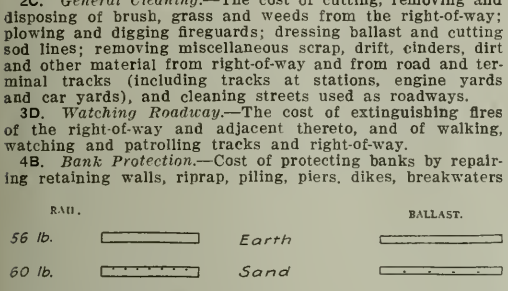
1A. *Care of Roadbed.*—The cost of blasting rocks; constructing and cleaning tile ditches, open ditches and drains;

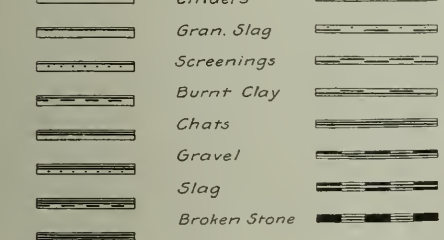
crowning track ties with retaining earth; filling borrow and cattle pits; landscape gardening along the roadway; oiling the roadbed; removing dangerous rocks; removing slides; restoring roadbed, cuts, fills and embankments to standard width; sloping cuts; sodding roadway; **E**, building temporary tracks around slides and washouts; keeping tracks clear and repairing subgrade in case of washouts; removing temporary tracks around slides and washouts; repairing roadbed damaged by washouts.

2C. *General Cleaning.*—The cost of cutting, removing and disposing of brush, grass and weeds from the right-of-way; plowing and digging fireguards; dressing ballast and cutting sod lines; removing miscellaneous scrap, drift, cinders, dirt and other material from right-of-way and from road and terminal tracks (including tracks at stations, engine yards and car yards), and cleaning streets used as roadways.

3D. *Watching Roadway.*—The cost of extinguishing fires of the right-of-way and adjacent thereto, and of walking, watching and patrolling tracks and right-of-way.

4B. *Bank Protection.*—Cost of protecting banks by repairing retaining walls, riprap, piling, piers, dikes, breakwaters





Proposed Conventional Signs.

and revetments, and by changing the channels of streams to prevent cutting, washing and sliding of embankments.

5F. *Train Service.*—The cost of work-train service in connection with work pertaining to roadway maintenance.

6A. *Track Changes.*—The cost of roadway work in connection with taking up and relocating tracks.

7A. *Other Expenses.*—The cost of roadway work not provided for elsewhere, such as official roadway inspection train service and premiums in connection with roadway maintenance.

No. 220. Track Laying and Surfacing.

1G. *Applying Ballast.*—The cost of labor expended in preparing the roadbed and applying ballast for repairs of tracks.

2G. *Applying Ties.*—The cost of labor expended in unloading, distributing and applying ties for repairs of tracks; in gathering up and disposing of the ties released; **H**, and in respacing ties.

3G. *Applying Rails.*—The cost of labor expended in unloading, distributing, cutting, slotting, drilling, adzing for and laying rails for repairs of tracks; in gathering up and loading rails released; **H**, and in adjusting for expansion and contraction of rails.

4G. *Applying Other Track Material.*—The cost of labor expended in unloading, distributing and applying other track material for repairs of tracks, and the cost of gathering up and loading the material released.

5H. *Track Maintenance.*—The cost of labor expended in alining, surfacing, gaging and shimming tracks; in tightening track bolts and track spikes; in restoring rails, ties and ballast in case of washouts, derailments and wrecks, and taking up tracks.

6J. *Train Service.*—The cost of work-train service (except work trains distributing ballast material) in connection with work pertaining to track laying and surfacing.

7H. *Track Changes.*—The cost of track work (exclusive of the cost of track material) in taking up and relocating tracks.

8I. *Other Expenses.*—The cost of track laying and surfacing work not provided for elsewhere, and expenses, such as repairing and replacing rail rests, official track inspection train service, and premiums in connection with track repairs.

The numbers indicate the I. C. C. classification subdivisions; and the letters indicate sub-divisions under which the whole or portions of the I. C. C. sub-division are classified.

CONVENTIONAL SIGNS.

The committee submits herewith for approval additional symbols relating to "Rail," "Ballast," and "Electrified Lines." These symbols were incorporated provisionally in the pamphlet issued during the summer of 1914, and are now in use by railway companies in the work of preparing maps and profiles to comply with the Government valuation act;

W. A. Christian (I. C. C.), chairman; M. C. Byers (W. M.), vice-chairman; F. J. Bachelder (Cons. Engr.), W. S. Danes (Wabash), Lester Bernstein (B. & O.), G. D. Hill (I. C.), Huntington Smith (N. Y. C. & St. L.), Henry Lehn (N. Y. C.), J. H. Milburn (B. & O.), J. W. Orrock (C. P. R.), J. C. Patterson (Erie), H. C. Phillips (A. T. & S. F.), J. H. Reinholdt (M. & St. L.), R. C. Sattley (C. R. I. & P.), Guy Scott (P. L. W.), H. M. Stout (N. P.), Frank Taylor (C. R. R.), J. L. Vollintine (C. B. & Q.), W. D. Wiggins (P. L. W.).

Discussion on Records and Accounts.

The suggested changes in the Manual were adopted. The suggestions under "Sub-divisions of I. C. C. Classification Account" were received as information. "Conventional Signs" were next considered.

W. H. Courtenay (L. & N.): It is utterly unnecessary to adopt that complicated system of symbols to designate the weight per yard of the rail. It is much cheaper and quicker to adopt the method of marking the weight per yard in figures. It will take draftsmen a long time to represent the weight per rail by these symbols. It will be a considerable strain on the memory of the man who refers to the drawing data to recognize one of these symbols. If he has the figures before him there will be no mental strain whatever. I move that the convention do not adopt the conventional symbols to designate the weight per yard of the rail, but in lieu thereof represent the rail by one straight line, with the weight per yard marked on it in figures The valuation engineers of the Interstate Commerce Commission have indicated their intention to adopt the symbols that are adopted by this Association. If the valuation engineers demand that this system of symbols be used to designate the weight of the rail, it will add to the cost of the preparation of the maps.

Chairman Christian: If you will go back to the Manual you will find that the Association approves colors representing the different weights of rail. We have tried to relieve all carriers of using any colors on account of blue prints, and we put in these symbols as a substitute.

(Mr. Courtenay's motion was put and carried.)

The President: The ballast symbols will be counted as approved, together with the symbols for electrified lines.

TIES

The following subjects were assigned:

(1) Continue the study of the effect of the design of tie-plates and track spikes on the durability of cross-ties. (Not reported on.)

(2) Continue the study of the economy in track labor and material affected through the use of treated compared with untreated cross-ties.

(3) Continue the study of metal, composite and concrete cross-ties, building up a history of same.

(4) Investigate and report on the future timber supply for ties (not reported on).

(5) Report on the distribution and care of cross-ties.

STUDY OF THE ECONOMY IN TRACK LABOR AND MATERIAL EFFECTED THROUGH THE USE OF TREATED COMPARED WITH UNTREATED CROSS-TIES.

The committee reported in last year's proceedings as fully as is possible at present on the comparative cost and life of treated and untreated ties. Various experiments with ties are being made which will in future furnish valuable data on the subject. It is evident that there are wide differences in the manner in which tests of tie life are being made, as well as in the way in which the records of the tests are kept by different railway companies. It is therefore suggested that standards of tie-life tests and of tie records be adopted by this Association, in order that the greatest possible benefit be derived from future experiments along these lines. In 1918 it is estimated that the Association may with profit again take up this subject with a view to tabulating information which will then probably be available.

The committee recommends for adoption and publication in the Manual:

Economic Comparison of Railroad Ties of Different Materials.

Except in isolated cases, ultimate economy in labor and material results from the use of properly treated ties, as compared with untreated ties.

Photo by Moffett, Chicago.

L. A. DOWNS,
Chairman Committee on Ties.

The economy of any tie of known price and life may be determined by the following formulas:

Given:

C = First cost of tie in place;
C^1 = Amount at compound interest which will produce interest equalling the first cost of tie during the life of the tie;
R = Rate of interest;
n = Life of tie in years;
I = Interest on first cost.

Required—Total capitalization of tie:

$$= C + C^1 = \frac{C\,(1+R)^n}{(1+R)^n - 1} \quad \ldots\ldots(1)$$

Given:

C = First cost of tie in place;
R = Rate of interest;
I = Interest on first cost;
A = Amount at compound interest which will provide for renewal at end of life of tie.

Required—Total annual cost:

$$I = CR$$

$$A = \frac{CR}{(1+R)^n - 1}$$

Total annual cost =

$$I + A = \frac{CR\,(1+R)^n}{(1+R)^n - 1} \quad \ldots\ldots(2)$$

Given:

R = Rate of interest;
C = Cost of tie of n years life;
C^1 = Cost of tie of n^1 years life.

Tie costs are equivalent when the capitalization or annual costs are equal, or

$$C^1 = \frac{C\,(1+R)^n}{(1+R)^n - 1} \times \frac{(1+R)^{n^1} - 1}{(1+R)^{n^1}} \quad \ldots\ldots(3)$$

USE OF METAL, COMPOSITE AND CONCRETE TIES.

During the year the sub-committee assigned to report on the use of metal, composite and concrete ties inspected substitute ties on the Bessemer & Lake Erie, the Pennsylvania Railroad, the Pennsylvania Lines (Northwest System), the Pittsburgh & Lake Erie and the Union Railroad of Pittsburgh. They have also taken up with each railroad on which substitute ties have been used the question of a report for this year, and the more important replies received bringing out new information, are given below:

"Fifty cast steel ties manufactured by the Metal Tie Co. were installed in the Baltimore & Ohio eastbound main track in March, 1909. A recent examination showed the ties to be in fair condition. The wooden blocks, however, have to be renewed on account of splitting. This renewal was made about a year ago. Screw spikes and screw spike tie-plates are in use. The track seems to hold to good line and surface, although the expense of maintenance is probably greater than with the ordinary tie, on account of the depth to which it is necessary to go in order to surface."

Since the Bessemer & Lake Erie first started to use the I-beam tie in 1904, 1,012,939 of the M-21 section (8-in. base) have been purchased and at the present time approximately 87 per cent. of the main line between North Bessemer and Conneaut Harbor, a distance of 141 miles, is laid with these ties. Of this 141 miles, 130 miles is double track and 8.9 miles is two single-track lines. These ties continue to give satisfaction, nothing having developed in the ten years they have been in that would indicate that the tie is not a practical substitute for the wood tie.

In 1908 a number of ties were carefully weighed separately, the actual weight was stamped with a steel stamp on each tie and put in the track at various points. In 1914, just six years later, 30 of these ties were taken out and reweighed after being given a thorough cleaning. The following is the result:

Original weight of 30 ties	5,213 lbs.
Present weight of 30 ties	4,912 lbs.
Loss in six years	301 lbs.
Loss per year	50 lbs.
Loss per tie per year	1.6 lbs.

In June, 1914, 3,200 ties of a heavier design were installed in the southbound track one mile south of Hartstown, Pa. They were laid under new 100-lb. A. R. A. type B rail, spaced 20 to a 33-ft. rail, and ballasted with screened slag. The ties are not insulated. This tie is known as Carnegie Steel Company Section M-28 and weighs about 27.75 lb. per ft., making the weight per tie 8 ft. 6 in. long, 235.9 lb. The fastenings weigh 33.4 lb., so that the weight complete is 269.3 lbs.

A comparison of the detail dimensions of this tie and the M-21 tie which is the section of which the road has over a million, is made below:

Section	Depth	Weight per ft.	Area section	Width of Top	Flange Bottom	Web	Weight tie only 8 ft., 6 in. long
M-21	5.5	21.2 lbs.	5.9	4.5 in.	8 in.	7/16 in.	181 lbs.
M-28	6.5	27.75 lbs.	8.18	5 in.	10 in.	3/8 in.	236 lbs.

In 1913 the Elgin, Joliet & Eastern installed 494 sets and in 1914 85 sets of steel switch-ties. In 1913 we used 1,638 steel cross-ties and in 1914 240 steel cross-ties. We have 160 sets of steel switch-ties on hand which will be put in track next year. In every case where we put in steel switch-ties we are putting in new gravel ballast, as we find that the old ballast contains considerable cinders, which, of course, is very hard on steel ties. The 62 Bates concrete ties we have in at Whiting are still in service and are apparently in as good condition as when first placed. They are certainly holding up in good shape.

The Florida East Coast installed 16 Percival concrete ties in the main line at St. Augustine in March, 1906. They are under 70-lb. A. S. C. E. rail and in sand ballast. Twenty-four trains pass over them daily. The 16 ties are under one rail. No defects have developed. Examination shows that they are in good condition in all respects. The fastenings are holding well and have never been touched since they were put on. The cushion between the bottom

of the rail and the tie is made of gumwood and has never been changed. The present shape of the ties between the rails is a "V" and they do not hold up well in our sand, but if the ties were flat-bottomed it is thought that they would.

A number of Percival concrete ties are interspersed with ordinary ties on the Galveston, Harrisburg & San Antonio at Edgewater, Tex. These ties were installed October 22, 1906. A derailment broke three ties, which were replaced by cypress ties, and disfigured 14 other ties. On Jan. 28, 1908, the defaced ties were replaced, but the three removed after the wreck were not replaced, thus reducing the number of ties in the track from 50 to 47. This derailment did not occur on the concrete ties, but on wooden ties, and the derailed car ran onto the concrete ties. Since date of replacement and up to July 1, 1914, ten ties have broken and have been replaced with cypress ties. An inspection during July, 1914, showed that all wooden cushions were badly cracked and must be removed. Seven ties were cracked and broken under rail and six or eight screw spikes were broken off. All failures were under rail and there were no noticeable cracks in the center of the ties.

In another test section at the same place the ties were laid out of face. An inspection in July, 1914, showed all wood cushions badly cracked and six cushions entirely rotten. All are to be renewed. Three ties were broken under the rail. All failures were on joint ties. The one tie reported as having been renewed last year was an error, as none of the original ties were changed.

Another test is being made of Percival concrete ties 7 in. by 8¼ in. by 8 ft. at Bayou Sale, La. There are 96 ties, the joint ties having been inserted after the chart was made. All ties are sound and in good condition with no cracks except in one tie. All wood cushions are cracked with the grain of wood. Owing to the practice of dumping cinders on this track, the majority of the wood cushions are burnt.

A number of National steel ties have been in the track of the Pennsylvania Lines, Northwest System, near Emsworth, Pa., about ten months and all are still in good condition. The cost of maintenance has been about the same as the cost of maintenance for an equal number of wooden ties. The traffic passing over these ties the last year has averaged about 60 passenger and 10 freight trains.

Fifteen Reigler concrete steel ties were placed in the westbound main passenger track of the Pennsylvania Lines just west of Emsworth, Pa., May 9, 1908, where they have been subjected to heavy traffic. All of the ties are still in good condition and giving satisfactory service, with no apparent depreciation. They have now been in the track 6½ years. The action of these ties under traffic shows that there is considerably less deflection of the track than in the adjacent wood tie track. No separate records of the cost of maintenance have been kept, but the opinion of the supervisor is that much less work is required for both line and surface than for wood ties. An average traffic of about 60 passenger and 10 freight trains passes over this track daily.

Twelve Rohm steel ties were installed in the easthound freight track of the Pennsylvania just east of Chestnut street, Sewickley, Pa., on June 15, 1910, and have now been in the track about four years and four months. Three of these ties have been removed from the track because of the failure of the wedges to keep the clamps tight. They will be put back again as soon as new wedges are received. It is necessary to tighten the wedges about once a month. As these ties are spaced alternately between wooden ties, it is impossible to keep any record of the cost of maintaining surface and line, but it is thought that they require about the same amount of surfacing as wood ties, and a little more work that wood ties to keep in line. The hollow triangles have been filled with cinders and considerable rust has taken place.

DISTRIBUTION AND CARE OF CROSS-TIES.

Untreated Ties.

On many roads it is necessary for the purchasing agent to have in the fall an estimate of the number of ties required the next spring for renewals, but an actual count in the fall comes so close upon the renewals made in the summer, when all unserviceable ties are supposed to have been removed, that it is but little better than a guess. On old roads an estimate based upon the average renewals for a series of years is more rational than an actual count in the fall, and is sufficiently close for the purchasing agent. Just before the time for distributing comes, the ties should be inspected and a record made of the number needed for renewals (1) between each two telegraph poles, or (2) on each curve and on each tangent.

In the first method the number should be marked with chalk on the pole which stands in the direction from which the train will come when distributing; the best plan is to take a short ladder and place the marking out of reach of mischievous persons. In the second method the number for each tangent and for each curve should be recorded in a book and the ties unloaded accordingly. Another method that is sometimes followed is to drive a stake on the shoulder temporarily for each ten ties required. When the ties are unloaded, any one of the three methods will make it an easy matter to throw off the required number, almost in place.

The details of the work of distributing wood ties for renewals vary considerably with different roads, according to conditions of supply, density of regular traffic, ideas concerning economical methods, etc. Where the supply of ties can be bought in the district tributary to the road they are usually received at the stations or at sidetracks or at other points along the right-of-way and loaded upon flat cars, to be distributed by the sectionmen or by a work-train crew. In some cases the loading of ties is contracted.

For rapid distribution the ties where possible should be loaded on flat cars, crosswise, except two under courses at each end. These courses should be placed lengthwise on the car, each course blocked under the outer end by a tie placed crosswise, to give a pitch toward the middle of the car. These slanting courses act as guards to keep the ties placed crosswise from being jarred or rolled over the end of the car. If in these slanting courses the two thickest ties of each course are placed on the outside, they will be held in place by the weight from above and no stakes will be needed.

The exact number of ties wanted for renewals in places can be known and the right number of new ties can be dropped off, just as well as not. Much useless handling and trucking of ties results from throwing them off by guess while distributing, for without some system of estimating or counting the number required and the number delivered there will usually be either too many or else not enough. Where ties are thrown off in excess of the requirements it is usually the case that many old ties which could profitably remain another year will be removed simply to make room for all of the new ties. On the other hand, if an insufficient number of ties is distributed in places, the deficiency must be made good by trucking, or else some old ties will remain in the track which ought to come out.

When ties are delivered in box, stock or gondola cars a strong force is needed to unload them promptly—say 25 or 30 men. On the average it takes four men about 30 or 45 minutes to unload a box car holding 300 oak ties. If the ties are loaded on flat cars a few men can tumble them off rapidly, and 15 to 18 men are a sufficient force.

The best way to control the number of ties put off when unloading from flat cars is to work the men in relays of a few men each. It is much easier to control the movements of a few men working rapidly than of a whole crew working at the ordinary gait. When unloading from flat cars four or five men besides one to tally are usually a sufficient force working at one time to do the unloading.

The train should not in general run faster than six miles per hour; and on high fills quite slowly, because in such places ties are thrown too hard will roll to the bottom of the slope. The foreman of the section whereon the ties are being unloaded or the supervisor or roadmaster should invariably accompany the train to advise as to the number of ties wanted and the exact location of the same. It is also well to have the section crew, or part of it, follow the train on a hand car, to throw out any ties which may have fallen too close to the track.

At narrow cuts it is a good plan to throw off the whole number in piles at each end of the cut, especially if the old ties are not to be taken out for some time, and the same is true for high, narrow embankments. Proper attention should be given to loading and throwing off the hardest ties for the curves. In distributing ties on curves observations should be taken of the side of the track from which the ties will have to be pulled in when making renewals, and the ties should be thrown off on that side. At all times, however, the ties should be so unloaded as not to require rehandling in order to remove old ties from track.

The question of using way-freight trains for tie distribution depends upon the traffic conditions. On roads where the local freight business is light it is found to be economical to send the ties out a few carloads at a time with these trains, to be unloaded in place by the sectionmen, who are previously notified to be on hand at the point where the ties are wanted. The delay to the train in waiting for the ties to be unloaded is necessarily considerable, and on roads where the local freight work is heavy the

way-trains are frequently or nearly always behind time, and the extra work of tie distribution is considered inexpedient. Such is also quite liable to be the decision where the ties are to be unloaded from box cars, or where a trainload of ties arrives and there is a demand for prompt release of the cars.

As a general thing ties distributed from a work train are put off in better shape than from a way-freight. The crews of the latter rush the work too fast, either by urging the men or by moving the train too fast for the men to properly unload the ties. An ordinary result of such haste is that ties are thrown down embankments, into bridge openings, or are so sparsely distributed that much time is lost in carrying them to place where renewals are made.

On roads where ties are handled by way-freight it is quite customary to begin the distribution as early as January, for the obvious reason that only a few carloads can be distributed each day, and it is necessary to take a good deal of time in order to get over the division by spring. Again, on roads where the ties are received from outlying sources of supply it is frequently the case that the distribution begins late in the fall, so as release the cars promptly and avoid piling the ties up in the yards. It is doubtful whether anything is gained in either case. In the first place, ties should not be unloaded and left lying on the ground through the winter, as in this position they gather moisture from the ground, are covered with snow or lie in ditches or wet places and become watersoaked, so that the germs of decay are well inducted before the ties see any service at all. In order to obtain all the advantage possible from seasoning, the ties that are received during the fall and winter, preferably, should be carefully piled at points exposed to the wind and sun, but it costs no more to do this in the yards and along sidetracks and to load them up again on flat cars in the spring and deliver them right where they are wanted, than it does to pile them up all along the right-of-way and then carry or truck them to place when the renewals are made. In the second place the practice of piling up new ties along the right-of-way, to remain three to six months before they are used, is contrary to principles of good policing. If the right-of-way is piled with new ties all winter and spring and with old ties all summer and perhaps most of the fall, there are but a few months when it presents a clean or finished appearance. In the third place, an accurate count of the ties to be renewed cannot be made until the time for renewing is close at hand, and then is the best time to make the distribution, unloading the ties where they are wanted, and so near the time they are to be used that they need not be piled.

When possible, all ties in any one car should be unloaded on the section on which car is opened. When ties are unloaded in piles, each pile should be distinctly marked with the car number.

Counting and Inspection.

The roadmaster, or his assistant, should, if possible, take charge of unloading ties when the work train is used, and see that a proper count and inspection are made. This count and inspection again should be verified by the section foremen going over the ties unloaded on their section, rechecking and reporting results to the roadmaster.

The general rules given above governing untreated also apply to treated ties.

In the case of zinc-treated ties, there seems to be a difference of opinion in regard to the piling. A number of railways which have used them very extensively believe that they should be piled in open piles similar to untreated ties, but a number of others that have gone into it from a more scientific standpoint, especially in the South, where the climate is warm and the seasons are long, think that by being piled in open piles their drying is so rapid that they develop checking, which is a serious objection to the wearing and life of the tie, and for this reason they are piling zinc-chloride ties the same as creosoted ties.

Treated ties should be handled with tongs. Creosoted ties in piles should be covered with cinders or earth to eliminate the danger of fire from sparks from passing engines. If treated ties, especially creosoted, are stored in large quantities a system of fire protection should be inaugurated.

L. A. Downs (I. C.), chairman; G. W. Merrell (N. & W.), vice-chairman; C. C. Albright (Purdue Univ.), W. A. Clark (D. & I. R.), E. D. Jackson (B. & O.), F. R. Laying (B. & L. E.), J. B. Myers (B. & O.), R. J. Parker (A. T. & S. F.), H. S. Wilgus (P. S. & N.), W. J. Burton (M. P.), S. B. Clement (T. & N. O.), E. P. Laird (A. C. L.), E. R. Lewis (D. S. S. & A.), J. V. Neubert (N. Y. C.), J. G. Shillinger (Rutland), Louis Yager (N. P.).

Discussion on Ties.

The report was presented by Chairman Downs.

The definitions presented by the committee were adopted.

Chairman Downs: The next subject is No. 2. Last year the committee made a report on this, and we asked that it be received only as information. This year we have a formula that we recommend for the Manual as economic comparison of railway ties of different materials. I move that this be adopted, to be printed in the Manual.

Mr. Sullivan: In the first paragraph C is taken to mean "first cost of tie in place," but further down, C has a different meaning.

Chairman Downs: We will alter that.

The President: The formula will be adopted for insertion in the Manual.

Chairman Downs: I move that the subjects on the use of metal, composite and concrete ties, and the distribution and care of cross ties be received as information. (The motion was carried.)

IRON AND STEEL STRUCTURES

The subjects assigned for investigation during the past year were:

(1) Report on the methods of protection of iron and steel structures against corrosion.

(2) Study designs and report on built-up columns, co-operating with other investigators and committees of other associations.

A. J. HIMES,
Chairman Committee on Iron and Steel Structures.

(3) Report on the design, length and operation of turntables.

(4) Report on the relative economy of various types of movable bridges.

Other subjects continued from the preceding year were:

(5) Investigation of secondary stresses and impact.

(6) Adaptation of designs of movable bridges to signal and interlocking appliances required.

(7) An elastic requirement for steel.

(8) Bridge clearance diagram.

A report on "Methods of Protection of Iron and Steel Structures against Corrosion" was submitted in Appendix A as information and without recommendation.

The study of built-up columns has continued throughout the year. The U. S. Bureau of Standards has furnished and tested 18 columns according to the plans and under the direction of the committee. A progress report was submitted in Appendix B which included the records of the above tests. It is expected that the Bureau will continue its generous co-operation with the committee and that further tests will be made during the ensuing year. The committee is in close touch with the special committee on Columns and Struts of the American Society of Civil Engineers and the work of the two committees has been supplementary and harmonious.

The "Design, Length and Operation of Turntables" has received considerable study and investigation. Much valuable information is being accumulated, but it is too early for the committee to make any recommendations. A progress report was presented.

The "Relative Economy of Various Types of Movable Bridges" has received much original study and experimental investigation. The data thus far accumulated has not yet been prepared for publication and the committee can only say that much progress has been made and that some very useful information will probably be available during the coming year.

A brief statement of progress in the study of "Secondary Stresses and Impact" was made. The committee is now contemplating a revision of the specifications with the purpose of making use of the experimental data heretofore accumulated.

At the last annual convention the "Adaptation of Designs of Movable Bridges to Signal and Interlocking Appliances Required" was referred back to the committee. The subject has received some discussion and information concerning current practices has been secured. Owing to a pressure of other work, no conclusions have been reached, and only a progress report was made at this time.

Sub-committee G prepared a very complete and careful statement of the need of an elastic strength requirement for steel, which was presented. Specifications were drawn for this requirement, and were recommended for adoption.

A report on the Bridge Clearance Diagram was also presented.

CONCLUSIONS.

The committee recommends that the following action be taken on the report submitted herewith:

(1) That the report on methods of protection of iron and steel structures against corrosion be received as information.

(2) That the report on the design of built-up columns be received as a progress report.

(3) That the report on the design, length and operation of turntables be received as a progress report.

(4) That the report on the relative economy of various types of movable bridges be received as a progress report.

(5) That the report on secondary stresses and impact be received as a progress report.

(6) That the report on the adaptation of designs of movable bridges to signal and interlocking appliances required be received as a progress report.

(7) That the specifications for an elastic strength requirement for steel be adopted and printed in the Manual.

(8) That the bridge clearance diagram shown be adopted by the Association and substituted for the diagram now published in the Manual; also that a footnote be added to the specifications calling attention to the recommendations of the Committee on Electricity for a clear height of 25 ft. in electrified zones.

C.), Charles Chandler (I. C.), C. L. Crandall (Cornell Univ.), J. E. Crawford (N. & W.), F. O. Dufour (Interstate Commerce Commission), W. R. Edwards (Interstate Commerce Commission), A. C. Irwin (C. M. & St. P.), B. R. Leffler (N. Y. C.), W. H. Moore (N. Y., N. H. & H.), P. B. Motley (C. P. R.), Albert Reichmann (Am. Br. Co.), C. E. Smith (M. P.), H. B. Stuart (G. T.), G. E. Tebbetts (K. C. T.), F. E. Turneaure (Univ. of Wis.), L. F. Van Hagan (Univ. of Wis.).

APPENDIX A.

METHODS OF PROTECTION OF IRON AND STEEL STRUCTURES AGAINST CORROSION.

The study of this subject has been continued along the lines of further investigation into the protection by means of paint and protection by means of concrete encasement.

It is realized that the vast bulk of iron and steel structures are protected by means of paint and must continue to be protected by this agency until something more effective and equally economical is introduced. As paints are made of a variety of materials in many forms and combinations, the relative efficiency of which for the purpose under consideration has not been well established, there appears to be a field for usefulness on the part of the committee in pursuing the investigation of this line of protection.

Study of Principles Underlying the Choice of Materials for Efficient Paints.

Paints for the protection of iron and steel structures may be simple liquids, as drying oils; dissolved solids, as asphalt paints and coal tar paints; combinations of pulverized or finely-divided solids, known as pigments, and of drying oils, known as vehicles; and lastly almost any combination of any of the above. Varnishes, which are mixtures of gums and oils compounded by means of heat, are frequently introduced into the vehicles of paints.

The most important and extensively used paints are those which are mechanical mixtures of pigments and vehicles. The most important and common vehicle is linseed oil. Other vehicles are fish oils, china wood oil, soya bean oil and mineral oils. All of these except china wood oil have been frequently used as cheap and inferior substitutes for adulterations of linseed oil, although china wood oil, soya bean oil and menhaden (fish) oil are recognized as valuable assistants in certain paints. Turpentine and light mineral oils (such as benzine, benzol, naphtha, etc.) are used as thinners and solvents and are so used both legitimately and otherwise.

An oil paint generally requires, in addition to the pigment and the oil, a small proportion of dryer, which is generally a liquid which, when incorporated into the paint, causes the film of it to dry by oxidation with the desired rapidity. Films of other paints, such as asphaltum and coal tar paints, dry by the evaporation of the solvent.

It is quite generally considered that the most durable paints are those which are composed of pigments with linseed oil as the principal ingredient of the vehicle. Linseed oil varies in its composition and properties according to its method of extraction from the flaxseed, and its later manipulation. There is little or no choice nowadays to the consumer as regards the method of extraction from the seed, this being controlled by large commercial concerns whose methods are practically identical in that they all employ the hot-pressed method which possibly gives inferior oil to that obtained by the cold-pressed method. (Cold-pressed oil is obtainable commercially at a large advance in price (10 cents per gallon at time of writing) over raw oil.) After pressing, however, the oil is processed and refined by many methods and graded commercially accordingly. Raw oil and boiled oil are the two general kinds employed for structural metal paints and both of these are variously treated so as to considerably modify their properties.

Raw oil with drier added to it without heating has been sold as boiled oil—"bung hole" boiled or "chemically" boiled by those who understand the difference between this makeshift and true boiled oil which is heated to a relatively high temperature, and generally has driers added also. When heated in open kettles, which is generally considered the best method, it is called open-kettle boiled and there is supposed to be some virtue in having the heat applied by means of a wood fire under the kettle.

There is room for much difference in treatment and skill in manipulation in boiling oil by the heating process and this leads to many claims of superiority by different paint manufacturers for their particular and secret methods in this line. Just how much if any real superiority there is in these special-processed oils over the commercial open-kettle boiled, now readily obtainable of the large oil manufacturers, is difficult to prove or disprove. It is generally conceded that neither raw nor boiled linseed should be free from certain ordinary impurities in order to give the best results in paints. There is a great difference of opinion as to the merits of raw or boiled oil for paint-making purposes, but for metal paints the tendency seems to be towards the use of the open-kettle boiled oil.

As films of linseed oil-and-pigment paints are always more or less porous and pervious to water and moisture, considerable experimentation has been undertaken towards increasing the impermeability of the film by adding varnishes, bitumens and other kinds of oils to the linseed oil in certain minor proportions. If the proportions of these added materials become too great, the durability of the film is generally decreased on account of brittleness or otherwise.

The most extensive scientific study of the properties of paint materials probably has been made on pigments. For a long time paints have been known principally to engineers and others simply by the name of the pigment element, as iron oxide paint, red lead paint, graphite paint, etc., and it was long supposed that the pigment was the principal factor in determining the efficiency of these aints.

Pigments are commonly divided into two general classes, which may be called primary and secondary. Those in the primary class are the ones strong in color or in covering power and sometimes forming chemical combinations with the vehicles. Those of the secondary class are weak in color and covering, generally not suitable for use alone as pigments, but suitable as fillers and extenders when mixed with these primary pigments; these are commonly known as "inert" pigments, although this is really a bad designation, since many of the primary pigments are chemically inert to all atmospheric influences and to the usual paint vehicles.

The principal primary pigments used for structural metal paints are the following:

(1) White leads, (a) The basic carbonate, which is the kind made by the well-known Dutch process, and (b) the basic

sulphate, commonly known as the "sublimed" variety. (2) Zinc oxide or white zinc. (3) Red lead. (4) Blue lead. (5) Iron oxides, including Venetian red. (6) Lampblacks, generally the product of burned petroleum oils. (7) Carbon blacks, generally the product of burned natural gas. (8) Graphites, natural and artificial. (9) Ochres. (10) Natural carbons, slates, clays, etc., possessing peculiar properties fitting them for pigments. (11) Chrome greens and yellows, used generally for tinting only.

The cost of the above pigments will usually range from 2c to 10c per pound, except the chrome pigments which, when pure, are much more expensive. Pigments which are sometimes used, but are generally prohibitory on account of their high cost, are American Vermillion and other chromates and Prussian Blue.

The principal secondary pigments are: (1) Silica. (2) Asbestine. (3) Barytes (natural sulphate of barium). (4) Calcium carbonate, including chalks (frequently called whiting). (5) Clays. (6) Gypsum. (7) Blanc fixe (artificial sulphate of barium).

These are all cheap materials, usually costing under 2 cents per pound. When used they are mixed with the primary pigments to cheapen the product and often with definite ideas of improvement of the paint. For instance, a small percentage of calcium carbonate is said to counteract any free acid that may be present in the primary pigment; silica is thought by some to give a "tooth" for holding subsequent coats; asbestine and china clay aid in keeping pigments in suspension in the vehicles; barytes gives weight and body to paint; blanc fixe, used in large proportions in proper mixtures, is said to give excellent results for certain sea air exposures.

As before mentioned it has been generally thought for many years that the pigment is the ingredient which has the greatest influence on the durability and efficiency of paint coatings, especially those for the protection of steel surfaces, although paint technologists recognize the great importance of the vehicle and that the two must largely be considered together. So many pigments have been available and in so many variations and combinations that it has not been easy to determine their relative merits or the properties which are necessary for suitable pigments. The question of color often is the determining factor, especially when white and very light shades of color are wanted, for which the white leads and zincs must be used; but for dark colors almost any of the pigments can be used, tinting as required, even the white pigments. (It may surprise some to know that a black pigment can be produced by mixing 45 parts by weight, of white lead and 55 parts of carbon black.) Excepting the question of color, the present field of pigments may be said to be the survival of those found fittest by many years of trial. To further determine the relative merits of these pigments, many tests have been made by individuals, paint manufacturers, railroad companies, technical associations and other, with coatings made with these various pigments, applied both to test plates and to structures in service, exposed to various atmospheric influences and to artificial substitutes for them, and except for certain special conditions of application and exposure, without decisive results. Probably the most prominent of these tests are those of the American Society for Testing Materials and widely known as the Atlantic City and the Havre de Grace Bridge tests.

A circular letter was sent out to 67 different railroads in the United States and Canada. The circular made inquiry by means of several questions grouped under the beadings of (1) shop coat on new fabricated steel; (2) field coats on new fabricated steel; (3) repainting or maintenance of bridges under traffic. Replies were received from 53. The following is a summary showing the extent of the use of each kind of paint as indicated by the replies; figures and percentages referring to individual railroads:

1. Kind of shop paint used:

Red lead pigment paint, 29 out of 50, equal to 58 per cent.

Linseed oil only, 5 out of 50, equal to 10 per cent.

Linseed oil, parts in contact after assembling with red lead pigment paint, 2 out of 50, equal to 4 per cent.

Linseed oil, parts in contact after assembling with various proprietary paints, 4 out of 50, 8 per cent.

Graphite and carbon pigment paints, including lampblack paint, 8 out of 50, 16 per cent.

Miscellaneous, 2 out of 50, 4 per cent.

2. Kind of paint (classified as to pigment) used for field coats on new steel:

Red lead straight or in part, 12 out of 48, 25 per cent.

Carbon or graphite or both, 24 out of 48, 50 per cent.

Miscellaneous, 12 out of 48, 25 per cent.

3. Kind of paint (classified as to pigment) used in maintenance:

Carbon, 13 out of 46, 28 per cent.

Graphite, 7 out of 46, 15 per cent.

Both carbon and graphite, 4 out of 46, 9 per cent.

Red lead straight or in part, 11 out of 46, 24 per cent.

Various, 11 out of 46, 24 per cent.

APPENDIX B.

COLUMN TESTS.

At the sub-committee's first meeting, July 10, 1912, after a discussion of the program of tests which had been arranged by the committee on Steel Columns and Struts of the American Society of Civil Engineers, it was decided to make drawings for a preliminary series of test columns to cover eight sections commonly found in the compression members of railroad bridges. It was planned to test a light and heavy section of each type made up in three lengths to give slenderness ratios of 50, 85 and 120. Three specimens of each column to be fabricated, making in all 144 test-columns for the series, which is designated as "Series No. 1."

James E. Howard, then engineer-physicist of the Bureau of Standards, stated on behalf of S. W. Stratton, director of the Bureau of Standards, that the Bureau would be glad to furnish the columns and make the tests, provided the sub-committee would furnish the detailed plans. It was expected that the 2,300,000-lb. Emery machine would have been completed late in 1912, but it was not in working order until about September, 1913. The fabrication of the columns was taken up in October, the first 18 columns were shipped to Washington in December and the first column of the series was tested in the presence of the committee on January 20, 1914. By October 15, 15 of the first 18 columns had been tested, and by November 30 all of the columns had been tested, and the complete test reports were received December 7. It will take at least three years more to complete the preliminary programs of the American Railway Engineering Association and American Society of Civil Engineers column tests. It is the expressed intention of the Bureau to carry on both sets of tests simultaneously.

It was the intention of the committee that the material should be rolled and the columns fabricated in accordance with the Specifications for Railway Bridges of the American Railway Engineering Association, but the Bureau, in ordering the first lot along with some columns for the American Society of Civil Engineers series, used the latter's very rigid specifications for this material. The difficulty of obtaining this material, in part, accounted for the delay in fabricating the columns. The material complied extremely closely with the specifications, being of very uniform quality, its weight per cubic in. being 0.2835-lb.

TABULATION OF PART OF TESTS, COLUMN I, SERIES I.

	No. of Test Piece	L/r	Nominal Section Sq. In.	Actual Section Square Inches	Failure lbs. per sq. in.	Method of Failure
1	12	50	9.56	9 55	37,930	
2	57	50	9.56	9.12	39,254	Failed by deflecting south and up.
3	74	50	9.56	9.29	38,200	Failed by deflecting south and down.
4	7	50	12.50	12.55	38,500	Failed by triple flexure.
5	72	50	12.50	12 45	37,765	Failed by buckling down and north.
6	73	50	12 50	12 48	35,380	Failed by buckling down and north.
7	17	85	9.56	9.636	32,860	Failed by triple flexure.
8	58	85	9.56	9.12	35,000	Failed by triple flexure buckling in center.
9	61	85	9.56	9.38	34,093	Failed by deflecting north and up.
10	20	85	12 50	5.92+5.73=11.65	34,060	Failed by triple flexure buckling in center.
11	60	85	12 50	11.83	34,937	
12	62	85	12.50	12.45	34,000	
13	29	120	9.56	9.42	33,020	Failed by triple flexure buckling n center.
14	55	120	9.56	9.54	32,000	
15	66	120	9.56	9.45	34,000	Failed by deflecting south and up.
16	25	120	12.50	12.28	32,565	Failed by triple flexure ibuckling in center.
17	67*	120	12.50	12.34	29,000	
18	68	120	12 50	12.39	30,863	

*Before testing, Column No. 67 was found to be bent down 0" .21 and south 0" .07.

Note.—The length of the column was assumed to be the total length between the milled end of the channels composing it. The actual sections are found by carefully weighing the channels, as it was found impossible to get very accurate results by calipering, or even by using the planimeter on imprints of the ends of the sections.

The sub-committee now proposes, instead of proceeding to Section No. 2 of the series, to make a sub-series of tests on Section No. 1, varying a detail at a time, in order to study the effect of the details on the strength of the column. Dr. Stratton assures the sub-committee that he will proceed to obtain the columns for these sub-series and test them as rapidly as possible.

APPENDIX C.

DESIGN, LENGTH AND OPERATION OF TURNTABLES.

The changes in railway structures and facilities due to the rapid increase in the weight and length of locomotives in recent years is not more marked anywhere than in the case of turntables. In 1895 the ruling length of turntables was perhaps 65 ft.; in 1915 it surely will be 85 ft. or more, thus showing in increase of 1 ft. per year. The increase has been quite uniform, but, of course, not in 1-ft. increments, the changes in length being made usually 5 ft. at a time. The increase in strength has kept pace with the increase in length, but both have fallen behind the proper requirements of the heaviest locomotives for the reason that a turntable failure does not result in disaster, but only in inconvenience and delay, and naturally the tendency is to get along with the old as long as possible rather than incur great expense for new.

In 1913 the committee caused to be sent to the membership a circular letter of inquiry concerning current and recommended practice in regard to ten of the principal features of turntable design. Length is, of course, the primary feature of design. Eighty-one per cent. of the replies gave 80 ft. or more as standard practice and 87 per cent. gave 80 ft. or more as the length recommended for ordinary road engines. Sixty-five per cent. of the replies favor either 85 or 90 ft. The conditions which determine the length of the turntable are the length of wheel base of the longest locomotive to be turned and the position of its center of gravity. For ease of turning the locomotive should be balanced, and for determining the length, the most unfavorable condition, that is, with the tender empty and the boiler filled, should be assumed. The length required then becomes twice the distance from the center of gravity to the rear tender wheel, with an arbitrary addition of, say, 1 ft. at each end for margin to facilitate spotting and to clear wheel flanges.

The question of designing turntables to be turned by power without balancing, in order to reduce the length necessary, has received some attention. Many turntables are so operated because they are too short to balance, but they are not designed for such operation and the result is a large expenditure of power and unsatisfactory service. This method of operation will require especially heavy and carefully designed end bearing journals and other features not common in present practice.

A table 85 to 90 ft. long will be long enough to balance most of the heavy freight and passenger engines exclusive of the Mallet type and a 100-ft. table will be required for roads which find it necessary to turn ordinary Mallet engines.

Type.—The replies indicate that the deck type is used and preferred almost to the exclusion of the through type. Only four roads indicated a preference for the through type. One of these gives as reasons, drainage, economy of pit construction and economy of time in reconstruction of the center at busy terminals. The other three roads give no reasons, but the above three are the ones commonly cited together with the one that the shallow pit of the through type is less subject to obstruction by snow.

Drainage is not a controlling feature if the turntable is at a modern engine house with drop pits, because the drainage necessary for the drop pits will take care of any reasonable depth of turntable pit. Economy of pit construction is in favor of the through type, but the increased weight and cost of the turntable neutralize part of it. The shallow pit also is conducive to safety, but this is partly offset by the hazard of narrow clearances and knee braces inside the through girders.

The economy of time in reconstruction of the center foundation does not exist in the case of a new location, and it may not be realized in the case of the renewal on an old center if the old center foundation requires reinforcement to carry the added load.

Obstruction by snow may be minimized in either type by providing ample space throughout, not less than 18 in., between the bottom flange of the girders and the pit floor.

Type of Center.—The majority in both practice and preference favor roller centers. Only 7 roads replying use disc centers, but 11 indicate a preference for that type. The disc center has been greatly improved in recent years and has advantages which entitle it to be thoughtful consideration. The roller center has the advantage of ease of turning. The disc center has few and simple parts, but is conceded to require more power to turn. This disadvantage is minimized by the fact that practically all heavy modern turntables will be equipped with power and the cost of the power consumed is negligible. Some tests which were made recently of the power required to turn a number of both disc and roller center turntables show that in the worst cases the power cost, including tractor losses, does not exceed ½ cent per 180 deg. turn. The first cost of the two types is about the same, if designed on similar specifications.

Good practice requires low-unit pressures on both types. For roller centers the pressure in pounds per linear inch of roller from full live and dead load on the center should not exceed 400 times the diameter of the rollers. This is exceeded in many centers in use, and much of the trouble in maintenance is attributable to too high unit pressures. For disc centers practice has varied from 3,000 lb. per sq. in. down to 1,500. The latter figure produces a very large disc and increases the lever arm of the frictional resistance unnecessarily. High unit pressures increase the difficulties of lubrication and pressures much in excess of 3,000 lb. per sq. in. have caused failures in the bronze discs. It has been found that a hard phosphor bronze, which will not flow under the pressure used, gives good results.

End Lift.—The most damaging thing in the operation of a turntable is the hammering of the ends by entering wheels. It has been proposed to reduce this damage by means of end lift or shock-absorbing devices. The replies indicate that only 4 roads replying use such devices and 15 consider such a device necessary. Where successful, they have been very expensive. Standard practice cannot be said to include them. Undoubtedly more liberal design of end bearings and better circle rail support will do away with the necessity for such devices to a great extent.

End Latch.—One-third of the roads replying use end latches and about half of them consider them necessary, or, in other words, one-sixth have them in use, but do not consider them necessary on power-operated turntables. The best designs for latches have a heavy sliding tongue connected to the girders by a breakable connection and engaging cast-iron sockets set in the pit wall. Preferably there should be a latch at each end. The latch should not be attached to any part of the track or track fastenings or deck.

Type of Deck.—The use of timber cross-ties is almost universal, although a few through turntables have been built with steel plate floors on I-beams. Eight of the replies express a preference for I-beam decks, and possibly more would have done so if there had been familiarity with that type of construction. A deck of transverse I-beams riveted between the girders just under the top flange has the advantages of permanence and rigidity without prohibitive cost. It also permits of greater depth of girder than the superimposed timber deck, but this advantage is shared with a timber deck similarly placed. In both cases the sidewalks are carried on riveted brackets outside the girders and independent of the track floor.

Live Load.—No single feature of the replies shows wider variations than the live load used for designing. The center loads vary from 312,000 to 720,000 lbs. Certainly the load should not be taken at much less than 500,000 lbs. where Mallets are not used, and justification can be found for loads from that up to 700,000 lbs. where Mallets are used. The 720,000-lb. center load reported is not an engine load, but results from the use of an arbitrary uniform load.

The center bending moments for one girder due to live load vary from 951 to 4,375 thousand foot-pounds. A great number of the replies indicate the use of some form of long wheel base consolidation or Mikado type locomotive giving a bending moment of from 2,000 to 2,500 thousand foot-pounds. Twenty out of 48 replies are between those limits. A surprising number indicate the use of some one of Cooper's series, which seems to betray lack of careful consideration of the matter on the part of those replying.

Unit Stresses, Impact and Deflection.—The permissible unit stresses are determined by the permissible deflection, and the two subjects should be considered together. Unit stresses, which would be entirely safe against failure, might permit excessive deflection of the ends and produce an unsatisfactory result. The replies as to permissible deflection probably are of little value because it is evident that the clearance over the circle rail has been confused with the deflection. From those replies on which this distinction seems to be understood clearly, it appears that the permissible deflection, measured at one end with the other end down on the rail, should be limited to from ¼ to ¾ in. The wheels of the loaded turntable should stand well clear of the circle rail at each end, not less than ¼ in.

The unit flange stress in tension used varies from 8,000 to 12,000 lb. per sq. in. without impact, and 21 out of 48 replies

give 10,000 as the permissible stress. The turntable should be designed so that the sum of the deflections at both ends will not exceed one one-thousandth of the length of the turntable and so that the unit tensile stress will not exceed 10,000 lb. per sq. in. The reversal of stress, which occurs near the center of each arm, should be provided for in accordance with the specifications for steel bridges. Provision for the reversal has the effect of extending the heavy flange sections toward the end and the heavy web requirements toward the center, which is beneficial as it increases the mass and stiffness of the girders. Parts not contributing to the end deflection of the girders may be designed by ordinary structural unit stresses, say 16,000 lb. per sq. in. tension. One condition of loading not often taken into account is that of a dead engine being pushed across the turntable by another engine. This condition is especially severe on the web and the stresses should be investigated for each design. Inasmuch as the turntable is not turned with such a load the higher unit stresses will apply.

Pit.—The hammer blow from wheels entering and leaving the turntable is especially severe on the circle rail and shore rail supports. Designers who have given attention to these details and their improvement are divided in opinion between a timber support for the sake of elasticity and an unyielding support on metal and concrete. More than 40 per cent. of the replies favor metal and concrete supports for the circle rail and more than 25 per cent. favor it for the shore rail support on the edge of the pit, indicating that this form of construction is growing in favor, as not many years ago the use of timber was universal.

APPENDIX E.

ELASTIC STRENGTH REQUIREMENT FOR STEEL.

The general specifications for steel railway bridges contain no elastic strength requirement for the steel otherwise specified. The only reference to the elastic strength of the materials is in the clause reading: "The yield point, as indicated by the drop of beam, shall be recorded in the test reports."

In 1901 the committee on Iron and Steel Structures presented certain specifications for structural steel as a basis for discussion and criticism at the annual meeting of the association. Two grades of structural steel were proposed at that time and a minimum value was fixed for the tensile yield point for each grade. In 1903 revised specifications were presented, calling for a single grade of structural steel with a specified range of ultimate tensile strength, and no definite requirements as to the yield point, but with the clause relative to this poiut as in the present specifications and as noted above. The opposition to the omission of the requirement was so strong that the specifications were not adopted at that meeting, but were referred back to the committee. They were presented again at the meeting of 1904, identical as regards the yield point, and the printed record of the Proceedings shows no discussion of this feature in the meeting, although there was a written discussion which questioned the propriety of dropping the yield point requirement. The specifications were adopted by the Association by a majority vote at the 1904 meeting.

Following the Quebec Bridge failure in 1907, the superimportance of the elastic strength over the ultimate strength in structural steel, especially for compression members, was so emphasized that it is to-day axiomatic. The question occurs: Is it not dangerous to suoordinate such a critical property to less important and misleading ones among those which are determined for the acceptance of material?

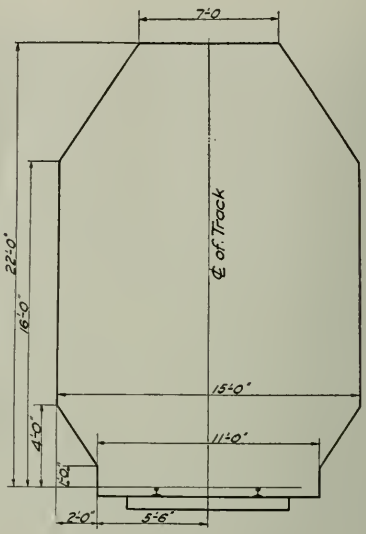
These considerations have led to an agitation for the restoration of an elastic strength requirement in specifications in which it has been omitted. The standard specifications for structural steel for bridges of the American Society for Testing Materials, which had previously been identical with those of the A. R. E. A. as regards the elastic strength requirement, were revised in 1913 to provide a yield point requirement. This sub-committee believes that the time is opportune for this committee to consider this question.

This sub-committee is of the opinion that the general specifications for steel railway bridges should include an elastic strength requirement that the yield point is the correct indication of the elastic strength and that the specifications should require a yield point not less than 30,000 lb. per sq. in. for structural steel, and not less than 25,000 lb. per sq. in. for rivet steel.

APPENDIX F.

BRIDGE CLEARANCE DIAGRAM.

Bulletin No. 163 of the Association published the replies to a circular letter, which indicate that the majority of the railroad engineers are in favor of increasing the width of the clearance diagram. In order to secure more detailed information as to the prevailing clearance diagram in use on the various roads limiting the size of equipment, and also to obtain information as to the size of the largest existing equipment, a letter was sent to the members of this committee and to several chief engineers of large railroad systems. After an extended discussion, a revised clearance diagram was



Proposed Clearance Diagram.

adopted for presentation to the Association. This diagram has been shown on the accompanying plan. There has also been placed on the plan a footnote calling attention to the recommendations of the committee on Electricity calling for a clear height of 25 ft. in electrified zones.

Discussion on Iron and Steel Structures.

The report was presented by Chairman Himes. Conclusion (1) was received as information.

C. E. Smith (Mo. Pac.): Many tests have been made of various kinds in Subject 2, in which the variables have been so numerous that a difference of behavior could not be assigned to a specific case. In the tests which we have underway we propose to work one detail at the time so that when we get through we will know what was the cause of the difference in behavior.

Chairman Himes: We are very fortunate in being able to secure the co-operation of the Bureau of Standards on Subject 2. This is submitted as a progress report, and I move that it be accepted as such.

(The motion was seconded and carried.)

O. E. Selby (C., C., C. & St. L.): The report on turntables is submitted as a progress report only. In the matter of length there has been a progressive increase in the requirements for some years. They seem to have gotten up to something like 85, 90 or 100 feet. It is important to decide whether we are to recommend two different lengths of turntable, or one standard length. The committee would like to ask the attention of the convention particularly to the features of length, live load, and unit stresses.

W. H. Courtenay (L. & N.): As to the first item, that of length, it seems to me that is hardly a matter for this association to decide—that is a matter which will be fixed by each individual railway company.

J. G. Sullivan (C. P. R.): The chairman of the sub-committee has given information we have all been looking for; a general idea of the lengths of turntables the roads are going to. It would be well in addition to this information to get some data as to different types of heavy locomotives in use, and how much room they must have so that they can be turned when the tank is full of water and when there is coal on the engine.

Mr. Courtenay: As to live load, it seems to me that the cooper intact is not generally figured on. Any one who has the care of turntables knows that turntables are subject to end shocks, being struck endwise by engines. My experience is that it is necessary to have the turntable stiff, and they

should be figured for an impact provision at the outset; very low working stress and stiffness is an important consideration with turntables. They should be particularly stiff laterally, with ample spacing and lateral bracing.

Mr. Smith: A large number of the roads are using Cooper's loading. The overload on the turntables for the ordinary Mikado engine is practically 80 per cent over and above the stresses given by Cooper's loading. It works in the other direction in the turntable than it does on a bridge. We have just completed the design of a 90-foot turntable to replace a 75-foot turntable. We made four designs. One was a 90-ft. complete deck design, giving a distance of 9 ft. from rail to top of center. Another one was double I-beam, flush type of girder, level with top of rail, to fit the center now used by the 75-ft. table. Another one was half through, with the girders half and half above the rail, the girders 13 ft. center to center, and the fourth a straight through type, girders about 16 ft. center to center. Leaving out the item of drainage, there is very little difference in the cost of the four designs, they all figure about $12,000 for the table and center, without tractor and without piles. The pile foundation costs about $1,000 more. The tractors will run $500 to $1,500 more, so in round figures a 90-ft. table will cost from $14,000 to $15,000, without drainage. To have a 90-ft. deck type turntable will require a 19-ft. pit, to be installed, to replace the 70-ft. table with the 6-ft. pit, and the increased pit will render heavy expenditure necessary for drainage in many cases.

F. E. Schall (Lehigh Valley): We are designing our tables for Cooper's 60-ft. load, but we interpose a uniform load, so as to make the action of the cantilever of sufficient section to stiffen the table something like a 6,000-lb. to the lineal foot, and then we are using regular bridge requirements with 100 per cent impact. I think the committee should be asked to fix the unit stiffness to be adopted for turntables.

C. H. Cartlidge (C., B. & Q.): We have found for general purposes in a through type table that building the turntable as a frame structure and not as a girder is the more economical. I agree with Mr. Smith that it is useless to try to design according to the Cooper classification. A turntable is necessarily designed for particular service, and it is very easy to design it for the engines which are to be placed on it. A combination of two very different services is required —a turntable must deflect very slightly, and low unit stresses should be used for all members which are directly concerned in the deflection. Other parts in a through table, whether a through girder or a through truss may be designed with high unit stresses, with resultant economy in the floor system throughout, and the floor system is a large part of the total weight. Proceeding along these lines our experience has been that a turntable such as Mr. Smith described, 90-ft. long for the heaviest power we run, will cost about $10,000 with a pit of a depth of not over 4.5 ft. deep in the center. I would suggest, in connection with the designing of turntables, that it is within the province of this committee to make designs for pits, ring wheels and center bearings as well as the turntable itself.

C. F. Loweth (C., M. & St. P.): I think that the committee should confine itself to giving requirements for different lengths of turntables and if it does this the different railroad companies can very readily determine what is the proper length for them to use in special cases. In almost every case it is a special thing when you come to the matter of turntable length.

The President: The recommendation that this be accepted as a progress report is before you, and if there are no objections it will be so received.

(The fifth subject was received as a report of progress.)

C. E. Smith (Mo. Pac.): Regarding the sixth subject, both mitered and square-end rails with easer bars have given entire satisfaction for drawbridge connections on heavy traffic lines when properly maintained, while both designs have also caused trouble when not properly maintained. On account of the comparatively uneven surface offered by the mitered ends they ride more smoothly and quietly than the square enos and the reduced pounding causes less wear and less danger of breakage. As the wearing surface of the easer bar or sliding tongue used with square ends must of necessity be outside the rail head the bearing of the wheel tread is widened for the short distance through which the easer bar carries the wheel over the joint. The resultant pounding rapidly wears down both the rail ends and the easer bar and causes hard, noisy track. Regardless of the type of rail and connection creeping must be absolutely avoided either by the use of a sufficient number of anti-creepers or by inserting switchpoints in the track at the proper places.

Hunter McDonald: The appliance Mr. Smith referred to has been in use on two drawbridges on our lines for about four years. On one of them we have about 60 trains a day. It was developed as a result of complaints on the part of the signal department that they could not interlock the easer rail, and that the split rail raised up was not a safe device. The split switch is fastened to the stock rail by means of a permanent cuff, it cannot separate more than 1-16 in., so that there is no danger in using the split points in the main line under these conditions. As soon as the stock rail is driven home into the socket prepared for it, on the fixed span a hollow block is driven behind it by means of a signal which holds it in position. I can only say that since we put it in about four years ago, our expenses for repairs have been about seven dollars. One was installed on a drawbridge 397 ft. in length and the other on a drawbridge 365 ft. in length, the latter being open three times a day and the former being open about three times a week.

Mr. Carpenter: I would like to offer this motion on the interlocking of the signal and bridge functions: The bridge operating functions shall be interlocked with the signal system in such a manner that none of the functions for opening can be performed until the signals have been set at stop indication and so that the signals cannot be set at proceed indication until all of the functions for closing have been completed. The bridge operating functions shall be interlocked with each other so that they must be performed in a predetermined order, both for opening and for closing:

T. S. Stevens (A., T. & S. F.): I would like to see that motion changed to require that the home signals shall display the stop indication.

C. E. Lindsay (N. Y. C.): I think the case would be covered if we say "until the signals controlling the movement of trains over the draw have been set at stop indication."

Mr. Carpenter: This will be considered simply as the sense of the convention.

Mr. Loweth: I do not understand that the motion offered provides that all draw bridges shall be interlocked. If it does I should be opposed to it. It seems to me that there are many bridges where the necessity for interlocking is not apparent.

(The motion of Mr. Carpenter as amended by Mr. Lindsay, was then put to vote and adopted.)

Chairman Himes: The next subject on which we will ask to report is on an elastic requirement for steel. We present a proposed revision of that specification. I move the adoption of the revision.

(The motion was seconded and carried.)

Mr. Carpenter: In order to carry that revision through the specifications consistently, we should have added a proposal to modify paragraph 163 of the General Specifications to Steel Railway Bridges, which refers to the Full Sized Tests of Eye-bars, as follows:

"In eye-bar tests, the minimum ultimate strength shall be 55,000 lbs. per sq. in., and the minimum yield point, as indicated by the drop of the beam or of the mercury column of the testing machine, shall be 29,000 lbs. per sq. in. Bars shall generally break in the body and the fracture shall be silky or fine granular, should a bar break in the head and develop the specified elongation, ultimate strength and character of fracture, it shall not be cause for rejection, provided not more than one-third of the total number of bars break in the head."

C. H. Cartlidge: I would like to ask the committee if it is decided as to whether 29,000 lbs. is the maximum minimum. Cannot they get a 30,000 lb. limit about as easily as 29,000 lb.? It is my experience that it is possible to get as high an elastic limit in eye-bars as we specify for the ordinary material in the same structure.

A. F. Robinson (A. T. & S. F.): I think we should let the elastic limit in the sample tests go in just as it is, and leave the other parts for further consideration. I do not think we ought to take quick action on the matter.

Mr. Carpenter: I do not understand that there will be any difficulty in obtaining the 29,000 lb. minimum proposed with the full size eye-bars. It seemed consistent and rational to drop the limit for the yield point of the full sized test a little below that for the specimen test.

Thomas Earle (Pa. Steel Co.): I know you will have difficulty in many cases in meeting the 29,000 lb. in your full sized test, where you only specify 30,000 lb. in your specimen test, and it also must be evident that if the grade is to be picked out and separated by the manufacturer, so as to obtain these results, while you may not see it, it is certain that you will pay the extra expense.

Mr. Selby: I think it is common practice with manufacturers whether specified or not, to pick out the higher grades of steel within the range of ultimate strength required by specimen tests and manufacture their eye-bars out of this steel.

Mr. Carpenter: I present the matter as a motion for adoption by the Association.

(The motion was carried.)

Chairman Himes: The next subject which we were to con-

sider, continued from last year, is the bridge clearance diagram. It is not a general clearance diagram. It is a diagram that is recommended for iron and steel structures for bridges and is 15 feet. If adopted it would mean that that was recommended by the Association as good practice, and it would be presumed that in future construction this clearance diagram would be followed. It is largely a question for the Association to decide whether they want to change the clearance diagram, and if they do whether this change is satisfactory. It is the recommendation of the committee that this diagram be adopted, and I so move.

Mr. Schall: The Manual specifies 14 ft. in the clear, and if you make an analysis on the 13 ft. standard space which is now adopted by the Association, you will find that on a 6 deg. curve, with a 45-ft. car, passing on multiple tracks, on which a train is moving and the other is at a standstill, you will have 1 ft. 9 in. clearance, or the same clearance as you will have on a straight track on a bridge built for 14 ft. clearance. If you have a four track system you will have to provide for two lines of trestles and make the track spacing 18 to 19 ft. centers, and it will cost a lot of money. What are you going to gain? We have freight cars 10 ft. 6 in. wide, and 14 ft. 11 in. or 15 ft. high. You have not gained anything except you are producing a lot of trouble for the eastern roads, who have tunnels of small capacity.

Mr. Loweth: I represent one of the western roads, and I know that we do not want this clearance. The standard clearance now in the specifications is 14 ft. and I think that is as far as this Association should commit itself.

Mr. Courtenay: If this Association increases the clearance from 14 to 15 feet it will encourage legislatures, and anyone who has been before them, to try to stop some of this erratic legislation knows that they don't know much about matters affecting railroads. I think this would be a dangerous thing.

H. T. Porter (B. & L. E.): I have made some investigation of the question of clearance and I have come to the conclusion that we cannot get what you call safe clearance unless we go to 16 ft. There are trainmen who can hang on the side of box cars, with 16 ft. clearance and hang out far enough to be rubbed, and 15 ft. clearance might reduce the accidents and might not, and if the bridge is wider the chances are they will be less careful.

C. E. Smith (Mo. Pac.): If our predecessors had adopted this same attitude, undoubtedly we would to-day be building bridges 11 ft. wide, with 14 ft. overhead clearance. I think the Association should anticipate the fact that increased clearance is going to be insisted upon and grow up to it. I am not prepared to recommend any larger diagram than that, but hope the diagram recommended by the committee will be adopted.

Mr. Robinson: I think we ought to leave the diagram just as it is, 14 ft. and if the various railway commissions or parties in control of these matters want to call for increased widths in certain states we can give it to them, but I don't think we ought to increase it above 14 ft.

Mr. Churchill: The recommendation of the committee, as I understand it, is largely based on the requirements of some of the state laws. Those state laws do not place the limit on cars but on another part of the equipment. A large portion of the engine cabs now used is wide enough to require a greater clearance than 14 ft. at bridges, under the state laws. The Ohio law reads that the clearance shall be 1 ft. 6 in. outside of the widest equipment, and 14 ft. does not comply in that case. It is a question of whether we should put that on record as the action of this Association. The fact still remains that many of the roads must build bridges 15 ft. clear.

C. H. Cartlidge (C. B. & Q.): It seems to me that it ought to be remembered that what the Association has adopted in the past and what it has now printed in the Manual is not a recommendation for the maximum clearance, but a recommendation of minimum clearance. Anyone who has conditions requiring larger clearances is completely at liberty to provide such larger clearances. The danger in adopting enlarged minimum clearance is very real.

E. A. Frink (S. A. L.): I think there is a great deal more to this subject than that. If there was any prospect of widening the clearance that would cure the evils that we anticipate, I think it would be well, but I don't think there is any. I think the width of the cars and other equipment will have to follow the widening of the clearance. It has taken us a good many years to get a right-of-way that will carry our equipment. When you widen the track you will have to get wider cars, and that will mean a heavier load per ft. for the equipment, and you know what that means on bridges.

Chairman Himes: It seems that there is a strong desire on the part of some members to set up a templet on the railroads that will throttle the capacity of the railroads and will not permit the passage of large equipment. It is fair to presume that the reason we are using larger locomotives and heavier, stronger cars is because by so doing we can handle the traffic more economically, and it is for the purpose of making money. Now, if by building greater locomotives and greater cars the road can earn enough more money to pay for the structures they want to take down and renew, it looks like pretty good business to do so. It is clear that there has been a little mismanagement in permitting a perpetual see-saw between the engineering department and the motive power department, by which we get larger bridges and so on at a great waste of money, but that is not a problem of engineering. I think the idea that we must so erect our structures that we will throttle the development of the motive power department, and the equipment department is entirely wrong. Second, in regard to the danger: I don't think that it is a matter for us to consider what the custom in the past has been in regard to the clearance diagram. We have to consider the element of safety to those who operate the railroad. (The chairman's motion was put and lost.)

RAIL

The subjects assigned for investigation and report are as follows:

(1) Recommend standard rail sections.

(2) Continue investigations of rail failures and deduce conclusions therefrom.

(3) Continue special investigation of rails.

(4) Present specifications for material in rail joints.

STANDARD RAIL SECTIONS.

The present A.R.A. sections "A" and "B" were adopted in 1908. We were instructed by the American Railway Associa-

J. A. ATWOOD,
Chairman Committee on Rail.

tion to study these sections and submit a single type for standard.

During 1908 and 1909 very little rail of the A.R.A. sections was laid, and, generally, it has not been laid in such manner as to give comparative results of the value of the two sections; in fact, up to the present time there have been but three places the committee has knowledge of where the "A" and "B" sections were laid in order to secure comparative results under similar track and traffic conditions. The matter of sections has been under consideration since 1908 and, owing to the lack of information giving comparative results, the committee has deemed it desirable not to be hasty in submitting new sections.

Tentative sections proposed by several members of the committee were submitted to the whole committee. These were criticised by members of the committee, and as a result there is now submitted for approval sections for rails weighing 100, 110, 120, 130 and 140 lb. per yd.

Suggestions have been made to the committee that a common fishing space should be used for more than one section; also, that a common width of base should be used for more than one section. To use a common fishing space for more than one section would result in a greater sacrifice in design-

ing some of the sections than seems desirable. To do so would be sacrificing one of the most expensive parts of our track, in order to help out a much less expensive part, and would appear to be a violation of the economical or theoretical principles which should control our work.

A common base for more than one weight of rail is less objectionable, and the only feature in the design that would necessarily be sacrificed would be the matter of stability against overturning. It seems desirable, however, to propose different widths of base for each of the sections recommended.

The designs submitted have kept in view the feature of the rail as a girder, and we have kept in mind a design having the

Proposed R. E. Rail Sections.

highest ratio of section modulus to area of section. The radia of the fillets between the head and web, and web and base, have been made as large as possible without interfering with the bearing of the joint bars.

Although the committee submits designs for sections weighing 130 and 140 lb. per yd., it does not consider them necessary, nor does it recommend them for adoption. They should be received as embodying the ideas of the committee in regard to such sections, and are a development along the lines of the sections 100 to 120 lb., inclusive.

The committee offers no new designs for sections under 100 lb., and for the 90-lb. section recommends the A.R.A. "A" section for the single type standard. The sections now in general use do not vary sufficiently from those that might be submitted as to make any marked difference so far as mill practice or wear in service are concerned, the distribution of the metal in sections of 80 lb. and under being such that it cannot be varied, except in minute details that will not affect the life or safety of the rail in service.

SPECIAL INVESTIGATION OF RAILS.

During the year special reports have been prepared and presented to the rail committee, as follows:

Influence of Carbon on the Properties of Rails, by M. H. Wickhorst.

Formula for Deflection of Rails in Drop Test, by M. H. Wickhorst.

Study of a Rail with Internal Fissures, by M. H. Wickhorst.

Comparative Service Test of 100-Lb. Sections, P.S. and A.R.A.-A on the Pennsylvania Lines West of Pittsburgh, by W. C. Cushing.

Influence of Finishing Temperature on Open-Hearth Rails, by M. H. Wickhorst.

Internal Fissures in New Rails, by M. H. Wickhorst.

SPECIFICATIONS FOR MATERIAL IN RAIL JOINTS.

The following specifications are presented for adoption:

(a) Specifications for High Carbon Steel-Joint Bars.

(b) Specifications for Heat-Treated, Oil-Quenched Steel-Joint Bars.

(c) Specifications for Medium Carbon Steel Track Bolts with Nuts.

(d) Specifications for Heat-Treated Steel Track Bolts with Nuts.

RAIL LENGTHS.

The question submitted to the committee was the advisability of using rails longer than 33 ft. The question may be considered in several parts, as follows: (1) The most suitable length of rail from the track standpoint; (2) the transportation of longer rail; and (3) the manufacture of longer rail.

With longer rail the advantages would be in better riding track, and the saving in the number of joints and in the labor of applying and maintaining them. From the standpoint of securing the best track, it is desirable to use the greatest length of rail, the necessary expansion for which will not increase the pounding at the joints, or materially increase their cost of maintenance. This is principally a question as to what maximum expansion per joint can be used. Rail specifications permit a variation of $\frac{1}{32}$-in. from square at the ends, which tends to increase the length of expansion space used above the amount prescribed. Some manufacturers mill the ends, which eliminates this trouble; and this would be especially desirable for longer rail. While the best track cannot be secured nor the lowest maintenance cost reached unless the expansion space is uniformly distributed, and kept so, this would be more important with longer rail. Some think the expansion space now generally prescribed could be reduced; from this standpoint, any reduction would permit a relative increase in the length of rail that could be used, and it is desirable to have this carefully investigated.

The disadvantages would be the increased expansion space at the joints and the increased difficulty of handling longer rail. Special tests should be made to determine the maximum expansion space that is practicable, considering the riding of the track and the cost of maintenance. The labor cost involved is relatively small, as compared with the cost of material renewals. As the use of power appliances for the loading and unloading, laying and relaying is economical, and is becoming general, the principal difficulty in handling would be by the section gangs in replacing failed rails, which will be further reduced by the increasing use of motor cars by these gangs. As this represents such a small part of the whole maintenance, it will not be sufficient to limit the length of rail.

What the most desirable length is from a track standpoint, as suggested, must be determined by additional tests, but it probably is considerably longer than 33 ft. Most European roads use lengths not less than 39 ft., while many use 45 ft. and over, including lengths of 49 plus, 54 plus, 59 plus, 60 and some even 72 and 78 ft.

As to the transportation of rail, considering the present equipment over 33 ft. long of nine roads, Eastern and Western, only 10 per cent is long enough to handle rail over 40 ft. in length, while 60 per cent will carry rail 39 ft. long and 70 per cent is long enough for 36-ft. rail. Eastern roads transport rail largely in open top cars, while in the West stock cars are used extensively. With the present equipment, generally rail over 40 ft. long would have to be handled in two open top cars, at some additional cost for blocking.

As regards manufacture, some mills could probably furnish rail in lengths of 36 or 39 ft. without changes in their plants, while others might need some reconstruction of their hot-beds

and finishing facilities. There seems to be some additional difficulty in straightening very long rail, but this does not appear sufficient to appreciably affect such lengths as we may tentatively consider. On the other hand, there would be fewer rail to saw, drill, finish and handle for a given tonnage.

The sub-committee on Length of Rail adopted the following resolution:

"From tests of long rail on American roads and the general practice in Europe, it seems that a longer rail—probably not exceeding 45 ft.—would yield advantages from the standpoint of economy and better riding track, providing, however, there is no additional cost per ton."

The character of present equipment may render inadvisable the use of lengths greater than 36 ft. or 39 ft., but if transportation is practicable for lengths of 45 ft., it is the opinion of the sub-committee that a general trial use should be made for lengths above 33 ft. up to 45 ft.

Transverse Fissures.

Investigations have been made during the year to determine the cause of transverse fissures, if possible. Report No. 42 is a study of a rail, in service, in which transverse fissures developed. It shows the presence of a large number of small fissures, many of which were transverse fissures. Report No. 46 gives the result of a similar examination of new rails. The report shows the presence of interior fissures similar to those shown in rail in service by Report No. 42. The investigations have not progressed to a point where definite conclusions can be reached, but present indications point to these internal fissures—the result of rolling conditions—as a possible cause or at least a contributing cause of transverse fissures.

FUTURE WORK.

About the time when 100-lb. rail began to come into considerable use (1906) the railroads experienced great difficulty in getting proper rail material. Tonnage, and not quality, was the aim of the manufacturer. Agitation by the railroads for better material developed a criticism by the manufacturer of sections then in use—the manufacturer claiming that good material could not be produced unless the section was modified. The American Railway Association appointed a committee to revise the sections. This committee reported the A.R.A.-A and A.R.A.-B sections. The American Railway Association then asked the American Railway Engineering Association to investigate the use of these sections and report a single section for each weight of rail. Since that time the Rail committee has been making a study of the rail situation —both in the mill and in track. In making the investigations it has had the financial support of the American Railway Association, and it is gratifying to report that the manufacturers have given the committee increasing support and co-operation.

Coincident with the work of the committee, there has been a gradual improvement in the quality of the material in rails until now there is no longer, as in 1906, a hesitancy on the part of railroads to order 100-lb. rail because of their inability to get good material in that weight of rail. The committee, holding, as it did, a semi-official position (as representing the A.R.A., as well as the A.R.E.A.), has been able to influence, to a considerable degree, general opinion on the subject of the manufacture and use of rails, and this influence, it believes, has been a considerable factor in the better rail conditions now prevailing.

The A.R.A. will discontinue its financial support after April 1, 1915. Mr. Wickhorst has, however, been retained for one year after that date by the A.R.E.A. The committee feels that it is unfortunate that the financial aid of the A.R.A. has been withdrawn, and hopes that it will be only temporary. The A.R.E.A., of course, cannot employ Mr. Wickhorst permanently, but the standardization of practice in the manufacture of approximately $100,000,000 worth of rails per year would seem to warrant the small outlay incident to the prosecution of the work of the committee.

CONCLUSIONS.

The committee recommends the adoption of the following conclusions:

First (a), That the sections of rails recommended for weights of 100, 110 and 120 lb. per yd. be approved as standard and printed in the Manual.

(b) That the A.R.A.-A section be adopted as standard for 90-lb. rails.

(c) That for sections below 90 lbs. it is inadvisable to recommend any changes in the sections now in use.

(d) That the above conclusions be presented to the A.R.A. for adoption.

Second, that the specifications for material in Joint Bars be adopted and printed in the Manual.

Third, that the revisions of the specifications for Carbon Steel Rails be adopted and printed in the Manual.

APPENDIX F.

INFLUENCE OF FINISHING TEMPERATURE ON OPEN-HEARTH RAILS.

An investigation was made concerning the influence of finishing temperature on the properties of open-hearth rails. The problem was divided into two parts—first, the influence on the rails of varying the initial temperature of the ingots as drawn from the pits; and, second, the influence on the rails of varying the finishing temperature by holding the bar toward the end of the rolling. A set of five ingots, all of one heat, was drawn from the soaking pits with varying temperatures and rolled into rail in the same manner, but, unfortunately, this part of the work was not successful, due to failure to obtain much range in the initial temperatures of the ingots. Another set of five ingots from the same heat was drawn from the soaking pits at about the same temperature for the several ingots, and rolled into rail in the same manner, except as to the length of time the bars were held toward the end before the finishing pass. The work was done at Gary, Ind., at the works of the Illinois Steel Company, who kindly furnished all the material and facilities for making this investigation. The rails were tested by means of drop tests, slow bending tests, tensile tests, transverse tests of the base, microphotographs and polishing of cross-sections.

The finishing temperatures of the rails were determined by means of a radiation pyrometer, showing the temperature of the bottom of the flange toward its edge. The comparisons between different temperatures, mentioned below, refer to differences in finishing temperatures obtained by holding the bar varying lengths of time before finishing. The finishing temperatures of the flange varied from 850 deg. C., with a shrinkage of 6.95 in., to 695 deg. C., with a shrinkage of 5.70 in. in a 33-ft. rail. The first bar was finished without holding between rolls, while the latter was held 115 seconds. The average decrease in shrinkage was .011 in. per second held.

The results in the drop, slow bending and transverse tests of the base were about the same for the different finishing temperatures, varied by holding the rail bar between rolls before final finishing. In the tensile tests the results were also about the same, except that the lower finishing temperatures showed a little greater elongation and reduction of area. The lower finishing temperatures also showed a somewhat finer grain structure.

APPENDIX G.

INTERNAL FISSURES IN NEW RAIL.

By M. H. Wickhorst, engineer of tests, Rail Committee.

In Report No. 42, "Study of a Rail with Internal Fissures," it was shown that a rail that had failed in service, due to a tranverse fissure, contained numerous small cracks or fissures in the head of the rail. These were most numerous in the lower part of the head and were mostly longitudinal, but some were transverse near the middle of the head. That work did not, however, show whether these cracks were developed in service or were contained in the original rail as made.

Report No. 45 described tests of rails finished at different temperatures, and cross-sections were selected from those rails for polishing by the improved method described in Report 42. The A and E rails were examined from 10 ingots of one heat and 4 sections were cut from each rail, making a total of 80 cross-sections. From each rail one section was cut from near each end and two from near the middle. The manufacture of these rails is described in Report 45. The rails were 100-lb A.R.A. type A section and were tested without straightening or gagging.

The preparation of the sections consisted of polishing with emery, etching or pickling with copper-ammonium chloride solution until the deposited copper could be wiped off easily and finally polished with tripoli to a point where any minute cracks or fissures showed plainly.

A few of the sections showed small cracks in the head or web, or both. All the cracks found were in the upper half of the A rails and none were found in any of the E rails. A

few of the cracks occurred in the web and had the appearance of being small slag enclosures, but most of them that occurred in the head had ragged sides and appeared to be tears or breaks in the steel.

This work indicates that cracks or ruptures may occur in new rails as made, but does not show at what stage of the manufacture these breaks occur, nor does it show the conditions that influence their occurrence. It is interesting to note that in this work they were found only in the A rails where some unevenness of composition would occur, and they occurred at different finishing temperatures, but the matter can be worked out only by considerable further experimental work.

APPENDIX I.

SPECIFICATIONS FOR HIGH-CARBON STEEL-JOINT BARS.

1. *Basis of Purchase.*—Inspectors representing the purchaser shall have free entry to the works of the manufacturer at all times while the contract is being executed, and shall have all reasonable facilities afforded them by the manufacturer to satisfy them that the joint bars have been made in accordance with the terms of the specifications.

2. All tests and inspection shall be made at the place of manufacture prior to loading, and shall be so conducted as not to interfere unnecessarily with the operation of the mill.

3. *Material.*—Material for joint bars shall be steel, made by the open-heart process.

4. *Chemical Properties.*—The chemical composition of each melt of steel from which joint bars are manufactured shall be within the following limits:

Phosphorus, per cent, maximum 0.04.

5. The manufacturer shall furnish the inspector a complete report of ladle analysis, showing carbon, manganese, phosphorus and sulphur content of each melt represented in the finished material. The purchaser may make a check analysis from the finished material; such analysis shall conform to the requirements in Section 4.

6. *Physical Properties and Tests.*—Joint bars shall conform to the following physical requirements:

(a) Tensile strength, lb. per sq. in., minimum, 85,000.
(b) Elongation, per cent in 2 in., minimum, 16.
(c) Cold bending without fracture on the outside of the bent portion through 90 deg. around an arc the diameter of which is three times the thickness of the test piece.

7. All test pieces shall be cut from finished bars.

(a) Standard ½ by 2-in. specimens, as adopted by the American Society for Testing Materials, shall be used for tension test.
(b) The bend test specimens shall be ½-in. square in section, or a rectangular bar ½-in. thick, with two parallel faces as rolled.

8. *General Requirements.*—The different sections of joint bars shall be rolled to dimensions specified in drawing furnished by the purchaser. No variation will be allowed in the dimensions affecting the fit and the fishing spaces of the rail. The maximum camber on either plant shall not exceed $\frac{1}{32}$-in. in 24 in.

9. The joint bars shall be sheared to the length prescribed by the purchaser and shall not vary therefrom by more than ¼-in.

10. (a) All joint bars shall be punched, slotted and shaped at a temperature of not less than 800 deg. C. (1470 deg. F.).

(b) All bolt holes shall be punched in one operation, without bulging or distorting the section, and the bars shall be slotted for spikes, when required, in accordance with the drawings, the slotting being done in one operation; a variation of $\frac{1}{32}$-in. in the size and location of the holes will be allowed.

11. All joint bars must be finished smooth and true, without swelling over or under the bolt holes, and be free from flaws, seams, checks or fins, and the fishing angles must be fully maintained.

12. The manufacturer's identification symbol, kind of material, month and year rolled and number of design, shall be rolled in raised letters and figures on each bar. The number of the melt shall be plainly stenciled on each lot of joint bars.

13. *Inspection.*—The joint bars from each melt shall be piled separately until tested and inspected by the purchaser's inspector. One joint bar for tension test shall be selected by the inspector for each melt represented in finished bars, or by agreement specimen for tension test may be cut from the bar as rolled. One joint bar for bend test shall be selected by the inspector for each lot of 1,000 bars or less presented.

SPECIFICATIONS FOR HEAT-TREATED, OIL-QUENCHED, STEEL-JOINT BARS.

[Where specifications for heat-treated bars are the same as those for high-carbon bars given above they are not repeated.]

6. *Physical Properties and Tests.*—Joint bars shall conform to the following physical requirements:

(a) Tensile strength, lb. per sq. in., minimum, 100,000.
(b) Yield point, lb. per sq. in., minimum, 70,000.
(c) Elongation, per cent in 2 in., not less than $\frac{1{,}500{,}000}{\text{Ten. str.}}$ minimum, 12.
(d) Cold bending without fracture on the outside of the bent portion through 90 deg. around an arc, the diameter of which is one and one-half times the thickness of test piece.

8. *Heat Treatment.*—Joint bars shall be heated and quenched in an oil bath from a temperature of about 810 deg. C. (1490 deg. F.), and shall be kept in the oil bath until cold enough to be handled.

13. *General Requirements.*—The manufacturer's identification symbol, kind of material, month and year rolled, number of design, and the letters "HT," to signify heat-treated, shall be rolled in raised letters and figures on each bar.

14. *Inspection.*—The joint bars from each melt or heat treatment lot shall be piled separately until tested and inspected by the inspector. One joint bar for tension test shall be selected by the inspector for each melt or heat treatment lot represented in finished bars. One joint bar for bend test shall be selected by the inspector for each lot of 1,000 bars or less presented, or from each heat treatment lot.

Discussion on Rail.

Chairman Atwood presented the report offering the first conclusion for consideration. Paragraph (a) was adopted.

W. H. Courtenay (L. & N.): I favor the A. R. A. B. section in preference to the A. R. A. A section. It seems to me that A. R. A. B is better. It has a heavy base. I am told by some manufacturers that it is a better rolling mill proposition and ought to last longer.

(Paragraphs (b), (c) and (d) were then adopted.)

The investigations of the Rail Failures and the conclusions deducted therefrom were received as information as was the work on the special investigation of rails.

Chairman Atwood: The next subject specifications for material in rail joints. We have presented for your consideration specifications for high carbon steel joint bars and specifications for heat-treated oil-quenched, steel-joint bars, and these specifications we present for adoption by the convention.

(Both specifications were adopted as were the changes in the Manual and the second and third conclusions.)

Chairman Atwood: Dr. Dudley has made some investigation of transverse fissures which has not yet come generally before the Rail Committee. He has some points he would like to speak to you about.

Dr. P. H. Dudley: We find that in a very few rails that leave the hotbeds the transformations are not entirely complete, from hot molten metal to the finished product, during the recrudescence of the head and the base. That sometimes leaves a central core in the head that is less ductile than it is in another place, and that is injured more or less in the gagging. If there are any transformations that are not complete enough, the tendency of the gag is to uncap this slightly, leaving an impression there, and the wheels will develop a crack in that metal from which an interior transverse fissure will develop. That will be a high rail and gagged upon the head. The low rails will have the base turned up. The metal in the base must be shortened, and that in the head lengthened, the reverse of what it is in the high rail. If there are any incomplete transformations in the head of that rail, we may check that core. Those I found and could trace all of those with the straight edge where they had been gagged more or less, and I termed that the inter-granular neuclea. We had only a few specimens and I termed those non-ductile metal. It was difficult to find any metal that was separated, except the track. In the past few days we have had a great many specimens come in, in which we were able to show that the fissure was produced by the gagging as well.

One of the interesting developments of the inter-granular neuclea came in a few days ago in a Bessemer rail that was rolled in 1906. That was when they were making the rails as fast as they could in the Bessemer output, and we were using a two-in. nozzle for steaming the ingots. In this case we have the inter-granular neuclea shown too plainly in the head of the rail. An ideal etching of that same section shows there was an inclusion of cast iron cut out from the stool, and we have an outside envelope, a very ductile metal, and a higher carbon shown by the shading, but a central core that was checked in the gagging. This was a low rail, and gagged from the base. We have all the different tests

showing that it was very much harder; the base was tougher, and we have all the exterior envelope to show that that was a non-ductile metal. There is probability that considerable improvement can be made, even under the present methods of gagging. In gagging some of these high rails in the center, they are often bit four or five times in very short spaces. You straighten that long sweep in the rail by making a series of short curves and you gag it in ten, twelve, or fifteen places on top, and cut that long sweep into a series of short curves, and shorten it at each place it is gagged. If we had maximum by which we could take out that long sweep stretching over an inch, probably it would not be injured so much.

We have been making a number of observations by chalking rails and noticing the width of the mark. We chalk right across the rail. We notice the mark made by some passing wheel. Some of the wheels only removed about a quarter of an inch of the width of the mark, and another would take off a half inch at a different place. This is all under the passenger equipment. Now, the proposition is to carry the chamfering out pretty nearly to the rim of the wheel, so that as the train wheels run over the rails, we will produce a wear very uniformly over the head, as we did a decade ago. I have had trouble with these transverse fissures, and I wanted to see whether we had conclusive proof of the effect of the gagging of these rails, and they have all given proof that the coning of the wheels and the shape of the tread is not what it should be, and they want to return to a less coning, but have the tread extend out so that it will cover the full width of the head, for the tangents at least, so that it will be wider on all of the curves that happen to be laid a quarter of an inch or a half inch wide on the curves. We think the wheel pressure tenses are entirely too great, not only upon the wheel but on the rail heads for the best wear of the rail. Our rails from New York to Chicago cost for the two passenger tracks, about ten million dollars. In going over portions of the line the other day we saw that we were only wearing off inside the web. There were hardly any marks outside of that, so we expect to extend out the chamfer so as to distribute the wheel contacts, make those larger, and our wheel intensities over a larger area of circuits.

Mr. Trimble: What do you think of canting the rail in order to overcome the difficulties you have just mentioned?

Dr. Dudley: We have the rail canted in several places, but we don't think it meets the condition at all. We are going to extend the coning out, so that we can get it over the head, as we had it a few years ago.

C. E. Lindsay: Has Dr. Dudley found any fissures in the base of the rails due to gagging?

Dr. Dudley: No, sir; you break the rail. All the breaking enect comes from the locked-up strains in the gagging.

WATER SERVICE

The following subjects were assigned:

1. Complete report on the design and relative economy of track pans from an operating standpoint.

2. Report on deep wells and deep-well pumping and relative economy of this as compared with other sources of water supply.

3. Report on the use of compounds in locomotive boilers to counteract: (a) Foaming. (b) Scale formation.

4. Continue the study of recent developments in pumping machinery and various kinds of fuels used.

The committee has given careful consideration to the subject of the revision of the Manual, and presents for approval a number of important changes in the subject matter now embodied in the Manual under the heading of water service.

The committee reports progress on the subject of design and relative economy of track pans from an operating standpoint.

REVISION OF MANUAL.

EFFICIENCY OF WATER-SOFTENERS.

Substitute the following for paragraphs 1, 2 and 3:

Designing and Installation.

(1) Special study should be made relative to the economical value of treating the water, and the method best adapted to meet the conditions.

(2) The installation of softening plants should follow a systematic plan. Greater success is generally obtained by completing the installation on one division first, rather than installing plants at individual points of especially bad water.

(3) Before the treatment of a water supply is undertaken the effect of the treatment on the water should be determined by complete analysis of the water.

(4) The plant should be of adequate capacity. It is necessary to anticipate possible increases in the consumption of water at the station considered.

(5) The mechanical device for introducing reagents should be such as to insure as near as possible a quantity of reagent in direct proportion to the flow of the untreated water. It should be simple of construction and operation and not readily thrown out of adjustment.

Operation, Maintenance and Supervision.

(1) Adequate supervision is necessary to the successful operation of a softening plant. Such supervision should be exercised at least in part by a chemist, or an engineer having adequate knowledge of water treatment.

(2) Provision should be made for frequent analyses or hardness tests of both treated and raw water. This is necessary, principally as a check on the treatment, and also on account of changes in the condition of the raw water.

In order that the analyses shall be effective, they must be made under the supervision of a competent chemist.

(3) Where the consumption of water is in excess of the rated capacity of the plant the use of undertreated water should be avoided by the use of raw water to such an extent as to give ample time for the proper treatment of all water that passes through the softener. The exception to this rule

A. F. DORLEY,
Chairman Committee on Water Service.

is the case of water which is being treated for corrosive properties. Such water should not be used raw if it can be avoided.

(4) The solutions containing the reagent should be properly prepared.

(5) The reagents should be as near chemically pure as practicable.

FOAMING AND PRIMING.

Substitute the following:

Foaming from treated water is due to the presence of sodium salts, as a result of treatment for incrusting sulphates, together with such quantities of the alkali salts as may have been present in the raw water. This condition is aggravated and is to a large extent due to the presence of suspended matter in the water.

Concentration of foaming solids in locomotive boilers reaches the critical point at about 100 grains per gallon. Concentration above this point will result in foaming.

The grains per gallon of foaming matter in solution represent the minimum per cent of water which must be wasted from locomotive boilers to prevent concentration rising above the critical point.

The cost of each pound of foaming matter per 1,000 gal. of water is approximately equal to the cost of pumping, treating and heating 70 gal. of water to the temperature of the boiler water.

The most efficient results are obtained by systematic, frequent blowing-off of the boilers on the road, as well as at terminals, together with occasional complete blowing-down and washing of boilers.

There are, of course, conditions where the concentration of foaming solids is so great that the required amount of blowing-off would be both impracticable and uneconomical, and it is necessary to resort to anti-foaming compounds.

DEEP WELLS.

The committee finds, after careful consideration, that a comparison between deep wells and other sources of water supply as such would be of questionable value and recommends as a substitute, for another year's work, a comparison of the costs of pumping under various conditions and with various types of equipment.

The committee submitted a tabulated statement on deep wells and deep-well pumping, covering information from 34 railroads. This showed the character of the wells and gave cost data and other information concerning pumps and pumping for deep wells. The special features of this statement were the figures given for pumping by the air lift. The striking feature about this was that the quantity of air used per gallon of water pumped as given ranged from 1 cu. ft. to 48 cu. ft. The first is abnormally low, but it may be explainable by exceptional conditions, if such exist, not developed by the investigation. The second can only be explained on the assumption that a vast amount of air is being forced through a well whose capacity is limited, thereby resulting in great waste of air.

Some tests on the El Paso & Southwestern developed the fact that whereas the compressor had been running at a speed of 100 revolutions per minute, maintaining an air pressure of 100 lb. at the well and consuming 5 to 6 cu. ft. of air per gallon of water pumped, the same quantity of water was lifted by reducing the speed of the compressor to 50 revolutions and the air pressure at the well to 85 lb., resulting in a reduction of air consumed to 2.7 cu. ft. per gallon of water lifted.

The committee's investigations lead it to the conclusion that the air lift is in many respects a desirable system for many deep wells, especially those in which the water is delivered from fine sand, requiring for the exclusion of the latter screens so fine, in order to avoid trouble with the pump plungers, that the capacity of the well is limited. By the substitution of the air lift for such wells, it appears that coarse strainers may be used, thereby permitting pumping out the fine sand and the collection of coarser material around the strainers, resulting in largely increased yields from the wells.

THE USE OF COMPOUNDS IN LOCOMOTIVE BOILERS TO COUNTERACT FOAMING AND SCALING.

The practice of introducing substances into a boiler for the purpose of preventing or tending to prevent the formation of scale on the interior surface of a boiler is probably almost as old as the use of the steam engine. The substances having an anti-scale action may be divided into two general classes: first, those having a mechanical action; second, those having a chemical action.

Prevention of scale by mechanical means consists in dilution of the scale-forming solids as they are thrown out of solution so as to exhaust or destroy their cementing properties. The materials used for this purpose may be divided into two general classes: first, purely inert materials which become suspended in the boiling water in a finely divided state, and are then deposited with the scale-forming material as it is thrown out of solution; second, materials of an oily or gelatinous nature or which assume this state when suspended in water; such materials have a tendency to surround the scale-forming matter with a slimy coating and to cover the water surface of the boiler in a like manner.

To the first class belong clay, talc, moss, coloring matter, ground glass, bran, sand and sawdust. To the second belong algæ, potatoes, starches, linseed, sugar, molasses, gum, dextrines, stearine, peas, oils, graphite, animal carcasses and resin. Of these some could be placed in both classes of mechanical acting substances, while others have more or less of a chemical action in addition to the mechanical effect. To these classes may be added a third to cover the use of wire, brush, twigs, etc., which afford additional surface upon which the scale may form.

The use of inert materials in a boiler cannot be recommended. It is very doubtful whether inert inorganic materials, such as earths or ground glass or sand, do any good at all. The other materials, in order to be at all effective in the prevention of scale, must be introduced in great quantities, with the result that the tendency to foam is augmented. The quantity of matter carried to the bottom of the boiler is also greatly increased, thus requiring an increase in the amount of blowing-off and washing and increasing the chances of mud burning. With waters tending to foam, the suspended matter may be carried over into the valves and cylinders, resulting in excessive wear of the working parts.

Petroleum oils are very commonly used in boilers, both alone and as an ingredient of compounds. They serve the twofold purpose of loosening the scale already in the boiler, and preventing its subsequent formation. Many grades of oil are used, from kerosene to heavy crude oils. While there seems to be a wide disparity of opinion as to the use of oils in boilers, the fact remains that oils as anti-incrustants have many strong advocates.

The action of oils is to coat the entire interior surface of the boiler, with a slippery veneer, to which the scale-forming solids cannot adhere. Even with the boiler surface covered with a coating of scale, the oils will tend to work into the cracks and with expansion and contraction gradually spread over the metal surface. Some oils also have a chemical action in that they combine with the calcium and magnesium salts to form insoluble soaps.

Several objections are raised to the use of oil, of which the most serious is the danger of burning and blistering due to the formation of a dense paste composed of a mixture of sediment and oil. In the absence of any fatty oils there does not appear to be much danger that this condition will be obtained unless they are used to excess or without proper care. Certain tests seem to indicate that oil has non-conducting properties far greater than those of scale, so that a film of oil of even inappreciable thickness may result in considerable fuel losses. Owing to the lack of sufficient verification, the extent of these losses can be only very roughly approximated at the present time. Oils sometimes give trouble through the passing into the cylinders of volatile constituents, which destroy the lubricating oils and rubber packing. When kerosene is used, open flames must be kept away from open manholes of empty boilers.

Oils are introduced into the boilers in most cases by some form of injector, such as the ordinary lubricator attached to the feed water pipe. A small pipe with a valve and immersed in a vessel of oil will serve the purpose. Another method is to throw the oil onto the surface of the water in the opened boiler, upon which it spreads out in a thin film to the sides of the boiler. Then as the boiler is emptied, this film of oil is carried down, covering the surface of all flues and the shell below the water line. Another method is to paint the interior with oil when empty.

The proportions of oil used seem to be governed more by the horsepower of the boiler than by the amount of incrustants in the water used. One advocate of kerosene recommends the use of one quart per day to 100 boiler horsepower.

Graphite.

Graphite is said to have properties similar to those of heavy oil and is introduced in the same manner. The flake or crystalline form of graphite is superior to the amorphous or powdered form for this purpose.

Prevention of scale formation through materials having chemical action comes about through reaction with the incrusting solids in the water to form new salts, which are either solubles to a high degree of concentration, or insolubles which have no incrusting properties, being precipitated as a sludge which is readily blown or washed out of the boiler.

Following is a list of chemical reagents which may be used to produce the results outlined above. Some are in common use, others are not, the considerations affecting a preference being cost, possible corrosive action, tendency to cause foaming, poisonous character, etc.:

Inorganic.—Sodium carbonate (Na_2CO_3), sodium silicate (Na_2SiO_3), tri-sodium phosphate (Na_3PO_4), sodium fluoride (NaF), caustic soda (NaOH), barium carbonate ($BaCO_3$), barium hydrate ($Ba((OH)_2$), barium chloride ($BaCl_2$), salammoniac (NH_4Cl), chromates, bichromates and oxalates.

Organic.—Tannic acid—tannates, other wood extracts, acetic acid, sugar, glycerin, oils and soaps.

Sodium Carbonate.

Sodium carbonate is the most common reagent used in boilers. It is found on the market in various forms under the names of soda crystals, sal soda, washing soda, scotch soda, concentrated crystal soda, sesqui carbonate of soda, crystal carbonate of soda, black ash, soda ash and pure alkali. The form commonly known as soda ash is the cheapest form of commercial sodium carbonate. Until recently it contained considerable quantities of impurities, but can now be obtained readily from 97 per cent to 99 per cent pure.

The principal disadvantage in the use of soda ash in boilers is the tendency of both sodium carbonate and sodium sulphate to cause foaming. The conditions are more severe when soda ash is used as a compound rather than as a reagent in a water-softener, because very little of the carbonates of lime or magnesia have been precipitated before entering the boiler and thus aggravate the foaming conditions by their presence in suspension.

Sodium carbonate is said by some to be much more conducive to foaming than sodium sulphate, consequently its

presence in a boiler ought to be prevented. By careful manipulation this may be accomplished fairly well in the water treated by a softening plant. On the other hand, with the use of sodium carbonate directly in locomotive boilers (tanks), an excess of the carbonate is almost sure to be obtained at some time during a run because of the impracticability of exact proportioning for the varying grades of water taken into the tank.

Soda ash is said to have a corrosive action on boilers, but from the consensus of opinion there appears to be small ground for this assertion. The use of large quantities of soda ash in boilers coated with scale will result in the rapid dissolving and loosening of the scale, thus uncovering leaks previously closed by the encrusted matter; and the leaky condition of the boiler thus produced has been incorrectly interpreted as an evidence of a corrosive action of the soda ash. In fact, it is the practice in the United States Navy to keep boiler waters alkaline by the use of soda ash as a measure for the prevention of corrosion.

Although this reagent has been repeatedly condemned by advocates of other chemicals, it remains the cheapest substance for the purpose. It is an ingredient of many proprietary compounds, including some for which all claims are based entirely on a mechanical action.

Sodium hydrate or caustic soda acts more quickly and powerfully than sodium carbonate. It is less desirable as a boiler compound than soda ash, because its caustic nature makes it dangerous to handle. There seems to be some difference of opinion as to possibility of corrosion from caustic soda.

Salammoniac.

Salammoniac, NH_4Cl, or ammonium chloride, and known also under the name of muriate of ammonia, is a by-product of the gas industry. It is not a desirable reagent for use in boilers owing to the possibility of liberating free hydrochloric acid with waters containing any amount of magnesium salts.

Barium Carbonate.

Barium carbonate is found in nature as witherite. It is also rapidly formed when baryta, hydrated or anhydrous, is exposed to the atmosphere and is also artificially made from heavy spar ($BaSO_4$). It is poisonous and only sparingly soluble in water.

Barium Chloride.

Barium chloride is prepared from witherite, the natural carbonate, or heavy spar, the natural sulphate. It is very soluble in water and very poisonous, but when used in the proportions required for water treatment is in no sense dangerous. The use of barium chloride with magnesium sulphate is not recommended on account of the corrosive tendency of the unstable magnesium chloride obtained in the reaction.

Barium Hydrate.

Barium hydrate, $Ba(OH)_2$, is an artificial product, not occurring in nature. It crystallizes from solution in crystals, $Ba(OH)_2 8H_2O$, which dissolve in water—20 parts at 15 deg. C. to 2 parts at boiling. The solution is caustic, but to a lesser degree that alkali caustic and decomposes on exposure to air with the formation of a film of barium carbonate.

Tannins are a rather common ingredient of boiler compounds.

The action of tannins in a boiler is complex and is still a matter of considerable conjecture. Ordinary tannins or tannic acid, whether free or combined with a metal when subjected to temperature and pressure conditions of a boiler, go through a series of reactions which result in the formation of one or more of a series of acids closely allied to tannic acid. Among these are gallic acid, pyrogallic acid, quercitanic acid, etc. These in turn act on the calcium and magnesium salts present in the water to form tannates, gallates, etc., of calcium and magnesium. Hydrates of these two salts may also be formed. Tannic acid or tannates when dissolved in hard or relatively pure water tend to cause corrosion, and must not be used in such waters unless made alkaline, as by the use of soda ash or other alkali salts.

British patent No. 23,618 of 1909 covers the use of barium salts with tannin. Barium tannate is formed by the action of tannin on the barium compound. The reaction in use in the boiler is as follows: Calcium carbonate plus calcium sulphate plus barium tannate equals barium sulphate plus barium carbonate plus calcium tannate. All these are non-incrusting compounds.

Sugars.

Sugar and substances containing sugar are used in boilers because they develop both a mechanical and a chemical effect. The mechanical action has been taken up previously. The chemical effect is due to a resulting increased solubility of lime and also to the formation of various sucrates of calcium and magnesium. A disadvantage of the use of sugar is the possibility of decomposition with storage where too warm, forming acetic acid, which, while it has a strong anti-scale effect, is sure to cause corrosion. Molasses of a grade which is by price available to use in boilers is liable to contain more or less sulphuric acid, a chemical not to be recommended for use in boilers.

Anti-Foaming Compounds.

Foaming of boilers results ordinarily from a concentration of alkali salts in the water, the exact degree of concentration to cause trouble depending on a number of other conditions, such as the amount of suspended matter in the water, rate of evaporation, etc. Unless the alkalinity of the water entering the boiler is too high, it is possible to control the concentration of the alkali salts by blowing-off. With some waters, however, notably in the states west of the Missouri river, this practice would result in the loss of excessive amounts of water and a large waste of fuel. Under such circumstances, the anti-foaming compound becomes a very important factor in boiler operation.

The action of materials tending to prevent foaming is physical, not chemical, and may be said, in general, to consist in a reduction of the surface tension of the water. Oils have this effect, petroleum oils and castor oil being commonly used. Tannic acids are also effective.

Very little has been written on the subject of anti-foaming agents and the use of other than patented or proprietary compounds seems to be very limited.

Extent of Use of Boiler Compounds.

Circular letters were sent out to mechanical officials on about 100 roads, inquiring as to the extent and manner of use of anti-scale and anti-foaming compounds. Fifty-nine replies were received, from which the following summary has been drawn as to the extent of use:

Roads reported	59
Roads using some form of boiler compounds	42
Roads using no boiler compound	16
Indefinite replies	1
Of those using compounds, extent of use is as follows:	
Use experimentally, or on less than 10 per cent of engines	12
Use on 10 per cent, but less than 50 per cent of engines.	13
Use on 50 per cent, but less than 90 per cent of engines.	7
Use on 90 per cent to 100 per cent of engines	10
Roads using some form of anti-scale compound	37
Roads using soda ash	19
Roads using caustic potash	2
Roads using proprietary compounds	26
Roads using a common chemical as well as proprietary compounds	8
Roads using some form of anti-foaming compound	20
Roads using proprietary compounds exclusively	18
Roads using both common chemical and proprietary compound	2
Roads using little or no anti-scaling compound	29
Of these 18 report reasons as follows:	
Good water	9
Use of water-softeners	5
No benefits	4

Boiler compounds are introduced in various ways, which may be enumerated as follows:

In the engine tank, the material being generally mixed in enough water to partially suspend it and then thrown into the tank at the time of filling.

Into the working boiler through the feed pipe. Oils, liquids and solids dissolved or suspended in water may be introduced in this way; generally by means of a syphon attached to the feed pipe outside of the injector. Special inspirators are sometimes used.

In the open boiler. Some forms of proprietary compounds are placed in the boiler in solid sticks or bricks through manholes or washout plug holes when boilers are being refilled after washing.

With a chemical-acting anti-scale agent, the best method of use, from a theoretical standpoint, is obviously one in which the chemical is added in exact proportion for the amount and quality of water as it is taken into the tank or boiler. To accomplish this it would be necessary to modify the treatment of water at each water station according to the content of incrusting solids. To this end, a compound for anti-scale use is sometimes given out to enginemen with instructions as to the amount to be used in engine tanks at the various water stations, but in general the practice has not been a success. In most cases such compounds as are placed in the tanks are applied only at terminals by the attendant

who fills the engine tanks, the amount being proportioned as well as possible to suit average condition of the water on the division.

Where a compound must be used to prevent foaming, the situation is somewhat difficult. In general, the material is introduced in proportion to the tendency to foam, as determined from experience and observation, rather than from a knowledge of the composition of the water.

For this reason the use of the anti-foaming compound is left much more to the judgment of the engineman. This applies both to compounds put into the tank and those introduced through the injector, though in the case of the former instructions are usually issued, giving the proportions to be used, but authorizing the engineman to use more than the specified amount if found necessary. Such instructions should always be accompanied with instructions for regular and thorough blowing-off.

The introduction of a compound through the injector is particularly advantageous where trouble with foaming is experienced, because this method permits of a quick increase or decrease in the proportion of compound in the water.

RECENT DEVELOPMENTS IN PUMPING MACHINERY.

The development of the internal combustion engine and the extension of electric power lines throughout the country, providing means for a reduction of the cost of operation of stationary engines, has resulted in the adoption of these agencies in numerous pumping plants.

The usefulness of any particular type of pumping plant is dependent upon its adaptation to the work required. The choice of the type for any particular location is determined primarily by the source of power available, source and character of water, quantity to be pumped and point of delivery. Having learned which kind of power is available, the further choice of the pump best suited for the purpose is dependent upon the economy of fuel, the efficiency of the pumping machinery and the degree of success in operation.

Centrifugal Pumps.

During the past 12 years great progress has been made in the theory and design of centrifugal pumps, so that now there has come into use the high pressure centrifugal pump capable of delivering large quantities of water under high heads, such as are used in certain mines where quantities of 1,000 gal. per min. against more than a 500-ft. head are delivered. The advantages of centrifugal pumps are the low cost, simplicity of parts, freedom from pulsation in operation, small floor space required, their adaptability to drive by belt or by direct connection to electric motor or steam turbines, the small amount of attention required and the small quantity of oil needed for lubrication. Centrifugal pumps are classified as high or low pressure pumps, the dividing line between the two types being about 30 to 50 ft. head of water delivered. They are also classed as horizontal or vertical pumps, according to the position of the shaft. Another distinction is made between two types of pumps, the Volute and the Turbine, the former without and the latter with guide vanes. The guide vanes were found to increase the efficiencies of high pressure pumps and are well suited to that class, though they also increase the efficiency of the low pressure type and are generally used with both.

The centrifugal pump has either an entrance or suction pipe, depending upon manner in which water is led into it. In a pump with entrance pipe, the pump is placed below the water level and is, therefore, always ready for service. Its inaccessibility when cleaning or repairs are needed is a serious disadvantage. The suction pipe is generally uesd, even though in most cases priming is necessary before it can be operated. The pump can, however, be thoroughly drained and made accessible.

There are six methods commonly used in driving centrifugal pumps: electric motor, gas engine, belt, steam turbine, water turbine and steam engine. By reason of their purely rotary motion, the electric motor and steam turbine are best suited. The efficiency obtainable is influenced by the speed at which pump is to be run, the head, the capacity and the characteristics desired. The following table gives the efficiency of centrifugal pumps as claimed by a leading manufacturer, covering those sizes applicable to railroad water stations:

Gals. per hr.	Gals. per min.	Size of pump.	Eff. of pump. Per cent.
8,000	133	2½	48
14,000	233	3	50
20,000	333	3½	55
30,000	500	4	60
40,000	667	5	65
50,000	833	6	68

Internal Combustion Engines.

The internal combustion engine has been developed industrially during the past 50 years. In railway water stations for many years gasoline had been used almost exclusively in this type of engine. During the past few years, however, the increased demand for gasoline has resulted in such an increase in price that gasoline engine plants no longer show a saving when compared with steam plants. It has, therefore, been necessary to find some other less expensive fuel to be used as a substitute and this emergency has been met by making use of oils of lower grades. Manufacturers have, therefore, developed a wide range of pumping units which utilize a number of these low grade oils for fuel, or may be operated by using the more expensive oils should occasion demand.

The oil engines in most common use in railway water stations are of two types:

(1) A two-cycle valveless type engine governed on the throttling principle, in which ignition is accomplished quite simply by means of a hollow hot ball.

(2) The four-cycle type, wherein there takes place four strokes of the piston or two revolutions of the crank. Ignition is effected by an electric spark or by contact with a hot surface, forcing the piston outward and by means of a connecting rod transmitting power to the crank shaft.

A number of gasoline engines have been converted into low grade oil-burning engines by the installation of appliances for heating the oil before it enters the cylinder. These attachments consist of generators, or mixing chambers, where the oil is heated by the exhaust of the engine, and are made in various sizes and types, both for throttling and hit-and-miss governors. Two methods of starting these engines are employed:

(1) By using gasoline for a quick start, running the engine on that fuel until sufficiently heated to permit changing to the heavier fuel oil on which it will subsequently run regularly.

(2) By installing a pocket or retort in the air inlet pipe where it can be heated by a torch. In this method approximately 15 minutes are required to start from cold and get the engine running regularly.

In connection with the use of either type of engine, an automatic stopping device can be installed. This will stop the engine when the tank or reservoir is full, at the same time opening the drain cocks to the water cylinder and pipe connections. These engines are also equipped with self-lubricating devices, and in some instances a reserve supply is maintained in case the other should clog. Attendance upon these engines is therefore necessary only in starting, but it must not be assumed that no other inspection of the machine is necessary.

KINDS OF OIL USED FOR FUEL.

These engines operate on gasoline, gas, naphtha, benzine, kerosene, crude oil and oils of lower grades, such as fuel oil, distillate, gas oil, solar oil, stove oil, engine distillate and Diesel oil.

Electric Motor-Driven Pumps.

The installation of electric power plants for the mechanical facilities of railroad terminals and the extension of electric power developments by private corporations and municipalities have made electric power so widely available that it is being used to a considerable extent in the operation of many railway water stations. Where current is available from the railroad powerhouse, it is apparent that it would be desirable to utilize it in the pumping station and thus avoid the installation of additional pumping facilities. In the case of private, corporate or municipal ownership of plants, it is often found that the owners are desirous of selling their power at an attractively low rate, providing that it is not consumed at a time when they are operating near their peak load. The operation of the water station may often be regulated so as to conform to these requirements and thus secure an economical power cost. In either situation it is many times possible to eliminate constant attendance and by use of an automatic controller for starting and stopping motors to cause the plant to be operated automatically, requiring attendance only for the inspection, repair and lubrication of machinery.

The electric motor speeds are so well adapted to the most desirable speeds for centrifugal pumps that the motor drive is most commonly employed. These pumps are designed for direct connection to either direct or alternating current motors. Where alternating current is used, consideration must be given to the available speeds in designing the pumps. With 25 cycles it is only possible to use speeds which correspond to synchronous speeds of 500, 750 and 1,500 revolutions per minute, except in large sizes, where lower speeds can occasionally be used. The centrifugal pump when direct con-

nected to a motor operates without any vibration, giving a decided advantage over the reciprocating pump in that heavy foundations are not required.

The initial cost of a centrifugal pump is less than that of a reciprocating pump, and at the same time the motor for the former will be cheaper than for the latter. Direct connected centrifugal pumps require high speed motors, whereas reciprocating pumps require slow speed motors.

Conditions Governing the Choice of Pumping Unit.

In small pumping plants, with a daily consumption of 50,000 gal. or less, it is usually possible to eliminate constant attendance. Under those conditions the internal combustion engine, using fuel oil, will prove most economical. Where the yield of water supply is sufficiently rapid, economy in operation will generally be secured by installing a pump of sufficient capacity to deliver the daily supply in a few hours. In the small pumping station, steam plants are uneconomical on account of requiring skillful attendants. The waste of fuel in firing up and in drawing or banking fire causes a further loss, tending to make such plants still less desirable. Where natural gas is available at 25 cents per 1,000 cu. ft., or less, it is an economical fuel. In localities where electric power is available at a low rate, as in connection with terminal machine shops or office building lighting, electric pumping plants are more economical than steam, gasoline or fuel oil engines unless the last named is secured at an exceptionally low rate.

If a rather constant delivery is required, resulting in a lower capacity for the pump, it will be found that the triplex reciprocating pump will prove to be more efficient than the centrifugal pump. In this case a slow speed motor direct connected to the pump will give the more satisfactory operation.

Table I, headed "Cost of fuel in various types of engines and pumps," giving the cost of fuel per unit of work done covering various types of engines, indicates the economy resulting from use of different fuels in the tests herein specified.

Table 1 - Cost of Fuel for Various Types of Pumps and Engines

Type		Fuel		B. H. P. Hour	Eff. H.P.	
Pump	Engine	Kind	Price	Fuel Used	Cost	No.	Cost 10 hr
Reciprocating	Steam (Slide Valve)	Bit.Coal	$2.00 per ton	14 lbs.	$0.0126	40	$3.16
"	Internal combustion	Coal Gas	0.50 M cu.ft	1/2 cu.ft	0.0050	60	1.50
"	"	Ill. Gas	0.75 M cu.ft	12 cu.ft	0.0090	60	1.90
"	"	Nat. "	0.25 " "	8 " "	0.0020	60	.40
"	"	Fuel Oil	0.06 per gal	1/8 gal.	0.0075	60	1.60
"	Electric motor	Elec.	0.06 K.W.Hr.	.746 K.W.	0.0224	60	4.48
Centrifugal	"	"	0.06 " "	.746 " "	0.0224	60	4.48
"	Internal combustion	Gasoline	0.16 per gal	1/8 gal.	0.0200	60	4.00
"	"	Fuel Oil	0.06 "	1/8 "	0.0075	60	1.60

Note: The last column, "Eff. H.P. Cost 10 hr." covers the work required to elevate 400 gal. per minute 100 ft., this being equivalent to a delivery of 240,000 gal. per day of 10 hours and is an average requirement condition of a railroad water station.

This table has been prepared from data secured from a series of tests of various pumping plants conducted by one of the largest railroads in the country, and from specific information relative to other tests conducted by other railroads, as well as by observations of tests by members of the Association and the committee.

A. F. Dorley (M. P.), chairman; J. L. Campbell (E. P. & S. W.), vice-chairman; J. T. Andrews (B. & O.), C. A. Ashbaugh (O. C. & S. F.), M. C. Blanchard (A. T. & S. F.), F. T. Beckett (C. R. I. & P.), C. C. Cook (B. & O.), R. H. Gaines (K. C. S.), W. S. Lacher (C. M. & St. P.), E. G. Lane (B. & O.), W. A. Parker (St. J. & G. I.), R. W. Willis (C. B. & Q.).

(The report was received and the committee excused.)

TRACK

DOUBLE-SLIP CROSSINGS, DOUBLE CROSSOVERS AND GUARD RAILS.

Your committee submitted drawings of typical layouts for Nos. 8, 11 and 16 double-slip crossings with movable points, to be operated by interlocking plant, together with drawings illustrating the spacing of ties for 16 ft. 6 in., 22 ft. and 33 ft. switch points for hand-throw and interlocking respectively.

The committee also submitted drawings of typical layouts for Nos. 8, 11 and 16 double crossovers for tracks 13-ft. centers.

Attention was called to the unsymmetrical arrangement, with the crotch frogs 6 ft. from the center of one track and 7 ft. from the center of the other.

The object of this arrangement is to properly guard the frog and crossing points, which is difficult and sometimes impossible with a symmetrical crossing when the distances between track centers are between 12 and 14 ft. With 12-ft. centers the upper half of the drawing would be used for both tracks, and with 14-ft. centers the lower half would be used, making symmetrical crossings. With centers under 12 ft. or between 13 and 14 ft., the upper half of the drawing would be used for one track and the distance from the crotch frog to the centers of the other track and the resulting leads would be varied to suit. With centers over 14 ft. or between 12 and 13 ft., the lower half would be used for one track and the layout

J. B. JENKINS,
Chairman Committee on Track.

for the other track varied to suit. Thus with any fractional distance between track centers, at least one of the two standards would be used.

The committee resubmitted for adoption the drawings of typical plans of Nos. 8, 11 and 16 double-slip crossings, changing the titles to read "Typical Layout for No. — Double-Slip Crossing."

The committee has made but little progress in the matter of guard rails.

RELATION BETWEEN WORN FLANGES AND WORN SWITCH POINTS

The committee has continued the study of the relations between worn flanges and worn switch points, with a view to correcting the causes and decreasing the number of derailments due to the combination of worn switch points and worn flanges on wheels, and has prepared a tentative rule for removing worn switch points, which will be used mainly as a basis for securing further information.

ECONOMICS OF TRACK LABOR.

The subjects assigned to the sub-committee for this season's work were:

(1) To continue the study of equating track values.

(2) To continue the study of extension of section foremen's duties.

One hundred and three requests were made for co-operation among the members of the Association in an effort to conduct a series of track tests for the purpose of arriving at relative values and track characteristics, and 17 railroads indicated their willingness to co-operate and have arranged to collect the necessary data. The tests will extend for one year, and the test sections have been selected with a view to

obtaining, as far as possible, all the various conditions entering into track maintenance.

With reference to subject No. 2, no further information is presented at this time, but we are watching the experiments which are being conducted by several railroads in connection with this subject and hope to present during the coming year some further light on the matter.

The sub-committee further recommends that the following subjects be taken up for the work next year:

(a) Economics of the use of motor cars.

(b) Investigation of the desirability of working a uniform track force throughout the season.

The sub-committee further recommends that the officers of the Association communicate again with the American Railway Association, strongly urging the adoption of December 31 as the end of the fiscal year, the reasons for which have been well put forward in the discussion of this matter at the 1914 convention.

CONTOUR OF CHILLED CAR WHEELS.

DESIGN OF MANGANESE FROGS AND CROSSINGS

The first subject was assigned to the sub-committee to consider jointly with a committee of the Master Car Builders' Association. No joint meeting was held with that committee, but the two committees have been in communication. The committee of the Master Car Builders' Association is compiling statistics of breakages of flanges in order to determine what part of the flange needs strengthening.

At a joint meeting of the sub-committee with the Standardization Committee of the Manganese Track Society and Manganese Steel Founders' Society and a committee of the Association of Manufacturers of Chilled Car Wheels, the questions of increased flanges on car wheels and increased flangeway and of standard design of manganese frogs and crossings were discussed. Until it is determined that the increased flanges are necessary, this committee does not feel called upon to take any action looking to an increase in flangeway, but will continue consideration of the subject in conjunction with a committee of the Master Car Builders' Association.

The committee offers the following tentative plans and specifications for manganese frogs and crossings:

Manganese Track Standards—Specifications.

Solid Frogs.

Referring to Drawing No. 1 of a solid frog, the minimum dimensions should be as follows:

a:—Not less than head of rail.
b:—1⅜ in.
c:—1 in.
d:—⅞ in., tapered to ¾ in.
e:—¾ in.
f:—½ in.
g:—¾ in.
h:—2¾ in.
j:—⅜ in.
l:—1¼ in.
m:—½ in.
n:—1 in.
o:—⅞ in., tapered to ¾ in.
p:—½ in.

q:—Place the actual point of frog at ⅝-in. spread of theoretical gage lines and chamfer the top to ½ in. wide, sloping the sides on a bevel to give a ¾-in. thickness of metal at ⅝ in. below the top; then join to the bottom of the groove with large fillet; the front of point to be sloped on an angle of about 45 deg. and curved or filleted to the bottom of the throat.

r:—Not less than ¼ in. and not more than ½ in. wider than the throatway.

s:—2¾ in.

Cross-ribs or tie-bars are recommended in the U section throughout the frog. They should be ¾ in. in thickness and not more than 18 in. apart.

"Section 4" to be not less than 1 in. thick at any point.

Rail-Bound Frogs.

Referring to drawing No. 2 of a rail-bound frog, the minimum dimensions should be as follows:

a:—2 in.
b:—1⅜ in.
c:—1 in.
d:—¾ in.
g:—¾ in.
i:—1⅜ in.
m:—½ in.

q:—Drawings No. 3 and 4. Place actual point of frog at ⅝ in. spread of theoretical gage lines and chamfer the top to ½ in. wide, sloping the sides on a bevel to give ¾ in. thickness of metal at ⅝ in. below top; then join to the bottom of the groove with a large fillet; the front of the point to be sloped on an angle of about 45 deg. and curved or filleted to the bottom of the throat.

r:—Not less than ¼ in. and not more than ½ in. wider than the throatway.

s:—Not less than 4¾ in., measured between gage lines at the ends of the rails.

t:—¾ in.
u:—¾ in.
v:—Not more than 2 in. nor less than 1¾ in.
w:—¾ in.
x:—⅜ in.

y:—With the head of the rail narrowed, the distance from the gage line of one heel rail to the back of the other heel rail shall not be less than 3½ in.

The manganese steel shall be carried beyond the waist (or bend in the wing rail) a sufficient distance to protect the rolled wing rail from the side blows of the wheel.

Minimum distance from gage line of one heel rail to back of other heel rail, at the top of the incline of the heel block, shall be 4½ in.; the length of slope, 6 in., with ½ in. drop, and the length of heel block, minimum, 15 in.

Cored holes to be not more than ⅛ in. greater diameter than bolt, except where a shearing strain comes on the bolt, and in such places the hole should be not more than $\frac{1}{16}$ in. larger than the bolt.

Bolts for all rails with a fishing section of over 3 in., measured on the vertical center line of the rail, should be 1¼ in. diameter; for rails with a less height of fishing section, down to and including 80-lb. rails, bolts should be 1⅛ in. diameter.

Sections for Solid Crossings.

Two sections are recommended for solid crossings, drawing No. 6 of a plain box or U-shape, with the webs flush with the outside edges of the top surface, and drawing No. 7, with an overhang of tread and guard to produce a fishing section for use at joints and where reinforcing bars are used.

The following dimensions are recommended:

Width of tread, 4 in.
Thickness under running surfaces, not less than 1⅜ in.
Thickness under groove, not less than 1 in.
Thickness of webs, not less than ⅞ in.
Thickness of flanges at out side edges, not less than ½ in.
Throat of groove to be 1⅞ in. deep and 1¾ in. wide at a point ⅝ in. below the tread surface.
Width of base flanges to be not less than 3½ in. each.
Width of guard for plain U section, 1¼ in. minimum.
Width of guard for reinforced section, 1¾ in.
Overhang of head or guard for fishing section, 1¼ in. minimum, but not less than the head of the adjoining rail.

Thickness of ribs or tie-bars on the plain U section, or the reinforced section where no metal surrounds the bolt, ¾ in., the vertical rib to extend to within ½ in. of the bottom of the section.

Cored holes to be of not more than ⅛ in. greater diameter than the bolts, except at the external joints, where larger or oblong holes can be used to compensate for shrinkage variations.

Bolts for all rails with a fishing section of over 3 in., measured on the vertical center line of rail, should be 1¼ in. diameter; for rails with a less height of fishing section, down to and including 80-lb. rails, bolts should be 1⅛ in. diameter.

Regarding the arms of crossings, it is recommended that easer extensions should be used in all cases, and the shaping of the arms to single web-rail section is not recommended. The run-off of the easer should be as long as possible, and a drop of ½ in. in a length of 12 in. is recommended where construction will permit. The general dimensions of the main sections, as far as applicable, are to be carried into the sections at the end joints and easer extensions. For internal joints of crossings, a miter joint across the tread, or a lap joint, is recommended.

REVISION OF MANUAL.

SUB-COMMITTEE NO. 5.

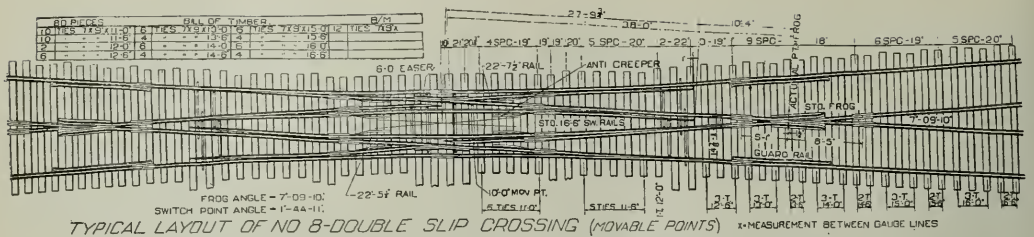
A number of minor changes in wording were recommended. The following additional definitions were proposed:

Connecting Track.—Two turnouts with the track between the frogs arranged to form a continuous passage between one track and another intersecting or oblique track or another remote parallel track.

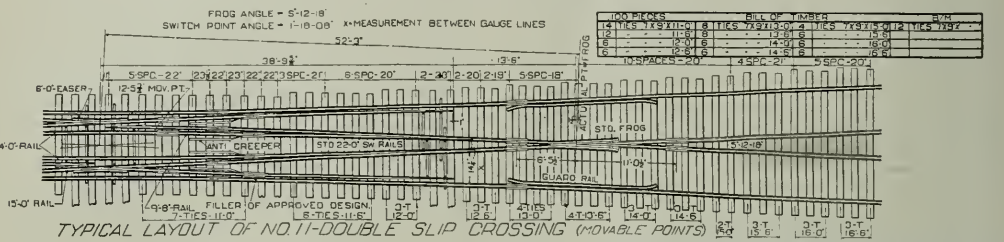
Crossover.—Two turnouts with the track between the frogs arranged to form a continuous passage between two nearby and generally parallel tracks.

Crossover, Double.—A combination of two crossovers in opposite directions which intersect between the parallel tracks.

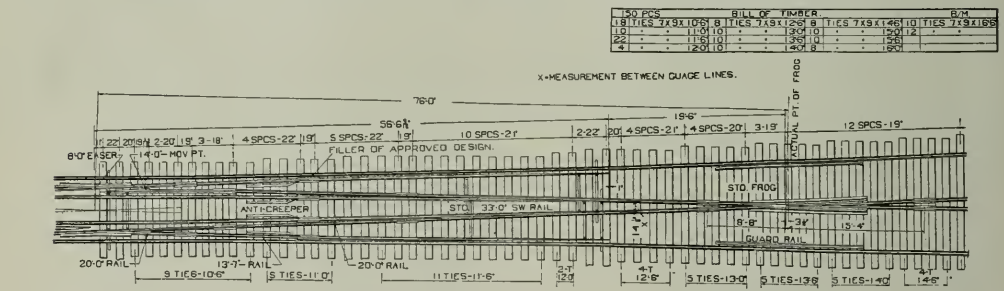
Frog.—A device used where two rails intersect to permit engines and trains on one rail to cross the other.



TYPICAL LAYOUT OF NO 8-DOUBLE SLIP CROSSING (MOVABLE POINTS) X=MEASUREMENT BETWEEN GAUGE LINES

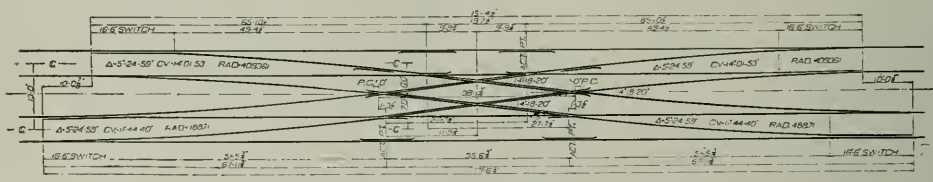


TYPICAL LAYOUT OF NO 11-DOUBLE SLIP CROSSING (MOVABLE POINTS)

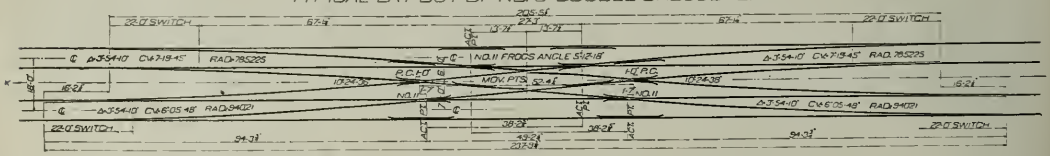


TYPICAL LAYOUT OF NO 16-DOUBLE SLIP CROSSING (MOVABLE POINTS)

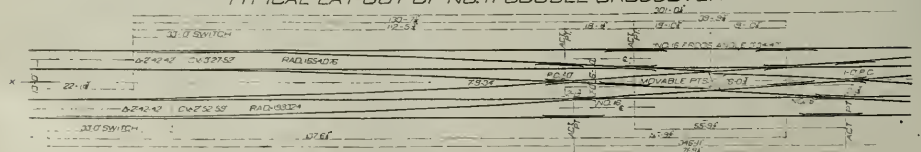
Double Slip Crossing Layouts Recommended for Adoption.



TYPICAL LAY-OUT OF NO. 8 DOUBLE CROSSOVER



TYPICAL LAY-OUT OF NO. 11 DOUBLE CROSSOVER



TYPICAL LAY-OUT OF NO. 16 DOUBLE CROSSOVER

Typical Layouts for Double Crossovers.

Gage (a tool).—A tool by which the gage of track is determined.

Lining Track.—Shifting the track laterally to conform to the established alinement.

Out of Face (referring to track work).—Work that proceeds completely and continuously over a given piece of track as distinguished from work at disconnected points only.

Scissors Crossover.—See "Crossover, Double."

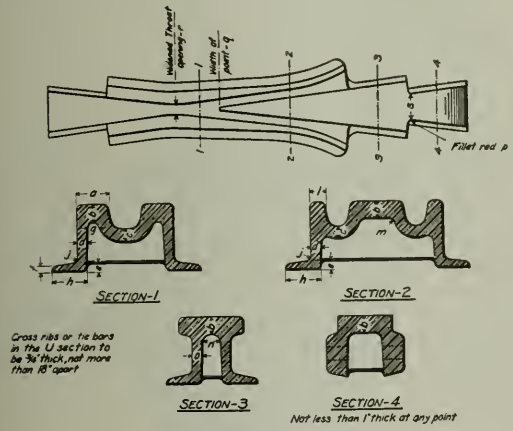
Slip Switch.—A combination of one or two pairs of turnouts and a crossing where each pair of turnouts has a common curved lead and stock rail, and the end frogs of the crossing serve for the turnouts.

Spiral (when used with respect to track).—A form of easement curve in which the change of degree of curve is uniform throughout its length.

Spiral, Ten-Chord.—An approximate spiral measured in ten equal chords and whose change of degree of curve is directly proportional to the length measured along the spiral by such chords.

Switch.—A device consisting of two movable rails, necessary connections and operating parts, designed to turn an engine or train from a track on which it is running.

Turnout.—A track device consisting of a switch and frog with connecting and operating parts and supporting ties by which engines and trains may be passed from one track to



Drawing No. 1.

another. A turnout begins with the switch and ends with the switch ties, or with the frog where long ties are not used.

Wye.—A principal track and two connecting tracks arranged like the letter "Y" with the top closed, by means of which engines or trains may be turned.

CONCLUSIONS.

Receiving as information:

(1) Drawings of typical layout of Nos. 8, 11 and 16 double-slip crossings, movable points to be operated by interlocking plant.

(2) Drawings of spacing of ties for switches to be operated by hand and by interlocking plant when No. 1 rod is used as lock rod.

(3) Drawings of typical layout of Nos. 8, 11 and 16 double cross-overs.

Receiving as a progress report:

The report on Economics of Track Labor.

For adoption:

(1) That it is very desirable that there be defined standards for the manufacture of manganese frogs and crossings.

(2) That drawings Nos. 1, 2, 3, 4, 5, 6 and 7 and specifications for solid frogs, rail-bound frogs and sections for solid crossings, Manganese Track Standards, appear to be satisfactory and that they be placed in general use as representing minimum sections, but they be not incorporated in the Manual for the present.

(3) That all frog, crossing or other track structures manufactured in accordance with these designs and specifications be stamped with the manufacturer's name and the initials "M. T. S.," signifying Manganese Track Specifications.

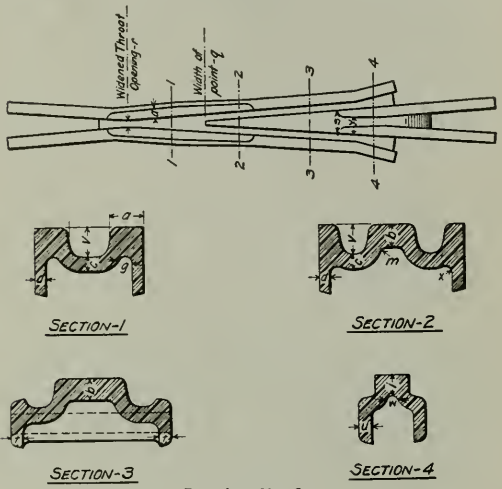
For adoption and publication in the Manual:

(1) Drawings of typical layout of Nos. 8, 11 and 16 double-slip crossings to be operated by hand as representing good practice for hand-thrown double-slip crossings.

(2) The recommended revision of the Manual.

The committee recommends for next year's work:

(1) Typical plans for guard rails, double-slip crossings to be operated by interlocking, typical layouts of Nos. 8, 11 and 16 double crossovers and specifications for crossings.



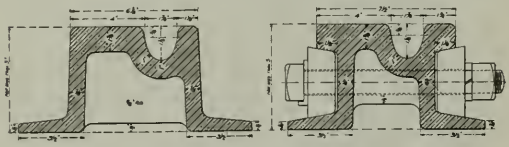
Drawing No. 2.

(2) Study the relation between worn flanges and worn switch points, with a view to correcting the causes and decreasing the number of derailments due to the combination of worn switch points and worn flanges on wheels.

(3) Continue the study of Economics of Track Labor.

(4) Confer with the Wheel committee of the Master Car Builders' Association on the question of increased flangeway to provide for wider flanges.

J. B. Jenkins (B. & O.), chairman; G. J. Ray (D. L. & W.), vice-chairman; Geo. H. Bremner (I. C. C.), H. M. Church (B. & O.), Garrett Davis (C. R. I. & P.), J. M. R. Fairbairn (C. P. R.), T. H. Hickey (M. C.), E. T. Howson (*Railway Age*



Drawings No. 6 and No. 7.

Gazette), L. J. F. Hughes (C. R. I. & P.), T. T. Irving (G. T.), J. R. Leighty (M. P.), A. C. Mackenzie (C. P. R.), P. C. Newbegin (B. & A.), F. B. Oren (I. C.), R. M. Pearce (P. & L. E.), H. T. Porter (P. & L. E.), E. Raymond (A. T. & S. F.), W. G. Raymond (Univ. of Iowa), S. S. Roberts (Cons. Engr.), L. S. Rose (C. C. C. & St. L.), H. R. Safford, (G. T.), C. H. Stein (C. R. R. of N. J.), A. H. Stone (K. C. Term.), W. I. Trench (B. & O.).

Discussion on Track.

The report was presented by Chairman Jenkins. The conclusions submitted as information were accepted as such.

W. H. Elliott (N. Y. C.): I would like to suggest to the committee the checking up of the position of the head block tie with reference to the switch point of the interlocking switch.

C. E. Lindsay (N. Y. C.): On the same subject the committee has presented drawings of layouts, eight, eleven and sixteen, double slip crossings, to be received as information, those to be operated by interlocking. Down below they recommend for adoption and publication in the Manual the drawings of similar layouts for hand-thrown switches. In practice it is very desirable to put in an interlocking slip

switch and operate it by hand before the interlocking is complete.

Chairman Jenkins: The committee will take that under consideration.

(On motion the division of the report dealing with the economics of track labor was adopted.)

Mr. Safford: The sub-committee working on economics of track labor after considerable amount of study developed a plan whereby a great deal of valuable information can be collected, reflecting the distribution of labor and other expenses in all kinds of track conditions. We have distributed blanks calling for this information and desire the co-operation of the members in securing it.

The portion of the report dealing with the drawings of typical layout Nos. 8, 11 and 16, was referred back to the committee for further consideration in conference with the Railway Signal Association.

The other recommendations of the report were approved.

CONSERVATION OF NATURAL RESOURCES

The work assigned was as follows:

(1) Continue the study of tree planting and general reforestation.

(2) Continue the study of coal, fuel-oil and timber resources.

(3) Continue the study of iron and steel resources.

TREE PLANTING AND GENERAL REFORESTATION.

It is estimated that $75,000,000 is lost annually because the forest lands of the United States are unproductive, and that 40,000,000 acres of natural forest lands now denuded are incapable of being regenerated naturally. As we are using 40 cu. ft. of timber per capita annually, while the annual growth of the forests produces only 13 cu. ft. per capita, or only one-third of the timber consumed is replaced by growth, it was estimated at the Fifth Conservation Congress that we will experience a scarcity of timber in 33 years unless proper measures are taken to prevent it.

Work of reforestation is being conducted by the federal government, by several state commissions and institutions, by railroads and by private individuals.

The Forest Service of the United States Department of Agriculture is now reforesting about 20,000 acres per year in the western national forests.

The states which are reported as most extensively engaged in reforestation are New York, Pennsylvania, Massachusetts, Vermont, New Hampshire, Connecticut, Ohio, Michigan, Wisconsin and Minnesota. The New York State Conservation Commission furnished some 5,000,000 young trees in 1914, which were planted on about 5,000 acres, divided between the State Forest Preserve, state institutions and private owners.

The following railroads are known to have experimented with tree planting and reforestation: L. & N., D. & H., C. V., N. & W., B. & A., P. R. R., Pa. Lines West, A., T. & S. F., C. P., I. C., and N. Y. C.

The Louisville & Nashville reports over 1,500,000 trees planted in 1904, 1905 and 1906, mainly black locust, in Kentucky, and Catalpa Speciosa in other states from Illinois to Florida At Carney, Ala., 700 acres were planted in catalpa, though usually planted on small tracts of land at different points available, some being planted on the edge of the right-of-way, where wide. The main object was to encourage owners of vacant lands to follow this example and utilize their lands for tree planting, incidentally giving considerable timber for ties. Mr. Courtenay considers the experiment a failure, and thinks the company will probably never recover its expenditure. Eleven thousand catalpa trees were planted in northern Kentucky in 1904 and 1905, and an inspection during the summer of 1910 showed only 17.8 per cent in good condition, while 67.1 per cent were dead or missing, the remainder being rated as fair or bad; 74,600 locust trees were planted in the same territory in 1904-1905, and 65.6 per cent of these were reported dead or missing. Perhaps the most favorable growth of catalpa was planted in the depot park at La Grange, Ky., in 1903, where one of the best trees was cut March, 1913, and the maximum diameter of the trunk within the bark was found to be a little less than 6 in. During the first three or four years after planting a large amount of money was expended in cultivating them and in destroying worms which infest catalpa.

The Delaware & Hudson reports that 2,600 acres have been planted, beginning in 1907 and continued to date. The plantations vary in size from two to 650 acres. The lands planted have been mainly worn out agriculturally or denuded through cutting operations and subsequent fires. Very little broadcast sowing has been done, as it has been found that better results are obtained from setting out seedling and transplants. The poplar planted is expected to produce good pulp timber in 20 to 25 years, and the pine to be available for general use in 40 to 50 years. The land planted is not a producing territory and has a relatively low value. It is estimated that the net returns will ultimately be from 5 to 10 per cent annually. The company does not consider it wise to plant trees for railroad purposes on account of the time element and the possibility of using substitute materials in railroad construction.

The Cumberland Valley reports 200 acres planted in plots varying from 2 to 60 acres, the soil varying from a good quality of clay, underlaid with limestone, to the poorest slate and gravel. Plantings are on strips variously located, from joining the right-of-way to three miles distant from the tracks. Early in 1906, 10,000 yellow locusts were planted; in 1908, 13,600 red oak seedings; in 1909, 63,000 red oak seedings; in 1910, 4,000 yellow poplar (on deep, moist ground), 5,000 yellow locust, 38,000 red oak; in 1911, 49,000 red oak; in 1912, 68,000 red oak. These were one year old, 6 to 12 in. high. Young trees did better where grass and weeds were kept trimmed back; in some cases seedlings showed better in poor land than on richer soils, where grass and weeds grew rank. The plantings are designed to produce car lumber, switch timber and ties in 40 to 60 years, depending on the variety of tree and character of soil in which grown. The reforesting will also help to preserve the water supply.

The Norfolk & Western reports that in 1905 about 2,000 catalpa trees were planted at Ivor, Va., but a short trial showed them unsuitable, and the loblolly pine is the natural timber for the eastern section of the railway, so that the company has discontinued its experiment in reforestation.

The Boston & Albany Railroad reports a planting of 25 acres of catalpa some 20 years ago without success. Nothing further has been done in reforestation.

Incident to extensive changes of line and grade, the Pennsylvania Railroad acquired property in excess of actual right-of-way and station needs. Most of this land was unsuitable in size, shape and location for sale to farmers. Though more suitable to agriculture than silviculture, the Pennsylvania Railroad undertook to plant trees upon it to encourage farmers along its line to similarly use their waste areas. Many tree planters have profited by its advice and experience. The first planting was made in 1902, and black locust was used exclusively until 1906, on advice that it was the most desirable tree. Professional foresters were then engaged and the planting of locust discontinued. In the railway territory that tree is subject to attacks by two boring insects, which so infested the plantations that the trees grew much more slowly than expected, and have generally been made unfit for other than fence-post material. Since 1906 plantings have had no unusual troubles and promise to furnish timbers as large as cross-ties within 50 years. All the lands available had trees planted during 1913.

COAL, FUEL-OIL AND TIMBER RESOURCES.

Reports were issued in 1914 by the U. S. Geological Survey on the production in the year 1913 of coal, petroleum and natural gas; also fuel briquetting. Interesting points of information noted in the report on the production of coal are that there is good reason for the belief that the maximum annual production of anthracite coal is nearly attained, and that production will soon decline; no such condition is anticipated in the case of bituminous coal, but the supply known to be available is about 4,000 times the amount exhausted in 1913, so that a tremendous increase must be made in production in order to exhaust the supply within any moderate period. The anthracite supply may be estimated at about 88 times the amount exhausted in 1913.

The committee considers that it has a field of usefulness in collecting and presenting to the Association information as to progress in the use of methods to preserve and of more permanent materials to replace the perishable materials now in general use, such as untreated timber and bare steel. It is also felt that the employment of such methods and materials should be urged wherever they appear economical, and that careful consideration be given to the economics of such methods and materials. In this category falls the preservative treatment of timber ties, piles, telegraph poles, etc., the substitution of reinforced concrete for timber structures, poles, piles, etc., and for bare steel in bridge spans.

For next year's work the committee suggests that it be assigned the following subjects:

(1) Study of developments in methods of lumbering and forestry tending to prolong the timber supply.

(2) Collection of statistics on extent of use of treated timber and of permanent materials to replace untreated timber and bare steel.

(3) Study the conservation and utilization of water power for railway purposes.

(4) Continue the study of coal, fuel-oil, timber, iron and steel resources.

C. H. Fisk (Cons. Engr.), chairman; A. W. Carpenter (N. Y. C.), vice-chairman; R. H. Aishton (C. & N. W.), Moses Burpee (B. & A.), F. F. Busteed (C. P. R.), A. L. Davis (I. C.), W. A. Hammel, William McNab, (G. T.), A. L. Moorshead (Erie), Francis Lee Stuart (B. & O.), S. N. Williams, R. C. Young (L. S. & I.).

(The recommendations of the committee were approved.)

BUILDINGS

REVISION OF MANUAL.

Numerous changes in the Manual were recommended. The following are the more important:

Engine House Design.

Turntable.

(a) The turntable should be long enough to balance the engine when the tender is empty.

(b) A deck turntable is preferable to a through table.

(c) At important terminals, turntables are most economically operated by mechanical means. Where few and light engines are turned, hand operation may be desirable. Where electric power can be obtained at a reasonable cost, an electric tractor is the most efficient means for operating a turntable, the cost of power is cheaper, and it is superior in continuity of service and maintenance. The first cost is approximately the same as an air motor of equal power and size.

Power wires are brought to the table either overhead or underground. The overhead device has the advantage of

M. A. LONG,
Chairman Committee on Buildings.

accessibility for inspection and repair. Special care must be taken to properly protect the collector head from weather and gases and to support the collector rigidly (the framework supporting same should be fastened to the steel frame of the table and not to the ties, and must be securely braced); the wires should be large enough to keep them from breaking from sleet and should be supported to the framework supporting collector. Any play at the table multiplies at the collector head. Wires should be brought to pole, close to curb of turntable, keeping lines as far distant from nearest wall of roundhouse as possible, to minimize the danger of destruction by fire.

When the underground system is properly installed, its advantages are that all exposed, non-current carrying parts are permanently grounded, including the circular-track rail (the only part of the system to repair is collector head); and non-interference from the weather if the turntable pit is properly drained. The disadvantages are that the wire is not so easily repaired, and is much more difficult to install originally, as it must be properly protected from water and cannot be laid successfully in a fill or on ground where settlement or shifting takes place. Where turntable pit cannot be well drained, it cannot be used with success. It has the advantage of protecting the power to run the table in case of fire in the roundhouse, especially in one of a nearly complete circle.

Compressed air tractors are frequently used. Ordinarily the power costs much more than electricity and is not so reliable. At points having no power plant the locomotive to be turned furnishes the compressed air; in this case an auxiliary supply should be maintained by providing a small air tank secured to the turntable for operating it before or after the engine is placed.

(d) The deck on the turntable should be wide enough to provide a walk on each side and be protected with hand-rails.

Turntable Pit.

(a) The turntable pit should be well drained and preferably paved.

(b) The circle wall should be of concrete or brick, with a wood coping not less than 6 in. thick.

(c) The circle rail should preferably bear directly on a concrete base. The use of wood ties and tie-plates supported by masonry is desirable under some conditions.

(d) Easy access to the interior of a turntable for the oiling of bearings, paintings and inspection should be provided in the design of the turntable pit, unless ample provision is made in the turntable itself.

Door Openings.

The clear opening of entrance doors should not be less than 13 ft. in width and 16 ft. in height.

Doors.

Doors should be easily operated, fit snugly, be easily repaired and maintained, and should admit of the use of small doors.

Tracks.

(a) Lead tracks to the turntable should line up with tracks of the engine house where possible.

(b) Tracks should be on a level grade and should be provided with stop blocks.

(c) Special fastenings of the track rails at the circle wall and on the turntable are desirable to prevent movement of the rails, to give good bearing and to lessen the damage from derailed wheels.

Position of Locomotive.

In a circular house the locomotive should stand normally with the tender toward the turntable.

Length of House.

The length of stall along center line of track should be at least 15 ft. greater than the over-all length of the locomotive, to provide a walkway behind the tender, a trucking space in front of the pilot and a certain distance in which to stop the locomotive or to move it to bring the side rods or other parts into convenient positions.

Materials.

(a) The material used in the construction of the house should be non-corrosive, unless proper care be taken to prevent corrosion.

(b) The additional security against interruption to traffic from fire warrants serious consideration of the use of a fireproof roof, and dividing the engine house into units of approximately 10 stalls by the use of division walls built of fireproof material.

(c) When the roof is of reinforced concrete the columns and roofbeams should be of the same material.

(d) Reinforced concrete should be used for the walls only where special conditions reduce its cost below that of brick or plain concrete, and should not be used for that portion of the wall directly in line of track where engine is liable to run into it.

The specifications for roofings and the principle covering the design of inbound and outbound freight houses adopted last year were also presented for inclusion in the Manual.

A detailed set of specifications for a rest house for employes was presented.

METHOD OF HEATING FOR MEDIUM SIZED STATIONS.

Methods of Heating.—There are four general methods of heating medium-sized stations: stoves, hot air, steam and hot water. In small stations where there is but one waiting room, or two waiting rooms contiguous and adjoining the office on one side, a single stove can be used for heating the office and the waiting room or rooms. The stove is placed in the partition so that about half of it is in the waiting room, and the half with the fire door, ash door and damper in the office. The partition about the stove and for several feet from it to be of wire grillwork. Where the waiting room is not too large, such a plant is satisfactory and represents about the cheapest installation that will provide comfort in cold weather.

Where the waiting room is large or where two waiting rooms are separated by the office, another stove is necessary or a central heating plant required. Stoves of large size are more desirable than small ones, as they give greater economy in fuel consumption and require less attention. Stoves are hazardous

at best. In placing a stove, care should be taken to place it at a safe distance from wood walls or partitions and if the clearance is restricted, metal shields with air space should be provided to deflect the heat. On wood floors a metal mat or pan should be placed under the stove and project far enough in front of it to catch any coals that may fall out of the fire or ash doors should they be left open. Stove-pipes should not pass through the ceiling. If it is necessary for the pipe to go through a wood partition, it should be protected by a double metal ventilated thimble of fireproof construction around the pipe.

Central Heating Plant.—While accurate figures are not available, it is the opinion of the committee, obtained after careful observation, that in stations in cold climates where more than two rooms are to be heated and where an agent and operator are on duty 18 or more hours per day, that a central heating plant is more economical, cleaner, constitutes a less fire hazard and requires less attention than stoves. The plant may be of the hot water, steam or hot air type. There is little choice between hot water and steam; each has some advantages over the other. Hot air is doubtless the least desirable of the three.

Care should be taken in installation that the boiler, where hot water or steam is used, is of ample size. For stations in a northern climate, the boiler should be rated at about two-thirds its advertised capacity. A very liberal ratio of radiating surface to cubic contents of room heated should be used. Where supervision can be depended upon in care of the plant, it is sometimes desirable in hot water heating to use the closed system, so that the water may be raised to a higher temperature before boiling. Thermostats or damper regulators, properly designed for the kind of installation used, are recommended as fuel savers—they should be automatic in operation.

Hot Air Furnaces—Advantages and Disadvantages.—The advantages of heating by hot air furnace, as compared with stoves, are, in general, its greater convenience and cleanliness and greater economy of fuel and its less cost of installation as compared with heating by hot water or steam. Its main disadvantages are due to the fire risk when hot air furnaces are carelessly handled, and to its unsatisfactory results when a building is so large and has so many rooms that long air ducts are required. The principal objection to heating with hot air is that on windy days it is impossible to maintain heat in all parts of a large room.

Advantages of Hot Water.—The advantages of heating by hot water compared with heating by steam are mainly the less consumption of fuel, the less cost of maintenance of the plant, and the greater ease with which an even temperature is maintained; and in the spring and fall, when a small amount of heat is required, it can be readily secured by a hot water plant without overheating the building. Steam radiators will not begin to get warm until the fire in the heater is sufficient to give some steam pressure, whereas any increase in the temperature of the water in a hot water heater will at once cause the circulation of the water in the radiators.

Advantages of Steam.—The advantages of heating by steam compared with heating by hot water are that the original cost of the plant is at least 20 per cent less; that after steam is raised the building is more quickly heated than with hot water, and that there is less liability of damage to the radiators if, through neglect, the system is allowed to freeze.

Signal Towers, Etc.—For heating interlocking towers and similar buildings, when not larger than about 500 sq. ft., a hot air furnace made from an ordinary cast-iron coal stove enclosed in a well-made case of No. 22 or No. 24 galvanized iron is satisfactory. A space of six inches to a foot is left between the stove and the casing and a little more than a foot above the top of the stove where the case converges into a hood. Two hot air pipes, 10 to 12 in. in diameter, lead from the hood to the register above. This method of heating towers gives sufficient heat and keeps the floor warm, but has been found to be objectionable on account of the danger of fire caused by overheated stoves. A more satisfactory arrangement is to place a small stove on the second floor of the tower, or to use a low pressure steam heating system. The chimney should be well built of fireproof material and lined with fire clay or terra cotta flue lining. It should start from the ground and be built so that it will not interfere with the mechanism of the interlocking machine. It is usually found best to build the chimney outside instead of inside the tower. For towers or buildings larger than 500 sq. ft. hot water steam should be used.

METHODS OF LIGHTING MEDIUM-SIZED STATIONS.

Where current can be obtained at reasonable cost electricity should be used for lighting. In wiring stations, the rules and regulations recommended by the National Board of Fire Underwriters should be followed. Where electric current cannot be obtained, gas may be used. The principal hazard from gas lighting comes from the gas where an open jet is used. A mantle is preferable and recommended. The fixtures should be stationary. If the jets or mantles are less than three feet from a combustible ceiling overhead, a heat deflector suspended at least 4 in. below the ceiling should be provided. All gas connections to the building should have a shut-off valve in the service pipe at the entrance to building or at curb line. Where natural gas is used, a pressure regulator to guard against varying fluctuations in pressure should be provided.

In small towns where neither electricity nor gas can be had, the most available source of light is usually from kerosene oil. Well-made metal lamps only should be used. But a small quantity of oil should be kept in the building, and the supplies should be carefully safeguarded. A metal or metal-lined cabinet is desirable, with a metal receptacle for the oily waste.

There are several types of acetylene installations that are approved by the Underwriters. These provide a very effective lighting system, which requires very little labor and will provide a better light than oil at a cost about equal to gas lighting, where gas is selling for 80 cents per thousand feet. The fixtures for the acetylene installation are similar to a gas installation. There should be sufficient light, and it should be properly distributed so that there will be no dark corners, for where dark corners appear one can always find an insanitary condition existing.

On side platforms and island platforms, where no shelter sheds are provided, lamp posts should be provided about 80 to 100 ft. apart, depending on the kind of illumination used. Where shelter sheds are used, the lights should be placed preferably in the ceiling, one to each panel, or approximately 20-foot centers, using proportionately smaller light units.

SANITARY PROVISIONS FOR MEDIUM-SIZED STATIONS.

There are few items in railway operation more annoying than keeping the small and medium sized station neat and clean. To facilitate sanitary stations, the building should be designed to that end. All different planes should be connected by curves. All beads and angles that may collect dirt and protect disease germs should be avoided. In frame stations the wearing surface of the floor should be composition, laid on top of a single layer of T. & G. flooring. A better wearing surface would be to place a false floor about two inches below the top of the joists, beveling off the joists and laying approximately four inches of cinder concrete, and on this concrete lay vitrified tile. These tiles are made in various colors—the ones mostly recommended are dark red and gray. Where a solid fill can be had, vitrified brick, laid in pattern on (approximately) a 4-in. concrete base, provides a very satisfactory floor.

In frame stations with masonry founoations, the foundation walls may be brought up to the window sill, and when cement floors with hard plaster base and walls are used, the same end is effected at but little extra cost. All woodwork should be closely fitted and plain in detail. For waiting rooms and offices, sufficient ventilation may be had from windows and doors, but it is desirable to hang the window sash with balance weights, and, in many cases, to place transoms over the door. Sunlight is the greatest disinfectant, and the more of it the design of the building admits, the easier it will be to secure sanitary stations.

The designer should keep in mind that when his own work is finished the station agent's begins, and the easier he can make it for the janitor or agent to keep the place clean, the nearer will sanitary stations be approached. Care must be taken in installing water-closets in freezing climates to have all water pipes protected from frost. Means of draining the system are necessary. In general, when the work is installed in accordance with good practice in that particular latitude or locality, trouble from freezing will not be great if reasonable care is taken of the building. Where connection with water under pressure and sewers can be made, water-closets in the stations should be provided. They should be plain, durable and carefully installed by the best practice.

Where water under pressure is available, but connection with a sewer cannot be had, septic tanks may be used, and are recommended in small towns where drainage is practicable and at not too great a distance from the station. The capacity if a septic tank should be more than equal to the daily volume of sewage. The tank preferably should be covered, and in cold climates protected from freezing. The tank should be located where there is no liability of its overflow contaminating wells, springs or other drinking water, for while the overflow is clear and limpid, many deadly germs and bacilli are not eliminated. Septic tanks do not require a great deal of attention. The bacteria in the scum live upon the solids of the sewage, so that a large part of the solids pass off either in gas or in solution in the overflow. No disinfectant should be allowed to enter the sewage that is discharged into a septic tank, for the disinfectant will kill the bacteria that live upon and destroy the organic matter in the tank. The remaining solids must be washed or

flushed out of the tank occasionally. Suitable openings with valves are left in the tank for this purpose. In addition to septic tanks, there are other methods for disposing of toilet waste.

Several methods of chemical treatment of toilet waste are being exploited. One apparatus is of water-closet appearance in outward form, but the fecal matter, instead of going into a sewer, is caught in a tank of from 20 to 100 or so gallons in size. This tank contains, perhaps, 10 per cent of its capacity of water, to which has been added a strong disinfectant or solvent. After the tank has been partly or nearly filled, it is taken out and trucked to a convenient place and the contents emptied or buried. The seats and covers of these closets are made practically air-tight by use of specially made gaskets and a ventpipe leads out from the closet to a chimney or through the roof, so that but little odor escapes into the building.

Closet incinerators are also to be had. They have (the same as the chemical treatment) the advantage of destroying all germs, whether dangerous or not. They are more expensive to install and operate, and require more attention than the chemical closets. There is also some greater fire hazard where installed in the station building, but they have the advantage of totally destroying all refuse placed in them, and there is no objectionable residue left to be carried or carted away.

A last resort is the privy, and as there are perhaps more installations of this type than any other, they should receive attention, and be built to keep flies from making a breeding place out of them. Holes for ventilation should be covered with wire screen, and seats provided with lids. The excreta should be caught in an iron kettle, and this should be dosed with chemicals made for the purpose and then buried. They should be located at least 25 ft. from the station, preferably on the same side of the main track; and at combination stations they should preferably be located at the freight end.

M. A. Long (B. & O.), chairman; G. H. Gilbert (B. & O.), vice-chairman; G. W. Andrews (B. & O.), C. H. Fake (M. P. & B. T.), J. P. Canty (B. & M), E. A. Harrison (A. T. & S. F.), D. R. Collin (N. Y. C.), A. T. Hawk (C. R. I. & P.), W. H. Cookman (P. R. R.), H. A. Lloyd (Erie), C. G. Delo (C. G. W.), P. B. Roberts (G. T.), W. T. Dorrance (E. B. T.), W. S. Thompson (P. R. R.), Committee.

(The recommendations of the committee were approved.)

THE ANCIENT SNIPE AND HIS MODERN SNIPES

"No lik-a to start till seven a clock," said Tony Chirigos.
"Put on the kyar, 'tis half past six," quoth the Irish Section Boss.
"Dis big-a lever car no good," said Tony Chirigos.
"Ye gas-kyar Ginnies make me sick," quoth the Irish Section Boss.
"I'll have yez know, ye shrimps, that whilst yes worruk on Section 'Leven
Yez'll all be on the thrack tampin' ties at sthroke of seven;
Ye air not here for yer health, ye know; I'll see ye airn yer livin'
Whilst yer worrukin fer Mulcahey on the Section."

"Dis-a line-a bar too heavy," cried little black Angelo.
"Let two of yez, thin, pull wan bar," they heard Mulcahey bellow.
"We gotta no tampa bars today," cried little black Angelo.
"Thin bend yer back and use thim picks," came back Mulcahey's bellow.
"Wid the tampin' bars, ye stand and talk; wid the picks, I'll make yez worruk,
Whilst I kape me eagle eye on yez, ye'll have no chanee to shirk.
Any three of ye'll tamp less jints than wan good husky Turk
Who'ud be worrukin fer Mulcahey on the Section."

"How long-a before we stoppa work?" old Dominick then cried.
"We'll put the hand-kyar on at six," the weary King Snipe sighed.
"Too late-a for our macarone," old Dominick then cried.
"Ye haven't done a day's worruk yet," the weary King Snipe sighed.
"A-chassin' ye and drivin' ye all day sure makes me weary,
I'd rather be a-diggin' peat on the bogs in County Kerry;
Sure I wisht I could send over there and just get wan good Jerry
To come worrukin' fer Mulcahey on the Section."

M. E. Carroll.

C. A. STEPHENS PROMOTED

C. A. Stephens, assistant engineer of the Texas City Transportation Company and the Texas City Terminal Company, has been appointed chief engineer, vice T. H. Kilpatrick, resigned.

SOME NEW CONTRACTS

The Flint River Railroad & Navigation Company has let a contract to Ricks & Co., Lilly, Ga., to build its line from Hawkinsville, Ga., to Albany, 80 miles. Ten miles of track has been laid.

The Philadelphia & Reading has let a contract to the Reading Contracting Company, Reading, Pa., for a 90-foot steel bridge north of Wagontown, Pa.

ANTI-PLUVIUS FOR NEW M. I. T. BUILDINGS

The G. Drouve Company of Bridgeport, Conn., has just received the contract for the installation of its Anti-Pluvius skylights and window-operating mechanism in the eleven new buildings for the new location of the Massachusetts Institute of Technology at Cambridge, Mass., for which the Stone & Webster Engineering Corporation has the construction contract. Skylights are generously used over practically all the buildings and in addition to the side lights will be the means of lighting the class and drafting rooms on the upper floors.

PROPOSED NEW PRODUCE TERMINAL FOR CHICAGO

The Atchison, Topeka & Santa Fe will petition the city council of Chicago in the near future for permission to close a few unimportant streets and build a fruit terminal on its property between Eighteenth and Twenty-second streets, Wentworth avenue and the Chicago river. The improvement as planned will include an auction house, a banana house, a cold storage plant and team tracks with a capacity of 1,000 cars per day. Some grading and leveling work will also have to be done and old tracks relocated and new ones laid. If the council passes this ordinance construction work will be begun at once. The estimated value of the land of the proposed site is $3,000,000.

ATTENDANCE AT THE COLISEUM

A large and enthusiastic crowd visited the Coliseum yesterday morning and from the interest shown and the opinions of the majority of the visitors that conditions in the buying field would soon approach a normal basis. One of the features of the convention this year is the improvements in the well-known appliances—the improvements in many instances showing a greater tendency toward simplicity with corresponding reduction in cost of manufacture. Naturally a large proportion of the visitors yesterday were track and signal men, but there were many operating and engineering officers. Many of the latter who are in town were doubtless at the meeting at the Congress Hotel. The exhibits of track tools and materials, and signal appliances, on account of the character of the visitors, were the busiest, and many of the exhibitors reported prospective purchases.

Annual Dinner of the Engineering Association

Abstracts of the Addresses Made at the Sixteenth Annual Banquet Last Night in the Gold Room of the Congress

The sixteenth annual dinner of the American Railway Engineering Association was given in the Gold room of the Congress hotel last night at seven o'clock. The banquet room was filled to capacity with members and guests who were entertained during the dinner by a musical program of orchestral and vocal selections. President W. B. Storey as toastmaster introduced the speakers, who were Chas. S. Gleed, president Missouri & Kansas Telephone Company; Sir George Foster, minister of trade and commerce in the cabinet of the Dominion of Canada; Frank L. Mulholland, President International Association of Rotary Clubs, and Benjamin Baum, chief engineer maintenance of way, Maumee Valley Railroad.

ABOUT THE HUMAN MIND

By CHARLES S GLEED.

It is the habit of your lives to study foundations. In all the countless tasks that you undertake your first thought and your last relates to rocks, clays, soils, quicksands, water at the mercy of those about you acting individually or in masses. It behooves you to know all you can of the weaknesses and treacheries of human nature.

In framing our opinions of the human mind as manifested by individuals or by masses our obligation seems imperative to judge by the standards of the most exalted, the most powerful and most clear-visioned specimens of the race. Christ and Socrates, Paul and Plato, Shakespeare and Lincoln—such are the men by whose teachings we must judge ourselves and our fellows. If this be true, I think we are forced at once to the conclusion that the human mind is almost as far below the standards as it is possible to be and still remain in the class. In short, the human mind, as we have it to deal with practically, is a superlative failure—a failure which would be a joke were it not a tragedy.

As we consider the men with whom we are most familiar, it is at least disheartening to comprehend how soon the best of them arrive at the outer limits of their intelligence. Select the masters about you in all lines of activity and see how little they know of what is knowable. Experiment with the ablest of your acquaintances and see how little dependable for wisdom are the best of them outside the narrow limits of

CHARLES S. GLEED

SIR GEORGE FOSTER

FRANK L. MULHOLLAND

courses, pilings, fillings and footings—to whatsoever gives support to your structure. If you are neglectful of fundamental conditions in any respect it is probably, as with all high-class workers, within the realm of your own personal and professional welfare. That which means most to your personal and professional prosperity probably gets your last and your least attention. I cannot hope to tell you about this anything you do not already know. My only hope is that I may encourage you to give more attention than you hitherto have to a line of thought which I consider of paramount importance.

You have all acquired education from the books and from the teachers. You have all acquired the education which comes from practical undertaking—experience. You have all acquired the education which comes from watching others in their struggle for achievement. Armed with all this education, you naturally feel that you are fortified against the world, the flesh and the devil—that you know the way home. But there is at least one more river to cross. After all is said and done, after all your arduous preparation for usefulness, after you rightfully feel that you are masters of the situation, it still remains true that you are at the mercy of the human mind—the human mind as it actuates individuals and as it actuates masses—mobs, parties, communities, states, nations. The most skillful driver is never free from danger in that other drivers are stupid or careless. After taking every precaution which your own ingenuity can devise you are still their own specialties. The more an individual knows about his own specialty the less he seems to know about the specialties of others—about things in general. The more he knows about some things the less he knows about all other things. This seems an unjust law, but it is the law nevertheless. Time is of the essence of achievement. To fully master one line of knowledge requires more time than any man ever yet had. How, then, can one be expected to know much outside of his own field—his own tiny garden of truth? The man who knows the stars may not know the flowers in his wife's conservatory. The man with the legal decisions at his tongue's end may not know first base from third. The man who knows the pharmacopœia from cover to cover may not know "Louisiana Lou" from "Annie Laurie." The lady who knows Beethoven and Chopin may not know whether Wellington whipped Napoleon or Carranza. I knew a railroad president who solemnly assured me that any lameness could be cured, no matter what might be the cause or condition. I know a United States senator who is certain that he will never grow old, no matter how long he may live. I knew a college president who condemned railroad companies for issuing stocks and bonds because people were tempted to speculate in them. I asked him if he condemned farmers in the same way for raising grain and cotton. He said he had never heard of speculation in grain and cotton. Samuel Johnson's parents took him to the queen to be touched by her for his scrofulous disorder, and Johnson himself was so stupid as to despise the

people of Scotland. I knew a president of the United States who thought all the people could be fooled all the time. The wonderful Wendell Phillips was a fiat money man and our popular secretary of state came within sixteen to one of being another. I think we all agree that Napoleon Bonaparte had superlative strength of mind, and yet, as he built the vast structure of his ambition, he forgot his foundations. His head was as big as his genius, but it got turned as easily as if it had belonged to some silly school girl. Millions of people would have been happier if it had been turned two or three times around on his shoulders at a very early date. President Lincoln's favorite poem has the line, "Why should the spirit of mortal be proud?" There is no telling why, but there is no denying that it is. There is no disease more frequent among men of consequence than the disease known in Latin as caput elephantasis and in Anglo-Saxon as "big head." The big head is an indescribable vanity which prevents its victim from being considerate, sympathetic, amenable, approachable and teachable. It shuts all his doors for the ingress of knowledge and wisdom and for the egress of charity and sympathy. It involves an unreasonable estimate of one's own intelligence and ability and an absurd jealousy of the ability and intelligence of others. The time came when Napoleon could not tolerate information or advice. When his chiefs told him he would lose his army in Russia he plugged their mouths with the swab of his offended vanity. The deadly big-head had him. I knew a railroad official who spoke of his subordinates as being fools or they would not be his subordinates. My thoughts ran along the same line, though his meaning and mine were different. I knew another railroad official who declared his subordinates to be "a bully lot of fellows." The first official had the big-head; the second had the greatest of all power in an official, the power to do justice without malice and without envy. Most of the men with the big-head have more or less real merit on which to predicate their intemperate self-appreciation. How they can have strength of mind to be truly expert in certain directions and still consent to be victims of this peacockitis it is impossible to explain. If there is a man in this room who has not at some time suffered irreparable injury because his superior was really his inferior through the working of this malady then I miss my guess.

There is another mysterious mental disease sometimes called the pig head. It is like the disease which afflicts the balky horse—and his driver. The big head is often cured but the pig head is hopeless. Annihilation or abandonment are the only remedies. The law against murder stops us on one side and fear of cowardice on the other. All we can do in the presence of a real case of pig head is to watch and pray.

But unsatisfacory as the human mind appears in its individual aspects it is infinitely worse in its aggregations, its acts of co-operation.

A mass of human minds in action never comes up to the level of the best in the mass or even to the level of the average. The process of compromising differences seems to result in the best making far more surrender than the worst.

All history is an indictment and a conviction of the human mind in its aggregate acts. Whenever the people or a great body of the people have accomplished some great good it is always a good that should have been accomplished long before and in a better way. No man can credit the people with a single reform without admitting that it was long overdue when it came.

For the thirty or forty centuries of which we have knowledge history is one long, weary procession of horrors—horrors that never could have been but for the low mental condition of the peoples involved. A swift glance at the field in any direction shows this to be true. The persecution of the Christians by the Jews; the persecution of the Jews by everybody; the Goths and Vandals plunging southward like ravening wolves; Roman legions crashing through the jungles of the north with cruel feet and dripping blades; the long, horrid annals of Russian cruelty; the frightful story of the rise and fall of the Spanish Empire; the perpetual dance of death in Africa; the unspeakable degradations of India and China; the hells upon earth in France from Charlemagne to now; the melancholy story of the English-speaking people who have slaughtered and been slaughtered in every nook and corner of earth; worst of all, what is now happening in Europe and Mexico—all these go far to establish the identify of man and beast.

"But," says one, "this is the bad side or a bad side. Look at the work of religion in the world." The religious record of the world is indeed a bit more wholesome than the war record—though both are, much of the time in history, badly confused—but yet the record of formulated religious belief does not much more effectively sustain the claims of mankind to intellectual greatness than the war record.

In theory, at least, religion is not a matter of taste like the preference one may have for fruits and flowers or painting or music. A religious conviction must, nearly always, be right or it is wrong; correct or it is incorrect. If the billions of Buddhists are right the billions of Mohammedans are wrong. If the Jews are right, the Christians are wrong. If the adherents of the church of Rome are right, the Protestants are wrong. If the Calvanists are right, the Universalists are wrong. And so on. Through an endless list of comparisons one great mass is perpetually proving that itself or its antagonist is wrong. All may equally desire to be right, but if one realizes its desire and is right, the other, by the same token, fails of its desire and is wrong. Alas, how often is the latter verdict finally applied to both!

In politics, nearly all phases of politics, the people are almost always wrong. Lincoln is quoted as saying that you can't fool all the people all the time. This hardly seems true. All the people seem to get fooled all the time. Perhaps it is better to say that all the people fool themselves all the time. If this were not so all the conditions would certainly be different from what they now are. Through all history the people have tamely submitted to wrongs or have openly and affirmatively espoused them. In its last analysis African slavery in the United States was the work of the dear common people. The awful method of getting rid of it was the choice of the people. The people preferred the hellish eloquence of men like Toombs and Yancy to the wise counsels of men like Washington, Madison, Randolph, Lincoln, Lee and Stephens. Whenever the people do arrive at a right conclusion and a right determination, they are usually driven there by the hands of an angry God.

Almost every day one may read solemn newspaper demands that no court shall be permitted to declare unconstitutional any act of any state legislature or congress.

With all the million miles of written and spoken language about trusts as the word is used in modern political debate, no statesman and no party has ever yet described a trust any more precisely than scientific men have described the Snark and the Jabberwock.

There has been a copious flow of language and money to accomplish the physical valuation of railroads. Scarcely a man outside the railroad business tries to determine what that is. The physical valuation of a railroad is precisely the physical valuation of a farm. What is that? What would be the physical valuation of this hotel in the desert a hundred miles from any railroad? Masses of people all about us talk a lingo they do not understand and do not try to understand.

Every year the government of the United States spends a billion dollars for work and material which any well regulated railroad would get for half the sum.

Every year our people spend enough time and money on preliminary political processes which might well be dispensed with, to pay for putting their homes, their highways and all their public works in first-class order.

The people select their public servants because of importunity and because of promises impossible of fulfillment rather than because of ability, faithfulness and honesty. The man who begs most cravenly for any political place is the one who gets it. Who can imagine such a thing as the election of a man to office who would not go from door to door, man to man, begging votes? Ability, faithfulness and honesty are not demanded as necessary qualifications, though, thank God, we sometimes get them. No wonder that when a public servant does become fit he is usually kicked out to make room for a charlatan. Those who are able and fit are less likely to be retained than those who are tricksters and pretenders because the latter know how to appeal to the weaknesses of the people and are eager to do so.

I have referred to Lincoln's favorite poem and the line, "Why should the spirit of mortal be proud?" Lincoln knew that if he were as great and as good as his most ardent admirers believed him to be and in spite of all his limitless love for humanity the day would come when his fellow citizens would smite him—and it was so. If Booth and his coconspirators had spared his life no one doubts that in some twist of selfish, stupid passion his fellow citizens would have assaulted him as a blunderer or a villain.

The instinct of the assassin which makes men inclined to shoot every animal and slander every character lead them to use their ballots as they do their guns and their tongues.

If the letter carriers of the country were elected by the people the best men in the service could not long hold their jobs. Someone would lie about them and the people would gladly believe the lies. This popular affection for lies and liars makes it possible for a statistician like Lauck to put over the statement that there are $200,000,000 of water in Santa

Fe stock and that undue returns have been made on the investment in Chicago Great Western. It is the people's love of lies that causes most of the lying.

Any man is foolish to enter the service of the people unless his purpose is to rob the people or unless he goes in like a missionary to the cannibals content to carry on his work if need be inside the cannibals.

So in all other directions the people pursue humbug with flying feet and open arms. Barnum said so. Every other philosopher has said so. If all the members of this association were to be unanimous in advising a certain step in the engineering of the City of Chicago or any other city the advice would probably be overruled by the city government and by the people. On the other hand, the most ingenious member of the association could not construct a political, religious or social system so fantastic, so gross, so monstrous that great numbers of people would not at once become its ardent devotees. There is not an imaginable cult among men so unworthy as to be without its host of disciples.

If I were to select any set of men to be excused from this indictment it would be the members of the engineering profession. They are so in love with accuracy, correctness, fact, as to instinctively require to be "shown." Theologies have come and gone. Medical theories have endured for centuries to be upset in an hour. Legal practices have outlived the lives of nations only to be abandoned in a moment of reform. But the work of engineers, being rooted and grounded in accuracy, has never needed apology. Pyramids and aqueducts have remained and roads have endured. What has engineering not done for this day and generation? It has revolutionized transportation, dotted the land with magnificent bridges, harnessed the most unruly rivers to the uses of agriculture and the industries, tunneled the cities and the mountains, invaded the air, hunted out the lurking places of disease, opened up the mines, cut the great canals uniting lakes and rivers, oceans and oceans, and covered the land with the nerves of civilization so that Theodore Vail at Jekyl Island, President Wilson in Washington, Dr. Bell in New York and Thomas A. Watson in San Francisco could gossip together like so many friends at a single fireside. So, while my logic compels me to leave the engineers under the common charge of mental insufficiency, it is with the largest possible charitable reservation.

This line of thought may seem, at first, pessimistic and ill balanced. On the contrary it is intended to be optimistic and as good natured as a botanical analysis. It is a tearful yet entirely cheerful recognition of certain facts in the science of humanity and the history that man has made. One who says that the rattlesnake is, under certain circumstances, a vicious animal ought not to be called a pessimist. He is merely a reporter in natural history. No man is more unlovely and unloved than one who kicks against the pricks. The constitutional sorehead is disliked above all men. He is not a good sport. He sulks if he does not win. So this argument is intended to help you avoid the fate of the sulker and the sorehead. It is intended to fortify you, to arm you in advance, to give you the poise of the man who knows what to expect. Your own personal and professional prosperity depend on the thoughts and acts of others. They depend on what the people set for their standards generally. They depend on what the people permit to be done by those who directly furnish the money that supports your work. They depend on the individuals who dictate for you the course of events in detail. You are indeed at the mercy of the human mind with all its freezings and thawings, seepages and floods, slides and cleavages, quicksands and earthquakes. You need all the stoicisms of philosophy and all the consolations of religion.

THE MOBILIZATION OF HUMAN ENERGY

By SIR GEORGE FOSTER.

We are living in a day when the community of workers is being constantly and aggressively forwarded. And so we are living in an age of associations and conventions. If there is any one thing, looking at it from this point of view, which strikes one as differentiating this age from the ages long past it is that when we search through history we get very few records of associations and conventions of the workers and thinkers of the world. In this age we meet them every year and we look upon them almost every day.

All this means that we are making collections of knowledge in each one of the guilds and associations of workers and we are making it, not on the isolated plan, but on the plan of a community of interest. You work, each one of you in your own sphere and in your own locality, and then you come from every part of the United States and join in this great gathering every year and that knowledge that each one has gained and that experience which each one has had, and the results that he has worked out, are made common knowledge to you all and to the world as well.

It cannot be said that constructive engineering is the monopoly of any age or of any people. Go back as far as you please in history and there has been constructive work on more or less scientific principles, carried out by the engineer with skill and ability. You have beautiful palaces and temples; you have walled cities; you have works such as were developed in Egypt, the monoliths, the pyramids and the sphinxes; you have the splendid triumphs of Greece and of Rome in stone and marble, and there is hardly a country in the world where you cannot find the remains of great and wonderful engineering construction. There is just one characteristic which distinguishes between the constructive work of those ages and that of to-day, and that is that the work of those ages, it appears to me, had little respect for the utility, benefit and happiness of the masses. Those temples and palaces were built for the gods, for princes and for rulers. They lived in them during their lifetimes and they were buried in them after their deaths, or they were for the purposes of war, or they were for the commemoration of the wonderful things done by certain dynasties or commemoration of some great historical event, wrought out in those symbolical figures and signs that we find still remaining extant, but so far as having a direct tendency and purpose for the development of the world's resources, materially, mentally, intellectually and morally, they seemed to have little purpose.

To-day it is exactly opposite, and there is a very strong, distinctive characteristic between the work of to-day and then. Does not this show that the human mind has made some progress in the two or three thousand years that have intervened between that time and this?

This shows me that although the forces of the universe work slowly, they work surely, and to definite ends, and this community of knowledge, of resources, material, spiritual, mental and moral, this communizing of them, this spreading of them, this easy mobilization of them is what is doing the vast work of the world to-day. Then everything was fixed within narrow orbits. Thought, intellect, moral force, spiritual force, the fruits of nature and the products of industry, were all localized. To-day they are made as wide as the world, and through these benefits of constructive engineering and building skill the man who ten thousand miles away grows the fruits that we eat here in Chicago and in the cities of the West and of Europe, is enabled to transport the results of his labor from the far-distant sources of supply, and is benefited, and he benefits us. The world to-day is all working together. The world six thousand, four thousand, two thousand years ago worked in limited sections and to small purpose, compared with the work of the world to-day. So, this wonderful mobilization of the resources, the products and the forces of the world, taking them all together, is the distinguishing characteristic of to-day.

I take this as my philosopy: I can not well do my work if I simply keep my eyes on my own work and do not correlate it with two different things, correlate my individual work with the aim and purpose of that work, and then correlate my work along a certain line with the aim and purpose and work of workers of every other line. Neither do I think that railroad engineers, making a guild of themselves, bringing from all parts of the world their experiences, their results and their knowledge, and making it common and correlating it with that of all others, should stop there, because the railroad engineers, as a guild, are only a part of the working guilds of the world and other guilds in other lines must be correlated with you and you with them, and you must see with long, steady vision what all these are tending to, the uplift of humanity in the common work of the units and the associations of workers the wide world through.

So, I think the association of workers do their best when they correlate their work with the great purpose of all work. The works of to-day look toward the utility and the happiness and the comfort of the masses of people. Take those great works of irrigation which to-day in India are being carried out by the British government; take the works of irrigation in Egypt which add vast spaces of territory, convert them from the desert to fertility and give opportunity for work to those who work them, and opportunity for supply to those who need the supply. How different are those in their scope and their virtue from those great constructive works of the ancients that have no utility in them and confer no benefit upon the great masses of mankind.

We are more than carpenters and bridge builders; we are more than blacksmiths and machine builders; we are men. We are builders of character, builders of homes, builders of states, builders of nations, builders of empires; and when we rise to that thought and keep it with us, the smaller planes of work are ennobled and our own spirit grows and

our vision is made stronger and better as we show ourselves and feel ourselves niched in with every other man the wide world through, for the betterment of the race and the happiness of mankind.

BE GOOD FOR SOMETHING

By FRANK L. MULHOLLAND.

Do you know that every line of human activity is looking for the fellow who is good for something? In politics, in religion, in society, in business, in commerce; here and there and everywhere the cry goes out for more men who are good for something. Our fellow men do not care very much about what we have. But they are intensely interested in the question of what are we doing with it and how did we get it? Someone has said there is a readaptation of an old phrase, "The survival value"; not the survival value of those things we commonly call property, but the survival value of life, your survival value, my survival value. The worth of the individual today is measured by the question of whether somewhere, somehow, he has fathered some great thought, put into operation some splendid enterprise, stood for something for the common good that lives when he is gone.

