The company, on the other hand, has proceeded as expeditiously as conditions would allow to carry out its obligations to the city. It will be remembered that the contracts made necessary the approval of the Public Service Commission to every detail of construction and equipment work performed by us, whether on our own lines or on those of the city. Every plan, every form of contract, every award of contract, and every dollar of expenditure are subject to the Commission's scrutiny, and must be approved by the Commission in advance. This arrangement makes for great delay, and in some cases the Commission has taken many months to consider contracts submitted to it which should have taken a few days or at the most a few weeks. Under these conditions our progress is necessarily slow, even in the extension and enlargement of our own facilities, and we cannot, of course, proceed with the equipment of the city-owned lines until they are substantially completed.

This entire situation involves serious consequences, both to the city and to the company, other than the substantial increase of costs which delay always occasions. At the time the contracts with the city were made it was the expectation of both parties, founded upon careful expert examination, that, while for a few years after initial operation the enlarged system which one of our companies is to operate would not earn full interest on both the city's and the company's investment, it would in a comparatively short time be self-supporting, and the city would then have added to its borrowing capacity upwards of one hundred millions of dollars, and in addition be the recipient of one-half of the divisible profits. That expectation was based upon the assumption that all the enlarged system would be placed in operation on or before January 1, 1917, whereas it looks now as if only the less profitable, or the unprofitable, new lines would then be in operation, and that the returns from the profitable lines would be indefinitely delayed. In the present financial condition of the city this result will mean not only that the city's credit will in the intervening period be too close to the debt limit to permit of expenditures for other municipal improvements, but that the taxpayers will be called upon for a longer period to make up more substantial deficits than were originally contemplated, and this at a time when taxes are a particularly heavy burden. It is true that by the terms of the contracts into which we have entered with the city, these deficits in meeting the city's interest during temporary operation are, contrary to all rules which apply to public service corporations generally throughout the country, chargeable to the city's construction account, but they must be paid by the city, either through direct taxation or through the issue of additional corporate stock not heretofore set aside for rapid transit purposes, and to the extent that additional corporate stock is issued for these deficits other municipal improvements must be postponed, or in some way not now discernible, the city's debt-making power must be expanded.

In the case of the company, while it is assured of its preferentials if earned, it must charge against earnings its new investment as put into operation, and if this investment is represented, as it will be very largely for the first few years, in construction and equipment work on lines which are the least hopeful as money earners, its net income will diminish.

It is extremely essential, therefore, from the point of view of the city and its people, as well as for the interests of the company, that every effort be made to expedite the completion of all these new rapid transit

facilities, and the facts are stated and given emphasis in this report because of our very sincere conviction that neither public officials, taxpayers nor property owners sufficiently appreciate the present situation and its consequences.

The following is a synopsis of the progress of rapid transit work during the year so far as our relation to it is concerned:

CENTRE STREET LOOP.

The work of reconstruction of tracks and structures in Centre Street Loop, included in Modifying Agreement No. 2 with the city, was completed during the year, and equipment of all four tracks has been finished except a certain portion of the signaling. The additional tracks were placed in operation from time to time during the year. Additional power equipment was also installed in the temporary sub-station at Centre and Walker Streets.

THIRTY-EIGHTH STREET CONSTRUCTION.

The work of construction in 38th Street, in the Borough of Brooklyn, included in Modifying Agreement No. 1 with the city, has been practically completed at Fourth Avenue and 38th Street; the remaining work between Fifth and Tenth Avenues is well under way and will be completed during the present calendar year.

SEA BEACH LINE.

The reconstruction of this line and the equipment thereof was completed during the present fiscal year, except station buildings, which will probably be finished before autumn. The tracks between Fourth and New Utrecht Avenues were completed by January 1, 1915, and between New Utrecht Avenue and 86th Street by May 1, 1915. That portion of the line between 86th Street and Coney Island has been equipped with third rail and temporary terminal facilities provided at Coney Island. Operation with new subway cars over this line was begun on June 1, 1915.

FOURTH AVENUE SUBWAY.

The city completed during the year track laying in this subway, between the Manhattan Bridge and 65th Street, to an extent that permitted operation on two tracks, which was begun June 22d, connecting at 65th Street with the Sea Beach Line, and forming in this way a complete route from Chambers Street, Manhattan, to Coney Island, via Fourth Avenue and the Sea Beach Line. Tracks and equipment of the Fourth Avenue Subway are incomplete, and signal equipment has been installed on only a portion of the two tracks in operation. Connections, however, have been completed at 38th Street and Fourth Avenue to permit taking cars out of service for inspection.

BROADWAY-MYRTLE AVENUE CONNECTION.

This connection was completed and operation thereover begun July 29, 1914.

LUTHERAN CEMETERY LINE.

The main portion of this line was finished and operation begun over the same on February 22, 1915. At the westerly end of this connection a temporary construction was provided pending the erection of new structure at Myrtle and Wyckoff Avenues, forming part of the third tracking of the Myrtle Avenue Line. Temporary arrangements have been made with reference to yard tracks at the east of this line pending the completion of the permanent yard.

LIBERTY AVENUE ELEVATED EXTENSION.

The steel structure of this line has been completed and track laying practically finished. Some work remains to be done on the station structures and it is expected that this line will be ready for operation some time during August or September of 1915.

JAMAICA AVENUE ELEVATED EXTENSION.

Contract for the steel structure of Section I of this line was let in March, 1915, and contract requires completion thereof by February, 1916. Section I is about one-half of the total line, extending from Cypress Hills to Richmond Hill. Plans for the second section are awaiting a definite determination with reference to street lines, to be fixed by the city, which has also caused some delay to Section I.

ADDITIONAL TRACKS, EXISTING LINES.

The third tracking work on Fulton Street, from Sackman Street to Nostrand Avenue, has been practically completed so far as erection of structure is concerned. Contract for stations has been let, all of which will probably be completed before the end of the calendar year. The work on the lower section, from Nostrand Avenue to the Brooklyn Bridge, is awaiting the approval of plans by the Public Service Commission.

The third tracking work on Broadway, for that portion between Have-meyer Street and Myrtle Avenue, is well under way and will probably be completed by the end of this calendar year. Steel for the second section from Myrtle Avenue to East New York is being fabricated, a portion of which is being delivered.

Plans for the third tracking of the Myrtle Avenue Line were approved by the Public Service Commission within a few days, and bids for construction will soon be invited.

CAR EQUIPMENT.

A total of 300 cars have been ordered, 160 of which have been delivered, 100 of the latter being now equipped and in operation.

Delivery of the remaining 140 cars will be made during the present calendar year.

SIGNAL EQUIPMENT.

In addition to the signaling contracted for with reference to Centre Street Loop, contract has been closed which will cover signaling for practically all the rapid transit lines involved in contract with the city. This contract provides for immediate installation of signaling as construction work proceeds, and also provides for the contractor making certain experiments with a system of Cab Signal and Speed Control which, if satisfactory, will mark a great advance over signal methods heretofore in use.

POWER ADDITIONS.

Numerous additions to power equipment were installed in existing substations, and two new substations were constructed, one at 64th Street and Fourth Avenue, equipped with two 2,000 K. W. Rotary Converters, and one at Ozone Park, for the new Liberty Avenue Line, equipped with two 1,000 K. W. Rotary Converters.

New transmission lines were also installed.

EXPENDITURES UNDER CITY CONTRACTS.

The New York Municipal Railway Corporation's expenditures for con-

struction and equipment to June 30, 1915, under the city contracts, were as follows:

On account of contribution to city-owned lines.....	\$10,582,892.05
On account of equipment of city-owned lines.....	3,596,219.92
On account of additions, extensions, and improvements of existing railroads.....	15,831,747.81
Total	\$30,010,859.78

RESULTS OF TEMPORARY OPERATION OF RAPID TRANSIT LINES UNDER CITY CONTRACTS.

The arrangement with the city, whereby the pooling of earnings between existing rapid transit lines with their extensions and the city-owned lines was to go into effect as new lines are added from time to time, was described in detail in the annual report for the preceding year. This temporary operation and pooling began on August 4, 1913, and the results for the year ending June 30, 1915, and for the entire period from August 4, 1913, to June 30, 1915, are given below:

RESULT OF OPERATIONS OF NEW YORK CONSOLIDATED RAILROAD COMPANY, LESSEE, UNDER THE PROVISIONS OF CONTRACT NO. 4, DATED MARCH 19, 1913, BETWEEN THE NEW YORK MUNICIPAL RAILWAY CORPORATION AND THE CITY OF NEW YORK.

	Year ending June 30, 1915	For the period Aug. 4, 1913 to June 30, 1915
REVENUE:		
Passenger Revenue.....	\$8,370,004.24	\$16,023,760.08
Chartered Cars and Misc. Transp. Revenue	1,115.10	2,350.02
Advertising	63,966.66	129,815.83
Other Car and Station Privileges.....	46,056.73	96,282.15
Rent of Buildings and Other Property..	27,266.70	53,752.78
Rent of Tracks and Terminals.....	44,515.98	77,666.63
Miscellaneous	7,631.19	7,919.62
	\$8,560,556.60	\$16,391,547.11
DEDUCTIONS:		
Rentals	91,050.78	174,479.33
Taxes	525,189.87	1,060,243.28
Operating Exp., exclusive of Maintenance	3,396,054.00	6,456,997.02
Maintenance Fund.....	1,026,389.42	1,967,034.43
Depreciation Fund.....	256,597.32	491,758.56
Proportion of Company's Preferentials..	3,591,000.92	6,786,447.66
	\$8,886,282.31	\$16,936,960.28
Deficit* in Company's Preferentials.....	325,725.71	545,413.17
Interest† Paid by City on Its Cost of Construction of Property Placed in Operation Plus Sinking Fund at Rate of 1 Per Cent per Annum.....	404,661.45	714,721.93
Total Deficit	730,387.16	1,260,135.10

*To be made good from future net income before payment of city's interest and Sinking Fund charges.

†Deficits in city's charges during temporary operations to be added to the cost of construction of city-owned lines.

ADDITIONS, IMPROVEMENTS AND MAINTENANCE.

Exclusive of expenditures on rapid transit lines under contracts with the City of New York (referred to above) there was expended for additions, chargeable to Capital Account, \$1,133,446.06, which are classified in detail in Table No. 3 attached.

The charges for maintenance of way and structure and of equipment were \$4,793,655.73, being an increase over similar charges for the preceding year of \$456,018.38, and exceeding the charges of any year in the history of the system. The actual expenditures were less than the charges by \$256,384.55, which amount was credited to Reserves.

Among the principal maintenance and construction expenditures during the fiscal year (other than construction expenditures on rapid transit lines referred to above) are the following:

TRACK AND STRUCTURE.

On the surface lines 83,930 feet of single track were relaid with standard 7-inch 105-lb. rail, and 96,072 feet of single track were overhauled; 154 pieces of special work were installed, repaired or renewed; 145,797 square yards of improved granite block pavement on concrete foundation were laid, and 781 square yards of wood block pavement, in addition to which the city laid at the expense of our companies 45,383 square yards of improved pavement.

A double track line consisting of 5,921 lineal feet of "T" rail construction was built in Stillwell Avenue from the West End Line, near Avenue "R" to a connection with existing tracks in Stillwell Avenue, north of New York & Coney Island Railroad.

On Hegeman Avenue, between Hopkinson and Rockaway Avenues, a double track line, comprising 1,578 lineal feet of track, was laid with 7-inch girder rail.

On New Lots Road, between Williams and New Jersey Avenues, 2,363 square yards of recut granite were installed.

The special work lay-out on Prospect Park Plaza at Ninth Avenue and Fifteenth Street was renewed, with extensive changes in alignment, etc., to accommodate the plans of the Park Department for improvement of the Plaza.

Many riveted joints of surface tracks were replaced by seam-welding process.

On the elevated lines renewals were made as follows:

51,658 lineal feet of rail,
1,425 lineal feet of steel guard rails,
35 switches,
28 frogs,
4 crossings,
16,789 ties,
39,630 lineal feet of timber guard rail, and
140,508 lineal feet of 2x6-foot walk.
22,593 lineal feet of elevated structure were repainted.

All elevated stations between St. Marks Avenue and 65th Street were given a general repair and repainting; similar work, although not so extensive, was done on the stations on the Lexington Avenue Line from Greene Avenue to Reid Avenue, on the Myrtle Avenue Line from John-

son Street to Knickerbocker Avenue, and the Broadway Line from Van Sicklen Avenue to Crescent Street.

BUILDINGS.

An extension of the shop building was constructed at Fresh Pond Road; an enlarged and improved school room for the instruction of motormen and conductors was provided in the 58th Street Car Barn, and various improvements and repairs have been made to many buildings.

POWER STATIONS AND TRANSMISSION LINES.

At Williamsburg Power Station a cinder catcher was installed in the flues for eighteen boilers located on the first floor; six underfeed stokers with their blowers and coal-handling equipment were installed, and the intake well of tunnel for condensing water was rebuilt.

At Central Power Station seven oil switch compartments were constructed, and additional switchboard and switching equipment installed for the operation of the Fourth Avenue Subway.

At Tompkins Sub-station one 3,000 K. W. Rotary Converter with its transformers, switchboard equipment and storage battery was installed, making the present capacity of the station 8,000 K. W.

At Hudson Sub-station two 2,000 K. W. Rotary Converters with their transformers and switchboard equipment were removed, and replaced with two rotaries of 4,000 K. W., making the present capacity of the station 14,000 K. W. The Rotary Converters removed were installed in the 64th Street Sub-station of the New York Municipal Railway Corporation.

The Sanford Street Sub-station of the Coney Island & Brooklyn Railroad Company, having been shut down, was dismantled and the equipment removed to Ozone Park Sub-station.

At Coney Island Sub-station one 2,000 K. W. Rotary Converter with its transformers, switchboard equipment and storage battery was installed, making the present capacity of the station 6,000 K. W.

There were removed from the system 17.91 miles of overhead D. C. feeders, and 8.95 miles of this were reinstalled in other parts of the system.

Connections were made between the high-tension cables and the conduit lines of the Coney Island & Brooklyn Railroad Company and other companies of the system, which permitted the removal from the conduit line of the Coney Island & Brooklyn Railroad Company of one 3/0 high-tension cable 14,850 feet in length. This cable was reinstalled between the Essex Sub-station and the Ozone Park Sub-station for the operation of the Liberty Avenue Extension.

High-tension cables were installed as follows:

One 350,000 C. M. Sector Cable between the Williamsburg Power Station and the Essex Sub-station—28,650 feet.

Three 350,000 C. M. Sector Cables between the Williamsburg Power Station and the Hudson Sub-station—31,026 feet.

One 350,000 C. M. Sector Cable between the Williamsburg Power Station and the Richmond Hill Sub-station—47,473 feet.

16.40 miles of underground feeders were removed, and 15.51 miles reinstalled in other parts of the system.

80.44 miles of trolley wire were renewed.

Telephone wire to the extent of 4.93 miles was removed.

2,524 trolley poles were repainted, 136 reinforced, 649 reset, 386 installed, and 297 removed.

2.15 miles of conduit lines were constructed.

EQUIPMENT.

462 complete air-brake equipments were installed on surface cars.

300 partial air-brake equipments were installed on surface double truck open passenger cars.

200 partial air-brake equipments—semi-automatic features substituted for straight air features—were installed.

617 improved geared hand brakes, supplementing air brakes, were installed.

112 pairs of new trucks have replaced a like number of old style inferior frames.

559 pairs of improved design maximum traction truck frames were installed under cars which are being equipped with air brakes.

On the surface division 21 single truck closed passenger cars, 201 double truck closed passenger cars, 509 semi-convertible cars, 250 double truck open cars, 432 convertible cars and 22 center-entrance cars were repaired and revarnished.

Of the Coney Island & Brooklyn equipment 90 double truck closed cars and 86 double truck open cars were overhauled and repainted.

83 plows and sweepers were repaired.

73 service and freight cars and 945 damaged passenger cars were repaired.

300 pairs trucks were overhauled and strengthened to operate under open cars equipped with air brakes.

541 cars were equipped with wheel guard chains.

In 107 semi-convertible cars longitudinal seats were substituted for Chamberlin chairs.

On the elevated division 31 cars have been repaired and repainted and additional circuit of five lights installed; 594 motor and trailer passenger cars have been repaired and revarnished; and 85 damaged passenger cars and 70 service and freight cars have been repaired.

At all machine shops machinery has been safeguarded to avoid accidents, and various additional tools have been installed.

EMPLOYEES' WELFARE WORK.

The broad program of employees' welfare, which has been under development for many years, was substantially added to during the last year. The Employees' Benefit Association, through which these activities are largely conducted, has now a membership of upwards of 8,000, of whom over 6,500 are in the operating branches, while about 1,500 are in other departments of the system.

We expended during the past year, in the maintenance and improvement of the club rooms for employees, in support of the Pension System, in medical inspection service, and in sickness and death gratuities in cases not reached by the Employees' Benefit Association, the sum of \$78,742.47.

The organization of a Brooklyn Rapid Transit Baseball League in the summer of 1914 was a distinct and very popular addition to the social diversions of the employees. The company provided all equipment, including uniforms, hired umpires and paid the ground expenses. A field day, under the auspices of the Baseball League, was attended by more than 5,000 employees and members of their families.

The system of compulsory medical inspection and free attendance for employees excused on account of illness, which was established January 1, 1913, for approximately 10,000 men in the operating department, accomplished during the past year a reduction in the amount of time lost by the operating employees on account of sickness of 13,185 days (or nearly 18 per cent) over the time lost in the year ended June 30, 1914. The milder winter of 1915 accounted for about 7,000 days of the total reduction. Making due allowance for this, however, there still remains a saving of upwards of 6,000 days' work for the year, or a reduction of 8.6 per cent over the sickness record of the year ended June 30, 1914.

The system of compulsory medical inspection was accompanied in its first year by a reduction of 24 per cent in the number of days' work lost by operating employees on account of illness, and it is gratifying to find that this initial record is still being improved upon as the activities of the Medical Inspection Bureau develop. These activities embrace not only the inspection and attendance of operating department employees reporting sick, but free medical attendance for members of the Employees' Benefit Association outside of the operating department; the care of all employees injured in the performance of their duties and entitled to medical attendance under the Compensation Act; the examination of candidates for employment and the periodic re-examination of all motormen.

A system of First Aid to the Injured has been developed to a high state of efficiency. An improved portable First Aid case with equipment for use both by an instructed layman and by a physician has been developed by the physicians of the Medical Inspection Bureau; 68 of these cases have been installed in the depots, terminals, shops and power houses of the company, and supplied to emergency and other crews required to work out on the lines. Wherever a First Aid case has been installed, a sufficient number of employees have been instructed in approved methods of First Aid to insure the presence of some qualified individual at all hours of the day or night when work is going on.

This system of First Aid to the Injured will have an important influence in minimizing the effects of injuries received by employees, particularly as it insures not only the prompt administration of First Aid, but the prompt reporting and treatment of all cases by the physicians of the Medical Inspection Bureau.

SAFETY CAMPAIGN.

On July 2, 1914, there was appointed a Central Safety Committee representing all the departments of the company in which the accident hazard is a material factor. In accordance with a plan of safety organization at that time adopted, each department set up a departmental safety organization, having as its objective the stimulation of a greater interest on the part of all employees in the problem of safety, through active participation in the study of conditions which produce accidents and in the devising of remedial measures.

The company invited all employees to report dangerous conditions and to make suggestions in the interest of safety. Meetings were held, both of committees and of departments generally, for the purpose of discussing the safety problem. So far as practicable, the investigation of accidents actually occurring was referred to the safety committees comprised largely of the rank and file. The employees demonstrated an immediate and vital interest in the safety movement, which was most encouraging. The various departmental organizations were completed during the fall of 1914. Although the period is too short to justify any general conclusions, it is at least gratifying to note that in each of the last six months boarding and alighting accidents, car collisions, accidents in which cars strike persons, and car vehicle collisions, have made a more favorable showing than in any one of the corresponding months of the previous year—and this in spite of the fact that the hazard of accident has been increased substantially by the reconstruction of several of the elevated lines and the construction of new lines, with operation over the same routes proceeding uninterrupted during the progress of the work.

The public safety campaign, conducted in co-operation with the Brooklyn Institution for Safety, was continued in the schools of Brooklyn throughout the year, with the approval of the Board of Education of the City of New York. Stereopticon and moving picture lectures were featured in the school instruction; Safety Patrols among the boys, and Careful Clubs among the girls, were organized. Safety calendars, bearing an appropriate drawing and text for each month, were supplied in the number of 9,000 for every school class room in Brooklyn; 234,000 safety stories were distributed to the school children, together with 415,000 safety buttons.

This educational work covered 159 public schools of grammar grades and below, 14 high schools, and 54 parochial schools. Sixty-eight prize competitions in essays on safety were held. In addition to the work in the schools, 104 safety lectures were delivered to adult audiences, reaching approximately 38,000 people. The attendance at lectures or moving picture performances given primarily for children, including children who may have attended more than one performance, was approximately 340,000.

During the summer of 1914, safety instruction was given in 53 playgrounds and nine summer schools in Brooklyn, and 43 motion picture performances featuring safety were given in the parks. Provision has been made for continuing safety instruction in the playgrounds throughout the present summer.

As in the previous year, the results of the safety work done in Brooklyn have been made available to public organizations and corporations engaged in similar work throughout the country, and substantial evidences of appreciation have been received from many quarters.

ACCIDENTS AND NEGLIGENCE ACTIONS.

The amount paid during the fiscal year for injuries to passengers and property aggregated \$607,700.61, or an increase of \$63,815.48. The legal expense in connection with damages was \$261,153.68, an increase of \$41,394.95. The total payments for damages, including legal expense, were 3.29 per cent of earnings. Of course, these payments represent accidents not only during the current fiscal year, but prior thereto. As a matter of fact, there were 1,333 fewer accidents on the system during the fiscal year than during the preceding year, and 139 fewer actions were brought against the companies. The number of accidents tried in the courts, however, showed an increased of 42 per cent over those tried in the preceding year.

Based upon awards approved by the State Workmen's Compensation Commission we have established reserves adequate to meet future obligations to the dependents of deceased employees.

FIRE INSURANCE.

In the year 1913 the New York Fire Insurance Exchange increased very largely the rates on the system's properties, and this action compelled the companies of the system to place their risks with London Lloyds, where a much lower rate was obtainable. In the succeeding year, however, the local Exchange offered an average rate somewhat lower than Lloyds, and about 20 points lower than the rates fixed in the preceding year, and our insurance was therefore placed with domestic companies for three years under blanket schedule. The average rate as fixed was .25387, which was afterwards reduced by reason of certain improvements made in the risks to .23388. The subsequent inclusion of the Coney Island & Brooklyn Railroad Company's properties may increase this rate slightly. Notwithstanding these low rates the companies of the system are continuing to accumulate an Insurance Reserve Fund, which, on June 30, 1915, had reached the sum of \$787,339.47, an increase of \$188,242.28 during the year. This fund, to the extent of \$736,011.20, is invested in stable securities.

CAR AND STATION ADVERTISING.

Contracts with the Inter-City Car Advertising Company having expired on April 30, 1915, and not being renewed, it was decided to under-

take this branch of business independently, and there was organized the Broadway Subway and Home Boroughs Car Advertising Company, with a capital stock of \$10,000, all of which is owned by the Brooklyn Rapid Transit Company. This advertising company, under the direction of Joseph P. Day, the well-known real estate man, as president, will conduct the car and station advertising and news and vending privileges for the various railroads of the system.

FREIGHT TRAFFIC.

During the fiscal year the freight department shows a gross revenue of \$625,769.97, an increase over the preceding year of \$128,200.81. The net revenue was \$287,355.64.

A small increase in the arbitraries allowed by the trunk lines has been obtained through the 5 per cent increase in rates authorized by the Interstate Commerce Commission.

The volume of freight has been considerably increased through the construction and excavation work incidental to the building of rapid transit lines.

The facilities of the freight department have been used by the contractors for practically all sections of the new rapid transit lines. Such transportation has not only been a convenience to the contractors, but has proved cheaper than other means of transportation, thereby lessening the contractors' cost and incidentally the cost of construction, has permitted the handling of material in much larger quantities and in less time, and has expedited the completion of the work.

There is a constant demand from manufacturers and commercial houses for side track connections in order to obtain deliveries of freight through the trolley or steam car deliveries over our lines.

INCREASE IN NUMBER OF STOCKHOLDERS.

The number of stockholders has increased by 2,514 during the fiscal year—the total number on June 9, 1915, being 8,833.

RESERVE ACCOUNTS.

There has been added to Reserves during the year the following:

Insurance	\$188,242.28
Amortization of Capital.....	256,384.55
Employers' Liability.....	34,995.85
	<u>\$479,622.68</u>
but retired property adjustments chargeable to these Reserves—	
aggregating	\$390,217.37
have reduced the year's gain in Reserves to.....	<u>\$89,405.31</u>

BROOKLYN RAPID TRANSIT REFUNDING MORTGAGE FOUR PER CENT. BONDS.

Authenticated to July 1, 1914.....	\$51,792,000.00
Authenticated during year.....	3,269,000.00

	<u>\$55,061,000.00</u>
Converted into stock.....	29,619,000.00

Net Authenticated and Outstanding.....	<u>\$25,442,000.00</u>
--	------------------------

In Hands of the Public.....	\$3,459,000.00
In Possession of the B. R. T. System.....	21,983,000.00

As follows:

*Collateral to \$40,000,000.00 6 yr. 5 per cent. Notes	\$10,000,000.00
Collateral to Bills Payable.....	4,876,000.00
In Treasury B. R. T.....	5,096,000.00
In Treasury N. E. R. R.....	1,046,000.00
Deposited with City of New York by The N. E. R. R. Co.....	15,000.00
Deposited with Trustee of The Nassau Electric Railroad Consolidated Mortgage.	700,000.00
Guaranty Fund Brooklyn City Railroad Lease	250,000.00
	<u>\$21,983,000.00</u>

Detailed statements of operation, statistics and consolidated balance sheet are appended hereto.

Respectfully submitted by order of the Board of Directors,
T. S. WILLIAMS,
President.

*\$301,000 par value of these notes have been converted into New York Municipal Railway Corporation's five per cent. first mortgage bonds, as permitted, prior to January 1, 1916, by the terms of the trust agreement.

*Illustrated.

is pleading ignorance or is trying to throw the blame on some other person he knows that he is raising a false issue. In other words, conscience is an important element in discipline. The superintendent or other superior officer who succeeds in getting the co-operation of the conscience of a delinquent or untrained employe has taken the best possible means of leading that employe toward the highest efficiency of which he is capable. "One hundred per cent is the mark to be attained," says Mr. Porter. Everybody agrees to this, in words. To exemplify it in acts often requires the most strenuous effort on the part of all concerned—energetic team work. And success in team work is greatly promoted when every individual puts aside all pretense, makes no claim to 100 per cent when he knows that the right figure is 90, and frankly estimates his own work on exactly the same basis that the superintendent estimates it. This is the way to cultivate high ideals; and high ideals—of our own, not those of the general manager, or of the safety-first committee—are essential to real proficiency.

The employment of women as ticket sellers is not a new thing, especially at small stations, but the Oregon-Washington Railroad

Women as Ticket Sellers

& Navigation Company has taken a new departure in employing women in large city ticket offices, one each in four offices. Here they will be required, not merely to hand out a 15-mile card ticket now and then to a farmer, but will have to keep themselves posted in all the intricate details of the passenger traffic department. The general passenger agent's announcement says that his purpose in these appointments was to smooth the way for women customers. Possibly also by working with the women the men clerks will become more proficient in making things pleasant for all customers. Encouraging employees to learn from other employees who are of different temperament is a neglected element in railroad discipline. Men in city ticket offices already stand (or should stand) at the head of the class in courtesy; but the best of us can improve, of course. Copying the best habits of our fellows is a rule which can be applied in all departments. According to the Knoxville *Sentinel*, President Fairfax Harrison, of the Southern Railway, at a big employees' meeting in Knoxville, recently, in urging all employees to aspire to the most honorable records, mentioned by name, as worthy of emulation, a conductor and an engineman who had been among the speakers at the meeting. Why is not this a good idea? An employee who is thus made prominent may have conspicuous faults; most of us have a bunch of them. But the point is that good habits and actions are worthy of imitation, notwithstanding.

The description of a bridge to be built by the Chicago, Burlington & Quincy at Kansas City, published on another page of this

Alloy Steel in Railroad Bridges

issue, is of particular interest because of the use of high elastic limit alloy steel in a structure of moderate size. The specifications for the metal follow very closely those used for the Metropolis bridge of the same road over the Ohio river, a structure involving four spans more than 500 ft. in length and one 723 ft. long, the longest simple span in the world. In this structure, as well as any others which have unusually long spans, the dead loading becomes a very serious problem. The weight of the truss members becomes such a large proportion of the total load that any reduction of the sectional areas to effect a corresponding reduction in the weight is highly desirable. This has led to the use of the harder, stronger alloy steels, the additional cost of manufacture and fabrication resulting from the increased hardness being more than compensated for by the saving in weight. These special steels have been specified for a number of other bridges under construction at the present time, among which may be mentioned those at Memphis, Quebec and Hell Gate. Nickel steel has been most commonly used, although a high carbon steel is being used in the Hell Gate arch and silicon steel has been

"Every employe competent to hold his job three months knows when his work is 100 per cent." These words, in a brief paper by B. A. Porter, superintendent of the Memphis division of the Yazoo & Mississippi Valley, from which an extract is printed in another column, contain an important truth which is often lost sight of. Its corollary is that the negligent or wrong headed employe knows his fault, or his breach of loyalty, or his failure to do as well as he knew how; and that in most cases when he

Striving for 100 Per Cent.

specified for the riveted members of the Metropolis and Kansas City bridges. While these structures collectively represent a large tonnage, when compared with the total weight of all structural steel being fabricated, the percentage of the special steel used is still very small. At the present time any contract for a bridge involving the use of hard steel creates a special problem for the fabricating shop, requiring special equipment and increased supervision. It will be interesting to watch the extent to which future developments in the use of these harder steels will reduce the difference between the actual costs of the fabricated structures of hard and soft steel and permit the use of these special materials for spans shorter than have heretofore been assumed to be economical.

STEAMSHIP AND RAILWAY ACCIDENTS

ACCIDENTS on the railways of the United States are too numerous, but when something suggests comparison between their accident record and the records of other classes of concerns in this country the record of the railways is seldom found to be so bad relatively as most people think. When the lake steamship Eastland turned over in the Chicago river recently about 1,000 passengers were drowned. Never in their history did all the railways of the United States together kill that many passengers in all ways in a year. In only two years of the last ten has the federal inspection service compiled the statistics of steamship accidents so as to show separately the number of fatalities to passengers. These were 1906 and 1914. In 1906 American steamships carried 330,235,959 passengers, of whom 323 were killed in accidents, or 1 in 1,022,000. In the same year the railways carried 797,946,116 passengers, of whom 359 were killed, or 1 in 2,222,000. The railways killed less than one-half as many passengers in proportion as the steamships. In 1914 the steamships carried 318,094,317 passengers, of whom 105 were killed, or 1 in 3,029,000. In the same year the railways carried 1,053,138,718 passengers, of whom 265 were killed, or 1 in 3,978,000. Here again the railways were relatively the safer.

These statistics relate only to "disasters" to vessels, which really should be compared with train accidents. In 1906 the railways killed only 146 passengers in train accidents, or 1 in 5,465,000, and in 1914, only 85, or 1 in 12,390,000. The risk of a passenger being killed in a train accident is several times less than the risk of his being killed in a vessel disaster. The total number of passengers carried by the steamships in the 10 years 1905-1914, inclusive, was 3,388,654,368, and the total number of both passengers and members of crews killed was 3,972. The total number of passengers carried by the railways was 9,252,160,740, and the total passengers and employees killed was 8,832. The steamships carried only 36.6 per cent as many passengers, and killed 44.7 per cent as many passengers and employees as the railways. It is not pretended that these statistics are strictly comparable. In view, however, of the fact that it appears to be commonly assumed that travel by water is safer in this country than travel by rail, they are interesting.

It should also be considered in this connection that steamships have been supposed to be subjected to the strictest regulation in the interest of safety by the federal government. Since government regulation cannot prevent such steamship disasters as the General Slocum and the Eastland catastrophes, it is evident that the confidence of the public that it will greatly improve the operation of railways and other concerns is based on hope rather than on experience. There are still to be found people who can observe and remember, and who are therefore about as willing to trust their lives and limbs to such private greed as was manifested by the owners and managers of the Eastland as to government bureaucratism, red tape and general inefficiency.

Our governments need improvement fully as much as the business concerns they are so busy instructing in the ways of virtue and efficiency.

OUR INEFFICIENT GOVERNMENTS

IN political matters the members of the great American democracy are supposed to be the wisest people in the world. There are certain things about government, however, which they have never learned and show very little disposition to learn. Among these are that the quality of government and the benefits it confers on the public depend only slightly on the number of laws passed, and very largely, indeed, on the kind of laws passed and on the efficiency with which they are administered and enforced; and that the kind of laws passed and the way they are administered and enforced depend mainly on the organization of the government and the efficiency of its personnel.

The fact that the American people have never learned, or at least have never acted in accordance with these important principles, is forcibly impressed on the mind by some event every day. One recent event which should have called it to the attention of everybody was the sinking of the steamship Eastland in the Chicago River, and the consequent drowning of about 900 people. Federal legislation has provided for the regulation and inspection of steamships in the interest of public safety. It has created a bureau, which is now a part of the Department of Commerce, for the performance of these functions. The public has assumed that the legislation is adequate and the bureau efficient. But although the law applied to the Eastland, and it had been inspected by the bureau repeatedly over a long period of years, the boat actually turned over in 20 feet of water while still tied up at her dock.

Those responsible for the administration of the law now say that it is, and always has been, inadequate in that it does not provide for testing the stability of vessels. It is perfectly evident that either the law is inadequate or that its administration has been inefficient. But for the steamship inspection service to say that the law is inadequate or even to demonstrate that this is the case, is not to exculpate the government, but merely to "pass the buck" from one branch of the government to another; from the administrative department to the legislative. If the law is inadequate this is due to the inefficiency of Congress as a law-making body. If it is adequate the failure to so administer it as to prevent this catastrophe was due to the inefficiency of the steamship inspection service. And a pertinent question suggests itself here. If the law is and always has been lame in such an important particular, the steamship inspection bureau ought to have known it. If it knew it, it should have brought the matter to the attention of Congress and recommended a needed amendment. Where is the evidence that it did this? It has not been forthcoming.

There is constant agitation for increases in the functions of government. This agitation is directed especially to making the intervention of the government in industrial and economic affairs more energetic and pervasive. There are abuses in the railway and other lines of business, and people leap from the premise that these abuses exist to the conclusion that government regulation will improve conditions. But there is a hiatus in their logic, as is easily shown by putting it into syllogistic form. Their reasoning put into this form is as follows:

Major premise: There are abuses in business and evil industrial and social conditions result.

Minor premise: The government is competent by means of regulation to remove these abuses and remedy these bad conditions.

Conclusion: Therefore, the government should regulate business.

The major premise is inassailable. But the conclusion does not truly follow from it because the minor premise is fallacious. It is not that government as we have it, and always have had, is competent to regulate business. In almost every case where it has attempted to do so it has shown its incompetency. Based on past experience we ought to make the minor premise read: The government is incompetent by means of regulation to remove these abuses and remedy these bad conditions. We should then come

nearer stating the facts, and the conclusion at which we should arrive would be entirely different.

The science which deals with the subject of economics formerly was called "political economy." It is now usually called "economics." We need to return to the old phraseology for both theoretical and practical reasons. In our analysis of and in our action regarding all matters falling under this general head, we need to recognize the fact that the effect which will be produced by the intervention of government in business affairs depends not only on the conditions in business, but also on the fitness of the government to deal with those conditions. Its fitness, in turn, depends on its organization and its personnel. Our governments have thus far shown themselves incompetent to regulate business in the interest of the public, because in honesty and disinterestedness of purpose they are not superior, and in organization and personnel they are far inferior to the business concerns which they are regulating.

We have had much agitation, not only for increasing the interference of government with business, but even for government ownership and operation of many kinds of concerns. When shall we have an honest, energetic and widespread movement for making our governments competent to perform the functions they already have? Raising them to this plane of efficiency is absolutely prerequisite to raising them to the still higher plane of efficiency where they will be fit to perform large and important additional functions. The advocates as well as the opponents of further increases of government functions ought to be able to unite in such a movement; for by far the strongest argument at present against further increases of government functions is the almost imbecile inefficiency which most of our governments display in most of the things that they now undertake.

THE DIVISION OF RAILWAY INCOME

THE complaint is heard constantly from social reformers, politicians and representatives of organized labor that labor does not receive in wages its fair share of the product of industry or of the increase of that product. Just what is labor's fair share has never been theoretically determined by anybody except the socialists, who claim that it creates all wealth, and therefore should have it all. As a practical matter, the facts show both that labor receives a very much larger part of the product of industry than capital, and that the part it receives is increasing in proportion.

We publish elsewhere a very interesting letter from W. A. Worthington on this subject. He calls attention to a recent report of the National Civic Federation showing that at the present time labor is receiving practically two-thirds of the product of manufacturing industries and capital one-third. He then analyzes the distribution of that part of railway income which is divisible between capital and labor. He finds that of this divisible income labor, in 1904, received 58.73 per cent, and in 1914, 66.01 per cent, while capital in the former year received 41.27 per cent, and in 1914 only 33.96 per cent. Of the increase of the divisible income between 1904 and 1914, labor received \$555,823,662, or four-fifths, and capital \$131,593,690, or one-fifth. The increase in the part of the divisible income going to the railways is shown to have been sufficient to pay a return of only 2.43 per cent on the increase in their investment in road and equipment.

This last figure raises the serious question whether labor did not receive too much of the increase in the divisible income, or what comes to the same thing, whether capital did not receive too little. The increase in the investment of capital is what creates the increase in the demand for labor; and, if capital, when invested in any business, is not adequately remunerated, it will cease to be invested in that business, and thereby the increase in the demand for labor in that business will be arrested. To a certain extent this is what has been happening in the railway industry. The decrease in the reward of

capital invested in railways has caused a marked reduction in recent years in the amount it invested; and in consequence the number of men employed on railways is no larger now than it was eight years ago.

Increases in wages are an unmixed blessing to labor only when they do not encroach on a reasonable return to capital. When they begin to do that, as they already have done in the railway business, they cause periods of retrenchment and of slowing down in the rate of investment which throw men out of employment, thereby nullifying the advantages derived by labor from the advances in its wages.

AN OBSTACLE TO JUST PROMOTION

THE promotion of employees or the selection of candidates for subordinate executive positions becomes a difficult problem whenever an organization assumes such proportions that the individual directly responsible for results cannot know personally the rank and file. It is all the more difficult in a complex organization, such as that of a railroad, and the situation is much the same with all large corporations. This matter has been discussed frequently, but there is one obstacle to the selection of men for promotion which apparently has never been squarely met. Whether or not any system of credits or personal records is in use, the executive responsible for the promotion of men is dependent upon the immediate superiors of the candidates for promotion for the data upon which to base his decisions. This being the case it is well to consider whether the interests of the company always coincide with those of the immediate superior when the promotion of a subordinate is under consideration, and whether under such circumstances the recommendations or reports of the officer may be influenced by his own interests in the matter.

It is frequently said that a man who becomes a successful station agent in a given town is destined to remain there for the rest of his life, for, having once established himself in the good graces of the community, the interests of the company might suffer should another man replace him, in the event of his promotion to a larger or more important station. In a similar manner we find that the department head suffers no little inconvenience from any change in his organization, a result which he feels more keenly when an assistant is taken out of his department. In other words, he finds every inducement to keep his assistants in their respective positions as long as possible, particularly when he cannot advance them in his own department. Furthermore, his superior officer may be of such a disposition that he may feel he does not dare give him a personal knowledge of his subordinates for fear that his department will be disrupted by the superior officer dealing with the subordinates directly. Many an unfortunate man has been put in this intolerable situation.

On the other hand, it frequently happens that a man has outgrown his job, and is lying his "light hidden under a bushel" simply because his superior is not as big a man as he is, and he cannot be moved up until his superior is eliminated. How, then, are we to make it to the interest of the superior to call special attention to a subordinate who is possessed of such qualifications as to justify advancement faster than his boss? In the first place, the integrity of the organization must be maintained. No matter how capable the subordinate may be, until such time as he is actually promoted he should not be favored by attention or clothed in authority which would be a source of embarrassment to his superior. Further than this, every effort should be made to avoid humiliating the man over whose head he is advanced. In fact, special attention should be drawn to the credit due him for having developed and trained the man promoted. The importance of this subject justifies a serious study of a method of proper reward for those men who have shown an interest and an aptitude in the development of the workers under them.

LEHIGH VALLEY

THE Lehigh Valley operates 1,442 miles of road, of which 595 is double track. The Lehigh Valley Railroad Company owns directly but 317 miles, 99 of this being the main line from Phillipsburg, N. J., to Wilkes-Barre, Pa. It owns, in addition, the entire capital stock of the Lehigh Valley Railroad Company of New Jersey; the Pennsylvania & New York Canal Company, and the Lehigh Valley Railway Company, whose main lines with its own give it a route from Buffalo to New York, 446 miles in length. It also operates the Lehigh & New York, having an aggregate mileage of 115, under lease. The company traverses the anthracite coal regions of Pennsylvania and no less than 45 per cent. of its total operating revenues in the year just closed were derived from the carrying of coal and coke.

In the fiscal year ending June 30, 1915, the road's total operating revenues were \$42,526,000, or \$355,000 more than in 1914, there having been an increase of \$668,000 in coal freight revenue, an increase of \$464,000 from other freight, but a decrease of \$751,000 in revenue from the carrying of passengers. Operating expenses totaled \$29,947,000, a decrease of \$141,000 from 1914, there having

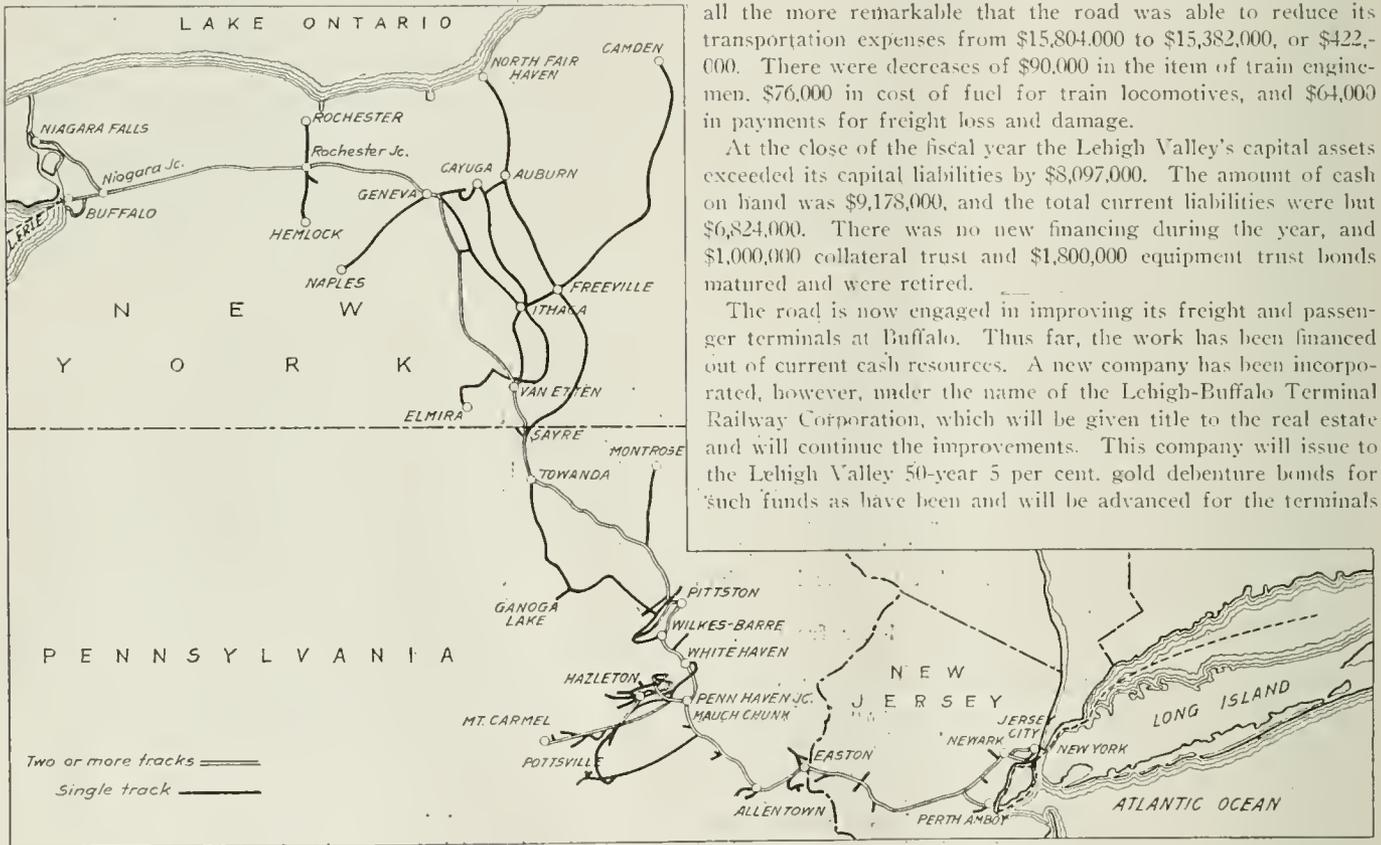

increase of 495,000 tons, or 1.66 per cent over 1914. Of the total tonnage carried, 14,603,000, or nearly one-half, was anthracite coal, there having been an increase in this commodity of 1,038,000 tons. The total ton mileage was 5,326,329,000, an increase of 2.70 per cent. The revenue per ton per mile was .601 cents, as compared with .657 cents in 1914. The ton mileage per mile of road was 3,690,000, an increase of 2.45 per cent, and the freight revenue per mile of road was \$24,386 as against \$23,660 in 1914, an increase of 3.07 per cent. There was but a slight change in the average train load, it being 621 tons.

The passenger revenue in the year just closed was \$4,044,000, or 15.67 per cent less than in 1914. This drop is attributed to the general depression and to the reduced immigrant traffic, of which the Lehigh Valley has received a large share. There were decreases not only in the number of passengers carried, but in the average journey and the average revenue per passenger. The passenger train revenue per mile of road was \$2,801, as compared with \$3,330 in 1914.

In view of the fact that there was an increase in freight traffic and that it is exceedingly difficult to decrease passenger train expenses proportionately to a decrease in passenger business, it is all the more remarkable that the road was able to reduce its transportation expenses from \$15,804,000 to \$15,382,000, or \$422,000. There were decreases of \$90,000 in the item of train engines, \$76,000 in cost of fuel for train locomotives, and \$64,000 in payments for freight loss and damage.

At the close of the fiscal year the Lehigh Valley's capital assets exceeded its capital liabilities by \$8,097,000. The amount of cash on hand was \$9,178,000, and the total current liabilities were but \$6,824,000. There was no new financing during the year, and \$1,000,000 collateral trust and \$1,800,000 equipment trust bonds matured and were retired.

The road is now engaged in improving its freight and passenger terminals at Buffalo. Thus far, the work has been financed out of current cash resources. A new company has been incorporated, however, under the name of the Lehigh-Buffalo Terminal Railway Corporation, which will be given title to the real estate and will continue the improvements. This company will issue to the Lehigh Valley 50-year 5 per cent. gold debenture bonds for such funds as have been and will be advanced for the terminals

The Lehigh Valley

been an increase of \$538,000 in maintenance of equipment expenses and decreases of \$191,000 and \$424,000 in maintenance of way and structures and in transportation expenses, respectively. The operating income for the year was \$10,875,000, an increase of \$451,000 over 1914. Other income, however, decreased no less than \$1,074,000 and was \$1,942,000. This was the result of a reduction in hire of equipment from a credit balance of \$325,000 to a debit balance of \$69,000, a decrease of \$394,000, and a decrease of \$528,000 in dividend income brought about by the inclusion of the Temple Iron Company's dividend of \$685,080 in the 1914 figures. This decrease was reflected in the net income, which was \$6,322,000, or \$734,000 less than in the previous year. The net income, nevertheless, was sufficient to pay the usual 10 per cent dividends, amounting to \$6,060,800, and there was merely a slight decrease in the credit balance of the profit and loss account from \$23,899,000 on June 30, 1914, to \$23,693,000 on June 30, 1915.