I don't think that any man can be good for anything unless he has learned to smile. I have a wholesome respect for the influence of a smile. I used to live in a town in Michigan called Ausable. A fire visited that town a few years ago and burned up everything that could be burned. So we called together a lot of the old crowd, and proceeded to bury the town. About two years after that I thought I would stop off and see the old locality. I found to my surprise a station there, a bus running up town, a hotel, about 150 houses, a bridge across the Ausable river, and a new dock sticking out into Lake Erie. That night I picked up their little paper, and I saw a prominent exhibit of what I thought must have been the slogan that was adopted by the men who rebuilt my old town, and here is what it said: "Smile, you son-of-a-gun, smile!"

Now, the man who wants to be good for something and develop a survival value must, in my opinion, be optimistic. A friend of mine said that the real pessimist was the fellow, who, offered a choice of two evils, would grab them both.

I don't think a man can be good for anything or develop a survival value unless he is a booster. Somehow I don't believe that a man can be good for anything who is a knocker. I distinguish between a knocker and a kicker. It may be necessary to kick, but a knocker is a fellow who is born that way and who can't help it, and the only thing that you can do with that kind of an individual is to give him a hammer, turn him into a blacksmith's shop and let him work at his natural calling.

The place to develop a survival value is where you are, and in fact, the place to begin to clean up a community is in your own backyard. If you and I, and each of us, would just lay hold of a little sunshine, just get a good grip on optimism, see that our fellow men are worth while, this old world is a good place in which to dwell, we would make our respective communities a good place in which to live. I do want to challenge your attention, as I challenge my own, to the responsibilities that you and I owe to the community's interest. It is an old doctrine. It is a doctrine that as we give of ourselves we shall profit. The doctrine that the badge of service becomes the diadem of sovereignty, is the truest gospel that can be preached in my sermon, and it is a wonderful little doctrine. Here is the thought that I will close with: With optimism in our hearts, with the desire day after day to do something for the other fellow, we cast our bread upon the water and it will come to us another day.

RESULTS OF THE NICK-AND-BREAK TEST

Apropos of the nick-and-break tests on every ingot for open hearth steel rails about which much has been written in the last few years, it is interesting to cite some of the results obtained recently in testing according to the first specifications of this nature that have ever contained this requirement. It should be remembered that the fundamental feature of this specification is that if the regular drop tests as heretofore made on open hearth rail steel heats are successful a piece from the top end of each "A" rail from the heat shall be nicked and broken and, depending upon whether the fracture is free from interior defects, the remaining "A" rails of the ingot represented should be accepted or rejected. That is, if the fracture of the test piece is free from such defects or piping or evidence of segregation the "A" and remaining rails of the ingot are accepted. If the fracture shows an interior defect the "A" rail of that particular ingot is rejected and another test made on its bottom end to represent the "B" rail, etc. Thus the testing by nicking and breaking and close scrutiny of the fractures proceeds.

The difference between this specification and the A. R. E. A. specification is easily seen, for with the latter if any of the test pieces representing any heat show interior defects all the top or "A" rails of that heat are rejected and retests made on the "B" rails, etc.

Under the current Canadian Pacific specifications applied to rails now being rolled by the Algoma Steel Corporation the following chemical composition is specified:

Carbon—0.58 to 0.72 and a majority of the heats cast each day must have a carbon content of 0.63 or over.
Phosphorus—Not over 0.03.
Manganese—0.65 to 0.90.
Silicon—0.075 to 0.10.
Sulphur—Not over 0.055.

This in itself will be seen to possess difficult features, and further the drop test specifies that two pieces of three selected from the top ends of "A" rails of the first, middle and last full ingots shall stand a fall of a weight of 2,000 lbs. from a distance of 20 feet under the usual conditions for an 85-lb. rail section.

The first 161 heats cast and rolled gave two rejections under the drop test. On these there were 2,193 ingots cast, from which 154 "A" and "B" rails were rejected because of containing interior defects. Under a strict interpretation of the A. R. E. A. specifications 263 rails would have been rejected. There was, therefore, a saving to the mill of nearly 45 tons of rails, while the railroad obtained the benefit of having each ingot tested as a unit.

ATTENDANCE AT THE R. S. A. CONVENTION

In the issue of the Daily Railway Age Gazette of March 16, the registration of members of the Railway Signal Association was incorrectly stated as 163. The actual registration was 220 active, junior and associate members. At one of the sessions 260 attendants were counted so that it is certain that the actual attendance was considerably in excess of the registration.

OTHER MAINTENANCE OF WAY ASSOCIATIONS REPRESENTED AT THE CONVENTION

The presidents and secretaries of three of the other important maintenance of way associations have been in attendance at the convention the last two days: T. S. Stevens, president, and C. C. Rosenberg, secretary, of the Railway Signal Association; L. D. Hadwen, president, and C. A. Lichty, secretary, of the American Railway Bridge & Building Association, and J. H. Waterman, president, and F. J. Angier, secretary of the American Wood Preservers' Association. In addition, the Roadmasters' Association has a booth at the Coliseum and is holding forth there.

ATTENDANCE AT THE CONVENTION

Each year a good many members and guests at the A. R. E. A. convention are sufficiently impressed by the number of men in the Florentine room during the meetings or in the lobbies surrounding the meeting hall before or after a session, to express a belief that all previous records for attendance are being broken. As a matter of fact, the records show that up to the end of the second day of the convention two years ago 407 members had registered, that the corresponding figure last year was 475 and this year is 457. The attendance in the meetings and the interest taken, however, have been fully up to the standard of past years.

REGISTRATION—AMERICAN RAILWAY ENGINEERING ASSOCIATION

ACTIVE MEMBERS

Abbott, R. B., Div. Eng., P. & R. Ry., Harrisburg, Pa.
Andrews, Geo. W., Insp. of Maint., B. & O. R. R., Baltimore, Md.
Andrews, J. T., Eng. Dept., B. & O. R. R., Baltimore, Md.
Atwood, J. A., Chief Eng., P. & L. E. R. R., Pittsburgh, Pa.
Austill, H., Jr., Bridge Eng., M. & O. R. R., Mobile, Ala.
Bachelder, F. J., Consulting Eng., Madison, Wis.
Baldwin, Hadley, Asst. Ch. Eng., C. C. C. & St. L. Ry., Cincinnati, O.
Barrett, W. C., Division Engineer, Lehigh Valley R. R., Sayre, Pa.
Barry, H. B., Dist. Eng., St. L. & S. F. R. R., Chaffee, Mo.
Bates, Onward, Con. Eng., Chicago.
Beahan, Willard, First Assistant Engineer, L. S. & M. S. Ry., Cleveland, Ohio.
Bergen, W. J., Asst. to C. E., N. Y. C. & St. L. Ry., Cleveland, Ohio.
Billman, H. E., Gen. Roadmaster, Mo. Pac. Ry., St. Louis, Mo.
Blanchard, M. C., Office Eng., A. T. & S. F. Ry., Topeka, Kan.
Bond, W. McC., Asst. Eng., B. & O. R. R., Akron, Ohio.
Bouton, W. S., Eng. B. and B., B. & O. R. R., Baltimore, Md.
Brooke, G. D., Supt., B. & O. S. W. R. R., Chillicothe, Ohio
Brown, E. C., Chief C. E., Carnegie Steel Co., Pittsburgh, Pa.
Brown, H. C., Jr., Asst. Eng., I. C. R. R., Chicago, Ill.
Browne, H. L., Masonry Inspector, Rock Island Lines, Des Moines, Iowa.
Burke, James, Supt. Chicago Ter. Div., Erie R. R., Chicago, Ill.
Clift, A. E., Gen. Supt., I. C. R. R., Chicago, Ill.
Cochran, C. W., Eng. M. W., Big Four, Mt. Carmel, Ill.
Cook, C. C., Div. Eng., B. & O. R. R., Pittsburgh, Pa.
Coon, C. J., Eng., Grand Cent. Ter., N. Y. C. & H. R. R., New York, N. Y.
Corell, E. J., Div. Eng., B. & O. S. W. R. R., Chillicothe, Ohio.
Cunningham, A. O., Chief Engineer, Wabash R. R., St. Louis, Mo.
Didier, Paul, Prin. Asst. Eng., B. & O. R. R., Pittsburgh, Pa.

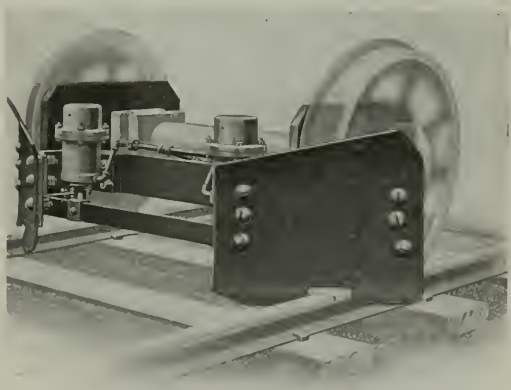
SCIENTIFIC RESEARCH IN THE UTILIZATION OF WOOD

The old method of judging lumber from personal experience has in a large measure given way to a selection on the basis of proven performance and adaptability. In order to help supply the scientific data necessary for engineers, contractors and architects to make such a selection the Southern Pine Association, formed in New Orleans last January, has made one of its primary purposes the carrying on of scientific research work. This association is composed of the manufacturers of yellow pine lumber in the southern states, its membership representing an annual production of approximately 5,000,000,000 ft. This research work will be under the supervisory charge of Dr. Hermann Von Schrenk of Von Schrenk & Kammerer, consulting timber engineers, St. Louis, Mo., and much of the work will be carried on in co-operation with the important national engineering and technical societies, including the American Railway Engineering Association, the American Wood Preservers' Association, the Master Car Builders' Association, the American Society for Testing Materials and the Western Society of Engineers.

The research work of this association will cover a wide field, taking up such scientific subjects as "Study of Fungi Attacking Yellow Pine Lumber," "Investigation of Failures of Yellow Pine Timber," "Investigation of Wood Fire Proofing Preparations," "Proper and Improper Uses for Yellow Pine," engineering subjects, such as "Plan for Various Types of Yellow Pine Construction," "Manual for Architects and Contractors," "Plans and Specifications for Ordinary Structures," chemical subjects, such as "Study of Utilization of Wood Waste," and various investigations of wood paving. The association invites engineers, contractors and others interested in yellow pine construction to consult it freely upon questions that may develop in connection with the utilization of this material.

THE RAY SELF-CONTAINED SNOW FLANGER

An important change has been made in the design of the lifting mechanism of the Ray snow flanger to make it automatic in action. In the former design the flanging blades were raised by the application of air to the operating cylinders and held in the raised position either by the continued



The Improved Ray Snow Flanger Applied to a Pony Truck.

air pressure or by holding rods. The flangers were lowered by releasing the air pressure, allowing them to drop under their own weight to a level ¾ in. to 1 in. above the top of the rail. In the improved design the flanger is forced to the lowered position by air pressure and is raised automatically by auxiliary springs within the operating cylinders as soon as the air pressure is released.

With the old equipment a break in the air line made it impossible to raise the flanger if it were lowered and allowed it to drop if it were in the raised position. Further, if the men in charge failed to hook up the flanger when not in use, it would drop to the lower position as the air pressure gradually decreased and, unknown to the operators, would remain in

that position until the engine struck a frog or crossing, damaging the blades and necessitating their removal for repairs. With the new type of cylinder the flanger is automatically raised if an air connection is broken, or if it is already in the raised position it becomes impossible for the engineer to lower the flanger for service until the break is repaired.

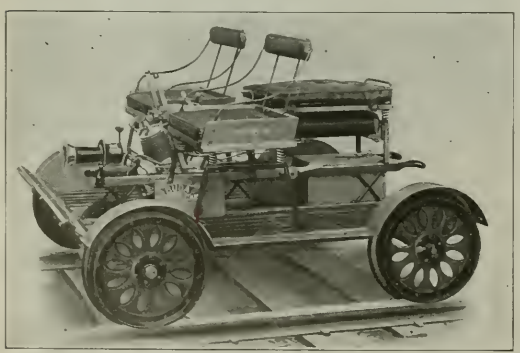
The complete weight of the moving parts of the improved flanger is about 500 lb. Each spring is designed to hold the flanger in the raised position without vibration and in addition to the spring a holding rod is furnished which can relieve the springs if desired. A forked piston rod in each cylinder straddles the cross-tie brace connecting the equalizers at the bottom, which in turn prevents the cross bar from dropping onto the rails when the flanger is lowered. The auxiliary springs are made from high grade spring steel, which is tested before assembling; the pistons are provided with a cast iron spring ring in addition to the cup leather packing and are designed to operate at 90 lb. air pressure.

The new type of lifting cylinder is interchangeable with the old and by furnishing a cross tie brace to join the two equalizers, the Priest snow flanger can also be transformed into the Ray improved type. This change eliminates all of the overhead lifting mechanism, such as the cylinder reach rod, axles, bearings, brackets, lifting rods. etc., and makes the flanger self-contained on the truck. The accompanying illustration shows the flanger applied to a standard pony truck. The assembled cross bar carrying the blade is of standard construction and can readily be changed from one engine to another, but it is generally necessary to make up new equalizer guide plates to suit the truck to which the flanger is to be attached. The lifting cylinders are arranged to exert the pressure directly over the center of gravity, thus reducing the wear on the equalizer guide slots to a minimum and causing the flanger to raise in a vertical line. These flangers have been successfully applied to all types of trucks on engine tenders, cabooses and freight cars.

This improved flanger was developed by the Railway Appliances Company and has recently been taken over by the Q. & C. Company, New York.

A THREE-PASSENGER INSPECTION CAR

In order to provide a more comfortable motor car for inspection purposes than those of the velocipede type and also to make it light enough to be operated without a train order the Buda Company, Chicago, has developed a new car



New Light Inspection Car for Three Passengers.

known as the No. 15-A. The frame is built up of square tubular steel with two seats facing forward and one lengthwise in the rear, all of these being mounted on coil springs and fitted with cushions. The engine is located between the two front seats bearing equally on the two sides of the car.

The engine is of the two-cylinder, four-cycle, air-cooled "V" type, developing seven horsepower. It is free running and is equipped with a muffler. The drive is of the multiple disc type, delivering power to the front axle through a roller chain and sprockets. A high tension Bosch magneto is provided, eliminating batteries. The engine is splash lubricated, the oil level being maintained by an automatic feed from the supply tank in the tool box. The timer, throttle, clutch, brake and muffler control levers are mounted over the engine in a position to allow them to be operated from any seat on the car. The car is braked by an external contracting band on the front axle.

The axles are 1½-in. in diameter, the wheels 17 in., with either a wood or a pressed steel center. The axle boxes are equipped with Hyatt roller bearings. The car weighs 530 lbs., so that it can be handled by one man if necessary. It has a rated speed of 5 to 35 miles per hour.

HYDRATED LIME FOR CONCRETE

Portland cement is dense and heavy, and when mixed with water and sand there is a tendency to segregate. This is especially true where unusually wet mixtures are used to facilitate placing the concrete.

As the durability of concrete depends upon the uniform distribution of cement, it follows that the separation of cement from the coarse aggregate would allow stone pockets and soft spots to form. It is at this point that hydrated lime exerts its physical influence and gives to the mass plasticity and uniformity, thus preventing the formation of such defects. It makes a fat, viscous mortar, which reduces to a minimum the possibility of segregation. This mortar adheres to each piece of the coarser aggregate and insures a uniform mixture of the aggregate.

In many large concrete operations it is customary to mix the concrete at a central point and elevate it, allowing it to run to place in the forms through chutes. To prevent sticking and clogging in the chutes it is quite usual to add more water to the mixture than usual to make it flow easily. This has the direct effect of causing segregation. The use of hydrated lime gives the mass sufficient plasticity to form a smooth-flowing, continuous stream, and the concrete falls into place, eliminating a large portion of the tamping and spading.

When moisture is allowed to penetrate concrete, it attacks the cement and causes this material to expand, and as the moisture dries out the cement naturally contracts. In order to prevent cracking from this cause the concrete should be a dense, impermeable mass. Hydrated lime increases the density of the concrete, as it has about 2½ times the volume of an equal weight of cement in its dry state. Being light and bulky, the lime fills up and closes all the minute voids in the concrete. This makes the mass so dense that it is rendered more nearly impermeable.

The consulting engineer on a large concrete dam in the West describes the use of hydrated lime as follows: "Fine and coarse crushed rock was stored in bins just above the mixing plant, from which 80 per cent of the concrete was poured down a spout or chute 400 ft. long to the dam site below. From numerous test results it was decided to use 10 per cent of hydrated lime, the mixture being 1:3:6. The concrete mixture without lime would not flow down the steel-lined chutes without mechanical aid, but by the addition of 10 per cent of hydrated lime, or approximately 40 lb. per yd., we literally transformed the physical appearance of the concrete. The concrete would leave the mixers, pass into the chutes and then onward without the slightest separation of the aggregate, and would arrive at the dam in a perfectly homogeneous mass, where it would flatten out to a level with but little shoveling and spading in the form. Without the use of hydrated lime in this work it was

actually demonstrated that it would have been impossible to secure satisfactory results without discarding the conveying of concrete in chutes and instituting a far more expensive method of handling the concrete."

COALING STATION WITH THREE STORAGE BINS

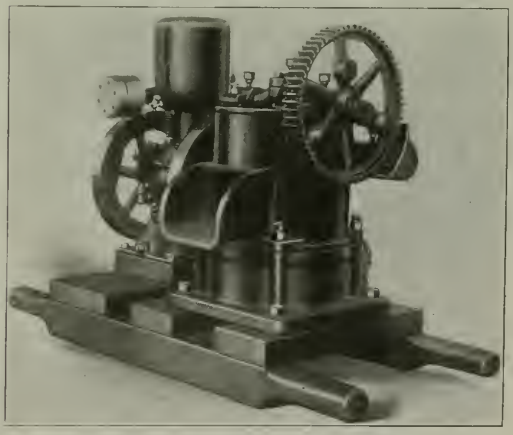
The Nashville, Chattanooga & St. Louis has recently completed a new locomotive coaling station at Hollow Rock Junction, Tenn., which is designed to handle separately three grades of coal coming from different mines and used

The N. C. & St. L. Coaling Station of Special Design at Hollow Rock Junction, Tenn.

by different classes of engines. The plant is of steel frame construction with steel storage tanks and an automatic balanced bucket elevating equipment. Two separate steel tanks are provided, one on either side of the elevating tower with capacities of 200 tons and 150 tons, respectively. The 150-ton tank is divided by a partition at right angles to the coaling tracks, separating it into bins of 75 tons capacity each. The coal which is dumped at the top of the elevating tower can be deflected to either of the storage tanks by a pivoted gate and if it goes to the divided tank it may be deflected to either side of the partition by another gate, both of which are controlled by a cable from the ground. The plant is arranged to deliver coal on two tracks, the 200-ton bin and one of the 75-ton bins serving one track and the other 75-ton bin the other track. Crossovers are conveniently located for placing locomotives on either side of the plant as desired. The entire plant was built on piling driven about 22 ft. to solid rock. The reinforced concrete hopper under the receiving track which is located between the coaling tracks was carried to solid rock. The steel frame structure is supported on concrete pedestals resting on piles. The elevating outfit has a capacity of 50 tons per hour, and is operated by a 16-hp. gasoline engine. As there was some question in the minds of the engineers as to whether Hollow Rock Junction would continue to be the best location for this plant, the design was worked out with great care in order to make as much of the equipment as possible available for use in single tank stations, if it should become advisable to change the method of operation or to move the plant to another location. The steel details are arranged to allow either tank to be used with the elevating tower if such a change is made so that by providing another tower and supporting frame, two separate plants could be built.

NEW POWER DIAPHRAGM PUMP FOR GAS ENGINE DRIVE

A convenient portable power pumping outfit has been placed on the market recently by the Goulds Manufacturing Company, Seneca Falls, N. Y., consisting of a diaphragm pump similar in design to those previously manufactured by this company, which is arranged for direct connection to any engine either by gearing or by belting. The old pump could not be driven by a gasoline engine except by the use of a pump jack made especially for that purpose. The new outfit



An Easily Portable Diaphragm Pump Direct Connected to Gasoline Engine.

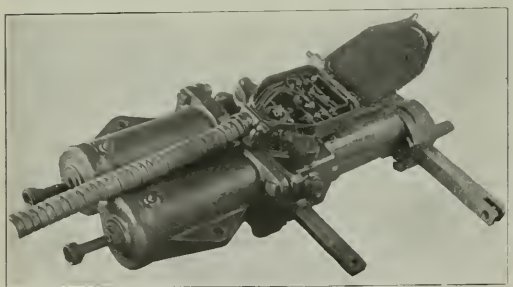
is carefully designed to make it as compact as possible so that it is easily portable.

The pump itself consists of two valves and a strong rubber diaphragm which creates suction by an up and down motion. It is fitted for side suction and has a rubber suction valve resting on an inclined seat, thus offering slight resistance to the passage of a liquid. The metal discharge valve seats on the diaphragm and is easily removable. The waterways are large and are designed to handle a large amount of liquid easily. A 1-h. p. engine is sufficient to drive this pump. The stroke is 2¼ in., a 3-in. suction pipe is used, and the displacement per revolution is 0.8 gal. It is recommended that the pumps be run at 35 to 50 revolutions per minute. The weight of the outfit exclusive of pulley or auxiliary gear-

ing is 210 lbs. The new pump is geared 5 to 1 and when furnished to belt drive is fitted with a single tight pulley 12 in. in diameter with a 3-in. face. When furnished for direct connection to the engine a second gear reduction is furnished. Any one of the eight sets of gears can be furnished to secure an over-all gear ratio varying between 6.1 to 1, and 16.6 to 1, so that the pump can be direct connected to practically any engine. The base of the pump is square and is provided with extra large holes for bolting it securely to the mounting.

RACK AND PINION ELECTRO-PNEUMATIC SWITCH AND LOCK MOVEMENT

The rack and pinion electro-pneumatic switch and lock movement is a new design developed by the Union Switch & Signal Company, Swissvale, Pa., employing two single-acting cylinders instead of one double-acting cylinder. Connected to the pistons are parallel racks which engage a pinion located between them. The shaft of the pinion terminates in a crank which is connected to the switch. The crank moves through an angle of about 220 deg., traveling 20 deg. past dead center at each end of the throw. This arrangement accomplishes a locking of the switch points in their final positions in addition to the locking of the lock rod by the ends of the racks, one of which bolt locks the adjustable lock rod in the normal, and one in the reverse positions of the switch. The switch movement has the advantage of a greater efficiency than the former type and will operate on much lower air pressure. There is also the advantage that it occupies but two ties and requires no removable covers. The circuit controller used with this switch movement is designed



"Twin-Cylinder" Switch and Lock Movement.

to give either direct battery or polarized indication. The model 13 switch valve is used which, in actual practice, is set upon a separate foundation and connected to the switch movement by armored hose.

AN IMPROVED BONDING DRILL

The "Chicago" bonding drill, embodying several improved features, has recently been placed on the market. This machine is held rigidly to the rail by means of an eccentric cam, which also serves to withdraw the bit from the rail without reversing the movement of the handle or changing into another gear. By pulling up the lever directly over the rail the bit is automatically withdrawn, and the drill can then be tilted backward on the hinged foot plate. This plate is easily removable, allowing a man to carry the drill without the foot plate striking his leg.

This drill is chain-driven and has a two-speed uniform feed and reverse, both speeds being controlled by a small lever under the operator's foot. The thrust bearing is an extra large ball bearing, all others being steel in bronze. The driving gears are enclosed in a housing, allowing them to be run in oil.

The drill can be furnished with one of three feed speeds: slow, for very hard rails; medium, for standard work, and fast, for drilling relatively soft steel. It is also furnished with three styles of chucks, one with a set screw to hold 9-32-in. standard track drills; another, an adjustable chuck

The "Chicago" Bonding Drill.

to take round shank or slabbed drills up to 3.8 in. in diameter, and a third, a special chuck to hold flat shank drills.

The machine is 26 in. high, which increases the convenience of operation, and weighs 30 lb. It is manufactured by the Chicago Railway Signal & Supply Company, Chicago.

FOUNDATION LOADING FOR A 150-TON TRACK SCALE

Many installations of track scales have failed to give satisfaction because the requirements in the design of the foundations were not thoroughly analyzed. A properly designed foundation will absorb all vibration of the scale mechanism and keep it in alinement, while a lighter foundation soon begins to settle in varying amounts, thereby giving incorrect weights before the losses are discovered. A distorted foundation may be temporarily leveled up, but the original error cannot be entirely overcome. In a paper read before the recent meeting of the National Association of Scale Experts in Chicago, Eugene Motchman, chief engineer of the Standard Scale & Supply Company, Pittsburgh, Pa., discussed the distribution of loads on a 150-ton, 50-ft., 4-section scale and emphasized the points to be considered in designing the foundation as shown in the following abstract.

Four cases of loading were considered: (1) a 50-ton gondola car on the center of the scale, 2) the same car with one truck over the second support, (3) two such cars coupled in train order with their coupling over the second support, and (4) a 2-8-0 locomotive weighing 195 tons, with the drivers centered over the second support. The assumed wheel loads were 20,000 lb. for the gondola cars and 27,500 lb. on each engine driver. The resulting reactions in the four main levers on each half of the scale for each of the four loadings are as follows: (One) 1, 15,241 lb.; 2, 24,759 lb.; 3, 24,

759 lb.; 4, 15,241 lb. (Two) 1, 3,224 lb.; 2, 33,541 lb.; 3, 12,754 lb.; 4, 30,481 lb. (Three) 1, 13,482 lb.; 2, 52,989 lb.; 3, 14,772 lb.; 18,757 lb. (Four) 1, 28,610 lb.; 2, 79,489 lb.; 3, 55,194 lb.; 4, 31,957 lb.

As shown in Fig. 1, these reactions are carried from the track rails through the I-beam supports to the main levers "M" at the points "b." These main levers transmit the load at their ends "c" to the upper system of levers "O" and "I." The main levers are supported at the points "a" on the piers "K," the length "a-c" being four times "a-b." On account of

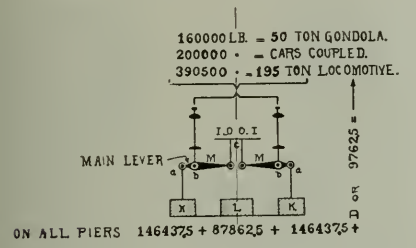


Fig. 1.

this multiplication in these levers, three-fourths of this load is carried by the piers "K" and one-fourth transmitted to the upper system of levers. The piers therefore must be designed for three-fourths of the maximum reaction in any main lever shown by the assumed loading. This maximum reaction occurs on the second support under the locomotive loading, amounting to 79,489 lb. The pier therefore carries 59,616 lb. This maximum loading could never be realized on the end piers, but by making them all uniform a desirable allowance for impact at the ends is provided.

The determination of the reaction on the center piers "L" is somewhat more complex. The load received by the longitudinal levers in the upper system is transmitted as shown in Fig. 2. The loads are applied at the points "b," the levers

15,241 lb. on the first support under the first loading when applied to the main lever causes a downward pull at "c" of one-fourth this amount or 3,810 lb. As the main levers from opposite sides act together on the upper levers, the pull at "b" of the outer lever "O" in Fig. 2, under the first loading, is 7,620.5 lb. as shown. These levers have a multiplication

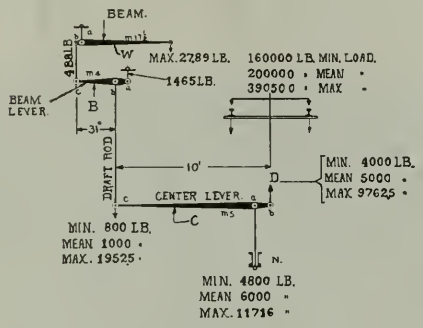

Fig. 3.

of 10, so that the end piers receive a maximum load equal to nine-tenths of the maximum pull at "b." The maximum loading, which occurs when the locomotive is on the scale, is 14,305 lb. for one end and 15,978 lb. for the other, resulting in pier reactions of 12,874.5 lb. and 14,380.7 lb., respectively. These are not the maximum loads to which these piers may be subjected, however, as the reaction would increase as the drivers approach the end of the scale. For simplicity and safety these end piers should be designed with the same section as the center piers on which the load is increased by the accumulation of the loads on the outer and inner levers being transferred to the center lever at "D." The maximum reactions on these center piers "L" as shown in Fig. 2 are 46,579.9 lb. and 33,552.4 lb. In cases where the span is more

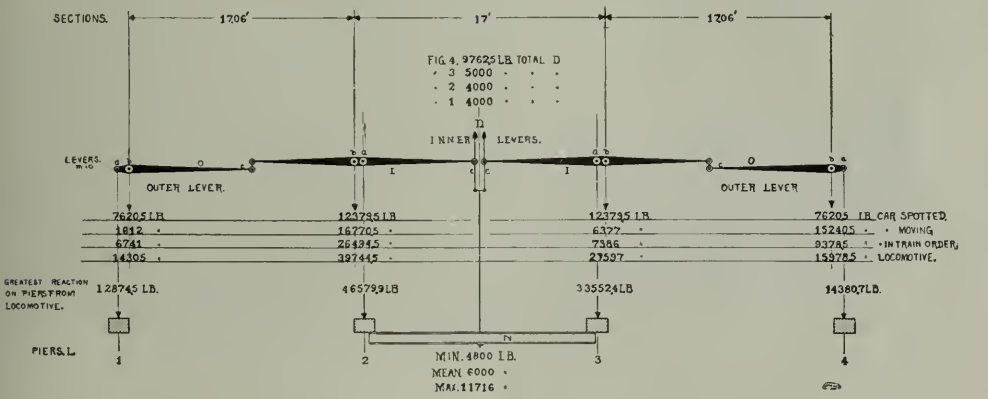

Fig. 2.

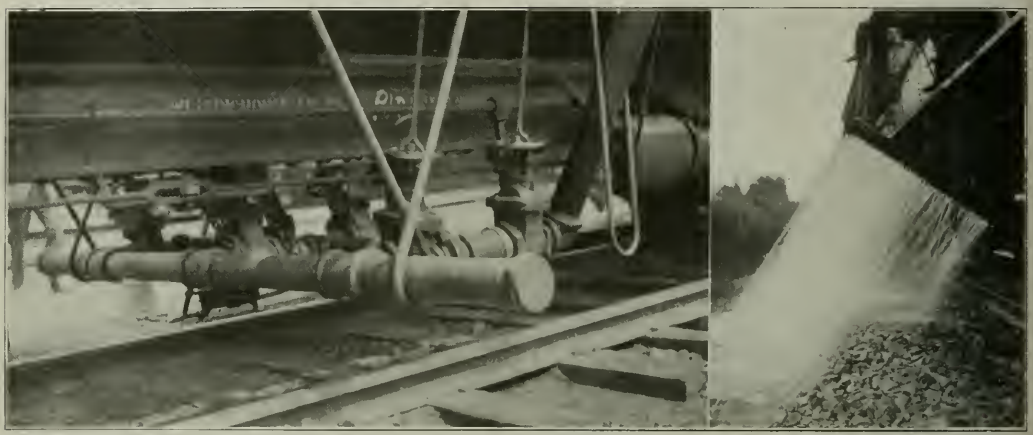
are supported on the piers "L" at the points "a" and the loads are transmitted at the points "c." The accumulation of the loads on the inner levers "I" is transmitted to the center lever "C" at the point "D." As shown in Fig. 3, this load "D" is transmitted to the draft rod, resulting in an upward pull on the channels "N" under the second and third piers equal to six-fifths of the load. Fig. 2 shows the load transmitted by the main levers to the upper levers for each of the four assumed cases of loading. For instance, the reaction of

than 17 ft., it may be more economical to set the channels "N" parallel to the center lever and imbed their ends under the surrounding wall and floor of the pit. In this case the total weight of the channels, floor and vertical walls should exceed the maximum upward pull. The surrounding wall carries the rigid deck upon which the dead rails are placed and should be designed to carry the maximum load to be placed on this deck and also to resist the action of frost and side pressure from adjacent tracks. A minimum wall thickness of

30 in. is recommended. The same thickness should be used for the end walls on account of the necessity for taking care of the impact. The use of 18-in. walls is considered good practice under the weigh house. The design of the floor of the foundation depends largely on the character of the soil. If solid rock is near the surface the piers may be built directly on it. In all other cases the bearing pressure of the soil must be determined and the piers dimensioned accordingly. The common practice at present in designing pits for heavy track scales is to design the floor as a concrete mat supporting the piers raised slightly above the level of the floor. In climates such as those in the United States south of Chicago and north of Oklahoma, the depth of foundations from base of rail to bottom of mat should never be less than 8 ft. and this dimension should be increased in northern climates and reduced in tropical countries if the scale mechanism does not require this depth.



Details of Latest Sprinkling Equipment, Showing Five Valves for Controlling Chemical and Adjustable Extension Arm for Spraying Ballast Shoulder.

IMPROVEMENTS IN ATLAS WEED-KILLING METHOD

Two important improvements have been made by the Atlas Preservative Company, New York City, in its method of applying the Atlas "A" chemical compound for killing track vegetation. The first of these is in the design of a sprinkling equipment to apply the compound in varying quantities across the track as it is needed. In many cases the center of the track is sterile or nearly so, while at the tie ends or on the ballast shoulders a considerable quantity of vegetation may exist. For the most economical treatment it is necessary, therefore, to use varying quantities both along and across the track. The sprinkling arms designed to accomplish this purpose can be made in any length and are divided into five sections, each controlled by an independent valve. These valves are operated from the running board by means of valve stems. The extension arm which sprays the portion outside of the rail is supported in the lowered position by a U-brace, and as it works on a loose thread it may be raised and lowered by a chain attached to its outer end. This is convenient in passing obstructions or in elevating the arms to force the mixture out over the ballast shoulder. The sprinkling equipment consists of one or more tank cars fitted with spraying apparatus and all necessary accessories for handling the chemical, the operation of the train being superintended by an employe of the Atlas Company. The size of the equipment is designed to spray from 8 to 20 miles, so that water for dilution may be obtained with a minimum train service. The speed of treating the vegetation is from 15 to 20 miles per hour.

A serious objection to the chemical method of treating vegetation in the early stages of the development of this system was the danger of cattle grazing on the treated area with fatal results. A compound to prevent cattle from eating vegetation so treated has been developed and in the early experiment was mixed with the Atlas "A". It was soon found, however, that the chemical action reduced the efficiency of the "cattle proofer" and to eliminate this action the special compound is now shipped and applied in a separate tank car. It is stated that the results with this new compound have been very satisfactory. The greater part of 743 miles of track on the Southern Railway was treated without harm to live stock and, in addition, 50 miles on the Seaboard Air Line and about 250 miles on the Chicago & North Western were treated with equally satisfactory results.

WESTERN AUTOMATIC DUMP CAR

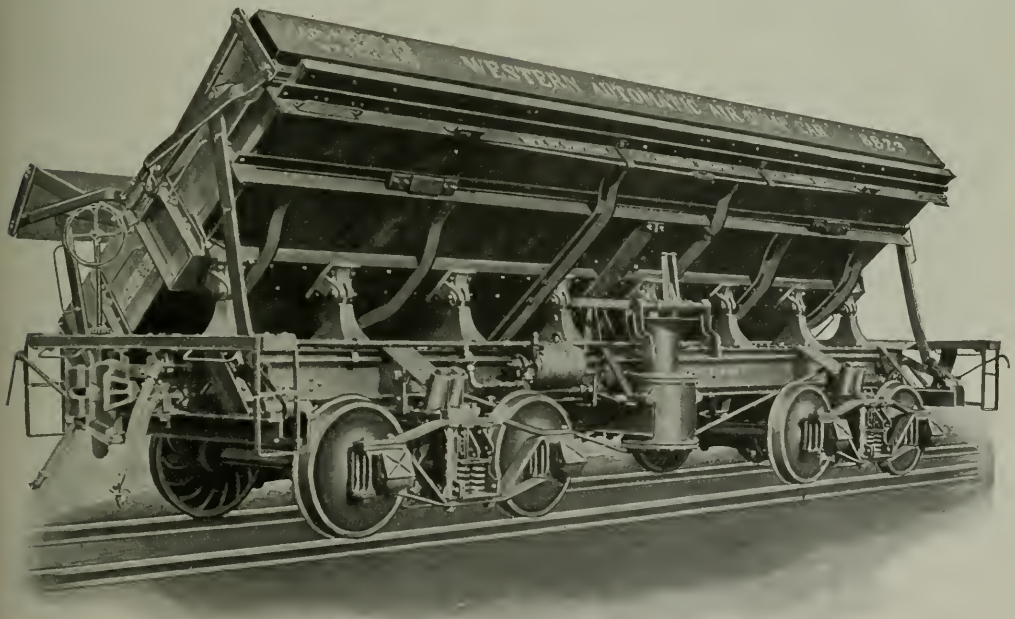
The Western Wheeled Scraper Company, Aurora, Ill., has perfected an automatic air dumping apparatus for application to the Western dump cars of standard design, and after thorough test the cars so equipped are now being placed on the market. As the use of side chains is strongly favored by some men, provision is retained on these cars for the application of such chains as on the other types of cars manufactured by this company. The new automatic device locks the bed in the upright position when loading and hauling the cars, and allows them to be dumped either by the engineer from the cab or by pulling a lever at each car. In the former case the engineer can unlock, dump, right and lock the entire train from the engine, effecting a saving in labor and time, as well as eliminating the chances for personal injury to the men.

The power for dumping these cars automatically is furnished by two vertical cylinders, one on each side, located centrally between the trucks, attached to the draft beams and supported by a truss rod fastened to the end of the bolsters. On the 20-yd. car the cylinders are 20 in. in diameter and have a stroke of 17 in., lifting about 16 tons at 100-lb. air pressure. By the use of this short stroke it is possible to place the apparatus so high on the car that

the possibility of obstructions on the track striking the mechanism is largely obviated and the chances for damage to the apparatus in case of derailment are reduced. The short stroke cylinder is made possible by the use of an extension on the upper end of the piston. The first movement of the piston throws this extension up against the car bed, and at the same time unlocks the bed, which is normally held in position by bars that lift the doors at the four corners of the car. The lower ends of these bars are attached to cranks fastened to the end draft beam cross sills, which are on dead centers in the locked position. These cranks are connected to a rocker shaft extending along the draft beams to the cylinders, so that the first 4 in. of the piston movement rocks this shaft and pulls the crank off the dead centers, thus unlocking the bed and permitting it to tilt and discharge its load. The same movement of the piston pulls the extension of the opposite piston in toward the draft beam, allowing the bed to descend without coming in contact with that piston extension. This inward movement of the opposite piston extension puts the automatic unlocking device on that side of the car out of operation, so that it remains locked. The continuation of the piston stroke performs the act of dumping the bed. To right the bed after dumping, air is admitted to the opposite cylinder, causing the roller in the upper end of the piston and at the lower end of the extension to come in contact with the car bed and move it half as far as when the piston extension is up against the bed. As this side of the bed remains locked, the movement is stopped when the bed has reached the carrying position. There is sufficient play to admit of slight oscillation when the car is in motion.

The air for dumping these cars is pumped directly into the train line from the engine, the system commonly known as "straight" air, in distinction to automatic air, the system used for air brakes. The advantages of straight air for operating this dumping mechanism are that the cars are not all dumped at one time, as would be the case with automatic air, and a saving in air is effected since a valve in the train line automatically cuts the air off when the piston has reached the dumping position. The distribution of the load over the bed of the car will rarely be the same on any two cars in a train, and the amount of power required to dump the car therefore varies with each car. With the Western automatic apparatus, if the car is loaded so that it will dump by gravity when unlocked, no air will be used. A car requiring a small amount of air will dump quickly and one requiring more air will dump later as the pressure increases. Thus the cars will dump in succession in accordance with the amount of air required, no matter where they are located in the train. This method of dumping greatly lessens the jar on the trestle as compared with the dumping of a complete train of loaded cars simultaneously.

The new automatic car has all of the features of the Western dump cars now in use. It is equipped with the automatic pivoted side doors which rise out of the way of the load as the bed is tilted and give a large opening for discharge of the material. The hinge sockets riveted to the draft beams are each provided with a slotted opening into which the flat connecting bar drops, which in turn is pivoted on the hinge casting attached to the car bed. The bed rests on the center castings, or pedestals, and not on the pins which hold the connecting bar in place. The hinge rocks on the pedestal, forming an ample bearing. The cars are equipped with the safety devices required by the Interstate Commerce Commission and conform with the M. C. B. specifications.



Sixteen-Yard Automatic Dump Car, with Steel Ends and Doors and Wooden Floor.

PROTECTION OF STEEL FROM LOCOMOTIVE GASES

The Chicago, Rock Island & Pacific has just completed the replacing of three spans of a highway bridge over its tracks near the Burr Oak yard, just south of Chicago, which, on account of limited clearance, necessitated careful attention to the method of protecting the steel in the lower part of the girders and in the floor beams and stringers from the destructive action of locomotive blasts and gases. In accordance with the almost universal practice at present under similar conditions a concrete encasement was adopted, the plans at first providing for the stringers to be enclosed by forms to make their encasement monolithic with the roadway and sidewalk slabs. As the main girders had a clearance of only 20 ft. 3 in. above the track and the floor beams 20 ft. 6 in., it was decided to encase the portion of these beams

COMPARATIVE WEIGHT AND COST OF CONCRETE AND GUNITE BEAM ENCASEMENT.

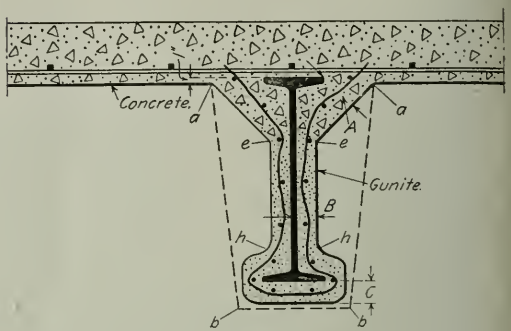
Size of beam.	Weight of poured encasement.	Weight of Gunite encasement	Per cent saved	Cost of poured encasement	Cost of Gunite encasement	Per cent saved	Dimensions A	B	C
8 in.	82 lb.	38 lb.	54%	$0.35	$0 33	6%	1½ in.	1½ in.	2 in.
10 in.	102 lb.	42 lb.	59%	.43	41	5%	2 in.	1½ in.	2 in.
12 in.	128 lb.	64 lb.	50%	.55	48	13%	2½ in.	1½ in.	2 in.
15 in.	187 lb.	89 lb.	52%	.81	67	17%	3 in.	1½ in.	2 in.
18 in.	228 lb.	94 lb.	59%	98	64	35%	3½ in.	1½ in.	2 in.
20 in.	260 lb.	122 lb.	53%	1 12	86	23%	3½ in.	1½ in.	2 in.

below the slabs with reinforced gunite on account of the greater density and impermeability of this concrete grout applied by the cement gun process. The contract for all concrete work was let to the Cement Gun Construction Company, Chicago, to be handled under the supervision of I. L. Simmons, bridge engineer of the Rock Island.

It was found that the building of the forms for encasing the stringers was a considerable part of the cost of the entire work, as 105 separate forms were required for the full length stringers in addition to a number of fractional lengths on the two skewed spans. At the suggestion of the contractor this difficult form work was eliminated by substituting gunite for the concrete around these stringers.

As shown in the accompanying cross section, the beams supporting the sidewalk slabs were encased in concrete

The following advantages are claimed by the Cement Gun Construction Company for this type of construction as applied to any floor beams or stringers subject to the direct action of blasts and gases. First, it forms a superior encase-

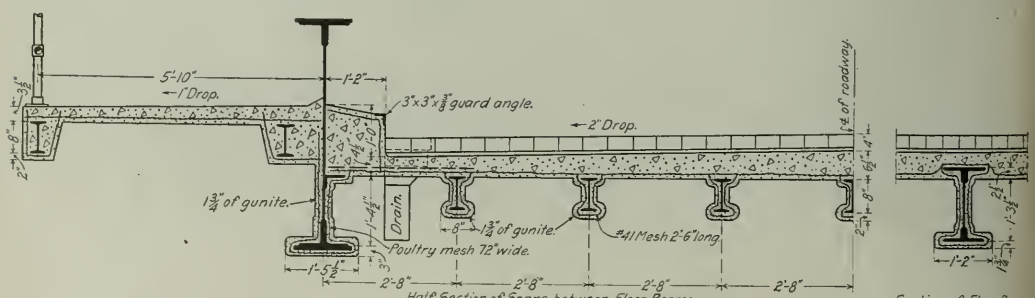


Gunite Encasement for a Typical Stringer Supporting a Concrete Slab.

ment, the gunite being at least 50 per cent more dense than concrete and to that extent better able to withstand the blast action. Gunite is also more impervious to gases, forming a better protection for the steel against rust than ordinary concrete. Second, a saving in cost can be effected and in addition economies in form work for slabs supported on these beams are possible through the use of the lower flanges to support the forms. Third, the dead weight of the floor system is materially reduced.

One of the accompanying illustrations shows a typical floor slab and stringer with gunite encasement of the supporting member and in dotted lines the usual concrete encasement. In the former design the gunite is carried up to "e e," where it is sloped in to the beam on approximately a 45-deg. angle. The concrete supported on this gunite is thoroughly bonded to it and is sloped outward at an angle of about 45 deg., so that the points "a a" are practically the same in either design, giving the slabs substantially the same support and the same clear span.

The advantages which this type of construction has over a poured concrete encasement in weight and cost are shown in



Details of Encasement of Girders, Floor Beams and Stringers of Chicago, Rock Island & Pacific Bridge at Burr Oak, Ill.

poured with those slabs because the simple design of the forms and the ease with which they could be supported on the sidewalk brackets made that method the least expensive. The floor stringers were first wrapped with poultry netting and then covered with 1¾ in. of gunite up to the bottom line of the floor slabs. When this had set, the flat floor slab forms were supported on the gunite-encased lower flanges of the stringers and the slabs poured in the usual way.

the accompanying table, computed by the above company, which compares these items per running foot for beams from 8 in. to 20 in. in depth, giving also the standard thickness of gunite. In this table the cost is based on the assumption that concrete for this type of construction costs $0.60 per cu. ft. and gunite $0.18 per sq. ft. 1½ in. thick. While these costs vary somewhat they are accurate enough for purposes of comparison.

Volume 58 March 19, 1915 Number 12

Contents

*Illustrated.

The new rule-book of the Buffalo, Rochester & Pittsburgh, noticed in another column, is one which deserves the attention of any railroad officer who is engaged in perfecting or improving his train rules—which appears to be a never-ending task on all roads. Not that the book is to be approved wholesale; many of the rules are susceptible of improvement; and, of the great multitude of divergences from the Association standard, many seem to be unnecessary. Moreover, it would be impossible in an editorial—or several editorials—either to praise or to criticize the whole book with adequate thoroughness. But in selection of subjects and phrasing of paragraphs there are valuable suggestions on nearly every page, suggestions the need of which is apparent in the rule books of many roads. The "General Notice," at the very beginning, contains good points which we have not seen anywhere else. The rules for giving instructions to flagmen in writing contain points which are neglected on many roads. Interesting novelties—novelties from the standpoint of rule-book fashions—are to be found in the rules for train despatchers. A part of the general impression created by an examination of this book is that a single master mind has had a good deal to do with its composition and arrangement; and that, often, is a good thing. Committee work is absolutely essential in this field, and its value must not be minimized; but a good many knotty points in language-tinkering never get settled in the right way except by giving one man—the right man—carte blanche in editing.

B. R. & P. Train Rules

The *Railway Age Gazette* finds it hard to decide what is the real attitude of the national administration toward the appeals of the railways for higher rates. Various utterances of President Wilson have indicated that he thinks rates ought to be advanced. In fact, it is suspected that he took a more than platonic interest in the deliberations of the Interstate Commerce Commission in the 5 per cent case. But the President has in his cabinet a gentleman who, besides being our greatest Secretary of State at present, and a Chautauqua attraction of the first magnitude, is also an editor and publisher; and we note that the tone of Mr. Bryan's Commoner is not friendly to increases in rates. These discrepancies between the utterances of the President and of the Secretary of State, if not corrected, are apt to give rise to fear and suspicion. They suggest the fear that there is serious want of harmony in the views of the President and his Polonius regarding the way the railways should be treated. They suggest the suspicion that maybe there is a good understanding by virtue of which the President looks after the votes of all who think the railways should be kindly dealt with, while Mr. Bryan looks after the votes of those who think they should be "soaked." If there is a real difference of opinion, and Mr. Wilson is for the railways and Mr. Bryan is against them, the railways are to be felicitated. Mr. Wilson has proved himself an almost invariable compeller of victory. Mr. Bryan, on the other hand, is the ablest architect of defeat in the country. If Mr. Bryan is against the roads, they hardly need anybody for them. It would be pleasanter, though, if the administration would not excite such suspicions as it sometimes does.

The Administration and the Railways

Congress threw a monkey wrench into the machinery of railway rate regulation at its recent session by passing, in its closing hours, a law forbidding carriers to make agreements with consignors limiting the liability of the carriers for loss or damage of freight. It looks very much as if Congress thereby unintentionally authorized the railways to make an advance of ten per cent in the freight rates ordinarily charged by them; for the bill of lading now in use, on which existing freight rates are predicated, provides that when the carriers take goods at their ordinary rates their liability shall be limited; and that when they accept unlimited liability they shall receive ten per cent more than the regular rates. The purpose of Congress was to further burden the roads by requiring them to accept their regular rates while assuming unlimited liability; but the law was so carelessly drawn, and was enacted on so little consideration that it looks as if, literally interpreted, it would authorize the railways, while assuming unlimited liability on all shipments, to also charge ten per cent more than their regular rates on all of them. To require the roads to assume unlimited liability and at the same time accept their regular rates is unjust; but, probably, if they should try to collect higher rates, as the existing bill

The Freight Liability Law

of lading provides, they would raise a storm. The Interstate Commerce Commission has called for a conference to determine in what condition Congress has actually left the matter. President Charles H. Markham, of the Illinois Central, has given out an interview in which he very justly cites the way in which this law was drafted and passed, as typical of the way in which railway legislation is being handled. "Obviously," says Mr. Markham, "it would have been far better for Congress to have considered the question deliberately and on its merits before acting; or to have left the entire matter to be handled by the commission. Public sentiment needs to be aroused so that it will demand, in the public interest, that in future the regulation of railways shall be dealt with in a different spirit and manner." Such legislation as this unlimited liability law is outrageous and disgraceful, and is largely responsible for the bad business conditions which continue to prevail. Business cannot thrive when Congress and other law making bodies deal with it in such an ignorant and reckless manner.

MUCKRAKING IN THE WAGE ARBITRATION

IN making their rebuttal in the arbitration at Chicago of the wage demands of the engineers and firemen of the western roads, Warren S. Stone, of the Brotherhood of Locomotive Engineers, and W. S. Carter, of the Brotherhood of Enginemen and Firemen, introduced a lot of testimony which the fair-minded and sensible majority of the members of their organizations do not seem likely to regard favorably. They ransacked the history of the western roads from the time their first mile was built to the time of the arbitration, for every piece of evidence the introduction of which might tend to bring into disrepute with the arbitrators and the public the managements of the railways. They tried to show that the railways had robbed the government in getting land grants and had misused the grants and the money derived from their sale. They put into the record all the details about the overcapitalization of certain lines, and sought to give the impression that all roads have been similarly mismanaged financially. They showed that some men prominently connected with railways have got rich, and tried to give the impression that they and many other men prominently identified with railways have got rich by abusing opportunities afforded by their fiduciary positions. They recited discreditable transactions in the past history of the railways, and tried to make it appear that because such things were done sometimes in the past they are being done universally at present. And they spared no effort to secure the widest publicity for every unsavory allegation they introduced, whether based on facts or on their own imaginings. The muckrakers and demagogues who for years have been assailing the managements of the railways in the magazines and from the stump were quite outdone.

The question which will doubtless arise in the minds of intelligent and reasonable railway employees is, What is the purpose of this testimony and what good will it do? It cannot be denied that some railways have been mismanaged. But the most conclusive demonstration that some railways have not been satisfactorily managed proves nothing in regard to the way in which other railways have been managed. And what was done in the management of railways in past years proves nothing as to what is being done now. Therefore, the attempt of Messrs. Stone and Carter to blacken the reputations of all the western lines by introducing testimony regarding the past mismanagements of some of them was entirely unjust.

But suppose they had been able to show that every railway in the West had dissipated its financial resources by mismanagement. What bearing would this have on the arbitration? If the ability of the railways to pay higher wages were an issue, and it were shown that they had all dissipated their financial resources, all this would prove would be that as a result of their mismanagement they have been rendered unable to pay higher wages. What good would this have done the case of the engineers and firemen?

As a matter of fact, however, whether the railways are or are not able to pay higher wages has never been an issue in this arbitration. It was agreed at the outset by the representatives of both the railways and the employees that the employees were entitled to receive reasonable wages, regardless of the earnings or financial condition of the railways as a whole or of individual railways. The employees had succeeded in getting this principle established in previous arbitrations over the protest of the railways, and in this particular arbitration the railways explicitly accepted it. It was expressly agreed that the only question to be determined was whether the wages being received by the engineers and firemen were reasonable, and, if not, what changes should be made to make them reasonable; and the employees contended and the railways conceded that the poorest road must pay the same wages as the richest, and that wages must be standardized throughout the entire western territory. We repeat, then what good could it do the case of the employees for their representatives to make sweeping, indiscriminate and, in the main, unjust and misleading attacks upon the financial management of the railways?

While it is impossible to see what good, from the standpoint of the employees, could be done by introducing this extraneous matter, it is easy to see how it is certain in the long run to do harm to both the employees and the railways. Every word of this kind of testimony tended to poison public sentiment against the railways. Most of it related to a comparatively few roads and to things done years ago. But the public often fails to distinguish between the way the railways were managed in the past and the way they are managed now, or between the way a few have been managed and the way a large majority have been managed.

Now, the public, through the legislatures and regulating commissions, determines what rates the railways shall be allowed to charge and, therefore, how much they shall be allowed to earn; and on how much they are allowed to earn depends, and always will depend, how much wages, in the aggregate they can pay. Arbitration boards can and do fix the wages *per employee* railways must pay, but, since the public determines how much the roads shall be allowed to earn, it evidently follows that the higher the arbitration boards fix the wages that must be paid the smaller is the number of men that the railways can employ *with any given amount of earnings*. It necessarily follows from this that in the long run every influence which tends to create a public sentiment that is hostile toward the railways, and which tends to limit the amount which they can earn, also tends to reduce the total amount of wages they can pay and the number of men they can employ. The testimony introduced by Messrs. Stone and Carter was necessarily adapted to inflame public sentiment against the railways. Therefore, it was necessarily adapted to prevent the railways from being allowed to earn enough money to pay as high wages and employ as many men as it is to the interest of their employees that they should. In other words, every word of the testimony in question was diametrically opposed to the selfish interests of railway employees themselves, including engineers and firemen. That it was opposed to the interests of the railways themselves goes without saying. These being the facts, it is plain that in injecting all this rubbish into the case, Messrs. Stone and Carter either were not trying to promote the interests of those they represented, or had a very erroneous idea as to how this could be done.

Mr. Stone intimated that while testimony of this kind might be familiar and uninteresting to the arbitrators it would make interesting reading for the thousands of men out on the lines whom he and Mr. Carter represented. We should think it would. But we should think that the interest taken in it by them would be of a very different nature from what Mr. Stone seemed to expect. We should think it would tend to arouse a suspicion, or even create a conviction, in the minds of the followers of Messrs. Stone and Carter that they have not been either very fairly or very intelligently represented in the arbitration proceedings.

The *Railway Age Gazette* does not believe that the course fol-

lowed by Messrs. Stone and Carter will be endorsed by the thoughtful and far-seeing members of their organizations. It is inconceivable that most of the members of the organizations can believe that their leaders are going to improve the condition of railway employees by blackening the reputations of the managements. Fundamentally, the interests of the railways and their employees are mutual; and whatever hurts the railways is bound to hurt the employees. One of the main reasons why hundreds of thousands of railway employees are out of work now and are receiving no wages at all is that the demagogues in politics and the misguided leaders of organized labor have been only too successful in creating a public sentiment which has made it impossible for the railways to get a square deal from the public. Whoever helps to foster a public sentiment that is hostile to the railways is an enemy not only to the interests of the railways but to the interests of every railway employee.

THE DECREASE IN EARNING POWER OF THE CHICAGO, ROCK ISLAND & PACIFIC, 1902-1914

THE operating income is the total amount of earnings of a railroad available to pay interest charges on the borrowed money invested in the property, rentals and a return on the investment made by the owners. It is arrived at by subtracting operating expenses and taxes from the total revenue received from operation of the railroad. It is a figure, therefore, that is unaffected by capitalization or the volume of stock or bonds issued by the company. It is the net result which the railroad obtains by charging its freight and passenger rates and paying for the labor and material *consumed* in performing the services necessary to earn the rates.

In the investigation which the Interstate Commerce Commission is making into the Chicago, Rock Island & Pacific Railway Company's affairs, the primary question involved is that as to (1) whether or not the managers of the railroad property have charged rates which, after the payment of expenses and taxes, would leave net operating income great enough to pay interest and dividends on an outstanding volume of securities obviously greater than the probable cost of the property would warrant; (2) whether or not the managers had charged rates sufficient to yield a net operating income, after the payment of expenses and taxes, to pay a fair interest rate on an obviously moderate volume of securities outstanding; or (3) whether or not the management had charged rates which would yield net operating income, after the payment of expenses and taxes, which would pay a fair rate of interest on a volume of securities obviously very much less than a conservative estimate of the cost of the property. In 1902 the operating income of the Chicago, Rock Island & Pacific, which then operated 3,910 miles of road, was $10,131,121. This would have been a return of 6 per cent on an investment of $168,852,017, or an investment in the railroad property of $43,185 per mile. In 1903, the first year in which the present management was in full control, the company earned $11,623,906* operating income. This would have been 6 per cent on $193,731,767. At the end of that year the company was operating 5,579 miles and the operating income, therefore, would have represented 6 per cent on an investment of $34,725 per mile.

In the fiscal year ended June 30, 1914, the operating income of the Chicago, Rock Island & Pacific, operating 8,328 miles of road, was $13,892,534. This would have been interest at 6 per cent on an investment of $27,803 per mile of road. The accompanying table shows the mileage, the operating income (total earnings remaining after the payment of operating expenses and taxes, and before the payment of any rentals or interest charges), the total amount on which this operating income would have paid 6 per cent, and the investment per mile of line operated at the end of the year on which the net income would have paid 6 per cent.

An average cost of $27,803 per mile for the Chicago, Rock Island & Pacific Railway property is obviously far below what could have been under any conceivable circumstances, the average cost per mile of such a property. This $27,803 would have been, of course, a total investment in road, terminals, shops and equipment. Take the question of equipment alone. In 1914 the Chicago, Rock Island & Pacific had 1,678 locomotives of all classes, with a total weight of 139,704 tons. A new locomotive cannot be bought for less than 10 to 11 cents per pound total weight. Taking, however, six cents per pound as a safely conservative figure, the Rock Island locomotives would have cost

	Mileage	Net operating income	6 per cent on	Capitalization per mile at 6 per cent
1902	3,910	$10,131,121	$168,852,017	$43,185
1903	5,579	14,524,883*	193,731,767†	34,725†
1904	7,259	11,657,020	194,283,667	26,765
1905	7,205	11,383,310	189,721,833	26,332
1906	7,426	14,538,909	242,315,150	32,631
1907	7,938	17,518,240	291,970,667	36,781
1908	8,004	14,365,554	239,425,900	29,913
1909	8,048	16,400,527	273,342,117	33,964
1910	8,024	15,274,509	254,575,150	31,727
1911	8,027	16,723,139	278,718,983	34,648
1912	8,042	15,200,498	253,341,633	31,502
1913	8,048	15,914,395	265,239,917	32,957
1914	8,328	13,892,534	231,542,233	27,803

*This is the total for 15 months.
†These figures are reduced to a per year basis.

$16,764,480. The company had in 1914, 989 passenger-train cars, exclusive of leased cars. This equipment, of course, includes coaches, chair cars, observation cars, dining cars, etc., and nine motor passenger cars. Again taking a figure that is conservative beyond question, this equipment would have cost at $2,000 per unit $1,978,000. There were in freight service, exclusive of leased equipment, 36,200 freight cars, including box, furniture, automobile, flat, etc. Again taking an unquestionably conservative figure, this equipment would have cost $22,340,000 at $700 per unit. The company had 4,500 work cars, cabooses, etc. Taking this equipment as having cost $300 per unit, its total cost would have been $1,250,000. The total cost of the equipment, therefore, would have been $42,332,480, or an average for equipment alone of $5,083 per mile.

Looking at it from another point of view. Since 1907 the Rock Island's accounts have been kept in accordance with the Interstate Commerce Commission's rules and the "investment since 1907" is, therefore, the actual cost of additions and betterments to the property. This amount since 1907, less total depreciation, was $60,763,427, or an average of $7,296 per mile. This is an investment of more than $1,000 a mile for additions and betterments per year. Here is $7,000 out of the total $27,000 capitalization on which the company is earning 6 per cent accounted for by additions and betterments of the last seven years. The remaining $20,000 is obviously entirely too low.

The conclusion, therefore, seems unavoidable that the rates charged have been inadequate to yield a fair return on anything like the actual cost of the property, leaving out of consideration entirely capitalization, credit and all other disputable questions.

NORTHERN PACIFIC

THE Northern Pacific was one of the parties to the recent order of the Interstate Commerce Commission in the transcontinental long and short haul decision, and will therefore share in the benefits of the commission's acquiescence in the railroad companies' contentions. The company's annual report for the fiscal year ended June 30, 1914, throws a rather interesting sidelight on the subject of transcontinental business and its importance to the railroads. The management says in the report in regard to the effect of the opening of the canal: "The Atlantic and Pacific coast will certainly be brought closer together by the canal, and some exchanges of commodities between them can hereafter be effected at a smaller cost than heretofore. However, the trade entirely through from coast to coast has never formed any large part, even of that minor proportion of the country's total trade arriving at or starting from coast points. . . .

"On lines serving a territory like that of the Northern Pacific the preponderating movement of traffic seems most likely

*The company changed the beginning of its fiscal year from April 1 to July 1 and the figures which the company reported were, therefore, for the 15 months ended June 30, 1903. To arrive at the operating income for the year we have taken four-fifths of the total operating income for the 15 months.

to be one local to the territories. . . . The Northern Pacific's main lines from the head of Lake Superior and the Mississippi river to Puget Sound towns are more than 1,900 miles in continuous length, but the average length of haul of a ton of commercial freight on the company's railways in the last business year was only 275.6 miles." In other words, the opening of the canal and the commission's recent decision will result in a smaller margin of profit on the through business; but the through business is very small proportionately.

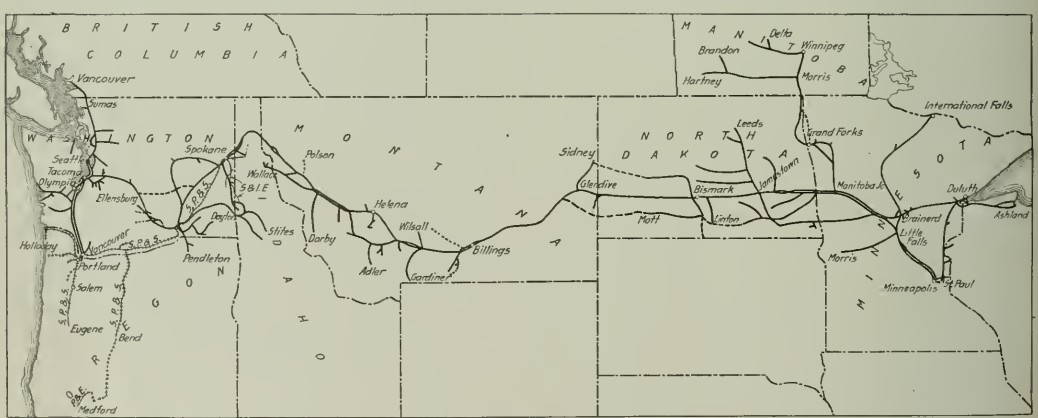
The Northern Pacific operated in 1914 an average mileage of 6,325 miles. Of this about 44.6 per cent was main line and 55.4 per cent was branch lines. Of the 20,422,419 tons of revenue freight carried 13,375,408 tons moved on branch line mileage. The branch line mileage of the Northern Pacific is an important factor in the security of the company's business from competition, and it is correspondingly an important factor in the development of the northwest.

The two important events in the fiscal year ended June 30, 1914, which stand out in the Northern Pacific's annual report are the arrangements made for permanent financing and the rather remarkable success which attended the management's efforts to reduce transportation expenses, in the face of a falling off in freight business and a lower passenger mile rate, without a decrease in passenger business.

Previous to 1914 the Northern Pacific had had two vehicles of permanent financing, the prior lien mortgage and the general lien mortgage. By January 1, 1914, all of the general lien bonds paid off, but the cash requirements for some time to come were very amply provided for.

Total operating revenues in 1914 amounted to $68,544,802, which is less by $4,131,337 than the revenues in 1913. Total operating expenses in 1914 amounted to $41,472,000, a reduction as compared with the expenses in the previous year of $3,201,000. Transportation expenses were $21,711,000 in 1914, a decrease of $1,858,000. It is this reduction of 7.88 per cent in transportation expenses, with a reduction of 9.67 per cent in ton mileage and an increase of 3.14 per cent in passenger mileage, that marks the success of the management's efforts toward more effective and economical operation of the property. It must be remembered that transportation expenses are incurred through the movement of trains, although revenue is earned through the carriage of ton-miles and passenger-miles. The total passenger train mileage on the Northern Pacific in 1914 was 12,015,000; the total revenue freight train mileage, 9,189,000. Whereas, therefore, the reduction in ton-miles appears to more than offset the increase in passenger-miles, as a matter of fact, as a potentiality of economy in transportation expenses, the decrease in ton-mileage was probably, if other things had been equal, much more than offset by the increase in passenger business. The saving in transportation expenses, therefore, was presumably due very largely to a more effective use of the plant. This presumption is strongly borne out by traffic and train mileage statistics.

The average number of freight cars per train-mile, exclusive



The Northern Pacific

which could be issued under the provision of the mortgage had been issued, and all but $4,000,000 of the prior lien bonds. A new refunding and improvement mortgage was made providing for the issue of bonds never to exceed three times the company's outstanding capital stock, the total of bonds, of course, including the amount of bonds outstanding under all prior liens.

The outstanding capital stock of the Northern Pacific is at present $248,000,000. The company now has outstanding $194,737,500 bonds. The provisions of the new mortgage, while conservative and restricting the issue of bonds, after the total aggregate outstanding has reached $500,000,000, to 80 per cent of the cost of new property or additions and betterments, provides a comprehensive method of future financing. There have been issued since the close of the fiscal year under this new mortgage $20,000,000 bonds, the proceeds of which paid off all of the outstanding short term notes and gave the company a very ample working capital. As of June 20, 1914, the company had outstanding $9,605,000 short term notes and had cash on hand of $6,596,000. With the receipt of something in the neighborhood of $20,000,000 cash the notes were not only

of caboose, was 38.67 as against 37.04 in 1913, a gain of 4.40 per cent. The percentage of empty cars to loaded was very slightly less—25.35—in 1914 than in 1913—25.95. The revenue trainload in 1914 was 567 tons as against 542 tons in the previous year, an increase of 25 tons, or 4.67 per cent. The average number of passenger cars in trains was 5.95 in 1914 as against 6.12 in 1913. This is a decrease of 2.78 per cent. Notwithstanding the increase of 4.40 per cent in the mileage of revenue passenger trains, there was a decrease of 4.04 per cent in the mileage of helper locomotives in passenger service, the total helper mileage in passenger service in 1914 being 594,000 and amounting to 4.95 per cent of the total revenue passenger train mileage. Even more notable is the fact that the mileage of revenue freight trains, amounting in 1914 to 9,189,000, was 14.87 per cent less than in 1913, while the mileage of helpers in freight service was 998,000 in 1914, a reduction of 27.10 per cent from the previous year. In other words, the percentage of helper to freight train mileage in 1914 was 10.05 as against 12.68 in 1913. Weather conditions may have in some instances been responsible for a part of this good showing, but only for a

part. There were no new locomotives added to either freight or passenger service, and nine in use at the beginning of the year were sold during the year.

Furthermore, smaller sums were spent on maintenance of equipment, and at the end of the year a quite considerably larger percentage of locomotives were at the shops than at the beginning of the year. At the end of the year 79.88 per cent of all locomotives were in good condition, as compared with 82.80 per cent at the beginning of the year, and 8.48 per cent were at shops, as compared with 7.17 per cent at the beginning of the year, the remainder in both cases being accounted for by locomotives in "fair" condition. The fact that 16.73 per cent of all locomotives were equipped with superheaters at the end of the year, as against 13.91 per cent at the beginning of the year, may have some significance in the good showing made in the reduction of helper mileage.

The total amount charged in 1914 for maintenance of equipment was $8,063,000, or 5.50 per cent less than the charge for 1913. It is interesting to note that the total amount charged to operating expenses for depreciation of equipment was $1,286,000, or slightly over 2 per cent on the book value of the equipment as carried on the balance sheet. Apparently the company charged between 2 and 2½ per cent depreciation on locomotives, about 2 per cent on freight cars and very considerably less than 2 per cent on passenger cars. The new requirements of the commission compel a company to charge a depreciation rate which will write down the total book value of equipment by the time it is renewed.

A total of $9,364,000 was spent in 1914 for maintenance of way and structures. This is less by $824,000 than the amount spent in 1913. The principal changes in the amount of maintenance work done was a much smaller mileage of main line relaid with 90-lb. rail—147 miles in 1914 as against 389 miles in 1913; a slightly smaller number of ties put in branch lines, and a larger mileage of branch lines relaid with rail—166 in 1914, as against 116 in 1913.

The following table shows the principal figures for operation in 1914 as compared with 1913:

	1914.	1913.
Average mileage operated	6,325	6,260
Freight revenue	$48,058,812	$52,270,686
Passenger revenue	15,707,000	15,808,036
Total operating revenues	68,544,802	72,676,139
Maint. of way and structures	9,363,824	10,188,054
Maint. of equipment	8,063,102	8,532,672
Traffic expenses	1,270,881	1,309,801
Transportation expenses	21,710,988	23,569,379
General expenses	1,063,258	1,073,392
Total operating expenses	41,472,053	44,673,298
Taxes	5,030,584	3,999,028
Gross corporate income	27,986,658	28,938,506
Net corporate income	19,655,247	22,313,518
Dividends	17,360,000	17,360,000
Surplus	2,295,247	4,203,518
Appropriated to cover passenger and freight refunds, etc.	.....	750,000

NEW BOOKS

Poor's Analyses (First Series). Published by Poor's Railroad Manual Company, 535 Pearl street, New York. Price $5.

This is a new volume published by Poor's Railroad Manual Company, presenting in bound form the weekly part of Poor's Manual Service for the nine months ending December 31, 1914. It contains an analysis of the operations of 41 corporations, railroad, public utility and industrial, giving the facts in such a manner that one may make estimates of the value of the securities. Only facts are given, without opinions or deductions as to values, but the matter is presented in a convenient form to enable and facilitate the formation of such estimates. The work is adapted to the needs of those requiring recent information to supplement that furnished by reference works, such as Poor's Manuals, and in addition to the analyses of the various corporations it includes a special introductory article, "Shall American Railway Credit Be Destroyed?"

Letters to the Editor

FAIR DEALING BETWEEN STATES AND CORPORATIONS

New York.

To the Editor of the Railway Age Gazette:

As is well known, this city has the best telephone service in the world. Some of the incidents of the recent investigations seem to indicate that perhaps we have the most reasonable telephone managers in the world. The New York Evening Post in a recent issue said:

> The soft answer of the New York Telephone Company in assenting to a just reduction of rates bears witness to a growing good will between the public and its public utility servants, displacing the old huffed spirit of menace on the one side, of obstruction on the other. In the broader field of interstate railway service we have heard much of this fairness for several months. It is time that States, and particularly cities, were learning that it is only on the basis of frank reasonableness that the civic regulation of such corporations can be successful. If the utilities refuse to do their part, public ownership will stare them in the face; if the public's commissions are tyrannical, the public shortly pays.

The Evening Post is a paper noted for far-sighted statesmanship and for its vigorous expressions of opinion on all economic subjects. Though you will, probably, call me an old pessimist, I want to tell you what I find in this editorial by reading between the lines.

1. Tyrannical commissions. Most commissions seem to be actuated mainly by a determination to please the voters. Voters being short sighted, the commissions must paint their pictures with bold strokes. Having, itself, little comprehension of its delicate task, the average commission almost invariably does crude work; and in endeavoring to be, or at least to appear, impartial, it hits wide of the mark; reduces rates too much. This is in effect tyranny, as this editor suggests.

2. It is time states learned, etc. This lesson was taught a third of a century ago in Massachusetts. Surely, "it is time." But in this as in other important lessons of statesmanship, the learning processes have to be repeated, apparently, in each generation, or oftener. Will it be the same in 1950, 1980 and A. D. 2015? The Massachusetts Commission was organized in 1869, the first intelligent, broad-minded and progressive state railroad commission in the country. After ten years its chairman, C. F. Adams, pioneer railroad publicist, retired; and as the columns of the *Railroad Gazette* will show, a most instructive chapter of history had been made.

But within the last few years, Massachusetts has followed Iowa, Texas and other radical communities in telling its commission to strike harder; in other words, to introduce more of tyrannical practice. Can we never get public servants who can be fair and also firm? Thus far the fair commissioners usually have been weak; the firm commissioners have not been fair. The Evening Post's postulate calls for strong men.

3. There is a difficult lesson for all of us to learn. The Evening Post's principles are all right; but the New York Telephone Company, making enormous profits, can comply with this ideal theory quite easily. A railroad, earning only 5 per cent or less, finds itself with a very different puzzle. The public asks about the same thing of the Erie Railroad, laboring under a burden of debt, as of the Telephone Company with its gold-bearing monopoly. "Growing good will" is a pleasant phrase; but to put it in practice in the railroad field still calls for an immense amount of patient study. The task of learning practical fairness is still a hard one, both for railroad officers and state commissions and legislatures. When a corporation releases to a city, in one year, five millions of profit, the people can, indeed, see what is done and they applaud. But if there is only a half million in all to divide, and when it will take perhaps five years to determine how the percentages should be apportioned, there is not so much éclat about it.

P. R. K.

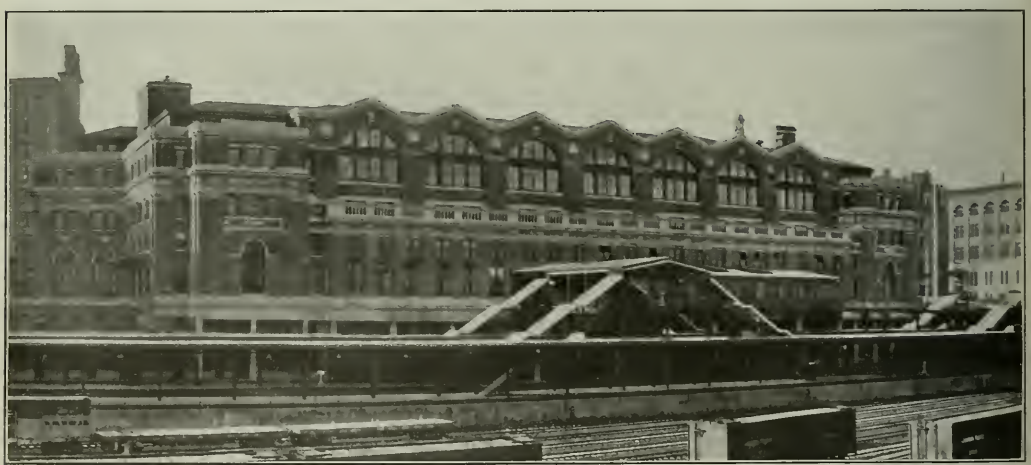
Canadian Pacific Terminal Improvements at Vancouver

A Passenger Station and Pier for Coast Steamships with Supplementary Facilities Were Completed Last Year

Owing to the rapid growth of traffic at the Vancouver, B. C., terminal of the Canadian Pacific, it became necessary about two years ago to undertake to provide increased facilities for handling both passenger and freight business. At this point is handled the trans-continental business of the Canadian Pacific, as well as its steamship traffic to the more important Pacific coast ports and its trans-Pacific business to and from ports in Japan, China, Australia and the Philippines, in addition to the interchange traffic with the various other steamship lines at Vancouver. This interchange of traffic between the railway and steamers, as well as between the city of Vancouver and other points necessitated terminal provisions of a somewhat unusual character.

The passenger station is located at the foot of Granville street, one of the principal thoroughfares in the city. This street has been extended over the passenger and freight tracks to a new steamship pier. To the west at Burrard street another viaduct has been constructed over the tracks to afford access to the steamship pier used for trans-Pacific service, built in 1908, and which has since been extended out to the harbor line to provide for the larger steamships which were put into service within the last two years. The site of the old passenger station was directly at the foot of Granville street, and the only means of access to the steamship piers before the improvements were made was by way of a grade crossing west of the old station. This crossing naturally was a source of danger and delay, and in the new plan the freight yard was re-arranged with connections to reach the present steamship piers as well as those which might be constructed in the future.

The passenger track layout provides four through tracks raised about 5 ft. above the old grade to reduce somewhat the vertical distance between the street level and the track level. Provision has been made for an extension of the trackage by leaving room for additional passenger tracks to the north over the site now occupied by freight tracks. The station building facilities are adequate to serve several times the number of passenger tracks built under the present plan.



View of New Canadian Pacific Passenger Station from the Harbor

RAILWAY PASSENGER STATION

Granville and Cordova streets are about 30 ft. above the track level. This condition necessitated the use of a two-level station with the principal public rooms on the street floor and railway facilities for baggage, express, etc., on the track level below. The plan also lends itself to providing a convenient means of access to the train platforms and shelters by a bridge over the tracks. Independent exits are provided so that passengers may go directly to the street without passing through the station. Electrically-operated baggage lifts are provided by which baggage may be raised from the platform level to the extension of Granville street, and thence carried to the steamship pier. On the street level of the station are the general waiting room, ticket offices, lunch room, women's waiting room, smoking room and baggage checking room, all conveniently located with relation to each other and with generous allowance for lobbies and corridors. The general waiting room is 212 ft. by 56 ft., including the east and west lobbies each of which measures 46 ft. by 28 ft. The women's waiting room and the smoking room are each 46 ft. by 36 ft. On this floor also are located the lunch room and its service pantry. The kitchen and refrigerating rooms are placed on a mezzanine floor below the street level. On the track floor are the baggage, mail and express rooms, also rooms for Canadian and United States customs, warerooms for the news and dining car departments and the power plant. Between the station building and Cordova street at the lower level is a large paved area used for baggage, mail and express trucks. Access to this area from Cordova street is had by a ramp descending by easy grades to the west of the station building.

The passenger station is a steel frame structure with pressed brick exterior walls and Indiana limestone trim. The main facade of the building consists of a colonnade of ten free standing Ionic columns, 35 ft. high, symmetrically flanked by pavilions or end wings. The track facade of the building is expressed by a series of large arched openings and occupies a very conspicuous position when viewed from the harbor. The main waiting room

is located immediately behind the colonnade and is approached by vaulted corridors from either end of the building. Ionic pilasters and engaged columns, artificial Caen stone, are used for the decoration of the walls of this room, with the walls tinted to match the stone work. The floors are of Terrazo, figured with a design panelled to match the arrangement of seats and wall columns. The ceiling is 40 ft. above the floor and of heavy beam and panel design. Illumination is by means of incandescent electric lamps, the ornamental ceiling fixtures and wall torches of special design being of cast bronze. The seats in the main waiting room and the woodwork around the ticket office are of oak. The smaller waiting rooms, dining room, etc., are treated in a very simple manner with oak wainscoting, plaster walls and plain panel ceiling.

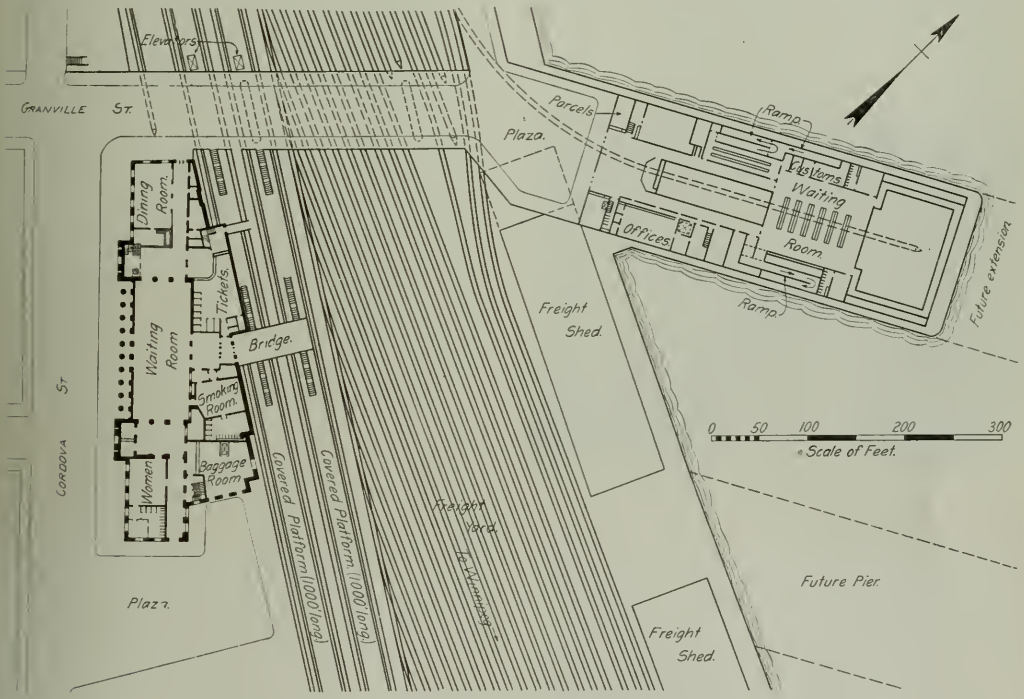
Above the ground floor are three floors devoted to offices for the use of the railway company. A large interior court affords natural lighting for the general waiting room and also for the interior office rooms. These offices are finished in natural wood with maple floors. Four passenger elevators serve the office quarters and the lower mezzanine and track level floors.

rooms are provided with an exhaust system. Vitreous china and porcelain plumbing fixtures are used throughout. For fire protection the lower floors of the building have a sprinkler system. The upper floors are served by standpipes and fire hose. A vacuum cleaning system consisting of a six-sweeper low suction machine operated by a direct connected motor serves all parts of the building above the track level.

Two tracks are provided for inbound and two for outbound passenger trains with separate platforms. There is also a platform adjoining the station used for baggage, mail and express only. While Vancouver is the end of the line, the station is arranged as a through station in order to secure the best use of the tracks and avoid blocking the approaches when the trains are backed out preparatory to shifting to the storage yards. Incoming trains proceed westward and back out over the thoroughfare in the freight yard, leaving the station tracks clear of all shifting movements.

STEAMSHIP PIER

The extension of Granville street by a viaduct over the tracks affords access to the upper level of the new steamship pier. This



Plan of New Canadian Pacific Terminal at Vancouver

The service plant, located on the track level floor, has a capacity of 450 hp. The boilers are of the horizontal return tubular type, designed for oil fuel, and supply steam for the forced circulation hot water heating system in the railway station, also for passenger and freight car heating and for the steamship passenger station which is heated by a direct steam system. A 12-ton refrigerating plant provides service for the lunch room and kitchens.

Alternating current, purchased from the public service company, is transformed and distributed throughout the terminal for electric lighting and for the operation of the elevators in the building and on the track level. Ventilation of the kitchen is accomplished by means of a supply and exhaust fan system. All toilet

viaduct is 80 ft. in width and is enlarged in front of the pier station to provide a plaza for public and private vehicles. Baggage and freight is received at the pier on the lower level to which access is had by ramps leading from Granville street and Burrard street viaducts.

The substructure of the pier is built largely of creosoted timber and presents a number of unusual features. Sea worms, the toredo navalis, are very active in the waters of Burrard inlet and untreated timber cannot be used safely for more than two years where called upon to bear heavy loads. The depth of water at high tide at the outer end of the pier prior to construction was over 60 ft., with a soft bottom, necessitating very long piles. The harbor was filled in at the site of the pier as high as prac-

ticable, and still not interfere with the draught of vessels which would use the pier and the piling was then driven through the filling. About 3,000 piles were driven in the substratum, these piles ranging in length from 80 to 110 ft. The substructure of the pier is well braced above the low water line and the filling referred to adds additional stiffness to the entire structure. Fenders of large logs chained together afford extra protection to the pier and distribute evenly throughout the structure any shock which may occur from a vessel striking the pier. A railway track, depressed to bring the floor of the cars about level with the pier floor, is carried through the center of the pier. The decking of the pier is of Australian hardwood, which has been found to give better wearing results with the class of traffic and atmospheric conditions existing in Vancouver.

The superstructure is slow-burning timber frame construction, covered with wood sheathing. The interior trim in the public rooms on the upper floor is of Douglas fir finished to show the natural grain and beauty of the wood, the exposed roof trusses in the main waiting room being dressed and chamfered. The waiting room is 83 ft. by 96 ft. A ladies' waiting room, a smoking room and rooms for the immigration and customs departments of Canada and the United States have been provided. There is a promenade overlooking the harbor, reached from the waiting room, on the outer end of the pier over the one-story freight structure. As one enters from the plaza the ticket office,

Interior of Main Waiting Room

parcel room and baggage checking room are conveniently reached on the concourse leading to the main waiting room.

Access to the steamships from the upper level is afforded by means of ramps leading from the concourse on easy grades to the landing on which the gang planks are placed. The landing is adjustable for different stages of the tide which has a range of about 16 ft. Passengers coming from the steamships use the ramps and go through the customs examining rooms, or, where examination is not necessary, they may be diverted directly into the concourse. On the lower level, which is used for baggage, express and freight, there are provided electrically operated lifts on each side of the pier to meet the vessel ports. These lifts are adjustable and may be used as sloping gangways or raised and lowered similarly to an elevator and are 10 ft. by 48 ft. in area, holding several trucks at one time.

The general designs and layout of this terminal were prepared, the terminal buildings constructed and the equipment installed by Westinghouse, Church, Kerr & Company, Montreal and New York, under the general direction of the engineering department of the Canadian Pacific, J. G. Sullivan, chief engineer. The architects for the passenger station were Barott, Blackader & Webster, Montreal. Work was begun early in 1912, and the station and pier were opened to the public in July, 1914.

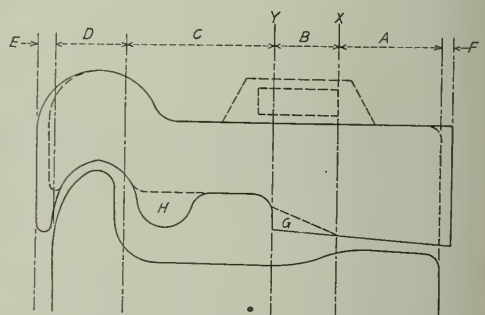
DRIVER BRAKE SHOES

By J. S. Sheafe

So many refinements in the design of locomotive details have been introduced during the past few years in an attempt to decrease weight and effect economies in maintenance that there now seem to be very few parts which have been overlooked. The contour of driver brake shoes, however, has remained for years practically unchanged while, by a few slight alterations from the present standard form, brake shoe service may be considerably improved.

The use of inserts in the face of the brake shoe to effect a more even distribution of tire wear has probably been somewhat overdone. Where the inserts are distributed over the entire length of the shoe its structure is weakened and there is an increased tendency to break before the shoe is worn out. By limiting the use of inserts to the ends of the shoe better net results would be obtained. In many cases chilling the ends of the shoe might give equally good results.

Driver brake shoes were originally made with solid faces, which wore the tread of the tire quite as much as the rim. The introduction of the groove along the center of the shoe was undoubtedly the means of effecting a large saving in tire wear, but the present standard groove is considerably narrower than that originally used, resulting in an increase in weight without a corresponding benefit to the service rendered. A



Present and Proposed Contour of Driver Brake Shoes

worn driving tire has a contour about like that shown in the sketch. The maximum brake shoe wear should take place on the rim and flange of the tire as shown at *A* and *D* respectively. Differential wear varying from a minimum at *Y* to a maximum at *X* should be provided for on the portion of the tire shown at *B* and the portion shown at *C* should receive no wear from the brake shoe. The contour of the average brake shoe is shown by the full lines. The metal at *F* and *E* on the sides of the shoe is superfluous and only adds to the weight in the scrap pile. The metal outside of the broken lines at *G* and *H* is not only superfluous, but is actually detrimental to the best service of the shoe because it produces wear on the tire at points where it would be preferable to eliminate all brake shoe wear. As shown by the sketch, *A* and *D* are acting against portions of the tire which otherwise receive no wear, while *G* and *H* are increasing the tire wear at *B* and *C*, which are subjected to wear from the rail.

The broken lines show a possible contour for the brake shoe by which useless metal is eliminated and undesirable tire wear reduced. The dimension at *E* need be only large enough to act as a guide for the shoe on the flange of the tire, and *F* may be considered as entirely unnecessary on a flanged shoe. Such a design would result in more brake shoes to the ton purchased with an equal service from each shoe, as well as in a reduction of tire wear and the resultant damage to frogs and crossings.

Hearings on Western Freight Rate Advances

Testimony by Railroad Men on Rates on Grain and Grain Products, Meat, Packinghouse Products and Fertilizer

The hearing before Commissioner Daniels at Chicago, on the application of railroads in Western Trunk Line and Southwestern Tariff Committee territory for advances in freight rates, during the past week was devoted to testimony of railroad officers, supporting their claim that increases asked for are reasonable as to individual rates. This followed the general testimony reported in last week's issue as to the financial needs of the carriers. Testimony on the rates on grain and grain products was presented on March 9 to 12, on livestock, fresh meat, packing house products and fertilizer materials on March 13 to 16, and on hay, straw and broom corn from March 17 to 18. This was to be followed by testimony on the rates on cotton piece goods.

RATES ON GRAIN AND GRAIN PRODUCTS

E. B. Boyd, chairman of the Western Trunk Line Committee, was the first witness for the railways on the rates on grain and grain products. Mr. Boyd was for several years manager of the transportation department of the Chicago Board of Trade, and, therefore, was able to testify as to the grain rates from experience on the side of the shippers as well as on that of the railways. His testimony showed how rate wars and repeated rate reductions by railway commissions have brought the present scale of freight rates on grain in the West to a point below that regarded as reasonable by the railways and that the increase of one cent was thought proper in comparison with the rates on other commodities, and because the Eastern roads have advanced the grain rates one cent. He said the roads would attempt to prove the reasonableness of the advance of one cent from points on and east of the Missouri river, and in the through rates from points west thereof built thereon, in comparison with rates approved by the Interstate Commerce Commission for similar distances, to Duluth, Minneapolis and Milwaukee, that the rates are based on the lowest rates west of the Illinois-Indiana state line. He said that they are also shown to be reasonable by comparison of the gross earnings per ton mile on a large number of other commodities, and by all the rules of reason that apply to the making of freight rates. Mr. Boyd said that with respect to other commodities grain is not paying its proportion of the transportation cost. It is a commodity given more consideration than any other one article of transportation in the way of privileges and facilities.

The rates today on grain are lower than, or as low as they were 10 years ago, although everything has advanced in price. Some years ago it took three bushels of grain to pay for a given unit of transportation, and today it takes less than one bushel.

Originally, Mr. Boyd said, the rates on wheat and corn from the Missouri river to Chicago were 21 and 19 cents, respectively. In one of the rate wars these rates were reduced to 6 cents, and finally rates of 17 and 16 cents were established in 1905. Since that time various rate reductions have carried wheat to 15¾ cents and corn to 14¾ cents. The one cent advance asked, therefore, would leave the rates lower than those prevailing in 1905. The proposed rates, he said, are lower than those prevailing in the Northwest, although the latter rates are based upon an unduly low scale through the effect of the unreasonably low distance tariff in Minnesota, which, he said, is lower than anything west of the Illinois-Indiana state line. They are lower also, he said, than the rates into Central Freight Association territory, which have already been pronounced unreasonably low by the Interstate Commerce Commission itself. These statements were supported by elaborate exhibits, one of which made a comparison of earnings per car mile and per ton mile, gross and net, on various carload commodities, with similar information on grain and its products, to and from Chicago, Ill., and various other points. This showed that for distances of 500 miles the proposed grain rates in the western territory are lower than the Central Freight Association rates.

Another exhibit accompanied by a map illustrated the effect of the first application on June 10, 1904, of proportional rates from Omaha and Council Bluffs to Chicago, which were on wheat 12 cents and on corn 11 cents. These rates applied to traffic originating beyond.

The rate from the first station west in Nebraska, Irvington, to Omaha was 5 cents. This rate added to the 12 cents and 11 cents proportional rates from Omaha and Council Bluffs made through local rates to Chicago from Irvington on wheat 17 cents and corn 16 cents. These became maximum rates from intermediate points. From Omaha and Council Bluffs the local rates to Chicago that were in effect before the proportional rates were established were wheat 20 cents and corn 18 cents. Examination shows that even the advanced rates are generally lower than the reductions originally made on account of the proportional rates.

In 1906 reduction in the proportional rates of 1¼ per cent per 100 lb. was made from all Missouri river points to Chicago because of the allowance of 1¼ per cent per 100 lb. for elevation, some roads preferring to reduce the rates and give the benefit to all shippers rather than pay elevation to a few. By the addition of the 5 per cent per 100 lb. to these reduced proportional rates the through local rates from Irvington, Neb., to Chicago were made on wheat 15¾ cents and on corn 14¾ cents per 100 lb. After the elevation question was finally settled by the Interstate Commerce Commission allowing an elevation allowance of ¼ cent per bushel the proportional rates were restored to 12 cents and 11 cents on wheat and corn respectively.

In the meantime, the lines operating from Council Bluffs and Omaha to the southwestern Missouri river points interpreted the term "originating beyond" as meaning from any origin, and therefore applied the proportional rates alike to both Iowa and Nebraska grain. This practice diverted considerable grain from Iowa through the back door gateway at Council Bluffs and Omaha to Kansas City and also to St. Louis and the East. The roads operating from Council Bluffs and Omaha eastward then did likewise. Because of the strongly competitive conditions with respect to Iowa traffic that developed under this method of applying proportional rates thereto, Iowa lines made no further advance in their local scale from Missouri river and Iowa to Chicago when the proportional rates were restored. The 15¾ cent rate on wheat and 14¾ cents on corn are in effect today, although the suspended rates make them 1 cent per 100 lb. higher.

Ordinarily, Mr. Boyd said, rates should be no lower on export grain than on domestic. The two cent increase to the gulf ports for export is proposed because there is already a one cent advance to Atlantic ports. The keen competition of gulf lines and the seaboard lines formerly resulted in a differential of one cent for grain for export, but on account of the expense of handling this traffic there is no reason why the rate should be lower.

"Car mile earnings on grain are excessively low compared to other commodities," said Mr. Boyd. "To bring grain up to equal earnings per car mile with other commodities, it is necessary to load to 70,000 or 80,000 lb. per car, while other commodities carry from 30,000 to 40,000 lb.

"We hear a great deal of talk about co-operation by shippers' associations, and there has been a great deal of co-operation toward economical loading of freight, but in the heavy loading of grain we have got nowhere. Millers are notoriously light loaders, yet they are the first to complain about car shortages."

Mr. Boyd was cross-examined at length by Clifford Thorne,

of the Iowa commission, and by A. E. Helm, of the Kansas commission. This involved a great deal of discussion as to the basis for making rates. Mr. Boyd said railroads no longer make rates, they change them, and he insisted strongly on the importance of the principle "what the traffic should bear." At various times Mr. Thorne asked questions about items of cost, to which Mr. Boyd invariably replied that rates were not made that way. He also made it clear that all of his figures related to the time prior to June 30, 1914, so that conditions caused by the European war in no way affected them, that the advance in rates had been decided upon before the war began, although he thought the high prices now prevailing for grain should be considered. Today the domestic consumer in this country, he said, is paying the price dictated by the warring nations of Europe on 85 per cent of the product, and the producers are reaping the benefit.

Judge Helm asked whether the carriers had reduced rates when corn was selling for 10 cents in Kansas and was being used for fuel. "Yes, they did," replied Mr. Boyd. "The governor asked the railroads to make an emergency rate and they did so, and inside of 10 minutes the price went down by the amount of the reduction in the Chicago market, because of the threatened movement, and therefore, no additional corn was moved on account of the lower rate." There was also a great deal of discussion as to whether or not the producer pays the freight rate, and Mr. Boyd said no one had ever succeeded in demonstrating to him that he did under all circumstances.

Mr. Boyd was followed by F. P. Eyman, assistant freight traffic manager of the Chicago & North Western, who showed how the rates on grain and grain products for a long term of years have shown a general downward tendency, while the market value in the same period has shown an almost unbroken advance.

"With the proposed increase of 1 cent per hundred pounds," he said, "the rate on wheat from the Missouri river would be 16¾ cents per hundred pounds against 21 cents in 1902, while that on corn would be only 15¾ cents against 18 cents in 1902.

"In that time there has been a conspicuous rise in the market value of these grains which had its inception long before. The Iowa price of corn, for instance, in the decade from 1870 to 1879 averaged 25 cents per bushel. Between 1880 and 1889 the average was 30 cents per bushel; between 1890 and 1899 it receded to 27 cents; between 1900 and 1909 the average was 39 cents, and on December 1, 1913, before the influence of the war sent the price higher, the Iowa price was 60 cents per bushel, while the Nebraska price was 65 cents per bushel.

"The effect of this decided rise in price, in conjunction with the decline in rates, is seen in the proportion of the market value consumed in the freight rate. In 1905 it took 204 bushels of corn in value to transport 1,000 bushels to Chicago based on the average rate and average price in 1905. Under the proposed advanced rate, it would take only 121 9/10 bushels to transport 1,000 bushels to Chicago, based on the December 1, 1913, price. In 1905 it took 234 7/10 bushels of wheat to bring 1,000 bushels to Chicago, while under the proposed rate it would take only 212 3/10 bushels to transport the 1,000 bushels."

The loss and damage claims per car of grain and grain products on the North Western, said Mr. Eyman, averaged 74.6 cents per car in 1913 and 77.1 cents per car in 1914. The average on all carload freight in 1913 was only 21 7/10 cents per car, while in 1914 it was 26 2/10 cents, only about one-third the average loss and damage per car involved in the grain traffic. In other words, the loss and damage per car of grain and grain products was 343 per cent of the loss and damage per car on all carload freight in 1913, and in 1914 was 294 per cent of the average loss and damage per car on all carload freight.

Judge Helm asked whether the railroads had ever tried to reduce the number of claims instead of increasing the rates. Mr. Eyman said that every effort had been made to reduce claims, particularly the claims for concealed losses, and that many of them had been litigated, but the roads had always lost.

B. E. Perkins, freight traffic manager of the Missouri Pacific and St. Louis, Iron Mountain & Southern, also spoke of the interference by state-made rates with interstate transportation.

Mr. Perkins paid particular attention to Texas and went at length into the history of grain rates. He showed that prior to December 15, 1902, there was a very unsatisfactory condition and no satisfactory rate basis. In 1902 the southwestern lines inaugurated a new system of rates, consisting of proportional or reshipping rates from primary markets. "The rates to Texas points," he said, "since then have been based upon the rate to Texarkana, on the state line, plus the rate from there to the point in Texas. The rate from Texarkana to the destination has been fixed by the Texas railway commission," he said, "and the volume of the rate obtainable for the interstate shipment to Texas has been largely controlled by the state rates controlled by the Texas commission. From 1902 to the present, by reason of reductions by the Texas commission in local rates within Texas, and the extension of the territory in Texas to which these rates apply have forced the carriers to reduce the rates for transportation of grain from all interstate points to Texas.

"In contrast with this descending grain scale the rates on class freight and commodities generally, including those now under consideration, have been advanced since 1902. The first class rates from St. Louis to Texas in 1902 was $1.30, whereas today it is $1.47. In 1908 substantial advances were granted by the commission on commodities generally, from interstate points to Texas, after an exhaustive hearing. Advances were granted on 127 commodities out of a total of 143 contained in the tariff."

Mr. Perkins then introduced exhibits comparing the earnings on grain to Texas with earnings on other commodities. He also gave a detailed history of rates in Louisiana, Arkansas and Oklahoma, bringing out the conditions peculiar to each, showing that the rates on grain for a number of years have remained either stationary or have declined, while rates on other classes of freight and commodities generally have advanced. His exhibits show that rates to Louisiana are even lower than those to Texas, themselves pronounced unreasonably low.

During the testimony on grain rates it was brought out that there had been a misunderstanding as to the dates set for the hearing, and it was announced that the railroads would be given the time originally set for hearings during March to present their evidence and arrangements would be made for rebuttal testimony on the part of the shippers after April 2.

Commissioner Daniels said he desired to reiterate some of the requests made by the commission in its circular calling for certain information which the railroads had not yet furnished. He said the commission desired statistics for 1913 and 1914 as to total carloads, average haul, total ton miles, total revenue, average revenue per net ton mile and gross ton mile, and average load per car on the commodities on which advances are proposed and on a number of other commodities also. He repeated a request for figures as to the comparative cost of terminal and line haul. C. C. Wright, general solicitor of the North Western and chairman of the committee representing the railroads, explained that only a few of the roads kept their figures segregated in the manner suggested by the commission, and that the method used by these was not uniform, but that the roads would furnish what information they could. As to the terminal and line haul comparison, he said it would be impossible to furnish anything that would be of the slightest value.

Mr. Wright said that if the advance of one cent per hundred were applied to all of the grain shipped from each county in Iowa, Kansas, Oklahoma, Nebraska and Missouri, according to government reports, the increase would only be $3,000,000 a year. This, however, is too large, because a very considerable portion of this grain is not moved to markets where the advances apply, while there is included also grain on which no advance is asked.

LIVESTOCK AND MEAT RATES

F. A. Leland, chairman of the Southwestern Tariff Committee, was the first witness for the railways on Saturday on the rates on packing house products, fresh meat, livestock and fertilizer. The advance on packing house products is from the various packing centers, such as Omaha, Kansas City, Fort Worth and

Wichita to Chicago, and is based upon an advance of 3½ cents per hundred pounds between Missouri river points and Chicago, with such adjustment of rates from other packing house points as shall continue the relation of rates heretofore maintained. The livestock rates are advanced from Missouri river points to the East and from southwestern points to the East, covering a portion of the territory which was not included in a case now before the commission.

"There has been severe competition between the carriers for this large tonnage," said Mr. Leland, "most of which is controlled by a half dozen large firms of packers, each of which maintains and has maintained a most efficient traffic organization, seeking at all times every advantage in rates or service. Any line failing to give preferred service on this traffic, both in movement of loaded and return of empty cars, has been deprived of it until ready to resume satisfactory schedules.

"In four years to December 31, 1914, a total of 321,539 cars of packing house products and fresh meats were shipped by these few shippers from Missouri river packing centers, of which about 250,000 consisted of fresh meat on which the normal rating is 13 cents higher than what we seek to get in these proceedings. If shipments from Wichita, Oklahoma City and Fort Worth are added, the total is probably 500,000 cars in four years. This represents about $4,000,000, or $1,000,000 a year which should have gone to the railways if the advances asked for are reasonable.

"The advance of 3½ cents per hundred pounds could not be reflected in the price of meat to the consumer. It amounts to only 1/33 of a cent per pound. Packers generally change the price of meat ⅛ of a cent per pound at a time, or 12½ cents per hundred pounds, almost four times the amount now asked in the freight rate. Therefore, the packer could not reflect the rate in the cost to the consumer, as the alteration is too small. Of course someone has to absorb the advance and the packer is the person who must and should do it."

Packing house products, he said, are regularly rated fifth class under present classifications, and fresh meat third class, the commodity rates on which advances are asked being considerably less. The advance would make both the same as fifth class, or 13 cents less than third class on fresh meat from Missouri river to St. Louis and Chicago. From Wichita to St. Louis the rate would be 23 cents less than fifth class and 30.5 cents less than third class, while from Oklahoma City to St. Louis it would be 27.5 less than fifth class and 52.5 cents less than third class, the respective classifications of packing house products and fresh meat.

"Present rates," said Mr. Leland, "are far below what they should be, considering the character of the traffic, the nature of the service and in relation to rates in effect on other carload traffic of similar classification. The traffic requires expedited service in cars provided by the shippers, weighing about 22 tons gross. The traffic is of perishable nature and about three tons of ice are carried as preservative, the cars being stopped often in transit for re-icing. The traffic, therefore, is of a very expensive nature, and the freight charges represent a very small portion of the value of the commodity transported."

The witness submitted numerous comparisons showing rates on this business as compared with fifth and third class rates established by the Interstate Commerce Commission in this western territory in recent cases. Figures were presented showing the gross ton mile earnings on this traffic as compared with the average of all commodity rates on other articles carrying the same classification.

"The present low level of rates," said Mr. Leland, "is due largely to stress of severe market and carrier competition. In the rate war from Omaha and Kansas City to the Mississippi valley and southeastern territory from 1897 to 1899, the rate on packing house products got down to 1 cent per hundred pounds, Omaha to Ohio river crossings. Another instance of severe competition was the gradual depression of rates from Wichita and the Kansas City market, in the effort to secure business to the east and southeast. As shown by the development of the packing industry at Fort Worth and later at Oklahoma City, there has been a gradual reduction of rates made to enable each of these new markets to compete with older markets. The element of market competition is one which cannot be divorced from rate adjustments on this traffic and its effect has always been to depress the rates."

The hearing on Monday was enlivened by a discussion of the newspaper reports of the case which Luther M. Walter, attorney for Morris & Co., declared were being influenced by the railways. Commissioner Daniels promptly shut off discussion of the subject, saying the case was not being tried in the newspapers.

E. B. Boyd, chairman of the Western Trunk Line Committee, and C. E. Spens, assistant freight traffic manager of the Chicago, Burlington & Quincy, testified on Tuesday as to the reasons for advancing live stock and meat rates.

THE STANDARD CODE ON THE B. R. & P.

The Buffalo, Rochester & Pittsburgh has adopted a number of changes in its train rules and has issued a revised edition of the whole book of rules for the operating department, to go into effect April 1. One of the principal changes is a requirement that conductors and enginemen at the beginning of each trip shall sign a report, to be transmitted to the despatcher, certifying that they have read all bulletins, naming the one last posted, and, on the same blank, that they have compared watches, specifying how much fast or slow each watch may be. The green glasses in the marker lights used on the rear of trains are to be abandoned, and yellow used in place thereof.

In the "General Notice" or introduction to the rules this code differs from the A. R. A. version in that there are two introductory paragraphs covering the conduct of employees in broader fashion than is common in cold official railroad rules. These two paragraphs are as follows:

The nature of the transportation business and its relation to the State and community require the services of men of active minds, good character and general ability. The employees of a railroad are at all times, both in the discharge of their duties as employees and as citizens, under the constant view of the public. Failure to be efficient parts of the transportation system, or valuable citizens in whatever place they are domiciled, brings reproach upon them and on the corporation with which they are connected.

There are corporate and private duties devolving upon each officer and employee that are not, nor can they be, expressed by fixed instructions or rules. A failure on the part of any one to perform such duties makes it the duty of the proper officer of the company to indicate to the person privately, in a proper way and place, his shortcomings. Subsequent failure to profit by the warning must sever the relations existing as employer and employee, notwithstanding the fact that there has been no literal violation of the printed rules.

A large proportion of the rules are in some respects different from those in the code as formulated by the American Railway Association. We note some of the more prominent differences.

The "General Rules," A to L, are amplified by the addition of others, extending to Z, and nine beyond Z. These added rules include all those matters in which all or many of the different classes of employees are interested and which in most codes are put into a chapter by themselves, following the numbered rules. One rule, H H, provides that on trains detoured over other lines the conductor and the engineman shall be equally responsible with the pilot for the safety of the train movement. Following the general rules are two short notices, one on applicants for employment and one on promotion. The code of definitions varies, in many small details, from the A. R. A. standard.

Rule 2a, requires watches to be shown to an inspector every two weeks or oftener. Rule 3 contains the usual injunctions about watches, and, in case of conductors and enginemen, both road and yard, requires them, when comparing, to assure themselves that watches are fully wound. Fusees, heretofore burning ten minutes, are changed; and flagmen will use five-minute red fusees and five-minute yellow fusees. Rule 11, forbidding a train to pass a red fusee, does not apply on a line where the

block system is in use; the train will stop and then proceed under control until a block signal is reached.

Rule 14, prescribing whistle signals for calling in the flagman names, on the branches, combinations different from those used on the main line. On double track, whistle signal 14c is to be used only when passing trains.

Following Rule 33 are four new rules regulating slow boards (or flags used for indicating that speed must be reduced) and another cautioning enginemen, when handling very long freight trains, to stop, if and whenever the hand signals cannot be seen.

Rule 90b requires the engineman, in the case of freight trains, when approaching a meeting point, to signal to the conductor by three blasts of the whistle, two long and one short; while in the case of passenger trains the conductor must be the first to act, sounding two long and one short on the air whistle.

The time interval specified in Rule 91, for trains of all classes, moving in the same direction, is five minutes.

A large portion of the lines of this company are equipped with automatic block signals; for other parts of the road the spacing of trains is covered in Rule 91a as follows:

Operators must block passenger trains a station apart, and all other trains a station behind passenger trains, unless it is otherwise provided.

Snow plows and engines equipped with flangers, in service, must be run in absolute manual block.

All other trains [freight following freight, etc.] must be blocked five minutes apart, unless otherwise provided.

Within yard limits trains do not have to flag, in clear weather, except when on the time of a first-class train. Rule 93 regulates practice in this respect; and requires that by night or in stormy or foggy weather proper signals must be displayed on all trains, cars or engines on main tracks.

Rule 99, the flagging rule, has four supplemental rules, a, b, c and d, the last of which reads: "Passenger trains making unusual stops in yard limits or standing an unusual length of time in yard limits must be protected by flagman."

Rule 100b requires that when, in the conditions named, flagmen are sent out they shall be given instruction in writing viz.: in the case of work trains, relief trains and section or bridge gangs; and when a conductor sends a flagman ahead on another train to hold the road. A flagman holding written instructions is to stop the train that he flags; and then hand the written instructions to the engineman; the engineman is to read them and then repeat them within the hearing of the flagman and the fireman. These instructions for flagging are to be issued by the conductor and engineman jointly, both signing. A flagman must not be sent out to flag only certain trains; he must flag all trains. This rule further reads: "Work and relief trains, running against opposing trains, must send out a second flagman when moving around all curves, and will not leave the regular flagman at an unreasonable distance from their work." A form is prescribed for the use of conductors in writing instructions to flagmen, and a carbon copy is to be kept by him.

Following Rule 104 are ten supplementary rules, dealing largely with the management of hand switches and with switching movements with passenger trains. Following Rule 105 are five supplementary rules on miscellaneous subjects.

Rule 208a contains elaborate precautions for the guidance of despatchers when sending a meeting order to a train at the meeting point. Rule 210 requires the conductor only to sign train orders. Orders on Form 31 must be delivered by the conductor personally to the engineman and he must read the order aloud to the conductor *before proceeding*.

The use of form 19 for orders restricting the superiority of a train is covered by Rule 211a, which is as follows:

Outside of territory covered by a block system, a "19" order must not be sent to a train, the superiority of which is thereby restricted.

Within the automatic block signal limits Form 19 train order may be issued to restrict the superiority of a train, except that Form 31 must be used as follows:

First: When orders are delivered at a non-train-order or closed train-order station.

Second: When necessary to restrict a train which has been cleared or the engine of which has passed train order signal.

Third: When issuing an order, Form G, example 3, or an order under any example of Form F.

Fourth: When giving any train right over all trains.

Fifth: When reducing a time order, where necessary that despatcher have signature of superior and inferior trains before completing order to superior train.

Within the manual block system limits, the "19" train order must not be used to restrict superiority, except that on single track when a copy of the order has been addressed to, and acknowledged by, the operator at the meeting or waiting point, Form A and examples 3 and 4 of Form E may be used.

Operators will fill out clearance card, designating thereon numbers of all orders, Forms 19 and 31, repeat to despatcher train and order numbers as they appear on clearance and obtain O. K. with time and despatcher's initials, writing same before delivery in blank space provided for that purpose. Operator will retain carbon copy of clearance.

Despatcher must write train and order numbers in his train order book as transmitted by operator from clearance, and must designate time clearance was made O. K. not transmitting O. K.'s unless operators repeat numbers of all orders to be delivered to the train to which clearance is addressed.

Conductor's and engineer's attention is called to the importance of approaching at a moderate rate of speed train order offices where orders are to be received; also to the necessity of carefully checking clearance card to ascertain positively that clearance is properly addressed, and that orders received are those called for by clearance.

Following the train rules are the manual block signal Rules 301 to 321, five pages, and next the automatic block signal rules, four pages. These last are preceded by three pages of explanatory notes. Neither the manual nor the automatic block signal rules correspond to those in the standard code as issued by the American Railway Association. The rules for interlocking signals differ from those in the standard code, although a larger proportion of them correspond with those in the standard.

Following the standard rules are eighty pages containing the rules addressed to different classes of employees; and following this part of the book are twenty pages containing rules regarding personal injuries; handling United States mail; train mail; uniforms; steam heat; air brakes; bulletins; tools required on engines, cabooses, baggage cars and passenger cars; and rules for the care of lamps.

Following are some of the instructions for despatchers:

720. . . . The train order signal should not be entirely depended upon to hold train for orders during a blizzard. Extra precaution must be used.

722. An even hour must not be used in giving time of day; that is, do not issue an order reading "10:00 a. m.," but make it read 9:59 or 10:01 a. m.

723. Before giving an extra its running orders, enter it on the train sheet, and carefully examine such sheet for opposing and work extras.

When practicable always run extras to their known destination; that is, avoid for temporary convenience, short running orders.

724. As far as possible avoid issuing round-trip orders; when necessary to give them, enter such extra on both sides of the train sheet. BEFORE ISSUING THE ORDER. Do not attempt to restrict such extra on its return trip by sending the order in advance of it; either get the signature of the conductor, or place the order affecting such train at a station which will be reached on its return trip.

725. A conspicuous circle should be drawn on train sheet around limits of any work trains on line.

Do not extend the limits or time of a work extra. Annul their former order and issue another as may be necessary under later conditions.

727. Meeting orders must not be issued except when the trains affected can see and identify each other at the meeting point.

730. When a train is to be detoured and its schedule annulled between certain stations, secure the acknowledgment of the conductor of the schedule which is annulled before issuing for other trains, or otherwise so place the annulment that an accident cannot result should the detoured crew regain their proper district at an unexpected point.

Railway Traffic in Morocco.—It is reported that a recent decree has sanctioned the use of military railways in the French zone of Morocco by private persons, whilst declining responsibility for their safety. Should this measure be further extended, it is stated, and the Rabat-Fez Railway be used for merchandise, there can be little doubt that goods imported from foreign countries destined for Mequinez, Fez, and the districts fed from those centers would be directed to Kenitra, the trade being thus diverted from Laraiche and Tangier.

RESULTS OF THE LOCOMOTIVE BOILER INSPECTION LAW*

By Frank McManamy

Chief Inspector, Locomotive Boilers, Interstate Commerce Commission, Washington, D. C.

A resume of the work of the locomotive boiler inspection service during the three years and eight months since the law became effective shows results for which we have not one word of apology to offer. The following table shows in concrete form the inspection work performed each year since the passage of the law; and the decrease in the percentage of locomotives reported defective indicates in a measure the improvement in conditions:

	1914	1913	1912
Number of locomotives inspected..	92,716	90,346	74,234
Number found defective.....	49,137	54,522	48,768
Percentage found defective.....	52.9	60.3	65.7
Number ordered out of service....	3,365	4,676	3,377

It does not, however, fully show the improved conditions resulting from the operation of the law, because, as pointed out in our 1913 report, our attention was first concentrated on the more serious defects, so that the number of fatalities might be reduced; therefore, the improvement is more accurately indicated by the reduction in the number of casualties, as shown by the following table:

	1914	1913	1912
Number of accidents.....	555	820	856
Decrease from previous year...per cent	32.3	4.2	...
Decrease from 1912.....per cent	35.1	...	...
Number killed	23	36	91
Decrease from previous year....per cent	36.1	60.4	...
Decrease from 1912.....per cent	74.7	...	...
Number injured	614	911	1,005
Decrease from previous year....per cent	32.6	9.3	...
Decrease from 1912 .....per cent	38.9	...	...

The data shown above is taken from the records up to July 1, 1914. A check of the first six months of the present fiscal year, that is from July 1, 1914, to January 1, 1915, in comparison with the corresponding period in the preceding year shows that during the period ended January 1, 1914, there was a total of 349 accidents which resulted in injury, with 15 killed and 385 injured thereby. During the period ended January 1, 1915, there was a total of 253 accidents which resulted in injury, with 6 killed and 271 injured thereby, or a decrease of 27.5 per cent in the number of accidents, 60 per cent in the number of killed, and 30 per cent in the number injured by the failure of locomotive boilers and their appurtenances.

Going back further and making a comparison with the corresponding period for 1912, we find that during the six months' period ended January 1, 1913, there were 470 accidents which resulted in injury, with 24 killed and 512 injured thereby. In other words, the number killed by failure of locomotive boilers and their appurtenances during the first half of our fiscal year which began on July 1, 1912, was 12½ per cent greater than for the corresponding periods in the two following fiscal years, with almost as great a decrease in the number injured and the number of accidents. Or, to state the whole matter briefly, in three years the number killed by failure of locomotive boilers and their appurtenances has been reduced from about 100 per annum to less than one-fourth that number, and the number injured from more than 1,000 per annum to less than one-half that number, with a corresponding decrease in the number of accidents.

These are the direct results of the operation of the locomotive boiler inspection law, and indicate the manner in which it is fulfilling the purpose for which it was enacted: namely, to promote safety. The question will no doubt arise as to just what the law has done to produce such results. The results are due to a number of reasons, among which are more careful inspection, more prompt repairs and attention to minor defects, investigation and classification of every accident that resulted in injury, with a view to determining the cause and remedying it, and giving publicity to the information collected.

No railroad man with a trace of honesty and a knowledge of conditions and practices prior to the passage of the law can question the fact that, generally speaking, inspections are now made more carefully and more regularly, and repairs are more promptly made, and further that the question of repairs is less apt to be determined by the number of loads in the yard awaiting movement, although unfortunately that is still occasionally considered to be the deciding factor; an illustration being a recent request by a master mechanic to operate a locomotive with 43 broken staybolts a distance of 312 miles, because they needed the power. It must be admitted, however, that such instances are becoming more rare, although we still occasionally find a superintendent or trainmaster who in spite of the fact that he is at the other end of the division considers himself a better judge of the condition of a locomotive than an inspector or foreman who is on the ground, and orders it into service regardless of its condition.

The importance of giving attention to minor defects can be shown by a single illustration. During the last fiscal year 18 persons were injured due to studs blowing out of firebox or wrapper sheets. The practice of repairing leaky studs by caulking, or permitting them to continue in service without repairs, should be discontinued.

I have recently had occasion to read very carefully statements made before Congressional committees at the time the boiler inspection law was pending, to the effect that all boiler explosions were really crown sheet failures due to low water; therefore, were man failures. In order to correct this misapprehension, attention is directed to the records of such accidents since July 1, 1911.

During the year 1914, as compared with 1912, accidents which are usually termed boiler explosions which resulted in injury have decreased 44 per cent, or from 97 in 1912 to 54 in 1914, and the number of killed and injured has decreased 64 per cent, or from 290 to 104. During the same period crown sheet failures due to low water decreased 48 per cent, or from 92 to 48. I am directing attention especially to this class of accidents, first to show that the class of accidents which were said to be unpreventable have been materially reduced, and also because our investigations have shown that by proper application and maintenance of boiler appurtenances they can be still further reduced.

Rule 42 provides that, "Every boiler shall be equipped with at least one water glass and three gage cocks. The lowest gage cock and the lowest reading of the water glass shall be not less than 3 in. above the highest point of the crown sheet." While it may be a compliance with the letter of the law to locate these appurtenances where they can be most easily applied, regardless of their convenience to the enginemen, it is manifestly not a compliance with the intent of the law, and is not conducive to safety, as an improper or inconvenient location may seriously interfere with their proper use. A certain type of locomotive has the water glass located directly behind the engineer and entirely out of sight of the fireman. In other instances glasses are found so obscured by other boiler appurtenances or by an improper shield that it is difficult, and under certain conditions impossible, to see the water level. A recent investigation of a crown sheet failure showed that the cab arrangement was such that the water glass and gage cocks were 9 in. above the engineer's head and that he regularly carried a small keg to climb upon to try the gage cocks. Can it be seriously questioned that such conditions cause accidents, particularly when operating in a busy terminal? Using a shield that obstructs the view of the water glass is also too common. The manner of application is also important, both as to water glasses and gage cocks.

We also find that the manner in which gage cocks and gage

*Presented at the March meeting of the Western Railway Club.

cock drippers are applied indicates that the purpose for which they were applied did not receive sufficient consideration. While the application of a dripper is important to prevent the discharge from the gage cocks from scalding anyone in the cab, it should not be located so close to the gage cocks that the nipples extend down into the dripper, preventing enginemen from seeing the discharge, as dripper pipes occasionally become obstructed and fill with water, in which event the sound of water and steam are identical.

Failure of injector steam pipes continues to be one of the most frequent causes of serious accidents, and is the only one which shows an increase during the present fiscal year over the corresponding period for the previous year. To bring out clearly the cause of these failures, the following is a complete list of all that have occurred since July 1, 1914, and which resulted in 1 killed and 15 injured, showing the cause of each:

Injector Steam Pipe Failures, July 1, 1914, to March 1, 1915

1. Collar broke on right injector steam pipe, due to old crack in collar.
2. Steam pipe to left injector blew off where brazed to collar.
3. Injector steam pipe blew off; union nut broke while being tightened under pressure, due to defective nut and use of improper tools for making repairs.
4. Threads stripped in injector steam pipe union nut while being tightened under pressure; nut too light and threads badly worn.
5. Injector steam pipe blew off; union nut broke while being tightened under pressure.
6. Union to left injector steam pipe blew off, fatally scalding fireman who was attempting to tighten it under pressure; spanner nut too large.
7. Steam pipe to left injector pulled loose at turret connection due to defective brazing and injector not properly braced.
8. Left injector steam pipe collar broke at injector throttle connection; old crack in flange of collar and wrapped with asbestos to stop leak.
9. Injector steam pipe collar broke; defective collar.
10. Injector steam pipe spanner nut broke while being tightened under pressure.
11. Spanner nut on injector steam pipe broke while being tightened under pressure. Nut had been badly damaged previous to accident by use of hammer and set.
12. Injector steam pipe pulled out of collar; improperly brazed.
13. Spanner nut on left injector steam pipe broke while being tightened under pressure; due to use of improper tools.
14. Injector steam pipe broke at brazing.
15. Right injector steam pipe collar broke; defective collar.
16. Injector steam pipe collar broke; defective collar.

The nine failures, four of which were due to poor brazing and five to collar or sleeve breaking, can, I believe, be prevented by extending the pipe through the collar or sleeve and flanging or beading it, thus reinforcing the collar and reducing the strain on it, as the end of the pipe itself will be solidly held in the joint; therefore, it will carry the load. If properly applied in this way, brazing is not necessary, although it can be done if desired. This method of application is at least as cheap as brazing, and defective or improper workmanship can be discovered by inspection, which is impossible with the brazed connection.

In view of the statements occasionally made relative to the expense to the carriers of complying with the Locomotive Boiler Inspection Law, it may be pertinent to inquire if proper entries are always made on the credit side of the ledger and a trial balance taken. I will confess that we do not feel ourselves competent to place a value on human life; but an estimate based on the average cost to the carriers of an accident resulting in the loss of a life multiplied by the decrease in the number of such accidents during the past three years will be at least as nearly correct as the average estimate of the cost of the law, and will give a substantial item to start with. As injured employees usually receive pay from the company or compensation from the relief department for the time lost, an estimate of the saving from this source based on the decrease in the number injured would be another important item.

There are other results, more or less indirect, but of substantial benefit to the carriers, among which are a reduction in the number of engine failures, as we have numerous records of locomotive performance which show an increase of from 200 to 800 per cent in the miles per failure since the law become effective, which it is admitted is largely due to improved conditions resulting from the stimulating effect of the law. A saving in fuel is another result of the improved conditions brought about by compliance with the requirements, among which are prohibiting the use of fire plugs and providing that boilers must be more carefully washed, and must have all scale removed when in shop for repairs, and that leaks both in and outside of firebox must be kept down to the minimum.

In this connection it is not out of place to state that few, if any, railroad men realized the extent to which the use of flue plugs had been carried prior to the passage of the law. It is true their use was admitted to be general, and our records of the hearings prior to the approval of the rules contains numerous statements made by prominent mechanical officers that a rule prohibiting the use of flue plugs would cripple their road. On one prominent road indifference to the rule was expressed, as they stated they were not using flue plugs; yet after the rule was in force they were the first to apply for relief from its provisions until they could prepare to meet its requirements, showing conclusively that they did not realize the extent to which they had been depending on flue plugs.

Failure to properly wash and scale boilers is another evil which had grown to alarming proportions, due perhaps to the fact that washing or scaling a boiler is among the most disagreeable tasks around a shop, and is too often performed by incompetent or indifferent labor not properly supervised. In addition to being one of the chief causes of leaking crown and staybolts, tests have shown that ⅛ in. of scale on heating surfaces results in a loss of approximately 15 per cent. of the value of the fuel; therefore, clean boilers mean in addition to increased efficiency a saving in cost of fuel as well as in the cost of repairs.

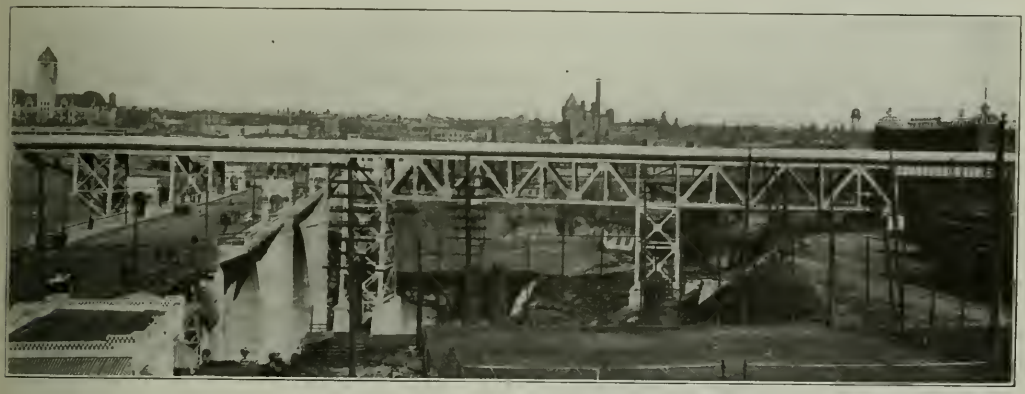
While it can not be doubted that the remarkable decrease in the number of casualties and the improved conditions noted, as well as many others, are a direct result of the operation of the law, I do not wish to be understood as claiming that those who are administering the law are entitled to all credit for the improvement shown. Such results could not have been accomplished without the co-operation of the railroad officers, which we have in a great measure received. However, co-operation does not mean that we should ignore defective conditions and permit locomotives to remain in service in violation of the law, and that will not be done; it does not mean that attempts should be made to conceal defects by making improper inspections or by certifying to reports which do not represent actual conditions.

Classes in the London Tubes.—On February 15 the Great Northern & City Railway of London introduced an innovation in the form of first class cars in the tubes. While the general tendency in recent years has been for the British railways to eliminate the second class, the tubes have been the only lines to conform with the democratic standards of the omnibus and the street car and provide one class only. Many objections were raised against this practice in the early days, but the opposition has now died down, the one-class system having worked so well in practice. The Great Northern & City desired to meet the special convenience of through season ticket holders who live on the Great Northern. In Paris it is customary to provide two classes on the street cars, as well as on the motor omnibuses and on the Metropolitan there are first and second but no third-class. The one-class system for short-distance traffic seems to suit the British public better than the French. It is the general opinion that such a division by classes would not pay in England, except in the case of a line like the Great Northern & City, which handles through season-ticket traffic to and from a main line, and is in a special position when it comes to catering for first class passengers.

Notable Structures On The Spokane-Ayer Cut-off

Some Interesting Problems Connected With Construction of Three Large Bridges on New O-W. R. & N. Line

A new cut-off 104 miles long was placed in operation on September 15, 1914, on the Oregon-Washington Railroad & Navigation Company, shortening the distance between Portland, Oregon, and Spokane, Washington, by 51 miles. The original distance was 419 miles. The grades were also reduced from a maximum of 3 per cent to 0.6 per cent, and the maximum curvature from 10 deg. to 3 deg. (except in some cases where special conditions govern speeds). The adverse grade was also very materially reduced.



The Completed Structure Over the Spokane River at Spokane

To maintain these low maxima it was necessary to build some very heavy and extensive structures at the Spokane terminal of the cut-off and through the rugged Palouse and Snake river canyons. All the steel structures are designed in accordance with the Common Standard Specifications of the Union Pacific system, with a live load of two 192.5-ton engines followed by 5,000 lb. per lineal foot of track. From the new station in Spokane to the city limits, a distance of 5 miles, all grade crossings are avoided and ideal operating conditions are obtained by means of steel girders with ballasted floors.

The Snake River Viaduct

THE SPOKANE RIVER AND MONROE STREET CROSSING

The Spokane river is crossed twice within the city, the first crossing being immediately at the head of the elevated passenger yard (see *Railway Age Gazette*, January 15, 1915) where the track is carried both over the falls of the Spokane river and

over the noted Monroe street arch bridge built by the city a few years ago. The height of the rails above the falls is about 160 ft. This structure, which was the closing link in the cut-off, is built for double track and is flared at the end to accommodate leads and crossovers for the head of the passenger terminal. It has a ballasted deck carried on reinforced concrete slabs supported on steel deck girders and trusses.

The entire structure is approximately 769 ft. long, consisting of one 195 ft. and one 160 ft. truss with tower and girder approaches on each end. The tower spans are 30 ft. long, and the intermediate girder spans vary between 50 and 110 ft. in length, a girder of the latter length being necessary to cross the Monroe street bridge properly. The towers vary in height from 42 ft. to 122 ft. The abutments are of the U type. The easterly one, adjacent to the station yard, is 65 ft. high and is reinforced concrete, with bottom slab and counterforts. The other abutment is of ordinary height, reinforcement being supplied only to take care of the effect of possible unequal settlement. It is supported on piles driven through the fill, which was thoroughly compacted with water previous to the building of the abutment.

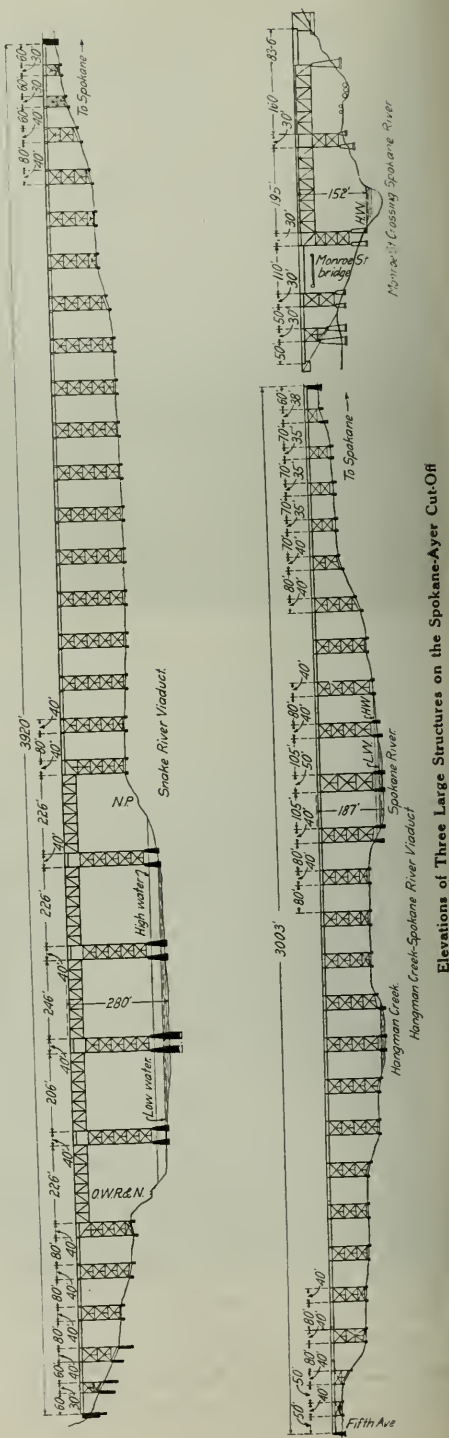
In order to take care of thrusts due to the fill, the pedestals which are subjected to such loads are connected by longitudinal walls, and where the effect of the falls during high water must

Erecting the Snake River Viaduct

be resisted the pedestals are connected by cross walls; otherwise they are of the usual independent construction. Local conditions involving protection against slides and facility in taking care of expansion details were considered sufficient reason for the adoption of a pier rather than a tower at the end of the 160 ft. truss span. The lengths of the spans and locations of the towers and piers were practically dictated in every case by right of way or other special conditions.

Good foundation material was encountered in all cases, either in the form of sand or basalt rock. Notwithstanding this fact, thorough investigations were made to eliminate the least doubt, as the igneous rock in this locality is often underlaid with clay or other soft material, or lacks continuity.

The erection of the structure proceeded from both ends simultaneously without falsework, except for the 160 ft. truss span, which was used as the anchor arm for the cantilever erection of the 195 ft. span. The anchor end of the 160 ft. span was counterweighted with 450 tons of rails. A tension member was placed over the top to the tower between the anchor span and the span to be cantilevered, this tie being 4¼ in. shorter than the length of the tower. The span to be cantilevered was in this way inclined upward to take care of the deflection due to the cantilever stresses. When the cantilever had been extended about



Elevations of Three Large Structures on the Spokane-Ayer Cut-Off

three-fourths of its length the bent which was to support its outward end was set in place from the span, it being impracticable to set it either from the shore or from the Monroe street arch. The cantilever was then continued out and over this bent. The anchor arm was jacked up to release the tie and to allow the 195 ft. span to be supported on its permanent bearings, the counterweight being gradually removed and the dead load transferred to the jacks. The anchor span was then lowered to its shoes. The derrick used in the work was assembled from four cars, two abreast, strongly tied together, and carrying two large booms, one 82 ft. and the other 92 ft. long. The heaviest single

Placing the Last Span in the Structure Over the Monroe Street Arch and the Spokane Falls

piece handled weighed 30 tons. The 110 ft. girders were placed last. They were extended over the Monroe street arch and were placed by means of an ordinary derrick and the large derrick described above.

The concrete slab rests directly on the stringer flanges and is divided by transverse expansion joints into divisions about 50 ft. long. These joints are waterproofed with sheet lead pockets filled with tar. Another joint was introduced along the center of the bridge on account of the deflection occurring with one track occupied with live load and the other unloaded. The center longitudinal joint was covered with waterproofing fabric. The slab was waterproofed with a mixture of coal tar, cement and kerosene, which has performed its function without giving any trouble. Drainage is taken care of where necessary by means of tile drains and downspouts.

The hand railings are reinforced concrete panels set into grooves in the curb. They were poured in place. A gray paint was used for the steel work to conform with the color of the city's concrete arch beneath. There are approximately 3,000 tons of structural steel and 10,000 cu. yd. of concrete in the structure.

HANGMAN CREEK VIADUCT

The line crosses the Spokane river a second time about three miles from the Spokane passenger station, at the confluence of Spokane river and Hangman, or Latah, creek. This structure is 3,003 ft. long and 180 ft. high, and is of the conventional tower and girder construction. The tower spans range between 35 ft. and 50 ft. in length, and the intermediate spans between 50 ft. and 105 ft. The pedestals in the river and on the low land adjacent to it are carried on wooden piles, while the others have bearing on sand or gravel. The river piers are 34 ft. high and were built in cofferdams.

Before the completion of the bridge, an extension to it involving a connection with one of the street crossings, and with a change of line, was decided upon. A concrete pier containing about 275 cu. yd., had already been built at the street crossing on the original location. This pier was jacked up, placed on rollers and moved about 50 ft. to the new line. The temporary supports were replaced with concrete, and wings being added, the pier was incorporated into an abutment. The cost of moving the pier was no greater than the probable cost of breaking it down, had this been done, so that the saving amounted to about the cost of the concrete entering into the pier.

There are about 5,700 cu. yd. of concrete and 3,900 tons of steel in this structure, which is constructed for single track.

THE SNAKE RIVER BRIDGE

The western portion of the Spokane-Ayer cut-off follows the Palouse river until this stream flows into the Snake river. The line is constructed high above the Palouse river, and at the confluence continues directly across the Snake river canyon about 270 ft. above low water, and on striking the left bank continues down to a connection with the older O.-W. R. R. & N. line which runs up the Snake river canyon. Incidentally the Northern Pacific tracks are crossed on the right bank.

The bridge across the Snake river is notable on account of its length, height and the problems involved in its construction. The structure is 3,920 ft. long and includes a viaduct approach 510 ft. long on one end and 2,040 ft. on the other, the tower spans being 30 and 40 ft., and the intermediate spans varying from 60 to 80 ft. The river channel spans proper consist of five riveted truss spans varying from 206 ft. to 246 ft. in length, supported on

False Work Tower and Girder Caps Used in Erection of Snake River Viaduct

steel towers. Each post of the towers supporting the truss spans is carried on an individual concrete pedestal, the height of the highest towers being 221 ft. above the masonry.

The foundations for the approaches presented no special difficulty, all being above the high water level. They were carried down to bedrock, and their dimensions are ordinary except where they run through loose material, in which case pedestals 65 ft. high were found necessary.

The sixteen pedestals in the river channel, however, presented many difficulties owing to the swift current of the stream, which

is the principal tributary of the Columbia, and to the sudden and rapid rise of the floods. The location of bedrock was found to be extremely variably in depth, and on this account the lengths of the spans were varied to obtain economy in the foundations.

The river pedestals were built by the pneumatic process, the deepest work being done 64 ft. below water surface, making the pedestal at this point 95 ft. in height. The abutments are of the U type of reinforced concrete.

On account of the lack of space available for storage close to the bridge site, the structural steel was unloaded at the railroad company's material yards at Hooper, Wash., 15 miles from the Snake river, whence it was hauled to the river as it was needed. At the bridge site the steel was unloaded by derrick in locations convenient to be handled to its final location in the bridge. The erection derrick, which was constructed at the site, was self-propelled and was capable of swinging the 80 ft. girders in place. The tower sections had to be outhauled because of their batter. This was accomplished by use of a timber outrigger projecting from the piers.

The westerly end of the bridge is on a 6 deg. curve, over which the large derrick could not be operated on account of its long wheel base. On this account, and to expedite the work, the steel for about 500 ft. of this end of the bridge was detoured 56 miles and handled to its place by a smaller derrick.

The first truss span crosses the Northern Pacific track on the right bank of the river. The first half of this span was erected on steel falsework supported on concrete piers. The falsework consisted of a tower and two 80-ft. girders of slightly special design to fit them for their use in erection; afterward these girders and the major portion of the temporary tower were removed and used as permanent portions of the bridge. The first half being in place, the remainder was erected as a cantilever and landed by means of sand boxes supported on the falsework.

The succeeding spans were built out as cantilevers, erection devices being used for this part of the work, which was at times rendered difficult and troublesome because of the very high and continuous winds. The erection devices consisted of the usual temporary compression members in the plane of the bottom chord and adjustable tension members in the top chords. The adjustment was accomplished by a wedge arrangement operated with screws between two bearings. The trusses are 21 ft. center to center and 36 ft. deep, while the girders in the approaches are 10 ft. on centers. The foundations contain 16,830 cu. yd. of concrete and 7,900 tons of steel were used in the superstructure.

COMMISSION'S CIRCULAR ON INCREASED REVENUES IN EASTERN TERRITORY

The Interstate Commerce Commission has sent to the carriers a circular calling for a report on the additions to revenue made by increases in freight rates authorized in the Eastern rate decision. An abstract of the circular follows:

You are required to prepare an estimate of the additions to your transportation revenues and incidental operating revenues accruing from the application of increased interstate and intrastate rates, fares and new charges, and of additions to revenues accruing under contracts or arrangements made subsequent to July 29, 1914, for May, 1915, and to report separately to this commission such additions to your revenues on or before July 1, 1915.

You are required to keep an actual account of the similar additions to your revenues for October, 1915, and April, 1916, to prepare an estimate of such additions to revenues for the 12 months ending June 30, 1916, and to report separately the additions to your revenues, herein described, such reports to be made on or before February 1, 1916, August 1, 1916, and September 1, 1916, respectively.

The actual account of the additions to revenue shall be based upon traffic or business included in the revenue accounts for October, 1915, and April, 1916.

The actual additions to freight revenue from increased rates and new charges must be based upon information appearing on the way bills and other records in which the details are kept. The actual amount of additions to revenues, other than freight, must be based upon records in which the details of the traffic or business are kept.

Additions to revenues from new charges include revenues accruing from services performed for which no charge was made prior to July 29, 1914.

The estimated amount of the additions to the revenues for the 12 months ending June 30, 1916, shall be based upon the aggregate actual additions to such revenues for October, 1915, and April, 1916, and upon a general review of the traffic or business for the 12 months. It is not expected that carriers will arrive at the estimate for the 12 months by merely multiplying by six the aggregate results for October, 1915, and April, 1916, unless the flow of traffic of a particular commodity or class or the volume of business is regular and constant throughout the 12 months, so that the results for the two months fairly represent one-sixth of the traffic or business for the 12 months.

Deductions from revenues, account of claims for overcharges, should not materially affect the amount of additions to such revenues resulting from the application of increased rates and new charges made subsequent to July 29, 1914. Such claims, therefore, need not be considered in compiling the statistics to be returned in this report, unless the carrier so desires.

The carriers also are required to keep, for each of the periods above specified, an account of the expenses incurred in compiling and reporting the information required to be returned in this circular, the report of such expenditures to accompany their reports on the additions to their revenues.

No methods for compiling the information to be returned in this report have been prescribed. Carriers are required to submit to the division of carriers' accounts of this commission, on or before April 1, 1915, for approval, a statement of the proposed methods of compiling the information required.

If carriers can more readily furnish the desired information by a system than by roads, they should so indicate to the commission, requesting authority to make the returns by a system and advising the names of the roads to be included in their system returns.

Australia's Interstate Strategic Railway.—At Melbourne recently, Mr. Fisher (the Commonwealth Prime Minister) stated that he would submit to parliament as soon as possible the question of constructing a strategic railway from Port Augusta to Brisbane. The probable cost of the railway will be £20,000,000.

Indian Coal.—The quantity of coal carried over the East Indian Railway in the six months ended September, 1914, was 5,317,982 tons. This total was made up as follows: Carried for other Indian lines, 1,015,117 tons; carried for the East Indian undertaking, 564,892 tons; carried for the public, 3,737,073 tons. The corresponding movement in the six months ended September, 1913, was 5,153,762 tons. The up-and-down coal traffic for railways and the public in the half-year ended September, 1913, was 4,752,190 tons, as compared with 4,620,229 tons. The outbreak of the war had an adverse effect upon Indian coal traffic, and crippled for a time export business from Calcutta docks. This caused a diversion of large quantities of coal for Bombay, and also of some for Karachi, to the all-rail route. The quantity of coal exported from Calcutta by sea during the half-year ended September, 1914, was 1,287,934 tons, as compared with 1,421,869 tons in the half-year ended September, 1913. Of the coal thus exported the East Indian carried 1,040,342 tons and 1,036,028 tons, respectively. The output of coal at the East Indian Company's collieries in the half-year ending September, 1914, was 332,919 tons (of which 265,206 tons were steam coal), raised at an average cost of 56 cents a ton at the pit's mouth.—*Engineering.*

CHARLES C. McCHORD

Charles C. McChord, who was appointed a member of the Interstate Commerce Commission by President Taft in December, 1910, at the same time that B. H. Meyer was appointed a commissioner, has become chairman of the commission. The chairmanship passes each year from one member to another in order of seniority. The most noteworthy point about Mr. McChord's work on the commission is probably the fact that he was one of the two commissioners who were in the minority in the 1914 eastern rate advance case as originally decided by the commission. He and Commissioner Daniels expressed the opinion that the railroads should have been granted the increase in rates asked for. In substance the majority of the commission on the rehearing of the case came around to agree with Mr. Daniels' and Mr. McChord's point of view.

The following quotations from Mr. McChord's dissenting opinion are of interest as showing his grasp of the rate situation:

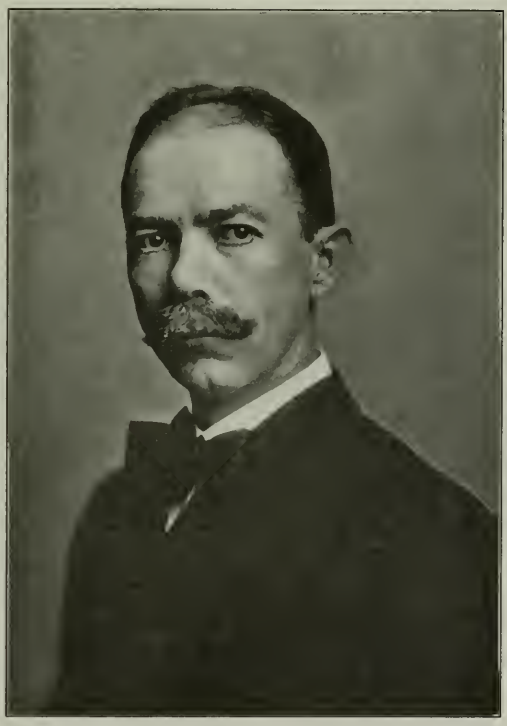
"To disallow an increase in the joint through rates and at the same time allow an increase in Central Freight Association territory to and from the Ohio river gateways would have the effect of allowing increased locals to Central Freight Association lines on this through traffic at the expense of their southeastern connections, who would be expected to shrink their earnings to the extent the Central Freight Association lines increased theirs. . . .

"Within each territory are some of the greatest commercial centers of the country, each in active competition with the other in the purchase and sale of raw materials and manufactured products. For many years the rates between these cities have borne a fixed and well understood relation each to the other. Commercial conditions have, to a considerable extent, come to be based upon this relationship, and insofar as is shown by this record, it appears to have given general satisfaction. It must follow that any general increase of rates within Central Freight Association territory alone will change the rate relationship as between cities in that territory and cities in trunk line territory, perhaps to the advantage of the latter.

"Viewed from a commercial, geographical, or transportation standpoint, and in the light of the facts of record, I am convinced that the reasons which impelled the commission to approve certain changes in Central Freight Association rates apply equally to trunk-line rates, and that the transportation conditions in the two territories are not absolutely so much unlike as to indicate the wisdom of dissimilar treatment of the rates proposed by the carriers in the entire official classification territory."

Before becoming a member of the Interstate Commerce Commission Mr. McChord had served as chairman of the Kentucky Railroad Commission. While a member of the Kentucky state senate, in which he served four years, Mr. McChord framed the bill popularly known as the McChord Railroad Law, which gives the Kentucky Railroad Commission the right to make reasonable freight and passenger rates for railroads. Mr. McChord is a democrat.

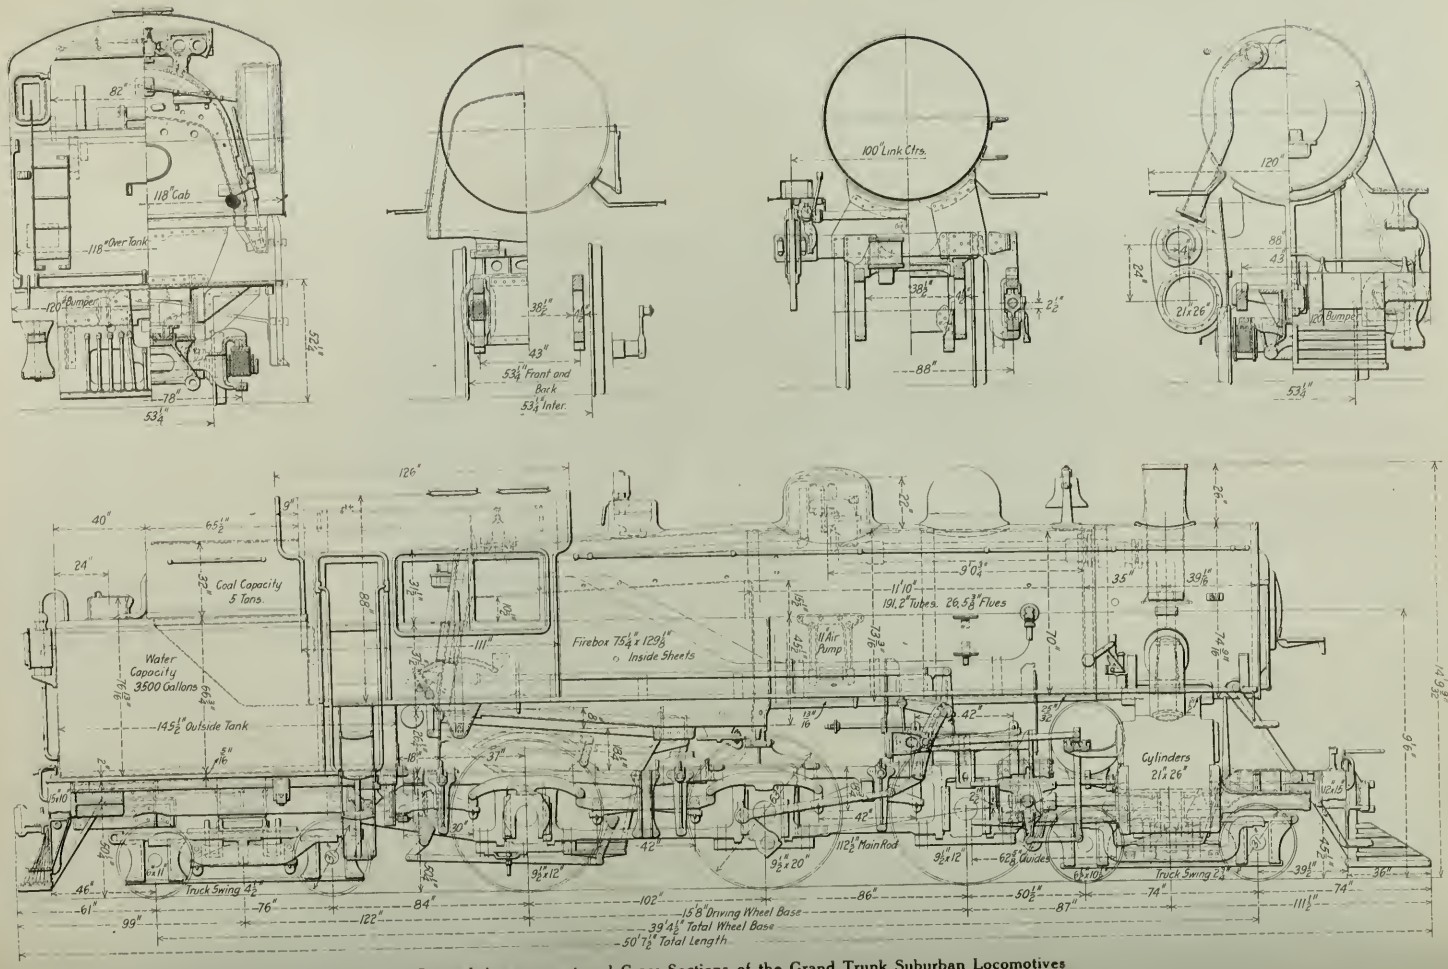
Charles C. McChord was born on December 3, 1859, at Springfield, Ky. He received his education at Center College, Danville, Ky. After graduation he became a member of the bar of Kentucky and practiced law in that state. He was made prosecuting attorney at Springfield, Ky., holding this office from 1886 to 1892. He was appointed a member of the Kentucky Railroad Commission in May, 1892, and was elected chairman of the board. He resigned in 1895 and was elected a member of the Kentucky state senate, serving for four years. In 1899 he was again elected a member of the state railroad commission and was again made chairman of the board. He was re-elected commissioner and chairman in 1903, and in 1910 was appointed by President Taft a member of the Interstate Commerce Commission.



Charles C. McChord

A New Central African Railway.—The Central Africa Railway is now approaching completion. The line extends from Port Herald in the British colony of Nyasaland to Chindio on the Zambesi river in Portuguese East Africa, a distance of 60½ miles, and is practically a continuation of the Shire Highlands Railway. This extension, together with the transport facilities provided by the British Central Africa Company's flotilla of steamers to Chindio, will considerably assist in accelerating the development of Nyasaland, where the soil is rich in agricultural and mineral wealth. The line is laid to the standard African gage of 3 ft. 6 in., with 60-lb. rail laid on steel ties. The contract for the construction of the line was let in April, 1913. No engineering difficulties were met with the exception of the bridge over the Zui-Zui river. This bridge consists of 38 through spans, the piers being 56 ft. apart center to center. The main girders are of plate girders and are carried on screw pile piers and abutments, each pier consisting of a cluster of six steel piles braced together. The successful construction of this bridge and other structural works, with the aid of the native labor, under climatic difficulties is a severe test of British engineering skill, endurance and supervision. At Chindo, arrangements for dealing with traffic to and from the river steamers, which consists largely of maize, cotton, sugar and tobacco, are being provided, including a passenger station building, sidings, freight houses, etc.

Hospital Trains in Germany.—Up to the present German private individuals and associations have established 75 hospital trains, which have been added to the medical corps of the army. These trains have an average capacity of 280 soldiers, cost approximately $25,000 each and are equipped in accordance with the latest achievements of the medical art.



General Arrangement and Cross Sections of the Grand Trunk Suburban Locomotives

Grand Trunk Locomotives for Suburban Service

Increased Traffic With Heavier Cars Resulted in Adoption of the 4-6-4 Type in the Montreal District

Six 4-6-4 type suburban passenger locomotives have recently been delivered to the Grand Trunk by the Montreal Locomotive Works. These engines have been placed in service between Montreal and Vaudrieul, a distance of 24 miles, and between Montreal and St. Hyacinthe, a distance of 37 miles. Where suburban traffic is frequent, locomotives of this type can be used to good advantage and delays caused by turning the locomotives are eliminated.

The suburban traffic out of Montreal on the Grand Trunk was formerly handled by 4-4-2 type tank locomotives having 17 in. by 22 in. cylinders and a total weight of 128,600 lb. As this traffic increased Moguls and ten-wheeders with 20 in. by 26 in. cylinders were also used. The new suburban cars recently placed in service on this road weigh 137,000 lb., as compared with 75,000 lb. for the older class of cars. As it was also desired to increase the number of cars in a train, it became necessary to design a more powerful locomotive. Experience with this traffic and the different types of engines used influenced the railway officers in deciding on the present type for the new power. These engines are now hauling an

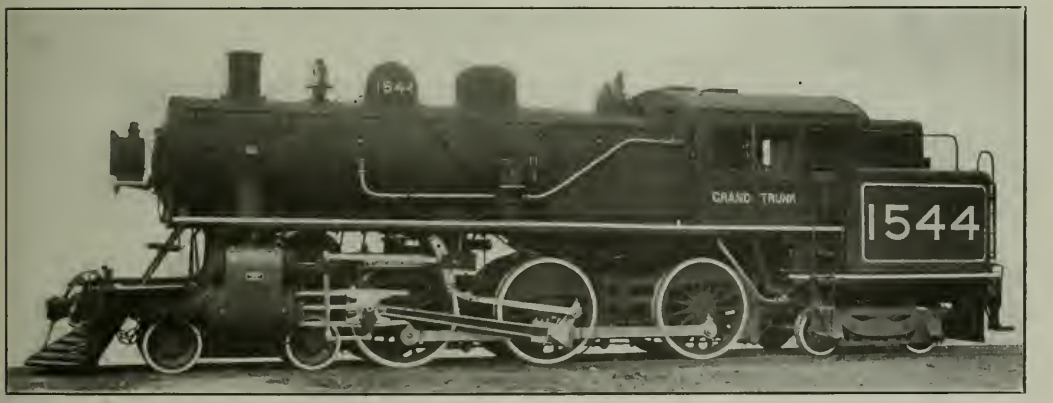
Driving, thickness of tires	3½ in.



Grand Trunk Locomotive for the Montreal Suburban Service

average train of seven cars, whereas trains of five cars were the average with the former power.

The design in general follows the standards of the builders. An interesting feature is the combination of the Gaines combustion chamber and a Security brick arch. This combination secures complete combustion, the back end of the firebox being more fully utilized with a resulting increase in the generation of steam; and the amount of smoke is reduced to a minimum, an important consideration in this kind of service. The leading truck is equalized with the drivers as it was not desired to have more than two systems of equalization. The Schmidt superheater is applied as well as outside steam pipes, self-centering valve stem guide, extended piston rod, the improved throttle lever bracket which has also been applied on the Mikado type locomotives for this road, long main driving box and vanadium steel main frames.

The principal data and dimensions are given in the following table:

General Data

Gage	4 ft. 8½ in.
Service	Suburban passenger
Fuel	Soft coal
Driving journals, main, diameter and length	9½ in. x 20 in.
Driving journals, others, diameter and length	9½ in. x 12 in.
Engine truck wheels, diameter	30½ in.
Engine truck, journals, diam. and length	6½ in. x 10½ in.
Trailing truck wheels, diameter	31 in.
Trailing truck, journals, diam. and length	6 in. x 11 in.

Boiler

Style	Straight
Working pressure	200 lb. per sq. in.
Outside diameter of first ring	71 9/16 in.
Firebox, length and width	129 in. x 75¼ in.
Firebox plates, thickness. Crown, ⅜ in.; tube, ½ in.; sides and back, ⅜ in.	
Firebox, water space	Front, 5 in.; back and sides, 4½ in.
Tubes number and outside diameter	191—2 in.
Flues, number and outside diameter	26—5½ in.
Tubes and flues, length	11 ft. 10 in.
Heating surface, tubes and flues	1,604 sq. ft.
Heating surface, firebox	173 sq. ft.
Heating surface, arch tubes	31 sq. ft.
Heating surface, total	1,808 sq. ft.
Superheater heating surface	347 sq. ft.
Equivalent heating surface	2,328.5 sq. ft.
Grate area	47 sq. ft.
Smokestack, diameter	15 in.
Smokestack, height above rail	14 ft. 9 in.
Center of boiler above rail	9 ft. 6 in.

Tender

Tank	Water bottom
Water capacity	3,500 gal.
Coal capacity	5 tons

*Equivalent heating surface = total evaporative heating surface + 1.5 times the superheating surface.

Supreme Court Decisions in Two State Rate Cases

The Court Holds That Each Class of Service Must Bear Its Share of Overhead Expenses and Yield a Return

The following is a very full abstract of the opinion of Justice Hughes in the so-called North Dakota coal case and West Virginia two-cent fare law case. The language of the opinion is preserved in the abstract:

By chapter 51 of the laws of 1907, the legislature of North Dakota fixed maximum intrastate rates, graduated according to distance, for the transportation of coal in carload lots. It was further provided that in case the transportation was over two or more lines of railroad it should be considered as one haul, the compensation for which should be divided among the carriers according to their agreement or, if they could not agree, as the railroad commissioners should decide subject to appeal to the courts. While the statutory rates governed all coal shipments, their practical application was almost solely to lignite coal.

The carriers refused to put the rates into effect, and claimed that the statute violated the commerce clause of the federal constitution, and also that it infringed the fourteenth amendment by fixing rates that were unremunerative, unreasonable, and confiscatory. The Supreme Court of the state, overruling these contentions. The Northern Pacific and the Minneapolis, St. Paul & Sault Ste. Marie have sued out these writs of error. The period to which the testimony relates is the fiscal year ending June 30, 1911.

THE FACTS TO BE CONSIDERED

The total revenue received by the Northern Pacific for the intrastate carriage of lignite coal for the fiscal year was $58,953. It was also deemed to be practicable to ascertain the amount of expense properly chargeable to this traffic.

With respect to the division of some of the items of expense (maintenance of way and structures, and taxes), there was no dispute, and, as to the others, the range of controversy was narrow. The company contended that the traffic in question produced at the statutory rates a loss of $2,254; the state insisted that it yielded a profit of $2,392. After a detailed analysis, the state court found the charges against the revenue received from the lignite traffic to be: (1) For train operation expenses, $30,850; (2) switching, $4,971; (3) station service, $4,183; (4) freight car repairs, renewals, and depreciation, $7,122; (5) traffic and general expenses (no loss and damage allowed), $1,456; (6) maintenance of way and structures, $7,120; (7) taxes, $2,424; making the total expenses, $58,126, and the surplus income, $828. The state court found that "such rate is slightly remunerative, but in fact non-compensatory, considering the volume of freight carried and the property of the railroad devoted thereto."

The state court regarded the statistics furnished by Minneapolis, St. Paul & Sault Ste. Marie as being in the main estimates without satisfactory bases. Still, on making an elaborate examination of the facts disclosed by the record—all the testimony adduced in the three cases being available in each one so far as pertinent—and on taking judicial notice of certain local conditions, the court was able to find sufficient proof to justify it in determining that under the statutory rates the intrastate transportation of lignite coal was conducted by this company at a loss. A large part of the traffic, after a short haul, was delivered to connecting carriers—the Northern Pacific and Great Northern lines—and the prorating of the statutory compensation for the entire haul operated injuriously. As to this part, said to be 'nearly half the lignite business,' this road was 'virtually a branch line of the other two railroads in accumulating for them their lignite traffic.' It was found, further, that the value of the railway property within the state had not been established, nor had the portion of value attributable to the intrastate business been determined; and, also, that the carriage of lignite coal increased 'the railroad expenses but 60 per cent of the usual statutory rate for the lignite haul,' that is, that this percentage of the rate covered the 'out-of-pocket cost' of the traffic, the remaining expenses in this view being such as would have been incurred had no lignite coal been transported.

The gross receipts from the intrastate traffic in question during the fiscal year were $83,670. The final results of the court's analysis in the case of this company are thus epitomized:

"Its total receipts amount to more than its actual out-of-pocket costs, or actual costs of transportation, but are from $9,000 to $12,000 less than the total costs including fixed and overhead expenses properly chargeable to the carriage of this commodity and against the earnings therefrom."

In answer to the contention of the state that the company could not be heard to complain with respect to the disadvantage of the prorating with connecting carriers, inasmuch as the basis was agreed upon without an appeal to the board of railroad commissioners, the court said that it was difficult to see what other basis could have been taken, and, further, that the result, in substance, would have been the same. The amount which could thus have been gained, it was said, would have been taken "from the net revenue of the Northern Pacific carrier principally," and would have been insufficient to have given to the Minneapolis, St. Paul & Sault Ste. Marie a net profit, so that "all the difference in fact would have been that both Soo and Northern Pacific would be then hauling this freight at less than the gross cost, including, of course, out-of-pocket and all fixed charges."

We understand that all the "fixed charges," to which the findings refer, are actual expenses which, while including taxes, do not include any return whatever upon the investment in the property whether by way of interest or otherwise.

The state court held that, after establishing the value of the property employed in the production of the net intrastate freight earnings, it must appear, in order to show confiscation, either (1) that such earnings are insufficient to yield a fair return upon that value and that the commodity in question is carried for less than what is sufficient to meet all expenses, including "out-of-pocket costs" and fixed charges, or (2) that the loss on the commodity under the rate attacked "reduces the balance of the net intrastate freight earnings" to a point where, including the loss on the commodity rate, they fail to yield such return.

And it was because their case failed to meet these tests that the plaintiffs in error were commanded to observe the rate.

DISTINCTION BETWEEN REGULATION AND OWNERSHIP

The general principles to be applied are not open to controversy. The railroad property is private property devoted to a public use. As a corporation, the owner is subject to the obligations of its charter. As the holder of special franchises, it is subject to the conditions upon which they were granted. Aside from specific requirements of this sort, the common carrier must discharge the obligations which inhere in the nature of its business. It must supply facilities that are reasonably adequate; it must carry upon reasonable terms; and it must serve without unjust discrimination. These duties are properly called public duties, and the state within the limits of its jurisdiction may enforce them. The state may prescribe rules to insure fair remuneration and to prevent extortion, to secure substantial equality of treatment in like cases, and to promote safety, good order and convenience.

But, broad as is the power of regulation, the state does not enjoy the freedom of an owner. The fact that the property is devoted to a public use on certain terms does not justify the requirement that it shall be devoted to other public purposes, or

to the same use on other terms, or the imposition of restrictions that are not reasonably concerned with the proper conduct of the business according to the undertaking which the carrier has expressly or impliedly assumed. If it has held itself out as a carrier of passengers only, it cannot be compelled to carry freight. As a carrier for hire, it cannot be required to carry persons or goods gratuitously. The case would not be altered by the assertion that the public interest demanded such carriage. The public interest cannot be invoked as a justification for demands which pass the limits of reasonable protection and seek to impose upon the carrier and its property burdens that are not incident to its engagement. In such a case, it would be no answer to say that the carrier obtains from its entire intrastate business a return as to the sufficiency of which in the aggregate it is not entitled to complain.

We have, then, to apply these familiar principles to a case where the state has attempted to fix a rate for the transportation of a commodity under which, taking the results of the business to which the rate is applied, the carrier is compelled to transport the commodity for less than cost or without substantial compensation in addition to cost. We say this, for we entertain no doubt that, in determining the cost of the transportation of a particular commodity, all the outlays which pertain to it must be considered. We find no basis for distinguishing in this respect between so-called "out-of-pocket costs," or "actual" expenses, and other outlays which are none the less actually made because they are applicable to all traffic, instead of being exclusively incurred in the traffic in question. Illustrations are found in outlays for maintenance of way and structures, general expenses and taxes. It is not a sufficient reason for excluding such, or other, expenses to say that they would still have been incurred had the particular commodity not been transported. That commodity has been transported; the common carrier is under a duty to carry, and the expenses of its business at a particular time are attributable to what it does carry. The state cannot estimate the cost of carrying coal by throwing the expense incident to the maintenance of the roadbed, and the general expenses, upon the carriage of wheat; or the cost of carrying wheat by throwing the burden of the upkeep of the property upon coal and other commodities. This, of course, does not mean that all commodities are to be treated as carried at the same rate of expense. The outlays that exclusively pertain to a given class of traffic must be assigned to that class, and the other expenses must be fairly apportioned. It may be difficult to make such an apportionment, but when conclusions are based on cost the entire cost must be taken into account.

It should be said, further, that we find nothing in the record before us, and nothing in the facts which have been set forth with the most careful elaboration by the state court, that can be taken to indicate the existence of any standard whatever by reference to which the rate in question may be considered to be reasonable. It does not appear that there has been any practice of the carriers in North Dakota which affords any semblance of support to a rate so low. Whatever inference may be deduced from coal rates in other states, as disclosed by the record, is decidedly against the reasonableness of the rate. And it may be added that, while the rate was found to be compensatory in the case of the Great Northern, this was distinctly shown to be due to the peculiar conditions of the traffic over that road, the differences with respect to which were fully detailed by the state court. Nearly 90 per cent of the total intrastate traffic in lignite coal upon the three roads was over the lines of the plaintiffs in error. It is urged by the state that the commodity in question is one of the lowest classes of freight. This may be assumed, and it may be a good reason for a lower rate than that charged for carrying articles of a different sort, but the mere grade of the commodity cannot be regarded as furnishing a sufficient ground for compelling the carrier to transport it for less than cost or without substantial reward.

The state insists that the enactment of the statute may be justified as "a declaration of public policy." In substance, the argument is that the rate was imposed to aid in the development of a local industry and thus to confer a benefit upon the people of the state. The importance to the community of its deposits of lignite coal, the infancy of the industry, and the advantages to be gained by increasing the consumption of this coal and making the community less dependent upon fuel supplies imported into the state, are emphasized. But, while local interests serve as a motive for enforcing reasonable rates, it would be a very different matter to say that the state may compel the carrier to maintain a rate upon a particular commodity that is less than reasonable, or—as might equally well be asserted—to carry gratuitously, in order to build up a local enterprise. That would be to go outside the carrier's undertaking, and outside the field of reasonable supervision of the conduct of its business, and would be equivalent to an appropriation of the property to public uses upon terms to which the carrier had in no way agreed. It does not aid the argument to urge that the state may permit the carrier to make good its loss by charges for other transportation. If other rates are exorbitant, they may be reduced. Certainly, it could not be said that the carrier may be required to charge excessive rates to some in order that others might be served at a rate unreasonably low. That would be but arbitrary action. We cannot reach the conclusion that the rate in question is to be supported upon the ground of public policy if, upon the facts found, it should be deemed to be less than reasonable.

The legislature, undoubtedly, has a wide range of discretion in the exercise of the power to prescribe reasonable charges, and it is not bound to fix uniform rates for all commodities or to secure the same percentage of profit on every sort of business. There are many factors to be considered—differences in the articles transported, the care required, the risk assumed, the value of the service, and it is obviously important that there should be reasonable adjustments and classifications. Nor is its authority hampered by the necessity of establishing such minute distinctions that the effective exercise of the rate-making power becomes impossible. The court, therefore, is not called upon to concern itself with mere details of a schedule; or to review a particular tariff or schedule which yields substantial compensation for the services it embraces, when the profitableness of the intrastate business as a whole is not involved.

But a different question arises when the state has segregated a commodity, or a class of traffic, and has attempted to compel the carrier to transport it at a loss or without substantial compensation even though the entire traffic to which the rate is applied is taken into account. On that fact being satisfactorily established, the presumption of reasonableness is rebutted. If in such a case there exists any practice, or what may be taken to be (broadly speaking) a standard of rates with respect to that traffic, in the light of which it is insisted that the rate should still be regarded as reasonable, that should be made to appear. As has been said, it does not appear here. Frequently, attacks upon state rates have raised the question as to the profitableness of the entire intrastate business under the state's requirements. But the decisions in this class of cases furnish no ground for saying that the state may set apart a commodity or a special class of traffic and impose upon it any rate it pleases, provided only that the return from the entire intrastate business is adequate.

It has repeatedly been assumed in the decisions of this court that the state has no arbitrary power over the carrier's rates and may not select a particular commodity or class of traffic for carriage without reasonable reward.

To repeat and conclude: It is presumed—but the presumption is a rebuttable one—that the rates which the state fixes for intrastate traffic are reasonable and just. When the question is as to the profitableness of the intrastate business as a whole under a general scheme of rates, the carrier must satisfactorily prove the fair value of the property employed in its intrastate business and show that it has been denied a fair return upon that value. With respect to particular rates, it is recognized that there is a wide field of legislative discretion,

permitting variety and classification, and hence the mere details of what appears to be a reasonable scheme of rates, or a tariff or schedule affording substantial compensation, are not subject to judicial review. But this legislative power cannot be regarded as being without limit. The constitutional guaranty protects the carrier from arbitrary action and from the appropriation of its property to public purposes outside the undertaking assumed; and where it is established that a commodity, or a class of traffic, has been segregated and a rate imposed which would compel the carrier to transport it for less than the proper cost of transportation, or virtually at cost, and thus the carrier would be denied a reasonable reward for its service after taking into account the entire traffic to which the rate applies, it must be concluded that the state has exceeded its authority.

The judgments, respectively, are reversed and the cases are remanded for further proceedings not inconsistent with this opinion.

THE WEST VIRGINIA CASE

In 1907, the legislature of West Virginia passed an act fixing the maximum fare for passengers on railroads, as described in the statute, at two cents a mile. After the rate had been tested by operating under it for two years, the plaintiff in error brought this suit to restrain its enforcement as being in violation of the constitution of the state, and also upon the ground that it was repugnant to the fourteenth amendment by reason of (1) its provision for penalties; (2) its classification of railroads, and (3) its alleged confiscatory requirements, through the reduction of the revenue from the traffic to less than a reasonable compensation. The validity of the statute, as construed by the state court, with respect to penalties and classification was upheld in *Chesapeake & Ohio* v. *Conley*.

The fundamental question presented is whether the validity of the passenger rate can be determined by its effect upon the passenger business of the company, separately considered. What has been said in the opinion in *Northern Pacific Railway Company* v. *North Dakota*, decided this day makes an extended discussion of this question unnecessary.

These considerations are controlling here. The passenger traffic is one of the main departments of the company's business; it has its separate equipment, its separate organization and management, and of necessity its own rates. In making a reasonable adjustment of the carrier's charges, the state is under no obligation to secure the same rate of return from each of the two principal departments of business, passenger and freight; but the state may not select either of these departments for arbitrary control. Thus, it would not be contended that the state might require passengers to be carried for nothing, or that it could justify such action by placing upon the shippers of goods the burden of excessive charges in order to supply an adequate return for the carrier's entire service. And, on the same principle, it would also appear to be outside the field of reasonable adjustment that the state should demand the carriage of passengers at a rate so low that it would not defray the cost of their transportation, when the entire traffic under the rate was considered, or would provide only a nominal reward in addition to cost. That fact, satisfactorily proved, would be sufficient to rebut the presumption of reasonableness; and if in any case it could be said that there existed other criteria by reference to which the rate could still be supported as a reasonable one for the transportation in question, it would be necessary to cause this to appear.

The passenger rate in question went into effect in May, 1907, and was observed by the company until about September, 1909, when under the terms of the interlocutory injunction in this suit the charge was increased to two and one-half cents a mile. There were, therefore, two fiscal years, June 30, 1907, to June 30, 1909, during which the company operated its road in West Virginia under the statutory rate. Evidence was introduced on behalf of the company showing the results according to its calculations. It was testified that the intrastate passenger receipts had been carefully ascertained. With respect to the operating expenses, it was said that for many years accounts had been kept for the purpose of separating the expenses incident to the freight and passenger traffic, respectively; that about 65 per cent of these expenses could be directly assigned, and that the remaining 35 per cent., consisting of items common to both sorts of transportation, were divided between the passenger and freight traffic on the basis of engine miles—this being deemed to be more equitable than the train-mile basis originally used, inasmuch as most of the freight was hauled by two engines. In practice, this method was assumed—in accordance with an early computation—to mean that 20 per cent of such items should be assigned to the passenger traffic; this, it was insisted, was a close approximation. Where a division of the road was partly in one state and partly in another the passenger expenses were apportioned according to track mileage. These expenses within the state having thus been ascertained, they were divided between the interstate and intrastate traffic upon the basis of the gross passenger earnings; that is, it was assumed that the cost of the interstate and intrastate passenger traffic was the same in relation to revenue. It was also testified that betterments were not included in expenses, and that the above-mentioned apportionment covered all the operating expenses, except taxes, the latter being apportioned to each class of business according to its share of the gross receipts.

It was stated that the intrastate passenger receipts which had been $362,998 in the fiscal year 1906-7* had fallen, notwithstanding a considerable increase in the number of passengers and passenger mileage, to $289,943 in the fiscal year 1907-8. The passenger expenses for the latter year, estimated according to the method above set forth, together with taxes, amounted to $275,520, leaving a net surplus of $14,423. In the following fiscal year, 1908-9, the intrastate passenger receipts were $281,865. This showed a reduction of $81,133, as compared with the fiscal year 1906-7, although there was a gain over that year of 1,567,374 in the passenger mileage. The expenses attributed by the company to the intrastate passenger traffic, including taxes, for the year 1908-9, amounted to $283,416.62, thus leaving a deficit in the passenger operations of $1,552.

In the receipts, as thus stated, there was omitted the revenue derived from the mail, express, news privileges and other items of passenger train earnings. Including this miscellaneous income, it appeared from the company's statement that the net return of the intrastate passenger business for the year 1907-8 was $18,355; in the year 1908-9, the inclusion of these items still left a deficit amounting to $616.

Criticizing the methods of apportionment adopted by the company, the state presented on its part elaborate calculations for the purpose of showing the effect of the rate. These calculations were based upon a painstaking analysis made by the state's expert accountant of the receipts and expenses disclosed by the company's records and accounts. For this critical study there were selected the months of November, 1909, and May, 1910, which the state's witness testified were typical with respect to the passenger business of the fiscal year ending June 30, 1910. The examination was made of the traffic on the Pocahontas and Kenova divisions of the road, which contained over 90 per cent of the total track mileage of the company in West Virginia, and the passenger traffic on which—according to passenger mileage—was stated to be over 97 per cent of the whole. The testimony was that the results of the analysis of the traffic on these divisions could be deemed to be fairly representative of the entire passenger business. The receipts of the intrastate traffic were adjusted to the two-cent fare basis; that is, according to the statutory rate as applied to the actual travel over the road. The state suggests that neither in its own calculations nor in those of the company was any account taken of the receipts from interstate passengers in West Virginia, but these were properly excluded. The company had kept on its books separate accounts

*Approximately eleven months of the fiscal year 1906-7 was under the former maximum fare of three cents a mile.

of the expenses of the freight and passenger business on the divisions above mentioned, but the state's expert did not accept the company's distribution. For example, on the Pocahontas division, the books showed passenger expenses in November, 1909, of $48,895; the witness for the state by his computations made these expenses $37,101. On the same division in May, 1910, the company's figures for passenger expenses were $51,886; the state's, $40,643. There were also similar reductions of considerable amounts on the Kenova division. It is not necessary to review in detail the methods thus used on the part of the state to apportion the various common items of expense—that is, after all items capable of direct assignment had been charged to the business to which they related. It is sufficient to say that instead of employing a general factor for the distribution of the outlays common to both kinds of traffic, freight and passenger, the state's witness divided each particular common item according to its character so as to make what was deemed to be a fair apportionment of that item. In this way, a variety of methods were employed which the witness described at length. After ascertaining the amount of the total expense considered to be attributable to the passenger traffic within the state, it was divided between the intrastate and interstate business; and for the most part—aside from the expenses of passenger stations—the division was made on the basis of passenger miles and without charging extra cost to the intrastate traffic.

By combining the results of the selected periods, it was shown that in the intrastate passenger business, according to the classification and apportionment adopted, the operating expenses and taxes consumed 97.4203 per cent of the total income.

This, in brief, was the result of the elaborate analysis presented by the state. There is no reason to suppose that either the periods chosen or the methods used were unfavorable to the rate. Included in the passenger business were the items of mail, express, excess baggage, etc.; the state did not present calculations as to the net return upon these items separately considered. When the state's expert who testified that he had undertaken to separate the cost of the express business, was asked on cross examination whether with these items omitted the actual cost of carrying intrastate passengers was not in excess of two cents a mile, he said that it would be difficult to answer without a separate analysis of the mail item, but added that "in rough computation" the cost was very close to two cents.

It is apparent, from every point of view that this record permits that the statutory rate at most affords a very narrow margin over the cost of the traffic. It is manifestly not a case where substantial compensation is permitted and where we are asked to enter the domain of the legislative discretion; nor is it one in which it is necessary to determine the value of the property employed in the intrastate business. It is clear that by the reduction in rates the company is forced to carry passengers, if not at or below cost, with merely a nominal reward considering the volume of the traffic affected. We find no basis whatever upon which the rate can be supported and it must be concluded in the light of the principles governing the regulation of rates that the state exceeded its power in imposing it.

The judgment is reversed and the case is remanded for further proceedings not inconsistent with this opinion.

Reduced Train Service in England.—The English railways have recently made considerable reductions in their train service because of the exigencies of war. These changes are expected to assist greatly in relieving the congestion and reduce the delays to ordinary traffic, which are caused by military movements. The modifications vary with the different lines and include important through trains as well as suburban trains. The reduced train service will save coal, about which one or two companies were becoming concerned. It is also reported that there was danger of a shortage of engines because work for the government is holding up repairs and because of the shortage of engine terminal forces.

ANTI-FULL-CREW LAW CAMPAIGN

R. L. O'Donnel, Chairman of the Executive Committee of the Associated Railroads of Pennsylvania and New Jersey reports that sentiment among business men of Pittsburgh is virtually unanimous for repeal of the excess man crew law, with amplification of the powers of the Public Service Commission to see that trains are properly manned, as proposed by the railroads. Many letters and petitions have been forwarded to Harrisburg bearing the names of influential men.

Among unemployed workers in the Pittsburgh section the figures issued by the railroads showing what the money now paid in wages to unnecessary trainmen would do in the way of giving employment, have created a distinct impression.

It is known, says Mr. O'Donnel, that a good many engineers and conductors employed by the Lehigh Valley and Jersey Central railroads have signed petitions asking for the repeal of the law. Such action is giving much concern to the trainmen's organization, and in several cases lodge officers have served notice on men who have so signed that unless they withdraw their signatures they will be expelled from the union. It is not believed that such harsh action will be actually taken.

An observer at Reading, Pa., reports that hot boxes, loose car doors and other out-of-order conditions which develop on freight trains are discovered more generally by signal tower operators than by the excess man in the train crew. For example, a signalman noticed and reported to the engineer that the twentieth car in a Reading freight train was being pulled with brakes set. Another case of a broken journal on a car ten back from the locomotive was similarly reported by a signalman, the trouble not being known to the train crew. These are but samples of the lack of attention on the part of the extra brakeman.

A few days ago a well-known business man of Reading took his station on an overhead bridge. He reports that a dozen freight trains passed beneath and that on not one of them was there a man visible except on the locomotive and in the caboose.

The Scranton (Pa.) Central Labor Union, upon motion by P. J. Shea appointed a committee to urge the editors of local papers to make no editorial comment against the law, the argument being that all the Scranton newspapers, with the single exception of the Scrantonian, a Sunday newspaper, of which S. J. McDonald, president of the Central Labor Union, is editor, were unfair to organized labor because they favored repeal of the law. The proposition to attempt to instruct the editors how to run their newspapers started a heated controversy and showed that the labor men are not in harmony on the question. Dennis Breslin made a heated reply to John A. Kane, of the Brotherhood of Railroad Trainmen, who suggested that labor should withdraw its support from the Daily News. Breslin asserted "that an editor has a perfect right to express an honest opinion on any question of moment." The trainmen have failed to make any effective answer to the statement of the full crew matter as being made by the railroads. Business men in Scranton are generally in favor of repeal of the law; though some are afraid to express themselves openly because of threats that union labor will boycott them.

One Pennsylvania senator says that he has two thousand letters and other communications, and that out of these only two were against repeal of the full crew law. A Philadelphia member of the House reports that when he went home last Sunday he found there about 1,500 letters which had been sent to his home address by constituents who wanted to make certain of reaching him. Some members are said to feel nettled at the mass of correspondence which has come upon them, but there is none who will publicly say that he has not been impressed by such expression and the unanimity with which it favors repeal of the law.

According to M. C. Kennedy, president of the Cumberland Valley Railroad, about half the entire number of voters of Franklin and Cumberland counties have signed petitions calling for repeal of the excess man crew law. In the state of Pennsylvania the Cumberland Valley employs, exclusive of those directly

engaged in train and yard service, 1,146 persons. After making the necessary allowances for employees under age and foreigners, 1,018 have signed this petition, being practically 100 per cent.

In addition to these employees, says Mr. Kennedy, 6,031 citizens of Franklin and Cumberland counties have so far signed the petitions. Mr. O'Donnel reports similar evidences of public sentiment in other parts of Pennsylvania.

F. M. Barker, assistant superintendent of the Lehigh Valley has given Chairman O'Donnel this little picture of real life: "To begin with, a through freight train is made up complete by the yard force, with air hose all coupled and tested.

"Then the engine backs down and the head trainman couples it to the train, while the rear trainman gets his markers and lights. The conductor in the meantime has checked his train and got his bills. The train starts.

"Then the only job the train crew has is to give some attention to running the train. This is usually done by the engineer from his side, the head trainman or fireman from the left side of the engine, while the conductor and rear trainman from opposite sides of the caboose give an occasional lookout. On arrival at end of the run, the head man cuts off the engine, the rear man takes care of the markers and locks the caboose, the conductor makes his reports.

"Ordinarily the extra trainman spends his time during the trip lounging in the caboose, there being no work for him to perform in the running of the train. It is contended that the extra man is of assistance when drawheads pull out. How infrequently this occurs appears in the fact that during January and February there were only nineteen such difficulties on our line between Coxton and Sayre. During that month there were 700 trains over that division."

F. R. Stevens, agriculturist of the Lehigh Valley, seeing on a helper engine a young fellow whom he had known as a farm hand getting $18 a month, asked him what he was doing there.

The man said, "I'm flagging." "What do you have to do?" Stevens asked. "O, just ride up and down the hill. When we get to the top, I turn the switch and let the helper in on the siding, set it again to let the train go by, then open it again for us to back out, close it, jump aboard and go back." "Well, that's not very hard work," Mr. Stevens said, and the flagman replied: "No, but it's easy money. I get $5 a day as a rule, and today I pulled down $7.50."

Figures prepared for use of Mr. O'Donnel's committee show that not one man in ten of the great army of railroad employees are trainmen. On June 30 last the Pennsylvania had in its service 110,686 men. Of these only 10,419, or 9.4 per cent were trainmen other than engineers, firemen and conductors. The average daily wage of these trainmen was $3.40; that of the whole body of employees, $2.82. The effect of the full crew laws is to give easy jobs to about one in each one hundred of present railroad employees.

DEBATE AT JERSEY CITY

The debate between a representative of the Pennsylvania Railroad and F. P. Boland, who is a member of the New Jersey legislature (and also is a brakeman of the railroad) which was announced in the *Railway Age Gazette* of March 5, page 400, came off on the evening of March 12, at Elks' Hall, Jersey City, N. J.; but neither side brought out any facts of importance not already well known. There was a large audience, which, judging by the applause, was in sympathy with Mr. Boland.

Each speaker was allowed 50 minutes, and each used his time in two installments. Mr. Boland, who spoke first, termed the railroads' campaign of publicity a campaign of misrepresentation. Mr. Fackenthall said that the law was an arbitrary one; that its operation was unfair to the railroads, and that it was enacted not in the interest of railroad employees but to provide jobs for a certain class of men. He compared the work now done by brakemen with that done in the days of the link and pin, and said that it was not right, after the employees had gone to the legislature and obtained laws requiring automatic couplers and automatic brakes, which decreased the work of a brakeman 75 per cent, to ask also for a law requiring an additional brakeman.

Mr. Boland, on continuing the argument, insisted that the law was for economic betterment. He said that under modern conditions brakemen had more work and responsibility rather than less. He mentioned certain cases in which he claimed that the additional members of the crew had prevented accidents. Mr. Fackenthall retorted that the full train crew law had no more to do with preventing some of the wrecks mentioned than had he himself. He condemned the practice of railroad employees going to the public service commissions or the legislature so often; the men would be in a much stronger position if they kept these matters out of the hands of the politicians and did the fighting themselves. Neither side was prepared with any accurate or full statistics, nor was there any effective marshalling of the weighty facts either for or against the law.

A good deal of the discussion consisted of irrelevant questions. For instance, Mr. Boland wanted to know why, in statement No. 1, issued by the Committee, it was stated that in the first half of 1914 two passengers were killed on the Pennsylvania Railroad, while in the bulletin previously issued by the road it was stated that 189,167,326 passengers were carried without any being killed. The answer is that the two passengers killed last year lost their lives falling from trains, a fact given in the statement. With equal clearness it was stated in the bulletin that no passenger was killed in a *train accident*. Mr. Boland also demanded an explanation of the statement that last year the laws forced a waste of $2,000,000 in Pennsylvania and New Jersey, when the Pennsylvania Railroad had given the figures as $1,702,407. The answer is that $2,000,000 was a general statement. There are now employed on eighteen roads in the two states 2,299 excess brakemen, whereas these same railroads, when the laws took effect, were compelled to add 2,819 men to train crews.

CRITICISM BY GOVERNOR FIELDER

Governor Fielder of New Jersey, replying to inquiries, says that he doubts the propriety of passing the repeal bill introduced by Assemblyman Stevens. He says: "I am receiving many letters on this subject (as well as petitions), making it apparent that the signatures therefor are being solicited. I suspect that many who sign them know little or nothing of the reason for the present law. . . . This bill provides that the Public Utility Commission shall have power to require any railroad doing business in this State, to determine the number of trainmen to be hired to operate such trains and that the commissioners may make rules and orders for the operating of such trains, as they may deem needful.

"If you will read the words carefully you will observe that the Utility Commission is not given the slightest power to specify the number of men necessary on trains. All that the bill proposes is to give the commission the foolish right to require the railroads to determine such number. Moreover, because the bill refers only to companies doing business in this State I am afraid it would not apply to those doing interstate business. . . ."

Chairman R. L. O'Donnel, replying to the Governor, says that the desire of the railroads is to amend the statutes so as to put in the hands of the Public Utilities Commissioners the power to fix train crews. The railroads reiterate their perfect good faith in this matter. They will welcome any suggestions from Governor Fielder which will result in making the terms of the bill clear and explicit. If he will suggest a better and fairer method the railroads will welcome that.

Swedish State Railways and Coal.—It is reported that owing to the scarcity of coal the administration of the Swedish state railways has been obliged to inform the private railways that it will no longer be in a position to supply them in case of emergency.

General News Department

The Canadian government, confronted with the continued refusal of the Grand Trunk Pacific to operate the National Transcontinental Railroad, which extends 1,500 miles from Moncton, N. B., to Winnipeg, Man., announces that to prevent the destruction of the road bed and track by flood and frost, preparations are being made to organize forces to take care of the property, and, probably, to establish a regular train service.

Governor Johnson of California has started a movement for the purchase of the Western Pacific, now in the hands of receivers, by the state of California. The governor is quoted as saying, "It is my idea that with California owning and operating a great transcontinental railroad the state will always be assured of commercial freedom." A memorial to Congress requesting it to take action toward the purchase of the road by the federal government has been introduced in both the House and Senate of the California legislature.

Patrick W. Mulligan, crossing watchman of the Pennsylvania Railroad at Norristown, Pa., is the recipient from the President of the United States, of the sixteenth medal, awarded under the act of Congress, providing for such medals, for heroism in the railway service. He saved the life of a little girl at his crossing August 19, 1914. The girl, three years old, ran beneath the gate in front of a train. Mulligan jumped for the child and pulled her off the track; but both were struck by the engine and somewhat injured.

Ralph Peters, chairman of the committee on railway mail pay, has issued a leaflet replying to newspaper reports emanating from Washington, and credited to Chairman Moon, containing misleading statements relative to the action of Congress in refusing to act on the appropriations for the post office for the next fiscal year. The Senate, says Mr. Peters, in refusing to pass the appropriation bill with the Moon rider attached, took a righteous stand against an almost undisguised effort at confiscation. The Moon amendment not only gave the postmaster general full power to reduce the payments made to the railroads, but provided a penalty of $5,000 a day for refusal on the part of carriers to perform mail service on the terms and conditions named by the postmaster general. Mr. Moon is quoted as saying that the information presented by his committee to Congress had cost the government $600,000; but Mr. Peters says that the total was not over $26,000, and this included other matters besides. At the same time the railroads, to furnish the information called for by the post office department, have spent approximately $250,000. Denying Mr. Moon's statement, Mr. Peters quotes the report of the Bourne committee to the effect that the mail earnings of the railroads, on the basis of car miles, are decidedly lower than from the express traffic. Mr. Bourne, in his report, added that there had been "an amazing amount of reckless assertion on this subject." Chairman Moon announces that he intends to introduce his railway mail pay bill again in the next Congress; but Mr. Peters, calling on all railroad officers to co-operate with his committee, declares that the efforts for a just and equitable basis of pay will be continued until the matter has been fairly adjusted.

New York Central Claim Department

The removal of the freight claim offices of the New York Central from New York City and from Cleveland to Buffalo where the two organizations are to be consolidated, is now going on, and after this week communications are to be sent to the new office. R. L. Calkins, freight claim agent, retains his office in New York City, and the office in Buffalo will be in charge of J. K. Lovell, assistant freight claim agent.

Coincident with the reorganization, the company will establish district freight claim agencies at New York, Albany, Syracuse, Rochester, Buffalo, Cleveland, Toledo and Chicago. The district agents will deal with claims where settlement can be better facilitated by prompt conference with claimants, and will have authority, within certain limits, to pay claims.

Claims on account of coal traffic are not sent to Buffalo, but, for the territory east of Buffalo, to the coal traffic manager, New York City, and for territory west of Buffalo to the general coal and ore agent, Cleveland.

Disastrous Train Wreck in Spain

A press despatch from Madrid, March 11, reports the derailment in the province of Asturias of a passenger train running from Vigo to Madrid, by a rock which had fallen on the track from a mountain. Eighteen persons were killed and a large number injured.

Proposed Railway Legislation

A bill before the New Hampshire legislature requires railroads in all cases to provide platform cars with stakes, when stakes are necessary, to hold loads of lumber. The bill has been passed by the lower House and is expected to pass the Senate.

The legislature of Michigan has under consideration a bill, introduced by Mr. Person, to transform the railroad commission into a public utilities commission, giving it authority over gas companies, electric lighting, and heating companies, and water power utilities.

The upper house of the Ohio legislature has passed by a unanimous vote a bill, introduced by Senator Winans, requiring railroads to file notices of proposed increases in freight rates thirty days before the new tariffs are to take effect; and authorizing the Public Utilities Commission to suspend increases pending investigations.

The New Jersey legislature has rejected a bill, introduced by Mr. Hunter, requiring railroads to protect grade crossings with a greater degree of care than at present by providing flagmen, gates and bells, and taking other precautions. One feature of the bill required that in any suit for injuries at a crossing the question of contributory negligence on the part of the person injured should, under certain conditions, be abolished as a legal defense for the railroad.

Damage-Suit Fraud Exposed

A unique phase of the "damage suit industry," which has worked great injury to the railroads of the south, was recently uncovered by the Morgan's Louisiana & Texas (Southern Pacific) in Louisiana; and the damage suit lawyers, ambulance chasers and jury fixers for once got a lesson. The case was tried in the Federal Court at New Orleans.

William Hoke, a negro of Birmingham, Ala., boarded a midnight train out of New Orleans for Morgan City, La. Apparently he was alone, but he had an accomplice, one Reynolds, who was afterwards used as his principal witness. Hoke slipped on the proverbial banana peel in the aisle of the colored coach, and the crash of his fall was immediately followed by groans of agony. Medical examination showed dislocation of the hip and subsequent history of the case marked a continuation of the injury and a permanent shortening of the limb by some three inches. The unlawful location of the banana peel in the aisle, the testimony of the witness and the apparently complex and permanent injury led his counsel, one of the ablest lawyers of the state, to file suit for $65,000. Hoke testified, denied, affirmed, etc., with great readiness, and his attitude during the trial stamped his as a most extraordinary negro.

But certain phases of the case had aroused the suspicions of the claim agent, and he collected evidence that Hoke was a professional in his line, and had victimized some eighteen railroads and accident insurance companies in the past few years, sometimes using a most remarkable and freakish ability to throw his right hip from its socket and thereby create a shortening of the limb, a condition not easily detected and deceptive even to those of the medical profession who examined him. Hoke on being confronted by seven or eight claim agents of companies

with which he had previously conducted similar negotiations, finally admitted having received various sums of money from them, in compromise. By the careful work of the claim agent these witnesses were produced unexpectedly and without the issuance of a subpoena.

Reynolds, Hoke's companion, had operated with him on several of his "accidents," in this particular case being personally responsible for the location of the banana peel in the aisle, and, of course, the only eye witness to the fall.

Following the entering of mistrial, the facts were reported to the United States Department of Justice, who caused Hoke's arrest. He was indicted on a charge of perjury January 23, and after trial was sentenced March 6 to eighteen months' imprisonment at Atlanta.

Operating Revenues and Expenses of Express Companies for November

The following statement, which is subject to revision, has been compiled by the Interstate Commerce Commission from the monthly reports of operating revenues and expenses of the principal express companies for November, 1914. (The express companies have three months in which to make reports.)

A—For the Month of November

Item	Adams Express Co.		American Express Co.		Canadian Express Co.		Globe Express Co.		Great Northern Express Co.

The Seamen's Law

The "Seamen's bill," which became a law March 4, regulates the employment of men on ocean-going vessels and on those navigating the Great Lakes, but not those on bays; but even as it is it bears heavily on the lines traversing Long Island Sound and those between Buffalo and Chicago and Duluth. The operation of a large steamer on the Sound will cost, it is estimated, $2,000 a month more than at present. The manager of a lake passenger line estimates that the law will increase his running expenses 200 per cent. It will be utterly impossible for all lines to provide, in season, the additional equipment required. The law itself is confusing as to dates. It goes into effect eight months after its passage, yet another section says that the new equipment must be provided by July 1, 1915.

Senator Burton, of Ohio, is quoted as saying that if the European countries were not fighting among themselves they would be ready to go to war with us because of the breaking of treaties that will be necessitated if this law is carried out. While the bill, as adopted, is in some respects less drastic than when it was under discussion a year ago it still retains so many unworkable, not to say outrageous features that shipping interests are almost in a panic. The Department of Commerce is being flooded with letters and telegrams from ship owners asking how they are going to avoid the destruction of their business. A representative of the Pacific Mail Steamship Company is quoted as saying that his line will not be able to compete with Asiatic lines in the trans-Pacific trade. The number of able seamen required to man the life-boats is far beyond the number required for actual service on any modern steamship. A typical Sound steamer carries 70 life-boats and has 10 licensed officers. Ordinarily, she carries from 10 to 12 able seamen. Other boats are provided for by the use of firemen and waiters. There is no possible use, it is claimed, for more than a dozen seamen aboard such a vessel. Under the new law, however, this steamer must add to her crew 40 able seamen for whom there is no deck work whatever. Each able seaman will get about $40 a month.

At first, the ship owners figured that they could save the cost of many additional seamen or officers by enlarging the size of lifeboats, but there is the provision that no such auxiliary craft can be carried of a size larger than can be operated by hand.

The government is confronted with the task of examining, between now and July 1, some 30,000 employees aboard vessels

engaged in coastwise and foreign trade in order that they may be licensed as "certified boatmen."

The rigid regulations concerning lifeboats are relaxed somewhat in warm weather. Between May 15 and September 15, vessels operating on routes less than 20 miles off shore would be required to carry equipment in boats and rafts for only 70 per cent of the passengers. Of this equipment, 50 per cent may be in lifeboats and 50 per cent in rafts. Vessels on the Great Lakes using routes more than three miles off shore between May 15 and September 15, must have equipment in boats and rafts for 50 per cent of the persons on board, two-fifths of which must be in lifeboats. Vessels on the Great Lakes on routes less than three miles off shore are to remain, as at present, subject to regulations of the Department of Commerce regarding accommodations in lifeboats, etc. For each boat or raft an officer or able seaman, with a number of certified lifeboat men, i. e., men from any department of the crew holding certificates of efficiency from the Department of Commerce, varying from 3 to 7 and beyond that point in the ratio of one additional lifeboat man for every 50 persons would be required. Rafts carrying less than 15 persons need not be in charge of an officer or able seaman, but the number of rafts of this type could not exceed 50 per cent of the raft equipment of a vessel.

Arbitration of Engineers' and Firemen's Demands

W. J. Lauck, statistician for the engineers' and firemen's brotherhoods, and a number of engineers and firemen employed on Western roads, continued the rebuttal testimony of the enginemen before the board of arbitration at the hearing in Chicago throughout last week and the early part of this week. Mr. Lauck continued his statistical testimony, including the presentation of an exhibit showing that 837 engineers for 3,418 months received average monthly earnings of $143.17, but after cross-examination it was shown that he had omitted engineers in passenger service, whose average earnings are much higher. Another table purported to show what the earnings of engineers would have been had they worked the same number of hours as brick masons, plasterers, steam fitters or plumbers. This table showed that the skilled artisans earned much more per hour than the engineers. This exhibit was based on hourly rates of wages in large cities where the men are best organized and where the wage scales are high.

"I see by your table that W. J. Devlin, of Medicine Hat, a freight engineer on the Canadian Pacific, would have earned $2,223.36 in 1913 on the basis of his wages in October of that year," said Attorney Sheean. "How much would he have earned as a plumber at Medicine Hat?" Mr. Lauck admitted that his figures applied only to the large cities, which furnished the basis of his compilation.

A number of firemen were put on the witness stand to testify as to the amount of coal shoveled, to offset testimony introduced by the railroads earlier and based on actual stopwatch tests; but most of the testimony was not capable of comparison with the figures produced by the railroads.

Air Brake Association

The twenty-second annual convention of the Air Brake Association will be held at the Hotel Sherman, Chicago, on May 4-7, 1915. The following is a list of the subjects to be discussed at the meeting: Accumulation of Moisture and Its Elimination From Trains and Yard Testing Plants; Adequate Hand Brakes on Heavy Passenger Equipment Cars; Need of Efficient Cleaning and Repairing of Freight Brakes; What Shall We Do to Improve the Present Pneumatic Signal Device?; Difficulties the Railroad Companies Encounter in Endeavoring to Run 100 Per Cent Operative Brakes in Freight Train Service; M. C. B. Air Brake Hose Specification and Recommended Practice. The afternoon of May 6 has been set aside for a series of air brake lectures, delivered by representatives of the Pittsburgh Air Brake Company, Westinghouse Air Brake Company, New York Air Brake Company and possibly the Automatic Straight Air System, each speaker being limited to one hour. The practice inaugurated at the last convention of giving one afternoon to the manufacturers' representatives for exploitation of their devices will be followed this year also, and May 4 has been assigned for the purpose.

MEETINGS AND CONVENTIONS

The following list gives the names of secretaries, dates of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

American Association of Demurrage Officers.—A. G. Thomason, Demurrage Commissioner, 845 Old South Bldg., Boston, Mass. Annual convention, March 23, 1915, Jefferson Hotel, Richmond, Va.

American Association of Freight Agents.—R. O. Wells, Illinois Central, East St. Louis, Ill. Annual meeting, May 21-24, 1915, Richmond, Va.

American Association of Passenger Traffic Officers.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Next meeting, April 15-16, San Francisco, Cal.

American Railway Association.—W. F. Allen, 75 Church St., New York. Next session, May 19, 1915, New York.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

Association of American Railway Accounting Officers.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Piedmont Hotel, Atlanta, Ga.

Association of Railway Claim Agents.—C. W. Egan, B. & O., Baltimore, Md. Annual meeting, May 19, 1915, Galveston, Tex.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton, Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

International Railway Fuel Association.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago. Annual meeting, May 17-20, 1915, Hotel La Salle, Chicago.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May 25 to 28, 1915, Chicago, Ill.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Railroad Master Tinners, Coppersmiths and Pipefitters' Association.—U. G. Thompson, C. & E. I., Danville, Ill. Annual meeting, May, 1915.

Railway Storekeepers' Association.—J. P. Murphy, L. S. & M. S., Box C, Collinwood, Ohio. Annual meeting, May 17-19, 1915, Hotel Sherman, Chicago.

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

Salt Lake Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.

Toledo Transportation Club.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of Newark.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, Newark.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meetings last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Transportation Club of Detroit.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

Western Canada Railway Club.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF JANUARY, 1915

Name of road.	Average mileage operated during period.	Operating revenues			Operating expenses							Net operating revenue (or deficit).	Railway tax accruals.	Operating income (or loss).	Increase (or decr.) comp. with last year.
					Maintenance

*Merged with the New York Central Railroad Co.

Traffic News

The new rate for mileage tickets, 2¼ cents a mile throughout the state of New Hampshire, went into effect March 9.

The spring meeting of the National Industrial Traffic League will be held at the Hotel Chisca, Memphis, Tenn., on April 8 and 9.

The Michigan railroads have published page advertisements in the newspapers of the state, reprinting letters from the lieutenant-governor, secretary of state, state treasurer, auditor general and other state officers, stating that if the claims of the railroads are substantiated the legislature should allow them to increase passenger fares.

A committee of passenger officers, including H. J. Phelps, general passenger agent of the Illinois Central; F. A. Miller, passenger traffic manager of the Chicago, Milwaukee & St. Paul; L. M. Allen, passenger traffic manager of the Chicago, Rock Island & Pacific; C. A. Cairns, general passenger agent of the Chicago & North Western, and L. M. Wakely, general passenger agent of the Chicago, Burlington & Quincy, has been touring the state of Iowa making addresses before commercial clubs, urging an increase in passenger fares in that state.

The Southern Railway, quoting from the annual report of its agricultural agent for 1914, says that in the 12 months the field agents of the company have given advice to about 100,000 farmers. They received detailed reports from 3,512 farmers covering 33,466 acres in cotton, 24,287 acres in corn and 11,383 acres in miscellaneous crops. The average yield of cotton per acre on fields cultivated in accordance with their advice was 1,255 lb. of seed cotton, as compared with 513 lb. in other fields: Average yield of corn 40.8 bu., as compared with 18.4 bu. in fields where their advice was not followed. Even in boll weevil territory many farmers averaged a bale or more of cotton per acre. The agricultural development work of the Southern is carried on in co-operation with the United States government and the agricultural agents of the states and counties. The work heretofore done for the development of live stock, dairying and poultry raising has been consolidated with the general agricultural work under the direction of the industrial and agricultural commissioner.

Proposed Increase in Freight Storage Rates in New York

C. V. Burnside, examiner for the Interstate Commerce Commission, continued on March 11 the hearing of complaints at New York against proposed increases in charges for storage and lighterage, and for handling heavy articles. S. W. Baker, of the American Locomotive Sales Corporation, said that the proposed increase in the charge for loading heavy freight would add $40 to the cost of delivering an engine to ocean vessels at New York City. It takes from three to eight days to get the parts of a locomotive from Schenectady to New York, and ten days' free time for unloading and delivery is necessary.

Michael Cohen, dealer in rough stone in large blocks, said that instead of charging him for delivery of stone by lighter to his docks, the railroads ought to increase the transportation rates on finished stone, which are not high enough in proportion to those for rough. The Fruit Despatch Company presented testimony to the effect that the proposed unloading charge would increase the expenses of its business in bananas more than $20,000 a year.

Express Companies Seek Rehearing

In accordance with the permission granted by the Interstate Commerce Commission, the Adams, American and Southern Express companies, and Wells, Fargo & Co. have presented a petition for a rehearing and modification of the general order of the commission, dated July 24, 1913, which put in force on February 1, 1914, greatly reduced rates. The order allowed the companies to report on their first year's business, with a view to the modification of the rates, if necessary.

The express companies say that the rates have now had a fair test and that they have proved entirely inadequate. They say that they have made a conscientious effort to make the rates a success. They have endeavored to obtain authority to make the order applicable in the several states so that there might be a uniform system of rates; they were successful in obtaining such authority in 39 states.

The companies also present figures, showing that in the ten months from February, 1914, to November, inclusive, gross earnings for the five companies, including the United States Express Company, which went out of business in July, declined $11,875,998, or from $125,313,003 to $113,437,004. The railroads lost $6,339,646 by reason of this shrinkage, while the express companies lost $5,556,643. As a result of loss in transportation revenues the five companies operated at a net deficit of $1,861,118 for the ten months, whereas, in the corresponding period of the preceding year, there remained a surplus of $718,619. The reports for December, 1914, and January, 1915, are not yet available, but will be given later. It is further shown that the loss ascribed to the new rates is even greater than appears, since the revenues as shown include earnings from operations other than transportation. The companies estimate that for the ten months non-transportation revenue amounted to $3,843,243 on which the profits were $899,685, and that if the revenue and expenses from this business are eliminated from the gross earnings, the net deficit for the ten months from the transportation of packages would be increased to $2,780,084.

The companies say that every available means has been adopted to increase efficiency, and that economy has been strictly practiced; also that the companies have made every possible effort to develop and obtain new and additional business to offset the reduction in revenue, and that as a result of these efforts and the reductions in rates the volume of business handled has substantially increased.

Notwithstanding such economies and the increase in the volume of business, the gross revenues of the companies have not been and will not be sufficient to enable them to continue their present standard of service, which standard cannot be impaired without serious injury to the shipping public.

It is pointed out that the three elements composing the rate structure proposed by the commission and now in effect are, first, a terminal allowance of twenty cents per shipment, which does not vary with the weight or distance; second, a weight allowance of twenty-five cents per 100 lb., which varies with the weight, but not with the distance; and, third, a haulage allowance for each fifty miles carried, which varies both with the weight and distance.

The express companies request permission to increase the terminal allowance from twenty to twenty-five cents per shipment, and to reduce the weight allowance from twenty-five to twenty cents per 100 lb., and asked for such further relief as the commission may deem proper. The companies believe that the changes requested would result in an increase of the gross revenue of the express companies of approximately 3½ per cent.

War Bonus for Scottish Railwaymen.—Something was said in the *Railway Age Gazette* of March 12, page 447, relative to the war bonus recently awarded to English railway men. As the result of a conference held in Edinburgh on February 20 between the managers of the Scotch railways and the representatives of the National Union of Railwaymen and the Associated Society of Locomotive Engineers and Firemen, the war bonus arrangement has now been extended to Scotland. The same basis has been adopted as in the case of English lines, i. e., wage-earning employees of 18 years of age and upwards in the grades embraced in the conciliation scheme. A bonus of 3s. (75 cents) a week will be paid to those whose rate of wages is under 30s. ($7.50) per week and 2s. (50 cents) to those whose rate of wages is 30s. and over, and it will date from February 15. The arrangement is to remain in force during the continuance of the agreement with the government, but is subject to review at the end of three months. When the government terminates the agreement with the railways the latter will give not less than two weeks' notice to the railwaymen's trade unions of the cessation of the bonus. The Scottish railways have made no announcement as to whether a bonus will be paid to men outside the conciliation scheme. Several of the English railways have already made such concessions. The railway employees in Ireland are also asking for increased wages and the Great Southern & Western and the Great Northern have already sanctioned special allowances.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Distribution of Coal Cars

McCoa Coal Company v. Coal & Coke Railway. Opinion by Commissioner McChord:

At this supplemental hearing the coal operators and the railway have submitted a statement showing the mine ratings which shall form the basis for the distribution of coal cars during periods of car shortage, which agreement being satisfactory to all concerned, is accepted by the commission. The commission also finds: During periods of car shortage, the allotment due any particular one of the four mines of the Davis Colliery Company shall be used by that particular mine, and should such mine countermand its order for cars on any day, such cars shall revert to the general supply. Cars which are partially loaded and remain over until the next day to be fully loaded shall be charged against the mine loading the same, as if such cars were empty. (33 I. C. C., 128.)

Rates to Coffeyville and Independence, Kans.

Coffeyville Mercantile Company et al. v. Missouri, Kansas & Texas et al. Opinion by Commissioner Hall:

The commission finds that the rates on classes and certain commodities to Coffeyville and Independence, Kan., from St. Louis, Mo., and points taking the same rates, or rates based thereon, from Chicago, Peoria, and other points taking the Chicago rates, and from points east of the Indiana-Illinois state line, made by combination on St. Louis are unreasonable and discriminatory. It is held that the class rates from St. Louis should not exceed the rates to Chanute and Parsons by more than differentials ranging from five cents on first class to two cents on class E, nor the commodity rates by differentials of two and one cent, respectively, on the commodities named, including beans, canned goods, coffee, etc. The rates from Chicago, Peoria and points taking the same rates are to be the present differentials over the rates here established from St. Louis. (33 I. C. C., 122.)

Bituminous Coal Rates to Baltimore and Other Points

Opinion by Commissioner Meyer:

The commission finds that the carriers have not justified proposed increased rates on bituminous coal from mines in Pennsylvania, Maryland and West Virginia to Philadelphia, Wilmington and Baltimore for trans-shipment to points inside the capes of the Delaware and Chesapeake bays. At present the rates on coal delivered over the piers for trans-shipment to points inside the capes are 25 cents a gross ton less than the rates for track delivery to industries or coal yards in these cities. It is proposed to narrow this difference to 18 cents by increasing the "inside the capes" rates seven cents a gross ton. The rates to Philadelphia on coal for trans-shipment to points outside the capes are 35 cents less, and to Baltimore 42 cents less than the rates for track delivery at those points.

The "inside the capes" rates are made lower so that carriers may reach by water industries or coal yards on the lines of their competitors. They have shrunk their inside the capes rates by the amount of the cost of boat service and discharge, so that the consignee of coal trans-shipped over the piers at Philadelphia, Wilmington, or Baltimore may obtain it at the same total transportation charge as the consignee of all-rail coal. The carriers allege that because of a decrease in the cost of boat service and discharge the present inside the capes rates are discriminatory against consignees taking coal all rail, and say that it was mainly to remove this discrimination that the suspended tariffs were filed.

The commission finds that this is an attempt to equalize conditions that are unequal. The advantage of the cheaper movement to the piers should be safeguarded to consignees who receive their coal in that manner. Since the rates apply on coal for trans-shipment by water, it is of importance that in determining their reasonableness, full consideration be given not only to the cost of delivery at the piers as compared with the cost of track delivery, but also to the cost of the entire service from the mines to the piers; but if the rail carriers be permitted to establish their rates in connection with water carriers upon a basis which will equalize shippers at various points along the waterway, they will absorb the benefit which should accrue to the public on a lower cost of water transportation.

Commissioner Harlan dissents on the ground that the carriers have fully justified the proposed increased rates. (33 I. C. C., 307.)

STATE COMMISSIONS

The New Jersey Board of Public Utility Commissioners has notified the Central Railroad of New Jersey that it will proceed to compel the road to abolish 24 grade crossings in the city of Elizabeth. A hearing will be held in Newark, May 10.

The New Jersey Public Utility Commissioners announce that they will refuse to approve the increases in passenger rates made by the railroads in that state at the time that commutation fares to and from Philadelphia were advanced a few months ago.

Hearing Before Texas Commission on Proposed Rate Advance

The Texas Railroad Commission began a hearing at Dallas on March 4, on the application of the railroads of the state for authority to make a 15 per cent increase in passenger fares. H. M. Garwood, general attorney of the Sunset-Central Lines, made an opening statement for the roads, in which he said that for more than 10 years it has been apparent to all authorities that the intrastate freight rates of Texas have been abnormally low and insufficient to yield a reasonable return upon either the amount invested or the actual value of the property by any known method of valuation, and that "the appalling spectacle is presented to the business world that for more than 20 years no investor in the capital stock of railroad property in the state of Texas has received one cent of return on his investment." For the year ending June 30, 1914, he said, the Texas carriers incurred a net corporate loss of $8,144,597, and that the net loss for the last seven years is $13,943,263, and that certainly the deficit for the year ending June 30, 1915, will be not less than $10,000,000. Several of the more important lines in the state are in receiver's hands and railway building in the state has ceased.

It would be shown, he said, that the bonded debt of the railways of Texas is the lowest in the world and less than half the average for the United States, and that the return on the valuation has been less than 2 per cent. Mr. Garwood said it was proposed to go more accurately into the cost of conducting the intrastate freight business than has ever yet been done, and that, using the Oklahoma plan, all of the operating expenses will be divided, first between the line expenses and the terminal expenses, and then the line expenses will be divided upon a basis of use between the passenger and freight expenses and the terminal expenses will then be divided between the two classes of service in the same manner. The total freight expense will then be divided between interstate and intrastate service upon the basis of use, and the value of the property devoted to the several services will also be divided. On account of the expense incident to this work this division has been made only by the Gulf, Colorado & Santa Fe and the Houston & Texas Central.

COURT NEWS

The Supreme Court of the United States announces that suits for reparation for overcharges on freight, when taken to the courts, must be presented within two years, which is the time prescribed by the Interstate Commerce Commission in its rules regulating the presentation of claims to the commission. The court makes this rule in the interest of uniformity.

The United States Circuit Court of Appeals, sitting at New Orleans, has affirmed the decision of the district court at Savannah, Ga., imposing a fine of $5,000 against Harvey C. Miller, a grain dealer of Philadelphia, for accepting a rebate of $5,000 on shipments of grain from Philadelphia to Jacksonville, Fla. The case was tried in February, 1913. It appears that the Merchants' & Miners' Transportation Company has paid a fine of $20,000 for its part in the same offence. Formerly there had been in effect a through rate on grain from western points, by

rail to Philadelphia, thence by water, in connection with which the steamship company's proportion was ten cents; but the Miller concern continued to enjoy the ten cent rate after this arrangement had expired, and the legal rate from Philadelphia to Jacksonville was fifteen cents.

Julius Kruttschnitt, chairman of the executive committee of the Southern Pacific, testified at San Francisco on March 10 and 11 in the suit of the federal government to separate the Central Pacific and the Southern Pacific railroads from each other. Mr. Kruttschnitt is quoted as saying that the Southern Pacific signed an agreement with the Union Pacific to sell the Central Pacific to the latter at a price of $104,000,000, under the compulsion and coercion of former Attorney-General Wickersham, who, he said, threatened him with a forced sale of the line if it were not sold to the Union Pacific. The California Railroad Commission, he said, prevented the conclusion of this agreement by refusing to approve the plan. Mr. Kruttschnitt said that the separation of the two roads would demoralize the Southern Pacific System and compel it to reproduce terminals which would cost $85,000,000. On the subject of government regulation he is quoted as saying "the government is a great big man wielding a great, big stick and the stick is growing bigger and being used oftener. The Interstate Commerce Commission is one man choking another man to death. Government management of enterprises is a failure."

In the United States District Court at Trenton, N. J., March 11, the Central Railroad of New Jersey was convicted, on 185 counts, of paying illegal rebates on shipments of coal made by the Lehigh Coal & Navigation Company. The suit was based on charges by the government that payments to the coal company of 23 cents a ton, in connection with trackage rights, amounted to a rebate on the transportation rate, which rebate was not specified in the published tariffs. All of the acts charged were committed in 1911, 1912 and 1913; but it is said that only a small part of the alleged offences discovered in the records were charged in the complaint. The attorney for the government estimates that these payments by the road to the coal company amounted to $500,000 a year. The indictment formed a book of 1,200 pages. The defense of the company was based primarily upon the agreement or contract entered into in 1871, under which the road acquired control of certain tracks then owned by the coal company. Under this contract the coal company was to receive a stipulated sum for each ton carried over the tracks in question. The road contended that such payments did not constitute rebates, but were, in fact, the payment of a rental to the navigation company. In its tariffs the road described the payments as "lateral allowances."

Costs of Successful Defendant

In an action against two railroad companies for injury to live stock where the plaintiff recovered against only one of the defendants, the Texas Court of Civil Appeals held that the costs of the successful defendant must be assessed against the plaintiff.—San Antonio U. & G. v. Storey (Tex.), 172 S. W., 188.

Injury to Passenger in Pullman Car Not Paying Extra Fare

The Missouri Court of Appeals in an action for injury by derailment, holds that a passenger who, for a temporary purpose of his own (in this instance, to wash his hands), enters a Pullman car forming a part of the train, without paying the extra fare for riding therein, he remains a passenger, and is entitled to protection as such.—Siegel v. Illinois Cent. (Mo.), 172 S. W., 420.

Personal Injuries—Excessive Damages

An engineman was injured by jumping from his engine to avoid a collision. He rolled about 35 feet and was stunned and badly scared. He called a physician the next day and said he was hurt about the back and shoulders, but not much. He consulted another physician who examined him, but did not prescribe, finding only a condition of nervousness, which might or might not have been caused by the accident. Osteopaths treated him for several weeks and relieved the soreness and stiffness. He made no claim for damages before bringing suit against the company. The Texas Court of Civil Appeals held that a verdict for $12,500 was so excessive as to show passion or prejudice of the jury and justifying the court in remanding the case.—Galveston H. & S. A. (Tex.), 172 S. W., 180.

Duty to Stop Train for Passenger

The greater weight of authority supports the rule that where a passenger, by reason of incorrect information of the carrier's employees, boards a train not scheduled to stop at the station for which he has a ticket, the carrier has a right to correct the mistake, and to require the passenger to alight at a regular stopping place, which is a suitable place, from which he may take the next regular train that does stop at his destination, and that it is the duty of the passenger to stop off at such place and wait for such train. This the Kentucky Court of Appeals, citing cases, considers a sound rule of law.—Louisville & N. v. Gaddie (Ky.), 172 S. W., 514.

"Turntable Cases" Doctrine

A railroad maintained a water reservoir just within the corporate limits of a city and permitted grass to grow on the strip between the reservoir and the fence surrounding it. Two or three boards had been torn from the fence and a child passed through, and fell into the reservoir and was drowned. In an action for his death the Texas Court of Civil Appeals held that there could be no recovery on the theory that the reservoir was unusually attractive to children, and that the company failed to exercise reasonable care for the safety of children. The court said that ponds or reservoirs are not to be classed with turntables, and that the doctrine of the "turntable cases" should not be extended.—M. K. & T. v. Moore (Tex.), 172 S. W., 568.

Duty Toward Passengers on Freight Trains

While passengers on freight trains assume the discomforts and risks necessarily attending that mode of conveyance, the Minnesota Supreme Court holds that the carrier is required to exercise as high a degree of care for their safety as is consistent with the proper operation of the train. A railroad company which receives passengers for transportation on freight trains must provide a reasonable and sufficient opportunity for them to enter and leave such trains in safety. The passengers do not go on board at their peril, but the carrier owes them the duty to guard against all dangers which reasonable prudence could foresee and avoid. Where the question as to whether the company negligently caused a train to be started while the plaintiff was in the act of boarding it, was submitted to the jury, which found against the company, the latter was held liable for the plaintiff's injuries sustained thereby.—Doran v. Chicago, St. P. M. & O. (Minn.), 150 N. W., 800.

Right of Action Against Terminal Carrier—Effect of Carmack Amendment

In an action against the last carrier of a shipment of apples, for shortage in weight, the question arose whether the right of action against the initial carrier given by the Carmack amendment is an exclusive remedy. The Wisconsin Supreme Court holds that the remedy is additional to and concurrent with any other existing federal remedy, and does not, of itself, prevent an action in a state court against the terminal carrier of an interstate shipment for a loss occurring on its line.—Judgment of dismissal was therefore reversed.—Bichlmeier v. Minneapolis, St. P. & S. S. M. (Wis.), 150 N. W., 508.

Liability for Baggage in Baggage Room

Mary M. Doyle, starting from Denver, over the Denver & Rio Grande, for Clifton, Colo., got a check for her suit case and then went to the Pullman office for a berth; but the berths had all been taken; and as she did not feel well enough to travel all night in a day car, she waited until the next morning and then went to Colorado Springs. There she tried to secure a berth to Clifton and was again informed that all were sold. She finally reached destination about two days late and found that the station had been burglarized, the night before, and her suit case stolen.

In the Colorado Supreme Court she has lost her suit against the railroad, the court holding that as a matter of law the baggage had not been called for within a reasonable time after its arrival;

and the company's liability was only that of a warehouseman. No negligence was proved. The court said: "If plaintiff had used ordinary care, thoughtfulness and prudence, it must have occurred to her that if she waited until a few minutes before train time she might have difficulty. She allowed her baggage to go on when she could easily have checked it for the train on which she was to travel. There was no delinquency on the part of the company in transporting either plaintiff or her baggage which would extend the reasonable time for its removal after its arrival." Denver & R. G. v. Doyle, 145 Pac. 688.

"Any Statute" in Federal Employers' Liability Act

Following the ruling of the United States Supreme Court in Seaboard A. L. v. Horton, 233 U. S., 492, 34, Sup. Ct., 635, the Washington Supreme Court holds that the phrase "any statute enacted for the safety of employees" occurring in the federal employers' liability act, declaring that an employee shall not be held to have been guilty of contributory negligence, or to have assumed the risk where a violation by the carrier of any statute enacted for the safety of employees contributed to the injury, is limited to federal statutes, and does not include a state statute enacted for the safety of employees.—Lauer v. Northern Pac. (Wash.) 145 Pac. 606

Federal Employers' Liability Act—Switchman

A switchman, who was regularly assigned to a switching engine in his employer's yard, was killed while crossing the tracks in the yard on his way to work. In an action by his administratrix, the proof showed that the engine was used indiscriminately in interstate and intrastate commerce. The New York Appellate Division held that, to establish liability under the federal employers' liability act, the plaintiff was bound to establish, either that this locomotive was used exclusively during that shift, which began at midnight and ended at 8 a. m., in interstate commerce, or that it was thus used at the very outset of the shift. The evidence being insufficient to show this, judgment for the plaintiff was reversed.—Knowles v. N. Y. N. H. & H., 150 N. Y. Supp. 99.

Regulation of Rates—Mileage Books

The New Hampshire Supreme Court holds that laws 1913, c. 92, requiring the sale by railroads of 500-mile mileage books for two cents a mile is not invalid as fixing an arbitrary rate, without regard to reasonableness, though under laws 1911, c. 104, Section 11a, the Public Service Commission is authorized to determine just and reasonable maximum rates, with the proviso that the commission shall not allow an increase above any rate prescribed or limited by statute. The reason given is that the act of 1913 was not enacted as a limitation upon the rate-making power conferred on the Public Service Commission, but as a legislative judgment of the reasonableness of the particular rate prescribed, especially as it merely amends an act of 1909 requiring the issuance of 1,000-mile mileage books.—State v. Maine Central (N. H.), 92 Atl. 837.

Scope of Employment

In an action in the Kansas courts under the federal employers' liability act, brought against a railroad company by a brakeman of a freight train to recover for injuries, it was shown that the conductor directed the brakeman to go forward and act as fireman while he himself took charge of the locomotive for the purpose of allowing the regular engineer and fireman to go to the caboose and eat their dinner. It was shown that while obeying the conductor's order, the plaintiff received injuries, resulting from the conductor's negligence in managing the locomotive. The Kansas Supreme Court held that in the absence of any rule of the company prohibiting the conductor from giving, or a brakeman from obeying such an order, the conductor had authority to order the plaintiff to act as fireman, and in obeying such order the plaintiff was acting within the scope of his employment. The railroad company was held liable for the conductor's negligence in the management of the engine. The evidence was held sufficient to sustain a finding that the plaintiff had not assumed the risk, and that he was not guilty of contributory negligence.—Martin v. Atchison, T. & S. F. (Kan.), 145 Pac., 849.

Railway Officers

Executive, Financial, Legal and Accounting

C. S. Runnells has been appointed assistant to the president of the Pullman Company, with headquarters at Chicago, succeeding Le Roy Kramer, promoted.

The officers of the St. John & Quebec, a new Canadian government railway are A. R. Gould, president; H. N. Crandall, treasurer, and S. B. Wass, secretary, Fredericton, N. B.

F. H. Silvernail has been appointed assistant to the president of the Lehigh Valley, with headquarters at New York. Mr. Silvernail entered the service of the Lehigh Valley in 1903, and since that time has served in the office of President Thomas.

Le Roy Kramer, assistant to the president, and Richmond Dean, general manager of the Pullman Company, have been elected vice-presidents, with headquarters at Chicago. Mr.

Le Roy Kramer

Kramer was born on August 19, 1875, at Wichita, Kan. He received a high school education and began railway work in December, 1897, with the St. Louis & San Francisco as stenographer and clerk. Until July, 1907, he held various clerkships in the division office, also the position of chief clerk to the general superintendent of transportation, general manager and vice-president, and assistant to vice-president. He was then promoted to superintendent of the Kansas division, and in September, 1908, was transferred to the superintendency of the Central division. In December, 1909, Mr. Kramer left the Frisco to become assistant to the vice-president in charge of purchases and stores of the Chicago, Rock Island & Pacific, and the following May he was appointed assistant to the second vice-president of that road. In June, 1912, he became assistant to the president of the Pullman Company, and has now been elected vice-president, as above noted.

Richmond Dean

Mr. Dean was born at St. Louis, Mo., November 2, 1862, and was educated in the public schools. In 1875 he entered the service of Boatmen's Bank in St. Louis, and subsequently until 1882 he was with the Missouri Pacific Railway. He then became connected with the Pullman Company and for six years was located at St. Louis, being transferred to the Chicago headquarters in 1888. He left that company in 1894 and became assistant to the vice-president of the Missouri, Kansas & Texas Railway. Five years later Mr. Dean re-

turned to the Pullman Company as assistant to the vice-president, and in 1905 he was made general manager, which position he held until his recent election as vice-president.

M. L. Crowell, assistant secretary and assistant treasurer of the Toledo, St. Louis & Western, with headquarters at Toledo, Ohio, has been retired under the pension rules of that company. He has been connected with that road and its predecessor, the Toledo, St. Louis & Kansas City, since 1886.

Operating

L. S. Hungerford, general superintendent of the Pullman Company, has been appointed general manager, with headquarters at Chicago.

W. C. Hamilton has been appointed trainmaster of the Copper Range at Houghton, Mich., and the office of chief train despatcher is abolished.

U. B. Williams, general superintendent of the Wheeling district of the Baltimore & Ohio, at Wheeling, W. Va., has been appointed general agent, and W. H. Averell, assistant general superintendent at New York succeeds Mr. Williams.

W. A. Hamler, trainmaster of the New York Central, at Corning, N. Y., has been appointed trainmaster, Buffalo division, with office at Buffalo. W. M. Corbin, trainmaster at Jersey Shore, Pa., succeeds Mr. Hamler. M. J. Quigley, assistant trainmaster at Rochester, N. Y., has been appointed trainmaster, succeeding Mr. Corbin, and H. J. Avery succeeds Mr. Quigley.

John McMillan, general superintendent of telegraph, western lines, of the Canadian Pacific at Winnipeg, Man., has been appointed manager of telegraphs, with headquarters at Montreal, Que., succeeding James Kent, who has for many years served as manager of telegraphs and, at his own request, has been allowed to relinquish those duties, and has been given leave of absence for an extended period.

W. H. Averell, who has been appointed general superintendent of the Wheeling district of the Baltimore & Ohio, with headquarters at Wheeling, W. Va., was born on May 13, 1879, at Ogdensburg, N. Y., and graduated from Yale University in the class of 1900. In September of the same year he began railway work in the accounting department of the Great Northern; two years later he entered the service of the Southern Pacific as statistical clerk, and was then consecutively trainmaster at Tucson, Ariz.; assistant superintendent at Bakersfield, Cal.; superintendent at Tucson, Ariz., and superintendent of the same road at Los Angeles, Cal., until February, 1911. The following May he was appointed assistant to general manager of the Baltimore & Ohio; in July, 1912, he was promoted to assistant general superintendent at Pittsburgh, Pa., and on May 1, 1913, was appointed assistant general superintendent of the New York division and general superintendent of the Staten Island lines, which position he held at the time of his recent appointment as general superintendent of the same road as above noted.

Engineering and Rolling Stock

J. W. Johnson has been appointed master mechanic of the Arkansas, Louisiana & Gulf, with office at Monroe, La., succeeding J. T. Tadlock.

J. O'Conner, assistant roadmaster of the St. Louis Southwestern at Mount Pleasant, Tex., has been appointed roadmaster at that point, succeeding J. J. Hughes, deceased.

R. J. McQuade has been appointed master mechanic of the St. Louis & Kansas City Terminal divisions of the Rock Island Lines, with office at Armourdale, Kan., vice O. C. Breisch, resigned.

Traffic

R. W. Stinson, contract agent, foreign freight department, of the Wabash, has been appointed import agent at Chicago.

C. A. Hayes has been appointed general traffic manager of the St. John & Quebec, a new Canadian government railway, and H. H. Melanson has been appointed general passenger agent, both with offices at Moncton, N. B.

H. N. Kennedy has been appointed general freight agent of the Great Northern Steamship Company, and A. B. C. Denniston has been appointed general agent of the passenger department, with headquarters at San Francisco, Cal.

E. H. Dow has been appointed general baggage agent of the Delaware & Hudson, the Champlain Transportation Company and the Lake George Steamboat Company, with office at Albany, N. Y., vice C. E. Durkee, resigned.

Owing to the consolidation of the freight and passenger departments of the Fort Worth & Denver City and the Wichita Valley, A. A. Glisson, general passenger agent of those roads, has been appointed traveling passenger agent, with headquarters at Fort Worth, Tex.

Purchasing

J. H. Conley has been appointed purchasing agent of the Georgia & Florida, with office at Augusta, Ga.

J. E. Mahaney has been appointed general storekeeper of the Norfolk Southern, with office at Norfolk, Va., succeeding W. J. Luke, resigned.

W. G. Humphrey has been appointed chief clerk and purchasing agent for the receivers of the Missouri, Oklahoma & Gulf, with office at Muskogee, Okla., and H. P. Abbey, who was purchasing agent at Muskogee, has been assigned to other duties.

OBITUARY

George H. McDevitt, commercial agent of the Lehigh Valley at Detroit, Mich., died on March 13 at that place, at the age of 37.

Eugene B. Cook, superintendent of the Toledo division of the New York Central at Cleveland, Ohio, was struck by a train while walking on a freight track at Cleveland on March 14, and was killed.

William McIntosh, formerly superintendent of motive power of the Central of New Jersey at Jersey City, N. J., died on March 15, at his home in Plainfield, N. J. He was born on August 20, 1849, at Franklin, Que., and began railway work in 1864 as locomotive fireman on the Chicago, Milwaukee & St. Paul; and he served as machinist and engineer on that road for seven years, or until 1871. He then went to the St. Paul & Pacific, now a part of the Great Northern at St. Paul, Minn., where he was employed as machinist. From August, 1872, to November, 1877, he was locomotive engineer on the Chicago & North Western and then for about ten years was foreman of locomotive repairs on the same road at Waseca, Minn., and at Huron, S. D. In July, 1887, he was appointed master mechanic at Winona, Minn., where he remained about 12 years. On March 1, 1899, he was appointed superintendent of motive power on the Central of New Jersey, from which position he retired in 1909. He was a prominent member of the American Railway Master Mechanics' Association and in 1908 served as president of that association. Mr. McIntosh was the inventor of a number of well known locomotive and car appliances. He was a member of the American Society of Mechanical Engineers.

W. McIntosh

Chinese Railroad Concessions.—Press reports state that at a recent conference between representatives of Japan and China concerning the demands recently made upon China by Japan, the Japanese made slight concessions from the letter of their demands as previously presented. A compromise was reached in the matter of the railroad and mining concessions in South Manchuria, but it was agreed that Japan should have the preference in future railroad loans and the right to prospect for mines for a fixed period and operate a large proportion of the mining properties so discovered.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Maine Central is reported to be in the market for tenders. This item has not been confirmed.

The Bethlehem Steel Company has ordered one switching locomotive from the American Locomotive Company.

The Missouri, Kansas & Texas has ordered 10 Pacific and 30 Mikado type locomotives from the American Locomotive Company.

The Denver & Salt Lake is reported to be considering the purchase of 6 Mikado type locomotives. This item has not been confirmed.

The Ogden, Logan & Idaho has ordered one 50-ton electric locomotive from the Westinghouse Electric & Manufacturing Company.

The Public Belt Railroad of New Orleans is in the market for 6 locomotives, to be used on an extension of the road to the cotton warehouse of the Dock Board.

CAR BUILDING

The Grand Trunk is in the market for 60 100,000-lb. capacity tank cars.

The Delaware, Lackawanna & Western is in the market for 2 postal cars.

The Missouri Kansas & Texas is in the market for 2 dining, 10 baggage and 3 postal cars.

The Grand Rapids & Indiana has ordered 6 coaches from the Pressed Steel Car Company.

The Pennsylvania has ordered 100 flat cars from the Altoona shops for 1914 replacement purposes.

The Prudential Oil Corporation, New York, has ordered 200 tank cars from the American Car & Foundry Company.

The Denver & Salt Lake is reported to be in the market for 200 coal and stock cars. This item has not been confirmed.

The Central Railroad of New Jersey is in the market for 15 coaches, 5 combination baggage and mail cars and 10 combination passenger and baggage cars.

The New York, Philadelphia & Norfolk has ordered 76 ventilated box cars from the American Car & Foundry Company, and 2 coaches from the Pressed Steel Car Company.

The Baltimore & Ohio has ordered 200 underframes from the South Baltimore Car Works, 200 from the American Car & Foundry Company and 200 from the Ralston Steel Car Company.

The Alberta and Great Waterways Railway, Winnipeg, Man., has ordered two 55-ft. all-steel, 200-h.p., combined passenger and baggage gasoline motor cars from the McKeen Motor Car Company.

IRON AND STEEL

The Boston & Maine has ordered 11,000 tons of rails from the Lackawanna Steel Company.

The Russian Government is reported to have ordered 40,000 tons of light steel rails from the United States Steel Products Company. This item has not been confirmed.

The Maine Central is reported to have ordered 8,500 tons of steel rails from the Pennsylvania Steel Company. This item has not been confirmed.

The French Government is reported to have ordered 8,000 tons of girder rails and 12,000 tons of portable track from the United States Steel Products Company. This item has not been confirmed.

The Chicago, Burlington & Quincy has ordered an additional 6,000 tons of rails, as follows: 1,000 tons from the Bethlehem Steel Company; 3,000 tons, from the Lackawanna Steel Company; 1,000 tons, from the Cambria Steel Company, and 1,000 tons from the Pennsylvania Steel Company.

Supply Trade News

The Railway & Traction Supply Company, Chicago, Ill., is equipping 20 tracks for the Pressed Steel Car Company at Pittsburgh, Pa., and 14 tracks for the Michigan Engineering Company at Kalamazoo, Mich., with its Little Giant type bumping posts.

The Locomotive Pulverized Fuel Company has obtained a charter in Delaware to manufacture patented fuel saving devices. The incorporators are Joel S. Coffin, Englewood, N. J.; John E. Muhlfield, Scarsdale, N. Y.; H. F. Ball and Samuel G. Allen, New York, and LeGrand Parish, Mountain View, N. J.

After March 22 the Chicago office of the Terry Steam Turbine Company, Hartford, Conn., will be in charge of A. W. de Revere, and located in the Peoples Gas building. The company has also opened an office in the Michigan Trust building, Grand Rapids, Mich., in charge of A. L. Searles, who will cover the southern peninsula of Michigan.

The Stark Rolling Mill Company, Canton, Ohio, has appointed the Dearborn Steel & Iron Company, with offices in the Peoples Gas building, Chicago, Ill., as its selling agent in Chicago, northern Illinois and Wisconsin. H. C. Perrine and E. L. Lyon will represent the company. Special interest will be given to the sale of the Toncan metal products of the Stark mill.

W. W. Rosser, manager of western sales of the T. H. Symington Company, Rochester, N. Y., has been appointed vice-president of the company, with office at Chicago. Mr. Rosser was born at Hutchinson, Minn., on November 4, 1877. He attended the Hamline University at St. Paul, Minn., and was for four years with the Minnesota Malleable Iron Company. In 1903 he left the company to take the position of superintendent of the Washburn Coupler Company, and two years later became sales agent of the T. H. Symington Company at Chicago. In 1910 he was appointed manager of western sales of that company, and now leaves that position to take up the duties of vice-president, as above noted.

W. W. Rosser

The Horne, Dole, Brown Company, with offices at 545 W. Washington Boulevard, Chicago, has recently been incorporated for $5,000 as Western sales managers for various eastern concerns. J. J. Dole, formerly sales manager of the Celfor Tool Company, Buchanan, Mich., is president; R. C. Brown is vice-president, and J. W. Horne, formerly manager of the Norton Company, Chicago, is secretary and treasurer.

The Russian government is negotiating with the New York Air Brake Company and the Westinghouse Air Brake Company for an order of 2,000,000 shrapnel. The Russian government has already established a credit in this country to meet payment for one-fourth of the order, which, it is said, will have a total value of $36,000,000. The same government recently placed a large order for shrapnel with the Canadian Car & Foundry Company.

At a meeting on March 11, the stockholders of the Yale & Towne Manufacturing Company authorized the issue of 5,000 additional shares of capital stock, or $500,000, substantially all of them waiving their rights of subscription thereto in order to place the stock so surrendered in the hands of the directors

and to enable the latter to arrange for its acquisition, in proper proportions and on equitable terms (at not less than par), by those of the officers and employees on whom will rest the chief responsibility for the further development of the business. The company has an authorized capital stock of $10,000,000, of which, excluding the above, $4,500,000 has been issued, $1,500,000 on January 2, 1914, in the form of a stock dividend.

The Southwark Foundry & Machine Company, Philadelphia, Pa., has secured the exclusive United States license to manufacture the Harris Valveless Engine, Diesel principle, which will hereafter be known as the Southwark-Harris Valveless Engine. The engine will be built in sizes from 75 B. H. P. to 1,000 B. H. P., for both marine and stationary service. With the company there will be associated as consulting engineer and naval architect Leonard B Harris, the inventor of the Harris Valveless Engine, so that the company will have the benefit of his extensive experience in power engineering, especially in the marine field. J. P. Johnston, who has been interested in and connected with the Harris Valveless Engine, will also be associated with the company in charge of oil engine sales. The Southwark Foundry & Machine Company also manufactures a full line of steam turbines, generators, turbine pumps, hydraulic pumps and presses, condensers, etc.

Henry R. Towne, for 46 years president of the Yale & Towne Manufacturing Company, New York, having signified his desire to retire from the duties of that office, has been elected chairman of the board. Mr. Towne was born in Philadelphia, Pa., August 28, 1844. He attended the University of Pennsylvania, but he left before graduation to enter business, receiving, however, the honorary degree of M. A. in 1887. He was first employed as a mechanical draftsman in the Port Richmond Iron Works at Philadelphia. In 1866 he made an extensive tour of the leading engineering establishments in England, Belgium and France, spending six months in Paris where he studied at the Sorbonne. Upon his return he worked for some time in the shops of William Sellers & Company, Philadelphia. In October, 1868, he formed a partnership with Linus Yale, Jr., and the Yale Lock Manufacturing Company was established at Stamford, Conn. Mr. Yale died shortly after and in 1869 Mr. Towne became the president of the company which at that time had a factory with 30 employees at Stamford and a salesroom in New York. To sketch Mr. Towne's career from that time is to sketch the growth of his company. At first it made bank locks and the Yale pin-tumbler locks. Later there were added safe deposit locks, mortise locks, the Yale time lock, etc. The company also had an important business in complete post office "equipments." In 1873 it added a bronze department, and in 1882 it established an art department. The company secured the American rights for the Weston differential pulley block. It was also one of the first, if not the first, in America, to build cranes, but the crane business was later sold to the Brown Hoisting Machinery Company, Cleveland, O. It being felt that the name Yale Lock Manufacturing Company was not sufficiently inclusive the title was changed in 1883 to the Yale & Towne Manufacturing Company. The company took many steps to broaden its activities. In 1878 it absorbed the United States Lock Company and the American Lock Company; in 1894 the Branford Lock Works and in 1895 the Blount Manufacturing Company, in each case adding new lines. Mr. Towne has been an active member of the American Society of Mechanical Engineers for many years and served as its president in 1888-89. He has been president of the Merchants' Association of New York and has been treasurer of the National Tariff Commission Association since its organization in 1909.

H. R. Towne

Walter C. Allen, vice-president and general manager of the Yale & Towne Manufacturing Company has been elected president and general manager to succeed Henry R. Towne, who has been elected chairman of the board. Mr. Allen has been in the service of the company for 23 years. He entered the works in 1892 as a truck boy and two years later obtained a position in the office. He then spent three years acquiring the tool trade and three more to obtain a knowledge of drafting, both of which he thought were essential to his advancement with the company. He was later made assistant to the general superintendent in the works at Stamford and then became general superintendent. In 1909 he was appointed general manager of the company at New York, and in 1914 became vice-president and general manager. Mr. Allen is a member of the American Society of Mechanical Engineers, the Republican Club of New York, the Stamford Yacht Club, and others.

W. C. Allen

Henry H. Sessions, vice-president of the Standard Coupler Company of New York, died at his residence, Chicago, on March 14. Mr. Sessions was born in Madrid, N. Y., on June 21, 1847. He entered the railway service on March 1, 1862, and until January 1, 1870, he acted as apprentice and journeyman in the car and machine shops of the Central Vermont at Northfield, Vt. From January 1, 1870, to November 1, 1878, he was master car builder for the Rome, Watertown & Ogdensburg, and from then to April 1, 1880, for the Sioux City & St. Paul, now a part of the Omaha. On April 1, 1880, he was made master car builder for the International & Great Northern, and on May 10, 1881, and September 1, 1882, he was appointed to a similar position with the Texas & Pacific and the St. Louis, Iron Mountain & Southern, respectively, acting in this capacity until 1885, when he was made manager of the Pullman Car Works. This position he held until 1892 and for four years he was chief mechanical engineer in an advisory capacity for the same company. During this time he invented the passenger car vestibule and later designed the standard steel platform for passenger cars which went into general use at once. This led to his becoming associated with the Standard Coupler Company as vice-president and director in 1896. Mr. Sessions also designed the Sessions friction draft gear and in the course of his active life left a strong impression of his inventive genius in railroad operations in many ways. He also showed his remark-

H. H. Sessions

able personality outside of his business and was most widely read and an unusually well informed man.

At the annual meeting of the stockholders of the Union Switch & Signal Company, held March 9, in the Westinghouse building, Pittsburgh, Pa., the following directors were elected: J. D. Callery, J. J. Donnell, William McConway, J. R. McCune, J. R. McGinley, M. S. Rosenwald, T. W. Siemon, W. B. Uptegraff and H. H. Westinghouse. The newly elected directors later went into executive session and chose the following officers for the ensuing year: President, Mr. Uptegraff; vice-president and treasurer, Mr. Siemon; secretary and assistant treasurer, Thomas S. Grubbs; assistant secretary, G. F. White. The new executive committee that was appointed is composed of Messrs. Callery, Donnell, McCune, Siemon and Uptegraff.

Union Switch & Signal Company

In the year ended December 31, 1914, the Union Switch & Signal Company had net income from sales of $911,281. There was also net income from other sources of $105,243, whereby the total income was $1,016,525, as compared with $1,763,995 in 1913. Deductions from this totaled $183,176, including amounts written off patents, depreciation of plant, tools, patterns, etc., and taxes. The net profit carried to surplus, therefore, was $833,348. The company on December 31, 1914, had real estate and buildings valued at $1,224,043; machinery, tools and fixtures worth $910,305; patents having a value of $1,000,000 and investments worth $406,527. On the same date the inventory was $1,042,300; the accounts and bills receivable $1,031,970, and the amount of cash on hand $2,371,103. The company's capital stock is now $6,662,758, of which $500,000 is preferred. The balance sheet shows that on December 31 there were accounts payable of $105,038, reserves for depreciation of $60,953, and a dividend payable of $199,743. The surplus on December 31, 1913, was $2,691,976. From this there was deducted the stock dividend $1,665,983, declared in March, 1914, leaving $1,025,992. The net profit for the year as noted above was $833,348. Cash dividends of $748,961 were paid during the year and there were also other deductions of $62,824, so that the balance on December 31, 1914, was but $1,047,556.

Lackawanna Steel Company

E. A. S. Clarke, president of the Lackawanna Steel Company, in his report to the stockholders states that the results of the year 1914 are the worst the steel trade of the United States has known since the company was formed. This condition he lays to the new tariff, which has tended to influence prices downward, to the uncertainty as to the effect of existing and proposed legislation which has impaired confidence and to the war. He expresses the hope, however, that 1915 will show an improvement over 1914.

The shipments of the Lackawanna Steel Company in 1914 totalling 579,742 tons, were the lowest in its existence with the exception of 1908, when 476,850 tons were shipped. The average price of $28.08 received per gross ton, however, was $2.26 less than in 1913, and $3.55 less than in 1908.

The company's gross earnings for the year were $16,281,639, as compared with $29,879,275 in 1913. The manufacturing and producing costs and operating expenses were $14,057,189, making a total net income of $2,224,450. There was also other income of $338,489. The net earnings after a deduction of administrative, selling and general expenses, taxes, commercial discount, etc., were $1,581,378 as against $6,605,762 in 1913. From this, deductions were made of interest and rentals and royalties of $2,167,186, so that there was a deficit for the year of $585,808, as against a surplus of $3,023,084 in 1913. There were also appropriations of $226,848 for the extinguishment of mines and mining investments, and of $839,789 for depreciation and accruing renewals, a total of $1,066,637, which with other deductions of $84,975 reduced the surplus of $7,514,877 on January 1, 1914, to but $5,777,457 on December 31, 1914.

The capital assets of the company at the end of the year totaled $68,939,362. The capital stock is $34,750,000, of which but $6,000 is preferred. There was also bonded debt on the Lackawanna Steel Company totaling $25,000,000, subsidiary companies' bonds of $6,319,000 and debentures due in 1915 totaling $9,994,000. The current liabilities were $2,589,256, and the current assets $19,130,193, of which $9,139,674 was in inventories and $2,261,088 in cash.

Railway Construction

Balsam Lake & Eastern.—This company has applied to the Wisconsin Railroad Commission for permission to build a standard gage railroad between Balsam Lake, Wis., and Centuria, a distance of six miles. It is stated that grading will amount to about 12,000 cu. yd. per mile, and that the maximum grade will be 1 per cent, with a maximum curvature of 6 deg. It has not yet been definitely decided whether steam or electric motive power will be used, or when construction work will begin. No contracts have been let. No bridges will be required, but two small depots will be erected. W. R. Taylor, Balsam Lake, Wis., is president; R. H. Sublette, Minneapolis, Minn., is chief engineer, and C. S. Roberts, Balsam Lake, is secretary.

Chicago & North Western.—Contracts for the season's bridge work on the various parts of the road were recently awarded to the Widell Construction Company, Mankato, Minn., the Koss Construction Company, Des Moines, Iowa, and the Cleary-White Construction Company of Chicago. The total expenditure for this work is estimated as $150,000.

Flint River Railroad & Navigation Company.—A contract has been given to Ricks & Company, Lilly, Ga., to build a line from Hawkinsville, Ga., southwest via Unadilla and Byromville to Albany, about 80 miles. There will be one 250-ft. steel bridge and three trestles, each 500 ft. long on the line. Track has already been laid on ten miles. The company expects to develop a traffic in lumber, coal and farm products. J. S. Morton, president, Byromville; J. W. Hawkins, chief engineer, Atlanta.

New York Subways.—The New York Public Service Commission, First district, has approved the recommendation of the New York Municipal Railway Corporation, that the contract for building Section No. 1 of the Jamaica avenue elevated extension about 2.3 miles long in the borough of Brooklyn be let to Post & McCord, Inc., the lowest bidder, who offered to do the work for $734,340.

Northern Pacific.—The report of this company for the year ended June 30, 1914, shows that the Duluth Transfer Railway track from Fifty-ninth avenue, Duluth, Minn., west to the Minnesota steel plant at Spirit Lake, 2.82 miles is being rebuilt, and the work is about 60 per cent finished. The Cayuna Northern branch built an extension to the North Line of 2.6 miles, to reach the mines of the Duluth-Brainerd Iron Company at a point north of Deerwood. A spur was also constructed 1.6 miles long from Loerch southerly to the Canadian mine in Crow Wing county, and a connection with the Minneapolis, St. Paul & Sault Ste. Marie at Cedar Lake to be 4,504 ft. long has been authorized, and is now under construction. The Minnesota & International has completed work on a change of line on the Leaks cut-off 5.84 miles, and the new line is now in operation. The grading and culvert work for proposed second track from Rice's to Little Falls, 14.61 miles, is about 75 per cent completed, and the remainder of the work has been deferred. On the West Dakota branch grading from Stanton, N. D., west on the Spring Creek line for a distance of 62 miles was finished last fall, and track has been laid from Stanton to Golden valley on 34.88 miles. The line is being extended to mile post 68.25. A line has been located southerly from Beach, N. D., into the Golden valley, and contract has been let for grading 25.50 miles. In connection with the replacing of a timber trestle over Fish Creek, Montana, by a new steel viaduct, a change of line was made on 0.5 miles, reducing the curvature 44 deg. The second track work and change of line between Lester, Wash., and Easton have been continued, and work was carried out on the Point Defiance line from Tacoma, Wash., to Tenino, and on a change of line and grade on the Interbay to Ballard line in the suburbs of Seattle, also on various grade changes and revisions north of Seattle.

Oklahoma & Interstate.—Extensive engineering work is being done by the W. K. Palmer Company, Kansas City, Mo., on the proposed extension of the Oklahoma & Interstate line in Kansas and Oklahoma. Definite plans for this project are not yet forthcoming.

Public Belt.—This company will build about 15 miles of track, it is said, in connection with an extension to the new cotton warehouse of the Dock Board at New Orleans, La.

Regina North Western.—Application has been made to the Canadian Parliament by this company for an extension of time in which to build a projected railway from Regina, Sask., to Tuxford on the Canadian Pacific, thence northwesterly to Red Deer, Alta. Also to build a branch to Battleford, Sask., and to Ft. McKay. The provisional directors include G. L. Kavanagh, O. L. Brunelle, J. Ehitesell, J. Clyma and G. Bordeau, Montreal, Que.

St. John & Quebec.—This new Canadian government railroad has been opened for traffic from Fredericton, N. B., northwest to Centreville, 88 miles.

Savannah & Northwestern.—This company, which operates a line from Savannah, Ga., to St. Clair, 108.6 miles, has asked for permission, it is said, to build a branch north to Augusta, about 27 miles.

Simcoe, Grey & Bruce.—This company has applied to the Canadian Parliament for an extension of time in which to build a projected line from Southampton via Owen Sound and Meaford to Collingwood. Also to build from Southampton via Port Elgin and Tiverton to Kincardine, Ont. The company was incorporated in 1911 and the provisional directors included C. M. Bowman, Southampton; J. B. Tudhope, Orillia; H. Pedwell, Thornburg; H. Clenand, Meaford, and A. G. McKay, Owen Sound, Ont.

RAILWAY STRUCTURES

Coeur d'Alene, Idaho.—The Northern Pacific has awarded a contract for the construction of a combination passenger and freight depot at Third street and Lakeside avenue, to Peter Van Laken, of Coeur d'Alene, Idaho. This depot will be 30 ft. and 9 in. wide, 146 ft. and 3 in. long and 12 ft. and 8 in. high. The foundation will be of concrete, and the exterior walls of brick, while the interior partitions and roof construction will be of wood and covered, with a prepared roofing material. The foundation has already been completed. The estimated total cost is $9,070.

Kansas City, Kan.—The Union Pacific and the Chicago, Rock Island & Pacific are now making arrangements with this city for the construction of a viaduct at the company's yards at Eighteenth street. The bridge will be about 1,500 ft. long, with an estimated cost of $150,000.

Lewisburg, Tenn.—Work is now under way, it is said, on a new station to be of brick construction for the Lewisburg & Northern.

Multnomah County, Ore.—An appropriation of $1,800,000 has been made by Multnomah county, Ore., and Clarke county, Wash., for the construction of a bridge over the Columbia river, which will carry highway, foot and street car traffic. On February 23, bids were received by the Columbia Interstate Bridge Commission and the commissioners of the two counties interested, 24 contractors bidding on this work. Bids were based on unit pieces and were compared with approximate quantities furnished in the specifications. As complete plans had been prepared, the bids were received on a bridge including a swing span and one including a lift span as the movable span. A comparison of the bids received on the two types of movable spans shows that the manufacture of steel for the lift would cost $23,237, or nearly 6 per cent more than the swing span, but on the other hand they also indicate that the lift span could be erected for $46,977, or about 32 per cent less than the swing span, resulting in a net saving for the lift span of $23,739, or 4.4 per cent. A further possible saving in the selection of the lift span was shown in the reduced estimated cost of the substructure. The bids for the substructure of the lift being $46,270, or about 12.6 per cent less than for the swing span. The lift span was finally adopted with an estimated total saving over the swing of $70,013, or about 7.7 per cent. Harrington, Howard & Ash, of Kansas City, Mo., are the consulting engineers.

Wagontown, Pa.—The Philadelphia & Reading has given a contract to the Reading Contraction Company, Reading, Pa., to build a concrete and steel bridge over Brandywine creek north of Wagontown. The bridge is to have six spans, each 15 ft. 3 in. long.

Railway Financial News

Boston & Maine.—The following statement was given out on March 12 by the chairman of the Massachusetts Public Service Commission:

"The commissions of Maine, New Hampshire and Massachusetts have spent two days in conference over the proposed legislation for reorganization of the Boston & Maine Railroad and have adjourned, having appointed a sub-committee consisting of Commissioners Benton of New Hampshire, Cleaves of Maine and Eastman of Massachusetts, with Mr. Anderson as attorney for the Massachusetts commission, to draft legislation as soon as may be and submit it to the other members of the joint conference for approval.

"A tentative understanding has been reached that the new bill will proceed among the general lines of authorizing the Boston & Maine and leased lines to consolidate as they may agree, but strictly within the limits of outstanding capitalization and without increasing the income accruing under present agreements to leased line stockholders.

"The bill will also provide for an alternative plan of reorganization either on voluntary or receiver's sale through a new corporation, but any plan of reorganization, before the same becomes valid, will be required to be submitted to, and approved by, each of the commissions of the three states in joint conference.

"The provisions of the bill are to be so framed as to contain such modifications of the bill presented by the trustees as seem to the commissions to be fully adequate to protect the interests of minority stockholders of the Boston & Maine, and of the stockholders of the leased lines and also to properly conserve the public interests involved."

Canadian Pacific.—The Dominion House of Commons has passed almost unanimously an act permitting the Canadian Pacific to transfer its steamships to a corporation to be known as the Canadian Pacific Ocean Services, Ltd. (March 5, p. 428.)

Erie.—A new issue of $10,000,000 one-year 5 per cent notes has been sold to J. P. Morgan & Co., New York, and associates. The proceeds of this sale, together with the proceeds of the recent sale of the Erie & Jersey and Genesee River Railroad bonds, will provide funds to pay for all obligations maturing in 1915. The Guaranty Trust Company is offering $6,000,000 Genesee River Railroad first mortgage 6 per cent bonds, due 1957, which they bought from the Erie, at 103¾, yielding about 5.76 per cent on the investment.

New York, New Haven & Hartford.—The number of stockholders on January 1, 1915, was 26,544, as compared with 26,240 in 1914, 22,716 in 1913, and 22,106 in 1912. Foreign holders of the stock own but 8,791 shares. Of the total number of stockholders 45.9 per cent hold from 1 to 10 shares.

Southern Railway.—Directors have announced that no dividend on the preferred stock will be paid in April of this year. Regular semi-annual dividends at the rate of 5 per cent per year were paid in 1913 and the first half of 1914. In October, 1914, a 2 per cent dividend, payable in 5-year 4 per cent interest bearing scrip, was declared.

New Railway in Asiatic Turkey.—Evidently for the purpose of expediting the movement of troops toward her eastern frontiers, Turkey began in January the construction of a new railroad from Angora for a distance of about 200 miles in the extreme northern district of Asia Minor. The new railroad will bring Sivas within three days of Constantinople and will open up a promising section, traversing the fertile Bozouk plain and touching the mines of Donek Madeni and Ak Dagh Madeni. It will make more accessible the many towns and cities in the neighborhood of Yozghad and will enable the tourist to reach the ancient Hittite cities at Boghaz Keuy and Euyuk by traveling a short distance overland. It is also possible that after the war the eastern terminus of this line will be the starting point of the railway, which eventually will open up the Turco-Persian frontier.

General expenses	1,073,392.43	1,063,257.90	—10,134.53
Totals	$44,673,298.15	$41,472,052.70	—$3,201,245.45
Per mile (average)	$7,136.48	$6,556.58	—$579.90
Net operating revenue	$28,002,840.57	$27,072,749.04	—$930,091.53
Per mile (average)	$4,473.40	$4,280.10	—193.30
OUTSIDE OPERATIONS:			
Sleeping, parlor, observation, dining and cafe cars and restaurants	$308,820.28	$304,819.65	—$4,000.63
Total net revenue	$28,311,660.85	$27,377,568.69	—$934,092.16
TAXES ACCRUED	$3,999,028.08	$5,030,584.01	$1,031,555.93
Per mile (average)	$638.84	$795.32	$156.48
Operating income	$24,312,632.77	$22,346,984.68	—$1,965,648.09
OTHER INCOME:			
Dividends and interest on securities, interest on deposits and miscellaneous	$2,077,682.81	$2,421,288.32	$343,605.51
Rentals received	2,232,902.32	2,353,811.25	120,908.93
Hire of equipment	315,288.14	864,574.22	549,286.08
Gross income	$28,938,506.04	$27,986,658.47	—$951,847.57
DEDUCT:			
Rentals paid	$537,303.22	$611,894.69	$74,591.47
Interest on funded debt and notes	6,837,685.00	7,563,449.16	725,764.16
Other interest and commissions	.....	156,067.26	156,067.26
Dividends on stock	17,360,000.00	17,360,000.00	.....
Totals	$24,734,988.22	$25,691,411.11	$956,422.89
Surplus	$4,203,517.82	$2,295,247.36	—$1,908,270.46
Less amount appropriated to cover sundry claims	$750,000.00	.....	—$750,000.00
Net surplus for the year	$3,453,517.82	$2,295,247.36	—$1,158,270.46
Ratio of operating expenses to total operating revenue	61.47%	60.50%	—.97%
Ratio of taxes to total operating revenue	5.50%	7.34%	1.84%

MILEAGE OPERATED.

Changes have taken place in the mileage operated during the year as follows:

There were added:

			Miles
Oct.	1, 1913.	Minneapolis Branch in Minnesota, constructed.	.51
Dec.	1, 1913.	Roslyn Branch in Washington, transferred from spurs	1.84
March	1, 1914.	Spring Creek Branch in North Dakota, constructed	34.88
March	1, 1914.	Oregon-Washington Railway & Navigation Co. in Washington leased	4.27
June	1, 1914.	Main line in Washington, transferred from side tracks	1.97
June	1, 1914.	Cuyuna Northern Branch in Minnesota, constructed	2.60
		Total additions	46.07

Deductions:

Oct.	1, 1913.	Red River Branch in Minnesota, track taken up	.42
Feb.	1, 1914.	Elkhorn Branch in Montana, track taken up	4.07
March	1, 1914.	Peninsular Branch in Washington, track taken up	.47
June	30, 1914.	Corrections in rechaining, etc	.05
		Total deductions	5.01
		Net additions	41.06
		Mileage operated June 30th, 1913	6,312,54
		Mileage operated June 30th, 1914	6,353.60
		Average mileage operated during the year	6,325.26

EARNINGS.

FREIGHT BUSINESS.

Freight revenue was $48,058,811.54, a decrease of $4,211,874.40, or 8.06 per cent. compared with the previous year.

5,629,351,427 tons of revenue freight were moved one mile, a decrease of 602,817,210 tons one mile, or 9.67 per cent. less than the previous year.

The average earnings per ton mile increased from .00839 to .00854.

The revenue train load increased from 541.62 to 566.91 tons. The total train load, including company freight, increased from 637.11 to 665.76 tons.

The number of miles run by revenue freight trains was 9,189,372, a decrease of 1,605,135, or 14.87 per cent.

PASSENGER BUSINESS.

Passenger revenue was $15,707,000.40, a decrease of $101,035.35, or 0.64 per cent. compared with the previous year.

Mail revenue was $1,043,720.46, an increase of $59,172.67, or 6.01 per cent.

Express revenue was $1,312,177.22, a decrease of $43,440.93, or 3.20 per cent.

Excess baggage and miscellaneous passenger revenue was $298,214.57, a decrease of $35,836.35, or 10.73 per cent.

Total revenue for persons and property carried on passenger trains was $18,361,112.65, a decrease of $121,139.96, or 0.66 per cent as compared with the previous year.

The number of passengers carried was 9,860,223, an increase of 747,066 over the previous year, and the number of passengers carried one mile was 682,271,430, an increase of 20,754,033, or 3.14 per cent.

The number of miles run by revenue passenger trains was 12,015,138, an increase of 506,357, or 4.40 per cent.

The average earnings per passenger per mile was .02302, and .02390 last year.

OPERATING EXPENSES.

CONDUCTING TRANSPORTATION.

The charges for transportation expenses were $21,710,988.19, a decrease of $1,858,391.05, or 7.88%, as against a decrease in total operating revenue of 5.68%.

MAINTENANCE OF EQUIPMENT.

The charges for maintenance of equipment were $8,063,101.83, a decrease of $469,569.91, or 5.50%.

LOCOMOTIVES.

Total number of locomotives on active list June 30, 1913		1,366
From which should be deducted:		
Engines withdrawn from service during the year	6	
Engines sold during year from active list	3	9
Total on active list June 30, 1914		1,357
In addition to the engines on active list there were on hand from previous year	123	
Withdrawn as above	6	
	129	
Less sold and dismantled	6	
Leaving on hand engines withdrawn from service, some of which may be sold	123	

HAULING CAPACITY.

Active List.	Number.	Tractive Power. (Pounds.)	Total Weight on Drivers. (Pounds.)	Total Weight of Engines. (Pounds.)
Assignment, June 30, 1913	1,366	45,687,700	205,065,173	260,604,108
Added during fiscal year*	.....	*59,460*	49,200	91,900
Total	1,366	45,628,240	205,114,373	260,696,008
Sold and permanently retired	9	231,300	1,085,900	1,287,900
Total	1,357	45,396,940	204,028,473	259,408,108

*Account compound engines changed to simple, engines having superheaters applied, and engines having cylinders bushed and steam pressure increased.

The following statement shows the character and condition of the locomotives of the Company on June 30, 1914.

Wheel Arrangement	Owned June 30, 1913	Sold or Permanently Withdrawn from Service	Added	Owned June 30 1914	Average Weight of Locomotives without tender Tons of 2000 lbs		Average Tractive Force—Lbs
					Total.	On Drivers

Total	1,366	9		1,357	95.58	75.16	33,454

Changes in weights and tractive power are due to engines being simpled, engines having superheaters applied, and engines having cylinders bushed and steam pressure changed.

Condition.	Number.	Per Cent.
Good	1,084	79.88
Fair	158	11.64
At Shops	115	8.48
	1,357	100.00
Number of oil burning locomotives	55	4.03
Number of locomotives equipped with superheaters	227	16.73

PASSENGER EQUIPMENT.

On June 30, 1914, the company owned 1,160 passenger train cars, including 130 sleeping cars owned jointly with the Pullman Company, a decrease of 2 cars. The number and kind of cars owned is shown in table on page 42.

Of the 1,160 cars owned 866 were not due in shops for two months or more.

FREIGHT EQUIPMENT.

Comparative number and capacity of freight cars:

	1913.		1914.		Increase or Decrease.	
	Number.	Capacity (Tons of 2000 lbs.)	Number.	Capacity (Tons of 2000 lbs.)	Number.	Capacity (Tons of 2000 lbs.)
Box	24,957	929,365	26,358	994,930	1,401	65,565

Totals	46,988	1,728,585	48,974	1,824,230	1,986	95,645
Percentage					4.23%	5.53%
Average capacity per car		36.8		37.3		

NOTE—Figures in italics denotes decrease.

Of the total number of freight cars June 30, 1914, 2,072 or 4.23% were in need of repairs costing $5 or more per car.

In addition to equipment shown as on hand June 30, 1914, the following have been authorized and will be purchased or built at Company's shops during the current year:

PASSENGER TRAIN CARS.	
Passenger-Freight refrigerator cars	23
FREIGHT TRAIN CARS.	
Flat cars—35 ton capacity	42
Steel ore cars—50 ton capacity	250
	292
Total	315

DEPRECIATION OF EQUIPMENT.

In accordance with the rules of the Interstate Commerce Commission the following amounts have been charged to operating expenses on account of estimated depreciation of equipment, viz.:

Locomotives	$411,047.34
Passenger cars	87,734.71
Freight cars	760,189.08
Work cars	24,948.87
Floating equipment	2,123.04
	$1,286,043.04

MAINTENANCE OF WAY AND STRUCTURES.

The charges for Maintenance of Way and Structures were $9,363,823.91, a decrease of $824,230.03, or 8.09 per cent.

The table in the Report of the Comptroller (page 30) shows the distribution of this decrease under the respective accounts.

The following statements give particulars of the work done and show that the property has been well maintained.

BRIDGES.

During the year 160 bridges were replaced, of which 89 bridges 14,579 feet in length were replaced by timber structures, and 4 permanent and 67 timber structures were replaced in permanent form as follows:

Replaced by embankment	58 bridges, 16,846 lineal feet.
Replaced by steel truss, girder, I-beam and reinforced concrete trestle	13 bridges, 1,253 lineal feet.
Total	71 bridges, 18,099 lineal feet.

In addition to changes referred to above, 4 permanent and 128 temporary bridges were abandoned by line changes, and 7 permanent and 125 temporary structures were added on old and new lines. 172 timber culverts were rebuilt, 45 in temporary and 127 in permanent form.

There are now under construction on operated lines 1,400 lineal feet of steel girders and I-beam spans for single track, 111 lineal feet of steel girders and I-beams for double track, 1,390 lineal feet of single track and 540 lineal feet of double track trusses, one 256 foot double track draw bridge, 576 lineal feet of single track and 84 lineal feet of double track steel viaduct, 484 lineal feet of single track and 160 lineal feet of double track reinforced concrete trestles, and two overhead highway viaducts of steel and concrete 3,800 feet in total length.

BRIDGES AS THEY EXISTED JUNE 30TH, 1914.

Description.	No.	Aggregate Length. Lineal Feet.	Miles.
Steel, iron, stone and concrete permanent bridges	632	107,714	20.4
Timber and combination iron and timber structures	2,735	420,291	79.6
Totals	3,367	528,005	100.0

Total length of timber structures replaced by steel bridges, embankment or other permanent form, from July 1st, 1885, when work was commenced, to June 30th, 1914, has been 130.71 miles.

BUILDINGS AT STATIONS.

New buildings and structures, or increased facilities have been provided at the following stations:

Minnesota.	*North Dakota.*	*Montana.*	*Washington.*
Ironton	Valley City	Cranesville	Roslyn
Center City	Alfred	Hysham	Everett
Barrows	Hesper	Logan	Fremont
Clitheral	Tenvik	Edgar	Auburn
		Roberts	Sumner
		Waterloo	Puyallup
		Avon	Hoquiam
		Paradise	Lebam
			Raymond
			Buckley

SHOPS, ENGINE FACILITIES AND YARDS.

Buildings, tracks, turntables or increased facilities have been provided at the following points:

Minnesota.	*North Dakota.*	*Montana.*	*Washington.*
Duluth—Rice's Point	Pembina	Logan	Parkwater

WATER SUPPLY.

Additional or increased facilities have been provided at the following points:

North Dakota.	*Montana.*	*Montana—Contd.*	*Washington.*
Sims	Pompey's Pillar	Stuart	Pullman
Richardton	Young's Point	Hamilton	Kiona
Gladstone	Springdale	Noxon	Wymer
	Rekap		Lamar
	Louisville	*Idaho.*	Kanaskat
	Emigrant	Lewiston.	Auburn
	Sappington		

BLOCK SIGNALS.

Block signals have been installed and placed in service at the following points:

Wisconsin and Minnesota.	*Minnesota.*
Superior, Wis.-Carlton, Minn.	St. Paul-West Duluth
Montana.	*Washington.*
Huntley-Billings	Alfalfa-Cle Elum
	Lester-Auburn

In addition to the above, installations of automatic block signals are now in progress on—Montana Division between Livingston and Toston—Idaho Division between Paradise and Sand Point and Athol and Hauser—Pasco Division between Pasco and Alfalfa—Seattle Division between Cle Elum and Easton.

On June 30, on 2,485 miles of important main line there were 894.60 miles protected by automatic block signals and 566.70 miles protected by manual block.

INTERLOCKING PLANTS.

Interlocking plants have been installed and placed in service at Hannaford and New Rockford, North Dakota, and at Seattle, Aberdeen, and Hoquiam, Washington.

An all electric interlocking plant is being installed for protection of Bascule Bridge over Salmon Bay, Ballard, Washington.

DOCKS AND WHARVES.

Duluth, Minnesota, Dock 6 portable conveyor—completed.

Seattle, Washington, Pier No. 1—electric wiring has been re-arranged and extended and heating system has been re-arranged.

Tacoma, Washington, part of the bins in coal bunker No. 4 have been re-arranged to facilitate the handling of coke through the bunkers.

BRANCH LINES PURCHASED FROM SUBSIDIARY COMPANIES.

Titles to the following named branch lines were acquired from subsidiary companies, for the respective amounts which appear below:

Clearwater Short Line Railway	$12,035,301.22
Missouri River Railway	8,542,687.98
Western Dakota Railway	4,980,403.10
Connell Northern Railway	2,291,286.49
Shields River Valley Railway	747,226.90
Camp Creek Railway	296,774.50
Cuyuna Northern Railway	258,597.86
Big Fork & International Falls Railway	999,886.49
Washington Central Railway	561,589.43
North Yakima & Valley Railway	1,290,690.28
Port Townsend Southern Railroad (Southern Division)	375,000.00
	$32,379,444.25

Except in the instance of the Port Townsend Southern Railroad (Southern Division, 15 miles long), which was acquired at the flat price of $25,000 per mile, free from liens, the above amounts represent advances made in this or prior years to the subsidiary company owning the property, for its creation, together with interest to date of conveyance to Northern Pacific Railway Company. No part of such interest has been taken into Income Account. Direct ownership of these properties by Northern Pacific Railway Company, will considerably simplify accounts, and save expense in connection therewith.

CHARGES TO CAPITAL ACCOUNT.

Upon requisition of the Executive Officers, approved by the Board of Directors, expenditures for additions to and betterments of the property have been made during the past fiscal year for:

REAL ESTATE, RIGHT OF WAY AND TERMINALS:		
Superior, Wisconsin, real estate	$387.85	
St. Paul, Minnesota, real estate	37,250.50	
Minneapolis, Minnesota, real estate	106,241.30	
Tacoma, Washington, real estate	234.52	
Credits account of property sold, etc.	*410,881.46*	
		Cr.$266,767.29
BRANCHES, LINE CHANGES, GRADE REVISIONS, AND SECOND MAIN TRACK:		
Superior, Wisconsin, right of way and track to ore dock	$87,351.31	
Grassy Point Bridge, Minnesota-Wisconsin (reconstruction)	10,679.61	
Duluth Transfer Railway, Minnesota (reconstruction)	40,434.52	
Edgeley, Missouri River Line, North Dakota (construction)	782.61	
Pingree West Line, North Dakota (construction)	*Cr. 659.60*	
Bitter Root Branch, Montana (extension)	13,664.57	
Elkhorn Branch, Montana (removal of line)	*Cr. 19,096.98*	
Flathead Valley Line, Montana (survey)	4,136.95	
Glendive-Helena cut-off, Montana	3,725.69	
Lake Basin Branch, Montana (right of way and survey)	15,560.94	
Ballard to Interbay, Washington (construction)	4,555.75	
Fremont-Ballard Line and Draw Bridge, Washington (construction)	128,876.52	
Gray's Harbor & Columbia River Railway, Wash. (right of way)	1,854.10	
Edgecomb to Kruse, Washington (construction)	42,000.47	
Lines in Seattle, Washington	46,464.46	
Point Defiance Line, Tacoma to Tenino, Wash. (construction)	2,502,365.20	
Sunnyside Branch, Washington (extension)	2,185.06	
Spokane, Washington (grade separation)	44,745.91	
Vancouver to North Portland, Oregon (interlocking and block signals)	5,333.72	
Cuyuna Northern branch, Minnesota (extensions)	10,489.20	
Western Dakota branches and extensions, North Dakota	342,999.01	
Missouri River branch extensions, North Dakota	97,720.37	
Missouri River branch extensions, Montana	71.54	
Kooskia to Lo Lo Line, Montana and Idaho	466,585.91	
St. Cloud to Little Falls, Minnesota (second main track)	27,646.19	
Bloom to Jamestown, North Dakota (second main track)	*Cr. 5,123.83*	
Bozeman to Logan, Montana (second main track)	8,947.56	
Tenino to Vancouver, Washington (grade revision and double track)	114,518.20	
Lester to Easton, Washington (grade revision and double track)	630,546.73	
Mile Post 72 to Yardley (Spokane) Washington (second main track)	*Cr. 3,394.68*	
Sundry expenditures and adjustments	1,005.94	
		$4,626,962.95
ADDITIONS AND BETTERMENTS:		
Right of way and station grounds	$112,926.86	
Real estate	317,597.77	
Widening cuts and fills	296,234.66	
Protection of banks and drainage	76,266.62	
Grade reduction and change of line	858,904.74	
Tunnel improvements	188,398.63	
Bridges, trestles and culverts	584,378.10	
Increased weight of rail	424,275.27	
Improved frogs and switches	39,958.68	
Track fastenings and appurtenances	445,768.01	
Ballast	647,547.02	
Additional main tracks	42,770.84	
Sidings and spur tracks	601,196.70	
Terminal yards	448,691.15	
Fencing right of way	24,796.89	
Improvement of crossings, under and over grade	132,463.11	
Elimination of grade crossings	123,631.87	
Interlocking apparatus	44,735.44	
Block and other signal apparatus	641,481.53	
Telegraph and telephone lines	68,144.54	
Station buildings and fixtures	289,479.91	
Roadway machinery and tools	7,520.83	
Shops, enginehouses and turntables	170,576.99	
Shop machinery and tools	64,577.52	
Water and fuel stations	115,242.96	
Dock and wharf property	12,737.12	
Snow and sand fences and snowsheds	2,884.83	
Other additions and betterments	146,855.72	
		$6,930,034.31

NEW EQUIPMENT:	*Total Expenditure.*	*Less used from Reserves.*	*Charged Capital.*	
Locomotives	$102,684.41	$50,164.75	$52,519.66	
Passenger train cars	234,766.87	41,612.85	193,154.02	
Freight train and work cars	4,130,045.04	337,474.90	3,792,570.14	
	$4,467,496.32	$429,252.50		$4,038,243.82
Total additions and betterments for the year				$15,328,473.79

RESERVE FOR ACCRUED DEPRECIATION OF EQUIPMENT.

Credit balance, reserve for accrued depreciation July 1, 1913.		$12,163,011.93
Credits during year ending June 30th, 1914:		
From charges to operating expenses and outside operations:		
Maintenance of equipment, depreciation	$1,286,043.04	
Maintenance of equipment, renewals	51,450.07	
Outside operations, depreciation of cars used in	104,418.80	
From salvage	281,404.12	
From equipment sold	34,736.30	
		1,758,052.33
		$13,921,064.26
Less equipment retired:		
Locomotives	$50,164.75	
Passenger cars	41,612.85	
Freight cars	304,637.44	
Miscellaneous equipment	32,837.46	
		429,252.50
Credit balance June 30, 1914		$13,491,811.76

CAPITAL STOCK AND DEBT.

There has been no change in the amount of capital stock outstanding during the year, viz: $248,000,000.00.

Changes in bonded debt were as follows:

Prior lien bonds issued in this and preceding calendar year under Article One, Section 4 of Mortgage	$3,000,000.00	
Deduct Prior Lien bonds purchased and cancelled under Article Eight, Section 2 of Mortgage	403,000.00	
		$2,597,000.00
Deduct:		
St. Paul & Duluth Railroad Company, Taylors Falls & Superior R. R. Mortgage bonds matured and cancelled	$210,000.00	
St. Paul & Northern Pacific Railway Company Mortgage bonds purchased by trustee and cancelled	2,000.00	
		212,000.00
Net increase in mortgage debt		$2,385,000.00
Notes issued July 9, 1913, for one year	$10,000,000.00	
Less—amount purchased and cancelled	395,000.00	
Outstanding June 30th, 1914	$9,605,000.00	

(These notes were paid at maturity, July 9, 1914.)

During the year bonds held as treasury securities (including Prior Lien bonds issued as stated above), were sold to provide funds for general construction purposes, viz:

Prior Lien bonds, (sold for $3,728,625.45)	$3,927,000.00
General Lien bonds, (sold for $2,319,525.00)	3,430,000.00
	$7,357,000.00

SPOKANE, PORTLAND & SEATTLE RAILWAY COMPANY.

The results of the operation of the Spokane, Portland & Seattle road (including the Astoria & Columbia River R. R., merged March 1, 1911), for the years ending June 30, 1913 and 1914, as shown by the accounts of those Companies have been as follows:

	1913. 556.15 Miles Operated	*1914. 556.15 Miles Operated*
Operating revenue	$5,341,465.67	$4,901,740.24
Operating expenses	2,696,545.21	2,808,642.54
Net operating revenue	$2,644,920.46	$2,093,097.70
Outside operations	1,695.74	*5,843.14*
Total net revenue	$2,646,616.20	$2,087,254.56
Less taxes	640,800.00	640,800.00
Operating income	$2,005,816.20	$1,446,454.56
Other income	1,389,844.81	1,498,660.19
Gross income	$3,395,661.01	$2,945,114.75
Rents, interest, hire of equipment, etc.	879,523.63	874,887.60
Balance	$2,516,137.38	$2,070,227.15

The gross earnings of the above company on business exchanged with the Northern Pacific Railway Company for the fiscal year approximated $1,840,000.00.

OREGON ELECTRIC RAILWAY COMPANY.

The results of the operation of this property for the year as shown by the accounts of that Company, compared with the previous year were:

	1913. 132.07 Miles Operated	*1914. 154.19 Miles Operated*
Operating revenue	$1,108,421.76	$1,181,804.13
Operating expenses	720,798.08	804,636.70
Net operating revenue	$387,623.68	$377,167.43
Less taxes	51,453.36	56,033.36
Operating income	$336,170.32	$321,134.07
Miscellaneous income	1,069.13	552.57
Gross income	$337,239.45	$321,686.64
Interest on bonds and notes	144,336.68	363,995.14
Balance	$192,902.77	*$42,308.50*

The Oregon Trunk Railway, The United Railways Company and the Pacific and Eastern Railway are operating the same mileage as shown in the last annual report, viz.: 222.62 miles.

These properties together with the Oregon Electric Railway Company are controlled and managed by the Spokane, Portland & Seattle Railway Company, the securities of which are owned one half by your Company and one half by the Great Northern Railway Company.

THE MIDLAND RAILWAY COMPANY OF MANITOBA.

The operation of the line of this Company (owned jointly by your Company and the Great Northern Railway Company) has been continued by the owners.

To June 30, 1914, the joint owners have advanced, with interest $4,527,660.19. Your Company's one half, $2,263,830.09, is included in the balance sheet, under the head of "Securities of Proprietary, Affiliated and Controlled Companies—unpledged" $2,150,000.00, and the balance, $113,830.09 in "Advances to Proprietary Companies."

TERMINALS AT VANCOUVER, BRITISH COLUMBIA.

Up to June 30, 1914, your Company has invested in the purchase and improvement of these terminals $1,525,513.67 which amount is carried on the books under the head of "Miscellaneous Investments."

NEW LINES, GRADE REVISIONS, LINE CHANGES, ETC.

MINNESOTA.

Duluth.

Duluth Transfer Railway track from 59th Avenue West to the Minnesota Steel Plant at Spirit Lake, a distance of 2.82 miles is being rebuilt. It is sixty per cent completed.

Cayuna Northern Branch.

An extension to the North Line of 2.6 miles was constructed to reach the mines of the Duluth-Brainerd Iron Company located north of Deerwood in section 32, township 47, range 29 west. A spur was also constructed 1.6 miles long from Loerch southerly to the Canadian mine located in section 13, township 45, range 30 Crow Wing County. A connection with the Minneapolis, St. Paul and Sault Ste. Marie Railway at Cedar Lake, 4504 feet long, has been authorized and is under construction and will be completed this fall.

Minnesota & International Railway—Leaks Cut-off, 5.84 miles.

This change of line has been completed and put into operation.

Rice's to Little Falls, 14.61 miles.

The grading and culvert work for proposed second main track from Rice's to Little Falls, a distance of 14.61 miles, has been seventy-five per cent completed, the remainder of the work being deferred.

Saint Paul.

The Company's business having outgrown the present General Office Building at St. Paul, a new office building has been authorized and work is now in progress.

NORTH DAKOTA.

Western Dakota Branch.

Grading for the line from Stanton, N. D., west, (Spring Creek line) a distance of 62 miles, was completed last fall and track laid from Stanton to Golden Valley, 34.88 miles.

The line is being extended this season to Mile Post 68¼ and track will be laid from Golden Valley to that point by November 1st.

Line South of Beach.

A line has been located southerly from Beach, N. D., into the Golden Valley and contract let for grading 25.50 miles.

MONTANA.

Fish Creek Line Change.

In connection with the replacing of timber trestle over Fish Creek by a new steel viaduct, a change of line was made so as to bring the new viaduct on correct alignment. The change is 0.5 miles long and reduces curvature 44 degrees.

WASHINGTON.

Lester to Easton.

The second track and line change in progress at the date of the last report have been continued. Grading will be completed early this fall and tracklaying before the end of the year.

Point Defiance Line—Tacoma to Tenino.

This line will be completed this fall.

Interbay to Ballard (Suburbs of Seattle). Change of line and grade.

The work in progress at the date of the last report has been completed.

Grade Revisions and Line Changes North of Seattle.

Work on the various grade changes and revisions referred to in last year's report has been continued and should be completed this fall.

THREE YEARS' PROGRESS IN DEVELOPMENT OF THE COMPANY'S TRANSPORTATION FACILITIES.

In the three-year period from June 30, 1911, to June 30, 1914, additions to and improvements of the system's road and equipment were made, at cost as follows:

Branches, line and grade revisions, additional main tracks		$11,136,889
Other additions and betterments		16,139,133
Advances to proprietary companies of money used by them for additions to and betterments of their respective properties		3,161,426
New equipment:		
Locomotives	$1,371,578	
Passenger train cars	253,973	
Freight train cars	10,279,361	
		11,904,912
Total		$42,342,360

These expenditures have brought the company's facilities up to a capacity for handling, with economy and promptness, a volume of freight traffic considerably larger than any heretofore enjoyed by it, and have amply provided for a satisfactory growth of that traffic during a number of years to come.

Toward meeting the outlays consequent on these additions and betterments, the company sold during the three-year period treasury securities, including Prior Lien and General Lien bonds of its own issues, aggregating $22,453,000, principal, producing net $20,703,122.93.

In addition, on July 9th, 1913, the company made and sold $10,000,000 of its one-year six per cent. notes, producing net $9,950,000. Before their maturity, $395,000 principal of these were redeemed and cancelled, leaving outstanding on June 30, 1914, $9,605,000, principal.

THE REFUNDING AND IMPROVEMENT MORTGAGE.

As part of the arrangements for reorganizing the stock and debt upon the properties, the present Northern Pacific Railway Company, in the year 1896, made its Prior Lien mortgage to secure future bond issues maturing in 1997, and limited to $130,000,000, and its General Lien mortgage to secure future bond issues maturing in 2047 and limited to $190,000,000, the latter to bear interest at a rate not exceeding three per cent. per year. Of these General Lien issues, $130,000,000 were reserved for retiring the bonds issued under the Prior Lien mortgage.

For additions to and betterments of property, the Prior Lien mortgage authorized a total issue of bonds under it of $25,000,000, at the rate of $1,500,000 per calendar year.

For like purpose, the General Lien mortgage authorized a total issue of $4,000,000. By January 1, 1914, all of the General Lien bonds under this provision, had been issued, and all the Prior Lien bonds under the like provision had been issued, save $4,000,000. The limitation of the interest on General Lien bonds to three per cent. per year, manifestly has made them unsuitable for refunding purposes. Therefore, by January 1, 1914, a point was reached, where existing arrangements for procuring money on bond issues were practically at an end, and the time for making new arrangements on a basis suited to the company's future financial needs had arrived.

With prior consent of a substantial majority of the company's stockholders, given at a meeting of stockholders held for the special purpose, the Board of Directors on June 29, 1914, authorized a new mortgage to bear date July 1, 1914, to be called this company's Refunding and Improvement mortgage, and to run to Guaranty Trust Company of New York, and William S. Tod, Esq., of New York, as Trustees; and which, at about the date it bears, was executed by all parties thereto and went into effect.

This mortgage covers the Northern Pacific system of railways, their appurtenances and equipment; but not the company's granted lands, its treasury holdings of bonds, the bonds or stock of the Northwestern Improvement Company, or the stocks of the Northern Pacific and Northern Express Companies. Of the bonds issuable under the mortgage, $421,492,500 are reserved for refunding purposes. The total authorized issue is limited, so that the amount thereof, at any one time outstanding, together with all outstanding prior debt of the company as defined in the mortgage, after deducting therefrom the amount of all bonds reserved under the provisions of the mortgage, to retire debt at or before maturity, shall never exceed three times the company's outstanding capital stock; but if, at any time the amount of bonds outstanding, when added to the aggregate amount then reserved to refund prior debt, shall be $500,000,000, no additional bonds shall thereafter be issued, in respect of work or property, in any amount exceeding 80 per cent. of the cost thereof, certified to the Corporate Trustee pursuant to provisions of the mortgage regulating the issue of bonds for future acquisitions by the company. Of the bonds in excess of the $421,492,500 reserved for refunding, $20,000,000 were by the mortgage immediately issuable at the company's request, and by the mortgage were appropriated, one-half to paying the company's outstanding one-year notes, due July 9, 1914, and the remaining half to reimbursement of the treasury to that amount for moneys previously advanced by it for capital purposes, without having been in any form repaid or capitalized.

The remainder of the bonds are issuable only to pay for work or property adding to or bettering the mortgaged estate, and coming under the lien of the mortgage. The bonds are to mature July 1, 2047; but the Board of Directors is authorized, in respect to any special series to provide at time of issue for their redemption at the company's election before maturity.

Bonds are issuable in series, and those in any series may, by the Board of Directors, be made payable in money of the United States, or in that of another country.

The interest rate to be borne by any series of bonds is to be fixed by the Board of Directors, at time of its issue, and is in the Board's discretion.

The Directors feel that the new mortgage will suitably cover all the company's legitimate needs for money, during a long future period, and will enable it to obtain what money it can profitably use, upon terms at least as favorable to borrower as those at the time enjoyed by the generality of large concerns.

Soon after the execution of the mortgage, the $20,000,000 of bonds authorized to be issued forthwith were all issued and sold at prices satisfactory to the company. Out of the proceeds the $9,605,000 one-year notes then outstanding were paid off and cancelled. The remainder of the proceeds of the bonds has come into the company's treasury as money usable by the company for any lawful corporate purpose.

THE BRANCH LINES.

Of 6,353 miles of railway operated by the company in the year, 2,837 miles, or around 44.6 per cent., were operated as Main Lines, and 3,516 miles, or around 55.4 per cent., were operated as Branch Lines.

During the year, on all operated lines, the company moved 20,422,419 individual tons of commercial freight. Those moved during the year, on the Branch Lines, aggregated 13,375,408. Part of these were local to the branch on which they moved, but by far the most moved to or from the main lines, and made their chief mileage on the latter. The average haul on the system of all commercial tons was 275.6 miles. While the major part of this, upon the average, was performed on the Main Lines it is manifest that without the tons contributed by the Branch Lines the volume of business on the Main Lines would have been greatly reduced, operating cost per unit of traffic movement very much increased, and net earnings diminished to a corresponding extent.

THE PANAMA CANAL.

A large event of this calendar year, in the world's transportation and commercial business, has been the opening of the Panama Canal. The new route may be expected considerably to affect some trade currents now established. It may diminish some now of relative importance, and swell others to larger volume. Nevertheless, to holders of the stocks of the transcontinental railways, and especially to the holders of those of the railways running from the Great Lakes across the northernmost tier of states, to the Pacific Coast, the important question is, the probable effect of the new route upon the traffic of these lines.

The Atlantic and Pacific Coasts will certainly be brought closer together by the canal, and some exchanges of commodities between them can hereafter be effected at smaller cost than heretofore. However, the trade entirely through, from coast to coast, has never formed any large part even of that minor proportion of the country's total trade arriving at or starting from coast points.

The bulk of traffic moving into and out of the ports on either ocean, starts from, or is destined for, the country's great interior, which the Panama Canal can never reach. The larger part of the country's transportation movements seems likely to an increasing extent to be between points in its interior.

On lines serving a territory like that of the Northern Pacific, the preponderating movement of traffic, seems most likely to be one local to the territory. Figures printed elsewhere in this report show such to be the fact now. Northern Pacific's main lines, from the head of Lake Superior, and the Mississippi River, to Puget Sound towns, are more than 1,900 miles in continuous length; but the average length of haul of a ton of commercial freight on the company's railways, in the last business year, was only 275.6 miles.

For a time, the Panama Canal route may give manufacturers located on or near the Atlantic Coast some advantage over their competitors of the interior for the Pacific Coast trade; but that question must be, and must remain, one quite as much "up to" the interior manufacturer as to the railways.

The report of the Comptroller gives further details of the transactions of the company.

The Board of Directors especially desires to extend to the company's officers and employes as a body, its consideration and thanks for the fidelity and intelligence with which their respective duties have been performed throughout the year. By order of the Board of Directors,

W. P. CLOUGH,
Chairman.

JULE M. HANNAFORD,
President.

PASSENGER AND FREIGHT STATISTICS.

	1912-1913. Miles, Tons, etc.	1912-1913. Amount, Rate, etc.	1913-1914. Miles, Tons, etc.	1913-1914. Amount, Rate, etc.	Increase.	Per Cent.	Decrease.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico	$5.00
Canada	6.00
Foreign Countries (excepting daily editions)	8.00
Single Copies	15 cents each

Engineering and Maintenance of Way Edition and the four Maintenance of Way Convention Daily issues, North America, $1.00; foreign (excepting daily editions), $2.00.

Application made at the Post Office at Chicago, Ill., for entry as mail matter of the second class.

WE GUARANTEE, that of this issue 6,330 copies were printed; that of those 6,330 copies, 5,640 copies were mailed or delivered by messenger to regular paid subscribers; 407 copies were distributed among members and guests of the American Railway Engineering Association and at the Coliseum; 133 copies were mailed to advertisers; and 150 copies were set aside for office use.

The RAILWAY AGE GAZETTE and all other Simmons-Boardman publications are members of the Audit Bureau of Circulations

CONTENTS

Cost Of Yard Operation

The Committee on Yards and Terminals presented a comparison of the costs of operation of one hump and two flat yards which is highly interesting. From this comparison it would seem that the cost of operating a flat yard is considerably below that of a hump yard. This has been a disputed point for many years, and although numerous attempts have been made to collect data of this nature, direct comparisons have been difficult if not impossible to make because of the widely varying bases upon which data have been compiled. This deduction of the relative cost of operating the two types of yards must be considered as only tentative, as the committee submitted the data only as information, not having sufficient statistics, and the investigation covering too small a number of yards to enable any definite conclusions to be drawn. One point emphasized by the chairman which deserves special emphasis is that the cost per cut of cars should be computed as well as the cost per car, for the latter figure depends directly upon the former.

Reduction In Engineering Forces

There has been a great deal of informal discussion outside of the convention hall regarding the very general reduction in engineering forces during the past year, and the effects of this form of retrenchment on the organization of this department as well as on future maintenance expenditures. The chief engineer of one road reports that his monthly pay roll of $40,000 one year ago has been reduced to $15,000, and his forces were formerly on a purely maintenance basis. The engineering organizations on many roads are now considerably below the 1907 basis. Every engineering officer feels strongly that such radical reductions in forces remove much needed supervision which cannot fail to be reflected in increased expenditures in other ways. Also, an organization once destroyed is exceedingly difficult to rebuild or replace. We do not believe that executive officers are unaware of this condition or that they are requiring such reductions without serious consideration of the results. With the continually increasing cost of operation and the severe slump in business and unaccompanied by sufficient increases in rates the problem is an exceedingly complicated and serious one. But we do believe that in some cases the line of present as well as ultimate economy, viewed from this standpoint, has been crossed.

Adopting Recommended Practices

At each recent convention there has been an undercurrent of opinion that the present method of adopting recommended practices is faulty in that standards of much importance are adopted by the vote of a very small proportion of the membership. Furthermore, many of those voting have not previously given the subject careful consideration. For instance, the proposed clearance diagram was rejected by the narrow margin of five votes, with less than 100 members voting. In spite of the fact that the American Railway Engineering Association bears no official relation to the railways, its recommendations carry much weight and are taken to represent approved practices, as should properly be the case. While the higher officers realize more directly their responsibilities in many of these matters, they are out-voted frequently by others whose positions do not entail such responsibilities and who, therefore, view these subjects from a somewhat different angle. One member's vote should, of course, have equal weight with that of any other member. The problem is to present the recommendations before the entire membership in such a manner that the decisions may represent the desires of the entire membership. It is questionable if a letter ballot will secure such a result any more closely than the present system, for while it will require the individual attention of the members, those not in attendance at the convention do not have the opportunity to hear the arguments on both sides unless they are presented in a statement accompanying the ballot. Such a procedure also delays action and involves a vast amount of clerical work. This problem is one of importance for the association.

Evidences of Business Improvement

The view has been expressed on all hands by railway men and railway supply men attending the conventions in Chicago that while business is improving much more slowly than could be wished, there are numerous evidences that it is getting better and that it will continue to do so. This view is given emphatic support by a statement made by President Fahey of the Chamber of Commerce of the United States, which was published in the newspapers yesterday morning. Mr. Fahey was in Washington attending a meeting of the board of directors of the Chamber of Commerce, and expressed the consensus of opinion of the directors, who come from all parts of the United States. "The resumption of business activity is con-

tinuing steadily," said Mr. Fahey, "and the movement should quicken now. The consensus of all expressions is that in almost all directions things are mending rapidly. As a result of the war it is inevitable that there be slowness in some lines, but more men are being put to work every week, and the industrial output is increasing." These assurances, coming from the highest authority in the commercial world, are highly encouraging. Whatever increases business activity in general increases railway traffic and earnings; and whatever increases them stimulates railway purchases and helps the railway supply business. It is a long lane of bad business that the railways and railway supply concerns have been traveling; but it's a long lane that has no turning, and the worst part of the difficult period of readjustment caused by the war appears to be behind us.

AN ACROSTIC ON THE ASSOCIATION

Ability
Reliability
Endurance
Action

A. S. T. M. COMMITTEE MEETING

Committee D-7 of the American Society for Testing Materials will hold a meeting at 9:30 this morinng in the French room of the Blackstone Hotel.

PHILADELPHIA ELECTRIFICATION IN SERVICE

The Pennsylvania placed in service yesterday the first section of the electrified suburban lines between Philadelphia and Paoli, 20 miles.

THE GRADING OF LUMBER COMMITTEE MEETING

Chairman von Schrenk of the special committee on Grading of Lumber has called a meeting of that committee for 9:30 this morning at the Blackstone hotel.

CHANGES ON KANSAS CITY TERMINAL RAILWAY

E. P. Weatherly, engineer maintenance of way; A. H. Stone, assistant engineer, and J. Tuthill, engineer of buildings, of the Kansas City Terminal Railway, have resigned and those positions have been abolished.

C. E. LINDSAY A DIRECTOR

C. E. Lindsay, division engineer of the New York Central at Albany, N. Y., was elected a director of the American Railway Engineering Association at the meeting of the board after the close of the convention yesterday, to fill the vacancy created by the election of J. G. Sullivan to the second vice-presidency.

CANADIAN NORTHERN HALF-INTERLOCKING PLANT

The Canadian Northern has asked for bids on a half-interlocking plant at the crossing of the Winnipeg Electric and the Canadian Northern, at Portage avenue, West side Winnipeg. The installation also provides protection for a bridge and a stretch of track used jointly by street cars and railway cars.

PENNSYLVANIA ENGINEERS

The Maintenance of Way Association of the Pennsylvania Lines held its semi-annual session Tuesday and Wednesday at the offices of the Pennsylvania Lines in the Insurance Exchange, considering general matters of interest to this department. About 35 division engineers and other maintenance of way officers were present. F. Watts, division engineer, Pittsburgh division, is president and D. M. Craig, assistant engineer, is secretary of this association.

ELECTRIC RAILWAY ASSOCIATION MEETING

The Illinois Electric Railway Association will hold its regular quarterly meeting at 10 a. m. to-day, at the New Morrison hotel. After the meeting the members will attend the regular association luncheon.

AMONG THE VISITORS

Morgan K. Barnum, superintendent of motive power and W. Malthaner, superintendent of shops of the Baltimore & Ohio, were visitors at the Coliseum yesterday.

J. W. Kreitter, superintendent of the Duluth, Missabe & Northern, was also a visitor at the Railway Appliance show.

OGLE COALING STATION

In the description of the coaling station of the Nashville, Chattanooga & St. Louis at Hollow Rock Junction, Tenn., for which a special design with three storage bins was prepared, published on page 603 of yesterday's Daily, the fact that this design was prepared by the Ogle Construction Company, Chicago, was unintentionally omitted.

VALUATION MEETING POSTPONED

The conference between the representatives of the railways and the division of valuation of the Interstate Commerce Commission, which was called by Director Prouty to be held in Washington on March 22 for the purpose of considering a number of questions in connection with the federal valuation, has been postponed until April 19.

SOUTHERN PINE SPECIMENS

The Forest Products Laboratory, Madison, Wis., furnished several specimen cases of Southern yellow pine which were on exhibit yesterday in the corridor of the Congress hotel adjacent to the convention hall. These specimens were examined with interest by many of the members as illustrating grades of lumber which would be accepted and rejected according to a proposed grading rule which in the essentials follows closely the rules which were used by the Isthmian Canal Commission in the purchase of lumber for the construction of the Panama Canal and were published as an appendix to the report of the committee on Grading of Lumber.

B. & O. OFFICIALS TO BEGIN DETAILED INSPECTION

A number of officials in branches of the operating department of the Baltimore & Ohio were in Chicago yesterday attending the convention and visiting the exhibit. Today they will start on a detailed inspection to determine their programme for improvements and maintenance during the coming months. The party is headed by A. W. Thompson, vice-president in charge of operation, and includes C. S. Galloway, general manager eastern lines; J. M. Davis, general manager western lines; E. A. Peck, general superintendent; F. H. Clark, general superintendent motive power; M. K. Barnum, superintendent motive power; Paul Didier, principal assistant engineer; Earl Stimson, chief engineer maintenance of way; John Spielman, engineer maintenance of way; H. R. Talcott, engineer of surveys; G. A. Small, district superintendent motive power; J. R. Kearney, general superintendent of transportation, and a number of others.

The annual luncheon of B. & O. officials attending the convention was abandoned this year because of depressed business conditions.

Proceedings of Railway Engineering Association

Abstracts of Eight Reports Including Masonry, Wood Preservation, Bridges and Trestles and Electricity

The Thursday morning session of the American Railway Engineering Association was called to order at 9:30 a. m. by President Storey in the Florentine Room of the Congress Hotel, Chicago.

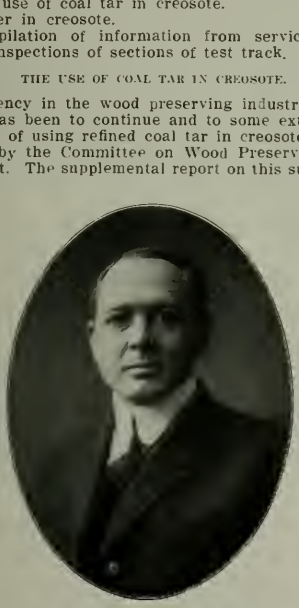
WOOD PRESERVATION

Of the subjects assigned by the Board of Direction, report is submitted on the following:

(1) The use of coal tar in creosote.
(2) Water in creosote.
(3) Compilation of information from service tests and reports of inspections of sections of test track.

THE USE OF COAL TAR IN CREOSOTE.

The tendency in the wood preserving industry during the past year has been to continue and to some extent increase the practice of using refined coal tar in creosote, which was considered by the Committee on Wood Preservation in last year's report. The supplemental report on this subject, which



EARL STIMSON,
Chairman Committee on Wood Preservation.

was presented by Dr. Hermann von Schrenk last year, covered the general situation, and there are as yet no new specific data available, although it may be stated that the practice of using a solution of refined coal tar and creosote has become more permanently established.

The commercial and economic conditions make advisable the conservation of the creosote supply. One of the feasible means of augmenting the available output of domestic creosote is by the proper addition of refined coal tar. This practice has been followed for some years, and there is every indication that it will be increased in the future. It follows, therefore, that a thorough mutual understanding between the treating plants and the consumer is desirable.

The best results are obtained from a solution of refined coal tar in creosote, which is filtered after being properly mixed. The filtration process removes much of the free carbon and reduces the viscosity of the fluid, with the result that the oils are thoroughly incorporated into an entirely homogeneous product. Such a solution is superior to and will give better penetration than one unfiltered and improperly mixed, and in tests under certain conditions (see pages 1074 to 1088, Vol. 15) did not reduce the penetration as compared with straight creosote. In cases where satisfactory penetration can be obtained the use of such a solution encourages the preservation of certain timbers which would otherwise be used untreated, and makes for economy where the supply of creosote is inadequate and the cost is higher than that of the solution.

The committee last year recommended certain precautions in case a creosote-coal tar solution was used, but made no recommendations as to the advisability of the refined coal tar addition. We are still unprepared to recommend regarding the advisability, nor can comparative service results between straight creosote and that to which refined coal tar has been added, be stated. The fact remains, however, that the practice is firmly established and widely followed. Hence, the committee feels justified in making recommendations which will protect the railway companies as fully as possible against unsatisfactory material or improper mixtures.

To this end we recommend for adoption and insertion in the Manual the following specification for a creosote-coal tar solution, and would emphasize that, while it is not a specification which is strictly accurate in a technical sense, it meets all practical requirements:

"The oil shall be a pure coal-tar product, consisting only of coal-tar distillates and oils obtained by the filtration of coal tar. It shall contain no admixture of crude tar.

"Water shall not exceed 2 per cent.

"Specific gravity at 38 deg. C. shall not be less than 1.03, nor more than 1.10.

"Matter insoluble on hot extraction with benzol shall not exceed 2 per cent.

"The specific viscosity (Engler) at 82.3 deg. C. (180 deg. F.) shall be not more than 1.170 for 200 cc. No variation above this standard shall be allowed. The term, 'Specific Viscosity,' in this case shall mean the number of seconds found for the sample tested, divided by the number of seconds for water at 20 deg. C. given in the official certificate for the viscosimeter used.

"On distillation by the standard method of the American Railway Engineering Association, it shall yield the following fractions based on dry oil:

"Not more than 1 per cent at 170 deg. C.
"Not more than 5 per cent. at 210 deg. C.
"Not more than 30 per cent at 235 deg. C.
"The residue at 355 deg. C. shall not exceed 26 per cent."

The quality of the coal tar used is an important factor, and as a further protection to the consumer, the committee recommends for adoption and insertion in the Manual the following.

(1) That the refined coal tar used be subject to inspection or analysis by the railway company at any time, such examination to be permitted upon request prior to the mixing of the solution. This is for the reason that determination of the quality of the coal tar after its addition to the creosote is difficult, if not impossible.

(2) That in case the railway companies makes its own solution of coal tar and creosote, using crude tar for this purpose, it specify clearly as to the quality of the tar.

In last year's report, the committee submitted for the information of the Association six precautions to be followed in the use of coal tar in solution with the creosote. The committee desires to modify these precautions so that they will read as follows:

(1) That there be a distinct understanding between all concerned that a mixture is specified and used.

(2) That the coal tar may be added to the creosote at treating plants when suitable facilities for properly mixing the solution are available otherwise the solution should be mixed by the manufacturer, but subject to the inspection or supervision of the railway company.

(3) That under no circumstances should the coal tar added constitute more than 25 per cent of the mixture.

(4) That the coal tar and creosote be thoroughly mixed at a temperature of approximately 180 deg. F. before being applied to the timber, and that the mixing be done in tanks other than the regular working tanks, and that the tanks containing the mixture shall be heated and agitated thoroughly each time before any oil is transferred to the working tanks.

(5) That only low-carbon coal tar be used, the amount of free carbon not to exceed 5 per cent.

(6) That in treating with the mixture the temperature of the solution in the cylinder be not less than 180 deg. F.

The committee recommends the adoption of these precautions as modified, and that they be inserted in the Manual.

WATER IN CREOSOTE.

One of the most important questions which arises almost daily in connection with the treatment of timbers with creosote is the question of admixture with certain percentages of

water. The committee has thought it advisable to present the following information with reference to this subject:

How does water get into creosote? A certain amount of water becomes mixed with creosote during the process of manufacture. During the distillation of the tar, where steam is sometimes used for agitating the stills, some of this steam vapor is condensed with the creosote in the condensing coils, and goes with the oil through the receiving tanks into the collecting tanks, and finally into the storage tanks there being no possible way of separating the water from the oil during its progress to the storage tank, as water present in small quantities does not separate by gravity except on long standing.

When steam is not used for agitation, air is generally used, and this air, of course, carries some moisture which condenses in the oil, although the amount of water introduced in this way would be much less than where there is steam agitation. In this connection, we might say that the use of steam agitation is limited, and most of the plants are now using air.

All coal tar contains water in greater or less degree. This usually is removed with the light oil and does not ordinarily constitute a source of water in creosote oil, although if the water is present in the tar in an unusual amount, it may not be entirely removed during the early stages of distillation and some may remain in the creosoted oil.

Water may enter the condensing worm where the vapor pipe passes through the condensing tank. Should any serious leak develop, it would be soon detected, but minor leaks would not be. Sometimes the lines leading from the stills to the storage tanks and from the storage tanks to the shipping point are equipped with inside steam pipes to prevent choking or blocking of the pipes with naphthalene in cold water. Of course, this steam pipe is apt to leak, and such a leak would not be detected until it became serious. The storage tanks in which the oil is kept from the time it is made until the time it is shipped, are almost always equipped with steam coils, and it is customary to keep the oil warm during cold weather. These heating coils sometimes develop leaks.

Where creosote oil is shipped in tank cars, water may get into the oil in the cars through leaky steam coils. Where it is transferred in vessels, a certain amount of sea water may get in through leaky seams or bulkheads.

At the treating plant water may get into the oil during the process of treatment, either through leaky steam coils in the cylinders or storage tanks, or from the timber itself. While the data concerning the actual quantities of water which may get into the oil during treatment from the timber itself are meager, it is a matter of general observation that, particularly during the early months of the year (especially in northern states), when timber is wet due to winter exposure, or, as is frequently the case, covered with snow, the water percentage in the oil, as used in treatment, rises. So, for instance, in 1913, at one of the northern plants, the average sample of oil for April had 5 per cent water in it. During the next two weeks, or early in May, the water percentage in the average sample dropped to 1.4 per cent, and during the last two weeks in May it dropped to 1 per cent. There was a very heavy rainfall during April, and early in May there were seven days of rain. As soon as a number of days of good, sunny, dry weather occurred, the water percentage in the oil, as actually used in treatment, dropped immediately. There was no leakage in the steam coils, and in no case was live steam admitted into the cylinder.

Where ties or timbers are steamed as a part of the treating operations, a certain amount of water may get into the creosote from the condensed water forming on the timbers and from some of the water which comes out of the timbers during the pressure and vacuum periods.

Another point at which water comes into creosote is in storage tanks which have no roof. Such storage tanks usually have to be provided with what is known as a water seal. Experience has shown that no distinct dividing line forms between water and creosote, and the result is that the upper 2 or 3 ft. of oil in the storage tanks are more or less mixed with water.

The actual determination of the percentage of water contained in a tank car or storage tank is a comparatively simple matter after a sample has been obtained. The accuracy of the determination will depend largely upon the method with which the sample is taken. Where it is possible to obtain a drip sample, this method is to be preferred, providing the sampling continues for the entire period of the emptying of a tank car. This is, however, frequently impossible, particularly where a considerable percentage of water is suspected, and where it is not desirable to empty the tank car. It is also impossible to use the drip sampling in the case of storage or working tanks.

Various schemes have been used for obtaining an average sample where the drip sample is not possible. One of these consists in constructing a thief, composed of a long tin or zinc tube 3 or 4 in. in diameter and 18 to 24 in. long, weighted at the bottom. This tube has a cover in which a small round hole is cut. The tube is dropped rapidly to the bottom of the tank car and then is pulled up slowly through the oil at such a rate of speed that when it reaches the surface of the oil it is full. A little practice will enable the operator to gage the rate of filling with a fair degree of accuracy.

Another method consists in taking a cross-section. For this purpose a glass or metal tube about 2 ft. long is usually used, set in metal collars, with a valve at the bottom. The tube is lowered into the oil with the valve open, and when in position the valve is closed and the tube pulled out. An exact measurement is made of the depth of the immersion. The per cent of water is determined in this column and the actual amount of water for the number of gallons represented by the section is determined.

Where water has gotten into the oil beyond a certain limit, every effort should be made to reduce the quantity. This may be accomplished by allowing the oil to settle in the tank car or storage tank, and, after standing for a number of days, the water should be syphoned off. If an examination of the oil still shows excessive water, the oil should be heated and allowed to stand for a further period. It frequently happens that, in spite of long standing, much of the water cannot be separated in this manner. In some cases the boiling-out process has been adopted, that is, the oil is put into the treating cylinder and heated until most of the water has been boiled away. Where an efficient condenser system is used there will be only a minimum loss of oil.

A third means of separating water from oil has recently been suggested, namely, the use of centrifugal pumps, after the pattern of the centrifugal apparatus used in sugar mills. Unfortunately, the capacity of these machines is as yet very small, not exceeding 300 gallons per hour.

While it is desirable to use as water-free oil as possible, the committee finds that this is not always possible. There should be a number of well-defined rules in connection with the water allowance, however, and the committee recommends the adoption and insertion in the Manual of the following as indicative of good practice:

(1) *Allowable Limits of Water.*—The use of creosote in treatment containing up to 3 per cent water is permissible. Where the quantity exceeds 3 per cent, proper allowance shall be made, but under no circumstances shall timbers be treated with oils having more than 6 per cent water.

(2) *Measurement of Oil.*—In all cases where water separates from the oil in the tank or car, the water should be taken off to as great an extent as practicable and the oil measurement then should be made from the point of separation between the remaining water and oil as nearly as this can be determined. This refers to the physical process of measurement.

(3) *Sampling of Oil for Water Content.*—In sampling oil a drip sample should be used in taking samples from cylinders during treatment, and an approved cross-section tube should be used for taking samples from tanks or tank cars.

(4) *Storage Tanks.*—All storage tanks should have a watertight roof.

RECORD OF SERVICE TESTS.

The tabulated record of the service of the ties in the several sections of test track on the railroads reporting such tests, which has become a permanent feature of this committee's yearly report, was again presented, revised to show the status of the tests at the latest inspection.

As some of the service tests covered by this tabulation are now of considerable age, it seemed desirable to supplement the tabulation with a more detailed history of these tests. With this in view inspections were made by members of the committee of such of these tests as are of eight or more years' duration.

Most of the tests are not yet complete and final conclusions cannot be reached.

Dr. Irving W. Bailey, of the Bussey Institution of Applied Biology, Harvard University, presented a paper, entitled "The Effect of the Structure of Wood Upon Its Permeability," which was presented as an appendix.

CONCLUSIONS.

It is recommended that the following be adopted by the Association and inserted in the Manual:

(1) The Use of coal tar in creosote:

(a) The Specification for a Creosote-Coal Tar solution.

(b) Paragraphs 1 and 2, referring to the quality of the coal tar to be used in the solution.

(c) The six precautions to be followed in the use of coal tar in solution with creosote.

(2) Water in Creosote:

The four rules relating to the water allowance in creosote.

OUTLINE OF WORK FOR 1915.

The committee recommends:

(1) Continue the study of the relation of water to creosote.

(2) Derive conclusions from the results of exposure tests of material tested with water gas tar oil.

(3) Report on methods of accurately determining the absorption of creosote.

(4) Continue the compilation of service test records, with detailed reports of inspections by members of the committee of ties in track treated by the various processes.

(5) Study the relations of amount of preservative and depth of penetration to the resistance of the material against decay.

Earl Stimson (B. & O.), chairman; E. H. Bowser (I. C.), vice-chairman; H. B. Dick (B. & O. S. W.), C. F. Ford (C. R. I. & P.), Dr. W. K. Hatt (Purdue Univ.), V. K. Hendricks (St. L. & S. F.);, George E. Rex (A. T. & S. F.), E. A. Sterling (Cons. Engr.), C. M: Taylor (P. & R.), C. H. Teesdale, Dr. H. von Schrenk (Cons. Engr.), T. G. Townsend (Southern).

Discussion on Wood Preservation

The report was presented by Chairman Stimson.

The President: The specifications on the use of coal tar in creosote as submitted, without objection, will be taken as adopted for insertion in the Manual, with the understanding that there is to be a note attached that will express the views of the committee on the use of the specifications.

The remaining suggestions under this subject were also accepted.

The four rules relative to water in creosote were adopted.

BALLAST

The following subjects were assigned for investigation:

(1) Continue the investigation of the proper depth of ballast of various kinds to insure uniform distribution of loads on roadway, conferring with other committees.

(2) Continue study of subject of ballast sections, with particular reference to the use of a sub and top ballast.

Specifications for Gravel Ballast.

Class A Roads: Bank gravel, which contains more than 2 per cent. of dust or 40 per cent. of sand, should be washed or

H. E. HALE,
Chairman Committee on Ballast

screened. Washed or screened gravel should contain not less than 25 per cent., nor more than 35 per cent. sand. Class B Roads: Bank gravel, which contains more than 3 per cent. of dust or 60 per cent. of sand, should be screened or washed. Washed or screened gravel should not contain less than 25 per cent or more than 50 per cent. of sand. Class C Roads: Any material which makes better track than the natural roadbed may be economically used.

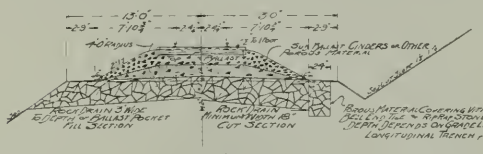
Specifications for Burnt Clay Ballast.

KIND OF MATERIAL.—Good ballast clay should be heavy and plastic, free from sand, gypsum or other impurities; must not crumble when exposed to air or brought in contact with heat.

LOCATION.—The pit must be located on level or moderately sloping ground, not subject to overflow. A water supply is desirable and it must be borne in mind that the sulphurous and carbonaceous gases liberated during the burning period damage the surrounding vegetation and make habitation in the near vicinity very disagreeable.

TEST.—The location site should be thoroughly tested to determine the quality of clay, the depth and uniform consistency of the deposit and small quantities should be burned in test kilns to show the quality of ballast to be secured.

BURNING.—Fuel should be fresh, clean slack and arrangements should be made to secure a constant supply. One ton of slack coal is sufficient for the perfect burning of four



Proposed Ballast Section for Single Track on Tangent.

cubic yards of acceptable ballast. From 1 to 1½-in. layer of slack are alternated with from 10 to 12-in. layers of clay, a new layer of slack and clay being applied to the fire every five or six days. Fires once started must be kept steadily and uniformly burning. To insure thorough and proper burning of the clay, the top and face of the first must be frequently raked down, to avoid clinker or black spots, caused by too much or too little air. When fully burnt a proper ballast clay becomes red in color, due to its high percentage of iron compounds; when underburnt the clay will show a yellow color.

SIZE.—Burnt clay ballast should be crushed or broken, if necessary, so that the largest piece will pass through a 4-in. ring.

DENSITY.—The finished product should absorb not to exceed 15 per cent. of moisture by weight.

STUDY OF BALLAST SECTIONS, WITH PARTICULAR REFERENCE TO THE USE OF SUB AND TOP-BALLAST.

This subject was first referred to the Ballast committee in 1913 and a sub-committee was appointed. In the 1914 report standard plans of ballast sections of various railroads in the United States and Canada were given in the report, and a proposed Class A section was submitted for consideration only, in the form of a progress report. During the year this proposed section has been compared with similar sections in service, and also studied and compared with standard plans of ballast sections of various railroads.

The committee made several changes in the proposed section and added a system of drainage which has been tried out and found to be very successful. The diagram of the proposed ballast section hereto attached shows a roadbed 26 ft. wide for single track. This width is considered necessary for a depth of 24 in., with a slope of 2 to 1 on the side and a path 2 ft. 9 in. wide. The committee wishes to call particular attention to the fact that with this depth of ballast the 2 to 1 slope on the side and the 2 ft. 9 in. path, the width of the sub-grade will have to be greater than 26 ft. on curves.

The committee recommends that this ballast section, with 24 in. of ballast under the tie, and roadbed 26 ft. wide on single tracks on tangents, be adopted as recommended practice for "Class A Track."

The committee further recommends that the slopes be sodded up to the top of the slope, but not beyond, as the application of sod on slopes shown in the present Manual lacks uniformity.

THE PROPER DEPTH OF BALLAST OF VARIOUS KINDS TO INSURE A UNIFORM DISTRIBUTION OF LOADS ON THE ROADWAY.

The committee again unanimously recommends that the test outlined in the 1913 report and 1914 report be made under regular traffic. The committee further recommends that continued efforts be put forth to secure the recommended test on one or more railroads, conferring with other committees. The corroborative results of comparing this test with others will, in the opinion of your committee, be extremely valuable.

BALLAST COMMITTEE'S WORK FOR NEXT YEAR.

(1) Continue investigation of proper depth of ballast of various kinds to insure uniform distribution of loads on roadway, conferring with other committees.

(2) Report on the best methods and cost of applying ballast, including the advisability of applying ballast by contract, and the organization of the most economic ballast gang if applied by railroad forces. Also the use of the pneumatic tamper, and the use of the spreader for forming the ballast shoulder and the path.

(3) Report on the comparative merits of different stones used for ballast, and gravels which disintegrate when exposed to the atmosphere.

H. E. Hale, chairman; J. M. Meade, vice-chairman, (A. T. & S. F.); L. W. Baldwin (I. C.), D. P. Beach (P. L. W.), W. J. Bergen (N. Y. C. & St. L.), T. C. Burpee (Cons. Eng.), O. H. Crittenden (I. & G. N.), J. M. Egan (I. C.), T. W. Fatherson (C. G. W.), H. L. Gordon (B. & O.), Geo. H. Harris (M. C.), C. C. Hill (M. C.), S. A. Jordan (B. & O.), William McNab (G. T.), S. B. Rice (R. F. & P.), E. V. Smith (B. & O.), D. L. Sommerville (N. Y. C.), F. J. Stimson (G. R. & I.), D. W. Thrower (I. C.), R. C. White (M. P.).

Discussion on Ballast

The report was presented by Chairman Hale.

The changes up to the specifications for Burnt Clay Ballast were adopted.

Chairman Hale: The committee recommends a new specification for burnt clay ballast. The entire specification is changed.

J. G. Sullivan (Can. Pac.): One of the clauses here reads, "When fully burnt a proper ballast clay becomes red in color." That is true, if there is iron in it. I think it might be well to add, "when the clay contains iron."

J. L. Campbell (E. P. & S. W.): In referring to the kind of material, I think the first line should read, "good ballast clay is heavy and plastic," rather than, "should be heavy and plastic."

The President: The committee accepts both suggestions.

A. M. Van Auken: There is quite a difference in the amount of coal needed to burn this clay into ballast in the different parts of the country.

The President: The committee suggests the insertion of the word "generally" before the word "sufficient" in the third line of the paragraph on "Burning" to cover this criticism. If there are no other comments on the specifications for burnt clay ballast they will be considered as adopted.

Chairman Hale: The study of ballast sections, with particular reference to use of sub and top ballast, has been given consideration for two years by the committee. The ballast sections are recommended for adoption.

C. E. Howard (Con. Eng.): I think you will find in some cases of deep rock cuts that the cost of cutting a wide roadbed over the narrowest one you could reasonably get along with would probably amount to more than the entire cost of the maintenance of a mile of track.

C. F. Ford (C. R. I. & P.): Has the committee given consideration to the fact of the tendency to increase to 14 ft. centers?

Chairman Hale: The committee did give consideration to this center distance of 13 ft. and 14 ft., and endeavored to select one which would show about the average conditions on the railroads, and also the committee did not like to add another foot to the roadbed if they could avoid it. The 24 in. of ballast is based on the two tests printed in the previous proceedings. Twelve inches of ballast is considered by your committee as too small an amount for heavy traffic. We had that in view when we recommended the 13 feet between centers in the two tracks.

Hunter McDonald (N. C. & St. L.): I have always felt that there was no necessity for banking the ballast up against the end of the ties. On the other hand, I think it is a detriment to the track. As the ballast at the end of the tie becomes clogged with any dirt it begins to act as a pump and pumps the clay up through the bottom of the ballast and fouls the ballast. The sections which are proposed here, it seems to me, could only be carried out on roads having sufficient tracks, to enable them to shift the traffic while this section was being introduced. On single track roads it is an impossibility. I believe a great deal of the foul ballast is due to the fact that it has been tamped too much. I have recently found a limestone paste that will pass through a number two hundred sieve, which, when mixed together, without any cementing whatever, will pull eighty pounds. Under these conditions it seems to me that if we continue to powder our limestone dust under the ties by tamping we will produce a paste which will cause churning, especially so if the border is clogged.

Mr. Ford: We have used a 12-in. ballast with the first 8 in. of coarse rock resting on the cinders and the last 4 in. resting on the crushed gravel, and the results have been surprising. I do not believe we thoroughly understand the action of ballast on the sub-grade. I do not think that we are in position to say what the proper depth of ballast should be, so much depends on the sub-grade. But certainly the distribution of the load on the sub-grade is better secured by using very much coarser ballast for a portion of the way than it is by putting a classified material, such as specified in the Manual, for the entire distance. In connection with this matter of clogging the sub-grade, I think there is a good deal of misapprehension. Mr. McDonald is undoubtedly correct. On the other hand, other roads can bring up the same objection in rebuttal. I think the trouble is due to the way of placing the material on, and the selection of the material. In some cases, to my certain knowledge, the ballast has extended down to at least five feet, but it is no longer ballast. It becomes part of the roadbed, due entirely to the clogging which Mr. McDonald has spoken of.

Chairman Hale: The usual form of providing ballast in the case of a new track is to make the ballast of gravel or cinder, and on top of that it was assumed would be placed the stone ballast at a later date. This section was selected in this form, so that that could be done. With regard to the shoulder or boxing in the object your committee desired in that was not so much for holding the track in line, although that is essential, but also to thoroughly support the end of the tie and to prevent the ballast from kicking from under the end of the tie. One railroad, the officers of which understood they had six inches of ballast, found that they had from one foot to two feet, and their plan, after they found that, instead of adding ballast, which they themselves were prepared to use, was to scrape off the shoulder, and give the ballast which was there a thorough drainage.

J. M. Meade (Vice-Chairman): We have had a great deal of trouble with the ditching machines digging the tile out of the point of the ditch, and they started the plan of putting it near the center of the track, but out of the point of the ditch. The plan which we have presented shows it both ways.

Hunter McDonald: In answer to Chairman Hale's statement about the necessity for maintaining the shoulder ballast at the tie. If a border 10 in. wide is left from the end of the tie at a level with the bottom of the tie it will hold the ballast in there just as well.

Earl Stimson (B. & O.): Our experience on the Baltimore & Ohio supports the statements of the chairman, namely, that it is necessary to have the ballast pretty well banked at the end of the ties in order to properly support the ties.

A. S. Baldwin (I. C.): It seems to me that the question of shoulder in the ballast is largely dependent on the character of the sub-grade. I think it cannot be denied that the shoulder does furnish an excellent brace to the tie so far as maintenance of line is concerned. At the same time there are some sub-grades so soft that it is almost impossible to maintain it. In my experience I found it a good plan to keep the shoulder where it could be kept without an unreasonable amount of churning.

C. E. Lindsay (N. Y. C.): Mr. McDonald is entirely right in saying that ballast that has become so foul as to retain the water around the end of the tie is very objectionable, and where that condition exists we clear away the ballast down to the level of the bottom of the tie. Anyone who will examine the bed disclosed by the removal of an old tie will find it packed full almost to a glazed surface in many cases and almost impervious to water. The drainage in that case must be into the ballast at the side, and where we clean the ballast we clean it as deep as we can go between the ties clear across the track so that we get a drainage in that way from the bed of the tie into the space between the ties and then out to the side. We find that clean ballast, either stone or gravel, at the end of the tie of decided benefit in maintaining the line. Everybody knows the proper place to support the tie is a space three feet equally distant from each side of the rail.

John R. Leighty (Mo. Pac.): I notice the drawings show a drain filled with coarse rock. I would say that in a good many cases the effective life of that drain can be materially lengthened by mixing cinders with the rock. If the character of the sub-grade is such that it carries a great deal of earth with the water it will clog the interstices between the rocks in a comparatively short time, whereas if cinders are put in they act as a sort of filter and will not materially, if at all, deteriorate the drain and the result is a long life.

Mr. Meade: I will say that the centers, in the course of a few years, will rot and will clog the French drain. As a substitute for this we have been using crushed rock on top of coarse rock.

Mr. Baldwin: I tried putting drain tile vertically below the end of the ties and found it a very excellent way for draining out the water holes. For a few years it gave excellent results, but the pressure from the roadbed and the fine dust caused it to fill up almost invariably. Finally we got a good deal better results by using a large tile.

Chairman Meade: We tried that for six or eight years.

Mr. Safford: We have placed in the past too high a value on the qualities of the farm tile, which permitted water to be absorbed through it. I think the bulk of the water that gets into the tile comes through the joints. We are bound now to use the bell-shaped harder burnt tile, under most conditions, to a much greater extent than we did in the past, due to the fact that our wheel loads are much heavier. I think our trouble has been in the past that we have not been able to tamp the material over the tile hard enough to resist the lateral action due to the heavier loads. My experience has been that we get equally good results from drainage standpoints from bell tile as from farm tile.

Mr. Campbell: Referring to these ballast sections, I notice that the sub-grade is sloped from the center of the roadbed.

Chairman Meade: The committee discussed that point. The man dealing with the sub-grade, seeing it washed out after it had been in service for a while, realizes that the top of the sub-grade has not been disturbed very much, and it is ridiculous to suppose that any such line as recommended here could be maintained, but your committee thought it was a step in the right direction, and therefore recommended greater height in the middle, and drainage outside if possible.

J. B. Jenkins (B. & O.): I wish to ask if the committee would not consider calling this clause on roadbed Clause AA, so as to preserve our former classifications, A, B and C.

Mr. Meade: The committee is heartily in sympathy with the suggestion that other revisions are necessary, but this was such a step from what we had in the Manual to the proposed one that we wished to recommend this to the Association first for consideration, and then at a later date to revise the remaining sections in line with the wishes of the Association.

J. R. W. Amhrose (Tor. Term.): I think we are making a mistake if we adopt this section at this time, because, in a way, you are tying the hands of other committees that are now investigating this question. I think very few of us would recommend the construction of a 25-ft. roadway for single track to-day.

Mr. Meade: The committee is working in harmony with the other committees. The Roadway Committee was notified of our meetings and we have been in conference with them. We did not have time to get their approval of the 26-ft. roadway, although we have taken it up with them. In regard to the width, it all depends on the depth of ballast. If the depth of ballast is assumed to be 24 inches, the other will follow. We hear of roads considering 125-lb. rail. The weight of the coal cars is increased over the old coal cars, and the committee feels that something ought to be done now to have a section which is practically, as nearly as we can get it, the recommended practice of the railroad. It may be revised in the future. We don't say it will not be, but it is the best practice that we know of at the present time. We find two roads already making proposed sections, and we feel the others would be helped by having something of this sort.

The President: The committee has moved the adoption of sections for insertion in the Manual.

(A rising vote was taken on the motion, which was lost, and it was referred back to the committee for further investigation.)

Mr. Meade: The committee has one further recommendation in regard to the track section. (Reading the last paragraph under the Study of Ballast Sections.)

The President: The recommendation will be taken as having been approved by the convention.

Mr. Meade: The committee had also referred to it the proper depth of ballast on the roadway. What the committee wanted was about $3,000, and it was suggested that we try to get that amount from thirty railroads. We would like to hear from the convention as to the possibility of getting $100 each from different railroads. If we can get the $3,000 we can make this experiment, and I think the whole thing depends on this experiment.

The President: This recommendation of the committee has been before the Board of Direction in the past. Funds did not seem available with which to carry on the work. I can think of no action that the convention can take at the present time except to refer it to the Board for further consideration.

J. B. Jenkins (B. & O.): I would suggest, if the ballast committee applied to the different railroads of the country to make this test on a 10-ft. section of track, perhaps several 10-ft. sections for each railroad, that it could be done at very low expense, and I have no doubt a number of the railroads would be willing to make the test at their own expense. By having a number of 10-ft. sections and different classes of material, they would get much more data than they would by making the test for which they want the $3,000.

STRESSES IN RAILROAD TRACK

The special committee on Stresses in Railroad Track was formed by action of the Board of Direction November 20, 1913. A similar committee was created by the Board of Direction of the American Society of Civil Engineers November 12, 1913. By action of these two bodies the two committees have the authority to co-operate, and this co-operation is being carried on. The Board of Direction of the American Society of Civil Engineers made an assignment of funds for the work of the Committee March 4, 1914, and a contribution toward the expenses of the tests was later received by the American Railway Engineering Association from the United States Steel Corporation. It has been decided that the first work shall include the development of instruments and methods for tests on track, and that the preliminary tests on track shall include observations of the equilibrium depression curve of the track

A. N. TALBOT,
Chairman Committee on Stresses in Railroad Track.

under static load (the measurement to include rail, ties, ballast and roadbed); and also measurements of the distribution of strains in the rail.

During the summer and fall plans have been developed and a beginning made. The work has included (a) a study of the problem; (b) development of instruments and methods of carrying on the tests and trying these out in field and laboratory, and (c) static tests on railroad track with heavy locomotives and with single concentrated load. These tests were made on the track of the Illinois Central, near Champaign, Ill. A test party was organized and a start was made on the field tests, and these tests were carried on until unfavorable weather interfered with the work. The work of computation, making records and developing apparatus has since been continued. Enough experience has been gained to show that the methods used are practicable. During the winter it is expected that some laboratory tests will be made on ballast and on rail joints. Preliminary arrangements have been made for tests on the Baltimore & Ohio and on the Delaware, Lackawanna & Western. It is planned to carry on the test work during the coming season.

The Engineering Experiment Station of the University of Illinois is co-operating with the committee on this work through the use of its laboratories and its staff, especially through the assistance of Prof. H. F. Moore, in the development of apparatus and methods of tests. It is expected that this co-operative work will be of great assistance to the committee.

A. N. Talbot (Univ. of Ill.), chairman; W. M. Dawley (Erie), vice-chairman; A. S. Baldwin (I. C.), J. B. Berry (Cons. Engr.), G. H. Bremner (I. C. C.), John Brunner (Ill. Steel Co.), W. J. Burton (M. P.), Chas. S. Churchill (N. &

W.), W. C. Cushing (P. L. W.), P. H. Dudley (N. Y. C.), H. E. Hale, Robt W. Hunt (Cons. Eng.), J. B. Jenkins (B. & O.), Geo. W. Kittredge (N. Y. C.), P. M. LaBach (C. R. I. & P.), C. G. E. Larsson (Am. Br. Co.), William McNab (G. T.), G. J. Ray (D. L. & W.), A. Reichmann (Am. Br. Co.), E. Stimson (B. & O.), F. E. Turneaure (Univ. of Ill), J. E. Willoughby (A. C. L.).

Discussion on Stresses in Railroad Track.

The report was presented by Prof. Talbot.

Prof. Talbot: Work is to be done with different types of locomotives, to determine the effect of wheel loads and wheel spacings. It is to be done at different rates of speed to endeavor to determine the effect of speed upon the stresses. The measurements of the stresses in the rail will be made by strain gages at different points along the roadbed. The committee has been working with different depths of ballast, with different sizes of ties. Some thought has been expressed as to different tie spacing. An instrument has been developed to measure the pressure in the ballast, that is, the distribution of the vertical load produced at any point through the depth of the ballast. In addition to that, I want to say that this is preliminary work, rather elementary in some respects; an endeavor to find some of the laws which may be used for planning other work, and for analyzing and drawing conclusions from the tests. That gives a general notion of what we have in mind for this season.

MASONRY

The subjects assigned by the Board of Direction were:

Complete the report on principles of design of plain and reinforced retaining walls and abutments. (No report.)

Collect data concerning the cost and methods of constructing concrete piles, and make recommendation as to their use. (Reports progress only.)

F. E. SCHALL,
Chairman Committee on Masonry.

Report on the cost, appearance and wearing qualities of various methods of surface finish for concrete. (Reports progress only.)

Joint committee on Standard Specifications for Cement.

Joint committee on Concrete and Reinforced Concrete.

JOINT COMMITTEE ON CONCRETE AND REINFORCED CONCRETE.

The committee held two meetings during this year, at which the reorganization of the joint committee was thoroughly discussed and the financial aspect of the committee considered. At the meeting held June 3, 1914, sub-committees for the investigation of certain phases of reinforced concrete work were appointed. By instructions from the Board of Direction, further attendance at the joint committee meetings is not desirable.

COMMITTEE C-1, STANDARD SPECIFICATIONS FOR CEMENT, AMERICAN SOCIETY FOR TESTING MATERIALS.

Meetings of this committee were held on April 28 and July 1, 1914; at the first meeting, special committees on "Accelerated tests of the consistency of volume of cements" and on standard screen scale and method of standardizing sieves were appointed. At the meetings of this committee reports were received that the Conference committee on "Standard Specifications for Cement" was making progress and expected to reach a satisfactory conclusion at an early date, but so far this has not been accomplished.

The sub-committee on Accelerated Tests met on July 1, 1914, and discussed the question of these tests from various points of view; the committee expected to obtain some valuable information on this subject from abroad, but by reason of the disturbed conditions of the European countries little information may be expected from that source; the committee so far has not undertaken to make any tests.

NEXT YEAR'S WORK.

It is recommended that the subjects of cost and method of constructing concrete piles, and the cost, appearance and wearing qualities of surface finish of concrete be reassigned for further examination and report.

It is also recommended that the subject of certain typical designs of foundations for piers, abutments, retaining walls and arches in various soils and depth of water (not including pneumatic foundations) be assigned for investigation and report.

F. E. Schall (L. V.), chairman; F. L. Thompson (I. C.), vice-chairman; R. Armour (G. T.), J. C. Beye (C. R. I. & P.), C. W. Boynton, H. A. Cassil (B. & O. S. W.), T. L. Condron (Cons. Engr.), J. K. Conner (L. E. & W.), L. J. Hotchkiss, Richard L. Humphrey (Cons. Engr.), J. H. Prior, R. A. Rutledge (A. T. & S. F.), G. H. Scribner, Jr. (Contr. Engr.), Job Tuthill (K. C. T.), J. J. Yates (C. R. R. of N. J.).

APPENDIX A.

CONCRETE PILES, COST, METHOD OF CONSTRUCTION AND RECOMMENDATION FOR THEIR USE.

The concrete piles generally used are of the reinforced type, though in several cases plain concrete piles have been used.

They are usually of 16-in. short diameter, whether square or octagonal. The Santa Fe varies the short diameter, using the formula $D = 7$ in. $+ \frac{1}{4}$ in. L, where L equals length of pile in feet. Concrete piles are used with both a tapered and a straight section, the latter type being more commonly used.

A large variance is shown in the amount of steel reinforcement used, both longitudinal and transverse. The greater portion of the piles have $\frac{1}{4}$-in. rods for transverse reinforcement, whether spiralled or hooped. Steel mesh is used in a few cases and in one case additional steel reinforcement is used in the head of the pile. The Burlington is one of the roads that uses steel mesh for reinforcement.

The cost of the concrete piles at the point of manufacture varies considerably, probably due in a large measure to the method of bookkeeping, or as to what is considered a proper charge against the actual cost of the piling; the number of piles manufactured and the available plant and labor for manufacturing the piles are also factors that may influence the cost.

The variation in the cost per linear foot of pile is also due to the use of different quantities of steel reinforcement, some roads using a design providing considerably more steel than others. For instance, the cross-sectional area of steel used by the Burlington runs 4.25 lbs., of the Illinois Central 12.5 lbs., and of the Milwaukee 17.5 lbs. per linear foot.

The cost of driving the piles also varies considerably, but this should be expected, as the nature of the soil, the accessibility of the work, the traffic conditions and the number of piles driven at a given structure affect the cost of driving to a certain extent. Thirty-five cents per linear foot, however, seems to be a fair average cost under ordinary conditions. This cost includes handling costs, which vary from 10 to 12 cents per linear foot.

Several of the answers received to a circular request for information show that it costs little more to drive concrete than wooden piling.

The general opinion seems to be that in cases where there is permanent moisture and no danger of future drying out, wooden piling is the cheaper; where the line of permanent moisture is low, concrete piling is the most economical. No Eastern railroads seem to have used concrete piling for bridge bents. Several of the Western railroads have used this to a considerable extent and found it to be good and permanent construction. In many cases concrete piling has been used for supporting small abutments, where placed on embankments, as this type of construction is more economical on account of the saving in the cost of expensive high abutments.

The foregoing, in conjunction with the two summaries of replies, are submitted as a progress report, understanding that the subject will be continued for next year, for the further investigation of the different designs of piles, and to

submit a complete report with certain typical designs of concrete piles, their cost and recommended use.

APPENDIX B.

COST, APPEARANCE AND WEARING QUALITIES OF VARIOUS METHODS OF SURFACE FINISH FOR CONCRETE.

A careful review of the current literature on this subject was made and the committee found a marked lack of reliable information. A circular letter of inquiry was therefore sent to the members of the Association and others interested. Fifty-two replies were received, many of which contain excellent information. A summary of these is made a part of this report, and a number are quoted that contain information covering generally the methods in use and specifications and typical recommendations. The sub-committee feels, however, that the subject requires further study, and that it is not in a position to make final recommendations. The committee presents this report as information.

A review of the answers received gives the following methods as most generally used. Each method has been numbered for reference, the same as in the tabulated summary of replies.

Spading, to Work the Coarse Aggregate Away from the Form to Bring the Mortar Against It.

This method is the one generally used, and where decorative treatment is not necessary furnishes the best finish at the least expense. The surface is generally smooth and nearly impervious to moisture, and its wearing qualities are equal, if not superior, to those of any other method.

Coating with a Wash of Cement.

A wash of usually one part of cement and one part of sand is applied with a brush after the forms are removed. This fills up the pores and covers the small inequalities and wood grain marks and gives a smooth surface of even finish and uniform color. This film of mortar, however, is liable to become checked and hair-crack and often scales; for this reason it is not generally used.

Rubbing.

There are several methods of treatment, as follows:

(a) The forms are removed as early as practicable, prominent joint marks chipped off, and the surface thoroughly wet and rubbed with a cement mortar or carborundum brick.

(b) After the forms are removed the surface is rubbed with wooden floats, keeping the surface well flushed with water during the rubbing and thoroughly washing after the rubbing is completed. The earlier the rubbing is done the better the results. The rubbing removes most of the inequalities, fills the pores and small cavities, and gives the surface a uniform finish and appearance, and does not flake or scale.

Removing the Outside Mortar to Expose the Coarse Aggregate.

There are several methods of accomplishing this result, all dependent on the use of a surface finish or coating at least one inch thick, composed of prepared aggregate, which coating is deposited as the placing of the concrete proceeds.

(a) Wash the surface immediately after the forms are removed, exposing the aggregate, which is usually done by scrubbing with stiff brushes of either bristle or wire, and water, rinsing the surface clean, keeping it moist and protected from the sun for about three days.

(b) Treat the surface with an acid, usually commercial hydrochloric and nitric. The acid attacks the cement and exposes the aggregate. The amount of dilution of the acid is usually obtained by experiment and varies with the age of the concrete.

(c) Removing the outer skin by means of a sand blast: This method has not generally proven successful, as it is very difficult to obtain a uniform surface.

Tooling the Surface of the Concrete, After the Forms Have Been Removed, by Means of Crandall, Bush-Hammer or Other Tools.

This method, applied to the extent of cutting slightly into the aggregate, produces a very attractive surface, and it is the experience of many engineers that for work in which the best possible appearance is desired, bush-hammering provides the desired results at a minimum cost. The best results are produced with spaded surfaces or those composed of special aggregate.

Scoring.

Scoring the surface by means of a system of horizontal and vertical "V" shaped battens placed on the forms to break up the flat appearance, to make a line designating the completion of the day's work, to indicate expansion joints or to produce the effect of courses.

Metal Forms.

Forms of metal or wooden forms lined with metal give a smoother surface than bare wood. The spading is done in the same manner as with wooden forms to push the aggregate back from the face. In doing this an excess or thin skin of rich mortar is brought to the surface of the concrete, and is liable later to develop checks and hair-cracks and become unsightly.

Abstracts of some of the replies received in answer to the circular letter issued by the committee are given below:

C. H. Cartlidge, bridge engineer, C. B. & Q:

"In the beginning of our concrete work in 1889, it was our practice to face the concrete against the form boards by working the grout against the forms. A great deal of rough lumber was used in the early work, and as we enlarged the use of concrete, we tried to improve its appearance by depositing the mortar against the form and filling in back of it with concrete. Another method was to leave the concrete rough and plaster it. In the 25 years that have elapsed since these experiments, it has become evident that the original method is by far the best of the three, and that the more nearly homogeneous the concrete can be maintained the better will be the wearing qualities of the surface and even of the concrete itself. In later work we have adopted the same principle, but have used surfaced forms, even lining them with sheet steel to obtain a smoother surface. This gives the best results for the cost, but at the same time a thin skin of rich mortar or grout is formed against the form and on the outer surface of the work. This checks with minute cracks and in the end will probably be more or less unsightly. It is true that these cracks are very small and there is not the tendency for the film of rich mortar to scale off, which is exhibited in every case in the thicker mortar facing used in earlier work. In 1900 an experiment was made with bush-hammering some concrete which had been faced in the most careful manner by spading against the form; a portion only of the work done at that time was bush-hammered, so that there is an excellent chance to judge of the relative merits of the two finishes. As the result of this it is the writer's opinion that for work in which the best possible appearance is desired bush-hammering provides the desired result at a minimum cost. In a good deal of the work finished by spading against the forms improvement on the surface obtained was made by rubbing with carborundum brick; this gives a good surface and a pleasing appearance temporarily, but it has been found that it is difficult to obtain a uniform texture by this means and that, while exposure does not affect the material itself, it causes the washing away of the fine particles of concrete ground off by the carborundum, so that the work is really not very much better than ordinary spade finish work, unless the grinding is carried to an extreme.

"The cost of the spade finish is practically nothing; it takes little more labor to confine the greater part of the puddling to the concrete on the outside than it does to have the same men do all the puddling in the middle of the mass. The cost of bush-hammering will run from ¾ cent to 2 cents per sq. ft., depending on the age of the concrete, amount of work, accessibility of work, etc.

"It is evident that the rougher the completed surface, the darker it will naturally become by exposure, smoke and weather, as every indentation must receive and retain some coloring matter from the smoke. On the other hand, such a thing as an absolutely plain surface is a practical impossibility. There will be slight waves, small ridges, etc., left by the seams in their forms and their slight distortion, and where a spade finish alone is used the contrast between the dark markings in the seams and the lighter places in the smooth surface is disagreeable in effect, while by bush-hammering an effect of uniformity of texture is obtained, which is much more pleasing to the eye. The bush-hammering has also the effect of cutting away the rectangular markings of the face, which are particularly objectionable from the standpoint of appearance.

"The writer believes that the best and most economic finish for concrete is obtained by bush-hammering, and where the process is carried to such an extent as to expose the aggregate and slightly to cut into it, very beautiful results may be obtained."

George W. Kittredge, chief engineer, New York Central:

"The cost of finishing surfaces with a wooden float while concrete is green is about one cent per square foot. After the concrete has hardened somewhat, and the use of a cement or a carborundum brick is necessary, the cost is increased to about two cents per square foot. The cost of troweling and using a dot roller on walks and platforms is about 1½ to 2 cents per square foot. The above average prices are for all labor and material, including any scaffolding required. I have

no record of actual prices of other methods of finishing surfaces.

"As a general proposition, I think the best manner of finishing a concrete structure is by the wooden-float method, as it leaves the concrete in a more natural state, is cheaper and has a better appearance in the long run. Application of cement on the surface or the use of a cement brick generally makes a white finish, which is more susceptible to discoloration and liable to wear away unevenly.

"Concrete surfaces should be finished in above manner whenever they are exposed, or where it is desired to obtain as much density as possible for waterproofing purposes. I do not think surfaces should be tooled, scraped or treated with an acid, except where the surfaces have been specially prepared and artistic finishes are required. Concrete walks and platforms troweled and surfaces roughened where they are exposed to weather, I think, give the best result. Floors usually require special consideration.

"Surfaces finished smooth are less susceptible to discoloration from smoke and the weather than when untreated. However, tooled surfaces, I think, have the opposite effect."

L. D. Hadwen, engineer of masonry construction, Chicago, Milwaukee & St. Paul:

"In addition to the ordinary surface obtained by spading, we have used a surface finish obtained by using a sand blast, as was done at the Columbus depot; a treatment of the surface with dilute acid to remove the surface mortar, as was done in the Missoula depot foundation; a brushed surface to remove the mortar and show the rough aggregate; removal of the mortar skin by bush-hammering; and treatment of the mortar surface obtained by spading, chiseling off board marks and rubbing the entire surface with emery.

"A special mortar surface was formerly obtained by the use of a steel gage with angle-irons fixed to create a space about 1½ in. deep between the form surface and the body of the concrete. This space was filled in with mortar and the gage removed. This method is unnecessary, as an equally good mortar surface can be obtained by spading the aggregate back.

"In building the Miles City depot foundation, the forms were lined with building paper with a view to getting a smooth finish, free from all board marks. The wrinkling of this paper caused a wavy finish and the surface approximated that of bridge stone, producing a freak appearance and is not a desirable finish.

"Whitewashing surfaces with a liquid grout, or with a cement wash, is contrary to our practice and undesirable. It is only a matter of time before any such wash will check and scale. Some experiments have been made with coloring matter, both lampblack and ochre, with the idea of getting a surface of a definite tint. The addition of any coloring ingredient to an aggregate is to be deprecated, because it is very difficult to insure uniformity in the mixture, and the result is liable to be a surface that is blotchy.

"For wearing surfaces, such as floors with heavy trucking, the use of a special aggregate may be desirable. On some of our shop floors, granite screenings have been used for this purpose to give a granitoid surface. We have also used finely divided iron in some experimental sections of freight house, and a hard-wearing surface seems to be obtainable by incorporating such material or other patented preparations in the wearing coat. Except where especially dustless floors are desired, it does not appear necessary to go to additional expense for this purpose."

Discussion on Masonry.

Chairman Schall: In regard to the change in the Manual the committee recommends one change as to the stress in the reinforcement to loads from 17,000 to 16,000 lbs. so as to agree with the requirements in the specifications for iron and steel structures.

The President: The change will be made. If there is no objection to the definitions the addition will be made.

Chairman Schall: For several years the question of getting a revised specification for cement has been under consideration by a joint committee of the engineering societies. However, conditions have arisen that have put this matter back further and the committee is not willing at this time to recommend striking out the old specifications. We prefer to work along those lines until we can get something better. In regard to the committee on reinforced concrete, the workings of that committee have not been as harmonious as you might expect, more particularly due to a misunderstanding about the representation of certain organizations with the American Society for Testing Materials. This so-called difference has been adjusted to a considerable extent, but for a number of reasons the Board of Direction has felt that it is not desirable for this committee to meet with the joint committee. Another point on the reinforced concrete work that was assigned to the Masonry Committee, was to complete the work on reinforced concrete structures. This matter is tied up with the financial capacity of the organization to furnish funds to make tests of earth pressures, and for that reason this sub-committee has not presented a report. It is hoped that every man that has any facilities to furnish any data will furnish it to the Masonry Committee, and the committee in turn will get in contact with the American Society of Civil Engineers so as to get information on this important subject.

R. L. Humphrey (Con. Eng.): The Board of Direction accepted the invitation to become a member of the joint committee, and they have been co-operating in joint action. That committee has sub-committees at work and they are drafting further modifications of the report already prepared, with the hope of finishing their work at an early date. This matter of re-enforcement is under consideration by that joint committee, which is composed of committees of the American Society of Civil Engineers, the American Society for Testing Materials, and of this Association. It would seem to me that it would be desirable that the Board of Direction be asked to reconsider the action that it was undesirable to further co-operate. I would suggest the desirability of referring this matter of re-enforcement of concrete and the continuation of the representation on the joint committee on concrete and re-enforced concrete to the Board of Direction for their consideration.

The President: It will be handled in that way.

WOODEN BRIDGES AND TRESTLES

The following subjects were assigned:

(1) Continue study of relative economy of repairs and renewals of wooden bridges and trestles.

(2) Report on design of docks and wharves.

E. A. FRINK,
Chairman Committee on Wooden Bridges and Trestles.

(3) Report on developments in practice of ballast deck trestles since previous report.

(4) Report on use of lag screws for fastening guard timbers.

RELATIVE ECONOMY OF REPAIRS AND RENEWALS OF WOODEN BRIDGES AND TRESTLES.

During the current year the sub-committee sent to various railroads letters containing questions bearing upon the method of repairs and renewals of wooden bridges and trestles. Numerous replies to these have been received, showing a varity of information and practice. The committee has given these replies proper consideration, and as a final report, recommends the following conclusions:

It is good practice to repair wooden bridges and trestles by parts until such time as the general condition of the structure requires entire renewal.

DESIGN OF DOCKS AND WHARVES.

During the past year the committee has collected considerable material showing many forms of docks and wharves, and much variety of practice. It is the intention to carry this

study still farther and attempt to develop a type or types of structures that may be recommended as suitable for general use; recommendations to be confined to sub-structures or up to the dock or float level, and to consider both all-timber and combinations of timber and concrete designs. The committee therefore reports progress and recommends continuing this subject for the following year.

DEVELOPMENTS IN PRACTICE OF BALLAST DECK TRESTLES SINCE PREVIOUS REPORT.

No important developments have occurred since the filing of the committee's report in 1908. The oldest creosoted timber ballast deck trestles in service have not yet begun to fail, nor have other than very minor renewals been necessary, notwithstanding the fact that some structures have been in service 18 years. The consensus of opinion of railway officers having most extensive experience with this class of bridges indicates that the serviceable life will doubtless extend over a period of 20 or 25 years, depending on soil and climatic conditions. These officers are unanimous in conceding the advantages of these structures, while some consider the disadvantages unduly magnified, especially with reference to the difficulty of securing properly treated timbers. Two general designs of structures of this type continue prevalent, viz., the solid stringer-floor design and the open stringer-floor plank design. In certain districts where it is economical to use deep stringers with correspondingly long spans, the open stringer and floor-plank deck requires less material than the solid-stringer floor and possesses the advantage of less expensive renewal of bents should the deck outlive the substructure. Two of the largest users of ballast deck wooden trestles have changed their standards so as to provide for an open stringer and floor-plank deck in lieu of the solid stringer deck. Both these railways operate in districts where deep stringers are readily obtainable. In certain other districts it is impossible to obtain large timbers at a reasonable price and therefore it is imperative to use shallow stringers and short spans, thus making the solid-stringer floor economical. The next few years should determine with fair accuracy the actual length of life and the annual expense of maintenance of these structures.

While only a limited number of inquiries were sent out, the replies received indicate the cost of ballast deck wooden trestles to be from 40 to 50 per cent of that of reinforced concrete trestles, from which fact it would appear that the construction of reinforced concrete trestles might not be entirely justified in all cases. The committee therefore begs to recommend that for next year's work it will report on the relative merits of ballast deck wooden trestles as compared with reinforced concrete trestles, and at the same time be relieved from further work in connection with the subject at hand, since no important developments in practice of ballast deck wooden trestles are likely to occur within the next few years.

USE OF LAG SCREWS FOR FASTENING GUARD TIMBERS.

In July, 1914, the committee issued a circular to the various railroads making inquiry regarding the present practice of the use of lag screws in fastening guard timbers to ties on wooden and metal bridges. One hundred and five replies were received, but of this number, only 19 per cent had ever used lag screws for this purpose on wooden deck bridges and 16 per cent on steel bridges. Almost without exception, the roads or systems using them reported satisfactory results from their use. Generally, where objections were offered, the reason was assignable to a faulty application, such as boring the hole only a small distance or not boring at all; depending on driving the lag screws and expecting them to remain tight. Too small sizes and spacing at too great intervals was another reason, in the opinion of the committee.

On October 31, 1914, at a meeting of the committee in Chicago, the data obtained from the circular was discussed, and it was decided to continue the investigation regarding the use of lag screws. Another circular was prepared and submitted to the various railroads throughout the country on January 2, 1915.

Seventy-five replies were received in answer to this second circular. Thirty-three roads replied they had never used lag screws at all for the purpose named, 13 had used them with success, 3 had used them without success, and 21 did not state definitely what experience they have had with them. Thirty-eight of the replies indicated that the subject was worthy of a trial, 9 stated it was not worthy, and 25 did not express any opinion on the matter. Thirty-three expressed their willingness to give them a trial upon the recommendation of the committee, 10 were doubtful, and 15 stated they would not make further trial.

The committee now recommends and urges that a further trial be made of the use of lag screws to fasten guard timbers to ties on wooden and steel bridges by such roads as have signified their willingness to give them a further trial.

The committee would recommend in this test that ties and guard timbers be sized one dimension at the mill and that the dapping of ties and guard timbers be omitted; that alternate ties be fastened to the stringers, and a lag screw be used to fasten the guard timber to each tie. Holes should be bored full depth and lags screwed into place.

The committee recommends that this subject be continued.

E. A. Frink (S. A. L.), chairman; W. H. Hoyt (D. M. & N.), vice-chairman; H. Austill, Jr. (M. & O.), J. E. Barrett (L. & H.), H. C. Brown, Jr. (I. C.), E. A. Hadley (M. P.), F. G. Hoskins (B. & O.), H. S. Jacoby (Cornell Univ.), A. O. Ridgway (D. & R. G.), I. L. Simmons (C. R. I. & P.), D. W. Smith (H. V.), W. F. Steffens (N. Y. C.).

Discussion on Wooden Bridges and Trestles.

The report was presented by Chairman Frink.

The first subject was adopted to be printed in the Manual.

The second subject was accepted as a progress report and the subject was continued.

Chairman Frink: We find that no developments have been made in the design of ballast deck trestles. They are still of the two principle types, the solid floor structure, made of stringers, packed tight against each other, and what you might call the open floor structure, with stringers separated and floored over with plank. During the investigation we have developed information which leads us to think that it would be well to investigate the comparison of cost and the justification of the building of concrete trestles as compared with ballast decked trestles. With the permission of the Board of Direction the committee would like to pursue this inquiry along these lines during the following year.

The President: The Board of Direction will take cognizance of the report of the committee and it will be considered.

Chairman Frink: The fourth subject has been given more investigation and study during the year than any of the other subjects. We find the vast majority of the roads that have used lag screws report in favor of their use. It would appear that there is little benefit to be expected from adopting lag screws as against bolts; but one of the principal reasons for using lag screws is that combined with their use you do no dap over your guard rail or your ties.

The President: The report of the committee will be received as progress.

G. H. Gilbert (C., N. O. & T. P.): As I understand it the use of lag screws eliminates the cost of dapping. The Queen & Crescent has not within the last few years dapped the guard rail, but uses $\frac{5}{8}$-in. bolts for each tie.

Chairman Frink: With the use of lag screws every tie is held in place and every fourth tie is held in place by drift bolting. If the road wishes to spike every tie to the stringer that will make them so much more secure, but in the experience of the last eight years that we have on the Seaboard, we never had a case of derailment on a trestle that bunched the ties.

Hunter McDonald: For the past twelve years on our line we have never dapped any guard timbers. We have applied them creosoted and sized, used lag screws, and we have never had a case of bunched ties, that I know of, in the case of a derailment.

The President: The report will be received as a progress report and the subject will be continued.

H. S. Jacoby (Cornell Univ.): I am unfamiliar with the reason which led the committee to recommend that the principles of pile driving, Paragraph 15, be omitted. There is a recommendation to omit the words, "the weight or," and to change the word "weight" to "size." It seems to me in view of the fact that we have concrete piles instead of timber piles, that we ought not to drop out that part of the principle which certainly must be recognized, that the weight of a hammer has some relation to the weight of the pile. I think without question that until in recent years the tendency was to use hammers which were too light; but now, with the increased use of concrete piles, we ought not to close our eyes to that important principle involved.

Chairman Frink: The reason that the committee made that change is as follows: Change the word "weight" of drop to drop, because we believed the drop automatically covered that, and we changed the "weight of pile" to "size of pile," because we thought it was a better way to determine the factor governing the length of the drop of the hammer.

J. R. W. Ambrose (Tor. Term.): This clause has become more or less of an axiom. If it is in order, I move its elimination entirely.

J. C. Nelson (S. A. L.): I wish to second Mr. Ambrose's motion to eliminate Paragraph 15. Another important feature is the character of the pile that you are driving. Our expe-

rience is that a pile of less weight, diameter or length, on certain classes of work, can be driven with much less drop of the hammer than another class. We use almost exclusively in our plain piles cypress, and we find that we can't drop a hammer anywhere nearly as high on a cypress pile as heart pine. Therefore, I think that clause ought to be eliminated entirely.

(The motion was carried and the other recommendations approved.)

GRADING OF LUMBER

The work this year has been devoted to an investigation of the grading rules of pine and hemlock lumber. The committee finds that the rules for northern pine and hemlock, which were adopted several years ago, are no longer standard. It has been found wholly impracticable to purchase lumber under the rules as they are at present printed in the Manual, and the committee is unanimously of the opinion that these rules should be rescinded. With the co-operation of the Northern Hemlock and Hardwood Manufacturers' Association, a new set of rules has been drawn up for hemlock, which the committee presents herewith for study and criticism during the coming year.

In addition to the work of the grading rules, the committee has considered the investigations which are being conducted for the purpose of more definitely standardizing the nomenclature of the southern pines. The committee has co-

H. VON SCHRENK,
Chairman Committee on Grading of Lumber.

operated with similar committees of the American Society for Testing Materials and manufacturers of yellow pine. It has been generally recognized for a number of years that the grading rules for southern yellow pine do not sufficiently define the quality of the wood. It has been generally acknowledge that there is no practical means for definitely distinguishing between longleaf pine, shortleaf pine, loblolly pine, etc., after timbers have once been manufactured from the trees. It is furthermore recognized that it makes little practical difference from what species of pine a structural timber is cut, so long as certain density requirements are met. With these considerations in view, a number of the pine manufacturing organizations and the United States government have been purposing revised rules for grading yellow pine timbers. These rules involve the omission of the terms "longleaf," "shortleaf," etc., and call all the pines "Southern pines." They then define the different grades of yellow pines according to density.

The committee also presented the three rules which have been suggested. It will probably be another year or so before the details concerning definite specifications can be worked out, but much active work is now being done by the Committee on the Grading of Timbers of the American Society for Testing Materials and the various manufacturing organizations interested.

We recommend that the present rules for white and Norway pine and hemlock, printed in the Supplement to the Manual, 1912, be rescinded. The committee suggests as subjects for investigation during the coming year:

(1) Further investigation of grading rules for white and Norway pines.

(2) The continuation of work on specifications for southern yellow pines, to be carried on in co-operation with the American Society for Testing Materials and other similar organizations.

(3) The formulating of specifications for timber to be treated, in co-operation with the Committee on Wood Preservation.

Dr. Hermann von Schrenk (Cons. Engr.), chairman; B. A. Wood (M. & O.), vice-chairman; W. McC. Bond (B. & O.), D. Fairchild (N. P.), A. J. Neafie (D. L. & W.), W. H. Norris (Me. C.), J. J. Taylor (K. C. S.).

APPENDIX A.

GRADING RULES FOR HEMLOCK LUMBER.

TO COVER HEMLOCK LUMBER PRODUCED IN WISCONSIN AND UPPER MICHIGAN.

General Instructions.

The principal objects to be sought in the formulation of these rules are to establish grades that will blend the slight characteristics incident to different localities in such a manner as to produce grades of equal quality and value, and so constructed as to be best adapted to the principal purposes for which hemlock lumber can be utilized.

1. The face side of the lumber is the side showing the best quality or appearance.

2. Defects in lumber should be distributed in proportion to the size of the piece. Long or wide pieces of the same grade may contain more and greater defects than shorter or narrower pieces. The same percentage should be observed in both long and short, wide and narrow.

3. Wane in lumber is a defect which cannot be described by rule with satisfaction, and therefore must be left to the judgment of the grader. The lowering of grade on the face side on account of wane should be governed by grade, width and defects in the piece.

4. Lumber must be accepted on grade in the form in which it was shipped. Any subsequent change in manufacture or mill work will prohibit an inspection for the adjustment of all claims, except with the consent of all parties interested.

5. Mixed width boards do not necessarily require as good edges as shiplap or dressed and matched stock of the same grade.

6. Planing mill work should be taken into consideration in all grades of dressed lumber, and its effect on a piece must be left largely to the judgment of the inspector.

7. The grade of partition shall be determined from its poorer side only, when the order specifies partition.

8. Lumber when worked shall be graded the same as the respective grades when in the rough.

9. Unless otherwise provided for, lumber worked two sides shall be graded from its better face; lumber worked one side shall be graded from its surfaced face.