In 1915 the total tonnage of revenue freight was 30,269,000, an

and the bonds will be kept in the Lehigh Valley's treasury. Application is now pending before the New York Public Service Commission, Second District, for permission to issue these bonds. The improvements at Buffalo include a new passenger station, the construction of which was recently begun, a new freight station, which, it is expected, will be completed by November 1, and a new steel and concrete coal dock, having a capacity of 500 cars in 10 hours, which will be ready shortly.

The Lehigh Valley has been considered fortunate in the matter of terminals in New York harbor. It is now building a new 1,060 ft. dock, equipped with modern ore handling machinery, at Constable Hook, near Bayonne, N. J., on New York Bay. This dock will be completed early next year and will be in a position to receive foreign ores from vessels of 35-ft. draft for furnaces at South Bethlehem and other places in the Lehigh valley region. It also has under construction a new 730-ft. concrete and steel pier at the foot of Rector street, on the North river front of

Manhattan, which, when completed, will be one of the best railroad piers on the island. A two-story pier will be built at Pier 44, on the East river, primarily for handling flour. The company is also building a new hay pier at 149th street, and has leased all of Pier 5, Wallabout, Brooklyn, instead of one-quarter of it as formerly. These improvements will strengthen the Lehigh Valley in New York considerably.

The Lehigh Valley Coal Company, the entire stock of which is owned by the railroad, had a net income in the fiscal year just closed, from all sources after deducting charges for royalties, sinking funds, depreciation of property and interest of \$1,023,000, an increase of \$458,000 over 1914. It and its tenants mined 8,089,000 tons of anthracite coal, and 258,000 tons of bituminous. The company paid no dividends, but increased its surplus from \$4,226,000 on June 30, 1914, to \$5,108,000 on June 30, 1915.

The following table shows the principal figures for the operation of the railroad company in 1915 as compared with 1914:

	1915	1914
Mileage operated.....	1,444	1,444
Coal freight revenue.....	\$19,195,756	\$18,528,246
Merchandise freight revenue.....	16,005,501	15,541,886
Passenger revenue.....	4,043,799	4,795,147
Total operating revenue.....	42,525,962	42,170,647
Maintenance of way and structures.....	4,483,925	4,674,725
Maintenance of equipment.....	8,207,491	7,669,793
Traffic expenses.....	959,830	1,040,594
Transportation expenses.....	15,382,187	15,804,059
General expenses.....	913,955	898,734
Total operating expenses.....	29,947,388	30,087,905
Taxes.....	1,689,109	1,659,281
Operating income.....	10,874,683	10,423,461
Gross corporate income.....	12,816,895	13,440,150
Net corporate income.....	6,322,445	7,056,660
Dividends.....	6,060,800	6,060,800
Surplus.....	261,645	995,860

NEW BOOKS

The North Eastern Railway, Its Rise and Development: by W. E. Tomlinson. 820 pages, 246 illustrations, 7 in. by 10 in. Bound in cloth. Published by Andrew Reid & Co., Ltd., and Longmans, Green & Co., London. Price \$7.50.

This is an exhaustive history of the various stages of the development of what is now the North Eastern Railway of England, which is especially interesting because one of its component parts was the Stockton & Darlington Railway, the first railway operated with steam locomotives in the world. It thus constitutes in a measure an epitome of railway progress, inasmuch as it affords an opportunity of following within the limits of a single railway system every step in the evolution of transportation by rail, from the horse-drawn coaches and trucks which were run over the wagon-ways prior to 1825, to the electrically operated trains of the present day, for the North Eastern still retains as an integral part of its system portions of some of the early wagon-ways that were used for the transportation of coal.

The plan of the work embraces a brief account of the work done on the early wagon-ways previous to the projection of the Stockton & Darlington, in the days of the experimental period of rail transportation, a chapter on early canal projects in the north of England, a history of the lines amalgamated in 1854 to form the North Eastern Railway and of the early lines which were afterwards absorbed by it, and a history of the North Eastern itself during the first 50 years of its existence, with an appendix giving a short summary of events from 1904 to 1914.

A considerable amount of space is devoted to the early history of the Stockton & Darlington, the early records of which, although this railway is the oldest in the world, the author says are practically complete.

In the preparation of the work the author has had access to special and official sources of information and he has thus been able to present a wealth of interesting detail on the various vicissitudes of early railway planning and building, as well as on the more modern development. Special features are the descriptions of the equipment and methods of operation at different periods, as well as of objects of engineering interest. The 246 illustrations, including maps, diagrams, portraits and views showing the engineering features of the older railways, are unusually interesting and represent a long and patient search, many of them being reproductions of rare prints. The book should be of very great value to all students of railway history.

Letters to the Editor

CREDIT MARKS FOR FREIGHT TRAIN MEN

CLEVELAND, Ohio.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The comment of "H. S. M." in your issue of June 25, on the method of recognizing efficient movement of train crews, that has been adopted by Mr. Lechluder, superintendent of the Baltimore & Ohio, is answered by the statement that the system does, in fact, give recognition to men whose records do not need "clearing up."

Indeed, this is one of the most encouraging features. The men are encouraged to preserve these records, or personal letters that are sent out by Mr. Lechluder for the express purpose of preventing a demerit record. Something will happen, which, on its face seems to indicate that discipline should be administered; or there may be a case of honest doubt; this system makes it unnecessary to leave the decision to hit or miss. The employe has the documents showing that in previous cases, at least, he has acted in the best interest of the company's welfare. This is something more substantial than a book entry.

Railroad men do take pleasure in performing their duties in conformity to the rules and standards of their employers. A clear record is an employe's best friend.

C. H. LEE.

PHILADELPHIA, Pa.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Your correspondent, "H. S. M.," evidently does not know to what extent the "credit" system is used on a number of railways. On the Baltimore & Ohio credit marks are given for any unusually meritorious service. On the Philadelphia Division we have recently started a practice of making credit entry on the record of the engineer who gets the best results as to time and tonnage, i. e., those who produce the largest number of ton miles per hour. Consideration, of course, is given to different conditions prevailing in different kinds of service. * * * *

P. C. ALLEN,

Superintendent, Philadelphia Division.

AN AMERICAN FIREMAN IN FRANCE

PARIS, France.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The arbitration of the enginemen's and firemen's demands in America has interested me greatly. As you say, their principal argument is that their earning power has increased because of the greater efficiency of the locomotives, but I wonder if they would have refrained from asking an advance in wages if their productive power had not increased because many ancient locomotives had been kept in service, and comparatively few modern ones added, as is the case on the Continent?

I am now engaged in firing on the French State Railways. A comparison of the working arrangements and wages in France and the far better working conditions in the United States may be of interest. To begin with, there is no overtime in France, nor is there any 16-hour law. An engineman might be on duty 24 hours; he would have to remain on duty until he had finished his run, and he would not receive a cent of overtime. Payment in road service is by distance, and in switching service by the day of 12 hours, two hours being allowed for the mid-day meal. Coal premiums, figured on a ton mile an hour basis, are paid to engineers and firemen. Fines are imposed for losing time if the crew is to blame, and a bonus is paid for making up time. Nearly all freight trains, including extras, are run on schedules. Engineers of fast expresses make (including premiums) up to 600 francs (\$120) a month, and firemen up to 300 francs (\$60), but their work is double that in the United States. For example, divisions up to 150 miles are doubled every day, the men frequently being on duty 13 to 14 hours. One day off in every 10 is given in any class of service.

The fireman has to clean the fire. At the end of the run

he has to clean out the smokebox, where two barrels of cinders usually collect, clean out the ash pan, which is flat and not self-cleaning like those in America, fill the sandbox (the sand usually has to be carried in buckets from the sand-house), and clean the entire engine, including the polished steel motion work, but not the wheels. The tender is not cleaned and the contrast of a clean engine and dirty tender is peculiar. Inside motion (most of locomotives being of the four-cylinder type) is not cleaned, with the result that the engineer gets a nice oil, grease and dirt bath when oiling. The fireman has to spend fully an hour after coming in to fix up the engine, and it is evident that on a French engine he is the man behind the gun.

There are other things that might be mentioned, such as the poor protection afforded by cabs, the lack of seats and the bad arrangement of cab fittings. Arrangement is a misnomer—the fittings were never arranged—they just happened that way. The tenders are also very poorly arranged, and 75 per cent of the coal must be shoveled forward. A large number of the engines, including particularly those in freight and switching service, are old, having been built in the 'sixties, 'seventies and 'eighties, and have no other brake on the engine than the Le Chatelier water brake, and on the tender only a hand brake, which the fireman has to operate.

Other inconveniences could be mentioned, but these will suffice to show how splendid American working conditions are as compared with those here.

A peculiar arrangement here is that whereby, after 25 years' service, employees are retired on a pension of 1,500 francs (\$300) a year. This takes them away when they are at their best for railway work, and it makes one wonder what an active man of 45 or 50 would do with himself when released from service.

W. G. LANDON.

DIVISION OF RAILWAY INCOME BETWEEN CAPITAL AND LABOR

NEW YORK.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The National Civic Federation has recently made public a preliminary report of its committee on the division of the people's income, which effectually controverts the assertion frequently made that labor is receiving an insufficient share of the product of industry and particularly of the increment in such product. The committee's report reaches the general conclusion that labor is receiving an increasing proportion of the product

all operating expenses, excepting labor, and all taxes, the amount remaining being the sum paid for labor, and the sum left for capital applicable to interest on bonds or other debt, dividends, improving property out of income, depreciation, which may not be included in operating expenses, other miscellaneous expenses, and surplus.

The accompanying table shows these results for the fiscal year ending June 30, 1914, as compared with 1904, also the changes which have taken place during this ten-year period. From these statistics the following conclusions may be drawn:

1. Of the divisible railway income labor is now receiving 66.04 per cent., whereas ten years ago it received 58.73 per cent. Capital is receiving for itself and for the other purposes mentioned only 33.96 per cent., as compared with 41.27 per cent. received ten years previously.

2. The return to capital last mentioned represents only 4.17 per cent. upon the railway investment in 1914, whereas this return was 4.99 per cent. in 1904.

3. Comparing 1914 with 1904, there was an increase of \$687,417,352 in railway income available for paying labor and for capital purposes. Of this amount \$555,823,662, or 80.86 per cent. was paid to labor, and only \$131,593,690, or 19.14 per cent. of the total remained for capital purposes. This shows that of the increment in divisible net income during the ten years, labor received four-fifths and capital only one-fifth. As compared with the latter the investment in road and equipment increased \$5,425,160,709, the increment available for capital purposes being only 2.43 per cent. upon the increased investment.

4. As compared with this inadequate return to capital it will be noted that the increase of \$555,823,662, or 67.98 per cent. in payments to labor was accompanied by an increase of only \$399,362, or 30.81 per cent. in the number of employes on June 30. This number may not correctly represent the average number of employes during the entire year, but it is a sufficient indication of the very large increase of payments to labor per individual.

5. Whilst returns to capital were greatly reduced through the necessity of larger proportionate return to labor, they were further reduced by the increased share given to the government as taxes, which increased \$78,835,221, or 127.78 per cent.

6. The statement shows that public services rendered by the railways increased during the ten-year period 60.83 per cent. as to passenger service, and 65.21 per cent. as to freight service, for

	—Year Ending June 30.—		—Increase, 1914 over 1904.—

1914 I. C. C. Press Bulletin of March 31, 1915, on 1914

Railway Statistics.

(d) Represents a decrease.

of industry, and that at the present time practically two-thirds of the product of manufacturing industries go to labor and one-third to capital.

In this connection, for the purpose of comparison, an interesting study may be made of the distribution of the net railway income to labor and capital, bearing in mind that railway operation requires an extremely large investment of capital for fixed plant and equipment in proportion to the income received.

From the statistics of railways of the United States, published by the Interstate Commerce Commission, this may be ascertained by first deducting from the gross operating revenue

which the railways received 54.27 per cent. additional gross revenue, paid out 58.62 per cent. more for operating expenses, other than wages, but paid in wages 67.98 per cent. more, and for taxes 127.78 per cent. more, the result of the undue increase in the latter items being to reduce the increased return for capital purposes to an increase of only 22.90 per cent. This is much less than the railways had a reasonable right to expect, and is entirely inadequate to reimburse them for the increase of 47.13 per cent. in investment in road and equipment.

W. A. WORTHINGTON.

Vice-President and Assistant to Chairman Southern Pacific Company.

Underground Cable on the Pennsylvania Railroad*

Railroad Telegraph and Signal Wires Absolutely Protected from the Storms for a Distance of Twenty Miles

By I. C. FORSHEE

Electrical Engineer, Telegraph Department

The Pennsylvania Railroad has this year completed an underground cable installation, including the telephone, telegraph and signal cables, on the New York Division, from Jersey City, where the division offices are located, to Rahway, a suburban point about twenty miles west on the main line toward Philadelphia. This important improvement was decided on after the very severe sleet and wind storm on that division in March, 1914, extending over a distance of seventy miles. This was not the first severe sleet storm which had given impetus to the underground movement, as the memory of the very disastrous storm during the inauguration of President Taft in 1909 was still fresh in the minds of all the officers interested in passenger train movements, and the importance of having at such times reliable telephone or telegraph communications, as well as an operating signal system, played its part in the decision in favor of an underground system.

REASONS FOR UNDERGROUND CABLE.

The following are factors considered in favor of this type of construction:

(1) Importance of continuous wire service, including train

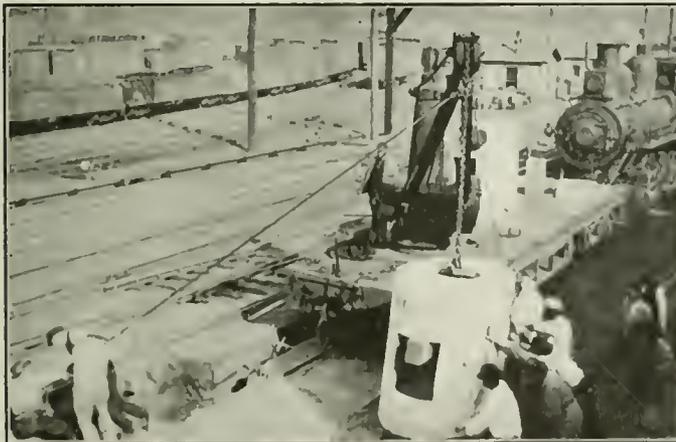

Fig. 1—Monolithic Concrete Manhole

despatching, block, message and way station telephone and telegraph circuits and automatic block signal circuits.

(2) Freedom from sleet, wind and lightning.

(3) Improvement in the appearance of the right of way.

(4) Absence of poles in congested yards, where clearances are small.

(5) Freedom from interruptions to traffic due to broken poles and wires falling across the track.

(6) No danger that failures will cause crosses with high tension crossings; freedom from this hazard to property and life.

(7) Not subject to troubles from induction caused by parallel high tension A. C. power circuits to as great an extent as overhead lines.

(8) Less liable to interruption in the event of derailments.

IMPORTANCE OF SERVICE.

The importance of communication with New York and Jersey City from Trenton and Philadelphia may be understood when one considers that the general offices of the company are located at Philadelphia, company shops and an important transfer point at Trenton, the New York Division offices at Jersey City, and the

Manhattan Division offices at New York. The telephone and telegraph circuits are owned and operated by the railroad company, but there are also Postal Telegraph wires on the line.

There is a total of 250 passenger trains and 150 freight trains each week day over the section between Jersey City, New York and Rahway, and frequently 3,500 messages are sent over the wires in a day between Philadelphia, New York and Jersey City alone, not counting way-station business. Over the section between Jersey City and Summit Avenue (two miles), including the Hudson & Manhattan electric train movements, there is a total of 950 trains a day, and 500 passenger trains over the section between New York, Jersey City and Newark.

The pole lines which were replaced by the underground, had a varying number of wires to provide for the local and long distance service. In the congested districts the local circuits were in cable, and the trunks were open wires. The heaviest line was a line across the Jersey Meadows on "H" poles, where there were 112 open wires and two or three cables. For the greater part of the distance to Rahway a total of 70 aerial wires of No. 9 B. & S. and No. 8 B. W. G. copper, and signal wires on two lines of poles, were replaced by the underground.

DUCT CONSTRUCTION.

The conduit line decided upon was a six duct multiple, with manholes spaced not over 500 feet apart. Three-inch fibre duct was used and laid in concrete, with a minimum covering of two feet of earth.

The concrete, which was a 1-3-6 mix, was three inches thick in the base, three inches on sides and four inches on top, with a separation in the standard section of one inch between ducts, the arrangement being three ducts wide and two high. The thicker section was used on top to afford a better mechanical protection to the ducts and for a wider separation between the 2,300-volt A. C. signal feeders located on top and the telephone cables in the duct. A half-round section of three-inch fibre conduit was laid in the top layer of concrete, with the open side flush with the top, for the purpose of placing the 2300-volt signal wires. Two of these wires, which were stranded, rubber insulated and braided, were placed in the half-round section, where they were covered with hot pitch and protected with re-enforced concrete slabs, two inches thick, six inches wide and four feet long. At the manholes these wires were carried in trunking around the outside. It was not thought advisable to have the high tension wires in the same manholes with the other cables.

The trench was graded and the ducts laid true to line with a minimum grade of three inches per hundred feet, for drainage toward the manholes.

MANHOLES.

Manhole design and construction is a very important part of a satisfactory underground installation and a great deal of care and study was given to this item.

On account of the conditions in many locations, which made it necessary to place the duct and the manholes close to the high speed tracks, a special manhole was developed that was rather unique and which worked out very satisfactorily. These were of reinforced concrete, elliptical in cross section, cast in one piece, including the bottom, sides and top; and were provided with pulling in irons, bolts for the cable racks, drain and openings for the entrance of the ducts. The covers were also of reinforced concrete, with protected edges. The shape of the manholes was such that very strong construction was obtained with minimum weight. They were allowed to season thoroughly before being placed. A wreck train derrick, or a hand derrick on a flat car was used

for placing them, as shown in Fig. 1. The manholes were usually put in place ahead of the conduit, at the proper grade; so that when the conduit was laid up to them the concrete work could be finished without delay. One is shown in Fig. 2, in place, before the top layer of concrete is finished. An interior view showing the arrangement of ducts, with two pump log outlets for service taps, is shown in Fig. 3. The pump log ducts are run on top of the concrete. The size of the end openings of the manholes is such that the conduit, with concrete covering, is accommodated for nearly every condition of grade; so that it was not necessary to cut out any of these openings except for very unusual conditions. Forms were used inside and outside the manholes to give the proper finish and strength around the ducts.

SHORING AND REINFORCING.

On account of the narrow clearance between the high speed tracks and the duct line in many places, and the character of the soil, and of the banks, often mostly cinders, it was necessary to use tight shoring as shown in Figs. 2 and 4.

Through some sections where the conditions were not as favorable, half-inch or three-quarter-inch square reinforcing rods were used in the bottom and top tiers of concrete, as shown in Fig. 5. This also shows the special jacks used to support the shoring. Reinforcing rods were used when it was necessary to extend the duct run under tracks.

SPECIAL CONDITIONS.

Many special conditions exist on this installation that made it

plates and locked. Drainage openings underneath the duct were provided at intervals of about twenty feet to allow any water entrapped behind this construction to run out into the ditch. Expansion joints were also provided in the concrete, as it is exposed to the sun, and in the winter is many times covered with ice.

For a portion of the distance through this cut the cables are carried on messengers, supported from cable arms, attached to steel poles set in concrete. These are located in an old portion of the cut, through which trains were originally run, but which is now used as a storage yard. The cables are for the most part out of sight from passing trains.

On account of proposed changes in the track at one point, it was not feasible to locate the duct on the north side of the right of way, and there was a retaining wall on the south side on the right of way line, with not enough room between it and the ties for the conduit. The duct here was placed on top of the wall, which was in good condition.

STREET CROSSINGS.

There are numerous undergrade street crossings throughout this district, and at some of them it is proposed to renew the bridges before long. The type of crossing decided upon for these locations was to carry the cables from the ducts on messengers across the streets. The messengers were attached to eye-bolts anchored in the concrete surrounding the ducts, and located immediately over them, so that no additional splices in the cable were necessary on account of this construction. Manholes were usually

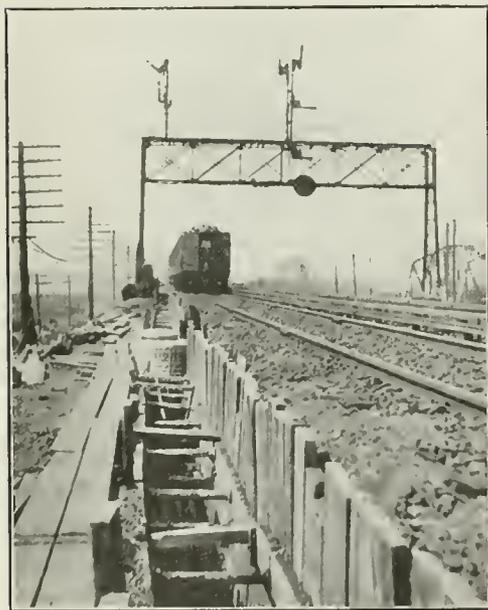

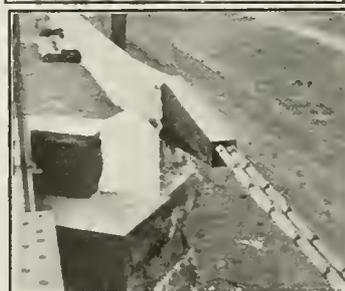

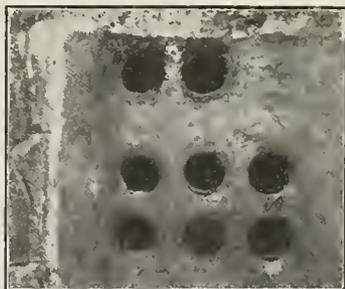

Fig. 2—Manhole and Duct in Place

Figs. 3 and 8—Interior of Manhole with Two Local Outlets. Conduit on Retaining Wall

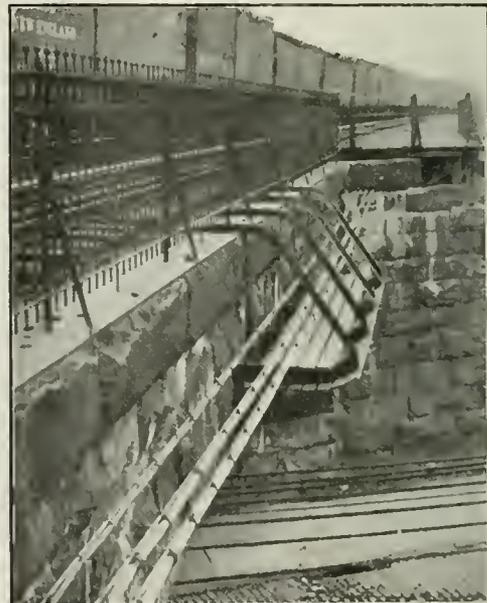

Fig. 9—Trolley Guard at Street Crossing

necessary to devise special construction which would be adapted for a permanent installation, as it cannot be as readily moved as a pole line. In this connection, the plans for any contemplated changes in the track layout were consulted.

One section for about a half mile, extends through Shanley Cut, near Summit Avenue Station, where the tracks lie in a deep trap rock cut. The face of the rocks on either side is very irregular, the tops of the banks on either side are likewise irregular and there are overhead street crossings to contend with. Trap rock is found only about a foot below the top of the ballast, and high tension lines for signal operation were in service here between the tracks. The location and type of construction decided upon for this section are shown in Figs. 6 and 7. Here the ducts were arranged two wide and three high on account of the limited space available between the edge of the half-round brick lined ditch and the rock cliff. Special splicing chambers were provided in these sections, placed on top of the surface, covered with steel

located close on each side of such a street crossing to facilitate matters in the event of the bridges being changed.

The construction on the retaining wall and across a street at an undergrade bridge, together with the method of protecting the end of the aerial cable from mechanical injury, is shown in Fig. 8.

PROTECTION FROM TROLLEYS.

At some of these crossings where aerial cable was used there were trolley lines running underneath. It was necessary to devise a satisfactory protection for the cables to prevent the trolley poles from accidentally hitting the cables, and to keep the cables from fouling the trolley. Such a scheme is shown in Fig. 9.

SUBMARINES.

Two sections of submarine cables, a total of about 2,100 feet, are necessary, and both are located in navigable streams at draw bridges. It was necessary to change the location of one of these and at the other it was necessary to have the channel dredged out to afford a safe covering.

TEST HOUSES.

On account of local conditions it was desirable to have the cables so arranged that the conductors would be accessible for testing and for changing the assignment of cable pairs. Two sizes of concrete test houses were used for this purpose, the large one being shown in Fig. 10. These were built of reinforced concrete, molded in one piece, except the door and ventilator, and made as nearly as possible fireproof. When these are associated with a tower for test purposes, they are so arranged that the cables can be cross connected without looping into the tower. Thus a fire in the tower would not cause any serious interruption

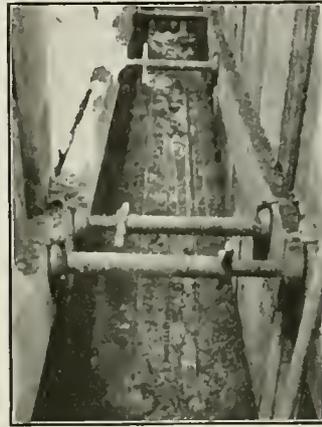

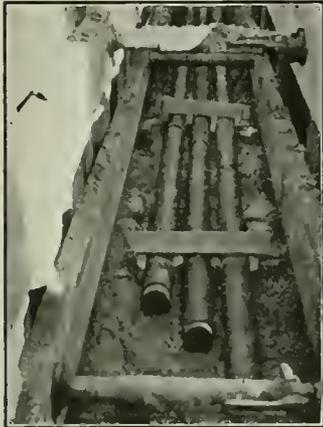

Fig. 4—Forms for Shoring, Spacing Combs and Plugs

Fig. 5—Re-enforcing Bars in Bottom

in the telephone and telegraph service. They are provided with electric lights to facilitate the work and to dry out any condensation during unfavorable weather conditions. Only telephone and telegraph cables loop into these test houses, no signal wires entering them. There are nine test houses altogether.

COST OF CONDUIT.

On account of the many obstructions met in some districts, the nature of the soil, which necessitated careful shoring, the location of the duct with respect to the tracks, the frequency of the train

Figs. 6 and 7—Construction Through Shanley Cut

movements, causing much loss of time in some sections, the special construction, the difficulty in getting water, materials, and labor to the places required, and the careful inspection of all materials and workmanship, the costs would be of little value for comparison except for the same conditions. The cost per lineal foot of six duct multiple including excavation, conduit, labor, concrete, manholes, cable test houses, reinforcing material, work train charges, engineering and supervision was \$153, exclusive of cables.

CABLES.

Two paper-insulated lead-covered telephone cables are installed throughout. In one the most important through or trunk circuits are carried and in the other the local circuits. These are constructed with a number of different combinations to meet the conditions in different sections, but only three gages of conductors were used—Nos. 10, 13 and 16 B. & S. G.—and all twisted into pairs, with phantoms in all the combinations.

The local cable was provided with a paper-insulated lead-covered test pair in the center, which is in reality a cable within a cable. The maximum diameter of the cables is 2 17/32-inch, but no difficulty was met in pulling them into the three-inch ducts.

The cable was shipped from the factory in maximum lengths of 500 ft. A reel of cable set up and ready to be pulled in is shown in Fig. 11. This also shows the grip used, the cable protector for the manhole top, and the location with respect to the main track.

The conductor splices were all made with tinned copper sleeves and soldered.

The phantoms or quads were tested and connected to give a minimum of capacity unbalance and are consequently commercially free from cross talk between the physical circuits, between the physical and phantom circuits and between the phantom circuits.

A compressed air test was made on all sections of cable, each about a mile in length, to detect the presence of leaks at the wiped joints or between manholes. This was considered a very valuable test, especially on account of some of the cables being continuously under water.

The signal cables occupy only one duct and carry 110-volt a. c.

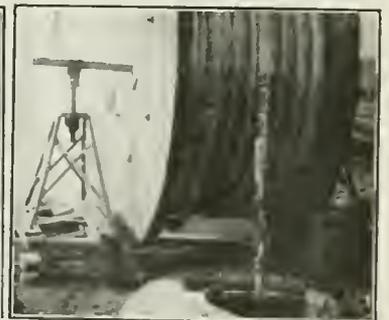

Fig. 10—Test House

Fig. 11—Reel of Cable Ready to Be Pulled In

for the local circuits. These are rubber insulated and braided, and are spliced and racked on the side of the manholes opposite the telephone cables.

Service taps for the signal system are carried in cypress trunking.

The work on the conduit began Aug. 20, 1914, and the last cable was placed in service in June, 1915. A longer time was required than otherwise would have been on account of a new fill east of Rahway, where it was not considered safe for the conduit line to be laid until the fill had settled.

The poles have now all been cut down and the road presents a much improved appearance. The telephone, telegraph and signal services are all very satisfactory. Extensions of the system are already under consideration.

CASUALTIES AMONG BRITISH RAILWAY MEN AT THE FRONT.—The London and North Western Railway Company reports 1,603 casualties among the members of its staff who are serving with the colors. Of these 209 have been killed in action or drowned, 78 have died of wounds, etc., 80 are missing, 1,073 have been wounded, sick, etc. Of these 30 suffered from gas poisoning. Prisoners of war number 163. Of the 1,073 men disabled 630 have returned to duty. From the North-Eastern Railway Company 7,498 men have joined the colors; 103 have died.—*The Engineer*.

An example of the detail required may be seen in paragraph 15, referring to train accidents, which is as follows:

15. Description of equipment: Give a brief description of damage to equipment, and, whenever possible, in reporting defects in equipment which caused or contributed to an accident, name the manufacturer and the type of the equipment or part, give weight and number or other identifying mark, and state the year of manufacture, and the year of placing in service; state also when, where and by whom the equipment was last inspected. Describe sufficiently the equipment involved and give all particulars necessary to permit its description and classification as follows:

(A) Locomotives and parts:

(a) Description—

- (1) Type, as simple, compound, articulated, etc.
- (2) Wheel arrangement.
- (3) Weight on drivers and total weight ready for service.

(b) Parts—

- (1) Firebox and attachments.
- (2) Boiler and attachments.
- (3) Cylinders and steam chests.
- (4) Reciprocating parts.
- (5) Headlight.
- (6) Pilot.
- (7) Drivers.
- (8) Truck wheels.
- (9) Other parts of running gear as enumerated under cars.
- (10) Miscellaneous parts, naming them.

This and other similar requirements apply to all accidents reported, even those of minor consequence.

It will be seen that in accordance with the requirements in connection with form V, the number of hours worked by all employees each month must be embodied in a statement to go with the accident report. For example, not only shopmen but station men and trainmen are liable to "falls of person" and to accident in use of tools, and must have their working hours recorded. As the new regulations were not received by some of the roads until after July 1, their records of man-hours for the first month may be somewhat lacking in accuracy.

A NEW COAL DOCK FOR THE CINCINNATI, HAMILTON & DAYTON AT TOLEDO

With the opening of navigation on the Great Lakes this spring the Cincinnati, Hamilton & Dayton placed in operation at Toledo a modern coal-handling plant, dock and yard to provide adequate facilities for a steadily increasing coal traffic. Work on this project was not started until December of last year. The new equipment is situated on the Maumee river, at Rossford. The

of concrete dock, the necessary foundations for the machine, the entire reconstruction of the load and empty yards and the fabrication and erection of a new mechanical car dumper with the necessary approach and run-off trestles. A drawing shows a cross section of the concrete dock construction. This type of dock was placed on both sides of the machine foundation. The dock immediately in front of the machine is of the same general construction, except that the batter piles were omitted, and the dock was made a part of the machine foundation, this foundation being of pile construction, capped with reinforced concrete slabs to which the dock is anchored.

The general layout of the plant is shown in the photograph. This machine is designed to handle cars of a maximum gross weight of 280,000 lb., and a length of 52 ft. over couplers. It is of the latest steam-operated type with counterweighted cradle, the steam being furnished by two Scotch boilers, each with a capacity of 250 h. p. The main engines are of extra heavy mill type construction, controlled by Hennebohl throttles. All gears are cast steel, with machine-cut teeth. Sheaves are also cast steel. The machine is designed to handle forty 100-ton capacity cars per hour. An unusual feature in the design of this machine is the placing of the cradle rail at an elevation of 30 ft. above the lake level, which is considerably higher than normally adopted for installations of this kind, this elevation being adopted because of a desire to reduce the amount of lift of cars in the machine to a minimum.

A disappearing barney was provided, which makes it possible to run a car over the barney pit from the load yard prior to the return of the barney from the delivery of a car to the machine. This is accomplished by means of by-pass gates in the barney track, which are operated by the steam cylinder controlling the reversing mechanism of the haulage engine. The barney returning from the machine passes into the barney pit on the by-pass gate nearest the machine, and then runs under the car to the end of the pit. The reversing of the haulage engine raises both by-pass gates, so that the barney in returning comes up behind the car by means of the by-pass gate furthest from the machine. This arrangement avoids the necessity of waiting for the barney car to return from the machine to the barney pit before the car is placed over the pit, and has the effect of keeping a car up to the machine at all times.

Contracts for the foundation and dock work and for the mechanical car dumper were placed about November 1, 1914,

View of Coal Dock From the Lake

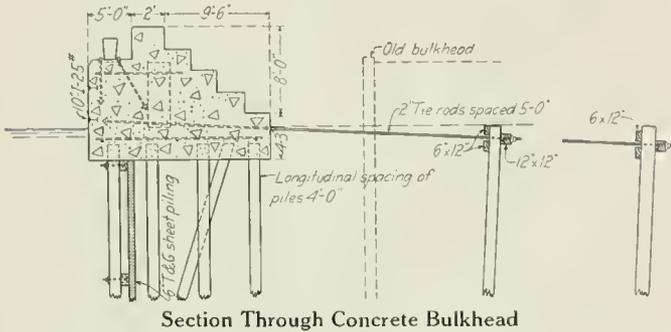

new dock is placed at the harbor line, which is a change in the old arrangement in which the dock was 25 ft. shoreward. This change enables the large freighters plying on the lakes to tie up directly at the dock and load their cargoes more quickly. The terminal is laid out with a yard having a capacity of 230 cars, adjacent to the unloading machine and in which 140 loaded and 96 empty cars can be handled. To the south of the dock is a classification yard with a capacity of 3,000 cars, affording ample space for assembling shipments. The yard plan is shown on the accompanying map.

The plans as prepared called for the construction of 802 ft

and preparations were made for starting the work at the close of navigation. The old machine was abandoned on December 2, 1914, and the dismantling started the next day, simultaneous with the construction of the new dock. The piles in front of the old dock were driven by floating equipment, using steam hammers, while those back of the old dock were driven by land drivers. The piles were driven to refusal to a bed of hard pan and small granite boulders, approximately 31 ft. below the lake level. The cut-off for the dock was made at a point 18 in. below mean lake level. The operation of the floating equipment for driving piles and sheet piling was made possible during extremely

cold weather by using an ice tug to keep the river ice broken and clear of the site of the work.

The construction of the machine foundation was undertaken first, and upon completion of the driving of the piles and sheet piles for this portion of the work, the fill between the old and new docks was placed. The driving of the piles for the dock on both sides of the machine was then started and as the pile driving was completed and the sheet piling placed, the new work was connected with the old dock by means of temporary ties and the fill placed to the elevation of the bottom of concrete.

Section Through Concrete Bulkhead

With the exception of the sand, all of the materials used in the concrete work were brought to the site by rail. The sand was unloaded from boats at the dock site. The mixing plant was located about 1,000 ft. south of the machine, where the storage bins were provided and a heating plant for heating all material was installed. A boiler plant was also installed at the site of the machine foundation. The concrete was transferred from the mixing plant to the site of the work in drop-bottom buckets on flat cars, by means of narrow-gage equipment. The concrete was placed continuously and without reference to the

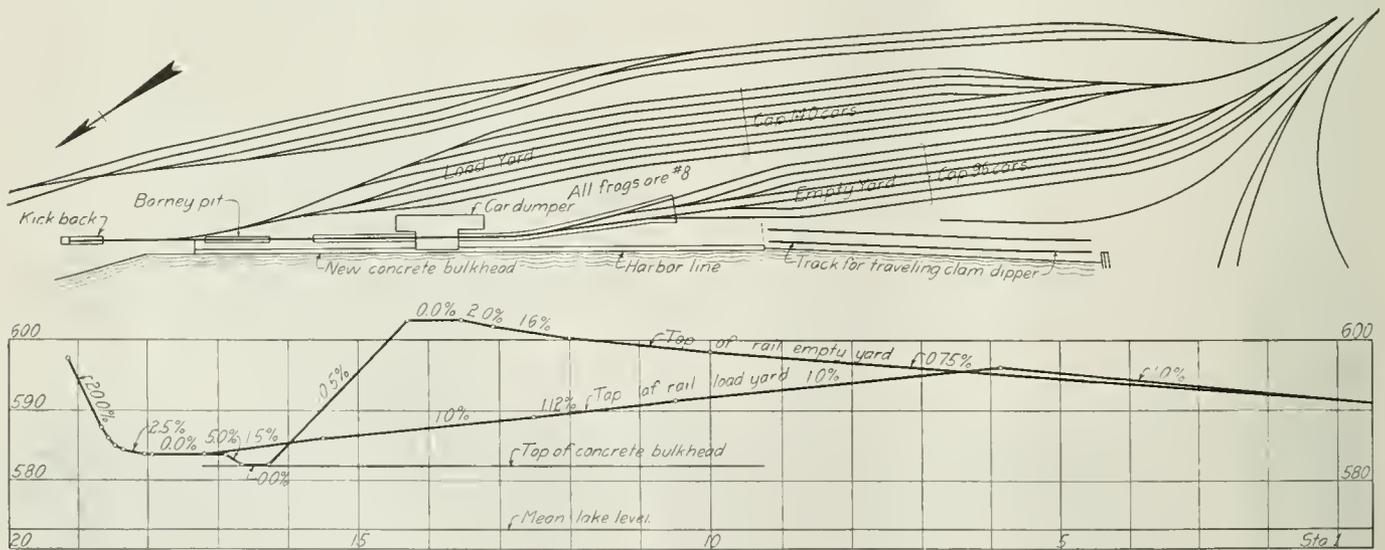

alignment and grades, at an elevation of approximately 8 or 9 ft. above the old yards. The material for all grading and back filling was secured from waste slag and cinder banks and hauled to the site of the work in standard-gage equipment. The reconstruction and raising of the yards were commenced December 6, 1914, and the yards were in condition for operation April 12, at the time the machine was completed. New first quality 90-lb. A. R. A. section rail was laid through switches and on curves, and 85-lb. A. S. C. E. first class relaying rail was used on tangents. The erection of the approach and run-off trestles was handled by the substructure contractor, the material being framed near the site of the work and transferred to final location and erected by means of a locomotive crane.

The construction as a whole involved the placing of the following material:

Piling in machine foundation and dock construction...	45,550 Lin. ft.
Tongued and grooved sheeting in machine foundation and dock construction...	133,581 ft. B. M.
Reinforcing steel in machine foundations and dock anchorages for dock construction...	218,543 lb.
Timber in machine foundations and dock construction...	47,407 ft. B. M.
Concrete in machine foundations and dock construction...	6,300 cu. yd.
Timber in approach and run-off trestles and kick back trestle	184,925 ft. B. M.
Fill for load and empty yards and river fill between old and new docks...	108,000 cu. yd.
New trackwork...	15,000 lin. ft.
Of the foregoing estimated quantity of concrete, approximately 1,850 cu. yd. were placed below mean lake level.	

While the improvement as a whole was ready for operation on April 12, 1915, three days prior to the opening of navigation, the machine was not put into active service until April 19, when the first boat was secured. For the two months ending June 19, the machine handled 10,439 cars, or 469,064 tons of coal.

The two months' period of operation above referred to has developed the fact that the machine and yard are capable of handling the coal as fast as anticipated. In one day's run of ten hours, 340 cars were handled, with a total tonnage of 16,393.

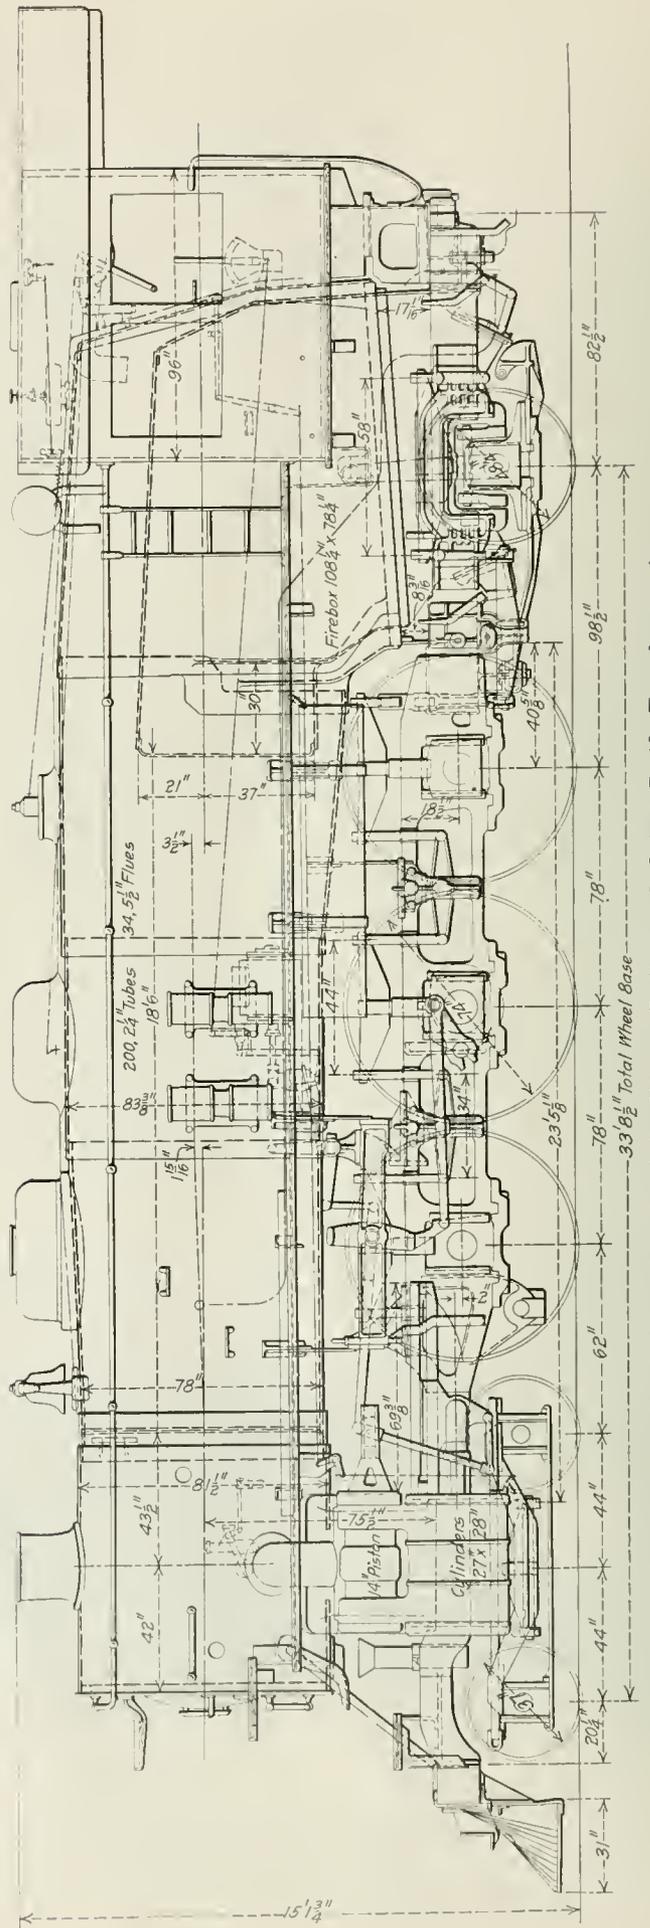

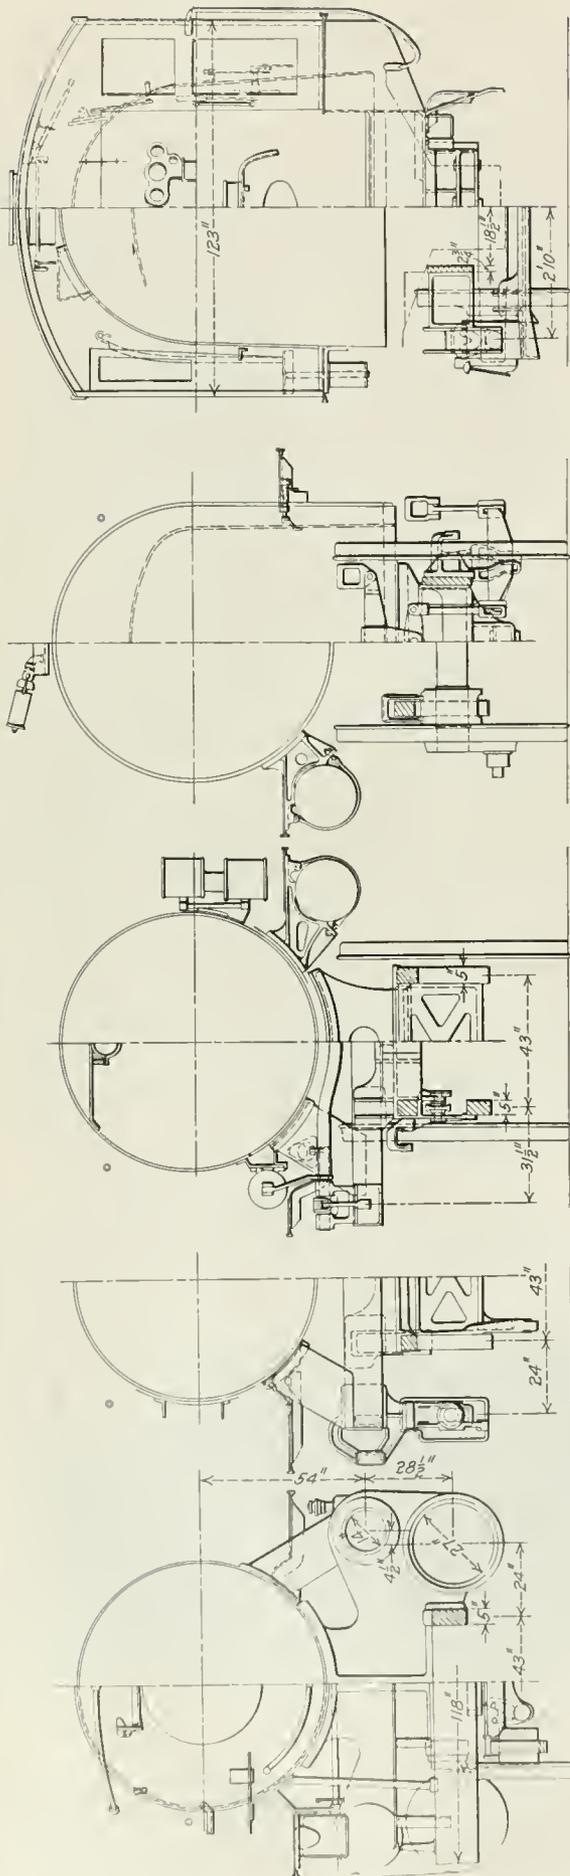

Plan and Profile of the Yard Serving the Coal Dumper

weather conditions. This was made possible by having the materials properly heated, and by keeping it warm after it was in place by means of the steam plant located at the machine foundation. Some of the concrete was placed with temperatures as low as 12 deg. F. below zero with no bad effects.

The machine foundation was completed February 8, 1915. The concrete for the barney pit construction was completed March 7, the superstructure contractor started operations on February 2, and the first steel was raised on February 15. The machine was finished, ready for the preliminary test of the cradle on April 9, and the entire machine was completed ready for operation April 12. During the progress of the construction of the concrete docks, machine foundation and superstructure, the railroad company's forces reconstructed the yards to the revised

There were also handled in one day's run of twelve hours 405 cars. These runs involved the handling of 45 to 49 cars per hour for short periods.

Smith-McCormick Company, of Easton, Pa., were contractors for the substructure and approach trestles, J. C. Carlin, of Toledo O., furnished the greater portion of the filling material, the Pittsburgh Construction Company, of Pittsburgh, Pa., were the contractors for the dismantling of the old machine, and the Wellman-Seaver-Morgan Company, of Cleveland, O., furnished the new car dumper. The design and construction of this plant was under the direction of F. L. Stuart, chief engineer, and the work was prosecuted under the supervision of A. M. Kinsman, engineer of construction; W. S. Bouton, engineer of bridges; A. H. Griffith, assistant engineer and P. Callahan, resident engineer.