Definitions of Defects.

Knots shall be classified as pin, small and large or coarse, as to size, and round or spike, as to form, and as sound, loose, encased, pith and rotton, as to quality.

A pin knot is sound and shall not exceed ½ in. in diameter.

A small knot is larger than a pin knot and shall not exceed 1½ in. in diameter.

A large or coarse knot is one of any size over 1½ in. in diameter.

A round knot is oval or circular in form.

A spike knot is one sawn in a lengthwise direction.

The mean or average diameter of knots shall be considered in applying and construing these rules.

A sound knot is one solid across its face; is as hard as the wood it is in, and is so fixed by growth or position that it will retain its place in the piece.

A loose knot is not firmly set, but still retains its place in the piece.

A pith knot is a sound knot with a pith hole not more than ¼ in. in diameter.

An encased knot is one surrounded wholly by bark or pitch.

A rotten knot is one not as hard as the wood it is in.

Pitch pockets are openings between the grain of the wood containing more or less pitch or bark, and shall be classified as small, standard and large pitch pockets.

A small pitch pocket is one not over ⅛ in. wide.

A standard pitch pocket is one not over ⅜ in. wide, or 3 in. in length.

A large pitch pocket is one over ⅜ in. wide, or over 3 in. in length.

A pitch pocket showing open on both sides of the piece ⅛ in. or more in width shall be considered the same as a knot-hole.

Wane is bark, or the lack of wood, from any cause, on edge.

White or bright sap shall not be considered a defect in any of the grades provided for and described in these rules, except where stipulated.

In hemlock will often be found streaks or patches of red or brown discolorations, sound and firm, the presence of which does not weaken the wood, nor detract seriously from its utility. Water stain should not be confused with rot, being firm and strong, while rot is soft and decayed wood.

STANDARD SIZES FOR HEMLOCK.

Rough Lumber.

Piece Stuff.—Standard lengths for rough piece stuff are 4, 6, 8, 9, 10, 12, 14, 16, 18, 20, 22 and 24 ft. Standard widths are 4, 6, 8, 10 and 12 in. The standard thickness is 1⅞ in.

Boards.—Standard lengths for rough boards are 4, 6, 8, 10, 12, 14, 16, 18 and 20 ft. Standard widths are 4, 6, 8, 10 and 12 in. The standard thickness is 15-16 in.

Dressed Lumber.

Piece Stuff.—Standard sizes for piece stuff S1S1E are: 1¾x3¾, 1¾x5¾, 1¾x7¾, 1¾x9¾, 1¾x11¾.

Boards.—The standard thickness for inch lumber S1S is ⅝-in.

Flooring, Ceiling, Shiplap, Drop Siding.—Standard widths are: 3¼, 5¼, 7¼, 9¼ and 11¼ in. face. Standard thickness is ⅝-in.

Estimated Weights of Hemlock Lumber.

Per M Feet, Shipping Dry.

3-in. plank rough	3,000
3-in. plank and 4x4 to 8x8 S1S1E	2,700
3-in. plank, S4S or D&M	2,500
4x10 to 12x12, rough	3,500
4x10 to 12x12, S1S1E	3,200
4x4 to 8x8, rough	3,000
Thick D & better, S1S	2,500
Thick D & better, S1S1E	2,200
2-in. piece stuff, S1S1E	2,200
2-in. piece stuff, rough or S1E	2,500
2-in. piece stuff, S4S or D&M	2,000
1-in. boards, rough	2,400
1-in. boards, S1S or S2S	2,000
1-in. clear and select, S1S	2,000
Shiplap, D&M or drop siding	1,800
1x6 well tubing beveled edges	1,800
Sheathing lath	1,500
Lath	500
32-in. lath	300

Grading Rules.

Thick D and Better.—1. Thick D and Better shall be 4 in. wide and wider, 1¼ in., 1½ in. and dimension thickness.

2. This grade shall have sound, square edges, and be of the grade of Inch D Stock and Better on the face side, and not below the grade of Inch No. 1 Common on the back of the piece.

Boards and Strips.—There are six grades made in Boards and strips: Inch clear and select, inch D stock, No. 1 common, No. 2 common, No. 3 common and No. 4 common.

Inch Clear and Select.—1. Inch clear and select should be 4 in. and wider, and 8 ft. long and longer, not to exceed 10 per cent 8 ft. long.

2. This grade is especially adapted for interior finish and only the face, or best side, is expected to show, although some attention should be given to the back of the piece.

3. The face shall show no wane, but the back may show such an amount of wane or other defects as will not interfere with the use of the piece for finishing purposes.

4. No shake or season check shall be allowed on the face side, but a very little tight shake and checks that are not deep may appear on the back of the piece.

5. This grade will admit on the face side several tight pin knots not over ⅜-in. in diameter. In a 4 or 6 in., 12 ft. and longer piece, not more than three knots are admissible, and proportionately more in a wider piece.

6. A 10 or 12 in. piece, 12 ft. and longer, will not admit of more than three sound, firmly set knots, not to exceed ¾ in. in diameter. Narrower and shorter pieces will admit of fewer large knots, but not a combination of large knots and other defects.

7. Pieces 12 ft. and longer are admissible that will, with not more than 10 per cent of waste, produce two clear cuts each 4 ft. long or longer.

Inch D Stock.—1. Inch D stock shall consist of boards and strips below the grade of clear and select 4 in. and wider, and 8 ft. long and longer, not to exceed 10 per cent 8 ft. long, and must be of a sound and water-tight character.

2. All knots must be sound and firmly set. Red knots must not exceed 1¼ in. in diameter, and spike knots must not exceed in length one-fourth the width of the piece. Black knots must not exceed ¾ in. in diameter, and must be specially well set.

3. A 6-in. strip 12 ft. long shall not contain more than three defects of the extreme sizes. A wider or longer piece may contain relatively more of these defects; and narrower and shorter pieces relatively less. The general appearance of the piece must be taken into consideration.

No shake shall be allowed in this grade, but slight season checks and water stain shall not be considered defects.

5. This grade shall be suitable for sound drop siding, ceiling and flooring, and shall have a smooth appearance, especially on the edges.

Inch No. 1 Common.—1. The grade of No. 1 Common in boards or strips includes stock of a generally sound character.

2. Some shake is admissible.

3. Numerous knots, whether red or black.

4. Some water stain of a firm character.

Inch No. 2 Common.—1. Boards or Strips will admit of considerable shake.

2. Black, unsound knots.

3. Two or three good-sized knot holes, or more of small ones.

4. Streaks, or patches of discoloration, showing partial decay.

5. This grade can be safely recommended for general building purposes.

Inch No. 3 Common.—1. The defects may consist of excessive shake.

2. Very coarse, unsound knots.

3. Some soft rot.

4. Some cross checks.

Inch No. 4 Common.—4 In. and Wider, 4 Ft. and Longer. This grade includes all serviceable lumber below the grade of No. 3.

Piece Stuff or Dimension.—1. The grade of No. 1 Dimension will admit of shake that will not materially affect the strength of the piece.

2. Also knots, either black or red, that are well located and fairly sound.

3. Or some slight cross checks or sound water stain.

4. This grade, while admitting the above defects, must at the same time retain the element of strength required for any building purposes.

1. The grade of No. 2 Dimension includes stock not good enough to be classed as No. 1, and the defects admissible are of the same general character as the defects found in No. 1, except that they are more pronounced.

2. Considerable shake, large unsound knots, loose knots, knotholes and cross checks are all admissible in this grade, but not a serious combination of these defects in any one piece.

The grade of Merchantable is a combination of No. 1 and No. 2, consisting of approximately 50 per cent of each.

1. The defects of No. 3 Dimension are excessive shake, numerous knotholes, coarse, rotten knots or considerable rot.

2. This grade can be recommended for cheap, light construction.

No. 4 Dimension, 2x4 and wider, 4 ft. and longer, includes all serviceable dimension below the grade of No. 3.

Discussion on Grading of Lumber.

The report was presented by Chairman Von Schrenk.

The recommendation that the present rules for white and Norway pine and hemlock be rescinded was adopted.

Chairman Von Schrenk: The committee presents Appendix A as information, Appendix B is an extremely important matter, and these rules are suggested for the grading of southern pine lumber.

The President: The action proposed will be approved and the rules will be received as tentative rules. The committee is excused with the thanks of the convention.

ELECTRICITY

The following work was assigned:

(1) Continue the study of the subject of clearances.

(2) Report on the effect of electrolytic action on metallic structures and the best means of preventing it.

(3) Continue the preparation of a standard specification for overhead transmission line crossings.

(4) Continue the study of electrolysis and insulation and its effect upon reinforced concrete structures.

(5) Report on maintenance organization with relation to track structures.

CLEARANCES.

The sub-committee has been working in conjunction with the joint committee of the American Railway Association,

American Railway Engineering Association and American Electrical Railway Association on the subject of Clearances, and has submitted the following report, which was accepted by your committee and the recommendations concurred in:

G. W. KITTREDGE,
Chairman Committee on Electricity.

In the report of this sub-committee to the Electricity committee, and in the Electricity committee's report to the Association for 1913, it was stated that sub-committee on Clearances proposed to continue the study, in conjunction with other associations, and to make a recommendation changing the clearance line on Diagram "A," modifying the limiting clearance line FE for rolling equipment, to give additional space for automatic train stops or other permanent way structures.

We have investigated this question during the year and compiled information received from 196 railroads as to existing conditions of rolling equipment encroachment within the space under consideration. One hundred and forty of these replies show no encroachment.

This information was laid before the Joint committee, and the following resolution was adopted:

"That the limiting clearance line for rolling equipment, as adopted by the American Railway Association, should be changed so that the points FE2½/15 and GE O/15 become FE 2½/6 and GE O/6."

TRANSMISSION LINES AND CROSSINGS.

There has recently been organized a standing "National Joint Committee on Overhead and Underground Line Construction" composed of representatives from 14 associations and companies as follows: American Railway Association, American Railway Engineering Association, Railway Signal Association, Association Railway Telegraph Superintendents, American Electric Railway Association, National Electric Light Association, American Institute of Electric Engineers, American Electric Railway Association, American Telephone & Telegraph Company, United States Bureau of Standards, Independent Telephone Association of America, Western Union Telegraph Company, Postal Telegraph Company and the National Fire Protection Association.

Sub-committees have been appointed on (1) Underground and Undergrade Crossings, (2) Crossings of Electric Wires Over Electric Railway Tracks, and (3) Crossings of Trolley Contact Wires.

The sub-committee on Transmission Lines and Crossings has been working through its representation on the National Joint Committee to the end that uniform action may be ob-

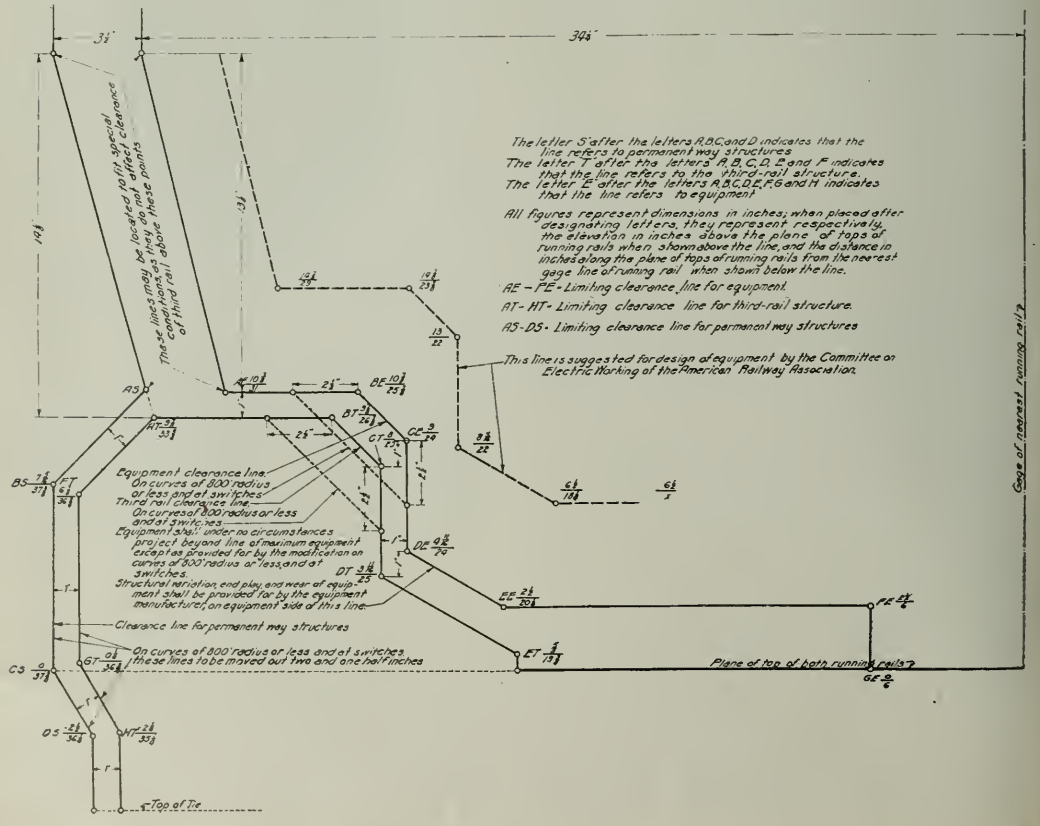


Diagram A, Showing Recommended Clearance Line for Equipment and Structures Adjacent to Third Rail.

tained by all associations on the present, as well as all future specifications. It is the hope and intention to submit new specifications when and after their adoption by the National Joint Committee.

The sub-committee recommends the adoption, as a new specification, of the "Specification for Crossings of Wires or Cables of Telegraph, Telephone, Signal and Other Circuits of Similar Character Over Steam Railroad Rights-of-Way, Tracks, or Lines of Wires of the Same Classes." This specification has already been adopted by the Association of Railway Telegraph Superintendents, the American Railway Association, the Western Union Telegraph Co., the Postal Telegraph Co. and the American Telephone & Telegraph Co.

The sub-committee recommends the substitution of the revised edition of the "Specifications for Overhead Crossings of Electric Light and Power Lines," in place of that adopted in 1912. The changes, while rather numerous, are not of great moment, but since this revised edition has already been accepted by the American Electric Railway Engineering Association and the American Railway Association, it is advisable that uniform action be maintained.

The joint committee, as a whole, is working on the revision of the wire crossing specification.

RECOMMENDATIONS.

(1) The committee recommends for adoption by the Association and publication in the Manual Diagram "A," "Recommended Clearance Lines for Equipment and Permanent Way Structures Adjacent to Third Rail and for Third-Rail Structures."

(2) The adoption of the "Specification for Crossings of Wires and Cables of Telegraph, Telephone, Signal and Other Circuits of Similar Character Over Steam Railroad Rights-of-Way, Tracks, or Lines of Wires of the Same Classes."

(3) The adoption of the revised edition of the Specification for Overhead Crossings of Electric Light and Power Lines, with the understanding that the National Joint Committee will take up the question of the additions or changes in this specification previously suggested by this Association at its 1912 convention.

The committee recommends that representatives continue to serve on the National Joint Committee on Electrolysis and on the National Joint Committee on Overhead and Underground Line Construction.

It is also recommended that the statistical data furnished by the sub-committee on Clearance be added to from year to year and kept up to date, and that consideration be given any new information that may develop in reference to maintenance organization and relation to track structures, and asks for such other instructions as seem necessary or desirable.

George W. Kittredge (N. Y. C.), chairman; J. B. Austin, Jr. (L. I.), vice-chairman; D. J. Brumley (I. C.), R. D. Coombs (Cons. Engr.), A. O. Cunningham (Wabash), Walt Dennis (C. R. I. & P.), J. H. Davis (B. & O.), George Gibbs (Cons. Engr.), G. A. Harwood (N. Y. C.), E. B. Katte (N. Y. C.), C E. Lindsay (N. Y. C.), W. S. Murray (Cons. Engr.), W. L. Morse (Jacksonville Terminal), J. A. Peabody (C. & N. W.), Frank Rhea (I. C. C.), J. W. Reid (C. & A.), A. E. Robinson (A. T. & S. F.), J. R. Savage (L. I.), A. G. Shaver, Martin Schreiber (P S. R.), H. U. Wallace.

Discussion on Electricity.

The report was presented by E. B. Katte.

E. B. Katte: The report of the committee is largely one of progress. The first recommendation relates to the clearance diagram for third rail, and the committee recommends the adoption of the recommendation by the association for publication in the Manual.

The President: If there is no objection the recommendation will be published in the Manual.

E. B. Katte: The second recommendation is in a way new matter. It relates to specifications for crossings of wires and cables over steam railroad rights-of-way, etc.

J. C. Nelson (S. A. L.): Are these specifications for crossings those adopted recently adopted by the American Railway Association?

Mr. Katte: Yes.

The President: If there is no objection, this recommendation will be approved.

Mr. Katte: The third recommendation pertains to certain revisions and modifications in the existing specifications for overhead crossings of electric light and power lines, for overhead transmission line wires of higher voltages. They have already been approved by the American Railway Association, and by the American Electric Railway Engineering Association.

The President: There is a modification of the specification apparently contemplated in the future, and the chair would ask the committee as to the intent of its recommendation—is it intended to take the revised portion of the specification as submitted without change, and have that incorporated in the Manual, with the idea that it will be changed in the specification before it goes into the Manual?

E. B. Katte: The committee does not recommend this publication in the Manual.

The President: If there is no objection, this revised edition of the specifications will be approved. The other two recommendations will be referred to the Board of Direction, which will decide what is to be done in both cases. I hardly think they are subjects for the convention itself to pass on.

(The committee was excused.)

YARDS AND TERMINALS

The Board of Direction outlined the work for 1914 as follows:

(1) Report on typical situation plans of passenger stations, of both through and stub types, with critical analysis of working capacity, and include a review of the different methods of estimating their capacity.

E. B. TEMPLE,
Chairman Committee on Yards and Terminals.

(2) Report on developments in the handling of freight by mechanical means.

(3) Report on developments in the design and operation of hump yards.

(4) Continue study of track scales.

REVISION OF MANUAL.

Definitions.

COACH YARD—A yard in which passenger cars are assembled, separated or prepared for service.

INTERCHANGE TRACK—A designated track on which cars are delivered and received, as between railroads.

General Requirements of Yards and Terminals.

SCALE TRACKS—Scale tracks should be so located that weighing can be done with least delay and without drilling over same; where many cars are to be weighed they should pass separately over the scale by gravity, being weighed while in motion.

REPAIR TRACKS—These tracks should preferably be connected at both ends and have a maximum capacity of about 15 cars each, spaced alternately 16 ft. and 24 ft. center to center and be connected conveniently to bad-order tracks.

Hump Yards.

(2) T hump yard is a desirable form of yard for receiving, classifying and making up trains because a greater number of classifications can be made in less time and at less cost than through any other form of yard.

"(7) Rider track should, if possible, be provided through center of classification yard running to summit of hump, independent of other yard movements, thereby avoiding hazard of personal injury to car riders and reducing the number of car riders to a minimum."

Yard Lighting.

(1) For yard lighting the use of nitrogen lights of 1,500 watts capacity, equivalent to about 2,200 candlepower, is recommended.

TYPICAL SITUATION PLANS OF PASSENGER STATIONS.

The work of the Committee on this subject was devoted to a study of the newly-completed passenger terminal at Kansas City, Mo., and the methods of studying the capacity and train movements at this station were described.

DEVELOPMENTS IN THE HANDLING OF FREIGHT BY MECHANICAL MEANS.

The main work of the committee has been an inquiry as to improved methods which have been or might be introduced to increase the capacity, rapidity, or efficiency of the work, and to effect a reduction in its cost. This includes both hand trucks and motor trucks, the latter, of course, being one system of mechanical handling.

Two things appear to be evident: (1) More attention is being given to the efficiency of freight-house operation; (2) there is a growing opinion in favor of the use of motor trucks.

The question of improved methods and trucking at any particular freight house must be considered in relation to the other facilties and the local conditions. While the freight house should be of sufficient size for the handling of its tonnage, it should be compact to avoid unnecessary length of trucking. In general, for an outbound freight house, a short house with several tracks tends to economy and rapidity of work (as compared with a longer house and fewer tracks), since it reduces the length of trucking distance. For an inbound house, a wide house, giving plenty of floor space, tends to economy and rapidity of trucking, as it avoids the necessity of piling the freight high and allows quicker location of freight for delivery.

It has been suggested that new freight houses should be planned with a view to the eventual use of mechanical handling. But it is not easy to see how this can be done, except by providing a minimum of column supports which might be obstructions to motor trucks or converyors. As noted later, clear space for movements is essential to good service with motor trucks.

In regard to mechanical conveyors for freight, it may be noted that the municipal wharf on the Missouri river at Kansas City, Mo., has a shed 300 by 40 ft., with two telpher tracks carried by the roof trusses and extending laterally through the building near each end. Along the front of the wharf is a track for an electric locomotive crane, which can take freight from the steamers or barges and deposit it at any point, or place it within reach of the telpher carriers.

This telpher equipment has not proved satisfactory and it is not believed that any such equipment could reduce the cost of handling the freight when it has been landed on the wharf in front of the doors of the warehouse. The house is narrow (40 ft.), with a continuous line of doors on both sides, and it is found simpler and cheaper to take the freight into the warehouse and across to the wagon side by hand trucking than by any form of telpher. In a warehouse of larger area and with packages of uniform size the telpher might be economical.

The equipment has been handled enough to thoroughly test it, but it is now used only when large and heavy pieces are moved from the wharf side of the warehouse directly through the house and loaded onto a wagon, as there is no crane equipment which will do this work. The equipment works satisfactorily, but it is thought that a lighter and speedier telpher would be used more frequently. The greatest cost in unloading barges and boats is in getting the freight from the boat onto the wharf, and this seems to be accomplished very easily by means of the locomotive crane. It is probable that an inclined chain package conveyor will be installed to handle small pieces and miscellaneous freight at this wharf.

The electric motor truck is increasing in favor and is of special advantage under proper conditions. As a freight carrier it is of use particularly where the commodities come in large lots, and where the freight house is so constructed as to give ample running room. A good and even floor is important also.

The electric freight trucks are adapted to the work at transfer houses as well as at ordinary freight houses. One point for consideration is as to their comparative advantages in freight houses where wagons deliver at a single doorway, and houses where they deliver at numerous doorways along the side of the house. Another point is that the increased speed of the trucking, with power trucks, tends to speed up the work of loading, unloading and stowing freight.

A particular point of interest in regard to these trucks is that some men consider them of most value when used as motor cars to haul trailer cars, rather than when operated as single independent units. This gives greater flexibility and facility of distribution. For the most efficient operation of motor trucks when thus used as tractors, it is necessary to have a sufficient equipment of four-wheel or six-wheel trucks to be used as trailers.

Some figures as to the cost of operation with electric trucks are given below.

A road operating 50 electric trucks states that an actual test by its electrical engineer indicates the following expense for maintenance and current consumption for these trucks

STATEMENT SHOWING COMPARISON OF OPERATING CONDITIONS IN ONE HUMP YARD AND TWO FLAT YARDS.

Month of August, 1914

Questions Asked	Yard A (Hump) Eastbound hump-double track Westbound hump-double track	Yard B (Flat)	Yard C (Flat)
(1)—Percentage of south or east bound traffic ..	64 per cent. loads. .... 36 per cent. empties .	69 per cent. loads.. 31 per cent. empties	87 per cent. loads. 13 per cent. empties.
(2)—Percentage of north or west bound traffic...	71 per cent. loaded 29 per cent. empties.	55.8 per cent. loads. 44.2 percent empties	65 per cent. loads. 35 per cent. empties.
(3)—Character of south or east bound loads ..	Fresh meat, live stock, live poultry, fruit, dairy and other food products, machinery, merchandise, grain, mill products, raw and finished coal and coke.....	Fresh meat, perishable merchandise, grain, flour, stone, coal, coke, etc...	Fruit, potatoes, sugar, vegetables, asphalt, cement, coal, flour, grain, hay, lumber, live stock, etc.
(4)—Character of north or west bound loads ..	Live stock, fruit, vegetables, merchandise, mill products, raw and finished machinery, coal, coke, limestone and ore.....	Perishable groceries, merchandise, lumber, sling, etc.	Automobiles, beer, furniture, machinery, fresh meat, merchandise, cement, coal, etc.
(5)—Number of loaded cars handled during the month.....	102,734 loaded cars (a)	96,903 loaded cars (b).....	43,341 loaded cars (e)
(6)—Number of empty cars handled during the month.....	53,692 empty cars (a).	68,720 empty cars.	13,037 empty cars (e).
(7)—Number of cars weighed during the month.....	10,852 cars weighed ..	2,696 cars weighed	6,275 cars weighed.
(8)—Maximum number of cars handled during 24 hours.....	4,998 cars (3,962 over humps) (h).....	2,976 cars (h).....	1,537 cars (h).
(9)—Maximum number of cars handled during any one hour.....	632 cars.....	450 cars.....	316 cars.
(10)—Number of cars classified	211,760 cars (c)	79,081 cars	83,832 cars (e).
(11)—Cost per car	23.76c per car (d).....	21.34c (d)	63.01c per car.
(12)—Rental of engines.....	$1.64 per hour (f).....	$1.09 per hour (g)..	$1.09 per hour (g)..
(13)—Cost of air.....	$258.77	$4.51	$523.73.
(14)—Cost of lighting.....	$ 76.39	$97.08	$361.88.
(15)—Cost of supplies.....	$96.00.....	$33 45.....	$148.70.
(16)—No. of cars damaged..	78 cars	60 cars	31 cars.
(17)—Cost of damage to cars	$1,854.59	$241.29.....	$359.50.
(18)—Are trains departing from yard made up in station order ..	With exception of 2 divisions set off trains are not made up in a station order—all trains are made up to embrace districts affording the longest haul to the break up point.....	Yes.....	All trains are made up in station order, except drag trains which handle dead freight exclusively and empties.
(19)—Estimated cost of duplicating yard, exclusive of grading, bridges and buildings	$750,000.00.	$329,200.00.....	$554,180.96.

EXPLANATORY NOTES.

(a) These cars are counted only on entering the yard—cars departing from yard are not counted

(b) 53,737 loads entering and leaving yard; 43,166 loads switched to and from local industries; total, 96,903.

(c) Report showed 105,880 cars entering Yard A from either east or west, and were counted but once. For comparative purposes this amount was doubled, as cars switched in Yard B were counted on entering as well as leaving the yard.

(d) These figures include cost of yardmasters and assistants, switchmen, towermen, clerks, car riders, car inspectors, switch tenders, weigh masters, engineers, firemen, engine rental, cost of supplies, including power, air, light, heat, etc. General office or administration expense not included.

(e) Cars are counted entering as well as leaving yard.

(f) At Yard A the cost of engine rental is made up as follows:

Cost per 100 locomotive miles run for repairs of locomotives, including replaced locomotives.....	$18.29
Cost per 100 locomotive miles run for fuel yard locomotives.....	5 26
Cost per 100 locomotive miles run for lubricants for locomotives (yard and road)	.29
Cost per 100 locomotive miles run for other supplies for locomotives (yard and road)	.40
Cost per 100 locomotive miles run for engine-house expenses (yard and road)....	3.07
Total cost per 100 locomotive miles run	$27 31
Average per mile.....	.2731
Average per hour, based on 6 miles per hour for yard engines.....	1 64

(g) Cost of engine rental at Yard B was figured at $5.00 per day, and Yard C at $24.00 per 24 hours.

For comparison purposes committee figured it as follows:

Cost per 100 locomotive miles run for repairs to locomotives including replaced locomotives.....	$18.29
Average per mile.....	.1829

Figuring 6 miles per hour for yard engines makes the cost 1 09 per hour as shown

Fuel, lubricants, other supplies and engine house expenses are not included in engine rental, as they have been included in general expense.

(h) These cars counted but once.

NOTE—The comparatively high cost of handling cars in Yard "C" is accounted for by the fact that wages paid in Yard "C" are higher than in Yard "B."

Also due to the fact that extra expense, was incurred in Yard "C" handling cars to and from other railways and the stock yards

Comparison of Yard Operation

working in the aggregate 48,000 hours in an approximate period of 12 months:

Labor and material	$3,630.90
Cost of current, 48,000 hours at 3.3 cents per hour	1,613.70
Cost per truck	104.89
Cost per truck per month	8.74

A report by the same road on the operating cost for handling freight with electric trucks, as compared with hand-truck operation, is as follows:

Eastbound.	Tons Handled by Electric Trucks.	Electric Trucks (Cts. per ton).	Hand Trucks (Cts. per ton).
Vessel to dock	24,050	19.25	29.23
Dock to car	12,383	11.38	13.15
		30.61	42.38
Westbound.			
Car to vessel	2,452	21.15	30.30

The 50 trucks were not in operation during all the working hours of the 12-month period. In addition to this, labor trouble was experienced at this point during this time, which compelled the employment of labor unfamiliar with the work. It is evident that if the work had been done under more favorable conditions, the cost per ton would have been reduced further.

The costs shown above include only the expense of foremen, truck operators and laborers. The figures show also the tonnage handled at these costs during October, November and December, 1912. On account of the short period the electric trucks were in operation and the small amount of tonnage handled, it is considered that it would not be fair to the electric truck operation to include all the items of expense incurred at the time of their installation and during their brief use at this point as a basis for the average cost per ton of handling freight.

The electric trucks were transferred to a transfer station in February, 1914, and the average results, based on the first seven months' operation (February-August, inclusive), are as follows:

	Average per Month.
Maintenance and repairs, including labor and material	$ 480.71
Cost of current	487.99
Labor expense, including foremen, checkers, truck operators, freight handlers, sealers and coopers	5,496.58
Interest on investment and depreciation of property	778.13
Total average expense per month	$7,243.41
Average number of tons handled per month	17,010 tons
Average cost per ton	42.58c
Average number trucks in use per month	47

In regard to electric trucks, the committee has the following statement from C. E. Taylor, secretary of the Local Freight Agents' Association of Chicago:

"All of the lines entering Chicago are still trucking freight by hand with the exception of the Chicago & Eastern Illinois and the Chicago, Burlington & Quincy. The former has three electric motors in use in the outbound house at Clark and Twelfth streets. The latter has seven electric motors in use in the outbound house at Harrison and Canal streets. Both lines are using these motors with trailers for trucking a large percentage of the l. c. l. freight which they handle at Chicago, but they als handle considerable quantities of freight with hand trucks. Each of these lines has demonstrated that the electric motors when used with a sufficient number of trailers, and when used in houses or on platforms which are adapted to their use, will result in a decrease in the cost of trucking freight as compared with the expense incurred in trucking exclusively by hand.

"It is generally conceded by freight agents who have given the subject much thought that the greatest benefit from electric motors as a means of trucking freight will be secured, not from the loading of freight on the motor, but by using the motor as a locomotive to pull trains of trailers. Under favorable conditions one of these motors can pull from six to ten four-wheel or six-wheel trucks heavily loaded, and by using the motors in this manner a very satisfactory decrease in average cost per ton for trucking freight can be secured."

DEVELOPMENTS IN THE DESIGN AND OPERATION OF HUMP YARDS.

Former reports have dealt more directly with the design of hump yards. This year it was thought desirable to obtain data covering the operation of a typical hump yard, as compared with a typical flat yard, preferably with a similar character of traffic.

One hump yard and two flat yards were selected for purposes of comparison. In the report the hump yard is referred to as "Yard A," and the flat yards as "Yards B and C." Statements were attached showing a comparison of the various features of the three yards. The figures were for the month of August, 1914, and represent the actual operating conditions and costs for each of these yards.

At yard A cars were counted only on entering yard. Cars leaving yard were not counted. At yards B and C cars were counted entering, as well as leaving the yard. On this account 211,760 cars are shown as handled in yard A at a cost of 23.76 per car, instead of 105,880 cars (actual) at a cost of 47.43 cents per car.

The committee thought it desirable to show cost of switching each cut of cars, as well as each car. The value of this information is apparent in making comparisons between two yards, as one road might average two cars per cut, and another road five cars per cut.

It was also thought desirable to itemize the cost per car for salaries of yardmasters, assistants, engineers, firemen, switchmen, towermen, clerks, car riders, car inspectors, switchtenders, weighmasters, etc., as well as cost of supplies, power, air, light, heat, etc., the total cost of each item per car to equal the total cost of switching per car. The cost of switching per cut of cars is shown for Yard A.

In this report, however, the committee was unable to distribute each item of expense on a car basis, but hopes to be able to do this in the future, as well as to show the cost of switching each cut of cars.

This year the committee also considered typical plans of turnouts on ladders. A member of the committee submitted plans of different track layouts over humps and ladders. The subject will be carried over and a further study made next year.

The committee suggests that the engine employed on the approach to the hump be of sufficient power to handle from a start the maximum train received in the yard.

TRACK SCALES.

Progress has been made on this subject, and the committee has under consideration the report adopted by the American Railway Association in 1913. A few important changes and several minor ones have been suggested. It is the desire of the committee, before making final recommendations on this subject, a very careful and full discussion shall be indulged in, and, with the approval of the Board of Direction, this committee will confer with the proper committee of the American Railway Association on an approved set of track scale specifications and rules.

SUGGESTIONS FOR NEXT YEAR'S WORK.

(1) Continue study of typical situation plans of passenger stations and approaches and methods of operating same.

(2) Report on handling of freight in double-deck freight houses, with cost of operation.

(3) Continue study of classification yards:

(a) Unit costs of operation of typical hump and flat yards.

(b) Yard lighting.

(c) Power vs. hand-operated switches in hump yards —advantages and disadvantages.

(4) Continue study, and, if possible, make report on track scales.

Discussion on Yards and Terminals.

The report was presented by B. H. Mann, vice-chairman. The reports on "typical situation plans of passenger stations," "developments in the handling of freight by mechanical means," and "developments in the design and operation of hump yards" were received as information and the report on track scales was referred to the Board of Direction.

The revision of the Manual was then taken up, changes being made in the following items:

C. Dougherty: With regard to the definition of an interchange track, will the committee make that "delivered or received"? The committee accepted the suggestion.

C. E. Lindsay: With respect to scale tracks, I suggest that in the second line it read, "drilling over scale."

B. H. Mann: The committee will accept that.

C. E. Lindsay: I repeat a request for the committee to study the subject of poling yards.

The President: That will be referred to the Board of Direction.

CHICAGO & NORTH WESTERN ROADMASTERS' MEETING

A meeting of the roadmasters of the Chicago & North Western—one of their regular meetings—was held yesterday at the general offices. A number of questions relating to track maintenance were reported on and discussed. The time of meeting and the location made it possible for the roadmasters to attend the convention and exhibit. In the past it has been customary for the assistant general manager to act as chairman of this meeting, but in this case one of the roadmasters was elected temporary chairman. The gathering took the form of an experience meeting, and labor problems, spring and summer work and other maintenance topics were discussed.

HIGHWAY CROSSING SIGNALS WITH MOVING ARMS AND LIGHTS

Many of the visitors at the exhibit commented on the large number of highway crossing signals with moving lights or moving arms which were exhibited this year. In all, there were 48 highway crossing signals shown by six companies, of which 18 had either moving arms, moving lights or both. The rest of the signals were standard types with crossing bells. This is a large increase in the number of these signals over any previous year.

RESOLUTIONS

The following resolutions were adopted in the closing business session of the convention yesterday afternoon:

Resolved, That the Board of Direction be requested to consider a working plan by which the conclusions of certain other associations working along the same lines of research as ours may receive the endorsement of this association without discussion in detail by its conventions.

Resolved, By the members of the American Railway Engineering Association, in convention assembled, that we desire to place on record our appreciation and extend our hearty thanks to Mr. Charles S. Gleed, Sir George Foster, Mr. Frank L. Mulholland and Mr. Benj. Baum, for their admirable and instructive addresses at the annual dinner; to the National Railway Appliances Association for the instructive and comprehensive exhibit of devices used in the construction, maintenance and operation of railways; to the technical press for the daily reports of the convention and useful information made available to the members; to the official reporters, Messrs. T. E. Crossman and G. W. Burgoyne, for their accurate and painstaking reports of this and previous conventions; to the tellers for their arduous labors in counting and tabulating the ballots for officers for the ensuing year, and to committee No. "23" on arrangements, for the highly successful arrangements made for the comfort and entertainment of the members and guests attending this convention.

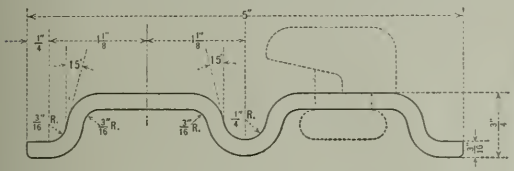
A LIGHT STEEL TIE

A steel tie designed for mine and industrial railroads and for light construction tracks has recently been placed on the market by the Cambria Steel Company, Johnstown, Pa. This tie is a rolled steel section, illustrated in the accompanying drawing, which is calculated to combine light weight with sufficient strength. The section illustrated, which is intended to carry 40 to 60 lb. rails, is 5 in. wide, ¾ in. deep and weighs 4 lb. per lin. ft. Two lighter sizes are also made, one for 16 to 45-lb. rail, which is 4 in. wide, ½-in. deep and weighs 2.16 lb. per ft., and one for 12 to 20-lb. rail, which is 2¼ in. wide, ½-in. deep and weighs 1.12 lb. per ft. The ties can be furnished for all gages from 30 to 54 in.

The rails are attached by flanged buttons permanently connected to the ties. These buttons are adjusted before shipment so that the friction will hold them in any position to which they may be turned. Solid wrenches are furnished for turning these fastening buttons in laying or removing rails, although ordinary adjustable or solid wrenches can be used equally well. A quarter turn with the wrench clamps each button on the rail, eliminating the driving of spikes and the adjustment of nuts. The fixed position of the button on the tie also automatically gages the rail. The fact that these

buttons are attached permanently to the tie avoids the possibility of loose or missing parts.

The light weight of these ties makes it possible to shift sections of track easily. A medium weight tie for 36-in. gage with fastenings complete will weigh about 10 lb., and short sections of track laid with such ties can be rapidly assembled and transferred, effecting a considerable saving in time for temporary light track work. The life of these steel

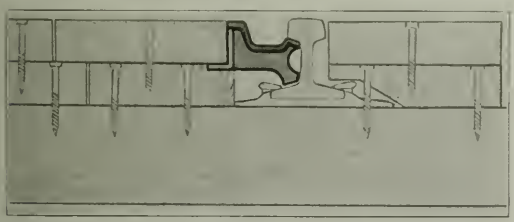


Section of the Slick Steel Tie.

ties depends largely, of course, on the conditions under which they are used, but in any event is doubtless greater than that of a wooden tie. The life of the ties may be further increased by a treatment with coal tar, asphaltum or similar coating applied by dipping the tie and fastening. The company is prepared to furnish ties so coated if desired.

A FLANGEWAY GUARD OF IMPROVED DESIGN

The Newhall flangeway guard, which is manufactured by the Cleveland Railway Supply Company, Cleveland, Ohio, is now being tested on a number of roads. This guard is so designed that when in place one side fits against the crossing plank or the pavement and the other side under the head of the running rail. It is held in position by the rail and the



Cross Section of Newhall Flangeway Guard with Planks.

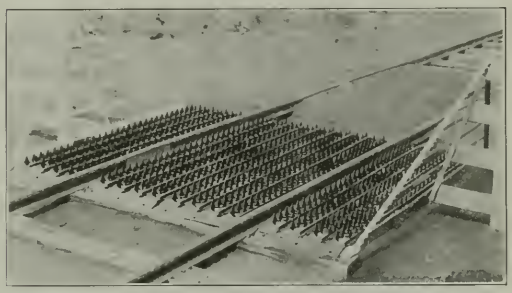
plank or pavement, no bolts or spikes being required. This rail is made of malleable iron in 4-ft. sections, which are securely interlocked. The flangeway provides the standard vertical clearance and the minimum longitudinal clearance necessary to avoid guard-rail action when the gage of track is ½ in. wide. The guard will not wear to a sharp edge, which is likely to cut automobile tires, nor can a horse's hoof be caught in it. The illustration herewith shows the general design and method of installation.

MASTER TRACK GAGE AND LEVEL

A new gage combining in one a standard track gage and level and a master gage for testing foremen's gages has recently been put on the market for the convenience of engineers, roadmasters and supervisors in checking up the gages of their men. This gage is made of seasoned hard maple finished in the natural color with brass caps on the ends forming the contact points. The standard gage includes a guard rail attachment and a graduated scale for measuring wide gage on curves and on the uppper side of the instrument are located the master gage and the level with adjustable bulbs and elevation slides. This device is manufactured by the Kalamazoo Railway Supply Company, Kalamazoo, Mich.

IMPROVED SURFACE CATTLE GUARD

The National Surface Guard Company, Chicago, manufactures a metal surface guard with high points punched from heavy plate, making it unusually severe on stock attempting to cross it and strong enough to prevent bending under the weight of an animal. This guard, shown in the accompanying illustration, is made of a high grade of open hearth steel, which is given a heavy coating of oil asphaltum paint. On account of the treatment given the metal and the ample

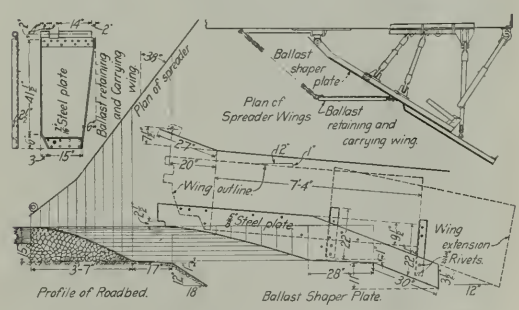


An Installation of the No. 10 National Surface Guard.

provision for drainage the liability to corrosion is greatly decreased. The points are approximately 2½ in. high and are assembled by so-called "thimbles," which raise the guard 2½ in. above the tie, forming a slight pit. In addition, it is recommended that one-half of the ballast be removed directly under the guard before its installation to provide a certain amount of oscillation under a load, considerably increasing its effectiveness.

SPECIAL WING FOR MANN-McCANN SPREADER

An attachment designed to spread the ballast to the standard roadbed section of the Chicago, Milwaukee & St. Paul has been developed and applied to a Mann-McCann ballast spreader in use on this company's lines in Montana. By the use of this wing the gravel ballast unloaded along the track has been spread and properly shaped at the rate of one mile in 20 minutes. This wing is also equipped with a ballast retaining and carrying wing with a capacity of 2½ cu. yd., which picks up the excess ballast and automatically feeds it out under its lower edge at points where there is an insufficient quantity. Such points are ordinarily



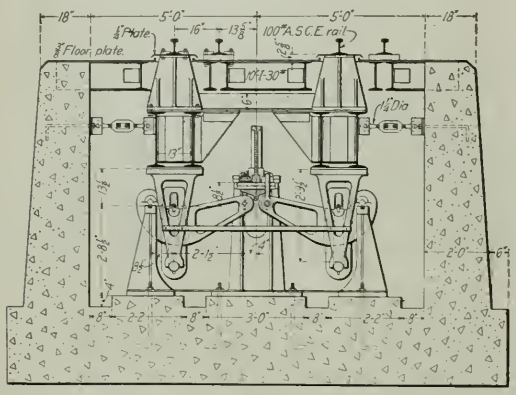
Details of the Ballast Shaper Plate and the Retaining and Carrying Wing Used with the Mann-McCann Spreader on the C. M. & St. P.

found at regular intervals corresponding to the spaces between the cars from which the ballast was dumped. This spreading wing is operated by compressed air in the same manner as the other side and center spreaders on this

machine, allowing it to be folded or unfolded almost instantaneously. This spreader is manufactured by the Mann-McCann Company, Chicago.

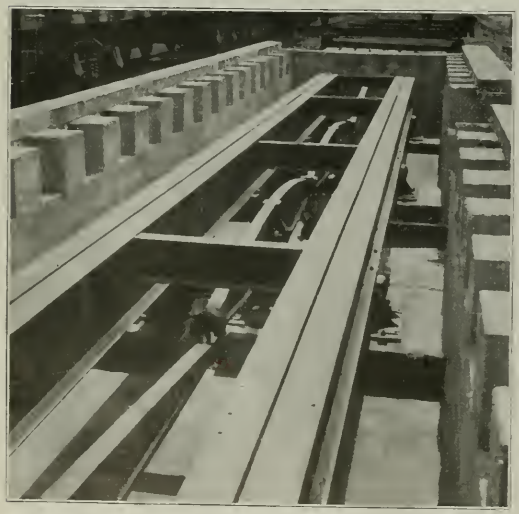
A SUSPENSION-BEARING CENTER-CONNECTED TRACK SCALE

A new single-link center-connected suspension-bearing railroad track scale has recently been designed by the Buffalo Scale Company, Buffalo, N. Y., and several successful in-



A Typical Cross-Section Through the Pit of the Suspension Bearing Track Scale, Showing the Details of the Main Lever Bearing.

stallations of the design have been made. The noteworthy feature of this design is in the bearing by which the load on the platform is transferred to the main levers. The main levers resting on chairs and the load is suspended from them



One of the Recent Installations of the New Suspension Bearing Center Connected Track Scales.

by a bearing consisting of only five parts. The platform girders bear directly on a steel yoke spanning the main lever and extending down to 24 to 28 in. below the bearing point on the upper surface of this lever. The sides of the yoke rest on the ends of a steel pin which extends through a heavy square-topped steel link passing up through a vertical slot in the main lever and over the heavy bearing block resting on the pivot on the upper edge of the main lever. In a four-section scale the load is carried by eight of these bearings, permitting free oscillation of the platform in all directions. In addition to this, the scale has a center connection which eliminates the use of an equalizer or rocker bar and adapts itself to any spring or slight irregularities in the platform girders.

The arrangements of levers conforms to the type of construction previously used by this company. The cross lever is furnished in 9-ft. or 10-ft. lengths and pivots wherever possible are heavily reinforced by the lever casting. The suspension links are made long to allow free, easy motion of the weighing platform in order to absorb thrust and impact in a transverse as well as a longitudinal direction and to avoid friction of the platform. These links are made of annealed cast steel. The chairs are of gray iron, the yoke of annealed cast steel and the yoke pins, which are 3½ in. in diameter, are made of steel with an ultimate strength of 84,000 lb. per sq. in. All metal exposed to moisture, with the exception of the bearing surfaces and the weigh beam, is coated with rust-resisting material and all parts are arranged for easy access for inspection and cleaning.

THE CONCRETE ATOMIZER

A new process of mixing and placing concrete in which the materials are heated to a high temperature after mixing in order to increase the hydration of the cement has been used with satisfaction on the Delaware, Lackawanna & Western and several other roads during the past two years. The quality of the concrete is said to be greatly improved by the application of heat and pressure as used in this system, the density being increased from about 137 lb. to 170 lb. per cu. ft., which is greater than granite, and the strength increased to three or four times that of average concrete. Microphotographs have disclosed no holes or cracks in this material, and one chemist who examined a specimen reported that no trace of unhydrated cement could be found.

The apparatus used for mixing and curing the concrete is known as a concrete atomizer. The process is described by the inventor, Harold P. Brown, 120 Liberty street, New York City, as consisting of thoroughly mixing measured amounts of cement, sand, broken stone and water in a cylinder, which is then filled with a hot gas or vapor under high pressure, the plastic concrete being then dropped into a superheated stream of rapidly moving gas or vapor, which separates the particles from each other and carries them in a rubber-lined hose to the point of deposit, projecting the stream against the work at high speed through an expansible nozzle. The blow struck by the material tamps it thoroughly and also jars out a portion of the water, the high temperature and the sudden reduction of pressure causing rapid evaporation of the remaining moisture so that quick setting is obtained. The process of building up the concrete on the surface of a wall or form by the deposit first of a layer of cement and then the imbedding in the cement of the particles of sand and later of the larger particles of crushed stone is similar to that which has been made familiar by the use of the cement gun, although the atomizer process differs from that of the gun in the use of crushed stone. The two processes also differ, of course, in the use of a preliminary mechanical mixing and the application of heat in the atomizer.

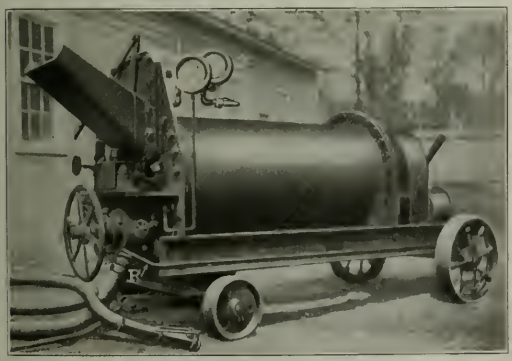
The No. 2 atomizer consists of a mixing cylinder with a charging door either at one end or in a dome on the top and containing a central driving shaft of square section which carries a series of mixing paddles and scraping devices for keeping the inner surface of the cylinder clear.

The necessary connections and valves for admitting steam to the cylinder and the discharge opening connecting with a 1¾-in. hose are located at one end of the cylinder. The mixing paddles are driven by a steam engine, the speed of which automatically increases as the load decreases during the discharge of the material, so that the rate of discharge can be kept uniform. When the cylinder is nearly empty the steam supply is shut off, the remainder of the work being performed by the expansion of the steam through the hose. The piston of the outlet valve is made to clear all material from its path when closing, so that the concrete cannot set in the pipe.

The No. 3 atomizer is similar in construction, having a mixing tank 5 ft. long and 3 ft. in inside diameter. It is designed to mix about 20 cu. ft. of loose materials at one batch and has a rated capacity of 150 to 180 cu. ft. of concrete per hour. This machine is designed to handle crushed stone up to 1 in. in size. An engine of special design is used to operate this machine, as the service requirements are unusual. This engine has a splash lubrication system and is self-contained. It can be operated with compressed air when the machine is used in tunnels or caissons and in this case the air can, if necessary, be superheated, giving the combined advantages of heat and pressure.

A special grade of rubber is used for lining the hose through which the concrete is placed, and it has been found that this hose is worn very slightly, since the wet cement lubricates the surface as soon as the stream is turned through it. Several lengths of this hose which have been in service for more than a year are said to show very little wear. Special couplings are used which have no metal parts exposed to the concrete. As an ordinary conical nozzle would be clogged frequently by stones, an expansible rubber nozzle was designed, the size of which is controlled by a lever in the hand of the operator. In case a pebble blocks the flow a slight movement of this lever opens the passage to the full diameter of the hose, allowing the obstruction to be blown out. The pressure at the nozzle is about 45 lb.

The concrete atomizer can be operated with one man at



The No. 2 Concrete Atomizer.

the nozzle, one at the machine and two or three laborers for handling the material. The accompanying photograph, illustrating its use on the Lackawanna retaining walls, shows two men at the nozzle, the duty of the second man being simply to keep a lookout for the flagmen who signaled the approach of trains. About 250 cu. ft. of fre air per minute at 40 to 50 lb. pressure is required when the machine is operated at full capacity on compressed air, and when steam is used the mixing is done at a pressure of 75 to 80 lb., with sufficient superheat to prevent condensation. By increasing the amount of superheat to the proper degree, the steam issuing from the nozzle is kept in gaseous form so that the work deposited can easly be seen by the operator. This stream is kept flowing from the nozzle continuously during the work in order to keep the surface on which the concrete is being deposited warm enough to prevent unequal contraction during the setting of the concrete. When the boiler is operated at 180 to 200

Repairing Retaining Walls on the D. L. & W. with the Concrete Atomizer Taking Steam from the Work Train Engine.

lb. pressure, a reducing valve placed close to the machine and set for 85-lb. pressure can supply the mixer, thus obtaining the required superheat. For use along an operated line, a machine can be connected to the steam dome of a locomotive and all other auxiliary apparatus eliminated.

At one point at which the small atomizer has been used a 60-hp. boiler was used to supply steam for a compressor furnishing air for the atomizer, this boiler consuming about 400 lb. of No. 3 buckwheat coal per hour, using forced draft, the output of concrete amounting to about 1 cu. ft. per minute. When steam was used direct instead of air the same amount of work was accomplished with natural draft on the boiler and a consumption of less than 100 lb. of coal per hour. The cost of the fuel for mixing, pouring and placing 1 cu. yd. of concrete with the No. 2 machine has been not more than $0.10 and the cost of fuel and labor less than $0.80 per cu. yd. With the larger machine this cost is reduced to less than $0.50 per cu. yd.

One of the early uses of this machine was in coating more than 6,000 sq. ft. of structural steel with 2 to 6 in. of concrete in the Grand Central Terminal improvements in New York City. Both compressed air and steam were used in this work, all of which has proved to be unusually hard, and it is said that no cracks or faults have developed in it. The Lackawanna rented one of these machines for several months to repair defective and honeycombed concrete subject to tidewater at its Hoboken terminal. Compressed air was used in this work, but for the repair of retaining walls, such as that illustrated herewith, steam was taken directly from the locomotive of the work train. This road has recently purchased this apparatus for further repair and construction work.

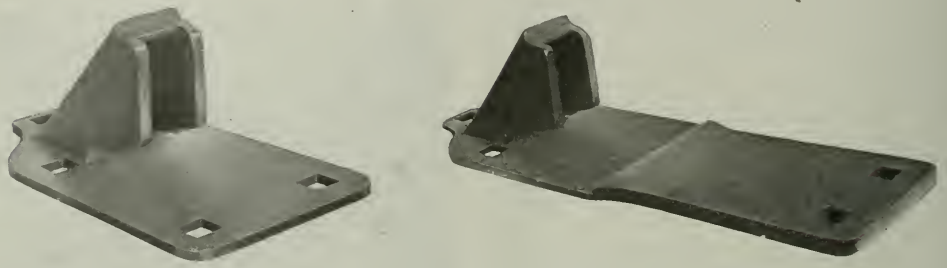
A CASE OF EXCESSIVE RAIL CREEPING

A very unusual instance of rail creeping is reported by the M. W. Supply Company, Philadelphia, Pa., manufacturers of the Vaughan rail anchor. A section of track near

Goshen, N. Y., is laid over very soft marshy ground commonly known as "meadows." It has seemed almost impossiple to get a solid foundation for this track, as much as 30 ft. of filling material having been put in in some places without changing the elevation of the track. A train passing over this section produces waves in the rail and in the surface of the ground near the track which are plainly visible. As a natural result creeping is a very serious matter, the spikes being pulled out of the joint ties by the moving the danger incident to those that involve a large proportion of benzine.

A COMBINED RAIL BRACE AND TIE PLATE

The Millies Railway Appliance Company, Hammond, Ind., has developed a combined rail brace and tie plate which has been on the market about one year and is in service on the Indiana Harbor Belt and several other roads. This device consists of a plate 6 in. wide, 11 in. long ½ in. thick under



The Millies Combination Rail Brace and Tie Plate and a Special Switch Point Brace and Plate.

slots in the splices, the ties being split and the splice bolts very frequently being sheared. The rails at one point were marked and during one summer were found to have moved ahead more than 80 ft. This necessitated the frequent use of switch points and constant attention on the part of the section gang as the joints were constantly opening. The application of rail anchors to practically every tie on this section has very greatly reduced the amount of creeping but has not entirely stopped it as the anti-creepers are pushing the ties ahead with the rails. While as a general thing 14 to 18 in. of creepage a year is considered excessive this company states that from 4 to 6 in. a year makes the use of anti-creepers an economy.

BARRETT SPECIFICATION ROOFS, FLOORS AND PAINT

The Barrett Manufacturing Company, New York, has recently laid much stress upon a more systematic inspection of the laying of Barrett specification roofs. An inspection sheet is now made a part of the specification, which includes full directions as to identifying the correct materials when they are delivered on the job. It gives methods of ascertaining that the contractor has used these materials in the requisite amounts to comply with the specifications. It also includes methods approved by the National Association of Master Gravel and Slag Roofers of America for cutting a slit in the roof at right angles with the way the felt is laid so as to exhibit a cross-section of the roof.

Another interesting field of development has been in the formation of practices and the preparation of specifications for the use of tar in sub-floors where a wooden floor is required at the ground level or below. Sleepers and heavy timbers are dispensed with and the planking laid directly on the mixture while it is still soft. The mixture hardens to a tough, solid base, which affords effective protection against dampness. These "Tar-Rok Sub-Floors," as they are called, are a sufficient foundation for any self-contained machinery.

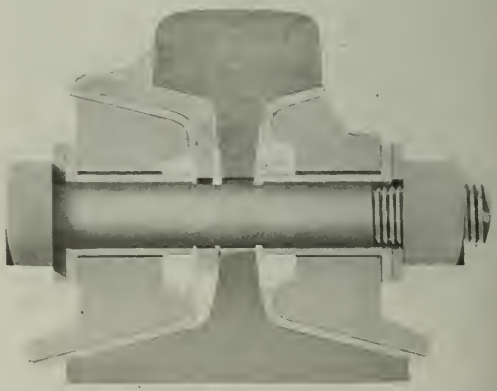
Other recent research work done by the Barrett company has been the development of "Hydronon," a damp-proofing paint adapted for use on interior surfaces of walls that are exposed to dampness. It will penetrate well into a wall of concrete or brick and will retain its effectiveness against considerable usage. Whitewash, cold-water paint, or plaster may be applied directly over this. It is less volatile than other paints made for this purpose and has a high flash point, re-

the outer edge of the rail base and ⅜-in. thick under the inner edge, with which is cast integrally a double-ribbed brace that can be made with a contour to fit any rail section. The details as to the size of plate, thickness and the use of ribs on the bottom surface can be varied to suit the requirements on different roads.

This device is made of malleable iron and weighs from 6 to 9½ lbs., depending upon the rail section with which it is used. By placing the inner spike holes slightly under the base of the rail the spikes serve to draw the brace firmly against the rail head. A special plate for use at switch points is shown at the right in the accompanying illustration. This plate is 9 in. longer than the standard, this extension being raised ¼ in.

KEYSTONE INSULATED RAIL JOINTS

New features recently embodied in Keystone insulated rail joints are continuous divided insulation, bakelized fabric as a substitute for fiber, and heat-treated bolts. The insulat-



Keystone Insulated Joint with Improved Insulation and Heat-Treated Bolts.

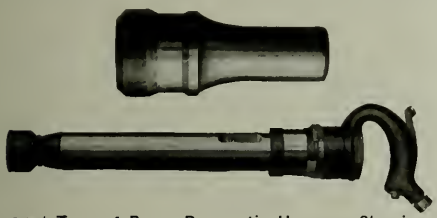
ing fiber is divided horizontally instead of vertically as heretofore, being continuous for the length of the rail joint. This makes all insulations the same size and interchangeable, and independent of the spacing of the bolts on all joints of a

given length, while providing a better insulation on account of being continuous. The insulation on the gage side of the joint under the head of the rail is bakelized fabric, the other three insulations being fiber. This new material has several times the wearing qualities of fiber and is impervious to moisture, maintaining its dielectric strength until it is worn out. The joints are equipped with bolts which have been given a special heat treatment, increasing their elastic limit over 40 per cent.

The Keystone insulated rail joint is manufactured and sold by the Union Switch & Signal Company, Swissvale, Pa.

AN IMPROVED PNEUMATIC HAMMER

The latest form of Boyer pneumatic hammer is the No. 11, illustrated herewith, which has just been placed on the market by the Chicago Pneumatic Tool Company, Chicago, Ill. It has a piston diameter of 1 3-16 in. with an 11-in. stroke, striking 700 blows per minute. It weighs 3½ lb. and is capable of



Improved Type of Boyer Pneumatic Hammer, Showing Also Parker Rivet Set.

driving 1½-in. rivets. Owing to the severe service required of the rivet sets in this hammer, the so-called Parker set is used, which has a wide tapering shoulder, enabling it to better absorb and withstand the effects of the blows.

In common with the standard form of the Boyer hammer, the No. 11 is divided into three distinct parts—handle, cylinder and valve—which allows quick examination and economical upkeep and repairs. In each of these members there is a moving part subject to wear, but in varying degrees. It is frequently possible to replace one of these parts and thereby render the tool comparatively new. All parts are made interchangeable on jigs and templates.

IMPROVEMENT IN THE GOSSO BED

An improvement has been made in the Gosso bed, since its appearance on the market a year ago as described in the *Railway Age Gazette*, of March 19, 1914, that will greatly

Improved Spring in Gosso Bed.

facilitate its installation in railway bunk cars and its removal when not in use. As originally installed there was some little difficulty experienced in expanding the small springs which are used to keep taut the perpendicular chains in which the beds are hung. There was also the possibility that an inexperienced workman might overstrain the small spring and "kill" it.

These beds are now equipped with an expander, which is opened until the chains are attached to the floor and the ceiling, when it is closed by a simple push and the small springs are stretched exactly one inch. This is sufficient to keep the chains taut and guards against the danger of overstraining the spring. When it is desired to take the beds down, the expander can be opened in an instant, releasing the tension on the spring and allowing the "S" hook to be disengaged from the eye in the floor. By means of this improved device, the two chains at the front of the beds can be taken down in a moment and the beds folded up and pushed against the side of the car, thus leaving the space available for other purposes, if that is desired. These beds are made by the Gosso Company, Chicago.

A HIGHWAY CROSSING ALARM WITH FOUR INDICATIONS

In order to eliminate as far as possible the chances for the warning indication to be overlooked a highway crossing signal has been developed and satisfactorily used on several roads which combines a ringing bell, flashing red

Highway Crossing Signal and Alarm Fitted with the Chicago Electric Flag.

lights and a waving red flag for warning highway traffic, with flashing green lights to indicate to approaching trains that the signal is properly working. The signal shown in the accompanying illustration is mounted on a 4-in. steel pipe equipped with four pressed steel pole steps and a standard crossing sign, the pipe being supported on a combination battery and relay box to accommodate batteries.

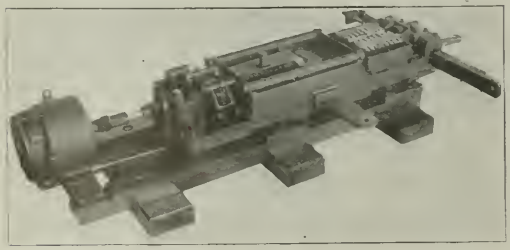
relays, terminals, etc., used in the highway crossing alarm circuit. The electric flag, as the apparatus mounted at the top of the post is called, can also be furnished with bracket mountings which project it 3 ft. or 8 ft. over the highway, these brackets being built up of 3-in. steel pipe.

The bell is 14 in. in diameter at the mouth and made of heavy bell steel, copper plated, or of genuine bell metal or crucible steel, if so specified, and is operated by an electric motor through a set of reduction gears and a cam. No contact trip or springs are used. The flag is 18 in. by 24 in., and is made of heavy sheet steel enameled red, with the word "danger" or "stop" painted in white across both faces in 6-in. block letters. The flag moves up and down through an arc of 45 deg. when the device operates, without jerks or stops. The operation of the flag is also accomplished by reduction gears and a cam from the same motor. The night signal is given by the flashing of two electric lamps at the proper focal points behind two 5⅜-in. red lenses mounted in the case, one on each side facing the highway. The flashes follow each other at evenly timed intervals as the lamp circuit is made and broken at large carbon contact blocks. These blocks are easily removed, and are of such proportions as to carry current up to 10 amperes at any voltage up to 650. Two green lenses are also mounted on the sides of the case visible from approaching trains, and similar flashing signals are given them.

The case which encloses the operating mechanism is water, dust and bug proof and includes an ample space for mounting resistance units, lightning arresters, terminals, etc. The motor is of standard design and can be furnished to operate on any voltage from 10 to 650 direct current, or 110, 220 or 440 volts, alternating current of any cycle. The operating mechanism is mounted on a base within the case, making it easily removable for inspection or repairs. The gears and pinions are bronze against steel, minimizing the friction losses, and the entire mechanism is machined and jig drilled to insure smooth operation, durability and interchangeability. All bearings are provided with easily accessible oilers. This highway crossing alarm is manufactured by the Chicago Railway Signal & Supply Company, Chicago.

A LOW-VOLTAGE SWITCH-OPERATING MECHANISM

The new model 5 low-voltage switch machine of the General Railway Signal Company, Rochester, N. Y., is designed to afford a convenient means of operating outlying switches



G. R. S. Model 5 Low-Voltage Switch Machine, with Cover Removed.

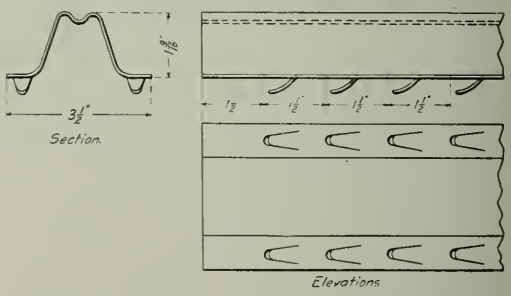
situated, for example, at the entering ends of passing sidings. With the exception of the motor, the switch machine is much the same as the high-voltage type and the a. c. and d. c. designs are an evolution of the model 2 and model 4 switch machines manufactured by this company. The model 5, however, is long, narrow and shallow and is placed parallel to the track where it affords maximum clearance. The machine can be installed in difficult locations and being light in weight, is easily handled. The old model 2 machine was placed at right angles to the track and cannot very well be installed in subways or on elevated structures, etc., where clearance is limited.

This machine, as stated above, permits the operation of outlying switches by power and therefore it eliminates the stopping of heavy trains at passing siding and other switches, which may cost for each stop anywhere from 50 cents to one dollar or more. It eliminates a delay of several minutes in the case of each train entering or leaving the switch, and this facilitates train movements; it serves as an efficient switch lock and insures a stop indication unless the switch points are in the proper position.

The company states that the elimination of one freight train stop per day would more than offset the fixed charges, interest on investment, depreciation and maintenance on an installation comprising switch machine, single-track circuits and control appliances and accessories.

A GALVANIZED METAL FENCE POST

Steel fence posts with a number of distinctive features are being manufactured by the Metal Post & Culvert Company, Niles, O. The line post consists of a rolled steel shape designed with a view to offering the greatest possible resistance



Cross Section and Part Elevations of the T. & T. Metal Post.

against bending or breaking at the ground line. Numerous small lugs are punched from the two plain surfaces which form the face of the post and bent up to serve as fasteners for the line wires. This construction makes the fastening device a part of the post itself and eliminates the necessity of handling separate pieces or complicated fastenings. Each strand of wire is caught by two of the lugs and the wires when applied serve to strengthen the post by their support.

About five times as many of these steel posts can be placed in a given storage space as wooden posts, the nestable feature of the steel post making it easy to store and to ship. The posts are furnished in lengths ranging from 5 to 12 ft., weighing from 7 lb. to 16.6 lb. They can be driven in ordinary ground, a malleable driving cap being recommended to eliminate any bending of the top of the post. In stony ground a 2-in. auger hole will make it possible to drive the post and such a hole can be driven much cheaper than a 6-in. post hole. In driving the posts it is recommended that they be so placed that the greatest strain will come against the post itself rather than against the fastening lugs, which, however, are designed to have strength enough to withstand any strain ordinarily encountered.

Two types of end and corner posts are made for use with these line posts. One consists of a No. 9 gage seamless cold drawn tubing 4 in. in diameter, galvanized inside and out, set in a concrete base at the end or the corner and reinforced by a brace or braces of tubing anchored to concrete blocks under

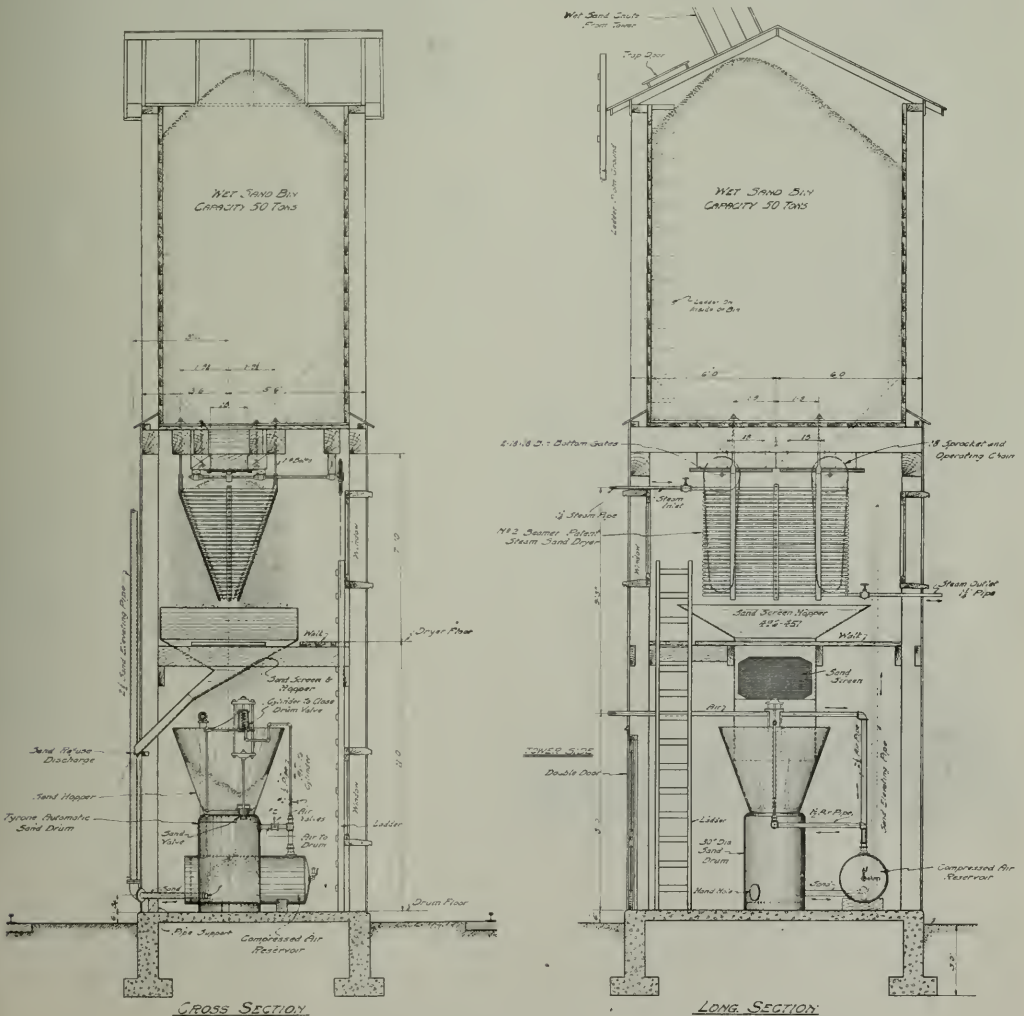
the fence lines. The other type of end and anchor posts consists of an 8-ft. diagonal post through which the line wires are strung and a 5-ft. rod connected to a malleable anchor buried 5 ft. in the ground, the line wires being brought together to fasten to the upper end of the anchor rod at the ground surface.

In addition to the advantages mentioned, this post can be easily painted, as there are no enclosed parts, the fence line can be burned with the remainder of the right of way, the posts serve as electrical grounds in storms, and are said to be free from heaving.

THE "RANDS" GRAVITY SAND PLANT

A new type of plant for handling and drying sand which eliminates sand-shoveling and coal-fired driers has been designed recently and has been installed in connection with locomotive coaling plants at a number of points including Cape Charles, Va., on the New York, Philadelphia & Norfolk; Nashville, Tenn., on the Louisville & Nashville; Trenton, Ont., and Capreol, Ont., on the Canadian Northern, and Henderson, Ky., on the Louisville, Henderson & St. Louis.

This sand plant occupies an area of only 9 ft. by 12 ft., allowing it to be installed between the receiving track and the coaling track of any locomotive coaling station. It can be built of reinforced concrete or frame construction as desired. A car of sand is dumped in the receiving hopper of the coaling plant in the same manner as coal and hoisted in the elevating bucket, from which it is discharged into a chute leading to a 50-ton wet-sand bin in the top of the sand plant. It has been shown that sand can be handled very successfully in this manner, but if the plant is isolated a malleable bucket elevator can be used for handling the green sand. A slide gate at the bottom of the wet-sand bin controls the flow into the "Beamer" patent steam sand drier. This drier is made of 1¼-in. pipe in continuous lengths without joints which are bent to form circular or rectangular receptacles for the sand. The openings are so regulated that the wet



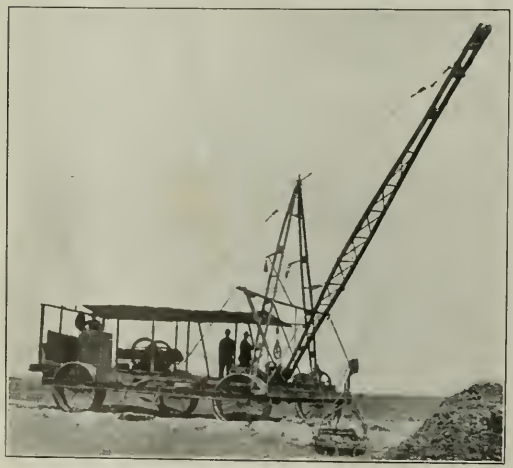
Two Sections of the "Rands" Continuous Sand Drying and Elevating Plant.

sand cannot pass through, but as soon as the sand is dried by the heat of the steam in the pipes it flows through the heater continuously into the hopper of the "Beamer" hand drum below. At the side of this drum is located an air reservoir with two air valves by which the pressure can be applied to the sand in the drum, elevating it to the dry-sand storage bin. A drum full of sand may be elevated in 75 seconds.

The drier is made in the circular shape when a capacity of approximately 7½ tons per 24 hours is desired and for larger capacities 15 tons per 24 hours can be secured by the rectangular shape, which is 8 ft. long and 3 ft. wide. This type of drier has been in service for a number of years on the Pennsylvania, where it has been demonstrated that sand may be dried for about one-seventh the cost for drying it with coal-burning driers, considering the cost of fuel, labor and repairs on the sand stove. The openings between the pipes allow the moisture to escape, thus preventing rusting of the pipes and baking or caking of the wet sand. The action of this drier is continuous and automatic, eliminating the labor required for keeping up fires, removing ashes, feeding the drier and shoveling sand. If steam is not available at the site, the other features of design in the plant may be utilized with coal-burning driers. The Roberts & Schaefer Company, Chicago, is the exclusive licensee of the "Beamer" sand drier, and the designs for the plant described above were prepared by this company.

THE ECONOMY LIGHT EXCAVATOR

A light excavator of the drag line type, known as the "Economy," has been in the use on a small scale for two or three years and has demonstrated its adaptability to a wide range of excavating work, such as throwing up small embankments, loading excavated material into wagons, stripping gravel pits and digging and back-filling trenches of all kinds. This machine is equipped with a bucket of



The "Economy" Excavator Handling Material with a ⅝-yd. Bucket.

⅝-yd. capacity, is driven by a gasoline engine, weighs only 12 tons, and is operated by one man.

The main frame work of the excavator is built up of I-beams and in the standard size is 24 ft. square, although these dimensions can be varied if desired. This frame is mounted on four steel wheels 5 ft. high, having a tread 3 ft. wide. The main frame supports a platform 12 ft. by 30 ft., which may be housed if desired, and which supports the operating machinery and all accessories. A rigid steel "A" frame and a 40-ft. boom are mounted on the front of the main frame and the hoisting, swinging and digging lines are arranged to properly connect these members with the engine. The swinging cable is attached directly to the side of the boom, giving a positive and rapid action and eliminating the necessity for a turntable. The excavator is

The Bucket Used with the "Economy" Excavator.

equipped with a 40-hp. gasoline engine of the 4-cycle type, a special carburetor being furnished to permit the use of either gasoline or kerosene for fuel. The amount of gasoline used is stated to vary between 20 and 25 gallons for a 10-hour run under heavy duty. A special scraper and bucket shown in the accompanying illustration is used with this excavator.

It is stated that an operator can swing the loaded bucket from four to six times per minute, and that on the average the machine can handle 500 cu. yds. in a 10-hour shift. During the past summer a contracting firm, Murphy & Engberg, Minneapolis, Minn., handled the material for a 5-ft. fill, with the Economy excavator taking all the dirt from one side. The ground surface was under more than a foot of water during the work, but in spite of this condition the machine handled 1,000 cu. yds. of earth per day. Another machine used for making a large fill behind a bridge on the Chicago & North Western, near Green Bay, Wis., loaded dump wagons at a rate of 500 yds. in a shift. The soil in this case was hard pan mixed with medium sized boulders. Another machine has been used for stripping and cleaning gravel pits on the Chicago & North Western at different points in Iowa throughout the last season, and also for loading gravel cars.

The machine has a number of incidental advantages. Only one operator is required, this man being able to control all movements of the excavator and to see all working parts of the machine from his operating position. The large steel wheels enable the machine to travel over soft ground that would be impossible for any other type. The wheel can be set to make any turn or curve. The machine can be moved ahead by means of a "dead man" or stake without interrupting the use of the bucket or can be moved in the opposite direction with the bucket. The control of the boom enables the operator to pick up the loaded bucket at any point within its radius and swing it to the dump. This eliminates the necessity of dragging the bucket up close to the machine before it is lifted, with a resulting saving in time. The machine complete weighs about 12 tons and is designed to be readily taken down or set up. It can be loaded on one flat car for transportation. This machine is manufactured by the Economy Excavator Company, Iowa Falls, Iowa.

Volume 58 March 26, 1915 Number 13

Contents

*Illustrated.

We publish in another column an interesting letter on the proposed standard box car from President Ripley of the Santa Fe, which was written in reply to an article on the same subject by W. R. Burnett, master car builder of the Canadian Pacific, published in the *Railway Age Gazette* of March 5. Mr. Ripley is the father of the movement for the standardization of freight car equipment, and is the chairman of the committee on Standard Freight Car Equipment of the American Railway Association. This is a very strong committee, the other members being President Harrison of the Southern, President Rea of the Pennsylvania, President Smith of the New York Central, Chairman Kruttschnitt of the Southern Pacific, Chairman Elliott of the New Haven and President Markham of the Illinois Central. With such a committee in charge of the general investigation of the subject and a capable sub-committee of manufacturers working out the details, the question of standardization is sure to be vigorously dealt with. Just how far the movement will be carried it is now impossible to predict, but one thing appears to be predictable with considerable certainty, and that is that it will result in the adoption of some methods or principles which will cause individual lines to pay more regard than they have in the past to the interests of the railways as a whole. As freight cars move almost as freely over foreign lines as over the lines of the companies that own them, it is the right and duty of the railways as a whole to exercise reasonable supervision over the way in which the cars of individual companies are built and maintained.

The Proposed Standard Freight Car

Of the passing of foolish and unjust railway legislation there is no end. It has long been customary for railways to give free passes to shippers of live stock to enable them to accompany and care for the stock. The legislature of Kansas has decided that shippers of live stock are entitled to an additional special dispensation, and has therefore passed an act to provide that "whenever any railroad company or corporation doing business within the limits of this state shall receive and ship any live stock by the carload and the shipper shall desire, either in person or by employee, to accompany such stock for the purpose of looking after and caring for it in transit, or if such shipper or his employee desires to ride on a passenger train from place of shipment to point designated in contract or from any intermediate point to destination, the charge for such shipment shall be held to include the passage of the shipper or his employee." It is further provided "that in all cases where more than one carload of stock is shipped at the same time the railroad company or corporation shall be required to pass one additional person for every carload or major fraction thereof in addition to the first carload, and one additional person for every six carloads or major fraction thereof after the first four carloads, provided, further, that not more than four persons shall be passed with any train load of live stock shipped by one shipper." Just how the shipper or his employee, or his four employees if he has so many, is to care for the live stock when it goes on a freight train and he or they go on a passenger train, the law does not indicate. The effect of the law, therefore, is to require the railways, for no good reason whatever, to throw in a certain amount of free transportation with every shipment of live stock. Why discriminate thus in favor of the shipper of live stock? Why not require a free pass to be issued with every carload shipment of grain or of coal or of any other commodity? Hardly ever is a session of certain state legislatures held without some such law being enacted. Are the men who pass such laws just plain fools or are they morally what they must be held to be if it be conceded that they have any intelligence?

Free Passes For Stock Shippers

The operating figures of the New York, New Haven & Hartford are beginning to indicate the results of the improvements in methods which have been and still are being introduced by the new management. The statistics for the year ending June 20, 1914, showed a marked improvement over those for the preceding calendar year, but the effects of the work of the new management became even more manifest during the first seven months of the present fiscal year, this being because during the fiscal year 1914 the management was in a difficult situation because of its negotiations with the government and because it has been profiting during more recent months by the work done during the preceding year. Some of the percentages of increase and

Operating Results on the New Haven

decrease in the operating figures during the fiscal year 1914 and the first seven months of the fiscal year 1915 are as follows:

	Year ending June 30, 1914	Seven months ending January 31, 1915
Tons one mile (revenue)...	9.4 per cent dec.	9.38 per cent dec.
Freight train miles (revenue)	13.2 per cent dec.	14.81 per cent dec.
Passengers one mile.....	0.3 per cent dec.	7.90 per cent dec.
Passenger train miles.....	1.8 per cent dec.	9.93 per cent dec.
Tons per train mile (revenue)	304, or 4.5 per cent inc.	322, or 6.38 per cent inc.
Revenue per train mile (frt.)	$4.30, inc. .387	$4.53, inc. .316
Revenue per train mile (pass.)	$1.91, inc. .003	$2.03, inc. .106
Transportation expense ...	1.2 per cent dec.	10.5 per cent dec.
Maintenance equip. expense	8.2 per cent inc.	3.8 per cent dec.
Maintenance of way expense	11.9 per cent inc.	8.4 per cent dec.

It will be seen that in both periods there was a decrease in both the passenger and freight traffic, but that the management succeeded in reducing the freight train miles and the passenger train miles still more, so that there were good increases in the earnings per train mile, both passenger and freight, and substantial reductions in transportation expenses. The maintenance expenses in the fiscal year 1914 could not be reduced with propriety, but largely owing, probably, to the heavy reduction in traffic there have been reductions during the present fiscal year both in the maintenance of equipment and maintenance of way. The figures given are a sufficient indication of the energetic efforts being made to increase efficiency and reduce expenses.

THE RAILWAYS AND THE STEEL COMPANIES

THAT the action of the Illinois Central and other railways in the United States in buying rails from the Algoma Steel Company, a Canadian concern, should excite criticism was inevitable. The Iron Trade Review for March 18 contains a long article denouncing both the tariff policy which enables a Canadian mill to underbid United States mills in this country, and attacking the managements of the railways that have bought rails from the Algoma company. The Birmingham (Ala.) Herald also has published an editorial criticizing the Illinois Central. The *Railway Age Gazette* does not intend to discuss at this time the tariff policy involved. The question of railway policy involved is another matter.

We believe that it would be a mistake for the railways of the United States to adopt the practice of buying equipment and supplies abroad merely to secure the benefit of small differences in prices. What they would gain by the lower prices would be largely or wholly offset by their indirect losses in traffic and earnings. But there are a number of points besides these general considerations which must be weighed before it can be decided whether our railways may be justified in buying rails from the Canadian mills.

It is asserted that the low price which the Algoma Steel Company is making in the United States is merely a "dumping" proposition, and this is assigned as one of the reasons why the railways of the United States should not take advantage of it. But the steel companies of the United States have sold rails all over the world for lower prices than they have made the railways of the United States. President Farrell of the Steel Corporation testified before the Stanley Committee that the average price received by it for export rails was only $24.74. If the steel companies are justified in selling rails abroad cheaper than at home, why are not the railways of the United States justified in buying rails cheaper abroad than they can get them at home? We are not criticizing the dumping policy of the steel companies; but it is a poor rule which does not work both ways. Furthermore the Algoma Steel Company is reducing the price of rails in Canada, as well as in United States.

It is intimated that because the steel companies of the United States are such good customers the railways should be willing to pay them more than they need pay foreign manufacturers. But the railways are the best customers of the steel companies. Do the steel companies, therefore, patronize the railways when they can get cheaper transportation elsewhere? Far from it. They never hesitate to take traffic from the railways and give it to steamship lines on the Great Lakes and in the coastwise service, or to build and operate railways and steamship lines of their own and compete with the railroads. Furthermore, some of the steel companies are buying ore in Cuba and Chili because they can get it cheaper there than in the United States. If it is the duty of the railways to patronize home industries regardless of price, why is it not the duty of the steel companies to patronize home industries regardless of price?

While the spokesmen of the steel companies are charging the railways with discriminating against home industries by buying rails in Canada at lower prices than they can purchase them in this country, the record clearly shows that for years the steel companies of the United States have been discriminating against the railways right in the domestic market. The price of other iron and steel products have fluctuated from year to year according to business conditions. The price of steel rails also fluctuated prior to the organization of the United States Steel Corporation, but after the Steel Corporation was organized the basic price was fixed at $28 a ton and regardless of all changes in conditions it has stayed there ever since. It is desirable to have the price of rails stable. But there is a strong suspicion that by pursuing the policy they have the steel companies have made larger profits in proportion out of rails than out of their other products. Such good customers as the railways are entitled, it would seem, to the protection of a "most favored nation" clause. There is no evidence that they have received such protection.

While we are on this question of price it should be added that the steel companies of the United States undoubtedly could have got every order for rails which has been placed if they had been willing to come somewhere near meeting the price of the Algoma Steel Company. If they had got the business by concessions in prices, such as all other classes of railway supply concerns have had to make within recent years, they could have put men to work and got such profits from the business as it yielded. Therefore, all the talk about the responsibility of the railways for failing to do what they can to put the unemployed of this country to work is buncombe. In this connection it might be added that no question of the "pauper labor of Europe" comes in here. Labor certainly costs at least as much at the Algoma plant as it does at any plant in the United States.

There are other points of great importance to be considered which those who are criticizing the Illinois Central for buying rails in Canada have been remarkably unanimous in failing to mention. One is that the Algoma company agreed to make rails according to specifications which the American steel companies refused to accept. The railways of the United States have been struggling for years with the rail makers to get them to make better rails. The steel companies of the United States refused to make the Illinois Central's rails according to the American Railway Engineering Association's specifications, including the nick-and-break test, while the Algoma company agreed to do this. The United States mills lost this business not only because they refused to meet the Canadian mill's prices, but also because they persisted, as they have for years, in refusing to make rails according to specifications drawn up and approved by the railways. Another point is that the Algoma company gave a five year guarantee on its rails, while the mills in this country some years ago discontinued giving such guarantees.

In view of all these facts criticism of the action of certain railways in buying rails in Canada comes with poor grace from spokesmen of the steel companies of the United States. If the steel companies of this country want all the rail business of this country let them do business with the railways as they expect the railways to do business with them. If they want the railways to favor them let them favor the railways. The steel makers have abused the power their position of practical monopoly has given them both in fixing prices and in negotiating regarding the specifications according to which rails should be made. They will have no difficulty in controlling their home market if they will deal with the railways in somewhat the same

spirit in which their spokesmen are demanding that the railways shall deal with them. If the railway worm has at last turned and the steel makers of the United States are in consequence losing business, they have only themselves to blame for it.

THE INCREASE IN VOLUME OF SERVICE RENDERED BY THE ROCK ISLAND 1902-1914

In nearly every manufacturing business the greater the output the lower is the cost per unit, and also generally the lower is the percentage of profit on each article manufactured. On the other hand, however, as a manufacturing business grows the owners may rightly expect to receive a greater total profit, despite the fact that they make a smaller profit on each article manufactured.

The units which measure the service which a railroad renders to the public are passenger miles and ton miles. The performance of these units of service is analogous to the manufacture of articles by a factory. Up to a certain point the law of decreasing cost of manufacture per unit, which is generally found in a manufacturing business, is applicable also to the performance of units of service of transportation. Beyond a certain point, however, recent railroad history has shown that an increased volume of services performed entails an enlargement of plant and facilities which at one stroke increases the unit cost of performing each service. Leaving aside, however, the rather complicated question of when any individual railroad company reaches this point where the law of decreasing cost per unit is superseded by the law of increasing cost per unit, the owners of all the securities of a given railroad have a right to expect that a larger total profit will be earned by their property, as the volume of business increases. Twice as much business could not be expected to yield twice as much profit, but it ought to yield a certain percentage of larger profit.

The Chicago, Rock Island & Pacific is under fire. It is therefore worth while to consider the real reasons for its present situation. In 1902 it rendered passenger service amounting to 372,313,683 passenger miles, and freight service amounting to 1,839,127,297 ton miles. In that year the operating income, which is the total amount of revenue received from the performance of the service rendered to the public, less taxes and the cost of rendering the service, exclusive of any return to the creditors of the company or to the owners, was $10,131,121. In 1914 the Chicago, Rock Island & Pacific's passenger service totaled 980,051,132 passenger miles, and its freight business 5,123,579,107 ton miles. The operating income for 1914 was $13,892,534. Whereas, therefore, the increase in total amount available for all security

	Net operating income	Passenger mileage	Ton mileage
1902	$10,131,121	372,313,683	1,839,127,297
1903*	14,524,883	438,703,832	2,452,729,874
1904	11,657,020	514,108,832	3,250,750,267
1905	11,383,310	552,903,897	3,171,456,832
1906	14,538,909	646,116,553	3,715,621,556
1907	17,518,240	725,233,506	4,281,228,365
1908	14,365,554	881,991,344	4,019,704,681
1909	16,400,527	952,679,666	4,160,828,170
1910	15,274,509	1,016,385,259	4,567,089,384
1911	16,723,139	1,010,037,752	4,718,460,846
1912	15,200,498	939,391,981	4,599,242,133
1913	15,914,395	983,696,182	5,203,973,087
1914	13,892,534	980,051,132	5,123,579,107

*15 months' figures for both earnings and service.

holders and for rentals was only 37 per cent greater than the corresponding amount available in 1902, the total volume of service rendered to the public in passenger business was two and a half times as great (an increase of 160 per cent) and in freight business more than two and a half times as great (an increase of 178 per cent).

The accompanying table shows the operating income and the passenger mileage and ton mileage in each year, 1902-1914. It will be seen that there has been a large increase, with certain exceptions, each year in the volume of service rendered by the Chicago, Rock Island & Pacific to the public. The security holders, however, have not benefited to anywhere near the extent which they might fairly have expected to benefit from the growth of their business *even if they had not put in any additional investment*. Since there may be some doubt as to the way in which the accounts were kept previous to July 1, 1907, it is safer to deal only with the additional investment since 1907.

In 1907 the railroads were prosperous, but they were not earning an exorbitant profit even at that time. Disregarding entirely the company's figures for capitalization, and capitalizing the operating income for 1907, which was $17,518,240, at 6 per cent, the property investment of the Rock Island would have stood July 1, 1907, at $291,970,667. This is the amount on which the company in the previous year earned 6 per cent. The accompanying table shows (1) the new investment in each year

	Additional investment	Total investment	Per cent on cumulated investment	Per cent on total
1908	$10,089,944	$302,060,611	—31.24	4.75
1909	3,642,373	305,702,984	— 8.87	5.36
1910	19,152,202	324,855,186	— 6.82	4.70
1911	2,456,438	327,311,624	— 2.25	5.11
1912	3,449,580	330,761,204	— 5.97	4.59
1913	9,537,862	340,299,066	— 3.32	4.67
1914	20,532,445	360,831,511	— 5.26	3.85

since 1907; (2) the total investment, taking the figure arrived at by capitalizing at 6 per cent the operating income of 1907 and adding to it each succeeding year's additional investment; (3) the per cent which has been earned each year on the *new* capital invested since 1907, which it will be seen is in each case a minus figure; and (4) the per cent of operating income to total investment as shown in column 2.

To get some adequate idea of the importance of the part which the decline in earning power of the Rock Island has played in the partial destruction of the company's credit it is worth while to study this table showing the failure of the new investment not only to earn anything for itself, but to prevent the decrease in earnings on previous investment from the point of view of the man who is asked to put new money into a railroad property. The table is like an inverted bond circular. And it must be remembered that we are dealing now not with the issue of securities, not with holding companies, not with inflated balance sheet assets, but with the actual return which the operation of 8,000 miles of railroad is making on new money spent only on additions or betterments to the property as defined by the Interstate Commerce Commission's accounting rules.

THE NEW YORK CENTRAL AND THE LAKE SHORE

The New York Central & Hudson River was able to save, almost dollar for dollar, in expenses in 1914 what it lost in revenue during that year. The combined system—Lake Shore & Michigan Southern and New York Central & Hudson River—did not, however, quite succeed in earning the total dividends paid to the public. This was due partly to the fact that the Lake Shore was not able to offset decreases in revenue through savings in expenses as effectively as was the New York Central, and partly to the loss in other income due to the reduction of dividends on other New York Central Lines.

The accounts and statistics for the entire calendar year 1914 for the New York Central & Hudson River, which operates 3,774 miles of road—the New York Central Lines East of Buffalo—and the Lake Shore & Michigan Southern, which operates 1,852 miles of road, have been kept separate, and the two tables at the end of these comments show the results of operation of the two properties separately. The tables do not show, however, the 1¼ per cent dividend declared in December by the new company, the New York Central Railroad, which took over the two heretofore separately owned properties. This fourth quarterly dividend called for approximately $2,784,000, whereas the combined surplus of the Lake Shore and the New York Central was but $1,330,000.

The loss in revenue for the New York Central system was due to general business conditions and was not any more serious than

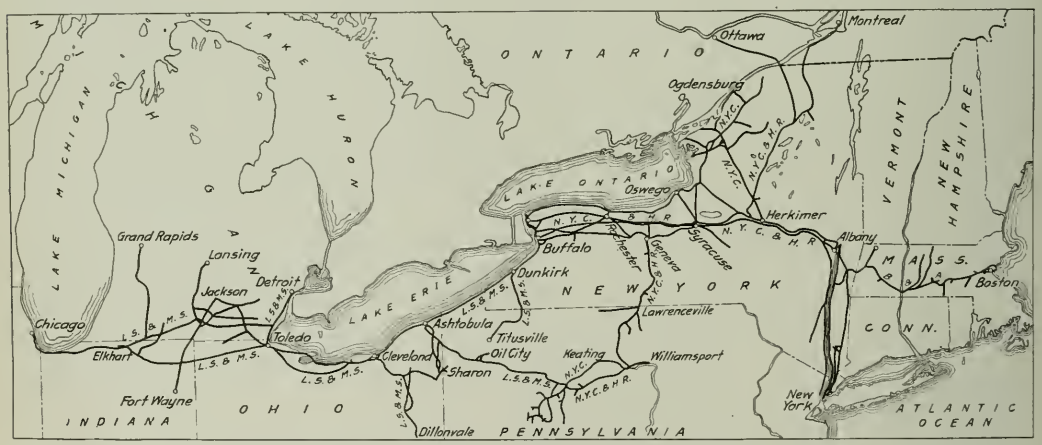
had been foreseen some time before the end of the year and predicted in the hearings before the Interstate Commerce Commission in the eastern rate advance case. On the other hand, the New York Central's ability to save a dollar in expenses for every dollar lost in revenue was a result even more favorable than had been generally hoped for. It is an augury for the future of far more moment than might at first appear.

Total operating revenues for 1914 for the New York Central & Hudson River amounted to $112,741,000, a decrease as compared with the previous year of $9,943,000, or 8.1 per cent. Total operating revenues amounted to $84,033,000, a decrease of $9,381,000, or 10 per cent. It will be noted from the table showing the results of operation that the loss in freight revenue was greater proportionately than the loss in passenger revenue. This fact, of course, was to a certain extent a help in holding down transportation expenses, since it is easier to cut down freight-train mileage to correspond with the loss in business than it is to cut down passenger-train mileage. Even so, however, there was a loss of $2,766,000 in passenger business, to offset which expenses in some department had to be cut.

Transportation expenses in 1914 amounted to $41,846,000, a decrease as compared with the previous year of $3,718,000. The greatest saving which has been made in railroad transportation expenses in recent years has, of course, been through the increase in average trainload of freight. In 1914 the New York Central's total trainload, including company freight, was 633 tons, an increase over 1913 of 28 tons, or 4.7 per cent. It has been an almost universal rule that along with an increase in trainload there has gone an increase in train-mile expenses. But the distinguishing feature of the New York Central's economies in transportation expenses in 1914 was that train-mile expenses were held down even below 1913, despite the heavier freight-train load and exactly the same average number of passenger cars per passenger-train. Thus, the total train mileage in 1914 amounted to 45,929,000, which was less by 6,624,000 miles, or 12.6 per cent., than in 1913, while train enginemen's wages amounted to $4,246,000, a decrease of $709,000, or 13.8 per cent., as compared with the previous year, and fuel for train locomotives cost $6,469,000, a decrease as compared with 1913 of $957,000, or 12.9 per cent. The wages of trainmen cost $5,182,000, a decrease of only $130,000; but the full-crew law, which went into effect in September, cost the company in trainmen's wages approximately $350,000, so that there would have been a corresponding saving in this item had it not been for circumstances beyond the control of the management.

The reasons why the New York Central was able to make these economies in transportation expenses are numerous. The most obvious one was that the management, with the falling off in business, was able to store the lighter engines which it had in service at the beginning of the year and only use its best power. This made better time possible, even with the increased trainload, and helped to offset the effects of the very severe weather in January and February and part of March, 1914. While this is the easiest explanation of the saving in transportation expenses, and to this fact may be ascribed a larger percentage of saving than to any other one single fact, it is not by any means as important as the bulk of the saving made by a multitude of other items not so easy of description.

For three years the New York Central has now had in effect a system of daily reports for the performance of each train on each division, which reports are made by the superintendent to the general manager and to the vice-president in charge of operation. It is quite impossible to say just when an improved system of supervision begins to show results, but it is safe to say that a part of the good showing in 1914 was due to the effectiveness of this method of supervision. The New York Central also has a system by which operating officers make out a budget, which is sent to the vice-president's office by the first of each month. By means of this budget, the daily telegraphic report of carloading and the daily report of train performance, it is possible to get a close, effective supervision over transportation expenses that would have been undreamed of a few years ago on the New York Cntral.



The New York Central & Hudson River and the Lake Shore & Michigan Southern

A reflection of this close supervision is to be found in yard expenses. Wages of yard conductors and brakemen amounted to $2,153,000 in 1914, a decrease of $262,000. The wages of yard enginemen amounted to $1,451,000, a decrease of $238,000, or over 14 per cent. With the general manager's office in such close touch with carloading, switch engines could be laid off before they had begun to eat their heads off in fuel and enginemen's expenses.

The saving in cost of fuel for train locomotives is worth noting. The average cost of coal per ton in 1914 was $1.82 as against $1.91 in 1913. The installation of improvements to locomotives, such as the superheater and brick arch and better types of valve gear, has made it possible to get as good results out of a cheaper coal as were heretofore gotten from more expensive coal.

Loss and damage to freight cost $1,321,000 in 1914, or $248,000 less than in 1913, and injuries to persons cost $604,000, or $252,000 less than in 1913. At least a part of the saving in loss and damage to freight is probably directly attributable to

the work of the ten supervising agents who have this matter directly in charge. These supervising agents occupy a position in regard to station agents somewhat analogous, insofar as authority goes, to the position of master mechanic or roadmaster in their departments. The supervising agents, however, act both as traveling inspectors and as superior officers to the agents. The saving in injuries to persons is in part due to the campaign for safety first which the New York Central has been carrying on, and in part to the success which has been met with in getting the co-operation of magistrates and town authorities in the suppression of the trespassing evil.

Maintenance of way cost $13,870,000 in 1914, a decrease of $3,394,000 as compared with 1913, and maintenance of equipment cost $21,598,000, a decrease of $1,726,000. The smaller maintenance of equipment charges are almost exactly proportionate to the smaller mileage and are the result of the reduction in cost of repairs of locomotives and of freight-train cars and to a reduction in the charges for retirements of locomotives, fewer engines being scrapped in 1914 than in 1913.

The reduction in maintenance of way expenses looks large. It is, however, the result of two distinct factors. One of these is the smaller expenditure for what may be called maintenance proper, that is, renewals of rails, ties and ballast, made necessary to maintain the same standard, and the wages of trackmen engaged entirely in maintenance of roadbed and the temporary discontinuance of the general program for the betterment of the property, part of which representing renewal in kind being chargeable, of course, to maintenance. It is estimated that the amount of the reduction in maintenance proper in 1914 as compared with 1913 was about $1,700,000, and that the remainder of the reduction is accounted for by the suspension of betterment work involving charges to maintenance. Thus, a saving of $394,000 in the maintenance charge for station and office buildings is largely accounted for by the charges in 1913 necessitated by the improvement work and replacement work at Utica, N. Y., and Rochester. The saving of $342,000 in maintenance charges for signals and interlocking is largely due to the fact that in 1913 a large mileage of lock and block system was replaced with automatic block, necessitating extraordinary charges to maintenance. Much of the saving in charges for rails and for other track material is due to the suspension of the programme of relaying branches and yards with heavier rail to bring up the average standard of the whole system.

In 1914 the New York Central spent a total of $15,442,000 for additions and betterments chargeable to capital account. Of this, $7,886,000 was on account of equipment and $7,556,000 on account of road and structures.

THE LAKE SHORE.

The Lake Shore & Michigan Southern earned total operating revenues in 1914 of $51,524,000, a loss as compared with 1913 of $7,829,000, or 13.19 per cent. As was the case with the New York Central, the loss in freight revenue was proportionately larger than in passenger revenue, the total freight revenue in 1914 amounting to $31,980,000, or 16.94 per cent less than the freight revenue in 1913. The total tonnage of freight carried amounted to 33,818,000, or 21.52 per cent less than in the previous year, and the average haul was slightly shorter in 1914 than in 1913, being 162 miles as against 163.6 miles. The total ton mileage, therefore, was less by 22.59 per cent. The average revenue trainload was 698 tons as against 689 tons the year before, and the total trainload, including company freight, was 743 tons as against 735 tons the year before. The saving, therefore, in freight-train mileage was a little greater than the loss in ton mileage, being 23.5 per cent. The accompanying table shows the percentage of each class of operating expenses for both the Lake Shore and the New York Central to total operating revenues.

	1914		1913	
	N.Y.C.	L.S.	N.Y.C.	L.S.
Maint. of way and structures	12.30	10.80	14.07	12.84
Maintenance of equipment	19.16	21.11	19.01	21.08
Traffic expenses	1.65	1.86	1.86	1.81
Transportation expenses	37.12	35.49	37.14	34.96
Miscellaneous expenses	1.86	1.14	1.80	1.12
General expenses	2.45	2.77	2.26	1.86
Total	74.54	73.17	76.14	73.70

Operating income for the New York Central in 1914 amounted to $22,543,000, or but $369,000 less than in 1913, and operating income for the Lake Shore amounted to $11,421,000, which is less by $2,073,000 than in 1913. The Lake Shore paid $6,000,000 in dividends in 1914, which, of course, went to the New York Central, as against $9,000,000 in 1913, and had a surplus of $1,125,000 as against $3,488,000 in 1913. The loss, therefore, in total profit was $5,363,000. The loss in profit (net corporate income) on the New York Central, exclusive of the $3,000,000 less received from the Lake Shore, was $1,555,000, making a total decrease in the amount available for dividends for the combined system of $6,918,000.

At the end of the year the Lake Shore & Michigan Southern had cash on hand amounting to $6,591,000 and loans and bills payable of $52,805,000. The New York Central has cash amounting to $16,079,000, and loans and bills payable of $60,510,000. Since the close of the year the new company—the New York Central Railroad—sold $100,000,000 6 per cent convertible debentures (see *Railway Age Gazette*, February 12, page 253). The proceeds of this sale, therefore, were nearly sufficient to pay off loans and bills payable.

The following table shows the principal figures for operation for the New York Central & Hudson River in 1914 and 1913:

	1914	1913
Mileage operated	3,774	3,753
Freight revenue	$62,384,617	$69,138,506
Passenger revenue	33,309,634	36,075,364
Total operating revenue	112,741,051	122,683,809
Maint. of way and structures	13,869,996	17,263,640
Maintenance of equipment	21,598,429	23,324,676
Traffic expenses	1,864,687	2,284,421
Transportation expenses	41,846,479	45,564,015
Miscellaneous expenses	2,094,827	2,201,031
General expenses	2,758,688	2,776,653
Total operating expenses	84,033,106	93,414,436
Taxes	6,162,220	6,356,546
Operating income	22,542,846	22,912,827
Gross income	36,674,325	39,581,056
Net income	8,688,672	13,243,558
Dividends*	8,458,890	11,243,021
Appropriations	24,347	.....
Surplus	205,435	2,000,537

*The last quarterly dividend on the New York Central & Hudson River stock was not declared by the old company but was declared by the new company and therefore is not included in the dividends in 1914.

The following table shows the principal figures for operation for the Lake Shore & Michigan Southern in 1914 and 1913:

	1914	1913
Mileage operated	1,852	1,853
Freight revenue	$31,979,888	$38,490,184
Passenger revenue	12,735,522	13,426,215
Total operating revenue	51,524,286	59,353,110
Maint. of way and structures	5,561,823	7,623,194
Maintenance of equipment	10,877,317	12,510,549
Traffic expenses	960,220	1,074,108
Transportation expenses	18,284,602	20,748,911
Miscellaneous expenses	589,774	664,501
General expenses	1,425,615	1,124,133
Total operating expenses	37,699,351	43,745,396
Taxes	2,413,900	2,126,438
Operating income	11,406,063	13,481,276
Gross income	19,012,176	23,954,488
Net income	7,124,874	12,488,340
Dividends	6,000,000	9,000,000
Surplus	1,124,874	3,488,340

NEW BOOKS

Poor's Summary of Investment News. Compiled by Poor's Railroad Manual Company, 535 Pearl street, New York. 558 pages, 6 in. by 9 in. Bound in cloth. Price $5.

This is a reprint of the news items that have appeared in Poor's Daily Summary from April 1 to December 31, 1914, inclusive. The book is made up of a large number of news items pertaining to matters affecting the financial condition of the principal investment corporations, taken from financial and daily papers

all over the United States and Canada, presented in condensed form in alphabetical order for quick reference. Under the names of the various companies the items are presented in chronological order. This book is intended to supplement the information given in Poor's railroad and industrial manuals, for the benefit of those who desire recent information in connection with the information given in reference books. It also, of course, gives a record of rumors, newspaper reports and other news that never gets into the reference books.

Proceedings of the American Railway Bridge & Building Association. Compiled and published by the association, C. A. Lichty, secretary, 319 North Waller avenue, Chicago. Size 6 in. by 9 in., 312 pages. Bound in paper and cloth. Price $1.

This volume contains the proceedings of the twenty-fourth annual convention of this association held at Los Angeles, Cal., October 20-22, 1914, and includes reports and discussions on the subjects of Railroad Ice Storage Houses; Warnings for Overhead and Side Obstructions; Reinforced Concrete Bridges; Mechanical Coaling Stations; Care of Traffic and the Construction of Bridges to Eliminate Grade Crossings; Water Pipe, and Concrete Posts, Poles and Signs. The report on Railroad Ice Storage Houses is specially complete and forms a valuable addition to the literature on this important subject.

The Arguments For and Against Train-Crew Legislation. Bulletin No. 73, issued by the Bureau of Railway Economics, Washington, D. C. 44 pages, 6 in. by 9 in. Bound in paper.

In 1913 the Bureau of Railway Economics issued Bulletin No. 53, entitled "The Arguments For and Against Train-Crew Legislation." There has been a large demand for the bulletin, and whereas such legislation continues to be sought by the Brotherhood of Railroad Trainmen, the bulletin has been revised and the information has been brought up to date in Bulletin No. 73. Following the repeal of the train-crew law in Missouri by referendum vote, the brotherhood has been advocating in some states train-limit bills as substitutes for or in addition to train-crew bills. The bulletin states that practically all of the arguments advanced against train-crew legislation apply with equal or greater force to bills to limit the number of cars in a train or the length of a train, and that there are also strong arguments against train-limit legislation which do not apply to train-crew legislation. The bulletin gives the history of train-crew legislation, and discusses the various arguments for and against it under the following chapter headings: Changing Conditions of Train Operation; Train Crews Under Present Conditions; Effect of Train-Crew Legislation; Issues Involved in Train-Crew Legislation; Train Crews and Accidents; State Action on Train-Crew Legislation and Train-Crew Legislation Vetoed by Governors.

Information. Compiled by the publicity department of the Pennsylvania Railroad. 200 pages 6 in. by 9 in. Bound in cloth.

Under this title the Pennsylvania Railroad has bound in book form a series of leaflets issued during the year 1914 by the Pennsylvania Railroad System in the interest of improved service, increased efficiency and a better understanding by employees and the public of railroad problems. The following articles are included in these leaflets: Address by R. H. Newbern on "The Pennsylvania System for Preventing Personal Injuries"; address by George D. Ogden on "How This Railroad Helps the Farmer"; an address by Ivy L. Lee on "What Can We See Ahead in Railroading?"; an address by President Samuel Rea on "The Necessity for Constructive Policy in the Practice of Public Regulation"; and articles on "What the Pennsylvania Railroad Does for Safety"; "The Paramount Cause of Deaths on American Railroads"; "How This Railroad Safeguards Its Employees and the Public"; "Digging the Railroad Out of the Snow"; "Some Incidents in This Railroad's Daily Task of Serving the Public"; "Cleaning up the Railroad's Front Yard"; "A Description of the Annual Track Inspection in 1914"; "Moving a 720-ft. Bridge Into Its Permanent Abode," and "Improving Pennsylvania Freight Service by Providing All-Steel Box Cars."

Letters to the Editor

PRESIDENT RIPLEY ON THE STANDARD BOX CAR

Santa Barbara, Cal.

To the Editor of the Railway Age Gazette:

In the *Railway Age Gazette* of March 5 appears an article by W. R. Burnett, master car builder of the Canadian Pacific entitled: "The Standard Box Car—A Negative Viewpoint."

It is my belief that Mr. Burnett is wrong in many, if not most, of his conclusions. Our principal trouble—and perhaps the one which made everybody anxious for the establishment of a standard car—is exactly the reference to the "traffic department" that Mr. Burnett advocates. The pressure brought by shippers has resulted in cars of all sizes and sorts for the benefit of individual industries, and has been destructive of standards.

Doubtless it is desirable to combine the maximum of strength with the minimum of weight, and that is what our committee wants and is trying to do, but at present we have the extreme idea of lightness at the expense of strength, and vice versa. Moreover, most of us are not as fortunate as Mr. Burnett in being able to use our cars on our home road 90 per cent of the time. Without present access to figures, I should say that in the cases of some of our principal roads the percentages would almost be reversed. On some roads, I believe that certainly more than half the cars seen moving in trains are "foreign."

Steel framing is desirable, and perhaps may soon be universal, but it is not universal yet. Meantime wooden cars are being turned out, and their owners are collecting just as much per diem as for a better car, and we have to repair them—ergo, they should be standardized. There may be some roads so isolated or otherwise fortunate to the extent that they have nothing to gain by standardization, but I believe it will redound greatly to the benefit of most of us.

E. P. Ripley,
President, Atchison, Topeka & Santa Fe.

"STATISTICS"

Chicago, Ill.

To the Editor of the Railway Age Gazette:

Chapter II.—(With apologies to "C. C." and reference to the *Railway Age Gazette* of February 12.)

It was something more than a year later. The superintendent of the Uppannattit division walked into his office with the confident air of one who knows. The old misleading statistics were ancient history. Picking up the daily statement of freight train operation, compiled in his own office from the train sheets and wheel reports, he quickly noted in turn the performance of fast freight, local and tonnage trains, with the movement of each, the overtime in money and the potential and actual tonnage with the explanation of failure to handle full rating.

One case not fully explained was discussed with the chief despatcher, who came in answer to the buzzer. The chief scribe also came in. "Overtime showing is fine," he said. "With more business and worse weather we are showing less overtime than we did either last month or a year ago." The superintendent glanced at the neat loose-leaf book which was handed to him, placed it in his pocket, dropped its counterpart into the basket to be brought up to date on the morrow and laughed comfortably. "Yes," he said, reaching for a small blueprint. "Yes, and wage cost per hundred train-miles and per thousand gross ton-miles wasn't so bad last month, either, and train haul and car loading are both showing the results of our campaign, too." "Great business, this of knowing where you are all the time. Watch the car sheet, Billy, the empty mileage looks a little high," and tossing a cigar to each he walked out.

"The old man looks ten years younger," remarked the c. t. d., as he struck a match. "He sure was one worried man." The c. s. chuckled. "He wasn't the only man who was worried," he replied. "I guess the g. m. and I got a new lease on life about the same time."

E. H. DeGroot, Jr.

Operating Results of Canadian Railways in 1914

Falling Off in Railway Earnings and Traffic Tell a Plain Story of the Commercial Depression in Canada

By J. L. Payne
Comptroller of Statistics, Ottawa

The great European war is, incidentally, emphasizing the intimacy between trade and traffic. Railway earnings are barometric in their reflection of the commercial activities of a people. They go up or down with the fluctuations of trade. This is not generally understood. It cannot be, or there would be a better and saner appreciation of the functions of our great carrying agencies. When earnings are on the ascendant there are many who fail to see in that fact the throb of national strength and success. They are apt to cry out that the railways are wringing too much from the people and must be restrained; but in the day of adversity, when earnings come tumbling down, they are not sympathetically disposed toward the hard-hit railways. There seems to be lacking that judicial view of the case, which recognizes the soundness of balancing good years against bad years.

The railways of Canada did not earn quite as much in 1914 as they did in 1913, and in 1915 they will inevitably run considerably below the record for 1914. This loss will fall upon the people at large with just as much severity as upon the railways. There is no industry, not even agriculture, which makes such a wide distribution of its prosperity as does the railway industry, and it is equally true that the pinch of railway poverty is as quickly diffused among all classes of the community. We shall have to learn a new lesson. For more than thirty years, with the single exception of 1909, we have seen railway earnings in Canada mount upward. During the past ten years in particular they have made sensational leaps. It comes, therefore, as somewhat of a shock, a disturbing departure from what was accepted as the established order, to find that for the year ended June 30 last there was a decline of $13,619,164, or from $256,702,703 in 1913 to $243,083,539 in 1914. Operating expenses, on the other hand, were reduced by only $3,036,431; so that net earnings, as represented by the difference between gross earnings and operating cost, fell off by $10,582,733 for the year. This result created a serious jump in the ratio of operating expenses to gross earnings. That ratio in 1912 was 68.7; in 1913 it rose to 70.9, and in 1914 to 73.6.

Of course, this setback happened, as has been pointed out, after a long period of really remarkable progress. That progress is strikingly demonstrated in the following statement of gross earnings per mile of line, which has not heretofore been published:

1899	$3,608	1909	$6,018
1904	5,158	1914	7,894

The decline for 1914 was equal to $866 per mile. The story is told succinctly in the following comparison of the sources of earnings in 1913 and 1914:

	1913	1914
Passenger service	$74,431,994	$72,564,203
Freight service	177,089,373	165,753,731
Station and train privileges	1,566,721	1,044,737
Telegraphs, rents, etc	3,614,615	3,720,868
Total	$256,702,703	$243,083,539

The principal falling off was in earnings from freight service, which was due to the hauling of 5,598,721 tons less than in 1913. The number of passengers carried was actually some 471,515 more than in the preceding year, yet the volume of earnings from ticket sales declined by $2,429,134. The reason for this is found in the fact that the average passenger journey fell from 71 miles in 1913, a comparatively high average, to 66 miles in 1914. That little five miles seems to have cost the railways nearly two millions and a half of dollars.

At this juncture a few condensed facts with respect to the public service of Canadian railways may illuminate the whole traffic situation in 1914:

Tons hauled	101,393,989
Passengers carried	46,702,280
Tons one mile per mile of line	716,359
Passengers one mile per mile of line	100,309
Receipts per passenger per mile, cents	2.007
Receipts per ton per mile, cent	.742
Average receipts per passenger	$1.328
Average receipts per ton	$1.614
Passengers per train	59
Tons per freight train	353
Tons per loaded car	19.18
Cars per freight train	18.4
Average freight haul, miles	217

The tendency to centralize railway interests in Canada continues. Last year, for example, 79 per cent of all traffic and earnings attached to three corporations—the Canadian Pacific, the Canadian Northern and the Grand Trunk. The Grand Trunk Pacific is counted in with the Grand Trunk. If seven other units be taken in, the ratio rises to 92 per cent, leaving but 8 per cent for all remaining lines, nearly ninety in number. This work of absorbing the carrying trade into relatively few hands has been proceeding for a number of years, and has not aroused serious opposition. The conviction obtains in the communities more or less directly affected that it has made for better service, without in any degree causing higher rates. In the western provinces, particularly in Manitoba, there has existed for some time a hostile feeling against the Canadian Pacific, resulting in urgent appeals for lower rates. This hostility, strange to say, is not directed at all against either the Canadian Northern or the Grand Trunk Pacific, which serve the same territory and have precisely the same rates as the Canadian Pacific. The officers of the latter allege that their company is paying the penalty of prosperity. The Canadian Pacific has voluntarily made concessions, and the railway commission has dealt with the whole matter judicially; and yet the great pioneer road of the prairie provinces, of which Canadians are justly proud, has not entirely turned some of the agitators into positive friends.

The foregoing observations, apropos of the case of the Canadian Pacific, quite naturally suggest the broad question of freight rates in Canada. The average receipts per ton per mile by all the railways of the Dominion in 1914 were 0.742 cent. There has not been any material change in this fundamental factor during the past eight years, and information back of that period is not available. The tendency in rate adjustments has for a long time been downward, and while earnings were rising steadily, as the result of swelling traffic, it would perhaps have been unpopular to permit increases. Happily, Canada escaped the two cent per mile passenger rate agitation which overwhelmed so many of the state legislatures across the boundary, and carried in its train a mass of admittedly meddlesome and restrictive legislation affecting railways. The situation on this side of the line might be summed up in this conclusion: While freight rates have not in any direction been increased, there have been numerous specific reductions and also changes of classification; so that, on the whole, there has been a slight impairment of earning power. This was not resisted by the railways while the tide of prosperity was running high; but the whole matter may assume a different complexion, and properly so, in the face of serious reverses. Since the outbreak of war there have been heavy declines in earnings, and no one may say when the trend will turn upward. Of course, the productive potentialities of the Dominion cannot be destroyed,

and the return to normal conditions is obviously a matter of time; but, without reference to how and when the volume of traffic will be restored to former levels, fair play demands that the persistent rise in the cost of operation should be recognized in its full bearing on rates.

In 1899 it cost 77.9 cents to run a train one mile in Canada. In 1914 it cost $1.66—an advance of 113 per cent. During the same period earnings per train mile increased by precisely 89 per cent. Such a disparity could only be endured by the railways under very favorable conditions. Should the very unfavorable conditions which have been created by the war and other causes persist for a term of years, it is clear that the railways will be compelled to take broad and comprehensive measures for either the betterment of earnings or the reduction of operating expenses. Indeed, there are signs that steps in the latter direction have already been taken. The larger roads have not only begun the cutting down of their working staff where possible, coupled with the elimination of certain trains and other services, but they have announced the imperative need for a recasting of the scale of compensation to employees.

Speaking broadly, railway corporations in Canada have been on good terms with the various brotherhoods with which their employees are identified. They have been able to meet the demands for higher pay out of buoyant earnings. It must not be assumed that the brotherhoods, representing a high standard of intelligence, will be disposed to ignore the force of economic conditions; but it is contrary to both human nature and considerations of policy to submit to a break in the movement for larger remuneration, which has continued almost uninterruptedly for twenty years, without resistance in some form. At this stage it would be impolitic to indulge in surmise, and nothing else is possible. The issue should turn upon conditions, as to which employee and employer will be well informed; for we live, happily, in time when the operations of railways are carried on in the open.

The vitality and soundness of a large group of railways may properly be tested by the same standards which are applicable to any one of the units. That is to say, a railway would be regarded as strong and prosperous if its operating expenses fell sufficiently far below gross earnings to leave a fair balance after fixed charges had been met, provided always—and this is absolutely vital—that the balance to profit had not been realized at the expense of physical property. The railways of Canada as a whole would not shrink from such a test. Indeed they appear to advantage when it is applied. In 1914 the ratio of operating expenses to gross earnings was 73.63 per cent, and that result was achieved after more than ordinary expenditures had been made for the upkeep of roadbed and equipment. In other words, net earnings have not been the result of an unsound policy with respect to operating conditions. During the past five years the outlay for maintenance of way and structures and for equipment has averaged 21.02 and 20.42 per cent, respectively, of total operating expenses, and that is somewhat better than the average of United States railways during the same period. In 1914, for example, $35,292,227 was expended on way and structures, and $36,375,331 on maintenance of equipment, these outlays being equal to $1,146.07 per mile of line in the first case, and $1,181,121 in the second. It can be fairly said that there has been a persistent movement toward the best standards in all service conditions, and Canadian railways do not in any respect fall below those of the United States in all that makes for general efficiency and comfort.

During the past three years the railways of Canada have made the following additions to rolling stock: Locomotives, 1,228; passenger cars, 1,489, and freight cars, 77,032. The betterment is strikingly shown in the following comparison:

	Per 1,000 miles of line	
	1907	1914
Locomotives	156	176
Passenger cars	162	194
Freight cars	4,783	6,636

Quite as important as numbers has been the rising scale in capacity of both hauling and carrying units. For example, the average capacity of a car in freight service in 1907 was 27.6 tons. In 1914 it was 33.2 tons. Likewise, the average trainload has been raised from 260 tons in 1907 to 353 tons in 1914. The direct effect of recent large additions to equipment has been to completely silence the general outcry against car shortage which had been heard for many years; but, owing to perhaps unavoidable, but nevertheless wasteful, marketing conditions, this has been achieved at the expense of loading the railways with a heavy surplus of cars during at least four months in the year. Some of this new rolling stock came from the United States. The official return of imports from across the line for 1914 shows that Canadian railways brought in 166 locomotives, 208 passenger cars, 4,596 freight cars and 4,113 other cars from the American side, which made up a total account of $7,987,877.

Canada has been taking giant strides for a number of years in railway construction. In 1914 the addition to operative mileage was 1,491 miles, bringing the total up to 30,795. This is considerably more than the mileage of the United Kingdom, and raises Canada to fifth place among the nations of the world in the matter of railways. The increment during the past ten years amounts to 11,364 miles of line. While the distribution of this new mileage has affected all the provinces, the west has had over 70 per cent of it. That is where the need has existed, and still exists, as the result of rapid settlement. It should also be mentioned, and perhaps with warranted emphasis, that during the year under review 309 miles were added to second track, making the total 2,293, and 583 miles to yard track and sidings, the aggregate of which was thereby brought up to 7,518 miles.

Perhaps more striking than the additions to operative mileage are the facts with regard to lines under construction. The situation on June 30, 1913, and 1914 was as follows:

	1913	1914
Surveyed	6,558	11,472
Under contract	8,591	5,521
Completed	2,956	3,417
In operation	542	2,443
Total	18,648	22,853

The mileage "in operation" refers to mileage which had not on June 30 last been officially taken out of the "under construction" classification. It is quite a common thing for the Railway Commission to permit parts of new lines to handle traffic pending the completion of the whole, and also to allow completed railways to be operated for a limited period by the contractors. It is reasonable to assume, however, that at least 10,000 miles of new line now in various stages of construction will be added to official operative mileage within the next four or five years. Of course, at this juncture no one may say what effect the war in Europe will have on the whole railway situation, especially with respect to availability of capital.

Building railways nowadays is an expensive proceeding, and it should not therefore be regarded as surprising that the capitalization of the Canadian system was increased by $276,950,000 during 1914. This increment consisted of bonds, $169,145,686; common stocks, $97,794,137; and debenture stock of the Canadian Pacific, $10,050,246. By these additions the aggregate liability was brought up to $1,808,820,761. In addition there were stocks amounting to $64,637,500 and bonds totalling $88,669,809 attached to lines officially regarded as being under construction; so that the final total would be $1,962,128,070. It was definitely ascertained that the interest on all outstanding bonds was paid. Dividends for the year ran up to $30,434,601, as compared with $27,333,373 in 1913. The force of these figures is accentuated by the fact that seven years ago the aggregate of dividends was $12,760,435. Funded debt in 1914 amounted to $23,481 per mile of the lines affected, which cannot be regarded as high. Stocks had an average of $30,138 per mile.

The policy of aiding railway construction continues, and in 1914 the largest expenditure for that purpose was made since

subventions were begun. Direct cash subsidies amounted to $16,583,059, of which all but $523,260 came from the federal treasury. That, however, fell far short of the contributions which were made by the Dominion and the provinces in the form of guarantees of bonds. Parliament voted $45,000,000 of guarantees to the Canadian Northern in May last, following very much larger assistance to that company in subsidies and endorsements in preceding years. The total account for guarantees having legislative authorization reached $406,259,165 on June 30 last, of which $188,965,063 stood in the name of the Dominion. The western provinces are chiefly involved in connection with the remainder, and as these guarantees are precisely like the endorsements made in everyday life of promissory notes, it will be seen that the situation would be exceedingly serious if default should be made by the railways concerned. However, these obligations represent two things: The optimism of the west and the need for transportation facilities. Under normal conditions nothing more will happen than happens when one friend endorses for another. The west will get its railways—has, in fact, already got thousands of miles of new line by that process—and the railway corporations will pay principal and interest. The emphasis is on the word "normal." It must also be borne in mind, before the attitude of the Canadian people in respect of transportation is understood, that the Dominion government is building the eastern section of the Grand Trunk Pacific, and has expended on that account $150,000,000; that it has guaranteed the bonds of the Grand Trunk Pacific for the construction of the western section, and had actually purchased $33,116,000 worth of these bonds up to June 30 last in order to secure par value for the company.

The war, following closely upon a lull in high pressure traffic conditions—a lull which might have been wholly temporary—has disturbed the fundamentals of commerce in Canada. One does not, however, see the effects very plainly. Production seems to be proceeding. There are not many industrial establishments idle. Business is apparently being carried on as usual. But the railway barometer tells a plain story of depression, and it is infallible, as has been said. The pinch here and the slackness there are reflected from ocean to ocean in lowered freight earnings. There may not be discouragement—you certainly would not hear anything pessimistic in Canada at this time of trial—but everybody realizes that economy is necessary. At the foundation of nearly all great commercial upheavals one may find uncertainty, and that word expresses the situation just now in Canada. So far as the railways are concerned, they cannot possibly escape the constriction; and the hard part of it is that, while many begrudged them a reasonable share in the prosperity of the past decade in particular, they will look in vain for general sympathy in any distress which the great European war may force upon them. War is not like any other disturbing influence. Neither its duration nor its consequences can be gaged. Under such abnormal conditions no one may say what will be the position of Canadian railways six months hence. Everything depends on what happens in Europe.

There was one element of relative novelty in the railway situation in Canada last year which is worthy of attention in a concluding paragraph. For a number of years past the railways have been experimenting with the despatching of trains by telephone. These tests must have been satisfactory; for on June 30 last, as was definitely ascertained, 7,297 miles of line were operated wholly by means of the telephone. In addition, 5,068 miles were operated by the joint use of telephone and telegraph. Although the introduction of the telephone to this extent must represent an important change so far as telegraph operators are concerned, it is understood that an adjustment has taken place without either serious friction or hardship.

Work on the Berlin Subway.—In spite of the war, work is being pushed on an extension of the Berlin subway. At the present time work is in progress on the tube along Friedrichstrasse, Berlin's principal thoroughfare.

A ROLL OF HONOR FOR TRAINMEN

Andrew Keiser, superintendent of the Conemaugh division of the Pennsylvania Railroad, Pittsburgh, Pa., has established in the train service of his division a "roll of honor"; that is to say, he has reversed the common practice of publishing information about the bad conduct of those employees who have to be disciplined, and instead publishes a list of the names of those men who have performed their duties satisfactorily for a year without any occasion for censure or punishment.

Mr. Keiser's primary motive appears to have been the hope of reducing the number of cases of discipline. In the railway service the object in giving prominence to punitive discipline is to warn other employees and give them the information, instruction or incentive which shall make them avoid the errors which are shown up; and Mr. Keiser hopes that equally satisfactory warnings can be given by publishing the evidence of satisfactory service rendered. The hope of reward—and a place on the roll of honor is a reward—should be as strong an incentive as the fear of punishment.

Concerning the operation of the new plan Mr. Keiser writes:

"In carrying out the idea there was prepared an "honor roll" containing the names of all employees who had been in active train service during the entire year 1914 without being disciplined; and the list contains the names of a very gratifying majority of a total of 709 employees in active service the entire year. The rosters show a total of 1,145 such men in that service during the year, but only 709 of these were in active service during the whole period, and it was necessary to use the smaller figure in preparing the statement in order that it might be on an equitable basis. It would not be fair to compare a man in this respect, who had been in the service, for example, only a month or two, with one who had served the entire year.

"In connection with the 'honor roll' the superintendent issues the following appeal:

"This HONOR ROLL is to be issued annually. You are all earnestly requested to assist in making subsequent honor rolls still larger, thereby individually reaping the benefits as well as increasing the efficiency of our work.

"To keep up the interest in the scheme it was deemed advisable to issue a monthly supplement, briefly placing before the men anything in the way of good results obtained because of their satisfactory service, and the January supplement reads:

"The discipline found necessary to impose on train employees during the month of January, 1915, as compared with January, 1914, shows a decrease of 73 per cent, and the value of time so lost to employees concerned and their families, a reduction of $1,340.24.

"This favorable showing is very gratifying to the management and one which train employees should be proud of.

"The record for the month of February will compare very favorably with those shown in January.

"The honor roll and the monthly supplements are posted under glass in the offices of superintendent, trainmaster, assistant trainmasters, road foreman of engines and engine house foreman.

"No change has been made in the manner of considering and applying discipline in the usual manner. It is believed that this is necessary as a means of properly controlling a small percentage of the men involved, usually the younger element. . . ."

American Foreign Commerce.—An analysis of the foreign commerce of the United States in the American fiscal year 1914 shows that vessels flying the British flag carried 53.45 per cent of the imports and exports of the United States during that period. The corresponding proportion carried by German shipping was 13.79 per cent; by American shipping, 9.26 per cent; by French shipping, 4.64 per cent; by Dutch shipping, 4.10 per cent; by Norwegian shipping, 3.49 per cent; by Japanese shipping, 2.14 per cent; by Italian shipping, 1.94 per cent; by Austrian shipping, 1.57 per cent; by Belgian shipping, 1.27 per cent; and by all other shipping, 4.35 per cent. The analysis extending in the fiscal year 1914 to American imports and exports represented an aggregate value of $3,785,469,000.

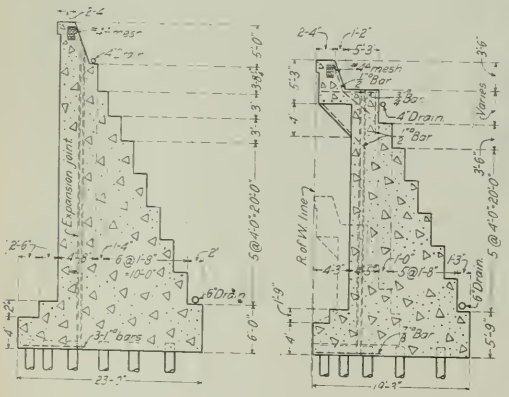
Rock Island Track Elevation Work at Chicago

Unusual Progress Made in First Year's Work on an Eight-Year Program Involving an $8,000,000 Expenditure

Although the track elevation project which the Chicago, Rock Island & Pacific now has under way in Chicago involves unusual difficulties in the size and complicated character of the structures and the amount of traffic to be handled, the first two tracks on the first section of this project were placed in service on the upper level before the close of the first season of active work. To do this it was necessary to build one line of retaining

Looking South Over the Seventy-Ninth Street Crossing Before the Elevation of the Tracks of Either Road Showing Temporary Diversion South of Crossing

wall and seven street subways in addition to a three-level structure at the crossing of the Chicago & Western Indiana and Seventy-ninth street, involving a total concrete yardage of 73,000, and to place 231,000 cu. yd. of filling material without interruption to the heavy main line freight and passenger traffic of ten roads on the two lines, aggregating over 500 movements with

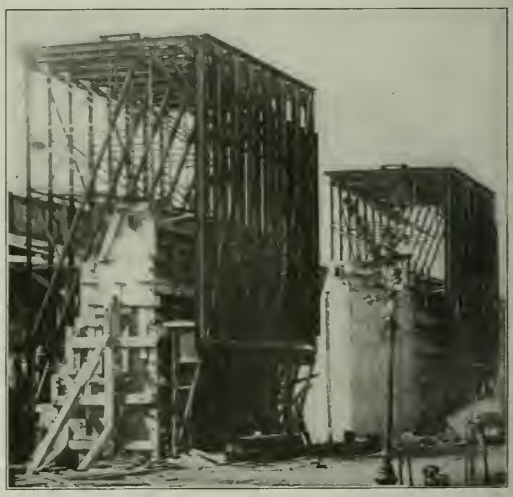


Cross Section of the Standard and Cantilevered Retaining Walls

about 7,000 cars in 24 hours over the Seventy-ninth street grade crossing.

As outlined in a description of the organization for this project in the *Railway Age Gazette* of March 13, 1914, this section including the main line between Seventy-second and Eighty-fourth street is the first item in a construction program covering about eight years' time and requiring an expenditure of over $8,000,000 to elevate the main line south to Ninetieth street and the South Chicago and the suburban branches. With the exception of the concrete pile driving and some portions of the steel erection, the work thus far has been handled by company forces under the chief engineer through a track elevation department and the program laid out at the beginning of the year was carried out with very little change. The remainder of the fill and subways and the west wall will be completed during the coming season and from then on short sections of the remaining lines that are under ordinance will be taken up in succession to complete the whole project in the specified time.

The first section was made exceptionally difficult by the presence of the Western Indiana crossing which required the design of a complicated structure, increased the necessary elevation considerably, involving high retaining walls, abutments and subway columns and added to the problem of handling the company's own traffic during the work, that of keeping trains moving over a very busy cross line and of changing both lines to



Two Sets of the Traveling Steel Forms Used in Construction of High Retaining Walls

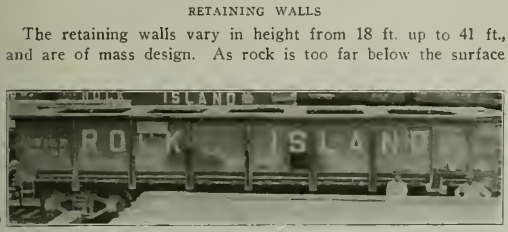
temporary locations where interference with the work would be avoided.

Although some preliminary work had been done before, the work was not actively pushed until March 31, 1914, when the three main tracks of the Rock Island were shifted west a maximum distance of about 80 ft. at the Western Indiana crossing. A construction trestle was driven along the east side of the right of way, the fill placed from this trestle being kept from encroaching on the operating tracks by tie cribs which reached a maximum height of 18 to 20 ft. At the completion of the first track over the new grade in November the northbound traffic was turned over it, and a short time later the second track was put in service. The fill was made wide enough for a third track which is to be used in widening the fill and handling materials for completing the subways and building the west wall. At the time of the first shift of the Rock Island tracks, the four Western Indiana tracks were shifted south to make pos-

sible the construction of the footings for the north abutment and three of the four piers for the structure which carries the Rock Island over the Western Indiana and the latter over Seventy-ninth street. As soon as the work on the north end of the bridge had advanced far enough the four tracks were shifted back to the bays between the new piers and the south end of the bridge was then finished.

RETAINING WALLS

The retaining walls vary in height from 18 ft. up to 41 ft., and are of mass design. As rock is too far below the surface



One of the Steel Gondola Cars Fitted with Improved Runways Leading to the Mixer

to be reached, all walls over 20 ft. high are founded on concrete piles. The footings for the walls, piers and abutments required 350,000 ft. of Raymond piling. These piles were loaded with 21 to 25 tons.

All telegraph, telephone and signal wires will be carried in a six-way vitrified clay duct which was embedded in the wall near the top. Two tile drains were provided, one 4-in. line on the first offset from the top and one 6-in. line approximately at the ground surface. These lines were laid with burlaped joints to accurate grade and were covered by coarse material. In addition, the back of the walls was waterproofed.

Where the width of right of way prevented the use of the ordinary section of wall on account of the extended toe, a special "gooseneck" section was adopted. The lower portion of this wall has the same section as the standard design, but on this gravity wall is carried a cantilevered top with the face of the parapet extending 1 in. beyond the extreme edge of the toe and 4 ft. from the vertical face of the body of the wall. This cantilevered section is of 1:2:4 concrete reinforced and supported at intervals of 12 to 13 ft. by concrete brackets. About 800 ft. of this type of wall was built.

In an effort to reduce the cost of concrete in these high walls and also to hasten their completion, movable forms supported on gallows frames were experimented with and proved so successful that they were used for about 60 per cent of the yardage. One set of timber forms and one of steel were provided, the principle of both being the same. With each of these forms it was possible to pour a complete section each day amounting to as much as 300 yd. in some cases. The wooden forms were designed for building 24-ft. sections, the set including two forms, one with bulkheads and one without, these being used alternately so that the sides of the latter could lap over the finished section at each end. The forms were suspended from a wooden gallows frame spanning the wall and running on rails on each side. The steel gallows frame was 35 ft. 3 in. high and the forms provided for a section length of 35 ft. The front and back sections of the frame were connected by a sliding joint to allow a variation in the distance between running rails from 13 ft. 3 in. to 20 ft. 6 in. The forms are tied together by rods running through tin tubes which were allowed to remain in concrete after the wall was finished, the ends of the holes on the outer face being filled with cement. The steel forms were made by the Blaw Steel Construction Company, Pittsburgh, Pa.

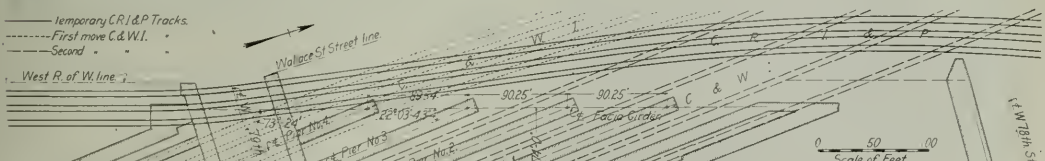
In studying methods to reduce the cost and increase the speed of the portable mixing plants used for the walls and abutments it was found that a considerable saving could be made by the use of a special runway on the gondola cars in which the concrete aggregate was shipped. With the separate side and cross planks previously used on these cars for wheeling it required from 40 min. to 1 hr. to remove the runways from one set of cars and replace them on another when loaded cars were

A Portion of the Slab Yard

switched in, the cost for this change amounting to $10 or $11. The improved runways which can be handled as a unit for each car were built up of three 3-in. planks 30 in. wide on each side with similar cross planks at frequent intervals on which the barrows are loaded. This equipment cost about $50 per car but resulted in an average saving in the cost of concrete of $0.07 per yd. through the decrease in the time of changing the runways and increased speed of the men in wheeling. It was sometimes necessary to wheel over five cars, the average time for a round trip of this length being about 3½ minutes.

SUBWAYS

Although the Rock Island main line was previously elevated to Seventy-sixth street the change in grade had to be carried back to Seventy-second street to secure the necessary elevation over the Western Indiana at Seventy-ninth street. This involved the reconstruction of the Seventy-fourth, Seventy-fifth and Seventy-sixth street subways, and in addition the grade crossings at five streets were eliminated by the construction of new bridges. The steel girders in the three old bridges were removed, the abutments raised or new ones built back of the old, and new steel-encased columns supporting reinforced concrete cross girders and slabs erected. This concrete slab and ballasted deck type was also used for four of the new structures, the fifth—



General Plan of the Three-Level Structure at Seventy-Ninth Street, Showing Temporary Track Locations

Seventy-ninth street—being carried under the Western Indiana bridge. Curb and center supports were provided at all streets.

The steel columns are carried on concrete pedestals supported by concrete piles and are encased in concrete, making them 2 ft. 6 in. square at the bottom, 2 ft. 1 in. under the capital and 3 ft. at the top. Horizontal braces were provided to stiffen the columns when necessary on account of the unusual height. The intermediate columns and all cross girders and slabs were cast in a yard in order to avoid the almost prohibitive cost of building falsework for such high structures. The end columns and facia girders and the braces were encased after erection.

General View of the Five-Span Structure Carrying the Rock Island Over the Western Indiana at Seventy-Ninth Street

placing the concrete around the assembled steel columns the encasement was poured up to the bead of the capital at one operation and this was allowed to set until the shrinkage was taken up before pouring the capital. The lifting hook pockets in the upper ends of the columns were filled with concrete after erection. The concrete encasing the braces was extended 1¼ in. into recesses in the sides of the columns.

The slab yard which is located adjacent to the material yard

The Three Levels at Seventy-Ninth Street—Rock Island Above. Western Indiana in the Middle and the Street Partially Excavated Below

near Eighty-ninth street, was operated from about March 1 to October 1, during which time 3,972 yd. of concrete was poured. The mixer outfit was operated on two tracks reaching three rows of forms. The concrete was mixed by a ½-yd. Marsh-Capron mixer operated by a gasolene engine. With the exception of the subway cross girders wooden forms were used for all parts cast in the yard. The erection of columns, girders and slabs was handled with a derrick car rated at 75 tons which was able to handle one of the 50-ton slabs at a radius of 20 ft. A total of 2,800 cu. yd. of concrete was placed during the season in this way.

ROCK ISLAND-WESTERN INDIANA CROSSING

In connection with the elimination of grade crossings with streets on both the Rock Island and the Western Indiana in the vicinity of Seventy-ninth street crossing of the two roads, it was mutually agreed to separate the railway grades by carrying the Rock Island overhead, although the cost of the work was increased by this decision an estimated amount of $1,000,000. While the Rock Island had three tracks and the Western Indiana four on the ground level, provision was made in the plans for the new structure to carry five Rock Island tracks and 10 Western Indiana tracks. The two roads cross at an angle of about 17 deg., and the Western Indiana intersects Seventy-ninth street at an angle of about 85 deg.

In considering the substructure for this bridge it was found

One Span of the Seventy-Ninth Street Structure Showing Main Girders, Floor System, One Abutment and One Pier Before Concrete Encasements Were Placed

that a mass abutment of the required height would contain over 3,000 cu. yd. of solid concrete in the intersection angle. To reduce this quantity and the resultant bearing pressure and the number of piles and also to provide space for a temporary Western Indiana track during construction, a shell abutment was adopted consisting of two rows of concrete columns with arched openings between, the space between the rows being spanned by concrete slabs. The wing walls are of similar construction, allowing the fill to spill through the opening. Reinforced concrete piers are used between the tracks with a minimum width of 3 ft. at the top and spread at the bottom to secure the necessary bearing on the concrete piles. Two of the piers at the south abutment could not be carried continuously for the full width of the bridge on account of the location of Seventy-ninth street under the Western Indiana tracks. The support for the upper

deck was made continuous over this street by locating steel columns in line with these piers and the abutment and also in line with the curb and center of street columns of the Western Indiana bridge extending down to footings below the street level. The maximum load on these columns is 848 tons. made it necessary to use caissons extending down 40 ft. to rock in four cases. Provision was made for the Western Indiana to connect the members of its steel structure to these columns wherever this arrangement was advantageous. The columns support concrete encased girders and are connected by concrete fenders.

The type of superstructure was adopted only after careful

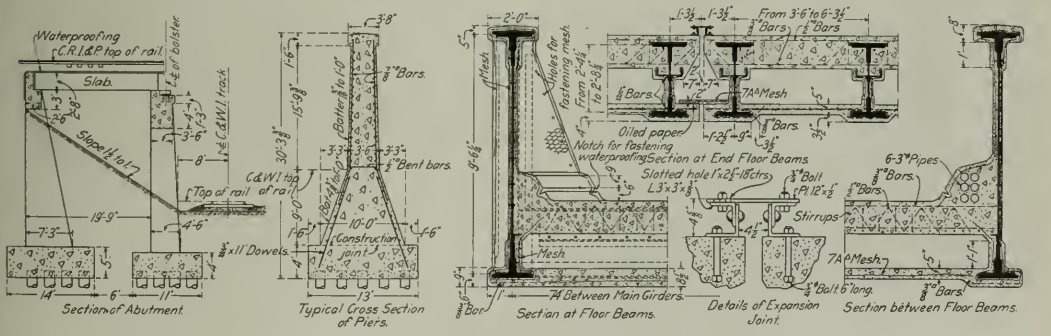
The New Suburban Station Located Under the Elevated Tracks

consideration of a number of designs. The allowable street depression, the required street clearance of 13½ ft., and the specified clearance of 17 ft. over the Western Indiana limited the elevation of the two upper decks of the structure very closely and in fixing the grade of the top deck it was estimated that every additional inch of elevation would cost $6,000.

The first type considered was a through girder structure with I-beam floor, the girders spanning two Western Indiana tracks, making them about 90 ft. long. The depth of floor in this design trough floors and one with floor beams and concrete slab deck. The floor beam and stringer designs had a floor depth of 5 ft. 2 in. In comparing their estimated cost, with the first through girder type, therefore, it was necessary to include $6,000 for each additional inch of floor thickness in excess of 3 ft. 11 in. On this basis the cost for a structure with beams perpendicular to the piers was estimated to be 4 per cent greater, and for one with the beams perpendicular to the main girders 6 per cent greater than the first design. The skewed floor beams also would have had the disadvantage of difficulty in detailing and erecting.

One of the trough floors had a depth of 4 ft. 9 in. and the other 5 ft. 3 in. Again including the cost of the additional elevation these designs were estimated to cost 7 per cent and 10 per cent more, respectively, than the through girder bridge. The floor beam and concrete slab deck with a depth of 4 ft. 10 in. was shown to have an estimated cost of only 2 per cent more than the original design and less than any of the other types. This structure was finally adopted on the basis of first cost, absence of obstructions above the deck and ease of fabrication and erection.

The assumed live loading was Cooper's E-55. The floor beams have a depth back to back of angles varying from 2 ft. 4¼ in. to 2 ft. 8¼ in. and the spacing between beams varies from 3 ft. 6 in. to 6 ft. 3½ in. The reinforced concrete floor slab encasing the tops of these beams is 15 in. thick and is supported on Z-bars riveted to the web of the beams. These Z-bars were used in preference to angles, as they serve as stiffeners and also have a greater tendency to hold the concrete close to the girder web. The top of this slab is waterproofed with a five-ply coating covered with a layer of mastic. The expansion joints are located at right angles to the girders with an offset of one floor beam over the piers. These joints consist of a 2-in. open space covered by a plate with slotted holes supported on two angles bolted to the concrete on each side of the opening. The structure carries a minimum depth of ballast of 6 in. As a protection against the gases and locomotive blasts under the bridge a reinforced concrete slab with a minimum depth of 5 in. was provided, the reinforcing bars in this slab being supported on the lower flange angles of the floor beams and the concrete covering these flanges continuously. This slab was placed with cement guns and all exposed steel work was coated by the same process. While it is impossible to foretell how long this "gunite" will protect the



Details of Design of the Seventy-Ninth Street Bridge

was only 3 ft. 11 in., but the girders required were so deep that their tops would have come above the car windows. A similar structure with 51 ft. 6 in. girders was designed with the same floor thickness and a girder depth that would eliminate this objection but the estimated cost was increased by 7 per cent, and the use of the maximum rolled sections which was necessary would have required the driving of field rivets 6 in. long through the flange of the girder. Five types without intermediate girders were considered, two having floor beams and stringers, two with steel under the severe conditions existing, it is estimated that it can be replaced at less cost than a coat of paint.

The design of this bridge had to be pushed at utmost speed. Given the strain sheet in February, the fabricated steel was delivered June 15. The detailed plans were prepared in the office of the American Bridge Company, which had the contract for fabrication, at its Gary, Ind., plant under the supervision of an experienced designer from the Rock Island bridge department who was given charge of the squad assigned to this work and

who personally checked all important details on the sheets. As an example of the class of work required in this design, only 8 field rivets per ton of steel were driven. The bridge department also had a representative in the field during the erection of the bridge who kept in constant touch with the man at the mill so that each car of steel was loaded with the pieces in the order needed in erection. In addition to the time saved in erection this eliminated the rehandling of steel which usually must be unloaded from cars for temporary storage and picked up again when needed. The bridge was erected under contract by the Ketler-Elliott Erection Company, Chicago, using a locomotive crane which also switched the cars in and out. The heaviest girder weighed about 43 tons. Under the system in use this contractor was able to erect 1,100 tons of steel in six days.

STATION

The track elevation work made necessary the construction of a new suburban station at Auburn Park, just north of Seventy-ninth street. This station is one of the best originating points for suburban traffic on the main line and it was essential that the new building be convenient and adequate in its facilities. As the right of way on this section is fully occupied by the elevated line and a suitable site adjacent to the desired location would have been difficult to secure, a somewhat novel plan was adopted, the bnilding being located at the street level under the tracks facing on the Seventy-eighth street subway and the street paralleling the east retaining wall. The accompanying photograph of this station shows how the tracks are supported over the building. Stairways from the Seventy-eighth street subway and from a special foot passageway at Seventy-seventh street lead up to the two island platforms between the tracks and a baggage elevator connects the station baggage room and the track level.

COST DATA

Detailed cost records on this work were unusually important on account of the division of expense between the roads, and in order to make the cost data of immediate value in directing operations a system was developed by which the books could be closed every night. The unit costs of all classes of work were computed every day, making possible a comparison of results at once and tending to check waste and reduce costs without interference with the progress.

Daily labor and material reports were filled out by each foreman and were received in the field construction office on the following morning. Seven of these sheets were furnished to each foreman in a paper binder each Monday morning for use during the following week. These reports showed the location and description of work, rates and hours worked, work done, material received and used, from which the labor cost, additional cost, total cost and unit cost were computed in the office and entered on the same sheet. From these daily reports monthly summaries were prepared showing the date, cost of labor, cost of material, additional charges, total cost, work done and unit cost, these sheets being indexed in a loose leaf folder according to the class of work. The final report on ledger sheets shows the date, item, work done, unit cost and debit, credit and balance, divided between additions and betterments and operation.

This work is being handled under the supervision of C. A. Morse, chief engineer, by R. H. Ford, engineer of track elevation, the bridge and masonry designs being prepared under the direction of I. L. Simmons, bridge engineer, and the station details by A. T. Hawk, architect.

Railway from Kem to Kola in Russia.—It is reported from Petrograd that the Russian cabinet has allocated the credit of $1,800,000 to the preliminary works for the construction of a railway from Kem to Kola on the Arctic ocean. It has also authorized a credit for preliminary works in connection with the building of lines from the region north of the Archangel-Vologda Railway to a point which will be selected as a port in the Government of Archangel.

LOCOMOTIVE SMOKE IN CHICAGO

The department of smoke inspection of the city of Chicago has adopted a new method of inspecting locomotive smoke in that city. Heretofore it has been the practice to assign several men to the specific duty of inspecting locomotive smoke at various times of the year. Under the new system the smoke inspectors are required to watch for locomotive smoke wherever they may be at all times. This eliminates any possibility of the railroads making special preparations during the period of inspection. Following is a list of the railroads in the Chicago district and their standing for the six months, from September, 1914 to February, 1915, inclusive:

Department Smoke Inspection, City of Chicago

	Railroad	Number of observations	Engine minutes	Smoke units	Per cent density
1	C. & N. W.	4,064	5,233.5	1,613.75	6.17
2	N. Y. C.	720	691.5	218	6.35
3	A. T. & S. F.	302	373.5	125.25	6.77
4	C. G. W.	321	435.5	149.5	6.86
5	C. B. & Q.	1,563	1,599	598.5	7.49
6	I. C.	2,199	2,256.5	953	8.44
7	N. Y. C. & St. L.	192	222.5	94	8.46
8	C. M. & St. P.	2,054	2,550.5	1,123	8.77
9	Pennsylvania	1,327	1,815.5	800.25	8.82
10	M. St. P. & S. S. M.	174	201	90.25	8.98
11	M. C.	249	295	135	9.15
12	Grand Trunk	387	545	263.5	9.67
13	C. & E. I.	257	286.5	139.5	9.72
14	B. & O. C. T.	379	617.5	309.75	10.03
15	C. I. & L.	175	187	94.75	10.14
16	B. & O.	197	306	175.5	11.47
17	C. R. I. & P.	1,077	1,091.5	637	11.67
18	I. H. B.	29	43.5	26	11.95
19	Ill. Northern	71	87.5	55.5	12.69
20	C. & A.	586	641	419	13.07
21	C. & W. I.	521	642.5	422.5	13.15
22	Pere Marquette	114	121	82.25	13.59
23	Erie	220	257	186.5	14.57
24	Wabash	403	555.5	406.5	14.64
25	C. & O.	34	31	23	14.84
26	Belt	178	232	195.5	16.85
27	C. I. & S.	29	28	29.5	21.07
28	C. J.	810	1,097.5	1,219.25	22.22
29	C. R. & I.	97	132	157	23.79
	Total	18,729	22,576	10,742.75	9.52

It will be noted that the average density for all the locomotives is 9.52 per cent. This compares favorably with the other seasonal readings, and goes to show how thoroughly the railroads in Chicago have the smoke problem in hand. The average is lower than in the summers of 1912 and 1913, and the autumn of 1912, and is higher than the autumn reading of 1913 and the summer reading of 1912, they being 5.79 per cent and 6.30 per cent, respectively. The Chicago & North Western Railway has the best performance for the first time since 1911. In previous inspections it held third, second and fourth places, respectively, and previous to 1913 it was about at the middle of the list.

Military Traffic on English Railways.—Some idea of the vast movement of troops and naval and military stores may be gathered from the remarks of the chairmen at the recent annual meetings of some of the English railways. First place is given to the London & South-Western, which company ran, up to December, 4,913 loaded specials, necessitating about 15,000 extra trains. The Great Western had run 6,684 special military trains, and the Great Eastern, up to the end of December, 2,793 special trains. The Great Central had carried upwards of 250,000 soldiers, in addition to those on short leave, more than 16,000 horses and some 1,400 service vehicles. The London, Brighton & South Coast has run over 4,400 specials and carried nearly 500,000 tons of government stores and supplies. The Metropolitan has conveyed 2,738 troop trains, and when the first expeditionary force was being moved, passed 58 troop trains on one day over the line, in addition to all the ordinary traffic. During the first fortnight in February, 2,935 goods trains were passed over the Widened Lines. The Great Southern & Western, when the first expeditionary force was being moved, ran 172 special trains, containing 60,000 men, 10,000 horses, 200 trucks of baggage and 1,100 cars of guns.

Troublesome Problems of Terminal Operation*

Necessity for Studying Conservation of Equipment, Proper Carding of Cars, Selection of Freight Solicitors

THE CONSERVATION OF EQUIPMENT

By J. E. Campbell
Freight Agent, Pittsburgh & Lake Erie, Bessemer, Pa.

The terminal expense consumes a very large part of every railroad's revenue and in some cases, such as short haul business between adjacent terminals, the operating expense is nearly all terminal expense. A careful study of terminal costs and a determination to reduce them to the lowest possible figure will probably tend more towards the prosperity of the carrier than any other effort that may be made. As traffic conditions are continually undergoing change the terminal problems are also presenting new features. Those methods which would have been the most efficient possible in a given yard ten years ago would not meet the requirements of the company and public in that yard today. This is true of every yard in the country.

The superintendent of terminals, or yardmaster, should strive to secure the largest possible results from each crew or unit of service under his jurisdiction. There should be a careful adjustment between day and night work, for the more evenly the work is divided between the two periods the fewer locomotives will be required. There is much work that can be done to the best advantage at night. Warehouse sidings, team tracks and private and industrial sidings should be switched and put in shape at that time. They will then be ready for business the first thing in the morning and much undesirable friction will often be avoided. If owners of private sidings, and industrial tracks, and agents in charge of warehouse and team tracks are educated to plan their work for a whole day it will often be unnecessary to switch such tracks until the next night. At least, by careful planning the day work on such tracks can be reduced to a minimum. Switch orders or a switching list for such tracks should be furnished each evening by the person in charge. In case of industries operating night shifts a similar work order can be furnished each morning. Much can be accomplished by educating patrons to plan their work so that unnecessary shifts will not be required.

Each crew should have its own routine work and should be trained to do that work quickly and promptly. The men should also distinctly understand that their work is not done when a particular routine has been accomplished, but that they should be ready to relieve the pressure in any other part of the yard where it may be unusually heavy. Efficiency does not result when one crew is idle and another overcrowded with work.

All work should be carefully planned. If it is necessary to switch a siding do not take out the loads, then come back and take out the empties, and a little later return a third time to place other loads and empties. Each crew should be taught how to do its work with the fewest number of moves and switches, for needless switching requires time and costs money. Empty cars should be placed upon the proper storage tracks when unloaded, and likewise loaded cars should be placed on the proper tracks for outbound trains. If the yards are of sufficient size outbound trains should be made up as cars are loaded and weighed, or otherwise brought into the yard. It is needless work to have such loads all placed in a storage yard and then switched by another crew to classification yards.

Whenever it is possible inbound loads should be delivered direct to the unloading tracks. Much can be accomplished in this direction where large consignments of bulk freight are arriving, such as ore, coal and coke for furnaces, grain for elevators, and freight for vessels at docks. Where yards are of a character that will permit, incoming trains can just as well deliver cars where they will be unloaded without additional expense by the company as to place them on a storage track for a yard crew to handle a second time. Pick-up locals can place many cars on arrival within the terminal district, and cars for connections can often be delivered direct to interchange tracks without extra handling.

It should be the aim of the yardmaster to forward every outbound load in the first train possible. This means much for his company. It gives the patrons of the road better service, it saves per diem on foreign cars, earns per diem sooner on home cars going to connecting lines and above all helps to keep the yards clear. The importance of keeping all loaded and empty cars moving cannot be overestimated. A congested yard multiplies expense rapidly and a few hours will sometimes disorganize the best managed yard if cars are not moved out when they should be. In yards where a large number of cars of a particular class, such as grain cars, coal cars, ore cars, etc., are made empty, they should be forwarded as quickly as possible. This not only is necessary to prevent congestion but to secure the greatest car efficiency possible.

The conservation of equipment is a very important function of the man in charge of any freight terminal. This is not a matter to be left in the hands of the superintendent of car service or car distributor. It is very largely a matter for the local yardmaster to regulate. While this part of the work may not show up in the expense account directly connected with his yard, and it may often be necessary to do work for which no direct credit will be received, yet it is work that greatly tends to the prosperity of the company. Foreign cars under per diem should be moved without delay. These cars often come to the road in switching territory and the per diem paid while the empty car is delayed in terminal yards consumes all or more than all the revenue derived from the shipment loaded in the car when received. In these days when there is a great demand for first-class box cars, such cars should not be loaded with rough freight when other cars are available. It often happens in time of scarcity of equipment that they are loaded with rough freight and shipments of high class freight are lost through the inability to furnish cars.

All foreign cars should be loaded and handled in accordance with general per diem rules so far as it may be advisable under conditions existing at any particular time. Where there is sufficient room empty cars should be classified on different tracks and held ready for prompt loading when required. All shop cars should be disposed of promptly; and if under load moved to the shop track promptly in order that shipments may not be unreasonably delayed. Where it is necessary to secure special equipment for outbound loading or to bring supplies from other parts of the road the requirements of patrons should be anticipated in order that there be no delay in furnishing cars. At competitive points the failure to furnish cars promptly when required often results in business moving by competing lines. Good judgment in this matter is a prime requisite as in all other matters relating to the conducting of the yard.

An important adjunct of every yard is a corps of well-trained clerks who will keep a correct check upon its operation. They should be taught that it is not sufficient to take the numbers and initials of cars in the yard but that they should know why the cars are there. No-bill cars should be investigated promptly and the necessary billing should be secured without delay. In case of hold cars the person ordering cars held should be communicated with frequently in order that they may not be lost sight of and that their release may be secured quickly. Errors in numbers, routing, and other details should be watched for and the proper corrections secured at once. The yard clerks

*Abstracts of several of the papers presented in the contest on Operation of Terminal Yards.

should see that the person in charge of the yard has every detail of the yard at his command on a moment's notice. A large accumulation of no-bill or hold cars, and cars with erroneous billing can soon develop if all of these details are not followed up with system and despatch.

ATTENTION TO THE DETAILS

By J. R. Hamilton

Terminal Trainmaster, Delaware, Lackawanna & Western, Buffalo, N. Y.

A yardmaster must work enough power to do all the important work each day. In this connection the unimportant work is hard to designate. As an illustration, the man in charge of the ash-pit may ask to have the loads pulled out and empties set in. Apparently this is an unimportant job, but he may have neglected to order the work done at the proper time. It is not done, the assistant yardmaster saying, "We will do that tomorrow." During the night the ash-pit becomes blocked, engines are delayed waiting to have fires cleaned, trains are probably held waiting for engines. The night yardmaster must take one of the regularly assigned engines from important work, and go and look up empties. Not knowing where to find them as promptly as the regular day man, he loses time with the engine. Hence the unimportant job becomes important.

All business offered by connections should be moved from the regular interchange tracks with little delay and placed on the classification tracks, where the cars should be handled in their turn as they arrive. Some of the worst delays come on account of the assistant yardmaster in charge of the classification yard clearing tracks which will be to his greatest advantage, while neglecting business that arrived at an earlier hour. All business, except that coming from connections, should be gathered up after the day's loadings have been completed. It is not economical to run after one car at a time, unless it be to get into a train which, if missed, would cause a bad delay and possibly be the cause of the company losing the next shipment to the same point. In these days, when the traffic department has nothing to offer except service, it might be considered good judgment to make special movement of an old car of scrap, wood or iron, as the party controlling such a shipment might be in position to give or withhold important business.

Trains should be made up properly classified through to destination, and when business will not suffer more than 24 hours' delay, I believe, making up full trains to one destination is an economical way to handle business.

Yard clerks are important factors in the proper handling of any terminal, and the right kind are scarce. A yard clerk should be a chap who is constantly looking for things, not a fellow who sits around waiting to be told what to do.

Car records, if properly kept, are money savers, and if not properly kept up they should not be kept at all. Interchange reports should receive considerable attention and the yardmaster should see the clerks who do this work as often as possible. Call them together at least once a month for a conference, and in order not to have the night men lose any time or rest invite them to breakfast with you at some nearby restaurant at the company's expense. It will be worth more to the company than if the same amount was added to their pay, and the benefit derived from such gatherings cannot be overestimated. It has been proved that such gatherings are beneficial for other classes of help, hence, why not for yard, interchange and car record clerks? You should be just as close to the despatcher and agents, who must depend upon you wholly, as you are to the roundhouse or general shop foreman, upon whom you must depend.

Don't refer anything to the superintendent which you are paid to look after. There will be enough matters referred to him to keep him busy. Educate those around you, such as agents, roundhouse foreman, car foreman, bridge and building foreman and general track foreman, to come to you first when they want cars moved. Don't put them off until the next day too often or they will go to some one else and you will be compelled to do what was requested. Give them the same reason for not moving their cars that you will give the superintendent when he asks regarding the delay.

All who have to do with writing orders, which will require the use of a switch engine, should be familiar with conditions, and also realize that a switch engine cannot be kept standing around waiting for something to show up. Foremen of different departments frequently do not figure ahead; hence, when they want anything it must be *rush*. A very large portion of such orders could be eliminated with proper attention on the part of those in charge.

CLASSIFYING INDUSTRIAL TRAFFIC FOR DELIVERY

By Z. Middlebrook

Trainmaster, Atlantic Coast Line, Florence, S. C.

The successful and economical operation of a large terminal is due in a large measure to the character of the man in charge. He should be affable as well as capable; should know the terminal and the patrons, and should pay the patrons a friendly call periodically. Such calls will keep him in touch with patrons as well as with his force and will quite often avoid a complaint which would sound quite ugly by telephone or mail. It is much easier to pacify a patron by discussing his troubles personally with him than to remain in the office until he has taken a strong position by mail.

To operate a large terminal successfully and economically, it is necessary to divide the industrial section into districts, each district to embrace as much territory as can be handled by one engine, and to have a schedule for each engine to work by so that shippers and consignees will be ready for the necessary shifts when the engine reaches its place of business. This schedule should be followed as closely as for a main line train.

The inbound yard should have tracks assigned for each district and men working engines in that yard should know each district and classify cars so that cars for each industry or consignee will be together and in the order in which they may be reached by the industrial engine, so that they may be placed promptly, as a great deal of industrial work has to be done on or across streets and the less switching done the better. In terminals where business warrants, it expedites the work to use an interchange engine to handle cars between the yard and the several districts. When such an engine is used it should run on a regular schedule and interchange with district engines at designated points.

Railway Construction in Peru.—The ambitious scheme once entertained by the Peruvian government, of constructing 3,000 miles of railway, and thereby bringing up the total mileage of the country to something over 5,000 (the present length does not much exceed 1,870 miles), is now said to have been put aside for the time being, owing to severe financial stringency. Some new construction is being proceded with nevertheless. The Amazon-Pacific line is getting along slowly. This line starts from a point on the Cerro de Pasco Railway, running thence to the port of Pucalpa, on the Ucayali river. Its length will be about 280 miles. When completed, it will open up the department of Loreto, and afford an outlet for the rubber, timber, tropical products, and extensive deposits of coal which are found in the neighborhood. The government has promised to subsidize the railway to the amount of $9,735,000, but the uncertain position of the national treasury and frequent changes in the industry make it seem improbable that this agreement will be carried out in its entirety. A new Transandine railway has also been surveyed, the contract for construction having been let to connect the Pacific port of Payita with points on the Maranon and Huallaga rivers, which are tributaries to the Amazon.

Locomotive and Train Supplies on the Frisco

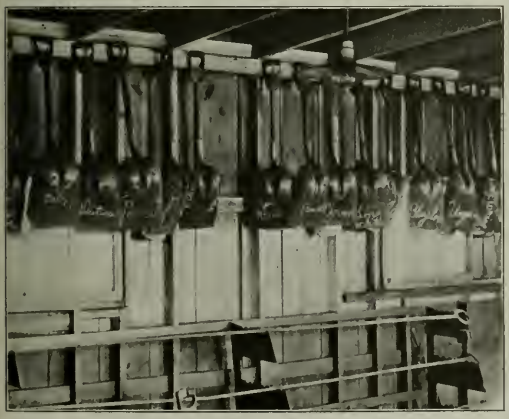
Standardization and Systematic Attention Have Improved Service and Reduced Expenses for These Accounts

The cost of locomotive supplies forms such a comparatively small proportion of the operating expenses, and these supplies are scattered over such a wide territory, that on many roads they have been overlooked in the handling of more important matters. However, systematic attention to this feature pays well not only in the resulting economy, but also because of the time and labor which may be saved in emergencies and in

Interior View of Engine Supply House

break-downs on the road due to having a complete and first class tool and supply equipment at hand.

In approaching this problem the St. Louis & San Francisco found that the cost of engine supplies during the past few years had averaged about 27 cents for every 100 locomotive miles. This is about the average for all of the railroads in the United States, but it was predicted on a basis of thorough investigation



Scoops Stored in Engine Supply House

and study that it could be materially reduced by standardizing the locomotive supplies and systematically checking and keeping the equipment on each locomotive complete and in good condition. Within a period of less than a year since the system was inaugurated the costs have dropped 25 per cent, and it is confidently believed that within another year it will be possible to reduce them to an average of 18 cents per 100 locomotive miles.

The steps which were taken to accomplish this result are of more than ordinary interest. Day and night supply men were appointed to look after the engine and train supplies at each engine terminal. The night man reports to the day man, but is also under the direction of the night roundhouse foreman. All employees who fill grease cups and lubricators and look after the drying of sand also report to the day supply man.

Typical House for Storing and Repairing Engine Supplies

Tools and oil cans which had been discarded were gathered together and it was found possible to repair and place a great number of them in good condition at a small expenditure. Steps were then taken to standardize the equipment on each locomotive and see that tool boxes were provided in which the various items of equipment could be arranged in a systematic

Engine Supply Box Under Tender Tank

manner and so that they could be checked over rapidly and accurately by the supplyman or tool checker at each terminal. Not only does this checker see that a full complement of tools is maintained on each engine, but he is expected to keep these tools in good repair. Supply houses have been constructed at the principal terminals, in which the locomotive equipments are stored when not in use and which the repairmen use as work shops and for carrying surplus stocks. These houses are cheaply but substantially constructed of scrap lumber and discarded metal car roofs. The illustrations give some idea

Standard Equipment List Which Is Posted in Cabooses

of their construction and the arrangements for repairing and storing the material.

The supplyman meets each locomotive on its arrival at the cinder pit and checks the equipment which it carries with a standard tool list, which is reproduced in one of the illustrations. The crew is asked for an explanation as to any missing articles. The light equipment, including the engineer's tool kit, oil cans and scoops, is removed and placed in the supply house, where it is cleaned and repaired if necessary. The heavier tools and such supplies as are designated as permanent equipment are locked or sealed in tank boxes to prevent their removal from the engine while it is in the engine house. The hit-and-miss method of carrying jacks and heavy tools on the top of the tank back of the coal space has been done away with and a box opening outward has been placed under the tender side sill near the middle for the storage of these heavy and infrequently used articles, including switch chains, jacks, frogs, brasses, air hose, etc. As the box containing this equipment is sealed, and this seal is only broken when occasion arises for using some of the contents, it does not have to be checked and inspected after each trip. The location of the box makes these heavier supplies easily accessible when they are needed and allows of their being so easily replaced that there is little likelihood of their being left behind after use. The supplyman replaces the light equipment on the locomotive as it passes the cinder pit on its way to the train.

The scoops are always maintained in first class condition, as the supplyman examines them carefully after each trip and

Engineer.

Supplyman.

Fireman.

Form for Checking Engine Supplies

trims up the edges if they are worn or damaged. One of the illustrations shows the way in which these shovels are stored in the supply house, and it will be noted that each one has a name on the scoop. This is because the firemen find that they can do better work when they have the same shovel on every trip and they insist upon the supplymen keeping them separate. If the supplyman notices an oil can, a marker or a lantern slightly damaged he immediately repairs it, thus greatly decreasing the expense of maintaining these articles and adding to their life.

It was noticed in visiting the supply houses that each supplyman had accumulated a stock of spare parts, in good condition, of one kind or another from discarded or badly damaged devices. These extra parts are used to great advantage in making minor repairs, such as those mentioned above. The supplyman must issue the requisition for new material, which is kept in the storeroom rather than in the supply house in order that the old material may in all cases be used first.

The supplyman is required to report promptly to the general

foreman all cases of neglect on the part of enginemen properly to care for equipment. Supplymen are also expected in their leisure time to pick up any neglected supplies, serviceable or scrap, which may be noticed in the vicinity of the supply house or in making trips over the company property. Serviceable material should be returned to stock; and at the end of the month, any surplus of the various items that have accumulated during the month should be turned back to the store with the regular form of credit to the supplymen's operating accounts. By handling in this way, not only is an asset created, but supplies are made available for some other part of the system where they are actually needed.

At the end of each month reports of what has been accomplished by each supplyman are distributed to all interested. These show the total cost at each terminal, the total credits and the actual net cost for supplies, with special mention of those making the greatest savings for the month.

TRAIN SUPPLIES

Supplies carried in the caboose are handled in the same way as the engine supplies and by the same men. The only exception is that the supplies are not removed at the terminals; instead a standard list (see illustration) is posted in the caboose for the information of the trainmen as well as the supplymen, and the supplyman periodically checks the equipment, showing the amount on hand, the shortage and the surplus, returning the surplus, if any, to the store stock with a form of credit to the caboose equipment account.

It will be noted that the cost of each of the items is shown on the train supply check list. This is in accordance with the general campaign of education on the Frisco, the fundamental idea being to promote a more intense interest on the part of every employee in the operation and welfare of the property. The supplymen, in particular, are thoroughly posted as to the cost of all of the materials which they handle, and the way in which they apply this knowledge in the more efficient and economical handling of these supplies is specially noticeable.

The scheme for handling caboose supplies has been in effect for three or four months, with good results, and it is expected that as favorable a showing will be made as in the case of locomotive supplies.

All of this work is carried on under the jurisdicton of the chief purchasing officer, N. M. Rice, who has charge of stores as well as purchases.

THE FEDERAL VALUATION OF JOINT FACILITIES

By Richard J. McCarty
Chairman, Valuation Committee, Kansas City Southern

The purpose of this inquiry is to determine whether the federal valuation of the property of a subsidiary terminal company should be treated as a separate and independent thing or whether it should be distributed to the proprietary carriers in proportion to the interest of each. To place the problem in a clear light, the well known causes and conditions which lead to the use of a subsidiary terminal company will be set forth in general terms.

In order to meet the demand for minimum delay and expense to the public in receiving, shipping and transferring freight as well as the public demand for more comfort, greater convenience and less expense in traveling, it is often necessary for two or more connecting carriers jointly to construct, maintain and operate the suitable facilities. This naturally requires that the interest of each carrier shall be clearly defined; that the cost of construction and equipment shall be kept separately; that the expense of maintenance and operation shall be accurately determined and apportioned and that all conflict and confusion from joint use shall be avoided. The most practicable way of meeting all these conditions is to organize a subsidiary company to take title to the joint facilities, then to define the interests of the carriers by ownership of its capital stock and cause the subsidiary company to maintain and operate the facilities for the benefit of all concerned.

As a rule, the principal services rendered by the subsidiary company are performed for the proprietary carriers at cost and its total net returns from station privileges, switching and other public services rendered as an independent company is negligible when compared with a fair return upon the investment. Consequently, the subsidiary company generally shows a deficit which the proprietary carriers must make good.

Considered as an independent carrier, the subsidiary company is entitled to a fair return upon the so-called "fair value" of the facilities. For reasons stated, however, its operating resources are limited to its small net returns, plus the payments at cost by the proprietary carriers for services rendered to each plus their contributions for making good the amount necessary to meet taxes and fixed charges, the total of which is naturally less than a fair return. Moreover, if the subsidiary company is treated as an independent carrier, each proprietary carrier would be entitled to earn with its own property, with respect to the facilities in question, only sufficient to pay at cost for the services rendered by the subsidiary company and make good its own proportion of the deficits. As a result, nobody would receive a fair return upon the amount invested in the terminal facilities.

The only practicable remedy for this condition is for each proprietary carrier to add to its own valuation its undivided interest in the valuation of the joint property; to include in its net returns its proportion of the net returns of the subsidiary company and to treat the interest on the bonds of that company guaranteed by it as fixed charges.

As against this it might be held that should the amount invested in the joint facilities be represented principally by the bonds of the subsidiary company, the amount invested by each proprietary carrier in the capital stock would be comparatively small and the return upon that amount would be too great. The answer is that the principal and interest of all bonds of the subsidiary company must then be guaranteed by the proprietary carriers, in some cases both jointly and severally, so that the liability of each carrier would be as great if not greater than with respect to its own outstanding bonds. The objection, therefore, can be no more valid than if urged against including in the valuation of any railroad property all proceeds of bonds invested therein.

It might also be objected that to add to the valuation of proprietary carriers the valuation of a subsidiary terminal company would be a duplication. The answer is that every such duplication may readily be avoided by disregarding the subsidiary company in so far as valuation is concerned and making a record to that effect.

There are, no doubt, other specious objections to including in the valuation of a carrier its undivided interest in the valuation of a subsidiary terminal company, but none that might stand in the face of the following facts and considerations:

1. The subsidiary company is used to meet a public demand for better and less expensive service and is the best means available for that purpose.

2. Towards meeting this demand a carrier may enlarge and improve its own terminals even though this means may not be the best. In this case the right of the carrier to the valuation of the enlarged and improved facilities would be unquestioned.

3. The use of the best means to meet a public demand cannot impair any rights which a carrier has through the use of inferior means to meet the same demand.

In view of all that has been set forth it seems clear that the valuation of the property of a subsidiary terminal company should be divided among the proprietary carriers in proportion to the respective interest of each.

Railway Service in Belgium.—Through train service, with sleeping and dining cars, has again been established between Berlin and Brussels.

Hearing on Western Freight Rate Advances

Testimony on Rates on Meat Packing House Products, Livestock, Hay, Cotton Piece Goods, Coal and Coke

Testimony of railroad officers as to the reasonableness of the proposed advances in freight rates on livestock, fresh meats, packing house products, hay and cotton piece goods occupied the hearing before Commissioner Daniels at Chicago last week on the application of the western railways for advances in a number of their freight rates, and this was followed on Tuesday, Wednesday and Thursday of this week by testimony on the advances in coal and coke rates.

MEAT AND PACKING HOUSE PRODUCTS

E. B. Boyd, chairman of the Western Trunk Line Committee, testified on the advance on meat and packing house products of 3½ cents per hundred pounds. With this advance, he said, the rates on these commodities would still be far below what has been approved by the Interstate Commerce Commission as a reasonable relationship between class rates on similar commodities in the West as compared with the East.

Mr. Boyd made this showing on third class traffic and fresh meats, and between fifth class traffic and packing house products from western points to Chicago, with the actual rates applying for equal distances east of Chicago, where the rates already have been approved by the Interstate Commerce Commission. Mr. Boyd introduced similar figures showing that the same discrepancies in favor of packing house products and fresh meats in the West and Southwest existed when the rates charged for hauls west and southwest of St. Louis were compared with those charged on the even more densely moving traffic eastward from St. Louis. As a result of these excessively low rates on packing house products and fresh meat, Mr. Boyd showed that the earnings accruing to the railways from the handling of this expensive traffic are among the lowest of all the commodities hauled by these railways belonging to similar classifications.

"Using an average distance of 325 miles, as approved by the Interstate Commerce Commission in a previous case," said Mr. Boyd, "the gross revenue per ton mile, not including empty car haul, on packing house products, is only .549 cent, while with the empty car haul included the gross revenue per ton mile sinks to .372 cent. Against these figures a few other commodities in the same class as packing house products return a gross revenue per ton mile, including and excluding, respectively, the empty car haul, as follows:

	Excl. Empties	Incl. Empties
Iron and steel articles	.825 cent	.743 cent
Petroleum oil	.613 cent	.548 cent
Pickles	.687 cent	.603 cent
Other articles, fifth class	.687 cent	.603 cent

"The same discrepancy in earnings is shown if we compare the gross earnings per ton mile on fresh meats with other articles properly belonging to third class. Not including the empty car haul, fresh meats return a gross revenue per ton mile of .477 cent, while if the empty car haul is included, the gross revenue per ton mile is only .314 cent. This compares with other commodities of the third class as follows:

	Excl. Empties	Incl. Empties
Agricultural implements	.766 cent	.665 cent
Oil cloth	.795 cent	.712 cent
Other articles, third class	.994 cent	.863 cent

Mr. Boyd's testimony applied to conditions prevailing on the railways operating west of Chicago and was corroborative of testimony introduced by F. A. Leland, chairman of the Southwestern Tariff Committee, as to conditions in the Southwest.

The present rates, it was further contended, are far below what they should be, considering the character of the traffic, the nature of the service and the rates in effect on other carload traffic of similar classification. The traffic requires a very expedited service, and therefore the train tonnage must be low, while the cars are much heavier than those used in other traffic, in addition to about three tons of ice per car, while the cars must be stopped often in transit for re-icing. Because of the high value and perishable nature, the damages are high. The traffic, therefore, it was contended, is of a very expensive nature and the freight charges represent an unusually small proportion of the value of the commodity transported.

C. E. Spens, assistant freight traffic manager of the Chicago, Burlington & Quincy, testified on livestock rates. The advance asked on livestock rates is generally a maximum of 2½ cents per hundred pounds, grading from that down to a fraction of one cent.

"Livestock tonnage in the United States is practically standing still," said Mr. Spens, "so there is no increase in the industry to be looked for and no hope of increasing the revenue from a growing traffic. The department of agriculture estimates as to livestock on farms, all stock yards records, and the loading figures of the railways, tell the same story. The Burlington handled less livestock in 1914 than in any other year for 10 years, except 1910, when the traffic was practically the same as in 1914. In our opinion this commodity does not contribute its proper proportion to our revenue, based on the cost of transportation, the value of the service to the shipper, or in comparison with other carload freight. A special livestock car can be used for little other traffic, special facilities are required, as stock yards, chutes, side tracks and other facilities, not required for other freight. Livestock requires greater care in transit, and there is greater hazard connected with its transportation. Free transportation must also be given to caretakers.

"The loading of livestock is greatly below the average of other carload freight and the cost of transporting freight depends largely upon the loading that can be secured. The percentage of empty to loaded mileage also is much greater on stock than on closed cars. Trains, moreover, cannot be loaded so heavily as with dead freight, which fact, coupled with the greater expedition required, makes an increased cost. Cars must be cleaned and frequently disinfected and federal statutes as to stopping in transit to feed and water entail additional expense.

"The value of livestock has increased greatly in recent years and the greater the value of the property, the greater the value of the service to the shipper. While it may be urged that the cost of producing livestock has increased, the cost to us of the service performed has increased also, but so far without any increase in our compensation. On the contrary there has been a decrease."

Mr. Spens submitted figures covering receipts for 15 years at the Chicago stock yards, showing the average prices received per head of cattle in each of three 5-year periods. "The third period, compared with the first," said Mr. Spens, "shows an increase in the price of cattle per head of 38.78 per cent; of hogs, 42.91 per cent; of sheep, 24.82 per cent, and of horses, 43.85 per cent.

"In 1914," he said, "the Burlington furnished free transportation to 79,484 carctakers of livestock. The total value of their transportation was $419,093, or 7.8 per cent of the freight earnings on the traffic. In the same year the damages paid on livestock were $243,951, and damages for injuries to caretakers $29,028. Claims on livestock were 5.09 per cent of the revenue from the traffic, while on other freight the proportion was only 1.4 per cent.

"How light loading increases the expense is shown by the fact that while livestock traffic furnished 5.62 per cent of our total freight tonnage, it required 14.34 per cent of our freight equipment. No commodity on the entire list requires so big a proportion of equipment to handle it in proportion to its tonnage

as does livestock. On no other commodity is our net loading so light, except poultry, eggs and furniture."

Mr. Speus showed that on few commodities is the revenue per gross ton mile or per car mile so small as on livestock. Some of the comparisons are as follows, including loaded and empty mileage:

	Per gross ton mile	Per car mile
Livestock	.375 cent	8.1 cents
Fresh meat	.277 cent	8.2 cents
Dressed poultry	.694 cent	20.2 cents
Beer	.456 cent	15.1 cents
Butter and cheese	.531 cent	15.2 cents
Agricultural implements	.527 cent	15.0 cents
Total manufactures	.416 cent	18.4 cents
Household goods	.435 cent	14.1 cents

The total revenue expected by the Burlington from this advance on livestock is only 2.54 per cent of the present revenue on the traffic, and only 22 per cent of the traffic is affected.