General Arrangement of the Chicago, Burlington & Quincy Pacific Type Locomotive

engine. The following actual weights are of interest in this connection:

Piston and rod complete, with crosshead key.....	557 lb.
Crosshead	414 lb.
Main rod	870 lb.
Side rod, weight on front crank pin.....	158 lb.
Side rod, weight on main crank pin.....	490 lb.
Side rod, weight on back crank pin.....	168 lb.
Crank pins, complete { front.....	125 lb.
{ main.....	295 lb.
{ back.....	130 lb.

The accompanying table gives some comparisons between the weights of the reciprocating parts of this engine and the two most recent Pennsylvania Railroad passenger locomotives:

Road and type	Cylinders driving wheels	Boiler pressure, lb.	Piston load lb. (area piston x full b. press.)	Weight, lb.			Total* wt. of reciprocating parts, lb.	Piston load carried, lb.			
				Cross-head	Piston rod	Main rod		per lb. wt. of rec. parts	per lb. wt. crosshead	per lb. wt. piston rod	per lb. wt. main rod
Penn., 4-6-2	27 in. x 28 in.; 80 in.	205	114,000	491	520	936	1,376	83	320	219	122
Penn., 4-4-2	23½ in. x 26 in.; 80 in.	205	89,000	327	408½	720	1,014	87	271	218	123
C., B. & O., 4-6-2.....	27 in. x 28 in.; 74 in.	180	103,000	414	557	870	1,319	78	249	185	118

*Includes 40 per cent. of the weight of the main rod.

The cylinders are cast from the same pattern as those used on the Mikado type locomotives for the Fort Worth & Denver City. They are fitted with vacuum relief valves, but no by-pass valves are used. The guide for the valve stem crosshead is cast in one piece with the back steam chest head.

The frames are of .40 per cent carbon cast steel, annealed, and manufactured to specifications prepared by the American Society for Testing Materials. The main frames are six inches wide. The rear sections are of slab form, arranged to accommodate the Rushton type of trailing truck with outside journals, which in this case is fitted with three-point suspension links. The frames are braced transversely at the front and main driving pedestals, also by the guide yoke, valve motion bearer, and a

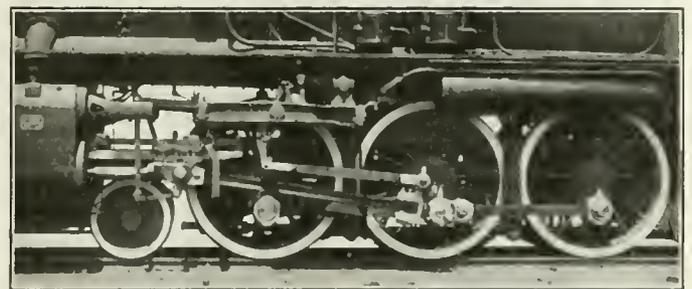

truck, prevents any rocking action on the part of the driving springs from being transmitted to the truck springs, or vice versa.

The tender is equipped with a coal pusher, and is carried on equalized pedestal trucks. The wheels are of forged and rolled steel, manufactured by the Standard Steel Works Company.

These locomotives were designed by the builders, in consultation with F. A. Torrey, superintendent of motive power, and C. B. Young, mechanical engineer of the Burlington. The practice of the railroad, as far as details are concerned, has been

closely followed. The principal dimensions and data are given in the following table:

Gage	4 ft. 8½ in.
Service	Passenger
Fuel	Bit. coal
Tractive effort	42,000 lb.
Weight in working order.....	266,400 lb.
Weight on drivers.....	169,700 lb.
Weight on leading truck.....	47,800 lb.
Weight on trailing truck.....	48,900 lb.
Weight of engine and tender in working order.....	425,000 lb.

Driving Wheels and Rods of the Burlington Engine

Wheel base, driving	13 ft.
Wheel base, total	33 ft. 8½ in.
Wheelbase, engine and tender.....	65 ft. 10¾ in.

Superheater heating surface.....	81 sq. ft.

Piston Used on the Burlington Locomotive

waist sheet crossie placed between the main and rear pairs of driving wheels. At the splice between the main and rear frames is placed a strong transverse casting, which contains a pocket for the rear truck radius bar pin, and also supports the front of the firebox through a vertical expansion plate.

The pedestal shoes and wedges are of bronze. The driving wheel centers are fitted with bronze hub plates, and the driving axles are of chrome-vanadium steel, heat-treated and hollow-bored.

The equalization system is cross-connected between the rear driving wheels and trailing truck. A central vertical link connects two transverse beams. The upper beam is suspended from the rear driving springs, while the lower beam is connected, by means of a vertical link on each side, with the rear truck equalizers. These are placed on an angle, so that they can connect with the truck spring hangers, which are placed outside the wheels. This construction, while maintaining the desired weight distribution between the driving wheels and the rear

THE WAR TEST OF FRENCH POLITENESS

By WALTER S. HIATT.*

The courtesy of the French railway employee in these times of stress is one of the details that cannot fail to attract the attention of the war-time traveler in France. We Americans are inclined to discount the real sincerity of French politeness and to regard it perhaps as superficial. The excitement of the great life and death struggle of the past 12 months, which surely could not possibly be a more supreme test of French character, has proved, however, that the French element of courtesy has a most solid foundation. Most people, however polite and kind they may be under normal conditions, are likely to forget their politeness in moments of stress. With the French the opposite is true.

Since I have been in France this year I have never seen posted in the stations or office buildings notices that employees must treat travelers with consideration. Yet, here is what happened to me one night while traveling in a train from Orleans to Paris. I wanted to get off at a certain station just inside Paris, but not the terminal station of the railroad. A railway employee happened to get into the compartment which I occupied. He had evidently been working all day and was going to another point of the road to continue his work the next day. The sleep he got on the cushion en route would probably be all that he would get. Before he stretched himself out, I asked him the exact name of the station where I wanted to get out. He told me and then went to sleep. From time to time, however, I noticed that he woke up to look at his watch. Finally, as the train began to slow down for Paris, he got up, looked out the window, waited a few minutes, and then said to me: "You get out here." I thanked him and the last I saw of him he was stretching himself out for a real sleep. He must have gone without a good deal of necessary sleep in order to be sure that I alighted at the right place. There is nothing extraordinary about this incident if it were not that it happens all the time.

That the French railway man has not lost his politeness in all the pressure and overwork accompanying the war is all the more to his credit, because, in perhaps nine cases out of ten, he has some distracting private grief, such as a son, brother or a father wounded or dead in battle. It is hardly necessary to point out that in a country where there are nearly two million dead, wounded or missing, every living individual must be affected.

If anything the French employees are more polite than before the war. They used to seem to me the least bit noisy, curt and self-important. This may have been because formerly my knowledge of French was limited, or again, it may be that the war has brought out fully the true character of the French and that the war and its suffering has made them more ready to respond to the needs of the traveler. But whatever the cause, the big fact remains that they are now as polite as one could hope. In a time when no stranger is looked upon favorably and when every stranger may be a spy in disguise—the French have paid bitterly for their old welcome to the stranger—they give every help to him who is unable to speak the language and is not familiar with French methods of travel. I have even seen a station master pilot a stranger half a block, either to or from the train, in order to set him right, and this in the heart of a big, scrambling crowd.

The railroad man, in being polite, does not appear to be acting

mechanically, as if carrying out company orders, nor does he become familiar by virtue of the service rendered. From the lowest to the highest employee, he does it with a certain air of self-respect and dignity. He acts as if he owes it to himself to be polite. There is no condescension in his manner, and no matter who you are, he makes you feel as if you were an important person, worthy of his every attention.

Thus, lately in Paris, I had occasion to call at the terminal of the Eastern Railroad to obtain a certain printed report. The porter at the street door, probably paid a dollar a day, without having the slightest idea of who or what I was, who saw in me merely a man who needed guiding in the labyrinth of a big and strange office building, showed me half way up the stairs. I might as well have been the company president by his manner. Another porter bowed me into a waiting room and took my message. He didn't look me all over, measure me up and down with a roving, calculating, half-insolent eye, as if to say: "Shall I throw him out or let him wait until he gets tired and goes away himself?" He saw in me an unknown person who wanted something and he made me feel at home by his manner. The clerk who came out treated me in the same fashion, with a slighter shade of reserve possibly, excusing himself for a moment while he went to ask if I might be given what I asked for. He brought the report out to me finally. However, had he been compelled to refuse it, his politeness would have been more gracious yet; he would have "regretted" with such nicety that I would not have gone away disgruntled, angry at the company, nor yet disappointed, but feeling that there were excellent reasons for the refusal.

There is one dull spot in this polished shield of the French railroad man, so far as concerns the traveling public, and that is the adamant attitude concerning the fares of children. It is hard to understand why such should be in a country where children are so loved. It is not so much the fault of the employee as it is of the company rules. The average conductor in the United States is struck blind when he sees children with their parents. If he sees the children at all, he ignores their ages, takes whatever fare is offered and lets this amiable fraud be worked on the company. Here in France, from time immemorial, the ticket collectors (who are not conductors, but rather employees who get on and off the trains at intervals) have been inexorable about children's fares and their politeness is sorely tried in securing their payment. During the war they have not been too careful about whether grown-ups paid first, second, or third class fares, but they have not forgotten to collect every time for children. The mothers who accompany their children, particularly in second and third class compartments, are always provided with sharp tongues and, with the ticket taker as unyielding as the rock of Gibraltar, an argument inevitably ensues. It is always a one-sided one, for a rule is a rule in France, no matter how stupid, and the railroad men enforce it to the letter.

Children over three years of age pay half fare and over seven full fare. So expert are the collectors that they can tell a child's age almost to a month. The strictness about children's fares must be set down as one of the curious sides of French railroading, and as providing the situation in which only French politeness could be equal to the emergency.

STATE RAILWAY CONSTRUCTION IN NORWAY.—The state railway construction in Norway is progressing on a very large scale, although some of the important work now in hand will not be completed at the time originally intended. Thus the Doore railway and the Rauma railway were to have been ready in 1917, but neither undertaking will be completed at that time. According to the railway plan of 1908 the railways which it comprised were calculated to cost \$13,600,000, but the actual expenditure has now been put at \$23,200,000. Alterations and further new lines, which have been decided upon later, were calculated to entail an aggregate expenditure of \$9,400,000, but they will, it has transpired, cost some \$2,700,000 more than originally calculated.

*Our special European correspondent.

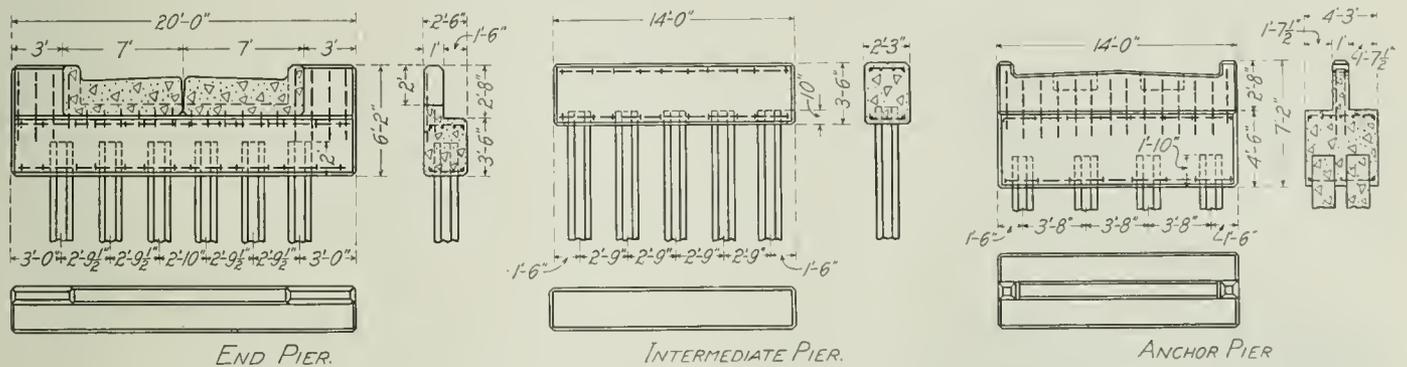

SOLID DECK TRESTLES AND BRIDGES ON THE ILLINOIS CENTRAL

The Illinois Central has recently opened for traffic about 34 miles of second track between Gibbs, Tenn., and Kerrville, on the main line just north of Memphis, the last single-track mileage between Chicago and Memphis. The construction of this second track involved the handling of 1,300,000 cu. yds. of grading and the building of about 9,500 ft. of concrete trestle in addition to other minor bridge work. In the design of these trestles the solid piers which have been used in a number of instances on this road to support concrete slab decks, were replaced by concrete pile bents recently adopted as the road's standard, the cost of the latter being about 80 per cent of that of the former. In order to secure the advantages of a solid deck on two 80-ft. through plate girder structures located between sections of the concrete trestle these bridges were built with concrete slab floors involving a number of interesting details.

The concrete trestle was used in heights ranging from 8 ft.

piles and the caps are 14 ft. long, 2 ft. 3 in. wide and 3 ft. 6 in. deep. The anchor bents have a double row of four piles each with a cap 14 ft. long, 4 ft. 3 in. wide and 4 ft. 6 in. deep, having a center wall 1 ft. thick extending up to the top of the slabs. An open space of 2 in. is allowed between the ends of the slabs and the back walls on the end bents and the center walls on the anchor bents. The heads of the piles are embedded in the concrete cap 2 ft. in the end bents, 10 in. in the intermediate bents and 1 ft. 10 in. in the anchor bents. When built as a double-track structure the end piers are 34 ft. long and the intermediate and anchor piers 28 ft. long, the two tracks being spaced 14 ft. center to center.

The piles used in this trestle are hexagonal with the lower end pointed. They are reinforced with spiral and longitudinal rods securely tied. The piles were made by the C. F. Massey Company, at Memphis, were seasoned 30 days and were driven with a steam hammer, using a wooden driving block and a rope cushion. The soil was clay and the piles sustained little damage in driving. The reinforced concrete caps were built

General Details of the Illinois Central Reinforced Concrete Trestle

to 20 ft. for practically all locations where timber trestles had been used in the old single-track line. In cases where the old structure in the first track had not reached the end of its life the new concrete trestle was built along side with the intention of renewing the wooden structure by a second single-track concrete trestle when necessary. In other locations the old timber construction was replaced by a new double-track concrete trestle.

The standard panel length is 16 ft., although in some instances

in place over the heads of the piles, the material being carried from stationary mixing plants in narrow-gage cars along the edge of the old trestle, where the new structure was of considerable length. For short trestles the material was handled with wheelbarrows to movable mixing boards. The end bent caps required 7 cu. yd. of concrete, the intermediate bents 4 yd. and the anchor bents 11.3 yd. The slabs are of a type used quite generally by this and other companies, the width of each slab being half the width of a single-track structure. About 250

One of the Sections of Reinforced Concrete Trestle, Built on Concrete Pile Bents, in Double Tracking the Illinois Central North of Memphis

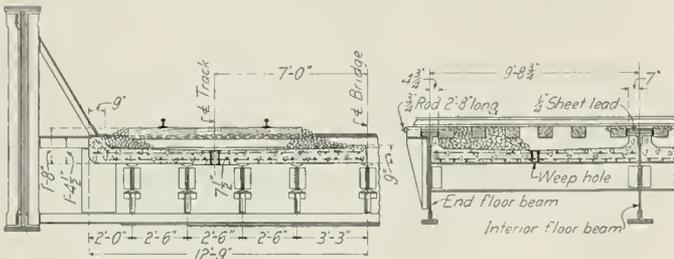

this was varied in order to miss the bents in the old trestle. The bents are of three types, the end, the intermediate and anchor. The anchor piers are located at every sixth bent in trestles of ten or more panels, serving to stiffen the structure. In the single-track structure, the end bents consist of six piles with a cap 20 ft. long, 2 ft. 6 in. wide and 3 ft. 6 in. deep and a back wall extending 8 in. up on the slab at the ends and to the top of the slab at the sides. The intermediate bents have five

of these slabs were cast by the C. F. Massey Company, and the rest were made by company forces in two yards at Fulton, Ky.

The two single-span through plate girder bridges with concrete slab floors are of standard design except for the lowering of the stringers, and the addition of one I-beam stringer at the center of the floor beams. The two slabs which are placed side by side in each panel between floor beams are supported on nine stringers, the tops of which are 1 ft. 3/4 in. below the tops of

the floor beams. Each slab is 9 ft. 8 $\frac{3}{4}$ in. long, the spacing between floor beams, and 12 ft. 9 in. wide. The slabs are cast with a curb along both edges to retain the ballast and across the end to fill the space under the flanges of the floor beams. The upper surface of the slab is pitched one inch from each side to the center where a 4-in. drain tile is inserted, being covered by a cast iron grating. The thickness of the slab at the center is 7 $\frac{1}{2}$ in. and the maximum thickness over the curb is 1 ft. 4 $\frac{1}{2}$ in.

The minimum depth of ballast under the tie is 6 in., bring-

Details of Concrete Floor for Through Plate Girder Spans

ing the bottom of the ties 2 $\frac{1}{2}$ in. below the tops of the floor beams. The two ties adjacent to each floor beam are held tightly against the flanges by $\frac{3}{4}$ -in. rods 3 ft. long threaded on both ends which are passed through the ties just outside of each rail and tightened by a nut on each end. The tops of the floor beams are covered by $\frac{1}{4}$ -in. lead sheets and the curb walls around the slabs, the tops of stringers and the tops and sides of the floor

A Portion of One of the Illinois Central Concrete Trestles, Showing the Solid Ballasted Deck

beams which come in contact with either lead, concrete or timber and the top surface of the slabs are thoroughly coated with pitch. A $\frac{1}{2}$ -in. space between the slabs is filled with pitch. The slabs for each of these 80-ft. double-track girder spans required 62 cu. yd. of concrete.

All of the bridge work on this double-tracking project was carried out by company forces under the supervision of the engineering department, A. S. Baldwin, chief engineer; F. L. Thompson, assistant chief engineer, and Maro Johnson, engineer of bridges and buildings.

REDUCING STOCK CLAIMS

By J. L. Coss,

Dispatcher, Rock Island Lines, Haleyville, Okla.

The railroads running through the Southwest have been paying out large sums of money each year as damages for stock killed on the right of way. In this particular part of the country there are few communities which support stock laws, and the farmers and stockmen as a rule do not co-operate with the railroads in trying to keep animals off the railroad property. In many cases it seems that they favor allowing the stock to be killed by the roads because they receive full value for it. It costs a railroad about \$300 a mile to fence its right of way and the cost of repairs and renewals is high; while because of the large number of almost-wild animals running at large it is almost impossible to fence against them. The question has often been raised whether it was cheaper to kill the stock or to fence the right of way. However, the conclusion has been that where stock is allowed to enter railway property there is always a chance of derailment of trains.

For the year ending June 30, 1914, the damage to stock alone on seven railroads running through this territory amounted to \$889,693. In order to reduce these payments and eliminate the possibility of accidents, the superintendent of the Indian Territory division of the Rock Island asked the co-operation of all employees. He issued special instructions to engineers that they must not under any circumstances take chances in striking stock and must stop their trains if necessary to avoid it. They must also notify the first section gang where they saw stock, gates open, fences down or any condition which might lead animals to enter on the right of way. The section men are required to go there at once, night or day, drive the stock off, repair the openings, and report. Train and engine men also notify the dispatcher of the location of any stock and the dispatcher immediately advises all trains and also sends word to the section men to remove the stock. The block operators also place the location of stock on their restriction and clearance cards to trains and when operators block with each other the stock conditions must be given the same as the information concerning trains. The operators also notify the section men of the location of stock. With this concerted action on the part of all concerned there is scarcely a chance for any stock on the right of way to be lost sight of for any length of time.

These measures effected a reduction in the payments for damage to stock from \$6,900 for April, 1914, to \$1,400 for April, 1915. This has been accomplished by the superintendent giving this matter his personal attention and impressing its importance on all employees. Getting the section men out at night to chase stock off the right of way has made them more careful to see that the fences, gates and guards are in good shape. Requiring the enginemen to explain personally before an investigating committee why and how they struck stock has made them more careful. The storekeeper has also been impressed with the necessity and importance of sending out repair fence material when ordered. The dispatchers are careful in placing their orders immediately on receipt of advice regarding stock on the right of way, and in getting word to the section men by the first train. At first, the train orders covering advice to trains regarding the location of stock numbered from 15 to 20 a day, while now they run from 3 to 7, and some days none.

WESTERN AUSTRALIAN RAILWAYS.—Western Australia had 2,854 miles of government railway in operation at the close of June, 1913. The cost of construction and equipment to the same date amounted to \$71,580,000. Branches were opened in many directions between 1908 and 1914. The object of these lines is to develop new country, and several additional spurs are in course of construction. The government of Western Australia has its finances well in hand, and while the government railways have undoubtedly given a great impetus to Western Australian industries, they have not been a source of embarrassment to the Western Australian treasury.—*Engineering*, London.

The Unnecessary Movement of Empty Freight Cars

Committee Report of the General Superintendents' Association of Chicago on the Proper Handling of Equipment

The General Superintendents' Association of Chicago early this year appointed a Committee on the Promotion of the Proper Handling of Equipment, consisting of E. E. Betts, superintendent of transportation of the Chicago & North Western, chairman; W. E. Beecham, car accountant, Chicago, Milwaukee & St. Paul; F. C. Batchelder, president, Baltimore & Ohio Chicago Terminal; E. H. DeGroot, Jr., superintendent of transportation, Chicago & Eastern Illinois; L. M. Betts, car accountant, Belt Railway of Chicago, and F. C. Schultz, chief interchange inspector, Chicago Car Interchange Bureau, to investigate the unnecessary movement of empty cars within the Chicago terminal district, with reference to good order empty foreign cars seeking a home route, cars delivered in bad order to fill orders for loading, and bad order empty cars seeking a home route. The committee has made a thorough study of the situation, and has issued a series of bulletins to members of the association, giving detailed statements of cars which it considered had been improperly handled, with the idea that giving publicity to the conditions found would result in an improvement. The committee also submitted a number of recommendations.

A special meeting of mechanical and transportation department representatives of all Chicago lines was held by the General Superintendents' Association on June 2, and the committee submitted the results of its investigation in a report. An abstract of this report is as follows:

REPORT OF COMMITTEE ON PROPER HANDLING OF EQUIPMENT

It is generally admitted that the present practice for handling foreign cars by the transportation and mechanical departments results in great economic losses to the railroads. Under the present practice of using cars regardless of ownership it is of common occurrence that their absence from home lines is indefinitely prolonged. They run without proper mechanical attention from one road to another, their condition growing steadily worse until they become a menace to the safety of trains and dangerous to life and limb. They are then taken out of service. They may be patched up and sent limping home for the owner to rebuild or destroy, or, perhaps, that is done by the road having the old worn-out cripple in possession when it finally lies down and can go no further, but in any event the results are the same—the owner pays the bill and is most injured by the practice of neglect.

Some of the bad results directly chargeable to the failure to keep cars in repair are shown in the increase in per diem expenses and empty mileage and in operating expenses, but undoubtedly the worst features are mechanical, the results of which fall on the owner. He cannot secure the return of his cars that he may keep them in repair, even though he is able and disposed to do so himself, and others will not do that for him. He stands helplessly by, sees his property depreciating physically day by day, its serviceability decreasing, and its life shortened by a practice he himself is a party to but is powerless to stop.

A car absent from the home line, we will say six years (and that is not unusual), becomes afflicted with old defects, some of them owners' defects, others users' defects. The car is finally taken out of service, and is then offered in interchange to a road which is known in our parlance as the "home route." The home route line rejects the car on account of its condition, and, pending a settlement of the question as to who is responsible for its condition and should make the repairs, it is held at the interchange point until the per diem accruing thereon is frequently many times greater than the cost of the repairs would amount to.

In other cases, especially in large terminals like Chicago, the

failure to inspect and properly repair cars, and the attempt to pass them from one road to another in defective condition, creates a heavy terminal expense where belt lines are used as intermediate links, and greatly increases the per diem earnings of idle and unserviceable cars.

The failure to keep cars in repair applies to all railroads in greater or less degrees. Probably no railroad is free from that charge. In some cases it is undoubtedly a studied policy; in others it is chargeable to a lack of facilities, indifference and carelessness of employees, and various other reasons, but in our judgment under any and all circumstances it is a mistaken policy, because the interests of railroads are linked together in this proposition so that what injuriously affects one injuriously affects all.

One of the fundamental principles of the Master Car Builders' rules is that, "Each railway company must give to foreign cars, while on its line, the same care as to inspection, oiling, packing, adjusting brakes and repairs that it gives to its own cars." This virtually makes the attention which a road gives to its own cars the standard for the attention it should give to foreign cars.

If this may be taken as a declaration of principles, it is open to construction by the individual, and is, therefore, of little or no value for the government of such interests as are combined in this proposition, and which the Master Car Builders' Association is supposed to protect and to properly provide for.

The Master Car Builders' rules make owners responsible for, and therefore chargeable with, the repairs to their cars necessitated by ordinary wear and tear in fair service, so that defect cards will not be required for any defects thus arising, and, if we are able to construe this rule properly, it is based on the idea that cars afflicted with defects that owners are responsible for may be returned to the owners for repair, and here we believe is the cause of all our difficulties where the mechanical department is involved, because it virtually permits railroads to avoid making repairs to cars and permits them to be sent home for that purpose. We believe this to be a fatal defect in the Master Car Builders' rules.

We now reach the point where in theory a given rule is just and equitable, while in actual practice the rule works a hardship and economic loss. Theoretically the M. C. B. rules contemplate the proximity of car owners' connections with the line to which a loaded car is last delivered. Therefore, when a car is made empty under such circumstances, the car is to be returned in practically the same condition in which it was originally received.

Box cars are loaded promiscuously by railroads which have no direct connections at Chicago. When they enter the Chicago territory, they are pooled, loaded anywhere and everywhere and their absence from owners covers long periods. Result—The cars lose the channels of "home" (no short-routing being permitted) except by circuitous routes resulting in excess mileage and the handling lines are unwilling to repair them, each railroad basing its justification for the refusal to repair cars upon the short period the cars are in its possession.

In large terminals like Chicago, some one should have arbitrary power to schedule cars for repairs under Rule 120 and check up to see that they are properly made—then the theory and practice under M. C. B. rules 1 and 120 become consistent and effective, and such box cars which have no direct connection with car owners' railroads will be repaired and placed in revenue service. Until a change is made along these lines, our difficulties will continue.

Another principle fully set forth in the Master Car Builders' rules is, that cars offered in interchange must be accepted if in

safe and serviceable condition, the receiving road to be the judge. The owners must receive their own cars, when offered home for repairs, at any point on their line, subject to the provisions of the rules. A car may be in safe condition to handle, but not be in condition for service, and here to our mind is another defect in the Master Car Builders' rules. This rule is open to criticism as being indefinite. It confers a latitude upon the receiving line which everybody recognizes as being eminently proper, as naturally the right to determine the safety and serviceability of cars to suit the receiving line rests with itself, and from that decision there can be no appeal, because this rule says in effect that, if the receiving road is satisfied to accept a car offered in interchange it has the privilege of doing so. If, for any reason, it does not wish to do so, it may refuse the car, and there the matter seems to hinge. There is no standard of principle in such a rule as that, and it can only result in endless disputes, bad delays, useless expense, and just as soon as you appeal from the decision of the receiving line you take away the right conferred by the rule, and the rule then becomes void and of no effect.

Illustrations are not wanting to show in the most emphatic manner that the amount of unnecessary mileage incurred by railroads in moving cars in an opposite direction from home in order to get them home is so enormous as to be almost beyond belief. Among the many cases which serve to emphasize the point is that of a car which was loaded for Toledo, Ohio, via the Pere Marquette and Milwaukee. The car went through to its destination, 340 miles, and when made empty it was returned to the delivering line at Milwaukee. At Toledo it was about 660 miles from an interchange point with the owners. When it returned to Milwaukee it was 1,000 miles away.

The present practice of handling empty foreign cars in an opposite direction from home instead of keeping them moving in a homeward direction according to their initials, is not justified by any requirement or necessity the railroads are called on to deal with.

If we are to secure proper and unrestricted movement of cars, and be able to employ them to their fullest extent, they must be kept in repair by the mechanical department. This seems to be a simple proposition on paper, and, inasmuch as repairs that owners are responsible for can be charged with a profit, we believe, to the road making them, the work should be done, and we can see no reason why it is not, unless the question of facilities, labor, supply of materials and other mechanical disabilities make it impossible. Where that is the case the cheapest, best and most rational thing to do before the car becomes in a dilapidated condition is to send it home direct to the owners and let them repair it, and such a car should not be made to travel two or three thousand miles in order to cover an intervening area of 100 miles or less.

The judgment of the mechanical department is accepted by the transportation department in all cases where the safety and serviceability of cars is concerned. At all interchange points rigid inspection should be maintained. Cars that are offered in interchange under load not in serviceable condition should be transferred and the empty returned to the delivering road, but if the transfer of the shipment is impracticable, some arrangement should be made to send the car through to destination, provided that it is safe, and when unloaded at destination, if it is wanted for a return load, or a load in another direction, the road using the car should make all necessary repairs, or should return it to the road it was received from to be continued in its homeward direction so that the owner may make them.

Individuals will differ as to what is or is not a serviceable condition, and for that reason if it is possible to define it, in a general way, at least, it should be done. There should be a standard of excellence for a freight car which shall govern inspection, and a matter of such vital importance to the railroads should be regulated by certain well-defined mechanical rules.

The remedy for the troubles that afflict the car supply, the handling of cars so far as the transportation department is concerned, is to be found in the movements of empty cars in a home-

ward direction by the shortest and most direct routes, the initials of the cars to be the ruling guide, no other marking, carding rules, or regulations being necessary.

RECOMMENDATIONS

The committee also offered a series of resolutions to be referred to the Master Car Builders' Association and to the special committee of 25 mechanical and transportation officers to be appointed by the president of the American Railway Association, in accordance with action taken at its recent meeting in New York. The resolutions urged that the Master Car Builders' Association considered the adoption of a standard of maintenance for all equipment offerable in interchange, and the elimination of an interpretation issued by the Master Car Builders' Association under date of January 1, 1915, in M. C. B. circular No. 16, under which, the committee declared, "loaded foreign cars may be delivered in bad order to a connection and by it hauled to destination, and eventually, regardless of the length of time, be returned empty to the delivering line, if in the same physical condition, thus defeating the intent of M. C. B. rules 1 and 2, which provide for repairs to such cars." The M. C. B. Association was also earnestly requested to take such further action as will make obligatory the handling of bad order cars strictly in accordance with the present terms of M. C. B. rules 1 and 2, and provide for the handling of bad order cars under the following principles:

Cars to be accepted in interchange, either loaded or empty, must conform to the standard of maintenance to be agreed upon.

A loaded car destined to a point within the limits of the terminal at which it is delivered, or a car which must be transferred on account of bad order (not complying with this standard of maintenance), must be accepted if safe to run and carded with Bad-Order-Return-When-Empty cards, or bad-order transfer cars, such cars to be returned empty to the delivering line.

A car not conforming to the standard of maintenance to be adopted, accepted by a receiving line and taken out on the road, must be repaired by the unloading line when empty, or returned to its owner.

Cars belonging to roads with which delivering line has no connection must not be transferred by the receiving line in order to save per diem or avoid repairs, which may be made under load, when such cars are loaded in a homeward direction.

Another resolution referring to good order foreign cars stated that a condition has arisen whereby foreign cars are not handled in accordance with the present car service rules, that under these conditions, during a slump in business, foreign cars are back-hauled thousands of miles over the various circuitous routes the cars may have traversed under load in order to finally reach their home. The American Railway Association Committee was urged to consider the revision of the present car service rules along the following lines:

All equipment, except box cars, shall be considered as special to the line owning and shall be returned to the owners in home route and a penalty applied for any misuse sufficient in amount to make the diverting of a car prohibitive.

Box cars may be loaded in a homeward direction or into home territory, regardless of the route via which they were received.

Foreign box cars belonging to a direct connection must be delivered to and received by that connection, regardless of whence they came, except cars received in switch service.

All box cars of individual ownership must be accepted by owner at any junction point offered.

Foreign box cars belonging to a road with which the holding road has no connection must be loaded for home or in a homeward direction or into home territory, regardless of whence they come, with the exception of cars received in switch service. Foreign box cars may be returned to the delivering line empty if in a homeward direction, but not otherwise.

In the event there is absolutely no loading of any kind that will take a foreign box car loaded in a homeward direction or into home territory, then provide a means whereby it may be short-routed empty.

Make a reciprocal arrangement whereby one road will haul cars for another empty and equalize on a mileage basis through the medium of some kind of a clearing house. Such an arrangement will provide that cars hauled empty will always be hauled in the right direction, instead of in the opposite direction as at the present time.

The paper and the resolutions were thoroughly discussed at the meeting, but inasmuch as the recommendations involved some radical changes in present methods and the establishment of more and better facilities for making repairs to foreign cars, it was decided to refer the matter to the general managers of the railroads entering Chicago for the purpose of taking a letter ballot. A motion was also adopted recommending the establishment of central repair shops.

As a result of the meeting and discussion, arrangements have been made with the Chicago Junction Railway to take bad order cars owned by lines not having an entrance to Chicago and repair them under M. C. B. rules at owner's expense. An agreement was also reached by which empty cars delivered to fill orders, when properly side-carded as evidence of inspection, will not be returned, but will be repaired by the receiving line, the expense to be charged to the owner, so that they can be used for loading.

SLIDE VALVE LUBRICATION ON THE BUFFALO, ROCHESTER & PITTSBURGH

Conditions attending a leak from a steam chest or a cylinder make it evident that the escaping steam carries oil in suspension, and the generally accepted theory that drops of oil from the lubricator become volatilized and widely diffused in the steam in the steam chests and cylinders thus seems to be confirmed. Accepting this as well established, what portion of the steam supplied to the steam chest touches the face of the valve, or that portion of the seat upon which the face of the valve travels? Probably only a very small percentage, and certainly the steam which does come in contact with the face of the valve and the seat carries no more oil than the much greater portion of the steam which does not come in contact with the frictional surfaces. Moreover, steam which comes in contact with the frictional surfaces probably does not deposit all the oil which it holds in suspension.

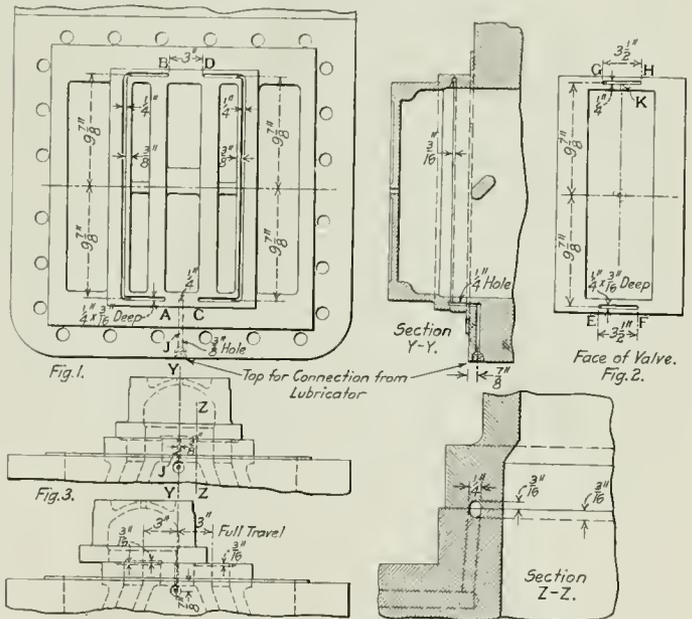

What percentage, then, of the oil supply can we believe performs the desired function of eliminating friction? Some portions of the slide valve face and seat are never exposed to the steam supply. What portion of the infinitely thin layer of oil which we assume is deposited by the steam supply in front of and behind the slide valve is drawn under the valve by its movements, to those unexposed frictional surfaces? Consideration of these questions seemed to indicate the advisability of improvement in the methods of conducting lubrication to the face and seat of slide valves, and the method described herein was devised and thoroughly tried out on the Buffalo, Rochester & Pittsburgh.

Two grooves, *AB* and *CD*, Fig. 1, were chipped in the valve seat and grooves *EF* and *GH*, Fig. 2, were chipped in the face of the valve; *K*, Fig. 2, is a small groove opening from *GH* into the exhaust cavity. With the valve in its central position, the two grooves in the valve face just overlap the ends of the grooves in the seat as shown in Fig. 3, the groove *EF* in the outer side of the valve also lapping the inlet *J* from the lubricator and thus permitting oil-charged steam from the lubricator to flow through both grooves in the seat and into the exhaust passage through grooves *GH* and *K*. The ends of the grooves are so located that communication between the lubricator and either of the grooves in the seat is cut off whenever the groove is not covered by the valve face. The face of the valve is thus brought into contact with saturated steam and oil, the richness of the mixture in oil being much greater than that obtained when the same amount of oil is introduced into the main steam supply and direct application to the frictional surfaces is obtained. Positive and regular feed is insured because

the flow of steam and oil from the lubricator is opposed only by the pressure in the exhaust cavity and by the friction in the pipes and grooves.

A Consolidation type locomotive, No. 331, with cylinders 21 in. by 28 in. and a tractive effort of 37,000 lb. was provided with this arrangement Feb. 1, 1914, and the usual opening for introducing oil into the steam chest was plugged. The engine was run with saturated steam until shopped for general repairs in January, 1915, during which period numerous test runs proved conclusively that the valves could be properly lubricated under maximum steam-chest pressure and short-travel conditions.

While heavy boiler repairs were being made, a superheater was applied to the locomotive, and on June 1 it was turned out of the shop, since when the performance, using superheated steam, has thoroughly justified the belief that this method of oil distribution would make it possible to successfully operate slide-valve locomotives using superheated steam. Up to July 27 the engine had made 5,000 miles without failure or repairs of any sort to the valves. The bearing surfaces of the valves and seats have developed a fine polish and are perfectly normal in contour. The reverse lever can be handled with the same ease as when saturated steam was used with this system of lubrication, and the engine is operated with full steam-chest pressure whenever operating conditions permit. At no time has it been difficult to hold the reverse lever by hand with the latch disengaged and the throttle wide open. The coal and water consumption show as great a reduction when compared with that of similar engines using saturated steam as was accomplished by the use of superheater locomotives equipped with piston valves.

Method of Slide Valve Lubrication in Use on the Buffalo, Rochester & Pittsburgh

During the first 1,500 miles superheat valve oil was used, but the last 3,500 miles have been run with Perfection valve oil, three pints being used during a run of 120 miles in heavy freight service. There appears to be every probability that this allowance can be materially reduced, but as yet no endeavor has been made to determine the minimum amount of oil required, although when using saturated steam it was possible to operate the engine on less oil than was allowed similar engines which were lubricated in the old way.

The steam-chest relief or vacuum valves are plugged and the engine is not provided with a drifting throttle, but in order to prevent the burning of the oil in the steam chest and cylinders and to prevent air or smoke-box gases being drawn into the cylinders, a small amount of steam is supplied through the main throttle while drifting.

This engine has been running regularly in heavy freight service, but on July 24 it hauled an excursion train consisting of

11 well-filled coaches, from Buffalo Creek to East Salamanca, a distance of 60 miles, in two hours, the grade rising 1,200 ft. in the first 40 miles of the run.

This system was developed by H. C. Woodbridge, general manager's special representative of the Buffalo, Rochester and Pittsburgh.

A NEW BRIDGE OVER THE MISSOURI RIVER AT KANSAS CITY

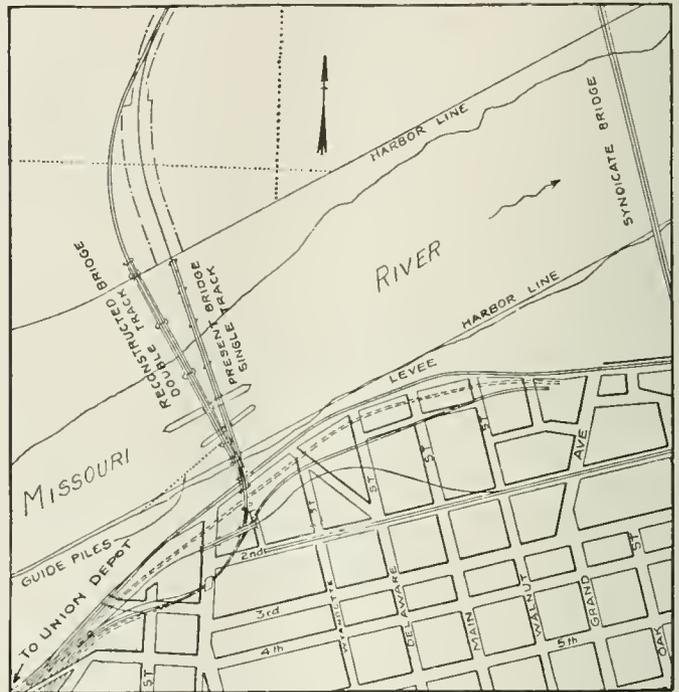

The Chicago, Burlington & Quincy has recently let contracts for a bridge across the Missouri river at Kansas City to replace the old Hannibal bridge, so-called because it was built by the Hannibal & St. Joseph Railway in 1869. This was the first bridge across the Missouri river. It was used for many years by the Burlington, Wabash and Rock Island as an entrance to the old Kansas City Union station, located three-quarters of a mile to the west, and is still used by these roads to reach the new Union station by way of the new Burlington connection around the bluff, south of the old station site. The old structure consisted of single track combination wood and steel through trusses on masonry piers. The superstructure was replaced by Pratt trusses in 1888, which are still in use on the original substructure, although it has been necessary to reinforce the piers extensively with iron rail bands. It is also used as a highway bridge, a plank floor being provided on the track deck and teams being allowed to cross the bridge between trains.

The new structure, which will cost about \$1,500,000, will be located adjacent to the old bridge. In fact, the south ends will coincide, the only difference in position being brought about by the fact that the new bridge will be a square crossing, while the old one makes an angle of about 15 deg., with a perpendicular to the river channel. In consequence the north end of the new bridge will be about 250 ft. up stream from the end of the old structure. There will be a 450-ft. draw span near the south side of the river with two 330-ft. fixed spans to the north, and one 120-ft. span on the south, making five waterway openings between harbor lines as against six in the old bridge. With the exception of the 120-ft. span the superstructure will consist of sub-panel through Pratt pin-connected trusses. There will be two decks, a lower one for two railroad tracks 13 ft. center to center, and an upper deck for a highway 25 ft. above the base of rail of tracks. Low iron is 26.25 ft. above standard high water and 40.53 ft. above standard low water. The clear width of the channel opening on either side of the center pier of the draw span is 200 ft. at standard low water.

The 120-ft. span south of the draw consists of a deck girder

means of a 4 deg. 30 min. curve on an embankment. The viaduct approaches are on 6½ per cent grades.

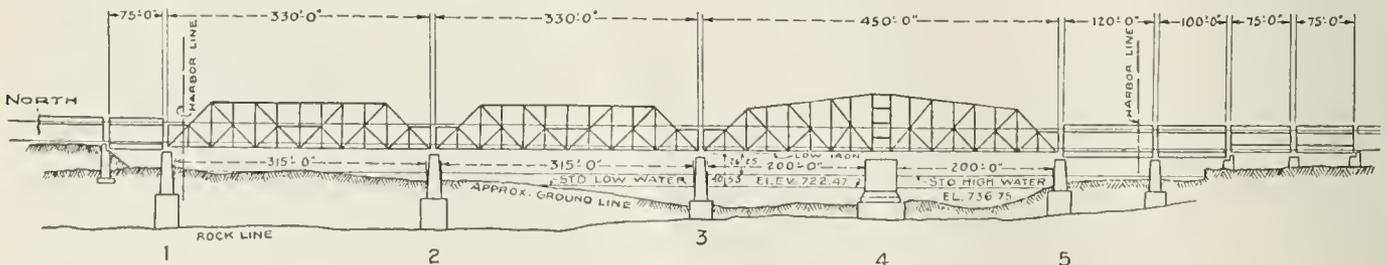

The design involves the use of high loading and high unit stresses, following the same idea as that used on the Metropolis bridge over the Ohio river. The live load on the trusses consists of two Cooper's E-90 engines followed by 7,500 lb. per ft. of track for the near track, and a uniform load of 7,500 lb. per ft. of track for the far track, except on floor, hangers and sub-diagonals, where the load is two E-90 engines on each track. The designing stresses under full dead load, live load and impact are 35,000 lb. per sq. in. for nickel steel eye-bars, 25,000 lb. per sq. in. for tension and 30,000 lb. per sq. in. for compression

Map Showing Location of Bridge

for silicon steel to be used in all main members of the truss spans other than eye-bars, and 18,000 lb. per sq. in. for medium steel to be used in all other parts of the bridge. The steel work amounts to 5,500 tons, and will be furnished by the American Bridge Company.

The piers for all of the main spans will be carried to rock, which is located from 70 to 130 ft. below the base of rail, the

Elevation of the Kansas City Bridge

span for the lower deck and a through girder span for the highway deck. South of this span there will be an approach, consisting of a 100-ft. span of the same type and two 75-ft. through girder spans for the railroad deck, as well as for the highway deck. Access to the latter will be had by means of a viaduct incline downward to a connection with Broadway. North of the bridge there is a 75-ft. approach span, consisting of deck girders for the tracks and through girders for the highway, the latter being continued on a viaduct incline downward on the east side of the railway embankment. The north railroad approach connects with the present alignment 1,300 ft. to the northeast by

surface of the rock dipping downward from south to north. Pneumatic foundations will be necessary. The substructure for the south approach will be on rock foundation, as the elevation of the rock rises rapidly south from the river bank. The north approach is located on flat river bottom and will require pile or spread foundations. The Union Bridge & Construction Company, of Kansas City, have the contract for the substructure and will commence work as soon as the present high water subsides. The design and construction of the bridge is under the direction of C. H. Carlidge, bridge engineer of the Burlington, who furnished the information given above.

Western Railways Get a Small Rate Increase

Advances Allowed on Coal, Coke, Fruit and Vegetables, Denied on Grain, Livestock and Packing House Products

The Interstate Commerce Commission handed down its opinion in the Western rate advance case on Tuesday, August 11. The report is "By the Commission." It held:

1. Proposed increased carload rates on grain and grain products considered as one commodity not justified.
2. Proposed increase from 30,000 lbs. to 40,000 lbs. in the minimum carload weight of grain products justified.
3. Proposed increased carload rates on live stock not justified.
4. Proposed increased carload rates on packing-house products and fresh meats, except as indicated between points on the Missouri River, not justified.
5. Proposed increased carload rates on fertilizer and fertilizer materials not justified.
6. Proposed increased rates on bituminous coal, except as to South Dakota points, justified. The rates on coke here proposed, which are the same as on coal, justified.
7. Proposed increased carload rates on brewers' rice and less-than-carload rates on domestic rice justified.
8. Proposed increased carload rates on broom corn not justified.
9. Proposed increased import rates and proposed increases in carload minima from Gulf ports justified.
10. Proposed increased carload rates on fruits and vegetables justified.
11. Proposed increased carload rates on hay and straw, where not in excess of Class C, justified.
12. Proposed increased any-quantity rates on cotton piece goods, and proposed increased carload rates from points in Texas, not justified.

Commissioners Daniels and Harlan filed dissenting opinions. They agreed with all the increases granted, but contended that others should have been allowed. The report of the commission, including the dissenting opinion, requires a pamphlet of about 190 pages. Following is a brief abstract of some of the more important parts of the report, the language of the commission being preserved so far as possible:

The carriers base their claims to additional revenue upon the grounds of their financial needs and the downward tendency of their net earnings in this western region and contend that commodities singled out by them to bear the proposed increases are not now carrying their equitable part of the costs of transportation.

Both of these contentions are traversed by the protestants, comprising both the state commissions of a number of the states primarily affected and individual shippers. Generally speaking, the protestants contend that the financial condition of the carriers does not warrant the proposed increase in revenue; that the last fiscal year was abnormal, both in regard to transportation and other branches of industry; and that in recent years the carriers in large measure have built up their properties to a higher standard out of operating revenues, and have thereby produced a showing which in so far as it is unfavorable is in great measure illusory. In general, it cannot be said that the protestants in the instant case have alleged that conservation of the carriers' revenues can be effected by the practice of more rigid and appropriate economies, but rather that the carriers have realized and are realizing the benefit of adequate revenues; that their real net revenues have been masked by new methods of accounting; that charging against income what is asserted to be a proper charge to capital and the practice in the past of conferring valuable concessions upon shareholders of record have resulted in an understatement of the real earnings of the carriers.

It was not asserted that the rules of the commission requiring that additions and betterments be charged to capital account were being violated, nor that the higher standards are not justifiable, but rather that the mere change from a lower to a higher standard involved increased operating expenses even under the accounting rules of the commission.

The following table is compiled as indicating roughly the annual increase in the carriers' revenue were the tariffs involved in this proceeding allowed to go into effect:

Grain and grain products	\$2,940,237
Live stock	1,500,000

Packing-house products and fresh meats	1,500,000
Hay and straw	175,000
Broom corn	31,623
Coal	1,226,122
Fruits and vegetables	134,265
Rice	42,000
Import rates	55,000
Total	\$7,604,247

For the 41 roads included in the carriers' exhibits the total freight revenues received in the fiscal year 1914 were approximately \$641,000,000. It appears, therefore, that the increases proposed in the present proceeding would fall within 2 per cent of the total freight revenue.

Inasmuch as the work of railroad valuation by the commission has not as yet sufficiently advanced to afford definite knowledge of the true value of the railroad properties involved in this proceeding, we are confronted at the outset with the problem of finding an appropriate method, if such there be, which might aid in determining the reasonableness and propriety of the proposed increased rates. It is hardly necessary to say that the duty of determining the justice and reasonableness of rates devolved by law upon the commission prior to the authorization by Congress of the work of valuation, and that the commission has been obliged to determine this issue without having available for its use authoritative valuations of the carriers' property. In approaching this problem we shall first study variations in the operating ratio for recent years. We shall next analyze the investments of carriers since 1907 and the concomitant variations in the revenue returns. Our accounting rules have been in force since that date, and the statements of additions and betterments to property and the contemporaneous revenue returns are believed to be substantially accurate. We shall thereafter analyze the variations in the carriers' revenues as compared with the book cost of their property, a procedure hitherto employed, but always with acknowledgment of the unverified character of the book cost in 1907 and the infirmity which its inclusion in subsequent figures of book cost entails. Next in order will come an analysis of such evidence as is of record with reference to valuations made by state commissions, by the carriers themselves in some instances, and by engineers who have testified in this case. Finally, before undertaking the study of increases proposed on individual commodities, we shall scrutinize the evidence bearing upon the financial experience of the carriers as regards their returns and their credit.

THE OPERATING RATIO

The operating ratio for any year, as that term is technically employed in the commission's statistics, is the ratio of that year's operating expenses to operating revenues. That there has been an increase in the operating ratio for the period 1901-1914 is incontestable. The fact is proof primarily that of every dollar in revenue received the amount remaining in the carriers' hands after charging operating expenses, taxes and rentals, is for the 26 roads approximately 20.5 cents in 1914 as against 31.3 cents in 1901.

Employing the basis of the equated traffic unit, all of the comparisons coincide in showing that the revenues received per unit show a decline in this period and that the expenses incurred per unit show an increase. Of perhaps equal significance is the fact that the percentage of variation between the showing based on the carriers' data, the protestants' data and the commission's data is slight.

The increase in expenses per equated traffic unit ranges from 0.56 mills shown by the Commission's figures to 0.62 mills and 0.63 mills shown respectively by the figures of the protestants and the carriers. We shall proceed to canvass the causes contributing to this increased cost under the following heads: Labor costs, taxes, maintenance costs, and various miscellan-

eous items, including, among others, fuel, train supplies, loss and damage claims, and injuries to persons.

Labor.—The commission has had constructed a table which indicates for the period 1901-1914 the ratio of total labor compensation to total operating revenues and to total operating expenses. The table, No. 4, is subjoined.

Year	Railroad witness Wetting, 41 roads.	Commission's compilation, 19 selected roads. ²	
	Ratio of labor compensation to total operating revenues. ³ <i>Per cent.</i>	Ratio of labor compensation to total operating revenues. ⁴ <i>Per cent.</i>	Ratio of labor compensation to total operating expenses. ⁴ <i>Per cent.</i>
1901.....	38.2	36.5	58.5
1902.....	39.0	37.4	60.2
1903.....	41.3	39.0	62.3
1904.....	41.7	39.9	60.8
1905.....	40.8	39.5	60.5
1906.....	40.5	38.9	60.1
1907.....	40.7	39.6	60.4
1908.....	43.5	41.5	59.7
1909.....	41.6	40.3	59.3
1910.....	42.9	41.5	58.2
1911.....	43.1	41.0	57.4
1912.....	45.0	42.7	58.8
1913.....	44.2	42.4	60.3
1914.....	44.4	42.8	60.0

¹ As shown by pay rolls and thus includes certain labor compensation not chargeable to operating expenses.

² Including the Atchison; Rock Island; Alton; North Western; Burlington; St. Paul; Minneapolis & St. Louis; Katy; Missouri Pacific, and Frisco.

³ Labor compensation includes general officers.

⁴ Labor compensation excludes general officers.

⁵ Chicago, Milwaukee & St. Paul not included.

Taxes.—The amount paid in taxes by the carriers parties to this case shows a material increase as between 1901 and 1914. These amounted in the beginning of the period to about 3¼ per cent of the operating revenues, but in 1914 they absorbed over 4½ per cent.

Maintenance.—There centered around the question of the interpretation of expenses for maintenance more acute differences between the carriers and the protestants than about any or all other items of cost. While the operating expenses have progressively increased in proportion to revenues, with occasional yearly recessions, the relative increase is most marked in the matter of maintenance of equipment. The increase in the ratio of this item to total revenues seems largely traceable to the substitution of heavier locomotives and cars of steel or of steel underframe construction. Some considerable part of the increased outlay upon maintenance of equipment would appear from the testimony to be traceable to the injury occasioned by the use of the heavier steel cars in connection with the older wooden equipment.

Some of the carriers' witnesses contended that heavy repair costs were entailed by the keeping in service of old equipment which their financial condition precluded them from scrapping and replacing by new cars. But it seems not unlikely that while the transition period during which light and heavy equipment are jointly used may necessitate unusually heavy repairs, the repairs normally demanded by the heavier equipment may be larger than had been estimated when its use was projected.

Apart from the question reserved for later discussion of the carriers' practices under the Commission's accounting rules prescribed in 1907, it cannot be affirmed with any degree of certainty that the increased charges for maintenance of equipment are excessive or undue. They seem rather to be a consequence of the general tendency to introduce heavier equipment, of the contemporaneous use of equipment, old and new, and in measurable degree attributable to the carriers' interpretation of the demand for transportation facilities of greater carrying capacity and of greater tractive power than formerly in vogue.

Conclusion.—Unless material modification is required by considerations arising from changes in accounting, or considerations due to financial maladministration of certain carriers included in the groups of roads here studied, the conclusion is substantiated that the attested increase in the operating ratio since 1901 must be attributed primarily to increased costs, each operating in different degree, but practically all in the same

direction, incurred by the railroads in the handling of traffic.

The accounting rules of the Commission, it is alleged by the protestants, allow a certain latitude of construction by the carriers whereby when improvements such as rebalasting or laying of new ties are made, some part thereof may be charged to operating expenses. While admitting the possibility of such practices, the moderate increase since 1907 in operating expenses under maintenance of way and structures and the few specific instances where betterments were covered by charges to operation would seem to render it unlikely that any very appreciable effect from this particular accounting practice has affected the operating ratio since that date. Similarly it was urged that car and locomotive reconstruction affords an opportunity within the Commission's accounting rules to charge what are essentially betterments to operating expenses. As indicated previously, we are of opinion that the increased cost for maintenance of equipment is mainly to be ascribed to other causes. The increase in the operating ratio has been a real and not an apparent increase, and is due mainly to augmented operating costs properly charged.

There remains to be mentioned the possibility that particular carriers by reason of financial mismanagement reflected in their operating methods have been uneconomical and wasteful in expenditure, and have thus unnecessarily increased their operating ratios. It does not appear that any uniform relationship can be traced between the present level of the operating ratios of carriers whose financial administration has been culpable and of the remaining carriers. Similarly, instances of notable increases in the operating ratio do not seem to be confined to roads such as the Rock Island or the Frisco. The negative conclusion reached in this connection is but confirmatory of the fact that the general increase in the operating ratio is traceable to deep-seated underlying causes which have affected carriers generally through increased operating costs.

It may be urged that the financial experience of carriers in this period has been that of industry generally; and unquestionably it is true that they often encounter and should be expected to encounter the same ups and downs of financial fortune as affect industry at large. A complete comparison of the relative prosperity of the carriers as against industries in general is not possible from data of record. But, there is force in the consideration that public service industries are under some disabilities from which private industries are exempt. The former may not discontinue operation even though net earnings decline or vanish; nor may they meet rising costs with as free a hand as other industries which advance their prices without the possibility of governmental restraint. Transportation, moreover, unlike many branches of manufacture or commerce, is a quasi public function, indispensable to industry generally. So long as the service is intrusted to corporate administration and the funds supplied by private investors, revenues sufficient to afford a return which will adequately remunerate the investment and secure the facilities required by the community have a justification which does not equally attach to every branch of private undertaking.

RETURN ON INVESTMENT

The rates at present under consideration may be gaged in a measure by comparing recent additions to the carriers' road and equipment with the concomitant changes in their net operating income. The only continuing inducement to invest additional capital in any line of industry is the prospect of net returns. If experience discloses that the return expected is small, the incentive to further investment will correspondingly decrease. If experience demonstrates that increased investment fails, over a term of years, to yield an increased return, the inference is either that the investment was ill judged and not calculated to serve the public, or that the price of the service has not been sufficient to allow an adequate return. The addition of increased income affords a percentage return upon increased investment which for the 41 roads in the carriers' exhibit amounts to 1.2 per cent, and for the 26 roads in the

Commission's compilation, to 0.7. It is, of course, true that the additional investments referred to have been added to or blended with the carriers' pre-existing property, and that no separate or physically distinguishable return can be traced specifically to the last \$1,000,000,000 added to road and equipment.

RETURNS ON BOOK COST OF PROPERTY

The unverifiable character of cost of property standing on the books of the carriers when the Commission's accounting rules were prescribed in 1907 has already been referred to. Subsequent outlay for specific additions and betterments as reported annually by the carriers may, in general, be accepted as more accurate. The basis of book cost, in default of the completion of the official valuation, may be employed, as it has been in the past, as a usable basis for a study of the course and tendency of the returns. The operating income less rentals shows a maximum return upon the cost of road and equipment in the fiscal year 1907. The general level for the six preceding years is higher than for the subsequent period. Roughly speaking, for the 41 roads as a whole, the level for the period 1901-1907 was approximately 5 per cent; and for the subsequent period of 1907-1914 about $4\frac{1}{4}$ per cent.

In view of the facts that the roads covered by the valuations which appear in the record are not sufficiently inclusive, and that the details of methods adopted in making the valuation are not of record, we have no sufficient evidence, taking the case as a whole, upon which to make a finding as to the fair value of the property devoted to the public service of transportation by the carriers which are here seeking an increase of rates.

The engineer of the Minnesota Railroad and Warehouse Commission testified as to value of various roads, using valuations made by several state commissions as his basis, and correcting in numerous details these valuations to accord with his own views.

Without detailed analysis of the methods of this witness, it may be said that he takes the actual market value of land without a multiplier or severance damage, in this way reducing the item of land values in Wisconsin, for example, about 45 per cent. He increases the Wisconsin depreciation of ballast from 20 per cent to 28 per cent; and likewise the Wisconsin depreciation of track laying and surfacing from 20 per cent to 32.72 per cent. For engineering and correlative labor he allows but 1.7 per cent as against 2.9 per cent allowed by the Wisconsin Tax Commission. Such items as interest during construction, organization expense, and contingencies he eliminates entirely on the ground that nothing but "actual property in existence and devoted to the public use" should be included. He likewise makes no allowance for stores and supplies or for working capital.

Without deciding here what are proper items to include in a valuation for rate-making purposes, it is evident that the methods of this witness are extreme in their rigor, resulting in every case in decreasing the valuations fixed by state commissions. We cannot accept the valuations proposed as a tenable basis for ascertaining the fair value of the roads in question.

THE FINANCIAL EVIDENCE

The progressive increase in the ruling rate of interest since 1900 has been demonstrated beyond question, and we do not deem it material to go behind the fact into the causes which have operated to bring about this increase. Railroads in common with industries generally have had to pay a rate of interest higher in 1914 than in 1907, and generally higher in 1907 than in 1900.

From the financial evidence we find that the credit of these carriers as a whole has not suffered an impairment not common to comparable industrial enterprises; that in common with other borrowers, corporate and governmental, these carriers are required to pay on the average a higher percentage than here-

tofore for the use of capital; that these carriers in common with comparable industries generally are paying higher prices for many materials and higher wages for most kinds of labor; that these carriers in meeting increased costs with increased prices for service are subject to certain disabilities not similarly encountered by many other industries; that the relatively equal depression of the carriers' credit with credit generally is not evidence of the adequacy or inadequacy of their present net revenues; that their net corporate income cannot be accepted as a measure of the adequacy or inadequacy of present rates; and that the increasing percentage of bonds to their total capital obligations indicates a growing disinclination to invest in their stocks and a growing unwillingness to accept the prospect of dividends as a sufficient incentive to assume the risks of railroad proprietorship.

From the preceding study of the trend of the operating ratio of the carriers here before us we have found that the relative profitableness of their business, taking the roads as a whole, has declined since 1901, and that the main cause effecting this result has been an increase in expenditures not offset by an increase in receipts.

GRAIN AND GRAIN PRODUCTS

By the tariffs on grain and grain products suspended in this proceeding the respondents proposed increases over current rates of equal amount on grain and the products thereof. The increases suggested are generally 1 cent per 100 lb., and apply as local and proportional rates from most of the region comprised within southwestern tariff committee and western trunk line territories. No increase is proposed in the rates from Minnesota, South Dakota, and northern Iowa to Duluth, Minneapolis, or Milwaukee. Increases are also proposed in export rates, and in the carload minimum on grain products from 30,000 to 40,000 lb. From points in defined territory in northern Iowa, southwestern Minnesota, and southeastern South Dakota to southwestern Missouri river points the increases proposed are from 2 to 4 cents per 100 lb., this excess over the general basis being intended to remove existing disparities in such rates as against rates from the same points to Chicago. The Minneapolis & St. Louis Railroad proposes tariffs establishing through rates to these southwestern Missouri river points in lieu of the existing combinations of locals, the result of which would be reductions ranging up to 4 cents per 100 lb.

The carriers have based their justification for increases upon the unity of the grain and the grain products and upon the unity of the whole territory involved. We find and conclude that they have not justified the tariffs increasing rates on grain and grain products.

An order will be entered directing the respondents to cancel the tariffs here involved proposing increased rates on grain and grain products. Such order will be without prejudice to the right of the Minneapolis & St. Louis Railroad to publish through rates to southwest Missouri River points in lieu of and lower than present combinations of locals. The carriers have justified and may establish increased rates on grain and grain products from points in northern Iowa, southwestern Minnesota, and southeastern South Dakota to Kansas City and related points reasonably and relatively conforming to rates from such points to Chicago.

LIVE STOCK

The proposed increased rates on live stock apply from points in western trunk line, trans-Missouri, and southwestern tariff committee territories, to Fort Worth, Tex., Oklahoma City, Okla., Wichita, Kans., Chicago and Peoria, Ill., and to markets on the Missouri and Mississippi rivers. From Missouri River points to Chicago, St. Paul, Peoria and St. Louis the amount of the proposed increase is generally 2.5 cents per 100 lb. In an effort to make a general rate realignment some rates are not changed, some are increased less than 2.5 cents, and a few more than 2.5 cents. The adjustment proposed makes the rates from Sioux City, Iowa, the same as from Omaha. This adjust-

ment from Sioux City would make the proposed increase in rates on cattle and on sheep in double-deck cars 1.5 cents and would reduce the rate on sheep in single-deck cars by 2.5 cents per 100 lb. From Kansas City to St. Paul no changes are proposed except on sheep in single-deck cars, on which there is an increase of 2.5 cents per 100 lb., nor are changes proposed from St. Paul to Chicago except in the rate on horses. From points in Iowa the proposed increases grade down from 2.5 cents in western Iowa to 0.7 of a cent per 100 lb. in eastern Iowa. Rates for transporting horses which have been on a per car basis, it is here proposed to conform to the normal live stock basis expressed in cents per 100 lb. Rates from interior Missouri points it is proposed to increase similarly to those from the Missouri River. From southwestern territory the increases proposed are generally 3 cents per 100 lb. on cattle, hogs and sheep, and 5 cents, or \$11.50 per car, on horses.

The rates on stock cattle moving from Texas to Oklahoma for feeding it is proposed to increase \$10 per car; to points in Kansas, \$5 per car, and other stock cattle rates it is sought to increase 5 per cent. This will average about \$5 per car. All trainload and 10-carload rates on stock cattle are, as they ought to be, eliminated.

The rates on cattle, hogs and sheep from New Orleans to points in western trunk line and trans-Missouri territories it is proposed to alter from the per car basis to the 100-lb. basis, but the change would result in practically no increase in transportation charges. No increases on live stock have as yet been obtained in intrastate rates or in rates controlled by the intrastate factors.

Taking into view our former decisions, the material modifications in the revenue statistics presented which would result from the segregation of state from interstate earnings, the relation of interstate to intrastate rates, and all the other facts of record, it is our judgment and determination that the carriers have failed to establish the propriety of the proposed increased rates on live stock.

The elimination of trainload and multiple carload rates has been justified.

PACKING-HOUSE PRODUCTS, ETC.

Claiming that market competition and other causes have tended to make present rates subnormal and that special services and costs incident to the traffic justify higher rates than the average on all commodities, the respondents have in this proceeding proposed increases in the rates on packing-house products, fresh meat, fertilizer and fertilizer materials, and green salted hides. Rates given are in cents per 100 lb. unless otherwise stated.

Packing-house products and hides usually take the same rate, and in western classification are fifth class; fresh meats are third class, and fertilizer and fertilizer material are class E. "Packing-house products," except where otherwise stated, will include hides. The proposed increases in the southwest are on a different basis from those in the remaining territory. Including the territory as a whole, increases are proposed from Ft. Worth, Tex., Oklahoma City, Okla., Wichita, Kans., from the packing plants on the Missouri River, from St. Paul and Austin, Minn., and points in Iowa to the Mississippi and Ohio rivers and to Chicago.

Generally the increase proposed is 3½ cents on both packing-house products and fresh meat; and in the proposed rates on packing-house products the fifth-class rating is usually fixed as a minimum.

Upon the whole record we are of opinion and find that the proposed rates on fresh meats and packing-house products between the Missouri River points named have been justified to the extent that they do not exceed the following, in cents per 100 lb., in carloads.

	Packing house products.	Fresh meats.
Between St. Joseph, Mo., and Kansas City, Kans.....	10	12.5
Between South Omaha, Nebr., and Kansas City, Mo.....	16	19.5
Between Sioux City, Iowa, and South Omaha, Nebr.....	10	12.5
Between Sioux City, Iowa, and Kansas City, Mo.....	20	23.5

The most of what was stated in our conclusions with respect to live stock applies to packing-house products. We must find that, with the exception which we have noted as to the rates on fresh meats and packing house products between the Missouri River points, the proposed increases on packing-house products, fresh meats, hides and fertilizers, have not been justified.

COAL AND COKE

It is proposed by tariffs under suspension to increase the rates on bituminous coal from mines in Indiana, Illinois, Kentucky, Alabama, Missouri, Arkansas, Oklahoma, Kansas, Colorado, New Mexico and Iowa, and from the docks on Lakes Michigan and Superior when shipped to points in western trunk line and southwestern tariff committee territories. Some reductions are proposed and the increases are either 5 or 10 cents per ton. The increased revenue is 5.36 per cent of the present revenue on bituminous coal.

From the facts of record we are of opinion and find that, with the exception of rates on coal to points in South Dakota, the proposed increased rates on coal have been justified, and the orders of suspension relating thereto will be vacated.

RICE

The carriers propose increases on both domestic and imported brewers' rice from the Gulf ports and Louisiana, Texas, and Arkansas rate points to basing points on the Missouri, Mississippi and Ohio rivers, and to the interior cities, to which the rates are made on these basing points, continuing the present minimum of 40,000 lb. The increases in the domestic rates range from one-half to 10½ cents, while those on import rates are generally 5 cents per 100 lb.

We are of opinion and find that the rate proposed on brewers' rice in the tariffs under suspension have been justified. The question of the proper relationship between the import and the domestic rates is, however, before us in another proceeding.

Clean rice. The proposed increases are in the less-than-carload rates from Arkansas, Louisiana and Texas points to the Mississippi river and Ohio river crossings, to Chicago and points basing thereon, to Missouri river points and stations west, including Utah common points and Colorado common points; to the Southeastern territory, omitting New Orleans as a point of origin; also from Arkansas to certain stations in New Mexico. The class rates resulting from this cancellation represent increases which range from 7 cents to 62 cents per 100 lbs.

We are of opinion and find that the respondents have justified the proposed cancellation of the existing less-than-carload commodity rates on clean rice, and an order will be issued vacating the suspension of those cancellations.

BROOM CORN

The rates proposed in this proceeding are generally 5 cents per 100 lbs in excess of the existing rates, with the third class as a maximum. No increase is proposed between Kansas points and the Missouri river. We are of the opinion and find that proposed rates upon broom corn under suspension have not been justified.

IMPORT RATES

The tariffs here involved contain import rates from the Gulf ports of Pensacola, Mobile, Gulfport, New Orleans, Port Arthur and Galveston. While rates on some other commodities are sought to be increased, no opposition was offered to the tariffs increasing these import rates except as to those tariffs proposing increases in the rates on fuller's earth and fertilizer materials.

We are of the opinion and so find that the carriers have justified the increased import rates and the higher minimum carloads, and an order vacating the suspension thereof will be entered.

FRUITS AND VEGETABLES

The carriers propose to increase their carload rates upon fruits and vegetables from various producing points in the state of Texas to numerous destinations in other states.

The proposed rates applicable on berries, grapes, peaches, pears, plums, melons, vegetables, cabbage and potatoes have been justified.

In the foregoing discussion of the fruit and vegetable rates from Texas we have named only those articles which constitute the larger part of the movement, but we are to be understood as also giving our approval to the proposed rates when applied to the other produce now taking the same rates as the articles mentioned in this report.

HAY

The increase proposed in the rates upon hay is generally 2 cents per 100 lbs., observing class C as a maximum, but no increases are proposed from Kansas points to the Missouri river. From Iowa and Missouri the present increase is approximately from 1 to 1½ cents. From Nebraska, from Kansas where increases are made, and from Oklahoma, the proposed rates are 2 cents in excess of those existing, although this does not bring them up to class C, while from Iowa and Missouri they are on a class C basis.

We are of the opinion and find that the rates on hay proposed in the tariffs under suspension, save for specified exceptions, have been shown to be reasonable, and an order will issue vacating their suspension. Wherever the rates in the suspended tariffs exceed class C, we shall require that they be canceled by the respondents, who may, if they so desire, in such instances file new tariffs wherein the rates on hay and straw shall not exceed class C.

COTTON PIECE GOODS

Upon the whole record we are of the opinion, and find, that the proposed increased rates on cotton piece goods and on sheets and pillowcases from Texas points have not been justified, and the suspended schedules must be canceled.

COMMISSIONER DANIEL'S OPINION

Commissioner Daniel's dissenting opinion covered about 27 pages of the printed report, and the following abstract therefore is extremely brief, consisting mainly of typical paragraphs lifted from the opinion:

In the essential outcome of the majority's report I am unable to concur, believing that on the record the carriers have in general sustained the burden of proof cast upon them by the statute and are of right entitled to increases in rates productive of revenue far in excess of what they are accorded by this decision.

While it is nowhere explicitly stated in the majority report, I am unable to escape the conviction that the reluctance to find that increased rates have been more generally justified is largely rooted in an unwillingness to find that the revenues of the carriers as a whole are smaller than is demanded in the public interest, and also in the belief that the financial exigencies of many of the carriers are traceable to financial maladministration, and that if due economy and integrity had been uniformly observed the difficulty over the attested decline in revenues would have been readily surmounted.

Among the particular carriers involved in this proceeding the Rock Island and the Frisco have recently attained unenviable notoriety by reason of financial mismanagement and other roads parties hereto, such as the Alton, have in the past been wrecked or plundered. There can be no question of these facts. There can be nothing said in extenuation or mitigation of them. And it has therefore resulted that a widespread disbelief exists in the general integrity of railroad management, and that a skeptical attitude has been assumed by many toward the plea advanced that railroad earnings are inadequate and that increased rates are warranted.

It would, nevertheless appear that, while the severest condemnation of these practices should suffer no particle of abatement, the time had at least come to take a discriminating view of the effect of refusing rate increases otherwise just and reasonable because of a widespread resentment as evils perpetuated in the past by dishonest or designing railroad officers or their

allied financiers. Such a policy visits in large measure the same penalty upon the proprietors of a railway conducted with integrity and honesty as upon the luckless shareholders of a looted road. In either case those who suffer from its effects are not those who have profited by the wrongs perpetrated in the past. It is therefore suggested that the appropriate remedy is the prosecution and punishment of the individual offenders, not the continued withholding of adequate rates to the carriers as a whole. In bank management this distinction has in large measure been recognized. The bank official who misapplies or misappropriates funds can do so only under the shadow of the penitentiary. But because there have been numerous instances of banking defalcations, no one would seriously suggest that banks generally should be prevented by law from raising the rate of discount in case competitive conditions warrant. Similarly in considering propositions involving more or less general increases of rates, the question should be judged in the light of the evidence of the adequacy or inadequacy of the carriers' revenues as a whole, and in the light of the reasonableness or unreasonableness of the particular rates proposed, and neither prejudged nor complicated by considerations of individual instances of corporate mismanagement.

The majority report in the instant case, despite the more unfavorable showing made by the Western roads, contents itself with finding that—

the relative profitableness of their business, taking the roads as a whole, has declined since 1901, and that the main cause effecting this result has been an increase in expenditure not offset by an increase in receipts.

Upon a far stronger showing in the instant case the majority report, instead of finding that the carriers' net operating income as a whole "is smaller than is demanded in the public interest," commits itself only to the proposition that the showing of "operating results and financial conditions of respondents" is "considered," and that certain particular increases are or are not justified. In view of the fact that one of the principal contentions, if not the principal contention, in the case was the general inadequacy of the carriers' revenue as a whole, and in view of the fact that the statute requires that whenever an investigation shall be made, it shall be the duty of the commission to report thereon, stating its conclusions, it would seem to be appropriate to enunciate a conclusion upon the question of sufficiency of revenue. The public and the parties to the case are entitled to a clear, unmistakable finding upon this matter.

There are certain additional considerations in the present case which strengthen the conclusion that a finding of inadequacy of operating income is alone consistent either with the pronouncement in the Five Per Cent Case or the facts of record herein. The aggregate freight advances there proposed were estimated to yield approximately \$50,000,000 per annum additional revenue, or about 5 per cent of the total freight revenue. The increases ultimately permitted are estimated to amount to 50 or 60 per cent of that amount. The total increase in freight rates sought in the present case falls below \$10,000,000 annually and amounts to approximately 1.2 per cent of the total freight revenues. Even with the increases asked for in other related proceedings, the total increase in revenue sought would fall within 2 per cent of the total freight revenues for 1914. In other words, the aggregate increase in freight revenue would be both absolutely and relatively far below the increases proposed in the Five Per Cent Case.

Upon the showing of record in this case as outlined in the majority report, and in the light of what was done in the *Five Per Cent case*, it seems to me impossible to avoid the conclusion that the carriers before us have, as a whole, abundantly demonstrated that their operating income is smaller than is demanded in the public interest; and equally impossible to escape the conclusion that the interstate rates should upon proper showing, be increased and that appropriate changes, if required, in state rates, should be made subsequently.

Findings on Miscellaneous Commodities—As indicated in the majority report, the increase in annual revenue estimated to

accrue, if the proposed rates were justified, amounted to \$7,604,247. The four principal contributors to this amount were (1) grain and grain products, (2) live stock, (3) packing-house products, (4) coal. These four were estimated to yield \$7,166,000, approximately, out of a total of \$7,604,247. The miscellany of minor articles was estimated as capable of yielding but \$438,000 in the aggregate. It is therefore apparent that if a substantial increase in revenue were to be obtained, it would have to come principally from the four major contributors. On only one of the four, and that the smallest, are increased rates found justified by the majority report, and even here only a part, although the greater part, of the proposed increase is accorded. Increased rates are not found justified on all of the minor commodities, broom corn and cotton piece goods being instances in point. The aggregate increases of revenue permitted under the majority report will hardly exceed \$1,600,000, or about one-fourth of 1 per cent of the total freight revenue of these carriers for 1914.

In so far as the majority report finds justified the increased rates on coal, hay and straw, fruits and vegetables, rice, and on certain miscellaneous imported goods, I concur therein, not only on the grounds cited in the majority report, but also upon the ground of the attested inadequacy of the carriers' revenue. I also concur in the finding on broom corn the proposed increased rates are not justified.

In the matter of grain and grain products, it is evident on the record that, taking grain products alone, the proposed increase of 1 cent per hundred pounds is amply justified. The products do not load much more than half as heavily as the grain. The tare weight carried is practically twice as great. The car earnings for the same length of haul are about one-half as great on the product as on the grain. The case presented for the increased rate on grain is more doubtful.

The proposed increase on cotton piece goods appears to me to be justified. The record established that their value per ton is approximately \$600 and that in certain instances they are more valuable than many commodities which take the first-class rate. The increases on cotton piece goods as between various points may be out of harmony with each other, and on that ground their denial may fall within the flexible limit of judgment which belongs to the power to fix rates. But the total increase in revenue to be derived from this increase is not of record, and may not be very material in the aggregate. In the case of live stock and the products thereof the reverse is true. The revenue that the increases would produce is estimated at \$3,000,000 annually, and the principle on which these are denied seems to me to be a novel and a dangerous departure from the established procedure of the commission. Their denial seems to me also to be unwarranted upon the facts of record.

Rates on Live Stock.—It is submitted that these comparisons confirm the accuracy of the conclusion that the present effective rates on live stock are too low.

The majority opinion, however, denies the increase proposed, not specifically because the respondents have failed to meet "the burden of proof to show that the * * * proposed increased rate is just and reasonable," but upon the ground as stated in the opinion of the majority that:

Protestants claim that a large proportion of all live stock here in question moves on state-made rates or on rates controlled by state rates. They further claim that state rates on live stock are generally much more below the level of the interstate rates on live stock than rates on almost any other commodity, averaging perhaps 30 per cent. less. There may be differences of opinion regarding the exact figures, but no one has questioned the correctness of these allegations. Herein is found an important fact which doubtless modifies the surface indications of the above tables very materially. There is no claim made here that the interstate rates on live stock are not adequately remunerative, but rather that the revenues derived both from intrastate and interstate traffic are inadequate.

This novel contention put forward as a reason of denying the increases here sought does not seem to comport with the record

or with the principles frequently announced and hitherto uniformly adhered to by the commission.

Interstate and Intrastate Rates.—It may be conceded that some intrastate rates are lower than some interstate rates, and possibly as to some intrastate rates the expressed opinion of protestants' witness that they are "too low" is correct. But upon this record it can not be affirmed that all intrastate rates, or an average thereof, are generally below interstate rates, and it seems to be conclusively proved that the estimate that 50 per cent of the live stock move on intrastate rates is far from accurate.

But even if the record furnished full and sufficient evidence in support of the allegations which are adopted as the basis of the conclusion of the majority, I could not concur in the holding that the existence of lower intrastate rates requires the commission to condemn increased interstate rates otherwise shown to be just and reasonable. It is true that this commission has always given consideration to state rates. We make comparisons between rates, state and interstate, for the purpose of deciding the question of the reasonableness of rates under investigation. We may condemn an interstate rate which from a comparison with intrastate rates voluntarily maintained by the carriers appears to be unjust and unreasonable, but in so doing we condemn the rate because it is unjust and unreasonable.

What the majority proposes to do is to deny increases in interstate rates because lower intrastate rates have not been increased and that in a case in which it is shown that applications for increases in certain state rates are pending. It is to be assumed that state tribunals will do their duty, and that if state rates are too low, they will permit them to be increased. Should these state tribunals fail to act, then in a formal complaint where the issue is directly presented and where the states may, if they choose, be heard, this commission has the authority and duty to require the removal of any undue discrimination against interstate commerce that may be shown, and in doing so the commission is not bound to reduce interstate rates "below what it may deem to be a proper standard fair to the carrier and to the public."

Inadequacy of Revenues.—I am individually of opinion that our duty in the present case requires us in frankness to make a finding upon the general issue of the alleged inadequacy of the revenues of the carriers collectively. The carriers, the protestants, and the country are entitled to know the conclusion of the Commission upon this point, and not to be left with a confusing mass of detailed evidence and isolated conclusions upon single matters involved therein. The three previous general rate advance cases have unquestionably held that the Commission may make a finding upon this general question and may employ such a finding to determine, in connection with other relevant testimony, the justice and propriety of permitting particular increased rates to become effective. In the present case the general issue is simply not met, and in passing upon particular rates proposed to be increased a novel doctrine is for the first time invoked to disallow increased rates save where the specific evidence relating thereto makes a refusal manifestly impossible. The failure to follow established premises to their legitimate conclusion only beclouds the principles upon which the Commission may be expected to act in future and leaves nothing certain but uncertainty.

In the matter of rate regulation and fixation we have reached a point where one of two courses ought deliberately to be chosen and clearly announced. If, despite increased costs not offset by increased revenue, increases in rates are to be denied, except where in individual instances gross injustice would be occasioned by their denial, the carriers ought to be apprised of this policy, so that they may set their house in order, if they can, against such a situation. If, on the other hand, we are to acknowledge in general, what we are perforce compelled to admit in detail, just and reasonable increased rates should be permitted not grudgingly, but with such fair measure of allowance as will indicate that the transportation industry is

entitled in the interest of the public to earnings sufficient to provide a service commensurate with public needs.

COMMISSIONER HARLAN'S OPINION

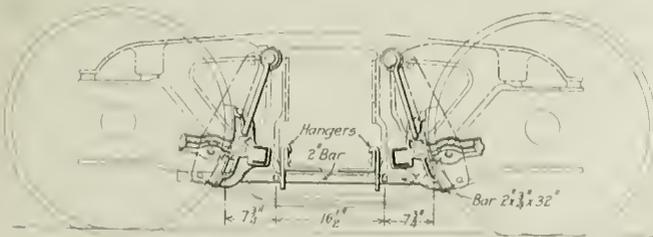

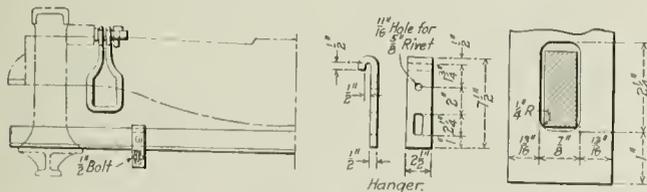

Commissioner Harlan's dissenting opinion is in part as follows:

I concur in the increases approved in the majority report. I share also the conviction of my Brother Daniels that the present rates on live stock, fresh meats, packing-house products, and cotton piece goods are also unduly low and may properly be increased. I am unable therefore to assent to the denial by the majority of the increases proposed by the respondents in the rates on those commodities. While the record shows that the revenue earned upon grain is fairly satisfactory, grain and grain products, generally speaking, have long taken a common rate throughout this territory, and considered together as one kind of traffic, the record, in my judgment, justifies an increase in rates on substantially the basis proposed by the carriers.

Several thoughts are suggested by the immense record before us in this proceeding: (a) Too much time and labor are expended in these recurring rate contests, and some way should be found under legislative authority for arriving at results more promptly than is now possible under our present powers and practices. (b) The Commission should have authority, as we have often pointed out, to fix the minimum as well as the maximum rate. The sincere efforts of carriers toward a fair and nondiscriminatory rate adjustment often fail because of the necessity of submitting to the rates and practices initiated by weaker and more circuitous lines in their pursuit of traffic. (c) The time is rapidly approaching when the public interest will demand a more effective control by the Commission over rates initiated or compelled by state authorities. With respect to a great volume of traffic interstate commerce is now bearing a burden under rates admittedly reasonable that should be spread over state commerce as well. (d) A uniform classification upon a normal basis, applicable throughout the entire country, and with it a normal rate structure in some such form as was prescribed in the *Express case*, 24 I. C. C., 380, having sufficient elasticity to allow for varying operating costs, density of traffic, circuitous routes, competitive and other conditions under which transportation is conducted in different parts of the country, may be possible of attainment, and I am satisfied that some effort looking to that end should be made.

SAFETY HANGER FOR BRAKE BEAMS

A brake beam safety hanger has recently been developed by the Elliott Company, 1807 North Camac street, Philadelphia, Pa.,

Elliott Brake Beam Safety Hanger

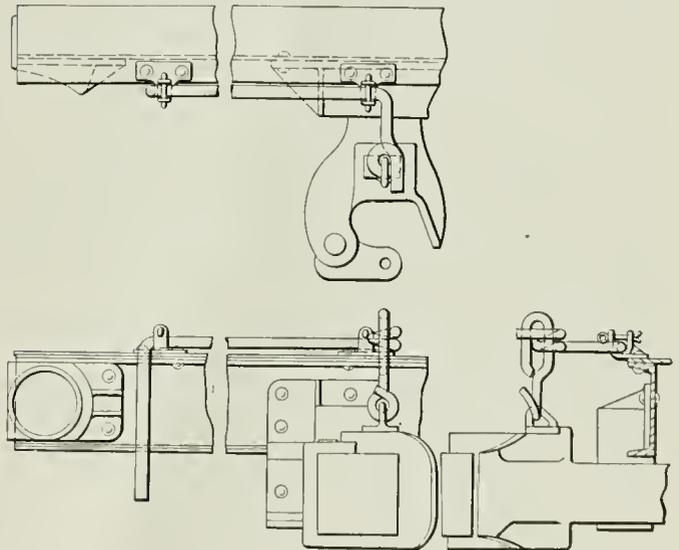

which is extremely simple and offers practically no obstruction to the removal and replacement of the beam.

The safety hanger is attached to the spring plank and under

normal conditions is entirely free from contact with the brake beam or brake head. It consists of a rectangular bar 2 in. by 3/4 in. in section and 32 in. long. This is supported by two hangers lipped over the vertical flange of the spring plank and riveted to it. These are shown in detail in the drawing. The bar is slipped into place through slots in the hangers and secured by means of 1/2-in. bolts placed through the bar at either end just outside of the hangers. In this position the device offers effective support to the brake beam should the brake-beam hangers fail. Should the removal of a brake beam be desired the bar may be slid back at one end as shown in the drawing by removing one of the 1/2-in. bolts, in which position it offers no obstruction to the removal of the beam. This safety hanger is in use on the Philadelphia & Reading.

COUPLER RELEASE RIGGING

The purpose in the design of the coupler release rigging shown herewith was to eliminate as many parts as possible and to facilitate the application of the device to the eye of the coupler lock and the end of the car. It is known as the Singlelink release rigging, from the fact that but one piece is used between the uncoupling lever and the eye of the coupler lock, and is manufactured by the National Railway Devices Company, Chicago.

Singlelink Release Rigging

The upper end of the link is made with an elongated eye, which provides for all motion of the coupler relative to the end sill, and the lower end is provided with an open eye.

The uncoupling lever is secured to the end sill of the car by means of open brackets, which are closed by cotter pins. In applying the rigging to the car the lower end of the link is first hooked into the eye of the coupler lock, the lever being then placed in the brackets and secured by the cotters. The lever connection to the link is provided with a tail which serves to prevent the link from turning and sliding out of place.

FERRY TRAFFIC BETWEEN SWEDEN AND DENMARK.—On account of the increased traffic it has been deemed advisable to put another ferry on the Copenhagen-Malmö trade, and negotiations are said to be pending between the Danish and the Swedish State Railway Departments as to which country shall build the new ferry.

COAL USED ON THE EAST INDIAN RAILWAY.—The output of coal at the collieries of the East Indian Railway Company in 1914-15 is reported to have been 367,051 tons, of which 283,084 tons were steam coal. The quantity of steam coal consumed by the undertaking (including coal purchased) in the same period was 449,058 tons, as compared with 424,345 tons in 1913-14

General News Department

The shop of the Northern Pacific at Livingston, Mont., is running full time for the first time since 1909.

On the 30th of July 31,189 tons of coal were loaded into vessels over the docks of the Baltimore & Ohio at Lorain, Ohio, believed to be a record tonnage handled by one machine.

The Vandalia, the Chicago & Eastern Illinois, the Central Indiana, the Evansville & Indianapolis and the Terre Haute, Indianapolis & Eastern have posted notices informing their employees that they have rejected the provisions of the Indiana workmen's compensation law.

The Georgia legislature, after long discussion, has passed the bill to establish a commission to attend to the leasing of the State-owned railroad, the Western & Atlantic, from the time when the present lease expires, which will be about four years hence. The governor is to be a member of the commission.

The board of arbitration which last spring decided the controversy between the western railroads and their engineers and firemen, regarding wages and conditions of employment, has been asked to reconvene to decide disputed points in its award. Both the Conference Committee of Managers and the officers of the brotherhoods have formulated their interpretations of the award, and there are many points of disagreement.

The five larger railroad brotherhoods held a meeting at Altoona, Pa., last Sunday, at which, it is said, one thousand members were present, the chief business being, according to the reports, a discussion as to how best to secure the election to the next legislatures of men favorable to the bills which the brotherhoods desire to have passed. Another large brotherhood meeting is scheduled to be held in Pittsburgh, August 29.

The cause of the derailment of a Denver & Rio Grande fast passenger train at Springville, Utah, on August 2, has been cleared up by the surrender of one Harry G. Hontz, apparently insane. He confesses to the burning of a station at Ulster, Pa., and to the wrecking of signals on the Southern Pacific. A special agent of the Denver & Rio Grande identifies the man as one who had been arrested for wrecking a signal and who was accused of causing a speeder to wreck a mail train.

Mr. McCrea, General Manager of the Long Island Railroad, thinks that the public has actually heeded the railroad's persistent warnings to cross tracks with care. There has been no serious accident at a crossing for sixty days—the days of the heaviest automobile traffic on Long Island during the year. But one person has been injured in these two months, and that only to the extent of a broken arm. But there has been an appalling number of "near-accidents," and he thinks that certain crossings will never be safe unless the gates are kept down and only raised when a vehicle is to cross, or unless wayfarers are required to come to a full stop before passing over the tracks.

In the first six months of 1915 the Pennsylvania Railroad made about 2,000,000 efficiency tests, and 99.9 per cent. of them showed perfect observance of all rules. Over 10,000 tests were made with signals set at stop, and in only 13 cases did the trains fail to stop before passing the signal by so much as a foot. The number of employees killed in the first six months of 1915 was 28½ per cent. less than in the corresponding period of last year—85 this year, 119 last year. This, it is said, was not due to a heavy decrease in train mileage, as passenger train miles were only 6 per cent., and freight train miles 8 per cent. less than in 1914. No passenger has been killed in a train accident on the Pennsylvania since 1912.

Valuation Hearing

The Interstate Commerce Commission will sit in Washington September 30, October 1 and 2, to hear oral argument upon the fundamental principles involved in the work of making valuation of the property of common carriers. It will hear argument on

all questions that may be deemed appropriate to be considered as arising under the valuation act. Representatives of state commissions, as well as the carriers, may participate in the argument, and all parties in interest will be allowed to file briefs.

Railroads in War

The Bureau of Railway Economics has just completed the compilation of a bibliography on the use of railways in war, which should be valuable to anyone interested in determining the magnitude of the influence of railway communication upon modern methods of warfare. The compilation is particularly valuable for the reason that in the case of most countries studies upon this subject are of a more or less ephemeral nature. For this reason the literature is very largely confined to articles in periodical publications, pamphlets, official reports and regulations, etc., which ordinarily are difficult to locate outside of the most comprehensive libraries. Following its usual custom in lists of references of this sort, the bureau gives all available information as to author, language, date and place of publication and reference to the library where the publication may be found.

The list is divided for convenience of reference. A "general" head covers nearly one-half of the references. The remaining part covers the United States Civil war, 1861-1865; Franco-Prussian war, 1870-1871; South African war, 1900-1901; Russo-Japanese war, 1904-1905; European war, 1914-1915; wars in Mexico; wars in the Philippine Islands. To the list of articles having special relation to railway service and arrangements in these several wars are added lists of articles on "Armored Trains" and "Hospital Trains." The references cover upwards of 300 treatises in English, French, German, Spanish and Italian. There are, however, some duplications covering in whole or in part translations into English of articles originally appearing in another language.

A Nineteenth Century Superintendent

[B. A. Porter, in Illinois Central Magazine]

Long years ago, to be exact, in the year of our Lord 1884, Superintendent Frye disembarked from Train No. 6 at Okolona, Miss., a division terminal on the Mobile & Ohio. This was our new superintendent's maiden trip. * * * It required about one minute for the aforesaid Frye to introduce himself to Agent Allen, Chief Clerk Cox, Yardmaster Brown, and the other fifteen or twenty lesser lights who helped to run up an unnecessarily heavy pay roll at this important station.

Superintendent Frye spent three hours on this trip, and if ever a station and yard and roundhouse organization got a trimming Okolona did on this fatal day. I got a promotion. When Frye landed we had a nice "kid" organization. Billie Griffin, messenger boy; Scrap Morris, caller; Skinny Porter, car checker. When Frye left Skinny Porter was assistant chief clerk and had assigned to him the duty of delivering messages, calling crews and checking cars, and to his salary of \$30 there was added \$15, which had formerly been paid to Operator Scales by the government because the negro porter took the maximum and minimum temperature and rainfall; for this increase the new assistant chief clerk was to be on hand at 2:47 a.m. to ticket an early morning train and check baggage.

Mr. Frye also pointed out the fact that there were enough links and pins scattered around the yard to last us nearly a year; that the ink on hand would run the auditor's office for one year, that the stationery would supply Mobile, Meridian and Cairo for one-half year, that we had three warehouse and two cotton trucks more than were needed; that the water tank had been running over for two hours, the pump still running, and the pumper asleep; pointed out many other unnecessary expenses, and wound up his short stay by stopping two truckers and weighing their load of inbound freight with the result that 220 pounds moving on a 72c. rate was added to the revenues.

After Frye left the "kid" organization held a called session. Billie Griffin and Scrap Morris voted "strike"; Skinny Porter, stuck on his new position as assistant chief clerk, voted not to tie the road up, and as a result lost one tooth and had one eye blackened for being a traitor.

Twenty-five years healed this breach and the last time the aforesaid Porter visited his early haunts, Attorney Griffin in a \$5,000 touring car took him for a ride and pointed out his 3,000-acre prairie plantation, and also the handsome residence of Dr. Morris, who was away for the summer in Canada.

The assistant chief clerk, no longer "Skinney," as his belt measure is now 46, plods away and thinks of Frye every day.

Superintendent Frye was correct so far as the necessity for economy was concerned, but in the application of the plan there was no permanent upbuild, such as we have on our line under the present management. Under his system there was no investigation to determine the needs; things were seen to be wrong and instant one or more employes lost out. No one dared to think and suggest; everyone lived in dread as to what would befall him next. The constant desire which is now shown on the part of 90 per cent. of our employes to want to help make everything just a little better, the pride we feel for working for what we believe to be the best railroad in the world, was lacking. No appeal to pride, no co-operation. * * *

The Erie Flood

The flood at Erie, Pa., on the afternoon and evening of August 4 in which, because of the breaking of a dam, about thirty persons in the city were drowned, is said to have caused a longer interruption in railroad service through that city than had been occasioned by a flood before in twenty years or more. The interruption of train service, however, was important more by reason of the magnitude of the traffic—the immense through passenger business of the Lake Shore four-track line and the heavy freight movement over the New York, Chicago & St. Louis—than by the length of time that it took to restore the track—which was only about ten hours. However, this was but a single track, and the restoration of normal passenger service took about eighteen hours, and of the Nickel Plate tracks more than 24 hours. This road had a washout about 300 ft. long, where it was necessary to build a trestle. The Lake Shore had only one serious washout; this was three miles east of Erie, and was about 60 ft. long and 12 ft. deep. Water ran over the tracks for several hours. Traffic was stopped at 8 p. m.; the roadway department was able to begin work about 1 a. m., and trains were put through at 6 a. m. Trains were detained for about 12 hours. The Twentieth Century Limited went through Detroit for the first time. Neither road had any derailments. At French street, Erie, a two-story house, carried off its foundation by the flood, lodged close to the Lake Shore tracks but no serious harm was done to the railway.