The testimony on livestock rates was not completed on Thursday, and a question arose as to whether livestock testimony should be continued on the following day or whether the schedule, which called for testimony on cotton piece goods, should be followed on Friday. The railroads wish to continue the livestock testimony at a later date, because their witness on cotton piece goods, S. H. Johnson, of the Rock Island Lines, desired to complete his testimony and leave town on account of the sickness in his family. Clifford Thorne and S. H. Cowan, attorney for the Texas livestock interests, insisted on continuing with the livestock testimony, and said that the railroads wished to postpone it to avoid cross-examination by Cowan, who also had an engagement that would require him to leave town. Their insistence brought forth a sharp rebuke by Commissioner Daniels, who asked that more consideration be given to what is due the commission, saying, "you have no charter to be a universal nuisance." There was some speculation as to whether the remark applied both to Thorne and Cowan or to Cowan alone, as he had been the last to interrupt the commissioner.

HAY

F. P. Eyman, assistant freight traffic manager of the Chicago & North Western, said that the western railways are asking for an increase in rates on hay from western and southwestern states to Chicago, in order to complete a readjustment, the beginning of which already has been approved by the Interstate Commerce Commission in a previous case. Advances of 2 cents per 100 lb. from Wisconsin, Minnesota and South Dakota to Chicago already have been approved, but no similar adjustment of rates was made from Iowa, Missouri, Kansas and Nebraska, on account of an unexpired order of the commission, which prevented the changing of the rates on hay between the Missouri river and Chicago.

"The proposed rates from Iowa and Missouri points," said Mr. Eyman, "are no higher than the rates approved by the commission in this previous case, setting rates from Minnesota, Wisconsin and South Dakota. A comparison of rates also shows that the proposed changes on hay from western territory to Chicago are not higher, but are practically the same as rates for similar distance from Chicago eastward, although the density of the traffic east of Chicago is much greater. Thus from Watertown, S. D., to Chicago, 593 miles, the proposed rate is 25 cents per 100 lb., while from Sandusky, Mich., to Albany, N. Y., 599 miles, where the traffic is denser, the present rate is 27.8 cents. The car mile earnings on hay on the North Western were only 11.50 cents against 18.18 cents on all other carload freight in the fiscal year 1914. Hay and its related products and excelsior are the only articles in the western classification with a minimum as low as 20,000 lb. which take the Class C rating.

"There has been a decided rise in the price of hay in recent years, the Chicago price on No. 1 timothy going from $11.85 per ton in 1900 to $22.38 in 1912, though receding to $16.79 in 1914. The farm prices in Missouri rose from $6.89 in 1902 to $13.60 in 1914, and in Iowa from $6.80 in 1900 to $10.10 in 1914.

"A very small proportion of the car capacity is used for hay as compared with other commodities. Hay occupies only 39 per cent of the car capacity, while for all products of agriculture the proportion is 59 per cent. Another factor increasing the cost of handling hay is the situation at terminals, where hay is handled as a peddling proposition and sold from team tracks to small buyers. This causes greater detention of cars on team tracks than on any other commodity. The total amount of increased revenue on hay for all railroads under the proposed rate would be only $175,000."

C. C. P. Rausch, assistant general freight agent of the Missouri Pacific-Iron Mountain system at St. Louis, took the stand later to justify the increase in rates on hay from territory west of the Missouri river and from southwestern and southern territory. He testified that the advance generally is 2 cents per 100 lb., and discussed the terminal situation at St. Louis, Memphis and New Orleans. By comparison of rates he showed that the proposed charges are not relatively high, as compared with the rates from St. Louis and Memphis to the Southeast. On broom corn, he testified, the advance proposed is 5 cents per 100 lb. from eastern Colorado, western Kansas, Oklahoma, northern Texas and eastern New Mexico to the Missouri River, the East and Southeast.

D. R. Lincoln, assistant general freight agent of the Missouri Pacific Railway, discussed the advances asked on hay from the standpoint of the Kansas City terminal situation. "Hay, to a very great extent, is reconsigned," said Mr. Lincoln. "The cars must be put on team tracks for inspection, which entails a great deal of extra switching service. The average detention on hay is over four days. It must be inspected for grading purposes and special tracks must be assigned for the commodity for this purpose. At one time recently we had over 1,100 cars at Kansas City, crowding our terminal, waiting for disposition or to get on team tracks. No demurrage can be charged on these cars until they reach the team tracks."

COTTON PIECE GOODS

S. H. Johnson, assistant freight traffic manager of the Rock Island Lines, testified as to the abnormally low rates prevailing on cotton piece goods and the unusually expensive nature of this less-than-carload merchandise traffic. The readjustment on cotton piece goods comprises, first, an advance of 5 cents per hundred pounds uniformly from such points as Chicago, St. Louis and Minneapolis to Western Trunk Line territory, Kansas and Nebraska; secondly, an advance of 5 cents from Texas producing points to the Missouri river and points west thereof, 10 cents to points east of the Missouri river and west of the Indiana-Illinois line, 20 cents to territory east of Chicago, and 10 cents to the seaboard via the Gulf.

"The average value of cotton piece goods is over 60 cents per pound or $60 per hundred," said Mr. Johnson. "The first class rate from the Mississippi to the Missouri river, 300 miles, is 60 cents per 100 lbs., or less than 1 per cent of the value. The proposed advanced commodity rate is only 40 cents, or less than 6/10 of 1 per cent. On a consignment of cotton piece goods valued at $65.45 the freight rate for 300 miles, even under the advanced rate, would be only 40 cents, or 6/10 of 1 cent for every dollar."

Mr. Johnson showed by an exhibit comparing 60 commodities moving between the Mississippi and the Missouri that the ratio of freight rate to value on 58 of the 60 was greater than on cotton piece goods even under the proposed advance, the average for the 60 being 9.04 per cent against 0.6 per cent on cotton piece goods.

"Cotton piece goods," said he, "is practically the only article which moves in less-than-carload quantities which is given a commodity rate. Less-than-carload business generally does not yield as adequate compensation as does carload business generally, which is one reason why the exception from class rates in the shape of a lower commodity rate on cotton piece goods should be minimized as proposed. The relatively low earnings on less-than-carload business is shown by the fact that the rev-

enue per gross ton mile on less-than-carload merchandise is 4.23 mills, as compared with 4.55 mills on carload shipments of manufacturers. The reason is that the average load on carload manufactures is 17.43 tons, while the average load on less-than-carload merchandise is only 3 tons. On one road last year the number of cars containing less-than-carload merchandise was 445,968, which paid only $8,131,843, whereas 126,920 carload shipments of manufacturers paid $7,574,965. In other words, it took about four times as many cars of merchandise as of carload shipments to earn about the same revenue.

As to the reasons why less-than-carload shipments are more expensive to handle, he mentioned the relatively larger use of local freight train service, the cost of handling and rehandling less-than-carload freight, whereas carload freight is loaded and unloaded by the shipper, and the fact that the ratio of loss and damage claims to revenue on less-than-carload freight is more than double that on carload shipments. There is also an immense increase in the cost of accounting.

Cotton piece goods in Western Classification territory is rated as first class freight, the same as dry goods. In Western Trunk Line territory the commodity rates on cotton piece goods are generally only third class. While believing the first class rate justifiable, the roads propose to retain the commodity rate to avoid too radical an advance. The proposed change, without restoring the rate to the normal first class basis, gets nearer to that basis to the extent of the advance.

Cotton piece goods, as indicated by the various decisions of the Interstate Commerce Commission, Mr. Johnson said, have been subjected to unusual stress of competition by reason of production in such widely separated producing sections as New England, the Southeast and Texas. These three producing sections meet in strong competition in the great markets of the Middle West. In addition to this influence, there has been vigorous competition between jobbing communities tending to depress rates.

GRAIN

On Monday of this week some additional testimony to show that a number of the tariffs filed by the railways would result in actually lower rates on grain than now prevail in some localities was given by F. B. Townsend, traffic manager of the Minneapolis & St. Louis. Mr. Townsend's testimony dealt particularly with the effect of the advances on traffic from South Dakota, Minnesota and Iowa as applied to the Minneapolis & St. Louis. The total grain tonnage handled by this road in the three states in 1913, he testified, was 35,894 cars.

"The increase asked," he said, "would give practically no increase on grain in South Dakota and Minnesota, as all moves to Minneapolis, Duluth, Chicago and Milwaukee, where no increase in rates is asked from these states. Thus there is a very heavy tonnage there which would feel no increase. On Iowa grain the proposed advance would yield an increased revenue to the Minneapolis & St. Louis and the lines connecting with it to the markets where advances are made, of approximately $75,000 per year."

An elaborate analysis of the present and proposed rates from all three states to the various grain markets was presented, which showed that to many no advance would be effected, while to others present rates would actually be reduced because of the inauguration of commodity rates on grain where at present no commodity rates apply, the grain being hauled under class rates.

Export grain has lost any features of desirability it may have had in 1907 when the commission found this traffic a desirable one from a railway standpoint, said N. D. Ballantine, assistant to second vice-president, Chicago, Rock Island & Pacific. "None of the factors mentioned then," said he, "holds good today. Far from entailing no excessive cost for delivery, last season we had 2,000 cars held back on account of the embargo and congestion on export grain. Cars were held as far back as 1,000 miles from the ports. The grain heated and it was necessary to inspect all of it and transfer and elevate a large portion. We had over $2,000,000 worth of perishable grain on our hands and it entailed a large expense.

"There is an excessive empty haul on these export cars, and they are not loaded to capacity, as the commission found in 1907. The load is not more than to within 15 to 20 per cent of the capacity of the car. There is a great added expense and delay to other freight trains where side tracks are filled with empty cars, stored for export grain loading."

L. E. Wettling, statistician for the roads, submitted detailed figures showing that the total increased revenue on grain for all roads would be $2,252,493, or only 1/3 of 1 per cent of their total freight revenue.

MISPLACED RESPONSIBILITY

By J. L. Coss.

The train despatcher is held responsible for the movement of trains over his territory and in many cases for delays which are caused by conditions over which he has no control; but if he writes up the facts in their true light the men on the road will complain of "rawhiding" and the local officers may look on him as a chronic kicker. Such officers should consider some of these obstacles:

A train is called for 5 p. m. and does not get out until 5:30 or 6. The delay report shows engine not out of house in time, or waiting for way bills; or some member of the crew received a short call, etc.

A train is called out of a terminal in the face of several incoming trains so as to avoid showing a delay of power in the roundhouse.

A conductor reports ready to go at a certain station at 3 p. m. and is cleared with a handful of meet orders; but he goes to the far end of the yard and does not get out for 30 minutes.

Officers out on the line change instructions to trains, or give them some work to do without notifying the despatcher's office.

Absence of consists of incoming or outgoing trains. The despatcher does not know what he has to set out or where.

Overloading of engines, making it necessary for them to double hills and run for water.

Trains are allowed to drag along until close to the 16-hour limit; then there is anxiety to get them into the terminal and opposing trains have to be killed to do it.

Switch engines that attend to industries outside of yard limits will pop up at all times of day, with but little advance notice, sometimes without any. If you ask them how long it will take them the reply, in most cases, is "Don't know."

Late notice of advice from connecting lines of passenger reports and for which trains are held a specified time.

Side tracks which will not accommodate the length of trains handled and positive instructions that certain trains must not be sawed at these points. Often this makes it necessary to hold other trains back.

Indifference on the part of train and engine crews to the duty of advising if anything is irregular on the run, such as engine not steaming, hot boxes, etc.

Local freights holding through trains at stations while doing their work; also trains which are delayed by engine trouble or something similar holding trains behind them to avoid being run around.

There are many other things that figure to the detriment of the despatcher. Officers, in studying delays, should not confine themselves to the train sheet.

Railway Extension in Spain.—The official publication is announced in Spain of a royal order, opening a new competition for the construction of the direct railway from Madrid to Valencia. This railroad, if built, will make Valencia the undisputed seaport of Madrid, as the line will be 240 miles in length as against 306 miles as at present. The Spanish government will guarantee 5 per cent interest on the net capital investment.

"The Railroads and the Public"—A National Problem*

Essentials of Sound Public Regulation. Nothing to Be Gained and Much to Be Lost by Government Ownership

By Daniel Willard
President of the Baltimore & Ohio

The railroad is not a manufacturer or a merchant, although it may be said that it manufactures train miles and sells ton and passenger miles. It is not a producer but in a large way is rather the servant of others—the servant of the *public*. Without the public there would be no need for the railroad; without the railroad or some equally good substitute, there would be an entirely different public, as well as an entirely different state of civilization. This view of the railroad as regards its function and relation to the public seems not to have been generally held at first, and much confusion of thought resulted therefrom.

Partly because of the rapid construction of new railroads in response to the great and insistent demand for such facilities, abuses and unwise practices developed in connection with railroad management, just as they have developed in all other kinds of human endeavor.

In 1876 the Supreme Court of the United States in the leading case of Munn vs. Illinois, held that "When the owner of property devotes it to a use in which the public has an interest, he in effect grants to the public an interest in such use, and must, to the extent of that interest, submit to be controlled by the public for the common good, as long as he maintains the use." The principles announced in this decision, and in an early English one, together with the constitutional right of Congress to regulate interstate commerce, may be said to constitute the foundation of our national policy of railroad regulation.

While the government might have constructed, owned and operated the railroads had it decided to do so, as a matter of fact the government did not build the railroads, but instead invited private capital to discharge for it this public function, upon the assurance—supported by the common law—that capital so invested should be allowed to receive a fair compensation for its use, and as Commissioner Prouty has well said, "Nothing can be more unjust than to deny to this capital that right." Under our system of private ownership with government regulation, the American railway system has grown to the total of 258,000 miles of operated main lines.

The *owned* mileage with no duplications is 249,803.

REMARKABLE USE OF OUR RAILROADS

The people of the United States make greater use of their railroads than is the case in any other important country, as the following table shows:

Number of Tons Moved One Mile per Capita per Annum

United Kingdom	286
Austria-Hungary	318
France	365
Germany	582
United States	2,737

This is partly because of the greater area and rich natural resources of the United States, but chiefly because the freight rates here are so low that the difference in cost of transportation may be and often is more than offset by the natural advantages of certain regions or localities, thus making it more economical to procure our coal, ore, lumber, grain, etc., where the superior natural advantages or conditions give the lowest initial cost, disregarding largely the element of distance.

The American railway system, taken as a whole, during the fiscal year ended June 30, 1913, carried 2,058,035,487 tons of freight an average distance of 146.59 miles, and received for so doing $2,198,930,565, equal to 7.29 mills per ton mile. During the same year 1,033,679,680 passengers were carried an average distance of 33.58 miles each, for a total sum of $695,987,817, or 2.008 cents per mile. The aggregate earnings of all the railroads for the year above mentioned were $3,125,135,798 and the total operating expenses for the same period were $2,182,769,000. More than 1,800,000 men and women are employed by these carriers with an annual payroll of $1,373,000,000. The total cost of these roads as represented by "property investment" account on June 30, 1913, was approximately $16,000,000,000.

NOT OVERCAPITALIZED

The following table shows comparative cost per mile of railways in leading European countries and the United States:

United Kingdom	$277,346 (1912)	Switzerland	$120,950 (1911)
Belgium	190,914 (1911)	Germany	116,662 (1912)
France	148,625 (1911)	Austria-Hungary	96,033 (1911)
Italy	126,886 (1911)	United States	65,681 (1913)

Notwithstanding the statement so often made in the past, but much less frequently at present, that our American railroads are over-capitalized, it will be seen from the figures just given that the average capitalization or cost per mile of the roads in the European countries mentioned, is more than double what it is in the United States. This is due largely to the fact that it has been the general custom in this country to make many additions to the properties from current earnings—that is to say, from the surplus earnings from year to year that might otherwise have been distributed to the stockholders as dividends.

The railroads now pay more than $130,000,000 per year as taxes, equal to 4.3 per cent of their gross earnings, a sum, by the way, more than two and one-half times as much as the government pays all the railroads for carrying the mails.

PROBLEM OF REGULATION

The figures quoted indicate to some extent the magnitude of the undertaking which has been built up with private capital and is now devoted to public use, and on that account subject to public regulation. A policy of regulation dealing wisely and well with such a problem must, in the broader interest of all, give just consideration to the rights of all. A selfish policy, were it possible, either in the interest of the 1,500,000 security holders or of the 1,800,000 employees of the American railroads would soon cause general dissatisfaction, which in turn would find expression in laws framed to punish as well as to correct. A policy intent only or chiefly upon securing lower and still lower rates, as is sometimes urged, regardless of the rights of those whose money has made the roads possible, will inevitably fail because new capital could not be obtained under such conditions, railroad growth would stop and all industry would suffer. The Interstate Commerce Commission has said truly that "The means of transportation are fundamental and indispensable agencies in our industrial life and for the common weal should be kept abreast of public requirements."

It is the function of regulation to so evenly balance the conflicting claims of the many that the just rights of all shall be properly conserved. Certainly this presents a most intricate problem, but in my opinion one by no means impossible of solution. Since the Interstate Commerce Commission has been in existence, it has handed down a large number of opinions or decisions, and in these decisions may be seen the gradual unfolding of our federal policy of railroad regulation. I shall discuss chiefly federal regulation, because the steam locomotive and the electric telegraph and telephone have in effect eliminated state boundaries in a commercial sense, and state regulation of

*From an address to the students of Dartmouth College, Hanover, N. H., March 22, 1915.

the agencies of commerce must on that account yield largely to federal regulation and control.

FEDERAL POLICY OF REGULATION

The two decisions of the Interstate Commerce Commission in the so-called Five Per Cent Rate Case contain the essentials of a bill of rights for the roads. In these decisions and in support of what I have just said is to be found the following language:

> The proceeding before us may therefore be described as, in some sense, a controversy between the consuming public which pays the rates, and the investor who furnishes the facilities for moving the freight; and our duty is to ascertain from the record before us what are their respective rights. That, in fact, is the real railroad question—the just balancing of the mutual rights of the public and of the carriers under a national policy that permits and invites the performance of this public function by private interests. From that point of view the problems and difficulties of our railroad become public problems of great national concern. . . .
>
> The public interest demands not only the adequate maintenance of existing railroads, but a constant increase of our transporation facilities to keep pace with the growth and requirements of our commerce. If, however, that development is to be accomplished with private capital, in conformity with our traditions, nothing can be more certain than that the facilities will not be provided except under such a system of regulation as will reasonably permit a fair return on the money invested.

In harmony with the policy indicated in the general statements just read, the commission, after considering all the testimony presented, said further—

> In view of a tendency towards a diminishing net operating income as shown by the facts described we are of opinion that the net operating income of the railroads in official classification territory, taken as a whole, is smaller than is demanded in the interest of both the general public and the railroads; and it is our duty and our purpose to aid, so far as we legally may, in the solution of the problem as to the course that the carriers may pursue to meet the situation.

Speaking more definitely in the same connection the commission also said:

> There can be no doubt upon the record that the carriers in central freight association territory ought, in the public interest, to have as much additional revenue as would be produced by a five per cent increase, as modified herein, and possibly more. . . . The traveling public is giving expression to its demands for better service, better accommodations, and for the adoption by carriers of all the devices that make for safety. A public that demands such a service can not reasonably object to the payment of a reasonable compensation therefor.

The commission also suggested certain reforms and changes of practice which it was thought would tend to augment net revenues.

In the decisions or opinions in the Five Per Cent Case from which I have just quoted, may be found not only a clear statement of the railroad problem of today as defined by the commission, but also a recognition of the principles essential to and sufficient for its satisfactory solution. The commission concedes and asserts:

That there is in this country a fundamental need of adequate transportation facilities.

That such facilities during the continuance of present economic conditions can only be had by means of private capital, combined with private enterprise.

That private capital can only be obtained by the hope and realization of fair and reasonable return.

That to produce such return, freight rates may be raised, when it is shown that existing rates as a whole yield inadequate revenue, and that the higher rates proposed would be reasonable.

That such reasonable passenger fares may be charged as will yield a fair return on the property devoted to passenger use, and further—that in general each class of service, including the mail and express, should contribute its just proportion to the total economic cost of operation.

By economic cost of operation I mean all costs, including the interest or dividends paid for the use of capital invested in the plant.

The foregoing principles have been contended for by the carriers; they have been clearly and freely admitted by the commission in the Five Per Cent Rate case, and I believe when the matter is clearly understood will be just as freely granted by the general public, because I believe the public when correctly informed will be fair.

THE LABOR PROBLEM

The relations between the railroad and the shipper have, as I have shown, been very clearly defined and established, but no authoritative word has yet been spoken concerning the relations between the railroad and its employees, or between railroad employees and the public. When it is recalled that the total number of railroad employees in the United States is roundly 1,800,000, or about one-tenth of the entire voting population, and that 44 cents out of every dollar earned by the railroads, equal to $1,373,830,589 per annum, goes directly to pay labor, the magnitude of this phase of the railroad question becomes apparent.

I shall not enlarge upon this particular matter, but any discussion of the railroad question which ignored this feature would be incomplete, and any forecast of the future of the railroads which fails to take this matter fully into account will also be incomplete and unreliable. Railroad employees or many of them are required to perform duties of a more or less hazardous nature, and they are also called upon frequently to think and act quickly and to use good judgment. As a whole there is, in my opinion, no better or more worthy class of men to be found anywhere or in any employment. They are semi-public servants and as a rule serve the public well, and deserve well of the public. All this, however, should not blind the public to the fact that all elements of cost, including wages, must finally be reflected in the freight and passenger rates which the public must pay. The railroad has no other source of revenue.

ENLARGE AND REORGANIZE THE I. C. C.

If the principles established in the Five Per Cent case be generally accepted, and actually made the basis of our national policy of railroad regulation, I feel confident that the problem of how best to provide adequate service at reasonable rates will be satisfactorily worked out under the present plan of private ownership with government control, but I also believe that before this result can be fully realized, the interstate commerce law must be amended. The Interstate Commerce Commission should be enlarged and reorganized and its powers so broadened that it may be able to deal promptly and effectively with the various matters under its jurisdiction. It is not able to do so at the present time. The interstate commerce law as it is today reflects the influence in the past of a nation-wide demand upon Congress to enact a law or laws which should primarily be sufficient to protect the public from the assumed greed of the railroads, and to that end the commission has been given the power among other things to order rate reductions and to prevent rate advances.

It is right that the people should be protected from the selfishness of the railroads, but it is equally important that the railroads be protected from the unreasoning demands of the public. The commission should be given the power to fix the minimum as well as the maximum rate which the railroads may charge. It should be kept in mind that the demands of the growing commerce in this country make necessary an annual expenditure by the railroads for additions and betterments of not less than $750,000,000. If those having money to invest lose confidence in the stability of railroad securities that fact is immediately reflected in reduced railroad expenditures for additions, betterments and equipment. Such expenditures at the present time I believe are at the lowest point reached in the last fifteen years, and much below the amount necessary to maintain the existing standards of facilities and service, and while the European war has had some effect, the situation was very serious before the war broke out and reflected in no small degree the results of our general policy of railroad regulation, particularly during the last ten years.

The policy referred to has found expression not only in the acts of commissions but in the laws as well—both state and federal. In the year 1913, 1,395 bills, designed to regulate the

details of practical railroad operation, were introduced in the legislatures of the various states then in session, and 230 of those bills were enacted into law. The increases in operating expenses and taxes of railroads, due to the causes just mentioned and to wage advances, have more than counterbalanced the economies derived from additional traffic and increased transportation efficiency, leaving no increased income to apply on the enlarged property investment. No industrial undertaking can thrive, or even continue to exist, under such conditions. If the present plan of private ownership with government regulation should fail because of unwillingness on the part of the public to invest further in railroad securities, it will be no less the fault of those responsible for the policy of regulation than of those responsible for the management of the railways.

ADEQUATE SERVICE VS. CHEAPER RATES

The most serious question before the people today is not whether they are going to have cheaper freight rates in the future, but rather will they be able in the future to obtain *adequate service* at any rate. The railroads may be depended upon to furnish adequate transportation for the growing commerce and at reasonable rates, providing only they feel assured that reasonable rates will be permitted, and providing also that the cost of operation be not unnecessarily augmented by unwise legislation, as has been the case in the past, or by forced wage increases not justified by existing conditions.

The total railroad mileage of the world as last reported was 683,000 miles, of which 258,000 or about 37 per cent are in the United States. Of the total world mileage, it is estimated that about 205,000, or less than one-third, are at present owned and operated by the several governments, and there are those who urge that our railroads also should be owned and operated by the government, instead of being privately owned as at present but regulated by the government.

GOVERNMENT OWNERSHIP

Those who advocate government ownership assert that because of its high financial credit the government would be able to obtain the necessary capital at rates lower than are paid under the existing plan, but no one knows how much lower, or what the actual saving in that respect might be, or how long that condition might continue. The price of government bonds under existing conditions is not a fair measure of what the government might have to pay for money in large amounts and under open competitive conditions. The advocates of government ownership also claim that all special privileges and discriminations would be abolished. That can be as easily accomplished under the present plan—in fact, has been. They claim that the government by operating all of the roads as one system could save the unnecessary expense involved in the large number of employees now engaged in soliciting freight and passengers for the different lines. This is true, but it does not necessarily follow that the public would be the gainer thereby. The fact that our freight rates are already the lowest in the world is due very largely to the stimulus of competition, and competition would, of course, cease to exist under the plan discussed.

Beyond question, the railroads in Germany and particularly in the Kingdom of Prussia, are well maintained and well operated, but the freight rates which obtain in that country are much higher than they are in the United States. It is more difficult to make a comparison of passenger rates because the conditions of the passenger service in this country are so unlike the conditions in Continental Europe. However, when consideration is given to the different classes of service and the character of the equipment used, together with the fact that baggage is not carried free on any of the European roads as is the case in this country, I am convinced that passenger fares upon the average in the United States are no higher than they are upon the average for similar service in Europe. In no country outside of Germany, in my opinion, are the railroads operated and managed as prudently or efficiently under government ownership as is the case in the United States under private ownership with governmental control, and freight rates in the United States are upon the average much lower than those charged in Continental Europe.

Under normal conditions and with present mileage, about 2,000,000 employees would be needed for our railways, with a payroll of approximately $1,500,000,000 per annum. I doubt seriously the wisdom of placing that additional number of men upon the civil list of the government. I submit that so far the government has not demonstrated its ability to carry on large industrial undertakings better than can be done by private enterprise, and until we have tangible evidence of such superior managerial capacity on the part of the government, I think it would be a most unfortunate mistake to make the change. I do not believe government ownership of railroads in the United States is impending. I do not believe any considerable portion of the people desire it, and I do not expect to see it come unless the present plan should break down because of the unwillingness of investors to put more money in railroad investments.

However, if the principles enunciated in the "Five Per Cent Rate Case" be made the actual basis of our future national policy of railway regulation, and if the powers of the commission be so broadened as to enable it to protect the railways as well as the public, I believe railroad investments will in time become so well established that the necessary new capital can be obtained from private investors at rates, upon the average, not more than one and a half or 2 per cent above the amount which the government would be required to pay. The average rate (interest and dividend) paid in 1913 was 4.3 per cent. As against that, if the people in this country were required to pay the higher freight rates which are charged today by the government-owned railroads of Europe, the increase in freight charges would be more than three times the amount which would be saved by the lower interest rates I have suggested. An increase of only one mill per ton-mile above our present average freight rate would mean a difference of more than $300,000,000 per annum, a larger amount, I believe, than the government could possibly save by lower interest rates due to its superior credit.

The general claim is also made that, for the reasons already mentioned and others, the government could operate the roads better and more cheaply than the present owners and managers, and consequently give still lower freight and passenger rates. Undoubtedly the government could, if it desired, give lower freight and passenger rates because if the total charges collected under government ownership fell short of the amount necessary to pay operating expenses and interest on money invested in the plant, the government could, by the exercise of its power to tax, raise in that way sufficient funds to meet the deficit. We have the example of a similar case in our neighboring country on the north. For the last two years, 1913 and 1914, the Intercolonial Railway of Canada, which is owned by the Canadian government, has failed to earn its operating expenses, and of course has contributed nothing towards the interest upon the $97,000,000 which that system has cost.

Our post office has been managed in a similar way; that is to say, if there is a deficit, it is taken care of from the general fund raised by taxation.

It should be kept clearly in mind that it is the "economic cost" of transportation which the public is most deeply interested in, rather than the specific rates which may be charged. It is of primary importance that the total economic cost of transportation shall be made as low as is compatible with good service, for while the total cost may be paid wholly in the form of passenger and freight rates, or partly in the form of rates and partly in the form of taxes, in the long run it must all be paid in some form, and in whatever form it is paid, it is a burden on the people, the industry and the commerce of the country which they cannot escape. Rates, of course, may be made as low under government ownership as the people through

their government may decide, but the total economic cost of transportation, all of which the public must pay in one form or another, depends upon the manner in which the railways are managed, and not upon the question of ownership.

Now that it has come to be generally recognized that there is a very distinct and intimate relationship between the total economic cost of transportation and the rates which must be paid, the public should be furnished all of the information that is necessary to enable it to judge whether the railroads are being prudently and wisely managed. Full publicity concerning all matters of policy and management, including the raising and expenditure of new capital, will go far to insure honesty and to prevent discrimination, and no stronger motive for efficiency can be found than the natural desire for larger profits which, of course, will obtain, and properly so, with private ownership, but will be entirely lacking under government ownership.

Those who manage the railroads should realize, as I believe they do, that they occupy a dual position—that of semi-public officer and also that of trustee for the owners of the property of which they are in charge, and that in the end they will best fulfill the function of trustee by giving adequate and satisfactory service to the public.

There is no reason why we should be ashamed of our railroads as a whole. Professor Ripley says, in his recent book on Railroads: "Never in our history, and probably nowhere else in the world, has the standard of probity, the quickened sense of responsibility, both public and private among American railroad men, been more pronounced than it is at the present time." He also says: "American railways are avowedly among the best in the world."

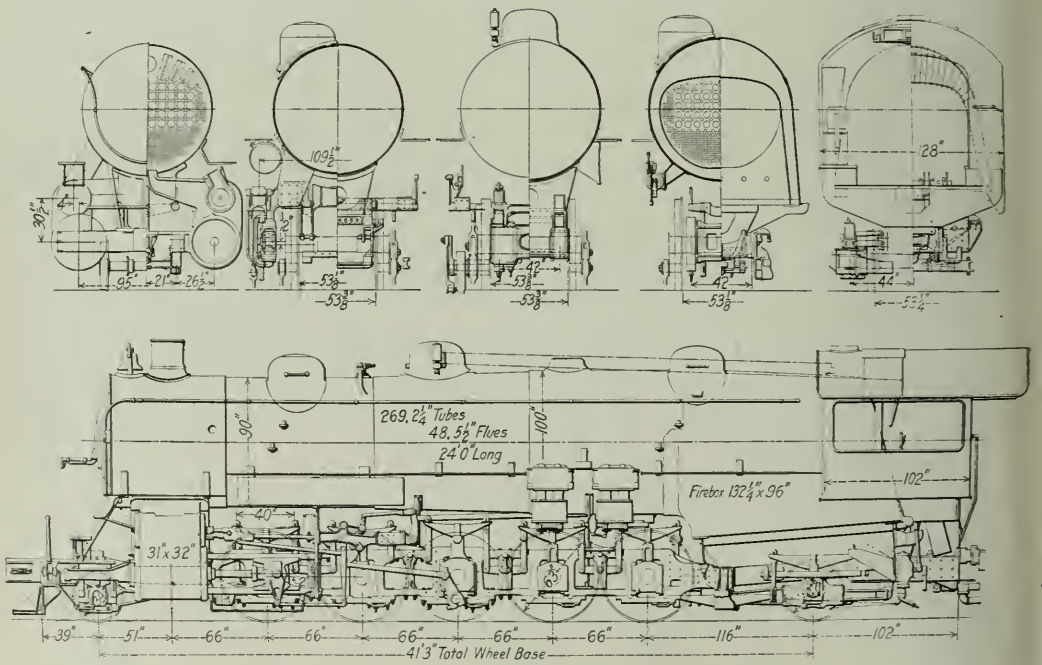
To my mind if there is any one thing distinctively American of which we should all be justly proud, it is our railway system, because, notwithstanding all that may be said against it, the fact remains that it has paid the highest wages, and sold its output—that is, transportation—at the lowest price, and at the same time has furnished more transportation per dollar invested in facilities than any other country in the world; a record, I repeat, of which we should all be justly proud.

ERIE 2-10-2 TYPE LOCOMOTIVE

The Erie Railroad has recently received from the Baldwin Locomotive Works a large locomotive of the 2-10-2 type, which is slightly heavier than the engines of this type built last year for the Baltimore & Ohio, and described on page 242 of the August 7 issue of the *Railway Age Gazette*. The new locomotive has 63-in. drivers, the largest yet to be placed on an engine of the 2-10-2 type, and by using 31-in. cylinders the tractive effort has been maintained very nearly to that of the Baltimore & Ohio locomotives. In the following table is a comparison of the leading dimensions of these locomotives:

Road	B. & O.	Erie
Tractive effort	84,500 lb.	83,000 lb.
Weight on drivers	336,800 lb.	327,250 lb.
Weight, total engine	406,000 lb.	407,700 lb.
Drivers, diameter	58 in.	63 in.
Cylinders, diam. and stroke	30 in. by 32 in.	31 in. by 32 in.
Steam pressure	200 lb.	200 lb.
Evaporating heating surface	5,573 sq. ft.	5,801 sq. ft.
Superheater heating surface	1,329 sq. ft.	1,377 sq. ft.
Grate area	88 sq. ft.	88.1 sq. ft.

The boiler of the Erie locomotive is similar in construction to that of the Baltimore & Ohio locomotive illustrated in the description above referred to. The difference in the heating surface is due almost entirely to an increase in the length of tubes, which are 24 ft. long as compared with a length of 23 ft. in the boilers of the Baltimore & Ohio locomotives. The tubes are welded into the back tube sheet. The new boiler has a conical ring in the middle of the barrel which increases the shell diameter from 90 in. to 100 in. The main dome is of pressed steel in one piece and is mounted on the connection ring, while the auxiliary dome is forward of the firebox on the



Longitudinal and Sectional Elevations, Erie 2-10-2 Type Locomotive

third ring and is placed over a 16-in. opening in the shell. The boiler contains a combustion chamber 28 in. long. The equipment includes a Schmidt superheater, Security brick arch, Street stoker, Talmage ash-pan and blowoff system, Franklin grate shaker and firedoor and Chambers throttle valve.

The cylinder castings are simple and massive in design, and are secured to the frames by 12 horizontal 1½-in. bolts each. Both the cylinders and steam chests are fitted with bushings of Hunt-Spiller gun iron and the same material is used for piston and valve packing rings. In designing the cylinders special attention has been given to the exhaust passages which are unusually direct and of liberal section area. Steam distribution is controlled by a 16-in. piston valve driven by the Baker gear and set with a lead of 3/16 in. The locomotive is equipped with the Ragonnet power reverse gear.

The reciprocating parts are comparatively light for an engine of this size. Forged and rolled steel pistons of Z-section are used. The guides are of the alligator type with a vertical distance of 20 in. between the bars. The crossheads have steel bodies with bronze gibs 32 in. in length and weigh 785 lb. apiece; this weight, although large in itself, may be considered low for the size required. The front and back main rod stubs are of the Markel type with removable brasses, the cast steel filling blocks in the main stub being cored out to remove as much weight as possible. Owing to the comparatively large diameter of the wheels and the relatively light reciprocating weights it has been possible to balance the locomotive satisfactorily without resorting to the use of auxiliary counterweights on the main axle, and lead has been used in the counter weights of the main wheels only.

The frames are Vanadium steel castings with rear sections of forged iron. The main frames are 6 in. in width and are spaced 42 in. between centers. The single front rails are cast integral with the main sections and in front of the cylinders they are bolted to a combined deck plate and bumper casting furnished by the Commonwealth Steel Company, in which is housed the Miner draft gear. Wherever possible this casting has been cored out to remove superfluous weight.

The driving wheels have a total lateral play in the boxes of ¼ in., and the first and fifth pairs have ¼ in. more play between the flanges and rails than the second and fourth pairs. The main wheels have plain tires, and in spite of the long rigid wheelbase the locomotive will traverse 16-deg. curves. The engine has the Woodard leading truck and the Cole trailing truck and the running gear details include Cole long main driving boxes.

Wherever practicable, details have been made interchangeable with corresponding parts of the Erie's latest Mikado type locomotives. Such parts include the tender trucks complete, the pilot, frame-crossties, brake shoes and heads, and the following parts except for the main wheels: driving boxes, axles, tires and shoes and wedges. Flange oilers are applied to the leading wheels and a speed recorder is operated from the rear truck.

The tender is of the Vanderbilt type, having a water capacity of 10,000 gal., and a coal capacity of 16 tons. The trucks have cast steel side frames and solid rolled steel wheels manufactured by the Standard Steel Works Company.

The 2-10-2 type, although not yet generally in use has met with marked success in heavy freight service and the large boiler capacity, together with the comparatively large driving wheel diameter of the Erie locomotive indicates the possibility of further development in this type toward sustained capacity at higher speeds.

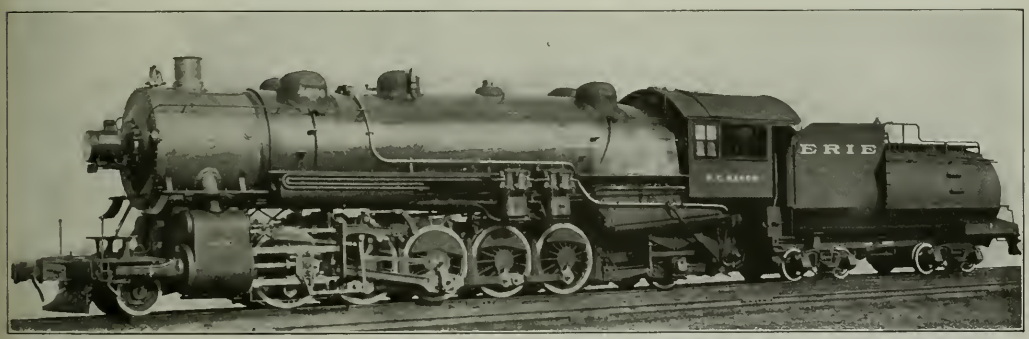
The following are the principal dimensions and data:

General Data

Gage	4 ft. 8½ in.
Service	Freight
Fuel	Soft coal
Tractive effort	83,000 lb.
Weight in working order	407,700 lb.
Weight on drivers	327,250 lb.
Weight on leading truck	24,450 lb.
Weight on trailing truck	56,000 lb.
Weight of engine and tender in working order	586,300 lb.
Wheel base, driving	22 ft.
Wheel base, total	41 ft. 3 in.
Wheel base, engine and tender	77 ft. 4½ in.

Ratios

Weight on drivers ÷ tractive effort	3.94
Total weight ÷ tractive effort	6.18
Tractive effort × diam. drivers ÷ equivalent heating surface*	664.72
Equivalent heating surface* ÷ grate area	89.29



Erie 2-10-2 Type Locomotive for Heavy Freight Service

Firebox heating surface ÷ equivalent heating surface,* per cent	3.28
Weight on drivers ÷ equivalent heating surface*	41.60
Total weight ÷ equivalent heating surface*	51.83
Volume both cylinders	27.95 cu. ft.
Equivalent heating surface* ÷ vol. cylinders	281.45
Grate area ÷ vol. cylinders	3.15

Cylinders

Kind	Simple
Diameter and stroke	31 in. by 32 in.

Valves

Kind	Piston
Diameter	16 in.

Wheels

Driving, diameter over tires	63 in.
Driving, thickness of tires	3½ in.
Driving journals, main, diameter and length	13 in. by 22 in.
Driving journals, others, diameter and length	11 in. by 13 in.
Engine truck wheels, diameter	34 in.
Engine truck, journals	6 in. by 12 in.
Trailing truck wheels, diameter	42 in.
Trailing truck, journals	9 in. by 14 in.

Boiler

Style	Conical
Working pressure	200 lb. per sq. in.
Outside diameter of first ring	90 in.
Firebox, length and width	132¼ x 96 in.
Firebox plates, thickness, sides, back and crown ⅜ in., tube ⅝ in.	
Firebox, water space	6 in.
Tubes, number and outside diameter	269—2¼ in.
Flues, number and outside diameter	48—5½ in.
Tubes and flues, length	24 ft.
Heating surface, tubes	5,443 sq. ft
Heating surface, arch tubes	37 sq. ft.
Heating surface, firebox	258 sq. ft.
Heating surface, total	5,801 sq. ft.
Superheater heating surface	1,377 sq. ft.

Equivalent heating surface*	7,866.5 sq. ft.
Grate area	88.1 sq. ft.

Tender

Weight	178,600 lb.
Wheels, diameter	33 in.
Journals, diameter and length	6 in. by 11 in.
Water capacity	10,000 gal.
Coal capacity	16 tons

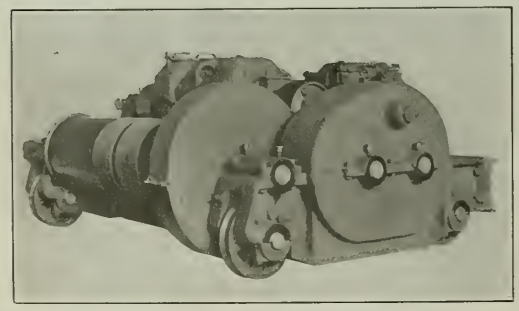
*Equivalent heating surface = total evaporative heating surface + 1.5 times the superheating surface.

ELECTRIC CRANE TROLLEY

The trolley shown in the photograph embodies a number of recently made improvements but is of the same general form as one which has been on the market for some time. It is built by the Northern Engineering Works, Detroit, Mich., and in the present form embodies the most recent crane engineering practice.

A primary consideration in the altered design has been safety, both in the way of strength and in the perfection of working parts. Durability of gears and other moving parts has been secured by enclosing and running them in an oil bath, thus protecting them from dust and grit. The construction is such that the covers of the gear cases must be in place before the gearing can be run, thus preventing carelessness in operating the trolley with gear covers removed.

Each train of back gears is rigidly mounted in a single frame, the bearings of which are bored in line, bronze lined and capped, through bolts instead of studs being used throughout. The hoisting gear train between the armature and drum gear is in a single rigid casting which insures permanent alinement. The drum gear is enclosed in a case of the same general type that is used for the hoisting gearing. All gears bear in the frame and are capped on top, no overhung bearings being used. All gear covers are castings and the joints are planed so that they are perfectly tight, thus preventing the leakage and dripping of oil from the trolley to the floor of the plant. The covers may be easily lifted, but for inspection and lubrication large manholes are provided in each cover. It has been found in



Electric Crane Trolley with Enclosed Gear Cases

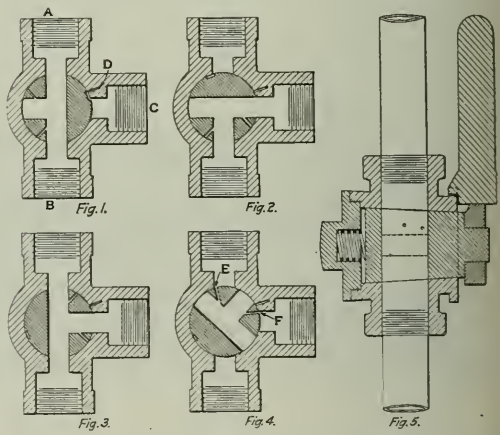
practice that a set of gears in a trolley of the enclosed type running alongside a crane having a trolley with exposed or partially protected gears lasts more than three times as long as the gears in the old type of trolley and the operation is almost noiseless. The hoisting gear box is made an integral part of the main trolley frame, thus securing permanency of alinement of all gears and their shafts.

A double system of electrical and mechanical brakes is used and the trolley is also equipped with an effective limit stop. Interchangeability has been insured by the use of standard gages and templates. The trolley is wired throughout in steel conduits. For mill service it has axle bearings either of the vertical or horizontal cast M. C. B. type. It is made in capacities from two tons to 125 tons.

SAFETY CUT-OUT VALVE

G. H. Wilson, a locomotive engineer on the Atchison, Topeka & Santa Fe, has invented a cut-out valve to replace the ordinary cut-out valve now used in the train line directly under the engineer's valve for the purpose of cutting out this valve when two or more engines are coupled to one train. The special features of the new valve are that it can be used in emergency if there is an accident to the engineer's valve; it is provided with a warning port which gives assurance that there is no train line stoppage between the rear engine and the leading engine as soon as the leading engine is cut in; it permits the rear engineman to instantly assume full control of the brakes in double-heading service, provided he finds it necessary to do so, and lastly, it is so designed that it will not be possible for the helper engine to cut off from the train until the second engineman takes control of the brakes, without the brakes being set throughout the entire train. Its use will eliminate the necessity of having a cut-out cock on the train line leading to the front end of the locomotive.

This valve is a three-way cock with the openings *A* leading to the engineer's valve, *B* to the main train line and *C* to the



Safety Cut-Out Valve for Locomotives

locomotive train line leading to the front end. Warning port *D* leads to the atmosphere, and when double-heading informs the engineman on the second engine that the engineman of the leading engine is ready to assume control of the brakes. Fig. 1 shows the valve in position for operating the train under ordinary conditions. In Fig. 2 the valve is shown in the position used on the second engine when double-heading. Fig. 3 shows the position used by the second engineman when he desires to assume control of the brakes while double-heading. In picking up cars on the head-end of the engine, the train line of these cars is chargd without disturbing the pressure of the main train line, by placing the valve in the position shown in Fig. 4. When a pusher engine is used on the rear of the train, the cut-out valve is operated in the same manner as on the second engine when double-heading. Further information regarding this valve may be obtained from Thomas Ogden, Box 252, Rawlins, Wyo.

Coal in Austria.—The congestion from lack of rolling stock in the Ostrau-Karwin district of Austria, is reported to have been somewhat alleviated, and the mines have been better able to satisfy their customers. The construction of the second line on the Kaschan-Oderberg Railway makes considerable progress in spite of the war, and the last portion of the Orlan-Oderberg section is expected to be ready in the spring.

General News Department

Mayor McMullen, of Norwich, N. Y., is engineer of a passenger train on the New York, Ontario & Western, and W. H. Kirkby, conductor of the same train, has just been elected president of the village of Sidney.

James Julian Carter, a brakeman on the Canadian Pacific, has been awarded the Albert medal, by the King of Great Britain, in recognition of his heroism is rescuing a little girl from in front of a railroad train at Tweed, Ont., some months ago.

The number of employees of the Grand Trunk Railway of Canada who have enlisted for service in the European war is about 600. These men or their families receive full pay from the railroad company for six months, and it is understood that probably the names will be kept on the payroll, at half rate, indefinitely.

The New York, New Haven & Hartford announces that a second dining car will be run on its "Merchants' Limited," the 5 p. m. train between Boston and New York, whenever the train consists of more than five parlor cars. Eastbound the second diner will be run between New Haven and Boston, and westbound between Boston and New Haven. This train now consists, on the heaviest days, of ten cars.

J. E. Long, safety engineer of the Canadian Government Railways—the Intercolonial—reports that during the first year of his incumbency, January 1, 1914, to January 1, 1915, fatal injuries to employees have fallen off from 19, in 1913, to 7, in 1914; injuries have been reduced from 695 to 523, and the number of trespassers killed dropped from 22 to 13. Mr. Long, who was formerly in the claim department of the New York Central, at New York City, is also editor of the Canadian Government Railways Employees' Magazine.

Peter M. Hoffman, coroner of Cook county, Illinois, has addressed a circular letter to various clubs and organizations in the county giving statistics of railroad accidents and pointing out the large preponderance of accidents to trespassers on railroad property. He encloses a copy of a bill which is before the Illinois legislature to prohibit trespassing and urges efforts on the part of the organizations to secure its passage. He shows that in 1914 there were 282 people killed in Cook county by railroads or on railroad tracks. Of these 13 were passengers, 100 were employees and 169 were trespassers. For the 10 years, 1905 to 1914, his records show that 80 passengers, 1,399 employees and 1,922 trespassers were killed.

"Welfare Work" is the title of a little pamphlet which has been issued by the Grand Trunk Railway of Canada, for the benefit of its employees, telling in brief compass about the superannuation, pension, provident and other beneficial funds maintained by the road, or by the road in conjunction with employees. The superannuation fund, for indoor employees, was established more than forty years ago, this company being the first in America to start such a fund on a comprehensive scale. The employees, as a rule, contributed one-half the money necessary to maintain the fund. Each employee paid 2½ per cent of his pay, monthly, and membership was compulsory on all who entered the service after October 1, 1874. Recently the contribution has been reduced from 2½ per cent to 1½ per cent; but since 1908 the company has paid pensions regularly so that the superannuation fund will be terminated. The pension fund now has on its rolls 730 employees, exclusive of those who had retired from service under the superannuation plan. The pension fund is maintained wholly by the company. The provident fund pays benefits in case of sickness and of death, and during 1914 disbursed about $100,000 for death benefits, and more than that sum for sick benefits. The pamphlet notices briefly the railroad Y. M. C. A. and its facilities for recreation, the safety-first movement, the plans for instruction in first aid to the injured and the schools maintained by the company for training apprentices. About 550 apprentices are now taking instruction.

New Railroad Laws in Texas

The legislature of Texas has concluded its session of two months and a final review shows that it has passed only a few general laws affecting railroads. The most important, perhaps, is that requiring employees to be paid twice a month. Another one provides that employees of railroads (and of certain other concerns as well) shall be free to choose the company from which they shall get surety bonds. The railroads now provide bonds without cost to the employee.

The railroad commission is authorized, by one of the new laws, to require railroads to make track connections with industries.

There was a full crew law but it died on the calendar as did the bill to require sheds to be built at all points where there are ten or more car repairers at work.

On the whole it appears to many careful observers that the anti-railroad spirit among the Texas law makers is very much abated.

Safety First in New Mexico

R. P. Kyle, safety supervisor of the El Paso & South Western, has issued a circular addressed to new employees in which he says:

"You will note that this railroad is active in SAFETY FIRST. The management is doing everything possible to make working conditions safe, and the present employees—the men with whom you will work—are proud of their record. . . .

"If you are with the road, there may be conditions that can be improved that you will notice at once, which have been overlooked by men working with the road for some time. The Safety Bureau invites you to make all suggestions for safety that you can, and it is your duty as an employee to do so. . . .

"To look out for your own safety is not all. You are working with many other men and in this brotherhood of men we treat our neighbor as ourself. . . . Be sure that the other man [as well as yourself] is safe.

"When you get to work, look around and see the men who are thought most of by the company, who have been here the longest, and who get along the best. They are the safe men, the workers, and the polite men. . . ."

Anti-Full Crew Law Campaign

The joint committee of the New Jersey legislature held a hearing on Monday of this week on the bill to repeal the full crew law. The speakers supporting the repeal were marshalled by M. A. Beeman, secretary of the New Jersey State Chamber of Commerce. Arguments were made by J. E. Reynolds of the Central of New Jersey, and George S. Patterson of the Pennsylvania. Testimony was given by C. H. Stein, superintendent of the Central division of the Central Railroad of New Jersey. The railroads presented a great mass of testimony in the shape of resolutions of chambers of commerce and other bodies, and editorials from newspapers; petitions were presented signed by great numbers of voters.

The legislature of Pennsylvania has held hearings at Harrisburg this week to listen to the arguments for the repeal of the full crew law, and next week will listen to those opposed to repeal.

R. L. O'Donnell, chairman of the committee representing the railroads of New Jersey and Pennsylvania continues to send out additional evidence of the unjust workings of the full crew laws of those states, and of the interest among the citizens, now constantly spreading, in the repeal or amendment of the law so as to put the regulation of train crews by the state in the hands of the Public Service Commissions. A number of railway surgeons report that injuries among trainmen are more numerous since the addition of the extra man to the train crew; and that the newer men are most likely to be found among the injured.

REVENUES AND EXPENSES OF RAILWAYS

SEVEN MONTHS OF FISCAL YEAR ENDING JUNE 30, 1915—CONTINUED

Federal Valuation

Thomas W. Hulme, general secretary, announces that the conference with the division of valuation, of the Interstate Commerce Commission, scheduled for this week, has been postponed to a date yet to be fixed; probably April 19.

Summary of Revenues and Expenses of Steam Roads

The Bureau of Railway Economics' summary of revenues and expenses and comments thereon for December, 1914, are as follows:

Railways operating 228,604 miles of line are covered by this summary, or about 90 per cent of all steam railway mileage in the United States. Their operating revenues for the month of December, 1914, amounted to $226,318,739. This amount includes revenues from freight and passenger traffic, from carrying mail and express, and from miscellaneous sources connected with rail and auxiliary operations. Compared with December, 1913, these operating revenues show a decrease of $26,062,485. Total operating revenues per mile averaged $990 in December, 1914, and $1,116 in December, 1913, a decrease of $126, or 11.3 per cent.

Operating expenses, which include the cost of maintaining track and equipment, operating trains, securing traffic, and of administration, amounted to $166,484,716. This was $19,073,260 less than for December, 1913. These operating expenses per mile of line averaged $728 in December, 1914, and $821 in December, 1913, a decrease of $93 per mile, or 11.3 per cent.

Net operating revenue, that is, total operating revenues of rail and auxiliary operations less operating expenses, amounted to $59,834,023, which was $6,989,225 less than for December, 1913. Net operating revenue per mile of line averaged $262 in December, 1914, and $296 in December, 1913, a decrease of $34 per mile, or 11.4 per cent.

Taxes for the month of December amounted to $10,090,035 or $44 per mile, a decrease of 12.1 per cent from December, 1913.

Operating income, which is net revenue from rail and auxiliary operations, less uncollectible revenues and taxes, averaged $217 per mile of line, and in December, 1913, $245, thus decreasing $28, or 11.4 per cent. Operating income for each mile of line for each day in December averaged $7.01, and in December, 1913, $7.91. Operating income is that proportion of their operating receipts which remains available to the railways for rentals, interest on bonds, appropriations for betterments, improvements, new construction, and for dividends.

The railways of the Eastern district show a decrease in total operating revenues per mile of line as compared with December, 1913, of 11.8 per cent, those of the Southern district a decrease of 18.3 per cent, and those of the Western district a decrease of 7.3 per cent.

Operating expenses per mile decreased 11.5 per cent in the East, decreased 15.3 per cent in the South, and decreased 8.8 per cent in the West. Net operating revenue per mile decreased 13.1 per cent in the East, decreased 24.8 per cent in the South, and decreased 4.1 per cent in the West.

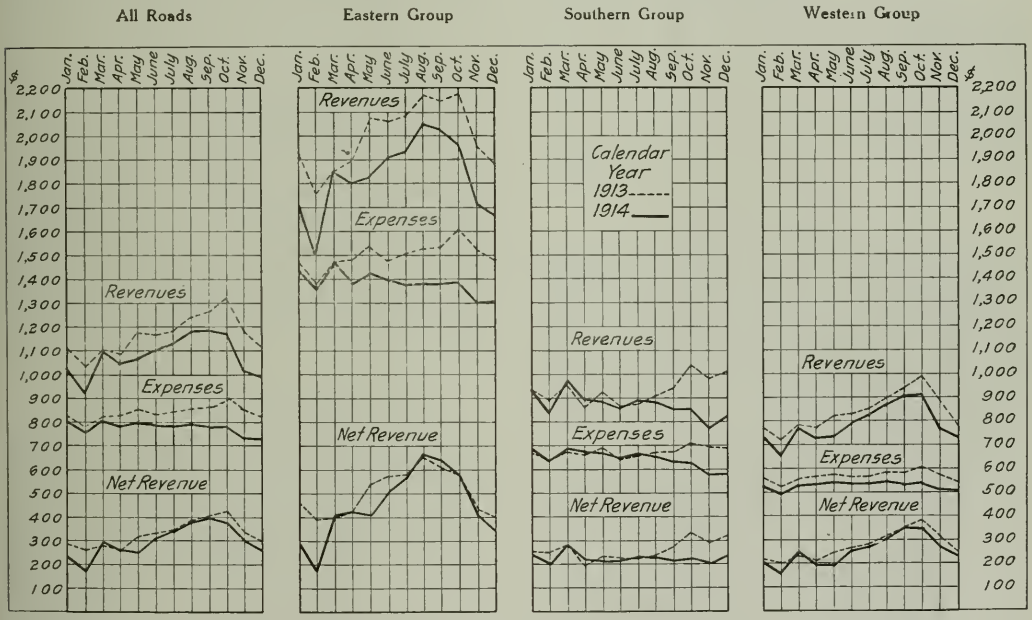
Taxes per mile show a decrease of 14.7 per cent in the East, a decrease of 9.6 per cent in the South and a decrease of 10.4 per cent in the West. Operating income per mile decreased 12.8 per cent in the East, decreased 27.0 per cent in the South, and decreased 2.9 per cent in the West.

The operating ratio for December, that is, the per cent of total operating revenues absorbed in operating expenses, was 73.6 per cent, which is comparable with 73.5 per cent in December, 1913, and 69.0 per cent in December, 1912. The operating ratio in the Eastern district for December was 79.2 per cent, as compared with 79.0 per cent in 1913; was 71.1 per cent in the Southern district, as compared with 68.6 per cent in 1913; was 68.6 per cent in the Western district, as compared with 69.6 per cent in 1913.

Comparison of returns for six months of the current fiscal year with the corresponding months of the previous fiscal year reveals a decrease in total operating revenues per mile of 8.6 per cent, a decrease in total operating expenses per mile of 9.8 per cent, and a decrease in net operating revenue per mile of 5.9 per cent.

This net operating revenue per mile decreased 1.1 per cent in the East as compared with the corresponding period of the previous year, decreased 19.7 per cent in the South, and decreased 5.4 per cent in the West.

Total operating revenues for the calendar year 1914 amounted to $2,935,018,985. This was a decrease from the previous year of $210,756,597, which is equivalent to $1,065, or 7.6 per cent, per



Monthly Revenues and Expenses per Mile of Line in 1914

mile of line. Operating expenses amounted to $2,124,918,955, which was a decrease of $137,165,191, equivalent to $703, or 7.0 per cent, per mile. Net operating revenue amounted to $810,100,030, a decrease of $73.591,406, equivalent to $362, or 9.3 per cent, per mile. Operating income per mile of line decreased $382, or 11.5 per cent.

The railways of the Eastern district show a decrease in operating income per mile of 12.5 per cent, the railways of the Southern district a decrease of 15.9 per cent, and the railways of the Western district a decrease of 8.9 per cent. All three districts show decreases in total operating revenues per mile and in operating expenses per mile, but in no district did the decreases in operating expenses overcome the decreases in revenues. Taxes per mile decreased 0.3 per cent in the East, increased 7.9 per cent in the South, and increased 5.6 per cent in the West.

The following table shows the per cent of operating revenues consumed by such class of expenses:

Per Cent of Total Operating Revenues

	December, 1914				Six months of the
	United States	Eastern District	Southern District	Western District	fiscal yr. 1915
Freight revenue	68.3	67.3	70.8	68.3	68.3
Passenger revenue	22.0	22.0	21.2	22.4	22.6
Mail revenue	2.1	1.8	1.8	2.6	1.9
Express revenue	2.7	2.8	2.9	2.6	2.3
All other revenues	4.9	6.1	3.3	4.1	4.9
Maint. of way and structures	11.2	11.7	11.7	10.6	12.7
Maintenance of equipment	17.9	20.0	18.0	15.6	16.9
Traffic expenses	2.2	1.9	2.7	2.2	2.0
Transportation expenses	38.8	41.9	35.7	36.9	34.5
General expenses	2.9	2.9	2.9	2.8	2.4
All other expenses	0.6	0.8	0.1	0.5	0.5
Total operating expenses	73.6	79.2	71.1	68.6	69.0

Mail Pay Controversy

In a statement given to last Monday morning's papers, Postmaster General Burleson attacked the railroads for their activity in getting the Senate to reject the post office appropriation bill on the closing day of the last session of Congress, declaring that they had carried on their propaganda by means of one-sided, prejudiced and biased statements, designed to mislead the public mind. That the deficit in the operations of the post office department during the current fiscal year is to be attributed to the parcel post is, says Mr. Burleson, an absurd falsehood. "Were it not for the parcel post the coming postal deficit would be much larger than it will be," says Mr. Burleson. He continues:

"Notwithstanding the equitable and liberal character of the legislation (proposed by the department), it was bitterly fought throughout its several legislative stages by the so-called railway mail pay committee, an organization representing certain of the railroads. This committee's emissaries were kept almost constantly in Washington, and, through an expensively maintained press bureau, the country was flooded with a propaganda in which the attitude of the Post Office Department and the action of the House of Representatives were grossly misrepresented. . . . The railroads are saying that the Post Office Department's attempt to remedy the present situation was an attempt at railroad confiscation. No! It was, and is, a determined, well considered effort to end a system under which the postal authorities are compelled to stand helplessly by while the railroads loot the postal revenues.

"Although the railways contend that they are underpaid for carrying the mails, the facts are that they are overpaid and that they are receiving from the government amounts which, for hauls of any considerable length, exceed by about two to one the amounts they receive from the express companies for like and similar service. . . . The proposed change to the space system at the rates granted in the legislation which failed March 4 last, while giving the railroads fully as much per car-mile as they are now getting, would place the transportation facilities paid for by the government more completely under the control of the postal authorities."

Senator John W. Weeks, of Massachusetts, at once replied to Mr. Burleson, calling attention to the extraordinary feature of the bill presented by the department, giving the postmaster general unheard of power in regulating the rates for transportation of mails by the railways. Senator Weeks resents the charge that a "railroad lobby" had anything to do with the action of the Senate. Thoughtful senators felt compelled to take a stand against the passage of an ill-advised measure, in the closing days of the session, without adequate debate. (Mr. Weeks was a member of the Bourne committee, whose report was noticed in the *Railway Age Gazette*, September 4, 1914, page 435.)

Ralph Peters, chairman of the railways' committee on mail pay, also replied to Mr. Burleson. Referring to the statement alleging the "looting" of the government revenues, he called attention to the report of the Bourne committee, in which an increase of pay for the railroads was recommended. "Was Senator Bourne's committee duped by the railroads, or did his committee become a party to the conspiracy to steal? . . . The fact is that Mr. Burleson, through lack of understanding of the postal service and through reliance upon advisers who were accused by the joint bi-partisan commission of Congress [the Bourne committee] of ignorance of their duties and greed for arbitrary power, is himself permitting the government of the United States to rob the railroads of at least half what is due them for carrying the parcel post. The railroads defy the postmaster general to point to a single act of their railway mail pay committee, in its efforts to present the facts in this case to the people, which has not been absolutely legitimate. . . ."

Mr. Peters has issued a circular quoting a dozen newspapers in condemnation of the policy of the Post Office Department in this matter. In this connection he reprints an article from the Ogden (Utah) Standard of February 2, which says:

"No one trouble of the railroads is more perplexing than that of the parcel post. The mail trains are being delayed while postmasters supervise the loading of this new mail matter, and cars are being added to those trains without extra compensation. Over at Wells, Nev., the agent of the Southern Pacific, without wishing any one bad luck, is hoping the warehouse burns down where eighty tons of grain are held for shipment, sack by sack, through the parcel post. One day last week a fast mail train was delayed by the loading of two tons of wheat as parcel post, and early in the same week a carload of potatoes was mailed from Deeth, Nev., to Halleck. . . ."

Evidence in Enginemen's Arbitration Concluded

The introduction of evidence in the hearing at Chicago before the board of arbitration on the wage demands of the engineers and firemen of the western railroads was concluded on March 18. The hearings were begun in Chicago on November 30, and its sessions have been continuous, having been held every day except Saturday and Sunday, except for brief intermissions during the holidays. It was announced that the board would continue to hold executive sessions daily until March 29, when it will hear the final arguments on behalf of the railroads and the enginemen. The briefs will be submitted to the board and the oral arguments will be made by President W. S. Carter of the Brotherhood of Locomotive Firemen and Enginemen, W. S. Stone, grand chief of the Brotherhood of Locomotive Engineers, and James M. Sheean, attorney for the Conference Committee of Managers. Three days will be allowed for argument and the board will render its decision not later than April 20.

The representatives of the enginemen concluded their rebuttal testimony on March 17, and J. H. Keefe, assistant general manager of the Gulf, Colorado & Santa Fe, was the only witness called in rebuttal by the railroads. In refutation of allegations made by the representatives of the brotherhoods that the original exhibit of the railways as to earnings of all engineers and firemen was incorrect in specific cases, Mr. Keefe produced the actual pay rolls and pay checks endorsed by the employees. He also presented figures as to the financial condition of the roads for the seven months of the present fiscal year ending January 31. The statement made by the railroads early in the case that many engineers earned larger salaries than the governors of some states, which was derided by the brotherhood officers during the hearing, was proved by Mr. Keefe in an exhibit showing that 344 engineers received more than $3,000 a year. The extreme illustration was the case of one engineer who earned $366.66 in October, 1913, or at the rate of about $4,500 a year.

MEETINGS AND CONVENTIONS

The following list gives the names of secretaries, dates of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

American Association of Freight Agents.—R. O. Wells, Illinois Central, East St. Louis, Ill. Annual meeting, May 18-21, 1915, Richmond, Va.

American Association of Passenger Traffic Officers.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Next meeting, April 15-16, San Francisco, Cal.

American Railway Association.—W. F. Allen, 75 Church St., New York. Next session, May 19, 1915, New York.

American Society of Civil Engineers.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.

Association of American Railway Accounting Officers.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Piedmont Hotel, Atlanta, Ga.

Association of Railway Claim Agents.—C. W. Egan, B. & O., Baltimore, Md. Annual meeting, May 19, 1915, Galveston, Tex.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

International Railway Fuel Association.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago. Annual meeting, May 17-20, 1915, Hotel La Salle, Chicago.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May 25 to 28, 1915, Chicago, Ill.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except, June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

Peoria Association of Railroad Officers.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

Railroad Master Tinners, Coppersmiths and Pipefitters' Association.—U. G. Thompson, C. & E. I., Danville, Ill. Annual meeting, May, 1915.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Railway Storekeepers' Association.—J. P. Murphy, L. S. & M. S., Box C, Collinwood, Ohio. Annual meeting, May 17-19, 1915, Hotel Sherman, Chicago.

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

Salt Lake Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, Piedmont Hotel, Atlanta.

Toledo Transportation Club.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of Newark.—John J. Kantzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, Newark.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meetings last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Gen. Agt., Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Transportation Club of Detroit.—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

Western Canada Railway Club.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Annual meeting in January. Extra meetings, except in July and August, generally on other Monday evenings.

Traffic News

The Chicago, Milwaukee & St. Paul has announced that a traffic arrangement has been made with the Oregon Short Line, giving the St. Paul passenger trains an entrance into Yellowstone Park from Butte, Mont. Direct connections will be made with the limited trains, the Olympian and the Columbian.

The Boston & Maine has filed new passenger rates in Massachusetts, to go into effect April 1, following the suggestions of the Public Service Commission of the state which, in its report issued February 27, approved new tariffs of the New Haven road, but disapproved those of the Boston & Maine and Boston & Albany. The principal change, now made, as compared with the tariffs which were disapproved, is the addition of family tickets, good for 25 rides, which are to be sold at two cents a mile and to be valid for three months only. These take the place of tickets on which passengers now ride at about 1½ cents a mile. The general basis of rates on the Boston & Maine in Massachusetts will henceforth be: for single tickets 2½ cents a mile; mileage tickets 2¼ cents; family tickets two cents; monthly tickets, good for a round trip each day, at the existing rates of from 1¼ cents down to ½ cent a mile. There are other special tickets in use to a limited extent, in the territory near Boston, these having been introduced, in most cases, to meet the competition of street car lines.

State Fare Laws and Other Proposed Legislation

The bill to increase the state passenger fare in Illinois from 2 to 2½ cents a mile was introduced in the Illinois legislature last week. The railroad committee in charge of the Illinois campaign has compiled a pamphlet of 32 pages containing editorials and articles from the leading Illinois newspapers regarding the 2½ cent fare campaign, and copies have been mailed to each member of the general assembly at Springfield and to each newspaper publication in the state. The committee has received a letter from the Illinois division of the Travelers' Protective Association of America, protesting against any increase in the passenger fare unless the railroads will agree to reinstate the interchangeable mileage book which was discontinued on December 7, 1914; but with a promise to assist the roads in obtaining the increase if the roads will definitely agree to provide a 2,000 mile interchangeable mileage book at two cents a mile.

The Illinois railroads have sent to the Illinois legislature a petition signed by 80,000 people of the state favoring an increase of the state passenger fare to 2½ cents a mile.

The Nebraska legislature has killed the bill to increase intrastate passenger fares to 2½ cents a mile.

A committee of officers of railroads operating in Iowa appeared before a joint session of the House and Senate committees on railroads of the Iowa legislature on March 18, and asked for an increase of the state passenger fare from 2 to 2½ cents a mile. C. H. Markham, president of the Illinois Central, who has acted as spokesman for the railway men, said that the net earnings of the seven principal railroads of the state for the year 1914 represented a return of 7 per cent. on a valuation of only $29,254 per mile, while the same roads were valued for the purpose of taxation at $31,816 per mile.

A committee of railroad men, including James J. Hill, of the Great Northern; W. A. Gardner, president of the Chicago & North Western, and Edmund Pennington, president of the Minneapolis, St. Paul & Sault Ste. Marie, appeared before a committee of the Minnesota legislature on March 18, and presented arguments and statistics in favor of an increase of the state passenger fare to 2½ cents a mile. Mr. Hill told the committee that it cost more money per train mile to operate passenger trains than the railroads received.

Daniel Willard, president of the Baltimore & Ohio; G. L. Peck, vice-president of the Pennsylvania Lines, and M. R. Waite, general counsel for the Cincinnati, Hamilton & Dayton, spoke before the Public Utilities Committee of the House of the Ohio legislature last week in behalf of the request of the roads for an advance in state passenger fares from 2 to 2½ cents a mile. Another hearing was held before the committee on March 23.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission has announced that the carriers have submitted a new plan for making rates from eastern defined territories to intermountain territory. Hearings on this plan will be held before Examiner Thurtell on April 12.

In response to the recent petition of the express companies alleging that the schedule of rates which went into effect on February 1, 1914, is not adequate, the commission has granted a rehearing of the case. No date has as yet been set for the presentation of evidence.

The commission has suspended from March 25 to July 23 Erie tariffs proposing increased ferry rates for automobiles, wagons, etc., between New York and Jersey City. The commission believes that this ferry as part of the Erie is doing an interstate business and that it is as much subject to the act as the railroad itself.

The commission has suspended from March 27 to July 1 proposed advances in lake and rail, rail and lake and rail, lake and rail rates. The filing of the tariffs grew out of the decision in the Five Per Cent case. The commission declined to permit the 5 per cent on these particular rates and the carriers filed the tariffs making them the subject of a separate proceeding.

Lumber Rates to Eastern Territories

In re lumber rates to central freight association and trunk line territories. Opinion by the commission:

The commission finds that carriers' proposed cancellation of through routes and joints rates on lumber from points in Louisiana and Arkansas to central freight association and trunk line territories via East St. Louis, Ill., and the Toledo, St. Louis & Western and via Flinton, Ill., and the Illinois Southern is justified. (33 I. C. C., 322.)

Class Rates to Beloit, Wis.

H. Rosenblatt & Sons et al. v. Ann Arbor Railroad et al. Opinion by Commissioner McChord:

The commission finds that the class rates from central freight association and trunk line territories to Beloit, Wis., are not unreasonable or prejudicial in that they exceed the class rates from the same points of origin to Rockford, Ill. The fact that the rates to Beloit are made on combination through Chicago or Milwaukee, while the rates to Rockford are stated in percentages of the New York-Chicago rates, is not in itself proof of discrimination. (33 I. C. C., 324.)

Rates on Apples from Virginia

Eastern Fruit Growers' Association et al. v. Baltimore & Ohio et al. Opinion by Commissioner Clark:

The commission finds that defendants' rates on apples in carloads from producing points in Virginia, West Virginia, Maryland, Delaware and southern Pennsylvania to various sections of the country are not unreasonable nor discriminatory as compared with rates from New York and New England producing points. (33 I. C. C., 343.)

Divisions Determined by the Commission

In re rates on lumber and other forest products from points in Arkansas and other states to points in Iowa, Minnesota and other states. Opinion by Commissioner McChord:

The commission in this second supplemental order modifies its first supplemental order so as to prescribe that the rates on lumber from points on the St. Louis Southwestern to Des Moines, Ia., via the Wabash, shall divide 17¼ cents to the St. Louis Southwestern and 7¾ cents to the Wabash. The previous order allowed divisions of 16.5 cents to the St. Louis Southwestern and 8.5 cents to the Wabash, whereas the Wabash only wished 8 cents. (32 I. C. C., 484.)

Lumber Rates from Helena, Ark.

In re lumber rates from Helena, Ark., and other points to Omaha, Neb., Des Moines, Iowa, and other destinations. Opinion by Commissioner Hall:

The commission finds that the carriers have not justified proposed increased rates on yellow pine, cypress and hardwood lumber from southwestern points and points in Mississippi and eastern Louisiana to the Omaha group and various points in Missouri, Iowa, Kansas, Nebraska and South Dakota. (33 I. C. C., 297.)

Track Storage Charges at New York

Murphy Brothers v. New York Central. Opinion by Commissioner Clark:

The commission finds that carrier's rule relating to the assessment at New York of track-storage charges, and stating that time will be computed from first 7 a. m. after car is placed, is unjust in that it does not provide that time will be computed from the first 7 a. m. after placing cars on public delivery tracks, and after the day on which notice of arrival is sent to consignee. Reparation awarded. (33 I. C. C., 355.)

Import Rates Properly Applied

National Dock & Storage Warehouse Company v. Boston & Albany, et al. Opinion by Commissioner McChord:

The complainant, operating a public warehouse at East Boston, Mass., for the storage of all kinds of traffic, whether foreign or domestic alleges that there is discrimination against it in carrier's rule relating to import traffic shipped from Boston which reads as follows:

> Rates named herein apply only on property coming from foreign ports (other than ports in the maritime provinces and Newfoundland) into the United States and delivered to the rail carrier direct from ship's side or dock of the vessel bringing such property to Boston, or on such property received by the rail carrier from custom bonded warehouses or appraisers' stores (not internal revenue stores).

The commission finds, however, that the tariff is neither discriminatory nor prejudicial. (33 I. C. C., 330.)

Class Rates Between Stations in Louisiana

Opinion by Commissioner Daniels:

The complainant, the Lafayette Chamber of Commerce, attacked the joint class and commodity rates from St. Louis and defined territories to Lafayette, La., as being greater than the aggregate of the intermediate rates on interstate traffic via Baton Rouge, La. Morgan's Louisiana & Texas thereupon attempted to close the Baton Rouge gateway by cancelling the interstate application of the mileage rates from Baton Rouge to Lafayette and other points on its line. The tariff making this cancellation was suspended, whereupon the carrier also cancelled the tariff carrying the interstate application of a mileage scale of rates from Baton Rouge. The commission finds that the proposed closing of the Baton Rouge gateway is not justified. The former mileage rates from Baton Rouge are required to be restored, except that 20 miles may be added for Mississippi river transfer. The joint class and commodity rates from St. Louis and defined territories to Lafayette are not found on the record to be unlawful, but the case is held open for further investigation. (33 I. C. C., 302.)

STATE COMMISSIONS

The Illinois Public Utilities Commission has again suspended, until September 15, the proposed general increase of 5 per cent in intrastate freight rates in Illinois.

The Michigan Railroad Commission has given an estimate to the legislature that an increase in the state passenger fare to 2½ cents per mile would increase the annual passenger earnings of the Michigan roads by $3,815,390.

The Arkansas Railroad Commission has granted the application of the Jonesboro, Lake City & Eastern Railroad to be allowed to increase its passenger fares to 3 cents a mile. This was made possible by a bill passed by the recent legislature authorizing the commission to grant the increase if the road should satisfy the commission of the reasonableness of the advance.

Bills to make important changes in the public service company law of Pennsylvania were introduced in the legislature Tuesday

by Representative James O. Campbell, of Butler. One bill would take away the exclusive jurisdiction of the court of Dauphin county (Harrisburg) in appeals, and allow appeals to be taken to the common pleas court of any county. Another would divide the state into three districts for convenience of hearings and taking action on complaints. The districts would be left in the hands of the commission, but the law would fix the places where sittings are to be held—Philadelphia, Pittsburgh and Harrisburg.

Commissioner Mayfield of the Texas Railroad Commission has sent a telegram to J. W. Everman, general superintendent of the St. Louis Southwestern of Texas, protesting against the recent closing of the company's shops at Tyler, Tex., which threw out of employment some 300 or 400 men. The commissioner says in his telegram that the company's business is better than it has been for some time, requiring, as he is advised, "an extra switch engine to adequately handle the traffic," and that the road should be getting its equipment in condition to handle the large business expected this spring and summer. He says that unless the shops at Tyler are reopened and the men put back to work he will consider it his duty to move that the commission suspend further action on the application for an increase in freight rates pending investigation into the reason why the shops were closed. Mr. Everman said it was found absolutely necessary to close the shops at Tyler because of the decrease in earnings.

The State Corporation Commission of New Mexico, in reply to a resolution by the New Mexico legislature requesting information as to what steps the commission had taken, if any, in the matter of fixing a fare of three cents a mile to be charged by railway companies in the state, says that since the election of the first members of the commission in 1911, it has never received from any citizen, taxpayer, individual, firm or corporation any written complaint, either formal or informal, protesting against the passenger fare of four cents a mile, now charged locally by the majority of the railroads. The commission further states that if any verbal complaints were ever made to the commission it does not recall them. Although no complaints had been lodged with the commission it had instituted an investigation on its own motion in July, 1912, of the entire passenger situation in the state which covered a period of several months, and it was deemed advisable to allow the matter to rest, at least pending the clearing up of financial conditions throughout the United States. The pamphlet reply gives the results of the investigation of the conditions not only in New Mexico but in other states, which led the commission to the conclusion that a reduction was not justified.

The Rate Hearing Before Texas Commission

At the hearing last week before the Texas Railroad Commission on the application of the Texas railroads for a general advance in freight rates, Frank Kell, of Wichita Falls, told the commission that he shipped annually 15,000 carloads of freight and that he is in favor of a general advance in rates, not only on the commodities which he ships but on those affecting interests in which he is a stockholder. He said he had no interest in any railroad in Texas, but thought that their condition ought to be improved in order to promote the development of the state. Other testimony regarding the financial condition of each of the Texas railroads was introduced by officers of the various roads, who gave the commission figures showing the great increases in the cost of labor and the increased expenses caused by legislation and commission orders. F. B. McKay, general freight and passenger agent of the Texas Midland, testified that the road had lost money for years, but that it had kept out of the courts because it had a "fairy godmother" in the person of Mrs. Hetty Green, mother of the president of the road. I. A. Cottingham, assistant general manager of the Sunset-Central Lines, offered in evidence figures covering a revaluation of all the Sunset-Central properties in Texas. J. W. Terry, counsel for the Santa Fe Lines in Texas, presented a statement outlining the history and condition of the Gulf, Colorado & Santa Fe, saying that had it not been for the parent company the Texas lines of the Santa Fe system would have been in the hands of receivers "as often as the International & Great Northern." James Peabody, statistician for the Atchison, Topeka & Santa Fe, testified regarding the division of expenses between freight and passenger service and state and interstate service for some of the lines, based on the Oklahoma plan. George H. Schleyer, receiver and general manager of the St. Louis & San Francisco in Texas; A. B. Warner, vice-president of the Rock Island lines in Texas; J. A. Brown, general freight agent of the New Orleans, Texas & Mexico, W. B. Scott, president of the Sunset-Central Lines, and F. G. Pettibone, vice-president of the Gulf, Colorado & Santa Fe, were also among the witnesses who testified.

The hearing of the railroads' evidence was concluded on March 18. Hearings will be set later to allow the shippers to present their views.

COURT NEWS

One hundred and sixty-four shippers have filed suits against the receivers of the Wabash in the United States district court at St. Louis for claims aggregating $335,658, for alleged overcharges on freight by the road, between 1905, when the maximum freight law in Missouri became effective, and February, 1914, when an injunction restraining enforcement of the rates was dissolved.

The Oklahoma passenger fare case, in which the railroads are seeking to have the three-cent passenger fare restored, was begun before Judge Youmans of the United States district court at Oklahoma City on March 15. The roads party to the suit are the Atchison, Topeka & Santa Fe; St. Louis & San Francisco; Chicago, Rock Island & Pacific; Missouri, Kansas & Texas and Kansas City Southern. The first day of the hearing was devoted to testimony regarding the formula for the division of expenses, which was described by A. L. Conrad, assistant general auditor of the St. Louis & San Francisco. This formula divides expenses between freight and passenger service, state and interstate service and line haul and terminal expense. This was followed by testimony by representatives of individual roads applying the formula to their own accounts.

Right of Way—Acquisition

Under the Indiana statute authorizing railroad corporations to secure rights of way by condemnation or by purchase or by voluntary grants or donations, and in no other way, the Indiana Appellate Court, following previous decisions of that court and the Supreme Court, holds that such a right of way may also be acquired by estoppel, adverse possession, or license.—New Point v. Cleveland C. C. & St. L. (Ind.), 107 N. E., 560.

Time Limit for Claims for Loss or Damage to Freight

The Georgia Court of Appeals holds that where a shipper signs and accepts a bill of lading containing a clause stipulating that "claims for loss or damage shall be made in writing to the agent at point of delivery promptly after arrival of the property, and if delayed for more than ten days after the delivery of the property, or after due time for the delivery thereof, no carrier hereunder shall be liable in any event," it constitutes a binding contract. The clause is not void on the ground that the carrier seeks thereby to limit its liability, and does not give as consideration therefor extra service or monetary consideration to the shipper, or that it is contrary to the public policy of the state. Such a clause, when applied to shipments of perishable products, such as turnips, is not an unreasonable limitation as to the time in which the claim is to be presented. W. H. Mitchell & Co. v. Atlantic Coast Line (Ga.) 84 S. E. 227.

Unloading Freight Not Intrinsically Dangerous

A boy 14 years of age was allowed by the conductor of a freight train to ride in the caboose in consideration of his services in unloading light freight. While between two stations one or two cars immediately in front of the caboose were derailed and the boy, becoming frightened, jumped off the caboose and broke his leg. In an action by his father for the loss of his services it was alleged that the work the boy was allowed to do was dangerous and arduous, and the defendant and its agents were negligent in permitting him to ride upon the train. It was held by the Kentucky Court of Appeals that it is neither intrinsically hazardous nor obviously dangerous for a youth 14 years of age to assist in unloading light freight from a freight car and placing it on a station platform; nor is it necessarily

hazardous or dangerous for such youth to ride on the caboose of a freight train, or to be permitted to do so. Judgment for the plaintiff was therefore reversed. Chesapeake & O. v. Smith (Ky.) 172 S. W. 1088.

Liability of Delivering Road

The Louisiana Supreme Court holds that, in the case of an interstate shipment of live stock, which was delivered in bad condition, owing to delays in transportation, the delivering carrier will not be held responsible in damages to the shipper, where the evidence shows that said carrier was not responsible to any appreciable extent for delay in transportation, and not at all for want of proper attention to the animals. Duvall v. Louisiana Western (La.) 67 So. 354.

Authority of Station Agent

In an action where the plaintiffs claimed to own a building which they had put up on the defendant's right of way, and for the alleged conversion of which they sought damages, it was held by the Nevada Supreme Court that the fact that a station agent and car foreman of a railroad assume to manage, in a general way, the company's business in the vicinity, does not warrant an inference of authority to lease or permit the construction of private dwellings on the right of way or to give away materials belonging to the company. Judgment for the plaintiffs was reversed, and a new trial ordered.—Mirodias v. Southern Pac. Co. (Nev.), 145 Pac., 912.

Improper Loading of Live Stock by Shipper

The Kentucky Court of Appeals says that it is well settled by the almost unanimous authorities that where the carrier furnishes a car to the shipper for the purpose of shipping live stock therein, and the latter loads the live stock himself, and in doing so he overcrowds the animals, or places in one compartment animals of different kinds, the risk of loss or injury is upon the shipper, being caused by his own act, or by his own act in conjunction with the inherent nature, propensities, and qualities of the animals themselves; and this whether the defective manner of loading be discoverable by the carrier or not, if it has not been actually discovered by it.—Illinois Cent. v. Rogers & Thomas (Ky.), 172 S. W., 948.

Knowledge of Danger—Assumption of Risk

A car inspector went between cars which he, erroneously, thought were coupled and would not be moved, without setting the warning lights required by the rule. It was the custom of switchmen to give notice before moving the cars or to refrain from moving them when they knew inspectors might be between them. In an action for his death it was alleged that the members of the switching crew were guilty of negligence in failing to notify him that they intended to make a second attempt to couple. The Texas Court of Civil Appeals held that it was negligence for the switching crew to move the cars, although the inspector did not set the warning light, and that there was no room for the operation of the doctrine of assumption of risk by the deceased; he having no reason to assume that the switchman would be negligent on this particular occasion.—Texarkana & Ft. S. v. Casey (Tex.), 172 S. W., 729.

Bonds by Shippers and Consignees

The Arkansas act of May 23, 1907, authorizes a shipper or consignee to execute to the carrier a bond conditioned that the "shipper" or "consignee" shall deliver to the carrier the original bill of lading, etc., and authorizes the carrier, on delivery of the bond, to deliver the goods to the shipper or consignee, without requiring surrender of the bill of lading. The Arkansas Supreme Court holds that the statute embraces all persons with whom a carrier deals in the receipt and delivery of goods transported by it. A consignor of freight which was consigned to itself, with direction to notify a milling company, notified the carrier that the shipment was intended for an elevator company, and authorized a substitution of that company for the milling company. The carrier in good faith made delivery to the elevator company. The delivery was held to be within a bond given by the elevator company, it being a "consignee" within the statute, though it subsequently developed that the elevator company was not legally entitled to delivery.—Chicago R. I. & P. v. Title G. & S. Co. (Ark.), 172 S. W., 263.

Injury Near Track—Unforeseen Result

A farm hand was plowing about 50 feet from a railroad track, when, just as a freight train passed at an unusually rapid speed, he was struck on the side by something which turned out to be an iron spike. This had presumably been picked up and hurled into the field by the passing train. In an action for his injuries the Texas Supreme Court held that, the spike being negligently permitted to be upon the track, or loose in the ties, the railroad would be responsible for injury proximately caused by such negligence as, in the exercise of reasonable diligence, the company might have foreseen the result therefrom. If the plaintiff had been lawfully on or near the track in discharge of a duty, and had received the injury, there might have been liability. But the occurrence, as stated, would be so rare that it could not be anticipated by the defendant, and the road therefore was held not liable. Trinity & B. V. v. Blackshear (Tex.), 172 S. W., 544.

Safe Appliances—Contributory Negligence

In an action by a fireman for injuries the negligence complained of was that the engine was not equipped with handholds for use by the fireman in going to light the headlight; that the plaintiff used the pilot light to steady himself; that the top of it broke off, and he fell to the ground. The Georgia Court of Appeals held that the injury must be attributed to the fault of the fireman. Ordinary diligence requires a master to furnish to his servant appliances reasonably suited for the uses intended; but the law does not exact extraordinary diligence by requiring of the master that instrumentalities intended for one use should be usable for every unintended use to which they might be casually or unexpectedly applied. And the master is not chargeable with negligence either because an appliance fails to serve a purpose not intended, or because the instrumentality was not inspected so as to discover that it was not suited for such unexpected and unintended use.—Williams v. Alabama G. S. (Ga.), 84 S. E., 149.

Hours of Service Law—"Employee"

The Hours of Service Act provides that it shall apply to any common carrier or carriers, their officers, agents, and employees engaged in the transportation of passengers or property by railroad from one state to another, and that "employees," as used therein, means persons actually engaged in or connected with the movement of any train. Following B. & O. v. Interstate Commerce Commission, 221 U. S. 612, 31 Sup. Ct., 621, the federal district court of Idaho, N. D., holds that the act did not apply to the engineer of a work train operated wholly within one state, though upon a line of railroad constituting a part of the company's through highway of interstate commerce, and though the train was engaged in hauling materials for the repair of the track over which interstate trains ran. United States v. Chicago, M. & P. S., 218 Fed., 701.

Interstate Commerce—Fuel for Interstate Traffic

The Kansas Supreme Court holds that an interstate railroad, when engaged in hauling cars of coal over its line from one point to another in the same state where their bulk was to be broken and some portions thereof afterwards used for fuel on engines running into other states, is not, by virtue thereof, engaged in interstate traffic. In an action for personal injuries the court held that the plaintiff, a fireman on a switching engine, which was, at the time he sustained his injuries by a derailment, hauling a train of cars loaded with such coal, was engaged in hauling coal which at a later date might become a part of interstate commerce, but that his work had no real and substantial connection with interstate commerce. The court said that the situation would be no different if, instead of coal, the shipment had consisted of articles intended to be used in the repair of a locomotive running from a point within the state to a point in another state. In such a case the mere fact that the consignee intended to attach the articles to a locomotive engaged in interstate commerce would not make the shipment within the state interstate in character. Barker v. Kansas City, M. & O. (Kan.), 146 Pac. 358.

Railway Officers

Executive, Financial, Legal and Accounting

L. E. Abbott has been appointed general claim agent of the Oregon Short Line, with headquarters at Salt Lake City, Utah, succeeding E. M. Bagley, resigned.

E. J. Pearson, first vice-president of the Missouri Pacific, has been elected vice-president of the Texas & Pacific, with headquarters at New Orleans, La., succeeding E. F. Kearney. He will be in charge of operation and will direct the construction of large terminals at New Orleans.

Operating

F. J. Hawn, superintendent of the Fort Worth division of the Texas & Pacific, has been appointed superintendent of transportation, with headquarters at Tyler, Tex., succeeding W. Mosby, assigned to other duties. H. D. Earl, superintendent of the Waco division, with headquarters at Tyler, Tex., has been transferred to Mount Pleasant, Tex., as division superintendent.

J. H. Clark, superintendent of floating equipment of the Baltimore & Ohio, at Baltimore, Md., has been appointed also assistant general superintendent of the New York division and general superintendent of the Staten Island lines, with headquarters at St. George, Staten Island, N. Y., succeeding W. H. Averell, promoted, and F. C. Syze, trainmaster at St. George, has been appointed assistant superintendent of the New York division and of the Staten Island lines.

Traffic

J. M. Beer has been appointed general freight agent of the Centerville, Albia & Southern, with office at Centerville, Iowa.

C. A. Blood, freight traffic manager of the Lehigh Valley, at New York, has been appointed traffic assistant, with office at New York.

Horace Booth, general freight agent of the International & Great Northern, has been appointed traffic manager, and L. M. Hogsett, assistant general freight agent, has been appointed general freight agent, both with headquarters at Houston, Tex.

F. B. Hillebrand, commercial agent of the Lehigh Valley at Toledo, Ohio, has been transferred in the same capacity to Detroit, Mich., succeeding G. H. McDevitt, deceased, and E. H. Schuttenberg, soliciting freight agent at Cleveland, has been appointed commercial agent at Toledo, succeeding Mr. Hillebrand.

James Horsburgh, Jr., general passenger agent of the Southern Pacific at San Francisco, Cal., has been transferred to Los Angeles, in a similar capacity, succeeding F. E. Batturs, who takes the place of Mr. Horsburgh at San Francisco. Eugene W. Clapp, assistant general freight agent at Tucson, Ariz., has been appointed general freight agent, with office at Los Angeles, Cal., succeeding J. G. Stubbs, who has been transferred to San Francisco as general freight agent. R. J. Smith, district freight and passenger agent at Philadelphia, Pa., has been transferred to Sacramento, Cal., in a similar capacity, in place of James O'Gara, who has been appointed freight and passenger agent at San Francisco. J. K. Butler has been appointed assistant general freight agent at San Francisco, and Blake D. Myers has been appointed district freight agent at that point.

Engineering and Rolling Stock

N. S. Airhart has resigned as master mechanic of the Missouri, Kansas & Texas at Denison, Tex.

William J. Tyers has been appointed general supervisor of the Grand Trunk, with headquarters at Montreal, Que., vice G. Dyson.

L. B. Wickersham, assistant engineer of the Spokane, Portland & Seattle, with headquarters at Portland, Ore., has resigned to engage in general engineering work.

The position of supervisor of track in the Louisville district of the Baltimore & Ohio Southwestern has been restored and the following supervisors have been appointed supervisors of track: T. Mahoney, with headquarters at Storrs, Ohio; D. Cassin and W. M. Downey, with headquarters at North Vernon, Ind., and T. Rowland, with headquarters at Seymour.

OBITUARY

W. B. McLoughlin, engineer of maintenance of way of the Cleveland, Cincinnati, Chicago & St. Louis, at Indianapolis, Ind., was injured in a motor car accident near Lawrenceburg Junction, Ind., on March 12, and died at St. Mary's hospital in Cincinnati on March 15.

John C. Breedlove, assistant engineer of the Northern Pacific at Tacoma, Wash., died suddenly on March 10 at St. Paul, Minn., aged 39 years. Mr. Breedlove was graduated from Cornell University in 1901, and was employed there for a year as instructor before entering railway service. About 10 years ago he left the position of assistant engineer of the Chicago, Rock Island & Pacific to go to the Northern Pacific, where he was in charge of much heavy grade reduction and improvement work, including the low grade cut-off from St. Regis, Mont., to Paradise. For the past four years he has had charge of the building of the Point Defiance low grade line between Tacoma, Wash., and Tenino, which was placed in operation a short time ago.

Charles Francis Adams

Charles Francis Adams, LL.D., the well known former chairman of the Massachusetts State Railroad Commission, president of the Union Pacific Railroad for six years, and prominent in other railroad affairs; a notable publicist and historian, died at his winter home in Washington, D. C., March 20, after an illness of a week.

C. F. Adams

Mr. Adams was born in Boston, May 27, 1835, son of Charles Francis Adams, minister to Great Britain during the time of the civil war; grandson of President John Quincy Adams and great grandson of John Adams, second president of the United States. He was graduated from Harvard College in 1856, and in 1858 was admitted to the bar in Massachusetts. He was a soldier in the civil war, rising to the position of colonel, and just before the close of the war was brevetted brigadier general. He was a member of the Massachusetts Railroad Commission ten years, 1869-1879, and was chairman for the last seven years of that time. In the years 1879-84 he was a member of the board of arbitration of the Trunk Line Association, and he was a Government director of the Union Pacific from 1877 to 1890. He was president of that road from 1884 to 1890.

Mr. Adams was a man of independent means, and devoted himself to the interest of the public all his life, a true "friend of the people." He was chairman of the committee which planned the metropolitan park system in Boston and vicinity, and an overseer of Harvard University from 1882 to 1907. He was prominent in political discussions, though he never sought public office, being always independent. In a speech delivered at Richmond, Va., in 1908 he said: "The people are governed too much. As to government regulation of monopolies, I don't believe in it. If a so-called monopoly is contrary to correct principles it will burst of itself. If it survives without governmental aid, it does so because it is in accord with economic truths. It then needs no regulation."

In October last Mr. Adams sent a long letter to President

Wilson showing facts justifying the request of the eastern railroads for authority to make a general increase in their freight rates. He told the President that the properties were deteriorating, that new capital could not be obtained to keep them up, and that eastern New England lines alone needed $100,000,000.

Mr. Adams was known as one of the foremost historians of the country, and he continued his studies up to the time of his death. A biography of his father, including a review of the diplomatic negotiations between the United States and Great Britain over civil war problems, is considered one of his notable books. His "Chapters of Erie" (1869) was a bold exposition of the evil management of that road. Other railroad books were "Railroads, Their Origin and Problems" (1878) and "Notes on Railroad Accidents" (1879). In 1913 Mr. Adams lectured at Oxford University, England, on American History. He was president of the Massachusetts Historical Society for many years, and a member of the American Academy of Arts and Letters and of many other societies.

Mr. Adams lived for years at Quincy, Mass., the ancestral home of the Adams family, but for several years past his home had been at South Lincoln, seventeen miles west of Boston. His last public appearance was at the town meeting in Lincoln, March 8, when he spoke at some length, advocating economy in civic expenditure. His wife, who survives him, was Mary Hone Ogden, of Newport, R. I. He leaves, also, two sons and three daughters.

By railroad men Mr. Adams will be best remembered by his work as a pioneer railroad commissioner. During his incumbency, as noted above, Massachusetts was a leader among the states. There had been state railroad commissions before, but he was the first man to make a national reputation in that field. And he made it by the normal method of dealing with the complex problems of his office in the broad spirit of true statesmanship. He informed himself fully as to facts; he exercised always an independent judgment and he looked at the conflicting interests of the railroads and the people with impartiality. Not the least element in his worth as a representative of the state was his ability as a writer, which enabled him to set situations before the people in such a way that they could appreciate them in their true light. His "Chapters of Erie," which, in a later time, might have been called "muckraking," effected its purpose in a similar way. It was forceful writing, backed by an independent and courageous character.

Lower Ganges Railway Bridge in India Completed.—The Viceroy of India on March 4 opened the Lower Ganges bridge at Sara Ghat, the eastern terminus of the meter-gage section of the Eastern Bengal Railway, thus inaugurating direct railway passenger communication across the river. It is expected that as a result of the opening of the bridge there will be a great development in the railway facilities of Northern Bengal and Assam, and the hope is expressed that the new lines to Gauhati and in Assam will form part of the trunk railway to Burma.

Progress of the Amur Railway.—The Russian state treasury has been authorized to spend $2,708,000 during 1915 for the temporary operation of the Amur Railway. Through communication along the whole length of the line will possibly be opened on January 1-14, 1917, and this year small credits only will be asked for, sufficient to cover expenditure which has been incurred in excess of estimates, and to construct a bridge across the River Amur. It is estimated that the total cost of construction of the railway, exclusive of expenditure in connection with the water supply, will amount to about $161,250,000.

Indian Railway Finance.—The railway program of the government of India for 1915-16 contemplates an expenditure of $40,000,000, which is proposed to be distributed as follows: $34,735,000 on open lines, including rolling stock; $3,598,500 on lines under construction; and $1,666,500 on new lines. The government's revised financial statement for 1914-15, which has recently been presented, when compared with the budget estimated published in March, 1914, shows a decrease of $10,330,000 in the revenue from state railways, and the budget estimate for 1915-16 compared with the revised estimate for 1914-15 shows a decrease of $1,294,500 in the net revenue from state railways.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Idaho & South-Eastern is inquiring for 1 light Mogul type locomotive.

Frazar & Company, New York, have ordered one locomotive from the Baldwin Locomotive Company.

The Remington Arms-Union Metallic Cartridge Company, New York, has ordered one 4-wheel saddle tank switching locomotive from the American Locomotive Company.

The California Western Railroad & Navigation is reported to have ordered one saddle tank switching locomotive from the Baldwin Locomotive Company. This item has not been confirmed.

CAR BUILDING

The International & Great Northern is contemplating the purchase of 1,000 freight cars.

The Interborough Rapid Transit is reported to have ordered 478 all-steel subway car bodies from the Pullman Company, subject to the approval of the Public Service Commission, First district.

The Minneapolis, St. Paul, Rochester & Dubuque Electric Traction has ordered 45 80,000-lb. capacity box cars, 12 trailer passenger cars and two electric motor cars from the J. G. Brill Co.

The Illinois Traction System, reported in an unconfirmed item in the *Railway Age Gazette* of March 12 as having ordered 50 cars from the Haskell & Barker Car Company, has ordered 50 50-ton hopper bottom wooden coal cars from that company.

The Pennsylvania Equipment Company, Philadelphia, Pa., is in the market for 100 60,000-lb. capacity second hand box cars, several cabooses, one short passenger coach, one cheap passenger coach to be converted into a camp car and one cook car or cheap box car.

IRON AND STEEL

The Philadelphia & Reading has ordered 2,500 tons of steel rails from the Carnegie Steel Company.

The International & Great Northern has ordered 1,500 tons of rails from the Tennessee Coal, Iron & Railroad Company.

The Rhode Island Company has ordered 1,600 tons of girder rails from the Pennsylvania Steel Company and the Lorain Steel Company.

The Northern Ohio Traction Company recently ordered 500 tons of rails from the Algoma Steel Company, Sault Ste. Marie, Ont.

The Chesapeake & Ohio has ordered 16,000 tons of steel from the McClintic-Marshall Company for its bridge over the Ohio river at Sciotoville, Ohio.

The Virginian Railway has divided an order for 3,500 tons of steel rails among the Pennsylvania Steel Company, the Lackawanna Steel Company and another company.

The Interstate Bridge Commission has awarded a contract for 7,700 tons of steel for the truss spans for the Interstate bridge over the Columbia river, near Portland, Ore.

The New York Municipal Railways have ordered 800 tons of rails from the Pennsylvania Steel Company, and 1,600 tons of girder rails from the Lorain Steel Company.

The Keystone Construction Company, Kansas City, Mo., has ordered 9,000 tons of 70-lb. rails from the Illinois Steel Company. These rails will be used on a new road to be known as the Salina Northern, which the company is building in Kansas.

Supply Trade News

George Hills, an expert on electric welding, has been made head of the arc welding department of the Burke Electric Company, Erie, Pa.

Frederick A. Hall, formerly head of the chain hoist department of the Yale & Towne Company, died at his home in Passaic, N. J., on March 16.

G. Haven Peabody, western representative of the Lima Locomotive Corporation, Lima, Ohio, has resigned, effective April 15, to accept a position with the Lackawanna Steel Company.

W. C. Chapman, who for several years has been connected with the sales force of the Philadelphia branch office of Manning, Maxwell & Moore, Inc., has been appointed manager of that office.

Frederick Winslow Taylor, originator of the modern scientific management movement, died suddenly in Philadelphia on March 21 from pneumonia. Mr. Taylor was born at Germantown, Pa., on March 20, 1856. He attended Phillips Exeter Academy, but left before completing the course because of impaired eyesight. In 1883, however, he graduated from Stevens Institute of Technology with the degree of Mechanical Engineer. In 1878 he entered the employ of the Midvale Steel Company, with which company he was successively gang boss, assistant foreman, foreman of the machine shop, master mechanic, chief draftsman and chief engineer. He left the company in 1889 and began his special work of reorganizing the management of manufacturing establishments. Mr. Taylor was an inventor of considerable ability. Among his numerous inventions was the Taylor-White process of treating modern high-speed tools for which he received a personal gold medal from the Paris Exposition in 1900 and the Elliott Cresson medal of the Franklin Institute. Mr. Taylor was a member of the American Society of Mechanical Engineers, and served as its president in 1905 and 1906. He was the author of a number of technical books and articles, among the best known being "The Principles of Scientific Management," and "Shop Management," both published in 1911.

F. W. Taylor

E. L. Leeds, who since 1907 has been manager of the railroad equipment department of the Niles-Bement-Pond Company, New York, has been appointed general manager of sales of that company and the Pratt & Whitney Company, Hartford, Conn.

Frank N. Grigg, with offices at 1201-2 Virginia Railway and Power building, Richmond, Va., has been appointed sales agent for the Harlan & Hollingsworth Corporation, Wilmington, Del., and the car seat department of the Heywood Brothers & Wakefield Company, Wakefield, Mass.

H. C. Hopson, who for the last six years has been at the head of a department of the New York State Public Service Commission, Second district (Albany), has opened an office at 61 Broadway, New York City, where he is prepared to advise concerning financing, rates, reorganizations, accounting and valuations of railways and other public utilities. At Albany, Mr. Hopson had charge of the examinations of the accounts and records of corporations, in connection with the investigation of capitalization, rates and reorganizations.

Western Electric Company

In spite of the quiet condition of business, the Western Electric Company was able in its fiscal year ended December 31, 1914, to pay its usual dividends and earn a considerable surplus. Its sales for the year were $66,408,000 as against $77,532,860 in 1913, and $71,727,329 in 1912. There was also other income of $948,509, making a total of $67,356,993. From this there were deducted: cost of merchandise, $57,360,541; expenses, $5,472,944 taxes, $490,041 and an appropriation of $500,000 for the reserve for contingencies, leaving $3,533,467 available for dividends. Interest was paid of $862,507, and the usual dividends of $1,500,000, leaving $1,170,960 to be carried to surplus, as compared with $1,671,695 in 1913 and $1,067,410 in 1912. The total surplus on December 31, 1913, was $22,840,459, and on December 31, 1914, $24,011,419. The company's orders on hand on January 1, 1915, were $4,309,000 less in value than on January 1, 1914.

The Western Electric Company manufactures the telephone apparatus used by the Bell companies, and also does a general telephone and electrical manufacturing business. It is the largest manufacturer of telephonic apparatus in the world, and the largest distributor of electrical supplies in this country. On December 31, 1913, the company's real estate, buildings, equipment and machinery had a total value of $19,217,809. There were sundry investments valued at $9,349,059, which value may have to be reduced because of the war, and current assets of $44,902,342, of which $5,242,421 was cash. The capital stock outstanding is $15,000,000, a majority of this being owned by the American Telephone & Telegraph Company. There are also bonds outstanding of $15,000,000. The accounts payable on December 31, 1914, were $3,210,970. There were also reserves for depreciation of $11,449,912, for employees' benefit fund of $1,000,000, and for contingencies of $3,796,909, the surplus, as noted above, being $24,011,419.

TRADE PUBLICATIONS

Multiport Valve.—Cochrane Multiport Valves is the subject of a booklet of 72 pages just issued by the Harrison Safety Boiler Works, Philadelphia, which describes the multiport valves introduced by that company for back pressure relief and vacuum service, flow service in connection with mixed flow turbines, and check valve service with bleeder or extraction turbines. The essential idea of the multiport valve is the use of a number of small discs instead of one large disc, in order to secure greater safety, quietness, lightness or moving parts and tightness.

Electric Hoists.—The Link-Belt Company, Chicago, in its bulletin No. 207 sets forth the special features of the Link-Belt electric hoists. These are of the monorail type, having a capacity up to four tons and are built with either a plain trolley, a geared trolley propelled by a hand chain, a motor driven trolley with pendant cords for operation from below, or with an operator's cage suspended from the hoist. These hoists may also be provided with shackle or hook suspension in place of the trolley, making them suitable for stationary work.

Engineering Calculations.—This is the title of a 23-page booklet issued by Felt & Tarrant Manufacturing Company, Chicago, which deals with the application of the comptometer to calculating work in the drafting room and the estimating department for a variety of calculations involving addition, multiplication, division and subtraction. It is well illustrated and contains numerous examples of the operations for which the machine is being used. The booklet will be of interest to those in charge of engineering offices and drafting rooms generally.

Lehigh Valley.—The Lehigh Valley has issued a booklet calling attention to its service in connection with the Panama Pacific Exposition. The booklet, which is intended to offer "First Aid to the Fair Goer," gives in concise form information relating to travel to and from the exposition, including fares, hotel rates, tours, etc., but it contains no description of the fairs themselves, since they will be described elsewhere. One of the features of the booklet is a map with all the railroads except the line of Lehigh Valley and Grand Trunk from New York to Chicago omitted, on which the intending traveler may mark the points of interest which he wishes to visit and which he may then take to the nearest Lehigh Valley agent, who will give him routes, rates and other necessary information.

Railway Construction

Alabama Roads.—The Perdido Lumber Company of Gateswood, Ala., is building a railroad, it is said, from Hollinger creek, south to a point on the Gulf of Mexico.

Arkansas Valley Interurban.—Efforts are now being made by this company to vote $30,000 in terminal aid bonds in the city of Hutchinson, Kan. It is said that if these bonds are voted the construction of the extension from Halstead, Kan., to Hutchinson will be started immediately.

Atlanta & Carolina Interurban.—According to press reports plans are being made to carry out the work on the line from Atlanta, Ga., east to Augusta, about 160 miles. In June, 1914, Ronald Ransom was appointed receiver, and up to that time, it is said, that about 30 miles had been graded and three miles of track laid.

Charleston-Isle of Palms Traction.—An officer writes that work will be started soon on an extension of this road. The company now operates an electric line from Mt. Pleasant, S. C., east to Isle of Palms, about 7.5 miles, and also operates a three-mile ferry line from Mt. Pleasant to Charleston. The extension work will be carried out by the company's forces. About two years ago extensions were projected from Isle of Palms east to McClellanville, about 30 miles, and from Mt. Pleasant to the Cooper river, thence over a concrete bridge, to be built over that river, to a terminal in the city of Charleston.

Fellsmere Railroad.—Work is now under way, it is said, building an extension to Broadmoor, Fla., 3.5 miles. This company now operates a railroad from Sebastian to Fellsmere, 9.94 miles.

Florida Roads (Electric).—According to press reports plans are being made to build an interurban line to connect Lakeland with other towns in Polk county, Fla. A. J. Holworthy, secretary, and G. C. Rogan, W. F. Sneed, M. F. Hetherington, S. F. Smith and A. J. Holworthy, members of the Board of Trade, at Lakeland, are back of the project.

Lula-Homer.—About 70 per cent of the grading on the proposed new line between Homer, Ga., and Lula, has been completed, according to a recent report from an official of that company. The line is to be 14 miles long, with a maximum curvature of 16 deg., and a maximum grade of 3 per cent. No bridges will be required. In connection with this road three depots will be built. S. S. Carter of Lula, Ga., is president, and D. G. Zeigler of Lula, is chief engineer.

North Carolina Roads.—Contracts are reported let to S. S. Royster and to O. Elan, Shelby, N. C., to build a railroad from Shelby north to Casar in Cleveland county, about 21 miles.

New York Roads (Electric).—Plans are being made by residents of Middletown, N. Y., and Walden, it is said, to build an electric line from the Wallkill Transit Company's line at Goshen north about 15 miles to a connection with the Orange County Traction Company's line at Walden.

Right of way has been secured and franchises are being asked for, it is said, to build an electric line from Jamestown, N. Y., north via Gowanda to Buffalo, about 70 miles. J. B. Anderson, Ellington, and F. E. Ward, Gowanda, are said to be interested in this project.

New York Roads.—Plans are being made by the MacIntyre Iron Company, it is said, to build a railroad from Sanford lake north of Tahawus, N. Y., east to Fort Ticonderoga, which is on the Delaware & Hudson and the Rutland Railroad, about 60 miles. The line is to be built to provide an outlet from ore fields owned by this company at Sanford lake.

New York Subways.—Bids are wanted, April 20, by the New York Public Service Commission, First district, for building Section No. 2 of Route No. 12 of the Eastern Parkway subway in the borough of Brooklyn. This section is from Prospect Park Plaza, under Eastern Parkway, to a point east of Nostrand avenue. The subway will be constructed on the double-deck plan.

The commission has approved the form of contract submitted by the Interborough Rapid Transit Company for the construction of a section of the West Farms subway connection. This section is to be built from the Third avenue elevated road, at a point near One Hundred and Forty-First street, through Willis and Bergen avenues in the borough of the Bronx, to a point near One Hundred and Forty-Ninth street, thence to a connection with the Lenox avenue branch of the existing subways.

Ocilla Southern.—Surveys are now being made at Macon, Ga., it is said, for an entrance of the Ocilla Southern into that city. The company now operates a line from Nashville north to Rochelle, 62.3 miles, and is building an extension from Rochelle north to Pope City, 7.3 miles. A further extension is projected north to Macon, about 73 miles and trackage rights may be secured over existing lines for part of the way. (February 26, p. 390.)

Ocmulgee Valley.—Work is to be started next month to complete a line from Lumber City, Ga., southwest to Jacksonville, about 20 miles. The construction work will probably be carried out by company forces, about 7 miles of track has already been laid. The line is to have maximum grades of 1 per cent, with a maximum curvature of 4 deg. The promoters expect to develop a traffic in lumber and farm products. The line will traverse a fine farming and timber land section, and the work will involve handling about 40,000 cu. yd. C. S. Smith, president; J. C. Work, chief engineer, Lumber City, Ga.

Pennsylvania Lines West.—Terminal tracks are now being laid to the new temporary freight shed of the Pennsylvania, located just south of Taylor street, near the Chicago river, Chicago, Ill., and preliminary work has been started on the new permanent freight terminal, which will be located between Polk and Taylor streets and near the Chicago river. The work of relocating the sewers incident to the construction of the new freight terminal is also being actively carried out.

Pennsylvania System.—The record of the mileage of the road on December 31, 1914, shows that the total length of main line on lines east of Pittsburgh, Pa., and Erie is 5,377 miles of first track, with 1,911 miles of second track, 559 miles of third track, 483 miles of fourth track, and 4,745 miles of company's sidings, a total of 13,075 miles. There was an increase of 28 miles of first track, 4 miles of second track and 54 miles of company's sidings, a total increase of 86 miles. On the Pennsylvania lines west of Pittsburgh and Erie the mileage is 3,108 miles of first track, 1,367 miles of second track, 222 miles of third track, 134 miles of fourth track and 2,672 miles of company's sidings, a total of 7,503 miles. During the year there was an increase of 14 miles of first track, 2 miles of third track, 5 miles of fourth track, and 43 miles of company's sidings, and there was a decrease of 6 miles of second track, making the total increase 58 miles. Mileage of the Vandalia Railroad is: first track 851 miles, second track 61 miles, third track 8 miles, and sidings 441 miles, a total of 1,361 miles. The grand total of all lines, including those in operation by and associated in interests with the Pennsylvania Railroad is 11,794 miles of first track, 3,734 miles of second track, 822 miles of third track, 636 miles of fourth track and 9,433 miles of company's sidings, a total of 26,419 miles. Of this 6,462 miles of first track are east and 5,332 miles are west of Pittsburgh and Erie.

Southern Railway.—This company is installing passing tracks of the lap type at Vantine, Archdale, Mt. Zion, Fair Forrest, Taylor, and Gaffney, between Charlotte, N. C., and Greenville, S. C., on the Washington-Atlanta line. Each of the sidings will accommodate four of the largest freight trains handled on this division. At each of these points an interlocking plant is being installed with distant signals, so that trains will not have to stop before entering the sidings. The passing tracks are being built to main line standards so that they can be later used as a part of double track.

Texas Roads.—Plans are being made to build a 28-mile railroad from Sierra Blanca, Tex., to new coal fields, which are to be developed. J. Shelby, El Paso, is said to be back of the project.

Valley & Siletz.—The Valley & Siletz Railway is building a line from Independence, Ore., to Newport, a distance of about 45 miles. This line will connect with the Southern Pacific at Airlie, Ore., about 10 miles southwest of Independence. Grading will require the moving of about 25,000 yd. per mile. Nine Howe trusses, and 6,000 ft. of trestle work will be required. The maximum curvature on the line will be 10 deg., and the maximum grade 2 per cent. About 25 per cent of the grading work has been completed. The company's offices are in the Northwestern Bank building, Portland, Ore.

RAILWAY STRUCTURES

Carbondale, Pa.—The Public Service Commission of Pennsylvania has approved plans, it is said, for the construction of a viaduct over the tracks of the Delaware & Hudson near Simpson. The estimated cost of the structure is $75,000, and is to be paid for jointly by the railway company and Lackawanna county.

Chicago, Ill.—The Atchison, Topeka & Santa Fe is completing plans for a petition to the city council for permission to build a fruit terminal on its property between Eighteenth and Twenty-second streets, and Wentworth avenue and the Chicago river. The terminal is to include an auction house, a banana house, a cold storage plant and team tracks to accommodate approximately 1,000 cars per day. If the council passes upon this petition favorably, construction work will be begun at once. A number of short streets will have to be closed and some grading done, as well as relocating old tracks and laying new ones. The value of the land on which this improvement is to be made is estimated at $3,000,000.

Hamilton, Ont.—Plans are being made by the Toronto and Hamilton Highway Commission to build a steel bridge across the inlet of Burlington bay at Hamilton. The proposed structure will probably carry tracks for the operation of electric railway cars, and is to cost about $300,000.

Harrisburg, Pa.—A contract has been given by the Cumberland Valley to the Robert Grace Contracting Company, Pittsburgh, Pa., to build the new arch bridge over the Susquehanna river at Harrisburg, to replace the present steel deck truss bridge. The new bridge will carry two tracks; it will have 46 spans, and will be 4,000 ft. long. The cost of the new structure will be about $750,000. (February 26, p. 390.)

New Orleans, La.—The Trans-Mississippi Terminal Railroad is making financial arrangements to build terminals for the Gould lines at New Orleans. The contract is reported let to J. W. Thompson, St. Louis, Mo.

Ottawa, Ont.—The city officers of Ottawa will build a steel and concrete bridge over Rideau canal at Pretoria avenue, Ottawa. It will be a Strauss type, direct-lift structure, with three spans, and will carry double tracks for the operation of cars of the Ottawa Electric Railway Company. The estimated cost of the work is $80,000.

Electrification in Great Britain.—The London, Brighton & South Coast practically stopped all work on capital account on the outbreak of war, but has been obliged to proceed with the equipment of the suburban lines for electrical operation, not only because contracts were made and certain orders given, but because a considerable quantity of material had been delivered which would have seriously deteriorated if not used. The work of electrification on the London & South-Western Railway was stopped when the war broke out, but new financing last October was so successful that the work was then resumed. Owing, however, to scarcity of labor the progress is slow, and it will be three or four months before the first section, i. e., the lines from Waterloo to Kingston via Twickenham and via Malden can be ready for service. The report of this company states that the main powerhouse at Wimbledon and the substations at other places are practically completed, and the machinery is being erected. Several of the new electric trains have been constructed. Good progress has also been made with the placing of conductor rails, the bonding of track rails, and the laying of high-tension cables on the first section.

Railway Financial News

Boston & Maine.—The bill for the reorganization of this road, which has been agreed upon by the Public Service Commissions of Maine, New Hampshire and Massachusetts has been laid before the legislatures of the several states. This bill was outlined in this column last week. It provides for the capitalization of the present floating indebtedness, but leaves it to the Public Service Commissions to provide for a gradual amortization of the deficit of income in preference to dividends on common stock, the provisions of this section to continue until July 1, 1916. There are provisions for taking over the Hampden Railroad and for demanding payment from Boston & Maine stockholders of a substantial assessment or its equivalent. There is a clause providing that any mortgage issued on the railroad property shall include all outstanding indebtedness.

The Vermont legislature has already discussed the bill, and it has been acted on favorably in the Senate, after being amended so as to require the new company, if one be organized, to be incorporated under Vermont law and to be specifically amenable to the Vermont Public Service Commission.

Chicago, Rock Island & Pacific.—John J. Quinlan and F. L. Forbes, vice-president and transfer agent, respectively, of the Chicago, Rock Island & Pacific Railway Company, have been charged in the criminal proceeding which had been brought by Warren C. Crane, a stockholder, to hold them amenable to the penal law for refusing access to the railway company's stock books. Forbes was discharged on the ground that it had not been proved that he was in control of the stock books, and Quinlan is held not guilty of wilfully refusing to allow the books to be inspected. The decision leaves Mr. Crane, as a member of the Amster committee, which is seeking to oust Quinlan and all the other Rock Island directors at the annual meeting of the stockholders on April 12, free to get the names, addresses, and the amount of the holdings of each stockholder of the Chicago, Rock Island & Pacific Railway. A vigorous canvass for proxies will now be made.

Pennsylvania.—In the whole Pennsylvania Railroad System there are now 11,794 miles of road and 26,419 miles of track; lying in thirteen states and the District of Columbia. The company issues a statement to the effect that more than half of its 92,225 stockholders live in the states served by the railroad. There are more owners of Pennsylvania Railroad stock today than ever before in the history of the company. On the first of March 31,865 people who live in Pennsylvania—1,799 more than on March 1, 1914—were shareholders; in New York, 15,712; in New England and the rest of the country, 32,726. Despite the European war, the road on March 1, had 190 more foreign stockholders than it did a year before. The average holding is 108.27 shares, or 3.53 shares less than a year ago. The number of women shareholders is 44,469, and their average holding is 63 shares.

Texas & Pacific.—At the annual meeting of the stockholders in New York, March 17, nine new directors were chosen; but the Gould interests continue to be represented. Most of the new members, however, represent the new Missouri Pacific interests. The new directors are Charles H. Sabin, president of the Guaranty Trust Company; B. D. Caldwell, president of Wells, Fargo & Company; John I. Waterbury; Henry Ickelheimer, of Heidelbach, Ickelheimer & Company; Seward Prosser, president of the Bankers' Trust Company; N. S. Meldrum, of Blair & Company; T. L. Chadbourne, personal counsel of George J. Gould; Henry A. Bishop and William Church Osborne, who represents the Phelps-Dodge interests in the stock of the road. The members re-elected are George J. Gould, R. M. Gallaway, Benjamin Nicoll, R. C. Clowry, Kingdon Gould, Dunlevy Milbank, Henry E. Cooper and Howard Gould. Members of the old board not re-elected are: John P. Munn, Frank J. Gould, Edwin Gould, E. T. Jeffery, J. L. Slocum, Finley J. Shepard, O. B. Huntsman, Thomas J. Freeman and E. F. Kearney.

ANNUAL REPORTS

NEW YORK CENTRAL AND HUDSON RIVER RAILROAD—ANNUAL REPORT

To the Stockholders of

THE NEW YORK CENTRAL AND HUDSON RIVER RAILROAD COMPANY:

The following report, covering the operation of the New York Central & Hudson River Railroad and leased lines, the Boston & Albany Railroad and the St Lawrence & Adirondack Railway for the entire year ended December 31, 1914, is submitted by the Board of Directors elected April 15, 1914, whose term of office expired December 23, 1914, on the consolidation of the company with several allied organizations into a new corporation named The New York Central Railroad Company, to which your interests, as stockholders, were transferred.

The statements and tables contained in the report are in accordance with the new classification promulgated by the Interstate Commerce Commission. For the purpose of comparison the figures representing the transactions of the year 1913 have been revised.

The mileage embraced in the operation of the road is tabulated as follows:

	Miles
Main line and branches owned	1,835.55
Proprietary line	.18
*Leased line	1,583.97
Line operated under contract	71.59
Line operated under trackage rights	282.66
Total road operated	3,773.95

*The Dunkirk Allegheny Valley and Pittsburgh Railroad, 90.51 miles, is also leased by this company, but its mileage and operations are not included in this report. Separate accounts are kept and independent returns prepared in its behalf.

This figure shows an increase of 20.83 miles, as compared with the mileage reported December 31, accounted for as follows:

INCREASES DURING THE YEAR.

	Miles	
New branch from tower 34 to Charles Street, in the city of Rome	4.19	
Extension of Rome Branch on account of Rome improvement	4.04	
On Terminal Railway of Buffalo: track formerly classified as siding	.54	
On Beech Creek Railroad: a gauntlet track over Pine Creek	.11	
On Beech Creek Extension Railroad: by inclusion of the Hooverhurst & Southwestern Railroad and consequent change in terminals	3.90	
Trackage rights from Saranac Lake to Lake Placid	10.08	22.86

DECREASES DURING THE YEAR.

	Miles	
By change of line and connections and sundry adjustments	.67	
By abandonment of a portion of the Beech Creek Railroad	.80	
By abandonment of a portion of the Cherry Tree & Dixonville Railroad over which this company has trackage rights	.56	2.03
Making a net increase of		20.83

The capital stock outstanding on December 31, 1913, including the amount of the convertible value of capital stock of the companies consolidated on April 16, 1913, was $225,581,066.00 and no change has occurred in this amount during the year.

The mortgage, bonded and secured debt outstanding on December 31, 1913, was $378,644,052.45

This has been added to as follows:

Refunding and improvement bonds of 1914 bearing interest at the rate of four and one-half per cent per annum	$40,000,000.00		
This company's pro rata liability in connection with equipment trust certificates of 1913, bearing interest at the rate of four and one-half per cent per annum	2,600,823.97		
This company's liability in connection with B & A equipment trust certificates of 1912	2,128,000.00		
There has been included in this account the amount of a loan from the New York New Haven and Hartford Railroad Company in connection with the Grand Central Terminal Improvement	$1,310,000.00		
Reduced by annual payments amounting to	157,200.00	1,152,800.00	45,881,623.97
			$424,525,676.42

and has been decreased as follows:

Three year gold notes of 1911 paid March, 1914	$30,000,000.00	
Mortgage on real estate in city of Utica paid off	2,500.00	
Payments of installments falling due during the year on this company's pro rata liability in connection with the certificates issued under equipment trust agreement, as follows:		
Trust of 1907, installment due November, 1914	793,660.12	
Trust of 1910, installment due January, 1914	433,964.42	
Trust of 1912, installment due January, 1914	477,116.10	
B & A Trust of 1912, installment due October, 1914	500,000.00	
Trust of 1913, installment due January, 1914	303,630.59	32,510,871.23
Outstanding as shown on balance sheet of December 31, 1914		$392,014,805.19

The New York Central and Hudson River Railroad Company

(including Boston & Albany Railroad, for which separate statistics will be found at end of report)

SUMMARY OF FINANCIAL OPERATIONS AFFECTING INCOME

	1914	1913	Increase or Decrease
OPERATING INCOME	3,773.95	3,753.12	20.83 *miles*
RAILWAY OPERATIONS	*miles operated*	*miles operated*	
Revenues	$112,741,051.22	$122,683,809.35	—$9,942,758.13
Expenses	84,033,105.56	93,414,436.04	—9,381,330.48
NET REVENUE FROM RAILWAY OPERATIONS	$28,707,945.66	$29,269,373.31	—$561,427.65
Percentage of expenses to revenues	(74.54%)	(76.14%)	—(1.60%)
Railway taxes accrued	$6,162,219.76	$6,356,545.91	—$194,326.15
Uncollectible railway revenue	2,877.49	.....	2,877.49
RAILWAY OPERATING INCOME	$22,542,848.41	$22,912,827.40	—$369,978.99
MISCELLANEOUS OPERATIONS			
Revenues	$2,133.67	$2,402.39	—$268.72
Expenses and taxes	2,171.65	3,449.08	—1,277.43
MISCELLANEOUS OPERATIONS LOSS	$37.98	$1,046.69	$1,008.71
TOTAL OPERATING INCOME	$22,542,810.43	$22,911,780.71	—$368,970.28

TOTAL DEDUCTIONS FROM GROSS CORPORATE INCOME	$27,985,652.71	$26,337,497.41	$1,648,155.30
NET CORPORATE INCOME	$8,688,672.37	$13,243,558.41	—$4,554,886.04
DIVIDENDS DECLARED: four in 1913; three in 1914*	$8,458,890.00	$11,243,021.25	—$2,784,131.25
MISCELLANEOUS APPROPRIATIONS OF INCOME	24,347.04	.....	24,347.04
SURPLUS FOR THE YEAR CARRIED TO PROFIT AND LOSS	$205,435.33	$2,000,537.16	—$1,795,101.83

Balance to credit of profit and loss (free surplus) as shown in report of December 31, 1913		$12,965,794.15
Additions for year:		
Surplus from operations	$205,435.33	
Sundry deferred credits and adjustments	938,561.05	$1,143,996.38
		$14,109,790.53
Deductions for year:		
Discount and expenses account of Refunding and Improvement mortgage bonds	$3,101,875.52	
Discount, commissions and expenses account N Y C Lines equipment trust of 1913	103,708.07	
Commissions, brokerage and expenses on various short term loans	74,922.19	
Cash advances to Clearfield Bituminous Coal Corporation	445,000.00	
Charging off value of abandoned facilities	213,396.30	
Adjustment of accounts with Pullman Co. July 1, 1910, to December 31, 1913	200,000.00	
Adjustment of amount paid in connection with land for Grand Central Terminal Improvement	210,227.65	
Charging off various uncollectible accounts, settlement of suits and sundry adjustments of accounts	324,918.72	4,674,048.45
BALANCE TO CREDIT OF PROFIT AND LOSS (FREE SURPLUS), DECEMBER 31, 1914		$9,435,742.08

*The fourth quarterly dividend at the rate of 1¼ per cent on its outstanding capital stock was declared December 23, 1914, by the successor company, The New York Central Railroad Company, payable February 1, 1915.

The decline in operating revenues which commenced in October, 1913, continued throughout the whole of the year 1914, causing a net decrease of $9,942,758.13, equal to 8.1 per cent.

The decrease in freight revenues, $6,753,888.35, was 11.6 per cent. Almost every commodity in the list shows a loss in volume and the consequent decrease in the density of freight traffic per mile of road was 381,215 ton-miles.

The decrease in passenger revenue, $2,765,729.79, was in both local and interline business. The decrease in mileage amounts to 142,118,913 passenger-miles. The average amount received from each passenger decreased a little over three cents and the density of passenger traffic per mile of road decreased 43,038 passenger-miles.

The revenue from express business decreased $649,931.06, due to decrease in the volume of business and reduced rates. Mail earnings increased $468,440.38, due to more mail transported.

Rail operating expenses decreased $9,381,330.48 or 10.04 per cent. The decreases by groups were as follows:

Maintenance of way and structures decreased $3,393,644.22. There was less improvement work conducted and a lighter traffic sustained. The property was maintained to its standard.

Maintenance of equipment decreased $1,726,246.57, due to decreased mileage made by equipment.

Transportation expenses decreased $3,717,536.64, due to decrease in volume of business and the benefits in the form of increased efficiency resulting from previous investments.

Traffic expenses decreased $419,733.85.

Miscellaneous operations decreased $106,204.18.

General expenses decreased $17,965.02, notwithstanding an increase of $52,347.24 in expenditures on account of the Government Valuation requirements. The Government has not yet undertaken the actual work of valuation of your property and this expenditure represents what has been done to organize for the work and assemble the large amount of records and data which will be required by the authorities when they start the work.

The Pension Department retired and placed upon the pension rolls 186 employees during the year; 104 of these were authorized because of the attainment of seventy years of age and 82 because of total and permanent physical disability; 94 pensioners died during 1914. The total amount paid in pension allowances was $238,011.51.

Operating income shows a decrease of only $368,970.28. Non-operating income shows a decrease of $2,537,760.46, due to less dividends having been received on some of the company's investments, principally in Lake Shore & Michigan Southern Railway Company and Michigan Central Railroad Company.

Deductions from corporate income show an increase of $1,648,155.30, due to increased carrying charges on the company's unfunded debt, resulting from the financial conditions which existed at the time when unfunded obligations had to be issued or extended.

During the year there was expended for additions and improvements to the property $7,555,914.69 and for similar items on lines of leased railroad companies, $4,761,835.28. These represent the continuance or completion of work authorized and commenced in previous years. There was expended for additional equipment $7,886,284.04, mainly for new deliveries of trust equipment.

During the year additional equipment trust certificates were issued under the New York Central Lines Equipment Trust agreement of January 1, 1913, to the amount of $6,944,000, so there is now outstanding a total of $22,438,000 of these certificates. Of the equipment bought with these certificates there has been allotted to the New York Central and Hudson River Railroad $8,628,836.92.

Under the refunding and improvement mortgage described in last year's report, the Public Service Commission of the State of New York has authorized the issue of $70,000,000, of which $40,000,000 has been issued and sold. The proceeds have been used to retire the three-year gold notes of 1911 and some of the notes maturing in 1914 which had been theretofore issued to pay for additions to the property. The balance of the amount authorized, $30,000,000, has been deferred because of the radical changes in the money situation which have developed since the authority was obtained.

The agreement between this company and the New York New Haven & Hartford Railroad Company for the establishment of through routes, etc., via the Boston & Albany Railroad, was cancelled by the New York New Haven & Hartford Railroad Company as of January 31, 1914, with the consent of the directors of your company, because of orders issued by the Government.

In May, 1913, this company joined in the application to the Interstate Commerce Commission for an increase of about five per cent in freight rates. The decision of the Commission at first gave no relief, but on account of the unusual business conditions which arose subsequent to this decision, the case was reopened, and on December 16th the Commission granted an increase of not more than five per cent with specified commodities excepted. To the extent of its application, the decision of the Commission is helpful, besides inspiring confidence in their general attitude towards the railroads.

Work continued during the year on certain phases of the Grand Central Terminal Improvement which could not well be suspended, such as the excavation of the block at 42d Street and Lexington Avenue and the construction of the loops under the building. The Board of Estimate and Apportionment of the City of New York accepted the street work completed during the previous year under the terms of the general agreement with the City dated June 19, 1903. A lease was made for a store and office building site at 45th Street and Vanderbilt Avenue, the building to cost $1,000,000. A new building has been commenced at 46th Street and Lexington Avenue to cost $980,000, principally for the use of the Post Office Department under lease, in connection with the parcel post business. The New Haven Company has the option until January, 1922, to participate in the cost and benefits of this structure. The building for the Yale Club at 44th Street and Vanderbilt Avenue has been completed. The building for the Railroad Branch of the Young Men's Christian Association at 50th Street and Park Avenue has been completed and occupied since May 1, 1914.

The following changes took place in the Board of Directors during the year:

Resigned: December 31, 1913—William C. Brown,
January 14, 1914—J. Pierpont Morgan,
April 15, 1914—Lewis Cass Ledyard,
September 9, 1914—James Stillman.

Elected: January 1, 1914—Alfred H. Smith,
January 14, 1914—Harold S. Vanderbilt,
March 12, 1914—Ogden Mills,
April 15, 1914—Robert S. Lovett.

On April 7, 1914, the death occurred of Samuel F. Barger, who had been a director of this company for a period of forty years from November 1, 1869, to January 27, 1909.

The following appointments were made during the year:

Malcolm R. Connell, Auditor of Disbursements, succeeding James H. Foulds, Jr., retired;

Ira A. Hubbel, Assistant Freight Traffic Manager, vice Herbert D. Carter, deceased;

William A. Newman, General Freight Agent, succeeding Ira A. Huhbel;

John McAuliffe, Jr., Foreign Freight Agent.

Under date of April 29, 1914, the Board of Directors of this company approved an agreement under the terms of which The New York Central and Hudson River Railroad Company, The Lake Shore and Michigan Southern Railway Company, Chicago Indiana and Southern Railroad Company, The Dunkirk Allegheny Valley and Pittsburgh Railroad Company, The Terminal Railway of Buffalo, Geneva Corning and Southern Railroad Company, Detroit and Chicago Railroad Company, Detroit Monroe and Toledo Railroad Company, Kalamazoo and White Pigeon Railroad Company, The Northern Central Michigan Railroad Company and the Swan Creek Railway Company of Toledo were to be consolidated into a new company to be named The New York Central Railroad Company. This agreement was duly approved by the public service commissions having jurisdiction in the states through which the several companies affected operated, and at a special meeting of the stockholders of The Lake Shore and Michigan Southern Railway Company, held at Cleveland, Ohio, December 22, 1914, the consolidation was duly ratified, and thereupon, on the same date, the agreement was filed in the offices of the Secretary of State of the states of New York, Pennsylvania, Ohio, Indiana and Illinois, and on December 23, 1914, in the office of the Secretary of State of the state of Michigan. Although the consolidation became effective on the filing of the agreement, action was taken by the Board of Directors of the new company providing that the accounts of each portion of the consolidated road formerly owned by a constituent company should be kept separate until the close of the year 1914.

Acknowledgement is hereby rendered to officers and employees for faithful and efficient service.

ALFRED H. SMITH,
President.

LAKE SHORE AND MICHIGAN SOUTHERN RAILWAY COMPANY—ANNUAL REPORT

Under date of April 29, 1914, the Board of Directors of this company approved an agreement under the terms of which The New York Central and Hudson River Railroad Company, The Lake Shore and Michigan Southern Railway Company, Chicago Indiana and Southern Railroad Company, The Dunkirk Allegheny Valley and Pittsburgh Railroad Company, The Terminal Railway of Buffalo, Geneva Corning and Southern Railway Company, The Detroit and Chicago Railroad Company, The Detroit Monroe and Toledo Railroad Company, The Kalamazoo and White Pigeon Railroad Company, The Northern Central Michigan Railroad Company and The Swan Creek Railway Company of Toledo were to be consolidated into a new company to be named The New York Central Railroad Company. This agreement was duly approved by the public service commissions having jurisdiction in the states through which the several companies affected operated, and at a special meeting of the stockholders of The Lake Shore and Michigan Southern Railway Company, held at Cleveland, Ohio, December 22, 1914, the consolidation was duly ratified, and thereupon, on the same date, the agreement was filed in the offices of the Secretary of State of the states of New York, Pennsylvania, Ohio, Indiana and Illinois, and on December 23, 1914, in the office of the Secretary of State of the state of Michigan. Although the consolidation became effective on the filing of the agreement, in accordance with action taken by the Board of Directors of the new company it was provided that the accounts of each portion of the consolidated road formerly owned by a constituent company should be kept separate until the close of the year 1914. This report, therefore, covers the operations and financial transactions of The Lake Shore and Michigan Southern Railway Company to December 23, 1914, and of the road and property owned by it, prior to that date, to and including December 31, 1914.

On July 1, 1914, there became effective revised classifications of revenues, expenses, income, profit and loss, general balance sheet accounts, expenditures for road and equipment, and locomotive, train and car mileage, as promulgated by the Interstate Commerce Commission, and the accounts and records of the company have been kept since that date in conformity with such classifications and in accordance with the orders of the Commission. For purposes of comparison, the revenue, expense and income accounts, and locomotive, train and car mileage figures for the first six months of the year 1914 and for the entire year 1913 have been correspondingly revised on the basis of the new classifications.

The mileage embraced in the operation of the road is as follows:

	Miles.
Main line and branches	849.80
Proprietary lines	269.72
Leased lines	542.52
Trackage rights	190.13
Total road operated	1,852.17

As compared with the mileage operated during the year ended December 31, 1913, there is an increase of .71 of a mile in main line and branches due to changes in tracks through Air Line Junction yard, a decrease of 1.18 miles in leased lines due to re-classification of track from the passenger station at Oil City, Pennsylvania, to a connection with the Pennsylvania Railroad, a net decrease of .33 of a mile in trackage rights due to adjustments and discontinued use of Pennsylvania Railroad track at Oil City, aggregating 1.07 miles, as against additional trackage acquired over rails of Chicago Indiana and Southern Railroad between Gibson, Indiana, and Gibson Transfer, Indiana, a distance of .74 of a mile. These changes resulted in a net decrease in miles of road operated of .80 of a mile. A table showing in detail the miles of road and track operated will be found upon another page.

There was no change in capital stock during the year, the amount authorized and outstanding December 31, 1914, being $50,000,000.00.

The funded debt outstanding on December 31, 1913, was		$169,084,532.79
It has been increased during the year by adding pro-rata liability for additional certificates issued under the New York Central Lines Equipment Trust agreement of 1913		1,154,735.30
		$170,239,268.09
It has been decreased by payments during the year of pro-rata of installments on account of equipment trust certificates as follows:		
January 1, fourth installment 1910 trust	$889,149.54	
January 1, second installment 1912 trust	198,330.75	
January 1, first installment 1913 trust	58,868.40	
November 1, seventh installment 1907 trust	447,226.18	1,593,574.87
Total funded debt outstanding December 31, 1914		$168,645,693.22

SUMMARY OF FINANCIAL OPERATIONS AFFECTING INCOME

	1914	1913	Increase or Decrease
Operating income	1,852.17	1,852.97	
Railway operations	*miles operated*	*miles operated*	.80 *miles*
Revenues	$51,524,285.83	$59,353,109.71	—$7,828,823.88
Expenses	37,699,350.80	43,745,396.36	—6,046,045.56
Net revenue—railway operations	$13,824,935.03	$15,607,713.35	—$1,782,778.32

*Debit.

The total railway operating revenues for the year were $51,524,285.83, a decrease of $7,828,823.88 or 13.19 per cent as compared with the previous year. The decline in operating revenues, which commenced in the latter part of 1913, continued during the year of 1914, reflecting the general business depression prevailing throughout the country.

Freight revenue was $31,979,887.51, a decrease of $6,510,296.24, or 16.94 per cent. There was a falling off in practically all classes of revenue freight carried, which amounted to 33,817,871 tons, being 9,276,162 tons or 21.52 per cent less than last year. Tons carried one mile decreased 22.59 per cent, and freight train mileage 23.3 per cent. The general reduction in freight traffic was partially caused by diminution in the export and import business of the country, and by a large decrease in tonnage of bituminous coal handled, brought about by a cessation of coal mining operations in southeastern Ohio since April 1st through a strike of miners as a result of a disagreement between mine operators and employees in connection with the Green screenings law. The hoof and mouth disease, which was prevalent during the latter part of the year in parts of the states of Ohio, Michigan and Indiana tributary to the company's lines, made necessary rigid quarantine regulations, causing a decreased movement in live stock and packing house products.

In May, 1913, this company joined with other carriers in an application to the Interstate Commerce Commission for an increase of approximately five per cent in freight rates. After devoting considerable time to hearings, and requiring the carriers to submit a voluminous amount of data compiled at a large expense to them, the Commission granted to roads in Central Freight Association territory an increase of five per cent to apply on class rates and certain commodities, but not including coal, ore and several other commodities which comprise a large portion of the tonnage handled by the company. The increased rates became effective October 26, 1914, and have not, therefore, materially affected the freight revenue of the company for the year. The Commission, in rendering their decision on the application for increased freight rates, recommended an increase, where permissible, in passenger rates, and the abolition of the various kinds of free service heretofore having been performed by the railroads.

Passenger revenue amounted to $12,735,521.64, a decrease of $690,693.47. There were decreases in the number of passengers carried of 1,027,654, or 9.84 per cent, in passengers carried one mile of 44,941,965, or 6.61 per cent, in passenger train mileage of 6.72 per cent, and in density of passenger traffic of 9.99 per cent.

Revenues from transportation of mails was $2,148,900.44, an increase of $88,611.13, due to the reinstatement, effective January 26, 1914, in mail service of certain magazines which were being handled in freight train service, and additional remuneration allowed from July 1, 1913, account parcel post.

Revenue derived from express traffic was $1,687,490.08, a decrease of $416,125.77, attributable to smaller volume of business handled, caused by the business depression and increasing use made of the parcel post facilities, also to reduction in express rates which became effective February 1, 1914, by order of the Interstate Commerce Commission.

Other transportation revenues amounted to $1,197,499.22, a decrease of $114,228.36, principally due to reduction in receipts from switching, occasioned by the falling off in freight traffic.

Incidental revenues, which include practically all revenues heretofore shown under other than transportation and auxiliary revenues, were $1,774,986.94, a decrease of $186,091.17. The noticeable reductions were in revenues derived from dining and buffet cars, parcel rooms, demurrage and miscellaneous sources, the latter including revenues from operation of coal and ore docks, all of which are the result of the decrease in freight and passenger business.

Operating expenses for the year, by groups, were:

	Amount	Decrease	Per cent
Maintenance of way and structures	$5,561,822.90	$2,061,371.48	27.04
Maintenance of equipment	10,377,316.84	1,633,232.21	13.05
Traffic	960,220.12	113,887.96	10.60
Transportation	18,284,601.98	2,464,309.12	11.88
Miscellaneous operations	589,773.61	74,727.25	11.25
General	1,425,615.35	301,482.46*	26.82
Total	$37,699,350.80	$6,046,045.56	13.82

*Increase

In the maintenance of the roadbed, buildings and other structures, such work was done as was necessary in order to maintain the property to its standard. There were 450,000 less ties renewed and 100 miles less of rail relaid than in the previous year. Expenditures for new ballasting and renewing of bridges and right of way fences were curtailed somewhat. Owing to the conditions at the Cleveland Union Terminal, the Passenger Station it became necessary to tear it down, in place of which an inexpensive but useful and, safe arrangement, with overhead concourse and improved capacity of tracks and platforms, was built. The expense of this work, together with the cost of other improvements which were made at the station simultaneously, resulted in a charge against maintenance expenses of $125,000.00, causing the increase shown against station and office buildings.

Although decreases are shown in practically all maintenance of equipment items, excepting depreciation, due to a diminished demand for use of the company's equipment during the year, expenditures were necessary in equipping 183 locomotives with automatic fire doors and the application of United States safety appliance standards to a large number of freight and passenger cars in order to comply with various state and federal laws. There were also substantial expenditures for other additions and betterments.

The decrease in traffic expenses is attributable principally to a lesser amount expended for advertising. Increases are shown for superintendence and outside agencies, due to the transfer of payrolls of soliciting agency offices located along the line of the road, previously paid by fast freight lines. The increase in these accounts are offset by a corresponding reduction in the expense of fast freight lines.

In transportation expenses practically all items affected by trade conditions show decreases, due to falling off in traffic.

Miscellaneous operations, which consist largely of expenses previously shown under "Outside Operations," decreased $74,727.25, attributable to reduction in dining and buffet car service and in the cost of ice used in the company's commercial ice supply plants.

General expenses increased $301,482.46, due to heavier legal and other expenses on account of the consolidation, additional accounting expense incurred in the preparation of data for the application for the increase in freight rates and to comply with legislative requirements, preliminary work in connection with the proposed Federal valuation of this company's lines and increase in amount paid for pensions. In the operation of the Pension Department during the year 99 employees were retired and placed upon the pension rolls. Of these retirements 49 were authorized because of the attainment of seventy years of age and 50 because of total permanent physical disability. Thirty-four died during 1914, and at the close of the year 429 retired employees were carried upon the pension rolls.

Railway tax accruals amounted to $2,413,899.63, an increase over the previous year of $287,462.09, chiefly due to a higher valuation placed upon the company's property and increase in tax rates.

Non-operating income for the year amounted to $7,591,468.53, a decrease of $2,869,599.18 as compared with the previous year. There was a loss in income from dividends on stock owned by the company of $1,904,628.95, largely due to the fact that no dividends were received on preferred stock of The New York Chicago and St. Louis Railroad Company and on the stock of The Toledo and Ohio Central Railway Company as compared with five per cent on each received in 1913; also to the payment in 1913 by The Pittsburgh and Lake Erie Railroad Company of an extra dividend amounting to five per cent as compared with no extra dividend received in 1914. Income from funded securities decreased $367,760.50 account sale of bonds of The Cleveland Short Line Railway Company. There were also large decreases in income from rental of equipment, and the company's proportion of profit from operation of The Pittsburgh, Mckeesport and Youghiogheny Railroad, caused by the business depression prevailing throughout the year. Income from unfunded securities and accounts increased $604,634.24, due to interest on additional loans made by the company during the year.

Deductions from gross income for the year were $11,887,302.68, an increase over last year of $421,154.48. The interest charges on unfunded debt were $651,323.45 in excess of similar charges for 1913, due to additional short term notes issued during the year.

Out of the net income for the year, amounting to $7,124,873.80, there were paid two dividends of six per cent each on both the guaranteed and common capital stock, aggregating twelve per cent or $6,000,000.00, leaving a balance of $1,124,873.80 which was transferred to the credit of profit and loss.

There was expended during the year, for additions and improvements to the property, $2,446,705.46, excluding equipment expenditures, all of which was charged direct to property investment account. The important items consisted of:

Completion of new car repair plant at Ashtabula to be used for repairing steel equipment.

Continuation of improvements at Air Line Junction, Ohio, consisting of additional yard tracks, new freight engine terminals and car repair shops.

Separation of grades and construction of third and fourth tracks through the City of Elyria, Ohio.

Continuation of work in connection with change of line at Port Clinton, Ohio.

Completion of new locomotive repair shops at Elkhart, Indiana.

Purchase from Armour & Company of ice houses located at Air Line Junction, Ohio.

Acquisition of land at Blasdell for connection with the Terminal Railway of Buffalo.

In addition to the above, expenditures were made for separation of grades at Chicago, Ashtabula, Cleveland, Toledo, Detroit and Sandusky in order to comply with state and municipal requirements.

A statement showing in detail the expenditures for additions and betterments will be found on a following page.

In an action instituted by the United States against this company and the Chesapeake and Ohio Railway Company, The Hocking Valley Railway Company, The Toledo and Ohio Central Railway Company, The Kanawha and Michigan Railway Company and others, the Circuit Court of the United States for the Southern District of Ohio on March 14, 1914, entered a decree in which, among other things, it was adjudged that the ownership of The Lake Shore and Michigan Southern Railway Company and the Chesapeake and Ohio Railway Company (altheugh not in form joint, but separate) in the stock of The Kanawha and Michigan Railway Company and the resulting control of the latter company inhering in such holdings, were acquired in violation of the laws of the United States and in order to avoid further infraction of the federal law in this respect it was ordered that either the stock of The Kanawha and Michigan Railway Company, held by the Chesapeake and Ohio Railway Company, shall be sold and transferred to this company, or such holdings of both companies shall be disposed of by absolute sale. As a result of said decree, this company sold all its holdings in stock of The Kanawha and Michigan Railway Company, consisting of 40,296 shares, to The Toledo and Ohio Central Railway Company, receiving in payment therefor the one year five per cent note of that company dated October 1, 1914, amounting to $2,901,312.00. The company also loaned to The Toledo and Ohio Central Railway Company $2,888,500.00 in cash to enable it to purchase the holdings of the Chesapeake and Ohio Railway Company and others in stock of The Kanawha and Michigan Railway Company, receiving five per cent promissory notes for the amount so loaned, all of which notes are secured by a pledge of the stock of The Kanawha and Michigan Railway Company so acquired.

In accordance with an agreement between this company and the Pere Marquette Railroad Company, the Cincinnati Hamilton and Dayton Railway Company, the Pennsylvania Company, The Michigan Central Railroad Company, The Grand Trunk and Western Railway Company, and The Toledo St. Louis and Western Railway Company and The Hocking Valley Railway Company and The Toledo and Ohio Central Railway Company, this company transferred to The Hocking Valley Railway Company and The Toledo and Ohio Central Railway Company each 1.16 per cent of the company's holdings or 464 shares of the capital stock of the Toledo Terminal Railroad Company, each of the latter companies agreeing to assume its pro-rata share of liability for deficiency in interest charges and working expenses of the Toledo Terminal Railroad Company accruing after January 1, 1914.

There were sold during the year 3,000 shares, par value $150,000.00, of the common capital stock of the Reading Company and $4,450,000.00 of the first mortgage bonds of The Cleveland Short Line Railway Company. There were also sold 18 shares, par value $1,800.00, of the common stock of the Chicago Indiana and Southern Railroad Company, 9 shares, par value $900.00, of the stock of The Detroit and Chicago Railroad Company, 11 shares, par value $1,100.00, of the stock of The Detroit Monroe and Toledo Railroad Company, 14 shares, par value $1,400.00, of the stock of The Kalamazoo and White Pigeon Railroad Company, 18 shares, par value $1,800.00, of the stock of The Northern Central Michigan Railroad Company, and 10 shares, par value $1,000.00, of the stock of The Swan Creek Railway Company.

There were acquired during the year by purchase 158 shares of stock, par value $7,900.00, of The Pittsburgh McKeesport and Youghiogheny Railroad Company.

During the year the company issued its short term notes running for one year or less as follows: On January 22, 1914, $7,000,000.00 of one year 5 per cent notes payable January 22, 1915; on May 15, 1914, one year discount, United States, franc and pound sterling notes, payable May 15, 1915, for a total amount of $19,124,230.23; on June 10, 1914, $6,000,000.00 of one year discount notes, payable June 10, 1915; on September 6, 1914, one year pound sterling notes payable September 6, 1915, for an amount equivalent to $1,425,000.00; on December 1, 1914, $14,774,000.00 of nine months 5 per cent notes payable September 1, 1915, and $3,726,000.00 of one year 5 per cent notes payable December 1, 1915, and on December 15, 1914, one year notes payable December 15, 1915, for $755,000.00, making a total amount of short term notes issued by the company during the year $52,804,230.23; of the proceeds realized $23,767,910.00 was used in retiring the company's one year notes due March 15, 1914, for $12,000,000.00; one year pound sterling notes due May 15, 1914, for $9,726,500.00, and one year pound sterling notes due September 6, 1914, for $2,041,410.00; the balance of the proceeds realized were placed in the treasury of the company.

The laws of the State of Ohio gave to dissenting stockholders of The Lake Shore and Michigan Southern Railway Company the right to have their stock purchased before consolidation. The New York State Realty and Terminal Company, all of the stock of which was owned by The New York Central and Hudson River Railroad Company, acquired 32,200 shares at the price of $500.00 per share, and borrowed from The Lake Shore and Michigan Southern Railway Company $16,100,000.00 which it used in making the purchase, and for which it gave its promissory notes.

Under the contracts for the acquisition of coal lands in Christian, Montgomery, Fayette, Saline, Franklin and Williamson Counties, Illinois, as fully referred to in report for the year 1912, the company has received during the year deeds for 4,594 acres of additional coal lands and has paid therefor $126,647.89, making the total lands acquired to December 31, 1914, 74,573 acres at an aggregate cost of $2,399,659.34.

The stockholders of the company at a special meeting held on June 16, 1914, approved the placing upon the railroad of the company of a mortgage amounting to $100,000,000.00, to secure the twenty-five year four per cent gold bonds which had been issued in accordance with two indentures executed by the company to the Guaranty Trust Company of New York, trustee, dated November 18, 1903, and March 12, 1906, under each of which were issued $50,000,000.00 par value of bonds, or a total amount of $100,000,000.00. The Board designated as trustees under the mortgage the Central Trust Company of New York and Frank L. Littleton of Indianapolis, Indiana. Effective November 15, 1914, the Guaranty Trust Company of New York resigned as trustee for the twenty-five year gold bonds of 1903 and 1906, whereupon the Central Trust Company was appointed by the Board as trustee of said bonds.

The New York State Workmen's Compensation Act which became effective July 1, 1914, while of very limited application to employees of interstate carriers, owing to the Federal Employers' Liability Act, was of such a nature that the State Compensation Commission required the company to deposit $2,500.00 in cash and $25,000.00 par value of New York City 4½ per cent bonds, costing the company $25,503.87.

The United States Express Company which had been conducting a through express business over the company's tracks from points east of Buffalo in connection with the Lackawanna Railroad, destined to Cleveland, Sandusky, Toledo, Detroit and Chicago and points beyond and vice versa, withdrew from the express business as of June 30, 1914. Thereupon a contract was made with the Adams Express Company, effective July 1, 1914, granting to that company practically the same territory and privileges heretofore enjoyed by the United States Express Company.

Out of $24,000,000.00 of certificates authorized under New York Central Lines Equipment Trust agreement dated January 1, 1913, there were issued to December 31, 1913, an aggregate of $15,494,000.00, of which this company's pro-rata allotment was $1,213,072.16. During the year 1914 additional certificates were issued amounting in total to $6,944,000.00. The cost of the equipment assigned to this company in connection with the issue of these latter certificates is approximately $1,291,333.18, and its pro-rata amount of certificates, representing an amount not to exceed 90 per cent of the cost, is $1,154,735.30.

Cost of road and equipment on December 31, 1913, was.. $147,356,093.89

It has been increased during the year as follows:

Expenditures for additions and betterments to the property as shown in detail elsewhere	$2,446,705.46	
Cost of equipment received during the year under the equipment trust of 1913	1,603,587.61	
Additional equity in 468 refrigerator cars cars covered by Merchants Despatch Equipment Trust of 1911	35,077.50	
Cost of equipment in excess of amount required to restore equity in equipment trusts of 1907, 1910 and 1912	19,696.71	4,105,067.28
		$151,461,161.17
Value of equipment retired from service during the year	$1,036,234.06	
Less amount charged account additions and betterments and adjustments	609,047.80	427,186.26
Cost of road and equipment, December 31, 1914		$151,033,974.91

A new transfer house which was constructed by the Indiana Harbor Belt Railroad Company near Gibson, Indiana, was opened for business on January 22, 1914. This transfer house is used for less than carload freight and at present is handling that class of freight received from Chicago industries and western railroads destined to points east and south of Chicago. The transfer house is used jointly by this company and The Michigan Central Railroad Company, Chicago Indiana and Southern Railroad Company and Indiana Harbor Belt Railroad Company. It was necessary for the company, in order to avail itself of the use of this facility, to acquire trackage rights for its freight trains over the rails of the Chicago Indiana and Southern Railroad Company between Indiana Harbor, Indiana, and Gibson Transfer, Indiana.

Mr. Alfred H. Smith, who was on December 10, 1913, elected President and a Director of the Company, assumed the duties of those offices on January 1, 1914.

On March 1, Mr. Frederick Zimmerman was appointed General Freight Agent of the company.

Acknowledgment is hereby rendered to officers and employes for faithful and efficient service.

ALFRED H. SMITH,
President.

B. B. Adams	R. E. Thayer	F. W. Kraeger
E. T. Howson	A. C. Loudon	K. L. Van Auken
H. H. Simmons	C. B. Peck	E. G. Zack

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico.....$5.00
Canada 6.00
Foreign Countries (excepting daily editions)..... 8.00
Single Copies.....15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention daily issues, North America, $1; foreign, $2.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue 8,750 copies were printed; that of these 8,750 copies 7,327 were mailed to regular paid subscribers to the weekly edition, 250 were provided for counter and news companies' sales, 1,067 were mailed to advertisers, exchanges and correspondents, and 106 were provided for samples and office use; that the total copies printed this year to date were 129,450, an average of 9,246 copies a week.

The RAILWAY AGE GAZETTE and all other Simmons-Boardman publications are members of the Audit Bureau of Circulations.

Volume 58 April 2, 1915 Number 14

Politics and the State Commissions

When the Public Utilities Commission of Illinois was organized, Governor Dunne appointed as its chairman a wholesale grocer named James E. Quan. Mr. Quan presided over numerous sessions of the commission, the chief result of which was to show that his knowledge of the business of railways and other public utilities was very circumscribed. He having resigned, Governor Dunne has appointed to succeed him William O'Connell. Mr. O'Connell was commissioner of public works of Chicago when Mr. Dunne was mayor, he was Mr. Dunne's manager during the latter's campaign for governor and he is now treasurer of Cook County, Illinois. All these things indicate that he is an active and successful politician. But why has he been appointed to the Public Utilities Commission? We anticipate that as public utility commissioners run, Mr. O'Connell will be above the average in ability and fairness. But his appointment raises the old, old question as to why members of public utility commissions should not be chosen because of their qualifications for public utility commissions instead of because of their qualifications as politicians.

Passenger Fares in Ohio

An unusually clear and convincing statement of the argument for the repeal of state two-cent fare laws is that regarding the situation in Ohio made by President L. E. Johnson, of the Norfolk & Western, in an address before the City Club of Cleveland, which is published in this issue. Mr. Johnson showed that the question involved is not so much one of increased profits for the companies, as whether by state laws the revenue from passenger service is to continue to be so unfairly reduced that the passenger service will not be self-supporting, the result being that the traveling public will finally suffer in decreased efficiency of service. As the Norfolk & Western is one of the roads that has maintained a division of expenses as between its freight and passenger service, Mr. Johnson was able to show that the operation of its passenger trains in Ohio last year was conducted at an actual loss of $40,000. While such figures are not available for all roads in the state, Mr. Johnson exploded in one sentence the theory on which fares were reduced, that the increased traffic would more than offset the decreased revenue per passenger. In 1905, under the three-cent rate, the railroads of Ohio carried an average of 44 passengers per train mile, giving a train-mile revenue of $1.32. In 1914, there were only 50 passengers per train mile, making the train-mile revenue $1, so that in connection with increased expenses of all kinds the railroads in 1914 received 32 cents less for each train mile for carrying 6 additional passengers. Ohio started the two-cent fare movement by passing a two-cent fare law in 1906. In the face of such a showing it would be very appropriate for the Ohio legislature to take the lead in partially undoing the wrong done.

The New Operating Expenses Classification

The New York Central Lines are the first railroad companies to make annual reports in the new form prescribed by the Interstate Commerce Commission. This new classification went into effect on July 1, 1914; but the New York Central Lines have reclassified their expenses for the first six months of the calendar year and also their 1913 expenses for purposes of comparison. From an examination of these first reports under the new system it would appear that one of the greatest improvements in the new classification as compared with the old is the more logical and scientific division of maintenance of way expenses. Whereas the old classification provided an account for roadway and track, which included the cost of applying material, of track surfacing and cleaning, policing, changing grades, bank protection and other expenses, the new classification divides these expenses as between roadway maintenance and track laying and surfacing. Thus, in 1913 the New York Central & Hudson River spent, according to the old classification, $5,269,000 for roadway and track, while according to the new classification the company spent in the same year $877,000 for roadway maintenance and $4,392,000 for track laying and surfacing. The splitting of the old account in this way is both logical and helpful. There is, however, included under track laying and surfacing the cost of track maintenance, which includes the labor cost involved in keeping track in alinement, surface and gage. From an accounting point of view it would have been more logical to have included this under roadway maintenance rather than to combine it with track laying. Such a division would have kept entirely separate the two independent variables—cost

of keeping materials already in track up to a certain standard and cost of applying new materials. Roughly, but not strictly, it would have corresponded to the distinction between repairs and renewals.

RECENT TENDENCIES IN CONCRETE BALLASTED DECK CONSTRUCTION

THE Judith river and other viaducts built on the new line of the Chicago, Milwaukee & St. Paul between Lewistown, Mont., and Great Falls, described on another page of this issue, are examples of the most advanced practice in adapting concrete ballasted decks to large steel structures. The use of this type of solid floor is not new but it is only within the last two or three years that it has been placed on structures of this size. The development of solid floor bridges has been most marked on the roads in the middle west, including particularly the St. Paul, the Santa Fe, the Rock Island, the Illinois Central and the Burlington.

Some of the earliest designs of solid floor construction were originated for track elevation subways in Chicago about ten years ago. Here it was necessary to construct solid floors to prevent moisture from seeping through the bridge to the street below. The heavy cost of maintenance, the special track construction required and the noise created by the shallow steel floors first used, led to the adoption of concrete slabs carrying the ballast and standard track construction. A similar development was also brought about near this time by the necessity for greater protection of timber bridges from fire, leading the Santa Fe, the Rock Island, and other roads to apply creosoted timber ballasted decks to these structures. The resulting uniformity of track construction and more satisfactory riding qualities soon led to the adoption of the same type of deck on other structures.

The choice between creosoted timber and concrete ballasted decks is purely an economic one. On roads such as the Santa Fe, passing through large timber areas and possessing extensive treating facilities, the timber deck is somewhat cheaper, although the difference is not great. The difference in weight is also not a material factor. Therefore, on roads not accessible to a suitable supply of timber or without treating facilities, a concrete deck is as economical as creosoted timber at the present time and its relative economy will increase materially with the rising cost of timber.

Confined at first to track elevation, subways and other short spans, the use of the solid floor has been extended gradually until the St. Paul, the Santa Fe, and several other roads have made this standard for all deck girder structures and are applying it on many through and deck spans of medium length. The St. Paul has placed such a deck on several 135-ft. deck girder spans and on deck truss spans 160 ft. long. While not important for short spans, the increased dead load resulting from the solid floor becomes of greater consequence as the length of span is increased. However, the advantages of the solid floor are resulting in a general increase in the length of spans to which this type of floor is being applied. The Santa Fe is placing a creosoted timber ballasted deck on spans 306 ft. long in its bridge crossing the Missouri river at Sibley, Mo., and the New York Connecting Railroad is using concrete ballasted deck on the entire elevated section of its four-track line nearly 10 miles long, including the Hell Gate arch with a span of 1,000 ft.

With the concrete ballasted deck built in units as illustrated in the Judith river viaduct referred to above, several difficulties are presented to the designer. In the first place, when casting a large number of slabs in forms it is very difficult to insure exact uniformity of dimensions. Any error in the forms becomes cumulative and noticeable when multiplied in a number of slabs. The joints between the different slabs have not been waterproofed in any way and there has been some fear that with the moisture and fine particles of ballast dropping down between the slabs onto the upper flanges of the girders there would be some deterioration of the girders. However, a recent examination of one of the earliest structures of this type which has been in service for seven years, failed to reveal grounds for any serious fear from this source. Another problem which has been given attention has been the tendency for the individual slabs to creep or move longitudinally along the structure. While this movement has been minor, it has been noticed in several structures. To prevent this a recent design of the St. Paul provides for a spacing angle to be riveted to the upper flange of the girder in the field with one leg extending between the adjacent slabs. These, however, are minor details of design which do not affect the practicability of the solid floor deck as a whole.

Several advantages are derived from this type of construction. Probably the most important is that of economy in maintenance cost. With the open floor replaced by the standard ballasted track construction, it is estimated that the cost of maintenance per foot of track on the bridges is reduced one half. At the same time, a better line and a uniform riding track are secured, while the more or less pronounced jar resulting from passing from one form of track construction to another at the ends of open floor bridges is eliminated. Also, a ballasted deck rides as quietly as the adjacent embankment, while the track may be maintained by the regular track forces without the necessity of calling a bridge gang from time to time. A further advantage which may be considered sentimental, but which is present, nevertheless, is the appearance of added strength which the solid floor gives to the layman.

THE DISINTEGRATION OF THE GOULD SYSTEM

IN 1906 the Gould system lacked only about 100 miles of line—which would connect the Wheeling & Lake Erie with the Western Maryland—of a transcontinental system running from Baltimore, Md., to Oakland, Cal. This 100 miles of line was never built because the disintegration had already begun. The backbone—although it was a weak backbone—of the system consisted of the Missouri Pacific and the Wabash. Today the Wabash is in the hands of receivers, and last week the election of a new board of directors of the Missouri Pacific apparently marked the transfer of control of that company to Kuhn, Loeb & Company and associates.

It is worth while to very briefly outline the steps by which a transcontinental system, of which there has never been one in the United States in the strict sense of the word, was so nearly established. Starting in 1876 with the Missouri Pacific, then called the Pacific Railroad of Missouri, which was controlled by Jay Gould, the St. Louis, Iron Mountain & Southern, the International & Great Northern and the Texas Pacific were brought under Gould control. By 1901 the control of the Denver & Rio Grande had been acquired, and previous to this control of the Wabash had been secured. In 1903 the Western Pacific was incorporated to build a line from Salt Lake City, Utah, the western terminus of the Denver & Rio Grande, to Oakland, Cal., and about this time the Goulds acquired control of the Wheeling & Lake Erie, the western extension being carried out on the credit of the Denver & Rio Grande and the eastern on the credit of the Wabash. The Wheeling & Lake Erie, through the construction of the Wabash-Pittsburgh terminal and the West Side Belt, got an entrance into Pittsburgh. The Goulds acquired the Western Maryland, which ran from Bellington and Elkins, W. Va., to Baltimore, Md. It was only about 100 miles from the southeastern terminus of the Wheeling & Lake Erie to Bellington. The Baltimore & Ohio already had a connection across here, but before the Goulds could build a line, the cost of the entrance into Pittsburgh broke the system's back.

The history of the system since the Wabash-Pittsburgh terminal receivership has been the record of a long fight against economic principles, in which economic principles have been triumphant in every instance. The Rockefellers gradually took over a large part of the Gould holdings of the Western Maryland; the Wabash, after a long up-hill fight, went into bank-

ruptcy; the Missouri Pacific went from bad to worse, and in 1912 was only saved from passing out of the control of the Goulds by a very narrow margin; year by year the Western Pacific became a more unbearable burden to the Denver & Rio Grande until it has been decided to make some default or some compromise in the payment of the Western Pacific's first mortgage bonds, and now George Gould and all but one representative of the Gould estate have retired from the board of directors of the Missouri Pacific.

The causes for the failure of the ambitious plan, backed as it was by the great personal wealth of the Gould estate, may be roughly divided into two classes: The mistakes which were made in carrying out the plan, and the inherent weaknesses of the plan itself. In the first class will be included poor management, shortsighted policies of maintenance and betterment, purchases at excessive cost, etc. In the second class are the inherent and ruinous waste of competition and the undermining of self-supporting local business through the reductions in rates made by state commissions. Every link of this transcontinental system was a line competing for through business with other railroads better situated, better managed or stronger financially. Although, of course, the extension west from Salt Lake City, as well as the acquisition of lines running east from the eastern terminus of the Wabash, might be expected to create new business, the avowed primary object was to secure traffic for the system which was then being secured and adequately handled by other railroads.

In a way the Gould attempt to establish a transcontinental system was an effort on the part of a single system to solve a problem which the roads in central freight association territory and the western roads have taken to the Interstate Commerce Commission. The Missouri Pacific and the Wabash are both economic assets to the territory which they serve of sufficient value to warrant adequate support. On the other hand, competition for the traffic which this territory has to offer was so keen that in self defense the Wabash and the Missouri Pacific had lowered rates to a point where they were not adequately remunerative. An individual system could not, of course, raise its rates without a simultaneous increase in rates by its competitors. To overcome this situation, therefore, the Goulds tried to secure additional traffic over the Missouri Pacific and the Wabash by buying or building "feeders" with termini at the Atlantic seaboard on the one hand, and the Pacific ocean on the other. It was a case of the tail trying to wag the dog. The Pennsylvania in the East lay entrenched in a position so strong that it could afford to support highly competitive lines running out from Pittsburgh west, and the Southern and Union Pacific were so strongly entrenched in California that they could afford to support their lines extending east across the desert. The Goulds, on the other hand, attempted to use as a base of operations the lines in highly competitive territory of the Wabash and of the Missouri Pacific and the lines of small local business of the Missouri Pacific to throw out highly competitive lines into the home territory of the Pennsylvania and of the Southern Pacific.

The case of the Denver & Rio Grande has not been mentioned. This road had a very profitable local business. It was a very expensive line to operate, but it had large sections of country rich in mineral resources where there was no competition. Left to itself it could, and probably would, have been a successful local railroad property. Its credit, however, was used to build the Western Pacific, while at the same time state commission orders reduced its compensation for the handling of local business, both freight and passenger, to a point that probably would have threatened the solvency of the company, even without the drain of the Western Pacific guarantees.

There are lessons which can be learned from this experiment: One is that either the eastern roads controlling central freight association territory roads will have to continue supporting these roads, or else there will have to be further large readjustments in rates in these territories. The day of competitive railroad building is over; the form of competition for traffic has radically changed. It is no longer so much dependent on the efficiency of the traffic solicitors as it is on the quality of service rendered by the transportation department. This was a point which was never fully appreciated apparently by those in control of the Gould system.

THE NEW ENGLAND RAILROAD SITUATION

FROM the standpoint of all the interested parties the railroad situation in New England is at present very serious, and this makes the business situation in that territory serious. No part of the country more imperatively requires good railway service in order that it may prosper than New England. Whether the solution of its railroad problem shall be made in some satisfactory way at an early date, or shall be indefinitely postponed and some of its principal railways shall be thrown into bankruptcy with the resultant demoralization of transportation and the consequent losses in all lines of business, depends on what action shall be taken by the legislatures of the New England states during their present sessions.

The acute problem presented is due to the financial condition of the two principal lines—the Boston & Maine and the New York, New Haven & Hartford. The Boston & Maine is already bankrupt and only a thoroughgoing reorganization can put it on its feet and fit it to render the service needed by the communities it serves. The New Haven, in addition to other difficulties, has outstanding $53,000,000 of floating debt, of which $33,000,000 matures between now and the middle of May and $20,000,000 in 1917. In order to help it to renew the notes falling due before the middle of May and to afterward put its finances on a sounder basis, it needs legislation validating certain stock and permitting it to refund its floating debt.

The situation immediately confronting the Boston & Maine is not merely serious, but desperate. Not many years since it was regarded as a strong railway and its stock commanded high prices. As recently as in 1909 and 1910 its fixed charges and dividends were earned and paid. In 1911, 1912 and 1913 it did not earn its dividends. In the fiscal year 1914 it not only did not earn any dividends, but failed by over $2,000,000 to earn its fixed charges; and its results since then have been discouraging. With its earnings in this condition it had $22,626,000 of short-time notes come due on March 2, 1915. The holders of 98 per cent of these have renewed them for six months pending action on plans for the reorganization of the system. If the legislatures should adjourn without agreeing on some such plan a receivership would result.

Why has a railway which a few years ago seemed to be doing so well been brought so quickly to such a plight? This has been due partly to the road's management under Mr. Mellen, partly to its financial organization, but mainly to increases in expenses and taxes, such as have taken place on all railways. The Mellen regime is ended. The passenger and freight rates are undergoing a readjustment which will at least partially offset the increases in expenses and taxes. But, as President Hustis has frankly stated, it is probable that no changes in its rates can be secured which will be sufficient to save the Boston & Maine unless the railway system itself is radically reorganized.

The Boston & Maine Railroad proper is a relatively small part of the Boston & Maine system. The company actually owns only a little more than 700 miles out of a total operated system of about 2,400 miles. The greater part of the system consists of roads which are leased to the Boston & Maine. The principal of these are the Boston & Lowell, the Concord & Montreal and the Fitchburg, and the total mileage of the leased lines is over 1,500 miles. When these lines were leased to the Boston & Maine the railways of the country were relatively prosperous and apparently promised to become more so; and the then management of the Boston & Maine contracted with the owners of the leased roads to pay them rentals ranging as high as 7 to 10 per cent. While business continued good and the net earnings

of the system were substantial these leased lines were valuable to the Boston & Maine. But when increases in wages, taxes and other expenses and reductions in rates and losses of traffic began to reduce net earnings the position of the Boston & Maine rapidly weakened. It had to pay the high rentals for which it had contracted as well as the interest on its own bonded debt, in consequence of which its total fixed charges were heavy; and at the same time it had to bear the entire loss of net earnings both on its owned lines and on its leased lines. The capitalization of the Boston & Maine system is about $200,000,000, or a little over $94,000 a mile, as compared with $136,000 for the Boston & Albany and $240,000 for the New Haven. Of this total, $160,000,000 is the capitalization of leased and controlled lines, on practically all of which a return has had to be paid whether it has been earned or not, while only about $40,000,000, or 20 per cent, is the capitalization of the Boston & Maine proper. Of the total per mile of $94,210, no less than $46,290, or almost half, represents leases, and $29,390 represents funded and non-funded debt, leaving only $18,530 of capital stock on which the payment of a return could be suspended. It is perfectly evident from this that, while the total capitalization of the system is not heavy for the territory in which it operates, the Boston & Maine's fixed charges are wholly excessive under the conditions which now exist and which will probably continue to exist for some time. Furthermore, it is apparent that the main reason why the Boston & Maine's fixed charges are excessive is that it contracted to pay amounts to its leased lines which may have been reasonable when the leases were made, but which, owing to changed conditions, have become unduly burdensome and will continue to be so. It is clear, therefore, that the owners of the leased lines must voluntarily give up their claims under their leases and enter into some new relation to the Boston & Maine, or that the company must go through bankruptcy, in which case all of the unprofitable leases would be canceled and the system would be broken up.

The owners of the leased lines have much to lose and nothing to gain by having the system disrupted and their roads thrown back on their hands. Some of the leased lines, such as the Boston & Lowell, are themselves made up largely of leased lines, and if the system were broken up they would speedily find themselves in the same situation that the Boston & Maine is in now. The various parts of the system could not be operated separately with profit. Each would have to have its own staff of officers. Each would have to provide independent terminal and other facilities in place of those which they now use jointly. Each would be cut off from markets which it now reaches over the lines of the others. Even if they would have enough credit individually to raise the money for new investment that they would require, which is wholly improbable, each would have its fixed charges and operating expenses increased and its business injured in a hundred ways. The day when such small properties could be operated independently with profit in a territory such as New England long since passed. From the standpoint of the New England public, an attempt to operate them separately would be disastrous; for the traffic of the territory speedily would become demoralized.

The only alternative to the dissolution of the system is a reorganization under which the leases will be canceled and the properties composing the system will be practically or completely merged under the ownership of a single corporation. If the owners of the leased lines are to save the most that they can they will have to do so as owners of the securities of the system rather than as owners of leased lines receiving a guaranteed return. It will be to their best interest for them to co-operate in preventing the system from going into a receivership, which, under present conditions, probably would last for some years and result in heavy losses to all concerned.

The need for a speedy reorganization is generally recognized, but efforts are being made to get for the owners of the leased lines more than can be conceded to them. Obstacles are being thrown in the way of the needed legislation, and provisions in it are being suggested which would render it practically impossible to effect a satisfactory settlement. For example, the Public Service Commission of Massachusetts proposes that the consent of two-thirds of the stockholders of each of the 25 interested corporations be requisite to the adoption of a plan of reorganization. When the Boston & Maine was taken from the control of the New Haven a board of five trustees composed of some of the most prominent and public-spirited citizens of New England was appointed by the Federal government to vote the New Haven's stock in the Boston & Maine until it could be disposed of. These trustees have recommended legislation to the various states which they believe will be fair to all concerned, and it seems clear that the legislation they have recommended should be adopted. The Springfield (Mass.) Republican usually expresses the most independent and intelligent opinion of New England, and, in advocating the adoption of the trustees' plan, it says: "It would surely be impossible to frame a reorganization plan for the Boston & Maine that would be free from objections. It used to be said in the days when the resumption of specie payments was the leading issue in the United States that the way to resume was to resume. So in the case of the Boston & Maine, the way to reorganize is to reorganize as simply, directly and expeditiously as possible in order that the system may be saved from a receivership."

Due consideration should be given to the rights and interests of those who leased their railways to the Boston & Maine company and turned their management over to it. But consideration should also be given to the rights and interests of those who in good faith have invested in the securities of the Boston & Maine itself, as well as to all the business interests of New England. If the rights and welfare of all be given due weight the legislatures will adopt some plan under which, while all directly affected will suffer some losses, the system will be held together and put on a basis where it can be so managed as in the long run to serve and promote the interests of all concerned.

Turning from the Boston & Maine to the New Haven, we find a peculiar situation. The New Haven has been developed and operated under charters from both Massachusetts and Connecticut. Massachusetts long has had a law which has authorized its state commission to regulate the issuance of railway securities and which prescribes the way in which this shall be done. Connecticut, on the other hand, has allowed railways, and the New Haven in particular, to do their financing very much as they have pleased. Prior to 1910 the New Haven, under its Connecticut charter, issued many securities which it could not have issued under its Massachusetts charter and the laws of that state. In 1910 the Massachusetts legislature, in order to clear up this situation, passed a law validating under the statutes of Massachusetts all the securities previously issued. Even after this the Mellen management of the New Haven continued to issue securities which it could not have issued under the laws of Massachusetts. In consequence, the New Haven now has out $52,500,000 of stock which has not been formally validated under the laws of Massachusetts, in addition to the short-time notes already mentioned. There will, therefore, be a cloud upon this stock, and for this and other reasons it will be impossible to so refund the New Haven's floating debt as to reduce its fixed charges, until special legislation is passed by the Massachusetts legislature.

The question as to what should be done about these matters was referred by the legislature to the Public Service Commission of Massachusetts for investigation and report. In February the commission made a report in which it criticised the policy of the state of Connecticut and also condemned the Mellen management for taking advantage of the laws of Connecticut and disregarding the laws of Massachusetts. But the commission recognized the fact that the harm which had been done could not be undone; that the management of the New Haven had been changed; and that the present management had publicly pledged

itself to refrain from the use of the methods which characterized the Mellen regime. In view of all the facts the commission concluded that it was to the interest of the public for legislation such as that being sought by the present management of the New Haven to be passed. It pointed out that such legislation would not increase the capitalization of the road, since the securities in question are already in the hands of the public, and that it would tend to reduce the New Haven's fixed charges and thereby enable it to make improvements which are needed in order that it may render adequate and satisfactory service.

However, much condemnation the former management of the New Haven may deserve, and however disagreeable it may be to the people of Massachusetts to have legislation passed to validate acts committed in disregard of their laws, the conclusion of the Public Service Commission seems the only rational one that could be reached. As the commission's report shows, the people of New England and of the United States must assume a part, and a large part of the responsibility for such mismanagement as has occurred on the New Haven. The old management could not have done what it did if Connecticut had not passed laws permitting it to do so. The New Haven could never have acquired control of practically the entire railroad system of New England if the Department of Justice of the United States had acted as vigorously to have it enjoined from violating the Sherman anti-trust law as it did to break up the combination long after it was formed. There probably never would have been a holding corporation in the United States if certain states for their own selfish advantage had not passed special laws expressly authorizing them to be created. Since the people, through their state and national governments, have permitted and even expressly authorized, a large part of the acts on the part of corporations, the results of which they are now trying to destroy, the people should be willing to suffer their share of the harm which has been done and to co-operate with the corporations in making the consequent period of readjustment as short and the suffering and losses caused by it as small as possible.

THE MICHIGAN CENTRAL AND THE BIG FOUR

THE two principal subsidiaries of the New York Central Railroad are the Michigan Central, operating 1,800 miles of road, the greater part of which lies within the state of Michigan, and the Cleveland, Cincinnati, Chicago & St. Louis, operating 2,381 miles of road, nearly all of which is within the three states of Indiana, Ohio and Illinois. The effect of the business depression was even more strikingly shown in the results of operation of the Michigan Central and the Cleveland, Cincinnati, Chicago & St. Louis in 1914 than in the results of operation of the New York Central and the Lake Shore (*Railway Age Gazette*, March 26, page 683), the combined properties of which are now operated as the New York Central Railroad. This is because one of the two subsidiaries was being operated previously on a narrow margin of safety above the bond interest and the other at a deficit. The final deficit on the Big Four compares favorably with the deficit in 1913 because of the flood conditions in that year.

The Michigan Central had $414,000 available for dividends at the end of 1914, so that after the payment of 4 per cent, calling for $750,000, the company had a deficit of $334,000. The Big Four had a deficit, after paying its fixed charges, of $1,974,000. Total operating revenues on the Michigan Central amounted to $33,465,000 in 1914, a decrease as compared with 1913 of $3,212,000. The Big Four had operating revenues in 1914 of $35,366,000, a decrease of $2,248,000. Both companies reduced expenses in greater proportion than the reduction in revenue, the Michigan Central operating in 1914 on a 75.25 per cent ratio of expenses to revenue, as against a 76.35 per cent ratio in 1913, and the Big Four on an 81.87 per cent ratio in 1914, as against an 87.23 per cent ratio in 1913.

The loss in revenue on both roads was very largely due to loss in freight traffic. In 1914 the Michigan Central carried 19,196,000 tons of revenue freight, a loss as compared with 1913 of 2,654,000, and the Big Four carried 26,078,000 tons of freight in 1914, a loss of 3,535,000 tons. With the exception only of an increase in the tonnage of fruit and vegetables, forest products other than lumber, and cement, brick and lime on the Michigan Central, the tonnage of nearly all commodities on both roads showed decreases in 1914 as compared with 1913. The heaviest losses on the Michigan Central were in the tonnage of anthracite and bituminous coal, 1,212,000 tons of anthracite being carried in 1914, a loss of 311,000 tons, and 3,447,000 tons of bituminous coal being carried in 1914, a loss of 469,000 tons. The largest losses on the Big Four were in the tonnage of lumber, which loss amounted to 659,000 tons, the total carried in 1914 being 1,748,000 tons; in the tonnage of grain, the loss being 570,000 tons and the total carried in 1914 being 1,327,000 tons, and in the tonnage of bituminous coal, the loss being 368,000 tons and the total carried in 1914 being 11,827,000 tons. A loss in grain tonnage on both the Michigan Central and the Big Four is noticeable because there was, of course, a bumper crop in the fall of 1914. The Michigan Central carried 1,062,000 tons of grain in 1914, a loss of 122,000 tons as compared with the year before. The explanation is probably that there were very large purchases of grain for export by agents of the English and French army and that the greater proportion of this grain was routed via Canada for export at Montreal. The much heavier loss to the Big Four than to the Michigan Central would bear out this assumption.