MEETINGS AND CONVENTIONS

The following list gives the names of secretaries, dates of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next meeting, October 21-23, 1915, Boston, Mass.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next meeting, August 19-20, 1915, San Francisco, Cal.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 8 W. 40th St., New York. Annual convention, October 4-8, 1915, San Francisco, Cal.

AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—H. G. McConaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichy, C. & N. W., Chicago. Next convention, October 19-21, 1915, Detroit, Mich.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.

ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Annual meeting, 2d Tuesday in October, 1915, New York.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual meeting, October, 1915.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, C. H. & D., Lima, Ohio. Annual meeting, August 17, 1915, Philadelphia, Pa.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next meeting, October 19-21, 1915, St. Louis, Mo.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 14-16, 1915, Detroit, Mich.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.

RAILROAD MEN'S IMPROVEMENT SOCIETY.—J. B. Curran, Erie R. R., 50 Church St., New York. Meetings, alternate Thursdays, October to May. Assembly Rooms of Trunk Line Association, 143 Liberty St., New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1063 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Next meeting, October 5-7, 1915, Chicago.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Annual meeting, September 14-17, 1915, Salt Lake City, Utah.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Annual meeting, September 14-16, 1915, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, C. R. I. & P., 1134 La Salle St. Sta., Chicago. Annual meeting, October 19-21, Colorado Springs, Colo.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.

TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Body House, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEWARK.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, 559 Broad St., Newark.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Hotel Astor, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Agt., Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., East Buffalo, N. Y. Annual meeting, September 7-10, 1915, Chicago.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.

WESTERN CANADA RAILWAY CLUB.—L. Koh, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Building, Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

Traffic News

The Baltimore & Ohio has opened a new freight station in Brooklyn, N. Y., with 200 feet water frontage.

Formal announcement is made of the discontinuance of service by the Pacific Mail Steamship Company on November 2. On that date the company will withdraw its five liners. It is reported that they have been sold to a Chinese syndicate.

During the month of June, 1915, the principal fast freight trains run by the New York Central lines between New York and Chicago arrived on time every day, making a perfect record. The record for the month of July was almost as good, but one delay being recorded, and that only 30 minutes.

The forty-third annual convention of the Traveling Passenger Agents' Association is to be held at Boston on October 4 and 5. Special trains will be run over the Michigan Central from Chicago to Niagara Falls, and the Cleveland, Cincinnati, Chicago & St. Louis from St. Louis and Cincinnati to Niagara Falls, thence over the New York Central and the Boston & Albany to Boston.

George Niedringhaus, of St. Louis, announces that definite plans for a \$3,000,000 by-product coke plant, using Illinois coal, will be made public in the near future. Upon this basis the St. Louis Republic urges the construction of docks and terminals for the utilization of the 8 ft. channel of the Mississippi river, with a view to assuring the future of the city as a steel center.

The Pennsylvania Railroad announces that direct through cars will henceforth be run daily from New York City freight stations to all of the more important cities in the Northwest, in the Missouri river territory and in the Southwest, regardless of the quantity of freight offered. Heretofore small consignments to far Western points have been transferred at various junction points en route.

The Nashville, Chattanooga & St. Louis has a new demonstration and lecture car, and with it the Industrial Department of the road has made a tour through the Sequatchie Valley where, during three days, over 2,500 farmers and their wives and children were entertained with stereopticon views and lectures on farm topics, improved agricultural methods, and better livestock. It is proposed to put on the car a motion picture machine to show motion pictures of farm scenes along the road.

Under the direction of the Industrial Department the car is making a tour of the Shelbyville and Sparta branches this week. In this work the road has the co-operation of the agricultural and dairy experts from the University of Tennessee. To aid in the introduction of pure-bred cattle on the farms along its road, this company has bought a herd of shorthorn cattle from a famous breeder, eighteen cows and heifers and four bulls. These animals are descended from stock imported from England, and are said to be recognized as the best breed for beef and milking purposes.

Passengers traveling in chair coaches on the Missouri Pacific-Iron Mountain may now have a light lunch served to them in their seats without the necessity of going into the dining car. This is a recent innovation and, according to officers of the road, is proving popular. A waiter from the dining car passes through the train during meal hours to take orders. This service is in effect on all trains that have dining cars, buffet or parlor-cafe cars. Freight and passenger service have been resumed on the National Railway of Mexico, between Laredo, Tex., and Monterey, Mex., after a suspension of 15 months.

The Southern Pacific now takes canned goods, beans, asphalt and barley from San Francisco and other California ports to New York at 40 cents per 100 lb.; this by rail to Galveston and thence by steamship. The rate applies only to shipments of at least 40 tons. The road has applied to the Interstate Commerce Commission for authority to make the same rate on oats, wheat and rice, with the same minimum. Between the same points the company takes dried fruit in boxes, minimum 30 tons, at 60 cents, and in sacks at 80 cents; and has asked for authority

to make lower rates on wine and alfalfa meal; wine 45 cents and alfalfa meal 50 cents; minimum, in both cases, 30 tons.

The principal railways of Canada, at the suggestion of the Railway Commission, have made a specially low rate—50 cents a ton for any distance up to 50 miles—for gravel in carloads for cities and towns, to be used in roadmaking. The request for a low rate came originally from Western Ontario, J. B. Armstrong, a member of Parliament, making the request of the Railway Commission that a low rate be ordered by the government. Chief Commissioner Drayton reminded the applicants that the commission could not justly require a railway to establish unremunerative rates, or any rate unfairly out of line with a basis high enough to maintain a satisfactory railway service.

Judge Elliott in the Maryland Court, at Baltimore, August 7, denied the application of the Baltimore & Ohio for an injunction restraining the Public Service Commission of the State from enforcing its order requiring the road to continue in use certain season tickets, which are declared by the road to be unprofitable. Of a number of commutation rate questions presented before the Commission recently several were decided in favor of the road and others against it. Judge Elliott held that the public should have the benefit of the lower rates until the Public Service Commission could present further facts and arguments, the question to be left open until the court should be in a position to issue or refuse to issue a permanent injunction.

Ohio coal operators are carrying on before the state commission a contest for the reduction of freight rates. A few weeks ago the Supreme Court approved reductions made four years ago by the state commission, following which approval the Hocking Valley, the principal respondent, filed new tariffs covering the reductions. The operators' complaint having been made before the reduced tariffs were filed, they are now in the position of having difficulty in holding the principal defendant in the case. The commission has held that for the time being, at least, the case against the Hocking Valley shall not be dismissed. In ruling out certain evidence which the railways desired to introduce to show that mining conditions and prices of production as between Ohio and outside coal fields, and not exorbitant freight rates, are responsible for present inactivity in Ohio mining centers, the commission declared the only question before it to be: "Are freight rates on coal within the state unreasonable and discriminatory?"

The State Public Utilities Commission of Illinois announces a hearing in Chicago on August 23 at 10 a. m., on the petition of various express companies for authority to advance certain rates. The scale of express rates applicable in Illinois adopted by the commission on February 1, 1914, proved to be an advance in some instances and a reduction in others. The express companies have proposed an advance, to become effective on September 1, and the commission has scheduled this hearing in order to determine what amounts of advance shall be allowed.

Effect of Proposed Advances in Texas Rates

With reference to state and interstate freight rates in Texas and the effect of the proposed increase in intrastate rates, for which an application is now pending before the State Commission, J. S. Hershey, general freight agent of the Gulf, Colorado & Santa Fe, has given out a statement explaining the views of the carriers. It has been suggested during the hearings before the commission that the increase would tend to divert the movement of traffic from interstate points of origin and that Texas railways would have their revenues curtailed rather than increased by obtaining greater revenues on intrastate than on interstate traffic.

Mr. Hershey says: "I should say, from a Santa Fe standpoint, that the proposed increase, which will affect the earnings of that line greatest, would be upon grain, grain products and hay, cotton, cotton seed products, fruits and vegetables, live stock, stone, sand and gravel. These commodities are all Texas products, and to the extent of their consumption within the State of Texas they surely have no outside or interstate interference, so that whatever increase might be made in the rates by the Texas commission for the movement of these commodities they would not be interfered with in any manner by outside sources. I think this same view of the proposition is manifestly apropos of practically all Texas products to the

same extent that they are consumed in Texas, outside competition within this state being nil. This explanation is made in order to correct any impression which may prevail that the rate adjustment as proposed by the carriers will operate to the disadvantage of Texas shippers and to the advantage of interstate shippers. Certainly no such purpose was in the mind of the carriers when these advanced rates were proposed, and assurances have been given to the commission that there was no desire on the part of the carriers to divert any traffic from its present channels, but the desire was merely to obtain a proper remuneration for the service the carriers were performing."

Twenty Millions in Gold

On Tuesday night last the American Express Company brought into New York City from Halifax, N. S., seven carloads of gold; \$19,534,200, in 700 boxes, which had been shipped by the British government to J. P. Morgan & Co., its New York bankers. The gold is said to have been brought from England to Halifax by a vessel of the British Navy, and the transportation throughout from London to New York was carried out with the greatest possible secrecy. The train came via Bangor, Me., Boston, Mass., and Chatham, N. Y., and was preceded by a pilot engine. It is said that in the same cars, or one of them, were securities valued at \$35,000,000; securities owned in England to be deposited in New York as collateral for loans. This is believed to be the largest shipment of gold ever trusted to a single vessel. There was a little delay at Halifax, to make the necessary arrangements with the express company; and, counting interest on the gold at 5 per cent. per annum, the delay incurred a trifle of, say, \$2,500 additional expense.

Car Surpluses and Shortages

The committee on relations between railroads of the American Railway Association, in presenting statistical statement No. 7 giving a summary of freight car surpluses and shortages for August 1, 1915, says:

The total surplus on August 1, 1915, was 265,131 cars; on July 1, 1915, 276,421 cars, and on August 1, 1914, 198,998 cars.

The surplus for August 1, 1915, shown above, includes figures reported since the issue of statistical statement No. 6, reported in the *Railway Age Gazette* of July 16, page 136.

The decreases in surplus under July 1, 1915, are chiefly in Groups 2 and 4 (East) in coal and gondola cars. There are also decreases in the surplus of box cars in Group 5 (South-east) and Group 8 (Central), which are offset by an increase in the surplus of box cars in Group 6 (Central North).

The total shortage on August 1, 1915, was 888 cars; on July 1, 1915, 785 cars, and on August 1, 1914, 2,333 cars.

The figures by classes of cars follow:

Classes	Surplus	Shortage
Box	132,342	352
Flat	12,666	99
Coal and Gondola	74,488	414
Other	45,635	23
	265,131	888

BRITISH LOCOMOTIVE EXPORTS.—The exports of locomotives from the United Kingdom are showing a sharp falling off, although when the comparison is extended to 1913 the outlook is less serious. The value of the engines exported in June was \$1,091,000, as compared with \$1,480,000 in June, 1914, and \$1,180,000 in June, 1913. In the six months ended June 30, 1915, locomotives were exported to the value of \$5,890,000, as compared with \$10,000,000 in the first half of 1914, and \$6,013,000 in the first half of 1913.—*Engineering*, London.

A NEW INDIAN RAILWAY.—The Teesta Valley Light Railway in Bengal is constructed, like the Darjeeling-Himalaya line, upon a 2-ft. gage, and the locomotives are of a special hill-climbing type. Although the new line is temporarily intended for goods traffic only, a journey from Siliquri to Teesta is so picturesque that there is little doubt that it will ultimately attract many tourists. At present the line stops short at Reang, but in a few months it will be carried another five miles to Teesta, thus bringing a traveler within easy reach of Kalimpong. The Teesta river forms the boundary between Sikkim state and the Darjeeling district. Near Sivok, the first station past Siliquri, the Teesta is 750 ft. wide, and at this point a suspension bridge is to be erected for the purpose of opening up Duars traffic. Several fine bridges occur upon the Teesta Valley line, notably at Sivok, Kalijore and Reang. Some of the spans on these bridges are 100 ft.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The South Bend, Ind., chamber of commerce has filed a complaint with the Interstate Commerce Commission against the withdrawal of proportional class rates applying to Northern Indiana cities to the Ohio river on traffic destined for the south-east.

The Southern Pacific Atlantic steamship lines have filed an application with the Interstate Commerce Commission for permission to quote low commodity rates from New York pier to California points without making corresponding reductions to intermediate points. A hearing before Examiner Thurtell has been set for September 1, in New York City.

Application Under the Panama Canal Act

In re Southern Pacific's ownership of stock in Sacramento Transportation Company. Opinion by Commissioner Clark:

The commission grants the application of the Southern Pacific and the Central Pacific to retain their control of the Sacramento Transportation Company, which owns and operates a line of steamboats on the Sacramento river and connecting waters. It is held that Southern Pacific competes for traffic with the transportation company, but that the operation of the boat line is in the interest of the public. (34 I. C. C., 648.)

Rates on Cottonseed Oil from Points in Oklahoma

Oklahoma Cottonseed Crushers Association v. Missouri, Kansas & Texas et al. Opinion by Commissioner Meyer:

The commission finds that the present grouping of points in Oklahoma, producing cottonseed oil, cake, meal and hulls, is unjust and unreasonable, and that the present blanket rates are unreasonable and prejudicial. The commission is unable to formulate conclusions regarding the details of a readjustment, but it is believed that the establishment of a distance tariff applicable from all points in the present blanket may be a solution of the difficulties. It therefore suggests a tentative schedule, worked out on the mileage basis. A further hearing in the case will be held at Kansas City, Mo., on October 11, 1915. (35 I. C. C., 94.)

Grain Milled in Transit at Lawrenceburg, Ind.

Opinion by Commissioner McChord:

The commission in this case rules against the reasonableness of a Baltimore & Ohio tariff, the effect of which would be to increase the rates from East St. Louis through Louisville or Cincinnati to points in Southeastern and Carolina territories on grain milled in transit at points on its line between East St. Louis and Cincinnati. It was found that the proposed tariff would effect an unjust discrimination against the protestant, a milling company of Lawrenceburg, Ind., in favor of competitors at St. Louis, Louisville, Cincinnati, and also at points south of the Kentucky-Tennessee State line on the lines of the Baltimore & Ohio's connections. (35 I. C. C., 27.)

The Ogden Gateway Case

Opinion by Commissioner Harlan:

The commission in this case finds that the Union Pacific has justified a proposed cancellation of the joint through passenger fares now in effect in connection with the Denver & Rio Grande between points in the territory of the Oregon Short Line and points east of and including Colorado common point territory. The purpose of that course is to give to the Union Pacific and the Oregon Short Line, two of the lines forming a part of the Union Pacific system, a longer haul than they now enjoy on passenger traffic to and from the local territory served by the Oregon Short Line. The commission makes certain suggestions, however, relative to the continuance of through accommodations for the benefit of travelers desiring to pass over the routes at the lawful fares available. (35 I. C. C., 131.)

Demurrage Charges

Picher Lead Company v. St. Louis & San Francisco. Opinion by Commissioner Clements:

Upon a complaint alleging that the accrual of 615 days' debits in excess of credits, under an average demurrage agreement, during a certain period resulted from defendant's failure to construct a 60-ft. extension to complainant's unloading track, the commission finds that the demurrage charges were properly assessed. It happened that the so-called contract for the track extension was of an informal character, and appears to have been only a promise to comply with complainant's request therefor. But even had it been a formal written contract, the question of alleged damages resulting from its non-fulfillment would be one for determination by the courts, and not by the commission. Complaint dismissed. (35 I. C. C., 45.)

The Checking of Baggage on Combination Tickets

Opinion by the Commission

The commission finds that the Pennsylvania and the Baltimore & Ohio have not justified proposed rules prohibiting the through checking of baggage and rate of through parlor and sleeping car tickets on combination tickets. For a number of years travelers from New York, Philadelphia, Baltimore and other trunk line territory points to points in the South and Southeast have been able to check their baggage through to destination and to secure through Pullman car accommodations on combinations of tickets good only to and from the gateways to Southern and Southeastern territory. The Pennsylvania and the Baltimore & Ohio have proposed to abolish the practice. The rules assailed apply to combinations of all forms of tickets issued by respondents and by their Southern connections to and from the gateways involved, but most of the testimony relates to combinations involving the use of Southern carriers' mileage books or southeastern passenger association interchangeable mileage exchange orders, which result in lower fares than the published joint through fares. The respondents state that the rules assailed were intended primarily to protect their joint fares and to conserve their revenues. The Pennsylvania issues 1,000-mile mileage books which it sells at a rate of 2¼ cents per mile. Southeastern passenger association interchangeable mileage exchange orders sell at a rate of 2 cents per mile. On this basis the combination fare from New York to Atlanta, for example, is \$13.88, or \$3.42 less than the joint through fare of \$17.30. From New York the joint through fares exceed the combination mileage fares by \$1.74 to Richmond, Va.; \$3.03 to Asheville, N. C.; \$4.30 to Savannah, Ga.; \$5.26 to Jacksonville, Fla.; \$6.06 to New Orleans, La. The protestants, on the other hand, emphasize the inconvenience that will result to travelers if they must detrain at Washington, for example, to recheck their baggage and to secure Pullman car accommodations for the portions of their journeys beyond Washington. Under the proposed rule, a traveler presenting two straight fare tickets for transportation from a point on respondent's line to a southern or southeastern destination on a connecting foreign line, for which he had paid a sum in excess of the joint through fare, would be denied through baggage checking and Pullman accommodations. Such a provision is obviously unjust and unreasonable. It operates to subject the holders of all such tickets to an annoying and often prohibitory inconvenience, and goes beyond the avowed purpose of respondents to protect the joint through fares in which they participate. No carrier receiving the equivalent of its full local fare to the junction may, in respect of combinations of tickets severally subject to the act, whatever the character of the transportation issued and accepted by the connecting line, lawfully withhold provision for incidental services so constantly and universally in demand as those at which the proposed rules are directed. (While Washington, as an important gateway, has been taken as illustrative of the situation involved, the local tariffs carrying rates to Washington and other junctions of the Pennsylvania Railroad with connecting lines from points on the Pennsylvania Railroad were not suspended, and the right of checking baggage and securing Pullman accommodations from points on that line through those gateways has therefore been withdrawn. In accordance, however, with the views above expressed, the arrangements should without delay be restored at all junctions with other lines. Upon all the facts disclosed we find that respondents have not justified the proposed rules, and an order requiring the cancellation of the suspended schedules

will be entered.) Commissioner Harlan dissents. (35 I. C. C., 157.)

STATE COMMISSIONS

The Nebraska State Railway Commission has received two conflicting opinions relative to the validity of the public warehouse law passed at the last session of the Legislature. The attorney-general has given an opinion that the act is invalid and cannot be enforced. The dean of the State University Law School says the law is valid. The commission is inclined to take the latter opinion. The commission had been advised by the attorney-general previously that it had no authority to take other legal advice than his own; but the Supreme Court of the state has held that in extraordinary cases a state officer is not required to accept the services of the state's attorney.

The New York State Public Service Commission, Second district, has taken the first steps toward the enforcement of the so-called jitney bus law passed at the last session of the Legislature by applying to the supreme court for a permanent injunction restraining James E. Adams in Corning, and Elmer G. Booth in Rochester, from operating "jitney" lines without the consent of the local authorities or a certificate of public convenience and necessity from the commission. This statute requires any vehicle operating in competition with a common carrier to procure the consent of the local authorities, and to obtain a certificate of public convenience and necessity from the Public Service Commission before operating in the streets of any of the cities of the state. The statute in specific terms makes all persons and corporations engaging in the jitney business, as defined, common carriers and subject to all provisions of law as such.

The New York State Public Service Commission, Second District, has issued an order forbidding the railroads to collect a charge for "spotting" cars, or placing them on and collecting them from industrial tracks and roads. This charge was proposed to be imposed on both interstate and intrastate traffic. The Public Service Commission suspended it in the case of intrastate traffic pending the decision of the Federal Commission. The Interstate Commerce Commission has issued its order deciding against the reasonableness of the charge in the large field, and the Public Service Commission follows this decision. The carriers—all of the roads of importance in the State—have now filed triffs discontinuing the proposed charge. The charge was to have been made at 5½ cents a ton, with a minimum of \$2 a car.

PERSONNEL OF COMMISSIONS

The railroad commissioners of South Dakota have appointed Joseph E. Love engineer for the commission. Mr. Love was formerly in the engineering department of the Chicago, Milwaukee & St. Paul.

COURT NEWS

The two-cent passenger fare case of the State of Oklahoma, which is being heard at Oklahoma City, has been continued by the Federal Court until September 6, because of the state being unable to take up its cross-examination at the present time.

The United States District Court at Detroit on August 5, denied the petition of the Pere Marquette to increase its passenger rates. The petition for an injunction to restrain the state authorities from enforcing the two-cent rate was filed by the holders of the consolidated mortgage bonds of the road. The circuit court of appeals at Grand Rapids had previously held that the showing made by the complainants did not justify an increase, but withheld final decision to permit the filing of a supplemental bill, which is now disposed of adversely to the railway company.

Injuries to Mail Clerk—Proximate Cause

A mail car was equipped, in accordance with the postal regulations, with an iron bar across each door, for the protection of the clerk. Before the car left the terminal, and while the clerk was working in it, a man came in to clean the car and told the clerk that he was going to take out the bar. The clerk acquiesced in this, but told the man to be sure to put it back.

The bar was not put back, and, in its absence, the clerk fell from the car and was injured. In an action against the railway company, the Virginia Supreme Court holds that the road was not liable, as its employee was not acting within the line of his duty in removing the bar, and he could not bind the company by his promise to restore it. If the clerk relied on this promise, he did so at his own peril. The fact that the car was insufficiently lighted was immaterial, for that was not the proximate cause of the accident.—*Washington & O. D. (Va.)* 85 S. E. 482.

Notice of Injuries to Live Stock—Amount of Claim

A shipper gave notice of injuries to live stock, but the claim filed with the notice was not so large as the amount afterwards sued for. The Texas Court of Civil Appeals held that this did not defeat recovery; but the amount of the claim was a proper matter for the jury to consider in estimating the damages sustained.—*Pecos & N. T. v. Holmes (Tex.)*, 177 S. W. 505.

Injuries to Live Stock—Notice

Construing the provision of the interstate commerce law requiring written notice of injuries to live stock, the Texas Court of Civil Appeals holds that the object of the provision is to afford an opportunity to the railroad to investigate the merits of the claim; and where it admits the justness of the shipper's claim his failure to give notice is not prejudicial to the carrier's rights, and notice becomes unnecessary.—*Hovey v. Tankersley (Tex.)*, 177 S. W. 153.

No Duty to Inspect Simple Appliances

In an action by a station agent for injuries caused by a fall, the result of a bolt which held the tongue of a four-wheel baggage truck in place, working loose, it appeared that the agent had 11 years' experience in the work of handling trucks, and knew of the dilapidated condition of that in question. The Virginia Supreme Court holds that such a truck is a simple appliance, the duty to inspect which rested on the agent rather than the railroad, which was not liable.—*Southern Ry. v. Snow (Va.)* 85 S. E. 488.

Boiler Explosion—Evidence of Cause

In an action by a locomotive engineer for injuries caused by the crown sheet "letting down," causing an explosion, it was alleged that the crown sheet and its fastenings were weak and insecure. The plaintiff's evidence tended to show that sufficient water was kept in the boiler to cover the crown sheet until at least a few minutes prior to the accident. The theory of the defense, with which this evidence was not inconsistent, was that in running down hill, after ascending an upgrade for about eight miles, the water ran forward in the boiler, and because of insufficient water therein the crown sheet was left uncovered, causing it to be burned out. Expert evidence was adduced to show that this was the cause of the explosion. The only evidence of defect in the crown sheet was that of one of the company's boiler makers, who testified that, on examining the engine the day before the accident, he found five broken stay bolts (of which there were more than 400 in the crown sheet) and about six bolts pulling through the sheet. The St. Louis Court of Appeals held that the evidence did not justify a finding that the crown sheet, as distinguished from the stay bolts, was defective. An employe, suing for a personal injury, has the burden of proving negligence of the employer, and a casual connection between the negligence and the injury; and where the injury might have resulted from one of two causes, for only one of which the employer was liable, the employe must show with reasonable certainty that the cause for which the employer was liable produced the injury. Under this rule the plaintiff could not recover.—*Sparkman v. Wabash (Mo.)*, 177 S. W. 703.

Discrimination in Diverting and Expediting Shipments

The interstate commerce commission has declared that the privilege of diverting cars is of value to the shipper, and in order to avoid discrimination it is necessary for the carrier granting this privilege to publish that fact in its tariff, together with the conditions on which it may be used. The Norfolk Southern adopted a tariff and conditions on which diversions would be made, which provided that parties making request for change of

destination must furnish satisfactory proof of ownership and acceptable form of bond. In an action by the shipper of a consignment which was delivered without change of cars to the consignee in Boston, Mass., the complaint was that while in transit the railroad agreed to divert the shipment to another consignee in New York and failed to do so. It appeared that this agreement to divert was made over the telephone. The Virginia Supreme Court holds that the regulations were not imposed solely for the benefit of the carrier, so as to be capable of being waived at its pleasure. They were intended to place all shippers upon the same plane and prevent unfair preferences among them, and the carrier could not waive them and allow diversion in an unauthorized manner. It followed the analogous case of *C. & O. v. Ruckman*, 115 Va. 493, 80 S. E. 496, where it was held that "a special contract with a particular shipper, whereby a carrier agrees for the published rate to expedite an interstate shipment of freight and deliver the same on a designated day, gives to the particular shipper an advantage over other shippers, and makes a discrimination in his favor which is prohibited by the interstate commerce act; hence such a contract is void."—*Norfolk Southern v. Whitehurst (Va.)* 85 S. E. 438.

Liability for Injury to Passenger on Steps of Vestibuled Car

A passenger, while standing on the steps of a vestibuled car in a moving train, to which position he had been invited by the action of a baggage man in opening the vestibule doors under instructions from the conductor to let the passenger off at the next station, was knocked from the steps by the swinging shut of the vestibule door, which the baggageman had negligently left unsecured. A rule of the company posted in the car prohibited passengers from going upon the platform when the car was moving, and a New Jersey statute exempted the company from liability for injury to a passenger "by reason of" such rule. In an action for his injuries, the Circuit Court of Appeals, Third Circuit, held that, while the passenger may have assumed the ordinary risk in violating the rule, he was not bound to anticipate the negligence of the baggageman, which was the proximate cause of his injury, and was not barred of the right to recover by contributory negligence.—*Central of New Jersey vs. Hirsch, C. C. A.*, 223 Fed. 44.

No Power to Construct Private Tramroad Over Right of Way

The predecessor of the Seaboard Air Line bought a tract of 40 acres from the state, built a railroad across it and then conveyed the 40 acres to third persons without reservation of any right of way. The owners of the land subsequently claimed that the railroad company was merely a tenant by sufferance, or, at least, that they could use the right of way for any purpose consistent with the railroad's use of it. They proposed to build a private tramroad to haul logs across the track, which the railroad sought to enjoin. The Florida Supreme Court holds that the railroad had no authority to sell its right of way; it must be held by implication to be excepted from the conveyance of the 40 acres.

The law recognizes the right of the public to have public roads cross railroad tracks, but makes no provision for a private tramroad. Common-carrier railroads as "public utilities . . . must be safeguarded for the safety of persons and property in transit." *Seaboard Air Line vs. McRaney (Fla.)* 68, S. E. 753.

Limitation of Powers of Railroad Companies

The Georgia Court of Appeals holds that it was beyond the powers of the president of a railroad incorporated under the general laws of Georgia as a common carrier, either with or without the consent of the board of directors, to give funds belonging to the corporation for the erection of a public school, or for the purpose of building up or promoting the town in which the school is situated, even though the school or town be located on the line of the company's road and its transportation business thereby be increased. A vote executed for such a purpose could not bind the corporation where the payee had full notice of the unauthorized purpose for which the vote was given. The court cited *Military Interstate Assoc. v. Savannah T. & I.* of 11, 105 Ga. 420, 31, S. E. 200, where the Supreme Court treated as ultra vires and void a subscription by a railroad to the capital stock of a corporation organized to furnish amusement to the public at a point on the line, and which therefore might inci-

dentally increase the road's transportation business.—Brimson, etc. (Ga.) 85 S. E. 634.

Validity of West Virginia Two-Cent Fare Law

The Public Service Commission of West Virginia sought by mandamus to compel the Baltimore & Ohio to obey its order requiring the railroad to conform to the provisions of Chapter 41, Acts of the Legislature of 1907, limiting railroads in their charges for the transportation of passengers and their baggage to two cents a mile. The railroad did not deny that the law was in force, and was not repealed by the public utilities act, but it claimed that it was confiscatory. It was held by the West Virginia Supreme Court that the act remained the paramount law on the subject, binding upon the railroad, until in the first instance, upon application by the railroad, or by some one injuriously affected by the act, or upon the initiative of the Public Service Commission, the rate had been investigated by the Commission and judicially determined to be unreasonable or confiscatory as to the Baltimore & Ohio, and therefore invalid. Until then or until the act had been otherwise amended or lawfully nullified, the Public Service Commission, as prescribed by the act creating it, had jurisdiction to compel observance of the act by the railroad. Until the Commission had investigated and determined that the rate complained of was unreasonable and invalid as to the Baltimore & Ohio, the courts could not interfere.—State vs. B. & O. (W. Va.) 85, S. E. 714.

Strict Construction of Air-Brake Law

The United States District Court for the Northern District of Ohio, Eastern Division, in the case of the United States vs. Pennsylvania Company, in a decision handed down July 2, penalizes the railroad on 34 counts for hauling 33 freight cars, all in bad order, without using air brakes. The decision by Judge Clarke, says:

"Where a carrier operates a train without the required percentage of air brakes being in use, due to the fact that the empty bad order and chained up cars composing such train are in condition such that the operation of the air brakes is not reasonably possible, and fails to establish that it was not reasonably possible to have placed these cars in such condition of repair, temporary or permanent, that the air brakes could have been connected up and used, such a movement is in violation of the air-brake provision of the safety appliance acts and does not come within the proviso to the act of April 14, 1910.

"The proviso exempts from the penalties of the acts only a movement of equipment which becomes defective when in use on a line of railway, and then only from the place where first discovered to be defective to the nearest available place where repairs can be made, and where such movement is necessary in order to make such repairs and they can not be made except at such repair point.

"The failure on the part of the carrier to have repair yards of adequate capacity or to provide a sufficient force of men to repair cars which may become defective in the vicinity of its established yards can not be permitted to create the necessity which the proviso declares shall relieve a railroad from liability for the movement of defective cars."

This is a civil action. The petition contains 34 counts. The first 25 counts are based upon the hauling of that number of empty bad order cars in a train from Mosier, Ohio, to Dock Junction at Erie, Pa., in July, 1913, when one or both ends of each of said cars (with the exception of the car mentioned in the 25th count, which was hauled by its own drawbars) were not equipped with automatic couplers as required by statute, but were fastened to adjoining cars by means of chains.

At Haselton, eight additional empty bad order cars were put into this train and hauled by means of chains instead of drawbars. The twenty-sixth count is based upon the operation of this train (33 cars), together with engine, tender and caboose, when less than 85 per cent. of the cars were controlled by air brakes, the air brakes being operated on engine and tender only.

The case was submitted to the court upon an agreed statement of facts, a jury being waived.

The cars, all empty, were thus moved because the repair facilities at Mosier and Haselton were congested, while those at Dock Junction were available. The air-brake hose was not coupled because of the liability of trouble from uncontrollable

slack and separation of hose couplings. The whole trip, about 97 miles, was made at about 10 miles an hour.

The court finds that the repairs could have been made at Haselton and Mosier but for the congestion; and virtually decides that repair facilities must, without exception, be adequate, everywhere.

"Such wise and humane legislation as the safety appliance acts" must not be weakened by allowing a railway to decide when its provisions may be suspended; must not be so construed as to put it in the power of carriers to largely suspend it "in a most important respect."

Reasonableness of Tender of Large Bill for Small Fare

In an action for wrongful ejection for refusal to pay a fare of four cents a mile, the question involved was whether a \$100 bill was a reasonable tender at a union station ticket office at Gulfport, Miss., in payment of \$2.01. It appeared that the plaintiff boarded the train at Pascagoula, Miss., and went to Gulfport, where he proposed to take the regular fast train to New Orleans two hours later. At Gulfport he found he was without small change. The ticket agent only opened his window when the train was in sight. When the plaintiff tendered a \$100 bill he said he could not change it, and to pay his fare on the train. The plaintiff boarded the train, tendered the \$100 bill to the conductor, and said if he had no change they could wait and get the bill changed at the ticket window at New Orleans. The conductor said he did not know whether the plaintiff tried to buy a ticket or not, and demanded four cents a mile instead of the regular fare of three cents. This the plaintiff said he would not pay and was ejected. The trial court instructed the jury to find for the defendant, which it did.

On appeal, the Mississippi Supreme Court held that the trial court was in error in holding, as a matter of law, that the \$100 bill was an unreasonable sum to tender in a cosmopolitan city like Gulfport, especially in view of the fact that the agent was in a union depot handling funds of two large railroads. "The railroad companies," the court said, "are, of course, in the business of providing transportation for hire, and owe, we think, a duty to the traveling public to provide reasonable facilities for making change at an important station like the one here involved. They are servants and not masters. The lack of adjudicated cases on this point indicates, in the language of Patterson, J., in Barrett v. Market St. Ry. Co., 81 Cal. 296 (where it was said a distinction should be made between passengers on street railways and steam railroads), 'that a question like this will, as is usual, settle itself by a spirit of mutual accommodation between carrier and passenger.' * * * We do not undertake to lay down any rule defining what is and what is not reasonable tender in all cases. This is a mixed question of fact and law to be determined in each case, taking into account always the size of the city, town or village where the passage is demanded, the volume of business done, and the facilities for making change. We do say, however, that in this particular case the court could not, as a matter of law, declare the \$100 an unreasonable amount in a city like Gulfport. There is no question of the good faith of appellant, and surely we have fallen on uncertain times if a white gentleman with a pocket full of \$100 bills cannot buy first-class passage on a train operated by a common carrier doing both an interstate and intrastate business without paying a premium to do so, especially when he has transacted all business on hand and is destined for the attractive and cosmopolitan city of New Orleans. Such conduct on the part of the railway company comes near violating the constitutional guaranty accorded every citizen of the 'pursuit of happiness.' Reversed and remanded."

Mr. Chief Justice Smith dissented, saying, in part: "I think that it can be said, as a matter of law, that a \$100 bill does not reasonably approximate a fare of \$2.01. To require a railroad company to keep its ticket agent supplied with sufficient money to change all bills of this amount that may be tendered them in payment of small fares will not only seriously handicap it in its business by keeping an unnecessarily large amount of its money thus tied up, but will make its ticket offices the most attractive of places for burglars and robbers; and, moreover, its agents cannot transact their business with that expedition to which the traveling public is entitled, if all or a great part of the intending passengers put them to the trouble of changing bills for large amounts tendered in payment of small fares."—Jones v. L. & N. (Miss.), 68 So., 924.

Railway Officers

Executive, Financial, Legal and Accounting

Lee H. Landis, assistant to the president and traffic manager of the Tidewater Southern, has had his headquarters transferred from Stockton, Cal., to San Francisco.

Operating

C. J. Connett has been appointed assistant trainmaster of the Creston Division of the Chicago, Burlington & Quincy, with headquarters at Creston, Iowa.

James Harry Johnson, trainmaster of the Yellowstone division of the Northern Pacific at Dickinson, N. D., has been transferred to the Fargo division, with headquarters at Dilworth, Minn., succeeding J. M. Boyd, who has been transferred to the Yellowstone division, succeeding Mr. Johnson.

Louis Charlton Fritch, assistant to the president of the Canadian Northern at Toronto, Ont., has also been appointed general manager of the lines east of Port Arthur, with headquarters at Toronto. Mr. Fritch was born in 1868, at Springfield, Ill., and took a course in civil engineering at the University of Cincinnati. Subsequently, he took a course in law and was admitted to the bar in Ohio. He began railway work in 1884, as supervisor's assistant on the Ohio & Mississippi. From January, 1886, to October, 1892, he was assistant engineer, and then to November, 1893, was engineer of maintenance of way of the same road, succeeding to the position formerly filled by the chief engineer and master maintenance of way. He was also chief engineer

L. C. Fritch

in charge of construction of the Cincinnati & Bedford. On November 1, 1893, he was appointed division engineer of the Baltimore & Ohio Southwestern, which absorbed the Ohio & Mississippi. From September 1, 1899, to November, 1902, he was superintendent of the Mississippi division of the same road. In February, 1904, he went to the Illinois Central at Chicago, and was engaged in special work until March 1, 1905, when he became assistant to the general manager of the same road. He was appointed assistant to the president in November, 1906, and from March 1 to November 15, 1909, was consulting engineer of the same road. He was later appointed chief engineer of the Chicago Great Western, and in March, 1914, was appointed assistant to the president of the Canadian Northern, which position he still holds.

Traffic

W. H. Mason has been appointed commercial freight agent of the Baltimore & Ohio, with headquarters at Uniontown, Pa., vice W. H. Eaton, promoted.

Edward J. Naylor, assistant freight and passenger agent of the Chicago & Alton at Peoria, Ill., has resigned to become general traffic manager of the Kansas City, Mexico & Orient of Texas, with headquarters at San Angelo, Tex.

J. D. Kenworthy, assistant general freight agent of the Denver & Rio Grande at Salt Lake City, Utah, has also been appointed assistant general passenger agent, succeeding I. A. Benton, resigned. His official title is assistant general freight and passenger agent.

F. S. McGinnis, district passenger agent of the Southern

Pacific at Los Angeles, Cal., has been appointed general passenger agent, with headquarters at Los Angeles, succeeding James Horsburgh, Jr., resigned. C. J. Balfour, commercial agent at Pasadena, Cal., succeeds Mr. McGinnis.

William T. LaMoure, whose appointment as general freight agent of the Boston & Maine, with headquarters at Boston, Mass., has already been announced in these columns, was born at Worcester, N. Y., and was educated in the public school of his native town. He began railway work in 1882, as a telegraph operator on the Boston, Hoosac Tunnel & Western, now a part of the Boston & Maine. In 1885, he was appointed station agent at Petersburg Junction, N. Y. One year later he was transferred to Valley Falls, and then became agent at Johnsonville, when the Boston, Hoosac Tunnel & Western was consolidated with the Fitchburg Railroad. In 1892, he was appointed freight agent of the Fitchburg Railroad at Troy, N. Y.; three years later he was transferred to Boston, as chief clerk of the local freight office, and two years later became local freight agent in charge of the Boston freight terminals of the Fitchburg Railroad, and continued in that position after the Fitchburg was leased to the Boston & Maine. In 1907, he was appointed foreign freight agent, and in January, 1914, was appointed assistant general freight agent of the Boston & Maine, which position he held at the time of his recent appointment as general freight agent of the same road above noted.

W. T. LaMoure

transferred to Boston, as chief clerk of the local freight office, and two years later became local freight agent in charge of the Boston freight terminals of the Fitchburg Railroad, and continued in that position after the Fitchburg was leased to the Boston & Maine. In 1907, he was appointed foreign freight agent, and in January, 1914, was appointed assistant general freight agent of the Boston & Maine, which position he held at the time of his recent appointment as general freight agent of the same road above noted.

Engineering and Rolling Stock

A. M. Harvey has been appointed signal supervisor of the Canadian Government Railways, with headquarters at Moncton, N. B.

Charles Edelman has been appointed signal supervisor of the Missouri Pacific, at Osawatomie, Kans., succeeding A. Dewey, transferred.

C. C. Jones has been appointed supervisor of bridges and buildings of the Detroit division of the Grand Trunk, with headquarters at Detroit, Mich., succeeding H. G. Batten.

Harry C. Ruppel has been temporarily appointed roadmaster of the Northern Pacific, with headquarters at Pasco, Wash., succeeding Dan McLaughlin, granted leave of absence.

F. C. Carlson, assistant master mechanic of the Texas & Pacific, has resigned to become master mechanic of the International & Great Northern, with headquarters at San Antonio, Tex.

Purchasing

H. M. Powell, recently general storekeeper of the St. Louis & San Francisco, has been appointed to the newly created position of supervisor of material and supplies of the Texas & Pacific, with headquarters at Marshall, Tex.

OBITUARY

M. D. Monserrate, second vice-president of the San Antonio & Aransas Pass, with headquarters at San Antonio, Tex., died at San Diego, Cal., on July 30, at the age of 78 years.

M. J. Healy, until recently general manager of the Estacado, Gulf & Western at Midland, Tex., died on July 27, at Muscatine, Iowa. For the past 20 years Mr. Healy had been promoting railroads in Texas and other states, and at the time of his death was promoting the Chicago, Western Illinois & Iowa, from Arpee, Ill., to Chillicothe.

Equipment and Supplies

LOCOMOTIVE BUILDING

THE FRENCH GOVERNMENT.—See item under Car Building.

THE PINE BELT LUMBER COMPANY, Fort Towson, Okla., has ordered one Mikado type locomotive from the Baldwin Locomotive Works.

THE UNITED STATES PORTLAND CEMENT COMPANY, Concrete, Colo., has ordered one 4-wheel switching locomotive from the Baldwin Locomotive Works.

THE PENNSYLVANIA has authorized its Altoona shops to proceed with the construction of 26 freight and 68 switching locomotives. This will complete the 1915 replacement program, which, as was noticed in the *Railway Age Gazette* of April 23, included a total of 194 locomotives for the Lines East and West of Pittsburgh.

CAR BUILDING

THE MAINE CENTRAL is in the market for 1,100 center constructions.

THE BANGOR & AROOSTOOK is in the market for 100 40-ton flat cars.

THE GUANTANAMO & WESTERN, with offices at 82 Beaver street, New York and Guantanamo, Cuba, has ordered 10 cars from the Magor Car Company.

THE HAVANA CENTRAL, which was reported in the *Railway Age Gazette* of July 9 as having ordered 660 freight cars from the Standard Steel Car Company, has now increased that order to 1,100 cars.

THE WHEELING & LAKE ERIE has filed an application in the Federal court at Cleveland, Ohio, to issue \$2,000,000 worth of receiver's certificates. Receiver Duncan wants to purchase 1,700 modern freight cars with the money.

THE BALTIMORE & OHIO has divided an order for 1,000 100,000-lb. capacity steel hopper car bodies among the Standard Steel Car Company, the Pressed Steel Car Company and the American Car & Foundry Company. These car bodies will be placed on trucks rebuilt in the company's shops.

THE FRENCH GOVERNMENT has ordered 1,000 gondola cars from the Eastern Car Company and has issued inquiries for 5,835 passenger and freight cars, 1,750 journal boxes, 744,421 kilograms of draw bars, 107 axle boxes, 600,000 kilograms of boiler tubes, 3 locomotive fire boxes and 101,147 kilograms of draft springs.

IRON AND STEEL

THE FLORIDA EAST COAST has ordered 2,200 tons of rails from the Pennsylvania Steel Company.

THE SOUTHERN RAILWAY has ordered 4,000 tons of rails from the Pennsylvania Steel Company.

THE PITTSBURGH & LAKE ERIE has ordered 7,500 tons of steel shapes from the Jones & Laughlin Company.

THE RUSSIAN GOVERNMENT is reported to have ordered 100,000 tons of rails from the Maryland Steel Company.

THE BALTIMORE & OHIO CHICAGO TERMINAL has ordered 149 tons of steel for various buildings at Chicago, from the American Bridge Company.

SIGNALING

THE WABASH has begun the installation of automatic signals between the following points: Danville, Ill., to Williamsport, Ind., and Attica, Ind., to LaFayette, a total of 7½ mi. of double-track and 34 mi. of single-track.

THE ST. LOUIS & SAN FRANCISCO has ordered two electro-mechanical interlocking plants from the Union Switch & Signal Company for installation at Southeastern Junction, Mo., and Nichols, Mo. The former plant will have 13 signals, 7 switches and 6 derails, and the latter will have 19 signals, 6 switches and 9 derails.

Supply Trade News

Samuel D. Fitton has been elected vice-president of the Niles Tool Works Company, Hamilton, Ohio, succeeding George T.

At a meeting of the board of directors of the American Locomotive Company held Wednesday, August 11, J. O. Hobby, Jr., was appointed treasurer.

Allan Strale, consulting engineer of the Inland Steel Company, died of heart disease at his home in Chicago on August 6, at the age of 58 years.

Owen W. Middleton, formerly editor of the *Railway Master Mechanic*, has been appointed publicity manager of the American Steel Foundries, with headquarters in the McCormick building, Chicago.

Simon S. Martin, formerly general superintendent of the Maryland Steel Company, Sparrows Point, Md., has been elected vice-president and a director of the Algoma Steel Corporation. Reiss, deceased.

The Pennsylvania Railroad Co. has asked bids on the construction of sixteen new vessels for use in New York Harbor. These will consist of one steam lighter, three derrick barges and twelve covered hatch barges.

Lewis Littlepage Holladay and Henry Negstad, consulting engineers, have formed a company under the corporate name of Holladay, Negstad & Co., and will specialize in the field of power plants, utilities and industries. They will be located at 109 North Dearborn street, Chicago.

M. A. Evans, western sales manager of the Railway Appliances Company, Chicago, at the time that company was bought by the Q. & C. Company, New York, and with the latter company temporarily during the reorganization period, has resigned. Mr. Evans will take a short vacation before returning to the railway supply business.

The Pratt & Whitney Company has opened an office and showroom at 16 Fremont street, San Francisco, in charge of S. G. Eastman, formerly manager of the Chicago office. A large stock of Pratt & Whitney machinery, small tools and gages will be carried for the convenience of customers, and the office has been appointed agent for the entire Niles-Bement-Pond line of machine tools, cranes, steam hammers, etc.

The Canadian Northern has given the Roberts & Schaefer Company, Chicago, an order to proceed with the building of three frame-constructed, 100-ton capacity, standard counterbalanced bucket coaling plants for installation at Rideau Junction, Ont., Capreol, Ont., and Fitzbach, Ont. This makes seven coaling plants this firm has constructed for the Canadian Northern within a year. The Roberts & Schaefer Company has also received a contract for the Temiskaming & Northern Ontario for a standard counterbalanced bucket locomotive coaling plant for installation at Porquis Junction, Ont.

Willy Lamot, a business man of Antwerp, but now with temporary address at "Shardhighs," Halstead (Essex), England, announces that he has established an organization for the purpose of introducing American products and manufactures into Belgium as soon as the war is over. The headquarters will be in Antwerp. It is Mr. Lamot's intention to engage as agents, representatives or dealers a number of Belgian manufacturers and business men who may have been partly ruined, but will still possess enough capital to be in a position to furnish proper guarantees. His organization will accept the agency for but one make of any one article, and contracts will be for at least two years. The various representatives will be established throughout Belgium, but will be under the supervision of the office at Antwerp.

TRADE PUBLICATIONS

BUILDING CONSTRUCTION.—The Stone & Webster Engineering Corporation, Boston, Mass., has published an attractive booklet showing photographs and essential data concerning projects recently completed by this company, including factory and office buildings, power plants, elevators, etc.

Railway Construction

CAROLINA, ATLANTIC & WESTERN.—See Seaboard Air Line.

CINCINNATI, BLUFFTON & CHICAGO.—Fred A. Dolph has issued a prospectus announcing a plan for the reorganization of this company under the name of the Huntington, Bluffton & Portland Short Line. Plans are being considered for the electrification of the line.

DALLAS & SOUTHWESTERN TRACTION.—J. O. Andrewartha, Dallas, Tex., consulting engineer of the Dallas & Southwestern Traction, is quoted as saying that the company will build from Dallas south to Austin, also that a system of interurban lines will be constructed in that part of Texas. The Dallas & Northwestern Traction, which is owned by the same interests, is planning to build an interurban line from Dallas northwest to Denton, to be operated by gasoline motor cars. E. P. Turner, president; J. T. Witt, chief engineer. (July 30, p. 219.)

DALLAS & NORTHWESTERN TRACTION.—See Dallas & Southwestern Traction.

EDDY LAKE & NORTHERN.—This company has filed an amendment to its charter, it is said, extending the time for ten years in which to complete the line. The proposed route is from Eddy Lake, S. C., north to either Marion or Mullins, about forty miles. G. Officer, secretary. W. M. Burgan, N. James, R. B. Scarborough, Conway, S. C., are interested.

FAIRMONT & HELEN'S RUN.—See Western Maryland.