As already mentioned, both companies succeeded in making very heavy cuts in expenses, the total saving for the Michigan Central being $2,822,000, or approximately 10 per cent, and on the Big Four the total saving being $3,857,000, or 12 per cent. The following table shows the percentage of each class of expenses to total operating revenues for the two roads in 1914 and 1913:

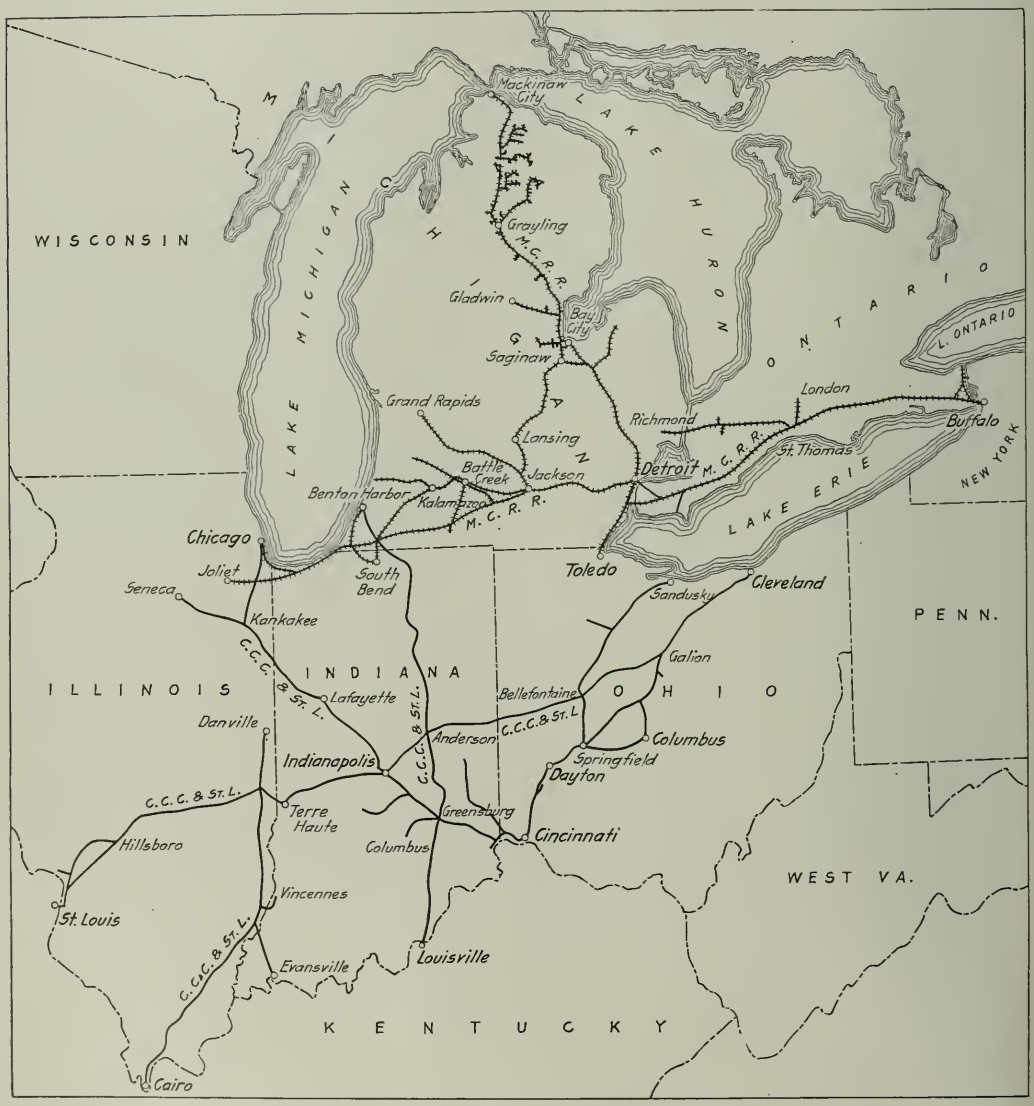
	1914		1913	
	M. C.	Big Four	M. C.	Big Four
Maint. of way and structures	10.84	13.40	13.30	15.27
Maint. of equipment	15.98	21.81	16.60	23.76
Traffic expenses	2.28	2.53	2.17	2.58
Transportation expenses	42.35	41.23	40.94	42.83
Miscellaneous operations	1.74	0.85	1.64	0.89
General expenses	2.06	2.13	1.70	1.90
Total	75.25	81.87*	76.35	87.23

*Of the total in 1914 for the Big Four 0.08 per cent represents "transportation for investment credit."

Transportation expenses on the Michigan Central amounted to $14,170,000, a saving as compared with 1913 of $843,000. On the Big Four transportation expenses amounted to $14,582,000, a saving of $1,528,000. The ton mileage of all freight on the Michigan Central was 3,205,000,000, a decrease of 532,000,000 ton-miles. The total number of passenger-miles handled was 434,800,000 in 1914, a decrease of 14,700,000. It will be noted, therefore, that the reduction in transportation expenses was not proportionate to the smaller amount of freight business handled, but this is probably partly accounted for by the comparatively small decrease in passenger business. On the Big Four the total ton mileage in 1914 was 4,601,000,000, a decrease of 230,000,000 as compared with 1913, and the total passenger mileage was 440,600,000, a decrease of 25,500,000 as compared with 1913. The Big Four, therefore, succeeded in reducing its transportation expenses to a greater extent even than the falling off in freight business. Passenger business did not fall off but about 5 per cent, so there was little, if any, chance for economy in this service.

Both the Michigan Central and the Big Four had a heavier average trainload in 1914 than in 1913, the Michigan Central's being 463 tons in 1914, an increase over the previous year of 6 tons, and the Big Four's being 571 tons, an increase of 62 tons over the year before. These figures for both companies are for total trainload, including company freight. Both the Michigan Central and the Big Four had better engines in

freight service in 1914 than in 1913, a large number of Consolidation locomotives having been converted in the previous year into Mikados; and, of course, also with a falling off in business it was possible to use only the engines in best condition and best adapted to the work required of them. The Michigan Central, however, with its large proportion of diversified commodities, and commodities which must be



The Michigan Central and the Cleveland, Cincinnati, Chicago & St. Louis

moved, whether a full carload or a full trainload is obtainable or not, could not show in its average trainload figures for 1914 as big a gain as could the Big Four, with its larger proportion of coal and other drag freight. Average carloading on the two roads illustrates this point. The average carload per loaded car of all freight on the Michigan Central was 17.42 tons in 1914 as against 17.92 tons in 1913. On the Big Four it was 23.3 in 1914 as compared with 21.8 in 1913.

The cut in maintenance expenses on both the Michigan Central and the Big Four appears to be heavy. As will be seen from the table at the end of these comments, the reduction in maintenance of way expenses amounted to about 26 per cent on the Michigan Central and 17 per cent on the Big Four. The saving in maintenance of equipment expenses was proportionately as great on the Big Four, but not so large as on the Michigan Central. In regard to the decrease in maintenance of way expenses on the Michigan Central President Smith says: "The decrease in maintenance of way and structures is accounted for by general retrenchment affecting nearly all of the items in this group." The decrease in maintenance of way expenses on the Big Four represents

in part a reduction in the amount of material used in replacement and renewals, but also in part a saving in wages, larger proportionately than the reduction in amount of work done. Thus the reduction in payrolls amounted to $673,000, which is more than half of the total reduction, notwithstanding the fact that there was an actual increase in the amount spent for ties and rails and for shops and engine houses.

The decrease in expenditures for maintenance of equipment, as shown by the table, is larger than the actual difference in the upkeep of the cars and locomotives as between the two years. In 1913 on both the Michigan Central and the Big Four a number of Consolidation engines were converted into Mikados, as previously mentioned. A part of the charge for this work was made to maintenance of equipment and a part, of course, to additions and betterments. There was nothing to correspond to this charge to maintenance of equipment in 1914. Taking this factor into consideration, the actual expenses per mile run for repairs were as liberal in 1914 as in 1913. This is true when applied to work done, as distinct from cost of work done, even on the Big Four. In the latter part of 1912 and the early part of 1913 the Big Four was so hard pushed to find equipment enough to handle its business that its own shops proved inadequate to make necessary repairs quickly enough. A considerable amount of work was therefore let out to contract shops, which proved more expensive than if the company had done its own work; and, furthermore, the bills for this work done in 1912 strung along into 1913, while in the latter part of 1913 a vigorous policy of cleaning up bills and of making charges to expenses, if necessary, on a basis of accruals, so as to get in the expense in the period in which it belonged, was made, and therefore the 1913's maintenance of equipment accounts were not properly representative of the amount of work done in that year.

The Michigan Central spent $1,434,000 for additions and betterments in 1914 and the Big Four $6,449,000. More than half of the amount charged by the Big Four is accounted for by the charges for equipment acquired under the 1914 equipment trust.

At the end of 1914 the Michigan Central had $2,448,000 cash and $9,364,000 bills payable, and the Big Four $2,979,000 cash and $8,042,000 loans and bills payable. The principal changes in the securities outstanding were the sale by the Detroit River Tunnel Company of $4,000,000 4½ per cent 50-year bonds, guaranteed by the Michigan Central, and the sale by the Big Four of $3,870,000 of its equipment trust certificates. These Big Four equipment trust certificates were in addition to the liability which the company assumed for its share of the New York Central Lines equipment trust, under which a total of $6,944,000 certificates were issued during 1914, of which the Big Four's assignment of equipment and corresponding liability amounted to $619,000 and the Michigan Central's to $715,000.

The following table shows the principal figures for operation for the two companies in 1914 and 1913:

	Michigan Central		Big Four	
	1914	1913	1914	1913
Average mileage operated...	1,800	1,800	2,381	2,365
Freight revenue	$20,717,272	$23,169,518	$23,436,211	$25,133,116
Passenger revenue	8,880,613	9,369,055	8,589,012	8,891,201
Total operating revenue.....	33,464,968	36,676,972	35,365,691	37,613,498

Letters to the Editor

DON'T DO BUSINESS WITHOUT A RECORD

Memphis, Tenn.

To the Editor of the Railway Age Gazette:

Since the telephone has come to be generally used for train despatching there is a tendency to do a lot of other work on it; work which should be handled by telegraph or on a telephone circuit separately assigned for the handling of outside matter. By the telephone there is tracing of cars, issuance of instructions and transmitting all kinds of information and of which there is no record whatever. It may end up in a misunderstanding. This has frequently occurred, and caused a bad mix-up, and in addition unnecessary expense. A question of veracity frequently makes trouble.

A great deal of this is brought about by station operators taking the view that if a matter is highly important and they cannot raise the operator that is wanted, the despatcher is the man to go to for the desired information. This is done in hundreds of cases.

When it takes all the way from two to six hours to transmit a telegram a distance of 300 to 600 miles and get an answer, there is something wrong. It is not the fault of the telegraph, but of those trying to operate it. Again, some of this is chargeable to clerks who do not want to take time to write a message and who just go into the despatcher's office and have the despatcher get what they want. On the other hand, had they filed a message very likely it would have hung on the hook for two hours before action would be taken on it; this, with the time lost at the other end, makes a bad delay, and we can hardly blame those who are in quest of important information for bothering the despatcher.

The telegraph service should be checked up closer. Getting information over the telephone may, for lack of a record, lay the foundation for a law suit.

While handling important matters on the telephone you are hampering the despatcher with his work. Every move made by him means dollars and cents to the company. To distract his attention from his train work to find out if some car left somewhere yesterday or last week may indirectly cause a serious complication in train movements.

Cannot superintendents of telegraph and managers of telegraph offices check their business more closely and show up the parties at fault? At all events, important communications—and one should be very cautious in deciding that a message is *not* important—should be put in writing at one end of the route or the other.

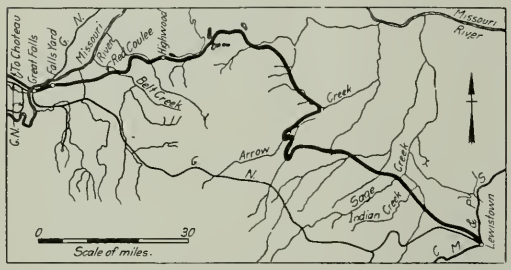
L. J. C.

Armored Trains in Action.—Some interesting details have recently been published concerning the operation of armored trains at the front. These trains did especially useful work during the siege of Antwerp and the subsequent retreat, when they were entirely under the command of British naval officers, who, according to circumstances, worked independently of or in conjunction with the military authorities. The standard armored train is composed of three locomotives, three long cars mounting 4.7 naval guns, a covered ammunition car, and a large covered car, the last known to members of the "crew" as the "chart-room." A locomotive is placed at each end of the train and one in the middle, and locomotives and the vehicles alike are well protected by armor plate. The "chart-room" to which reference is made carries special maps, compasses and instruments, a stock of rifles and ammunition, and comfortable chairs, besides refreshments and newspapers, and the whole is well warmed and lighted by electricity. It is said that the crew of one train was provided with a sleeping car, which was left behind at the nearest siding, to which the crew would return every night.

New Line From Lewistown, Mont., to Great Falls

The Chicago, Milwaukee & St. Paul Has Recently Completed a 138-Mile Extension of Permanent Construction

Immediately upon the completion of the coast extension of the Chicago, Milwaukee & St. Paul, about five years ago, this company began the construction of branch line feeders into the contiguous country, practically all of which had been regarded heretofore as Hill Lines territory. One of the most aggressive invasions of this nature is the construction of a new line from Lewistown, Mont., northwest 137.7 miles, to Great Falls. This line has been completed and opened for local freight and passenger service recently, and a further extension is under construction from Great Falls, northwest 67 miles, through Choteau to Agawam. This new line not only opens up for settlement a



Map Showing New St. Paul Line Between Lewistown and Great Fall

large area of very productive agricultural land in the Judith basin in central Montana, but also gives the St. Paul an entrance into Great Falls, the second city in commercial importance in Montana. The permanent character of the construction adopted also indicates the possibility of this line eventually forming a link in an alternate route to the Pacific coast.

GENERAL DETAILS

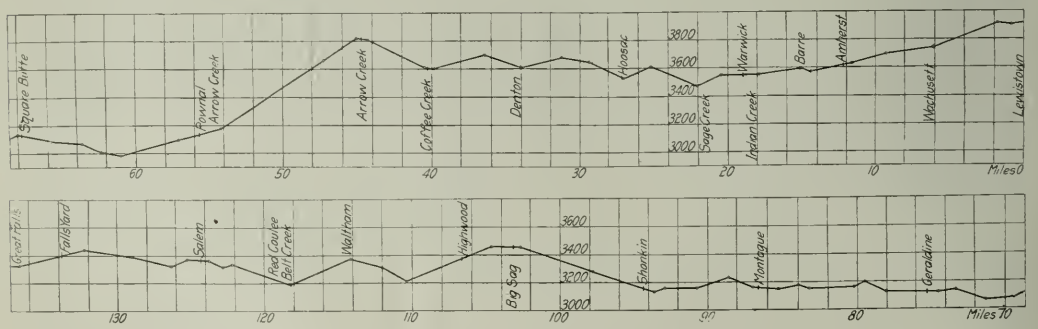
At the time the St. Paul built the coast extension, it purchased the Montana Railroad, extending from Lombard on the Northern Pacific to Lewistown, and completely rebuilt that portion from Lombard to Harlowton, making it a part of the main line. This new line extends northwest from a connection with the old Montana Railroad at Lewistown, generally parallel to, and about 20 miles northeast of the Billings-Great Falls line of the Great Northern.

In order to traverse the center of the Judith basin it was necessary to adopt a line 20 miles longer and with higher grades than the parallel line of the Great Northern between the same points. The country traversed is generally rolling, with occasional high benches and with very precipitous and deeply eroded stream beds. The benches are frequently close to the streams, making the problem of locating a satisfactory crossing more than usually difficult, especially since this line crosses the drainage approximately at right angles. At the crossing of Arrow creek the bench one mile east of the stream lies 800 ft. above the creek, and it was necessary to develop the line and to sacrifice 14 miles in distance to secure a crossing. At this point particularly, but also at Sage and Belt creeks, a very rough formation, closely resembling that found in the Bad Lands of North Dakota, was encountered, requiring very heavy and expensive work, which at Belt creek averaged 100,000 cu. yd. per mile for six miles. In fact, practically all the heavy work of the entire line was encountered in crossing these gashes.

The maximum grade in each direction was established at 1 per cent, except in descending into Arrow creek from the east, where a 1.5 per cent grade was inserted for 10 miles. All grades were compensated .04 per cent per degree for curvature. The maximum curvature was fixed at 8 deg. The construction of this line required the excavation of over 5,500,000 cu. yd. of materials, including 1,400,000 cu. yd. of earth, 2,500,000 cu. yd. of hard pan, 1,025,000 cu. yd. of loose rock and 575,000 cu. yd. of solid rock.

With the exception of a few temporary timber bridges constructed on the 10 miles of 1.5 per cent grade descending into Arrow creek, all structures were built of permanent construction. As this line crossed the drainage at right angles, large steel viaducts were required at the crossings of Judith river, Indian, Sage and Belt creeks, and Red coulee. Numerous long concrete arches were required under high fills at other points. The total amount of steel work required on this line was 10,000 tons, in addition to 76,000 cu. yd. of concrete.

Starting from a connection with the old Montana Railroad at Lewistown the new line of the Milwaukee parallels a branch of the Great Northern, built into Lewistown two years ago from a connection with the Billings-Great Falls line at Moccasin, crossing Big Spring creek, nine miles out of Lewistown, with the Great Northern on a single track gauntleted timber trestle, 1,300 ft. long and 80 ft. high, which is to be replaced by double track embankment. Beyond this point the Great Northern branch swings to the west, while the St. Paul line continues northwest, crossing Judith river and Indian and Sage creeks in the next 12 miles. After crossing the divide between Sage and Dry Wolf



Profile of New Line Between Lewistown and Great Falls

creeks, in Sage creek tunnel, this line traverses rolling country, requiring only moderately heavy embankments, until it reaches the bench near Belton, above Arrow creek, 23 miles beyond the crossing of Sage creek. From this point the line descends toward Arrow creek for 15 miles, 10 miles of which is on a 1.5 per cent grade on a supported line, requiring very heavy work through a badly broken formation. After leaving Arrow creek the line then continues across a fairly light rolling country for 50 miles, until it reaches Belt creek. The next 9 miles, including the crossings of Belt creek and Red coulee, involved some very heavy work. The remaining 17 miles into Great Falls were quite light.

THE GRADING

The grading was handled by steam shovels, elevating graders, fresnos and station men. Much of the material in the heavy portions of this line was moved by the station men who trapped the material into cars. Six steam shovels were also employed to carry out the work at various times. Aside from the crossings of the streams, the largest fills ranged from 55,000 to 150,000 cu. yd.

Six tunnels were constructed with a total length of 5,333 ft. The longest one was 2,063 ft., located three miles west of Sage creek viaduct. A tunnel 250 ft. long was driven near the top of the ascent from Arrow creek on the south side. The other four tunnels were located within a distance of 3 miles, near Belt creek viaduct.

The methods adopted in driving these tunnels varied somewhat. At Sage creek, where a wet shale was encountered, a full arch section top heading was driven, and the bench then removed, all excavation being done by hand. Work was pushed from both portals, and also from two shafts. In most of the other tunnels a center bottom drift was first driven and the remaining material was then trapped into small cars. Tunnels 1 and 5 are on tangent, while tunnels 3 and 4 are on 8 deg. curves. Tunnel 6, 780 ft. long, is on an 8 deg. reverse curve with 150 ft. of intermediate tangent. All tunnels were lined with concrete before the road was turned over for operation, excepting the Arrow creek tunnel, 250 ft. long.

AMPHITHEATER SLIDE

The most puzzling problem, which arose in connection with the grading, developed at a large slide at the east end of tunnel 4, known locally as Amphitheater slide from the shape of the mountain at that point. Here the entire side of the mountain has been moving at irregular intervals ever since the first stages of the work destroyed the equilibrium, until now the original grade line, which is about 190 ft. above the level of the flats, has settled over 100 ft., going down as much as 7 ft. in 48 hours. This material has broken about 150 ft. above grade, and is moving on a stratum inclined about 10 deg. from the vertical. In addition to the vertical settlement, it has moved 75 ft. laterally during this time. The adjacent end of tunnel 4 was also moved about 14 in. out of line, which caused a serious distortion of the easternmost 200 ft. of the tunnel, and made necessary the retimbering of the bore for this distance. At the time this distortion became apparent, the bore was preserved, as far as possible, by timber struts placed between opposite wall timbers and the retimbering was done just ahead of the placing of the concrete lining. A peculiar characteristic of this slide is the fact that the movement is the greatest during dry weather, and appears to be entirely arrested during a rainy season. The underlying cause for the movement has not been definitely determined. An examination of several smaller slides in the vicinity has shown that they rest on a shale which crumbles after exposure to the air for five or six months, and that this disintegration ceases about 10 ft. from the face. One theory advanced is that the crumbling of this shale allows the material above to settle and in this way starts it moving.

To arrest this movement, sliding material was transferred from the upper to the lower side of the railway embankment by steam shovels in an attempt to equalize the weight. This effort proved successful in June of last year, the slide discontinuing movement, but for purposes of safety and to allow the material ample time to gain a dependable equilibrium, a shoo-fly track skirting the hill has been built for train operation, and no attempt will be made to operate trains on the original alinement before next summer. Owing to the geological formation pecu-

Amphitheater Slide Showing Steam Shovel Working at Grade in the Center of the Photograph

liar to this section of the country and chiefly to the widespread presence of shales subject to rapid air-slaking disintegration, a number of similar slides of lesser magnitude have developed, notably on the Arrow creek hill, which have been arrested in the manner outlined above.

HAULING MATERIAL

The most interesting feature in the construction of this line was the bridge work, which was estimated to cost $1,700,000. This included 5 high steel viaducts, 14 arch culverts, and numerous smaller openings. The bridge work was handled by company forces from its inception to completion.

It was necessary that all the culverts and substructures for the viaducts be built in advance of the grading, to enable the line to be completed at the earliest possible date, and, as a result, the material for these structures had to be hauled in wagons from the nearest railroad stations, sometimes as far as 30 miles distant. Over $100,000 was paid for this item of hauling alone.

Material required on the east end of the line was unloaded at a temporary spur 2½ miles east of Glengarry, a station on the Milwaukee road a short distance east of Lewistown, while that required at the west end was hauled in from Swift and Wayne on the Great Northern.

This hauling was let by contract to local freighting contractors. At Glengarry the contractor received 35 cents per ton-mile, and 35 cents per 1,000 ft. B. M. for lumber, hauling all the material required for the first 30 miles of the line out of Lewistown, which included the substructure material for three of the viaducts. On this contract the railway company handled all material at the siding and loaded all wagons. The average haul was 12 miles. At Wayne and Swift, where the average haul was 14 miles, the contractor was paid 50 cents per ton-mile, and per 1,000 ft. B. M. for lumber. Here, however, all loading and unloading of material and payment of demurrage charges were cared for by the contractor.

A material clerk was stationed at the unloading point on the railroad, and he checked all material as it was unloaded from the cars into the wagons. He issued triplicate tickets for each wagon load, showing the contents of the wagon; he retained one of the tickets, one was given to the teamster and one was sent to the office of the engineer in charge of the work to which the material was going. The teamster handed his tickets to the contractor, and once each month the contractor and the various engineers checked their accounts, after which the teaming bill for the month was made up. Under this system not a single controversy arose between the contractors and the engineer in charge, nor was any material lost.

The hauling was done with traction engines and teams. When the roads were good, traction engines would haul two Buffalo-Pitts wagons of 20 tons capacity each, doubling the hills by dropping one trailer. As many as 750 sacks of cement could be hauled in this way at one trip, requiring 14 hours for 24 miles. On this short haul the engines would make the trip during the day, returning to the railroad in the evening, and the wagons would then be loaded at night. However, these engines could not be operated across the adobe flats during wet weather, and about 150 horses were required at Glengarry and a similar number at Swift and Wayne. These horses were generally operated in "four- and six-up" teams, but at times as many as 14 horses had to be used to transport such heavy equipment as hoisting engines. As would be expected in a new country, the hauling of these large quantities of material required the construction of a considerable mileage of new roads, all of which were built and maintained by the contractors with the co-operation of the railroad.

Sage Creek Viaduct

CULVERTS

The larger culverts were constructed of reinforced concrete of parabolic-arch cross section. These were constructed with the use of wooden movable forms made in sections 16 ft. in length, and the work was handled in such a manner that after a start was made, almost all stages of the work were in progress at the same time. One of these culverts was a double 20 ft. by 15.5 ft. arch under a 60 ft. fill. One 10 ft. arch was built under a 65 ft. fill and a 16 ft. arch was placed under an embankment 102 ft. high.

Because of the high freight and teaming charges on cast-iron

pipe, careful attention was given to the selection of the materials for small culvert openings up to 42 in. in diameter. For fills up to 6 ft. in height American Ingot Iron and Acme Nestable corrugated iron culverts were used. For fills higher than 6 ft., cast-iron pipe was used for the most part, although after establishing a concrete pipe plant at Great Falls, concrete pipe was substituted for cast iron in those openings remaining on the line to Lewistown, and for all openings on the Choteau extension. About 1,275 tons of cast iron, and 3,000 lineal ft. of corrugated iron pipe were used on the Lewistown line.

The concrete pipe plant at Great Falls was a field plant, erected for this one piece of construction alone. Four sizes of pipe, 24 in., 30 in., 36 in. and 42 in., were made at this yard. The concrete was mixed, depositing in the forms was done by hand, the

Traveler Placing the First Steel at Judith River Viaduct

concrete being delivered to the forms in steel dump cars. During warm weather the inside forms were removed in four hours, while the outer forms were taken off the following day, all forms and pipes being handled by a traveler moving on a track spanning the working platform. In order to keep up the output in cold weather, live steam was turned into the interior of the inner form, which enabled the inner form to be removed almost as soon as in warm weather. Fourteen men and a foreman made nine pipes regularly every day at the beginning, and the output was later increased to 12 per day by the addition of other forms. This included all work, such as removing the forms, preparing the reinforcement, etc. Wooden forms were used for making the pipe.

VIADUCTS

The largest single structure on the line is the Judith river viaduct, 14 miles northwest of Lewistown, which is 1,953 ft. 10 in. long and 135 ft. high. This one structure required 2,829 tons of steel, and cost $300,000. It consists of 46 ft. 6 in.-towers and 69 ft. 6 in.-intermediate deck spans supported on concrete pedestals, with large concrete abutments at each end. The viaduct was designed for Cooper's E-60 loading, and is provided with a ballasted concrete floor. One interesting detail of the design is that no horizontal bracing is used in the towers. The high abutments are of the type developed at the time of the construction of the coast extension, and described previously in these columns. (See *Railway Age Gazette*, October 27, 1913, page 839.) The east abutment is 65 ft. high above the top of the footing.

About 5,000 cu. yd. of concrete was required in the abutments and pedestals at the crossing. As this concrete was placed in advance of the grading, that for the west abutment was placed by means of a tower, while at the east abutment a trestle was run out from the adjacent bank. The pedestals on the side hill were built by delivering the concrete into the forms by spouts leading from the mixer set farther up the hill. In constructing the pedestals across the flat area in the center, a trestle was built and the mixer moved out over each in turn, going out on one side of the structure and returning on the other. With these arrangements one mixer delivered about 150 cu. yd. of concrete per day. Sand and gravel were delivered to the work in wagons from a nearby pit opened for the purpose.

No steel was erected until after the track laying had reached the bridge site. The erection was accomplished with a large traveler of the type developed by the Milwaukee several years ago, and first used in the construction of a high viaduct at Tekoa, Wash., in 1908. The traveler is shown setting the first steel at Judith river viaduct in one of the accompanying photographs. The material was delivered to this traveler by two work trains, each provided with a derrick car. A force of 100 men, including the derrick crews, erected and riveted about 100 tons of steel daily. The entire 33 spans were erected in 31½ working days of nine hours each.

At Indian creek a viaduct 1,302 ft. 10 in. long and 150 ft. 6 in. high was built. This structure required 1,803 tons of steel and about 3,000 cu. yd. of concrete. Sage creek viaduct is 1,698 ft. 2 in. long and 156 ft. 6 in. high, and contains 2,735 tons of steel and 7,000 cu. yd. of concrete. These structures are four and ten miles west of Judith river viaduct, respectively, and are practically identical in design and construction with that structure. At Sage creek some difficulty was encountered with foundations, and 1,600 piles were driven under the pedestals. The 22 spans at Indian creek were erected in 22 days.

The two remaining viaducts are about 20 miles east of Great Falls. Red coulee viaduct is 675 ft. long and 137 ft. high, requiring 916 tons of steel and 2,400 cu. yd. of concrete. It was possible here to deliver material on top of the bench above the coulee at both ends of the structure, and this made two setups of the concrete plant necessary, one at each abutment. For each setup, two light rail industrial tracks were laid on a trestle, built just high enough to enable concrete to be delivered to the pedestal forms, out to a point midway of the viaduct. By means of a cable on a specially designed drum, a loaded steel dump car was made to pull an empty car up to the mixer. With this layout concrete was taken from the mixer as rapidly as it could be mixed, and both lines of pedestals were concreted simultaneously.

The Passenger Station at Lewistown

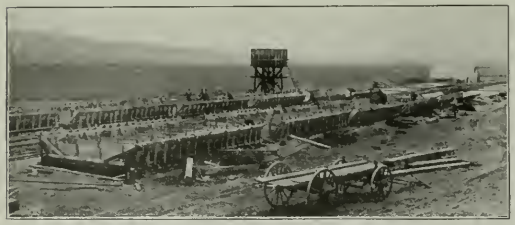
Belt creek viaduct is 651 ft. 10 in. long and 189 ft. 6 in. high, and contains 1,002 tons of steel and 2,000 cu. yd. of concrete. At this point the concrete material was delivered to the site in the bottom of the canyon and the concrete had to be raised by various means. Industrial track on low trestles, upon which 18 cu. ft. steel dump cars were used, enabled the concrete to be placed in the pedestals lying between the bases of the high cliffs. To place the concrete in the pedestals, situated high up on the west cliff and the west abutment, a timber skidway and bucket were devised. The bucket was drawn up or down the

skidway by means of a hoisting engine and was made to dump automatically at any desired point by means of a specially arranged timber yoke. The west abutment was poured by means of a bucket operated with a stiff leg derrick mounted on top of the cliff near the abutment.

The steel in Belt creek and Red coulee viaducts was erected by means of derrick cars. At Red coulee no difficulty was encountered, but at Belt creek tunnels adjacent to the ends of the viaduct necessitated the delivery of the steel by the work train inside of tunnel 6, from which point the erection derrick had to secure it. This slowed up the erection somewhat, but it was accomplished in 15 days.

The concrete deck slabs for these viaducts were built in two yards, established for the purpose. Those for Judith river, Indian creek and Sage creek were made on a level piece of ground just east of Judith river and adjacent to an adequate supply of gravel in a pit which was opened to supply material for viaduct substructures. In the gravel pit, at the extreme east end of the slab yard, was placed a loading trap, and from this trap a light rail track extended the entire length of the yard. Parallel to this track a standard gage track was laid upon which the concrete mixer was operated. The mixer was placed upon a raised timber platform, mounted on trucks, its height being such as to enable the concrete to be delivered directly to the slab forms by spouting. Gravel and cement were delivered to the mixer in steel dump cars, operated by a hoisting engine and cable, and the mixer was moved along its track as the slab forms were filled. The gravel was loaded at the trap with fresnos.

The forms for the slabs were built in sections so that they



Concrete Slab Yard Near Judith River Viaduct

could be easily removerd, as soon as the concrete had set, and placed again for other slabs. The reinforcing was assembled to form complete units for one slab to avoid assembling the steel in the forms. More than 1,200 slabs, 3 ft. 4 in. to 4 ft. 10 in. wide, were built in this yard, with an average of 25 slabs built per day for the entire time the plant was in operation.

The second slab yard was established just west of Red coulee, where the deck slabs were made for Red coulee and Belt creek viaducts. The space was so limited at this point, due to the topography, that it was necessary to build half of the slabs on top of the other half. This, together with the fact that the gravel had to be hauled in wagons a distance of three miles, reduced the average daily production of slabs to 18. For this yard the mixer was stationed at the point where the gravel was delivered by wagons, and the concrete was delivered to the forms in steel dump cars, operated on a light rail track.

Immediately after the steel was erected at the viaducts, the slabs were loaded onto flat cars by means of derrick cars, taken to the structure sites, and put into place by the derrick cars. On the average, 40 slabs were placed per day during the time that the work was in progress.

TERMINALS

At Lewistown, where several lines of the St. Paul enter a 12-stall roundhouse, 96 ft. deep, was built, together with a power house, machine shop, oil house, rotary sand dryer, storehouse, and office building, all of which are of brick construction. A 170-ton mechanical coal hoist of timber construction, C. M. & St. P. standard clinker pit, 225 ft. long, and a 67,000-gal. water tank, were also provided, in addition to the usual small buildings.

At Great Falls a 9-stall engine house, 96 ft. deep, a power house, an oil and tool house and a sand drying house of brick construction were built, and an air-operated coal dock of timber, a water tank identical with that at Lewistown, and a clinker pit 150 ft. long were provided. For the water supply of this engine terminal, a triplex pump, direct-connected to a 10 hp. a. c. motor, was installed on the bank of the Missouri river, from which water is pumped a distance of one mile and raised a height of 268 ft. to the water tank through 6-in. cast-iron and wooden water pipe. All machines in both terminals are operated electrically.

PASSENGER AND FREIGHT STATIONS

Various standard and special designs were used for the passenger and freight stations along the line, all of which are of timber construction. At Lewistown a brick passenger station building, 273 ft. long and 24 ft. to 36 ft. wide, with shingle tile roof, art marble floor and tile wainscoting, and timber beamed ceiling, was built. A portion of the building 81 ft. long and 36 ft. wide is two stories high, on the second floor of which is provided room for division offices. The building also houses a lunch counter for which space 58 ft. by 26 ft. is assigned. All platforms about the building are of concrete and these are lighted by electric lamps, mounted on iron lamp posts, with two 60-watt lamps enclosed in 10-in. frosted globes on each post, and lights placed beneath the building cornice. A novel feature of the building is the C. M. & St. P. trademark in mosaic, placed in the gables and illuminated by reflecting lamps.

The freight house and office building at Lewistown is 302 ft. by 32 ft., of which space 70 ft. by 32 ft. is used for the office. This building is one story high and of brick construction, with concrete floors.

At Great Falls it was very desirable to locate the freight station near the center of the business section, and to accomplish this the area occupied by the city's restricted district was purchased and all the buildings were razed prior to beginning construction. Here a building 469 ft. by 40 ft. was constructed of brick, with concrete floors and basement. One end of this building, 40 ft. by 49 ft. two stories high, contains the local offices of the company. The passenger station at Great Falls, a brick and concrete building 207 ft. by 46 ft., two stories high, has art marble floors, tile wainscoting, Spanish tile roof and coping and plaster beam ceilings. An indirect lighting system is employed. At one corner of the building is a tower 135 ft. high, near the top of which is placed the Milwaukee trademark, made of terra cotta and illuminated with flaming arc lamps. The station platforms are of concrete, lighted in the same manner as at Lewistown, except that there are no cornice lights about the building. Instead of these there are a number of arc lamps on the walls of the building and numerous incandescent lamps about the ornamental iron marquises.

BOARDING CAMPS

As all bridge work was handled by company forces, it was necessary for the railroad to arrange to feed these men. This was done by organizing a commissary department directly, instead of bringing in a boarding contractor. Each camp was placed in charge of a camp clerk with the usual number of cooks and assistants, reporting direct to the engineer's office at Lewistown. Each clerk was allowed to order the food he desired for his camp by telephone from the Lewistown office, one clerk assembling the orders from these various men and then buying in large quantities, and locally as far as possible. At the end of each month an inventory of the supplies on hand at each camp was taken and the actual cost of the meals was computed. A circular letter was then sent to all camps, giving the cost per meal at each camp, with the names of the assistant engineer, the clerk, the foreman and the cooks. It was found that this public

comparison stimulated considerable interest among the men in securing the best food at a low cost. The men in each camp were charged a uniform rate per day, which was deducted by the timekeeper in the usual manner, although this rate varied somewhat in the different camps, depending upon the class of camp; that is, skilled mechanics desired better food than did the laborers and paid a correspondingly higher rate. An average of about 550 men were fed in this manner, at as many as nine different camps. The camps were not run for profit, but were managed so as to be self-sustaining, while endeavoring to give the men the best possible food for the money paid, two direct results being that the company camps held their men on the work and there was a very small amount of sickness. There was no typhoid fever in any of the company camps, although other camps along the line were not immune.

The track was laid by hand from Lewistown to Sage creek crossing. North of this point a Roberts track-laying machine was employed. Seventy-five pound rail was laid on sawed ties fully tie plated and in gravel ballast. Stations were established at intervals of 8 miles, with a house track 1,500 to 2,000 ft. long at each station, and a passing track at each alternate station. Water is secured from streams in most instances, although a gravity supply is secured from one spring at Highwood, and a deep well was driven at Pownal, near the crossing of Arrow creek.

The construction of this line was started in July, 1912. The track laying was completed last spring, and irregular freight service was inaugurated as far as Great Falls about May 15. Local passenger service was started on August 10, and it is expected that through passenger service will be started soon. The grading on the Choteau line has been completed, but no rail has been laid.

The construction of this line was handled under the direction of Charles F. Loweth, chief engineer, and E. O. Reeder, assistant chief engineer. F. J. Herlihy was assistant engineer in charge of all masonry, steel, superstructure, and building work until October 1, 1913, when he resigned to accept service with another company, and was succeeded by F. B. Walker. A. G. Baker was division engineer in charge of grading and water supply work. Assisting him were district engineers C. D. Jackson, W. R. Felton and J. D. McVicar, each of whom was in charge of five resident engineers. C. L. Whiting, superintendent of construction, had charge of track laying and ballasting. Twohy Brothers, of Portland, Oregon, were the contractors for the grading of the Great Falls terminals and for the first 70 miles of the line out of Lewistown. Winston Brothers, of Minneapolis, had the contract for grading the intermediate portion. All other work was done by company forces.

TRAIN INDICATORS AT EUSTON STATION

In the terminal station of the London & North Western at Euston, London, the train indicators, showing the times that outgoing passenger trains will start, are mounted in cases standing on the floor, an arrangement which brings the reading matter into the best possible situation for the convenience of passengers seeking information. There are four of these indicators at Euston, and one of them is shown herewith. Indicators of the same kind are in use at Crewe, Liverpool, Manchester and other important points on that road.

The lettering is black, printed on white paper, the sheets of paper being pasted on a continuous apron or curtain of white canvas. The curtain is carried on rollers and is rolled on to the upper roller and off the lower one as occasion demands, the practice being to show at all times every train that is scheduled to depart within the next hour, or thereabouts. The lettering on the case, above the white space, not clear in the illustration, shows that the bold-face figures in the column in the right hand margin of the curtain indicate the number of the platform at which the train stands. At the top of the case, opposite the index fingers, the passenger is informed which platforms are at the right and which at the left.

It is to be noted that four of the trains among the eleven here shown are run on Saturdays only, while a fifth, that leaving at 1:50, runs every day except Saturday. This condition suggests that a different sheet, with these Saturday trains left out, might well be used on the other days of the week.

New sheets are usually printed twice a year. When it is necessary to make changes at other times, narrow slips are pasted over the lines which are superseded.

For the foregoing information and for the photograph, we are indebted to L. W. Horne, superintendent of the London & North Western, London.

Readers desiring to make comparisons with American practice will find the indicators recently put up at Kansas City and at Memphis, described in the *Railway Age Gazette*, February 12 last, page 272, and those used at the Pennsylvania and the Grand Central stations in New York City in the issue of February 14, 1913, page 296. An indicator arranged on the same general principle as that at Euston, but different in some particulars, is in use at Charing Cross, London. This was described in the *Railway Age Gazette*, December 12, 1913, page 1122. The indicators at the Central station, Glasgow, Scotland, unique in some respects, were described August 9, 1912, page 255.

London & North Western Train Indicators

THE ANTUNG-MUKDEN RAILWAY.—At the conference between the Chinese and Japanese representatives in Peking on March 10, the Chinese agreed to an extension of the Antung-Mukden railway agreement, which expires in 1923, to 99 years.

Hearings on Western Freight Rate Advances

Testimony of Railway Men Concluded, Protestants Begin Presentation of Case in Opposition to Advances

The Western railways practically completed the introduction of their direct testimony as to the reasonableness of proposed advances in freight rates on a number of commodities in Western Trunk Line and Southwestern Tariff Committee territories on Monday of this week, and on Tuesday representatives of the protestants and interveners began the introduction of their evidence in opposition to that of the railroads. Four days were allotted for general evidence in rebuttal of the general and financial testimony presented by the railways at the beginning of their case. This is to be followed by the introduction of evidence bearing on the specific commodity rates involved in accordance with a schedule similar to that which was followed in the presentation of the railways' case.

March 23, 24 and 25 were devoted to the introduction of evidence on behalf of the railways as to their reasons for advancing rates on coal. March 26 and 27 were devoted to the rates on fruits and vegetables, and March 29 to the increased rates on rice and rice products. Some testimony which was not finished on the days allotted for it will be introduced later.

C. C. Wright, general solicitor of the Chicago & North Western, and chairman of the committee in charge of the case for the roads, said that the carriers would need perhaps four days for odds and ends of evidence not yet introduced. Mr. Thorne requested that the carriers be required to finish their direct testimony before the protestants offered their general rebuttal, and when Commissioner Daniels refused to permit the departure from the schedule, he registered a formal protest. He asked for a postponement of 10 days. The commissioner announced a tentative schedule for the evidence to be introduced by the protestants, which provides for the introduction of unfinished evidence by the carriers on April 3 to 8, following the general evidence of the protestants.

COAL RATES

Eugene McAuliffe, general coal agent of the St. Louis & San Francisco, testified on March 23 and described the advances in coal rates asked and the territory affected. He presented a statement representing one year's business based on an actual check of way bills in seasons of both rush and slack traffic on roads which originate 86.5 per cent of the coal originating in the territory.

The average weighted haul, Mr. McAuliffe said, is 303 miles, while the average gross revenue is $1.48 per ton under the present rates. This yields 4.89 mills per net ton-mile or 3.42 mills per gross ton-mile, while if 90 per cent of the empty return haul is included, the revenue is only 2.84 mills per gross ton-mile. The average increase asked is 7.95 cents per ton, which would add .262 mills per net ton-mile, .183 mills per gross ton-mile, and .145 mills per gross ton-mile if 90 per cent of the return haul is included.

The total amount of the proposed increase on roads embraced in this tabulation, he said, is $1,080,286 per year. Including all roads affected the total additional revenue per year would be $1,226,122. This represents an increase of only 5.36 per cent and would entail an addition of 5.37 cents per capita yearly to the expenses of the population in the states affected. Participating in the increase are 121 roads, operating 131,053 miles of line. The increase would add to the revenue of these roads $9.36 per mile yearly.

Mr. McAuliffe testified that the advance applied from mines in Illinois, Indiana, Missouri, Iowa, Kansas, Arkansas and Oklahoma and some from western Kentucky and Alabama to Iowa, Wisconsin, Minnesota, North Dakota, South Dakota, Nebraska, Missouri, Arkansas, Kansas, Louisiana, Texas and Oklahoma. He presented a complete tabulation for a one-year period covering 118 cities, showing the average haul to each, the tons of coal consumed in a year, the average rate per ton, the gross revenue received on the existing basis, the average increase per ton and the amount of increase which would be felt by each city during the course of a year.

The popular mind and the railroad baiter should be disabused of the idea that coal, with its heavy carloads and heavy trainloads, is a necessary foundation to railway traffic, said Mr. McAuliffe. It is often said that the railway should haul coal at any price and make its profit on hauling other products. That is not true. The coal movement is spasmodic. Instead of being adapted to filling out our trains, it monopolizes almost our entire facilities at the worst season of the year, the time of cold weather. Other traffic falls off, but bad winter weather means fuel and lots of it. There is not a road but must not only stand prepared to take care of the maximum normal requirements of the winter season, but also must carry enough potential transportation ability to take care of abnormal conditions in unusually cold weather, or when a coal strike is impending. Railways must keep a tremendous amount of equipment for the sole purpose of taking care of a peak in traffic which lasts only three months a year.

On one road alone the bituminous coal hauled amounted to 30.52 per cent of the total revenue tonnage, yet this paid only 11 per cent of the total freight revenue. There is an immense fluctuation in extremes of coal traffic. If we take the minimum month on 16 roads as 100 per cent, the maximum month is 289.13 per cent. On other commodities the extremes are only the difference between 100 per cent and 152.39 per cent.

Coal is not carrying its share of the burden for many reasons. First, there is an enormous empty haul, the percentage of empty cars to loaded cars being nearly 100 per cent. Secondly, there is the tremendous spread in the volume of business, with commissions, states and courts all demanding that we be equipped for the maximum. Thirdly, weather changes or an impending strike may increase the consumption of coal over night by 25 per cent, at the same time the transportation ability of the roads is cut 50 per cent. The cost of assembling coal alone in the southwestern territory runs as high as 18.1 cents in Arkansas, while the lowest cost, in Kansas, is 8.2 cents per ton. This represents the cost to the railway of maintaining switch engines at the mines, the placing of empty cars, movement of loaded cars to scales and gathering yards, to be picked up by main line trains, and the rental of coal cars while in mine territory. It does not include any interest charges or maintenance on the main line facilities used.

E. H. DeGroot, Jr., superintendent of transportation of the Chicago & Eastern Illinois, testified that the cost of assembling coal on his road in the southern Illinois district is $4.39 per car, or 9.83 cents per ton. Of the total freight traffic of the road bituminous coal represents 54.17 per cent, but the revenue thereon is only 35.45 per cent of the total freight revenue.

Bituminous coal as a predominating article of freight is a liability rather than an asset to railways in the Central Western coal producing states, according to testimony presented by J. M. Daly, former general superintendent of transportation of the Illinois Central on the advance on coal from Illinois and Indiana fields. Daly's testimony related purely to the operating features of coal traffic. Western coal roads, he said, would have saved $12,000,000 a year toward maintaining their credit if their car repairs could be held down to the level on the western non-coal roads. "From $1,600,000 to $8,000,000 invested in coal cars," testified Mr. Daly, "is standing idle every day, representing 2,000 to 10,000 cars a day which are not in use through nine months of the year. Bituminous coal requires cars which, in the West-

ern coal fields, cannot be used for other commodities, as iron ore, lumber, etc. In the East coal moves to the lakes and ore back, but out here the return haul is mostly empty. In the East, because of lake traffic, coal moves in the summer; out here it moves in the winter, when operation is most costly.

"Coal goes to the West, but none comes back. The few cars of scrap iron or gravel could be taken care of 10 times over with the empty cars which had gone west with company coal. If we hauled no commercial coal at all, we would still be hauling empty cars eastward. The empty coal car haul is 95 per cent of the loaded or bituminous coal on these Western coal roads, against an average of only 30 per cent on all freight, including coal.

"Every two years the mines close down or threaten to close down on account of labor disputes. This lasts from two to five months, causing more idle equipment. In January, February and March of these years everyone rushes to stock up on coal, anticipating a strike, so that not only must we furnish cars for the normal winter rush, but extra cars must be maintained because mine operators cannot agree with their miners."

To show that bituminous coal roads should receive a higher rate, Mr. Daly compared 11 roads originating nearly all the bituminous coal from Indiana and Illinois mines with 13 western roads not originating much coal and 10 eastern bituminous coal roads.

"These 11 roads," said he, "report 51 per cent of originated traffic as bituminous coal. Their ratio of operating expenses to revenues is 74.05 per cent. The 13 non-coal roads report only 8 per cent originated tonnage as bituminous coal. Their operating ratio is only 64.24 per cent. The 10 eastern roads report 66 per cent of originated traffic as bituminous coal and their operating ratio is 71.82 per cent.

"Four of the eleven western bituminous roads now are in receivers' hands and three are not paying dividends. The others are fortunate in having a large volume of other business to help them out. It is not a question of traffic density, but of inadequate rates.

"Cost of repairs and depreciation is 1.32 cents per car mile on these western coal roads, 43 per cent of whose cars are coal cars. On the western non-coal roads, the cost is only 0.87 cents, because only 7.3 per cent of their cars are coal cars. On the eastern bituminous roads, 70 per cent of whose cars are coal, the cost is again 1.30 cents. If the western coal roads had the same car repairs as the non-coal roads, the cost would be $12,000,000 per year less.

"Even under proposed rates the proper burden would not be put on coal. There is no doubt that there is a big coal traffic and that it is growing, but there is no money in hauling it at present rates, and the more a road hauls the more it loses."

How rates on bituminous coal in the West have undergone a gradual reduction because of the competition between shipments from western mines and coal from the eastern states via the Great Lakes, was described by F. B. Townsend, traffic manager of the Minneapolis & St. Louis. Mr. Townsend's testimony dealt with the history of coal rate adjustments from the mines in Illinois and Indiana to destinations in Iowa, Minnesota and South Dakota, outlining the competitive conditions which fixed the rates.

"Since 1901," said Mr. Townsend, "there has been a gradual reduction in coal rates to points of destination in these several states and the general level of rates is much below the basis which prevailed in 1901. The advance of 10 cents per ton proposed would not restore the rates to their former basis. For instance, the rate from Peoria to Hanley Falls, Minn., on August 1, 1901, was $3 per ton. On October 6, 1903, this was reduced to $2.25. On August 6, 1906, it was cut further to $2.10. On October 29, 1906, it went down to $1.80, which has prevailed to the present time. The proposed advance would add 10 cents, making it $1.90, only 63 per cent of the rate prevailing in 1901.

"The present adjustment to eastern Iowa and southern Minnesota originated with the adjustment to the Twin Cities and a desire on the part of Illinois lines to reach that market in competition with eastern coal moving from the docks at Duluth and Superior. Duluth and Superior receive annually from 7,000,000 to 9,000,000 tons of soft coal shipped into Minnesota, South Dakota and northern Iowa, a very large tonnage finding a market at the Twin Cities.

"Prior to 1889 the rate on soft coal from northern Illinois to the Twin Cities was $2, and from Duluth $1. These rates were gradually reduced by force of competition between the carriers from northern Illinois and the carriers from Duluth to the Twin Cities, until the rate finally settled, in 1904, to $1.40 from northern Illinois, and 90 cents from Duluth to the Twin Cities. This continued and became the maximum at the intermediate points until December, 1910, when a general advance of 10 cents was made in rates from northern Illinois to intermediate territory in Iowa and Minnesota, but no advance in the Duluth-Twin Cities rate was made, pending decision by the United States Supreme Court of the Minnesota rate case. After the Minnesota rate decision and upon passage of the new rate law in Minnesota, the Minnesota State Commission prescribed a new distance tariff under which the rate from Duluth to the Twin Cities was advanced to 96 cents per ton and following this the northern Illinois rate was advanced to $1.50 per ton.

"It is now proposed to advance the rates from northern Illinois to this territory generally 10 cents per ton with corresponding advances from the various coal fields in southern Illinois and Indiana, rates from which are fixed on a differential over the rates from northern Illinois. In making this adjustment no advance can be made in rates from Duluth to Minnesota points, as these are controlled by the Minnesota commission. Therefore, no advance will be made in rates from Lake Michigan ports to the same territory. The tariffs under suspension also propose a general advance of 10 cents to the western half of Iowa, to western Minnesota and to South Dakota east of the Missouri river."

The Interstate Commerce Commission set rates on coal in 1908 as high as those which southwestern railways now are asking, according to W. W. Miller, general freight agent of the Missouri, Kansas & Texas, who testified as to the advance of 10 cents per ton in the southwestern territory. Since then the rates have been reduced voluntarily by the railways in order to enable Oklahoma to get into Texas in competition with Colorado and New Mexico. This relationship, the witness testified, would not be disturbed, since the proposed advance is horizontal and would maintain the present adjustment of rates. Mr. Miller presented exhibits showing the present rates from fields in Illinois, Kentucky, Alabama, Arkansas, Oklahoma, Colorado and New Mexico to Arkansas, Oklahoma, Louisiana and Texas, showing the present rates to a number of points in each state and the average rate and the rate per net ton mile compared with Class E to the same points.

"Class E is the lowest classification," said he, "and comprises such articles as sand, brick, sewer pipe, etc., while coal is classified one class higher, in D. The coal commodity rate is only about half the class-rate on this lower class, E. From Texas, for instance, the average rate to some 30 points in Oklahoma with an average distance of 311 miles is $2.32 per ton on lump and $1.82 per ton on slack, the proposed rate being 10 cents higher in each instance, an advance of 4.31 per cent on lump and 5.39 per cent on slack. The average class E rate between those same points is $4.63 a ton, just double the present rate on lump coal, although coal belongs to a higher class of freight. The disproportion between the coal commodity rate and its own proper classification, or Class D, would be even greater."

The witnesses on coal rates were cross-examined by J. H. Henderson, commerce counsel for the Iowa commission, and by a number of attorneys for coal interests. C. R. Hillyer, representing Illinois coal producers, said that the change would increase the discrimination between Illinois coal fields and the lake coal by 20 cents a ton, and asked Mr. Townsend if the Minneapolis & St. Louis would increase its revenue by the

change. Mr. Townsend said that it would lose some business to the Twin Cities, which it had retained only by sacrificing revenue on other traffic and that the net result would be to substantially increase its revenues. Mr. Hillyer insisted that the result would be to take tonnage away from the Minneapolis & St. Louis and give it to roads which were less in need of increased revenues. Mr. Townsend said this was true only in part of the territory. The witnesses were also cross-examined by M. O. Lorenz, statistician for the commission. Before the introduction of the testimony on coal Mr. Wright announced that the commission would be requested to allow the withdrawal of all tariffs providing for increases on anthracite.

FRUIT AND VEGETABLE RATES

J. S. Hershey, general freight agent of the Gulf, Colorado & Santa Fe, at Galveston, Tex., testified on Friday, March 26, as to the advances in rates on fruit and vegetables from Texas producing territory to interstate consuming destinations. The advance applies only on carload shipments and is 10 cents per hundred pounds on strawberries, 8 cents per hundred pounds on peaches and cantaloupes, 8 cents per hundred pounds on tomatoes and onions in straight or mixed carloads, and 5 cents per hundred pounds on cabbage, potatoes and watermelons. His testimony reflected generally the present and proposed rates from representative shipping points in Texas to points of consumption and was representative of conditions on all Texas lines.

"Earnings on carload shipments of strawberries from Alvin, Tex., to points in defined territory," said Mr. Hershey, "range from 14.6 cents per car mile to 19.3 cents, while on canned goods the earnings range from 17.5 cents to 26.1 cents, and on agricultural implements from 15.9 cents to 25.9 cents. This is based on the minimum weights of carloads of other commodities moving between the same representative points, and the actual weights would much exceed the minimum and result in a higher average earning. Yet based on these minima, the resulting earnings are thus higher than on perishable fruits and vegetables. The average loading of cars on practically all other commodities is greater than on fruits and vegetables. The loading on heavier articles is generally no less than 30,000 lb., while on fruits and vegetables it ranges from 17,000 lb. on strawberries to 24,000 lb. on heavier vegetables.

"Comparison of the proposed commodity rates on these fruits and vegetables with the classification and rates southbound which have been approved by the Interstate Commerce Commission, show that the proposed advanced rates are far below the approved class rates. On peaches, for instance, the proposed rate ranges from only 47 per cent to 65 per cent of the class rate.

"Based on the movement for 1914, even if every car originating in Texas moved to a point on which advanced rates were in effect, the total gross increase in revenue to all carriers for this traffic would be only $135,000. In fact, however, probably not over 65 per cent or 70 per cent of the total would move to points where rates are advanced, the balance moving to points within Texas or points not involved. The total movement of fruits and vegetables from Texas in the three years 1912 to 1914 was about 40,000 cars. In 1914 the total was only 10,208, showing a falling off in the last year. This movement represents, in all probability, 80 per cent of the total movement from Texas."

L. M. Hogsett, general freight agent of the International & Great Northern, of Houston, Tex., testified regarding the nature of the transportation service rendered in handling these commodities. "Prior to the time of production," he said, "the railways must secure from every available source, information to enable an estimate of the period of production, the volume of traffic, the character and amount of cars needed and whatever other transportation requirements will be necessary. The crops require special equipment, as refrigerator cars and ventilated cars, which must be ordered and stored near producing points before time of shipment. As these cars are used to handle perishable freight throughout the United States, when the shipping season is starting in Texas this equipment has to be secured from the principal market points and transported a great distance to the prospective points of production to await the crop. This causes unusual transportation conditions and heavy expense in furnishing cars.

"Even after cars are assembled, insects, rain or cold, or market conditions, may affect the time of shipment and the size of the crop so that carriers must be prepared to fit the car supply to any situation. Peculiarities of this traffic have caused many lines to construct special side tracks, loading sheds and other facilities costing considerable money and seldom, if ever, used for any other purpose. One Texas road 25 miles long has 24 spur tracks for loading of onions, which are idle 80 per cent of the year.

"Reconsigning and diversion instructions, after the cars are en route, are common and must be handled with extreme care and caution to avoid the various liabilities which fall upon the carriers. On one road which handled 2,795 cars there were sent and received 4,250 telegraph messages as a necessary incident to diversion instructions.

"The refrigerator cars principally used have a dead weight of about 10,000 lb. more than the box car of the same capacity. The ordinary refrigerator car capacity is only about 82 per cent of that of box cars of the same dimensions. Even with the light load, there is still this excess dead weight of 10,000 lb. plus about 5,000 lb. of ice."

RICE RATES

C. W. Owen, assistant general freight agent of Morgan's Louisiana & Texas Railroad & Steamship Company; J. D. Youman of the traffic department of the New Orleans & Northeastern, and D. R. Lincoln, assistant general freight agent of the Missouri Pacific, testified regarding the proposed advance on brewers' rice in carloads from New Orleans, interior Louisiana, Texas and Arkansas to St. Louis, Chicago and Milwaukee. This is the lowest grade of rice and the principal advance proposed is 5 cents per 100 lb. to St. Louis and ½ cent to Chicago and Milwaukee. The witnesses testified that the railways are now asking permission to advance rates which were originally made excessively low in order to develop the communities, and that based on the total yield for 1914-15, the total amount of revenue all the railways would receive from the advance would be $18,500 per year.

OPENING STATEMENT BY CLIFFORD THORNE

Clifford Thorne, chairman of the Iowa Railroad Commission and of a committee of western state commissioners, and attorney for certain organizations of shippers, began the presentation of the case for the protestants on Tuesday with an opening statement. Heretofore, he said, the railroads have been better equipped than the shippers in cases involving rates, but in the present case the commissions of 16 western states have secured the services of an eminent corps of expert accountants and statisticians, and are looking after the interests of the public in connection with the representatives of the shippers.

He objected that, as indicating conditions in the territory, the testimony of only three chief executives had been introduced, the presidents of the Chicago Great Western, the Missouri Pacific and the Missouri, Kansas & Texas. The commission and the public know, he said, whether they represent typical lines or weaklings, and the protestants propose to show that three-fourths of the traffic in this territory is being handled by companies that are earning above all operating expenses and interest, from 6 to 16 per cent on all their capital stock. The present movement for increased freight and passenger rates, he said, involves several times the amount of money involved in "the famous Gould printing press scandal where they made Erie stock over night, which only involved some $23,000,000."

The impression has been given that railroads have not been able to maintain their property during recent years. This is true as to some railroads, he said, but is untrue as to western railroads as a whole, and it would be shown that the western carriers expended in 1914, in maintaining their properties, $2,800

per mile of line, which was greater than in any other year in their history, and that the railroads in western territory as a whole have expended in maintenance during the past five years an average of $50,000,000 a year more than for any preceding five-year period since the first railroad was built in this territory. It would also be shown that the decline in percentage of operating income to property investment results from a change in the system of accounting and not from any operating condition.

The year 1914, he said, was one of world-wide business depression. In the exhibits to be offered on behalf of the protestants it would be shown that in 1913 the net revenues of the western railroads as a whole were the largest, with only one exception, 1910, since the first track was laid west of the Mississippi river; that the average net revenues during the past five years have averaged more than for any five-year period prior to 1913 in their whole history, and that the percentage return of net corporate income on capital stock outstanding in 1913 is more than double what it was 15 years ago, and five times greater than it was 25 years ago. It would also be shown, Mr. Thorne said, that the railroads have been charging many additions and betterments to operating expenses.

"President Felton of the Great Western frankly admitted on direct evidence," he said, "that practically one-half the cost of additions and betterments could be charged to operating expenses, and that very large sums were so charged during the past four years. President Bush of the Missouri Pacific admitted that large portions of the cost of rebuilding his road during recent years had been paid out of operating revenues and charged to expenses. Mr. Wettling, a witness for all of the railroads, made a similar admission, but was unable to state how much of that had been so charged. The magnitude of the sum involved may be grasped when it is noted that Mr. Wettling's exhibit shows that over $700,000,000 have been expended in additions and betterments by these western railroads during the past seven years.

"It is safe to say that the cost of additions and betterments, amounting to several hundred million dollars, has been charged to operating expenses by these western railroads during recent years. So long as this practice is permitted to continue, it is going to be exceedingly difficult to determine just what are the net earnings of our railroads. When prosperity is at its very highest, the railroads can show the lowest net earnings, by simply building a larger amount of improvements and extensions, and charging large portions of this to operating expenses, thereby automatically reducing their net income.

"We are perfectly willing to pay the people these gentlemen represent an adequate return for their investment, such adequate return to include a reasonable surplus for tiding them over lean years, but we are absolutely unwilling to build their properties for them and then pay a return on what we build."

THE RAILROAD CRISIS: A WAY OUT*

By Ray Morris

Of White, Weld & Co., Bankers; Formerly Managing Editor *Railway Age Gazette*

It would perhaps not be too hasty a summary of American railroad policy to say that, from the earliest beginnings until the second Roosevelt administration, the roads were expected to be built, owned and operated by groups of private citizens acting under the minimum of regulative restraint. From about 1904 until the present time, however, experiments in regulation have gone forward so rapidly that we have fairly been swept off our feet by them, and at last have found ourselves committed to a policy of full regulation, state and national. Unfortunately, in the exercise of this regulation, we have failed to attach any responsibility to the full output of authority; we have provided an abundance of regulative statutes, part of which are administered by commissions and part by prosecuting attorneys, but we have nowhere provided a commission, bureau, or department of the government charged with the contingent responsibility of seeing to it that railroad operation should remain profitable. As a matter of fact, during these years of house-cleaning, when our national back yard has been hardly large enough to contain all the linen, once soiled, which we have so newly washed and hung out to dry, we have not especially cared whether railroad operation was being profitable or not.

Consequently, when the war added its especial and heavy burdens to the roads last summer, we awoke suddenly to a realization of the fact that Europe, with some four or five billions of our railroad securities, had a lively interest in our railroad policy, or lack of one, and that if Europe was dissatisfied with it, our own distressed security markets might conceivably have a digestive task forced upon them quite beyond their capacities of assimilation. It is probable that not even the war shock has as yet made the nation realize how seriously the railroads are handicapped, or that regardless of the potential European selling, we simply cannot finance the annual railroad budget of about a billion dollars unless private capital, which has to do the financing, is satisfied with the security and profitableness of its investment. As Thomas F. Woodlock has well expressed it, the investor decides what return on capital is reasonable, not the Supreme Court.

Although I recognize that a certain amount of inefficiency is the price we pay for democracy, and that difficulties of just this sort (as well as the far more galling difficulties arising from state interference) are an unintentioned but essential adjunct to the rule of majorities, yet I believe that we are nationally capable of handling our railroad regulation a great deal better than this. It seems quite clear that the indicated remedy is to bring our scattered regulative efforts together; to do the regulating in an office where there is accompanying responsibility, instead of allowing the two things to be wholly unrelated, as they are today.

Without specific reference to the railroad situation, but as a solution for the evils arising from vesting the control of national business in a local-minded Congress, reinforced by the secret sessions of its own committees, Henry L. Stimson suggested last year, in an able address before the Law Academy of Philadelphia, that the members of the President's Cabinet should be given the right to appear on the floor of the House and discuss matters of general legislation affecting their respective departments. This simple change in procedure, which, as Mr. Stimson points out, is almost universal among other nations, and could be adopted without constitutional amendment, would give each government department a spokesman before the whole people and a national representative, by virtue of his position free from sectional influence, who could harmonize conflict and inconsistencies, and answer questions from the standpoint of the administration's continuous policy, now so often obscured and befuddled by a multitude of counsellors.

In the interest of constructive railroad regulation, suppose this accomplished; a further step would be the creation of a railroad department with a cabinet officer at the head. The secretary of Commerce, recently shorn of some of his duties by the creation of the labor department, might conceivably be able to add this heavy task to his functions, or it might well be better to create a new cabinet officer, to deal either with internal communications alone, or with rail and marine alike. The latter plan would perhaps be in line with a recent suggestion looking towards the establishment of an American minister of marine. Without the direct recourse to Congress, I think this plan could be only partially successful; with it, a great change in our helter-skelter system of administration of our great national interests might be worked almost overnight. The cabinet officer, concerned with the interest neither of the shipper nor of the carrier, but solely with the general good, could readily locate the points of maximum friction, and form his independent judgment as to the merits of conflicting

*From an Article Published in the Yale Review for April, 1915.

claims. As an impartial executive and expert in the service of the administration, he could set before Congress instances of inequitable burdens imposed by the states; or, better yet, he could act as an accredited go-between, to line up and harmonize the respective railroad policies of the states and the national government, without troubling Congress with the matter except as a last resort, and on questions of policy rather than of detail. In view of the extraordinary mixture of local and national legislation under which the railroads are compelled to operate, it is a curious fact that we have devised no intermediary system of communication.

To what extent work of this sort could be performed satisfactorily by a cabinet officer would probably depend a good deal on the personal characteristics of the men who attempted to do it. If the job were handled skilfully, it would develop its own traditions and gradually take its place as an accepted factor in the constantly enlarging machinery of national administration. I should feel sympathy and some concern for the first railroad secretary who tried to wean Texas from the home-industry rate-making habit, but the attempt would at least have the merit of being an advance in national economics over the present method of neglecting state regulative enactments until they become so flagrant that the Supreme Court is called upon for relief.

Recent events have sufficiently justified some of the early criticisms of the interstate commerce act, in holding that the combination of administrative and judicial functions vested in the commerce commission would sooner or later break down from its own weight and complexity. But the matter goes farther than that. The commission, an immensely thorough-going and conscientious body, has not only elaborated a slow, judicial procedure which is nearly the precise opposite of executive efficiency, but it has all the dread of a minor court, of stepping outside the narrow boundaries of its work. What can it do today, when the need is to relieve the railroads from real regulative oppression at a hundred points? It has no access to the state governments; if it had chosen to make a voluntary report to Congress covering suggestions for emergency relief, I believe the report would have been well received, both by Congress and the country, but the commission did not care to take its place as the single national representative of the roads; perhaps, even in the crisis, it felt the old duty to protect the shipper against the carrier.

How differently would this have been handled by a cabinet officer and his department, especially under the plan of direct access to Congress! The need of a spokesman would have been met automatically, and the effect on the public confidence would have been tremendous. Nor is there a single European country today, with the possible exceptions of Greece and Montenegro, where specific machinery has not been provided to meet railroad crises, and where there is not a regularly constituted bureau or office, having executive powers of its own, or accredited access to the government.

In England the Railway and Canal Commission, a body in many ways analogous to the Interstate Commerce Commission, judges of the reasonableness of the rates; but the Board of Trade, which is a branch of the government, formulated the maximum rate schedules of 1891-1892 for enactment by Parliament, and maintains a railway department which deals with privately owned and operated companies like our own, and is in every sense a national administrative body. In Germany, the *Bundesrath*, or Federal Council, made up of delegates appointed by the various states, maintains the *Reichs-Eisenbahnamt*, an executive office, and deals with matters affecting the empire as a whole; while the Prussian minister of public works, for example, is practically supreme in the local administration of Prussian railroad matters, working at the head of an elaborate system of councils and directories, so constituted that the advisory and consultative boards are carefully separated from the executive board. The minister of public works manages the state-owned roads and supervises the private-owned ones. In France, where private companies own much the greater proportion of mileage, the minister of public works is similarly vested with executive authority supported by four permanent boards of committees dealing with various branches of the service, but deriving their authority from the public works office. Italy carefully separates the administrative functions of her minister of public works from the general national control exercised by the department of railways, headed by a permanent council of railway administration, which has nine members whose qualifications are described by statute. Private-owned roads in Italy constitute about fifteen per cent of the total.

In short, we find the commission, or consulting council, an essential part of the regulative plan all over Europe; but the tendency is equally plain to unite the specialized functions of these bodies in an executive office which exercises the authority and accepts the responsibility. The Prussian advisory councils, for example, were instituted with the express purpose of considering traffic and rate changes from the combined standpoint of the management and the public, but these councils do not possess the rate-making power; their suggestions are carried up through the district directories to the general advisory council, whose function it is to supply information and advice to the minister of public works. Sometimes this machinery has been over-elaborated, as in France, where the great commercial advisory board, which deals with minor rate changes, is headed by a permanent committee of 68 members, and works slowly. But provision has everywhere been made to deal with the railroads and their major problems in their entirety; we alone have failed to create a general railroad office with this function, although the need for it is much heightened in this country by our system of state autonomy.

It seems to me that it is our clear duty to supplement the careful and thorough, semi-judicial work of the Interstate Commerce Commission with such an office, and with an executive capable, as the commission is not capable, of appearing before Congress, or before the state governments, or of going from one to the other, with suggestions tending to increase efficiency, promote harmony, and settle abuses without the crude recourse to direct legislative action or the slow and unsatisfactory appeal to the courts: an appeal which takes so long that much irremediable damage is done in the meantime, while the final decision must necessarily turn on general constitutional and statutory rights, without much reference to the administrative necessities of the immediate case at hand.

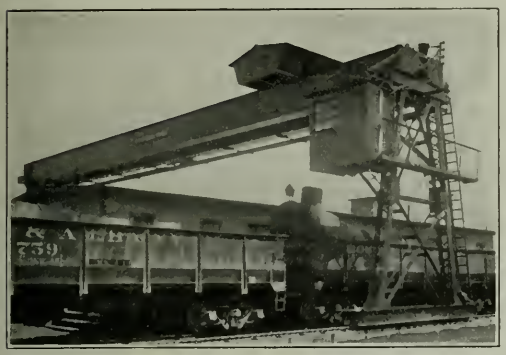
As an ultimate solution, it may well be that we shall come to some form of profit-sharing between the railroads and the national and state governments, either with or without a system of minimum guarantees. New York and Chicago have both worked out a plan of this sort to provide for local traction needs, and it has operated with great success and with conspicuous lack of friction. E. P. Ripley, president of the Atchison, Topeka & Santa Fe, goes even further than the municipalities have gone, and would divide the railroads into groups somewhat after the manner of the regional reserve banks, with a certain number of government directors, and with minimum guarantees of earnings and complete freedom to work out traffic pools, subject to government veto power in the public interest.

Before any constructive plan can be worked out, it will certainly be necessary to create an executive department at Washington to consider the situation in all its bearings. The planning will be a tremendous job, and it is quite obviously idle to look to the Interstate Commerce Commission or to the respective Senate and House committees on interstate commerce to undertake it. But it is fair neither to the capital which has built up the existing railroad system nor to the business interests of the country requiring its extension and development, that our national railroad policy should be permitted to remain in such a muddle, without plan or leadership, and holding out absolutely no inducement to build into new territory, or to rehabilitate and modernize the weak lines.

Plant for Handling Scrap on the Boston & Albany

Includes Reclaiming Shop and Storehouse. Material Is Unloaded, Sorted and Reloaded with a Gantry Crane

On January 1, 1914, the Boston & Albany put into operation at West Springfield, Mass., a new scrap reclaiming plant, and concentrated the handling of scrap for the entire road at this point. Prior to the completion of the plant scrap had been sorted and broken up by hand at several points on the system with little attention to reclamation of serviceable material.



Storehouse and Gantry Crane, Showing Crane Trolley Wires

Considerable material is now economically salvaged and the cost of handling the scrap has been much reduced.

The plant consists of a storehouse 25 ft. by 40 ft., with a connecting shed, 25 ft by 50 ft., housing the reclaiming shop. A high platform, 10 ft. wide on the sides and 30 ft. wide on the end, extends around three sides of the building. Beyond the end of this platform at ground level is an area 45 ft. wide and 200 ft. long, on which the scrap is sorted. This is surfaced with cinders and screenings and is divided into 15 bins, 10 ft. wide, with a large bin 50 ft. wide in the center. Tracks for loading and unloading extend the entire length of the plant, one on each side, and a five-ton gantry crane, running on rails laid on a continuous concrete foundation, spans the entire layout. The tracks are 47 ft. apart, center to center, and the span of the crane wheels is 80 ft.

The tools in the shop consist of a pair of alligator shears, driven by a 7½ h.p. motor; a drop hammer driven by a 7½ h.p. motor; a bolt threader and nut tapper, and one magnetic chip separator. These last mentioned machines are driven from a line shaft by one 7½ h.p. motor.

The gantry crane is of the standard three-motor type of five tons capacity. The maximum travel of the hook from lower to upper limits is 22 ft., and the clearance from the under side of the girders to the base of the rail is 22 ft. The main hoist is driven by a 22 h.p. motor and lifts at a speed of 40 ft. per minute. The trolley is driven by a 3 h.p. motor and travels at the rate of 125 ft. per minute. The bridge is operated on the rails by a 22 h.p. motor and travels 200 ft. per minute. All motors are for two phase, 60 cycle, 440 volt alternating current and were furnished by the General Electric Company. They are enclosed on the sides and top by galvanized corrugated iron with suitable doors for inspection.

The hoisting mechanism is controlled by mechanical load and electric brakes, and a limit switch is provided for opening the main current of the motor to protect the crane from injury should the hook be raised to a dangerous height. A powerful foot brake of the post type is operated by a foot lever located conveniently in the operator's cage, which is placed at one end of the bridge.

The lifting magnet is of 3,500 lb. capacity and has a lifting surface three feet in diameter. It is lifted by the hook of the crane, and when not in use is set on the platform. Direct current for the magnet is supplied by a 7½ kw. 230 volt General Electric motor generator set bolted on the side of the crane bridge girders and controlled from the cage. When loaded to its full capacity the magnet requires about 45 amperes at 230 volts.

The track on one side of the plant is used for unloading scrap as it is received and shipments are made from the other

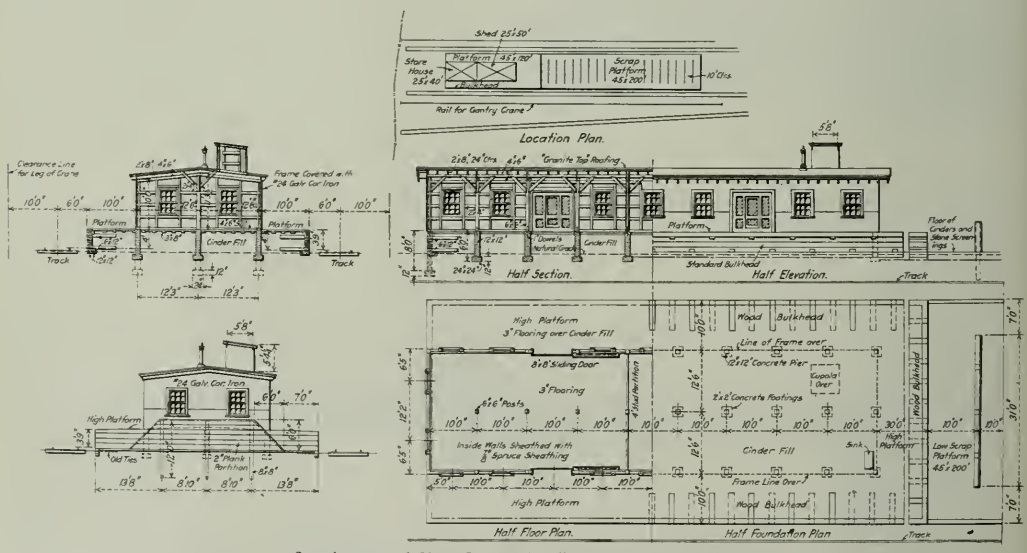
Arrangement of Bins for Sorted Scrap, Boston & Albany Scrap Yard

side. Cars loaded with miscellaneous scrap are placed opposite the large central bin into which they are unloaded by the lifting magnet. The material is then sorted to meet the several specifications as to size, quality of material, etc., each class being placed in a separate bin and held for shipment. In this operation boxes 30 in. by 40 in. square with side bars 8 in. high on three sides are used. Each box is handled by a three-part chain sling, and when filled with sorted material is carried by the crane to the proper bin and dumped.

The power hammer in the reclaiming shop is used for straightening bolts and spikes. A special die has been provided by means of which three spikes may be sharpened at one time with a few blows of the hammer. Bolts and nuts are reclaimed by retapping and rethreading. All brass borings are run through the magnetic separator which removes steel and iron chips. The plant is provided with an oxy-acetylene outfit which is extensively used to cut up into sizes convenient for handling and shipping structural material, old boilers, tender frames and other large pieces.

At present the organization consists of 15 laborers, who are in charge of one foreman. The latter reports direct to the storekeeper and all reclaimed material is turned over to the stores department for disbursement on requisition. During the last eight months of 1914, 10,000 gross tons of scrap was handled by the plant, and material worth $8,715 was reclaimed and returned to store stock. The value of the reclaimed material amounted to about $139 per month in excess of the operating expenses, and during the eight months $139,000 worth of scrap was sold. As compared with the previous method of handling scrap, a saving of 10 cents per ton has been effected by the new plant, and under the former method practically no material was reclaimed. The reclaimed material consists of brake shoes, brake pins, brake levers, connection rods, couplers, follower nuts, washers, fire hooks, bolts, spikes, side irons, tie plates, shovels, round and flat iron, etc.

The installation was made from plans prepared by the engineering department of the railroad.



Storehouse and Shop, Boston & Albany Reclaiming Plant

Australian Strategic Railways.—It is reported that the construction of the strategic railway by the nearest direct route between Adelaide and Brisbane will shortly be begun.

TRAIN ACCIDENTS IN FEBRUARY[1]

The following is a list of the most notable train accidents that occurred on railways of the United States in the month of February, 1915:

Collisions.

Date.	Road.	Place.	Kind of Accident.	Kind of train.	Kil'd.	Inj'd.
†1.	Cin. G. & P.	Amelia, Ohio.	bc.	P. & F.	3	13

The trains in collision on the Cincinnati, Georgetown & Portsmouth near Amelia, Ohio, on the 1st, were an eastbound passenger, consisting of a single electric car, and a westbound freight. Three passengers were killed and thirteen injured. Both trains were running at full speed, making a very bad wreck. There was a dense fog at the time.

The trains in collision at Irving, N. Y., on the second, were northbound freights, the second train running into the one preceding at about three miles an hour. The engine, caboose and ten freight cars were badly damaged. One of the brakemen was killed and five other trainmen were injured. The leading train was an extra, stopped for water. The other, No. 303, was

[1]Abbreviations and marks used in Accident List: rc, Rear collision——bc, butting collision——xc, Other collisions——b, Broken——d, Defective——unf, Unforeseen obstruction——unx, Unexplained——derail, Open derailing switch——ms, Misplaced switch——acc. obst., Accidental obstruction——malice, Malicious obstruction of track, etc.——boiler, Explosion of locomotive on road——fire, Cars burned while running——P. or Pass., Passenger train——F. or Ft. Freight train (including empty engines, work trains, etc.)——Asterisk, Wreck wholly or partly destroyed by fire——Dagger, One or more passengers killed.

running under a permissive block signal and also had been warned by torpedoes.

The trains in collision at Cayuga, N. Y., on the ninth were a westbound passenger No. 3 and an eastbound freight. The freight was standing on a side track and the passenger ran over a misplaced switch and into the head of the freight. Three trainmen were injured. The switch had been left open by a brakeman of the freight in consequence of a misunderstanding with the conductor.

The trains in collision at Irvington, Ky., on the ninth, were eastbound passenger No. 143 and westbound passenger No. 144. Both engines were considerably damaged, but no cars were badly smashed or ran off the track. The fireman of the westbound train was injured.

In the collision at Dillon, S. C., on the night of the 28th, northbound passenger No. 88 ran over a misplaced switch and into some freight cars standing on a side track, damaging the engine and wrecking four freight cars. The engineman of the passenger train was slightly injured.

The train derailed near Beardstown, Ill., on the fifth was southbound passenger No. 122. One passenger car was overturned and fell into water 2 ft. deep. Eleven passengers were injured. The cause of the derailment was the breaking of a pin in a switch stand.

The train derailed near Greene Junction, Pa., on the seventh was eastbound passenger No. 6, and the train ran several hundred feet on the ties before it was stopped. Many passengers were injured, but none seriously. The cause of the derailment was a broken pedestal of one of the trucks of the tender of the locomotive.

The train derailed near Hailey, Okla., on the night of the tenth was a southbound freight, and seven cars of oil were burnt up. The derailment, as well as the fire, was caused by the ignition of oil which dripped from a tank car on a hot brakeshoe, the burning oil causing a sudden and violent explosion.

The train derailed at Dubberly, La., on the night of the eleventh was westbound passenger No. 11. The train ran over a misplaced switch and was derailed entering the side track, three cars being overturned. Two passengers were slightly injured. The cause of the misplacement of the switch is charged to maliciousness. The switch had been moved but slightly from its normal closed position and the switch light gave an indication of clear for the main line.

The train derailed at Youngstown, Ohio, on the nineteenth was an eastbound freight, and the engine and eight cars of cattle were piled up in a bad wreck. A brakeman was killed and the engineman and fireman were injured.

The trains involved in the accident at Bristow, Va., on the twenty-third were a northbound freight of the Chesapeake & Ohio and a southbound passenger of the Southern. The freight was derailed half a mile north of the station by failure of bolts in a freight-car truck, and ten cars were badly damaged. The southbound track was obstructed. The passenger train came along just at that moment and the engine and first two cars were derailed and the fireman was killed. Two passengers and three employees were injured.

The train derailed near Colorado Springs, Col., on the twenty-second was passenger No. 15 and the engine and three cars were ditched. The engineman and fireman were killed and nine passengers and two trainmen were injured. The cause of the derailment was not determined.

The train derailed at Morris Junction, Pa., on the twenty-fifth was a westbound passenger, and five trainmen were injured. The derailment was caused by a large rock which fell down the mountainside.

The train derailed near Claremont, N. H., on the twenty-sixth was an eastbound passenger and four cars were partly overturned. One employee was killed and one passenger and three employees were injured. The cause of the derailment was a washout due to a flood in Sugar river.

THE PASSENGER FARE QUESTION IN OHIO*

By L. E. Johnson,
President, Norfolk & Western

I come to you, not as a stranger, but as a friend and neighbor, to ask your aid and influence, not in order that your railway properties may show increased profits, but that the efficient passenger service furnished to the citizens of Ohio shall be at least self-supporting, and shall pay to the carriers within the borders of your state its fair proportion of the expenses of operating the railroads of your state. The railroad companies, as Justice Hughes pointed out in a decision of March 8, 1915, declaring that a two-cent maximum passenger rate law of West Virginia was unconstitutional, should not be "forced to carry passengers, if not at or below cost, with a merely nominal reward considering the volume of the traffic affected." If by such laws the revenue from the passenger service is thus unfairly reduced, the result inevitably must be that the traveling public will finally suffer in decreased efficiency of service.

The development of your railway properties under private ownership and by private initiative, in co-operation with the various fields of human endeavor, has been responsible for great material development and prosperity in all activities, and I cannot feel that our citizens, when the matter has been frankly placed before them, will sanction, for political or other reasons, legislation prescribing a rate for the carrying of passengers that does not pay to the carriers a reasonable return for the services rendered, and in so doing prevent a continuance of further development, not only in the sections which are now served by railway companies, but also in areas of undeveloped territory.

The progressiveness, initiative, and resourcefulness of the people of our country can be illustrated by the fact that, with a population of 100,000,000, we have under private investment and management about 250,000 miles of railway; while all Europe, with 450,000,000 population (about four and one-half times as many) has 213,000 railway miles, principally state-owned. In Europe there are 5.7 miles of railway line per 100 square miles of area, and in the United States over 8 miles of railway for the same area. With us there is a mile of railway for each 400 inhabitants, and in Europe there is a mile for about 2,100 inhabitants. If the European ratio to population prevailed in this country, we would have less than 48,000 miles, instead of nearly 250,000.

Our mileage has grown because of the prevision of the men who projected it, and invested in the securities of your railway properties. These securities are held, broadly speaking, by the American people. The integrity of every life insurance policy, the proceeds of which we may hope to leave to those dependent upon us, rests in great measure upon the integrity of your railway property. To permit the value of this property to be depreciated will affect intimately the value of your life insurance policies, and nearly every other form of investment. These values will of necessity be seriously affected unless your railway properties are permitted to earn a fair return upon the monies devoted to the service of the public, and I believe that the American people will demand that this fair return be permitted to be earned, when they understand the situation of the railway companies, and feel that the matter is being fairly laid before them.

Prior to March 10, 1906, the passenger fares in the state of Ohio were lawfully based upon a rate of three cents per mile, and by legislative enactment of that date the rate per mile was reduced to two cents, a reduction of 33⅓ per cent. Under this act the receipts from the passenger service are not only insufficient to provide a reasonable return upon the investment, but in reality cause the carriers to operate their passenger service at a loss.

That the service has been well performed, though at a loss,

*From an address before the City Club of Cleveland, Ohio, March 18, 1915.

is evident by the reports of your commission, which show that millions of passengers have been safely carried, and that few have been injured while under the care of the railway companies. Travel upon railway trains, privately operated, is far safer than travel upon public highways, publicly administered. But the continuance of this condition, at least as to the adequacy of train service, cannot go on indefinitely against diminished and inadequate revenues.

That careful and scientific investigation of passenger rates has shown them to be below the value of the service is proven conclusively by the findings of the Interstate Commerce Commission. Can you ask for any higher authority than the finding of this commission charged with the duty of regulating the carriers of this country?

Acting upon this finding of the commission, interstate passenger rates were increased generally to two and one-half cents per mile. If a ticket from Buffalo to Cleveland (interstate) is worth two and one-half cents per mile to both carrier and passenger, a ticket from Cleveland to Columbus (intrastate) on the same train, is worth as much. Yet the law says it must be furnished for two cents per mile, which is less than the cost to the railway for rendering the service.

I know you will concede that confiscation is not reasonable or lawful regulation, and that under the guise of regulating passenger fares we should not be compelled to operate at a loss. Yet that is precisely the condition confronting the Ohio railroads today. The receipts of the Norfolk & Western for passenger fares in Ohio for the year ending June 30, 1914, were $706,048.84. The cost of operating the passenger trains was $683,658.57, leaving an excess of but $22,390.27. Against this small balance is chargeable the taxes, interest and dividends apportioned to the passenger traffic. The taxes paid in Ohio chargeable to the passenger traffic were over $63,000, so, without considering dividends, interest and the maintenance of equipment, roadway and structures, the Norfolk & Western operated its intrastate passenger trains in Ohio last year at a loss of over $40,000.

The total valuation of the Norfolk & Western in Ohio for taxes is over $26,000,000. The Norfolk & Western paid the state of Ohio in 1907 over $136,000 for taxes, and last year it paid more than $316,000, an increase of more than 132 per cent, and not including the United States income tax. The taxes paid per mile of road have increased in seven years from $514 per mile to $1,245 per mile. But this is not all. Grade crossing elimination work in Ohio, ordered by the local authorities, will cost the Norfolk & Western about $700,000 this year. During this same period in other states traversed by the Norfolk & Western our assessment for taxes has increased from $530 per mile to $788. While in Ohio passenger rates have been decreased one-third, our taxes are increased more than two and one-half times.

In addition to this, the increased value of passenger equipment demanded by the public will call for additional expenditures for such equipment, and additional taxes on the value of such equipment. The construction of wooden passenger cars has practically ceased. During the year 1913 and 1914, the Norfolk & Western has spent for steel passenger cars $933,000, and to replace with steel the wooden cars still in use will require an expenditure of more than $4,600,000—this for the Norfolk & Western alone. To replace the wooden passenger cars of the railroads of the United States with steel will cost more than $614,000,000; and yet the railways are expected to arrange for this expenditure, which will not add one dollar to the revenue, and for a business which is now handled at a loss for every passenger carried for two cents per mile.

At the time that the two-cent passenger rate law was enacted in 1906, it was argued by the proponents of the measure that the reduction of the rate from three cents would stimulate traffic, and that the increased traffic would more than offset the decreased rate. Experience has shown that this expectation has failed. In the year 1905, under the three-cent rate which then existed, the railroads of Ohio carried an average of 44 passengers per train mile, equaling $1.32; while in 1914, in spite of the increased population, there were only carried 50 passengers per train mile, equaling $1.00; so that your railways received 32 cents per passenger train mile in 1914 less than they received in 1905, and are only carrying an increase of 6 passengers at the end of nine years.

Every American takes pride in the passenger service of American railways. Here in Ohio, in the very face of adverse legislation, we have each year made betterments for the welfare and comfort of the traveling public. Roadbed, motive power, and equipment are the safest and best that money can buy. Safety and speed combine to make the journey of the traveler short and in comfort, and keep the business man in close communication with his affairs, however distant his trade and commerce may go and come. The roadbed has been made safe and is kept safe for you. The motive power is efficient and swift. The steel cars are safe and comfortable. Employees who operate the trains and keep up the tracks are competent, and are paid the highest wages of any railroad men. The rates charged for both freight and passenger service are the lowest in the world.

In the face of loss we have continued to improve our facilities, increase wages, and make betterments. We expect to pay—and do pay—a fair profit to the manufacturer on every car, every locomotive, every steel rail, every tie, and all other supplies that we buy. No man, no community, and no nation can prosper unless a profit is made. Every man in Ohio, whether he be a manufacturer, merchant, banker, farmer, or workman, expects and has the right to expect a profit upon what his energies and activities may supply to the world. It is not fair to ask any man to give of his talents or property without a reasonable reward. You gentlemen do not do it and you should not ask the railroads to do it. The difference between you and the railroads is this: you will not operate your business at a loss—we have to.

All that the Ohio railroads are asking is fair and equitable treatment as between mutual business interests. The Interstate Commerce Commission, after an exhaustive investigation, has sustained our case for an increase of passenger fares, and named Ohio as one of the offenders in enacting confiscatory legislation as to such fares. All we are now asking the people of Ohio to do is to right the wrong.

Our appeal is made directly to the representatives of the people of the state and if this appeal is backed up by public sentiment enlightened by the information coming from such business associations as are represented at this meeting, then there will be no question that the injustice that now exists will be remedied by the law-making authorities.

FREIGHT TERMINAL CAR CHECKING SYSTEM*

By I. T. Tyson

Assistant Trainmaster, Philadelphia & Reading, Port Richmond, Philadelphia, Pa.

In the operation of large terminal yards I have always found that success depends upon the proper training of the men on whom you must rely at times of congestion; too often, for various reasons, terminals are forced until the "filled up" question is forgotten and they are compelled to become blocked for a period. Under these adverse conditions, every man, from the general yardmaster down to the messenger boy, must be on the job every minute. The engine despatcher must keep in close touch with the mechanical department that he may be thoroughly familiar with just how the road engines are getting through the house so that where repairs are necessary and engines will not be ready by the time the crews' rest is up another engine can be ready. He must also keep in close touch with the yardmasters so that trains may be moved from the congested territory, or where there must

*Submitted in the contest on the Operation of Terminal Yards.

be a clean-up to permit the handling of promised business, or the making up of scheduled or fast freight extras.

From the moment a car arrives at the terminal yard a record should be kept of its movement to enable each yardmaster to keep in touch with every car standing or moving within his respective territory without any waste of time in hunting up the information. We have found it good economy to have sufficient car checkers to allow a yardmaster to be out on the job looking after his power and the proper handling of business. On the arrival of all trains at the terminal the car tickets are turned over at once to the car checker for checking. In this way no cars should get in without tickets or bills, and if a car does arrive without a ticket the question is immediately taken up with the conductor who brought it to learn where it was picked up, etc., and that point is wired for the necessary information, which is usually promptly received. At the time the train is being checked the cars are marked for different territories.

Sample of Car Record Ticket Used on the Philadelphia & Reading, Slightly Reduced

The car tickets are then turned over to the clerk, who takes the record, which is operated by the card system. The inbound record being taken, the card is filed in a rack specially constructed in three sections of 100 pockets each, in rows of 10 to a section, with numerals running on the top and the side from 0 to 9. This permits the use of the last two numerals of a car number for filing. The left hand section is used for the arrival of cars, and the right hand section after the cars have gone out and the outbound record has been filled in on the bottom of the tickets, which are then filed in this rack until the end of the month. At the close of each month all cards which have been filed in the outbound section are removed to a drawer constructed in the same way, where they are held for one year, to be handy for any question that may come up. At the expiration of one year the cards are removed to a record room; the cards from each pocket are tied up separately, and the entire month is filed in a box, which makes it handy to find any record that may be asked for. Any cards that may still be in the left hand rack at the end of the month or because of still being on hand are removed to the middle frame and as the cars go out these cards are removed, filled out and filed where they belong.

The cards used are in 10 different colors, so arranged that each day has its special color, viz.: dark red, left hand corner at top, first of the month; in the middle, the eleventh; in the right corner, the twenty-first; all white, thirty-first; this being the only date where the four tickets are required: With the second, light yellow in the left corner; twelfth, middle; twenty-second, right corner, and so on with all colors. The form number corresponds with the date that the card is to be used, and acts as a check. This enables us to learn at sight the number of old cars in the territory, and just how old they are. These cards can be quickly gone over each day and action taken to start the old cars moving.

In breaking up trains we use the ram system with very good results from the fact that it is not necessary to furnish a crew with the large number of men used to operate a hump. This crew consists of an engineman, fireman, conductor and seven brakemen; one of the latter operates the ram, one is a cutter and five are car riders.

Our receiving yard permits us to pull in and cut out four 60-car and four 45-car trains, which enables us to keep the ram crew going constantly when business is running normal. Should there be a slack time the ram crew is utilized to switch light cars in the outbound yard. Our classification yard is divided into three sections, with 15 tracks to each ladder, the tracks holding from six to 30 cars each.

Our car riders ordinarily ride the cars for a distance of two city blocks, catching them while on the run. The man on the ram regulates the speed according to the distance and the time between the cuts. The engine can be kept going without stops with a good operator on the ram, and car riders who understand their business so as not to take cars in too fast or place them on switches or the head end of tracks, requiring the engine to stop poling and run down to push the cars into clear.

I have always impressed upon our men the importance of the prompt handling and spotting of any car after its arrival. High class freight must receive preference. We aim to have all cars placed promptly, so that the agents may feel perfectly safe in going after the consignee to get teams to release them. I have always found this to be the real secret of keeping down congestion, as there are so many "holidays" and so much "inclement weather" to be accounted for that the only thing to do is to spot the cars and keep pounding for their release, after which they should be promptly moved to the outbound yard, properly switched and started to destination to release per diem charges. The men are taught that today is the time—let nothing lie over until tomorrow, and we will then be prepared for the unforeseen things which will arise the day following and which will require all of our attention without having to take care of something left over from yesterday.

The secret of successful handling is eternal vigilance. The only true way to obtain this is by keeping a constant check not only on the men, but on the results obtained, as well, by actually knowing how each man in charge is performing his duties—whether he works for a clean-up each day, handling his scheduled trains on time and getting his extras out within the prescribed time. With this condition all of his subordinates soon get the habit and everything moves with one strong push. If we find the bad-order car left over, part of a drag backed off without being properly switched and thereby requiring the second handling, tracks not checked up, and the conductor not in position to say what cars are on hand and why they are delayed, we may know that this fellow is going to give all the trouble that is required for an ordinary sized terminal. He wants to be set right as quickly as possible before that spirit extends to the whole territory.

Soldiers and Railway Fares in England.—The regulations regarding fares to be paid by soldiers traveling on English railways have recently been set forth in a letter from the Army Council to the Railway Nationalisation Society: (a) All soldiers are granted one free journey on leave, prior to embarkation, or after serving three months, if they have not previously received this concession. (b) All officers and men, traveling on leave from the continent, get a free warrant to their homes and back. (c) All sick and wounded soldiers, recommended by the medical authorities for sick leave, receive free warrants to their homes and thence to the station at which they are ordered to rejoin. (d) All officers and men under training, traveling on leave at any time, can do so at a single fare for the double journey. Soldiers may also travel free in cases of serious illness or death of a near relative.

J. W. BETTENDORF ON FREIGHT RATES AND BUSINESS ACTIVITY

Clifford Thorne, chairman of the Iowa railroad commission, who is opposing the freight rate increase proposed by western railroads, has received a vigorous protest against his policy from J. W. Bettendorf, president of the Bettendorf Company, of Davenport, Iowa.

Mr. Bettendorf says:

"For the period of ten months following July 1, 1913, our payroll amounted to $1,400.000, paid to an average of 2,000 men at the rate of $35,000 per week. From May 1, 1914, to the present time (ten months) we have been enabled to employ an average of only 400 men, and in this period the payroll has not exceeded $300,000.

"This shrinkage of $1,100,000 during the past ten months represents just this much loss to the merchants of this community, a loss most seriously felt. Merchants approach me continually in the hope that I can assure them that conditions are improving and business will soon return to normal. This I cannot do. . . . What has the shipper gained if, by the saving of a few dollars in freight, he contributes so largely to a condition that actually destroys the buying power of the community? As a large shoe dealer recently put it, 'What gain is there in saving a few cents on freight if I cannot sell my shoes?'

"The very fact that the railroads claim the increase of rates asked for would produce but $10,000,000 additional revenue, while the opposition claims it would produce $100,000,000, would seem to indicate that much if not all the present discussion is based entirely on theory and the skilful manipulation of figures.

"That business is paralyzed, practically at a standstill, with our manufacturing institutions and merchants thoroughly alarmed, is an undeniable fact and not a theory. Will not these deplorable conditions be aggravated by a determination to prove a doubtful theory? Activity of the railroad companies spells prosperity; their inactivity means depression generally.

"Grant this increase asked for. If the returns resulting therefrom are abnormal, it will be immediately reflected in a surplus (since future railway accounting is to be under government supervision) and when this surplus assumes normal proportions then will the shipper be justified in demanding participation therein through the medium of lowered rates.

"I will not attempt to defend the past conduct of some of the railway companies, but it seems to me that with the future issuance of bonds or increases in stock, under the supervision of the government (just as are the public utilities companies of the state of New York under the control of the state) the past can and must be absolutely ignored. We are now confronted with a condition that must be met by the application of common sense.

"Under normal conditions, such as existed in 1913, the tonnage of freight arising directly from the activity of our company amounted in round numbers to about 450,000 tons, or an average of one train a day consisting of fifty carloads of 60,000 pounds each, which at an average of $2.40 per ton, created a revenue to the railroad company alone of about $1,100,000, while in 1914 this tonnage shrunk to about 170,000 tons, creating a revenue of about $400,000 to the railroad companies.

"This inability on the part of the railway companies to purchase equipment not only resulted in the vast falling off of business, but was also the direct cause of the cancellation of orders placed, or the suspension of delivery on large orders, for some of which we had already provided the necessary materials. One such order alone represented nearly $750,900."

CYLINDERS AND VALVE GEARS*

By G. W. Rink

Mechanical Engineer, Central Railroad of New Jersey

While every effort is being made to increase the efficiency of the locomotive boiler, the economical distribution of steam in the cylinders has also received some attention. In general, however, we are not getting the results that are obtained in good stationary engine practice, due to long steam ports and the use of a single slide or piston valve which has to control admission, cut-off, release and compression.

A design of cylinder overcoming these objections to a considerable extent has been introduced in recent years. It is known as the Hobart-Allfree cylinder, is designed with extremely short ports and the exhaust passages are separated from the live steam passages, thereby reducing radiation and the condensation of the steam. The cylinders are designed to operate with either a slide or piston valve, the latter for use on superheater locomotives. This valve controls admission, cut-off and release, the same as any other valve, except that greater expansion is obtained by providing a sufficient amount of exhaust lap. A small compression valve of the piston type was introduced which controls the compression and provides greater fredom for the escape of exhaust steam. While the two valves release at the same instant, the compression valve remains open slightly longer to allow the exhaust steam, which would otherwise be in compression, to escape, until the piston reaches about 90 per cent of its stroke at working cut-off.

The Jersey Central has two locomotives in high-speed passenger service equipped with slide valves and two with piston valves, with this type of cylinder. A comparative test was made with one of the engines fitted with this type of cylinder and a slide valve against another engine of the same class in the same service fitted with the regulation slide valve and cylinder. These tests showed an economy in fuel and water consumption of approximately 12 per cent. This is the result of investigations on six trips to Philadelphia and return with each engine pulling a four car train, weighing approximately 175 tons.

Tests conducted on other roads with Mallet type locomotives equipped with the same type of cylinders with slide valves show a saving over similar engines not so equipped. With practically the same amount of coal used per ton mile, an increase of 13½ per cent in tonnage was hauled, with an increase in speed of 4.3 per cent and a saving in water per ton mile of 11.1 per cent.

Two of our Atlantic type locomotives were equipped with the piston valve type cylinders during the early part of this year. These engines were also equipped with superheaters and Baker valve gear. No actual tests have been made to obtain an accurate comparison, on account of its being impossible to separate the economies obtained. However, the saving in fuel and water is very noticeable, and in fact is considerably more than if superheaters only had been applied. The locomotives are also capable of much higher speed and can easily haul two to three extra cars without effort. Since its introduction, 162 locomotives have been equipped with the slide valve cylinder in connection with various types of valve gears, and 30 locomotives on various roads are now in service with the piston valve type of cylinder, 20 of which are operated with the Baker valve gear and 10 with the Walschaert gear.

British Rail Exports.—The aggregate export shipments of rails from the United Kingdom this year to February 28 were only 266,585 tons, as compared with 641,247 tons in the first two months of 1914 and 510,935 tons in the first two months of 1913. The exports for the month of February of this year declined to 99,840 tons, as compared with 243,495 tons and 279,202 tons.

*Discussion of report on Steam Locomotives of Today, at the annual meeting of the American Society of Mechanical Engineers, New York, December 2, 1914.

ARGUMENTS PRESENTED IN ENGINEMEN'S WAGE ARBITRATION

Oral arguments were presented in the arbitration proceedings at Chicago on the demands of the Western engineers and firemen, during Monday, Tuesday and Wednesday of this week, and briefs have been filed by James M. Sheean, attorney for the Conference Committee of Managers, and by Warren S. Stone and W. S. Carter for the engineers' and firemen's brotherhoods. The board is to render its decision by April 20.

In the brief filed by Mr. Sheean, it is claimed that the employees have failed to establish the propositions on which their demands for increased pay are based. The decision of Seth Low and John H. Finley, in the Eastern trainmen's case, is cited to sustain the position that the present demand for further increases can only be supported by showing that conditions have changed since 1910, and makes the claim that each of the basic propositions contained in Mr. Stone's opening statement is disproved, not only by the railroads' exhibits, but by those which the employees themselves have submitted.

Attention is directed to the fact that since 1910 the railroads involved have expended over $660,000,000 in extensions, additions and improvements to property, and that over $220,000,000 of this amount was expended for the purpose of increasing efficiency and safety and to expedite train movement, that through the elimination of grades and curves and the improvement of roadbed, as well as motive power, the engineers and firemen, with the larger power, which takes the higher rates of pay, have been able to get over the road in a shorter period of time than in 1910; and therefore the higher rates of pay taken by the larger power have been earned in fewer hours upon the road.

Attention is also directed to the fact that the exhibits introduced on behalf of the employees disclose that between 1909 and 1913 the amount of coal consumed on the railroads involved for each thousand dollars paid to locomotive firemen has decreased nearly 5 per cent; even with this decreased coal consumption per thousand dollars of compensation, it is shown by railroad exhibits that with the installation of heavier power there has been constant improvement in the matter of labor-saving devices, such as mechanical stokers, coal-pushers, ash pans operated by compressed air, pneumatic door openers, sloping tanks, etc.

As to the claim advanced that the so-called "productive efficiency" of the engineers and firemen has increased, the brief points out that the net income from operations in 1914 was $15,000,000 less than in 1910; that in 1914 there was declared out of income $22,000,000 less in dividends than in 1910; that there was carried to surplus in 1914 $24,000,000 less than in 1910; and that in the first seven months of the current fiscal year there is a falling off of over $41,000,000 as compared with the gross revenues for a corresponding period in 1914.

The brief emphasizes the fact that no witness on behalf of the employees contradicted the correctness of the interpretation placed by the railroads upon the proposals in arbitration in making application of the proposals to the actual operations on the roads involved during the month of October, 1913, in which the proposals were presented. The employees' expert statistician testified that if there was given to this month's operation only the importance which that month's payroll bore to the payroll for the entire year, an accurate estimate of the increased expense could be made for the year; and by the adoption of this method it is shown that through a year's operation the proposals would mean an increase in the payrolls of the engineers and firemen from $75,000,000 to over $115,000,000, or nearly $41,000,000.

Conceding that the rates and rules should provide full, fair and adequate pay for important duties and responsibilities, Mr. Sheean directed attention to these facts: "When a fireman enters railroad service he is on the bottom rung of a ladder of promotion created by seniority rules under which the oldest man in the service has the right to make selection of his run. From the day he enters service he is guaranteed: (1) A minimum daily wage for every day he is called upon to work, no matter how few the hours he works or the distance he runs. (2) Pay for every mile he runs, no matter how short the time in which the run is made. (3) A minimum hourly rate, irrespective of the distance run. And with these guarantees, under the schedules now in force, some of the men are earning each year as high as $3,725 as passenger engineers, $3,342 as freight engineers, over $2,000 as passenger firemen, over $1,800 as freight firemen. From actual payroll figures here introduced, which give the names of every individual in engine service, with detail of his earnings, it is shown that in regular passenger service engineers earn as high as $341.60 per month, and that the average monthly earnings of all engineers in such service is $183; that firemen in such regular passenger service earn as high as $209.89 per month, and that the average monthly earnings of all firemen in such service is $115; that engineers in regular freight service earn as high as $358 per month, and that the average monthly earnings of all engineers in such service is $170; and that the firemen in regular freight service earn as high as $221 per month, and that the average monthly earnings of all firemen in such service is $110."

In conclusion Mr. Sheean said: "These payroll figures demonstrate that the present schedules provide full, fair and adequate pay, whether measured by comparison with other trades, by comparison with other railroad employees who have like duties and responsibilities, or by comparison with engineers and firemen of the East or the South. These payroll figures have not been contradicted by the employees whose names appear thereon, notwithstanding the fact that during the hearing, while the railroad exhibits were being introduced, Mr. Carter stated to the board of arbitration: 'I have reached the conclusion that our case is lost if we treat the exhibits of the railroads too seriously.'"

A thinly veiled threat that the engineers and firemen would not again be inclined to submit to arbitration if their demands were not granted in this proceeding was made by President W. S. Carter, of the Brotherhood of Locomotive Firemen and Enginemen, in his oral argument.

"If these wage movements are adjusted amicably," he said, "through arbitration and under a federal law, it must take from one to two years to reach a conclusion. These wage movements may be begun when railroad business is at its height, and it may be that when the time comes for the rendering of an award one or two years later railway traffic may be at a low stage. If railroads are to take advantage of that it would make it impossible for the officers and committees of these organizations to curb the men on the engines. We were told at the beginning of this movement that if we did not strike there would be a change in traffic before the arbitrators could render an award, and if what they told us is true I fear they will never again give us consent to prolong the agony for two years before an award is made.

"Hundreds of millions of dollars would be available for the remuneration of engineers and firemen if the finances of western railroads had been wisely and properly managed," he said. "A review of the past history of western railroads discloses the fact that the extraordinary gains in revenue which have arisen from the bounty of the federal and state governments, the population of the country, the development of trade and industry, the adoption of mechanical devices and improved operating methods, added capital investment and the increasing work and efficiency of employees have, to a large degree, been absorbed by fictitious capitalization or dissipated by improper or misguided financial management."

Mr. Carter also asserted that the roads had failed to report to the Interstate Commerce Commission the exact value of their holdings, saying that "the Southern Pacific alone is now estimated to have oil and timber holdings ranging in value from $100,000,000 to $700,000,000, which are reported to the Interstate

Commerce Commission at a book value of slightly more than $40,000,000." Mr. Carter also referred to the finances of the Rock Island and the St. Louis & San Francisco and asserted that all of the railroads in the West are virtually under the control, through interlocking directorates and stock ownership, of the Morgan and Rockefeller groups of financiers.

COOLING HOGS IN TRANSIT

One of the results of placing the settlement of claims in charge of the operating department on the St. Louis & San Francisco, was the introduction of a device for watering or cooling off hogs, which has considerably decreased the claims due to their dying in transit. Formerly when it was desired to cool them water was used direct from the track tank spouts. The cold water striking the hogs on the back and neck caused congestion, and consequent death. The loss in this way has been greatly reduced by putting in a special hog watering device at each of the tanks, similar to the one shown in Fig. 1. The 3 in. wrought iron pipe extends from the bottom of the tank to within about 5 ft. of the ground, and the lever which operates the valve is fitted with a lock, so that it cannot be tampered with. The valve is in the tank, at the top of the 3 in. pipe, so that when it is closed there will be no water left in the pipe to freeze and cause trouble.

In cooling off the hogs a stream of water is first turned on the bedding underneath them. After this is well saturated the nozzle is turned toward the roof of the car and the water is

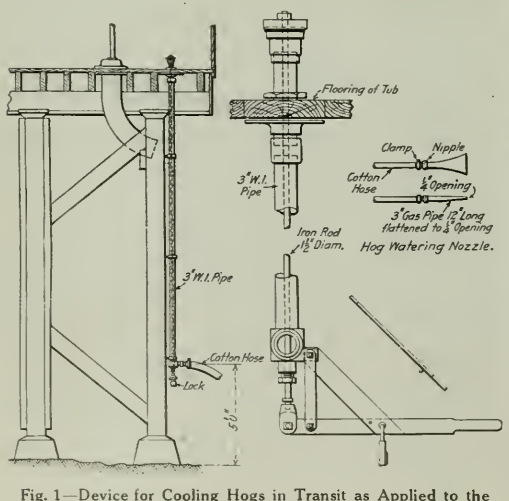

Fig. 1—Device for Cooling Hogs in Transit as Applied to the Older Water Tanks

allowed to spray over the backs of the hogs gradually. The device is simple in construction and saves its cost many times over during the summer season. The bill of material is as follows:

2	3-in. hose nipples	$ .30
1	3-in. floor flange	.30
1	3-in. nipple	.12
15-ft.	3-in. W. I. pipe at 22c	3.30
1	3-in. special valve	2.00
1	3-in. lock nut	.10
1	16-in. iron rod, ½ in. diameter	1.00
1	3-in. special elbow casting	2.00
25-ft.	3-in. cotton hose at 40c	10.00
2	clamps to fasten hose	.20
1	nozzle, 3-in. flattened to ¼-in	.20
1	switch lock	.40
1	valve operating device	2.25
	Labor	10.00
	Contingencies 10 per cent	3.18
	Total	$35.35

With the present standard 50,000 gal. capacity frame water tanks the hog watering device is attached direct to the supply pipe, which is enclosed in a frost proof box as shown in Fig. 2. This costs only $20.85.

1	2-in. globe valve	$ 3.15
1	hump hose rack	2.95
25-ft.	2-in. linen rubber cased hose	10.00
1	nozzle, flattened	.75
	Labor	4.00
	Total	$20.85

Circular 316, issued by the superintendent of freight loss and damage claims, gives detail instructions for the watering of hogs in transit. It specially directs attention to the fact that the first

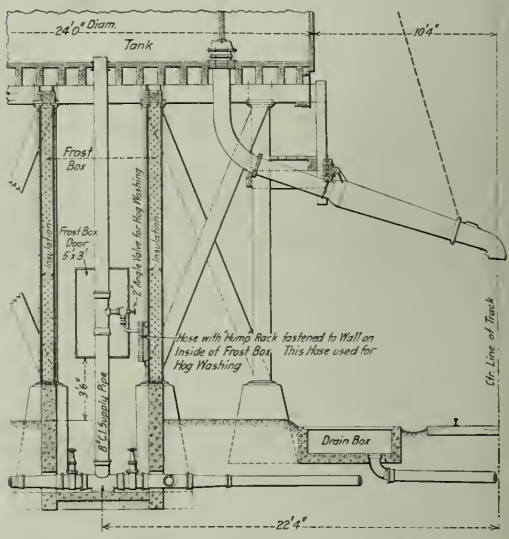

Fig. 2—Hog Washing Device as Applied to New Standard Track Tanks

warm weather of the season is more severe on hogs than the extreme warm weather later; therefore, extra precautions should be taken in the handling of the shipments made in the early part of the season. Hogs as a rule do not suffer while the cars are moving, but a great many die from overheating while cars are not in motion. Conductors are cautioned to watch the condition of hogs closely, and when they see they are getting warm or heating up, should arrange to have them watered at the first opportunity.

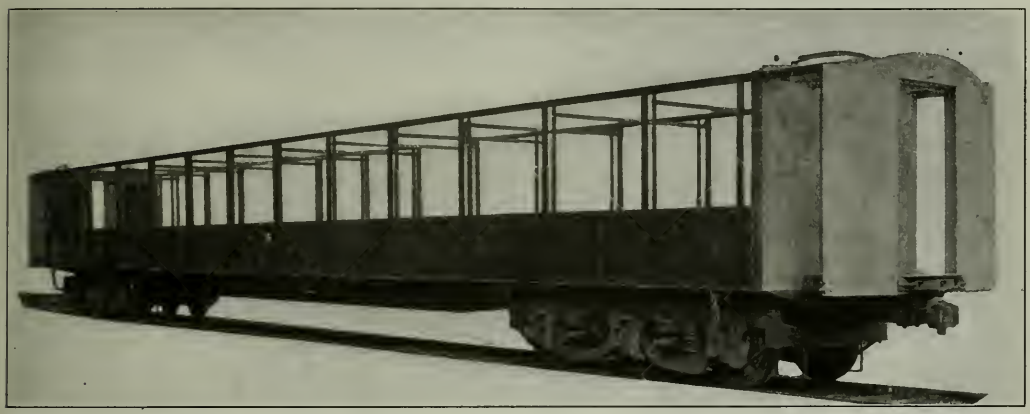
When any of the hogs are found dead on arriving at St. Louis or Kansas City, bad order reports are immediately rendered, so that an immediate investigation may be made to ascertain whether the shipment was properly watered. The hogs are watered immediately upon arrival at division points, or at the last water tank before reaching such points. A great many of them arrive in St. Louis in the morning after 7 a. m., and seldom reach the stockyards until noon, or in the heat of the day. The loss has been considerably reduced by seeing that they are watered before delivery to the terminal.

English Railwaymen and Enlistment.—The British war office has made the following announcement: The railway executive committee is working out a scheme in conjunction with the war office by which increased opportunities to enlist into the army will be afforded to the men employed by the railways. This scheme will be framed in such a way as not to impair the working of the railways, and until it can be put into operation railwaymen will only be recruited under the regulations which existed previously.

Steel Frame Passenger Equipment With Wood Finish

New Grand Trunk Suburban Cars Are Designed for Ease of Repairs in Present Shops, as Well as Strength

The Grand Trunk recently placed in service a number of suburban coaches, which are 83 ft. 3¾ in. long over buffers, 74 ft. long over body end sills and weigh complete, ready for service, with six wheel trucks equipped with rolled steel wheels, 137,000 lb.



Grand Trunk Suburban Car During Construction, Showing the Arrangement of the Steel Members

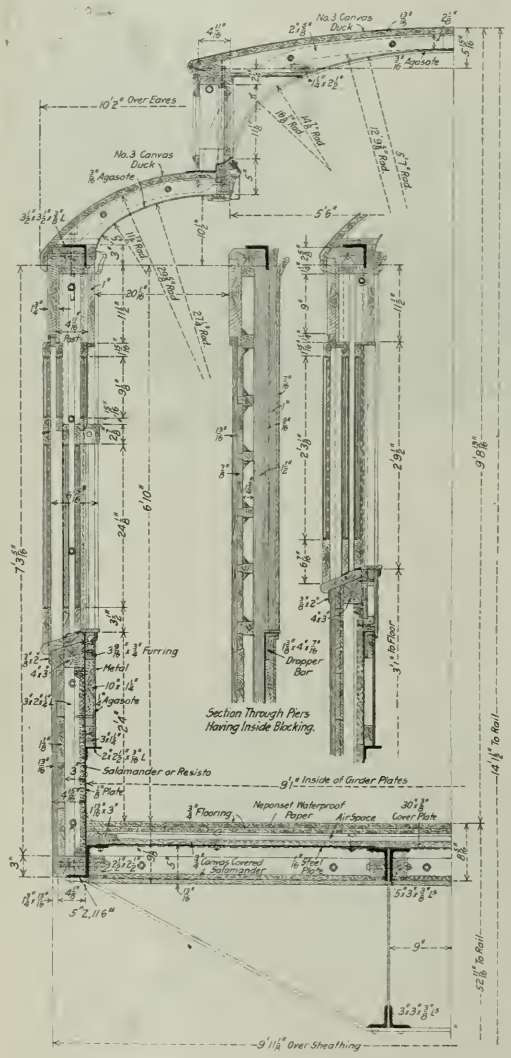
The framing of these cars is of steel construction with all steel vestibule, the interior and exterior finish being of wood. This is the result of much study and consideration, with the object in view of obtaining a construction which offered a maximum of safety and comfort to the traveling public, and a minimum expense to the railway company for maintenance. This problem seems to have been successfully solved by the adoption of a steel underframe and steel side framing, equivalent in strength to a steel car, in addition to which the car body and truck are locked together, so that the braking force is effective in stopping the car body as well as the trucks in case of derailment or collision. By the introduction of this truck and body bolster locking device,* and the adoption of all-steel vestibules, the possibility of telescoping is believed to be practically eliminated. The locking device is designed to have a three-fold function, in case of wreck or derailment: First, to prevent telescoping; second, to lower the center of gravity by adding the weight of two trucks (40,000 lb.) to the car body, and thus prevent the body from turning over in case of derailment; third,

Steel Frame Suburban Car with Wood Finish Recently Placed in Service on the Grand Trunk

*For description of this device see *Railway Age Gazette*, January 10, 1913, page 53.

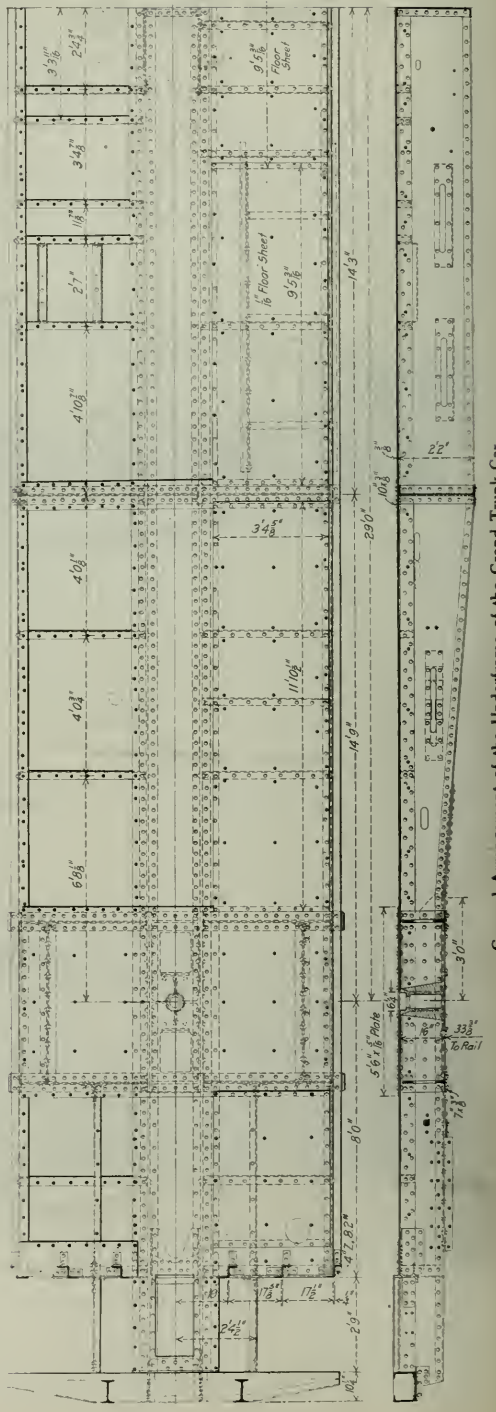
the full effects of the air brake can be obtained under all conditions, even after a derailment has taken place, as each truck is held in position under the car.

By installing steam heat and electric light the car is rendered practically fireproof. The railway officers concluded after careful investigation that the passengers' wearing apparel, the upholstering, etc., in a passenger car is more inflammable than a wood inside finish, and that the paint and varnish in a steel



Cross Sections of the Grand Trunk Car

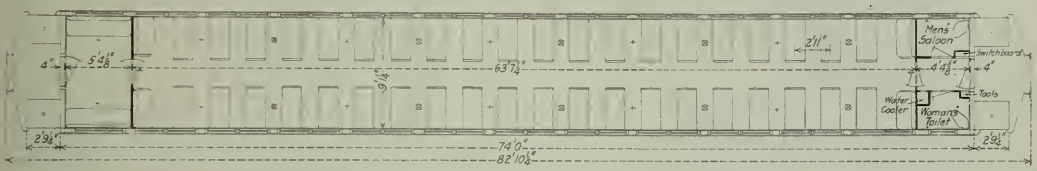
car is inflammable. By the adoption of a composite construction the car is claimed to be warmer in winter and cooler in summer, and in addition, these cars can be repaired in any of the company's shops at the same cost as a wood car, thus saving the expense of buying special machinery and keeping in stock special material for repairs, which would be necessary with steel interior and exterior finish.



General Arrangement of the Underframe of the Grand Trunk Car

UNDERFRAME

The underframe is constructed with the center sills as the principal members. They are of the built up fishbelly type, continuous from buffer beam to buffer beam and consist of a 30 in. by 3/8 in. top cover plate, 5 in. by 3 in. by 3/8 in. top angles, 5/16 in. web plate and 3 in. by 3 in. by 3/8 in. bottom angles. The depth of the center sill at the center of the car is 26 in., and at the bolster 16 in. The body bolster is built up of eight 3/8 in. pressings as side members, one cast steel center member of



Floor Plan of New Grand Trunk Suburban Car Which Seats 96 Passengers

heavy construction designed to take the locking device, a top cover plate 5 ft. 6 in. by 5/16 in. extending the full width of the car and two 7 in. by 3/8 in. reinforcing plates extending from side sill to side sill. There are two crossbearers placed 14 ft. 3 in. on either side of the center of the car and built up of 3/8 in. pressed steel diaphragms placed back to back, with 10 in. by 3/8 in. top cover plate and 7 in. by 3/8 in. bottom cover plate, both extending the full width of the car.

BODY AND END CONSTRUCTION

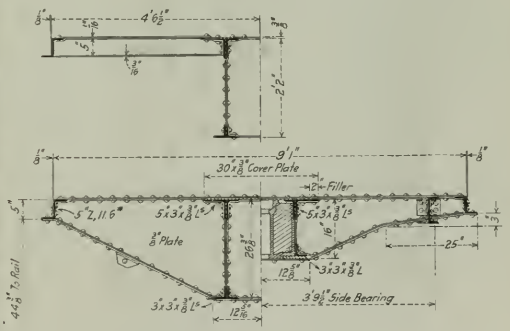
The side girder consists of a 1 3/8 in. by 4 in. by 7/16 in. dropper bar, 1/8 in. by 35 in. web plate, 2 in. by 2½ in. by 3/16 in.

Interior of the Grand Trunk Suburban Car

intermediate angle and 5 in. by 11.6 lb. Z-bar side sill. The side posts are 3 in. by 2 in. by ¼ in. angles, and the side plate is a 3½ in. by 3½ in. by 3/8 in. angle. The steel construction of the body is reinforced with wood posts and horizontal and vertical wood blocking. The interior and exterior finish is of wood. Wrought iron carlines, 2 in. by 5/8 in., are riveted to the side plate, completing the steel superstructure, and here again the wood reinforcing is employed. Canvas duck is used for the final roof covering and the headlining is 3/16 in. Agasote. Agasote is also used below the belt rail. No special insulation was necessary in this construction except below the belt rail, where 3/4 in. Salamander is applied outside the 1/8 in. steel plate. Special care was taken, however, for insulation under the floor, two air spaces, two layers of 3/4 in. Salamander and one layer of Neponset paper between the upper and lower course of the floor being used.

The end posts are 4 in., 8.2 lb. Z-bars with wood reinforcing, and the end plate is a 4 in. by 3 in. by 5/16 in. angle. The vestibule posts are 8 in., 18 lb. I-beams connected at the bottom direct to the platform end sill, which is built up of 7 in. channels, while at the top these I-beams are connected to the body of the car by 6 in. channels running parallel with the center line of the car and by 3 in. by ¼ in. angle diagonal braces from the ends of the I-beams to the corners of the car body; these braces are in turn braced to the vestibule corners by 2½ in. by 2½ in. by ¼ in. angles. The vestibule end plate is a 3½ in. by 3½ in. by 3/8 in. angle and 2 in. by 2½ in. by 5/16 in. angles brace this plate to the end of the car body between the I-beam and the outside of the car. The vestibule is sheathed with 1/8 in. steel plate.

The interior finish is mahogany and rattan seats are used,



Cross Sections of the Underframe

the seating capacity of the car being 96. The Stone Company's axle system of electric lighting is used, the generator being arranged to cut in at about six miles an hour, and the cars are heated by the Chicago Car Heating Company's vapor system of steam heat. They were built by the Canadian Car & Foundry Company, Montreal, Quebec.

Railway Electrification in Switzerland.—There is already a large mileage of railway operated electrically in Switzerland, though a considerable proportion is represented by mountain and special lines other than the general railway system. It is now stated that 1,873 miles of the Swiss state lines are to be converted from steam to electric traction, power being derived from the wealth of water power available.

General News Department

The Atlanta & West Point has put up a telephone line for train despatching, between Atlanta and Montgomery, 175 miles.

Jacob C. Frist, station master at the union station in Meridian, Miss., has received from President Wilson a medal, in recognition of his heroism, a year ago, in rescuing an aged woman and a child from in front of a locomotive. Frist had a leg broken and was otherwise injured.

The United States Civil Service Commission announces examinations, April 27, for the position of assistant supervisor of accounts, in the division of valuation, Interstate Commerce Commission; salary from $3,000 to $4,200 a year. It is desired to get men of large experience in railroad accounting.

It was announced at Ottawa on Wednesday that the Canadian government would at once begin operating the transcontinental railway. The line was built by the government for the Grand Trunk Pacific, which signed a contract to take it over for operation on completion, paying for fifty years as rent, 3 per cent of the cost of construction. The road has declined to sign the lease or to begin operation, claiming that terminals at Quebec have not been finished and that in other respects the road is incomplete.

The Baltimore & Ohio requires train employees, and station and track forces, in times of emergency, to render assistance in putting out fires on adjacent property as well as on the right-of-way; and there have been numerous instances where serious losses have been prevented. Henceforth employees receiving information concerning the existence of a fire are to notify the division superintendent by wire, so that the fire warden or other state, municipal or county officer may be informed. If fire were detected by railroad employees in a farm house, assistance could be summoned by the railroad from the nearest place where such facilities were at hand.

Postmaster General Burleson has replied to Mr. Peters and other critics of his position in regard to railway mail pay, giving the newspapers, for their Monday morning issues, a statement filling a column. He says that the statement issued by Mr. Peters, to the effect that the joint congressional committee had accused the officers of the post office department of ignorance and greed is erroneous; that Mr. Bourne, chairman of that committee, in making that statement was not supported by the other members of the committee. These other members publicly repudiated some of Mr. Bourne's statements. Mr. Burleson says that in the current fiscal year the railroads will have received nearly $4,500,000 for carrying parcels in the mails; and he has recommended to Congress legislation which, when passed, will allow the roads nearly $1,000,000 more for this special purpose. He again says that on long hauls the railroads get more from the post office department than they do from the express companies.

Railroad Laws in Texas

The bill which was discussed by the recent session of the legislature of Texas designed to give railroad employees the option of securing bonds from any desired source, regardless of the regulations of the railroad company, did not become a law. The statement published to the effect that this bill had been adopted by both houses of the legislature was erroneous; it was killed in conference on the last day of the session.

Two New Brunswick Railways to be Transferred

The Canadian Parliament has under consideration three resolutions looking to the expansion of the government railway system. The first authorizes the acquisition of any railway in Quebec, New Brunswick, Nova Scotia or Prince Edward Island, not more than 200 miles long; but no line can be taken that does not connect directly with the government system. The resolution provides for new construction, but no railway of more than 25 miles is to be built until after a sum of money for the purpose is appropriated by Parliament. The next resolution is designed for the ratification of an agreement dated March 18, for the sale to the government of the New Brunswick & Prince Edward Island Railway, 36 miles long, Sackville to Cape Tormentine. The purchase price is $270,000. The third resolution confirms an agreement of August 1, 1914, between the International Railway of New Brunswick and Thomas Malcolm, contractor, and the King, for the sale to the government of the whole of the company's line, from St. Leonards, N. B., near Van Buren, Me., northeast to Campellton, N. B., 112 miles, for $2,700,000. It is provided that the money may be paid any time within five years, and that the line may be leased to the government in the meantime at $90,000 per annum.

Proposed Railway Legislation

The lower house of the Iowa legislature has passed its first railroad bill of the session, a bill to require railroads to provide bunk cars on stock trains for the accommodation of shippers accompanying their stock.

The bill before the Missouri legislature to require the state public service commission to make a physical valuation of the railroad property in the state, before allowing any increase in passenger fares, has been passed by the House.

Anti-Full-Crew Law Campaign

The bills to repeal full crew laws are still under discussion at the capitols of New York, New Jersey and Pennsylvania. At Albany and at Trenton amendments or substitutes have been proposed designed to make sure that the Public Service Commission shall have full authority to regulate the number of men to be employed on trains. The governor of New Jersey is understood to be opposed to the repeal of the present law, and a member of the legislature has proposed that, leaving the present law on the book, an act can be passed authorizing aggrieved railroads to appeal to the Public Utilities Commission.

R. L. O'Donnel, chairman of the committee of New Jersey and Pennsylvania Railroads, continues to publish information concerning the state of public sentiment in those states. He reports that the Reading Chamber of Commerce submitted the full-crew law question to a referendum vote, and the result is 261 votes against the law and 26 for it. The Board of Trade of Williamsport acted after a referendum vote of its members, which resulted 175 to 7. The Civic Association at Media voted 212 to 1. In Scranton, the stronghold of labor unions, the Scranton Board of Trade adopted a resolution in support of the railroad position by a vote of 100 to 12.

Arguments against repeal were heard by a committee of the legislature at Harrisburg, Pa., on Tuesday of this week. Delegations from every railroad center of the state were present and from Philadelphia there came a company of 300, who were met at the railroad station by a band and escorted to the capitol. John C. Bell, former attorney general of the state, was one of the counsel for the brotherhood. Petitions protesting against repeal were presented bearing 68,000 names. Reports of the hearing indicate that no new facts were brought out. It was argued that if the railroads should succeed in having the matter put into the hands of the Public Service Commission they would at once appeal from that commission to the courts, and in a few years they would ask for the repeal of the act creating the commission. Counsel declared that the railroads' money had better go for clothes and food for the extra trainman's family than to go into supplies; as, in either case, it would be put into circulation. William G. Lee, grand master of the Brotherhood of Railroad Trainmen, said that 11 states already had laws providing for an additional man on certain trains, and that the extra man "does more than anything that can be devised to prevent accidents" to trainmen.

Summary of Revenues and Expenses of Large Steam Roads

The following figures were compiled by the Interstate Commerce Commission from monthly reports of operating revenues and expenses of large steam roads for January, 1915. No reports are included for roads whose operating revenues for the year ended June 30, 1914, did not reach $1,000,000.

For the Month of January

Master Car and Locomotive Painters' Association

The advisory committee of the Master Car and Locomotive Painters' Association has selected the following subjects and queries for the next convention, which will be held at Detroit, Mich., September 14 to 16:

Subject No. 1: Flat color v. enamel color—which gives the best results under varnish in durability and permanency of color?

No. 2: Can we suggest any changes in the design or construction of steel passenger train cars to make them better fitted for preservation by protective coatings?

No. 3: Will equipment finished in enamel or varnish color wear and "clean up" in service as easily and economically as the varnish finish?

No. 4: Best methods of taking care of piece-work accounts, including rate fixing, printed forms, and clerical organization, etc., for work in paint shops.

No. 5: What is the most practical and economical method of maintaining the inside of steel passenger cars?

Essay No. 1: The possible results, where price v. quality is enforced in buying paint for the car and locomotive paint shop.

No. 2: The official recognition due the efficient railway master car and locomotive painter.

Query No. 1: Are we having any serious trouble with varnish turning white, and if so, with what grade of varnish?

No. 2: Is there any way by which a greater field can be covered by the association without increasing the time consumed in handling the work?

No. 3: Of what value to the railway companies is ornamentation of the exterior of railway passenger equipment?

Railway Signal Association

The board of direction announces that the regular meeting of the Railway Signal Association will be held at Hotel Astor, Broadway and Forty-fourth street, New York City, on Wednes-

day and Thursday, May 26 and 27; and that the annual convention of the association will be held at Salt Lake City, Utah, beginning September 14.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

AIR BRAKE ASSOCIATION.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—A. G. Thomason, Demurrage Commissioner, 845 Old South Bldg., Boston, Mass. Annual convention, March 23, Jefferson Hotel, Richmond, Va.

AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next meeting, October 21-23, 1915, Boston, Mass.

AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, Illinois Central, East St. Louis, Ill. Annual meeting, May 18-21, 1915, Richmond, Va.

AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Next meeting, April 15-16, San Francisco, Cal.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next meeting, August 19-20, 1915, San Francisco, Cal.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 29 W. 39th St., New York. Annual convention, October 4-8, 1915, San Francisco, Cal.

AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—H. G. McConnaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

AMERICAN RAILROAD MASTER TINNERS, COPPERSMITHS AND PIPEFITTERS' ASSOCIATION.—W. E. Jones, C. & N. W., 3814 Fulton St., Chicago. Annual meeting, July 13-16, 1915, Hotel Sherman, Chicago.

AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next session, May 19, 1915, New York.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 19-21, 1915, Detroit, Mich.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March, 1916, Chicago.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June 9-11, 1915, Atlantic City, N. J.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—Owen D. Kinsey, Illinois Central, Chicago. Annual meeting, July 19-21, 1915, Hotel Sherman, Chicago.

AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa. Annual meeting, June 22-26, 1915, Hotel Traymore, Atlantic City, N. J.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York, Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York. Next spring meeting, June 22-25, 1915, Buffalo, N. Y. Annual meeting, December 7-10, 1915, New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, Supt. Timber Preservation, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 18-20, 1916, Chicago.

ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Piedmont Hotel, Atlanta, Ga.

ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Annual meeting, 2d Tuesday in October, 1915, New York.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—C. W. Egan, B. & O., Baltimore, Md. Annual meeting, May, 1915, Galveston, Tex.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreuccetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Semi-annual meeting with Master Car Builders' and Master Mechanics' Association. Annual meeting, October, 1915.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 22-25, 1915, Rochester, N. Y.

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conrad, 75 Church St., New York. Next meeting, June 22-23, Niagara Falls, N. Y.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

FREIGHT CLAIM ASSOCIATION.—Warren P. Taylor, R. F. & P., Richmond, Va. Annual meeting, June 16, 1915, Chicago.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago. Annual meeting, May 17-20, 1915, Hotel La Salle, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1126 W. Broadway, Winona, Minn. Next convention, July 13-16, 1915, Sherman House, Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, C. H. & D., Lima, Ohio. Annual meeting, August 17, 1915, Philadelphia, Pa.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next meeting, October 19-21, 1915, St. Louis, Mo.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May 25 to 28, 1915, Chicago, Ill.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 14-17, 1915, Detroit, Mich.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June 14-16, 1915, Atlantic City, N. J.

NATIONAL RAILWAY APPLIANCES ASSOCIATION.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March, 1916, Chicago.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

PEORIA ASSOCIATION OF RAILROAD OFFICES.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—G. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December, 1915, Waldorf-Astoria Hotel, New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1063 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Next meeting, October 5-7, 1915, Chicago.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Stated meeting, May 26-27, 1915, New York. Annual meeting, September 14-17, 1915, Salt Lake City, Utah.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, L. S. & M. S., Box C, Collinwood, Ohio. Annual meeting, May 17-19, 1915, Hotel Sherman, Chicago.

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders and Master Mechanics' Associations.

RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Annual meeting, September 14-16, 1915, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, C. R. I. & P., La Salle St. Sta., Chicago. Annual meeting, September, 1915.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. R. R., Atlanta, Ga. Next meeting, 3d Thursday in July, 1915, Atlanta. Annual meeting, January, 1916.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.

TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

TRUCK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEWARK. John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, Newark.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Genl. Agt., Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh. Annual meeting, 2d Monday in June.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldgs., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRAIN DISPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7122 Stewart Ave., Chicago. Annual meeting June 15, 1915, Minneapolis, Minn.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

TRAVELING ENGINEERS' ASSOCIATION. W. O. Thompson, N. Y. C. R. R., East Buffalo, N. Y. Annual meeting, September 7-10, 1915, Chicago.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.

WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

Traffic News

The Canadian Northern announces that its line between Port Arthur and Ruel will be open on May 1 for freight traffic. It is expected to put on regular passenger trains by June 7.

The meeting of the National Industrial Traffic League, announced to be held at Memphis, Tenn., on April 8 and 9, has been postponed to a date to be announced later, probably about the middle of May.

The Chicago, St. Louis & Gulf Transportation Company has announced that service between LaSalle, Ill., and New Orleans, La., will be established on May 1 via the Illinois and Mississippi rivers, with a fleet of steel barges and power boats.

President Bush of the Missouri Pacific is reported to have announced that the railroads in Missouri would appeal to the courts in their efforts to get increased intrastate freight and passenger rates if the increase is not granted by the public service commission.

The Agricultural Department announces that the foot-and-mouth disease has been brought under control in all places throughout the country, except in New York and Pennsylvania. Illinois has been the greatest sufferer from the epidemic, 57,388 animals having been killed in that state; while the number killed in Pennsylvania was 22,958; in New York, 5,727; in Michigan, 7,799; Indiana, 6,643; Wisconsin, 4,704, and Iowa, 3,866.

A bill has been introduced in the Illinois legislature requiring the railroads to publish their time tables in the newspapers. A similar bill was presented at the present session of the Nebraska legislature. The railroads had no trouble in defeating it by having a representative publisher appear in opposition before the railroad commission. He said that the honest and intelligent publishers in the state did not favor the measure and offered to produce, if necessary, many other newspaper men who would testify to the same effect.

Commercial and civic associations in 93 Illinois cities and towns before whom the Illinois railroad officers have presented their arguments in favor of an increase in passenger fares from 2 to 2½ cents a mile, have adopted resolutions endorsing the application of the railroads and have forwarded copies to their representatives in the general assembly. The substance of these resolutions is that on proper showing by the railroads that the proposed higher rate is reasonable, the general assembly will be expected to grant the request. In addition, over 75,000 voters of the state, outside of Chicago, have signed petitions addressed to the general assembly, asking that the increase in fares be granted.

A lively controversy has been aroused in the Michigan legislature by an interview given by C. S. Cunningham, a member of the state railroad commission, published in a full-page advertisement in the Lansing State Journal of March 22, in which he said the railroads would be justified in taking off one-third of their passenger trains if an increase in state passenger fares is denied. Representative Symonds introduced in the legislature a resolution, which was passed, requesting the individual members of the commission to communicate with the house at the earliest opportunity whether such statement by Cunningham meets with the approbation of the commission and represents the views and attitude of the commissioners.

Traffic Club of Chicago

At the annual election of the Traffic Club of Chicago on March 30, the following officers were elected for the ensuing year: President, Fred Zimmerman, vice-president, Chicago, Indianapolis & Louisville; first vice-president, F. L. Bateman, president, Transcontinental Freight Company; second vice-president, W. O. Davis, division freight agent, American Steel & Wire Company; third vice-president, W. J. Leahy, general passenger agent, Chicago, Rock Island & Pacific; secretary, W. H. Wharton, commercial agent, Nashville, Chattanooga & St. Louis; treasurer, Charles B. Hopper, general freight agent, Goodrich Transit Company.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Complaint Dismissed

Public Utilities Commission of Idaho v. Oregon Short Line et al. Opinion by Commissioner Clark:

The commission finds that the carriers' rates on bituminous coal in carloads from Kemmerer and Rock Springs, Wyo., to points in southern Idaho, are not unreasonable. (33 I. C. C., 103.)

New York Central's Reicing Rule Held Reasonable

Providence Fruit & Produce Exchange v. New York Central & Hudson River. Opinion by the commission:

The commission finds reasonable the carrier's rule reading: "Shippers must state at what points cars shall be reiced, if reicing is desired or necessary, and the percentage of salt, if to be used in connection with such icing." (31 I. C. C., 294.)

Rates on Grain and Grain Products to Kansas, Oklahoma and Other States

Opinion by the commission:

The commission finds that the carriers have justified proposed increased rates on grain and grain products from points on the Minneapolis & St. Louis in Iowa and Minnesota to points on the Chicago, Rock Island & Pacific in the southwest. (33 I. C. C., 374.)

Rates on Lumber from Wisconsin, Minnesota and Michigan

Northern Pine Manufacturers' Association et al. v. Chicago & North Western et al. Opinion by Commissioner Daniels:

The commission finds that the rates on lumber from producing points in Wisconsin, Minnesota and Michigan to upper and lower Missouri river crossings are not unreasonable or discriminatory. (33 I. C. C., 360.)

Complaint Dismissed

New England Coal & Coke Company v. Norfolk & Western et al. Opinion by the commission:

The commission finds that the Norfolk & Western is carrying on an entirely lawful practice in making a charge for dumping coal into boats from its piers in the harbors of Norfolk and Newport News, Va., in addition to the regular transportation rate applying to the port on business destined beyond the Virginia capes. (33 I. C. C., 276.)

High Explosives Rates on the Louisville & Nashville

E. I. Du Pont De Nemours Powder Company v. Louisville & Nashville. Opinion by the commission:

High explosives are rated in southern classification first class C. L. and double first class L. C. L. The commission finds that the exception to the classification in the tariffs of the Louisville & Nashville and the Lexington & Eastern providing a double first class rate on high explosives in any quantity is unreasonable in so far as shipments of this commodity in carloads are rated higher than first class. (33 I. C. C., 288.)

Rates on Wire Fence from Adrian, Mich.

Adrian Wire Fence Company et al. v. Lake Shore & Michigan Southern et al. Opinion by Commissioner Clements:

It is alleged that the carload rates on wire from Pittsburgh to Adrian, Mich., and on wire fence from the latter point to Chicago are unreasonable and disadvantageous to Adrian. The commission, following its decision in *Delphos Manufacturing Company v. Pennsylvania Company* (33 I. C. C., 400), is unable to require the carriers to grant Adrian proportional rates from Pittsburgh and to Chicago equal to the through rates from Pittsburgh to Chicago, with a reasonable charge for the privilege of unloading and reloading at Adrian. It is held, however, that the grouping of Adrian with Detroit on traffic from Pitts-

burgh subjects it to disadvantage and that the rate on wire from Pittsburgh to Adrian should not exceed the rate to Toledo by more than one cent a 100 lb. (33 I. C. C., 403.)

Rates on Fish from California to Eastern Points

G. W. Hume Company et al. v. Southern Pacific et al. Opinion by Commissioner Harlan:

The commission finds that carriers' refrigeration charge of $70 per car on salted or pickled fish in carloads from San Francisco and other points in California to New York and other eastern points is not unreasonable. This charge of $70 is in addition to the rate of $1 per 100 lb. for fish moving under refrigeration, the rate being 85 cents on fish when not under refrigeration. (33 I. C. C., 126.)

The Carrying of Coal for Use on Ships Not Export Business

Basin Supply Company v. Texarkana & Fort Smith. Opinion by the commission:

The commission finds that defendant's demurrage regulations relative to the free time allowance on bunker coal at Port Arthur, Tex., are not unreasonable or discriminatory. The carrying of coal for use as fuel and to be consumed by a vessel engaged in coastwise or foreign trade does not constitute a coastwise or export movement of that commodity. (33 I. C. C., 157.)

Rates on Agricultural Implements from California Points

In re rates on agricultural implements from San Francisco, Stockton, and other points to Spokane and other points. Opinion by the commission:

The commission finds that the carriers have justified a proposed cancellation of proportional carload and less-than-carload-rates on agricultural implements from Stockton, Cal., to Portland and East Portland, Ore., when destined to points beyond, resulting in increased rates, and an increase in the carload minimum from 20,000 to 24,000 lb. (33 I. C. C., 119.)

Classification of Address Plates, Culverts and Iron or Steel Tanks

Opinion by the commission:

The proposed rating of first class on address plates, in Supplement No. 4 to Southern Classification No. 40, is found not to be justified and respondents are required to establish a rating not to exceed second class. Proposed changes in the same supplement with reference to the classification on tanks (iron or steel, not otherwise indexed by name), and culverts are found to be justified. (33 I. C. C., 281.)

Rates on Tanning Extracts from Knoxville to Points in Michigan

Tanners' Supply Company, Ltd., v. Louisville & Nashville et al. Opinion by Commissioner Meyer:

The commission finds that the rates on liquid tanning extract in tank cars from Knoxville, Tenn., to Michigan destinations are not unreasonable per se, or discriminatory as compared with the rates from Knoxville to points in Illinois, Wisconsin, New York, Pennsylvania and Ontario. It is also found that the rating of fifth-class for liquid tanning extract in official classification territory is not unjust, in so far as can be determined from the evidence in the instant case. (32 I. C. C., 394.)

Joint Rates Between Rail and Water Lines

Chattanooga Packet Company v. Illinois Central et al. Opinion by Commissioner Meyer:

The Chattanooga Packet Company proposes to re-establish its former boat service on the Ohio and Tennessee rivers between Chattanooga, Tenn., and Joppa, Brookport and Metropolis, Ill. It alleges, however, that the railways discriminate against it in that on traffic routed via the rail carriers connecting Chattanooga with the Ohio river, they apply proportional class and commodity rates to and from the Ohio river crossings, but on that routed via the complainant's boat lines, they apply the local rates to and from the river points at which the interchange is made, which are upon a higher basis than the proportional rates.

The commission finds that defendants by restricting the application of their proportional rates discriminate against the complainant as alleged and against shippers who desire to route their goods over complainant's boat lines. The defendants are therefore required to apply the same rates to traffic between Chattanooga and points north of the Ohio river routed via Brookport, Metropolis and Joppa and complainant's boat lines as they contemporaneously apply on traffic routed via their southern rail connections. The carriers by rail may make a reasonable charge to cover the additional expense, if any, of interchange with boat lines over and above the cost of interchange with rail carriers. The commission in reaching its decision holds that a proportional rate, the use of which is limited to shipments over a particular line is discriminatory. It also holds that the fact that the proportional rates to and from the Ohio river are compelled by competition can have no bearing upon its determination of the issue of unjust discrimination and believes that if carriers are permitted to apply higher rates for the same service on traffic routed over connecting water lines, than on traffic routed all rail, they will be in a position to destroy all water competition and to deprive shippers of the advantage of their location upon navigable waters. (33 I. C. C., 384.)

Rates on Coke from Chicago and Peoria to St. Paul, Duluth and Other Points

Opinion by Commissioner Daniels:

The commission finds that the carriers have justified proposed increased rates on coke in carloads from St. Louis, Mo., Chicago, Waukegan and Peoria, Ill., and Milwaukee and other points in Wisconsin and Menominee, Mich., to points in Minnesota other than Duluth and in Wisconsin, Iowa and South Dakota. Proposed increased rates on the same commodity from the same points of origin to Duluth, Minn., are held unreasonable to the extent that they exceed $2.15 per ton. (32 I. C. C., 543.)

Cement Rates from Salt Lake City

In re cement rates from Salt Lake City, Utah, and other points to Butte, Mont., and other destinations. Opinion by Commissioner Clements:

The commission finds that the carriers have not justified proposed increased rates on cement in carloads from Salt Lake City, Bakers, and Devils Slide, Utah, to Wapello, Idaho, Butte, Mont., and intermediate points on the Oregon Short Line; Anaconda, Mont., on the Butte, Anaconda & Pacific and Helena, and other Montana points on the Great Northern and Northern Pacific. (33 I. C. C., 5.)

Transit of Beans at Saginaw and Jackson, Mich.

Saginaw Milling Company et al. v. Michigan Central et al. Opinion by Commissioner Daniels:

The commission finds that defendants' rules and charges applying on transit of beans at Saginaw and Jackson, Mich., are not unreasonable or otherwise unlawful. It is also held that the withdrawal by defendants of their transit privileges on dried beans at these points upon complainants' refusal to cancel billing to cover the local disposition of transit tonnage, was in accordance with the tariff requirements, and not unreasonable or otherwise unlawful. (33 I. C. C., 25.)

Grain Rates from Milwaukee

Opinion by Commissioner Clark:

The carriers proposed to cancel the so-called reshipping rates on grain and grain products applying from Milwaukee, Wis., via Manitowoc, Wis., and via Chicago to points in central freight association and trunk line territories. If the cancellations were made as proposed, the reshipping rates would still be available directly from Milwaukee and Manitowoc across Lake Michigan via car ferry and joint through rates from Milwaukee via Manitowoc and via Chicago higher than the reshipping rates would also apply.

As it is a fundamental principle in rate making that differences in distance between producing points or markets gradually lose their effect as the distance to destination increases, the commission believes that a distinction may properly be made as between the rates on grain and grain products from Milwaukee via Chicago or Manitowoc to central freight association points west of Buffalo and Pittsburgh, and points taking the same rates, on the one hand, and Buffalo, Pittsburgh and points taking the same rates, and points east thereof, on the other hand. It holds that the carriers have justified the proposed withdrawal

to points in central freight association territory, but that they have not justified withdrawal of the rates to points in trunk line territory, including Buffalo and Pittsburgh and points taking the same rates.

The principal reason advanced in support of the proposed charge was that the revenue of respondents under existing schedules was unsatisfactory. The commission holds it to be essential that Chicago and Milwaukee as grain markets be kept on a substantial parity of rates. They are but 85 miles apart, both are Lake Michigan ports, both are served in common by carriers from the west and from the east, and the commission can not recognize disagreement between the carriers as to how the earnings shall be divided or as to which of them shall perform certain services as justification for disrupting that parity. (33 I. C. C., 417.)

Rates on Black-Iron Sheets

Delphos Manufacturing Company v. Pennsylvania Company. Opinion by Commissioner Clements:

The commission finds that the rates on black-iron sheets from Pittsburgh to Delphos, O., and on galvanized iron sheets from Delphos to Chicago and beyond are not unreasonable or prejudicial.

The basis for complaint was that the combination of rates named above exceeded the through rate from Pittsburgh to Chicago applicable on either of the commodities named by more than a reasonable amount or by more than a reasonable charge for the additional terminal service at Delphos. The commission finds that to fix the rates as suggested would be to take into consideration only the distance without regard to competitive influences which may have fixed the Pittsburgh-Chicago rate at a figure lower than the commission, upon investigation, would prescribe as the maximum of reasonableness. (33 I. C. C., 400.)

Minimum Charges on Bulky Articles

Opinion by Commissioner McChord:

The commission after an investigation into the reasonableness of the application of rule 7 B and C of official classification No. 42; rule 26, section 3, of southern classification No. 40; and rule 17 B of western classification No. 50, restated as rule 20 B in western classification No. 53, relating to minimum charges on articles too long or too bulky to be loaded through the side doors of box cars, holds that carriers should restate these rules embodying these provisions: Unless otherwise provided, a shipment containing articles the dimensions of which do not permit loading through the center side doorway 6 ft. wide by 7 ft. 6 in. high without the use of end door or window in a closed car not more than 36 ft. in length by 8 ft. 6 in. wide and 8 ft. high shall be charged at actual weight and authorized rating subject to a minimum charge of 4,000 lb. at the first-class rate for the entire shipment. (33 I. C. C., 378.)

Rates on Sand Glass from Ottawa, Ill., to Cincinnati

Charles Boldt Company v. Chicago, Rock Island & Pacific et al. Opinion by the commission:

The commission in its previous report in this case found that a rate of $1.80 a net ton on glass sand from Ottawa, Ill., to Cincinnati, Ohio, was unreasonable to the extent that it exceeded $1.60 a net ton. The commission, in view of the fact that the carriers in official classification territory have been allowed a general increase of 5 per cent in some of their rates, now finds that the carriers may establish a rate of $1.80 on this traffic. Rates on glass sand from Ottawa to certain other points in Ohio are, however, found unreasonable and rates are prescribed as follows: To Columbus and Mount Vernon, $2 (now $2.18); to Zanesville and Lancaster, $2.20 (now $2.40), and to Barnesville, $2.40 (now $2.60). (33 I. C. C., 8.)

Rates on Sash and Doors

Anson, Gilkey & Hurd Company et al. v. Southern Pacific et al. Opinion by Commissioner Meyer:

The complainants allege that the rates on sash and doors from their manufacturing plants in Wisconsin, Iowa and Illinois to points in central freight association and trunk line territories are unreasonable and discriminatory when compared with rates from points on the Pacific coast to the same destinations. They also attack as unreasonable the rates on lumber in carloads from California, Oregon and Washington, and from the territory known as the "inland empire" to the points where their plants are located. The commission finds that the rates attacked are not unreasonable, but that there is discrimination with respect to the classification of lumber and lumber products, especially sash and doors, in the various competing territories here involved. The railways are therefore given 90 days in which to work out tariffs which will bring about greater uniformity in this regard. (33 I. C. C., 332.)

Trap Car Hearing

Examiner George N. Brown of the Interstate Commerce Commission began a hearing at Chicago on March 25, on the tariffs filed by the railways proposing a charge of four cents per 100 lb. for trap car service. Similar hearings have been held at Pittsburgh, Cincinnati, St. Louis and Kansas City. The first day's hearing at Chicago was devoted to testimony of shippers regarding the situation at eight different cities outside of Chicago, as to which no representatives appeared for the railroads. E. C. Lindley, general attorney of the Great Northern, and Charles Donnelly, attorney for the Northern Pacific, appeared and arranged for a hearing as to the situation at the Twin Cities on Tuesday of this week, and W. D. McHugh appeared for the Pennsylvania Lines and the western railroads as to the Chicago situation, which was taken up at the hearing on Friday, March 26. At the other hearings the carriers presented very little evidence. Protesting shippers were represented by John S. Burchmore, attorney for the National Industrial Traffic League, and by H. C. Barlow, W. L. Fisher and Rush C. Butler, appearing for the Chicago Association of Commerce and the Central Manufacturing district.

At the hearing on Thursday as to cities outside of Chicago, H. D. Cherry of the Kewanee Boiler Company, Kewanee, Ill., testified as to his plant, which is located on a side track of the Chicago, Burlington & Quincy, and he said that the railroad had no facilities at its freight station for loading boilers and other freight for his company, which must therefore be loaded at the industry tracks. He thought it would cost 40 to 50 cents a ton to cart the freight to the freight house, but that the railroad could not handle it if he did so. His company had enjoyed trap car service ever since the plant was built about 25 years ago, and he thought the addition of 4 cents per 100 lb. to the line haul rate of 15 cents to Chicago would be unreasonable in addition to subjecting him to discrimination in favor of some of his competitors. Witnesses for plants at the other cities gave similar testimony.

On Friday, at the hearing on the Chicago situation, George Hodges, assistant general agent of the American Railway Association, took the stand to testify that the average earnings of a freight car per day are $2.55. He was followed by Willis E. Gray, who has been engaged for some time in making a study of the Chicago terminal situation for the Chicago roads. Mr. Gray described the freight house facilities of the railroads in Chicago, saying that in addition to the main freight station there were seven universal stations and 234 substations, and he gave the history of the establishment of the universal stations. At the present time, he said, there is an average movement of 121 trap cars a day in Chicago, hauling 993 tons of freight to and from industry tracks. There are 3,087 industries in the city having trap car facilities, of which 2,090 are located on carrier lines and the others are on switching lines, while there are over 7,178 industries that have no facilities for using the trap car or the tunnel or lighterage facilities. Fifty-three per cent of the trap car business originates north of Monroe street, in a district which is well provided with freight house facilities. He presented a statistical exhibit showing the revenue from these cars, the switching and other terminal charges absorbed by the railroads, what the charge would be to the shipper at the proposed rate of 4 cents per 100 lb., and the value of such a car to the railroad based on the average earnings of a car per day for the average time consumed in trap car service, in addition to other figures. This exhibit gives figures showing that out of the gross revenue received by the railroads per car the amount paid out for switching and per diem reclaimed ranged between 4.31 per cent and 42 per cent.

PERSONNEL OF COMMISSIONS

The governor of New York has appointed Colonel William Hayward, a lawyer of New York City, a member of the State Public Service Commission, First district, in place of M. R. Maltbie, whose term has expired.

William O'Connell, county treasurer of Cook county, Illinois, has been appointed a member of the Illinois Public Utilities Commission, succeeding James E. Quan, resigned. Mr. Quan had been chairman of the commission since its organization a little over a year ago.

COURT NEWS

In the United States District Court at Detroit, Mich., March 24, the Michigan Central was found guilty of discrimination in failing to collect demurrage from the National Fireproofing Company. The court imposed a fine of $24,000. Eighteen counts in the indictment were quashed.

Judge W. B. Sheppard of San Antonio, Tex., has decided not to grant the application of the receiver of the San Antonio, Uvalde & Gulf Railroad for authority to reduce the wages of its engineers, firemen, conductors and brakemen, but the receiver was authorized to reopen the case and take additional testimony to ascertain what would be a fair and reasonable wage for the employees in comparison with those on other roads similarly situated.

In the United States District Court at Philadelphia, March 31, indictments were returned against the Philadelphia & Reading Railway Company on the charge of violating the law in the transportation of coal by barges for the Philadelphia & Reading Coal & Iron Company and other shippers to New England points without having on file with the Interstate Commerce Commission tariffs showing the freight rates; also for failure to collect demurrage on shipments of coal to Port Richmond.

In the United States District Court at New York City March 27, Judge Charles M. Hough enjoined the Lehigh Valley Railroad from paying commissions to Sheldon & Company, freight forwarders, holding that such payments amounted to rebates, and consequently were illegal. Edward Sheldon, head of the firm in question who had been indicted for the same offence, has gone free, the indictment having been dismissed by Judge Martin. Judge Hough, referring to this action, spoke of the seriousness of branding as a convict a man doing an honest business who fails to comply with a new-fangled statute. Judges are cautious against encouraging juries to find criminal intent in offences against such statutes, where no moral turpitude is evident.

Delivery of Live Stock at Market

When the railroad delivers live stock at market on the day agreed upon, even though delivered at such hour and in such condition as to make it necessary to carry the animals over to the following day's market to get the best results, the Texas Court of Civil Appeals holds that such delivery is a compliance with its contract, and it is not liable for any resulting damage.—Texas Midland v. Fogleman (Tex.), 172 S. W., 558.

Railroad Relief Association—Invalid Contract

The Indiana Supreme Court, following the ruling in Philadelphia, etc., R. Co. v. Schubert (1912), 224 U. S., 603, 32 Sup. Ct., 589, holds that a provision of the contract between a railroad relief association and an employee of the company which deprived the employee of any benefits unless any suit by the employee for negligent injury should be discontinued, being forbidden by the federal employers' liability act, invalidated the entire contract, and left the employee without any claim on the association.—Baltimore & O. v. Miller (Ind.), 107 N. E., 545.

Injury to Shopman at Work (Not an Employee)

A railroad company maintained a track extending from its main tracks half way into the shed of a company which made and repaired cars. The track was used for delivering material and taking away cars made or repaired. Several of the manufacturing company's employees were at work on car bodies in the shed, in such a position that they could not care for their own safety. While the railroad company's servants were making an attempt to couple cars on the delivery track, the rear car was pushed off the end of the track, crushing a workman. In an action for his injuries, the New Jersey Court of Errors and Appeals held that, as the railroad company's servants knew of the nearness of the cars to the end of the track and to the car bodies in the shed, the company was guilty of negligence, rendering it liable. Jacowicz v. D. L. & W. (N. J.) 92 Atl., 946.

Fellow Servants

In an action for the death of an employee engaged in repairing cars in the defendant's repair yards it appeared that the death was the result of negligence of the crew of a switch engine which brought cars to and from the yards. The switching crew did switching all over the yards where the deceased and other laborers were working. They were all in the employment of the railroad, and were engaged in the same general enterprise. The Indiana Appellate Court holds that they were fellow servants, and that under the common law rule that a master is not responsible for injuries caused by fellow servants, the railroad was not liable.—Chicago & Erie v. Mitchell, (Ind.) 107 N. E. 743.

Changing Grade—Compensation

The New York Appellate Division holds that the Court of Appeals having decided, in re Application of Grade Crossing Commissioners, 209 N. Y. 159, 102 U. E., 552, that a railroad company may elevate or depress its tracks without making compensation to abutting owners, such owners were not entitled, in proceedings to eliminate a grade crossing, to compensation for damages alleged to have been sustained by a change of grade of a railroad on its own right of way, although the report of the commissioners allowing such compensation was made and affirmed before the said decision of the Court of Appeals was rendered. In re Grade Crossing Commissioners (N. Y.) 151 N. Y., 146.

Injury to Live Stock—Proof of Cause

The Kentucky Court of Appeals holds that where live stock is accompanied by the owner or his agent, the burden is on him to show how any injury occurred; but where not accompanied, then, on the owner showing injury, the fact of injury is taken as *prima facie* evidence of negligence in transportation; and the burden is on the carrier to show that the injury was due to the inherent propensities or viciousness of the animals. After several cows and calves, not accompanied by owner or agent were loaded, the car was delayed for some time. A commotion broke out among the animals, and on investigation it was found that one of the cows was fighting the others, and ten of them were dead, without indication that they were gored to death. It was held, in an action for their loss, that the question of the cause of loss was for the jury, and judgment for the plaintiff was affirmed.—C. N. O. & T. P. v. Veatch (Ky.), 172 S. W., 89.

State Regulation of Intrastate Carriers—Facilities to Express Companies

The Texas Court of Civil Appeals holds that the absolute power of the federal government to regulate interstate commerce is not interfered with by a Texas law requiring a railroad to grant to an express company the same facilities and accommodations on the same terms and conditions as are afforded another express company. The state has power to fix intrastate rates, applicable through its territory; and both the railroad and the express company are subject to such regulations and rates as may be provided by state law for intrastate commerce. If it be said that the question of interference with interstate commerce by the establishment of statewide rates for intrastate traffic has seldom been raised, this fact itself attests the common conception of state authority, and the decisions recognizing and defining the state power wholly refute the contention that the making of such rates either constitutes a direct burden upon the interstate commerce or is repugnant to the federal statute. Trinity & B. V. v. Empire Express Company (Tex.) 173 S. W., 217.

In another case, where a railroad company was held bound, under the Texas statute, to grant an express company equal facilities with another express company, the same court held

that it devolved upon the plaintiff to show a willingness to obligate itself to perform the same services for the railroad company, as the other express company performed under its contract, since such services were valuable to the railroad company and necessarily entered into the reasonableness of the rate charged the other express company. Missouri, K. & T. v. Empire Express Company (Tex.) 173 S. W., 222.

Cessation of Interstate Commerce—Drifting Cars—Employer's Liability

Empty cars were delivered in the state of New York to the railroad owning them, and were then, according to railroad terminology, "at home." They were moved, without being billed or destined for any particular place, to points in Pennsylvania, where such cars were usually assembled for distribution and use, and, not being needed at these points, were from time to time moved to other distributing points in Pennsylvania. While they were still "drifting," an injury occurred to a brakeman on a train on which they were being moved. It is held by the Circuit Court of Appeals that the interstate movement of these cars ceased when they reached the first distributing point in Pennsylvania, and thereafter their movement did not constitute "interstate commerce," within the federal Employers' Liability Act. Pennsylvania v. Knox, C. C. A., 218 Fed. 748.

Injuries from Animal Escaped from Railroad Wreck—Proximate Cause

A collision between freight trains, caused by the negligence of the railroad's employees, resulted in the wreck of a number of cars loaded with cattle, from which a number of wild, dangerous Texas cattle escaped into the city of Harper, Kan. About four hours after the collision, while the cattle were being gathered together and driven to the stockyards by persons employed by the railroad for that purpose, one of the animals, a cow, charged and injured a woman who was walking on the sidewalk. This cow, after the wreck, and before attacking the woman, had made three separate attacks on one of the men driving her. In an action against the railroad the Kansas Supreme Court held, by a divided court, that the railroad was liable for the injury done to the plaintiff, of which the collision was the proximate cause. Three justices dissented, on the ground that the injury was not the natural or probable consequence of the collision, which, therefore, was not the proximate cause of the injury. Hartman v. Atchison, T. & S. F. (Kan.), 146 Pac. 335.

Transition from Intrastate to Interstate Commerce—Point of Time

A railroad company was owned by a mill company, and its road was used as a logging road from its timber lands in the state of Washington to Puget Sound, where the logs were placed in the water. A portion of the logs were thereafter sold to other mills and the remainder made by the mill company into lumber, which was afterwards sold, some for use locally, and some for shipment to other states or countries. Poles for electric wires were sold to a dealer, to whom they were delivered in the water, and he rafted and removed them, afterwards reselling them to go to other states. In an action for personal injuries brought by a brakeman under the federal Employers' Liability Act, the Circuit Court of Appeals held that the logs, poles, or lumber did not become subjects of interstate commerce until committed to a carrier for transportation to another state, or started on their ultimate passage to that state, and that the railroad company was not engaged in interstate or foreign commerce within the meaning of the act. The court quoted the United States Supreme Court's definition of what is and what is not interstate commerce in Coe v. Errol, 116 U. S. 517, 6 Sup. Ct. 475. Norgard v. Marysville & N. C. C. A., 218 Fed. 737.

Duty Toward Invitees on Railroad Premises

A public weigher had placed upon a railroad platform a shipment of cotton, which by mistake contained two bales not intended to be shipped. He afterwards went to the platform to get the two bales, and, not finding them there, attempted to enter the car into which some of the cotton had been loaded, using the truck iron leading from the platform to the car. The truck iron fell under his weight and he sustained injuries for which he sued the railroad. It was held by the Texas Court of Civil Appeals that the plantiff was an invitee of the railroad company, and not a mere licensee, since his purpose in entering the car was incidental to and connected with the railroad's business, though not of direct pecuniary benefit to the railroad; and the railroad owed him as such invitee the duty to exercise ordinary care to keep its premises reasonably safe. M. K. & T. v. Kinslow (Tex.) 172 S. W. 1124.

Derailment—Presumptions as to Cause—Defective Complaint

Three freight cars, part of a mixed train, left the track while moving at a speed of about 15 miles an hour, resulting in a severe shake-up of a passenger coach, and, as alleged in an action against the railroad, in personal injury to the plaintiff. The plaintiff based his right to recover mainly on the prima facie presumption of the company's negligence which was raised by law, in view of the unexplained derailment of the cars. A derailment, the Alabama Supreme Court said, in such cases may conceivably be due to defective car wheels, a defective roadway, including rails and ties, a foreign obstruction, or an excessive rate of speed. The evidence rebutted any presumption of defective cars, foreign obstruction or excessive speed; and there was nothing in the slightest degree to show wilful or wanton misconduct on the part of the company or its servants, proof of which must be affirmative, and cannot be supplied by the presumption of the law referred to. The evidence did not rebut the presumption that the derailment was due to a defective condition of the rails, ties, or roadbed; but the court held that the specification of negligence in the plaintiff's complaint, which was the negligent operation of the defendant's train, was not broad enough to cover any negligence of the defendant with respect to the condition of the roadbed. Judgment for the defendant was affirmed Knight v. Tombigbee Valley (Ala.) 67 So. 238.

Liabilities as to Trespassers on Tracks

It is a well-established rule that the mere use of a railroad track by the public does not convert the users from trespassers into licensees, unless its use is at a place where the public have a right to go and be, as at a public crossing, or the like; or unless it is in a city, town or populous community, where large numbers of people use the track, thereby putting upon the company the duty of anticipating their presence, and the use of ordinary care to avoid injury to them. In an action for the death of a person struck by a train while crossing a railroad trestle, it appeared that the engineer and fireman did not discover his position of peril, and did not know that the train had struck him until told so later in the day. The public were warned not to use the trestle, but it was frequently made use of by persons in the vicinity. The Kentucky Court of Appeals holds that the deceased was a trespasser, for whose death no recovery could be had.—Card's Admx. v. Cincinnati, N. O. & T. P. (Ky.) 173 Pac. 335.

Applicability of Federal Employers' Liability Act

In an action for personal injuries under the federal employers' liability act it appeared that the plaintiff was at the time of the accident front brakeman of a freight train engaged in interstate commerce. In response to a call to join the train, which was standing upon a "ready track," he asked the fireman if he was ready to start. The latter replied that he was not quite ready, that the tool boy had left him no tin cup, and he asked the plaintiff to hunt the tool boy up and get one. He started to do so. The night was foggy. To avoid an engine he took a few steps backwards and fell into a cinder pit. For the resulting injuries he brought suit, alleging negligence in the omission to supply the tin cup; in the construction and maintenance of the cinder pit; and in its dangerous condition. The defenses were, denial of the alleged negligence, assumption of risk, and that the plaintiff was doing an act not materially or directly connected with interstate commerce.

The Court of Appeals of Maryland held that the act of the plaintiff in looking for the tool boy was such a participation in interstate commerce as to bring him within the act. It was held that the doctrine of assumption of risk did not apply, that the plaintiff was not guilty of contributory negligence, and that the railroad company was liable, on the ground, apparently, of negligence in the construction and maintenance of the pit. Baltimore & O. v. Whitacre, (Md.) 92 Atl. 1060.

Switching Privilege or Use of Terminals?

The Supreme Court of the United States in the decision reported in this column February 26 forbidding the Pennsylvania to refuse to switch cars for the Buffalo, Rochester & Pittsburgh, sustained an order of the Interstate Commerce Commission holding that the B., R. & P. in demanding that its cars should be switched to industries at reasonable rates was not demanding the "use of terminals," in the meaning of Section 3 of the Interstate Commerce Law. The facts, in brief, are given below:

The Interstate Commerce Commission, on the petition of the Buffalo, Rochester & Pittsburgh, ordered the Pennsylvania to accept from the B., R. & P. carloads of freight within the switching limits of Newcastle, Pa., as it did from the Pittsburgh & Lake Erie and other roads. Commissioner Harlan, dissenting, was disposed to agree to an order fixing reasonable joint through rates for the use of the Pennsylvania's terminals, but disagreed with the order on the grounds made. The Pennsylvania went to the federal court for an injunction against the enforcement of the order. The motion was denied, two judges concurring and one judge dissenting, and the Pennsylvania appealed to the United States Supreme Court, which, in an opinion by Mr. Justice Day, says:

Section 3 of the Interstate Commerce Act forbids any undue or unreasonable preference, etc. What is such undue preference, etc., is a question, not of law, but of fact. If the order made by the Commission did not contravene any constitutional limitation and was within the constitutional and statutory authority of that body, and not unsupported by testimony, it could not be set aside by the courts, as it was only the exercise of an authority which the law vests in the Commission. The sole question was whether the Commission exceeded its authority in requiring the Pennsylvania to desist from what the Commission found to be a discriminatory practice.

When the Pennsylvania used its terminal facilities in connection with the receipt and delivery of interstate carload freight it was subject to the provisions of the act, and was obliged to afford all reasonable, proper and equal facilities for the interchange of traffic with connecting lines at non-discriminating rates.

The cars transported over the B., R. & P. are brought to the Pennsylvania at a point where it receives from other roads. The Pennsylvania insisted that the statutory provisions did not apply to it under the circumstances of this case, and that the Commission exceeded its authority for three reasons: (a) That there was no discrimination in a real sense, and certainly none warranting the making of the order; (b) that the order required the company to give up the use of its terminals to another company in violation of the last clause of section 3, and (c) that the order was a taking of property without due process of law, since it subjected the Pennsylvania's property to the use of the B., R. & P. without compensation. With the other three roads the Pennsylvania had certain reciprocal arrangements, covering many junctions. It was contended that this, more than the $3 per car which it charged these companies, was the real inducement for its favorable treatment of them. But the court said that the amount of traffic between these three roads being of a varying and differing quality, to ascertain the value of such service to the Pennsylvania would be a futile undertaking. For instance, it was shown that during 1911 the B. & O. switched for the Pennsylvania 69 cars at New Castle, and in the valleys generally 8,900 cars. The B., R. & P. switched for the Pennsylvania in the same year 406 cars in New Castle and 3,661 cars to points adjacent thereto. The Pennsylvania moved nearly twice as many cars for the B. & O. as the B. & O. did for it. The court therefore sustained the government's contention that such reciprocal switching arrangements ought not to justify giving the B. & O. a preference.

It was also held that there was no requirement in the order of the Commission amounting to a compulsory taking of the use of the terminals of the Pennsylvania by another road, within the inhibition of the last clause of section 3. The order gave the B., R. & P. road no right to run its cars over the terminals of the Pennsylvania or to use or occupy its stations.

Chief Justice White dissented, saying: "I have found it impossible to escape the conclusion that instead of being a question concerning a mere switching privilege, it is really one involving the using of terminal facilities."

Railway Officers

Executive, Financial, Legal and Accounting

George J. Gould, president of the Texas & Pacific, with headquarters at New York, has been elected also chairman of the board of directors.

W. R. Sullivan and H. R. Warfield of New York, and J. M. Wilkinson of Valdosta, Ga., have been appointed receivers of the Georgia & Florida.

J. C. Nelms has been appointed auditor of the Norfolk Southern, with headquarters at Norfolk, Va., succeeding L. A. Farquhar, effective April 10.

Charles F. Black has been appointed attorney of the Central Vermont, with office at St. Albans, Vt., vice C. W. Witters, deceased. Effective April 15, 1915.

E. K. Crowell has been appointed auditor of the Kansas City & Memphis, with headquarters at Rogers, Ark., in place of W. W. Moody, who has resigned to accept service with another company.

Stephen Little, having voluntarily retired from the office of secretary of the Denver & Rio Grande, John P. Howland, assistant secretary, has been elected as his successor, with headquarters at New York.

Alexander Robertson, assistant to the president of the Missouri Pacific, the St. Louis, Iron Mountain & Southern, the Denver & Rio Grande and the Western Pacific, will until further notice, it is announced by President Bush, assume all duties heretofore performed by E. J. Pearson, vice-president in charge of operation of the Missouri Pacific. The position is an elective office and requires a vote of the board of directors of that company to make any selection permanent. Mr. Robertson was born at Albany, N. Y., in 1860, and began railway work in 1885 with the Fitchburg Railroad, with which company he remained until April, 1897, being employed consecutively as brakeman, conductor, general yardmaster, station master and trainmaster. In November of that year he went to the Wabash and until August, 1903, was successively general yardmaster, trainmaster and superintendent of the Middle division. He then became manager of operation of the Western Maryland and West Virginia Central & Pittsburgh, resigning in January, 1904, to accept the position of general manager of the Terminal Railroad Association of St. Louis. Mr. Robertson returned to the Western Maryland and West Virginia Central & Pittsburgh in November, 1905, as general manager; in April, 1907, he was made vice-president of the former road, which absorbed the West Virginia Central & Pittsburgh and was elected president in May, 1911, resigning January 1, 1913. He was appointed assistant to the president of the Missouri Pacific-Iron Mountain system on June 9, 1913, his jurisdiction being extended over the Denver & Rio Grande and the Western Pacific the following month. He now becomes vice-president in charge of operation of the Missouri Pacific-Iron Mountain system, with headquarters at St. Louis, Mo., as above noted.

Alexander Robertson

Edward J. Pearson, whose election as first vice-president of the Texas & Pacific, with headquarters at New Orleans, La., has already been announced in these columns, was born at Rockville, Ind., in October, 1863. He was graduated from the engineering department of Cornell University and began railway work in 1880 as a rodman on the Missouri Pacific. Subsequently he was in the engineering department of the Missouri, Kansas & Texas and the Atlantic & Pacific until 1883, when he went to the Northern Pacific as assistant engineer. From 1885 to April, 1890, he was supervisor of bridges, buildings and water supply of the Minnesota and St. Paul divisions; the succeeding two years he was engineer of the Eastern division and from May, 1892, to May, 1894, he was principal assistant engineer at Chicago in charge of the construction of Chicago terminal lines and of work on the Wisconsin Central Lines being operated by the Northern Pacific. He was then made superintendent of the Yellowstone division; in August, 1895, was transferred to the Rocky Mountain division as superintendent, and from December, 1898, to April, 1902, was superintendent of the Pacific division. On the latter date Mr. Pearson was promoted to assistant general superintendent and in September of the following year was made acting chief engineer, being appointed chief engineer in May, 1904, which position he held until December, 1905, when he left the Northern Pacific to become chief engineer of the Chicago, Milwaukee & Puget Sound. He resigned June 1, 1911, to go to the Missouri Pacific and the St. Louis, Iron Mountain & Southern as first vice-president, and he now has been elected first vice-president of the Texas & Pacific, in which position he will be in charge of operation and will direct the construction of large terminals at New Orleans.

E. J. Pearson

Operating

James Shannon, trainmaster of the Northern Pacific at North Yakima, Wash., has been transferred to Spokane in a similar capacity.

Asa C. Bowen, trainmaster of the Chicago, Milwaukee & St. Paul at Lewistown, Mont., has been transferred to Tacoma, Wash., as trainmaster of the Coast division.

Harry Gee, foreign traffic manager of the American Express Company at New York, has been appointed general manager of the foreign department, with headquarters at New York, succeeding M. F. Berry, deceased.

E. D. Hogan, superintendent of transportation of the New Orleans, Mobile & Chicago, at Laurel, Miss., has been appointed general superintendent, with headquarters at Laurel, and his former position has been abolished.

T. J. Wyche, chief engineer of the Western Pacific, has been appointed assistant general manager, with headquarters at San Francisco, Cal., and C. E. Benton has been appointed superintendent of dining cars, with headquarters at Oakland, Cal.

A. P. Apperson, general superintendent of the Utah lines of the Denver & Rio Grande, at Salt Lake City, Utah, has been appointed also general superintendent of the Salt Lake City Union Depot Company, vice William Otteson, superintendent, deceased.

W. F. Schaff, superintendent of the Detroit division of the New York Central, at Detroit, Mich., has been appointed superintendent of the Toledo division, with office at Cleveland, Ohio, succeeding E. B. Cook, deceased. E. R. Bissell, assistant superintendent at Toledo, is appointed superintendent at Detroit, succeeding Mr. Schaff. E. D. Moon, assistant division superintendent at Ashtabula, Ohio, is appointed assistant superintendent at Toledo, Ohio, succeeding Mr. Bissell, and J. R. Todd, trainmaster at Ashtabula succeeds Mr. Moon as assistant superintendent at Ashtabula.

William Marshall, superintendent of telegraph of the Canadian Pacific at Toronto, Ont., has been appointed assistant manager of telegraph, with headquarters at Winnipeg, Man., and H. J. Lille has been appointed superintendent of telegraph, with headquarters at Toronto, Ont., succeeding Mr. Marshall.

James Warren Roberts whose appointment as general superintendent of passenger transportation of the Pennsylvania Lines West, with headquarters at Pittsburgh, Pa., has already been announced in these columns, was born on February 10, 1872, at Buckhannon, W. Va. He was educated in the public and high schools of Indiana, and later took a business course in the Lafayette Business College, Lafayette, Ind., and a scientific law course in the Indiana College, Covington, Ind. In March, 1894, he began railway work with the Lake Erie & Western, remaining with that company until February, 1900, when he entered the service of the Cleveland, Cincinnati, Chicago & St. Louis, and from July, 1903, to January of the following year was in the service of the Missouri, Kansas & Texas, serving consecutively as telegraph operator, station agent, yard clerk, assistant yardmaster, yardmaster, car distributor, train despatcher, chief clerk in division superintendent's office, chief clerk in assistant general superintendent's office, with supervision over freight and passenger car distribution matters, and as chief clerk in the general superintendent's office. He entered the service of the Vandalia on January 4, 1904, as a clerk in the transportation department. The following January he was appointed assistant chief clerk in the office of the general manager, and in January, 1910, was appointed assistant car accountant. He was promoted to car accountant in September, 1910, and in October of the following year was appointed superintendent of car service of the same road, which position he held at the time of his recent appointment as general superintendent of passenger transportation of the Pennsylvania Lines West, as above noted.

Traffic

H. C. Hallmark has been appointed assistant general freight agent of the Southern Pacific at Tucson, Ariz.

Charles Hamilton, traveling passenger agent of the Wabash, at Pittsburgh, Pa., has been appointed district passenger agent, with office at Philadelphia.

F. T. Brooks, district freight and passenger agent of the Southern Pacific at Buffalo, N. Y., has been appointed district freight and passenger agent, with office at Philadelphia, Pa., vice R. J. Smith, assigned to other duties, and S. C. Chiles succeeds Mr. Brooks.