FLORIDA ROADS (ELECTRIC).—Plans are being made, it is said, to build an electric railway in Clearwater, Fla., and vicinity. E. W. Parker, Tampa, and associates, are back of the project.

Work will soon be started, it is said, on the construction of an electric line from Brooksville, Fla., south to St. Petersburg. James Murphy, St. Petersburg, is interested.

FORT DODGE, DES MOINES & SOUTHERN.—This company will extend its line from Swanwood Junction, Iowa, its present junction with the Chicago, Rock Island & Pacific, to a connection with a leased track of the Des Moines Western. There is about 75,000 cu. yd. of grading, which has been awarded to the Conn Construction Company, Boone, Iowa. Track laying and bridge work will be done by company forces. R. L. Cooper, Boone, Iowa, is chief engineer.

GRAND TRUNK PACIFIC SASKATCHEWAN.—See Grand Trunk Pacific.

GRAND TRUNK PACIFIC.—The Saskatchewan legislature has passed an act extending the time to January, 1917, in which to build a number of branch lines, for which the province has guaranteed the bonds of the Grand Trunk Pacific and of the Grand Trunk Pacific Saskatchewan, and also extends the time within which these companies may build terminals at Regina, Saskatoon and Moose Jaw.

HUNTINGTON, BLUFFTON & PORTLAND SHORT LINE.—See Cincinnati, Bluffton & Chicago.

ILLINOIS CENTRAL.—This company has awarded a contract to the J. D. Lynch Construction Company, Vandalia, Ill., for 35,000 cubic yards of grading at Vandalia. This company has also awarded a contract to H. W. Nelson, Chicago, for 500,000 cubic yards of filling for bridges on the Indiana division.

JACKSON & EASTERN.—This company, it is said, has applied for a charter in Mississippi to build a line from Jackson to Houston, Miss., about 130 miles. The incorporators are S. A. Neville, R. W. Harris and C. J. Currie, of Meridian, Miss. Mr. Neville is vice-president of the Meridian & Memphis, now operating between Meridian, Miss., and Union, which is building an extension from Union to Sebastopol, about 13 miles. (January 29, p. 211.)

LAKE HURON & NORTHERN ONTARIO.—An officer writes denying the report that this company has given a contract to the

National Engineering Company, Cleveland, Ohio, to build the projected line from Sault Ste. Marie to a point on the Grand Trunk Pacific.

LA KEMP & NORTHWESTERN.—A charter has been granted the La Kemp & Northwestern Railway Company of Oklahoma for a line to be constructed from a point on the Atchison, Topeka & Santa Fe, in Ellis county, to a point on the Chicago, Rock Island & Pacific in Texas county, a distance of about 125 miles. The charter also provides for a 20-mile branch line from Ivanhoe to May, Okla. The company is capitalized at \$100,000, and the estimated cost of the proposed line is \$500,000. The incorporators are George C. Walick, I. N. Edwards, J. W. Bell, J. W. Lehman, E. W. Lehman, Theodore Doering and J. D. Key, all of La Kemp.

MERIDIAN & MEMPHIS.—See Jackson & Eastern.

MISSISSIPPI ROADS.—An officer of the Gilchrist-Fordney Lumber Company, Laurel, Miss., writes regarding the report that a logging line is being built from Montrose, Miss., eastward several miles, that the company is only putting in a logging spur. The grading work is finished and the company has already secured the rails and equipment.

MITCHELL STREET & INTERURBAN RAILWAY.—Incorporated in South Dakota with \$200,000 capital to build 30 miles of line at Mitchell, S. D., and near that place. O. E. Cassem, L. E. Cassem, D. N. Hill, A. N. Hill, F. E. Hill, all of Mitchell, are the incorporators.

MORRIS COUNTY TRACTION COMPANY.—This company, it is said, is interested in the organization of another company for the purpose of constructing an electric railway from Landing, N. J., to Lake Hopatcong, through Port Morris to Netcong.

OHIO VALLEY ELECTRIC.—This company has under consideration the question of building an extension, it is said, from Ashland, Ky., north to Russell.

OREGON-WASHINGTON RAILROAD & NAVIGATION COMPANY.—This company has awarded a contract to Twohy Bros., Portland, Ore., for the construction of its 30-mile extension from Riverside, Ore., to Crane Creek Gap. The estimated cost of the work is \$1,500,000. (July 16, p. 143.)

SCHUYLKILL ELECTRIC.—A contract is reported let to the Trexler Contracting Company, Reading, Pa., to build a section of this line over Broad mountain. The proposed line is to connect Pottsville, Pa., Frackville and Shenandoah.

SEABOARD AIR LINE.—The directors of the Seaboard Air Line have adopted a plan to take over the Carolina, Atlantic & Western, and have authorized the beginning of work on the extension of the C., A. & W. from Charleston, S. C., southwest to Savannah, Ga., 85 miles. See also Railway Financial News.

SOUTHERN RAILWAY.—Contracts have recently been let, it is said, for double-tracking 36 miles of the Southern Railway's main line in North Carolina and in South Carolina.

TOLEDO, ANN ARBOR & JACKSON.—See Toledo-Detroit.

TOLEDO-DETROIT.—This company, formerly the Toledo, Ann Arbor & Jackson, has been authorized by the Public Utilities Commission of Ohio to sell \$523,000 of bonds, to secure funds to complete the line from Toledo, Ohio, northwest to Dundee, Mich.

TUCSON, CORNELIA & GILA BEND.—A contract is reported let to James H. Maxey, Yuma, Ariz., to build from Gila Bend, Ariz., south to Ajo, 44 miles. John C. Greenway, general manager; R. H. Jones, chief engineer of construction, Gila Bend. (May 28, p. 1140.)

VIRGINIA-BLUE RIDGE.—This company, which is building a line from Tye River, Va., northwest via Lowesville to Massies Mill, 22 miles, has completed its line from Tye River as far as Lowesville, 13 miles. (January 29, p. 211.)

WESTERN MARYLAND.—This company has let to A. L. Anderson & Bros., of Altoona, Pa., the contract for the construction of the Fairmont & Helen's Run Railway, which is a company recently incorporated in West Virginia in interest of the Western Maryland. The new line will be about six miles long and will connect the Western Maryland with the Baltimore &

Ohio at a point near Chieftain, W. Va. It will give the Western Maryland a connection with the coal fields of the Consolidation Coal Company in West Virginia. Work is to be begun at once. (July 30, p. 219.)

RAILWAY STRUCTURES

BRATTLEBORO, Vt.—The Central Vermont has given a contract to H. Wales Lines Company, Meriden, Conn., for building a brick and stone station at Bridge street, in Brattleboro. The building is to be three stories high, 52 ft. 4 in. wide, by 183 ft. 6 in. long, and will cost \$70,000.

CHEEKTOWAGA, N. Y.—The Delaware, Lackawanna & Western is making plans to carry out grade crossing elimination work at Cheektowaga.

NEW YORK.—The joint order of the New York Public Service Commissions of the First and Second districts, which requires the elimination of grade crossings on the New York Central and the New York, New Haven & Hartford at Two Hundred and Forty-first street and Two Hundred and Forty-second street, in the borough of the Bronx, as was mentioned in these columns last week, also calls for the construction of a new station at Two Hundred and Forty-first street.

Bids were recently opened by the New York Public Service Commission, First district, for the construction of station finish on Section No. 2 of Routes Nos. 36 and 37, the Astoria line. The lowest bid was submitted by Charles Meads & Company, who offered to do the work for \$268,102.

QUEBEC, Canada.—The new stone and brick passenger station now under construction for the Canadian Pacific at Quebec will include a head house 65 ft. by 142 ft., a concourse 68 ft. by 142 ft., and an express and baggage building 44 ft. by 92 ft. Part of the building will be one story and part two stories. The improvements will cost \$300,000. W. S. Dowling Cook, Montreal, Que., has the contract for the work.

SMITHVILLE, TEX.—The Missouri, Kansas & Texas contemplates the rearrangement and replacement of certain portions of its roundhouse at this place.

SAN ANTONIO, TEX.—The San Antonio Belt Terminal Railway has accepted the franchise granted by the city commission of San Antonio, it is said, for the construction of a system of railway terminals, including new passenger and freight stations in San Antonio. The franchise is for a period of 25 years, and the proposed improvements will cost about \$1,200,000. It is understood that construction work on the terminals will be started within the next two or three months.

ITALIAN RAILWAYS AND THE WAR.—A recent issue of the *Journal des Transports* contains some interesting information relative to the role of the Italian Railways in time of war. During the mobilization the railway service is entirely subject to the military authorities, who regulate the conditions of operation, not only for military transport, but also for ordinary traffic. As soon as mobilization is decreed, a "Direction of Transport" is set up, and the Director of Transport is placed at the head of a special department attached to the general staff. The "Direction" is given an entirely free hand in arranging, modifying and suspending the train services. Operating details are actually entrusted to special military committees attached to the various lines, which exist in times of peace, and are more or less similar to the French *Commissions de reseaux*. Among the duties of the "Direction of Transport" is that of repairing and rebuilding lines and bridges, etc., when necessary, for which purpose it has under its control a special military railway engineering organization. The system planned in times of peace has proved admirably efficient under war conditions. The whole of the mobilization was carried out without suspending the ordinary passenger and freight traffic, and the very few individual trains which were actually suspended were on unimportant sections of line, where a temporarily reduced service was decided on more for economic than for military reasons. The results were really remarkable, since on some sections of line, according to the *Corriere della Sera*, the traffic was increased a hundred-fold. In some instances this enormous increase was handled on lines whose facilities were considered inadequate even for normal traffic requirements. Yet there was not a breakdown, and the military trains arrived punctually.—*Railway Gazette*, London.

Railway Financial News

SEABOARD AIR LINE.—The directors at a meeting in Baltimore on August 9 adopted a comprehensive financial plan looking to a fuller development of this property. The statement given out by S. Davies Warfield says that the plan provides for the following:

"The Seaboard Air Line Railway will be consolidated with the Carolina Atlantic & Western Railway under the corporate name of the Seaboard Air Line Railway Company. The Carolina Atlantic & Western is a recent consolidation of the North & South Carolina, Charleston Northern and South Carolina Western Railroads—operating a total of 416 miles. The Carolina Atlantic & Western recently acquired the Georgetown & Western operating from Lanes to Georgetown, S. C., and from Andrews to the Pee Dee River, S. C., a distance of 70 miles. The Charlestown Northern is the line recently completed connecting the North & South Carolina with Charleston, giving the Seaboard Air Line entrance into Charleston and now becoming a part of the main line of the consolidated system. The new terminals at Charleston are admirable both as to location and facilities.

"The line will be extended from Charleston to Savannah by the immediate construction of 85 miles of railroad with maximum grade of only 3-10 of 1 per cent. This new line will also become part of the main line of the consolidated system.

"This will give the Seaboard Air Line Railway Company—the new company growing out of the consolidation of the above mentioned properties—a low grade line from Hamlet, N. C., to Savannah, Ga. By this new line the Seaboard will reach Georgetown, S. C., Charleston, S. C., and Savannah, Ga., will tap a rich and fertile territory, highly productive in cotton and tobacco, will admit of the Seaboard's running time to the South being shortened, will create a line with maximum grade of only ½ of 1 per cent as compared with 1½ per cent, the maximum grade of the present line to Savannah, and will permit the increase of the freight train load. In effect this will give the Seaboard, through South Carolina, from Hamlet, N. C., to Savannah, Ga., two lines, the other line running via Columbia, each one self-supporting in its own territory, and thus will be obviated the necessity of double-tracking the Hamlet-Columbia line, where traffic is becoming congested. The territory to be opened up between Charleston and Savannah is generally well adapted to the growing of vegetables, corn, rice and sea island cotton and will put the Seaboard immediately into Charleston's heaviest vegetable producing section.

"The Seaboard Air Line Railway Company, the new corporation, will have its first and consolidated mortgage securing an authorized issue of \$300,000,000 bonds of variable interest rates and maturities. This mortgage will be immediately a first lien on the 416 miles of main line track between Hamlet and Savannah, via Charleston, Lanes and Georgetown, S. C., and on the lines running from McBee, S. C., located on the Hamlet-Columbia line, to Florence, Poston, Sumter and Timmonsville, S. C. There will be pledged as collateral under the new mortgage a majority, \$22,361,000, of the outstanding refunding 4 per cent bonds of the Seaboard Air Line Railway.

"There will be presently issued under the new first and consolidated mortgage \$22,893,000 of 6 per cent thirty-year gold bonds; part are to be used in exchange for underlying bonds of constituent properties, the balance has been sold, proceeds to be used for the construction of the new line from Charleston to Savannah, for retirement of equipment trust obligations falling due during the year ending June 30, 1916, for the retirement of the \$6,000,000 three-year notes due March 1, 1916, for the acquisition of certain new property and for improvements and betterments.

"Subject to the carrying out of agreements for the exchange of bonds of the underlying railway properties to be consolidated with the Seaboard Air Line Railway, arrangements have been made for the sale of the bonds of this issue of Series 'A,' as above stated."

ANNUAL REPORT

SIXTY-FIRST ANNUAL REPORT OF THE LEHIGH VALLEY RAILROAD COMPANY

PHILADELPHIA, August 3, 1915.

To the Stockholders of the

LEHIGH VALLEY RAILROAD COMPANY.

The Board of Directors herewith submit the annual report of the business and condition of your Company for the fiscal year ended June 30, 1915.

MILEAGE.

The first track mileage owned or controlled and operated by the Lehigh Valley Railroad Company, the main line of which is double track, extending from Jersey City, N. J., to Buffalo and Suspension Bridge, N. Y., is as follows:

	MILES
Lehigh Valley Railroad Company.....	316.88
Controlled by ownership of entire capital stock.....	938.67
Controlled by ownership of majority of capital stock and lease....	115.37
Operated under lease	27.73
Total mileage operated (owned or controlled).....	1,398.65
Trackage rights over railroads owned by other companies.....	43.71
Total first track mileage.....	1,442.36

In addition to the above there are 594.86 miles, or 41.24 per cent. of second track, 99.51 miles of third track, 44.84 miles of fourth track, and 1,215.76 miles of yard tracks and sidings, a total of 3,397.33 miles of track in operation at the close of the year. A detailed statement of track mileage is shown below. The average number of miles of railway operated for the year was 1,443.52, upon which the mileage statistics in certain tables submitted in this report are based.

The total decrease of 1.38 track miles compared with the preceding year is due, in the main, to the deduction of 1.07 miles of trackage rights, the use of which was discontinued during the year.

OPERATING REVENUES AND EXPENSES.

The following statement sets forth the total revenues and expenses and net revenue from operation for the fiscal year, compared with similar figures for the fiscal year 1914. The complete income account appears on page 24.

The Interstate Commerce Commission having ordered certain further changes in the classification of operating revenues, expenses and income, effective July 1, 1914, it has been necessary, for the purpose of a proper comparison, to re-state the figures for the preceding fiscal year; hence those figures will in many cases be at variance with similar items published in last year's annual report. The principal change is the elimination of Outside Operations, which represent the operations of certain of our water lines, etc., the revenue from which is now included in Operating Revenues and the expenses in Operating Expenses. Similar explanation applies with respect to the classification of various items on the balance sheet which has been changed from the balance sheet published in previous years so as to conform with the accounting requirements of the Commission.

FROM	OPERATING REVENUES			
	1915	1914	INCREASE	DECREASE
Coal freight	\$19,195,755.50	\$18,528,246.44	\$667,509.06

OPERATING REVENUES.

COAL FREIGHT.

The revenue derived from the transportation of coal and coke amounted to \$19,195,755.50, an increase of \$667,509.06, or 3.60 per cent., as compared with the preceding twelve months.

The percentage of coal freight revenue to total operating revenues was 45.14 per cent., an increase of 1.20 per cent.

The coal and coke transported, excluding the Company's supply coal, was 16,894,930 tons, an increase of 429,982 tons, or 2.61 per cent.

This class of tonnage was 55.82 per cent. of the total tonnage hauled during the year, an increase of .52 per cent.

MERCHANDISE FREIGHT.

The transportation of merchandise freight produced a revenue of \$16,005,501.45, an increase of \$463,615.55, or 2.98 per cent., as compared with the preceding year.

The revenue derived from the transportation of merchandise freight was 37.64 per cent. of the total operating revenues, an increase of .79 per cent. The tonnage moved, excluding Company's material, was 13,373,771 tons, an increase of .49 per cent.

GENERAL FREIGHT.

The total revenue derived from both coal and merchandise freight was \$35,201,256.95, an increase of \$1,131,124.61, or 3.32 per cent., as compared with the preceding twelve months.

The entire freight traffic amounted to 30,268,701 tons, an increase of 495,421 tons, or 1.66 per cent.

The number of tons carried one mile was 5,326,328,902, an increase of 140,128,336 ton miles, or 2.70 per cent.

The average haul was 175.97 miles, an increase of 1.78 miles, or 1.02 per cent.

The average revenue per ton was 116.30 cents, as compared with 114.43 cents last year, an increase of \$1.131,124.61, or 1.63 per cent.

Company's freight, not included in the above, amounted to 3,073,660 tons, a decrease of 62,095 tons, or 1.98 per cent.

The total freight train mileage was 8,580,867 miles, an increase of 244,295 miles, or 2.93 per cent.

The revenue received per freight train mile was \$4.10, an increase of \$0.01, or .24 per cent.

The average trainload of revenue freight was 620.72 tons, a decrease of 1.38 tons, or .22 per cent. Including Company's freight, the average trainload was 643.62 tons, a decrease of 1.57 tons, or .24 per cent.

PASSENGER.

The earnings received from passenger traffic amounted to \$4,043,799.00, a decrease of \$751,348.44, or 15.67 per cent., compared with the preceding year.

The total number of passengers carried was 5,206,972, a decrease of 522,070, or 9.11 per cent.

The number of passengers carried one mile decreased 49,671,062, or 18.72 per cent.

The average revenue per passenger was 77.66 cents, a decrease of 6.04 cents, or 7.22 per cent.

The average revenue per passenger per mile was 1.875 cents, an increase of .068 cent, or 3.76 per cent.

The average distance traveled by each passenger was 41.42 miles, a decrease of 4.89 miles, or 10.56 per cent.

Passenger train mileage was 4,170,202, a decrease of 225,157 miles, or 5.12 per cent., as compared with a decrease in this revenue of 15.67 per cent.

The average revenue from passengers per passenger train mile was 96.97 cents, a decrease of 12.13 cents, or 11.12 per cent.

MAIL.

The sum of \$195,124.81 was received from the Federal Government for the transportation of United States mail, an increase of \$71.94.

EXPRESS.

The revenue from this class of business amounted to \$449,622.82, an increase of \$5,651.07.

OTHER TRANSPORTATION.

The earnings derived from transportation other than shown under the preceding headings were \$2,022,230.85, a decrease of \$41,419.19.

INCIDENTAL.

Incidental revenue amounted to \$613,927.59, an increase of \$11,235.25.

OPERATING EXPENSES.

MAINTENANCE OF WAY AND STRUCTURES.

The sum of \$4,483,924.72 was expended for the maintenance of way and structures, a decrease of \$190,800.65, or 4.08 per cent., as compared with the preceding year.

A new four-track steel bridge was constructed during the year to replace a double-track steel bridge. Three overhead steel street bridges were raised, in connection with Buffalo Terminal improvements, and additional spans with solid floors were erected. One steel bridge was built in connection with new track construction. Sixteen steel bridges and eleven concrete-steel bridges were placed in the track, replacing light iron or wooden bridges. Three iron and eight wooden bridges were replaced by pipe culverts, and four iron and two wooden bridges were abandoned and the openings filled. One arch culvert was filled and abandoned and four wooden trusses were substantially shortened by filling.

5,535 tons of 110-pound rail, 30,549 tons of 100-pound rail and 45 tons of 90-pound rail, together with necessary frogs, switches, etc., were placed in the track.

1,118,810 tie plates and 193,934 anti-rail creepers were used. 1,001,577 cross ties, 2,842,100 feet B. M. switch ties, 637,471 feet B. M. bridge ties and lumber amounting to 3,511,267 feet B. M. were used.

647,981 of the cross ties, 2,495,412 feet B. M. of switch ties and 596,560 feet B. M. of bridge ties were treated with creosote.

65,612 cubic yards of crushed stone were used in ballasting track. 18,197 feet of drain tile were placed in the roadbed.

334.93 miles of copper and 54.50 miles of iron wire were used in extending and renewing the telephone, telegraph and signal wires on the system.

MAINTENANCE OF EQUIPMENT.

The expenditures for the maintenance of equipment amounted to \$8,207,491.18, an increase of \$537,698.13, or 7.01 per cent., as compared with the preceding twelve months. Included therein is a charge of \$1,426,831.06 for the depreciation of equipment, as required by the accounting rules of the Interstate Commerce Commission.

Ten worn-out locomotives, one passenger car, three express cars, two fruit cars, 572 freight equipment cars and thirteen road service cars were condemned and either sold or destroyed during the year, and their value written off the books by appropriate charges through operating expenses.

Four passenger cars, five express cars, four fruit cars and one combined baggage and mail car were converted into workmen's cars. Eighteen produce cars were converted into ice cars and fifty freight equipment cars were transferred to road service.

Twenty-eight locomotives have been equipped with additional air pumps

and one hundred and fifty-nine with bull's-eye lubricators, to meet the requirements of the Interstate Commerce Commission.

Fifty-six locomotives had new fire boxes applied, one hundred and fifteen were equipped with new cylinders and nine with new boilers.

275 passenger equipment cars were painted and varnished and thirteen equipped with electric lighting apparatus. Three dining cars and five milk cars were equipped with steel underframes.

Steel underframes were applied to 2,286 wooden freight and coal cars, making a total of 14,658 cars so equipped during the last seven years. Five eight-wheel cabooses were equipped with steel underframes. 12,855 freight equipment cars, one passenger equipment car and thirty-six road service cars were equipped with safety appliances to conform to the requirements of the Interstate Commerce Commission.

The total number of locomotives on hand at the close of the year was 945, with a tractive power of 30,234,824 pounds. The total number of freight equipment cars was 45,459, with a capacity of 1,693,578 tons.

TRAFFIC EXPENSES.

The expenditures under this heading amounted to \$959,830.08, a decrease of \$80,764.07, as compared with the preceding twelve months.

TRANSPORTATION EXPENSES.

The cost of conducting transportation was \$15,382,186.83, a decrease of \$421,871.94, or 2.67 per cent., as compared with the preceding year, notwithstanding an increase of .84 per cent. in the total operating revenues.

The ratio of transportation expenses to total operating revenues was 36.17 per cent., a decrease of 1.31 per cent. as compared with the preceding year.

GENERAL EXPENSES.

This class of expenses amounted to \$913,954.73, or 2.17 per cent. of the total operating revenues.

TAXES.

The taxes accrued on your property, capital and business, during the year amounted to \$1,797,379.16, an increase of \$36,967.58 over the preceding year.

ADDITIONS AND BETTERMENTS.

The sum of \$2,974,042.42 was expended during the year for the acquisition of new property and for the improvement and development of existing property, which amount has been charged to Additions and Betterments, as required by the Interstate Commerce Commission. A classified statement of these expenditures appears below. Specific mention is made of the more important expenditures, viz:

The new equipment purchased and added to the property during the year is as follows: Three passenger locomotives, five switching locomotives, two locomotive tenders, thirty steel passenger coaches, ten steel smoking cars, twenty-five steel baggage cars, two 150-ton steam derricks, two Russell snow plows, one caboose, one motor inspection car and one tank car. A portion of this equipment is covered by the Equipment Trust referred to in full under the heading "Financial."

In addition to the foregoing, orders have been placed for ten Pacific type passenger locomotives, five switching locomotives, three locomotive tenders and twenty steel underframe milk cars.

During the past fiscal year fifty-three heavy Consolidation type freight locomotives were rebuilt and equipped with superheaters, new cylinders and Walschaert valve gears. These changes have resulted in a reduced fuel consumption as well as increased efficiency of operation, due to the better sustained steaming qualities of the engines.

Work in connection with the new passenger and freight terminals at Buffalo is progressing favorably. The plans for the buildings were approved, contracts awarded and work commenced on April 14, 1915. It is expected that the freight terminal will be completed and ready for use by November next and the passenger terminal at a later date.

A new open pier 1,060 feet in length and 76 feet in width, equipped with modern ore handling machinery, together with necessary yard tracks, is being constructed at tidewater near Constable Hook, and, when completed, will accommodate steamships of 35-foot draft. The furnaces in the Lehigh Valley region will utilize these facilities for the handling of foreign ores. It is expected that this improvement will be completed early in the spring of 1916.

During the year considerable improvements and additions have been made to the pier stations in the City of New York. A long term lease was concluded with the city for the wharf property on the North River at the foot of Rector Street, and your Company is now constructing thereon a new pier 730 feet long and 75 feet wide, with suitable bulkheads on each side, which will be ready for operation about January 1, 1916. This will enable your Company to dispense with the station facilities at Pier 2, which are no longer adequate. The substructure of the new pier will be of concrete above the low-water line and the superstructure will be of steel, the pier section of which will be one-story and the bulkhead section two stories. Pier 44, East River, located between Gouverneur and Jackson Streets, has also been acquired under a long term lease from the city and will be equipped with a two-story steel shed, primarily intended for the handling of flour, the pier being advantageously located in the center of distribution of that commodity. At the 149th Street station there is now in course of erection a steel building, equipped with automatic sprinkler, for the storage of hay, a commodity which is extensively handled in that locality. At Pier 5, Wallabout, Brooklyn, where your Company previously leased only about one-fourth of the pier, it acquired the entire pier, enlarged the steel shed and installed an automatic sprinkler system. The acquisition of these additional pier facilities will permit your Company to render improved service to its patrons.

A modern steel and concrete ground-level plant for handling coal from cars to boats, with a capacity of 500 cars in ten hours, is being installed at Tift Farm, Buffalo, and will be ready for service early in August. It will be operated by electricity and will consist of two rocking cradles for unloading box cars and four fixed hoppers for unloading open cars. The coal will be conveyed by apron flights to a telescopic chute in the boat. This installation will reduce breakage of coal to a minimum, will eliminate all fire risk now incident to the high wooden trestle and also reduce the cost of maintenance.

66,422 feet, of 12.58 miles, of Company's sidings, and 15,787 feet, or 2.99 miles, of industrial sidings, were constructed during the year.

To avoid surface disturbances by reason of mine workings of one of the large anthracite mining companies, a change of line was completed between Espy Run and Newport, a distance of 1.2 miles. In making this change 82 degrees of curvature were eliminated, including a double reverse curve of 6 and 8 degrees respectively.

The car repair yard at Coxton is being relocated in order to provide additional room necessary for car repairs and at the same time to permit of the use of the old car repair tracks for the enlargement of the classification yard. About 8,000 feet of track have been constructed in this connection. The yards at South Plainfield, Perth Amboy and Oak Island were enlarged, resulting in increased capacities of 41, 174 and 32 cars respectively.

A new fifty-stall fireproof enginehouse, together with a 100-foot electrically operated turntable, is in course of construction at Sayre.

A concrete freight house was erected at Lehighton. Dwelling houses of hollow tile and stucco construction, for the accommodation of foremen and laborers, were constructed at Flemington Junction, Ashmore and Phelps. Extensive improvements were made to the Company dwelling houses at Delano and to the milk shipping stations at West Portal, Tioga Centre and Wysox. A frame shelter was erected at Weequeh Park, Newark, for the accommodation of incoming passengers waiting for trolley cars. In the waiting rooms of the Wilkes-Barre passenger station a new marbleoid floor was laid and new seating accommodations and electric light fixtures were installed.

A new 46-foot track scale was installed at South Plainfield. Eleven gasoline motor cars were purchased for use of section, bridge, signal and telegraph gangs, making a total of 110 now in service.

The improvements in connection with the water supply at Lehighton and Packerton, comprising the construction of a reservoir of five million gallons capacity on Beaver Run and a dam across Mahoning Creek, together with electric pumping machinery and connecting pipe lines, which will afford an independent and ample supply of water for the locomotives and shops at those points, referred to in last year's report, are about one-half completed. A new water station with a 52,500-gallon steel standpipe supplied by gravity was established at Sheldrake Springs.

Automatic disc signals between Slatington and Penn Haven Junction, a distance of 21.3 miles, were replaced with three-position upper-quadrant signals, and the automatic disc signals between Laceyville and Wilkes-Barre, a distance of 49.1 miles, have been renewed with two-position lower-quadrant signals. Extensive improvements were made to the mechanical interlocking plant at Pine Junction.

Visible and audible crossing signals were installed at the following points: Morley's Crossing, east of Athens; Stanton; Clinton Avenue, South Plainfield; Colfax Avenue and Walnut Street, Roselle Park; Manville, and Lexington Avenue, Pictou.

During the year thirty-five portable telephones were installed on freight and passenger trains, making a total of 720 in service, which completes the work of equipping trains. The purpose of these telephones is to enable train crews to communicate immediately with the proper officers in case of accident or unusual delay.

New telegraph and telephone pole lines were erected for a distance of 4.50 miles on the Mahanoy and Hazleton Division, .83 of a mile on the Seneca Division, and 2.50 miles on the Buffalo Division. Telegraph and telephone lines were rebuilt for a distance of 9.68 miles on the New Jersey and Lehigh Division, 2.10 miles on the Mahanoy and Hazleton Division, 23.85 miles on the Wyoming Division, and 21 miles on the Buffalo Division. Poles were rest for a distance of 23.90 miles on the New Jersey and Lehigh Division, 19.70 miles on the Mahanoy and Hazleton Division, and 6.60 miles on the Wyoming Division.

FINANCIAL.

No capital obligations have been issued and sold by your Company during the fiscal year.

The following obligations matured and were retired during the year:

DESCRIPTION	INTEREST		AMOUNT
	RATE	MATURITY	
Collateral Trust Bonds.....	4%	Feb. and Aug.	\$1,000,000
Equipment Trust, Series I, Certificates..	4%	September	400,000
Equipment Trust, Series J, Certificates..	4½%	Mar. and Sept.	500,000
Equipment Trust, Series K, Certificates.	4%	Mar. and Sept.	300,000
Equipment Trust, Series L, Certificates.	4½%	April and Oct.	400,000
Equipment Trust, Series M, Certificates.	4½%	March	200,000
Total.....			\$2,800,000

Thus far the improvements which have been made in connection with the new freight and passenger terminals at Buffalo, referred to elsewhere in the report, have been financed out of the current cash resources of the Company. It is proposed, however, at a later date to make a specific issue of bonds to cover the major portion of this expenditure. Accordingly a new company has been incorporated, known as the Lehigh-Buffalo Terminal Railway Corporation, which will take title to the real estate and make all the improvements incident to the construction of the terminals. Application is now pending before the Public Service Commission of New York State for authority to have the terminal corporation issue to the Lehigh Valley Railroad Company Fifty-Year Five Per Cent. Gold Debenture Bonds for such moneys as have been and will be advanced to it for this purpose. These bonds, when received, will be placed in the treasury of your Company. All of the real estate which was acquired by your Company and its subsidiaries is now being transferred to the new company.

The Equipment Trust, known as Series M, covering an issue of \$1,800,000 Four and One-Half Per Cent. Certificates, which was authorized last year, as mentioned in that annual report, has been completed and the certificates are now in the Company's treasury. The same mature in annual installments of \$200,000 on March 1st of each year, the last installment being due on March 1, 1923. The \$200,000 which matured March 1, 1915, were duly cancelled. This trust is a lien upon one thousand self-clearing double hopper steel coal cars of 100,000 pounds capacity each, sixty-five steel passenger coaches, twenty-five steel baggage and express and ten steel smoking cars.

The advances made by the Lehigh Valley Railroad Company to subsidiary companies, of which it owns the entire capital stock, were reimbursed by the issuance of Fifty-Year Five Per Cent. Gold Debenture Bonds as follows:

The Lehigh Valley Rail Way Company.....	\$380,000
Lehigh Valley Railroad Company of New Jersey.....	240,000
Pennsylvania and New York Canal and Railroad Company..	145,000
National Storage Company.....	80,000

These securities have been deposited with the Trustee of the General Consolidated Mortgage, as required by the terms of that mortgage.

To reimburse your Company for advances made to it for capital expenditures, the Wyoming Valley Water Supply Company has issued \$80,000 First Mortgage Five Per Cent. Bonds which have been received and placed in the treasury.

The book value of the capital stock of Cox & Company, Incorporated, has been reduced by the sum of \$1,000,000, and Profit and Loss charged with that amount, as has been the practice in preceding years.

There has been a reduction in the book value of the capital stock of the Temple Iron Company as a result of the liquidation of its anthracite business following the decree of the Supreme Court of the United States.

Material and Supplies on hand at the close of the year amounted to \$2,906,007.63, a decrease of \$467,253.15.

Current Assets are \$8,097,354.72 in excess of Current Liabilities.

Four quarterly dividends of two and one-half per cent. each on the preferred and common capital stocks of the Company were declared and paid during the year.

The cash and security balances of the Company for the year have been verified by certified public accountants and a copy of their certificate as to the correctness of the same is given on page 19.

GENERAL REMARKS.

Your Company has pursued a fairly aggressive policy in the matter of expenditures for the development and improvement of its property. The appropriations for the year were also very liberal for the maintenance of the permanent way and equipment. In fact, it will be observed by reference to the statement of operating expenses, that the total maintenance appropriations have been somewhat in excess of the preceding year, noticeably so in the case of equipment. Your Board of Directors believed it to be for the best interests of the stockholders to pursue this policy of liberal maintenance and conservative development for the future, notwithstanding the fact that the revenues were somewhat affected during part of the fiscal year as a result of the disturbed business and financial condition of the country resulting from the European situation.

The attention of the stockholders is again called to the tax accruals which are steadily increasing, and at a rate out of all proportion to the increase in revenues. The total taxes now amount to 4.23 per cent. of your Company's gross operating revenues. In the last ten years operating revenues have increased 29.69 per cent., while taxes have increased 154.21 per cent.

Five new covered barges were received during the year and added to the floating equipment of the Lehigh Valley Transportation Company, the entire capital stock of which is owned by your Company. One tug, fully covered by insurance, was lost at sea. One steam lighter, two cattle boats and six barges which, on account of age and capacity, became undesirable for further service, were condemned and sold.

The Interstate Commerce Commission rendered a decision in the month of May, 1915, under the so-called Panama Canal act, the effect of which, unless the decision can be modified, will be to compel the Lehigh Valley Railroad Company to cease the operation of six steamers owned by the Lehigh Valley Transportation Company and now operated upon the Great Lakes. These vessels have for years been operated in miscellaneous freight service and served as valuable feeders from western points to your Company's lines which end at Buffalo. The decision of the Commission does not require the discontinuance of these operations until December 1, 1915. The matter is one of grave concern to your Company and is now occupying the earnest attention of its officers.

Your Company has seventeen men engaged in the preparation of data and collection of records in connection with the valuation of the Company's property, for use by the Interstate Commerce Commission, as required by law, and this force will have to be increased as the work progresses.

The passenger stations at Waterloo and Seneca Falls and the passenger train service between Geneva and Seneca Falls were discontinued as of October 1, 1914. This discontinuance was consented to by the Public Service Commission of New York State upon proof being furnished to it that the service was being rendered at a loss to your Company and that the communities interested were being well served otherwise.

Upon petition of the Board of Trade of Irvington the Board of Public Utility Commissioners of New Jersey ordered your Company, effective January 29, 1915, to operate three passenger trains on the Irvington Branch in connection with three main line trains to and from Jersey City. The receipts from this service were so hopelessly inadequate in meeting the expense of operation that the Board of Public Utility Commissioners consented to the withdrawal of the service as of June 22, 1915.

The operation of the Lehigh and New York Railroad for the year under review resulted in a loss of \$225,826.13. The property of that Company is leased and operated by your Company under an agreement made in 1895.

Sixty new industries were located on the system during the year, of which fifty have direct track connections with your Company's lines.

Total payments direct to labor for the year amounted to \$16,834,699.53, or 56.21 per cent. of the total operating expenses, the same having been distributed among an average of 20,173 employees.

The contribution made by your Company to its Employees' Relief Fund amounted to \$59,989.38.

The officers and employees are thanked for their loyal and faithful services rendered during the year.

E. B. THOMAS, President.

COMPARATIVE INCOME ACCOUNT FOR THE YEARS ENDED JUNE 30, 1915 AND 1914

OPERATING REVENUES:—	1915	1914	INCREASE OR DECREASE
Coal freight revenue.....	\$19,195,755.50	\$18,528,246.44	\$667,509.06

THE LEHIGH VALLEY COAL COMPANY

REPORT OF OPERATIONS.

PHILADELPHIA, August 2, 1915.

The annual report of the operations conducted by The Lehigh Valley Coal Company for the fiscal year ended June 30, 1915, and statements indicating its financial condition at the close of the year, are herewith submitted.

The conditions in the anthracite trade have not been very satisfactory because of the mild weather which has prevailed during the past several winters. While the tonnage mined shows a slight increase over the preceding year, all of the increase was made in the first six months. The second half of the year shows a decrease as compared with the same period a year ago.

The total net income of the Company from all sources, after deducting charges for royalties, sinking funds, depreciation of the property and interest on the funded debt, amounted to \$1,022,814.91, an increase of \$457,955.47 as compared with the preceding year.

The production of anthracite coal from the lands owned and leased by The Lehigh Valley Coal Company, including that mined by tenants, was 8,088,901 gross tons, an increase of 211,511 tons.

The percentage of sizes above pea produced by the mining operations of the Company was 65.41 per cent., a decrease of 1.05 per cent.

The number of breaker hours worked was 42,085, an increase of 867 hours.

The bituminous coal mined from the Snow Shoe lands, located in Centre County, Pennsylvania, amounted to 258,205 gross tons, an increase of 5,474 tons.

The property of the Company was fully maintained during the year and \$517,542 was expended for additions and betterments.

The steel fireproof breaker at Packer No. 5 colliery, referred to in the last annual report, was completed and is now in successful operation. Other improvements at this colliery, including a substantial addition to the boiler plant and a new steel headframe over the shaft, have been completed, and a new steel fireproof ventilating fan is now in course of construction. At Packer No. 4 colliery the alterations to the breaker and the concentration of the underground pumping are well under way and will be completed during the coming year.

An addition to the boiler plant at Dorrance colliery has been made to provide the increased amount of steam required because of the extension of underground operations.

Prospecting on the Broadwell lands in Lackawanna County is now under way with a view to commencing mining operations thereon and taking the coal to Heidelberg colliery for preparation.

To reduce still further the risk of destruction by fire, a complete spray system was introduced at each of the frame breakers and, as a result of tests made under the observation of representatives of the insurance companies, a substantial reduction was made in the premiums paid for fire insurance.

DIVIDENDS:—

Two and one-half per cent. on preferred stock, paid Oct. 10, 1914.....	\$2,657.50	
Two and one-half per cent. on common stock, paid Oct. 10, 1914.....	1,512,542.50	
Two and one-half per cent. on preferred stock, paid Jan. 9, 1915.....	2,657.50	
Two and one-half per cent. on common stock, paid Jan. 9, 1915.....	1,512,542.50	
Two and one-half per cent. on preferred stock, paid April 10, 1915.....	2,657.50	
Two and one-half per cent. on common stock, paid April 10, 1915.....	1,512,542.50	
Two and one-half per cent. on preferred stock, due July 10, 1915.....	2,657.50	
Two and one-half per cent. on common stock, due July 30, 1915.....	1,512,542.50	
Balance, June 30, 1915.....	23,692,716.88	6,060,800.00
		\$30,802,767.18
Balance brought forward, July 1, 1915.....		\$23,692,716.88

The operations on the bituminous coal lands at Snow Shoe are being steadily developed to permit of greater efficiency. As soon as the power line, now under construction, is completed, electric haulage will be substituted for mules and electric coal cutting machinery will be introduced in place of pick mining.

The properties at West Harrison Street, Chicago, and Fillmore Avenue, Buffalo, which were no longer required in the conduct of the Company's business, were sold during the year.

Included in the cash on hand is the sum of \$678,085 representing an amount set aside on account of the special tax levied by the State of Pennsylvania of two and one-half per cent. of the value of the coal mined. The constitutionality of this law has not as yet been decided by the courts. No new capital obligations have been issued during the year.

By action of the Sinking Fund \$404,000 Delano Land Company First Mortgage Five Per Cent. Bonds were purchased and canceled during the year. The retirement of these bonds will result in a reduction of \$20,200 per annum in the fixed charges of the Company.

The obligations appearing on the balance sheet as "Deferred Real Estate Payments," representing short term notes given for the purchase of property in prior years, have been reduced by the sum of \$100,000.

Payments amounting to \$112,804 were made to the sinking funds of the various mortgages on the Company's property.

Current Assets are \$3,521,901 in excess of Current Liabilities. The books and accounts of the Company have been verified by certified public accountants and a copy of their certificate as to the correctness thereof appears on page 9.

By order of the Board of Directors.

F. M. CHASE,
Vice-President and General Manager.

*Illustrated.

The experiments on lateral thrusts on rails on curves, described by George L. Fowler on another page, are interesting and to a certain extent instructive; but as stated by Mr. Fowler, it is impossible to draw accurate conclusions from them.

Lateral Stresses
in
Rails on Curves

In the first place, the curves on which the tests were made were too short—215 ft.

in one case, and 237 ft. in the other. The test instruments were so placed on the curves that they were only about 125 ft. from the ends. Under these conditions, there is a question as to whether the wheels or trucks were exerting a normal amount of pressure on the rail at the time they passed over the recording instrument. In the next place in plotting the curves showing the average thrust for different speeds, the median lines were roughly drawn, and while they would appear to approximate parabolic curves, no pretense was made at determining their exact shape with mathematical accuracy; in fact, an insufficient number of experiments were made in each case to warrant so doing. In studying the results of the tests, it should be remembered therefore, that "the records cannot be taken as comprehensive enough to base a final conclusion on, but their general trend is sufficiently consistent to indicate a probability.

Elsewhere in this issue there is an article by Walter S. Hiatt, Special Correspondent for the *Railway Age Gazette* in France, describing handling of the wounded from the front to the permanent hospitals of the country. The magnitude of the business of transporting wounded soldiers is fearfully impressive when one thinks of

600 carloads of wounded men sent back each day. It brings quite vividly to mind one phase of the horror of the European war. In sending the article printed elsewhere, Mr. Hiatt suggests that some of the railroad men of America might like to contribute toward the rebuilding of one or more of the freight cars into hospital cars. Commandant E. Loiseleur, who is in charge of the rebuilding of these cars, will see that if money for a car or cars is contributed by American railroad men, a plate will be placed on the car stating from whom the money came. The suggestion is worth considering. One or more of these cars in service would form a fitting tribute of American railroad men to the resourcefulness and good work of the French railroads in this war. Such tribute would be in the nature of contribution to Red Cross work and not an act of partisanship. As Mr. Hiatt points out, the cars cost less than \$250 to rebuild. Money should be sent to Commandant E. Loiseleur, Fourth Bureau, Fourth Division, Ministère de la Guerre, Boulevard St. Germain, Paris, France.

The voluntary reorganization of the finances of the Missouri-Pacific has proved impracticable and on August 17 the company was put into the hands of the receiver B. F. Bush, president, was appointed sole receiver by the court. A plan of readjustment which called for an assessment of \$50 per \$100 share on the stock and

The Missouri Pacific Receivership

the exchange of various issues of bonds for preferred stock and bonds was announced by Kuhn, Loeb & Company and associates on July 1, and deposits of security were asked under this plan. August 17 was the last day for deposits, but presumably if there had been any at all satisfactory response from security holders previous to August 17 the date for deposits would have been extended. The board of directors, however, in announcing the receivership, say that "the deposits of securities are wholly insufficient." Kuhn, Loeb & Company and various protective committees representing different issues of securities announce that a reorganization will take place along the same lines as had been proposed for the voluntary reorganization. An attempt to get the co-operation and consent of so many conflicting interests and to secure sacrifices so drastic (at least

on paper) had never been made before in the history of American railroad companies. Although there were very numerous individual complaints against numerous provisions of the plan of reorganization, the failure of a sufficient number of security holders to make the required deposits does not necessarily cast any reflection on the merits of the reorganization plan. It may and probably does simply reflect the extreme difficulties of the case, and the quite natural attitude of each class of security holders to put up the strongest possible fight for their own individual interests and to distrust the co-operation and sacrifices made by other classes of security holders.

If any reader should complain of the levity of our court news column now and then, we should hardly be ready to disprove the charge, especially if he should cite a decision like that reported from Mississippi last week (page 298). Courts are always dignified, but of the exceedingly frivolous matters which they are often obliged to listen to, the railroad law column seems always to have its full share. In this Mississippi case the judge seems to have thought himself that his decision would probably reach the reader in the summer, when light reading is in order, and his reference to "white gentlemen with pockets full of hundred dollar bills," shows a delicate appreciation of all sides of the question at issue. The only legitimate criticism that the editor can admit is that he failed to put the article in the humorous column. In speaking of the frivolousness of damage suits we refer, of course, to the impression on the readers. Every law suit is intensely serious to somebody. In this case the serious side, to the railroad man, is entirely ignored in the decision, as reported. The serious side is that the ticket agent, who could not change the hundred-dollar bill, in all probability would have averted the law suit if he had opened his office ten or fifteen minutes earlier, as he ought to have done; and the conductor, who ejected the passenger, would also have averted it if he had taken the passenger's word that he had tried to buy a ticket. It would not be fair to condemn the conductor at this distance, and it is true that the question when to stretch the regulations is a delicate one, very difficult to provide for in advance. Nevertheless, discreet employees who do go outside of their instructions now and then, often thereby smooth the relations between their employer and the public in a way to deserve praise. At all events, we have here the lesson that a very small irregularity can make troublesome and often costly litigation.

The railroad policeman is, probably, very much like the average policeman in other service, in that he is subject to the insidious weakness which in ordinary concerns, where there is little excitement and apparently no great matter at stake, causes him to follow the line of least resistance. The Court News column this week contains an illustration, from Massachusetts, of how a conductor and a brakeman failed in their duty, compelling their employer to pay damages to a passenger who was assaulted by another passenger. The conductor and the brakeman were police officers, but failed to realize their responsibilities as such. Passenger trainmen must be affable to pleasant passengers and severe with those who deserve restraint, rebuke or punishment. This is a difficult dual role, and it is not to be wondered at that many trainmen fail to measure up to its requirements. It sometimes looks as though it would be a good idea to have the rough, energetic and ugly conductor give courses of instruction to those who are lazy or too mild. Drill and discussion are the only means by which conductors generally can be educated in this matter, for actual practice is too intermittent and irregular to be depended on. It is very desirable for the trainman to cultivate an aggressive habit of mind without reference to his duties in connection with law breakers. Most of the time, it is true, he must be cultivating gentility; but that does

not mean that this suggestion is out of place. Indeed, the efficient passenger trainman must exercise these opposite qualities every day. On many trains there are enough thoughtless passengers who occupy two seats while women with children walk through three cars to find one seat, to occupy profitably the attention of several brakemen at every large station. It may be questionable whether a railway can afford thus to educate boorish passengers, for the task is a big one; but there is no question that the brakeman, well trained in all his duties, who voluntarily cultivates the iron hand for law-breakers—even petty law-breakers—is a valuable member of society.

WESTERN FREIGHT RATE DECISION

THE decision of the majority of the Interstate Commerce Commission in the western freight rate advance case is disappointing to the carriers and surprising to most people who followed the hearings closely. It is disappointing to the carriers because the advances granted are only a minor part of those asked for and so small that they will do practically no good. Some newspapers, desirous of stimulating prosperity by artificial respiration, have estimated the advances at \$4,000,000 a year. "The aggregate increase of revenue permitted under the majority report," says Commissioner Daniels, who heard the case, "will hardly exceed \$1,600,000, or about one-fourth of 1 per cent of the total freight revenue of these carriers for 1914." This is the estimate made independently by representatives of the railways and is undoubtedly correct.

The decision caused so much surprise because most people who followed the hearings thought the roads made out their case. Repeated careful readings of the majority opinion itself tends to confirm this view. The facts accepted and presented sustain almost every contention made by the representatives of the railways. It is significant that Commissioner Daniels, who knows the record better than any one else, attacks the decision of the majority as unsupported by facts, logic or justice. It is almost unprecedented for the commission to make a decision so exactly opposite to that favored by one of its own members who heard the case.