Gerrit Fort, passenger traffic manager of the Union Pacific and the Oregon Short Line, with office at Omaha, Neb., has been appointed also passenger traffic manager of the Oregon-Washington Railroad & Navigation Company, and effective on April 1, will have jurisdiction over the entire Union Pacific system. His headquarters have been moved to Chicago, although the general offices of the department will remain at Omaha.

It is announced that effective on April 1 the Denver & Rio Grande and the Western Pacific will be operated separately. E. L. Lomax, assistant passenger traffic manager of both roads, has been appointed passenger traffic manager of the Western Pacific, with headquarters at San Francisco, Cal. C. R. Miller, assistant general baggage agent of the Western Pacific, has been appointed general baggage agent, with office at San Francisco.

Engineering and Rolling Stock

A. H. Powell, master mechanic of the Western Pacific at Sacramento, Cal., has been appointed general master mechanic, with headquarters at that place.

OBITUARY

C. H. Trimble, commercial agent of the Atlantic Coast Line at St. Louis, Mo., died recently in that city.

Sidney Freshman, general manager, secretary and treasurer of the Sierra Railway of California, died on March 16, at San Francisco, aged 60 years.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Dallas Terminal is inquiring for 3 switching locomotives.

The Montour Railroad is in the market for 5 Mikado type locomotives.

The Sumpter Valley has ordered 2 Mikado type locomotives from the Baldwin Locomotive Works.

The Missouri Pacific is reported to be considering the purchase of a number of Decapod type locomotives. This item has not been confirmed.

The Toledo, St. Louis & Western.—Walter L. Ross, receiver, has asked permission of the Federal court at Toledo to borrow $600,000, part of which is to be used for the purchase of 5 new locomotives, 50 furniture cars and 2,000 tons of steel rails.

The Lehigh & New England has ordered two superheater eight-wheel switching locomotives from the Baldwin Locomotive Works, for delivery in about 60 days. These locomotives will have 22 by 28 in. cylinders and a weight on drivers of 201,300 lb. They will be provided with Westinghouse air brakes, Symington steel tender journal boxes, Westinghouse friction draft gear with Farlow attachments, Dressel oil-burning headlights, Sharon couplers, Watters air sanders, Standard solid forged rolled steel wheels, Midvale tires, Railway Materials Company brake shoes, Sellers' injectors, Walschaert valve gear and Elliott flange oilers.

CAR BUILDING

The Aliquippa & Southern is asking for prices on 20 freight cars.

The Toledo, St. Louis & Western.—See item under Locomotive Building.

The Chicago & Eastern Illinois is in the market for two 60-ft. steel postal cars.

The Helena, Parkin & Northern, Parkin, Ark., is in the market for a few second hand dump cars.

The Minneapolis & St. Louis has revived an inquiry for freight cars, and is now in the market for 900 box cars and 100 coal cars.

The Chicago Great Western has ordered 2 buffet library and chair cars, 2 observation parlor cars and 2 baggage and smoking cars from the Pullman Company.

The Central of New Jersey has ordered 15 coaches, 10 combination passenger and baggage cars and 5 combination baggage and mail cars from the Harlan & Hollingsworth Corporation.

Russian Government.—The Petrograd correspondent of the Daily Telegraph of London has reported that an order for rolling stock amounting to about $7,000,000 has gone to this country and that a British syndicate lost the order because its bids were higher than those of the American firms.

IRON AND STEEL

The Toledo, St. Louis & Western.—See item under Locomotive Building.

The Wabash has ordered 683 tons of steel for repairs to its bridge at St. Charles, Mo., from the Decatur Bridge Company.

The Chicago & Eastern Illinois has ordered 10,000 tons of 90-lb. open hearth steel rails from the Illinois Steel Company.

The Great Northern has ordered 350 tons of steel in the form of girder spans from the Milwaukee Bridge Company, Milwaukee, Wis.

Supply Trade News

The Stentor Electric Manufacturing Company, Inc., has moved its office from 1790 Broadway, New York, to 126 Fifth avenue.

The Federal Signal Company, Albany, N. Y., has moved its New York office to the Vanderbilt Concourse building, 52 Vanderbilt avenue.

The American Locomotive Company has received a large contract for shrapnel, and has purchased $500,000 worth of machine tools to enable it to fill the order.

The Burd High Compression Ring Company has moved its general and executive offices at Rockford, Ill., from the Masonic Temple to 307-309 South Main street.

The American Car & Foundry Company will participate in the order for shrapnel recently placed with the Canadian Car & Foundry Company by the Russian government.

The Wyckoff Pipe & Creosoting Company, Inc., has moved its offices from 50 Church street, New York, to the Forty-second Street building, at 30 East Forty-second street.

The National Carbon Company, Cleveland, Ohio, is marketing a new signal cell, type 72. It is made in accordance with the R. S. A. specifications for signal cells, and has been in severe operating service for two years at various places.

William T. Simpson, vice-president of the American Rolling Mill Company, Middletown, Ohio, died in Cincinnati on March 30. Mr. Simpson was born in Saratoga county, New York, 59 years ago. He was one of the leading men in the steel industry of the middle west.

The Bird-Archer Company, New York, has opened a St. Louis office at 513 Frisco building, and a Chicago office at 866 Peoples Gas building. The St. Louis office is in charge of J. A. McFarland, vice-president, and the Chicago office is in charge of L. F. Wilson, vice-president.

Frederick Dietz, head of the firm of R. E. Dietz & Co., New York, one of the largest manufacturers of lanterns in the world, died at his home in New York on March 31, in his 68th year. Mr. Dietz was born in that city and was a son of the late R. E. Dietz, founder of the lantern firm, of which he had been a member all his life.

Osborn Van Brunt, for 10 years traffic manager of the Simmons Hardware Company, St. Louis, and formerly chief contracting freight agent of the Chicago, Burlington & Quincy, has been appointed manager of traffic and railway sales of the General Roofing Company, St. Louis, effective April 1. Mr. Van Brunt will supervise the traffic work of the entire company, this work having previously been handled by the traffic manager of each mill. He will also organize a railway sales organization to enable the company to cultivate more extensively the sale of the company's products to the railroads.

TRADE PUBLICATIONS

Electric Drills.—Bulletin E-35 of the Chicago Pneumatic Tool Co., has recently been issued. It is devoted to electric portable drills which are designed for operation on direct or alternating current.

Rail Joint Expander.—The Chicago Railway Signal & Supply Company, Chicago, recently issued a four-page folder which describes and illustrates the uses of the Chicago rail joint expander. It also contains a price list of this device.

Prevention of Belt Slipping.—The Gripwell Pulley Covering Co., 501 Candler Bldg., New York, has just issued a folder devoted to its product "Gripwell" which is a cement and canvas covering for pulley surfaces designed to increase the adhesion of the belt.

Glacier National Park.—The passenger department of the Great Northern recently issued a circular, which contains detailed

information regarding the points of interest in the park and how they may be reached. It also gives complete time schedules and prices covering the various trips.

Pipe Bender.—Bulletin No. 5,001 of the Hydraulic Press Manufacturing Co., Mount Gilead, Ohio, is a folder entitled Bending Pipe with Hydraulic Power. It deals with a recently developed hand-operated pipe bender manufactured by this company and having a pressure capacity of 30 tons.

Coaling Plants.—The Roberts & Schaefer Company of Chicago, Ill., recently issued an eight-page folder containing general data on locomotive coaling plants. Numerous illustrations showing the various types of construction are shown. It also describes briefly a few gravity sand plants.

Hydraulic Presses and Pumps.—The Hydraulic Press Manufacturing Company, Mount Gilead, Ohio, has issued a booklet in which a few of the various hydraulic appliances manufactured by this company are briefly described and illustrated. The development of the business of this company as well as its present organization is briefly set forth and the plant briefly described. The booklet is intended for distribution to visitors of the exhibit of this company at the Panama-Pacific International Exposition and contains a list of catalogs dealing in detail with various classes of hydraulic equipment, which are now ready for distribution.

Pumps.—The National Transit Company, Department of Machinery, Oil City, Pa., has just issued bulletins Nos. 1, 2, 4, 101 and 301, all of which are contained in a neat binder and are devoted to its line of pumping machinery for general service recently added to the line of oil and gas pumping machinery which it has long manufactured. In bulletin No. 1 are illustrated the pumps for different classes of service manufactured by this company, including the duplex, crank and fly-wheel direct steam driven and geared pumps; a line of gas engines and a line of pipe fittings. The other bulletins are each devoted to a particular class of service.

Belt Conveyors.—The Stephens-Adamson Manufacturing Company, Aurora, Ill., recently issued section 3 of its general catalog No. 19. This catalog contains 126 pages, which are chiefly devoted to reproductions of drawings and photographs illustrating the principle, design, uses and installations of the various types of belt conveyors, gates, chutes and feeders. Numerous illustrations show typical views of conveyors installed for construction work, handling cement, sand, rock, etc., also for handling coal and ore. It also includes some descriptive matter and some curves plotted to give width of belts necessary to handle certain maximum tonnages per hour.

Paints.—The St. Louis Surfacer & Paint Company, St. Louis, Mo., has issued a number of circulars and color cards, each one devoted to paints and varnishes for a particular class of work, all of which are neatly bound in a loose leaf folder. Among the circulars are found the following dealing with paints for railway work: No. 1-A, steel and wood freight car paint; No. 2-A, coach and car surfacer; No. 3-A, locomotive surfacer; No. 5-A, canvas roof paint, floor paint and truck enamel; No. 6-A, hand rail and headlining enamel, rattan seat finish and interior car colors; No. 7-A, coach colors and color varnishes; No. 8-A, station and building paint; No. 9-A, bridge and signal target paint, and No. 14-A, car cleaner and metal polish. A color card is included with each circular.

Centrifugal Pumps.—The DeLaval Steam Turbine Company of Trenton, N. J., recently issued catalogue B, an attractive 298-page book, devoted to the design, manufacture, testing, erection and adaptation to the various uses, and characteristics of the DeLaval centrifugal pump. This book is divided into 13 parts, each dealing expressly with one phase of the problem, the first part being devoted to the work for which this pump is adapted, giving illustrations of installations, and curves representing its characteristics. The second and third parts deal with the selection of pumps, the fourth with tests of pumping equipment, giving general test data and formulae, etc., and so each chapter discusses fully one particular topic; reproductions of photographs and curves show results of experiments. A few chapters treat especially on speed-reducing gears and turbine-driven waterworks pumps.

Railway Construction

Alabama Roads.—The Henderson-Waits Lumber Company, Tuscaloosa, Ala., has recently secured control of about 23,500 acres of timber land in Tuscaloosa county, Ala., and it is understood will build a railroad about 15 miles long into these lands.

Atchison, Topeka & Santa Fe.—A contract has been given to the L. J. Smith Contracting Company, Kansas City, to grade seven miles out of Exeter, Cal.

Canadian Roads.—Plans are being made to build a railway from Pennfield, N. B., on the Canadian Pacific southwest to Beaver harbor, L'Etang and Blacks Harbor, about eight miles. The promoters have asked the government of New Brunswick to guarantee bonds at the rate of $20,000 a mile. L. Connors, Blacks Harbor, and H. I. Taylor, are interested.

Chowchilla Pacific.—The grading work on the two-mile extension of this company's line in Madera county, California, has been completed and the track is being laid. Gasoline motive power will be used. Chadwick & Sykes, San Francisco, Cal., are the contractors.

Hillsboro & Northeastern.—This company has applied to the Wisconsin Railroad Commission for authority to extend its line from Hillsboro, Wis., via Yuba and Rockbridge, to Richland Center, a distance of 28 miles. The building of this line will require the construction of 12 bridges with spans about 100 ft. long and several small ones.

Kentucky Roads.—Right of way has been secured in Clay county, it is said, for building a line from Manchester, Ky., south to Barbourville, in Knox county, about 25 miles. W. D. Boyer and E. W. Gerheart, represent a contractor who agrees to build the line. Pennsylvania capitalists are back of the project. C. B. Lyttle and C. B. Donnelly, Manchester, are interested in the project.

New Britain, Kensington & Meriden (Electric).—This company has asked for an extension of time in which to complete a line from Meriden, Conn., north via Kensington to New Britain, about ten miles. E. A. Moore, president, New Britain.

New York Subways.—The New York Public Service Commission, First district, will receive bids up to April 9, for the construction of section No. 4 of Routes Nos. 4 and 36, which is that part of the Broadway-Seventh avenue subway in the borough of Manhattan, between Fifty-first and Fifty-ninth streets. It is expected that bids for the section between Thiry-eighth and Fifty-first streets will be asked for within the next few weeks. The entire line will be under contract when these two sections are let.

Ottawa & St. Lawrence Electric.—This company, which was organized in 1912, to build about 300 miles of electric railway in eastern Ontario out of Ottawa, will resume construction work early this spring, it is said. About 28 miles have been graded and are ready for ties and rails, and the company expects to build about 56 miles this year. H. W. Pearson, Confederation Life building, Toronto, is secretary. (February 5, p. 25L.)

Palm Beach & Everglades.—A sub-contract is reported let to Sanders & Company, Miami, Fla., to build a canal and grade this line from West Palm Beach southwest. The plans call for building from West Palm Beach, west to Lake Hicpochee. The Everglades Construction Company, it is said, has the general contract. Charles H. Baker, president, New York. (March 12, p. 494.)

Petersburg & Appomattox (Electric).—This company with $100,000 capital was recently given a charter in Virginia to build an electric line from Petersburg, Va., southeast to City Point, 10 or 12 miles. A preliminary survey has been made and the engineers have nearly completed a second survey. As soon as the engineering work has progressed far enough and the right of way has been determined upon and secured, the company expects to begin construction work and to push the

work to completion. T. M. Wortham, president; D. W. La Prade, vice-president; W. W. La Prade, secretary and treasurer in charge of engineering, Richmond, Va. Edwin Wortham, an electrical engineer, is also associated with the company and will later take charge of the engineering department. (March 12, p. 494.)

Savannah Piedmont & Western.—Incorporated in South Carolina to build a railroad from a point on the Savannah river at or near North Augusta in Schultz township, Aiken county, north to a point in Saluda county, thence northwest to Greenwood in the county of the same name, about 60 miles. The company has not yet decided whether it will use steam or electricity as the motor power. J. Peyton Clark, New York; S. H. McGhee and K. Baker, Greenwood, S. C., are among the incorporators.

Tennessee Roads.—The Kingsport Lumber Company, Kingsport, Tenn., is building a railroad, it is said, into timber lands adjoining their mills.

Tidewater Securities Corporation.—A contract has been given to J. N. Gillis & Son, Brewton, Ala., to build a railway from the terminus of the Mobile & Ohio tracks near Alabama Port, Ala., to Cedar Point, 3.66 miles. The line is later to be extended to Dauphin Island, a total of about nine miles. J. M. Dewberry, president, and T. W. Nicol, chief engineer, Mobile. (February 12, p. 289.)

Toledo, St. Louis & Western.—W. L. Ross, receiver for the Toledo, St. Louis & Western, has applied to the Federal court at Toledo for permission to borrow $600,000 to cover additions and betterments to property, elimination of trestles, etc., also for purchases of locomotives and cars.

Toronto & York Radial (Electric).—The Railroad Committee of the Ontario legislature has granted this company a two years' extension of time in which to start the construction of certain lines outside the city of Toronto, Ont. This extension of time is subject to the approval of the Hydro-Electric Power Commission of Ontario.

RAILWAY STRUCTURES

Bala, Ont.—Bids are wanted until April 10, by A. L. Hertzberg, division engineer, of the Canadian Pacific, Toronto, Ont., for the construction of four concrete piers and two concrete abutments for a bridge on the Muskoka subdivision to be built over Shaw's creek, at a point about seven and one-half miles south of Bala.

Blackwell, Okla.—The Atchison, Topeka & Santa Fe has awarded the contract for the construction of the combination passenger and freight station at this point to Nelson & Sons, Chicago. The estimated cost is $15,000. (See *Railway Age Gazette,* March 12, page 494.)

Carbondale, Pa.—Bids will be received by James MacMartin, chief engineer of the Delaware & Hudson, at Albany, N. Y., for the proposed steel viaduct to be built over the Lackawanna river and the tracks of the Jefferson branch of the Erie Railroad and a proposed line of the Delaware & Hudson near Carbondale. The viaduct will be about 411 ft. long and will require 398 tons of steel. The cost of the structure will be about $70,000. (March 26, p. 721.)

Fort Worth, Tex.—The St. Louis Southwestern has just begun work on the construction of 1,800 ft. of standard pile trestle in the Trinity river bottom near Fort Worth, Tex. This work is a part of the general improvement of the terminal situation, and will be completed as soon as possible. The trestle is only a temporary structure and later will be filled in. All work is being done by company forces.

Sciotoville, Ohio.—A contract has been given to the McClintic-Marshall Company for the fabrication and erection of 16,000 tons of steel for a bridge over the Ohio river at Sciotoville for the Chesapeake & Ohio Northern. The bridge is to have two 775-ft. spans with 1,900 ft. approaches, and the greatest height will be 140 ft. The contract for the substructure has been let to the Dravo Company, Pittsburgh, Pa. The estimated cost of the structure is $1,500,000.

Railway Financial News

Atchison, Topeka & Santa Fe.—This company, it is reported, has taken over the St. Louis, Rocky Mountain & Pacific, which runs from Des Moines, N. Mex., to Ute Park, N. Mex., 106 miles. Atchison, Topeka & Santa Fe 4 per cent bonds totaling $3,000,000 have been exchanged for the authorized and outstanding bonds of the St. Louis, Rocky Mountain & Pacific.

Boston & Maine.—E. D. Codman, former president of the Fitchburg Railroad, one of the leased lines of the Boston & Maine, and at present a stockholder, has announced that he is strongly opposed to the reorganization as now proposed (*Railway Age Gazette,* p. 721). Up to within a few days Mr. Codman was in favor of some arrangement by which the road could be reorganized, but he has changed his mind because of a large reduction in maintenance charges and cost of transportation. Mr. Codman, upon seeing the figures which showed the reduction, inquired about it of President Hustis, and he replied:

"There has been no curtailment in maintenance of way or equipment expenditures necessary for safe operation and for preservation of the property. Economies in operation have been practiced and all work not necessary for safety and reasonable service has been stopped. There has been a curtailment of passenger train service to an extent which might not be justified except under the critical conditions obtaining at this time."

Mr. Codman looks upon the saving, nearly $1,600,000 in four months, or $400,000 a month, as "magnificent." Coming as it does mostly out of operating instead of equipment or maintenance, "there is abundant promise that the gains are going to be lasting. Now is the time for the leased line stockholders to wake up and understand that their lessee is after all a solvent corporation, capable of replacing a $2,000,000 deficit with $1,000,000 surplus for dividends and that President Hustis is the man they have to thank for it. . . ."

The management of the road has accepted the bill drafted by the public service commissions of Maine, New Hampshire and Massachusetts as the basis for the proposed reorganization. It still remains, however, for the various state legislatures concerned to pass the necessary legislation before further steps in the reorganization plan can be carried out.

Chicago, Rock Island & Pacific.—The Amster committee has given out the names of the four men whom they say they propose to vote for as directors to succeed the directors of the Chicago, Rock Island & Pacific Railway Company, who retire on April 12. These are J. W. Burdick, president of the West Pennsylvania Steel Company; George G. Prentice, a retired manufacturer of New Haven, Conn.; George Warren Smith, of New York, and N. L. Amster. It is, of course, only the Chicago, Rock Island & Pacific Railway Company on the board of directors of which the Amster committee is seeking to place its representatives.

Erie.—The New York Public Service Commission, Second district, has approved the issue by this road of $1,000,000 of its general lien bonds. The issue will be used as a part of the general new scheme of Erie financing by these bonds. Part of the proceeds will go to the treasury to reimburse it for capital expenditures and part will be used as collateral on the $10,000,000 indenture to the Bankers' Trust Company for one year 5 per cent collateral gold notes dated April 1, 1915. The indenture takes care of the securities of the Erie & Jersey and the Genesee River, the handling of which issues by this method was recently approved by the public service commission.

Georgia & Florida.—W. R. Sullivan and H. R. Warfield, of New York, and J. M. Wilkinson, of Valdosta, Ga., have been appointed receivers of the Georgia & Florida on the joint application of the Baltimore Trust Company, which is the trustee for the $6,500,000 5 per cent bonds which are in default in interest since May 13, and the officers of the road. The Georgia & Florida runs from Augusta, Ga., to Madison, Fla., 250 miles.

ANNUAL REPORTS

THE CLEVELAND CINCINNATI CHICAGO & ST. LOUIS RAILWAY COMPANY

To the stockholders of

The Cleveland Cincinnati Chicago & St Louis Railway Company:

The Board of Directors herewith submits its report for the year ended December 31, 1914, with statements showing the results for the year and the financial condition of the company.

The mileage embraced in the operation of the road is as follows:

	Miles
Main line and branches owned	1,242.73
Proprietary lines	433.33
Leased lines	203.70
Operated under contract	337.92
Trackage rights	163.56
Total road operated	2,381.24

This is an increase over a similar table in last year's report of 367.46 miles, of which 346.88 miles is accounted for by the inclusion this year of the Peoria & Eastern Division. Included also are trackage rights over the Terminal Railroad Association of St Louis, 12.08 miles, and additional trackage over the Indianapolis Union, 9.53 miles, partially offset by a decrease of 4.73 miles heretofore treated as trackage rights of the Peoria & Eastern Railway and other slight changes in mileage at various points.

A statement showing in detail the mileage of road operated will be found on another page.

There was no change in the capital stock during the year, the amounts authorized and outstanding on December 31, 1914, being as follows:

Preferred stock authorized		$10,000,000.00
Common stock authorized		50,000,000.00
Total preferred and common stock authorized		$60,000,000.00
Preferred stock issued and outstanding	$10,000,000.00	
Common stock issued and outstanding	47,056,300.00	57,056,300.00
Balance common stock authorized but not issued, December 31, 1914		$2,943,700.00

The funded debt unmatured outstanding December 31, 1913, was $91,943,067.88

It has been increased during the year as follows:

C C C & St L Ry general mortgage five per cent bonds, issued for retirement of prior lien bonds	$4,161,000.00	
To place upon the general books of the company its liability in connection with additional certificates issued under the New York Central Lines Equipment Trust Agreement of 1913	619,224.32	
To place upon the general books of the company the certificates issued under the Big Four Railway Equipment Trust Agreement of 1914	3,870,000.00	
Big Four trust equipment notes 1914, issued for equipment	776,314.25	9,426,538.57
		$101,369,606.45

It has been decreased during the year as follows:

C C C & I Ry Co first consolidated mortgage bonds retired	$4,138,000.00	
Pro rata equipment trust certificates due January 1, 1914	432,019.42	
Pro rata equipment trust certificates due November 1, 1914	246,689.81	
C I St L & C Ry Co general first mortgage bonds retired	74,000.00	
C I St L & C Ry Co first mortgage bonds retired	6,000.00	4,896,709.23
		$96,472,897.22

Less:

C C C & St L Ry (St L Div) first collateral trust mortgage bonds held in sinking fund	$676,000.00	
C C C & St L Ry (S & C Div) scrip held in treasury	230.00	676,230.00
Total funded debt outstanding December 31, 1914		$95,796,667.22

Out of $24,000,000.00 of certificates authorized under New York Central Lines Trust Agreement dated January 1, 1913, there were issued to December 31, 1913, an aggregate of $15,494,000.00 of which this company's pro rata allotment was $1,087,551.00. During the year 1914 additional certificates were issued amounting in total to $6,944,000.00. The cost of the equipment assigned to this company in connection with the issue of these latter certificates, viz., 25 steel passenger coaches, 10 steel combination passenger and baggage cars and 12 steel mail cars, is approximately $688,027.02, and its pro rata amount of certificates, representing an amount not to exceed 90 per cent of the cost is $619,224.32.

Under Big Four Railway Equipment Trust agreement of 1914 dated June 1, 1914, there were issued equipment trust certificates aggregating $3,870,000.00 covering the purchase of 5,085 freight train cars. The aggregate cost to the company of this equipment is approximately $4,837,974.75, to be covered with certificates representing an amount not to exceed 80 per cent of the cost, the remaining 20 per cent of the cost to be paid by notes payable respectively eighteen, thirty and forty-two months from January 1, 1915.

During the year the sinking fund of the Cleveland Cincinnati Chicago & St Louis Railway Company's St Louis Division first collateral trust bonds has been increased by the purchase of 31 bonds, par value $31,000.00, making a total of 676 bonds, par value $676,000.00, in the hands of the Central Trust Company, trustee of this fund.

All of the company's roadbed destroyed or damaged during the disastrous floods of March and April, 1913, has been restored to the original grade, and the track is again in good condition. All bridges lost or damaged have been replaced with the exception of the joint bridge at Dayton, Ohio, over the Miami River, which can not be rebuilt until the plans are agreed to by the Flood Prevention Committee of the city of Dayton, Ohio, the County Commissioners and the other roads interested.

In the reconstruction of bridges deeper foundations for bridge piers have been made and greater openings provided in order to avoid if possible a repetition of the damage sustained during this flood.

All station buildings, interlocking plants, etc., which were damaged have been either replaced or repaired.

All tracks on the Peoria and Eastern Division have been restored to their original grade. The bridges have been rebuilt with the exception of those at Troy, Ohio, which have not been permanently rebuilt on account of legislation pending which will affect them.

The direct cost of this catastrophe was $3,223,749.21. The indirect cost from loss of use of property and business interference was large—it cannot be approximated in money.

Incident to the restoration of the property there was charged to the appropriate road and equipment accounts $622,695.60, representing the excess cost of the new facilities over those replaced, and $448,854.33 to operating expenses.

Section 19-A of the Act to Regulate Commerce which became a law on the first day of March, 1913, provides that the Interstate Commerce Commission shall investigate and ascertain the value of all property owned and used by railroad companies: During the year the engineering department has been engaged in the preparation of right of way maps, the compilation of lists of various kinds of property such as bridges, buildings, ownership of tracks, etc., which lists have been furnished to the field force of the Interstate Commerce Commission, Division of Valuation, for their work in inventorying the property owned by this company. During the latter part of the year four field parties of the Division of Valuation were engaged in making cross section measurements of the amount of grading in the present railroad, measuring the track, and taking inventory of track material and small bridges. These parties covered about 510 miles of the road and expect to return in April, 1915, for further work. In addition, a field party of the Division of Valuation has been engaged in making an inventory of interlocking plants on the Cairo and St Louis Divisions. A force of clerks in the general office has been created for the purpose of examining old and current books, records and memoranda necessary for use in the verification of certain of the general accounts appearing on the books of the present and predecessor companies.

SUMMARY OF FINANCIAL OPERATIONS AFFECTING INCOME

	1914	1913	Increase or Decrease
Operating income	2,381.24	2,365.39	15.85 *miles*
Railway operations	*miles operated*	*miles operated*	
Revenues	$35,365,690.61	$37,613,498.15	—$2,247,807.54
Expenses	28,954,969.13	32,811,468.02	—3,856,498.89
Net revenue from railway operations	$6,410,721.48	$4,802,030.13	$1,608,691.35
Percentage of expenses to revenues	(81.87%)	(87.23%)	—(5.36%)
Railway tax accruals	$1,528,026.70	$1,408,769.06	$119,257.64
Uncollectible railway revenues	8,608.66	.....	8,608.66
	$1,536,635.36	$1,408,769.06	$127,866.30
Railway operating income	$4,874,086.12	$3,393,261.07	$1,480,825.05
Miscellaneous operations			
Revenues	$16,518.48	$19,900.15	—$3,381.67
Expenses and taxes	11,874.84	14,846.65	—2,971.81
Miscellaneous operating income	$4,643.64	$5,053.50	—$409.86
Total operating income	$4,878,729.76	$3,398,314.57	$1,480,415.19
Non-operating income			
Joint facility rents	$400,607.05	$365,906.70	$34,700.35
Income from lease of road	98,660.59	.....	98,660.59
Miscellaneous rents	149,214.71	147,256.31	1,958.40
Miscellaneous non-operating physical property	77,407.69	72,276.05	5,131.64
Dividend income	61,997.90	57,665.15	4,332.75
Income from funded securities	28,690.00	29,015.00	—325.00
Income from unfunded securities and accounts	85,344.05	115,416.71	—30,072.66
Miscellaneous income	31,276.20	28,660.82	2,615.38
Total non-operating income	$933,198.19	$816,196.74	$117,001.45
Gross income	$5,811,927.95	$4,214,511.31	$1,597,416.64

Deductions from gross income			
Hire of equipment—debit balance	$1,706,711.86	$1,399,335.25	$307,376.61
Joint facility rents	613,538.58	555,028.53	58,510.05
Rent for leased roads	674,561.59	587,116.00	87,445.59
Miscellaneous rents	141,587.28	145,837.85	—4,250.57
Miscellaneous tax accruals	408.64	6,566.20	—6,157.56
Separately operated properties—loss	95,560.19	93,395.08	2,165.11
Interest on funded debt	4,049,176.32	3,975,071.19	74,105.13
Interest on unfunded debt	485,072.14	267,997.11	217,075.03
Miscellaneous income charges	5,729.70	33,825.15	—28,095.45
Income applied to sinking fund	13,269.00	.....	13,269.00
Total deductions from gross income	$7,785,615.30	$7,064,172.36	$721,442.94
Income balance transferred to debit of profit and loss	$1,973,687.35	$2,849,661.05	$875,973.70

Amount to debit of profit and loss December 31, 1913		$1,389,643.20
Add:		
Deficit for year 1914	$1,973,687.35	
Discount, commissions and expenses N Y C Lines equipment trust certificates 1913	15,354.25	
Discount, commissions and expenses Big Four Ry equipment trust certificates 1914	46,281.54	
Discount on C C C & St L Ry Co general mortgage bonds	124,830.00	
Adjustment of sundry accounts	119,124.19	2,279,277.33
Balance to debit of profit and loss December 31, 1914		$3,668,920.53

The gross operating revenues for the year were $35,365,690.61, a decrease of $2,247,807.54 from 1913, largely due to the general depression in business. Of the decrease $2,077,377.15 was in transportation revenue and $170,430.39 in incidentals.

Freight revenue for the year was $23,436,210.75, a decrease of $1,696,905.36 or 6.75 per cent. The revenue per ton mile was 5.31 mills, a decrease of .16 mills. Total revenue tonnage decreased 3,335,223 tons. The average haul per ton increased 14.2 miles. Train loading for the year was 548 tons per train mile, an increase of 64 tons, or 13.2 per cent.

Mention was made in last year's report of the application to the Interstate Commerce Commission for an increase of five per cent in freight rates. The Commission, in a decision rendered July 29, 1914, granted an increase of five per cent in freight rates on certain traffic to and from points witbin the limits of the Central Freight Association territory; these increased rates becoming effective October 26, 1914. In a further opinion submitted December 16, 1914, the Commission granted increases on cement, brick, tile, starch, clay and plaster, which were excepted in their former decision. Also upon traffic to and from territory East of Buffalo and Pittsburgh, excepting coal, coke and iron ore, which commodities during 1914 comprised 48.42 per cent of the total tonnage carried by the company. The increases under the order of December 16th are to become effective January 15, 1915, in the territories and on the commodities prescribed. Similar increases on the same commodities have been allowed on intra-state traffic in the State of Ohio, but no increases have been made effective on intra-state traffic in the States of Indiana and Illinois due to the suspension of the proposed increases by the public service commissions of the states in question. It is hoped, in the interest of the transportation needs in these States, that the commissions will finally grant the increases.

Passenger revenue for the year was $8,589,012.14, a decrease of $302,189.15, or 3.4 per cent. This amount is made up of a decrease in the revenue from local business of $354,693.95, partially offset by an increase in interline revenue of $52,504.80. The average distance carried was 55.7 miles, an increase of 4.4 miles. The average amount received from each passenger was $1.087.

Interstate passenger rates on a lower basis were increased to 2½ cents per mile, effective December 1, 1914. The states of Ohio, Indiana and Illinois either have been or shortly will be petitioned to permit an increase of the statutory rate of 2 cents per mile to 2½ cents per mile on intrastate traffic.

Revenue from transportation of mail was $772,359.42, an increase of $24,984.80, or 3.34 per cent, due to the reinstatement effective January 26, 1914, in mail service of certain magazines which were being handled in freight train service, and additional remuneration allowed from July 1, 1914, account parcel post.

Revenue derived from express traffic was $953,181.41, a decrease of $154,808.01, or 13.97 per cent, attributable to smaller volume of business handled caused by the business depression and increasing use made of the parcel post facilities, also to reduction in express rates ordered by the Interstate Commerce Commission effective February 1, 1914.

Incidental revenues decreased $170,430.39, of which $40,998.47 is in dining car operations, due to the decrease in passenger business, $44,178.91 in demurrage and $83,189.58 in miscellaneous.

The gross operating expenses for the year were $28,954,969.13, a decrease of $3,856,498.89, while the decrease in gross operating revenues, as previously stated, was $2,247,807.54. Divided by groups the fluctuations in expenses making up the total decrease for the year were as follows:

Maintenance of way and structures—decrease	$1,002,950.41
Maintenance of equipment repairs—decrease	1,389,284.33
Equipment depreciation and retirements—increase	166,479.73
Traffic—decrease	78,824.32
Transportation—rail line—decrease	1,527,627.62
Miscellaneous operations—decrease	33,366.31
General—(including Government valuation)—increase	36,826.10
Transportation for investment—Cr.—increase	27,751.73
Total decrease	$3,856,498.89

The decrease in maintenance of way and structures is comorised of decreases in charges for roadway maintenance $289,867.11, bridges, trestles and culverts $81,856.63, ballast $35,449.98, track laying and surfacing $765,234.32, telegraph and telephone lines $34,534.16, and maintaining joint tracks, yards and other facilities $44,494.68, partially offset by increases in ties, rails, crossing signs, shops and engine houses and removing snow, sand and ice. The nay rolls of this department decreased $672,562.31.

The increase in equipment retirements and denreciation is $166,479.73, of which $131,271.66 is in retirements and $35.208.07 in depreciation, the latter due to the additional equipment acquired during the year and the increased value of locomotives. Actual retirements of equipment were substantially less than in the preceding year, the increase being due to an extraordinary charge to this account of $313,678.30, incident to the repair and conversion to Mikado type of 62 consolidation locomotives.

Equipment repairs decreased $1,389,284.33 account decrease in shop machinery $32,192.38, steam locomotives $97,283.86, freight train cars $1,069,263.02 and passenger cars $192,939.60. Actual repairs made to locomotives at company's shops decreased $292,378.86, but this decrease was partially offset by a charge to locomotive repairs of $195,095.00, representing the repair feature of locomotives converted.

Traffic expenses show a decrease of $78,824.32.

The decrease in transportation expenses of $1,527,627.62 is distributed throughout practically all of the primary accounts. Notable decreases are in fuel for train locomotives $497,779.16 and in train supplies $154,261.22.

General expenses increased $36,826.10, due to increases in the accounts, salaries and expenses of clerks and attendants $31,192.84, pensions $7,827.09, valuation expenses $25,791.69, and other expenses $9,486.15. The other accounts in this group showed decreases. The increase in the account salaries and expenses of clerks and attendants is largely the result of increased demands on the accounting department incident to the requirements of laws with respect to accounting and the preparation of statistics for the various rate cases and proceedings, inventory work, etc. Valuation expenses for the year, $27,439.99, are almost wholly an increase over last year as the work was not actively prosecuted until the current year.

Taxes for the year show an increase of $119,257.64, of which $116,894.95 is due to increases in tax rates applicable in the different states, $12,350.00 to additional property returned for assessment, $6,550.00 to increase in the appraisal of property by the different state boards and local assessors and $14,015.96 in the tax on gross earnings in the State of Ohio.

Railway operating income for the year increased $1,480,825.05. Non-operating income was $933,198.19, an apparent increase of $117,001.45, heing largely the result of the change in accounting methods prescribed by the Interstate Commerce Commission. Dividend income, income from funded securities, and income from unfunded securities and accounts, show decreases aggregating $26,064.91. Gross income was $5,811,927.95, an increase of $1,597,416.64.

Deductions from gross income for the year were $7,785,615.30, an increase of $721,442.94. Of this amount $307,376.61 is per diem on freight cars and rent for locomotives, passenger cars and work equipment, $74,105.13 in interest on funded debt including equipment obligations, $217,075.03 in interest on outstanding notes, (aggregating on December 31, 1914, $8,041,-810.00) and $58,510.05 in joint facility rents. The deficit for the year was $1,973,687.35, as compared with a deficit in 1913 of $2,849,661.05, a decrease of $875,973.70.

There was expended and charged to road and equipment during the year $6,448,860.13, a detailed statement of which will be found on another page.

During the year the company advanced $1,029.01 for construction on the Saline Valley Railway Company, all of whose capital stock and funded debt is owned by the Cleveland Cincinnati Chicago & St Louis Railway Company.

There has been charged to income the company's proportion of the deficit resulting from the operation of the Central Indiana Railway Company for tbe year amounting to $76,046.13, an increase of $14,173.27.

The operation of the Kankakee and Seneca Railroad (for which separate accounts are maintained) shows revenues for the year $75,133.01, operating expenses, taxes and additions and betterments $106,040.53, deficit $30,907.52, one-half of which, $15,453.76, was charged to income in 1914.

The Mt Gilead Short Line (for which separate accounts are maintained) shows revenues for the year $7,016.72, operating expenses and taxes $11,-207.52, non-operating income $130.50, deficit $4,060.30, all of which was charged to income in 1914.

The statement of financial operations affecting income for the year includes the operation of the Peoria & Eastern Division from Springfield, Ohio, to Pekin, Illinois, the accounts for 1913 being restated for comparative purposes. Separate accounts for this division are maintained and the operations for the year 1914 show revenues amounting to $3,025,668.63, operating expenses and taxes $2,568,913.21, operating income $456,755.42, non-operating income $209,221.39, gross income $665,976.81, deductions from gross income $826,382.40, deficit $160,405.59.

The financial condition and results from operation for the year for The Cincinnati Northern Railroad Company are shown in a separate report.

The credit balance in equipment replacement account on December 31, 1913, was		$2,002,412.21
There was added during the year 1914 representing value of equipment retired		878,150.58
		$2,880,562.79
There was charged against this account the following:		
Locomotives	$924,141.39	
Passenger cars	62,450.24	
Freight cars	75,507.91	
Work cars	12,193.50	1,074,293.04
Balance December 31, 1914		$1,806,269.75

The City of Indianapolis is engaged under contracts with the railways in constructing sewers, changing the channel of Pogue's Run, etc., as a work preliminary to the separation of grades within the central part of the city. When completed all the companies affected, including this company and the Indianapolis Union Railway Company, in which this company is a stockholder, will be required to proceed with the separation of grades. It is estimated that this company's proportion of the cost of the improvements will be $950.000.00, and that the work will be completed by July 1, 1918.

In the operation of the pension department 63 employees were retired and placed upon the pension rolls. Of these retirements, 35 were authorized because of the attainment of seventy years of age and 28 because of total and permanent physical disability. Twenty-six pensioners died during 1914, and at the close of the year 255 retired employees were carried upon the pension rolls. The total amount paid in pension allowances during the year was $62,706.74.

Apoointments during the year were as follows:

On January 1, Rush R. Harris, Superintendent Freight Transportation.
On January 1, Joseph R. Cavanagh, Superintendent Car Service.
On January 1, Ira S. Downing, General Master Car Builder.
On March 10, Daniel J. Mullen, Superintendent Motive Power.
On May 1, Charles J. Brister, Traffic Manager.
On May 15, Sidney B. Kent, Superintendent Dining Cars.
On June 10, Charles A. Theis, Chief Claim Agent.
On July 1, William T. Stevenson, Assistant General Freight Agent.

On the pages following will be found the general balance sheets and tabulated statements showing results of operation for the year.

Your property is in good physical condition and your officers and employees are loyal and efficient. Much credit is due them for the hard and painstaking work performed through the flood and since, and I express my thanks and appreciation to each.

ALFRED H. SMITH,
President.

MICHIGAN CENTRAL RAILROAD COMPANY'S SIXTY-NINTH ANNUAL REPORT

To the Stockholders of

THE MICHIGAN CENTRAL RAILROAD COMPANY:

The Board of Directors herewith submits its report for the year ended December 31, 1914, with statements showing the results for the year and the financial condition of the company.

The report covers the operation of mileage, as follows:

	Miles
Main line	270.07
Proprietary lines	326.29
Leased lines	1,110.50
Lines operated under trackage rights	93.18
Total road operated (as shown in detail on another page)	1,800.04

There was an increase of three-tenths (.3) of a mile, compared with the previous year, the result of a re-measurement of leased lines.

Of the total road operated, 73.38 miles are operated in freight service only and 26.44 miles in passenger service only.

There was no change in capital stock during the year, the amount authorized and outstanding being $18,738,000.00.

The funded debt outstanding December 31, 1913, was		$44,587,252.36
It has been increased during the year by pro-rata liability for certificates under the New York Central Lines Equipment Trust Agreement of 1913		639,580.41
		$45,226,832.77
It has been decreased during the year by payment of pro-rata of installments on account of New York Central Lines equipment trust certificates		
November 1, 1914 trust of 1907	$260,425.45	
January 1, 1914 trust of 1910	368,019.72	
January 1, 1914 trust of 1912	151,710.90	
January 1, 1914 trust of 1913	64,279.71	844,435.78
Total funded debt December 31, 1914 (detail on another page)		$44,382,396.99

The changes in the road and equipment account during the year were as follows:

Amount charged against main line to December 31, 1913			$55,469,315.36*
Charged for road and equipment in 1914, as shown in detail on another page			
Against capital account			
For road		$626,527.90	
For equipment	$1,059,292.56		
Less:			
Equipment replacement account	480,289.17	579,003.39	1,205,531.29
Total main line			$56,674,846.65
Amount charged against leased lines to December 31, 1913			$17,799,115.56
Charged for road and equipment in 1914, as shown in detail on another page			
Against capital account			
For road	$374,175.19		
Less reimbursement by Canada Southern Railway Company on account of expenditures in prior years	145,493.51	228,681.68	
Total leased lines			18,027,797.24
Total December 31, 1914			$74,702,643.89

*Exclusive of depreciation reserve, now shown as a liability.

On March 2, 1914, this company issued its one year promissory notes for $6,000,000.00, hearing interest at the rate of 4½% per annum, and retired its one year 4½% notes for $4,000,000.00, which matured on that date.

Additional advances aggregating $9,237.29 were made to The Detroit, Delray & Dearborn Railroad Company during the year for completion of improvements, for which this company will be reimbursed by the proceeds of the sale of additional capital stock of that company.

This company advanced to the Toronto, Hamilton & Buffalo Railway Company, during the year, on its promissory notes, hearing interest at 6% per annum, $100,000.00, as its one-sixth proportion of the estimated cost of construction of The Erie & Ontario Railway, a new railroad incorporated May 27, 1914, and extending from a connection with the Toronto, Hamilton & Buffalo Railway at Smithville, to Port Maitland, Ontario, on Lake Erie, a distance of about eighteen miles. Agreement for amalgamation of this road with the Toronto, Hamilton & Buffalo Railway Company was approved by the Governor in Council December 15, 1914, and will be made effective on filing at Ottawa, January 30, 1915. The road was completed and placed in operation December 22, 1914, between Smithville and Dunnville on the Grand River, a distance of 14.9 miles. It is expected, owing to the great natural facilities afforded at Dunnville and along the Grand River to Port Maitland, that the road will attract many industries to the territory which it serves.

Out of $24,000,000.00 of certificates authorized under the New York Central Lines equipment trust agreement dated January 1, 1913, there were issued to December 31, 1913, an aggregate of $15,494,000.00, of which this company's pro-rata allotment was $2,055,234.09.

During the year 1914 additional certificates were issued amounting in total to $6,944,000.00. The cost of the equipment assigned to this company in connection with the issue of these latter certificates is approximately $715,230.84, and its pro-rata amount of certificates, representing an amount not to exceed 90% of the cost, is $639,580.41.

During the year the Detroit River Tunnel Company issued and sold additional Terminal and Tunnel 4½% Fifty-Year Gold Bonds to an aggregate amount of $4,000,000.00. These bonds bear date May 1, 1911, and the principal and interest is guaranteed by The Michigan Central Railroad Company under an agreement dated May 10, 1911. The proceeds arising from the sale of the bonds were used in the completion of the passenger station and terminal yards at Detroit.

Since January 1, 1914, the effective date of the lease covering the use of the Detroit River Tunnel Company's terminal station and facilities, the items of expenditure covering the maintenance and operation of the properties have been included with the operating results of The Michigan Central Railroad Company.

In accordance with the terms of an agreement with the Canada Southern Railway Company, dated January 2, 1906, and upon the satisfaction during the year of that company's second mortgage, which matured March 1, 1913, this company acquired the entire capital stock, namely 15,476-⅝ shares, and $1,500,000.00 of outstanding first mortgage 4% bonds of the Toledo, Canada Southern & Detroit Railway Company.

Three additional shares of stock of the Michigan Air Line Railroad Company were acquired by purchase during the year, thereby increasing this company's holdings to 6,688-¼ shares, out of a total of 7,855 shares outstanding.

The old passenger station at the foot of Third Street, Detroit, which was partially destroyed by fires in December, 1913, and February, 1914, was repaired and has furnished needed additional facilities for the transaction and handling of this company's freight business.

SUMMARY OF FINANCIAL OPERATIONS AFFECTING INCOME.

	1914 *1,800.04 miles operated*	1913 *1,799.74 miles operated*	Increase or Decrease *.30 miles*
OPERATING INCOME			
RAILWAY OPERATIONS			
Revenues	$33,464,968.45	$36,676,970.58*	—$3,212,002.13
Expenses	25,181,483.72	28,003,098.71*	—2,821,614.99

Pullman Company adjustment account	50,000.00	879,449.68
BALANCE TO CREDIT OF PROFIT AND LOSS (FREE SURPLUS) DECEMBER 31, 1914		$12,361,195.21

The statements herein are prepared in accordance with the classifications issued by the Interstate Commerce Commission, effective July 1, 1914, and the results of the previous year have been revised for comparative purposes.

For the year covered by this report the revenue from transportation was $32,442,460.81, a decrease of $3,195,934.01 as compared with the previous year; revenue from incidentals and joint facilities was $1,022,507.64, a decrease of $16,068.12. The total gross revenue from railway operations was $33,464,968.45, a decrease of $3,212,002.13, due to the general business depression throughout the year, and which was aggravated by the European war, and to other causes mentioned in connection with separate classes of revenue.

The freight revenue was $20,717,272.24, a decrease of $2,452,245.58, resulting from a decreased movement of nearly all commodities. This is particularly noticeable in the tonnage of lumber, iron, steel and manufactured products, in which there is a decrease of about 25.4%. The decrease in anthracite coal tonnage is due to the increased movement by water routes, and the decrease in the bituminous tonnage to the labor troubles in the Ohio coal districts.

The prevalence of the hoof and mouth diseases in districts tributary to this company's lines, with the consequent embargoes imposed, caused a decrease in the movement of live stock, packing house products, hay and other commodities. The restrictions imposed affected especially traffic of this nature entering in or passing through the Dominion of Canada. The loss in revenue from this cause was, approximately, $103,000.00.

The principal items showing an increased movement are fruit and vegetables, due to large citrous fruit shipments from the Pacific coast and to the abundant Michigan crop.

In May, 1913, this company joined with other carriers in an application to the Interstate Commerce Commission for an increase of approximately five per cent in freight rates. After devoting considerable time to hearings, and requiring the carriers to submit a voluminous amount of data compiled at a large expense to the carriers, the Commission granted to roads in Central Freight Association territory an increase of five per cent to apply on class rates and certain commodities, but not including coal, ore and several other commodities which comprise a large proportion of the tonnage handled by the company. The increased rates became effective October 26, 1914, and have not therefore, materially affected the freight revenue of the company for the year. The Commission, in rendering their decision on the application for increased freight rates, recommended an increase where permissible, in passenger rates, and the abolition of various kinds of free service heretofore performed by the railroads. A further opinion submitted by the Commission on December 16, 1914, granted increases on certain commodities, and in certain territory excepted in its previous decision, but these increases do not become effective until January 15, 1915.

The passenger revenue was $8,880,613.03, a decrease of $488,442.36. The European war directly caused a decrease of approximately $170,000.00 in immigrant business, also a loss of passenger traffic via Montreal, for which new through train service had been established. Compared with 1912 there is an increase of approximately $63,000.00.

Revenue from the transportation of mail was $469,259.59, an increase of $24,532.64, due to increased compensation allowed from July 1, 1913, account parcel post.

Express revenue was $1,443,143.62, a decrease of $273,160.26 as compared with the previous year, attributable to smaller volume of business handled, caused by the business depression and increasing use made of the parcel post facilities; also to reduction in express rates ordered by the Interstate Commerce Commission, which became effective February 1, 1914.

Revenues from all other sources, including incidental and joint facility operating revenues, were $1,954,679.97, a decrease of $22,686.57; the principal increases being $8,162.37 in station and train privileges, and $20,882.91 in grain elevators; the decreases being $19,860.78 in switching, $45,964.69 from hotels and restaurants and $10,617.84 in demurrage.

The total railway operating expenses were $25,181,483.72, a decrease of $2,821,614.99, as per detail on following pages. By groups the decreases were as follows:

Maintenance of way and structures	$1,248,157.52
Maintenance of equipment	739,676.67
Traffic expenses	38,002.56
Transportation expenses	843,402.84
Miscellaneous operations	16,773.64
	$2,886,013.23
Increase—General expenses	64,398.24
Total	$2,821,614.99

The decrease in maintenance of way and structures is accounted for by a general retrenchment affecting nearly all of the items in this group.

The decrease in maintenance of equipment is almost entirely accounted for by the general reduction in repairs to all classes of rolling stock on account of the falling off in traffic handled.

The noticeable decreases in traffic expenses are in advertising and fast freight lines. The decrease in the latter expense is partially offset by an increase in outside agencies, due to the withdrawal from participation in certain fast freight line expenses and the establishment of independent soliciting agencies.

The decrease in transportation expenses is principally due to the falling off in freight and passenger traffic, with a resulting reduction in freight and passenger train mileage as compared with the previous year. The purchase in the latter part of 1913, of more powerful locomotives made possible an increase over that year in the average freight train load. There was an expense of approximately $25,000.00 incurred in connection with cleaning, disinfecting, repaving, etc., at stock yards on account of the prevalence of the hoof and mouth disease. The large increase incidental to higher rates of wages paid various classes of labor, as well as other causes not prevailing a year ago, have been overcome by extraordinary economies in operation.

The larger portion of the increase in general expenses is due to the employment from the middle of 1913 of additional clerks for a more thorough revision of wayhills, and for paying employees twice a month, the expenditure for the full year being thus compared with that for six months of the previous year, the remainder of the increase is due to unusual requirements for supplies and furniture, coincident with the occupancy of offices in the new terminal station, and to preliminary work in connection with the valuation of the company's property by the federal government.

The railway tax accruals for the year were $1,598,350.12, an increase of $205,536.61 as compared with the previous year, of which $124,563.80 is in connection with the property of the Detroit River Tunnel Company, and due principally to an increased valuation of that property by the State of Michigan and Dominion of Canada. The balance is largely due to increased rates on all property in the various states and Dominon of Canada.

The non-operating income was $926,362.67, a decrease of $319,694.17, as compared with the previous year, due principally to decrease of $258,782.00 in dividend income, also decrease in joint facility rent, and in income from unfunded securities and accounts.

The deductions from gross income amounted to $7,193,738.80, a decrease of $50,215.90; the principal fluctuations being decrease of $261,358.00 in rental of the Detroit River tunnel and terminal as compared with the previous year which included allowance for operation and maintenance charges, and taxes; increase of $27,701.54 in interest on funded debt, due to equipment trust certificates and increase of $248,828.65 in interest on unfunded debt, partially offset by decrease of $42,927.93 in separately operated properties—loss.

The final result for the year, after the declaration of a dividend of 4% upon the capital stock, was a deficit of $335,100.56.

The changes in equipment replacement account during the year were as follows:

Credit balance equipment replacement account December 31, 1913		$671,478.11
There was added during the year:		
Value of equipment retired from service	$768,887.25	
Allowance by C I & S R R Co account shortage in equipment covered by lease of the St J S B & S R R	23,072.07	791,959.32
		$1,463,437.43
Less cost of 144 box cars and 1 official car acquired during the year, and cost of application of superheaters to locomotives and other additions and betterments to equipment		311,670.15
Credit balance, December 31, 1914		$1,151,767.28

In the operation of the pension department, forty-nine employees were retired and placed upon the pension rolls. Of these retirements, twenty-eight were authorized because of the attainment of seventy years of age, and twenty-one because of total and permanent physical disability. Twenty-three pensioners died during 1914, and at the close of the year two hundred thirty retired employees were carried upon the pension rolls. The average monthly pension allowance to these employees was $27.70, and the total amount paid in pension allowances during the year was $58,615.60.

The principal expenditures for improvements during the year, as shown in detail on another page, were as follows:

Additional expenditure at Junction Yards, West Detroit	$184,219.33
Completion of ice house, West Detroit	19,755.49
Completion of elevator, Kensington	138,917.53
Completion of bridge over L S & M S Ry at Air Line Junction	34,212.15
Additional expenditures on Saginaw River draw bridge at Saginaw, in excess of replacement charges	16,249.16
Logging branches on Mackinaw Division	14,665.35
Total	$408,019.01

The death during the year of three venerable officers of the company is recorded.

Major George C. Hopper, retired Paymaster, died in Detroit, June 22, 1914, at the age of eighty-three. Major Hopper worked for this company sixty-eight years. He entered its employment when it was organized in 1846, and his long period of service was unbroken, except during a leave of absence from 1861 to 1864, when he was in the Union Army. He retired from the army with the rank of Major, and credited with distinguished services. He was an able, all-around man, and on account of his usefulness was appointed to many different positions in the service, and always did his work well.

Edwin C. Brown, retired January, 1910, after thirty-nine years' service in the positions of Division Superintendent, Assistant General Superintendent and General Superintendent, died in Detroit, December 4, 1914, at the age of eighty-three. Mr. Brown was a master in his time in the conduct of transportation, and he had practical, personal charge of train operation until his retirement. He rendered efficient service and won the respect and good will of all with whom he came in contact.

Thomas Eedson, retired Auditor of Freight Accounts and Freight Claim Agent, died in Detroit, November 1, 1914, at the age of seventy-three. Mr. Eedson came into the service of this company in 1883 from a position with the Canada Southern Railway Company, and remained in the accounting department until his retirement in 1912. He also held a similar position with the Toronto, Hamilton & Buffalo Company from the date of its organization to the date of his death. He was an industrious man, of studious and inquiring mind, and rendered good service in his own department as well as in the organization and conduct of the Freight Claim Association and the Association of Railway Accounting Officers.

Acknowledgment is hereby rendered to officers and employees for faithful and efficient service.

ALFRED H. SMITH,
President.

Damage to freight is not only a dead loss to the railroad, but the annoyance to the patrons, even if full reparation is made for the actual damage, causes a tension in the friendly interest which is so essential if the best results are to be secured. Although practically all of the roads are giving attention to the problem of reducing loss and damage to freight, only a few have succeeded in making any very great reduction in this item. One of the most far reaching and effective efforts which have come to our attention is the campaign on the St. Louis & San Francisco which aims to educate every employee who has anything to do with the handling and transporting of freight to a better understanding of the proper way in which to perform his work and as to his responsibilities. The development of this educational campaign and the most successful methods which have been used in connection with it will be described in a series of three articles, the first one of which appears in this issue.

Reducing Loss and Damage to Freight

The appointment of a politician as chairman of the Illinois Public Utilities Commission was noticed in these columns last week. Governor Whitman (Republican) of New York, has appointed as a public service commissioner in the New York First district a New York city lawyer who aided him in exposing the weaknesses of the present commissioners (Democrats) but who otherwise has no special qualifications; and he has the special disqualification that up to 1912 he lived a thousand miles away—in Nebraska. He has been prominent also in national politics. He is appointed, not in place of one of the unsatisfactory commissioners whom he investigated—they are still in office—but in place of M. R. Maltbie, who although somewhat radical in his views, was the one member of the board who possessed both honesty and conspicuous ability. His term has expired. Mr. Maltbie, with Mr. Decker in the other district, were the last two of the original ten commissioners appointed by Governor Hughes in 1907. Hughes did his best to secure competent commissioners; his successors have done their best to use the offices as political plums. The high salaries—fixed at $15,000, with a view to getting strong men—have not proved as advantageous as they were expected to. They constantly whet the spoilsmen's appetites.

Politicians as Railroad Commissioners

The successes of General von Hindenburg have been attributed largely to his skill in swiftly moving large bodies of troops by railway to the places where from time to time they have been most needed. This has been cited by advocates of government ownership of railways as an example of the great things which can be done under this system. It is therefore somewhat amusing to read an interview with the general himself in the New York Times of March 7, in which he said that while "America might possibly be materially assisting Germany's enemies with arms, ammunition and other war material, certain it is that America, in the last analysis, has helped Germany far more. But for America, my armies would possibly not be standing in Russia today—without the American railroading genius that developed and made possible for me this wonderful weapon, thanks largely to which we have been able with comparatively small numbers to stop and beat back the Russian millions again and again—steam engine versus steam roller." In other words, while the advocates of government ownership say von Hindenburg's achievements have been largely due to government ownership of railways, the general himself says that they have been largely due to his use of methods developed by the privately owned and operated railroads of America. In view of the fact that the Kaiser had to go to the Hamburg-American Steamship Company, a private concern, for a man to manage his

American Railroad Methods and the War

railways during the war and that General von Hindenburg has paid this tribute to American railway methods, the comfort derived by the advocates of government ownership from the progress of the war appears a little ludicrous.

THE CHICAGO, ROCK ISLAND & PACIFIC—1902 TO 1915

A STOCK certificate of a railroad company generally measures about 9 in. by 12 in. If a railroad company were to decide to double the size of its stock certificates it would not lay itself open to the charge of burdening the earning power of the railroad with worthless securities.

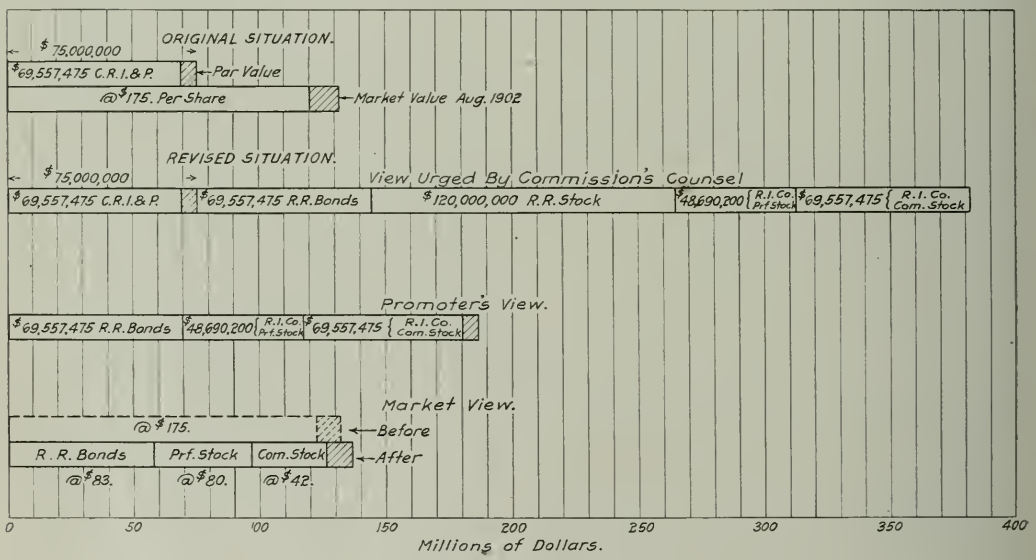
In the investigation which the Interstate Commerce Commission is now making of the Chicago, Rock Island & Pacific Railway Company's affairs, the charge has been made and repeated over and over again that in some way not defined the issue of stock certificates by the two holding companies in exchange for stock certificates of the Illinois corporation the Chicago, Rock Island & Pacific Railway Company—has placed a burden on the railroad which it would not have had to carry if this exchange of certificates had not taken place. The charge is made that because of the multiplication of the securities outstanding against the property, a compelling incentive to earn a larger profit was created which has resulted, on the one hand, in the neglect of proper upkeep and, on the other hand, in excessive rates.

A study of the history of the Chicago, Rock Island & Pacific's earnings, expenses, interest payments and distribution of profits to the owners will show that these two charges are indisputably false.

The total earnings from April 1, 1902, to June 30, 1914, were $713,092,788; the total receipts from the sale of securities were $176,818,196; the total other income was $17,123,516 and total expenses were $505,970,480. The total expenditure on betterment of the property was $40,564,387; the total expenditure for new property was $120,554,575; the total payment of rentals was $16,925,594; the total interest payments were $106,103,614; and the total dividends paid were but $49,654,574. It must be borne in mind that the exchange of Railway company stock for securities of the two holding companies affected in no way whatsoever the amount of money received by the Railway company nor the amount of money disbursed. The exchange of a certificate of Railway company stock, which had written on it the figures $1,000, for a collateral trust bond, which had written on it $1,000, and two certificates of stock, one of which had written on it $1,000 and the other $700, brought not one cent into the Railway company's treasury; neither did it cost the Railway company anything. There were no bankers' commissions, no underwriting syndicate profits; it was precisely the sort of transaction that takes place when a man takes a certificate for 100 shares of stock to the transfer agent of the company and receives four certificates for 25 shares each.

A brief review of the events of the Rock Island affairs from 1900 to 1903 will make clear why this rather elaborate exchange of certificates was made. As D. G. Reid has testified before the Interstate Commerce Commission, he began to buy Chicago, Rock Island & Pacific Railway Company stock in 1900-01. He found that his friend, William B. Leeds, had also been buying the stock, and later they learned that both William H. Moore and James H. Moore had been buying that stock. Previous to this time control of the company had been exercised by an executive committee, which in 1900 consisted of R. R. Cable, Marshall Field, A. R. Flower, W. G. Purdy and H. R. Bishop. Marshall Field and R. R. Cable were the two dominating personalities in this committee. When they learned of the purchases of the stock in the open market by D. G. Reid, William B. Leeds and the two Moore brothers, they invited these men to become members of the board of directors, and by the end of March, 1902, these four men had become the dominating personalities in the company's management. Mr. Leeds was president and a member of the executive committee, and among six other members the executive committee were the two Moore brothers and Mr. Reid. Thus the new interests had a majority of the members of the executive committee.

At the time of the Moore-Reid purchases Chicago, Rock Island & Pacific Railway Company stock was selling in the neighborhood of 175. The new interests had bought in the open market only about a third of the outstanding stock. They were therefore in the position of having made a very heavy investment in a high priced stock without having gained a position in



Shaded area represents undeposited railway stock

The Rock Island Reorganization of 1902

control of the company that was impregnable to attack. A somewhat similar situation has occurred in the history of various railroad companies in the United States and has been met in various ways, one of the most common being the formation of a voting trust. The Moore-Reid control of the Chicago, Rock Island & Pacific Railway Company could not be perpetuated in that way because, although controlling the executive committee and the board of directors, the Moore-Reid group could not offer any inducement to majority stockholders to deposit their stock under a voting trust, nor could they bring pressure to bear to compel them to do so, as has often been the case where submission to these terms was made the price of furnishing new and needed capital. The Moore-Reid group, therefore, cast about for some means of accomplishing its purpose and decided on the holding company device. Its members were optimistic as to the future possibilities of the earning power of the Chicago, Rock Island & Pacific, as was also market opinion.

Two holding companies were formed—the Chicago, Rock Island & Pacific Railroad Company, an Iowa corporation, and the Rock Island Company, a New Jersey corporation. There were now three corporations—the Chicago, Rock Island & Pacific Railway Company of Illinois and the two holding companies, one an Iowa and one a New Jersey corporation. It will simplify matters to refer to these three companies hereafter as the Illinois, Iowa and New Jersey companies, respectively.

The Iowa corporation authorized $120,000,000 capital stock and $75,000,000 4 per cent bonds. The New Jersey corporation authorized $50,000,000 preferred stock and $75,000,000 common stock. All of the $120,000,000 of the Iowa corporation stock was held in the treasury of the New Jersey company. The Iowa company's bonds were to be issued only in exchange for the Illinois company's stock. Stockholders of the Illinois company were offered a $1,000 Iowa corporation 4 per cent bond, seven shares of preferred stock and 10 shares of common stock (par value $100 per share, both preferred and common) of the New Jersey company in exchange for 10 shares of their stock (the Illinois company stock).

Voting power for the majority of the board of directors rested in the preferred stock of the New Jersey company. Stockholders of all but $5,442,525 (reduced to $3,467,000 by 1914) of the old stock accepted these terms, deposited their Illinois corporation stock certificates and received in exchange the new certificates of the holding companies. The Reid-Moore interests could now, by buying a majority of the preferred stock of the New Jersey company, obtain control of an absolute majority of the board of directors of all three companies. By selling part or all of their Iowa company bonds and New Jersey company common stock they could very much reduce their investment and still retain control; but here again it is well to bear in mind that it was not to the Illinois company that the Reid-Moore interests sold their bonds, if they did sell them, but to other investors or speculators.

The accompanying diagram shows what took place upon the formation of the holding companies. In 1902 the par value of the stock outstanding was $75,000,000. The valuation which the market put on this stock was a little over $130,000,000. The promoters' view of the value of the property, subject to its debt, with its earning power, subject to its interest requirements, was $193,247,675. This is the total nominal valuation which the promoters placed upon the stock of the Illinois company. The diagram shows graphically how different this is from the view which has been expressed before the commission, in which the fact that the Illinois company's stock was deposited as collateral for the Iowa company's bonds, and the Iowa company's stock was all held in the treasury of the New Jersey company is overlooked. If the promoters' view of the case had been right, the Illinois company would have needed to earn $7,729,917 net available for dividends to have paid an average of 4 per cent on all of the outstanding securities. In other words, the average net income, making allowance for the proper margin of safety, would have had to have been about $10,000,000. As a matter of fact, the property never earned this amount net. For the 15 months ended June 30, 1903, it earned $9,195,819 net. The best year since was 1907, in which year there was $8,750,517 net earned.

The market's view of the earning power of the property, after the exchange of securities, was only very little different from the view held by the market before the holding companies were formed. The formation of the holding companies and the issuance of their securities did not, therefore, even inflate the market. The market, after the holding companies' securities had been distributed, placed the total value of the "burden" on the railroad itself at $153,750,000, or just about $5,000,000 higher than the market value of the Illinois company's stock in August, 1902 (before the formation of the holding companies). If the market's view of the situation had been correct, the Illinois company would have had to earn net $6,150,000 to pay an average of 4 per cent on the valuation placed on the holding companies' securities by the market.

The actual total amount which the Illinois corporation has paid in dividends to the holding companies, and which is the total amount which the owners of the property received as profit on their investment, is as follows:

15 months ended June 30, 1903	$5,680,540
Year ended June 30, 1904	5,985,060
Year ended June 30, 1905	4,676,622
Year ended June 30, 1906	4,677,553
Year ended June 30, 1907	4,116,728
Year ended June 30, 1908	3,929,785
Year ended June 30, 1909	3,930,019
Year ended June 30, 1910	3,743,272
Year ended June 30, 1911	3,930,948
Year ended June 30, 1912	3,743,760
Year ended June 30, 1913	3,743,525
Year ended June 30, 1914	1,871,763
Total	$50,029,575

This is a total of $50,029,575 in the 12 years and three months, or an average per year of $4,034,026. This amounts to an annual dividend on the *par* value of the $75,000,000 Illinois company stock of 5.45 per cent. It is an average of 2.11 per cent on the promoters' capitalization, and an average of 3.14 per cent on the market valuation of August, 1902.

Instead of being a glaring example of the evils of overcapitalization, the Rock Island's history since 1902 is a striking illustration of the fact that no amount of promoters' hopes can make a railroad property earn more than it can earn, and that no amount of stock certificates affects the total profits available for distribution on these certificates. Time has proved that the market's view of the value of the owner's equity in the Chicago, Rock Island & Pacific Railroad property was wrong and that the promoters' views of its value were wrong, but only to a somewhat greater extent.

The reasons why the hopes of 1912 have not been justified by later events are, of course, a matter of opinion. The property which Mr. Reid and his associates bought in 1902 was not as good a physical property as they thought and as most eastern people at that time thought it was. It is very hard to convince any one who was more or less familiar with Rock Island affairs in 1900-02 of this fact, but fact it has proved to be.

The railroad has suffered not from too great a security issue having been placed on it, but from not having sufficient new capital raised and spent on it. Lack of strong banking connections has been a serious factor in the failure of the management to provide sufficient new capital to meet the progress of the science of railroading.

The movement of traffic as it affects the lines to the southwest has been different from what in 1902 was the general expectation. The grain movement east and the commodity movement west had been sufficient to make the Chicago & North Western, the Burlington and the Chicago, Milwaukee & St. Paul very profitable. It was thought that this grain traffic would move as easily south from Chicago to gulf ports as it had moved from the west to Chicago. If this expectation had been justified, a large volume of business would have been provided

for the Rock Island, the St. Louis & San Francisco and the Missouri, Kansas & Texas which, as a matter of fact, these lines have never received.

The new owners of the Rock Island recognized certain serious difficulties in the way of development of their property as soon as they had bought it. Railroad building was going on at a rather furious pace in the southwest and it was thought necessary to do something to put a stop to this waste. The control of the St. Louis & San Francisco, therefore, was bought, probably in an effort to avoid duplication of new railroad building.

The Rock Island had a very bad line east out of Kansas City. It was so bad in fact that the report of the expert for the bondholders' committee made recently recommended that an entirely new line be built. There are too many lines now between Kansas City and Chicago. The Rock Island owners thought that they saw an opportunity to buy instead of build a line, and therefore bought into Chicago & Alton. Both of these attempts to solve serious problems, one of which has not been solved yet, were failures. The Rock Island had to bear the expense of these mistakes of judgment.

In 1902 the new owners of the Rock Island could not have foreseen the flood of hostile legislation against railroads in the Southwest, which has been so great a factor in the failure of the Rock Island to justify the hopes of its purchasers. This is probably the most important single factor in the situation, but the other factors named have each had an important influence.

THE PRESS AND THE RATE ADVANCE CASE

NEWSPAPER reports of the western rate advance case have been the subject of several controversies during the hearings. Although Commissioner Daniels has properly shut off discussions of this kind, the impression the public gets of such matters is of considerable importance. Each side has intimated that the other has been too generous in giving matter to the press, but only the representatives of the shippers have tried to impute a sinister influence to ordinary publicity methods, such as they themselves have been practicing for years. Mr. Thorne and one of the packers' lawyers have referred to the railroad publicity as "organized propaganda." The Sioux City (Ia.) Tribune in "A Tip to Chicago Newspapers," published on March 19, expresses deep concern because it thinks the Chicago papers are "partial to the railroads." It says:

> The amount involved in this conference is greater than the sum of money involved in any peaceful conference ever held in the United States. Yet to read the Chicago papers one would scarcely know such a conference was actually in session in that city, and certainly no one would ever guess that anyone was present except railroad officials. The opening statement made by the representatives of the western people was never even epitomized. None of the cross-examinations of the railroad officials is even mentioned. Even if the Chicago newspapers are partial to the railroads, they should give the news.

Possibly the Sioux City paper did not know that the first month of the hearing was devoted to the railroad side of the case, just as most of this month has been allotted to the other side, and that at the time its editorial was published the railroads were still at bat.

There has been a change in the character of the newspaper reports of this case, as compared with those made of the 1910 western rate advance case, for example, but there are reasons for the change which our Sioux City contemporary may have failed to note. In the first place, evidence that there is such a large amount of money involved as our contemporary thinks can be found only in the opening statement of Commissioner Thorne. In the second place, whereas, in the 1910 case the shippers were almost unanimously opposed to the advances, in this case comparatively few are taking any part in the proceedings, leaving the opposition almost entirely to Mr. Thorne and the representatives of the big packers.

But perhaps one of the most important reasons why the newspapers are printing the railroad testimony is that the railroads have taken some pains to present it to them by securing the services of an experienced newspaper man who prepares in advance summaries of the testimony and exhibits presented by the railroad witnesses and furnishes them to the newspapers. Without such an arrangement it would be impossible for any newspaper man without hours of study to get an adequate or intelligible report of the evidence. Many newspapers have expressed appreciation of the assistance thus rendered, and the summaries have been used to a considerable extent. There has been no secrecy about it, they have been distributed under the eyes of the commissioner in charge of the hearings and in plain sight of all present. Printed copies have been mailed to out-of-town papers, plainly indicating that they are furnished by the railroads. While naturally they represent but one side, all who receive them know just where they come from and are free to use them, or to throw them on the floor. Moreover, the Associated Press has an experienced man in constant attendance and representatives of individual papers drop in daily. They have used the statements because they are a big help to them and because they can see that they are accurate. If the newspapers are furnished with a concise summary of the direct evidence there is less temptation to make a story out of the fact that some lawyer on cross-examination "charged" something.

In the reports of the 1910 case many of the papers did just what the Sioux City Tribune apparently thinks they ought to do now. They crowded out the direct testimony of the railroads and devoted their space largely to the cross-examination. When there was no cross-examination or when it was not sufficiently sensational "statements" by Thorne or others were usually forthcoming. Mr. Thorne has been playing the publicity game for years, and although he has usually been his own best press agent, when his side had its innings at the hearing last week summaries of his statements and of the testimony of each witness were also given to the press, by a man employed by his side for that purpose. If the newspapers failed to give Mr. Thorne's utterances first page position, possibly the fact that he is using "old stuff" may have had something to do with it. Several times when he first charged the railroads with padding their maintenance accounts and showed they were grossly overcapitalized in comparison with the lowest state valuations he could find, his views made newspaper stories. Their repetition excites less attention, naturally. His exhibit on a reasonable rate of return in the eastern rate case had also lost some of its news value when reintroduced as J. Pease Norton's exhibit in the western case. One of Mr. Thorne's statements during the 1910 hearing that the advance asked by the roads would amount to $500,000,000 a year made a headline at the time, but after the evidence failed to corroborate him his exaggeration of the scope of the present case was less impressive. In his combined capacity of amicus curiae, representative of the public and attorney for shippers, Mr. Thorne has "conservatively estimated the advance which the railroads are trying to put through" at 10 per cent of $700,000,000 freight revenue and 20 per cent of $195,000,000 passenger revenue, or a total of $109,000,000, but because the papers also printed the statement of the railroad men, who are presumably at least as honest as Mr. Thorne and undoubtedly know just as much about it, that the proposed advances in this case only amount to about $10,000,000 a year, the Sioux City paper apparently despairs of the freedom of the press.

If the newspapers generally continued to swallow Mr. Thorne's figures they would undoubtedly publish more than they have on both sides of the case, but they have gradually learned in recent years to accept his calculations with a degree of reserve. At any rate, it will require a great deal of activity on the part of railway men and railway publicity agents to make up for the reams of copy that Mr. Thorne has been putting over for the past five years.

DELAWARE, LACKAWANNA & WESTERN

THE business of the anthracite roads is more likely to be adversely affected by mild weather conditions than by bad business conditions, although, of course, the anthracite roads, in company with the other roads, felt the effects of the business depression in the calendar year ended December 31, 1914. The Delaware, Lackawanna & Western's anthracite coal business was considerably reduced by the mild weather in the first three months of 1914, and the total loss in earnings from the transportation of coal in 1914, amounting to $378,000, was the result of this mild weather. During the rest of the year the coal business, despite the general business conditions, compared favorably with 1913. On the other hand, passenger business was apparently very much affected by the European war and the general inclination to avoid all expenditures not absolutely necessary.

The Delaware, Lackawanna & Western operates a total of 985 miles of road, of which 543 miles has second track and about 25 miles has four tracks. In 1914 the company earned $39,250,000, a decrease as compared with 1913 of $1,334,000, or 3.76 per cent. Earnings from the transportation of coal amounted to $14,041,000, and the decrease of $378,000 previously mentioned amounted to 2.62 per cent. Revenue from freight other than coal amounted to $14,448,000 in 1914, or $641,000 less than in 1913, a decrease of 4.25 per cent. Passenger revenue amounted to $8,158,000, $391,000 less than in 1913, a decrease of 4.57 per cent.

While the Lackawanna can afford to be, and is, one of the most liberal roads in the country in making additions and betterments to its property, it is very economically run. The ratio of expenses to total operating revenues is 64.76 per cent, and of transportation expenses to revenues about 32 per cent. In 1914 transportation expenses amounted to $12,423,000, a decrease of $111,000, or a little less than 1 per cent. This decrease of a little less than 1 per cent in transportation expenses compares with a decrease of 4.57 per cent in ton mileage of coal handled, 6.40 per cent in ton mileage of other freight, and a decrease of 2.89 per cent in passenger mileage handled.

The average trainload of all freight in 1914 was 655 tons, as against 660 tons in 1913. The average ton-mile rate on coal was 8.47 mills as against 8.30 mills the year before, and on freight other than coal, 6.65 mills in 1914 and 6.50 mills in 1913. The full-crew laws, which were in effect during the entire year 1914 in Pennsylvania and for only part of the year 1913, account in part for the comparatively higher transportation costs in 1914. Thus, while fuel for road locomotives cost $2,385,000 in 1914, a decrease of $54,000, road trainmen were paid $1,516,000 in 1914, an increase of $74,000 as compared with 1913.

In 1914 the company spent $1,299,000 for additions and betterments, exclusive of the sums which are being spent on the new Summit-Hallstead cut-off, which is being financed by a separate corporation. The Lackawanna is conspicuously liberal with its maintenance appropriations, and quite rightly so. In 1914 maintenance of equipment cost $6,319,000, an increase of $130,000, or a little over 2 per cent as compared with 1913; and maintenance of way, $5,075,000, a decrease of $75,000, or a little over 1 per cent. The average cost of repairs per locomotive was $2,465 in 1914 and $2,518 in 1913; of passenger-train cars, $528, as compared with $602, and of freight-train cars, $67, as compared with $61.

The total tonnage of all revenue freight carried by the Lackawanna amounted to 22,727,000 tons in 1914, as against 24,723,000 tons in 1913, a decrease of 1,996,000 tons. Of the total tonnage in 1914, 9,803,000 tons were furnished by anthracite coal, and in 1913, of the total for that year, 10,178,000 tons were furnished by anthracite coal. Besides anthracite coal tonnage, the most important commodities from the view point of volume of tonnage are bituminous coal, stone and sand. Bituminous coal in 1914 furnished 1,601,000 tons, a decrease as compared with 1913 of 552,000 tons. Stone and sand furnished 1,776,000 tons in 1914, a decrease of 289,000 tons. From the standpoint of revenue, grain and l. c. l. merchandise are probably the two most important classes of traffic, exclusive of anthracite coal. The total tonnage of grain carried in 1914 was 1,088,000 tons, a decrease from 1913 of only 20,000 tons, and the tonnage of merchandise amounted to 1,488,000 tons in 1914, an increase of 251,000 tons over the previous year.

At the end of 1914 the company had on hand $3,613,000 cash, with total working liabilities of but $5,890,000. The company had in its treasury $12,687,000 marketable securities. The Lackawanna is, of course, unique among important American railroad companies in having practically no funded debt, the total stock outstanding being $42,348,000, with but $320,000 mortgage bonds.

The following table shows the principal figures for operation in 1914 as compared with 1913:

	1914	1913
Average mileage operated	985	985
Revenue from anthracite coal	$14,040,574	$14,418,507
Revenue from other freight	14,448,308	15,089,057
Passenger revenue	8,158,458	8,549,346
Total operating revenue	39,249,790	40,784,148
Maint. of way and structures	5,074,501	5,148,035
Maint. of equipment	6,318,720	6,189,093
Traffic expenses	837,384	887,576
Transportation expenses	12,423,183	12,533,966
General expenses	878,346	815,173
Total operating expenses	25,417,882	25,573,842
Taxes	2,060,832	1,980,000
Operating income	12,121,918	13,742,106
Gross income	18,951,115	18,070,201
Rentals	5,874,935	5,928,930
Interest	6,344	6,486
Betterments	1,299,286	1,879,576
Discounts on bonds	.....	574,050
Dividends	8,444,080	6,028,800
Surplus	3,525,559	3,670,816

NEW BOOKS

Public Utility Economics. Published by the West Side Young Men's Christian Association, New York.

This is a series of ten lectures delivered before the Finance Forum of the West Side Y. M. C. A. of New York. The lectures were given by men prominent in the work about which they spoke and taken together form a quite comprehensive discussion of the various aspects of public utility economics. The subjects covered are the magnitude of electric light, power and transportation business; holding companies; public ownership; lighting companies; telephone companies; future of the public utility corporations; centralization of power supply; public utility securities as investments; regulation, and the legal aspects of regulation. The article on the holding companies is by Francis T. Homer and is a remarkably clear and interesting exposition of the reasons which have led to the general adoption of holding company devices for the control of public utilities and the advantages to the investor through averaging of risks and to the public served through the extension of unified operation, management by specialists and economy in purchases.

The Finance Forum of the West Side Y. M. C. A. was inaugurated in 1905. The forum invites speakers of practical experience of all shades of opinion. The audiences are earnest to an unusual degree and the work that has been done is thoroughly commendable. As a general rule the lectures are not published, but the ten lectures on public utilities form such a valuable addition to the as yet comparatively scanty literature of lighting, electric railway and other public utility companies that an exception was made to this rule. The book can be recommended to anyone interested in the economic questions which at present are of so much importance and which form the subject of a vast amount of federal and state legislation.

United States Safety Appliances. Issued by the Master Car Builders' Association, Joseph W. Taylor, secretary, Chicago. 111 pages, 3⅞ in. by 7 in. Bound in brown press-board. Price 25 cents.

This book contains the orders issued by the Interstate Commerce Commission concerning safety appliances, and includes the rules and illustrations for their application and maintenance.

Letters to the Editor

PASSENGER FARES IN EUROPE AND THE UNITED STATES

Pittsburgh, Pa.

To the Editor of the Railway Age Gazette:

Referring to Daniel Willard's most excellent paper on "The Railroads and the Public," published in the *Railway Age Gazette* of March 26, it is apparent that the author was very conservative in all his statements. For instance, when he speaks about passenger fares, he says, "I am convinced that passenger fares upon the average in the United States are no higher than they are upon the average for similar service in Europe."

This is true if we take one dollar to be equal to 4 marks or 5 francs. If we consider that the European roads pay only half the wages to their conductors, engineers and brakemen, only half the wages to the men along the line that the American roads do; if we further remember that all the shop employees, from the sweeper to the skilled mechanic, get only half the wages paid here; and that living only costs half of what it does in this country (I do not speak about hotel rates charged to tourists in the height of the season), then we must conclude that the money in Europe is actually worth twice what it is in the United States, and that the passenger rates, accommodations being equal, are nearly twice as high in Europe as they are here.

A. Stucki.

WHY USE A HIGH FACTOR OF ADHESION IN STEAM LOCOMOTIVES?

New York.

To the Editor of the Railway Age Gazette:

From the standpoint of utilizing the greatest possible proportion of the total engine and tender loaded weight in developing tractive effort, the ideal locomotive is the one in which all such weight is carried on the driving wheels. Where truck wheels must be used, the same reasoning dictates that the weight on drivers shall be as large a proportion of the locomotive weight as is practicable. It is, therefore, surprising to note in how many instances designers fail to make use of even the weight actually carried on the drivers in deciding on the factor of adhesion. For example, why should it be necessary to use a factor of adhesion of from 4.5 to 5.0 or over, when it has been fully demonstrated by locomotives now in successful operation that a factor of 4.1 or 4.2 is sufficient?

While it is easy to understand that in high-speed passenger locomotives, designed for long, continuous runs, it may be impracticable to keep down the adhesive factor to such a limit, due to the requirements of sustained boiler capacity, still it is believed that in the majority of cases the higher factor is the result of a desire to obtain a relatively low pressure boiler that will maintain the maximum allowable steam pressure under all possible working conditions, as well as to give adhesion that will enable quick starting with maximum train load on bad rail without slipping.

While it is desirable to provide ample steaming capacity, there are locomotives now in service on which this idea has been carried to extremes, particularly in view of superheating and modern methods of stoking, the result being that these locomotives are hauling around a considerable amount of self-contained and non-productive dead weight which is not only useless but expensive, simply in order to meet extraordinary service conditions. In such cases the factor of adhesion runs as high as 4.75 or over, so that considerable of the weight on the drivers is never utilized as regards developing drawbar pull.

Furthermore, there are many enginemen who abuse locomotives and increase maintenance and operating costs unnecessarily, in order to make "a flying start and a slow finish," whereas the same results in schedule time between start and stop could be more economically obtained, and with a lower factor of adhesion, by making the start easier or on sanded rail and the stop quicker with less "rolling" and "drifting" and the more effective use of the train brakes.

Comparing the present day representative Pacific and Mikado type locomotives with the older Eight-wheel and Mogul designs, the added number of driving wheels per locomotive should certainly enable reducing rather than increasing the adhesive factor. The writer firmly believes that no consistent reasons can be advanced for the general use of adhesive factors above 4.1 or 4.2. This practice would enable the elimination of much of the non-productive weight that is now carried not only on driving, but on truck wheels, and which could be more effectively utilized in developing drawbar pull and thereby increasing the average train load performance at less transportation cost per revenue ton-mile.

It would be interesting to hear from the readers of the *Railway Age Gazette* on this subject, particularly those engaged in new locomotive designing. Mechanical Engineer.

UNCLE SAM'S HIGH FINANCE

New York.

To the Editor of the Railway Age Gazette:

As you are running a series of articles on government management in connection with the Panama Railroad, I thought the following extract from the annual report of the Pacific Mail Steamship Company for the year ended June 30, 1912, would interest you. It is printed over the signature of Judge Lovett.

"STEAMERS AND OTHER PROPERTY OWNED"

"In the early fifties the Pacific Mail Steamship Company acquired the sole ownership of the four islands in Panama Bay, i. e., Isla de Naos, Flemenco, Perico and Culebra. In the early sixties a one-half undivided interest in these islands was sold to the Panama Railroad Company

"The Pacific Mail Steamship Company erected on these islands shops, storerooms and warehouses, built stone ways, stone seawalls, and made other improvements thereon. During the time when these islands were in the domain of the United States of Colombia they were exempted from taxation, but when the government of the United States of America assumed control of the Panama canal zone, it assessed the one-half interest in these islands at $72,500 and collected taxes upon that valuation. Subsequently the United States government served notice that it would require these islands for canal purposes and condemned them under the right of eminent domain, awarding to the Pacific Mail Steamship Company but $44,000—$20,000 for the one-half undivided interest, and $24,000 for the improvements. The islands and the extensive improvements thereon were carried on the books of the Pacific Mail Steamship Company at the nominal sum of $118,150. The difference between this sum and the amount received from the United States government was written off to profit and loss."

The government is preaching frugality to the people and leads in extravagance; it is preaching honest finance and leading in high finance. F. J. Lisman.

New Trade Route from England to Russia and Roumania.—A new trade route has been arranged from the United Kingdom to Russia and Roumania without passing through Bulgaria or Turkey. The route is as follows: By rail from Salonica to Prahova via Nish, Parachin and Zaichar, a distance of about 435 miles; from Prahova goods will be carried via Shleps to Turn Severin, a Roumanian port on the Danube (a journey of from 2 to 2½ hours), and thence by rail to their various destinations. "La Société Roumaine de Transports Internationaux et de Camionnage," of Bucharest, has opened a branch at Salonica for the purpose of facilitating traffic by this route.

An Effective Freight Claim Preventive Crusade

Part 1.—The St. Louis and San Francisco Slogan is "$200,000 Reduction in Claim Payments for Fiscal Year"

A most effective and aggressive educational campaign for the prevention of loss and damage to freight, carried on along the lines of a safety first campaign and in some respects similar to the campaign for increasing the train tonnage and car loading on the St. Louis & San Francisco, described in the *Railway Age Gazette* of March 13, 1914, page 501, was inaugurated several months ago on the Frisco. The results have been surprising—in fact, almost unbelievable.

The Frisco officers had been scheming and working for years to reduce freight loss and damage claims and with very considerable success, as those who have watched the progress of these efforts as chronicled in the *Railway Age Gazette* will recognize. In spite of this, however, the freight claim payments for the fiscal year 1913-14 amounted to $16.82 for every $1,000 of gross freight revenue. Critical study seemed to indicate that under favorable conditions this figure might eventually be reduced to less than $10 per $1,000. But how? It seemed as if ingenuity had almost been exhausted in the previous efforts.

It was finally decided to inaugurate an educational campaign and to adopt the slogan "A $100,000 reduction in freight claim payments for the fiscal year." The intensity of the campaign and the good generalship is apparent from the fact that the $100,000 was saved in the first six months and the slogan has been changed to read "A $200,000 reduction in freight claims for the fiscal year." For the first six months of the fiscal year the loss and damage claims were reduced to $9.28 per $1.000 of gross freight revenue. This saving was not made because conditions on the Frisco were particularly bad in this respect. As has been said, an aggressive campaign had been waged for years to reduce the loss and damage to freight and the Frisco was in the first ranks as compared with the other roads, similarly situated, when the educational campaign was started. That the relative importance of the improvement may be properly appreciated, the progress of this work during the previous seven years will be briefly reviewed.

BRIEF REVIEW OF PREVIOUS EFFORTS

The record for the past seven fiscal years is shown in the following table:

Fiscal year	Freight claim payments	Gross freight revenue	Per cent ratio	Number L. & D. claims filed	Claim payments per $1,000 revenue
1907-08.....	$644,354.00	$22,605,000.00	2.85%	80,285	$28.50
1908-09.....	560,759.00	23,759,000.00	2.36%	61,770	23.60
1909-10.....	505,503.00	26,233,000.00	1.88%	58,527	18.80
1910-11.....	511,812.00	26,381,000.00	1.93%	54,962	19.30
1911-12.....	451,632.00	25,744,141.00	1.77%	53,638	17.70
1912-13.....	489,656.00	29,489,000.00	1.66%	58,538	16.60
1913-14.....	482,039.29	28,654,454.10	1.67%	64,572	16.82
1914-15 (8 mos)..	181.055.17	18,788,766.30	0.97%	35,842	9.68

On January 1, 1909, a loss and damage freight bureau* was installed in the office of the superintendent of transportation. This bureau had two functions: To investigate loss, delay and damage to freight with such despatch that all the facts would be available before the claims were presented; and to locate and remove the causes of the failure and prevent a reoccurrence. The claims were, however, paid by the freight claim department as formerly.

On September 15, 1911, the entire handling of claims was transferred to the operating department. The prime objects of this new arrangement were stated in the *Railway Age Gazette* of July 26, 1912, page 163, as follows: "(1) To investigate promptly and thoroughly over, short and damage reports with the object of having investigation completed before claims are filed; (2) to investigate thoroughly each claim filed, so as to locate the cause, properly fix responsibility and apply discipline; (3) by the thorough investigation of claims and OS&Ds from a transportation standpoint, to bring about a reduction in the number of claims filed by correcting bad transportation; (4) to make friends for the Frisco by giving first class service in handling refused and unclaimed freight and l. c. l. tracers; (5) by disposing of claims promptly and equitably, to satisfy patrons and attract business to the road and reduce unfriendly public sentiment, which has been partly caused by past methods of handling claims." The organization for accomplishing these purposes was fully outlined and its methods of operation described in the above mentioned article.

A considerable number of improvements have been made in the handling of claims as the work has developed, resulting not only in a decrease in the number of claims, but in a more prompt method of handling, approximately 68 per cent being adjusted within a period of 30 days from their receipt. Moreover, beginning May 1, 1914, each station agent was furnished with a book of drafts limited to amounts from $10 to $50 and authorized to make immediate payment for physical damage, shortages and concealed losses and damages to freight not exceeding the draft limit.

EDUCATIONAL WORK

The study of the latest development, the educational campaign above referred to, is most interesting and instructive. Beginning in a simple and, to a certain extent, a somewhat cumbersome way as compared with later developments, the movement grew rapidly and soon developed into a whirlwind campaign with possibly less of organization and red tape, but more of enthusiasm and immediate returns.

Remember that for years the safety first movement had been developing into a well organized and most fruitful effort, largely of an educational nature. The receivers of the Frisco, when they took charge of the property, realized full well that little money would be available for additions to equipment or extensions and enlargements of the plant and facilities. At the same time it was also fully recognized that much was needed in the way of improvement to increase the safety and efficiency of operation. One principal direction was open in which to turn and this was quickly taken advantage of. Some scheme must be adopted for enthusing each man in the organization, and at the same time educating him to a higher degree in order that his efficiency might be brought to a maximum. We have already shown how this was accomplished in certain branches of the work. The better carloading and increased trainloading, which was brought about largely by an educational campaign, was described in the *Railway Age Gazette* of March 13, 1914, page 501. In the past three years a million dollars has been saved in the fuel bill, largely by following up individual performances and giving special attention to the training of individuals who were not up to standard. This work was described in the *Railway Age Gazette* of May 8, 1914, page 1018.

EFFICIENCY ASSOCIATIONS

About a year ago G. E. Whitelam, superintendent of freight loss and damage claims, came to the conclusion that about as much as possible had been done in refining the machinery for handling claims—that is, so far as the organization of the freight loss and damage claim department and the detail methods of handling the work were concerned. The causes responsible for the loss and damage to freight were so numerous and so widely distributed that in order effectively to locate and remove them, it would be necessary to have every man in the organization on the lookout and giving his best efforts further to decrease loss and damage to freight. One way in which this

*See article on "Freight Claim Delays Reduced," *Railway Age Gazette*, February 19, 1909, page 353; also an extensive article on "New Methods of Handling Freight Claims on the St. Louis & San Francisco," November 12, 1909, page 925.

might be accomplished seemed to be to form local efficiency associations, for the purpose of having the employees gather together and discuss the different problems or troublesome questions which might come up in connection with their work.

As a starter, the force in the freight loss and damage claim department at the general offices, Springfield, Mo., organized the Freight Claim Department Efficiency Association on March 10, 1914, with the slogan, "Improvement of the Service Our Watchword." In addition to its officers it had several standing committees, including the executive, reports and forms, transportation, office organization and efficiency, and correspondence and files committees. The results soon proved to be such that it was decided to form similar associations at the larger stations.

A round-up was first made to find out whether organizations of this or a similar sort had been formed at any point and to ascertain definitely what had been accomplished. It was found that the agents in a few places occasionally called their men together, but the practice was very limited. These staff meetings had been encouraged by the assistant division superintendents in charge of station work,* and indeed were often called by and presided over by them in their trips over the division.

Here are some of the subjects which were considered in a typical meeting of this sort at Ft. Smith, Ark.:

Weighing of household goods and all l. c. l. freight.
Importance of proper marking of l. c. l.
Importance of nailing up, or repairing slight damages to boxes, etc., to prevent loss by pilfering, or otherwise.
Maintaining clear seal records in and out.
Keeping station bulletin board properly marked up.
Keeping water in waiting rooms.
Importance of courtesy to the public at all times, and especially when talking to patrons over the 'phone.

On April 26, 1914, the Ft. Smith Station Efficiency Association was organized at Ft. Smith, Ark. A constitution was adopted, officers were elected, and a number of standing committees were appointed. The association was scheduled to meet every 60 days, and its object was to secure greater efficiency in station handling, betterment of the service generally by a full discussion of irregularities, and the improvement of the members by intelligent study of the rules and general instructions. The membership included all employees connected with the station proper, the yard and the car department.

Briefly, the duties of the standing committees, as specified in the constitution, are as follows: The executive committee arranges for meetings, acts as an advisory board and passes on all matters. The safety committee reports to the president all irregular practices or conditions which may have a tendency to produce personal injury, and the president in turn forwards these to the division superintendent. The tools and supplies committee was authorized to look after, devise means for preserving and prevent unnecessary waste and destruction of tools and supplies. The loss and damage committee was instructed to make recommendations as to ways and means to reduce loss and damage, due to rough handling or otherwise. The weighing and inspection committee was authorized to suggest the best plan and means for quick inspection and weighing, with a view of getting correct weights and classification on all shipments with minimum cost. The station efficiency committee was instructed to look into and devise plans for greater efficiency of station operation and administration.

It will be recognized that the prevention of loss and damage to freight was only a small part of the work of this association. It was soon found advisable to hold meetings at more frequent intervals than 60 days, as called for by the constitution, for the entire force, including switchmen, car inspectors and platform men seemed to derive great benefit from the meetings.

A number of similar associations were organized during May. One at Sapulpa, Okla., including the platform and warehouse forces, decided to hold its meetings twice a month, and because of conditions a very different set of standing committees than those at Ft. Smith was appointed. For instance, there was an accounting committee and committees to look after miscellaneous affairs, dock transfer, warehouse problems and the stowing of merchandise. We find this association giving much attention to the discussion of bulletins and statistics concerning the loss and damage to freight. The comparative statement of errors for each station was discussed, with the idea of making such improvements at Sapulpa that it might head the list. Specific cases of bad handling resulting in claims were also discussed, with a view of adopting measures to overcome similar errors in the future. As a result, it is reported that errors of this kind have almost been done away with and that there is a much better understanding all around as to the most efficient way of handling the work.

The Birmingham (Ala.) Association, organized on May 3, had as its object the proper solution of problems pertaining to the operation of stations by free interchange of ideas and opinions; the betterment of the service by analyzing irregularities, and the improvement of the members by intelligent study and discussion of rules and special instructions. This association included all employees working on a monthly basis, held monthly meetings and had as its slogan, "Do It Right."

Here again conditions seemed to demand a different set of standing committees. Birmingham has a safety committee; fire prevention committee; building, tools and supplies committee; loss and damage committee; a correct practice committee to reduce misloading of packages and improve the manner of stowing, and a committee on sanitation and working conditions. This association had only been organized a short time when Birmingham was able to show fewer bad orders than usual, and an almost complete elimination of overs and shorts. It was found, however, that errors in billing and handling of waybills were keeping the records down and special measures were at once taken to overcome this deficiency.

The Oklahoma City Efficiency Association, organized on May 8, found it necessary, because of conditions at that point, to have two auxiliary associations, one under the direction of the first vice-president composed of the freight handling force, and the other under the direction of the second vice-president made up of the clerical and office forces. A few months after its organization it reported the following results: "Education of employees, as every man, including the freight truckers, is kept posted as to what is being done in the way of claims, what the losses are, and receives benefits from the suggestions which are made for further improvement. The employees are encouraged and are made to feel that they are of some importance in the organization."

A Frisco Employees' Co-operative Association was organized at Muskogee, Okla., on May 10, with provision for bi-monthly meetings. Two months after the Okmulgee (Okla.) Association was formed on May 17, it was reported that not one error in loading or in handling freight had occurred since its second meeting and that every O. S. and D. handled had been thoroughly investigated for educational purposes. The improvement in individual performance was said to be readily noticeable.

The movement spread rapidly and similar associations were formed at many points. The agent at Hugo reported that the holding of monthly meetings of this sort brought about a decrease in claims, resulted in less errors being made, reduced correspondence and improved the handling of merchandise on the platforms; also, that this improvement was so noticeable that it attracted the attention of the patrons and pleased them. At some points question boxes were maintained to good advantage in connection with the efficiency association meetings.

The agent at Tulsa, Okla., reported these meetings as one of the best schemes he had ever seen, and that not the least important advantage was the fact that instructions could be placed

*This additional supervision was provided December, 1913. See article on "The Agency Plan on the St. Louis & San Francisco," March 20, 1914, page 671.

before the men at such meetings in a far better way than either by letter or a personal talk with each man. This latter is a point well worth considering. Too little attention is often given to the education and training of station employees. It is remarkable how much can be done in an open discussion at a general meeting to educate these men and inspire them to greater and better efforts.

As may be imagined, the superintendent of freight loss and damage claims was not slow in taking advantage of the opportunities afforded by the efficiency associations for getting the loss and damage problem placed squarely before the members. A regular stream of reminders, circulars, bulletins and statistical data started to flow from his office to the officers and committee chairmen. These increased in number and effectiveness as the campaign developed, and will be considered in more or less detail in the second and third articles in this series.

So much for the efficiency associations. They are doing splendid work, the value of which cannot be discounted. On the other hand, there are many places where because of local conditions it has been impossible to organize and develop them. Moreover, good as the work was which was being accomplished in reducing loss and damage to freight, it was felt that even more aggressive and widespread efforts should be adopted. The next step in the campaign will be considered in the second article of this series, which will appear in next week's issue.

PACIFIC TYPE LOCOMOTIVES FOR THE UNION PACIFIC

A few years ago a number of standard locomotives were designed for service on the Union Pacific.* Since that time this road has developed and standardized a heavier Pacific type locomotive to handle the increased weights of passenger trains and the increased volume of mail; 25 of these locomotives have been built by the Lima Locomotive Corporation.

The engines were intended to provide greater sustained power at high speed, and are a distinct advance over the Pacific type locomotives previously referred to, the tractive effort being 38,600 lb., as against 29,900 lb. for the older engines, while the diameter of the cylinders has been increased from 22 in. to 25 in. The stroke, diameter of drivers and boiler pressure was not changed. With the 29 per cent increase in tractive effort the total weight of the engine was increased from 221,100 lb. to 273,500 lb., or 23.7 per cent. The boiler was changed from the straight top to the wagon top type, the outside diameter of the first ring being increased from 70 to 74 in. The length of tubes was increased from 20 ft. to 22 ft. Superheaters were applied in both cases and maintain substantially the same ratio to the total evaporative heating surface. The larger boiler, however, provided an increase in the total evaporative heat nearly 50 per cent and an increase of 47 per c equivalent heating surface. In addition to the increa there is thus provided a substantial increase in the steam pacity in order to take care of the sustained speed requireme

These locomotives are distributed over the main line district, from Omaha, Neb., to Ogden, Utah, and on the west end of this line there are many grades averaging 0.7 per cent. The engines maintain time card speeds of 41 miles per hour with from six to eight heavy storage mail cars, and on one occasion a run was made from North Platte, Neb., to Omaha, a distance of 291 miles, in 290 minutes, including six stops.

In the detail construction of these locomotives interchangeability of parts has been very carefully considered, a large number of the parts being duplicates of those used on the road's Mikado type engines.

The engines are equipped with the brick arch Schmidt superheater and power reverse gear. The Walschaert valve gear, which is the standard of the Union Pacific, is also employed. The main valves have a travel of 6½ in., with 1¼ in. lap, ¼ in. lead and ⅛ in. exhaust clearance. With the increased length of boiler it was necessary to increase the total wheel base of the engine 2 ft. 4 in. over that of the previous Pacific type; the driving wheel base, however, was maintained at 13 ft. 4 in., the same as in the previous engines.

The following table gives the principal dimensions and ratios of the old and new Pacific type locomotives:

	Old	New
General Data		
Service	Pass.	Pass.
Fuel	Oil	Coal
Tractive effort	29,900 lb.	38,600 lb.
Weight in working order	221,100 lb.	273,500 lb.
Weight on drivers	141,500 lb.	164,100 lb.
Weight of engine and tender in working order	382,000 lb.	440,000 lb.
Wheel base, driving	13 ft. 4 in.	13 ft. 4 in.
Wheel base, total	33 ft. 4 in.	35 ft. 8 in.
Wheel base, engine and tender	68 ft. 6¼ in.	70 ft. 3¼ in.
Ratios		
Weight on drivers ÷ tractive effort	4.72	4.25
Total weight ÷ tractive effort	7.36	7.09
Tractive effort × diam. drivers ÷ equivalent heating surface*	652	572
Equivalent heating surface* ÷ grate area	71.3	73.8
Firebox heating surface ÷ tube heating surface, per cent	7.3	6.3
Weight on drivers ÷ equivalent heating surface*	40	31.6
Total weight ÷ equivalent heating surface*	62.6	52.7
Volume both cylinders (cu. ft.)	12.32	15.90
Equivalent heating surface* ÷ vol. cylinders	286	326
Grate area ÷ vol. cylinders	4.01	4.42
Cylinders		
Kind	Simple	Simple
Diameter and stroke	22 in. x 28 in.	25 in. x 28 in.
Wheels		
Driving, diameter over tires	77 in.	77 in.
Driving journals, main, diameter and length	10 in. x 12 in.	11 in. x 12 in.

Latest Development of the Pacific Type Locomotive on the Union Pacific

Wheels—(Continued)

Driving journals, others, diameter and length	9 in. x 12 in.	10 in. x 12 in.
Engine truck wheels, diameter	33½ in.	33 in.
Engine truck, journals	6 in. x 10 in.	6½ in. x 12 in.
Trailing truck wheels, diameter	45 in.	45 in.
Trailing truck, journals	8 in. x 14 in.	8 in. x 14 in.

Boiler

Style	Straight	Wagon top
Working pressure (lb. per sq. in.)	200	200
Outside diameter of first ring	70 in.	74 in.
Firebox, length and width	108 in. x 66 in.	120⅝ in. x 84 in.
Tubes, number and outside diameter	173—2 in.	210—2¼ in.
Flues, number and outside diameter	24—5¾ in.	32—5½ in.
Tubes and flues, length	20 ft.	22 ft.
Heating surface, tubes and flues	2,477 sq. ft.	3,731 sq. ft.
Heating surface, firebox	181 sq. ft.	235 sq. ft.
Heating surface, total	2,658 sq. ft.	3,966 sq. ft.
Superheater heating surface	380 sq. ft.	815 sq. ft.
Equivalent heating surface*	3,528 sq. ft.	5,188 sq. ft.
Grate area	49.5 sq. ft.	70.4 sq. ft.

Tender

Tank	Vanderbilt	Vanderbilt
Weight	160,900 lb.	166,300 lb.
Wheels, diameter	33 in.	33 in.
Water capacity	9,000 gal.	9,000 gal.
Coal capacity	2,940 gal.	14 tons

*Equivalent heating surface = total evaporative heating surface + 1.5 times the superheating surface.

THE PROPOSED TRANSCONTINENTAL RAILROADS OF AUSTRALIA

By W. D. Hornaday

The commonwealth of Australia has now completed about one-third of the transcontinental railway which it is building from Port Augusta in South Australia to Kalgoorlie in Western Australia. This line, when finally completed, will be 1,063 miles in length and will form a connecting link between the present railways of the state of Western Australia and those of South Australia, Victoria, New South Wales and Queensland, although the differences in gage will prevent an interchange of cars. It will thus be part of a greater transcontinental route, 2,500 miles in length, extending from Sydney on the Tasman Sea to Freemantle on the Indian Ocean, traversing the southern part of the continent from east to west and touching the cities of Melbourne, Adelaide, Perth and a number of smaller towns.

The Railways of Australia

Many difficulties have already been encountered in the construction of this great transcontinental system. The enterprise as a whole is complicated to begin with because the several divisions that comprise the completed portions of the line are now owned by the governments of the states in which they are situated while the long connecting link that remains to be constructed is a commonwealth project. The first work on the commonwealth's section was done at Port Augusta, on September 14, 1912. It was originally thought that it would take about four years to build the road, but, at the expiration of two years, only about 200 miles has been completed. The original estimate of the cost of construction was about $20,000,000, but it is now known that that sum will be exceeded by several millions. Politics have interfered with the project ever since its conception. The work, for instance, was inaugurated under the administration of the labor government. The next government, however, rescinded several of the contracts which had been made and thereby delayed the work considerably. The commonwealth's railway for nearly its entire length will pass through a desert region almost wholly uninhabited except for a few points where oases have been created by the development of a water supply. The government in consequence has experienced no little difficulty in arranging for the supply of water and food, medical attention and amusements for the men working in the remote districts. The route, on the whole, offers no important engineering difficulties as the country it traverses is comparatively level.

The gage of the new railway is to be 4 ft. 8½ in. The railways of Victoria and part of those of South Australia are of 5 ft. 3 in. gage; those of Queensland, Western Australia and part of South Australia are of 3 ft. 6 in. gage and those of New South Wales are of 4 ft. 8½ in. gage. It is probable that the decision of the commonwealth to have its railways of standard gage will exert great influence in causing that gage to be made standard throughout the continent. However, the cost of conversion of the existing roads not now standard gage is estimated at about $200,000,000.

The commonwealth government also expects to construct another great trancontinental railway within the next few years from a point on the Port Augusta-Kalgoorlie line in Western Australia to connect with the proposed extension of the Northern Territory railroad, a distance of about 1,000 miles. This latter line, together with the completed link that is now owned by the government of South Australia and the line that runs from Darwin on the north coast to Katherine, will form a north and south line across the continent, about 2,000 miles in length.

The fact that Freemantle on the east and west line is the nearest Australian port to England and that it holds this same relation to the near East, including India and Egypt, makes this new line of vast importance to the whole eastern seaboard of Australia where the population and industries are now chiefly centered. It means a step in the reduction of Australia's geographical disability and, when considered in connection with the new lines of railway that are being constructed in Asia, it affords a prospective reduction of several days in the voyage between the eastern portions of Australia and Europe.

A CORRECTION

In an article entitled "Safety Cut-Out Valve," which appeared on page 708 of the March 26 issue of the *Railway Age Gazette*, the position of the valve shown in Fig. 3 is referred to as being used by the second engineman when he desires to assume control of the brakes while double-heading. The position shown in Fig. 3 is not used in double-heading, but is used in handling cars on the front end of the locomotive, after their train line has been charged by the position shown in Fig. 4. When the second engineman desires to control the train when double-heading he places the valve in the position shown in Fig. 1.

Progress on the Siamese Southern Railway.—It is reported with reference to the progress of the Siamese Southern Railway that considerable difficulty has been experienced, owing to the swampy nature of the ground, in finding a suitable crossing over the Patani (or Goloh) river in order to carry the railway southward to connect with the railway system of the Federated Malay States. After several surveys the difficulty has now been overcome, and the point of junction has been definitely fixed. The route to be followed has been laid out for a distance of about 93 miles south of Ootapao, leaving still some 44 miles, which is is hoped to get completed within a short time.

Hearing on Western Freight Rate Advances

General Evidence on Behalf of Protestants Concluded and Carriers Given Five Days to Complete Testimony

Representatives of the western state commissions and shippers who are opposing the western rate advances occupied four days of last week, from March 30 to April 2, with the introduction of their general evidence in rebuttal of that of the carriers bearing on the general financial condition of the railroads. This was followed on Saturday by uncompleted evidence by the carriers which was to continue until Thursday of this week. Commissioner Daniels announced that the request of Clifford Thorne for an adjournment for 10 days had been declined and that under the schedule for the remainder of the hearing April 9 and 10 are allotted to protestants' evidence on hay and broom corn; April 12 and 13, to cotton piece goods; April 14, 15 and 16, to coal and coke; April 17 to 21, grain and grain products; April 22 and 23, fruits and vegetables; April 24, rice and rice products; April 26 to 30, packing house products and fresh meats; May 1 to 5, livestock; May 6 to 10, uncompleted testimony of protestants. Briefs are to be filed 20 days after the close of the hearing and a date for arguments will be set in June.

Representatives of the railroads have agreed to furnish to the other side copies of minutes and correspondence of the tariff committees bearing on the proposed advances, with names of roads and of individuals concealed by the use of numbers or other devices. The railroads were willing to furnish copies of minutes of the meetings but made some objection to the introduction of the correspondence. Commissioner Daniels said he thought this correspondence ought to be furnished in so far as it threw any light on the reason for making advances on the specific commodities.

At the opening of the protestants' case the committee of state commissioners filed a new appearance showing the committee as representing also the Utah Traffic Club, the American National Livestock Association, the National Council, Farmers' Co-operative Association, National Broom Manufacturers' Association, National Hay Association, and other individual firms and companies.

TESTIMONY OF PROTESTANTS

The first witness for the protestants was Henry C. Wallace of Des Moines, Iowa, editor of a farm paper. He declared that the present attempt to advance rates in the west was largely a conflict between the railroads and the farmers, and that the great body of investments in the United States, including over $40,000,000,000 worth of farm property, only expects a return of 3 to 5 per cent, while the railroads are attempting to establish for themselves a basis that will yield from 7 to 9 per cent, the great burden of which would fall upon the farmers. The farmers of Iowa, he said, are getting a return of not more than 3 per cent on their investment after making an allowance for the farmer's own labor of only $600 a year, while billions of dollars seek investment at from 2½ to 5 per cent and the bonds of well-managed railroads have sold readily at prices which net the investor between 4 and 4½ per cent and the stocks of good roads have sold readily at prices which net the investor less than 6 per cent.

C. C. Wright, attorney for the railways, asked how many automobiles the Iowa farmers owned. The witness admitted that they owned a great many, but he did not know the number. He admitted he had had opportunities to invest money and had invested in farms, and had never invested in railway bonds, stocks or other securities, nor did he know of any one who ever sold farms to invest in railways.

J. Pease Norton, formerly assistant professor at Yale University, and now a bond expert and financial writer, testified regarding the reasonable rate of return on investments. "The true criterion as to a reasonable rate of return," he said, "is the yield the public is willing to accept on its investment. The railroad testimony in the present case appears to be built up on the theory that this rate is 7 per cent, but this is not the case. Applying this test to the bonds of 10 representative roads we find that in 1914 the public was willing to accept an average return of 4.583 per cent, against the railroad claim of 7 per cent."

Mr. Norton presented an exhibit containing tables showing the yields on bonds of various kinds over a period of years. He also presented figures as to the cost of railway supplies, saying that advance figures for 1914 on 82 articles of railway supplies compiled by the Department of Commerce and Labor show that the average price for that year was 123.5 per cent of the average for the period 1890 to 1899, as against 131.5 per cent in 1913.

On cross-examination Mr. Wright asked Mr. Norton how it happened that his exhibit on the reasonable rate of return was identical as to the wording, and largely so as to the figures, with exhibit No. 13, introduced by Mr. Thorne in the Eastern rate case. Mr. Norton said that the exhibit was a joint production of himself and Mr. Thorne, that no change had been made in the principles and arguments set forth, but that the statistics had been brought up to date, and that he had interpolated some additional matter in placing it into the record.

Wayne Ellis, statistician of the Iowa Railway Commission, introduced exhibits to show that the tendency of net returns during the past five years has been higher than ever before in the history of the railroads, that the ability of the carriers to secure capital on favorable returns was never greater and that the cost of supplies is decreasing. One of Mr. Ellis' exhibits, he said, showed that the average percentage of net earnings on the capital stock of railroads serving the bulk of Western Trunk Line territory, was 7.82 per cent in 1914, and 9.4 per cent in 1913. These roads, he said, handle 84.55 per cent of the traffic in the territory. He also presented an exhibit showing 20 roads which he said handled 75 per cent of all the freight traffic handled by roads earning over $1,000,000 a year in the western district, showing earnings on common stock ranging from 6.06 per cent in the case of the Chicago, St. Paul, Minneapolis & Omaha, to 78 per cent for the Duluth & Iron Range. This table included, however, a number of roads not connected with this case.

"During the past five years," said Mr. Ellis, "the net revenues of the western railroads are greater than ever before. The net per mile of line is greater. As compared with 1890, this period shows an increase per mile of line of 74.99 per cent. The greatest previous increase for a consecutive five-year period was only 67.28 per cent. The same is true after the reduction of taxes. Less taxes, the total net revenue for this last period showed an increase of 156.75 per cent compared with 1890 and the next preceding five-year period showed an increase of 151.14 per cent.

"The railroads claim that operating expenses have increased at a greater rate than net revenues, but this is true only during the last five years. And while the increase of operating expenses per mile of line was 91.91 per cent compared to 1890, at the same time the increase in maintenance was 111.44 per cent. The cause of this is, that the railroads have charged to operating expenses large amounts connected with additions and betterments. The western railroads are being built up and improved from operating expenses."

Mr. Ellis' exhibit, in addition to the statistical table, contained many pages of text making deductions from the figures and arguments based thereon, which the witness read in giving his testimony, but when counsel for the railroads sought to cross-examine on them Mr. Thorne objected, saying the witness was only supposed to testify as to the accuracy of the compilations. After some argument Mr. Thorne took the stand himself to tes-

tify as to the text of the exhibits. Mr. Thorne was cross-examined as to his statement that railroads had charged improvements to operating expenses by M. O. Lorenz, a statistician for the Interstate Commerce Commission. "How can a railway make improvements from operating expenses without evading the commission's rules of accounting?" he asked. "Some items could be charged to expenses without violating the rules," said Mr. Thorne. Mr. Lorenz said that to that extent then, the expenditures for betterments would be understated.

One of the exhibits as to which Mr. Thorne testified, was a book of 62 pages on maintenance expenditures. "It has been claimed," it was stated in the text, "that the large increase in other expenses has prevented our railways during recent years from having money to put into better facilities, improvements, etc., and that as a consequence they have been running behind recently. These remarkable increases in maintenance charges suggest the possibility of building betterments and improvements and charging them to operating expenses. If that be possible then a declining net revenue and net income would be shown without any loss to the carrier, and the result—a mere matter of bookkeeping—could be used for certain very obvious purposes.

"We find under existing accounting rules that it is possible to charge many expenditures to operating expenses under the head of maintenance, that can also legitimately be charged to additions and betterments, according to whatever course may chance to suit the policy of the company. Sufficient doubt exists as to the interpretation of some of these rules as to give room for various courses of action. In addition to this, the rate of renewals from year to year is subject to the control and policy of the company officials. Maintenance expenditures can be delayed from year to year, or several years could be packed in one year.

"The agitation for this proposed advance in rates started in 1913. Maintenance charges for western district railroads for that year were larger than for any previous year in their history. This exhibit discloses the remarkable fact that in every instance where there is a decline in net revenues, comparing 1914 with 1912, the increase in maintenance exceeds the decrease in net revenues with only one exception, the Chicago & Alton Railroad."

U. G. Powell, rate expert, and in charge of accounts for the Nebraska Railroad Commission, introduced several bound volumes of statistical exhibits, to show, he said, "that the exhibits introduced by the carriers do not correctly show the true comparisons between the period since 1907, when the accounting rules of the Interstate Commerce Commission became effective, and the eight-year period prior thereto, because in the prior period a very large amount of additions and betterments were paid out of surplus and charged to profit and loss, and in the latter period were charged to property investment.

"The special study made by me of six roads, to wit: Santa Fe, Burlington, Milwaukee, North Western, Rock Island and the Katy, which own 49,006 miles of road, or over 50 per cent of the mileage of the roads involved in this controversy shows that, in the period 1898 to 1906, $86,220,421 was the combined surplus earnings of said roads used in additions and betterments not shown in the property investment account, and that, in the period 1907 to 1914, not only was surplus so applied, charged to property investment account, but that the carriers in addition charged off as a part of operating expense an arbitrary depreciation charge of $67,098,737. While this amount is deducted arbitrarily by the carriers from their income it is not carried on their books as an actual liability against the assets of the companies.

"The depreciation fund so created is not generally speaking used in the replacement of property worn out or displaced. The present rules provide that all property worn out or replaced may be and it is charged to repairs. The carriers geneally speaking use the depreciation fund so created in additions and betterments which are charged to property investment account.

"In substance the study shows that the six roads in question had a net income over and above all expenses sufficient to pay an average return of 7.51 per cent in the first eight-year period, and 8.02 per cent in the last eight-year period on all property investment excluding so much thereof as was paid for out of surplus earnings and an average return of 6.13 per cent for the first eight-year period, and 6.06 per cent for the last eight-year period shown by the carriers' own balance sheet. If the $86,220,421.82 charged by the carriers to their profit and loss account in the first eight-year period were carried in their property investment account as required and done in the second period, the average rate of return on all property investment would be greater in the latter period than the former.

"The net surplus of the six roads in question after paying all operating expenses, taxes, interest and dividends in the first eight-year period was $190,681,161.60, and in the second period $228,412,885.69, or a total for the entire period of $419,094,047.29."

Cross-examination of Mr. Powell by Mr. Wright showed that by deducting improvements and additions paid for out of surplus the value of the Burlington figured out $3,000 per mile less in 1914 than in 1899, $30,000 per mile against $33,000 per mile. The witness' figures also showed the value of the Rock Island at $2,000 less per mile than 15 years ago. Mr. Wright asked if he considered his six roads representative. Mr. Powell said they cover the territory, but admitted that a larger list would have been more representative. He said he had not included some of the roads in the hands of receivers because their condition was the result of improper location.

D. F. Jurgensen, chief engineer of the Minnesota Railroad & Warehouse Commission, testified as to a large number of exhibits based on the state appraisals of railroad properties in Michigan, Minnesota, Wisconsin, Nebraska and South Dakota to show that the capitalization of the roads not only exceeds the present value but the book cost as well. Other exhibits were presented to show that the depreciation reserve set up to take care of obsolescence of equipment and to maintain the railroad properties had not been so used but had been expended for additions and betterments. Mr. Jurgensen said that the capital stock and funded debt outstanding, apportioned on a main line mileage basis to the states in which the appraisals were made, averages $56,198 per mile of main line and the book cost reported by the railroads averages $51,398 per mile, and that the book cost is $139,093,327 less than the capital stock and funded debt outstanding, while the depreciated book cost is $455,333,754 less than the capital stock and funded debt, representing a value of $40,485 per mile. The present cost of the property within the five states, as compiled by him from the state valuations, not including depreciation but including an allowance for general expenditures, he said, is $445,787,430 less than the capital stock and funded debt outstanding. This cost represents $40,815 per mile. The present depreciated cost, including general expenditures, he figured at $691,659,626 less than the capital stock and funded debt apportioned to these states. This depreciation cost represents $32,330 a mile.

On cross-examination Mr. Wright showed that these figures took the value of railway property in states where their lines were the cheapest and applying those figures to the entire line, and that as to the North Western the witness' figures had been taken from states where the road was largely single track, while in states where it was double-tracked and had expensive terminals no valuation had been made.

ADDITIONAL EVIDENCE FOR CARRIERS

Depressed and subnormal rates prevailing on import traffic from the Gulf of Mexico, forced by competition with direct rates from Europe via North Atlantic ports, and the fact that import rates from these North Atlantic ports, the main depressing factor, already have been raised, disturbing the relationship, were given as reasons why gulf lines are asking permission to increase import rates from gulf ports. W. M. Rhett, assistant to freight traffic manager of the Illinois Central, in charge of foreign business, took the stand on Saturday, April 3, to justify the proposed advances. The increases range from ½ cent to 5 cents per 100 lb., and apply on imported commodities, such as sulphate of ammonia, chalk, clay, potash and other fertilizer material, fuller's earth,

glycerine, magnesite, spelter, vegetable tallow, whiting, brewer's rice, pig lead, crockery and earthenware, sisal, flax waste sweepings, linoleum, hemp and manila. The advances apply to interstate points, Mr. Rhett testifying as to points east of the Mississippi river, including St. Louis.

"Even with the advances," said Mr. Rhett, "we would still be far below the normal basis. The first-class domestic rate, New Orleans to Chicago, is $1.10, being a normal first-class rate. The import rate is only 57 cents, forced by an 18-cent differential under the 75-cent rate from New York. If 75 cents is reasonable from North Atlantic ports, surely 57 cents is reasonable for practically the same distance from the gulf. Low rates have been necessary to induce traffic to move via the longer route through gulf ports. Import rates thus are in a depressed and subnormal condition to meet competition from New York. How potent is competition is shown by the fact that the import tonnage from Europe to competitive territory moves 78 per cent through North Atlantic ports and 22 per cent through gulf ports. The total added revenue which would accrue from the proposed advances to the gulf lines would be only about $50,000 yearly."

J. W. Allen, assistant general freight agent of the Missouri, Kansas & Texas, and C. C. P. Rausch, assistant general freight agents of the Missouri Pacific, corroborated Mr. Rhett's testimony largely as to points west of the Mississippi river.

B. J. Rowe, coal traffic manager of the Illinois Central, testified as to the reasonableness of proposed advances in coal rates from Illinois and Indiana mines and Chicago to Iowa, Missouri, Minnesota, Wisconsin and the Dakotas. The advances in general are 5 cents a ton to central and southern Wisconsin; 10 cents a ton to points on the west bank of the Mississippi river and west thereof in Iowa, Missouri, Minnesota and part of the Dakotas. In northern Minnesota and part of northern Dakota there is a general revision of rates.

"In this latter territory," said Mr. Rowe, "the revision entails reductions as well as increases and there are, in fact, more reductions than advances. Taking this western territory as a whole, the advance averages 7.95 cents per ton."

The proposed advanced rates on bituminous coal to Missouri river states would earn, in all cases, less per ton mile than present rates to various representative states west of the Missouri river on hauls of about the same length, according to C. E. Warner, assistant general freight agent of the Missouri Pacific, who testified on Monday. Rates to those cities west of the Missouri have been advanced, the witness testified, and the readjustment is asked east of the river to bring this territory to a more self-sustaining basis. Mr. Warner took the stand to justify the proposed advances of 10 cents per ton from coal mines in Missouri, Kansas, Arkansas and eastern Oklahoma to Missouri river states. He introduced exhibits showing rates from southern Kansas and southwestern Missouri and other mining districts showing distances and the proposed rates, bringing out the fact that the commodity rate on coal, which belongs properly to Class D, is far below the rate prevailing on lower Class E, which covers such articles as sand, brick and sewer pipe.

Eugene McAuliffe, general coal agent of St. Louis & San Francisco, presented additional exhibits showing the cost of assembling and transportating bituminous coal. "Figures covering 16 railways," he said, "show that bituminous coal is 28.57 per cent of the total revenue freight tonnage. The revenue therefrom is 12.92 per cent of the total freight revenue, while the percentage of coal cars to total freight cars is 31.54 per cent, or 27.18 per cent if cars used for company coal are deducted. This means that we handle 28.57 per cent of our freight tonnage, using 27.18 per cent of our revenue freight car equipment, to get 12.92 per cent of our freight revenue."

George H. Kummer, coal freight agent, of the Chicago & Eastern Illinois, testified that in the fiscal year 1914 the Chicago & Eastern Illinois handled 7,476,933 tons of bituminous coal, on which the yield was only $4,168,388. Total other freight handled was only 6,326,842 tons, but the yield therefrom was $7,155,904.

C. W. Galligan, general freight agent of the Chicago & Alton, testified that rate wars in the past were largely responsible for the level of rates on bituminous coal prevailing on western railways. His testimony referred to advances from Illinois and Indiana to Kansas City, Omaha and other Missouri river points.

C. Haile, vice-president of the Missouri, Kansas & Texas, and C. E. Spens, assistant freight traffic manager of the Burlington, testified on Tuesday concerning livestock rates.

CARRIERS SUBMIT NEW PLANS FOR ADJUSTMENT OF TRANSCONTINENTAL FREIGHT RATES

Traffic officers of the western transcontinental lines will appear at a hearing before Examiner Thurtell of the Interstate Commerce Commission at Washington on April 12, to present new plans for the adjustment of trancontinental rates. The report of the commission issued January 29, respecting commodity rates to Pacific coast terminals and intermediate points, in which relief was allowed from the fourth section to enable the carriers to meet water competition on a large number of commodities designated as Schedule C, on which the water competition is especially keen, directed the carriers to submit within 60 days a plan for the adjustment of rates to so-called back-haul points.

The lines leading to California terminals have submitted the following plan for making rates from eastern defined territory to such points. It is proposed to deduct from the terminal commodity rate 7 cents per 100 lb. on carload freight and 10 cents per 100 lb. on l. c. l. freight for basing rates, to which are to be added the full local rates from the nearest terminal points to destination. This basis is to prevail eastward from the terminal points until the point is reached where the direct rate is the same as or less than this combination. In no case shall the rates to any back-haul points be less than to the terminal point.

The plan submitted by the north coast lines provides that rates to points in Group 2, as shown in T. C. F. B. tariff 4-L shall be made by adding to the terminal rates not more than 5 cents per 100 lb. per carload shipment, and 10 cents per 100 lb. for less than carload shipment; that rates to points in Group 3, shall be made by using terminal basing rates, 5 cents on carload and 10 cents on less than carload shipments, less than the rates to Pacific coast terminals. To these basing rates shall be added the lowest rate applying from any Pacific coast terminal point, provided that the rate thus made shall not be less than the rate for similar shipments to Group 2 points, or more than the rate for similar shipments to Group 4 points. The Washington-Idaho line is to be the eastern boundary of Group 4, with the exception of points on the line of the Northern Pacific from Pullman, Wash., to Lewiston, Idaho, which are to be included in Group 4. Rates are to be made to points in Group 4 by the same method as to Group 3, except on a limited list of carload commodity rates embracing staple articles shipped by sea, upon which lower rates are necessary to insure direct movement from the East and permit reasonable competition in the distribution from Group 4 points, as against shipment by sea, and subsequent distribution of the same commodities from Pacific coast ports.

This list of commodities, designated as Schedule C-2, includes canned goods, coffee, iron and steel articles, concentrated lye, paper, soap and starch. In the republication of tariff 4-L an additional group is to be provided to include those points on each road which are situated east of the east boundary of Group 4, as above described, and west of the Idaho-Montana state line. The rates to points in this group, No. 5, are to be made in the same manner as rates to points in Group 4, except that the rates on the commodities named in Schedule C-2 shall be 10 cents per 100 lb. higher than the rates on the same commodities to points in Group 4.

Rates from eastern defined territory to points east of the eastern boundary of Group 5 are to be limited by the maxima prescribed in the report of the commission, but the rates on the Schedule C-2 commodities are to be not more than 10 cents

higher than the rates on the commodities to points in Group 5.

The carriers have also petitioned the commission for a modification of that part of its order which fixes maximum commodity rates on less than carload shipments from Missouri river points to points intermediate to the Pacific coast. They have asked for authority to establish as maxima on less than carload commodities from the Missouri river to Intermountain territory rates made by taking 80 per cent of the present class rates from the Missouri river to Reno, Phoenix and Spokane. They further propose that rates from points east of the Missouri river may be made by adding to the rates above named the differentials prescribed by the commission in its report.

The commission has extended the effective date of its order on Schedule C from May 1 to June 1. A very large number of shippers in the middle western states have written to the commission, asking that their commodities be included in the list on which reductions may be made to the Pacific coast terminals in order to meet water competition, on the ground that they cannot otherwise meet the competition of shippers located near the eastern seaboard, who are in a position to ship via the Panama canal. In giving their reasons to the commission for the petition for a modification of the order on l. c. l. shipments, the carriers point out that they would hesitate to grant Chicago, St. Louis and other interior communities, rates to Pacific coast terminals upon less than carload shipments that they are asking for and which the carriers believe are necessary, because of the effect such rates would have upon their intermediate revenues, and that a curtailment of the list of l. c. l. rates now proposed in Schedule C, and denial to make such further additions as middle west shippers are asking for and which carriers are willing to grant, if protected against excessive reductions at intermediate points, would cause many complaints to both the commission and the carriers. The maxima suggested by the carriers they point out, would put the railroads in a position where they would not be embarrassed in granting applications to interior shippers for l. c. l. commodity rates to terminal points.

The railroads have also discussed a revision of some of their other rates to the coast terminals with a view to adding to the list of commodities in Schedule C on which relief was granted in the order, but difficulties have appeared and it is somewhat doubtful whether the list will be extended. It is proposed to publish the reduced rates on Schedule C commodities as soon as possible after the hearing.

INVESTIGATION OF WAGES PAID BY PULLMAN COMPANY

The United States Commission on Industrial Relations began a hearing in Chicago on Monday for the purpose of investigating the wages and conditions of employment of Pullman conductors and porters. L. H. Hungerford, general manager of the Pullman Company, was the principal witness the first day. He said the company employs about 2,500 conductors and 6,500 porters; that conductors are paid from $70 to $95 a month, with somewhat higher pay for special trains, and porters from a minimum of $27.50 a month on ordinary runs and $35 on tourist sleeping cars to $49.50 on private cars. All car service employees with clear records also receive an extra month's pay at the end of the year. Asked if the company expected its porters to bring their pay up to a living wage by "holding up" the public, Mr. Hungerford said that undoubtedly the porter takes tips into consideration in seeking employment at that rate of pay, but that the Pullman Company did not invent tipping, and simply accepts conditions as it finds them and pays what wages it has to to carry on the business.

As to the wages of conductors, he said that although they often work long hours they have nothing like the responsibility of a train conductor, for example, and have practically no more responsibility than the passenger who travels for pleasure. No previous experience is required and energetic young men have an opportunity for promotion in the service of the company. Ninety per cent of their district superintendents and their assistants and other officers have been conductors. Chairman Walsh asked if it was reasonable for any concern not to pay its employees a living wage and whether tipping ought not to be made unlawful. Mr. Hungerford said that that was too comprehensive a question for him to discuss. Mr. Walsh read into the records a large number of letters of complaints from Pullman employees objecting to long hours and low pay, and Mr. Hungerford was asked to discuss the points raised. He said that if conditions were so bad he did not understand why they had so many applicants for work and why if a man was discharged he tried so hard to be reinstated. Of the total number of porters, 1,721, or about one-fourth, have been in service 10 years or over and 1,704 have been in service between 5 and 10 years, making 3,425 out of the 6,500 that have been in service five years or more.

Mr. Hungerford said that as far as he had been able to ascertain the men in the company's employ were satisfied with their work, although he said the men may not be fully satisfied as to wages; few large bodies of workers are. Mr. Walsh brought out that two petitions had been sent to the company signed by conductors and porters asking for an increase in wages, one in June, 1912, and one in January, 1914. Mr. Hungerford said that these had been instigated by men outside of the service and that the company had not replied to them because there was no way of replying, except to issue a general circular. He said the petitions related entirely to wages and that the company had not received any general complaint about conditions of employment. Meetings were held in each district every three months with the employees and they had any opportunity to bring up suggestions for changes. Premiums were given for suggestions for the improvement of the service, and any or all employees had an opportunity to present any grievance to the officers. He also described the relief and pension systems of the company.

The principal grievances mentioned in the letters from employees were that they had longer runs and received less pay than train conductors, that on some runs they are only allowed 4 hours of sleep out of 24, insufficient layovers, and the fact that the cost of lost linen and supplies is sometimes deducted from their wages. Mr. Hungerford said that he did not believe in long runs and had reduced them wherever possible. He hoped to straighten out the entire situation some day. He said porters were not required to pay for small articles or linen lost, unless the loss was due to a clear case of negligence.

Mr. Hungerford was followed by R. W. Bell, a former Pullman conductor, who said he had been dismissed from the service for attempting to organize a Pullman conductors' and porters' federation.

Importance of Rule F.—A large per cent of loss of life and money could be saved and a corresponding number of good men who lose their positions could be saved, if men would report flagrant violations of the rules. I have often tried to figure out why this was not done more frequently and have about reached the conclusion it is for the want of backbone more than anything else. I know a number of men who report employees who have not carried out the rules, in cases, too, where no trouble was caused, but which sooner or later would result in trouble. Each man I have in mind is a man who carries out the rules himself and is known by all the men as a good man. No one ever criticizes these men; it is realized they have done the right thing and there is not room for criticism. Live up to the rules yourself, be strong and you can help yourself as well as the company by reporting men who are negligent and careless.—*E. H. Daniel in the Railroad Herald.*

Reconstruction of the Jersey City Terminal Yards

C. R. R. of N. J. Is Enlarging and Rearranging Its Facilities and Installing Electro-Pneumatic Interlocking

The extensive rearrangement and enlargement of the Jersey City passenger terminal of the Central Railroad of New Jersey, which was undertaken in 1912 to secure increased capacity and greater facility of operation is now practically completed. This project has involved the reconstruction of the ferry house, station building, ferry and train concourses and train shed, the construction of a new engine terminal at Communipaw, about one mile west of the station, the rearrangement and enlargement of the coach yard with the auxiliary shop buildings, the addition of new main tracks to Communipaw and the installation of a new electro-pneumatic interlocking system covering the entire terminal. The improvements effected in the ferry house, station building, concourses and train shed, were described in the *Railway Age Gazette* of July 18, 1913, and November 6, 1914, and an article in the issue of June 26, 1914, was devoted to the new engine terminal. The changes in yard facilities and interlocking are described in the following pages.

TRAFFIC

As mentioned in the description of the station improvement, this terminal is used by the Philadelphia & Reading, the Baltimore & Ohio and the Lehigh Valley, in addition to the Central of New Jersey. The maximum number of scheduled trains in 24 hours is about 200 each way. The Reading and the Baltimore & Ohio trains are operated by the Jersey Central in the same way as its own service, but the Lehigh Valley with about 12 trains each way daily, operates separately, using the Jersey Central tracks for about 10 miles. As the Jersey Central has a heavy suburban business, the number of trains is much greater than normal during the morning and evening rush hours, and as all passengers use the ferry boat service between the station and New York City, schedules are arranged in many cases so that several trains will arrive or depart at a time that will allow close boat connections, thus further aggravating the tendency to congestion during certain parts of the rush hours. The maximum number of trains regularly handled into and out of the station in one hour is about 38. In addition to these scheduled trains a large number of movements are necessary in making up trains from the coach yard, pulling out empty trains after their inbound runs, and in handling locomotives to and from the engine terminal.

NATURE OF IMPROVEMENTS

The old layout consisted of 14 station tracks, 12 of which were under a shed and 2 main line tracks and 2 Newark branch tracks, the latter paralleling the main line as far as the junction with this branch at Communipaw. The passenger engines were handled in a terminal north of the main line near this junction, which was not ample in capacity or convenient in location or arrangement. The coach yards were located on a narrow strip between the engine terminal and the station north of the main tracks, as all property south of these tracks was occupied by the freight terminal. These limited quarters made necessary a 12-ft. spacing between tracks and the cleaning facilities provided could not be as convenient as the large number of cars handled warranted. In addition, it was necessary to cross the main line with all empty coaches moving between the yards and the southerly station tracks. The operation of switches and signals in the old terminal was controlled from two mechanical interlocking plants.

In planning for the improvement it was desired to provide additional main line and branch tracks to Communipaw, to replace the engine terminal by more commodious facilities, to enlarge and rearrange the coach yards, and to replace the mechanical interlocking by a system that would better safeguard and facilitate the operation of the terminal. The new layout includes 20 station tracks under the new shed and 4 main line and 3 Newark branch tracks to Communipaw. The second outbound Newark branch track was added in order to allow a heavy through train operating over the Newark branch and a Newark suburban train scheduled to leave at the same time to pull out together and both keep moving. The lighter train can reach Communipaw and make the station stop while the other train is reaching that point and passing it a sufficient distance to allow both to proceed at a safe interval on the same track. In addition to the Lehigh Valley and suburban trains a few Jersey Central trains for the main line and points on the shore branches are operated over this branch, connecting with the main line again at Elizabethport.

The new engine terminal was located south of the main

The Revised Track Layout of the Central Railroad of New Jersey Between the Jersey City Terminal and Communipaw

line and consolidated with the facilities for handling freight engines. This terminal is connected with the main interlocking plant by two engine leads which are operated left-handed. Between 225 and 300 freight and passenger engines are handled at this combined terminal daily.

The reconstructed yard north of the main line has a capacity of about 350 coaches, 100 additional can be stored in a new yard located south of the main tracks, and a third yard about one mile further west is used as an overflow yard. The track spacing in the new north yard is 14 ft. in general with alternate spaces of 17 ft. in the Pullman car-cleaning yard. A new repair shed, store house, oil house, shop, Pullman building and rest house have been built adjacent to the cleaning-yard and new service lines for gas, steam, water and vacuum and plug outlets for charging the storage batteries on the electric-lighted coaches have been installed throughout the yards. The facilities also include a new shed large enough to shelter two private cars. All Lehigh Valley equipment is cared for in a separate yard on adjacent property to the north, reached by a lead through the Central of New Jersey yard.

Looking West Through the Throat of the Yard Showing Double Crossed Ladders

The track layout in the main interlocking plant, known as "A," and located at the head of the train shed consists of a nine-track throat across which extend four ladders, two in each direction. At the west end two of the ladders are extended to the north to include four yard receiving tracks. At the east end where the layout is expanded to embrace the 20 train shed tracks, the four main ladders are supplemented by five additional ladders, two on the north side and three on the south. The layout provides for connections between the seven northerly train shed tracks and the north yard and the ten southerly tracks and the south yard outside of the limits of the main throat. It is possible to make simultaneously six moves between the train shed tracks and the coach yards, and at the same time make four moves between the main line and central train shed tracks.

The terminal interlocking is divided into three plants, A, at the throat of the yard, built new as part of the terminal improvement; B, at the engine terminal, built in connection with the new work at that point, and C, at the junction of the main line and the Newark branch, altered to conform to the new standards.

The work of reconstructing these yards had to be handled in stages in order to avoid interference to traffic. During the reconstruction of the train shed and station tracks, numerous temporary changes in the throat of the yard were necessary and a 29-lever electro-pneumatic interlocking machine was installed in the old tower 1 to control the added functions. When the new engine terminal was put in service in May, 1914, some track and interlocking changes were made at the old tower 2 to get engines in and out of the new layout. At this stage, however, it was necessary in many cases for an engine to run to Communipaw and back, as it was impossible to reach the northerly five station tracks without a reverse movement. The next step was to connect up the new engine leads and complete as much as possible of the permanent work in the throat of the yard. This step required the installation of 23 double slip switches and the functions included represented about 40 per cent of the operated units in the new plant A. The new westerly coach yard was also built during this stage. The control of this portion of the plant was turned over to the new tower on November 9, allowing engines to move directly to and from the engine terminal.

The next move was to connect up the newly completed coach yard with the running tracks, placing the functions under control of the new interlocking plant and putting the old tower 2 entirely out of service. This was completed December 27. At the same time a temporary lead to the Lehigh Valley coach yard was installed. The remaining steps consisted of connecting up the northerly five house tracks with the double crossed ladders, then the southerly six tracks and two additional northerly tracks, and finally the middle seven. These stages were placed in service on January 24, February 28 and March 20, respectively. At the same time the remaining coach yards were completed in sections, the permanent lead to the Lehigh Valley yard was put in, and the new shops and service lines were completed. The changes to the interlocking at tower C were made after the completion of tower A.

YARDS, SHOPS AND SERVICE LINES

The main tracks are laid with 100-lb. A. R. A. section-A rail, tie-plates, creosoted yellow pine ties and switch timbers and stone ballast. The yard tracks are of 90-lb. or 80-lb. relaying rail on creosoted ties in cinder ballast. Duquesne rail joints and Keystone insulated joints are used throughout. No. 9 turnouts are standard with rail-bound manganese frogs and manganese switchpoints for main line switches. All crossing frogs within the interlocking limits are of solid manganese.

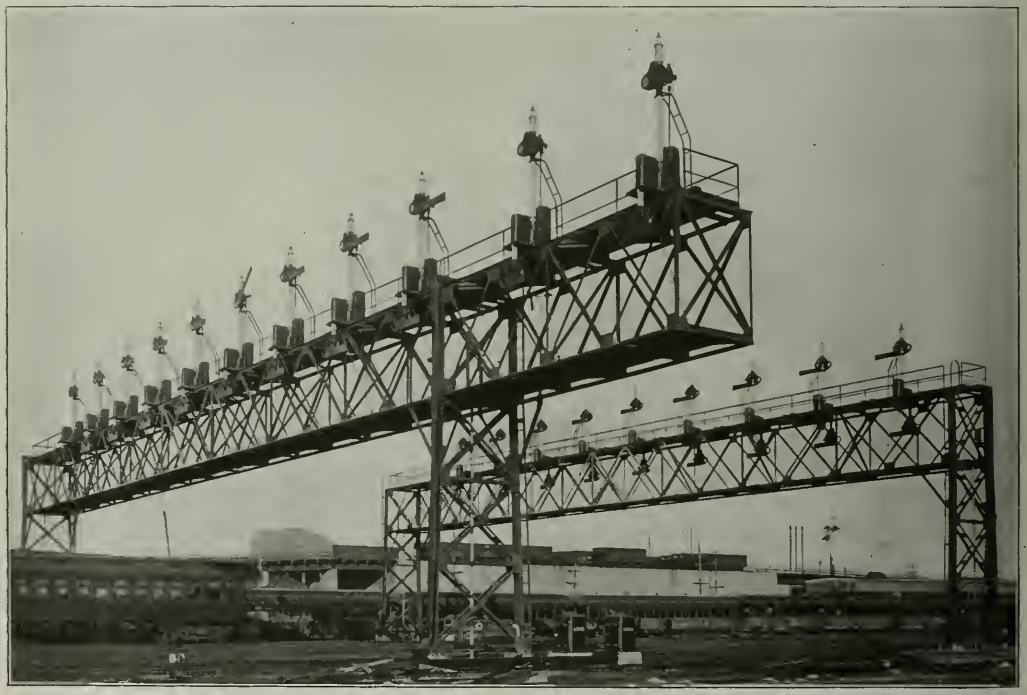
The drainage in the yard is collected by 6-in. lateral drains under the tracks leading to sewers along each side of the yard which empty into a 24-in. outfall sewer. The lateral drains are of cast iron under the tracks and vitrified clay between, laid with open joints. Catch basins are located at frequent intervals to receive most of the surface run-off.

The yard buildings and facilities include a repair shop 180 ft. long with a single track over a full-length pit and a cross drop pit in the center, a space for wheel storage, a two-story shop with offices on the upper floor, an oil house equipped with eight tanks and a pumping system installed by the

Wayne Oil Tank & Pump Company, Fort Wayne, Ind., a storehouse, Pullman building and rest house, with a cantilevered concrete material platform. The car repair shed is an open steel frame structure with wooden roof covered by a prepared roofing. The upper portion of the sides is sheeted with asbestos covered with corrugated iron and on the side facing the street the lower portion is filled in with a concrete wall. The other buildings are of concrete and hollow tile construction on piles 80 to 85 ft. long. A floor construction that is strong and at the same time light and inexpensive was adopted, consisting of lines of hollow tile embedded in the lower portion of the concrete floor at intervals about equal to the width of the tile.

All coach yards are equipped with air, gas, steam, water and vacuum lines. The steam line was designed with more than the usual care with a view to economizing steam in the numerous long runs. No pipes less than 6 in. in diameter of the Railway Signal Association. Since all movements within the limits of the terminal are at moderate speed the high speed blade was omitted in plants A and B. At tower A, the upper of the two arms governs moves over all routes fully equipped with track circuits and the lower arm is used for closing in when the section of track to be entered is occupied. The signals in the plant at tower C are arranged to indicate for high speed main line movements.

In the plant at tower A, 16 signal bridges were required, three of these being of considerable length. One spans 10 tracks, another 11 tracks, and a third 10 with an additional two-track cantilever end. The signals are the Union Switch & Signal Company's three-position upper-quadrant electro-pneumatic type employing tandem cylinders. The lower blades are suspended below the upper chord in all bridge mounted signals. The upper blades are semi-automatic and the lower are non-automatic. The signals are electric-



Two of the Long Signal Bridges in the Jersey City Terminal. The One on the Left Spans Ten Tracks and Has a Two-Track Cantilever End

are used, all being of extra heavy galvanized pipe covered with asbestos and encased in cast iron pipe with lead caulked joints. The steam is supplied both from the Communipaw power plant and the service building at the station, the distributing lines being connected so that they can be supplied from either end. The air is also supplied from both ends, the vacuum from the service building and the Pintsch gas from a plant near the terminal. All electric wires, including the Western Union, telephone and power lines are located underground in lead covered cables in wrought iron conduits encased in concrete.

INTERLOCKING

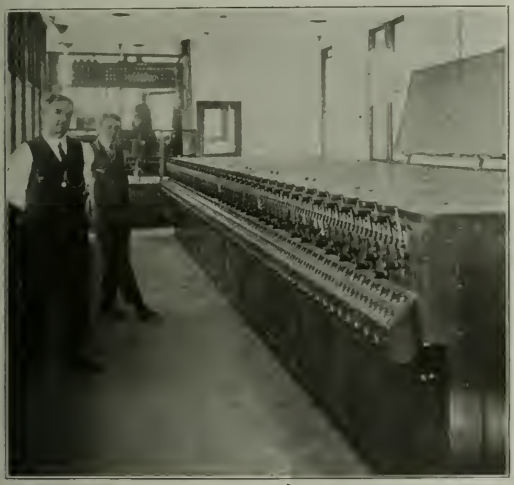
All train movements are controlled by three-position upper-quadrant speed signalling conforming to the recommendations lighted by Dressel lamps and the semaphore blades are the "Saco" enameled steel type.

The new tower A is a steel frame structure with brick walls supported on piles driven about 65 ft. to rock, cut off at low water level and capped by reinforced concrete beams. The floors are of concrete, the upper one being finished with Taylorite surface and wainscoting. The roof is of slate with copper cornice and Lupton steel sash are provided for all windows, making the building fireproof throughout with the exception of the wooden relay rack.

The interlocking machine is the Union Switch & Signal Company's electro-pneumatic type with a number of improved features. It has a 179-lever frame in an enameled steel case. Lever light indicators are provided for all switch and signal levers to show the condition of track, signal and de-

tector circuits. These lights directly under the levers give the lever men the information needed without the use of an illuminated track diagram. A push button is also provided below each signal lever which, with this lever reversed, operates the lower arm as a calling on signal for slow speed movements when the route to be taken is occupied. This push button when depressed remains in that position, eliminating stick relays. The levers are also improved by the application of a latch depressor which insures that time will be allowed in throwing them for the latch to drop. A flashing light indication is momentarily given when a signal has gone to the clear position or started for the danger position. The flashers are located under the signal levers.

Probably the most important change in design of this machine is the system by which all of the combinations needed in this large plant can be made on two vertical combination plates. This is accomplished by connecting through a link arrangement, the lower end of a roller which is not long enough to carry all the necessary contacts with some other roller with spare space. A change has also been made in the design of the electric lock on the lever, making it possible to equip adjoining levers with three locks each. The



Interior of Tower "A" Showing the 179-Lever Electro-Pneumatic Machine and in the Distance Various Indicators Over the Train Director's Desk

third lock is sometimes desirable for a traffic lock, for example.

The plant is equipped with switch detector circuits, advance route locking, approach locking, approach indicator lights and bells, train describing instruments, an indicator showing which, if either of the two receiving tracks alongside the coach yards is occupied, an electro-pneumatic whistle for controlling the movements of trains in emergencies and a complete telephone system between signal bridges, relay locations, work shops, etc., to allow the maintainers to keep in touch with the tower at all times. The train-starting system providing for intercommunications between the ferry master, gatemen, conductors and towermen was mentioned in the previous article.

The power for operating the three interlocking plants is secured normally from the company's power house at Communipaw. Single-phase, 60-cycle, alternating current is received at 550 volts and compressed air at 100 lb. at the compressor. An alternate source of electric power is furnished by a connection with the Public Service Company's 2,200-volt line through a transformer which reduces this voltage to 550, and the compressed air can also be supplied from the service building north of the station. An automatic switch in each tower cuts in the Public Service circuit immediately if the company line is de-energized and when power returns to this line the switch immediately connects the plant to it again. Duplicate installations of four sets of 12 cells each of Edison storage battery charged by a mercury arc rectifier supply direct current for the operation of switch and signal circuits.

The 550-volt current is transformed in the tower to 110 volts and distributed at that voltage for operating track circuits and for tower and signal lighting. Each track circuit is fed by an individual air-cooled transformer of the reactive type mounted in an iron housing, thus eliminating all resistance or reactance coils. The 110-volt current is stepped down to 12 volts for signal lighting by a small air-cooled transformer at each bridge or signal location. This arrangement permits the use of 12-volt, 2½-watt lamps in the signals controlled through Signal Accessories Company automatic cut-in relays. The direct current supply is distributed throughout the plant to terminal boards from which the signal and switch movements are fed.

The compressed air is distributed in a 2½-in. main laid along each side of the yard and connected over each signal bridge with proper valves in the line to allow either main to supply all signals. All switch machines are also connected to both mains by ¾-in. pipe. All cables for the control of functions are Okonite lead-covered, laid in creosoted yellow pine conduits encased in a layer of clay with the top of conduit 18 in. below the bottom of the ties. Concrete bootlegs are used for all track connections, two conductor cables being used in order to eliminate the inductive effect of the alternating current.

All wires are brought into the tower in a gallery under the first floor from which they are carried up to Brach tagged R. S. A. terminals on three terminal boards. The R. S. A. written circuits and wire numbering are used throughout. All conduits in the tower are lined with asbestos. The relay rack of standard wooden construction contains 404 relays in tower A. The U. S. & S. vane type relay is used for all track circuits on account of its quick release.

At tower B all signals are two-position upper quadrant, the machine has 47 levers, the track circuits are alternating current and the system of power supply, lighting and distribution is similar to that described at tower A. At tower C the signals were changed from two-position lower quadrant to three-position upper-quadrant, the 71-lever machine was rebuilt and the track circuits changed from direct current to alternating current. The main tracks between towers A and C are protected by 22 automatic signals with 19 track circuits. The track circuits are polarized and equipped with U. S. & S. model 12, three-position polyphase track relays.

The buildings and the conduit lines in this improvement were built under contract by Westinghouse, Church, Kerr & Company, New York, the new interlocking towers were built by John W. Ferguson & Co., Paterson, N. J., the interlocking system was installed by the Union Switch & Signal Company, Swissvale, Pa., and all track work and changes in the existing plants to keep them in service during the installation of the new plants was handled by company forces. The entire improvement was carried out under the general direction of W. G. Besler, president and general manager, and J. W. Meredith, general superintendent, and the personal supervision of J. O. Osgood, chief engineer and W. H. Higgins, signal engineer.

Dining Car Service on English Railways.—The English railways, which have recently made curtailments in their passenger services, are now considering withdrawing suspension of dining car service.

PROPOSED TERMINAL RAILWAY FOR JERSEY CITY

A report has recently been prepared for the Jersey City Chamber of Commerce by F. Van Z. Lane, a consulting engineer of New York, proposing the construction of an industrial railway which will serve a large part of the water front section of Jersey City, not now well served by railways, and connect with the several trunk lines having terminals in that city. Jersey City not now having the legal power to construct or operate such a railway, the scheme is subject to the approval of the state legislature. The New Jersey Public Service Commission is said to have given its informal approval.

The project involves the construction of a double track main line through five miles of city streets along the water front from the Lackawanna terminals near the Jersey City-Hoboken line south to Caven Point avenue, a short distance below Communipaw, with a possible further extension southward to connect with the West Side Connecting Railroad which it is proposed to build along Newark Bay and the Hackensack river. The road will connect with all the trunk lines, and in the several industrial districts which the line will serve there will be 16 miles of sidings and industry tracks.

It is proposed to operate the railway by electricity, using overhead trolley or storage battery locomotives. The estimated cost is $1,500,000, including trackage, paving, etc. This cost may be borne in various ways. If it is borne by the city, 20-year bonds may be issued at 5½ per cent, whereupon there will be a yearly obligation of $116,250, including interest and sinking fund. The road may be operated by the city or leased to private parties.

The railway may conceivably be built in three sections. It will serve a total area of over 15,000,000 sq. ft. of ground which, because of the transportation facilities given by the railroad, will possess great advantages for high grade warehouses and manufacturing plants. It is claimed that the construction of the line will increase property values by at least $50,000,000 and that the railroads will gain greatly because of the increased freight business.

ANNUAL REPORT OF BUREAU OF EXPLOSIVES

The seventh annual report of the Bureau for the Safe Transportation of Explosives and Other Dangerous Articles, which has just been issued, shows that no person was killed in accidents in the transportation of explosives by railroads in the United States during the year ending December 31, 1914, and that the property loss was only $14,100; and Colonel B. W. Dunn, the chief inspector, estimates that the quantity of dangerous explosives transported during the year was about 300,000 tons. Five persons were injured, but all of these injuries were in accidents where explosives had been concealed in the baggage of passengers by railroad.

Fires and explosions in railroad transportation chargeable to accidents with all kinds of dangerous and semi-dangerous articles, caused a loss of $283,006; thirteen persons were killed and 114 injured. One item, inflammable liquids, accounts for more than half this loss. The 28 inspectors of the bureau now maintain a very thorough oversight of the transportation of dangerous articles and the record for safety is being constantly improved. The report gives a detailed list of 15 cases where cars containing explosives were roughly treated. There is a mass of information concerning the causes of 452 fires on railroads occurring in matches, charcoal, acid, gasoline and other dangerous articles. Charcoal alone figured in 52 fires, doing damage amounting to $9,871, and a special investigation has been made of the causes of these fires. Details are given, in the same way, of fires reported in the transportation of gasolene, nitric acid and rubber scrap. Over 300 illustrated lectures have been given to railroad employees during the year.

The total number of boxes of high explosives condemned as unsafe for transportation during 1914 was 4,949, about 800 less than in the preceding year; and of kegs of black powder 317, which is 78 more than in the preceding year.

The chemical laboratory of the bureau made examinations during the year of 1,166 samples of explosives, inflammables, etc.

Appendixes, filling 70 large pages, contain a great amount of detailed information relating to the safe transportation of dangerous articles.

The office of the bureau is at 30 Vesey street, New York City, and it now represents 397 railroads operating 263,922 miles of road. N. D. Maher (N. & W.) is president, and W. F. Allen is secretary.

RAILROAD REGULATION*

By Senator John W. Weeks.

If the control of the railroads given to the Interstate Commerce Commission were wise and competent, with definite limitations, the situation would, in my judgment, be extremely unhealthy; but it is even more so under present conditions, for the Commission now feels that it is hampered and restricted by the statutes so that it cannot deal with the railroads as would be done by the officers of a large corporation. The railroads have to face contradictory orders from the courts, the Interstate Commission and State Commissions. During a discussion of the trade commission bill in the Senate a resolution was introduced, inquiring of the attorney-general why he had not proceeded to bring suit to dissolve the New York Central, Lake Shore and West Shore railroads. An examination of railroad consolidations since the passage of the act demonstrated that there have been 1,845, and the inquiry was naturally made if it is wise to dissolve the corporations referred to, why would it not be equally wise to broaden it so that it would apply to all consolidations? As a matter of fact they have been winked at by the department of justice.

I have recently been a member of the Commission to study and determine the rate of pay which railroads should receive for transporting the mails. These studies have convinced me that the railroads are carrying passengers, including mail and express, without profit; that an actual loss is incurred in many cases; and yet the rate for pasesnger service within the states are controlled by state regulation and in many cases the rates are fixed by law. Substantially speaking, the only profit made by railroads under present conditions comes from their freight service. The Interstate Commerce Commission has power to fix, or pass upon interstate rates, and the Commission takes the general ground that in approving rates it cannot base its action on general conditions or the requirements of any particular time, but that there must be a fair return upon the capital actually invested.

Physical valuation of the railroads is now being conducted by Charles A. Prouty at an expense of $50,000,000. Mr. Prouty has stated that it would take at least ten years to complete that valuation and that in the meantime he thought there would be no proper basis on which to fix freight rates. Of course that calculation would mean strangulation of the activities of the country, if not receiverships, for the larger part of our railroad mileage.

The results from this valuation are almost certain to be of no real value in connection with the rate problem and the cost of $35,000,000 to the railroads, in addition to the $15,000,000 to the public, must be paid for by increased rates or taxes, so that in the final analysis it will be another element in the increased cost of living.

*From an address before the Illinois Manufacturers' Association at Chicago on December 8, 1914.

Simple Pacific Type Locomotive for the Santa Fe

For Oil Burning Service; Ample Boiler Capacity for Tractive Effort of 41,000 lb.; Axle Load Limited to 58,000 lb.

The Atchison, Topeka & Santa Fe has recently received from the Baldwin Locomotive Works a simple Pacific type locomotive, which at the present time forms a part of the exhibit of the builders at the Panama-Pacific International Exposition at San Francisco, Cal. It is the first single expansion engine to be built for passenger service on the Santa Fe system in some years.

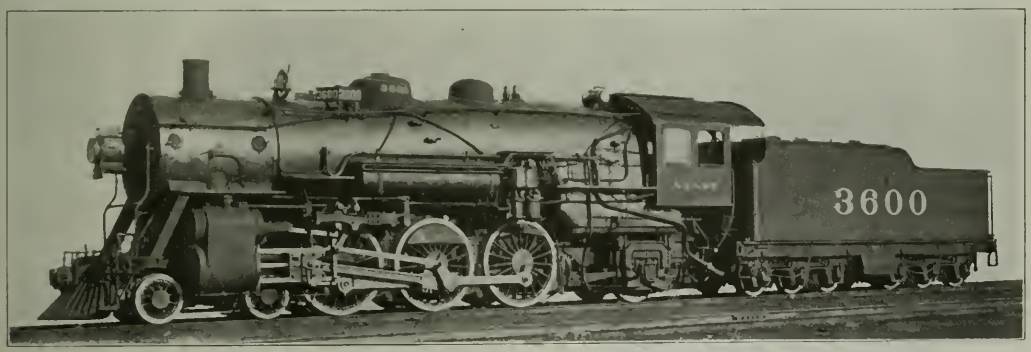
The locomotive is designed to develop the maximum possible capacity within a limiting rail load of 58,000 lb. per pair of driving wheels, and the total weight on the driving wheels of 172,500 lb. closely approaches this limit. The design was prepared conjointly by the railway company and the builder and, as in all recent Santa Fe locomotives, the details have been designed to interchange as far as practicable with those of locomotives already in service. The new locomotive develops a tractive effort of 41,000 lb., with a factor of adhesion of 4.2, and has a total equivalent heating surface of 5,913 sq. ft. The ratio of cylinder tractive effort to equivalent heating surface is 506.17, which indicates a capacity for high sustained performance.

The boiler is composed of three courses, the middle course being tapered, with the slope at the top, and the main and auxiliary domes being placed on the third course. The diameter of the first course is 80 in., which is increased to 90 in. at the third course. A circular opening 16 in. in diameter under the auxiliary dome permits entrance to the boiler without dismantling the standpipe and throttle fittings in the main dome. The boiler is equipped for oil burning but the staybolts are so located that arch tubes may subsequently be applied should it be necessary to fit the locomotive for coal burning service. The inside firebox door sheet is flanged outward, bringing the rivet heads in the water space, and the seam is closed with a copper calking strip. The O'Connor fire door flange is used and the door seam is welded by the autogenous process. Flexible staybolts are used in the breakage zones in the throat, sides and back as well as in the first four rows of crown stays. The boiler is equipped with a Schmidt superheater of 40 elements with a superheating surface of 980 sq. ft., and among the special fittings is included the Chambers throttle.

The cylinder castings are strongly built with liberal steam and exhaust passages and all cylinder saddle bolts are secured with double nuts. The steam distribution is controlled by 16-in. piston valves driven by the Baker valve gear. The valves are set with a lead of one-quarter inch and cut off at 87 per cent when in full gear. The valve motion is reversed by means of the Ragonnet power reverse gear.

The steel frames are each cast in two sections with the splice located back of the rear driving pedestals, the main sections having a width of 5 in. The splice has a slab fit with a large bearing area and is secured by 18 horizontal 1⅛ in. bolts and a pair of vertical keys. A substantial system of transverse frame bracing is applied. The guide bearer brace which is a large steel casting, extends the full depth of the leading driving pedestals, serving as a fulcrum for the driving-brake shaft, and the valve motion bearer, which is located midway between the front and main driving pedestals, has a long bearing on the upper frame rail. A similar brace supporting a waist sheet is placed between the main and rear driving pedestals. A deep brace is also applied at the main pedestal and the frames are braced at the splices between the main and rear sections by a large casting which supports the front end of the firebox and carries the trailer truck radius bar pin.

The driving boxes are cast steel and are fitted with brass hub faces which bear against steel wheel-centers. The shoe and wedge faces of the boxes are also lined with brass, while the shoes and wedges are cast iron. Flange oilers are applied to the main driving wheels. The trailer truck is of the Rushton type with outside journals, a design that has been applied to a large number of locomotives built for the Santa Fe System. The truck frame is composed entirely of steel castings and the swing links are of the three-point suspension type.



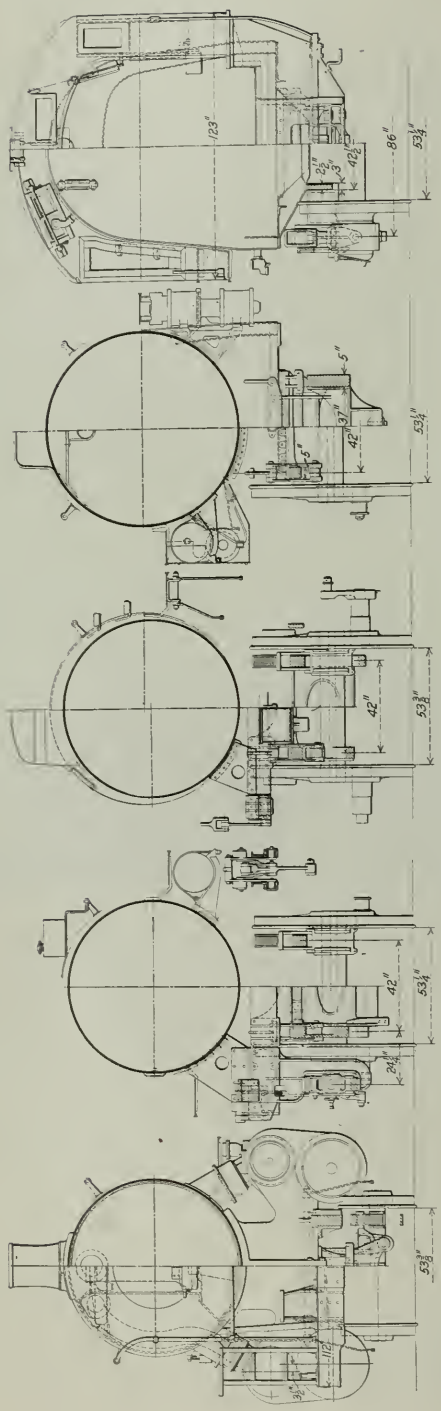
Santa Fe Simple Pacific Type Locomotive

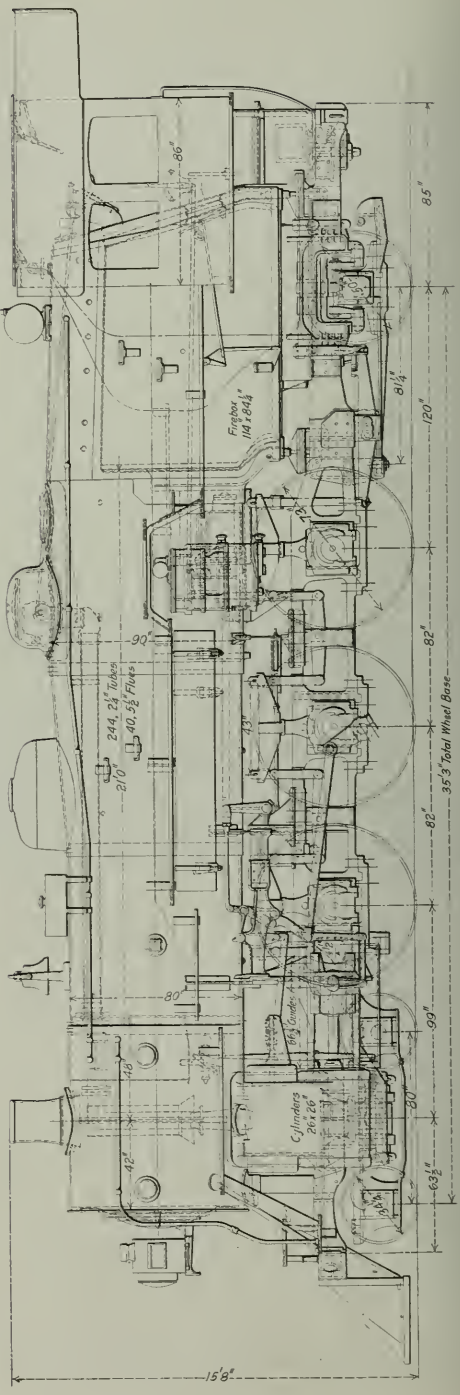
The tender has a water capacity of 10,000 gal., and carries 3,300 gal. of oil. The trucks are of the six-wheel Commonwealth type; this type is now in use under a large number of high capacity tenders in passenger service on the Santa Fe System.

The principal dimensions and data are as follows:

General Data

Gage	4 ft. 8½ in.
Service	Passenger
Fuel	Oil
Tractive effort	41,000 lb.
Weight in working order	288,700 lb.
Weight on drivers	172,550 lb.
Weight on leading truck	59,950 lb.
Weight on trailing truck	56,200 lb.
Weight of engine and tender in working order	506,000 lb.
Wheel base, driving	13 ft. 8 in.
Wheel base, total	35 ft. 3 in.
Wheel base, engine and tender	71 ft. 5¼ in.





General Arrangement of Santa Fe Pacific Type Locomotive

Ratios

Weight on drivers ÷ tractive effort	4.21
Total weight ÷ tractive effort	7.04
Tractive effort × diam. drivers ÷ equivalent heating surface*	506.17
Equivalent heating surface* ÷ grate area	88.65
Firebox heating surface ÷ equivalent heating surface,* per cent	3.92
Weight on drivers ÷ equivalent heating surface*	29.18
Total weight ÷ equivalent heating surface*	48.82
Volume both cylinders	15.98 cu. ft.
Equivalent heating surface* ÷ vol. cylinders	370.02
Grate area ÷ vol. cylinders	4.17

Cylinders

Kind	Simple
Diameter and stroke	26 in. by 26 in.

Volves.

Kind	Piston
Diameter	16 in.
Lead	1¼ in.

Wheels

Driving, diameter over tires	73 in.
Driving, thickness of tires	3½ in.
Driving journals, main, diameter and length	11 in. by 13 in.
Driving journals, others, diameter and length	11 in. by 13 in.
Engine truck wheels, diameter	34¼ in.
Engine truck, journals	7 in. by 12 in.
Trailing truck wheels, diameter	50 in.
Trailing truck, journals	8 in. by 14 in.

Boiler

Style	Extended wagon top
Working pressure	200 lb. per sq. in.
Outside diameter of first ring	80 in.
Firebox, length and width	114 in. by 84¼ in.
Firebox plates, thickness	Sides, back and crown, ⅜ in.; tube, ½ in.
Firebox, water space	Front and sides, 5 in.; back, 4½ in.
Tubes, number and outside diameter	244—2¼ in.
Flues, number and outside diameter	40—5½ in.
Tubes and flues, length	21 ft.
Heating surface, tubes and flues	4,211 sq. ft.
Heating surface, firebox	232 sq. ft.
Heating surface, total	4,443 sq. ft.
Superheater heating surface	980 sq. ft.
Equivalent heating surface*	5,913 sq. ft.
Grate area	66.7 sq. ft.

Tender

Journals, diameter and length	5½ in. by 10 in.
Water capacity	10,000 gal.
Oil capacity	3,300 gal.

*Equivalent heating surface = total evaporative heating surface + 1.5 times the superheating surface.

RAILROAD STATISTICS TO JUNE 30, 1914

The Interstate Commerce Commission has issued its preliminary statement of the earnings, expense and traffic and financial statistics of railroads *having annual operating revenues of over* $100,000, and of subsidiary non-operating companies operated by them, but not including switching or terminal companies, for the fiscal year which ended nine months ago. The principal items of the statement are tabulated below, but some of the figures for the year preceding are taken from the statement issued last year, which was given in the *Railway Age Gazette* of July 17, 1914, page 102. Where statistics of operating companies include transactions which are reported also by owning companies, there is a duplication at the end of year, the amount of which does not appear. Other items, such as capital stock of one road owned by another, make a fictitious element in the totals.

Statistics of Class 1 and Class 2 Railroads

	Year ending June 30, 1914	Year ending June 30, 1913
Miles of line operated at end of year	247,398	244,418
Miles of trackage rights included in above	11,299	11,163
Average miles operated during year	245,625	242,657
Miles of track at end of year	377,102	369,580
Locomotives	64,760	63,378
Locomotives per 1,000 miles	262	259
Cars, passenger service	53,466	51,700
Cars, freight service	2,325,647	2,273,564
Cars, company's service	124,709	120,244
Cars, total	2,503,822	2,445,508
Cars, per 1,000 miles	10,121	10,005
Passenger miles per passenger locomotive	2,365,000	2,341,269
Ton miles per freight locomotive	7,369,000	7,843,663
Employees, June 30	1,695,483	1,815,239
Employees per 100 miles	685	743
Capital stock, *thousands*	$8,680,760	$8,610,611
Funded debt, *thousands*	$11,566,542	$11,185,514
Dividends, declared	$451,263,197	$368,606,327
Dividends, average per cent	5.20	4.28
Dividends, average per cent on dividend-paying stocks	7.97	6.38
Cost road and equipment, *thousands*	$16,936,698	$16,351,639
Passengers carried, *thousands*	1,053,139	1,033,680
Passengers carried one mile, *thousands*	35,258,498	34,575,873
Passenger mileage, per mile of road	144,278	143,067
Freight carried, *thousands* of tons	1,976,138	2,058,035
Ton miles, *millions*	288,320	301,399
Decrease, *millions*	13,079	37,619
Ton miles, per mile of road	1,176,923	1,245,158
Average freight train load, tons	452	445
Average receipts per passenger mile, cents	1.982	2.008
Average receipts per ton mile, mills	7.33	7.29
Average receipts per passenger train mile	$1.35	$1.36
Average receipts per freight train mile	$3.31	$3.24
Average receipts per revenue train mile, freight and passenger	$2.45	$2.45
Average operating expenses per train mile	$1.77	$1.70
Per cent expenses	72.21	69.44
Passenger revenue, *thousands*	$700,403	$695,988
Freight revenue, *thousands*	$2,114,698	$2,198,931
Total revenue, including miscellaneous, *thousands*	$3,047,020	$3,125,136
Operating expenses, *thousands*	$2,200,313	$2,169,969
Operating expense, detailed, *thousands*—		
Maintenance of way	$419,278	$421,232
Maintenance of equipment	$532,139	$511,561
Traffic	$63,770	$62,850
Transportation	$1,101,597	$1,096,253
General	$83,530	$78,072
Revenue per mile	$12,400	$12,873
Operating expenses per mile	$8,955	$8,939

The increase in dividends declared during the year, $82,656,870, is principally accounted for by increased dividends declared by the Union Pacific and the Central Pacific. The dividends declared during the year by these two companies were more than $86,000,000 greater than those of the preceding year. The total dividends of operating roads, $379,865,024, included $162,760,634 declared out of surplus; and the dividends of non-operating roads, $71,398,173, included $34,170,961 declared out of surplus. No interest was paid on $1,331,581,452, or 11.94 per cent, of the total amount of funded debt outstanding (other than equipment trust obligations).

The expenditures for additions and betterments, as well as the expenditures for new lines and extensions, during the fiscal year 1914 are explained as follows:

Investment to June 30, 1914 (236,706.60 miles of line)	$16,936,697,840
Investment to June 30, 1913 (234,220.06 miles of line)	16,424,359,514
Increase 1914 over 1913	$512,338,326

	Expenditures for additions and betterments	Expenditures for new lines and extensions	
From cash or other working assets	$330,529,491	$61,370,851	
From special appropriations	43,616,529	114,129	
Through issue of securities	138,135,821	60,062,788	
Not assigned	3,779,449	157,910	
Total	$516,061,290	$121,705,678	$637,766,968
Miscellaneous charges not classified			851,008
Total expenditures during year			$638,617,976

Credits.	
Property retired or converted	*$88,104,245*
Adjustments	*8,524,764*
Difference between record value of grantor and purchase price of grantee in cases of roads sold, merged, consolidated, etc.	*29,650,641*
Total	*126,279,650*
Net increase during year	$512,338,326

The 2,325,647 cars in freight service were classified as follows:

Description	Number	Aggregate capacity. *Tons*
Box	1,043,796	36,622,074
Flat	146,133	5,214,949
Stock	82,971	2,597,278
Coal	899,314	40,583,490
Tank	8,530	340,722
Refrigerator	48,886	1,577,973
Other cars in freight service	96,017	4,040,612
Total	2,325,647	90,977,098

CONDENSED INCOME ACCOUNT

Following is a condensed income account of the roads included in this list, below which is a similar statement for the controlled, non-operating companies, both incomplete because of the omission of a few unsatisfactory returns. The accounts of the operating roads include both operating and financial transactions, while the accounts of the non-operating roads are confined for the most part to receipts and payments under leases, contracts and agreements. For a number of items, such as dividends, taxes, etc., both statements must be taken into consideration in order to learn the aggregates

of such items for the railways of the United States therein represented.

The aggregate of dividends declared during the year, $451,263,197, includes those declared out of current income and those declared from surplus both by the operating roads and by the non-operating roads. This amount includes dividends declared on railway capital stock owned by other railway companies.

REFRACTORY LEGISLATIVE MACHINERY

[Springfield Republican]

The closest student of American history could not recall probably a case similar to the present effort of four New England state legislatures to enact at about the same time the same law on a highly important matter of business. If the legislatures of Massachusetts, New Hampshire, Vermont and Maine, in their efforts to rescue the Boston & Maine from a receivership, seem to be in the wildest confusion over the bills and the numerous amendments thereto, one finds no cause for surprise. The difficulties to be encountered in making four independent bodies of lawmakers do team work on a question which affects differently, perhaps, the selfish interests of their constituents were sure to be most formidable. The history of legislative bodies, under somewhat similar circumstances, is that they will work in harmony only when menaced by a common peril sufficiently grave to force unity of action.

There is no question as to the necessities of New England as a whole. The Boston & Maine system should be reorganized and saved from a receivership; indeed, it should be reorganized even if a receivership could be avoided without legislation. The highest conception of the public welfare of this section probably does not control these four lawmaking bodies; selfish and local interests are making themselves powerfully felt. In one of the states it is the common talk that no bill can be passed which is not satisfactory to certain leased lines. . . .

The six New England states have a common name, indicating a historical and geographical identity uncommon among other groups of states in the country. This railroad case is a test of the ability of several states having a common interest to act together on a voluntary basis. Success would exercise a far-reaching influence in mitigating a certain chaos into which, in various matters, our whole state system appears to be drifting.

ROLLING RESISTANCE OF CARS OVER SWITCHES AND FROGS*

By C. L. Eddy

Assistant Professor of Railway Engineering, Case School of Applied Science, Cleveland, Ohio.

In making the design for a gravity yard it is necessary to know or to assume the resistance to rolling of freight cars in order to determine the proper grades to use. This information may be obtained from the results of experience in the operation of yards, or may be taken from tests made to determine the rolling resistance of cars. Considerable data is to be had pertaining to freight-train resistance on straight track, but this information cannot be used in the design of the proper grade for a ladder track in a gravity yard on account of the methods used in making the tests and the difference in track conditions. It is known that train resistance varies not only with the speed, car weight and the number of cars, but also with the condition of the track. In a gravity yard the switches and frogs on a ladder track offer additional resistance to the motion of a car that is not encountered on ordinary track, and might be comparable to the resistance of a badly surfaced track with worn rails.

Modern freight-train resistance tests are made with a dynamometer car and full-length trains in service. This method gives good results for the proper rating of engines, but not for the design of gravity yards, since trains in the yard are divided into cuts of from one to ten or more cars each, which introduces car resistance instead of train resistance. Drop tests with single cars have been made, but usually on straight track free from switches and frogs. In order to obtain data on the rolling resistance of cars over switches and frogs, the tests described below were undertaken by students at Case School of Applied Science as a part of their thesis work.

The tests were made on the south ladder of the south classification group of tracks of the New York Central yard at Collinwood, Ohio. This group consists of 23 tracks running in a general east and west direction, and connected with the hump track by two ladder tracks, which separate about 200 ft. from the top of the hump. No. 8 rigid frogs and split switches are used, all of which are in good order. The tracks are numbered from north to south, so that track 23 is the outside track on the south side. The track from the top of the hump to the classification group is a continuation of the south ladder and has a grade of 4 per cent. The grade of the south ladder is 1.175 per cent, the change being made at the separation of the ladders.

In taking observations, the velocity of a car was measured

*Abstracted from Bulletin 175 of the American Railway Engineering Association, March, 1915.

near the top and bottom of the ladder track. With this information, the distance between points of observation and the rate of grade, the resistance in pounds per ton could be computed.

Only cars going over the hump in the usual routine of yard operation were used in making the tests. In order that the distance between points of observation might be as great as possible, and still have both on the same grade, one point was taken near the foot of the 4 per cent grade and the other at the entrance of track No. 20. Thus cars for tracks Nos. 20, 21, 22 and 23 could be used for observations. The first 76 observations—the first set—were taken during March, April and May, 1913, by one set of students, while the remainder were taken by another set in May, 1914.

In addition to measuring velocity, the following information was obtained for each test: (1) Light weight of car and load, if any; (2) capacity of car; (3) direction and velocity of wind; (4) Temperature of air, and (5) weather conditions.

The light or stenciled weight was taken directly from the car, as was the capacity, while the load was taken from the waybills. During the first set of observations the direction and velocity of the wind were obtained from the local United States weather bureau. The velocity recorded, therefore, was the maximum for that day. While making this first series of tests, a great many observations were taken which have not been recorded on account of too high wind velocity. Those recorded showing wind velocities as high as approximately twenty miles per hour were used for the reason that from notations on the log-sheet it was certain that the wind was not blowing at that velocity at the time the observations were taken. During the second set of observations the wind velocities were taken on the windward side of the ladder track by means of an anemometer, while the wind directions were obtained by means of a weather-vane attached to a staff set in the ground.

Care was taken to see that the brakes were not set on any car under observation from the time it left the top of the hump until it passed the last contact. The car riders were instructed by the assistant yardmaster to allow the cars to run freely between the points of contact when possible. This was not always possible, and it was the duty of one of the observers to watch the car riders. If brakes were set, the record was so marked and the observation was discarded.

The velocity was obtained by recording automatically the time required for a car to pass over a measured distance—usually 60 ft.—and dividing the distance by the time. Contact blocks, placed near one rail of the ladder track, were connected electrically with the recording pencil of a chronograph, so that a record was made when the wheel of a car struck them. One pair was placed near the foot of the 4 per cent grade below the separation of the ladders, and the other near the entrance to track No. 20. The chronograph was also connected electrically with a pendulum, calibrated to accurately beat half seconds, so that each half second was recorded by a V-shaped mark on the record. By scaling between these marks and the records made by the wheels, the time required for a car to run from one contact to another could be obtained to 0.01 of a second. The velocity thus obtained was taken as the velocity of the car midway between the contacts.

To see that there was no material error in taking this average velocity as the velocity at a point, the four contacts were placed 30 ft. apart and observations taken by recording the contact of all four wheels of each car. By measuring the distance between wheels it was possible to compute the average velocity from the time it took the car to travel these distances. Thus the average velocity over a distance as short as 5 ft. was obtained, and at four consecutive points 30 ft. apart. The velocities thus obtained at the second contact were a mean of those obtained at the first and third and checked with the average velocities over the first 60 ft. within 0.5 per cent. By having the fourth contact, a check on the above observations could be had by using the velocities at the second, third and fourth points.

From the results of these observations it was decided that the average velocity as obtained above might safely be used.

All observations were taken on box cars except one with an empty gondola, and two with loaded gondolas.

The results were analyzed with the idea of investigating the effect of variations in the initial velocity upon the total resistance, but no definite conclusions could be drawn because of the limited range of velocities. This range was between 11 and 14 miles per hour for the greater part of the observations, a few falling as low as 9 miles per hour and a few going as high as 16 miles per hour.

There was no definite relation developed between car weight and resistance. This is as might be expected, considering the limited number of observations taken and the variations in the condition of cars observed. However, if established, this law of variation could be given no consideration in the design of a yard, since the inclination must be such as to properly handle both empty and loaded cars. The resistances obtained were not only high in comparison with train-resistance tests, but cover a wide range in their variation.

The average of the resistances derived from the first set of observations, exclusive of the first eleven, was 21.7 lb. per ton. These first observations were not included in the average, because the temperature of 20 deg. F. was outside the range that the observations were designed to cover. The average for the second set of observations was 22.3 lb. per ton. Considering the total number of observations, exclusive of the first 11, the average is 22 lb. per ton. The resistance of from 24 to 27 lb. per ton was obtained more times than any other, showing that it is probable that this resistance might be expected to occur more times than the average of 22 lb. per ton. The tests also show that a resistance of from 27 to 30 lb. per ton might be expected to occur about as many times as the average, indicating that a resistance of at least 30 lb. per ton should be considered in the design.

Over 77 per cent of the total number of cars observed had a resistance less than 27 lb. per ton, and 90.8 per cent had a resistance less than 30 lb. per ton. Therefore, if provision be made in the design for a resistance of 27 lb. per ton, it is probable that 22.3 per cent, or about one-quarter of all the cars passing over the hump, would have a resistance greater than this, and there is considerable certainty that some of them would stop before reaching their destination. Providing for 30 lb. per ton resistance would take care of 90.8 per cent of all cars, leaving only 9.2 per cent with a resistance greater than that provided for. Thirty-three pounds a ton would provide for all but 5 per cent of the total, 36 lb. for all but 1.4 per cent, 39 lb. for all but 0.7 per cent and 42 lb. for all cars.

It is recognized that in gravity switching the speed on the ladders should be as great as consistent with safe operation, in order to get the maximum operating capacity of the yard. However, the speed must not be so great as to cause derailment of the cars on the turnout curve of any classification track. The Committee on Yards and Terminals of the American Railway Engineering Association, Vol. 9, quotes W. C. Cushing, chief engineer of maintenance of way, Pennsylvania Lines, Southwest System, as follows: "The grades on the hump should be sufficient to give the cars a speed of 12 miles per hour on any track, and the speed should be regulated by the brakeman to meet the conditions on any particular track on which his car is going." The committee approved of this statement and continued: ". . . and as a general rule it is no doubt proper to consider about 15 miles per hour as the maximum speed at which cars should reach the turnouts leading to classification tracks."

The momentum grade, then, should be sufficient to deliver the cars to the ladders with a speed of about 12 miles per

hour, and this speed should be attained as quickly as possible to facilitate operation.

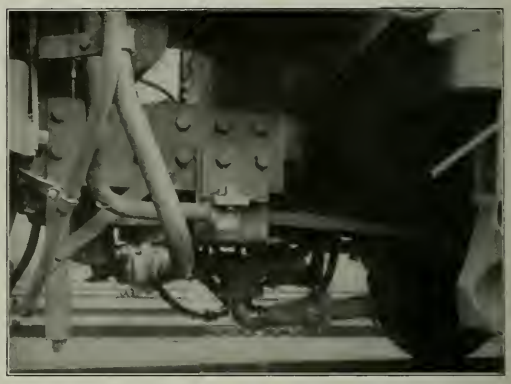
At Collinwood about 56 per cent of the cars observed had a speed greater than 12 miles per hour, about 28 per cent had a speed greater than 13 miles per hour, 5 per cent greater than 14 miles per hour and 1 per cent greater than 15 miles per hour. The conclusion might be drawn from this that the hump is too high, but it must be remembered that the temperature conditions under which these tests were made were all favorable to high velocities. From the first 11 observations, which were taken with the temperature at 20 deg. F., speeds are obtained ranging from 9 to 14 miles per hour, with an average of 11.6 miles per hour. While there are not a sufficient number of these observations to conclusively prove anything, the indications agree with the conclusions reached from observation that less speed can be expected in winter weather than in summer. Attention is called to the fact that all of the cars observed at Collinwood ran down a straight track, a fact which must be taken into account when comparing these results with those observed at yards having a curve at the separation of the ladders.

There should be no lagging or stopping of the cars on the ladder, since either will limit the operating capacity of the yard. On the other hand, there should be no increase in the speed of the cars on the ladder, since they enter with the maximum desirable velocity. Therefore, the grade on the ladder, or "continuing grade," should be such that the cars will be carried along with a uniform velocity. The question then arises as to what car resistance shall be used as the basis of the design in accordance with the above recommendations. It would seem consistent to say that provision should be made for at least 95 per cent of the cars observed in this test, since the observations were made under favorable temperature and atmospheric conditions.

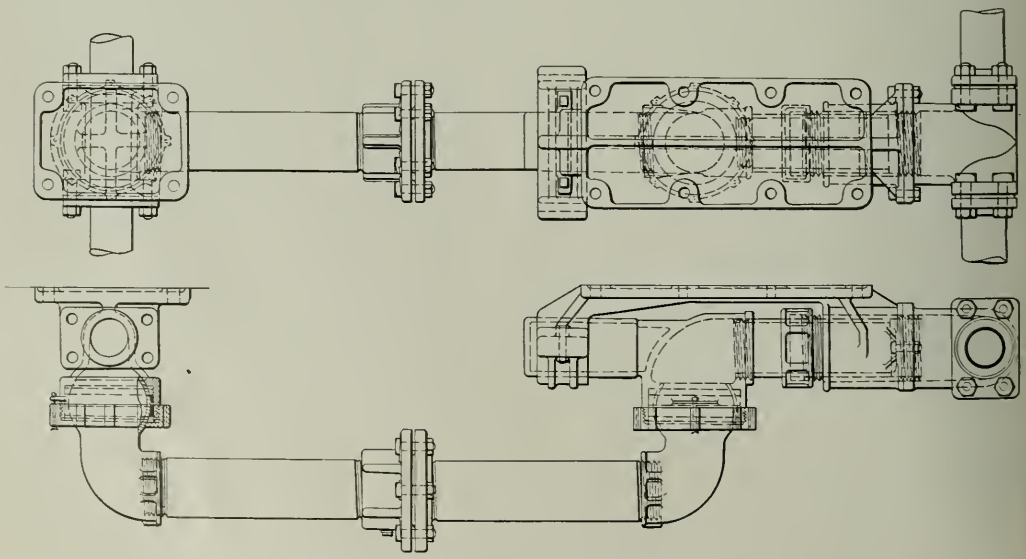
As shown above, when providing for 95 per cent of the cars, provision is made for cars with a resistance of 33 lb. per ton. This would mean that the continuing grade on the ladder tracks should be 1.65 per cent in order that there would be no lagging of these cars. It would also mean that brakes would have to be used to regulate the speed of all cars with a resistance less than 33 lb. per ton, or they would increase in velocity. It is understood, of course, that no yard can be operated under ideal conditions; that provision must be made for adverse winds, low temperatures, etc., so no general rules can be laid down for the design of a yard for year-around operation which are based upon experiments made, or experience obtained, under summer weather conditions only.

SINGLE LOCOMOTIVE WATER JOINT

A single water joint for use between the engine and tender has recently been developed by the Franklin Railway Supply Co., 30 Church street, New York. It eliminates the use of the present rubber hose connections for the injector suction pipes and provides one connection which is large enough to supply water to both injectors. The water joint is located directly under the drawbar on the center line of the locomotive.



Location of the Single Water Joint Under the Drawbar



Single Water Joint for Use Between Engine and Tender

The water connection, which is made up of extra heavy wrought iron pipe, is attached at either end to tee heads, the

branches of which lead to the two tank wells on the tender and to the two injector suction pipes on the engine. It includes two ball joints and one slip joint, a combination which takes any motion occurring between the engine and tender. At its rear end the inside sleeve of the slip joint is threaded into an elbow connection which turns downward and forms the outer casing of the forward ball joint. An extension is cast on the elbow which is supported in a slide bearing bracket secured to the deck of the locomotive. This arrangement serves as a guide for the slip joint, relieving it from lateral strain.

All the attention this joint is said to require is the occasional renewal of the gasket in the ball and slip joints. One of the difficulties it is expected to overcome is freezing, which often occurs in the present hose connections. The probability of freezing in this connection is reduced owing to the fact that either heater will keep it open while both heaters are required with the usual type of double connection.

EXHAUST NOZZLE WITH INTERNAL PROJECTIONS

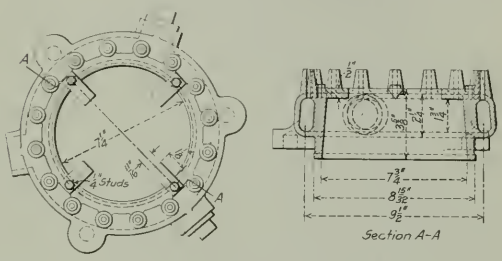
An exhaust nozzle having internal projections from the periphery of a circular opening of the usual type has recently been developed in the Pennsylvania locomotive testing plant at Altoona, Pa., and patented by F. A. Goodfellow, foreman of the testing plant, by the use of which considerable increase in locomotive capacity has been effected. The projections are of triangular section, four in number; each extends out 1⅛ in. from the periphery of the opening, and is 11/16 in. in width at its top face, the area of the opening being reduced 3.44 sq. in. in the nozzle shown in the drawing. The projections are machined to size and fastened in place with studs so that the apex of each piece points in a downward direction, but will be drop forged in the future, thus saving the cost for machining; they will also be fastened permanently in place by electric welding. This will make it impossible to either increase or decrease the size of the opening without breaking off the welded projections and will eliminate the tendency to make unauthorized changes in the size of standard nozzles. In making up a nozzle of this type, it has been the practice to bore the circular nozzle for the particular class of locomotive on which it is to be tried, ¼ of an inch larger than the specified diameter. The projections are then made to give an area equal to the difference between specified and bored out areas. This method reduces the cost of application to a minimum and does not necessitate the making of a new nozzle.

The purpose of the projections is to break up the continuity of the circular section of the exhaust jet and change it to a Maltese cross form, thereby increasing the gas entraining capacity of the jet and creating a greater vacuum in the front end. The nozzle is fastened to the exhaust stand without attention to the angular location of the projections relative to the axis of the front end, as experiments have proved that alterations in this location do not affect the performance.

A number of tests were made in the locomotive testing plant at Altoona of both the standard circular nozzle and the internal projection nozzle on engines of three classes, in each case the only change made on the locomotives being the change in exhaust nozzles. These engines* were an Atlantic, E 6s, a Pacific, K 4s, and a Mikado, L 1s.

The accompanying table gives a comparison of the maximum results which were obtained from the locomotives when using each of the two nozzles. A wide open throttle was used in each instance and the working pressure was 205 lb. per sq. in.

It will be observed that a much better performance in general was obtained from each of the locomotives when using the new type of nozzle, and especially is this true in the case of the Pacific and Mikado type locomotives, both of which have boilers similar in design. The Pacific type locomotive delivered an equivalent evaporation of 87,414 lb. per hour and 3,183.9 indicated hp., with the internal projection nozzle, while with the standard 7 in. circular nozzle it was possible to obtain but 51,842 lb. equivalent evaporation per hour and 2,241.5 indicated horse power. The Mikado type locomotive, having smaller drivers and a longer stroke, developed 79,675 lb. equivalent evaporation per hour compared with 58,539 lb. obtained with the circular nozzle, and 2,835.5 indicated horse power or an increase of 469 i. hp. above what was developed with the use of the 7 in. circular nozzle. Comparing the performance of the Atlantic type locomotive when equipped with each of the two nozzles, there was obtained with the four internal projection nozzle an increase in equivalent evaporation of 24.2 per cent and 14.6 per cent greater indicated horse power.



Internal Projection Exhaust Nozzle

The considerably higher front end draft obtained with the new type of nozzle in each instance is responsible for the remarkable results attained, enabling a much greater rate of combustion and a higher degree of superheat to be obtained.

Type of locomotive	Atlantic		Pacific		Mikado	
Kind of nozzle	Four internal projections	Circular, 6.25 in. diameter	Four internal projections	Circular, 7 in. diameter	Four internal projections	Circular, 7 in. diameter
Area of nozzle, sq. in.	30.86	30.68	38.19	38.45	38.08	38.45
Speed, m. p. h.	46.9	47.0	47.3	37.8	28.3	29.3
Actual cut-off, in per cent.	52.0	46.0	60.3	46.4	60.8	51.1
Average boiler pressure, lb. per sq. in.	204.9	184.8	201.3	203.2	204.7	204.4
Draft in smokebox, in. of water	15.1	8.3	18.8	5.7	14.9	8.6
Draft in ashpan, in. of water	0.40	0.41	0.71	0.51	0.60	0.64
Dry coal fired per hr., lb.	8,271	6,942	11,813	5,146	9,312	6,621
Dry coal per sq. ft. grate	148.3	124.4	170.6	74.3	133.0	94.6
Water evap. per hr., lb.	44,628	35,928	65,400	39,977	59,508	46,170
Equiv. evap. per hr., lb.	58,641	46,771	87,414	51,842	79,675	58,539
Superheat, deg. Fahr.	204.2	175.9	215.2	157.2	183.5	122.2
Indicated horsepower	2,304.8	1,901.1	3,183.9	2,241.5	2,835.5	2,366.7

ARGENTINE RAILWAYMEN AND THE WAR.—The number of men from the Central Argentine Railway who have volunteered for active service with the Allies totals 270, which is equivalent to nearly 30 per cent of the total English staff of the company.

*For descriptions of these locomotives see the following numbers of the *Railway Age Gazette:* E6s, page 356, February 20, 1914; K4s and L1s, page 12, July 3, 1914.

General News Department

The machine and blacksmith shops of the Seaboard Air Line at Portsmouth, Va., were destroyed by fire on the night of April 6.

A bill has been introduced in the Minnesota legislature providing that whenever two or more railroads enter a city, village or town in the state the railroad and warehouse commission may order the construction of a union station.

Of 336 fast freight trains run by the Baltimore & Ohio from New York, Philadelphia and Baltimore to Chicago, Columbus, Cleveland, Cincinnati and St. Louis, March 1 to 12 inclusive, only one suffered by delay, and this was the result of an unavoidable delay near Cincinnati.

The British American Company, Chicago, Ill., announces that it is making plans and specifications for the erection of a $5,000,000 ship building plant, to be located on the Atlantic coast. All business pertaining to the machinery required will be handled directly by this company.

The semi-annual meeting of the Santa Fe Loss and Damage Committee was held in Dallas, Tex., last week. About 100 men, representing all four grand divisions, were in attendance, devoting their time to the consideration of methods of reducing claims for loss of and damage to freight.

Baltimore & Ohio Southwestern train No. 27, a local passenger train running part of the time between Cincinnati, Ohio, and Seymour, Ind., a distance of 87 miles, and the remainder of the time between Cincinnati and North Vernon, a distance of 72 miles, has been on time for 412 consecutive days, up to and including April 1; this is on a busy single-track railroad.

The Canadian Pacific proposes to discontinue the use of its Broad street station at Ottawa for passenger business and to run all trains to and from the Central station of the Grand Trunk. It is understood that arrangements are nearly or quite completed, and that the change will be made about June 1. Counting trains in and out there will be about 34 Canadian Pacific trains daily. Trains of the Canadian Northern already use the Central station.

The International & Great Northern has organized a central safety first committee and division safety committee. The central committee includes A. G. Whittington, general manager; the assistant general manager; the superintendent of transportation, the purchasing agent, the general claim agent, the superintendent of telegraph, the superintendent of motive power, superintendents of various divisions and the general chairmen of the various brotherhoods. The division committee consists of superintendents of the divisions and representatives of the employees.

With their new summer suits the uniformed forces of the Baltimore & Ohio will be decorated with badges of honor upon the basis of length of service. Coat sleeves will bear gold bars and stars, the bars signifying five years' service and the stars twenty-five years. The service record of the Baltimore & Ohio men is approached by few railroads. Many of the passenger conductors, station masters and others will wear the gold star. Pensioned employees have been asked to wear their old uniforms to headquarters that they may be decorated; and those veterans whose service did not require uniforms will receive fitting recognition at the same time.

George Hannauer, general manager of the Indiana Harbor Belt; F. A. Spink, traffic manager of the Chicago & Western Indiana, and John G. Drennan, district attorney of the Illinois Central, appeared before the public utilities committee of the house of the Illinois legislature last week, to oppose a bill to give the city of Chicago power to regulate steam railroads and public utilities within the city limits. The speakers showed that this bill would put Chicago railroads under the jurisdiction of three commissions—the Interstate Commerce Commission on interstate business, the state public utilities commission on most of the intrastate business, and the city commission on business within the city limits of Chicago.

Students of the railway department of the University of Illinois, under the leadership of Prof. E. R. Dewsnup, spent four days last week in Chicago making an inspection of the Chicago terminals, and visiting the offices of various departments of the railroads where officers of the roads explained to the students the work of their various departments. On Monday they visited the local freight station of the Chicago, Milwaukee & St. Paul and were given a talk on freight handling by Agent Nelson W. Pierce. Later they visited the auditing offices of the Rock Island lines, where W. H. Wallace, car accountant, described the system of car service records and accounts. In the afternoon they visited the Fordham classification yards of the Illinois Central, where W. J. Leahy, superintendent of freight terminals, and Trainmaster Bernard described the work of a classification yard. Tuesday was devoted to an inspection of the Belt Railway and the Clearing yard, and on Wednesday the students were given an insight into the work of train despatching, shop work and the storekeeping department at the offices and shops of the Burlington. On Thursday they visited the offices of the superintendent of transportation of the Rock Island lines, the LaSalle street station, the office of chief engineer, where Mr. Morse described the system by which the Rock Island supervises maintenance of way and structures, and later at the office of the Chicago & North Western, R. C. Richards, chairman of the General Safety Committee, gave the students a talk on railway safety.

Proposed Legislation Affecting Railways

The transportation committee of the Minnesota Senate has killed the bill to increase state passenger fares from 2 to 2½ cents a mile.

The bill to increase intrastate passenger fares in Ohio from 2 to 2½ cents a mile has been tabled by the utilities committee of the lower house of the Ohio legislature. It is stated that it is proposed to present a substitute measure giving the state public utilities commission authority to grant an increase if, after investigation, it finds an increase justified.

A bill has been introduced in the Illinois legislature providing for the appointment of a committee, consisting of five senators and five representatives, to investigate the business and condition of the Illinois railroads with reference to revenues, rates, earnings, expenses and equipment, with a view to a determination as to whether their rates are too low. The committee is to be authorized to inquire into all financial relations of the companies and their control.

Enginemen's Arbitration Proceedings Concluded

The board of arbitration, which has been hearing evidence on the wage demands of the western engineers and firemen, began holding executive sessions daily at Chicago on Monday of this week for the purpose of formulating the decision of the board. The oral arguments in the case were concluded on Friday, April 2, when Warren S. Stone, grand chief of the Brotherhood of Locomotive Engineers, closed his argument on the brief filed by himself and by W. S. Carter, president of the Brotherhood of Locomotive Firemen and Enginemen. Before the hearing closed both sides agreed that the time for the arbitrators to render an award may be extended to April 30, if necessary, although Chairman Pritchard said he hoped and believed that the board would be able to make its award by April 15.

Referring to the statement made before the eastern arbitration board in 1910, that there was no reason why the western engineers should be paid more money than those of the East on engines of the same class, Mr. Stone said he proposed to make the eastern rates come up to the schedules of the western lines. He did not say when he would present the demands on the eastern

lines for an equalization. Several times during his argument Mr. Stone intimated plainly that if the award in this case failed to satisfy the engineers and firemen they will never again agree to submit wage controversies to arbitration.

The hearings before the board began at Chicago on November 30. The testimony and arguments presented have made a total of more than 2,500,000 words, in addition to thousands of pages of statistical exhibits, and the cost to the railroads and the brotherhoods is estimated to have been more than $500,000.

Summary of Revenues and Expenses of Steam Roads

The Bureau of Railway Economics' summary of revenues and expenses and comments thereon for January, 1915, are as follows:

The net operating income of the railways of the United States for January decreased $5 per mile, or 2.8 per cent, as compared with January, 1914; in January, 1914, it was 25.6 per cent less than in January, 1913.

Total operating revenues amounted to $214,196,786, a decrease from 1914 of $17,006,859. Operating expenses were $163,769,221, a decrease of $16,307,796. Net operating revenue amounted to $50,427,565, a decrease of $699,063. Taxes amounted to $11,213,928, a decrease of $87. This left $39,174,218 for net operating income, the amount available for rentals, interest on bonds, appropriations for improvements and new construction, and dividends. Operating revenues per mile of line averaged $936, a decrease of 8.3 per cent; operating expenses per mile averaged $716, a decrease of 10.0 per cent; net operating revenue per mile averaged $220, a decrease of 2.4 per cent, while taxes per mile were $49, a decrease of 1.0 per cent. Net operating income per mile was $171, a decrease of 2.8 per cent. Railways operating 228,690 miles of line are covered by this summary, or about 90 per cent of the steam railway mileage in the United States.

Total operating revenues of the eastern railways per mile of line decreased 6.3 per cent as compared with January, 1914, operating expenses decreased 9.8 per cent, net operating revenue increased 11.8 per cent, taxes increased 0.7 per cent, and operating income increased 16.3 per cent.

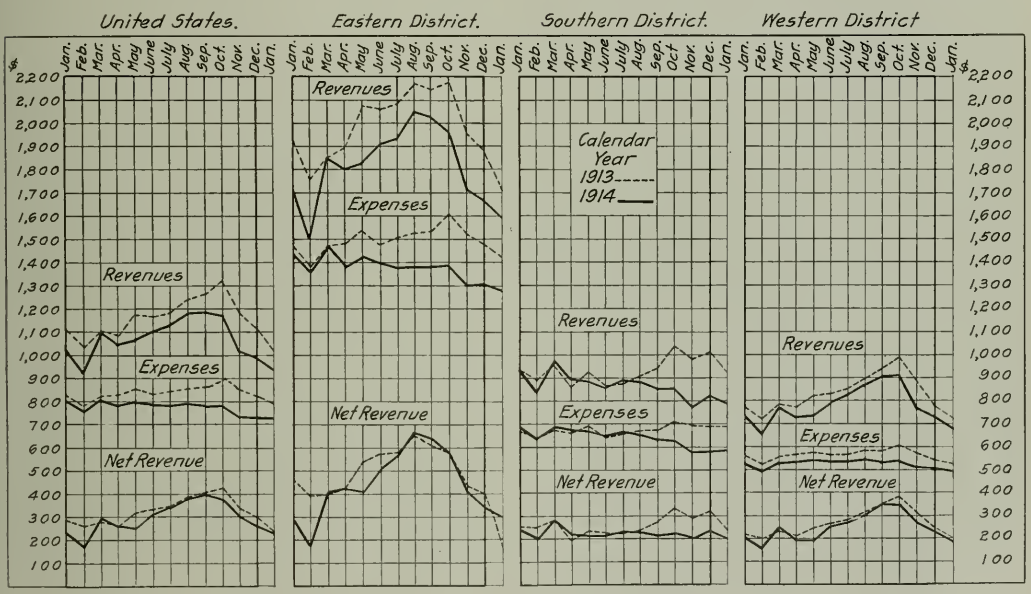
Total operating revenues of the Southern railways per mile of line decreased 15.0 per cent, operating expenses decreased 15.2 per cent, net operating revenue decreased 14.3 per cent, taxes decreased 0.5 per cent, and operating income decreased 17.0 per cent.

Total operating revenues of the western railways per mile of line decreased 7.1 per cent, operating expenses decreased 7.4 per cent, net operating revenue decreased 6.5 per cent, taxes decreased 2.4 per cent, and operating income decreased 7.6 per cent.

The seven months of the current fiscal year show a decrease in total operating revenues per mile of 8.6 per cent as compared with the corresponding period of the preceding year, a decrease in operating expenses per mile of 9.8 per cent, and a decrease in net operating revenue per mile of 5.6 per cent.

This net operating revenue per mile shows an increase of less than one-tenth of 1 per cent in the East, decreased 19.0 per cent in the South, and decreased 5.6 per cent in the West.

January operating income per mile was 2.8 per cent less in 1915 than in 1914, 28.0 per cent less than in 1913, 8.5 per cent more than in 1912, and 13.8 per cent less than in 1911.



Monthly Revenues and Expenses Per Mile of Line 1914 and 1915

Mail Pay Controversy

The intemperate deliverances of Postmaster General Burleson, in connection with the failure of Congress to adopt his recommendations in relation to railway mail pay, have been widely criticized in the press, his denunciations of the railroads, unsupported by any statement of facts, eliciting unfavorable comments from papers of all political parties. Ralph Peters, chairman of the railways' committee on mail pay, has issued a leaflet quoting editorials from a dozen prominent papers.

Mr. Peters has also issued a statement commenting on Mr. Burleson's comparison of mail and express earnings. Mr. Burleson says that from New York to Chicago railway mail pay amounts to $2.58 per 100 lb., while the railroads' proportion of the first class express rate between those cities is $1.20 per 100 lb. But, says Mr. Peters, the fact is that the express rate Mr. Burleson names is not an average, or in any way a representative rate, but is the railroads' share of the express company's share for a single 100-lb. package, on which the very lowest wholesale rate is given to the shipper. "The railroads' receipts from the smaller express packages,

which make up the great bulk of the actual business—and hence their average receipts per 100 lb. of express—are far higher than the figure Mr. Burleson quotes, a fact of which it is scarcely conceivable he could be unaware.

"For instance, for carrying 100 one-pound express packages from New York to Chicago, the express company would receive 23 cents apiece, or a total of $23. Of this amount the railroads' share for its portion of the service would be about half, or $11.50, which is nearly 4½ times the rate for carrying 100 lb. of mail. Such a comparison, if offered as representative of average conditions, would be no more misleading than the one going to the opposite extreme which Mr. Burleson has used. The truth, of course, lies between the two extremes."

Michigan Legislature Fails to Locate Alleged "Slush Fund"

A committee of the Michigan legislature last week held a hearing at Lansing for the purpose of investigating rumors said to have been circulated about the legislature, that the railroads had a large "slush fund" for influencing the attitude of the members of the legislature and also newspapers in the state. The investigation was devoted mainly to a consideration of a number of statements by state officers which appeared in a full-page advertisement in the Lansing State Journal favoring an increase in passenger fares. Investigation of the alleged "slush fund" dwindled to a number of denials from members of the legislature that they had ever heard of such a fund, although some of them admitted discussing a large fund to be used by the railroads for publicity. Newspapers have printed various rumors about a fund of $300,000. W. W. Walker, vice-president and general manager of the Duluth, South Shore & Atlantic, testified on April 1, that since last September three assessments of $5,000 each had been levied against the railroads of the state to be used in newspaper advertising, and that about $500 had been left over from another fund. Later A. W. Towsley, vice-president of the Ann Arbor, submitted a detailed statement of expenditures made for publicity and attorney's fees amounting to $15,283. Some of the state officers who were quoted in the newspaper advertisement either denied the correctness of the statements attributed to them or insisted they did not know they were being interviewed for publication. C. L. Glasgow, chairman of the Michigan Railroad Commission, objected to one of these statements attributed to Commissioner Cunningham, saying it did not represent the views of the commission. Officers and reporters of the Lansing State Journal also were called to explain the way in which the interviews were obtained.

A hearing was held before a committee of the legislature on March 30, on a bill which has been reported by committees of both the House and the Senate, providing for a sliding scale of passenger fares based on the past earnings of the roads. Representatives of several of the railroads appeared and objected to such a bill. Paul King, receiver of the Pere Marquette, said that under such a law his road could not charge the higher rate between points where it came into competition with the Michigan Central, which, under the proposed law, would be allowed to charge no more than two cents a mile. H. Russell, general counsel for the Michigan Central, also objected to the bill. It is reported that a majority of the members of the legislature are in favor of this bill.

June Mechanical Conventions

J. D. Conway, secretary-treasurer of the Railway Supply Manufacturers' Association, advises that already 178 exhibitors have arranged for space on Young's Million-Dollar Pier during the Master Mechanics' and Master Car Builders' conventions in June. Applications for space are coming in daily and in spite of the business depression the indications are that the exhibits this year will be at least as extensive as, and possibly larger than, those of last year. The list of exhibitors shows a number of new companies which have never before exhibited. There seems to be little question but that the New Traymore Hotel will be open to receive guests by June 1. It will have 700 rooms with private baths and, it is said, will compare favorably with the newer and better class hotels of New York. The Convention Hall on the Million-Dollar Pier will be considerably enlarged and the exhibit space designated as Hotel Men's Annex will be enclosed with glass sash. Other improvements and rearrangements are being made in the space, which, it is expected, will add greatly to the effectiveness of the exhibit.

International Engineering Congress

The American societies of civil, mining, mechanical, electrical and marine engineers have arranged for a special train from New York to San Francisco to attend the International Engineering Congress, which will be held there September 20 to 25. The train will leave the Grand Central Terminal New York, at 7:45 p. m. Thursday, September 9, and will stop 4 hours at Niagara Falls, 12 hours at Colorado Springs and 15 hours at the Grand Canyon, arriving at San Francisco at 9:00 p. m. September 15. Since many members of these societies cannot conveniently join this party from New York, extra cars will be added to the Sunset Limited of the Southern Pacific leaving New Orleans at 11:00 a. m. Sunday, September 12, and arriving at San Francisco at 1:00 p. m. Wednesday, September 15.

Electrical Engineers

The American Institute of Electrical Engineers will hold its thirty-second annual convention at Deer Park, Md., June 29 and 30, and July 1 and 2. Morning and afternoon sessions will be held, that of Thursday afternoon being devoted to problems of electrified steam roads. Among the subjects considered at this session will be: Construction and Maintenance Costs of Overhead Contact Systems, by E. J. Amberg and Ferdinand Zogbaum; The Contact System of the Butte, Anaconda & Pacific, by J. B. Cox; Third Rail and Trolley System of the West Jersey & Seashore, by J. V. B. Duer; Top Contact Unprotected Contact Rail for 600-Volt Traction System, by Charles H. Jones, and Under-Running Third Rail Conductors, by Edwin B. Katte.

International Railway Fuel Association

The seventh annual meeting of the International Railway Fuel Association will be held at the Hotel LaSalle, Chicago, May 17 to 20, inclusive. Papers will be presented on the following subjects: Powdered Coal; Fuel Oil for Locomotive Use; Standardizing the Preparation of Coal; South American Railways' Fuel Supply; Analysis of Dependent Sequence as a Guide to Fuel Economies; Relation of Mechanical Stokers to the Fuel Problem; Employment and Training of Firemen; Waste of Fuel in Railway Stationary Plants. In addition to these papers committee reports will be made on Fuel Stations, Storage of Coal, Fuel Accounting, Firing Practice, Fuel Tests and Front End, Ash Pans and Grates.

MEETINGS AND CONVENTIONS

The following list gives the names of secretaries, dates of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

American Association of Freight Agents.—R. O. Wells, Illinois Central, East St. Louis, Ill. Annual meeting, May 18-21, 1915, Richmond, Va

American Association of Passenger Traffic Officers.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Next meeting, April 15-16, San Francisco, Cal.

American Railway Association.—W. F. Allen, 75 Church St., New York. Next session, May 19, 1915, New York.

American Railway Master Mechanics' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June 9-11, 1915, Atlantic City, N. J.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa. Annual meeting, June 23-26, 1915, Hotel Traymore, Atlantic City, N. J.

American Society of Civil Engineers.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York. Next spring meeting, June 22-25, 1915, Buffalo, N. Y. Annual meeting, December 7-10, 1915, New York.

Association of American Railway Accounting Officers.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Piedmont Hotel, Atlanta, Ga.

Association of Railway Claim Agents.—C. W. Egan, B. & O., Baltimore, Md. Annual meeting, May 19, 1915, Galveston, Tex.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Semi-annual meeting with Master Car Builders' and Master Mechanics' Association. Annual meeting, October, 1915.

Association of Railway Telegraph Superintendents.—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 22-25, 1915. Rochester, N. Y.

Association of Transportation and Car Accounting Officers.—G. P. Conrad, 75 Church St., New York. Next meeting, June 22-23, Niagara Falls, N. Y.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday in month, Pittsburgh.

Freight Claim Association.—Warren P. Taylor, R. F. & P., Richmond, Va. Annual meeting, June 16, 1915, Chicago.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

International Railway Fuel Association.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago. Annual meeting, May 17-20, 1915, Hotel La Salle, Chicago.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May 25 to 28, 1915, Chicago, Ill.

Master Car Builders' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June 14-16, 1915, Atlantic City, N. J.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except, June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

Peoria Association of Railroad Officers.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Railway Electrical Supply Manufacturers' Association.—J. Scribner, 1063 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

Railway Signal Association.—C. C. Rosenberg, Myers Bldgs., Bethlehem, Pa. Stated meeting, May 26-27, 1915, New York. Annual meeting, September 14-17, 1915, Salt Lake City, Utah.

Railway Storekeepers' Association.—J. P. Murphy, N. Y. C. R. R., Box C, Collinwood, Ohio. Annual meeting, May 17-19, 1915, Hotel Sherman, Chicago.

Railway Supply Manufacturers' Association.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meeetings with Master Car Builders' and Master Mechanics' Associations.

Railway Telegraph and Telephone Appliance Association.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

Richmond Road Club.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

Salt Lake Transportation Club.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 a. m., Piedmont Hotel, Atlanta.

Toledo Transportation Club.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of Newark.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, 559 Broad St., Newark.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meetings last Tuesday in month, except June, July and August, Hotel Astor, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Gen. Agt., Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Dispatchers' Association of America.—J. F. Mackie, 7122 Stewart Ave., Chicago. Annual meeting June 15, 1915, Minneapolis, Minn.

Transportation Club of Detroit.—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

Utah Society of Engineers.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.

Western Canada Railway Club.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

Traffic News

Circulars have been issued by the traffic department of the Rock Island lines, the Wabash and the Missouri, Kansas & Texas to their representatives urging their co-operation in the "buy it now" campaign. The Rock Island lines have also given this movement some space in their March time table, the Chicago & North Western has an editorial on the subject in its passenger department bulletin, and the Atchison, Topeka & Santa Fe has taken it up in its employees' magazine.

The International & Great Northern is making preparations to handle a very heavy movement of freight during the next few months. Extensive agricultural development is in progress in the territory along the division between San Antonio and Laredo, and the company expects an increase in the interchange of traffic between Mexico and the United States through the Laredo gateway. Villa is now in control of a large area of the country that is tributary to that point and is restoring traffic on the National Railways of Mexico as rapidly as possible.

The Moberly (Mo.) Commercial Club has issued a call for a conference of all the commercial clubs in Missouri to be held at Moberly on April 8, for the purpose of discussing the present financial condition of the Missouri railroads, which the circular issued by the club says is one which should commend the serious attention of every thinking citizen of the state. It is pointed out that more than 2,000 miles of railroads in the state are in the hands of receivers, while several other large systems have been on the brink of receivership for some time, and that such a condition would gravely menace the future commercial, industrial and agricultural welfare of the state.

Transcontinental express service was inaugurated on March 30 by the Baltimore & Ohio road and its western connections from New York, Philadelphia and Baltimore to San Francisco and Los Angeles, handling shipments of Wells Fargo & Company through the Chicago and St. Louis gateways on the fastest schedule ever attempted between the leading cities on the two coasts. The first train left Jersey City at 8:45 p. m., and extra cars were attached at Philadelphia and Baltimore. At Cumberland, Md., the train was divided into two sections—one due at Chicago at 9 p. m. and the other due at St. Louis at 1:50 a. m. The section through Chicago connects with the "Fast Mail" of the Atchison, Topeka & Santa Fe, arriving at Los Angeles at 8:55 a. m., and San Francisco at 5:30 p. m., the fifth day from New York. At Chicago connection is made with the Chicago, Milwaukee & St. Paul "Olympian," for Seattle, Portland and Tacoma. The St. Louis section connects with the Missouri Pacific for Kansas City and San Francisco and with the Iron Mountain to Texas and the southwest.

Traffic officers and lawyers of the railways have held several meetings during the past two weeks to discuss the bill passed by Congress at its closing session to prohibit the railways from limiting their liability for loss or damage of freight, in which it is believed Congress unintentionally authorized the railways to make a general advance of 10 per cent in their freight rates. All existing freight rates are embodied in tariffs which include a provision, printed in the classification, to the effect that if the uniform bill of lading, with its numerous conditions, is not used, and the railways accept unlimited liability, they shall receive 10 per cent more than the rates printed in the tariffs. Representatives of the roads in the three classification territories have had meetings and joint conferences in an effort to agree on an understanding of what the law requires and what the attitude of the railways should be toward it. Many of the lawyers are of the opinion that if no action is taken rates will automatically be advanced 10 per cent on the effective date of the law, but there is some difference of opinion among the traffic men as to whether the railways ought to try to take advantages of it. The Interstate Commerce Commission will hold a public hearing on April 10, and has announced that "the representatives of the carriers are expected to present to the commission suggestions or plans to be followed by the carriers in the light of these changes in the law."

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The Duluth Commercial Club has filed a complaint with the Interstate Commerce Commission charging discrimination in favor of St. Paul and Minneapolis in rates to points on the Northern Pacific, Great Northern, Minneapolis, St. Paul & Sault Ste. Marie and Minnesota & International.

The Interstate Commerce Commission has issued a notice saying that since the discontinuance of the printing of its unreported opinions in January, 1913, representatives of carriers, shippers, trade bodies and representatives of the press have been insistent in their demands that they be furnished with copies of the unreported as well as the reported opinions. In response to such requests it has been decided to resume the printing of the unreported opinions, and one copy of each will be placed upon the press tables in the secretary's office. Additional copies desired may be obtained directly from the superintendent of documents of the government printing office, at a nominal price.

Railway Ownership of Boat Line on Lake Tahoe

Opinion by Commissioner Clark:

The commission finds that the Lake Tahoe Railway & Transportation Company does not violate the fifth section of the Panama canal act by operating a boat line around Lake Tahoe. The boat line operated is but an extension of the rail line between Truckee, Cal., and Tahoe City, and the rail line does not, or may not, compete for traffic with the boat line within the meaning of the act. (33 I. C. C., 426.)

Rates on Strawberries from Washington and Oregon to Montana

Lindsoy & Company, Ltd., et al. v. Northern Express Company et al. Opinion by Commissioner Hall:

The commission finds that the rates on strawberries and cherries shipped by express in carload lots from Seattle, Tacoma and eight other points in Washington and Oregon to Helena, Butte, Great Falls and Billings, Mont., are unreasonable and discriminatory and lower rates are prescribed for the future. The rates for initial icing of such shipments or for icing in transit are not found to be unreasonable. (33 I. C. C., 394.)

Rates on Fertilizer from Shreveport

Meridian Fertilizer Factory et al. v. Abilene & Southern et al. Opinion by the commission:

The commission finds that the present single line rates on acid phosphate from Shreveport, La., to Marshall, Jefferson, Texarkana, Palestine, Fort Worth, Houston, Bryan and certain other points in Texas are not unreasonable but that they are prejudicial in those cases where they exceed the rates from New Orleans to the same points. It is also found that the rates for a haul over two or more lines are unreasonable and it is held that the rates for such a haul should not exceed those for a haul of like distances over a single line by more than two cents per 100 lb. There are certain violations of the fourth section in these rates from Shreveport, but consideration of them is left for further investigation. (33 I. C. C., 160.)

Commutation Fares at Washington, D. C.

Opinion by Commissioner Daniels:

The Baltimore & Ohio, which at present sells for commutation traffic out of Washington on its Washington and Metropolitan branches 180-trip tickets good for three calendar months, 60-trip tickets limited to 30 days from date of sale and 10, 24 and 50-trip tickets has proposed to abolish the 180-trip, the 24-trip and the 50-trip tickets, and also to increase the rate on the 60-trip tickets which will be left in existence with the 10-trip tickets.

The carrier was able to show that the traffic was comparatively light and that the service was on the whole unprofitable. The commission finds that the 24 and 50-trip tickets may properly be withdrawn. It also holds that the carrier has justified its proposed withdrawal of the 180-trip tickets, noting in this connection that it is difficult to see what warrants such a spread as exists under the respondent's tariff between the daily charges under the 60-trip ticket and the 180-trip ticket, that the present cost per trip under this three months' ticket is by comparison with the fares of other carriers evidently too low and that the tendency among carriers generally seems to be to do away with the 180-trip commutation ticket or to put it upon the same basis as the 60-trip ticket. It also believes that there is a certain amount of discrimination under the present arrangement in favor of the commuter who has money to invest in three months' transportation as compared with him who can afford to buy his transportation only by the month.

The withdrawal of the 180-trip ticket will relegate the users of that ticket to the 60-trip ticket with a much higher rate per trip. In view of the uncertainty of the result the commission does not believe it wise at this time to permit an increase in the price of the 60-trip ticket.

Commissioner Clements dissents from the above opinion. (33 I. C. C., 428.)

Trap Car Hearing at Chicago

Testimony regarding the methods of handling less than carload freight at Chicago was presented at the hearing last week at Chicago before Examiner Brown of the Interstate Commerce Commission, on the tariffs filed by the railways imposing a charge for trap car service. Testimony on behalf of the Chicago roads was presented by Willis E. Gray, who has been making an investigation of the Chicago terminal situation for the roads. Mr. Gray's testimony bearing on the cost of trap car service was briefly reported in last week's issue. Attorneys for the shippers, including Water L. Fisher for the Chicago Association of Commerce, and John S. Burchmore for the National Industrial Traffic League, discovered a large number of errors in his statistical exhibits. Mr. Gray disputed the contention of the shippers that railroad freight stations are congested, saying that not one of them is worked to full capacity. He said the average team delay was 35 minutes.

It was brought out that among the tariffs filed hardly any two had the same definition of trap car service. Several shippers testified as to conditions at their plants to show that if they are obliged to pay a charge for trap car service they would cart their freight instead and most of them thought that the facilities at the railroad freight stations were not sufficient to handle the business.

Mr. Fisher called to the stand W. H. Lyford, general counsel for the receivers of the Chicago & Eastern Illinois, who was largely instrumental in getting the railroads to co-operate on the construction of the classification yards and L. C. L transfer station at Clearing. He said the present freight stations in Chicago had capacity sufficient to handle the increase of freight for the next 20 years, but that it would be necessary to supplement them by a transfer plant at some outside point, and that a large percentage of freight which now passes through the city should not come within the limits at all. Under present conditions he said the more freight a railroad receives, in many cases, the more expensive it is per ton to handle it. The present system of handling less than carload freight, he said, has become unbearable to the railroads and is fast becoming so to the shippers. He cited some instances in which the terminal charges in Chicago amount to more than the gross receipts for the total haul, and he thought the cost to the railroad of handling freight after it gets to a station is practically double if it comes in trap cars to the cost of handling when it comes by team.

John F. Wallace, chairman of the Railway Terminal Commission of Chicago, said that one of the most impressive facts about the situation is that the more freight a road handles and the more nearly in a wholesale manner the business is conducted the more it costs per ton. He said the remedy involves a changed attitude on the part of railroad officials He suggested two possible remedies. First, loading outbound freight in bulk in full carloads, moving the cars to an outside station and resorting, and, second, the construction of freight houses so that several floors could be utilized, somewhat in the manner contemplated by the Pennsylvania for its proposed new freight terminal. He thought that groups of roads might co-operate in handling freight to outside sorting stations and that a great deal of money could thus be saved. Much of the trouble comes from the law which forbids pooling, without which he said the roads might be able to unite on some co-operative system.

Bion J. Arnold, consulting engineer, and member of the Railway Terminal Commission, urged the necessity of eliminating some of the freight terminals in the congested parts of the city or utilizing them in a more universal way. He said all should be made universal stations, thereby releasing much property which is needed for commercial purposes.

H. C. Barlow, traffic director of the Chicago Association of Commerce, said the proposed trap car tariffs would create discrimination all over the country. He insisted that the trap car service is as much a convenience to the carrier as to the shipper and that the shipper shall not be required to pay for it.

J. Charles Maddison, traffic manager of Montgomery Ward & Company, one of the largest users of trap cars in Chicago, said that the trackage at the plant cost about $120,000. During February 1,457 trap cars were handled, the tracks having a capacity of from 55 to 60 cars. These cars are loaded to the firm in another city, to gateway points, to outside transfer stations and to downtown stations. If the company should send its freight to the downtown stations instead of to transfer points, the railroads would be unable to handle it. He had made an experiment by delivering by team to the downtown station of one of the roads, and they asked him to let up on that kind of delivery. If the four cent rate is applied, Montgomery Ward & Company would quit using the trap cars, but would team the freight. He thought the trap car service was a distinct advantage to the carriers, saving them the expense of loading, especially as a large part of the cars loaded out are those that were brought in under loading. He thought there was no excuse for a charge on cars that go directly to destination, but as to cars that go to downtown service stations he said the service is in effect a substitute for drayage, and there should perhaps be a charge for it.

STATE COMMISSIONS

The public service commission of Missouri, in connection with its investigation of freight and passenger fares, has called upon the roads for lists of all officers and their salaries and the amounts expended for labor in the various departments. This was prompted by a request of one of the interveners in the case, that the commission require the roads to file a list of their officers who are paid more than $2,000 a year, with the duties of each.

The public utilities commission of Colorado, on April 1, put into effect a code of demurrage rules and charges applying to all standard-gage railroads in the state. These rules were adopted by the commission after investigation and a hearing on February 23, at which all the larger carriers in the state were represented by their attorneys, traffic and operating officers, also by Arthur Hale, general agent of the American Railway Association, and W. E. Backensto of the Colorado Demurrage Bureau. On March 15, the commission tentatively adopted and issued a set of rules to which the carriers were to set forth all objections before April 1. Some changes were made in response to these objections. It has been the aim of the commission, it is stated, to have these rules follow as closely as possible the national uniform code of demurrage rules with only such exceptions as are considered necessary to meet the conditions of Colorado intrastate traffic.

COURT NEWS

In the United States District Court at Little Rock, April 3, Judge Trieber handed down a decision making void the Arkansas two-cent passenger fare law, and the commission freight tariff as applied to the St. Louis & San Francisco in Arkansas. He held both to be confiscatory and the state was perpetually enjoined from enforcing a two-cent intrastate rate upon that company. The case had been in court seven years. The road will at once announce passenger tariffs based on a rate of three cents a mile.

In the Federal Court at Trenton, N. J., April 5, the Central of New Jersey was fined, in connection with the violations of law, noticed in these columns March 19, page 643, the sum of $200,000, being at the rate of $8,000 on each of 25 counts in the indictment. The company announced that an appeal would be taken to the higher court. Counsel for the road in his argument declared that no one had been injured by the rebating and that no shipper had complained.

The attorney general of Texas has filed suit against 41 railroads in the district court at Austin, Tex., seeking to enjoin them from issuing free transportation, except to officers, agents and employees. It is charged that the issuance of free transportation is a discrimination against all of the traveling public who are required to pay full fare, and that the railroads in the past 10 years have issued free transportation to the extent of 12 per cent of their total passenger mileage, or to an amount great enough to pay a dividend of 2.41 per cent on their capital stock.

E. P. Vanderwicken, president and general manager of the Art Shade Company, was fined $125 and costs by Judge Carpenter in the United States circuit court at Chicago on April 2, on charges of violating the law by the misdescription of shipments of art glass shades as glass shades. Indictments were returned against the company on November 7, 1914. These shipments were forwarded from Chicago to various points in Western Classification territory and the Western Classification rates art glass shades, L. C. L., as double first class and glass shades as second class. Several notices were sent to the firm directing its attention to the misbilling as being in violation of Section 10 of the act to regulate commerce.

Interstate Traffic Suits in State Courts

The Supreme Court of the United States on Monday of this week, in the case of the Pennsylvania Railroad against the Puritan Coal Mining Company, held that a suit against a carrier for damages could be brought in either the federal or the state court, the amendment to the Interstate Commerce law, in putting suits of this kind under the authority of the Interstate Commerce Commission, having provided that litigants should not lose any right which they already possessed. The Interstate Commerce Commission has jurisdiction to decide as to facts; but in this case there was no question as to the facts which constituted the illegal action of the road, and therefore the Puritan Coal Company was justified in going directly to the court. The amendment to the Interstate Commerce act as to car supply was purposely drawn to secure new rights to shippers, and at the same time to protect them in all former rights under the common law or the statutes.

The case arose out of the failure of the road in the period of the coal strike in 1902 to furnish the proper quota of cars to the Puritan Company, which presented a claim for a loss of profits amounting to $260,777. Suit was brought in the Court of Common Pleas of Clearfield county, Pennsylvania, where the court without a jury found the facts as set forth by the coal company. The distribution sheets put in evidence by the road showed that it was the practice to supply cars to the "Scalp Level region" in preference to the mountain region. The Berwind-White Coal Company being located in the former region, it was charged that the road purposely discriminated in favor of that company.

Justice Lamar, in the decision, holds that Section 3 of the Interstate Commerce act makes it unlawful for the carrier to prefer one shipper over another, and that Section 8 gives the shipper the right of action for damages by presentation of his case to the Interstate Commerce Commission for a determination of the facts, and then by suit in the federal courts to the exclusion of any other remedy in the state courts, the federal courts having exclusive jurisdiction. With these two sections standing alone, the shipper would have had no remedy in the state courts; but under Section 22 of the act it is provided that there shall be no abridgment of remedies already existing at common law or statute, so that all three sections must be read together; and therefore Sections 8, 9 and 22 give the shipper new rights and protect those he has already enjoyed.

While former decisions provide that suits for discrimination must be passed on first by the Interstate Commerce Commission, and that until the commission has passed on the case no court has any jurisdiction, the present decision holds that if the carrier's rule shows on the face of it that it has been unequally applied and suit is brought for damages by violation or by discriminatory enforcement, there is no administrative question involved, and the courts may decide on the facts. The decision holds that the liability is the same whether there is a breach of common law duty to furnish cars or discrimination in the supply of cars.

Railway Officers

Executive, Financial, Legal and Accounting

T. J. Kennedy on March 19 qualified as co-receiver of the Algoma Central & Hudson Bay, with headquarters at Sault Ste. Marie, Ont.

W. E. Douglass, assistant claim agent for the Sunset-Central Lines at El Paso, Texas, has been appointed general claim agent, with headquarters at Houston, Texas, succeeding W. D. Herring, deceased.

J. O. Talbot, auditor of disbursements of the Missouri, Kansas & Texas, of Texas, with headquarters at Dallas, has been appointed auditor of the Maryland & Pennsylvania, with office at Baltimore, Md., effective April 1.

P. B. Bradley, vice-president of the Charlotte Harbor & Northern at Boston, Mass., has been elected president, with headquarters at Boston, succeeding James M. Gifford, who becomes first vice-president and general counsel, with headquarters at New York. L. M. Fouts, second vice-president and general manager at Boca Grande, Fla., has resigned, and Thomas A. Doe has been appointed treasurer, with headquarters at New York, succeeding James B. Kilburn.

John Calvin Nelms, Jr., who has been appointed general auditor of the Norfolk Southern, with headquarters at Norfolk, Va., was born on June 21, 1871, at Suffolk, Va., and began railway work on November 1, 1891, with the Norfolk & Western. He served consecutively as warehouse clerk, yard clerk, billing clerk, cashier, assistant agent and agent on that road until January, 1903, and was then out of railway work for less than one year. He was then appointed freight claim agent of the Suffolk & Carolina, and in January, 1905, was promoted to auditor. He subsequently served as auditor of its successor, the Virginia & Carolina Coast, until August, 1906, when the latter road became a part of the Norfolk Southern, and since that time was in the service of the John L. Roper Lumber Company, Norfolk, Va., as auditor, from which position he resigned on April 1 to become general auditor of the Norfolk Southern. Mr. Nelms is also vice-president and auditor of the Carolina Railroad and the Kinston Carolina Railroad & Lumber Company.

Operating

R. J. Hinkle has been appointed general manager of the Mississippi, Hill City & Western, with office at Hill City, Minn., succeeding W. W. Rabey, resigned.

H. J. Plumhof, trainmaster of the Idaho division of the Oregon Short Line, has been appointed safety commissioner, with headquarters at Salt Lake City, Utah, succeeding L. E. Abbott, promoted.

R. S. Anderson has been appointed terminal trainmaster of the Chesapeake & Ohio, in charge of all yards, with headquarters at Richmond (Va.) terminal, and the office of general yardmaster at Richmond terminal has been abolished.

Jesse G. June, superintendent of terminals of the Erie with office at Jersey City, N. J., has been appointed superintendent of the Allegheny and Bradford divisions with office at Salamanca, N. Y., succeeding Fred M. Hawley, deceased. Eugene R. Allen, assistant superintendent of terminals, at Jersey City, succeeds Mr. June, and D. R. Crowley, special agent, has been appointed terminal trainmaster at Jersey City.

E. B. Pengra, superintendent of the Sumpter Valley, has been appointed general manager, with headquarters at Baker, Ore., and will assume the duties heretofore taken care of by D. C. Eccles, president, to whom Mr. Pengra reports. Mr. Pengra began railway work in 1893 with the Southern Pacific, with which company he remained 20 years, filling the positions of telegraph operator and agent and chief train despatcher. In November, 1913, he went to the Sumpter Valley as superintendent of transportation, and he is now promoted to the position of superintendent, as above noted, effective March 23.

George Owen Brophy, whose appointment as superintendent of the Wyoming division of the Union Pacific, with headquarters at Cheyenne, Wyo., has already been announced in these columns, was born on November 14, 1864, at Eagle, Waukesha county, Wisconsin. He was educated in the common schools, and began railway work in August, 1888, as a brakeman on the Union Pacific at Laramie, Wyo. He left that road in November, 1888, and reentered its service in April of the following year as a brakeman. In April, 1891, he went to the Missouri Pacific at St. Louis, Mo., as a switchman, and in July of that year again entered the employ of the Union Pacific at Omaha, Neb., as a brakeman. He was promoted to conductor in August, 1892, and was appointed trainmaster in March, 1912, which position he held until his recent promotion to superintendent of the Wyoming division, as above noted.

G. O. Brophy

J. H. Clark, who has been appointed assistant general superintendent of the New York division of the Baltimore & Ohio, also general superintendent of the Staten Island lines and superintendent of floating equipment of the same companies, with headquarters at St. George, Staten Island, N. Y., as has already been announced in these columns, was born on June 22, 1864, at Smithtown, Long Island, N. Y. After finishing the public school course he took a special course in engineering at Cooper's Institute, New York. He then served as an apprentice with the New York Iron Works & Engine Builders, and on April 1, 1884, became engineer of ferries of the West Shore Railroad. In October, 1888, he was appointed chief engineer of ferries of the Staten Island Rapid Transit Railway and in April, 1895, was placed in charge of the Baltimore & Ohio's floating equipment in New York harbor. Four years later Mr. Clark was appointed assistant superintendent of floating equipment of the Baltimore & Ohio, and in September, 1902, he was promoted to master mechanic of the Staten Island Rapid Transit Railway. In May, 1913, he was promoted to superintendent of floating equipment of the Baltimore & Ohio system and now becomes also assistant general superintendent of the New York division and general superintendent of the Staten Island lines, as above noted.

J. H. Clark

Traffic

William J. Doran has been appointed general agent of the Union Pacific at Los Angeles, Cal., in place of H. O. Wilson, resigned.

H. W. Rieck, superintendent of transportation of the San Antonio, Uvalde & Gulf at San Antonio, Texas, has been appointed division freight and passenger agent at that place.

W. H. Snell, general agent, passenger department, of the Canadian Pacific at New York, has been appointed general passenger agent, eastern lines, with headquarters at Montreal, Que., succeeding William Stitt, deceased.

William H. Lewis has been appointed general agent, freight and passenger departments, of the Chesapeake & Ohio, also representing interests of the Kanawha Despatch and Blue Ridge Despatch Fast Freight Lines, at San Francisco, Cal.

H. B. Brittan, district passenger agent of the Pacific Coast Steamship Company, at Los Angeles, Cal., has been appointed district passenger agent, with headquarters at San Francisco, succeeding W. R. Meech, resigned, and A. S. Jones, city passenger agent at Los Angeles, succeeds Mr. Brittan.

J. W. Daly, division freight agent of the International & Great Northern at Galveston, Tex., has been appointed also division passenger agent, and J. W. King, division freight agent at San Antonio, has been appointed also division passenger agent at that point. W. E. Pitch, district passenger agent at San Antonio, has been assigned to other duties.

Engineering and Rolling Stock

Samuel T. Wagner, assistant engineer of the Philadelphia & Reading at Philadelphia, Pa., has been appointed chief engineer, with headquarters at Philadelphia, succeeding William Hunter, deceased.

B. J. Schwendt, formerly signal engineer of the Toledo & Ohio Central, and the Zanesville & Western, has been appointed superintendent of telegraph, and now has charge of the telegraph department, while retaining jurisdiction over the signal department. The telegraph department work on these roads was formerly handled by the superintendent of telegraph of the New York Central Lines West, at Cleveland, Ohio.

The offices of supervisor of track, buildings and water supply on the Newport News and Norfolk Terminal district of the Chesapeake & Ohio have been abolished. J. S. Purdie, supervisor of track, Rivanna district, has been relieved of jurisdiction over Virginia Air Line branch. V. T. Douglas, supervisor of track, Peninsula and Piedmont districts and Orange branch, has been relieved of jurisdiction over Piedmont district and Orange branch, and his territory in future will include Newport News and Norfolk Terminal district. The territory of I. Garrison, supervisor of bridges and buildings, Richmond division, has been extended and will include Newport News and Norfolk Terminal district, and C. A. Stanley has been appointed supervisor of track in charge of Piedmont district, Orange and Virginia Air Line branches.

Robert Ferriday, engineer maintenance of way of the Cleveland, Cincinnati, Chicago & St. Louis at Indianapolis, Ind., has been appointed engineer maintenance of way of the Chicago division, with headquarters at Indianapolis. A. M. Turner, district engineer, with offices at Middletown, Ohio, and Indianapolis, Ind., has been appointed engineer maintenance of way of the Peoria & Eastern division, with headquarters at Indianapolis, Ind., vice Robert Ferriday. C. W. Cochran, engineer maintenance of way of the Cairo division at Mt. Carmel, Ill., has been appointed engineer maintenance of way of the Cleveland division, with headquarters at Galion, Ohio, vice Joseph Mullen, who has been appointed assistant engineer attached to the office of the chief engineer at Cincinnati, in charge of special investigations. A. F. Maischaider, engineer maintenance of way of the Michigan division at Wabash, Ind., succeeds Mr. Cochran, and J. W. Burt, supervisor of track at Springfield, Ohio, succeeds Mr. Maischaider.

Purchasing

E. J. Roth has been appointed purchasing agent of the Chicago, Indianapolis & Louisville, with headquarters at Chicago, succeeding Fred Davidson, resigned. The position of supply agent is abolished and the purchasing agent will have jurisdiction over purchases and supplies.

Special

T. A. Rittenhouse has been appointed real estate and tax commissioner of the Chicago & Alton, with headquarters at Chicago, succeeding D. J. Corkery, resigned.

OBITUARY

William Stitt, general passenger agent, eastern lines, of the Canadian Pacific, with headquarters at Montreal, Que., died suddenly on April 1 in that city.

Albert G. Tuttle, formerly division general freight agent of the New York & New England at Hartford, Conn., and later in the service of its successor, the New York, New Haven & Hartford, in the general freight office at New Haven until he retired from railway work in 1904, died on April 2 at Hartford, at the age of 81. He was a brother of the late Lucius Tuttle, formerly chairman of the board of directors of the Boston & Maine.

G. W. McMullen of Picton, Ont., who was one of the two leaders in the construction of the Central Ontario, now a part of the Canadian Northern, died suddenly in Chicago, March 23, of heart failure. Mr. McMullen was not only prominent in Canada as a railway builder, but also was an important figure in the Canadian Pacific, in its early days. He it was who brought together Sir Hugh Allan and the American capitalists who proposed to provide the money for the construction of the first Canadian railway to the Pacific ocean. He was also an inventor, and his visit to Chicago last month was made in connection with the annual convention of the American Railway Engineering Association, before which he spoke on his invention for the preservation of timber.

William Hunter, chief engineer of the Philadelphia & Reading, with headquarters at Philadelphia, Pa., died on April 2, in a hospital in that city from the effects of a stroke of paralysis.

W. Hunter

Mr. Hunter was born on May 25, 1854, at Moselem, Berks county, Pa., and graduated from the Polytechnic College of Pennsylvania in 1872. The same year he began railway work as a rodman on the Philadelphia & Reading, remaining in that position until 1876, when he became engaged in private business. In the summer of 1877 he returned to railway work, and until the fall of 1878 was division engineer on the Pittsburgh & Lake Erie. The same year he was appointed assistant engineer of the Philadelphia & Reading, and later served as assistant roadmaster and assistant chief engineer until August, 1900, when he was promoted to chief engineer of the same road.

Turkey and the Smyrna-Aidin Railway.—With a terminus at a port of such international importance as Smyrna, the Ottoman Railway from Smyrna to Aidin was bound to be seriously affected by war conditions. Even before the actual rupture of diplomatic relations between England and Turkey on November 5, there was serious arbitrary interference by the Ottoman government with the conduct of the company's business. From the end of August the traffic was much hindered by the mobilization of troops, the commandeering by the government of all animals available for transport, the prohibition of the export of grain, and the closing of the port of Smyrna. Yet the working of the railway was carried on until November 27, when, without previous notice, the Turkish military authorities took forcible possession and placed the general manager under arrest as a prisoner of war. The Turkish government formally assumed the management of the line on December 6 and immediately dismissed the French and British members of the staff. All postal and telegraphic communication with Smyrna has been cut off since the beginning of the war, but it is understood that a limited circulation of traffic is still maintained.—*Railway Gazette.*

Equipment and Supplies

LOCOMOTIVE BUILDING

The Chestnut Ridge has ordered one six-wheel switching locomotive from the Baldwin Locomotive Works.

The Mount Hope Mineral has ordered one Consolidation type locomotive from the Baldwin Locomotive Works.

The Standard Oil Company has ordered two four-wheel switching locomotives from the Baldwin Locomotive Works.

The Minneapolis, St. Paul, Rochester & Dubuque Electric Traction has ordered 3 gas-electric locomotives from the General Electric Company.

The Chicago, Burlington & Quincy has ordered 5 Mikado type locomotives from the Baldwin Locomotive Works, in addition to the 15 Pacific, 20 Mikado and 15 Santa Fe type locomotives reported in the *Railway Age Gazette* of March 12.

CAR BUILDING

The Illinois Central has ordered 100 gondola cars from the American Car & Foundry Company.

The Richmond, Fredericksburg & Potomac has ordered 6 all-steel coaches from the American Car & Foundry Company.

The International & Great Northern, reported in the *Railway Age Gazette* of March 26 as being in the market for 1,000 freight cars, has issued inquiries for 500 80,000-lb. capacity steel underframe box cars, 200 60,000-lb. capacity steel underframe stock cars and 300 ballast cars. This company also contemplates purchasing 6 passenger cars.

The Minneapolis, St. Paul, Rochester & Dubuque Electric Traction was reported in the *Railway Age Gazette* of March 26 as having ordered 45 80,000-lb. capacity box cars, 12 trailer passenger cars and two electric motor cars from the J. G. Brill Company. This item was incorrect in that there were ordered from the J. G. Brill Company 45 box cars, 9 trailer passenger cars, 2 combination mail and express cars and one baggage car and from the General Electric Company, 2 gas-electric motor cars.

IRON AND STEEL

The Philadelphia & Reading is asking bids on 150 tons of bridge work.

The Norfolk & Western is in the market for 4,000 tons of heavy section rails.

Pennsylvania Railroad has ordered 400 tons of bridge material from the Fort Pitt Bridge Works.

The Vicksburg, Shreveport & Pacific has ordered 230 tons of steel for its bridge over the Red river at Shreveport, La.

The Southern has ordered 500 tons of steel from the Pennsylvania Steel Company, for a bridge at Charlottesville, Va.

The Chicago, Milwaukee & St. Paul has ordered 165 tons of steel for roofs and lintels for seven sub-station buildings in Butte, Mont.

The Erie has ordered 5,000 tons of steel rails from the Bethlehem Steel Company and 9,000 tons from the Lackawanna Steel Company.

The Atlantic Coast Line has placed an order with the Phoenix Bridge Company, Phoenixville, Pa., for 250 tons of steel to be used in a drawbridge which it is constructing at Tampa, Fla.

Railway Employees in the United Kingdom.—A report recently issued by the English Board of Trade shows that the railways of the United Kingdom during 1913 employed 615,585 persons weekly, the average salaries and wages amounting to $4,424,085. The 12 principal companies employed 508,434 of this number and paid $3,610,220 of the total weekly amount.

Supply Trade News

George F. Murphy has been placed in charge of the Pittsburgh sales office of the Heine Safety Boiler Company, St. Louis, Mo.

The Standard Paint Company has moved its head office in New York from 100 William street to room 572, Woolworth building.

A. G. Shaver, recently signal engineer of the Rock Island Lines, announces the opening of an office in the Transportation building, Chicago, as consulting electrical and signal engineer.

J. S. Wright, formerly in the Detroit office of Manning, Maxwell & Moore, Inc., has been appointed manager of the Boston office, succeeding Walter M. Wood, who has resigned because of ill health.

L. L. Cohen, formerly with the H. W. Johns-Manville Company, has resigned to accept service with the Safety First Manufacturing Company, with headquarters in the Railway Exchange building, Chicago.

M. A. Sherritt, manager of the Philadelphia branch of Manning, Maxwell & Moore, Inc., New York, has resigned to accept the position of vice-president and general manager of the Sherritt & Stoer Company, Inc., Philadelphia, Pa.

Stockholders of the International Smokeless Powder & Chemical Company, at a special meeting held on April 6, agreed to sell the plant, franchises and patents of the company to the E. I. du Pont de Nemours Company for $5,760,000.

The American Steel Foundries has been given a license by the United States Steel Corporation for the construction of a six-ton Heroult electric furnace at its Indiana Harbor, Ind., plant and will add electric steel castings to the products of that plant.

The Oregon-Washington Railroad & Navigation Company has awarded a contract to the Roberts & Schaefer Company, Chicago, for the designing and building of a large reinforced concrete counterbalanced type locomotive coaling plant with electric automatic operation, with sand handling facilities at the new Summit Boulevard yard, Spokane, Wash.

William Disston, president of Henry Disston & Sons, Philadelphia, Pa., died suddenly of heart disease at his summer home near Philadelphia on April 5. Mr. Disston was born in Philadelphia on June 24, 1859. Besides being president of the saw company he was head of the Henry Disston & Sons File Company, and the Henry Disston & Sons Steel Works.

L. G. Grossman, who for some time has had an office in Washington, D. C., for the general practice of law and the handling of legal business in the District of Columbia, and dealing largely with the securing of patents, has also opened an office at 538 Transportation building, Chicago, and contemplates opening offices in Cincinnati, Ohio and Kansas City, Mo.

The annual luncheon of the former employees of the New York Central signal department will be held at the Hotel Astor on May 26, which is the first day of the New York May meeting of the Railway Signal Association. It is announced that further details may be obtained from F. C. Lavarack, general sales manager of the Signal Accessories Company, 30 Church street, New York.

W. B. Huey, until recently president of the American Blue Print Paper Company, and A. H. Huey, until recently sales manager of that company, announce the formation of a new company, under the name of the Huey Company, with offices and plant at 59 East Adams street, Chicago. The company will engage in the production of blue, black line and other prints, litho productions, hectograph copies and photostat reproductions.

J. P. Rapp, a steel wheel specialist, has resigned from the Forged Steel Wheel Company, Pittsburgh, Pa., and allied companies, and has been appointed vice-president of the Gulick-Henderson Company, inspecting, consulting and chemical engineers, of New York. Mr. Rapp assisted Charles T. Schoen in developing his wheel, and has been directly connected with the

industry from its earliest inception. He will give this item of railway equipment his particular attention.

Judge Landis, of the United States district court at Chicago, rendered a decision on March 25, in favor of the plaintiff, in a suit brought by Felt & Tarrant Manufacturing Company for infringement of its Comptometer patents by the Burroughs calculating machine made by the Burrough Adding Machine Company. The suit has been pending for several years and involved charges of infringement of 58 claims in four patents. The decree was suspended pending an appeal to the court of appeals.

The reorganization plan of the United States Light & Heating Company, Niagara Falls, N. Y., which was announced April 6, provides for the issue of $3,000,000 7 per cent noncumulative preferred stock and $4,000,000 common stock. The preferred is to have the right to elect a majority of the board of directors and will be held in a voting trust for five years. It is also proposed to authorize $1,000,000 first mortgage sinking fund 6 per cent 20-year gold bonds, of which $500,000 are to be issued and sold at present. Preferred stockholders are given the right to subscribe to the new preferred stock and upon payment of $15 per share of their present holdings will receive share for share in new preferred stock. Common stockholders will be given the privilege of subscribing to the preferred and common stock of the new company, and upon the payment of $2.50 per share of their present holdings of common stock will receive $5 in new preferred and $20 in new common stock. Both common and preferred stockholders may also subscribe for the new bonds at the price of $875 and accrued interest, for each $1,000 bond with $1,000 of common stock of the new company attached. The bonds are also offered in denominations of $500 and $100 at the same rate.

Osborn Van Brunt, whose appointment as manager of the traffic and railway sales department of the General Roofing Manufacturing Company was announced in these columns last week, was for 10 years traffic manager of the Simmons Hardware Company, St. Louis. Before entering the service of that company he was for seven years connected with the traffic department of the Burlington system, beginning his railway service in 1898 in the local freight office of the old Hannibal & St. Joseph at Kansas City, where he served for three or four months, after which he was located at Leavenworth, Kan., for a year as soliciting freight agent. He was then engaged as rate clerk in the general freight office at St. Louis for a year or two under D. O. Ives, at that time general freight agent, then until 1905 he served as chief clerk and contracting freight agent in the commercial office of the Burlington lines at St. Louis. In the spring of 1905 he went to the Simmons Hardware Company as assistant to S. F. Pryor, then traffic manager. When Mr. Pryor left to become general purchasing agent for the Gould lines Mr. Van Brunt succeeded him as traffic manager, which position he held until his recent appointment with the General Roofing Manufacturing Company.

O. Van Brunt

Stockholders of the Youngstown Sheet and Tube Company on April 6 approved a resolution of the board of directors to issue $5,000,000 in stock to provide for additions to the company's plant at Youngstown. A by-product coking plant will be installed. The Republic Iron & Steel Company has announced the expenditure of nearly $3,000,000 for changes and additions at its Youngstown mills, and the Youngstown Iron & Steel Company will spend nearly $2,000,000 in additions to its open-hearth plant.

Locomotive Pulverized Fuel Company

The Locomotive Pulverized Fuel Company has recently been organized, with offices at 30 Church street, New York, for the purpose of introducing the use of powdered coal, lignite and peat on steam locomotives. The officers are Joel S. Coffin, chairman; J. E. Muhlfeld, president; H. F. Ball, vice-president, and Samuel G. Allen, secretary and treasurer. This company has obtained the control of various practical appliances and processes which are essential to the effective and economical use of powdered anthracite and bituminous coal, lignite and peat in locomotive and other types of steam boilers used for railroad purposes, the equipment being also readily convertible, with practically no extra cost, for the use of fuel oil.

For some time past the officers of the company have had exhaustive research, investigations and experiments made to determine the practical utility of various improved methods for firing steam locomotives, with the result that they claim to have demonstrated in actual road service that the burning of solid fuels, in a powdered form in suspension, gives the most satisfactory results with respect to boiler evaporative capacity and cylinder power through the elimination of cinders, sparks and smoke and by the reduction of otherwise waste fuel and heat, and of cylinder back pressure. Incidental to these advantages may be added the elimination of the usual smokebox draft and cleaning appliances; rocking and drop grates; ash pans; fire tools; physical labor for firing; liability to set fires from smokestack and ash pans; necessity for building, cleaning and dumping fires; clogging of boiler tubes and flues; and the constant inspection, repair and renewal of the combustion appliances required when fuel is burned on grates. This development in locomotive firing is of interest at this time when the railroads are being pressed to obtain the greatest possible capacity from their locomotives at the minimum cost for operation and maintenance, when there is a constant demand for the use of the smaller sizes and inferior grades of fuel for railroad purposes and when the public is complaining of the smoke, cinder, spark and dust nuisances and of the constantly increasing fire losses.

J. S. Coffin

J. E. Muhlfeld

Joel S. Coffin, the chairman of the company, is also president of the Franklin Railway Supply Company, New York, which he organized in 1902, and vice-president of the American Brake Shoe & Foundry Company, Mahwah, N. J. He entered railway service when he was 17 years old as a shop apprentice and was later fireman, engineman, and road foreman of engines. In 1892 he entered the mechanical department of the Galena Signal Oil Company, becoming in 1896 manager of that department and in 1907 vice-president of the company.

John E. Muhlfeld, the president of the company, has been engaged for some years in railway expert work and has developed

several important devices. He was born at Peru, Ind, on September 18, 1872. From 1889 to 1893 he attended classes in mechanical engineering at Purdue University, spending summer vacations in civil engineering work on the Peru & Detroit and as engine wiper and machinist apprentice in the Fort Wayne shops of the Wabash. After leaving Purdue he continued as apprentice, machinist and pit foreman until the summer of 1894 when the great railway strike of that year gave him an opportunity to become a fireman and engineman on the Wabash. As a result of the experience gained he was made, in November, 1894, engine house foreman at Peru. He later became general foreman and remained with the Wabash until February, 1899, when he left to become master mechanic on the Grand Trunk. In September, 1901, he became superintendent of machinery and rolling stock on the Canadian Government Railways at Moncton, N. B., leaving in October, 1902, to become assistant to the general superintendent of motive power of the Baltimore & Ohio at Baltimore. In February, 1903, he was made superintendent of motive power at Newark, Ohio, and in June, 1903, general superintendent of motive power at Baltimore. He held this position until November, 1908, when he left to engage in railway expert work. In this connection he made inspections and reports of the characteristics of a number of roads, including the Kansas City Southern, of which, from November, 1910, to August, 1912, he was vice president and general manager.

H. F. Ball

H. F. Ball is also president of the Economy Devices Corporation, New York. He entered railway service in 1884 as an apprentice on the Pennsylvania at Altoona. In 1888 he entered the drafting room at Altoona, and in 1890 was appointed chief draftsman of the car department of the Lake Shore. In 1892 he was made general foreman of the car shops at Cleveland, and two years later became general car inspector. In 1899 he was made mechanical engineer and in 1902 superintendent of motive power. In 1906 he left the road to become vice-president of the American Locomotive Automobile Company, but a few months later his jurisdiction was extended over the American Locomotive Company as vice-president in charge of engineering. In December, 1912, he left the American Locomotive Company to open an office as special consulting engineer, becoming early in 1913 president of the Economy Devices Corporation. Mr. Ball was president of the Central Railway Club in 1900 and of the Master Mechanics' Association in 1905-6.

S. G. Allen

S. G. Allen, the secretary and treasurer of the new company, graduated from college in 1891 as a lawyer. After practicing for about nine years he became general manager of the Franklin Air Compressor Company, now part of the Chicago Pneumatic Tool Company. He is now vice-president of the Franklin Railway Supply Company, secretary of the American Arch Company, treasurer of the Locomotive Superheater Company, vice-president of the Economy Devices Corporation, secretary of the American Materials Company and vice-president of the General Equipment Company, all of New York, and secretary of the executive and finance committees of the American Brake Shoe & Foundry Company, Mahwah, N. J.

TRADE PUBLICATIONS

Rail Joint Insulation.—The American Vulcanized Fibre Company, Wilmington, Del., has issued bulletin No. 35—an eight-page folder, showing the method of installation and characteristics of Vul-Cot for insulating joints. It also gives a comparative table of various insulating materials.

Guard Rail.—The Cleveland Railway Supply Company, Cleveland, Ohio, has just issued a booklet describing the Newhall guard rail structure, including the main rails, tie plates and other accessories. The booklet is well illustrated with photographs and drawings, showing the essential features of the design.

Steam Trap.—Catalog No. 8 of the Automatic Steam Trap & Specialty Co., Detroit, Mich., is devoted to the Barton expansion automatic steam trap which is manufactured by this company. In addition to the price list the catalogue contains a number of illustrations of traps in service and a number of testimonials from users of the device.

Graphic Method.—The Statistics Bureau, 5 East 42nd street, New York, has issued a 20-page catalog entitled Materials for the Graphic Presentation of Facts. It deals with drawing room material, cross section paper, maps and other materials for statistical work, and in addition contains a list of books dealing with the general subject of graphic presentation of facts.

Compressed Air.—The Blaisdell Machinery Co., Bradford, Pa., has recently issued a loose-leaf catalog which is devoted to its line of air compressors, vacuum cleaning system and accessories. It is well illustrated and contains considerable information relative to the installation and operation of compressed air equipment in addition to the description of the devices manufactured by the company.

Water.—The Kennicott Co., Chicago Heights, Ill., has recently issued a pamphlet entitled Water, Its Storage, Purification and Measurement for Industrial Purposes, in which is set forth the advantages of soft water as applied to various industries. It contains several illustrations of Kennicott plant, Kennicott water softener plants and other equipment manufactured by this company.

Protecting Structural Steel.—The Cement Gun Company, New York City, has issued a pamphlet describing the use of the cement gun in protecting the steel substructure of the Cortlandt street ferry terminal of the Pennsylvania at New York from corrosion by a thin coating of Gunite applied without reinforcing of any kind. The detailed outline of the method of procedure is accompanied by photographs.

Steel Rail Specifications.—Standard Specifications for Steel Rails is the title of a booklet which has just been issued by Robert W. Hunt & Co., Chicago. In addition to containing the specifications for carbon steel rails adopted by the American Railway Association and those of the American Society for Testing Materials, the Manufacturer's Standard Specifications for open hearth rails and for Bessemer rails and the specifications for open hearth rails of the Colorado Fuel & Iron Company, this book contains a detailed comparison of the dimensions of the various rail sections in common use and the section numbers required at each mill for these standard sections.

Cement Tile Roofing.—The American Cement Tile Manufacturing Company of Pittsburgh, Pa., recently issued two bulletins which are devoted to the description and illustration of its products. One bulletin entitled "Bonanza Data Sheets," contains 2 pages of general data on cement roof tiles and 30 pages devoted to data sheet sketches which are offered as suggestions to structural steel building designers. The other book contains 40 pages, mostly devoted to reproductions of photographs of some of the important structures in which this product is used. It also gives tables of dimensions and weights of interlocking tile and also a discussion on its strength, fire resistance, etc

Railway Construction

Black River Traction.—This company is planning to build 1,000 ft. of double track and about 250 ft. of single track to replace single track now in operation. The company operates an electric line from Watertown, N. Y., west via Glenpark and Brownville to Dexter, 10.38 miles.

Brule, Grand Prairie & Peace River.—Application has been made in Canada for a charter to build a railway from Brule Lake, Alta., north and northwesterly via Grand Prairie, thence to a junction with the Pacific Great Eastern in the Peace River section; also to build a branch from Grand Prairie crossing the Peace river near Dunvegan, to a junction with the projected Pacific, Peace River & Athabasca at the Montagneuse river. The provisional directors include D. R. McDonald, Alexandria, Ont.; C. L. Hervey, Montreal, Que.; T. A. Burgess, R. H. Pringle and L. Cote, Ottawa, Ont.

Buckhannon & Northern.—See Pittsburgh & Lake Erie.

Chartiers Southern.—See Pittsburgh & Lake Erie.

Chesapeake & Ohio.—Bids are now being asked for building a section of 28 miles to connect the C. & O. with the Norfolk & Western near Waverly, Ohio, and a trackage agreement may be made to use the N. & W. tracks from that point north to Columbus. This includes part of the route of the Chesapeake & Ohio Northern, which was organized to build from Columbus, Ohio, to a point in Greenup county, Ky., 92 miles, to connect the Hocking Valley with the Chesapeake & Ohio. Bids were let recently to build a bridge over the Ohio river at Sciotoville, but arrangements have not yet been made for the construction of the entire line.

Chesapeake & Ohio Northern.—See Chesapeake & Ohio.

East Georgia (Electric).—Application has been made for a charter in Georgia by this company, with a capital of $212,500, it is said, to build an interurban electric or steam railway from Glennville, Ga., north to Adabelle, about 30 miles; also to build a short branch from Hagan east to Claxton. The incorporators include H. P. Talmadge, J. K. McIver, G. J. Baldwin, W. B. Stillwell, L. Adler and E. Leffler, all of Savannah.

Huntingdon & Hemmingford.—An extension of time in which to build this projected line has been granted by the Quebec legislature. The proposed route is from Huntingdon, Que., east to Hemmingford, thence to a point on the International boundary. The company was organized about two years ago, and the provisional directors include H. Timmis, R. H. Barron, Montreal; C. W. Taylor and A. R. McMaster, West Mount, Que.

Kansas City, Kaw Valley & Western (Electric).—A contract has been given to S. Dolman Sons, Topeka, Kan., at $100,000, it is said, for grading work between Bonner Springs, Kan., and Lawrence, on about 20 miles It is expected that track laying will be started about August 1. Bids will be asked for soon to build four bridges varying in length from 60 ft. to 100 ft. in length. The line is eventually to be extended west from Lawrence to Topeka, 25 miles. (January 8, p. 78.)

Lake Erie & Eastern.—See Pittsburgh & Lake Erie.

Monongahela Railway.—See Pittsburgh & Lake Erie.

Norfolk & Western.—Contracts are reported let for building the low-grade line between Burkeville, Va., and a point near Pamplin, about 36.5 miles, as follows: To Patterson-Moran & Company, Inc., New York; the Robert Grace Contracting Company, Pittsburgh, Pa.; Rinehart & Dennis Company, Charlottesville, Va., and to J. J. Sheehan, Roanoke, Va. (February 12, p. 289.)

Pacific Great Eastern.—This road has been extended from D'Arcy, B. C., northward to Lillooet, 34.3 miles.

Pittsburgh, Chartiers & Youghiogheny.—See Pittsburgh & Lake Erie.

Pittsburgh & Lake Erie.—The report of this company for the year ended December 31, 1914, shows that the construction of the Buckhannon & Northern as an extension of the Monongahela Railroad from State Line to Fairmont, W. Va., is about finished, and these two lines are in process of consolidation as the Monongahela Railway Company. The Lake Erie & Eastern is about finished on the 8.75 miles of line through Youngstown, Ohio, to reach a number of important industries, except on a proposed connection with the Lake Erie & Pittsburgh west of Youngstown. The grading and masonry work on the extension of the Pittsburgh, Chartiers & Youghiogheny from Van Emman to Eighty-four, Pa., and on the Chartiers Southern from Eighty-four to Marianna are completed, but the track construction has been deferred by reason of the unusual depression in the coal and coke industry and until sufficient revenue is assured.

Seaboard Air Line.—The Lake Wales extension has been opened for business from Bartow, Fla., east to Lake Wales, about 15 miles. (October 10, p. 717.)

Williamsport, Nessle & Martinsburg.—A contract is reported let to Claiborne, Johnston & Company, Baltimore, Md., for work on part of a 15-mile line between the Potomac river and Martinsburg, W. Va. The company was incorporated in West Virginia with $250,000 capital in 1913 to build from Williamsport, Md., southwest to Martinsburg, W. Va., about 15 miles. J. Carmichael, president, Hagerstown, Md.

RAILWAY STRUCTURES

Beaumont, Texas.—The Atchison, Topeka & Sante Fe will enlarge its passenger depot on Crockett street. New train sheds will also be erected and additional tracks laid. The estimated cost of this improvement is $25,000.

Buffalo, N. Y.—The Lehigh Valley is asking for bids until April 15, for the construction of the new terminal in Buffalo. This work will include the construction of new passenger and freight stations. (January 15, p. 116.)

Chicago, Ill.—The Illinois Central has completed plans and expects to start work in the near future on three proposed subways at the crossing of its tracks with Seventy-ninth, Eighty-second and Eighty-third streets. The subways will be built of reinforced concrete. Contracts will probably be let next week.

The Baltimore & Ohio Chicago Terminal started construction on its coach yard and engine terminal at Fourteenth street, between Lincoln and Wood streets, last week. Piles for bridge abutments are being driven and the excavations for retaining walls are being made.

Lexington, Ky.—A contract is reported let by the Louisville & Nashville to T. S. Moudy & Co., Chattanooga, Tenn., for putting up a freight house and other structures at Lexington. The proposed freight house is to be of concrete, brick and steel construction, and will be 700 ft. long. There will also be a transfer platform of steel and concrete construction.

Lindsay, Cal.—The Atchison, Topeka & Santa Fe is asking bids for the construction of a stucco depot at this point. The bids will be received at Los Angeles, Cal. The estimated cost is $8,000.

Marshalltown, Iowa.—The Chicago & North Western will ask bids in the near future for the substructure for a 1,100-ft. viaduct which will carry Third avenue over the Chicago & North Western and the Minneapolis & St. Louis tracks. Steel girders will be used for 930 ft. of the length of the viaduct. The structure will be built jointly by the Chicago & North Western and the Minneapolis & St. Louis.

English Excursion Fares Cancelled.—The English Railway Executive Committee was compelled because of military exigencies to cancel the issue, with a few exceptions, of "cheap bookings" for the holidays. The reasons given were as follows: "(1) The fact that the large works employed in the production of ammunition and ordnance will not be closed as usual during the Easter holidays, and that the collieries are expected to be working nearly full time. As a result the railway companies will have to run a full service of goods and mineral trains. (2) The large number of men who have left the railway service to join the colors, the great majority of whom it has not been possible to replace without having a retarding effect upon recruiting. (3) The necessity for keeping a large number of men, engines and vehicles constantly in readiness for naval and military purposes."

Railway Financial News

Boston & Maine.—The act permitting the reorganization of the Boston & Maine in substantially the form that the Maine, New Hampshire and Massachusetts public utilities commissions approved it, has been passed by the Maine legislature and has been signed by the governor. It now remains for the legislatures of New Hampshire and Massachusetts to pass similar bills.

Chicago, Rock Island & Pacific.—The protective committee, of which E. W. Sheldon, president of the U. S. Trust Company, is chairman, has announced the names of the directors for whom it will vote proxies at the meeting to be held on April 12. These are Colonel T. S. Williams, president of the Brooklyn Rapid Transit; William J. Matheson, a merchant and a director of the Continental Insurance Company; W. Emlin Roosevelt, of the firm of Roosevelt & Son, and Charles Hayden, senior partner of Hayden, Stone & Co.

Detroit United Railways.—Stockholders have authorized the directors to accept the offer of the city government to buy the street railways of Detroit, now owned by the Detroit United Railways. The price offered by the city is $24,900,000.

Long Island Railroad.—The formal complaint in the suit which Dick Brothers, brokers of New York City, have brought against the Long Island, following the refusal of the Pennsylvania Railroad Company to buy certain minority stock represented by Dick Brothers at the price asked for, has been filed in the Supreme Court. There are nine items on which the complaint asks judgment. One of these items asks for the appointment of a receiver and another for an injunction restraining the directors from advancing money for further expenditures of the Long Island for the benefit or purposes of the Pennsylvania Railroad.

Missouri, Kansas & Texas.—Stockholders will be asked to authorize an increase of the interest rate on the consolidated mortgage from 5 to 6 per cent. None of the $125,000,000 bonds authorized under this mortgage in 1910 have been sold, but there is $24,516,000 pledged as security for notes.

New York, New Haven & Hartford.—Accompanying the notice for the stockholders' meeting which is to be held at New Haven on April 24, Howard Elliott, chairman of the board and president, has sent a letter to stockholders in part as follows:

"The company and its subsidiary, the Harlem River & Portchester Railroad Company, have issued and now outstanding in the hands of the public short-term notes amounting to $32,304,000, of which $29,399,000 becomes due May 1 and $2,905,000 between that date and August 1.

"The New England Navigation Company has issued and now outstanding in the hands of the public, short-term notes of $20,000,000 due May 1, 1917.

"The Massachusetts Public Service Commission has recommended to the Massachusetts general court that all capital stock outstanding in the hands of the public, 1,571,179 shares, be validated under the laws of Massachusetts, but has recommended that the 228,991 shares now in the company's treasury should be retired and canceled. In this recommendation the directors concur. The continued existence of this treasury stock is unnecessary; its retirement will have no effect upon the company's balance sheet; and the remaining stock if validated in accordance with the recommendation made to the Massachusetts general court, will start the company with its capital stock and indebtedness issued and the outstanding and premiums paid in and shown in the company's premium account on June 30, 1914, validated by the laws of all the three states in which it is incorporated.

"Directors believe that every security holder of the company is interested in having remedial legislation passed along the lines suggested, and to use influence to bring about the passage of these laws during the present session of the various legislatures. Directors hope and expect to renew the short-term notes as they fall due, but if the legislation fails at this session the company will be confronted with the necessity of renewing the notes again in 1916, and of again making an effort to get the necessary laws so that some permanent plan of financing can be adopted. Officers and employees are straining every nerve to conduct business of the company economically and efficiently, but business is at a low ebb, and the margins are very small. The situation needs careful attention and help. Prompt action is necessary for the welfare of the company, its owners, its employees and its patrons."

Pennsylvania Railroad.—See Long Island Railroad.

St. Louis & San Francisco.—The United States district court has given the receivers authority to pay $1,249,000 interest, due April 1, May 1 and June 1, on securities on which interest has not hitherto been defaulted.

Southern Pacific.—James N. Wallace, president of the Central Trust Company, New York, has retired as a director of the Southern Pacific. The annual meeting was held in Anchorage, Ky. Hugh Neill, secretary of the company, was elected to succeed Mr. Wallace.

The proposition calling for the purchase of the following companies was ratified at the meeting: Coos Bay, Roseburg & Eastern Railroad & Navigation; Corvallis & Eastern; Pacific Railway & Navigation; Portland, Eugene & Eastern; Salem, Falls City & Western, and Willamette Pacific.

Toledo & Ohio Central.—In the fiscal year ended December 31, 1914, this company, operating 446 miles of line in Ohio, had gross revenue from operation of $4,930,626, a decrease of $1,100,804, primarily due to the suspension of coal mining in the Ohio fields in April, May, June and July, and in the West Virginia fields for a considerable part of the same period. The net result of the year's operations was a deficit of $306,616 as compared with a surplus of $441,227 in 1913.

The Toledo & Ohio Central is one of the New York Central Lines. It connects with the New York Central at Toledo, and from Whitmore, just south of Toledo, it has two parallel lines running southeast to a junction at Thurston, the western line passing through Columbus. At Corning, Ohio, it connects with the Kanawha & Michigan. It controls the latter through stock ownership, having purchased during the year 89,478 shares of its stock, and issued for this purpose and for current requirements demand or one-year notes aggregating $8,719,012. Previous to 1914 the Kanawha & Michigan was controlled jointly by the Lake Shore and the Chesapeake & Ohio. The Toledo & Ohio Central also owns the Zanesville & Western, and in 1914 lost on its operation, $254,499.

In the fiscal year ended December 31, 1914, the company earned operating revenue per mile of road of $11,048 as compared with $13,620 in 1913. The freight revenue per mile of road was $9,107 as against $11,443 in the previous year. The total ton mileage of revenue freight was 38,517,440, a decrease of over 8,000,000. The average receipts per ton per mile were 4.25 mills as against 4.10 mills in 1913. The average revenue train load was 669 tons, a decrease of 8 tons. The total number of passengers carried in 1914 was 1,104,290 as compared with 1,157,804 in 1913. The average passenger receipts per passenger mile in 1914 were 1.765 cents, and in the previous year, 1.775 cents.

On December 31, 1914, the company's investments totaled $37,357,158, and its current assets were $2,962,570, of which $676,792 was cash. There was capital stock outstanding of $10,208,000, and funded debt of $12,226,523. The current liabilities were $12,544,587, of which $10,219,012 was loans and bills payable. The loans and bills payable on December 31, 1913, were but $1,500,000, the increase from this total being due to the issue of notes to provide for the purchase of the Kanawha & Michigan stock as above noted.

English Railway Women.—The question of employing women in railway service in England, so as to free men for the colors, is arousing considerable discussion in England just now, particularly in view of the fact that the railways are about to take a census with the object of ascertaining how many of their employees are within the military age limits. A number of companies have already hired women for various employments.

Contents

*Illustrated.

The market conditions were never so good in years as they are now for the purchase of cars and locomotives. With the general depression in business all over the country the railways have found it necessary to store a large number of engines, and there is an unusually large car surplus. These things, of course, decrease the demand for new equipment and the builders of cars and locomotives are greatly affected by this condition of affairs. They have made savings by partially or wholly closing their shops, but this only reduces their loss, as a large part of the overhead expense must continue. In order to reduce their loss several companies have offered very favorable prices in the hope that the railroads can thereby be induced to buy. At these prices the equipment would be built at a net loss, but it would not be as great as if the equipment were not built at all. If roads that are able to obtain the necessary capital purchase equipment now they will make profitable investments, even though it be necessary to store the new equipment for a while. They will, besides, help the builders and also give employment to a large number of men now unemployed. When business again returns to its normal condition it is probable that the demand for equipment will be so great that it will be impossible to obtain prompt delivery and that prices will be higher than they have been for several years past.

Purchase of Cars and Locomotives

The United States Department of Agriculture has issued, for the benefit of the farmers of the country, a brochure on freight-car demurrage, in which farmers who ship products by rail are advised not to accept special concessions from the railways in the use of cars. Such privileges, says the bulletin, are far from being a real advantage. "The man who is backward in loading a car is contributing to the car shortage throughout the country, and from a general car shortage farmers are likely to suffer more than any other business men." Our paternalistic government meddles with a good many things with which it has no business; and at first sight a pamphlet on a transportation subject from the Agricultural Department looks like an example of the wrong use of public money; but the author, G. C. White, has in this case done his work so well as to merit warm praise. As he says, "the bulletin should be of interest to shippers of all commodities and to transportation men." Perhaps that department of the federal government which deals exclusively with transportation ought to have done this job, though it could hardly have been expected to do it in the trenchant style in which it is here done, by a single individual, studying the subject without responsibility, and having a free hand. At any rate, Mr. White has put into vigorous language some salutary truths which need to be recognized everywhere. Extracts from the pamphlet will be found in another column.

An Illuminating Study of Demurrage

A brief description of the Chicago, Rock Island & Pacific stockholders' meeting in Chicago on April 12 is given elsewhere in this issue. The situation is complicated and interesting. There is a complaint before the courts which denies the right of the representatives of the majority of the stock to vote the proxies which they held at the meeting. One of the four directors elected at this meeting was N. L. Amster, who represents the minority interests. It is, of course, counsel for the minority interests who are pressing the complaint, which if it were upheld by the courts would make the election of all four of the directors, including Mr. Amster, at the April 12 meeting illegal, presumably. Mr. Amster, therefore, is placed in the position of accepting his election to the board as bona fide, in which case the complaint would have to be dropped, or else of refusing to recognize his

The Rock Island Situation

election as a director as legal, remaining on the outside and pressing the complaint. It might be pointed out that the majority interests are homogeneous, in that they are working for some constructive plan of reorganizing the company. They represent, however, very many different viewpoints and, probably in many cases, quite sharply opposed interests. The various classes of security holders other than the stockholders have interests in the future of the property, which in some cases are by no means identical, nor are they necessarily identical with the point of view of the majority stockholders. The bankers representing these various interests have, it is understood, generally supported the majority stockholders' position as represented by the Sheldon committee.

WANTED—DIRECTORS WHO WILL DIRECT

THE struggle over the Rock Island appears to have resulted in the control of the property being left in practically the same hands as before. But it has not been without important results. The minority stockholders won representation on the board. This is as it should be, for every element having a substantial interest in a property should have representation. But in the opinion of the *Railway Age Gazette* the changes made in the directorate were not the most important feature of the meeting at Chicago on Monday. In our opinion the most important feature was the remarks made and the resolutions offered by A. F. Van Hall, chairman of the Dutch Protective Committee of Stockholders. There were more sound principles and sound sense regarding the way a railway board should be constituted, and concerning the duties of directors, concentrated in Mr. Van Hall's brief remarks than we have seen put into an equal number of words in years. If Mr. Van Hall's remarks bear their appropriate fruit the Rock Island in a few years will occupy a different place in the esteem of the public, if not also in the field of transportation, from that which it has occupied for some years.

Mr. Van Hall acted with the committee representing the majority stockholders, but he refused to be blinded to the main cause of the troubles the Rock Island has been having. The main cause has been, as Mr. Van Hall said, that the board of directors has played a negligible part in the road's organization. Nominally the courts of last resort in the organizations of our railways, the boards of directors of many of them, are nothing but rubber stamps to register the wishes and ambitions of a few men who usually own but a small part of the outstanding securities. Commenting on the results of this condition in the Rock Island, Mr. Van Hall made the following statements, which deserve to be read and pondered by every man who desires the welfare of the railways of the United States:

> I am convinced that a great many things which have happened would not have happened if all the directors of the company had always been keenly aware of the trust which they have accepted, and of the responsibility which rested upon them for the proper execution of that trust. I firmly believe that they were not aware of it because they did not feel that they had been elected for such a purpose. Many members of this board, as of many other boards, have accumulated upon themselves so many directorates, have upon their hands the management of so many important affairs, that they cannot have started as directors in this company with the intention of looking after the business of this company as business men should. And this is the strangeness of the thing—every one will agree with me that a grocer who is not attending to his business will certainly see his business go to pieces, and so will a coal merchant or a hotel owner, or a banker. But with a railroad it seems to be otherwise. The boards of directors of this kind of business often seem to think that it is not necessary to attend to the business, and that things will look after themselves. That is all very well when there is a Harriman available to take the load upon his shoulders, but if there is not, things are bound to go wrong. It is true, there are difficulties in the way. Boards of directors are often very numerous and consist of men living widely apart from each other. How can you expect such a board to meet frequently and to handle situations carefully and promptly?

The statements we have quoted apply with as much force to the directorates of many other railway companies as to that of the Rock Island. The board of directors of many of our railway companies are composed of so many men that very few of them feel any special responsibility for the trusteeship they have voluntarily assumed or really exert themselves to perform the duties which they have solemnly undertaken to perform. A small part of the time of a really able man is worth a great deal more than a great deal of the time of a mediocre man; but, unfortunately, many of the able men who have accepted memberships on numerous boards have given almost no time whatever to the duties they have assumed on a large part of these boards. The consequence is that often they do not take an active part in the management of the companies, and that often when they do take an active part their ignorance of the conditions and needs of the concerns is so great that their activity does more harm than good.

The remedy for this condition of affairs was pointed out by Mr. Van Hall.

> What we therefore need in a big corporation such as the Rock Island is a small board of good experienced business men, living not too widely apart from each other, who have got the time and are willing to devote it to the promotion of the business of the company. If there is a Harriman among them, so much the better; he will certainly not fail to assert himself. But even such a man will need the co-operation of other good men. If I remember well, it was the late J. P. Morgan who said that it was his experience that even the best and biggest technical men always needed sound financial advice.

Mr. Van Hall also advocated the payment of a substantial compensation to the directors.

To those familiar with the large directorates of most American railways the suggestion that a board should contain only seven members will seem radical, but a small board composed chiefly of men who live along the property, and who consider it a part of their business to thoroughly acquaint themselves with the public opinion and commercial and industrial conditions in the territory, and the needs of the property, will usually be far superior to the typical board composed of from fifteen to two dozen men who do not live on the property and who know almost nothing about it except what is disclosed in statistical reports concerning it. Of course, the kind of directors that we now have usually think that they are pre-eminently fitted for their duties. The great trouble with them is that they have too much egotism and wealth, and too little knowledge and sense of duty and responsibility. A board of directors should be a working committee and not a list of ornamental and highly useless names, as so many are now.

On Mr. Van Hall's motion the stockholders of the Rock Island adopted resolutions instructing its board of directors to consider the desirability of adopting his suggestions and report thereon at the next annual meeting. It is understood that the management of the road is in sympathy with Mr. Van Hall's views. The results of the board's deliberations on the subject will be awaited with much interest.

LONG ISLAND RAILROAD

IF there is one point more than another on which the majority of railroad operating officers differ radically from the majority of patrons of railroads it is as to the relative importance and profitableness of passenger business as compared with freight business. To the majority of railroad operating officers the economical handling of freight is of much more importance than the development of passenger business. To the great majority of patrons of railways the passenger service which a railroad renders is the measure of the railroad's usefulness. Of course, both of these views have elements of truth in them and each is an exaggeration. Passenger business under the present rates in the United States is nowhere as profitable per train mile as freight business.* On the other hand, the very fact that the quality of the passenger service is so large a factor in the esteem or disesteem with which the public holds a road gives it an importance disproportionate to its net revenue as compared with the net revenue from freight.

Mr. Brandeis pointed out in the 1914 eastern rate advance case that no one of the roads which had shown marked prosperity in the last few years had a very large proportion of passenger business. Nevertheless this question of passenger busi-

*Of course, there may be individual passenger trains which would show a larger net profit than individual freight trains, but the statement here made is intended to apply to averages rather than individual cases.

ness is one which is now being faced squarely and without prejudice by many of the railroad executives who are devoting a part of their time to a study of the broader questions of railroad economics and the relations of the railroads to the public. In this connection the Long Island Railroad Company's annual report for the calendar year ended December 31, 1914, is of particular interest. In 1914—the third-third year of its operation—despite the business depression, the Long Island showed the largest net revenue in its history, and a deficit, after paying fixed charges, half as great as the deficit for 1913. The fact that there was a deficit at all was probably due to business depression, and there are many indications in the annual report that the Long Island, after all the years that the Pennsylvania has put money into it, has at last turned its corner and is in a fair way to become a self-supporting railroad property.

The Long Island's conditions are unique. It operates 398 miles of road, of which four miles are trackage rights through the Pennsylvania Railroad tunnels from Long Island City to the Pennsylvania station in New York. It has practically no through freight or passenger business, the average length of haul of freight being 23 miles and the average passenger journey 14.5 miles. Of the total $13,220,000 operating revenue in 1914, $3,684,000 was from freight and $7,900,000 from passengers. The density of freight (ton-miles per mile of road) was 257,771 in 1914, while the passenger density (passenger-miles per mile of road) was 1,520,000.

The management of the Long Island, as will be seen, had

The Long Island Railroad

conditions to face which are peculiarly difficult. Like other American railroads, it has had to meet demands for continually increasing standards of passenger service. While, of course, it has no heavy fast long-distance trains, with comparatively few passengers per train-mile, which is characteristic of long through runs of trains composed entirely, or nearly entirely, of Pullman cars, it has a very large commutation business, and it has to meet demands for frequency of service which are unusually exacting.

On most roads that have made large gains in operating economies much of the saving has been made through a decrease in the number of trains necessary to handle the same volume of freight traffic. Most roads have shown an increase in the costs of operating each train-mile in both freight and passenger service. The small proportion of freight business on the Long Island leaves it but a small margin for possible gains in economy in this branch of the service and an analogous economy in passenger service; that is, fewer trains to handle the same amount of business is not feasible because of the public demands for frequency of service.

Shortly after the Pennsylvania acquired control of the Long Island in 1900 it was apparent that even with a large growth in business the Long Island would show larger and larger deficits. To offset this some means had to be devised for holding down operating expenses other than a rigid restriction of passenger-train mileage.

In part to facilitate more economical operation, in part to meet the demands of the public for a cleaner and more comfortable service, electrification of the western lines of the system for passenger service was undertaken. The accompanying map shows the lines now operated for passenger service by electricity. A similar policy was adopted toward grade elimination and the construction of permanent passenger stations and over and under grade crossings. Both of these improvements necessitated very large expenditures of new capital, and during the time the work was being done increased instead of decreased the operating expenses of the company. Such a program of investment for the quite distant future and to meet the demands of the public service could only have been made by a rich railroad, willing and able to wait for years for a return on its additional investment.

The result has been that since 1900 more than $50,000,000 of new money has been invested in the road and a debit balance to profit and loss had slowly been increasing, until at the end of 1914 it totaled $6,125,000.

In 1914, however, the results of operation were very encouraging. Total operating revenue amounted to $13,220,000. This is an increase over 1913 of $136,000, despite a loss of $329,000 in revenue from express, and despite the depressed business conditions which affected passenger travel on the Long Island to a marked extent. Operating expenses amounted to $9,116,000, a decrease of $453,000; but of this decrease $352,000 was accounted for by the lower cost of handling express business.* Railway operating income in 1914 amounted to $3,318,000, an increase of $566,000 over the previous year. After the payment of rentals and fixed charges there was a deficit of $494,000, a decrease in deficit as compared with the previous year of $484,000.

The total passenger mileage handled amounted to 605,528,000 in 1914, an increase of 11,928,000, or 2 per cent, over the previous year. This increase of 2 per cent in passenger mileage was handled with an increase of less than half of 1 per cent in passenger-train mileage, the total passenger-train mileage in 1914 being 5,449,000. Moreover, whereas passenger-train mileage showed a slight increase, the expenses for passenger enginemen amounted to $180,000, a decrease of $22,000 from the previous year, and the cost of fuel for passenger locomotives was $331,000, a decrease of $53,000 from the previous year. On the other hand, the wages of motormen amounted to $155.000, an increase

*In 1913 the Long Island entered into a contract with the Adams Express Company to take over its express business; and whereas, therefore, the revenue from express shown in 1914 is the net received from the express company, the revenue in 1913 was for five months the gross, and the cost of handling the business during those five months was a charge to expenses.

of $21,000 over the previous year, and the cost of "purchased power" amounted to $102,000.

A detailed study of both transportation and maintenance costs would show a reduction in a number of items, each of which is small, but the aggregate of which is considerable, due to electrical operation of all passenger trains on the lines shown crosshatched on the map.

The following table shows principal figures in 1914 and 1913:

	1914.	1913.
Average mileage operated	395	395
Freight revenue	$3,684,335	$3,508,173
Passenger revenue	7,899,972	7,814,299
Total operating revenue	13,220,334	13,083,925
Maint. of way and structures	1,457,510	1,611,313
Maint. of equipment	1,440,907	1,547,489
Traffic expenses	141,851	181,072
Transportation expenses	5,687,110	5,882,050
General expenses	345,088	347,169
Total operating expenses	9,115,779	9,569,093
Taxes	784,051	762,864
Operating income	3,318,434	2,751,969
Gross income	3,981,938	3,422,537
Net deficit	494,131	977,985

NEW BOOKS

Department Reports of the State of Ohio. Weekly; published by Nemar Publishing Company, 49 North High street, Columbus, Ohio. Price $10 a year; single copies 25 cents.

This is a new periodical, issued every Thursday, started for the purpose of giving to the public the reports and decisions of the Public Utilities Commission, all of the other commissions, the secretary of state, the attorney general and the supreme court, of the state of Ohio; and with news also of subjects of legislation, when the general assembly is in session. No. 24, dated April 1, contains about 40 pages, and includes decisions by the industrial commission, by the attorney general and by the supreme court of the state. A circular issued by the publishers contains commendatory letters from the Public Utilities Commission and from the attorney general of the state.

Graphic Methods for Presenting Facts. By Willard C. Brinton. Published by the Engineering Magazine Company, New York. 372 pages. Price $4.

In the preface to his book Mr. Brinton says that "the reader who examines only the illustrations and the titles without any reference to the text will undoubtedly get a major portion of vital material in the book. It is believed that an average reader may go through the illustrations and the titles in about one hour." With the first of Mr. Brinton's observations it is impossible to disagree. The book has a wealth of illustrations, which, if carefully studied, will give the student a quite comprehensive, although, of course, necessarily a superficial, knowledge of the principal methods of graphical presentation of facts. Although the sub-titles contain criticisms of the methods used in the illustrations, the text adds a great deal to the value of the work and is very readable. The fact that Mr. Brinton should attempt to expound a language by the use of that language itself is interesting and logical, but to the majority of lay readers of Mr. Brinton's book the English language of the text will form in all cases a source of additional information and in many cases a source of necessary information to make the diagrams and charts comprehensible.

The statement that the average reader can go through the illustrations and titles in about an hour illustrates one of the weak points in the theory of graphic presentation of facts. Not only would it be impossible for the average reader to go through all of the illustrations and titles and understand them in an hour, but it would be quite safe to say that a reader very much above the average who had not had long practice in reading diagrams and charts could not go through even a majority of the charts and diagrams in an hour and understand them.

In the attempt to make a chart or diagram an easy method of conveying facts or figures it is sometimes assumed that there is a mechanical substitute for comprehension. It is quite possible for any one to take one of the numerous charts which Mr. Brinton's book contains and almost at a glance get a certain kind of information conveyed to his understanding; but to assume that this is a substitute for an analysis of the facts is a fallacy into which it is quite evident from Mr. Brinton's text that he does not fall.

Apparently the fundamental theory on which graphic methods of presenting facts is recommended is that the eye can convey to the brain an understanding of relative sizes more accurately and more quickly through a comparison of lengths of line or area of surface than by the shape of a figure. Thus, if the eye sees the Arabic numeral 3 in conjunction with the word tons, and the Arabic numeral 9 in conjunction with the word tons, it does not convey to the brain as quickly or as accurately the relative quantitative importance of the two groups as it would if a line three units long were shown next to a line nine units long. In simpler quantitative measures this is not true. To the average man the fact that a ten dollar bill is no larger in size than a one dollar bill does not obscure the relative buying power of the two pieces of paper. When, however, we come to a complex series of facts, if the eye is to convey the knowledge of the relative quantitative values of these facts to the brain it must either take in all the facts at once or convey each fact separately to the brain to be there set aside and remembered, while the eye brings other facts to place alongside of it, so that all the facts will be held retained at the same time. By presenting a group of facts graphically they can be taken in by the eye as a whole, whereas if they were presented in a column of figures each fact would have to be conveyed separately to the brain and there retained while the other facts were being picked up one by one by the eye. This is what is meant very often when it is said that the *trend* of earnings, expenses, population or any other units can be shown better by a chart than by figures. All this Mr. Brinton brings out very clearly in his comprehensive work on Graphic Methods for Presenting Facts.

What has often been said of the ease with which figures can be made to lie is equally true of charts. Mr. Brinton's book gives numerous examples of misleading charts. These are criticized freely and in a very helpful way. On the other hand, Mr. Brinton at times assigns a function to a chart which the chart is incapable of performing. Thus he shows a chart on which the marks received by English school girls in arithmetic and in English respectively have been plotted, and in commenting on the line which is obtained says that its position proves that girls have much more ability in English than in arithmetic. The marks received by the girls are the proof of their ability and the chart plotting these marks is a graphic presentation of it, nothing more; it is not itself proof.

There are two functions which graphic presentation of facts may perform to better advantage than could either the English language or tabulations of figures. Attention may be drawn more easily and quickly to facts which need analysis, and facts may be conveyed to another person who would not give the time or the attention necessary to comprehend these facts if they had to be presented either in written language or in figures. It is of the utmost importance that the medium which is used to call attention to facts needing analysis shall be so scientifically adapted to its purpose that it will neither draw attention to unessential comparisons or permit comparisons to which attention should be drawn to escape notice. It is also of the utmost importance that if graphic charts are to be used to instruct the public or to help the operating or technical man to lay before his president or his board of directors facts in a form easy of their comprehension, the foundation for the science of chart making must be based on logical and scientific principles. It is the exposition in a comprehensive way of the mediums adapted to various kinds of facts, and the science and logic of the fundamental principles on which the very great value of Mr. Brinton's work rests. In addition to discussing, analyzing and illustrating these fundamental principles, Mr. Brinton's book also describes in detail the mechanical devices used in the graphic presentation of facts, such as map presentations, pins and beads, card records, etc.

An Effective Freight Claim Preventive Crusade

Part II—One Hundred Thousand Dollars Saved During First Six Months of Campaign, Ending December 31

In the first article of this series, which was published in last week's issue, we covered the preliminary steps which were taken in the educational campaign to reduce loss and damage to freight on the St. Louis & San Francisco. The efficiency associations which were formed at several of the larger stations, however, had this as only one of their objects. To supplement their efforts and wage a more direct and aggressive campaign, it was decided to organize freight claim preventive committees along almost exactly the same lines as the safety first movement had been developed. Each division and terminal* has a freight claim preventive committee, of which the superintendent is chairman. These committees are not divided up into sub-committees and supervised by the chairman, but act as one committee. The division and terminal committees are under the general direction of the Central Claim Preventive Committee, which is composed of the general officers of the road.

FREIGHT CLAIM PREVENTIVE COMMITTEES

The scheme was first tried out in June, 1914, on the Northern division. Four meetings were held under the direction of a division freight claim preventive committee—one at Ft. Scott on the ninth, one at Kansas City on the tenth, one at Pittsburgh on the eleventh, and one at Springfield on the twelfth. These meetings were all held in the evening, and over 300 persons attended the four meetings. Those men on the committee who were not on a monthly salary basis were compensated for loss of time from their regular duties and the company paid all traveling expenses. The purpose of the movement was purely educational and committeemen were selected because of their influence with their fellows, the idea being to secure the co-operation of every man who had to do with the handling of freight.

The movement on the Northern division proved so successful that it was decided to extend it to other points on the system as rapidly as possible. On July 7 authority was issued to organize committees at the Kansas City terminal, St. Louis terminal, Memphis terminal, Springfield terminal, and on the Eastern and Ozark divisions. A division freight claim committee is made up about as follows: Superintendent (chairman), assistant superintendents, yardmaster, agent, platform foreman, local engineer, local conductor, local brakeman, car inspector, car foreman, switch engineer, engine foreman, special agent and master mechanic.

The freight claim preventive committee at Memphis is a typical terminal committee and in its membership includes the following: Superintendent of terminal, agent, general foreman motive power department, general foreman car department, platform clerk, receiving clerk, yardmaster, day switchman, night switchman, day engine foreman, car inspector and yard engineer.

WHAT IS DONE AT THE MEETINGS

At the first meeting which a freight claim preventive committee holds at a terminal, it is the practice to place before the employees, in a clear and forceful way, the actual facts concerning the amount of money wasted in paying for loss and damage, and the possibilities which will result from co-operation on the part of each one of the employees in helping to reduce this waste. As far as possible the superintendent of freight loss and damage claims has attended all of these initial meetings and has outlined the situation clearly and thoroughly. In fact he has spent the greater part of his time for several months in traveling over the road, and keeping in close personal contact with all of the freight claim preventive committees. Possibly this intimate personal supervision is the greatest single factor responsible for the remarkable success which has accompanied the work of the committees. In addition to this, Mr. Whitelam has kept a steady stream of pertinent bulletins, statistical data, diagrams, reminders, and other material flowing from his headquarters to all parts of the system.

In the preliminary talk, for instance, attention should be drawn to the large amount of money expended for the payment of loss and damage per thousand dollars of gross freight revenue, and the possibilities of decreasing this amount by eliminating or cutting down certain classes of claims which are due almost entirely to carelessness or thoughtlessness on the part of those engaged in handling freight, thus not only saving money for the road, but making better satisfied patrons. A statement, such as the one following, showing the relation of loss and damage to freight to certain of the more important transportation department expenses, can be quoted from to good advantage. These figures are for the year ending June 30, 1914.

Passenger employees—station service	$324,089.32	or 2.05 per cent
Telegraph and telephone operators	395,082.50	or 2.50 per cent
Yardmasters and clerks	304,562.97	or 1.93 per cent
Yard enginemen	465,659.82	or 2.32 per cent
Fuel, water and supplies	481,569.26	or 3.05 per cent
Enginehouse expense, yard and road	578,269.43	or 3.67 per cent
Water for road engines	212,160.28	or 1.34 per cent
Care of passenger cars	269,341.31	or 1.71 per cent
Passenger supplies and expense	171,934.94	or 1.09 per cent
Care of freight cars	68,506.48	or 0.43 per cent
Freight supplies and expenses	170,575.78	or 1.08 per cent
Loss and damage—freight	513,954.90	or 3.29 per cent

Or possibly extracts may be used to advantage from the following table, showing claim payments made during the previous year for certain classes of freight due to errors of employees, improper refrigeration and ventilation, and improper loading and stowing. these particular items being the largest and most susceptible of reduction with the proper care on the part of the employees.

	Errors of employees	Improper refrigeration and ventilation	Improper loading and stowing
Boots and shoes	$ 264.60	.....	$ 109.48
Clothing, dry goods and notions	1,332.19	.....	951.43
Live stock	2,365.02	.....	140.20
Meat and packing house products	1,014.48	$2,732.65	169.05
Flour and other mill products	472.19	.....	134.54
Sugar	19.50	.....	85.04
Groceries	169.13	9.64	868.99
Wines, liquors and beers	63.22	232.01	157.77
Furniture (new)	5.94	.....	1,540.37
Household goods	107.16	.....	963.45
Glass and glassware	56.95	.....	1,339.77
Products of cement, clay and stone	105.00	.....	788.37
Stoves	33.70	.....	722.36
Iron and steel castings and bars	74.45	.....	194.00
Vehicles	9.79	.....	105.48
Agricultural implements	9.02	.....	186.96
Products of mines	423.57	.....	149.31
Coffee	20.84	.....	209.77

Then again statements showing the amount paid out in claims for various commodities and just what could be bought with this money, as indicated by the following items which are taken from an extensive list, may also drive home the importance of using greater efforts to prevent loss and damage.

A Few Things the Frisco Bought and Paid For, and Did Not Receive During the Fiscal Year Ending June 30, 1914.

Amount	*Commodity*	*Would buy*
$11,976.35	Boots and shoes	3,422 pr. shoes at $3.50.
31,671.69	Clothing, dry goods and notions	31,672 yd. silk at $1, or 452,453 yd. calico at 7c.
46,838.75	Fruit and vegetables	20,817 bu. peaches at $2.25, or 59 cars of 350 bu. per car.
41,415.51	Live stock	207 mules at $200, or 10 cars of 20 mules each.
28,478.62	Meat and packing house products	113,914 lb. breakfast bacon at 25c. per lb.
31,001.93	Grain	44,288 bu. wheat at 70c. per bu., or 44 cars of 1,000 bu. per car.

*The terminals at St. Louis, Kansas City, Memphis and Springfield are under the jurisdiction of terminal superintendents who report to the general superintendents.

Amount.	*Commodity.*	*Would buy.*
22,311.93	Flour and other mill products	9,700 98-lb. sacks flour at $2.30.
16,310.79	Groceries	Supply 652 families of 3 persons 1 month at $25 per family.
9,577.71	Tobacco	95,777 10c. cigars.
16,777.11	Furniture	Furnish 33 homes of 4 rooms at $500 each.
11,207.97	Household goods	Furnish second-hand furniture for 111 families at $100 each.
6,967.77	Vehicles	14 Fords at $500 each.

Another statement from which items may be quoted with good results is reproduced in part below:

$482,039.29 paid in claims for loss and damage to freight, fiscal year 1913-14, would have bought any one of the following items:

21	1040 class locomotives.
412	cabooses.
567	36-ft. box cars.
43,035	freight car axles.
53,616	freight car couplers.
302,395	air hose.
362,875	cast iron brake shoes, engine.
1,163,061	locomotive scoop shovels.
1,198,931	steam gage lamps.
1,463,206	cast iron brake shoes, freight car.
2,387,326	1 gallon oil cans.
3,239,950	½-gallon oil cans.
3,779,949	white lantern globes.
4,123,581	engine torches.
9,071,880	lb. cotton waste.
15,119,797	machine bolts, average size.
22,679,695	lb. 8 penny nails.

A motive power department employee will stop and think when he realizes that the amount paid out in claims for the fiscal year 1913 would buy 21 large freight locomotives. The conductor or brakeman cannot but be surprised when he learns that this money would buy 412 cabooses or 567 36-ft. box cars.

The importance of prompt reply to correspondence is also emphasized in order that the handling of claims may be facilitated. At present 56 per cent of all the claims are settled within a period of 15 days, and 68 per cent within a period of 30 days. The desire is to improve this record in order to secure the good will and the interest of the patrons.

There are 15,000 employees on the Frisco, each of whom has something to do with the handling of freight in some capacity. If each one of these 15,000 employees could save five dollars it would make seventy-five thousand dollars, or three-quarters of the amount which it was aimed to save in the first year. Statements can then be made giving specific instances covering a wide range of activities and showing how by a little care and thought abuses have been removed and losses stopped.

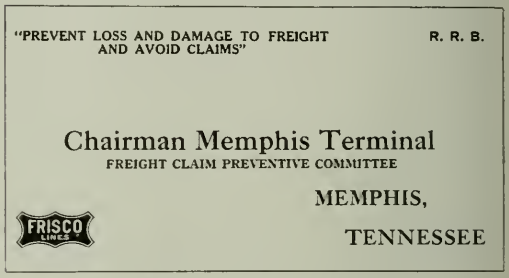
Usually after a brief address of this sort different members of the freight claim preventive committee discuss various phases of the question in which they are especially interested. The meeting is then thrown open and all present are urged to ask questions or make suggestions. This roughly covers the method of procedure at one of the initial meetings.

The succeeding meetings at each point are under the direction of the division freight claim preventive committee and are usually devoted to an analysis of the latest statistics available, the study of any bulletins which may have been received from the office of the superintendent of freight loss and damage claims, and a discussion of abuses which have been discovered at the local points and how they may be overcome.

FREIGHT CLAIM PREVENTIVE POSTAL

One of the more important details and one which has developed the greatest amount of material for discussion at the local meetings is a postal card, both sides of which are shown in the illustrations. The address of the chairman of the local committee is printed on one side. On the other side any employee may, and in fact is urged to, call attention to anything which comes under his notice, the remedying or bettering of which will, in his opinion, prevent loss and damage to freight. It is thoroughly understood that no discipline will be assessed for any mistakes or abuses that are called attention to in this way and that the information will be used for educational purposes only. The wide range of mistakes and abuses which have been located by these cards and the progress which it has been possible to make by their aid is remarkable. The abuses noted are immediately investigated by the superintendent upon receipt of the cards, and the investigations are discussed at the business sessions of the freight claim preventive committee. When the committees ride local freight trains the business session is held between stations. It generally takes a day and a half to go over and discuss the investigation.

Some idea of the extent to which these cards have been used

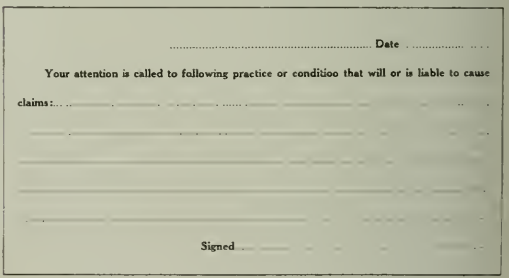


The Address Side of the Special Postal

may be gained from the following figures covering the number received for each of the past four months:

November	1,860
December	1,780
January	1,743
February	2,520
Total	7,903

The number received in February is the largest for any one month to date, and is due to the greater interest which the employees are taking in the campaign. The minutes of the



The "Business" Side of the Special Postal

Eastern Division Freight Claim Preventive Committee meeting, held at Springfield, Mo., January 6, 1915, indicate, for instance, that 67* of these cards were read and discussed. Following are a few extracts showing the sort of information that is often turned in on these cards:

C. L. Mikkelson, Conductor—Train 43 on November 26 had S. F. 31,480 out of Pacific loaded with merchandise from St. Louis. The car was not cleaned before loading with merchandise. Comment: This was handled with St. Louis for improvement in cleaning of cars before loading merchandise in them.

B. C. Barham, Conductor—S. F. 46,975, loaded with cattle, handled on October 3, one cow dead in car. This would not have happened if stock had been properly taken care of en route. Comment: Handled generally and with all concerned.

R. L. Herndon. Operator—Chadwick to Osceola, Mo., waybill No. 40, November 13, covers double marked household goods. Comment: Handled with Chadwick, who advises will have no further cause for complaint.

T. J. Sullivan, Special Agent—S. F. 32,303, loaded with wheat, arrived at Choteau avenue, 6:05 a. m., November 10, in train No. 32. Car leaking wheat along right-of-way. Was loaded at Springfield on October 28. Comment: Handled with the superintendent of terminals, Springfield, as to why such cars were furnished for tight loading.

*This is a rather low figure compared with other months.

F. D. Wrightsman, Conductor—Train No. 31, December 5, S. F. 94,332 and 93,801 loaded with street cars. These street cars were covered with canvas and were placed on head end of train where sparks from engine were liable to set fire to the canvas covering and damage the street cars. Comment: Handled with Newburg where cars were properly placed in the train.

W. W. Fitch, Engineer—New sill needed under freight-house door at Conway to prevent water running in on freight when it rains. Also two windows broken out of transom. Comment: Handled with general foreman bridge and building department, who had repairs made on December 15, 1914.

C. O. McCain, Agent—St. Louis, Broadway to Lebanon, waybill No. 563, December 1, S. F. 33,094. One sack of coffee loaded under freight for station west of Lebanon. Necessary to move all of the freight in the car to get at this shipment. Comment: Handled with Broadway station.

C. O. McCain, Agent—S. F. 29,590, loaded Broadway, St. Louis, December 4. Toe blocking and nails left in both doors. Comment: Handled with Broadway station, St. Louis, who advise person responsible has been told of his errors and promises to be more careful in the future.

W. S. Lea, Agent—Car LS & MS 86,535, loaded with merchandise out of Springfield had large hole in floor. Comment: Handled with Springfield station force, which has been instructed to watch matters of this kind and have them properly attended to before allowing cars to move out.

Springfield Terminal—Car No. 101,420 at Springfield platform, November 18. Part of the waybill for this car showed number of same as 10,142, instead of 101,420. Comment: Handled with the agent at Monett and transfer clerk claims pure oversight on his part and says he will watch these matters more closely in the future.

E. M. South, Conductor—S. F. 31,784, merchandise out of Newburgh on train 45, November 19. One brake beam gone and car not fit for merchandise loading. Comment: Handled with the mechanical department as to why no brake beam was on the car.

E. M. Frew, Agent—S. F. 125,761, merchandise car Broadway, St. Louis, November 12. Number of nails and spikes driven in the floor of the car. Comment: Handled with St. Louis, which in turn handled with the station force, giving men to understand that work of this kind would not be tolerated.

The minutes of the meeting indicate that 11 members of the freight claim preventive committee were present. There were 54 other persons present, including, in addition to the employees from the different departments a number of patrons of the road; among these were grocers, lumber men, harness men, a publisher, auto dealers, tailor, attorneys, bankers, farmers, etc. It is the purpose at all these meetings to invite shippers and patrons in order to interest them in helping to secure better results and to let them understand the care which the railroad employees are exercising to prevent loss and damage to freight.

It is the intention also to have freight claim preventive committees carefully inspect the facilities at the different points which they visit, and also study conditions as they travel. They are instructed to use local trains, where possible, in order to make constructive suggestions as to how this service may be improved. The division freight claim preventive committees have covered the entire Frisco Railroad on local freight trains, have talked to all the agents, checked the stations and held general meetings. This has required two solid days' work of each committee each month.

The following extract, taken from the minutes of a regular monthly meeting of the Western Division Freight Claim Committee, is of interest in this connection:

"Before departure from Beaumont Junction on Monday morning, the committee was divided into three sub-committees,* as follows: Grounds, station records, and merchandise. These committees on arrival at a station inspected the grounds, the cars in the yard, the station records and observed the handling of merchandise. On Tuesday, the 5th, the committee made a trip on a local freight train from Enid to Tulsa, inspecting station grounds, station records and observing the handling of merchandise. This meeting was the most successful the Western division has had. Not only was a great deal of enthusiasm aroused among the members of the committee, but they spread enthusiasm among all with whom they came in contact. Over 100 freight claim preventive post cards were turned in by the different sub-committees on this trip."

A few of the items mentioned on these postal cards and cards from other divisions may be worth consideration, as they differ somewhat from those which have been called attention to in connection with the Eastern Division Freight Claim Preventive Committee meeting, noted above.

S. W. Scudder, Fireman—Clinton Station had two freight trucks in bad condition for handling freight, having several holes in them. Comment: Trucks repaired.

Perry Skinner, Brakeman—Paper and stationery firms are shipping tablets and stationery weighing over 200 lb. in cases which should be reinforced with metal strips. Comment: Handled with Mr. Whitelam, who advises that this class of shipments will be watched particularly as to claims, and will be handled according to the results which develop.

Perry Skinner, Brakeman—Nearly all wholesale houses ship beans in sacks of 200 lb. each and use an inferior grade of sacks which split, scattering the beans. Comment: Referred to Mr. Whitelam, who advises that he will watch this class of shipments closely and handle with the shippers.

C. E. Jones, Brakeman—Run-way to stock pen at Cordell has holes in the floor which are liable to cause the stock to break their legs. Comment: Pens were repaired.

Anonymous—Called attention to agents leaving freight on platform several hours after departure of locals, subjecting it to theft or damage by the weather. Comment: Circular issued to all agents calling their attention to this practice and instructing them to discontinue it.

R. C. Meador—S. F. 123,755, sacked oats loaded against harrow which resulted in hole being worn in sacks. Case of improper loading on part of Oklahoma City. Comment: Matter called to attention of warehouse force at Oklahoma City. Has been handled with foreman personally and an item placed on bulletin board for inspection of all freight men.

J. H. Hammond, Switchman—"If some engineers would take more care in stopping and starting at the Iron Mountain crossing at Tower Grove, I think that it would save freight claims." Comment: Superintendent is handling; it has developed that some engineers use only driver brake and not the air brakes.

R. C. Meador—Merchandise car doors are left open on platform at noon, Afton. No one in charge. Think there should be a man left in charge or doors closed and avoid chance for pilferage. Comment: Matter called to attention of agent at Afton who has put a stop to the practice.

STATISTICS

Another factor which is helping to secure results is the monthly statement of damages at stations. The different stations are divided into groups according to the amount of business which they handle. For instance, Group 1 consists of

The Blackboard at the Hugo Freight Station

Springfield, Monett, Kansas City, St. Louis, Seventh street, St. Louis; Broadway and Memphis. The statements show the total number of shipments handled in each place, the number of damages and the number of shipments loaded to each damage. These statements are discussed at the various meetings at local points, and there is considerable rivalry in the attempt to head

*This is the regular practice for all of the division committees.

the list. At one place, Hugo, which heads Group 2, a large blackboard in the freight station reproduces the data for Group 2 and every man at that place is working hard to keep Hugo at the head of the group. That they are being successful is indicated by the fact that during February not a single error in billing or handling freight was made at Hugo, although 2,382 tickets were billed and 8,074 shipments were handled. This is the first time in the history of the Frisco that a station the size of Hugo has gone through a whole month without being charged with a single mistake. A photograph is shown of the blackboard, as it appeared in October, but the two tables included on it are not very clear and are therefore separately reproduced, as follows:

Statement Showing Total Number of Errors Made at Stations in Group 2, September, 1914. Also Number of Tickets Billed to Number of Billing Errors and Number of Shipments Handled Over Platform (Outbound) to Number of Loading Errors

Stations	Error billing	Error handling	Misbandling waybills	Total	No. tickets billed	No. tickets handled to each error billing	Shipments handled	No. shipments handled to each error
Hugo	2	4	..	6	2,513	1,256	8,206	2,051
Sapulpa	2	10	5	17	1,553	776	14,931	1,493
Tulsa	1	10	1	12	4,645	4,645	8,357	836
Oklahoma City.	10	22	..	32	11,921	1,192	14,333	651
Birmingham	6	12	..	18	5,755	959	7,288	607
Ft. Smith	13	26	..	39	6,051	465	10,359	398

Failures to unload and mishandling waybills not included in above averages.

Damages on Stations (Group 2)—September, 1914

Stations	No. shipments handled	No. damages straight cars	No. shipments loaded to each damage
Hugo	8,206	2	4,103
Ft. Smith	10,359	11	942
Birmingham	7,288	9	810
Oklahoma City	14,333	27	531
Sapulpa	14,931	29	515
Tulsa	8,357	21	398

It should be clearly understood that while the committees cover the different points on the division, the terminals; i. e., St. Louis, Memphis, Springfield and Kansas City, which have terminal superintendents, have freight claim preventive committees of their own and hold regular monthly meetings.

The Central Committee is made up as follows: E. D. Levy, general manager, chairman; J. E. Hutchinson, general superintendent; J. A. Frates, general superintendent; P. T. Dunlop, general superintendent motive power; R. W. Schulze, superintendent car department; W. H. V. Rosing, special engineer; T. B. Coppage, superintendent transportation; J. H. Doggrell, assistant superintendent transportation; J. H. Smith, chief special agent; E. C. Lilley, inspector of transportation and station service; W. E. Ogston, superintendent Frisco Refrigerator Line, and G. E. Whitelam, superintendent of freight loss and damage claims. Mr. Whitelam is secretary.

It was estimated that about $9,000 would be required to cover compensation to committeemen and traveling expenses for the first year's operation of the freight claim preventive committees. The division committees hold meetings monthly, but this interval will be made greater as the work becomes more fully developed. The time of meetings varies with local conditions and the convenience of the committee. Some are held in the evening; others at various times during the day.

There is one important factor which thus far has only been lightly touched upon and which in a large degree is doubtless responsible for the record which has been made. That is the ingenious devices which have been developed for keeping all concerned fully posted as to the progress of the campaign and in holding their interest to a high pitch. Not a week elapses but what something in the way of a bulletin, a reminder, a terse comment, a comprehensive diagram or a cleverly worded poster is sent broadcast over the system. The more important devices of this sort will be considered in Part III of this article, which will appear in next week's issue.

STRONG CLAIMS FOR CHILLED IRON CAR WHEELS

In a paper presented before the Richmond Railway Club, April 12, 1915, F. K. Vial, chief engineer of the Griffin Wheel Company, Chicago, made some very strong statements with reference to the superiority of chilled iron over steel car wheels. The following is taken from the summary of the paper:

"Collecting the various items, we have a saving of over $37,000,000 in the annual expenditures of the railroads of the United States when chilled iron wheels are used instead of steel wheels.

"It has been shown that the railroads cannot purchase immunity from accidents by the expenditure of tens of millions of dollars annually as a premium for steel wheels. It has been shown that there are many fundamental physical properties of chilled iron which are favorable to wheel requirements, that cannot be duplicated by steel. There are many properties of steel that do not harmonize with wheel requirements, that do not exist in chilled iron. It is, therefore, imperative that the fundamental laws of wheel design and the relation of chilled iron to service conditions be thoroughly established.

"A vast amount of work has been done in studying the peculiarities of steel rails in service, and the same line of investigation should be made with reference to wheels. The fundamentals of flange design are well established by the Association of Manufacturers of Chilled Car Wheels, but are not accepted by the M. C. B. standing committee on car wheels, and nothing is given in their place. The relation of the plate of the wheel to heat stresses is also fairly well established by the manufacturers, but is not yet accepted by the M. C. B. wheel committee.

"Notwithstanding the fact that nearly all breakages of wheels in service are caused by heat stresses, no study has ever been made by the wheel committee to classify railway equipment with respect to its braking power, which is the measure of heat generated in the wheel when operating on grades; neither do their specifications refer in any way to heat stresses, which are of greater magnitude than those arising from any other cause. It has been necessary for the wheel manufacturers to establish their own rules for wheels designed for heavy duty, which are based on wide observations at points of maximum service and also on tests made at Purdue University, showing the magnitude of heat stresses developed in wheels of various designs under various brake pressures. These rules have proved to be absolutely reliable and chilled iron wheels are now in use under loads exceeding 200,000 lb. In fact, there is far less trouble in the use of chilled iron wheels under maximum loads on maximum grades when designed according to well established rules than now occurs in the lightest capacity cars using the M. C. B. standards.

"The chilled iron wheel is especially serviceable in passenger service on account of the comparatively light loads carried and the freedom from tread failures such as occur in steel wheels. The difficulty in passenger service has been that only the lightest wheel manufactured, of the chilled iron variety, has ever been used. In fact, in the case of all-steel coaches using chilled iron wheels, the 625 lb. chilled iron wheel is used; when steel wheels are used, however, under the same coaches, they weigh above 1,000 lb. Notwithstanding the large percentage of chilled iron wheels in passenger service, it is only recently that the standardization of design for this service has been presented to the various railroad companies, and it would not be at all surprising if a return were made to the chilled iron wheel for exclusive passenger service.

"There is no question regarding the superiority of chilled iron wheels for the heaviest tender service, whether for passenger or freight; in fact, there is no field of wheel service where chilled iron is not preferable to any other material. It has all the possibilities for making a perfect wheel; all that remains is to establish the proper design and proper method of manufacture."

Hearings in Western Freight Rate Advance Case

Useless Questions Asked by Mr. Thorne. The High Cost of Carrying Live Stock and Useless Attendants

The western railways completed the introduction of their evidence in the western rate advance case being heard in Chicago before Commissioner Daniels, on April 8, after five days had been allotted to them for the presentation of testimony which they were not able to complete in the time scheduled for it last month.

At the close of the railroads' side of the case Clifford Thorne of the Iowa Railroad Commission filed with the commission a list of 36 interrogatories calling for information to be furnished by the railways as to the disposition of railroad revenues during recent years, specific data on certain operating costs and a complete exposition of the financial history of the railroads in the case.

One interrogatory reads: "State what sums have been expended in raising the standard of your property or in making improvements, additions or extensions which have been charged to operating expenses during each of the fiscal years 1901 to 1904, inclusive. Another interrogatory asked for a list of all directors, officers and employees who received salaries of $10,000 or more per annum during the last fiscal year. Another asked for information regarding "payments made for influencing legislatures, assisting political campaigns, special legal services, entertainments of public officials or influencing public opinion through the press during the period 1907 to 1914, inclusive."

Information was also asked as to the charges to road and equipment for the period covered by the carriers' exhibits, property acquired during the same period, life of ties, fuel consumption, purchasing data and sleeping car contracts.

The questions relating to the financial operations include queries concerning sources of money charged to road and equipment, non-railroad property held, security issues, securities retired or converted and intercorporate holdings, the amount of unproductive expenditures for permanent improvements, whether made voluntarily or in compliance with governmental requirements, since 1901, and the amount of unproductive expenditures for other than permanent improvements.

Mr. Thorne also asked that President Bush of the Missouri Pacific and President Felton of the Chicago Great Western, be recalled for further examination.

A vigorous protest against this wholesale demand for information was filed with the commission by C. C. Wright, chairman of the committee representing the railways. Mr. Wright stated that similar questions had been put to the carriers in the eastern rate case, and the information was not used after the roads had been put to tremendous expense in compiling it, and the case had been delayed for months; and that while the questions would be proper in a general investigation of railway management they were out of place in the present case. Moreover, he said, the request comes too late in the case and is unnecessary, as all books and records of the carriers have been open to the shippers from the beginning.

"The record of this case disclosed," he said, "that from time to time the representatives of the state commissions have asked for information of a most general and extensive character, which the carriers have either furnished or are preparing for them. The expense incident to requests already made has been very great and the expense of the present requests would be large. The carriers are ready to undertake anything which may be deemed material to a full and fair presentation of the propriety of the rates suspended in I. & S. Docket 555, but are unwilling to further gratify the curiosity of the complainants in matters which do not bear upon the issue before the commission."

Representatives of the protestants on April 9 and 10, presented their evidence in opposition to the proposed advances in the rates on hay and broom corn, and they will have until May 10, to present their evidence bearing on the rates on specific commodities, and uncompleted testimony bearing on financial conditions.

CONCLUDING TESTIMONY OF CARRIERS

The uncompleted testimony of the railroads was devoted mainly to the proposed advances in rates on livestock and packinghouse products. A large number of operating officers were called to testify as to the unusual expenses attending the handling of this traffic.

C. E. Spens, assistant freight traffic manager of the Chicago, Burlington & Quincy, testified that in 1914 the Burlington furnished free transportation for 79,484 caretakers of livestock, representing free transportation amounting to $419,093, or 7.8 per cent of the revenue from livestock. Mr. Thorne asked how many attendants are carried in the bunk cars. "The number varies with the attractions of the great city of Chicago," replied Mr. Spens. "These caretakers relieve the railroad of a great deal of work, don't they?" asked Mr. Thorne. "They are supposed to," answered the witness.

C. Haile, vice-president of the Missouri, Kansas & Texas, testified that rates on livestock have always been regarded as too low in comparison with other articles comprising the bulk of the tonnage and considering the extraordinary expense and unusual conditions surrounding the traffic.

"This commodity," he said, "is of a perishable nature, with liability for heavy claims for damages; extreme promptness is necessary in reaching markets; free transportation both ways must be accorded caretakers, and the carrier is liable for damages for injuries to the caretakers while en route. Loading of cars and trains carrying livestock is very light, the paying weight being not above 40 per cent of the gross weight hauled, against 50 per cent on other commodities. Special facilities are required for the exclusive use of this traffic, such as pens and chutes, and special side tracks must be built and maintained. The cars must be bedded at the carriers' expense in the Southwest and under the law the stock must be unloaded, rested, watered and fed at least every 36 hours. Cars must be cleaned and disinfected under state and federal regulations, and cars used for livestock are available for loading only a few other commodities. For this reason the empty mileage of stock cars is excessive. On the Missouri, Kansas & Texas the empty haul of stock cars is about 97 per cent of the loaded haul, while the empty mileage on all box freight cars is only about 27 per cent of the loaded mileage. On our railway the average earnings per car on livestock are only $29.81 against an average of $42.07 per car on all other carload freight, excluding livestock. In fact, out of 43 commodities livestock shows lower earnings per car mile than any other, excepting rice, flour and other mill products, on which advances also are asked.

"Owing to the perishable nature of the freight and the necessity of reaching markets at specified hours, unusual expedition is required in the movement as compared with other freight, resulting in reduction of the tonnage of trains hauling livestock as compared with trains made up wholly of non-perishable freight. Excessive claims must be paid in the handling of livestock traffic as compared with other freight. The proportion of total claims paid, excluding livestock, to total freight earnings, was 2.63 per cent. The proportion of livestock claims paid to total livestock earnings was 10.41 per cent, or about four times as great. Damages per car on livestock were $3.10 against average earnings per carload of only $29.81." Mr. Haile submitted figures showing that on six roads, operating 44 per cent of the entire mileage interested, the new revenue which would accrue from livestock would be $645,709. If the same ratio were applied on other mileage the total would be less than $1,500,000 per year.

J. A. Somerville, superintendent of transportation of the Mis-

souri Pacific, described the operating difficulties in the handling of live stock trains. "Livestock business," he said, "is more expensive than the general run of traffic because we are obliged to maintain schedules with a view of reasonable loading time for the shipper, while reaching the market within specified hours and within the time limits set by federal laws. Livestock reduces the tonnage of trains. Observations we have made show that stock trains carry only 51 per cent of the engine's capacity, while through trains not handling livestock carry 91 per cent. The empty movement of stock cars ranges from 67.7 per cent to 97 per cent of the loaded, against 24.1 per cent to 31 per cent on box cars. Excessive empty mileage results from special equipment in which livestock is handled, which cannot be loaded to any material extent in both directions."

The witness then presented schedules prevailing on stock trains, showing that they range from 14½ to 18½ miles an hour, against 10 to 13½ miles per hour on ordinary time freight trains and against 10 miles an hour on ordinary freight. On branch lines and in pick-up service, under which stock is concentrated at junction or division points, he said schedules must be maintained to make proper connections with through trains. Otherwise additional expense for further fast movement in special trains is necessary, instead of regular trains to market points.

G. B. Vilas, general superintendent, Chicago & North Western, showed that free transportation accorded livestock shippers is used extensively by persons neither owners of livestock nor employees of owners, but who travel on someone else's contract.

"In January alone on the North Western," he said, "we furnished on a passenger rate basis $20,475.80 of transportation from shipping point to the market and return. In a year this would amount to $245,000 passenger transportation, on account of the livestock movement.

There is no real necessity for attendants. An actual check for five weeks showed that out of 3,164 such attendants, only 2,033 were actual owners, 231 were employees of owners, while 900 were neither employees nor owners. We paid last year in claims $4,005 on account of attendants being injured and claims amounting to $3,000 more are pending.

"The value of livestock facilities on the North Western is $1,428,000 and the yearly maintenance cost is $74,775. Last month we spent $7,910 disinfecting and cleaning stock yards and the federal authorities have ordered us to do it all over again, because of the cattle infection. Cleaning and disinfecting stock cars costs $2.50 each and often results in a delay of from 24 to 48 hours when the car is needed badly. When the market price of livestock goes up during the week, we receive orders for empty cars, rush them to the loading territory in special trains and then if on Saturday the market drops, the cars are not shipped and we have been put to useless expense running them out at high speed, when they are not used for a week or two.

O. C. Smith, superintendent of transportation, Missouri, Kansas & Texas, and C. B. Strohm, superintendent transportation, Atchison, Topeka & Santa Fe, presented similar testimony.

J. R. Koontz, general freight agent of the Santa Fe, said that livestock pays the least per gross ton mile of any commodity carried. "On a typical run from a southwestern point to Chicago," he said, "the earnings on livestock are only 2.13 mills per gross ton mile, including the empty returns, and 3.22 mills excluding the empty returns. The average carload is only 11.61 tons. To mention only a few other commodities in this same territory, eggs make an average carload of 13.04 tons and earn 6.83 mills per gross ton mile, excluding empty returns; cotton loads 12.16 tons and earns 4.63 mills; beans load 20.46 tons and earn 5.50 mills; poultry loads 9 tons and earns 6.73 mills; agricultural implements load 14.42 tons and earn 6.36 mills; stoves load 16.06 tons and earn 6.81 mills, while structural iron loads 28.62 tons and earns 7.15 mills. Yet loss and damage claims are higher than on any other commodity. Livestock revenue is only 5.7 per cent of total freight revenue, yet the claims paid on livestock are 17.9 per cent of the total claims paid on all commodities, or over three times the proportion of revenue."

N. D. Ballantine, assistant to second vice-president of the Chicago, Rock Island & Pacific, presented figures covering tests made on the Rock Island, which showed that on trains carrying livestock, either exclusively or in part, only 63.9 per cent of the locomotive capacity was utilized, while on trains carrying other freight, 71.1 per cent was utilized. "Had we been able to carry as much tonnage on stock trains as on trains carrying other commodities," said Mr. Ballantine, "we would have saved 2,822 train-miles on the trains investigated, yet this was on divisions where we got the maximum benefit from concentration of livestock traffic, and as we get away from the territory covered, we would get an even small equalization.

"The increased cost of fast freight train service demanded by livestock traffic, as against slow freight service, is shown by the fact that by actual tests where the average speed between terminals was increased 12 per cent, the fuel consumption increased 30 per cent per gross ton mile and the cost of fuel, wages, water, lubricants, repairs, interest and depreciation on locomotive and caboose increased 24 per cent. In a test with another class of locomotive, equipped with superheaters, where the speed was increased 49 per cent, the fuel expense increased 32 per cent and the total expense 11.49 per cent."

S. B. Fisher, chairman of the valuation committee of the Missouri, Kansas & Texas, testified as to the cost of special facilities on his railway, required by the livestock traffic, including lands, tracks, chutes, pens and appurtenances. He showed that the original cost to date of these special facilities reached $688,617. The cost of reproduction new would be $1,017,692, while the cost of reproduction new, less depreciation, would be $784,050.

TESTIMONY OF SHIPPERS ON ADVANCED RATES

Clinton R. Lee, president of the Lee Broom Company and chairman of the board of governors of the National Broom Manufacturers' Association, testified in opposition to the proposed advance in rates on broom corn, saying the manufacture of brooms is conducted on a decreasing margin of profit which will not permit of the absorption of added freight rates, and that the industry has already more than borne its share of the transportation burden by advances in rates in recent years.

C. A. Steel, traffic manager of the National Broom Corn Manufacturers' Association, testified that the existing rates on broom corn are sufficiently remunerative to the carriers. He said that the rates now in effect from 25 representative shipping points in the states principally affected average 54.4 cents per 100 lb. for the average haul and give an average revenue per car of $97.77, or 13.8 cents per car mile.

C. W. Hillman testified as an expert accountant for the protesting state railway commissions, that broom corn instead of failing to pay its proper share of the burden of transportation, shows a very favorable return when contrasted with the rates on other commodities. He presented data covering the movement of 261 cars, moving during October and November, 1914, to show that the average earnings per car were $116.94, and per car mile $16.36, and per ton mile 15.44 mills. He said there were no special costs incident to the broom corn traffic other than its comparatively light loading as compared with other carload freight.

Testimony against the proposed advance in rates on cotton piece goods was presented on Monday, and for a time the room in which the hearing was conducted took on the appearance of a large dry goods store. S. H. Johnson, assistant freight traffic manager of the Rock Island Lines, in his testimony had presented a list of the principal articles included under the head of cotton piece goods, with the high and low prices for each article, making an average of $65 per 100 lb. Leon Smith, president of the Smith-McCord-Townsend Dry Goods Company of Kansas City, before taking the stand had spread out on tables before the commission the contents of two large packing cases of dry goods, saying he had "filled Mr. Johnson's order," and that the value was only $27.65, instead of $65. He said that the prices

as given by Mr. Johnson not only were too high but that they represented an average of the high and low extremes in prices, whereas the great volume of shipments to the Missouri river was made up of articles priced much lower than Mr. Johnson's figures. The effect of the testimony was to show that a freight rate of 40 cents per 100 lb. for the 300 mile haul between the Mississippi and Missouri rivers, represented 1.5 per cent instead of 0.6 per cent, as stated by Mr. Johnson, of the value of a 100 lb. shipment. The proposed advance is 5 cents per 100 lb.

Other testimony was given by J. I. Sweeney, traffic manager of the Smith-McCord-Townsend Dry Goods Company, Thomas Byrne, a dry goods jobber of Omaha, and J. C. Saunders of Bonham, Tex. Mr. Byrne protested that the advance would have a serious effect on his business. T. J. Norton, attorney for the Atchison, Topeka & Santa Fe, asked the witness what percentage the advance in rates would bear to his profit. When objection to this question was raised by counsel for the shippers and the witness refused to give the amount of his profits, Commissioner Daniels said he need not answer the question but that his refusal must be taken into consideration with his testimony that the increase in rates would be a burden.

INDUSTRIAL COMMISSION INVESTIGATES 1911 STRIKE

An investigation of the strike of the labor unions in the mechanical department of the Illinois Central and the Harriman Lines, which was declared in September, 1911, was taken up by the federal commission on industrial relations at a hearing at Chicago beginning on April 7. Charles H. Markham, president of the Illinois Central, was the first witness and occupied the stand almost the entire day. He presented a 70-page typewritten statement outlining the history of the strike and the events that led up to it. This strike, Mr. Markham said, was as ill-advised and inopportune as it was unexpected, and grew out of no real or substantial grievance. Within the year the company had granted large increases of pay to the mechanical department employees and no request for an advance in wages was involved. He said the company refused to recognize the new system federation because contracts were in force with the individual unions, and no 30-day notice was given, as required in the agreement, that it was desired to terminate the existing contract. He also said that the strike grew out of an attempt of the American Federation of Labor to organize the shop crafts on each railroad system and that the railroads opposed the movement in principle. He said the company objected to having men outside of its service who were leaders in the organization of the federation interfere in the affairs of the company, and that it objected to having its labor situation complicated with labor troubles which might exist in shops outside of the railroad service, which would be the result of the system federation plan.

Chairman Walsh asked if it was not a fact that at the time the strike was called 31 railroads were dealing with the federation and that now 52 railroads recognize the federation. "I don't know," replied Mr. Markham. "May I say that if that be true they will be sorry for it?" Asked why, if it was a good thing that railroads should be organized into large corporations, the same proposition did not apply to labor organizations, Mr. Markham said that the consolidations of railroad corporations made it possible to give better and more efficient service to the public, but that labor unions were not organized for that purpose, and that the federation plan placed too much power in the hands of labor leaders. He said the strike had cost the Illinois Central millions of dollars, but that the road had replaced the strikers and that its shop work was now being carried on just as efficiently, if not more so, and at a slightly less cost than before. Mr. Markham said he had no objection to the railroad brotherhoods, but that the mechanical unions had shown they could not be depended upon to live up to contracts; and he considered unions which combined railroad men and men employed outside of railroad service a menace.

A. O. Wharton, president of the railway employees' department of the American Federation of Labor, and a number of other witnesses who had participated in the strike, defended the federation plan of organization of the mechanical department employees. Other union officers and organizers said that the strike on the Harriman lines had been caused by discriminations and arbitrary methods of dealing with the men, including the employment of "spotters" and efforts to break up the unions. Several of the witnesses testified that E. H. Harriman, after settling the Union Pacific strike in 1904, had said that the ideal way to handle such questions would be to deal with an organization representing the entire system, instead of taking up the time of both sides in dealing individually with smaller organizations. They said they felt they had taken his advice in organizing the system federation of the mechanical department unions, and that if Harriman had lived the difficulty would have been avoided. Various witnesses put into the record results of an investigation of the effects of the strike on the men engaged in it; the number who had been obliged to give up their homes and take their children out of school, etc.

Julius Kruttschnitt, chairman of the executive committee of the Southern Pacific, testified on April 10, giving a comprehensive review of the events and causes leading up to the strike. The principal reason of the railways for opposing the demands of the men, he said, was the proposition to establish the system federation plan for the entire Harriman system. This would involve, he said, a recognition of the rights of outsiders to negotiate agreements for the employees. Asked by one of the commissioners what he would suggest for the alleviation of industrial unrest, Mr. Kruttschnitt said that complete publicity for labor controversies is one of the best methods of maintaining industrial peace. "I have observed that no strike succeeds with public opinion against it," he said, "and as I grow older I am more fully convinced than ever that the public should be fully informed on exactly what the issues are. The judgment of the public will be almost always right."

The commission's investigation of wages and conditions of employment of Pullman conductors and porters was interrupted on April 6 by the failure of Chairman Robert T. Lincoln and President John S. Runnells, to appear to testify. Both sent messages asking to be excused on account of ill health.

A number of porters were called as witnesses and testified that they were satisfied with the condition of their employment. R. W. Bell, a former Pullman conductor, said he had been discharged for activity in trying to organize the conductors, and other former employees of the company complained about the conditions and the wages.

On Monday of this week the commission took up the investigation of conditions of employment of the Western Union Telegraph Company.

Ratio of Trainmen Killed.—Statistics prepared by the Interstate Commerce Commission show that in a given year for every 208 trainmen employed in the United States, one was killed and for every 8 employed one was injured. I am afraid a good many of us do not appreciate these figures. Suppose as an illustration the name of every trainman on your division should be taken, these names put on separate slips of paper, these slips put in a hat and you all knew that for each 208 names, one would be drawn from that hat one year from today and the man bearing that name would be taken out and shot. How many of you would remain in the service and take the risk of having your name drawn? This is just what it means, so far as life and death is concerned, except that the man would have a full year to live, whereas in accordance with actual conditions he may be killed today. We are too secure in our belief that it is the other fellow who is careless.—*E. H. Daniel in the Railroad Herald.*

IMPORTANT DECISION IN THE ARKANSAS RATE CASE

On April 3 the United States District Court for the Western division of the Eastern district of Arkansas handed down a decision in the suit of the State Railroad Commission against the St. Louis & San Francisco to enjoin the enforcement of a freight tariff promulgated by the State Railroad Commission and also the 2 cent passenger rate established by the state legislature in 1907. The court declared these rates confiscatory and granted a perpetual injunction to the railroad. The railroad's case was based on a division of expenses made according to the "Oklahoma formula," and the court upheld this formula.

The original bill in this suit was filed in July, 1908. A temporary injunction was granted and a new tariff for freight rates adopted under the supervision of the court, which raised the freight rates above those established by the tariff enjoined and restored the passenger rate of 3 cents a mile. In 1909 an agreement was made between the state and the railroad that the hearing of the case be postponed until the final determination of similar actions instituted by the St. Louis, Iron Mountain & Southern, and the St. Louis Southwestern, and a further stipulation that the company should make a test of the passenger rate at 2½ cents per mile for the purpose of determining what the effect of such a rate would be on the net earnings of the company. The company reduced the intrastate passenger rate to 2½ cents per mile for 18 months in 1909 and 1910, and then restored the 3 cent rate, claiming that the test showed that the rate was not remunerative. On June 16, 1913, a decision was rendered in the Iron Mountain and the Cotton Belt cases, holding that sufficient proof was not presented to justify the court in overruling the action of the state, and the bills were dismissed. On the preceding week the opinion in the Minnesota rate case was filed.

Following these decisions representatives of a number of Western roads devised a formula for the purpose of dividing valuations and expenses between intrastate and interstate and between freight and passenger traffic upon the basis of the use made of the property by each class as suggested by the Supreme court, for special use in the Oklahoma rate case. This formula, which was described in the *Railway Age Gazette* of July 3 and July 24, 1914, was amended to meet the conditions prevailing on the Frisco lines in Arkansas, and was submitted by the road as a basis for its contentions.

As no separate records had previously been kept by this or any other company on this basis, it was necessary to collect special data. This was done for all the lines of the Frisco in the state of Arkansas during November and December, 1913. Printed forms were prepared by the company and distributed among the employees, on which they were required to report every item of expense and the use made thereof for freight or passenger and for intrastate or interstate traffic. To obtain this information clerks were placed on every train running in Arkansas during this period. Special yard clerks were placed at the termini of all through freight runs to record the contents of the trains and when they arrived and left. Conductors in charge of freight trains were required to record the character and quantity of feight, the distance hauled and the amount picked up and set out at each intermediate station. For passenger traffic a division of expense was made on the "car foot mile" basis, the measurement of the space assigned in each car to each class of service being multiplied by the number of miles that car ran in Arkansas.

In a similar way the time devoted by yard engines to the various classes of service and the time of yard and station agents' work was classified. To allocate maintenance of way expenses, experienced men were sent over the road who instructed the section foremen regarding the methods of keeping accounts and who classified every track under the charge of each foreman according to its use as a line or terminal track or common to both. If used exclusively for freight or passenger traffic it was likewise again classified. A similar method was applied to bridges, buildings and other structures. Terminal charges were localized to the state where the terminal was located and each individual yard was treated separately.

The expenses of intrastate passenger traffic were divided between intrastate passenger miles actually determined within that period and the cost per passenger mile for all expenses by this method arrived at. The same method was followed for the interstate traffic and thus the excess cost relation of the work determined. The cost of the intrastate passenger business based on the use of the property was found to be 15.43 per cent more than that of the interstate, and for the freight service the intrastate cost was found to be 319.58 per cent greater than the through.

Comparisons were made with the test period commencing with the year ending June 30, 1913, and working back to the last four months of 1907, which showed that the test period was practically the same as that for the preceding years.

Although the state contested this method of comparison the court decided that "this method of equation will secure results as nearly correct as is possible when no separate accounts of the two classes of traffic have been kept." While the state attacked the formula as incorrect, it presented no better one and all its exhibits were based on the formulae used by the company. The state did not separate the Arkansas business from that of the entire system, assuming that there was no difference in the cost of operation, in spite of the fact that the traffic density in Arkansas was shown to be considerably less than that on the system as a whole, the lines of heavier grades and less favorable operating conditions, and the length of haul of the intrastate traffic much shorter than that of the entire system.

After the hearing began the average value of the property for the years 1910-13, inclusive, was stipulated by agreement as $17,924,441.75, the value fixed by the state taxing board, and the average annual gross earnings in the state were shown to be $4,172,121.71. Had the freight and passenger tariffs of the state commission in question been enforced during this period these returns would have been $456,103.72 less. Deducting this difference the company claimed that there would have been an actual loss on the intrastate business for these four years of $122,651.26, while upon the entire business in the state, intra and interstate, the company earned a net profit of 5.63 per cent.

The state contended that the reduced passenger rate of 2 cents a mile would stimulate traffic to such an extent that the intrastate business would gain. The company charged 3 cents per mile for interstate business, and to ascertain the effect of the reduced intrastate fare a test was made for the month of August, 1913, which showed that while the intrastate business increased it did so because many passengers bought tickets to the state line and then to destination. The court found therefore that the two-cent rate did not stimulate traffic except at the expense of the interstate.

The court found that the average annual net earnings of the Frisco lines in Arkansas from all sources were $1,122,463.21 for the four years 1910-1913, inclusive, yielding a net return of 6.26 per cent on the agreed valuation. Adopting the same basis for the intrastate traffic, the profit on the valuation of the road assigned to intrastate business would be $198,249.25. Deducting the decrease which would have resulted if the enjoined rates had been charged there would have remained a net profit from intrastate traffic of $84,223.32, equivalent to 2.65 per cent on the valuation of $3,166,921 allocated to the intrastate traffic according to its use.

As no claim was made for the state, and no evidence introduced to show that the road is not properly and economically managed, or that it was not built to meet a public demand, the court granted a decree making the temporary injunction, preventing the enforcement of these rates, perpetual but retaining jurisdiction so that the state may apply for further orders to meet new conditions should they change.

One of the reasons why this decision is of special importance is that this Oklahoma formula is being used by the railways as the basis for important rate cases now being contested in Texas, Kansas and Oklahoma.

CHAPEL CARS FOR CHURCH EXTENSION WORK

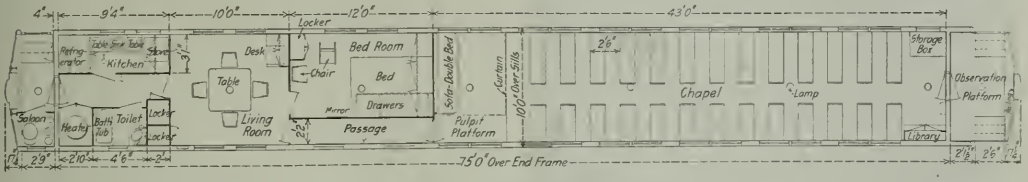
The Barney & Smith Car Company, Dayton, Ohio, recently completed a chapel car for the Catholic Church Extension Society of the United States and one for the American Baptist Publication Society.

The former, which is named the "St. Paul," is 86 ft. long over all, having an observation platform at each end. It weighs approximately 134,000 lb. The framing and exterior construction is entirely of steel and the roof is of copper. The interior finish throughout is in Cuban mahogany, of Barney & Smith design, executed in ecclesiastical Gothic lines. The car is equipped with two lighting systems, gas being used as a primary light, and electric light for an auxiliary. The car can be heated either by direct steam, or by means of an oil stove heating apparatus. There is seating capacity for about one hundred people.

In addition to the chapel and altar, the car is equipped with private quarters for the chaplain, assistant and porter, as shown on the floor plan. Provision has also been made for toilet rooms, sleeping quarters, kitchen and pantry, and there is also a goodly supply of locker space.

The "St. Paul" was built for missionary work, and is intended for use in the Southern states exclusively.

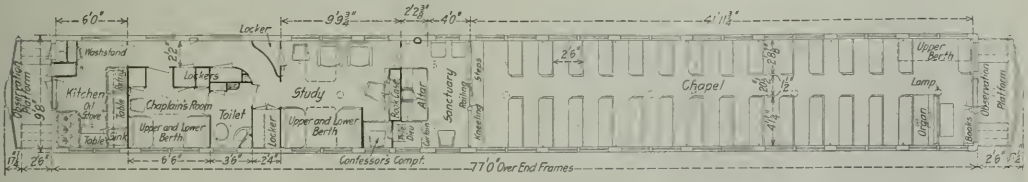
The chapel car for the American Baptist Publication Society is 85 ft. 6 in. long over all, having an observation platform 4 ft. 4½ in. long at one end and a standard closed vestibule platform at the other end.



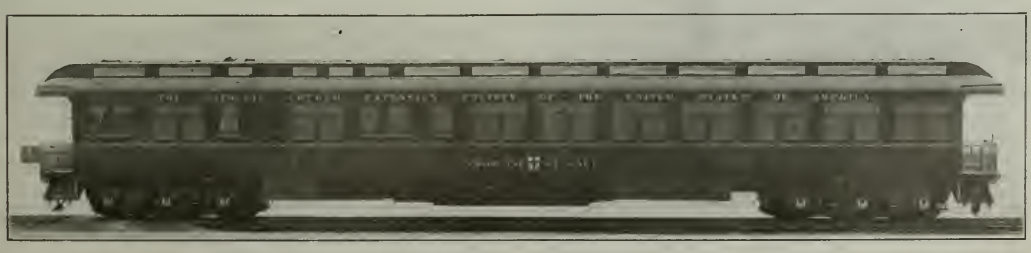
Floor Plan of the Baptist Chapel Car

Chapel Car of the American Baptist Publication Society

The framing and exterior construction is entirely of steel, including the roof framing, the covering of which is of sheet steel. The interior finish throughout is in golden oak, executed in Gothic lines. The finish for the platforms is in flat steel, painted and grained. A raised pulpit platform is provided at the forward end of the chapel. The floor covering in the chapel is linoleum, with carpet aisle strips; for the bedroom, it is linoleum, with small rugs distributed about the room; for the living



Floor Plan of Chapel Car "St. Paul"



Chapel Car for the Catholic Church Extension Society

room, carpet is used; while linoleum is employed for the passageway, kitchen and toilet rooms. The seats in the chapel end of the car are reversible and of the regular day coach type,

An Interior View of the Baptist Chapel Car

finished in oak to harmonize with the interior finish. The total weight of the car is approximately 134,000 lb.

In addition to the chapel, the car is equipped with private quarters for the chaplain, a living room and library, kitchen, toilet rooms with bath, and lockers.

Interior of the Chapel Car "St. Paul," Looking Toward the Altar

The car, after a formal dedication and an exhibition trip from coast to coast, is to be used in the missionary field in sections of the country where no churches have been instituted.

THE CUMMINS AMENDMENT

The law of March 4, 1915 (Public No. 325), commonly called the Cummins Amendment, making changes in section 7 of the Interstate Commerce law (*Railway Age Gazette*, March 12, page 482) was the subject of a hearing before the Interstate Commerce Commission at Washington, on Saturday, April 10. The principal argument tor the railroads was presented by O. E. Butterfield, of the New York Central, representing all the roads in Official Classification territory. The southern lines were represented by Lincoln Green, traffic manager of the Southern Railway, and C. J. Rixey; L. M. Walter appeared for various shipping interests, and H. C. Barlow represented the Chicago Association of Commerce.

R. B. Scott, of the Chicago, Burlington & Quincy, who appeared for roads in the western territory, said the roads did not expect to make a general increase in rates of 10 per cent, but that they desired to be heard further on the question of some increase in those rates which are now predicated on a restricted liability, for in some or all of these the liability of the carriers will be increased. H. G. Wilson, president of the National Industrial Traffic League, opposed any increase in rates, declaring that the present limited liability rates are the rightful rates for the unlimited liability provided under the Cummins bill, and that the effect of the bill is simply to wipe out the limitation of liability; it was not the intent of Congress to increase rates.

C. W. Stockton, speaking in behalf of the express companies, claimed that their tariffs and bills of lading are now so framed that the Cummins law imposes no additional duties; therefore, they had nothing to propose. W. H. Chandler, speaking for the Boston chamber of commerce, said that if the commission should insist on having the value of goods always stated in bills of lading for shipments sent by express many large shippers would be seriously embarrassed, for they ship at the lower rate now provided and depend on outside insurance companies to cover possible losses. They regard the higher rates of the express companies as optional insurance.

Mr. Rixey, for the southern lines, declared that the railroads might properly impose the ten per cent increase in rates, provided for by existing tariffs when a shipper declines to accept any of the conditions in the standard bill of lading; but that the roads in that territory, while not demanding all that they have a right to demand do propose to file tariffs making a five per cent increase; except that for livestock they propose to make a much larger increase.

This statement of the southern lines was the only definite proposal presented on behalf of the railroads except that of Mr. Butterfield. He, speaking for the eastern lines, went into the subject in considerable detail. Following are the main points of his argument:

He began by saying that, judging this matter by their experience in the conduct of affairs under strict governmental regulations, the railroads had attempted in good faith to interpret this law so as to place upon the carriers the full measure of the burden which it is believed was in the minds of its framers of the law, and at the same time to minimize as far as possible the burdens on the shipping public, which a strict construction of the words used by Congress might possibly be said to justify. In forbidding all stipulations as to value of goods this law neutralizes ten decisions of the Supreme Court, beginning with the Croninzer case in the 226th volume and ending with the Pierce case in the 236th.

The first point to be taken up is the uniform bill of lading. The section of the law which has now been amended requires (1) a receipt or bill of lading to be given; (2) imposes liability on the carrier; (3) prohibits exceptions from liability, and (4)

imposes liability regardless of the bill of lading. There is a proviso that if goods are hidden from view the carrier may demand a written statement of value; another that claims must be presented within four months, and a fourth, qualifying the last one, that this four months' limitation does not apply if the loss or damage was due to carelessness, etc.

Mr. Butterfield discussed the subject under seven heads, namely, (1) classification ratings not based on specified value; (2) export and import rates; (3) classification ratings based on specified value (household goods, ore, ostriches, paintings, quartz, silk, watches); (4) livestock; (5) commodity rates based on declared or assumed value; (6) lake and rail rates, uninsured; (7) baggage.

The present tariff rates are conditioned on the use of the standard bill of lading and all its condition. Except as these conditions may affect the value of goods, they are still valid, and the bill of lading may be used. The clause relating to settlement for goods lost or damaged says that the value is to be computed as of the time of shipment and at the place of shipment, with the provision, in parenthesis, that the value is to be "the bona fide invoice price, if any, to the consignee, including the freight charges, if prepaid." This parenthetical clause might be considered a limitation of liability, though the Interstate Commerce Commission in the case of Shaffer, 21 I. C. C. 8, held that it was not a limitation. However, the carriers propose to adopt a form of bill of lading with this left out. Continuing Mr. Butterfield said:

"We believe that if the commission shall be of opinion that the Cummins law condemns the 'place and time of shipment' clause, great confusion and probably unjust discrimination in the settlement of claims will result, and a substantial loss of revenue will be suffered by the carriers; and, while we do not expect an increase of ten per cent in all rates, we submit that some increase in the normal rates should be simultaneously permitted. Upon that point we would desire to be heard further if any such ruling should be contemplated. . . .

"The clause in the bill of lading providing for a notice of claims within four months was held in the Harriman case, 227 U. S., to be reasonable and apparently lawful, and, notwithstanding the Cummins law, may still operate upon claims for loss and damage for which the carrier is liable under the bill of lading although not caused by it, as, for example, loss and damage resulting from fire communicated to the property while in the carrier's possession but without the carrier's fault.

"We propose to amend this clause to read as follows:

"'Except in cases where the loss, damage, or injury complained of is due to delay or damage while being loaded or unloaded, or damaged in transit by carelessness or negligence: . . . . claims must be made in writing to the carrier at the point of delivery or at the point of origin within four months after delivery of the property. . . . or, in case of failure to make delivery, then within four months after a reasonable time, etc.

"It is the opinion of the carriers that this change will result in substantial loss of revenue, and they reserve the right to assert at the proper time a claim for some increase in rates on account of it. We have not the data which would enable us to make any intelligent statement of the extent to which revenue will be affected by that change."

The act does not apply to commerce with non-adjacent foreign countries unless the inland portion of the transportatoin crosses a state line, even if it does then; nor does Rule 1 of the classification apply the ten per cent clause on export rates when the terms of the export bill of lading are not used. The carriers propose to amend the notice clause in the export bill of lading to conform to the suggestions already made with respect to the uniform bill of lading.

As to household goods two rates are already provided. There seems to be nothing in the Cummins law to prevent the promulgation of these two rates, depending on values, provided they are reasonable. If the consignor fails to state the value it will be proper to charge him the higher rate; and while the statement of value, if he makes one, may not be conclusive against him in a suit to recover a greater amount, it will be evidence on the question of fact, and may subject him to criminal prosecution for false declaration.

The carriers propose to strike out the last part of the second paragraph of Section 3 of the conditions of the uniform bill of lading, the paragraph specifically condemned by the Cummins law.

Whether the carriers will continue to maintain rates based on valuation is a matter for further consideration by the traffic officers of the roads. As to all of the other commodities named, ores, ostriches, quartz, etc., the conditions are the same as in respect to household goods.

Livestock.—Livestock is shipped always under a special livestock contract, and this, if not revised, will increase all rates ten per cent. It is thought that there is nothing in the Cummins law to prevent a carrier from promulgating different rates for animals of different values, requiring the owner to specify the value for the purpose of fixing the rate, and declining to accept animals for transportation in case of failure on the part of the shipper to state the value; or, perhaps, imposing the highest rate in case of failure to secure a statement of the value. A misrepresentation of value would be evidence against the plaintiff in a suit to recover a greater sum and might subject him to criminal prosecution if he undertook to recover a greater sum. As to livestock the Cummins law does impose an increased burden. It is hoped that the carriers will be able to submit new tariffs prior to June 3; they are not yet prepared to do so.

Miscellaneous Commodities.—The commodities hereinbefore named are in the classification; now as to goods which are carried under special commodity rates there are 30 or 40 commodities on which two rates are named, one made lower than the other conditioned on various stipulations relating to valuation. For example, copper bars, Chicago to New York, go at 21 cents provided the value does not exceed $100 a ton. Others are, certain articles of furniture, a great variety of crockery and similar wares imported from Europe, liquors, imported printing paper, etc.

On all these rates the carriers are as yet unprepared to say whether or not the ten per cent increase, which they may take under the present tariffs, will be satisfactory.

On westbound lake-and-rail tariffs the railroads bear the cost of insurance; but on certain eastbound lake-and-rail traffic there is a clause exempting the carrier from liability in case of collision or stranding of vessels. This clause seems to be authorized by Section 3 of the act of February 13, 1893, Chap. 105, Vol. 111, U. S. Comp. Stat., 1901, p. 2946, and is not affected by the Cummins law ("*The Hoffmans*," 171 Fed., 455, 464), where it seems to be held that it was not intended by the Carmack Amendment to overthrow the established law with respect to navigation.

Baggage.—Mr. Butterfield, citing the case of Hooker vs. Boston & Maine, 233 U. S., holds that Section 7 applies to baggage; and if so the Cummins law applies to baggage. Most baggage is hidden from view. Baggage tariffs already provide charges for baggage the value of which is more than the ordinary amount, and these tariffs have been approved by the commission. In some states it has been the practice for some time to call upon each passenger offering baggage to declare its value, if he wishes to do so. Under the new law it seems permissible unconditionally to require a statement. As to bicycles, baby carriages and other things not concealed, the carriers will have to make rates sufficient to cover their increased liability.

Argentine Railway to Borrow Twelve Million.—A report from London says that a special treasury consent has been granted to issue £2,500,000 ($12,500,000). Central Argentine Railway 5 per cent five-year notes of which amount £2,000,000 will be offered at 98. The funds secured through this issue will be required for the completion of construction work on the road.

AN IMPARTIAL STUDY OF FREIGHT-CAR DEMURRAGE

Bulletin No. 191 issued by the United States Department of Agriculture and dated March 19, entitled "Demurrage Information for Farmers," is an intelligent and thorough study of the subject, filling 25 pages. Copies can be had from the Government Printing Office at five cents each. It is issued from the "Office of Markets and Rural Organization," Charles J. Brand, chief, and is written by G. C. White, transportation specialist. The principal chapters are those headed Regulation by the States, Interstate Regulation, the Uniform Code, and "Reciprocal Demurrage." In twelve states demurrage is regulated by statute, and in 23 by orders of a commission. The peculiarities of the different state regulations are clearly set forth. An appendix gives a list of demurrage bureaus.

Following are extracts from this bulletin:

The average agreement in rule 9 is of no advantage to the farmer for the reason that he is shipping more than he receives. Its abolition would decrease car detention and thereby benefit the farmer as well as other car users. It is under attack from many quarters on the ground that it enables industries to detain unduly inbound cars of raw material on credits accrued on outbound cars of finished product, which are loaded to fill orders and would be loaded just as promptly in the absence of an average agreement.

The allowance of additional time for inspection and grading of grain and hay is necessary under conditions as they now exist, with different grades and standards effective in different cities and states. Grain is probably reconsigned more than any other one commodity and frequently must bear the burden of car delay in several markets. Instances are on record of its having moved through 15 different markets, in each of which it was subject to official inspection, before it was finally unloaded. This constitutes a serious burden on that commodity. Federal legislation fixing grades and standards for interstate shipments would undoubtedly render much of the present inspection and grading unnecessary. To that extent it would decrease the detention of cars now caused by frequent inspection and grading and thus relieve agriculture of one unnecessary burden.

"Reciprocal demurrage" has done away, to some extent, with the discrimination against the small shipper, in the furnishing of cars, as compared with the man controlling large tonnage. This has been of especial benefit to the farmer. In addition to enabling him to secure cars more promptly when needed, it has had a very powerful influence in awakening the conscience of the railroads to the needs of the farmer and in bringing the railroads to a fuller realization of the fact that their prosperity depends on the prosperity of their patrons. It must be admitted, however, that it is open to the objection of making possible collusion between carriers and shippers whereby carriers may pay rebates, or purchase routing, through the medium of failure to furnish cars on fictitious orders. Similarly the payment of demurrage has been avoided by collusion whereby cars have been set out in transit and held at intermediate points till consignees were ready to receive them.

Conclusions.—If in times of acute car shortage, the shipper who needs cars and is unable to get them could actually see all the other car users at all the other stations in his immediate section who are taking from two to seven days to load and unload cars, when it could and should be done in as many hours, no doubt there would be a speedy reformation among car users and a radical revision of some of the demurrage regulations now in effect. If his vision could be enlarged so as to take in the entire country the effect would be magical. Most, if not all, of the difficulties experienced in connection with car supply and car detention and the demurrage remedies proposed to alleviate the evils of car shortage have arisen from a lack of breadth of vision on the part of shippers, railroad officials, and legislators.

No car user has any moral right to detain a car one moment longer than is necessary to load or to unload it. Unfortunately the proportion of shippers who take this view of the situation, when they themselves are the detainers, is very small. Every shipper holds this view when it is some one else that is detaining the car. Car users who detain cars through carelessness, indifference, or ignorance of the meaning of "car shortage" and "congested terminals" are few. The people responsible for car detention are that vast body of highly intelligent business men who find it more profitable to use cars for storage purposes than to provide other storage facilities. Other reasons for car detention by this class of shippers are comparatively insignificant.

It is not good business to use for storage, space which costs 50 cents per cubic foot to construct, when better storage space can be had for one-third that cost or less, and especially when the higher priced space can earn so much more as a freight car than as mere storage. Storage space does not need costly trucks, steel underframes, automatic couplers, and air brake equipment. Shippers must realize that, from one point of view, they and not the railroads are the owners of the cars of the country. So long as they insist on using them as storage warehouses they must be prepared to pay the cost without complaint. Moral suasion has so far failed to induce them to construct their own storage warehouses when they could get apparently cheaper storage in freight cars. The next step in remedying car shortage should be to limit more closely the free time allowed and to impose demurrage charges sufficiently high to make storage in cars clearly unprofitable.

Refrigerator cars are now paying the nominal demurrage charge of $1 per day and, in some cases, additional charges for track storage. The proposal to impose higher and other charges, in addition to track storage and ordinary demurrage, as a penalty for the detention of refrigerator cars, is a move in the right direction. It will do more than anything else to solve the problem of shortage of refrigerator cars. It will also give an impetus to the erection by municipalities, railroad companies, and private capital of terminal markets with track connections and ample cold storage facilities. . . .

The railroads are between the upper and nether millstone of the man who has the car and the man who wants it. Each abuses the road for the shortcomings of the other. In the last analysis of the case both are the same man, unable or unwilling to see that a car can not be a stationary warehouse and a movable vehicle at the same time. The railroads would gladly forego all revenue from demurrage in return for prompt release of cars.

Some of the state demurrage codes contain provisions apparently designed as special concessions in favor of the farmer. No doubt other industries would not very readily give up any special concessions in their favor on the strength of the farmer voluntarily giving up his. It would seem, however, the proper thing for farmers to insist on the elimination from all demurrage regulations of all special concessions in their favor. Then they could with greater force demand the abolition of concessions in favor of others. This would mean a minimum of car detention, more cars for all shippers, and greater prosperity for the farmers.

The Kenitra-Mequinez Railway of Morocco.—The military railway between Kenitra and Mequinez has been completed to within 3½ miles of Fez, and will probably be opened for traffic in May. The use of the railway has been restricted hitherto by the insufficiency of the rolling stock and the difficulty of obtaining engines, etc., from France. The freight rates work out very favorably in comparison with transport by camel between Fez and Laraiche. While the journey will only take three days by this route, the journey by camel from Laraiche to Fez takes 12 days in summer and 50 days or more in winter. There seems little doubt that, if the deficiency in rolling stock can be made good, the Kenitra route will have a great advantage over that by Laraiche and the traffic of the latter port will be very seriously affected by the opening of this railway.

Tests of a Mountain Type Locomotive on the Rock Island

Conducted with 16-Car Trains on District with One Per Cent Grades; Maximum Horsepower Developed 2700

By W. J. Tollerton

General Mechanical Superintendent, Rock Island Lines, Chicago, Ill.

The Chicago, Rock Island & Pacific recently conducted some tests with one of their Mountain type locomotives, No. 999, which is one of two delivered to that road by the American Locomotive Company in the Fall of 1913. These locomotives were intended for hauling the St. Louis section and the Chicago section of the Colorado trains in one train west of Phillipsburg, Kan.

From Phillipsburg westward to Goodland, on the Colorado division, over which the tests were made, there is a steady uphill pull for 139.9 miles with maximum and ruling grades of 1.0 per cent, as shown on the accompanying profile. The trains on which this type of locomotive is used have a normal consist of 10 or 11 all-steel cars, the weight varying from 675 to 750 tons, and the locomotive is capable of hauling as high as 1,175 tons in 19 cars. In the distance of 139.9 miles there are 16 stations, 4 of which are regular stops and the remaining 12 are flag stops. On an average, 11 or 12 stops are made on this run, and it is not infrequent that 15 stops are made, resulting in hard pulls out of stations, many of which are located at the