The western railways based their claims mainly on the grounds that they needed larger earnings and that the specific proposed advanced rates were reasonable. Upon the first point they introduced evidence showing that their operating expenses had been rapidly increasing, both absolutely and relatively, to their total earnings and that in consequence their net operating income and the return on their capitalization and property investment had been declining. Those who opposed the advances sought to show that the increasing ratio of operating expenses to earnings was more nominal than real, being due to changes in accounting methods required by the commission in 1907. The majority of the commission definitely rules that the increases in the operating ratio have been due to actual increases in operating expenses. Those who opposed the advances also claimed that the increases in expenses of some of the roads were due largely to financial mismanagement. The majority explicitly finds that there is no apparent connection between the increases in the operating ratio and the financial mismanagement of certain roads. It finds also that there has been a large increase in the ratio of the bonds to stocks outstanding, and that this is due to an increasing reluctance on the part of the public to risk investment in railway stocks.

But while it makes these and other similar findings, the majority refrains for some reason from making any finding as to whether the net returns of the roads are inadequate. As Commissioner Daniels points out, the eastern lines made no clearer demonstration in the five per cent. case of the inadequacy of their revenues, and yet in that case the commission specifically held that they were insufficient from the standpoint of the public welfare.

There are several roads in western territory which recently have been under attack for financial mismanagement. But the commission explicitly recognizes the fact that all the roads in a

group should not be judged either by the strongest or the weakest, the best managed or the worst managed, but that it should consider the situation as a whole. Nevertheless, in view of the hiatus between the facts which it presents and the decision it reaches, there seems ground for the suspicion that it was unduly influenced by the disclosures which have been made in some other proceedings.

When Commissioner Daniels says that such cases as this should be "neither prejudiced nor complicated by considerations of individual instances of corporate mismanagement," he is plainly implying that this is just what the majority has done. The blame for the outcome, so far as it is due to this cause, cannot all be put on the commission. A large part of it should be placed on the management of the roads that have brought railways in general into bad odor. But two wrongs do not make a right. The commission has no moral or legal authority to base its decisions in rate cases on prejudiced or punitive considerations. It has no right to punish all roads for the shortcomings of a part.

The second important point involved was the reasonableness of the proposed advanced rates. In its opinion in the five per cent case the commission intimated that it did not look with favor on general advances. The tariffs, it indicated, were full of inconsistencies and discriminations, and the carriers should first secure increases in revenues by advancing the rates which were relatively low. The western lines sought to do this. The four principal commodities on which advances were proposed were grain and grain products, live stock, packing house products and coal. The majority of the commission refused the advances on all these but coal.

It refused the increase on live stock on the ground that above half of the traffic now moves on state rates and that many state rates are lower than the present and proposed interstate rates. Commissioner Daniels shows it is not a fact that so large a part of the traffic moves on the state rates. He also contends that the commission should not have refused advance in interstate rates because there were lower state rates. The attitude adopted by the majority is illogical and disappointing. The Federal authority over commerce is paramount. It would seem, therefore, that the reasonable and proper thing for the commission to do, where it finds state rates are lower than interstate rates, is to determine which are reasonable and then bring them into harmony. For it to refuse reasonable advances in interstate rates because there are lower state rates, is to let state regulation control interstate regulation. If the Federal commission is to begin to refuse advances in interstate rates because of low state rates, and the state commissions are to refuse advances in state rates because of interstate rates that do not suit them, the situation of the railways is indeed an unhappy one. The attitude assumed by the majority of the commission is lacking in fairness and courage and contrasts strongly with its opinion in the Shreveport case. As to the rates on packing house products, these have been notoriously low in proportion to the value and cost of the service rendered for years. The decision of the commission against advances in them is almost inexplicable. However, certain of the railways have themselves afforded some ground for refusing advances by keeping in effect between Kansas City and Chicago certain packing house products rates that are unremunerative and discriminatory.

The worst feature about the decision is its negative character. Nothing has so blighting an effect on the management of a business concern as to have at its head a man who has no constructive program or policies of his own and who vetoes most of those suggested by his subordinates. This is very much the situation in which the railways find themselves. The Interstate Commerce Commission is in an important sense at their head. When their eastern lines asked for a horizontal increase in freight rates it conceded they needed larger revenues. In its first decision in the five per cent case, however, it gave them only a small part of the advances they asked and told them to get the rest of the needed revenues by imposing special charges

for special service at terminals, advancing low rates on specific commodities and raising passenger rates. The railways, east and west, filed tariffs fixing special rates for special services. The commission promptly suspended and soon annulled them. They advanced their passenger rates. The commission let the advances go into effect in the east, but suspended them in the west. The western lines proposed advances in the low rates on certain specific commodities. The commission suspended them and now has annulled most of them. By permitting some freight rate advances to be made and by its discussion of the financial condition of the western lines, the commission seems to admit that the western lines need larger revenues. But it does not explicitly concede this, and nowhere does it give the roads any hint as to how they should proceed to get additional revenues.

The decision, as Commissioner Daniels says in his dissenting opinion, "only beclouds the principles upon which the commission may be expected to act in future and leaves nothing certain but uncertainty." As he adds, a point has been reached where "one of two courses ought deliberately to be chosen and clearly announced. If, despite increased costs not offset by increased revenue, increases in rates are to be denied, except where in individual instances gross injustice would be occasioned by their denial, the carriers ought to be apprised of this policy, so that they may set their house in order, if they can, against such a situation. If, on the other hand, we are to acknowledge in general, what we are perforce compelled to admit in detail, just and reasonable increased rates should be permitted not grudgingly but with such fair measure of allowance as will indicate that the transportation industry is entitled in the interest of the public to earnings sufficient to provide a service commensurate with public needs." The course the commission has thus far followed regarding advances in rates has been illogical, inconsistent and vacillating.

"D—d IF THEY DO AND D—d IF THEY DON'T"

WHAT everybody expected would happen is happening—in Texas. It is a mild statement that a Dallas paper makes in saying that the railroads "occupy rather an awkward position." The environments of the position are the Interstate Commerce Commission, the Louisiana Railroad Commission and the Texas Railroad Commission. The bone of contention is the advantage claimed to have been given to Shreveport, La., over inland Texas jobbing points by a supplemental order of the Interstate Commerce Commission, which defines East Texas. The western limits have been set at a line drawn through Gainesville, Fort Worth, Waco and down the Brazos river to the gulf. Within that territory the railroads are ordered to put in rates from Texas points toward Shreveport that shall be uniform with rates from Shreveport for like distances. The railroads are expected to comply with this order by September 15.

Now come in the devil and the deep sea. Rates between Texas points are fixed by the Texas commission. The rates required by the Interstate Commerce Commission are under an order authorized by the Supreme Court of the United States. The first proceeding by which the situation was brought about was instituted by the Louisiana commission. The railroads are the goat. They have been brought into a controversy in which they have little interest except to know whether it will be better to obey the law of the state or of the United States. It has been suggested that Congress might take some action that would settle controversies between the commissions of two states or between a state commission and the Interstate Commerce Commission, and not allow all the punishment to fall upon the innocent bystander who is being robbed at the same time, but Congress has not done so.

It has been intimated by one of the Texas commissioners that he will ask the attorney-general of the state to bring an injunction suit against the carriers if they attempt to apply the rates required by the order of the federal commission. The railroads are left in a position where they have to guess which one of

the commissions will triumph and risk a penalty for guessing whether the guess is right or wrong. The Dallas News hits the mark in saying: "The mistake of the state railroad commission was in standing back on its dignity and muttering the litany of state's rights when it ought to have been engaged in showing that the discrimination complained of by Shreveport was one more of appearance than reality." In a way the railways should welcome the struggle between the state and federal commissions; for it is another step toward a final settlement of the question as to what authority is finally to be their master.

BUFFALO, ROCHESTER & PITTSBURGH

At one time almost exclusively a coal road, the Buffalo, Rochester & Pittsburgh, under its present management, has been developed into an all-around profitable railroad, doing a large passenger business and general freight business, as well as being a carrier of coal and coke. Being an independent north and south road, serving Pittsburgh and the territory north to Lake Ontario, it has been necessary to maintain earning power through the development of economies and the utilization of modern methods of railroading, freight rates per ton per mile having shown a steady decline, and passenger service a steady increase in cost, due to more exacting demands of the public.

Since a considerable part of the coal traffic moves from the neighborhood of Vintondale and nearby branches over almost the entire length of the road north to Buffalo or Rochester, it was obvious that one of the surest methods of effecting economies in operation would be the development of a south-bound traffic which could be carried in coal cars, and it was through the efforts of the present management that a company was induced to locate an iron furnace on the southern part of the road. The development of an iron ore traffic south at once greatly improved the average train load of revenue freight.

A railroad doing a competitive passenger business, the train mileage of which amounted in 1915 to 1,343,611 miles, as compared with the revenue freight train mileage of 2,344,000 miles and with an average ton mile rate of only 0.477 cents, must of necessity operate economically to show a profit, and especially is this true with a road having as heavy and numerous grades as has the Buffalo, Rochester & Pittsburgh.

The year ended June 30, 1915, was in a way a test applied to the work of development, which has been carried on by the management. Military strategists say that a retreat is a far more severe criterion of generalship than a victorious advance. This is in some measure equally true of the operation of a railroad in a time of business depression and falling off of traffic. What makes the Buffalo, Rochester & Pittsburgh's 1915 year peculiarly interesting is that the falling off of ore traffic was in much greater proportion than the falling off in bituminous coal traffic. The total tonnage of freight carried in 1915 was 10,928,000; in 1914, 12,295,000. The bituminous coal tonnage in 1915 was 7,108,000, or 1,069,000 less than in 1914, and the tonnage of iron ore was 417,000 in 1915, or 283,000 tons less than in 1914.

In 1914 and the first part of 1915, very considerable additions had been made to the engines in the service, and the new engines put into freight service were mostly Mallets, Mikados having previously been the heaviest locomotives used.

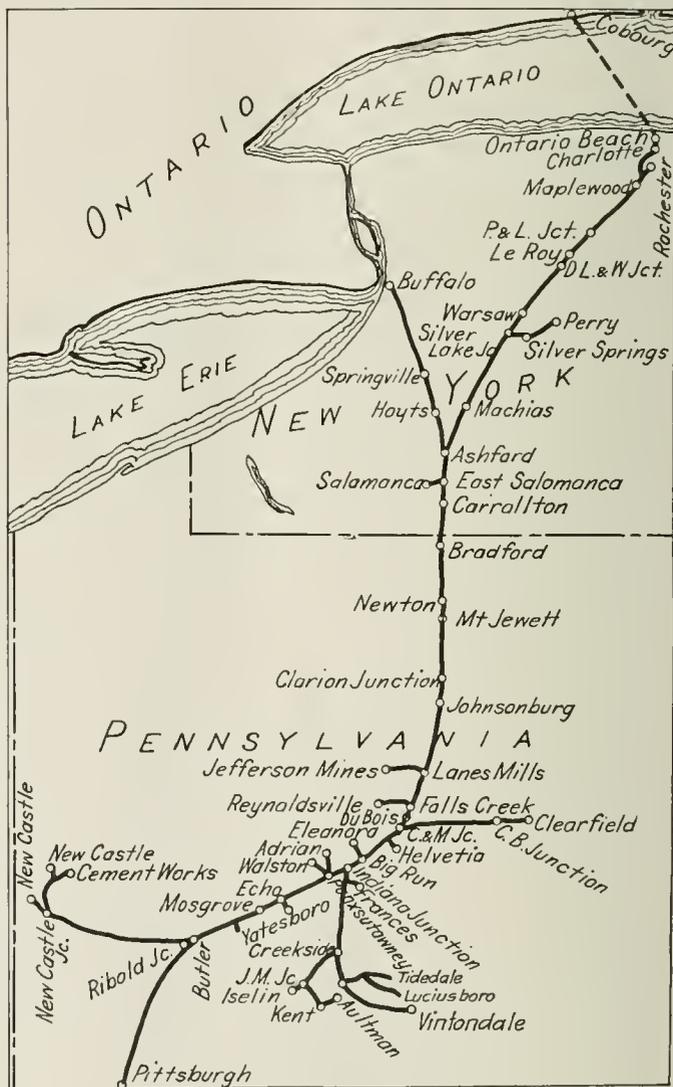

It is only necessary to reflect that if two train loads of coal of 50 cars each are sent north 100 miles, and the 100 cars have to be sent south empty, even if combined into one train, the average train load is about 1,700 tons, whereas if 50 of the coal cars can be loaded south-bound, even if the empties and loads are sent south in two trains, the average train load is about 1,900 tons, to see what the Buffalo, Rochester & Pittsburgh was brought up against with the falling off of 40 per cent. in ore tonnage as compared with 10 per cent. in coal tonnage. The purchase of heavier locomotives, however, had apparently come in the very nick of time. The average revenue freight train load in 1915 was 707 tons, as against 694 tons in 1914, and the average load of revenue freight per engine mile was 477 tons, the highest in the history of the road, comparing with 454 tons in 1914 and 463

tons in 1913, the best previous record. Transportation expenses in 1915 amounted to \$3,145,000, as compared with \$3,880,000 in the previous year, a decrease of 18.96 per cent. A striking and significant saving was made in the cost of fuel for train locomotives. This was \$473,000 in 1915, as against \$773,000 in 1914, a decrease of 39 per cent., as against a decrease of 14 per cent. in total train mileage. The total operating expenses amounted to \$6,935,000 in 1915, as compared with \$7,965,000 in 1914, a decrease of 12.93 per cent.

The following table shows the ratio of each class of expenses to total operating revenues in 1915 and 1914:

	1915.	1914.
Maintenance of way.....	13.37	13.49
Maintenance of equipment.....	22.53	20.65
Traffic	1.50	1.40
Transportation	33.17	36.15
Miscellaneous	0.15	0.25
General	2.44	2.26

In commenting on the annual report of the Buffalo, Rochester & Pittsburgh for 1914, it was pointed out that the adoption of

The Buffalo, Rochester & Pittsburgh

very heavy power was made only after the completion of a far-sighted and scientific strengthening of the entire permanent property and especially of those parts of the road on which the heavy locomotives were to be placed. The opinion was expressed that the result of such a scientific development would be clearly reflected in materially greater effectiveness of the plan. The showing made in 1915 confirms this opinion fully as conclusively as would a great gain made in net profits in a year of increased traffic and large ore shipments.

In 1915 the total operating revenues amounted to \$9,480,000. This was a decline as compared with 1914 of \$1,255,000, the de-

crease in expenses previously mentioned amounting to \$1,030,000, leaving a net revenue in 1915 of \$2,545,000, which was less than the 1914 net by \$225,000. There was a decrease also in non-operating income, due principally to the fact that the credit balance for hire of freight cars was less by \$115,000 than in the previous year, so that the net income available for dividends amounted to \$913,000, as against \$1,355,000 in the previous year. From this was appropriated in 1915 \$22,000 for pension and fire insurance, and \$111,000 principally for the payment of equipment trust and \$780,000 for dividends, being 6 per cent. on the \$6,000,000 preferred stock, and 4 per cent. on the \$10,500,000 common stock. In 1914 6 per cent. was paid on both the common and the preferred, calling for \$990,000, and a larger appropriation, \$348,000, was made for payment of equipment trust, etc.

The total current assets at the end of 1915 amounted to \$3,547,000, of which \$1,409,000 was cash and demand loans and deposits. The current liabilities amounted to \$1,245,000, with only a nominal amount of loans and bills payable, \$9,600.

Apparently a return to normal business conditions with a resumption of iron ore shipments would, barring some unforeseeable great increase in operating expenses, not only restore the earning power of 1913, when a substantial margin was earned over 6 per cent. dividends on the common, but give the company an even greater margin of safety. This fact, it might incidentally be mentioned, is wholly due to the foresight and good judgment of the management of the property, since the Interstate Commerce Commission 5 per cent. rate advance affected the Buffalo, Rochester & Pittsburgh to only a very small extent, the increase not applying on coal, coke or iron ore. President Noonan in his report says that "A careful estimate indicates that such increases (those granted by the Interstate Commerce Commission) added about \$41,000 to our revenues this year."

The following table shows the principal figures for operation in 1915, as compared with 1914:

	1915.	1914.
Average mileage operated.....	586	586
Coal freight revenue.....	\$5,040,101	\$5,904,106
Coke freight revenue.....	318,638	338,339
Merchandise freight revenue.....	2,663,951	2,911,497
Passenger revenue.....	1,101,981	1,184,417
Total operating revenues.....	9,479,936	10,734,691
Maintenance of way and structures...	1,267,253	1,447,954
Maintenance of equipment.....	2,135,354	2,216,194
Traffic.....	141,767	150,553
Transportation.....	3,144,598	3,880,160
Miscellaneous operations.....	14,658	27,054
General expenses.....	231,621	243,202
Total operating expenses.....	6,935,252	7,965,117
Taxes.....	230,000	234,000
Uncollectible revenues.....	596
Operating income.....	2,314,087	2,535,574
Gross income.....	3,032,733	3,355,798
Net income.....	912,720	1,354,784
Appropriations.....	132,720	364,784
Dividends.....	780,000	999,000

NEW BOOKS

Oxy-Acetylene Welding and Cutting. By Calvin F. Swingle, M.E. 190 pages, 4½ in. by 6½ in. Illustrated. Bound in leather or cloth. Published by Frederick J. Drake & Co., Chicago. Price, \$1.50 in leather; \$1.00 in cloth.

This book is intended as a practical treatise on the subject of welding and cutting with the oxy-acetylene flame, and only so much of the theory pertaining to the subject has been included as will enable the practical man to acquire a thorough working understanding of the subject. After an introductory chapter dealing briefly with the adaptability of various methods of welding, several chapters are devoted to welding flames and the properties and methods of handling the gases most commonly used. This portion of the book is confined largely to the oxy-acetylene flame, which has the widest practical application, and touches only briefly on other gases which have been used with oxygen to a less extent in welding and cutting operations. The equipment used in welding and cutting is next discussed, after which the operation of the plant and the practices followed in welding and cutting are taken up. A final brief chapter is devoted to the subject of carbon removal with the oxygen torch. The book contains a large number of illustrations and a number of tables.

Letters to the Editor

DEPRECIATION AND CONFISCATION

NEW YORK, N. Y.

To the Editor of the Railway Age Gazette:

Permit me to comment on the article in your issue of June 4—A Billion Dollar Confiscation—by Morrell Walker Gaines, and your editorial in the same issue, and the letter of Lawrence K. Frank, in your issue of July 9.

The subject of depreciation, *so-called*, is of vital importance to-day to the railroads and other public utilities of the country and, therefore, to the people as a whole.

Mr. Gaines' first paragraph in which he condemns the present tendency towards over-regulation of railroads by "powerful Federal and State commissions," in which "counsels of perfection" are substituted for "experience, rough grown from the soil of struggle," is fully justified by the conditions which have developed, especially during the last few years, in answer to public clamor and the activities of honest but incompetent reformers and self-seeking politicians. As has been well said, regulation has degenerated into strangulation.

Mr. Gaines' objections to the present unwieldy, inefficient, costly and unfair scheme for valuing the railroad properties as a basis for rate-making are also fully justified. An additional argument might be advanced against this scheme, which is now costing millions of dollars a year and will in the end, I feel sure, cost more than the \$50,000,000 mentioned by Mr. Gaines. The appraisals will be obsolete by the time they are completed.

One radical fault in this system is in deducting for depreciation, *so-called*; not alone for the actual depreciation, but for the proportion of cost indicated by the age of the several parts as compared with the *assumed* expectation of life. That is, the ratio of the present age to the expected life.

This aging of plant calls for a charge for renewals and replacements, but does not call for, nor does it in any way justify a writing down of the fixed capital account.

The income must, if possible, be made to pay for the maintenance of plant, and this renewal or replacement is part of the maintenance. If all parts of the plant were to last only one year and then to be renewed or replaced by an equivalent, the total cost of renewals would fall automatically on each year and be paid for from the year's income. In this case the confounding of cost of renewals with "depreciation" would never have taken root with commissions, courts and others.

Particularly in the case of a new or single unit plant, the accruing liability for the renewal or replacement of its several parts must be carried into the accounts each year, for otherwise the profits will be overstated. This is the justification for an annual charge as an item of expense for deferred, future, or periodic renewals, wrongly styled "depreciation."

It may happen, and does not infrequently happen, in the case of composite properties built up of units of different ages, that the total cost of maintenance, including accruing liability for renewals, is fully met by current expenditures.

This charge to operating expense for future renewals should be credited to reserve, and this reserve should be kept as an open account to be charged for items of renewal and replacement and credited with the annual apportionment, plus the interest on the balance if kept on the sinking fund principle.

It is to be borne in mind constantly that an expectation of life table made up from averages (or said to be) must not be relied upon for individual application. In the case of plant of the same class, even if of standard design and construction, the life of such parts will vary widely according to the character of maintenance and of operation in general. An estimate of accruing liability for renewals and replacements should be held subject to constant amendment and correction as experience indicates in each separate case.

The later rulings of the Interstate Commerce Commission indicate that they are beginning to appreciate some of the practical features of this complicated question.

But we find in the commission's "Classification of Investment in Road and Equipment"—Issue of 1914—effective July 1, 1914, page 32, under the head of, 11. Equipment, the following:

"The ledger value of each unit of equipment shall be credited to the appropriate equipment account when it is retired from service. The amount of this credit shall be concurrently charged as follows:

"The amount of the balance in the balance sheet accrued depreciation account with respect to the equipment thus retired shall be charged to that account; the salvage recovered shall be charged to the materials and supplies account or elsewhere, according to the purpose for which used; the amount of depreciation prior to July 1, 1907, not previously written off or provided for, shall be charged to Profit and Loss, and the remainder shall be charged to the appropriate operating expense account for equipment retired."

That is, so much of the "ledger value" as cannot be located in the "accrued depreciation account" (renewal reserve) and recovered in the parts saved for future sale or service must be charged against income, either past or current.

The question as to the entire cost of renewals being a charge against income depends upon whether, in the early years of the property's life, the income was sufficient to pay all expenses, including cost of maintenance and a fair return on the investment.

A fair study of all the elements involved should be convincing that no such rule should be made retroactive and applied indiscriminately. Here is where, by way of example, the "counsels of perfection" should be tempered by the saving grace of common sense.

Mr. Frank is right so far as he argues for spreading the accruing liability for future renewals over the years of effective service; but he is far from the vital facts of this important question when he speaks of the setting up of a "depreciation reserve" as "a hook transaction." The transaction involves fundamental principles; the book-entry is the record only of the transaction. A record may be an entirely accurate statement of an improper transaction. May it not be suggested that a fault to be guarded against on the part of accountants as well as bookkeepers is the placing of the book record above the transaction recorded.

Mr. Frank, in the statement just referred to, says that plant retired should be credited to fixed capital. If it is intended here to refer to such parts only as are permanently retired and not to the parts renewed or replaced by substitutes, then there may be a sufficient reason for the practice proposed. But even in the case of parts thus permanently retired which, for instance, were required to bring into effective action some necessary continuing structure or equipment, the writing off or crediting to fixed capital by no means necessarily is good practice.

To put this in another way—in making a schedule for a valuation, there should be included more than the parts which meet the eye; there should be included and valued the parts which were necessary to bring the plant as a whole into position and condition for effective service.

This brings me to the point which I wish particularly to make in regard to "depreciation" charges as intended to cover only renewals and replacements of active plant.

Because a plant or any of its parts has spent part of its anticipated life, this presents no reason for deducting from plant valuation. The owners are liable for the renewals as they fall due. So long as the renewals are made as required for adequate efficiency of operation, and the renewals are charged against income instead of being capitalized, every legitimate requirement has been met.

Suppose, for instance, that in the case of a composite plant, on the basis of expected life and age the property as a whole has settled down to an 80 per cent. age, and it is assumed that nothing better than this can be maintained, then it is argued that 20 per cent. should be deducted from the valuation on account of "depreciation." If this procedure is enforced by the commission, then they should allow a 20 per cent. item to be included in the

estimate of original cost to cover under this ruling a *necessary* item of cost of construction. Otherwise, the investors have to face at the outset a confiscation of 20 per cent. of the necessary original investment.

In this connection it is to be noted that Mr. Frank, while supporting the Interstate Commerce Commission against Mr. Gaines' criticisms, indorses the investment of "depreciation" reserves in plant and then states that these investments "are unalienable." If the plant paid for from reserves represents an unalienable investment, certainly the original investment should be at least equally secure from confiscation.

In your editorial you say:

"The commission's theories about depreciation and charges for retirement are in general sound. Any number of individual instances may be cited where the facts would fail entirely to conform to the theory; but this does not vitiate the general soundness of the rules for charging depreciation. . . . Co-operation between individual railroad companies and the Interstate Commerce Commission should, if the commission takes a broad point of view and the railroad managements a helpful attitude, minimize the hardship that will be worked on present security holders."

There is some evidence that the Interstate Commerce Commission is now more inclined than formerly to take a broad view of its grave responsibility; there is also some evidence to the contrary. Let us hope for the best. One instance of greater breadth of view on their part is found in the public statement made by Judge Prouty and Commissioner Daniels that engineers should be included in the personnel of our commission boards instead of being employed only as members of the staff. This is a decided, though tardy, concession. In this connection I am reminded of an opinion expressed by a man eminent in the engineering profession, H. L. Gantt, in his paper—The Relation Between Production and Cost—presented at this year's spring meeting of the American Society of Mechanical Engineers:

"The cost accountant of the future must himself be an engineer."

Here we may well bear in mind that a man may be competent as a keeper of books, and yet not be qualified in the principles of accountancy and the fundamentals of the business under consideration.

If each of our commissions had as a full member as least one competent engineer, trained in theory and practice, a man of character and judicial temperament, and qualified as an administrator by extended practical experience, there would be more hope for definite improvement in the line of justice and common sense in regulation by commissions.

I speak from my own experience when I say that the executives of railroads and other public utilities are far more likely to do their full part in the line of co-operation advised in your editorial than are the members of our commissions.

The tremendous authority placed in the hands of our commissions, including the three functions of government which, according to our traditions, should be kept separate and apart, is a fundamental fault and puts before the commissions a temptation too strong for the average man to resist.

In conclusion I must dissent positively from your statement:

"The commission's theories about depreciation and charges for retirements are in general sound."

So long as the commission confounds actual depreciation with the accruing liability for renewals and replacements and in any degree deducts from plant valuation on account of this liability, so long will their theories be unsound.

ALEX. C. HUMPHREYS,
President Stevens Institute of Technology.

ITALIAN RAILWAY EMPLOYEES REFUSE BONUS.—Press despatches report that the employees of the Italian State Railways at Milan, recently refused to accept 3,000,000 lire (\$600,000) offered them by the government for extra work done by them in connection with the mobilization of the army. The railway men at Rome have followed their example and have issued a statement saying, "We would feel ourselves humiliated if we were not willing to give our toil while others give their lives to their country."

Reductions Ordered in Rates on Anthracite Coal

Revenues of Carriers May Be Decreased \$8,000,000
by Lower Rates Ordered to Tidewater and Eastern Points

The Interstate Commerce Commission in a decision given out Friday, August 13, finds unreasonable the rates on anthracite coal in carloads, from the Wyoming, Lehigh and Schuylkill regions of Pennsylvania to tidewater and certain interior eastern points. The commission also condemns certain of the practices of the anthracite carriers, with reference to their subsidiary coal companies. The opinion was written by Commissioner McCord. The case bears the name: "In the matter of rates, practices, rules and regulations governing the transportation of anthracite coal," and is to be found in 35 I. C. C. 220. The decision covers 90 pages and connected with it there is an appendix of 154 pages. An abstract follows, the language of the commission being preserved insofar as possible.

Pursuant to an order of June 10, 1912, a general investigation was made of the rates, and practices governing the transportation of anthracite coal from the Wyoming, Lehigh and Schuylkill regions of Pennsylvania to tidewater and interior points on the lines of the initial anthracite carriers. The order named all the carriers in official classification territory, but it was found impracticable to extend the inquiry beyond the affairs of the 11 initial carriers, as follows: Central of New Jersey; Philadelphia & Reading; Delaware, Lackawanna & Western; Lehigh Valley; Erie; Wilkes-Barre & Eastern; New York, Susquehanna & Western; New York, Ontario & Western; Pennsylvania; Northern Central, and Delaware & Hudson.

Freight rates on many commodities are but an infinitesimal part of the price which the consumer pays for such commodities. On coal the freight rate is a more important factor. Anthracite coal is very largely a fuel for domestic use, and it is a necessity. That reasonable freight rates should be charged for the distribution of the great fuel tonnage herein involved is of vital importance to the producers and of equal concern to the consumers.

Anthracite coal is mined in three regions in Pennsylvania—the Wyoming, the Lehigh and the Schuylkill. Practically the entire source of supply is confined to an area of 496 square miles, having an extreme distance from northeast to southwest of about 100 miles. The tonnage (in tons of 2,240 lb.) of anthracite coal shipped from the three regions was 3,358,899 in the year 1850, 16,182,191 in 1870, 36,615,459 in 1890, 45,107,484 in 1900, and 71,295,716 tons in 1913. The tonnage shipped has practically doubled since the year 1890. This large tonnage is produced from approximately 302 operations, collieries and washeries.

Anthracite coal is sold in the market in eight sizes. The sizes smaller than pea are a by-product in the preparation of domestic sizes. The sizes larger than pea are designated "prepared sizes" in the carriers' freight tariffs.

The stove and chestnut sizes are in the greatest demand and constitute 40 per cent of the total shipments. The sizes larger than pea size constitute approximately 61 per cent of the total tonnage shipped. Anthracite coal is principally a domestic fuel. Its selling price at tidewater (the wholesale price obtained by the operators) shows a very definite upward trend during recent years, 34 to 49 per cent during the past 13 years.

These carriers are to a large extent interested in the mining and sale of anthracite coal through their affiliations with or their control of separately incorporated coal companies. Two of the carriers, the Delaware, Lackawanna & Western and the Delaware & Hudson, own coal lands and conduct mining operations.

THE LARGE COAL COMPANIES

The Lehigh Coal & Navigation Co. owns a large portion of the railway lines operated by the Central of New Jersey. Under leases entered into from 1871 to 1883 for 900 years, the

Central of New Jersey operates the railroads, and the navigation company is obligated to ship 75 per cent of its output over the leased railway lines. The navigation company is not controlled by the Central of New Jersey.

The Delaware, Lackawanna & Western Coal Co. was organized in 1909. It ships and markets all of the coal mined by the Delaware, Lackawanna & Western. At the time the coal company was organized the Lackawanna Railroad paid an extra dividend of \$13,000,000 to its stockholders, and the latter were allowed to purchase the \$6,500,000 stock of the coal company. Most of them availed themselves of that privilege.

The Lehigh Valley Coal Sales Company was organized in 1912. It ships and markets all of the coal mined and purchased by the Lehigh Valley Coal Company. The coal sales company issued \$6,060,800 in stock, giving the shareholders of the Lehigh Valley the privilege of purchasing the stock. At the same time the Lehigh Valley paid an extra dividend of \$6,060,800 to its shareholders to provide them with the funds to purchase the stock of the coal sales company.

The Reading Company, a holding company, owns the entire capital stock of the Philadelphia & Reading Railway Company and the Philadelphia & Reading Coal & Iron Co.

With these exceptions the stocks of the coal companies that ship the largest portion of the total tonnage of anthracite coal shipped over the railway lines of the several initial carriers are owned by the carriers.

The tonnage shipped by the coal companies amounts to a very large proportion of the total tonnage shipped by all shippers over each particular railway system.

RATES ON ANTHRACITE COAL

Generally speaking, all the collieries on the lines of any one of the initial carriers in each region are, under the schedules of rates established by the carriers, covered by blanket rates to a particular destination; that is, the several collieries in each region are placed in one group taking the same rate, although the distance between the collieries in the group may be 50 miles more or less. To many important groups of destinations also the rates via any given line are frequently the same; that is, they are blanketed from all the regions reached by that line. Exceptions to this rule apply principally to local short-haul rates.

Rates to Tidewater. For many years a large number of the independent operators sold their coal at the mines to the carriers, or to their allied coal companies, in accordance with the terms of "percentage contracts." Instead of a fixed money price per ton, the independent operator received a certain per cent of the average price at which that grade of coal was sold in New York harbor.

The percentage of the tidewater selling price paid to the operators on prepared sizes of coal was, in the early years, about 40 per cent. It gradually increased, reaching 50 and 55 per cent in the eighties, 60 per cent in 1892, and 65 per cent on November 1, 1900. The remaining portion of the selling price of the coal, 40 or 35 per cent in the more recent years, was the freight rate which the carriers charged the individual operators who elected to ship their own coal production to tidewater. The percentage freight rate was also applied on anthracite coal shipped to Buffalo in the early days. In 1882 the Reading rate on anthracite coal to Buffalo was 57 per cent of the selling price at Buffalo.

In July, 1901, several of the carriers took action to establish fixed or flat rates to tidewater. Six of them, the Reading, Lehigh Valley, Jersey Central, Lackawanna, Erie and Susquehanna & Western were represented on the board of directors of the Temple Iron Company, which was merely a holding company

for the several carriers. Through this medium rates were established for outside shippers as follows: Prepared sizes, \$1.60; pea, \$1.45, etc.

The rates to the lower ports, such as Perth Amboy, are 5 cents per ton less than those to the upper ports because of the higher cost of lighterage from the lower ports. Thus the rates to New York City are equalized.

The rates actually charged by the Lehigh Valley on anthracite coal from the mines to tidewater, for November in the years named, were:

Year.	Prepared sizes.	Pea.	Buckwheat.
1898	\$1.3930	\$1.1225	\$1.1312
1899	1.4965	1.1887	1.1695
1900	1.55	1.3204	1.2290
1901-1910, inclusive	1.55	1.40	\$1.25-1.20

The prevailing percentage rates at the time the flat basis of rates was adopted became the tariff rates to tidewater. The definite upward trend of the rates based on a percentage of the selling price is clearly set forth in the Lehigh Valley figures. Rates based on a percentage of the selling price of a commodity whose selling price increased from year to year would naturally climb to an excessive basis.

The Percentage Contracts Established Excessive Rates. It appears that the 35 per cent division of the selling price of the coal constituted an excessive freight rate, and it was fixed at a high basis in order to make it more advantageous to the individual operator to sell his output to the railroad interests at the mines than to ship it to market.

UNNECESSARY RAILWAY CONSTRUCTION AND PROJECTED RAILWAY LINES

The history of the development of anthracite mining presents a series of persistent but apparently unsuccessful struggles by the individual operators against the conditions imposed by the carriers. The independent shippers did all in their power to promote the construction of additional railway lines. Some of such efforts were unsuccessful, but at the present time eight railway lines extend into the Wyoming region. It is apparent that the Wyoming region was already adequately served by railway lines before the extension of the last two lines, the Ontario & Western and the Susquehanna & Western, into that region subsequent to 1890. Under normal conditions, wherein the interests of the carriers and the shippers were not antagonistic, with the construction of additional tracks when needed the region would have been amply served by the six railway lines which were constructed into that region prior to 1890. Under existing conditions the anthracite tonnage is charged with the burden of earning an income on the investments in a large portion of two railway lines which were not required and which surely would not have been constructed had proper conditions existed in the marketing of the commodity.

The resistance of the individual operators to the rates and selling conditions imposed by the carriers is well illustrated by the efforts of the individual operators to cause the construction of additional lines of railway into the Wyoming region. The construction of two of these projected lines, the New York, Wyoming & Western and the Delaware Valley & Kingston, was prevented by the action taken by several of the respondent carriers.

CONDUCT OF THE CARRIERS AND THEIR ALLIED COAL COMPANIES

The act to regulate commerce imposes on these carriers the obligation to establish and maintain just and reasonable rates, and it prohibits the granting of rebates or concessions from or offsets against the established rates whereby interstate shipments shall by any device be transported at less than the lawfully established rates, or whereby any advantage is given or discrimination is practiced amongst shippers. Although published rates may be collected on the shipments transported, concessions and offsets may be extended by the carriers or the interests who control the carriers to favored shippers. These concessions and offsets are as precious as direct rebates, and it matters little whether they are in the form of cash payments, interest charges,

royalty earnings, the use of valuable property at inadequate rent, the free use of the carriers' funds or credit or other insidious means, if they confer concessions and advantages which place certain shippers in a position of preference and advantage over competitors who are also customers of these carriers. Some of the advantages granted to the coal companies that are allied with the carriers are disclosed by the following facts established in this case:

Reading Companies. The evidence shows that prior to the reorganization of the Reading companies in November, 1896, the Philadelphia & Reading Railroad had advanced to the Philadelphia & Reading Coal & Iron Co. \$76,154,000. In December, 1896, the Reading Company, the present holding company, became the owner of this debt and the creditor of the coal and iron company. From December, 1896, to October, 1913, the holding company extended to the coal and iron company financial assistance, which increased the indebtedness so that in October, 1913, it was \$82,980,000. The coal and iron company has paid no dividends to the holding company on its stock, and it has paid very low rates of interest on the indebtedness. The payments of interest actually made by the coal and iron company to the holding company were \$34,000,000 less than the amount of such interest, computed at 4 per cent, from December 1, 1896, to June 30, 1913.

On the date the holding company acquired this indebtedness, December 1, 1896, it immediately entered the \$76,154,000 in its accounts as an asset and issued its own obligations to the amount of every dollar of assets it possessed, including the said \$76,154,000. The income of this holding company during recent years has been from \$14,000,000 to \$15,900,000 per annum, and with the exception of the inadequate payments of interest made by the coal and iron company and from \$200,000 to \$300,000 per annum derived from outside sources, this entire income of the holding company has arisen from dividends, interest and rental payments made to it by the Reading Railway lines, and such payments have been at very high rates per annum. This clearly shows the remarkably remunerative character of the rates assessed by the carriers.

The situation here presented is that this shipper, the coal and iron company, ships approximately 10,000,000 tons of anthracite coal annually over the Reading railway lines. Presumably it pays the tariff rates on this product. The carrier and the coal company are but the subsidiary corporate hands of the holding company, inasmuch as the same interests direct and administer the affairs of the three corporations. By the aid of the railway earnings that are paid into its treasury, the holding company furnishes the coal and iron company with its working capital. The holding company also assumes the burden of the interest charges on the capital invested in the properties of the coal and iron company, and the railway earnings enable it to do so. These facts constitute an unlawful discrimination against other shippers who are competitors of the Coal & Iron Company.

Published tariff rates are of no significance to this shipper, the Philadelphia & Reading Coal & Iron Company, under these circumstances. The same executive officials control and administer the affairs of the railway company, the coal and iron company, and the holding company; therefore the coal and iron company receives offsets, against such published rates, in the form of interest charges which are waived by the same parties who are charged with the duty of collecting and retaining the full published tariff rates on all shipments. These facts have been referred to the department of justice.

Central of New Jersey. Similarly reference is made to the dealings of the Central of New Jersey with the Lehigh Coal & Navigation Company. The coal company leases to the railway lines of railroad for which the New Jersey Central has paid compensation of upward of 10 per cent. yearly. At the same time the carrier has transported coal for the coal company at reductions of from 11 to 23 cents a ton below the tariff rates. These reductions are known as lateral allowances and result from the tenth covenant of the lease in which it is provided that

on coal delivered by the Navigation Company on sidings at the northern end of the Nesquehoning tunnel for transportation by the carrier, the rates should not exceed the rates from Penn Haven. Although the carrier for many years has transported the shipments the Navigation Company at the Penn Haven basis of rates, it has published in tariff form a higher basis and then at the close of each month's business paid back to the shipper a portion of these established tariff rates.

Reference is also made to the dealings of this carrier with Burns Brothers, who lease from the railroad docks and trestles in New York harbor, and to the dealings of the other carriers with their related coal companies.

THE COMMODITIES CLAUSE.

The mining, transportation, and to a considerable extent the selling operations necessary to market this commodity, though in a sense being each conducted under the name of separate corporate entities, are united under one management and control. The relations of the controlling carriers and the coal companies have not undergone any substantial changes since the effective date of the commodities clause in the Hepburn Act, May 1, 1908, with the exception that the shipping and marketing of the coal production of the Lackawanna, the Delaware & Hudson, and the Lehigh Valley Coal Company are now performed by the Delaware, Lackawanna & Western Coal Company, the Hudson Coal Company, and the Lehigh Valley Coal Sales Company, respectively. These three coal companies assumed their present functions after the decision of the Supreme Court in March, 1909, in the Commodities cases (213 U. S., 366), and the decision of the Supreme Court in the Lehigh Valley case, decided April 3, 1911 (220 U. S., 257). The evidence shows that the three coal companies were organized and financed without the interposition of outside interests or capital.

Delaware, Lackawanna & Western. This carrier owns coal lands and conducts mining operations. Prior to August 1, 1909, it sold its own coal in the markets. To rearrange its affairs in conformance with the decision of the United States Supreme Court (213 U. S., 366), the carrier caused to be organized the Delaware, Lackawanna & Western Coal Company. It paid to its stockholders an extra dividend of 50 per cent—that is, \$13,000,000—on its stock, in cash, and its stockholders were given the option to use part of the dividend so paid to purchase the capital stock, \$6,500,000, of the coal company. Most of them availed themselves of this privilege. Under two contracts entered into between the coal company and the carrier under date of August 2, 1909, the coal company assumed the selling operations theretofore conducted by the carrier.

The carrier conveyed to the coal company its established trade, its stock of coal, its selling facilities, and the good will of its established business at much less than their true and actual value. The use of the properties leased, approximately 170 trestles, at the inadequate rental reserved in the lease has each year constituted a substantial concession to the coal company, a discrimination against competing shippers, and an offset against the freight rates paid to the carrier by the coal company.

Under the contracts between the carrier and the coal company the coal company is obligated to purchase from the carrier all of the anthracite coal which it sells and to purchase no coal from other sources without the written consent of the carrier, and to conduct the business of selling the coal in such manner as best conserves the interest of and preserves the good will and markets of the coal mined by the carrier. The only property owned by the coal company, excepting current assets, is property and fixtures valued at \$169,070, and its annual sales of coal amount to approximately \$35,000,000. On six months' notice the carrier can discontinue its contractual relations with the coal company and take over the stocks of coal the coal company has on hand. Under such conditions the coal company is merely a dependency of the carrier, and the conduct of its business is subject to the arbitrary will of the carrier.

Ownership by Carriers of Capital Stock of Shipping Corporations. The amendment to the act to regulate commerce com-

monly known as the commodities clause, has not resulted in a bona fide separation of the affairs of these carriers from the mining and selling of anthracite coal. The dual and inconsistent position of public carrier and private shipper that would exist where the carrier was miner, transporter and seller of this commodity now exists, and is effectuated by the relations of the carriers respondent in this case and the several coal companies allied with and controlled by the carriers. Corporate charters and contracts, as used by these carriers, are merely devices whereby the business of mining, transporting and selling the anthracite coal production of each carrier and its allied coal company are united under one management and directed and controlled by one paramount power.

PRESENT EFFECTIVE RATES ON ANTHRACITE COAL.

The average revenue per ton (2,000 pounds) per mile for all anthracite coal transported by the initial anthracite carriers during the year ended June 30, 1913, is as follows: Jersey Central, 8.37 mills; Reading, 8.82; Lackawanna, 7.40; Delaware & Hudson, 7.54; Lehigh Valley, 7.11; Pennsylvania, 5.99; Northern Central, 6.02; Erie, 5.96, and Ontario & Western, 6.47.

Anthracite coal is hauled in trains that transport the maximum train tonnage. The large tonnage hauled in the trains produces high earnings per train-mile. At the present effective rates the revenue per train-mile on anthracite coal transported to tidewater is, for the Jersey Central, \$19.30; for the Lehigh Valley, \$16.14, and for the Lackawanna, \$16.43. These revenues are substantially higher than average train-mile revenue, the average for the United States in 1912 being but \$3.02284; for the eastern district, \$3.12891; for the southern district, \$2.48888, and for the western district, \$3.17357.

Anthracite coal is a low-grade commodity which is transported in vast quantities in trains of maximum tonnage. The car load is much greater than is attained in the loading of most other classes of traffic excepting bituminous coal and ore. Most of the anthracite tonnage is produced from collieries whose daily production, measured in carloads, is very large. These conditions tend toward lower operating costs in transporting this commodity than result from the transportation of most other commodities.

COST OF TRANSPORTING ANTHRACITE COAL.

The commission's examiners computed the cost of service for anthracite coal, including only such costs as are represented in operating expenses. Complete results were reached as to the tidewater movement of anthracite over the Central of New Jersey. The traffic hauled in November, 1912, was the basis of the computations. Part of the operating costs resulting from the transportation of anthracite coal to tidewater on the Lackawanna and terminal costs on the Reading were also compiled.

The conduct of the anthracite traffic involves the collection of the loaded cars from the breakers and washeries into assembling yards, the necessary switching into trains, the road haul to destination, terminal services, and the return of the empty cars. The computations are set forth in detail in the appendix to this opinion, and they indicate how the various services were accounted for in the computations made by the commission's examiners.

Briefly stated, the examiners found that the operating cost of transporting anthracite coal to tidewater by the Central of New Jersey was 59.26 cents per long ton from the Wyoming region (average haul, 160 miles), 44.35 cents per long ton from the Lehigh region (average haul, 120 miles), and 49.04 cents per long ton from the Upper Lehigh region (average haul, 140 miles), making a weighted average of 3.3 mills per short ton-mile to the three tidewater termini of this carrier. The Central of New Jersey costs were computed for a railway line whose average distance to tidewater is shorter than the average haul of the other carriers. We have frequently held that cost of service per ton-mile properly decreases as the length of the haul increases. In the short haul of the Central of New Jersey there are included the assembling costs and the terminal costs which necessarily result in causing a higher cost per ton-mile than would result

under similar operating conditions for the longer haul to tide-water of the other carriers.

The margin of profit on tidewater anthracite is indicated by a comparison of the cost of transportation, 3.3 mills per ton (2,000 pounds) per mile, with the average revenue here shown:

Carrier.	Average haul.	Average revenue per ton.		Average revenue per ton-mile.	
		2,240 pounds.	2,000 pounds.	2,240 pounds.	2,000 pounds.
	Miles			Mills	Mills
C. R. R. Co. of N. J.	140.58	\$1.489	\$1.329	10.59	9.45

CARRIERS' INVESTMENT AND INCOME AS DEDUCED FROM THEIR BOOKS.

The carriers submitted statements concerning their investment in road and equipment and in working capital, their net operating income, and the ratios of net operating income to investment for a number of years.

The investment, total property devoted to public use, as thus presented by the carriers, and the per cent. of return on the investment produced by the net operating income as adjusted are here shown:

Carrier Year ended June 30, 1913.	Book value of property devoted to public use.	Net operating income.	Rate of income on investment. Per Ct.	Amount of income.	
				In excess of 6 per cent. per annum.	Less than 6 per cent. per annum.
D., L. & W. R. R.	\$187,102,870	\$14,450,741	7.73	\$3,234,569
Reading	238,325,264	21,836,887	9.16	7,537,371
D. & H. Co.	107,906,939	8,990,587	8.33	2,516,171
C. R. R. of N. J.	94,827,868	8,269,160	8.72	2,579,488
N. Y., O. & W. Ry.	56,694,648	2,471,471	4.36	\$930,208
L. V. R. R.	196,753,503	12,985,175	6.60	1,179,965
Pennsylvania and Nor.					
Central	753,420,790	42,431,006	5.63	2,774,241
Erie	386,648,946	16,246,206	4.20	6,952,731
N. Y., S. & W. R. R.	44,155,784	1,010,923	2.29	1,638,424

The combined investment of the several carriers, including working capital, was shown to be \$2,131,046,429 on June 30, 1914. By merging the book entries of property costs of their various railway lines the carriers have proceeded to the conclusion that 6 per cent. per annum is the lowest possible suggestion as to what would constitute a fair return on the investment, and that "a legislative command to accept anything less than 6 per cent. would be adjudged to be confiscation."

In considering this question we do not suggest that 6 per cent. per annum income is too high a rate of return on railroad investments or too low a return. The stockholders of several railways operated by the initial anthracite carriers have leased their properties to anthracite carriers for a return of 4 per cent. per annum on their investment; some properties are leased at 7 per cent. per annum, and some at 10 per cent. per annum under long term leases.

The trouble is that the investment shown in the carriers' statements does not represent cost of property nor an approximate figure of cost.

The evidence shows that the road account, now designated "cost of road," was used prior to 1907 as a general clearing account into which were charged valueless and uncollectible items and liabilities which could not conveniently be absorbed into other accounts. This was not considered wrongful or bad book-keeping in those days, and we do not desire to criticize these carriers now for such past practices.

Property costs deduced from the old books of these carriers are not reliable. The fault is back of the books. This is well illustrated by the cost of construction of the Port Reading Railroad, which the carriers' expert has ascertained from its books to have been \$3,025,000. This railroad is of recent construction, being completed in 1894. The commission's examiners found, by their review of the construction contracts and records, that the actual cost of constructing this railroad was \$1,525,000, and that the book cost includes \$1,500,000 representing a bonus payment

in securities to the construction company. Such practices were so prevalent in railroad construction in former years that we must regard property costs deduced from the old books as very unreliable.

The property costs per mile of line shown for the Erie are \$199,832, and for the New York, Susquehanna & Western, \$200,213, while for the Reading they are \$157,732, and for the Pennsylvania, \$180,543. Such property costs for the New York, Susquehanna & Western, whose terminal properties are very limited in comparison with the other lines mentioned, clearly indicate the unreliability of book costs as representative of actual cost of property.

The carriers have used the term "total property devoted to public use" as representative of the investment in their railway properties devoted to public use. They have included in their investment the cost of properties rented to tenants and used for private purposes, and they justify this by the assertion that it was acquired for railroad purposes and may in the future be used for railroad purposes.

Unproductive Betterments. The Pennsylvania has expended on its new passenger terminal properties in New York City approximately \$114,000,000. These properties are operated by the Pennsylvania Tunnel & Terminal Railroad Company, and the operations result in deficits each year. The deficit in the year ended June 30, 1913, was \$2,087,000. The record shows that the terminal was constructed for the benefit of the Pennsylvania lines west of Pittsburgh as well as the lines east of Pittsburgh, but no part of its cost is, by the carrier, assigned to the income of the lines west of Pittsburgh. In the statements of investment and income the deficit is charged to the income of the Pennsylvania Railroad (the lines east of Pittsburgh), and the per cent. of net operating income on the investment for the Pennsylvania Railroad is substantially reduced because of these deficits and the large investment in this terminal property. The record shows that when the New York Connecting, now under construction, is completed the terminal properties will some time in the future be used for passenger traffic between the Pennsylvania lines and the New Haven. Thus the question is presented: Must the present effective freight rates of the Pennsylvania earn an annual return of 6 per cent. on the investment in these passenger terminal properties? The record shows that \$47,000,000 of the expenditures in this property has been charged to profit and loss and to income of the Pennsylvania; that is, its past surplus income has already contributed \$47,000,000 to the cost of this property.

The commission notes at this point that the total property investment given above includes the cost of lines which, as noted previously, would not have been built had proper treatment been given the independents.

INCOME OF THE INITIAL ANTHRACITE CARRIERS.

For the year ended June 30, 1913, the total operating revenues of these carriers were \$448,711,496, their total freight revenues were \$342,499,310, and the revenue they derived from transporting anthracite coal was \$96,516,183. The ratio of their anthracite coal revenues to their total freight revenue ranged from 6 per cent. to 86 per cent.

The operating revenues earned by these carriers have increased greatly during the past 10 years, as shown by the averages per mile of line following:

	1904	1913
C. R. R. of N. J.	\$29,769	\$42,016
P. & R. Ry. Co.	33,795	49,553
D., L. & W. R. R. Co.	35,227	42,275
L. V. R. R. Co.	21,456	29,665
D. & H. Co.	17,682	28,115
P. R. R. Co.	30,097	45,101
N. C. Ry. Co.	21,962	27,147
Erie R. R. Co.	21,926	27,147
N. Y., S. & W. R. R. Co.	13,655	18,954
W.-B. & E. R. R. Co.	6,751	7,180
N. Y., O. & W. Ry. Co.	12,165	16,715

Of all the railways in the United States with annual operating revenues of \$1,000,000 or more, only three besides those above indicated had revenues in 1913 and in 1914 averaging \$40,000 per mile of line or more. The three exceptions are the Pittsburgh & Lake Erie, the Bessemer & Lake Erie, and the Bingham & Gar-

field. The very unusual traffic conditions enjoyed by the first two roads are well known, while the third is a heavy carrier of ore, so that the four initial anthracite carriers showing such unusual earning capacity hold a position unquestionably unique among the steam transportation systems of the country having diversified traffic.

The exceptional earning capacity of the principal anthracite carriers is well illustrated when comparison is made with the average operating revenue per mile of line of the following representative carriers for 1913:

New York Central & Hudson River, \$30,776; Baltimore & Ohio, \$22,789; Buffalo, Rochester & Pittsburgh, \$19,113; Michigan Central, \$19,448; Pittsburgh, Cincinnati, Chicago & St. Louis, \$30,236; Hocking Valley, \$22,241; Illinois Central, \$13,497; Louisville & Nashville, \$12,338; Atlantic Coast Line, \$7,833; Virginian, \$11,896; Chesapeake & Ohio, \$15,129, and Norfolk & Western, \$21,623.

The net corporate income of these carriers has enabled them not only to pay the very substantial dividends shown by these figures, but also to set aside large amounts for the purchase of additional property and still have considerable amounts remaining to add to their surplus. In addition to providing for necessary expenses and charges and for generous dividends, the Central of New Jersey, the Reading, and the Lackawanna have set aside from income \$74,607,157 for additions and betterments to their properties. During this period the capital obligations of these carriers have actually decreased, indicating that their net income has not only provided for the necessary maintenance of their properties and for substantial dividends, but has also provided the improvements to the properties necessary to handle the large increase in traffic. The Lackawanna recently has issued capital stock to its shareholders at par to provide funds for large improvements to its property, but the improvements were not available for use during the 10-year period.

The Less Prosperous Roads. For the reasons underlying the Erie's failure to earn satisfactory net income it is necessary to look further than the net operating results. One reason is found in its high capitalization. The Erie's operating revenue per mile of road is considerably lower than that of the principal anthracite carriers.

To its over-capitalization and the resulting burden as well as traffic conditions can be ascribed the failure of the New York, Susquehanna & Western to earn satisfactory net income.

The small volume of its local traffic and the limitations as to the tonnage of the anthracite coal traffic which the New York, Ontario & Western can command preclude the possibility of its income ever mounting to the high standard of earnings which result to its more fortunately situated competitors that reach New York harbor.

POSITION OF THE CARRIERS.

Counsel for the carriers has frankly admitted that the cost of transporting anthracite coal is so low that the revenues resulting from the anthracite coal rates are sufficient not only to pay the costs chargeable to the anthracite traffic, but to take care of the general costs, which other traffic cannot take care of because of lower rates assessed for the transportation of other traffic; but counsel stated that the actual cost of transporting anthracite, when it could be ascertained, would be higher than the cost computed by the commission's examiners.

The carriers have stated upon their briefs that "in the end this study of cost accounting reaches the inevitable condition of the railroad business of the United States, that railroad rates must be made with regard to what the traffic can afford to bear."

The experience of shippers and carriers in the past resulted in the enactment of the act to regulate commerce, and the law limits such principles of rate making; at least to the extent that the rates on the low-grade commodities must be just and reasonable to all shippers and not discriminatory. The transportation of this low-grade commodity, anthracite coal, has been termed by these carriers "their backbone traffic." They are engaged in producing and selling, as well as transporting it. We cannot over-

look the fact that some force has brought the production and sale of most of the tonnage of this commodity under their control. If they established excessive rates on anthracite they became the beneficiaries of conditions which were prejudicial to the business of the individual operator or shipper. The power to fix freight rates on this commodity was the opportunity to confiscate property if the carrier so willed.

Our railroad properties should be kept in a high state of efficiency, and freight rates should be sufficiently remunerative to permit it. Necessary improvements should be made to the properties. The carriers respondents in this case command a traffic of exceptional volume and density, and all these results can be accomplished by them without imposing excessive and unreasonable rates. The more important reductions ordered by the commission are as follows:

Delaware, Lackawanna & Western to Hohoken, Paterson, Newark, Boonton and Washington, N. J., prepared sizes, from \$1.60 per ton to \$1.45, \$1.35, \$1.40, \$1.20 and 95 cents to those points, respectively; other sizes from \$1.45 to \$1.35, \$1.22, \$1.30, \$1.09 and 86 cents. To Binghamton, Waverly and Elmira, N. Y., prepared, cut \$1.50 to 90 cents, \$1.15 and \$1.25; other sizes, from \$1.50 to 82 cents, \$1.05 and \$1.14, respectively. To Corning and Syracuse, N. Y., prepared, from \$1.90 to \$1.35 and \$1.40; smaller sizes, cut from \$1.65 to \$1.17 and \$1.22. East Lancaster and Utica, prepared, \$2 to \$1.90 and \$1.50; other sizes, \$1.75 to \$1.66 and \$1.31.

Lehigh Valley to Jersey City and Newark, prepared, from \$1.60 to \$1.45 A. D., \$1.40; smaller sizes, \$1.45 and \$1.40 to \$1.35 A. D., \$1.30. To Ithaca, prepared, \$1.65 to \$1.45; smaller, \$1.50 to \$1.32. To Phillipsburg, N. J., from Wyoming region, prepared, from \$1.45 to 95 cents. From Lehigh and Schuylkill regions, prepared, from \$1.30 to 85 cents, prepared, from \$1.30 to 85 cents; smaller sizes, Wyoming, prepared, from \$1.15 to 75 cents; Lehigh and Schuylkill, prepared, from \$1 to 68 cents. To Rochester, N. Y., prepared, \$1.90 to \$1.85; smaller, \$1.05 to \$1.61.

Erie to Jersey City, Paterson, Newark, N. J., Middletown and Port Jervis, N. Y., prepared, from \$1.50 to \$1.45, \$1.35, \$1.40, \$1.05 and 90 cents, smaller sizes from \$1.45 to \$1.35, \$1.22, \$1.30, and 95 and 82 cents. To Binghamton, N. Y., prepared, from \$1.65 to 90 cents; smaller, \$1.50 to 82 cents. To Elmira, prepared, \$1.65 to \$1.25; smaller, \$1.50 to \$1.14. To Rochester, prepared, from \$2 to \$1.85; smaller, \$1.75 to \$1.51.

Central of New Jersey to Jersey City and Newark, prepared, \$1.60 to \$1.45 and \$1.40; smaller, from \$1.45 to \$1.40 to \$1.35 and \$1.30. To Elizabeth and Somerville, N. J., prepared, \$1.55 each to \$1.40 and \$1.20; smaller, from \$1.40 to \$1.30 and \$1.09. Phillipsburg from Wyoming region, prepared, from \$1.45 to 95 cents; from Lehigh region, prepared, from \$1.30 to 85 cents; smaller, from \$1.15 and \$1.00, respectively, to 75 and 68 cents.

Delaware & Hudson to Windsor, N. Y., prepared, \$1.65 to 85 cents; smaller, \$1.40 to 72 cents. To Albany, Troy and Mechanicsville, N. Y., prepared, from \$1.93 to \$1.60; smaller, from \$1.60 to \$1.31.

From the Central of New Jersey producing points to the Elizabethport and Port Johnston, N. J., piers, from \$1.55 a ton on prepared coal to \$1.40, and from \$1.40 to \$1.30 on pea and smaller sizes. To Communipaw pier and Port Liberty, N. J., prepared, from \$1.60 to \$1.45, and on smaller sizes by 10 cents a ton. Similar reductions ordered on the various lines to Weehawken, Perth Amboy, Undercliff and South Amboy, N. J.

Several of the respondents have granted the exclusive use of some of their piers, docks, storage plants, retail delivery trestles, and other properties to their allied coal companies at inadequate rental charges and under conditions which constitute substantial discrimination in favor of such coal shippers. The exclusive right to operate certain of the carriers' public docks and piers has also been granted to such coal companies, who in operating such properties gain information as to the shipments of their competitors, handled over the docks and piers, which section 15 of the Act to regulate commerce prohibits common carriers from giving to shippers and prohibits shippers from receiving from common carriers. We assume the carriers will at once adjust these practices to remove the discrimination and conform with the requirements of the law.

The evidence shows that several of these carriers have in the past declined to establish joint rates for all shippers, while the coal production of their allied coal companies has been accorded an interline movement by means of trackage arrangements and the free transportation to junction points of the coal production exchanged by the coal companies controlled by the carriers. Such a practice is unlawful and is discriminatory in its worst sense, since the discrimination results to the benefit of the carriers. The carriers will be required to establish through routes and to publish joint rates, of which other shippers may avail, such as will neutralize any such undue benefit heretofore enjoyed by the coal operations of railroad ownership.

Commissioner Harlan, Dissenting. In my judgment the record before us here justifies a modification of many of the present

rates, but for the future a rate structure on anthracite coal based upon the general standard of the Meeker case, surcharged, so far as that would result in a reasonable rate schedule, with the 5 per cent. increase that has been imposed in The Five Per Cent. case upon substantially all other traffic in official classification territory, would seem to be a more consistent disposition of the case.

THE TRAIN DESPATCHER

BY ONE OF THEM

In many respects the despatcher is like a ship without a rudder on a tempestuous sea. He must fight his way through the multitude of obstacles that obstruct the way, all by himself; even though he use his best judgment at the time, his anticipations may not materialize for the best and then he is open to criticism by everybody from the call boy to the general manager's office. Many times the criticisms are unjust, no thorough investigation being made of the surrounding conditions at the particular time.

The feeling seems often to prevail among his superiors that if a bad move is made he is "laying down on the job." It has always been a profound mystery to the writer, why these critics do not see that the despatcher is just as much interested in good service, just as anxious to make good meeting points, to avoid delays to trains, to reduce overtime and to rightly handle any irregularity that comes up as any one in the employ of the company. He worries over bad moves a great deal more than do his superiors. How often do you see him in his chair after his hours are up and the relief man standing by ready to take the transfer. He has in hand some complicated condition that he is anxious to straighten out; not because he can do it better than his relief, but because he has the outline in his mind and possibly can do it in less time than he could explain it; and also because of the natural satisfaction in finishing a job that has been begun. How many times have you seen him come back to the office after going home to see how some complicated affair worked out, or to see that the other man completely understands some proposition to be handled.

He has certain rules laid down to work by, but it is a foregone conclusion that some of these rules at times will have to be violated in order to make some emergency move which is for the interest of the company. As an example, the management says, "Passenger trains must run on time; freight trains must be kept out of their way; despatchers must keep freights off the time of passenger trains twenty minutes; certain red ball trains must have the same treatment as is accorded passenger trains so far as the despatchers are concerned; certain forms of orders must be used in all cases, and some forms he is ordered not to use at all. The despatcher finds a train close to the sixteen-hour limit, or on overtime, which, if allowed five or ten minutes on a passenger or fast freight, can be got in, thereby saving overtime and avoiding tying up the engine on the road. The passenger or fast freight undoubtedly will recover the time used to advance the belated train. If the despatcher adheres strictly to his instructions he may be censured for not taking a chance; if he takes a chance and everything goes all right, there may be nothing said (in this particular case); but if a drawbar is pulled out or something happens to make a bad job of it, then the old instructions are flashed in his face, and he is called a poor despatcher. Many things just like this confront the despatcher every day.

I have in mind a case where an important stock train crept up on the sixteen-hour limit; ten minutes on a fast passenger train would move the freight to the terminal; the despatcher took the change, and he was discharged for disobeying his instructions. But did he not save the company money by this move? A like infringement of the rules by some trainman or engineman, and with such sentence imposed, would have been followed quickly by a visit from the committee and the offender, after a few days, would be reinstated, and maybe with full pay for the time out of service.

Many times prejudice arises against a certain despatcher in the office, and some local officer goes back and checks him on every

little move that he has made, and then makes a show to the superior officer that the despatcher is not doing his work satisfactorily. But no investigations were made to bring out the existing conditions at the time the so-called bad work was performed, and now it is taken for granted that the despatcher was at fault.

What does it cost to make a despatcher? What does it cost to break in a despatcher, even though he be what they call an experienced man, from another line? What does it cost to break in one that has had no experience at all? It is estimated that it costs a railroad company \$5,000 to make an engineer. If that much for an engineer who handles one train, what would be a fair estimate for a despatcher who handles all of them on from one to three divisions?

The despatcher is the commander-in-chief of the division in the absence of the superintendent, trainmasters and chief despatcher, and he must be qualified to act in their stead judiciously, expeditiously and economically. In the face of this, how about his surroundings in the office? Has he a quiet office where he can figure and study out these questions? Generally the latch string is on the outside of the door and nearly every one that desires comes in; they think nothing of asking the despatcher about this, that and the other thing, even without taking time to see if he is busy; they poke their heads in at the door and shout at him. Frequently there is a telephone or two in the office connecting to the yard, roundhouse, ticket office, freight house, car office, water service shanty, etc., and there is a continual ringing of bells. This interrupts him even though some one else is doing the calling and talking. If he is located near the yards where switch engines are working the whistling and other noises will disturb him in his work.

If the telephone despatching circuit is used for other purposes conversations thereon distract his attention from his work. No man can sit with a telephone on his head—and the despatcher is required to keep it there all the time—and be forced to hear miscellaneous conversations, and still be able to concentrate his mind on the trains.

Telephone lines have brought in some new annoyances. Batteries at outlying stations are sometimes allowed to run down, so that you cannot hear the operators plainly. Where does "safety first" come in when the despatcher makes out reports, traces cars, and has to do other jobs just because he seems to have an idle moment now and then? His hands may be idle but, no doubt, his brain is working.

Is it reasonable to suppose that a man can give the necessary attention to the handling of trains while he is forced to have his train sheets covered with reports, with some one running over to his desk every now and then to pull at his sheets and maybe take them off the desk entirely for a while?

The despatchers of to-day have more to do than they did twenty years ago, for the reason they have the sixteen-hour lay, the live stock confinement law, and other laws to contend with. The telephone has given the despatchers of to-day about double the territory they used to have. It may be said that with the telephone the work can be done easier and quicker. Granted, but the load on the mind has not decreased one bit.

THE SOUTHERN SHAN STATES RAILWAY OF INDIA.—The Shan States are on the inland side of Upper Burma. The southern Shan States touch Chinese territory, Tonking and Siam and the Southern Shan States Railway runs mainly in an east and west direction, branching off from the Burma Railway's main line from Rangoon to Mandalay, at Thazi, 306 miles from Rangoon. It is a metre-gage road and as planned is to be 103 miles in length. At present it has been completed and put in operation as far as Aungban, at mile 72, and the continuation to Heho is being undertaken, but further work beyond that point will have to be postponed for the present. The cost of the present line differed but 2.8 per cent from the estimate. The line has been constructed at the cost of the government by the Burma Railways Company and will be operated by the latter.

Lateral Stresses on Rails in Curved Tracks

Experiments with Ten-Wheel, Pacific, Consolidation and Mikado Locomotives: Also Tenders and Cars

By GEORGE L. FOWLER,
Consulting Mechanical Engineer.

Supplementing the investigations of the lateral stresses on rails in a straight track, which were described in the *Railway Age Gazette*, June 11, 1915, page 1231, an investigation was entered upon to make a similar determination on sharp curves, with this difference, however, that whereas the thrust on the rail in the straight track was taken as that of the heaviest of the engine as a whole, the apparatus used on curves measured the thrust on the outer rail of each individual wheel as it passed. This apparatus

above 5 in the evening. During the night the movable rail was bolted rigidly in place so that it had no effect on the recording apparatus.

The speed of passing trains was obtained by setting a twig, carrying a piece of paper, in the center of the track, 176 ft. from the apparatus, and another at the apparatus itself. An assistant started a stop watch when the pilot of the locomotive struck the first twig and stopped it when it struck the second. As 176 ft. is the distance traversed in two seconds by a locomotive traveling 60 miles an hour, it was simply necessary to divide 120 by the number of seconds occupied in passing from one twig to another to obtain the speed of the train in miles per hour.

The apparatus was in the 6 deg. 12 min. curve 11 days and in the 8 deg. 7 min. curve 10 days. In these periods records were obtained of 40 different locomotives in the first and 16 in the second curve, running at speeds of from 6.1 to 54.5 miles an hour, the great majority, however, falling between 25 and 40 miles an hour. In all there were 45 different locomotives, of which 4 were

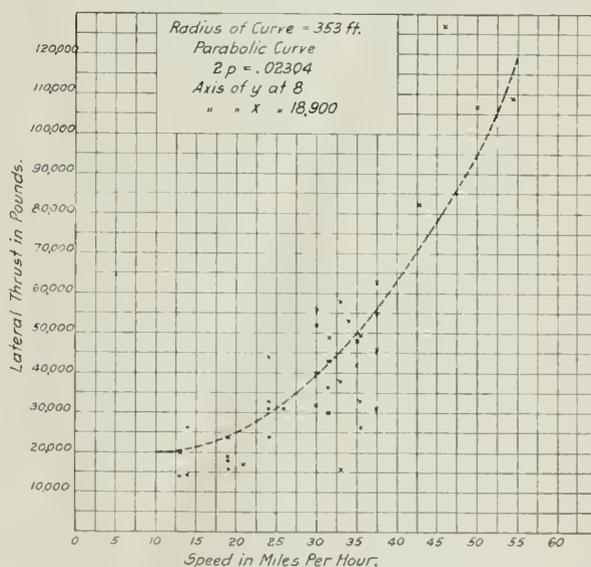

Track and Recording Apparatus for Measuring Lateral Thrust of Wheels on Rail

is the same as that originally designed to measure the outward thrust of car wheels on the outer rails of curves, as described in the *Railroad Gazette*, November 15, 1907, and furnishes a graphical record of the thrust of each individual wheel.

The apparatus was first installed in the outside rail of a 6 deg. 12 min. curve which had a total length of 215 ft.; the apparatus was placed 130 ft. from the east end. The outer rail was elevated 5 in., the gage was widened $\frac{1}{4}$ in., and the location was on a 1.31 per cent. grade, dropping to the west. A curve of 6 deg. 12 min. has a radius of 462 ft., and the elevation of 5 in. compensates for a speed of 24.4 miles an hour.

The second location was in the outer rail of an 8 deg. 7 min. curve. The radius of this is 353 ft. The 5 in. elevation of the

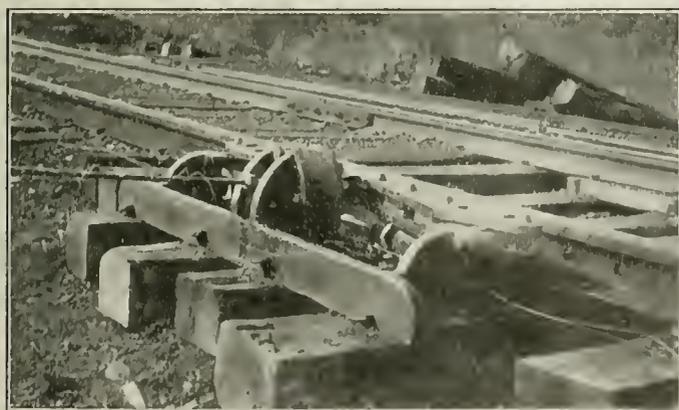

Lateral Thrust on Rails for Consolidation Locomotive Running at Different Speeds Over an 8 deg. 7 min. Curve Elevated for a Speed of 21.3 Miles Per Hour

of the Ten-Wheel type; 6 Pacific; 25 Consolidation, and 10 Mikado.

As in the case of the experiments on a tangent track, a complete survey of the lateral play in the axle boxes of each of the locomotives was made. The records have been grouped in a series of tables with each type of locomotive by itself. Of all types tested the largest number of records were obtained with the Consolidation—40 on the 6 deg. 12 min. curve and 41 on the 8 deg. 7 min. curve. They therefore present the best opportunity for drawing conclusions, and will be considered first.

No final conclusions can be drawn as to the effect of the lateral play of the axles in their boxes on the lateral thrust of the wheel on the rail. The records are, seemingly, contradictory and confusing, but a careful examination seems to indicate that an excess of lateral play tends to increase the lateral thrust. Whether this would hold in the case of an engine on which the lateral play was entirely eliminated there is nothing to show.

The stresses with the wedge trucks seem to run higher than with the swing trucks. This does not always appear in the truck,

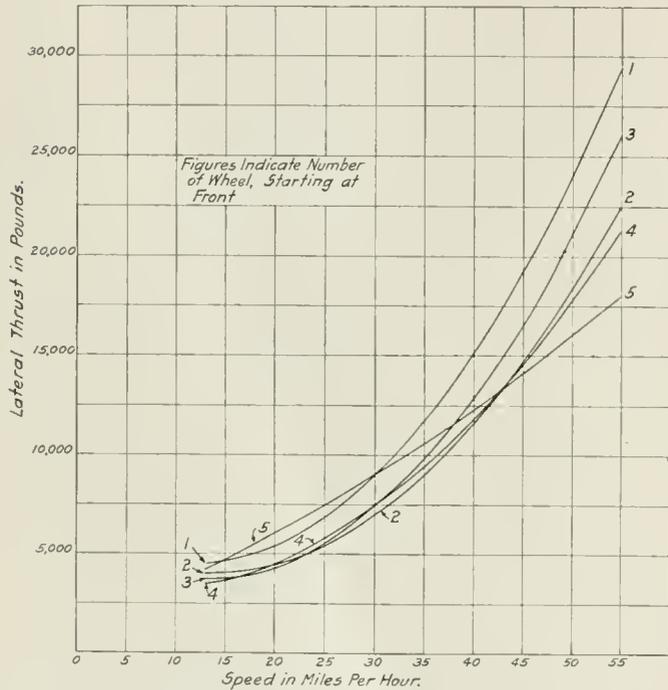

Track Apparatus for Measuring Lateral Thrust of Wheels on Rail

outer rail compensated for a speed of 21.3 miles an hour. The gage was widened $\frac{3}{8}$ in. The total length of this curve was 237 ft., and the apparatus was located 122 ft. from the east end. The grade was .8 per cent., dropping to the west.

The apparatus was put in service at about 8 o'clock in the morning and records were taken of all locomotives passing until

but may appear in the total thrust of the engine. In the case of the Consolidation locomotives on the 8 deg. 7 min. curve, the total thrust of those having the wedge trucks was almost invariably higher than with those having the swing trucks. The same thing appears in a general way, though to not quite so pronounced an extent, in the thrusts on the 6 deg. 12 min. curve. On the 8 deg. 7 min. curve this holds for the leading truck wheel; but for the 6 deg. 12 min. curve the excess so far as the front truck is concerned largely disappears, though, in the majority of cases, the thrust of the wedge truck is more than that of the swing.

In making comparisons of the lateral thrust exerted by any

Comparison of Individual Wheel Thrusts for a Consolidation Locomotive at Different Speeds on an 8 deg. 7 min. Curve Elevated for a Speed of 21.3 Miles Per Hour

type of engine, it was found necessary to take the sum of the thrusts of the individual wheels in order to gain an idea as to what the engine was doing, because of the slight actual difference of pressure exerted by any one wheel at different speeds. This I have used as a basis. As for the different wheels it will be found that there is a certain sequence of relative pressure that is peculiar to each type, but when the work is considered with reference to the speed it is necessary to take the total thrust of all of the wheels in order to get the range needed to draw conclusions.

After plotting the individual runs the usual median line was drawn to indicate the averages for the different speeds and then, when this had been done with no regard to mathematical accuracy, an equation was developed for the several lines so drawn, and they were found to be parabolic. This statement is made as to the method employed for the location of the lines in order to impress the fact that there was no preconceived idea as to their form. From this it appears that the records indicate that the total average increase of pressure on curves of all of the engines tested increases in the ratio of the equation of the parabola

$$y^2 = 2 p x.$$

in which

- y = the speed in miles per hour.
- x = the lateral thrust in pounds.
- 2 p = a constant which varies with the locomotive and the curve.

This holds for each of the engines. The rate of increase of pressure with the increase of speed also varies inversely with the value of 2p. The value of 2p was determined for the curves given in the manner indicated, and for the Consolidation and

Pacific types was found to vary nearly as the squares of the radii of the curves.

- 2p = .03652 for the Consolidation on the 6 deg. 12 min. curve.
- 2p = .02304 for the Consolidation on the 8 deg. 7 min. curve.
- 2p = .09375 for the Pacifics on the 6 deg. 12 min. curve.
- 2p = .056 for the Pacifics on the 8 deg. 7 min. curve.

These curves could not be plotted for the Mikados and Ten-wheelers on the 8 deg. 7 min. curve because of insufficiency of records, but inasmuch as the median lines for the 6 deg. 12 min. curve are parabolic* there is no reason why those for the 8 deg.

7 min. curve should not be of the same character. If the conclusions drawn from those of the Consolidations and Pacifics are accepted the curves for the Mikados and Ten-wheelers for the 8 deg. 7 min. curve can be readily calculated.

The value of the constant 2p varies with each type of engine, and the less this value the more rapid is the rise of lateral thrust with the speed. For example, the thrust on the Consolidations with a value of 2p of .02304 rises much more rapidly than it does on the Pacifics where the corresponding value is .056.

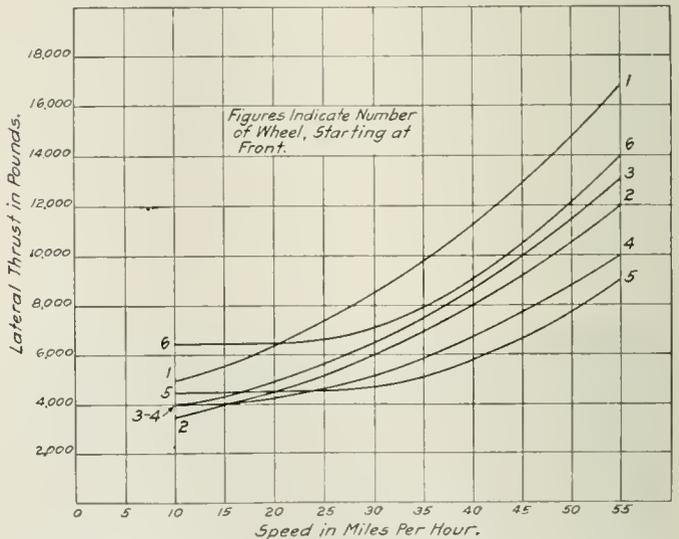

This then serves to gage the relative intensity of the lateral thrust imposed by the several types of locomotives tested. According to it they stand in the following order, taken from the data obtained on the 6 deg. 12 min. curve:

- Consolidation.....2p = .03652
- Ten Wheel.....2p = .06562
- Pacific.....2p = .09375
- Mikado.....2p = .10866

There is not sufficient data to warrant a similar arrangement on the 8 deg. 7 min. curve.

The actual location of the curves on the diagrams are, however, modified by the locations of the directrix, which varies from 11,800 for the Ten-wheelers to 17,750 for the Mikados. This does not essentially change the relationship of the curves as given above.

If the total lateral thrusts of the several locomotives rise on a

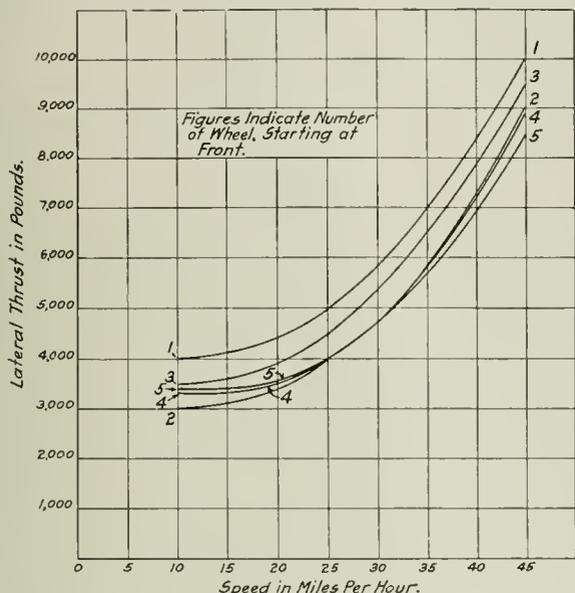

Comparison of Individual Wheel Thrusts for a Pacific Locomotive at Different Speeds on an 8 deg. 7 min. Curve Elevated for a Speed of 21.3 Miles Per Hour

parabolic curve it is fair to presume that the same is true of the lateral thrusts of the individual wheels. In order to ascertain how this would work out the individual wheel thrusts of the Consolidation and Pacific locomotives have been plotted for both the 6 deg. 12 min. and 8 deg. 7 min. curves, and approximately median lines have been drawn through these in the form of parabolas, which are substantially accurate. In each case the sums of the ordinates of these curves are equal to the corresponding ordinates of the curve for the total thrusts. This was not done for the Mikados and Ten-wheelers, because of the small number of records obtained. These individual wheel record curves have also

* As roughly determined in the manner described above.

been brought together for each curve and locomotive, from which a comparison of the relative average intensity of the thrusts of the individual wheels can be made.

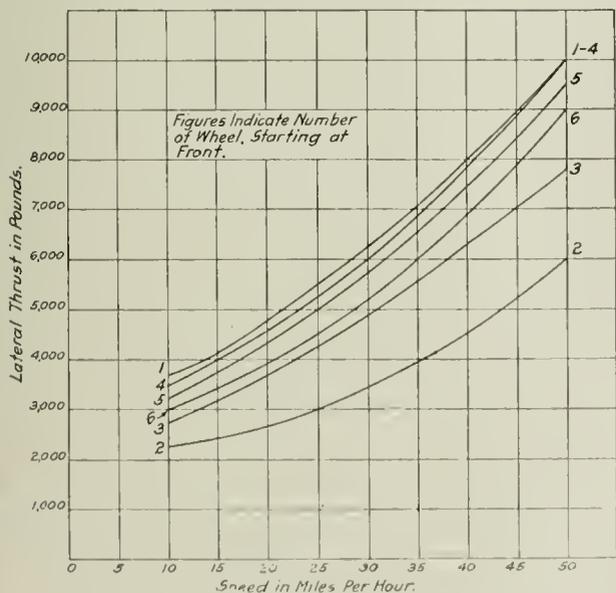

In the case of the Consolidation locomotives on the 6 deg. 12 min. curve the front truck wheel stands clearly out as exerting the maximum thrust on the rail, followed by the third wheel which

Comparison of Individual Wheel Thrusts for a Consolidation Locomotive at Different Speeds in a 6 deg. 12 min. Curve Elevated for a Speed of 24.4 Miles Per Hour

is the second driver. This is in exact accord with the results obtained on the Pennsylvania a number of years ago. The other three wheels reverse their relative positions in rising from slow to high speed and it is interesting that they come together at a speed which is approximately that for which the track is elevated.

On the 8 deg. 7 min. curve the same general order prevails, except that it is complicated by an evident binding of the rear

Comparison of Individual Wheel Thrusts for a Pacific Locomotive at Different Speeds on a 6 deg. 12 min. Curve Elevated for a Speed of 24.4 Miles Per Hour

driver. In this, too, it will be seen that the thrusts of the second and fourth drivers are about the same at a speed approximating that for which the outer rail was elevated (21.3 miles an hour).

In the case of the Pacific locomotives on the 6 deg. 12 min. curve, the average maximum thrust was exerted by the leading truck with the second truck wheel the lowest of the six. The

order of average maximum thrust, taken in the wheels counting from the front, is 1, 4, 5, 6, 3, 2, and this order is preserved throughout the whole range of speeds.

On the 8 deg. 7 min. curve the order of wheel thrusts is 1, 6, 3, 2, 4, 5. The reason for this change may have been due to a binding of the wheelbase, due to the sharpness of the curve, or the low center of gravity of that portion of the engine over the trailing truck. I am inclined to attribute it to the latter cause. Throughout the whole of the tests on this curve the excessive thrust put on the rail by the trailing truck wheel was very apparent, when compared with the rear driver. It was the rule, to which there are a few exceptions, that the trailing truck wheel put a thrust on the rail in excess of that imposed by the rear driver.

E = East. W = West.

In addition to the locomotive records a number of records were taken of tenders, freight cars and sleeping cars. These must, however, be considered as indicating possibilities rather than average results. From the thrusts on the 6 deg. 12 min. curve it will be seen that the three classes of vehicles are grouped very closely together without much difference between them; but, on the 8 deg. 7 min. curve, the sleeping cars exerted the heaviest thrust, followed by the freight cars and tenders in the order named. I think the position of the tenders in this regard is due

to the fact that the work was done only 13 miles from the division terminal, that the run was mostly down grade, requiring the consumption of very little water and fuel, and that, as a result, the center of gravity was high when the records were obtained.

As for the sleeping cars, the thrusts, which are for individual wheels, were invariably higher than those imposed by the locomotive at the head of the train—a comparison will show that they are from two to three times as much. This cannot be attributed to low center of gravity because, if that of the one car measured is taken as an average height of the other cars, it will be seen to be considerably higher than that of any of the locomotives. The fact, however, remains that the lateral thrust put on the rails by sleeping cars is considerably in excess of that imposed by the locomotives.

In addition to the above a few records were obtained from Consolidation locomotives running backwards, and of switching engines. These records emphasized very distinctly the excessive lateral thrust imposed when there is no guiding truck. For example, at 18.8 miles an hour we have a maximum of 10,375 lbs. for a Consolidation locomotive running backwards, as against 7,125 running forwards. At 19.4 miles an hour we have 13,000 lbs. and 6,000 lbs., and at between 28 and 29, and at 31.6 miles an hour we have 12,000 and 13,000 lbs. as against from 7,000 to 9,000 lbs. Thus a Consolidation locomotive running backwards puts a maximum lateral thrust on the rails about 50 per cent. in excess of that imposed by the same locomotive running forwards.

These records cannot, of course, be taken as comprehensive enough to base a final conclusion on, but their general trend is sufficiently consistent to indicate a probability. They do show, however, that no predication can yet be made of the performance of any individual locomotive on a curve. The total thrust of the locomotive, as well as the individual wheel thrusts, is evidently dependent to a great extent on the way in which the locomotive enters and passes the curve, though of this we have no information. Apparently the amount of lateral play in the axle boxes has an influence tending to increase the thrust, but the information is too meagre to warrant the statement as a fact. There are indications also that the lateral thrust is greater when the engine is using steam than when it is not, but the data on this point is still too meagre to serve as a basis for a final conclusion. As for the effect of the height of the center of gravity, that of all of the engines tested was too nearly alike to warrant any inferences regarding it. I can only say that when these results are compared with others obtained elsewhere, they show that the lateral thrust is increased as the center of gravity is lowered. Finally the ratio of average increase of thrust along the lines of a parabolic curve, cannot be regarded as having been proven, but the method by which the curves were drawn indicates that pressures do not tend to increase directly as the square of the speed, but by that square as modified by a constant which is itself a function of the radius of curvature.

In developing the equation for the parabolic curves indicative of the wheel thrust it was found that the directrix did not lie at the base or zero of pressure, but at a considerable distance above it, nor was the axis on the zero line of the speed, but at one side, usually to the right. Hence in order to determine the locus of any particular point of the parabola a constant must be added that varies with the type of engine and the radius of curvature. It follows, therefore, that, accepting the equation as correct, the value given for the lateral thrust for low speeds will be higher than that usually obtained by the use of the centrifugal formula. If, however, the centrifugal formula

$$F = \frac{Wv^2}{gR}$$

in which

F = Centrifugal force.
W = Weight in lbs.
v = Linear velocity in feet per second.
R = Radius of curvature.

be used for the calculation of the stresses imposed and the effect of the elevation of the outer rail be disregarded, it will be found that this will give results below the experimental parabola for low

speeds, and above it for high speeds, and that the two lines will cross at a point near, but somewhat above, the speed for which the track is elevated.

In other words the resultant thrust of the locomotive on the outer rail does not follow the formula for centrifugal action, because it is not a freely rotating body, but has its action modified by the binding of the wheels and flanges on the rails, the height of its center of gravity and other details as to the precise influence of which we have no knowledge.

A TRAIN DESPATCHER AS A REVENUE SOLICITOR

By J. L. Coss.

There is a large field in which the train despatcher, in an indirect way, can materially aid in the solicitation of business. At stations where only one man is employed, he performing the duties both of agent and operator, there are times when, if he could be excused from the office a while he would be able to secure some business, but he is in duty bound to remain at the office to take train orders. The despatcher by a little advance figuring could arrange his work to accommodate these agents in this direction and give them a chance to see shippers and prospective passengers. A little trip into the country in the afternoon or early evening might secure some emigrant outfit or a number of passengers for a long haul. The agent having made his request for this opportunity the despatcher, very likely, by arranging to use some other office, perhaps by holding a man on duty a few minutes extra, can arrange it all around.

Suppose an agent calls up the despatcher and says that some influential citizen of his town has just been called away on some important matter, or by sickness, and wishes to take the fast train, which does not stop at that particular place. Stopping the train will keep him from driving to a station on some other line. If no one higher in authority is within call, don't wait two or three hours to find out if it will be all right; take a chance; stop the train. Have the agent and the passenger understand that this is not establishing a precedent. Then make an explanatory note to the chief despatcher and he can lay it on the superintendent's desk. You may have secured a nice little bit of revenue for the road at some future time. In case of emergency give a man a permit to ride on a freight train; he will appreciate it and no doubt repay you many times in the way of shipments.

Despatchers who have families will frequently hear of prospective travelers or movers. When this comes to your ear get the word to the agent or traffic representative. In the course of social correspondence we often hear of people who are contemplating a trip. Suppose it be in St. Louis; why can't we drop our representative in that city a postal card? When your wife or daughter comes home from the club ask who is going away or who is going to have visitors.

When traveling and coming in contact with other people on the train bring up the subject of travel and learn what business your fellow passenger is in; he may be a big shipper. After you get the desired information explain to him the advantages of your road.

In conversation with any one don't unravel to them any trouble the road has experienced; always tell them of the good engines, fine cars, excellent dining service, fast freight and passenger trains, good road bed, rarity of accidents and loyalty of employees. This will be a good advertisement for the road and, no doubt, some one will get the idea that he ought to give it a trial, even if it be a few miles out of his way.

In the elections, vote for the man who will favor the railroads regardless of your politics. If the little town elects a town marshal who will see that the children are not allowed to play around the station and hop trains, keep trespassers off the right of way and promote law and order generally, he is the man to vote for.

The despatcher's work is confining and the majority of us are satisfied to plod along and not reach out very far; but why not take another view of the situation and lend a hand?

The Interstate Commerce Commission's Report on Rock Island

Commission Reviews History of the Rock Island; Condemns Severely the Policy of Controlling Syndicate

The Interstate Commerce Commission on the afternoon of August 17, gave out its report which is signed "By the Commission," "In re financial transactions, history and operations of the Chicago, Rock Island & Pacific Railway Co." The report, a very full abstract of which is printed below, is the result of hearings on various dates from April 24, 1914, to June 5, 1915. In the abstract the exact language of the commission has been preserved with a few slight exceptions.

In 1902 the main line of the Chicago, Rock Island & Pacific Railway Company extended from Chicago to Denver, with branch lines to St. Paul, Minneapolis and Kansas City. The territory served is one of the richest and most prosperous in the country and the system's ramification of branch lines insures to it a large volume of tonnage. It was then thriving and its prospects were promising, its stock selling in the markets of the world at more than \$200 a share. In 1914 the shares had fallen to \$20 and the road is now in receivers' hands. The evidence shows that the earnings of the railway company have steadily increased, and that in 1914 they were the largest in its history.

The results of the management, which is the subject of this investigation, may be seen from the statement above made as to the market value of the stock, and from the table below, showing the capitalization, indebtedness and operating accounts for the years 1901 and 1914:

	1901	1914
Capital stock	\$49,921,400.00	\$74,995,122.50
Funded debt	63,538,000.00	235,246,000.00
Loans payable	None.	3,500,000.00
Operating revenue	26,075,574.00	65,848,258.00
Operating expenses	17,096,066.00	49,517,948.00
Interest on funded debt	2,931,980.00	9,934,169.00
Rentals	473,962.00	1,881,651.00
Net income	5,306,519.00	395,915.00
Surplus	10,263,184.55	6,264,208.84
Mileage owned	3,128	5,367
Mileage operated	3,772	7,729

SYNDICATE CONTROL.

In 1901 Daniel G. Reid, W. H. Moore, J. H. Moore and W. B. Leeds purchased about \$20,000,000 of stock of the company, and by the use of proxies they soon became members of the board of directors, W. B. Leeds being made president and D. G. Reid chairman of the executive committee. This syndicate procured the selection of other members of the board of directors, notably F. L. Hine, George McMurtry, and George T. Boggs, each of whom appears to have acted and voted in accordance with the wishes of the members of the syndicate. One other director stated that he knew but little of what was being transacted in the affairs of the railway company, and that he was a member of so many other boards of directors that he had no opportunity to examine into things for himself, but had to take the word of those in authority. Thus the syndicate controlled the board through the directorships held by themselves and by those subject to their wishes.

At a stockholders' meeting held June 5, 1901, at which an increase of the capitalization of from about \$50,000,000 to approximately \$60,000,000 was authorized, W. H. Moore was elected a director of the company, and at a directors' meeting held on the same date Daniel G. Reid was also elected a director. At the former meeting a 10 per cent. stock dividend was declared. On July 31 W. B. Leeds was elected by the board a director to succeed W. A. Nash, resigned.

On October 24 the articles of incorporation of the railway company were amended to provide for an executive committee to consist of the president and six directors, to be designated by the board, and to be invested with all of the powers of the board when it was not in session. W. H. Moore and W. B. Leeds were appointed on this committee on the day it was

created, and on December 12 following W. B. Leeds succeeded W. G. Purdy as president of the railway company. Then D. G. Reid became a member of the executive committee and J. H. Moore a member of the board. On January 30, 1902, J. H. Moore was elected by the board to the executive committee in place of H. R. Bishop, resigned. The other members of the executive committee at this time were R. R. Cable, Marshall Field and A. R. Flower.

On June 4, 1902, the capital stock of the railway company was increased to \$75,000,000 and the board authorized President Leeds to sell to certain individuals portions of this increased stock at par, although at the time the stock was quoted on the market above 175.

In July, 1902, the syndicate organized two holding companies, the Chicago, Rock Island & Pacific Railroad Company of Iowa, and the Rock Island Company of New Jersey. The railway or operating company will be referred to hereinafter as the railway company, and the holding companies as the Iowa company and the New Jersey company, respectively. The St. Louis & San Francisco Railroad Company will be referred to as the Frisco.

The authorized capitalization of the Iowa company was \$125,000,000 in stock and \$75,000,000 in 4 per cent. collateral bonds. That of the New Jersey company was \$150,000,000 in stock, of which \$54,000,000 was preferred and \$96,000,000 common. In the latter company the preferred stock only had voting power to elect directors of the first class, which directors under the by-laws constituted a majority of the board. The directors of these two corporations first elected were merely figureheads, but later members of the syndicate became directors of both companies and controlled them. The New Jersey company and the Iowa company each issued their stock as fully paid, whereas no payment was made on either. Then upon motion of D. G. Reid, the Central Trust Company, of New York, of which J. N. Wallace was and is president, was selected as trustee, and an arrangement was made with that company whereby the entire bond issue of the Iowa company and stock issue of the New Jersey company were placed with it under an agreement that they were to be exchanged for stock of the railway company in the proportion of \$100 in Iowa company bonds and \$70 in preferred and \$100 in common stock of the New Jersey company for each \$100 in stock of the railway company, or \$270 face value of the holding company securities for each \$100 par value of the railway company stock. Under this agreement the members of the syndicate deposited railway stock as follows:

D. G. Reid	\$5,915,437.50
W. H. Moore	6,118,975.00
J. H. Moore	3,059,262.50
W. B. Leeds	5,597,100.00

making a total of \$20,690,775, for which they received \$20,690,775 in the Iowa company's bonds and the same amount in the common and \$14,483,542 in the preferred stock of the New Jersey company, at total of \$55,865,092.

The 10 per cent. stock dividend declared by the railway company on June 5, 1901, had the apparently intended effect of creating a demand for the stock of the holding companies, the only revenue of which was from dividends on the stock of the railway company and practically all of the stockholders of the railway company exchanged their stock, the total amount deposited being approximately \$71,000,000, or all but about \$4,000,000 of the total railway stock. The par value of the holding companies' securities issued in exchange amounted to about \$191,000,000.

Under the terms of the trust agreement the railway stock deposited was to be held by the trust company as collateral

to secure the Iowa company's bonds, and the trust company was authorized to sell the railway stock upon default of payment of interest on any of the bonds.

Thus by the organization of the two holding companies the syndicate, the members of which held but little more than one-fourth of the railway stock, secured control of and dominated the affairs of this transportation system.

A significant transaction at this time is that growing out of the action of C. H. Venner, a stockholder of the railway company. He made demands upon the officers of the railway company in December, 1902, and in January, 1903, for a list of its shareholders. Being ignored, he instituted on January 31, 1903, a proceeding in a state court of Illinois to enjoin the organization of the holding companies and the exchange of railway company stock for their securities. In February and March, 1904, the railway company paid Venner \$291,000, ostensibly in consideration of his delivery to it of securities of the New Jersey company and of the railway company valued at \$91,000 and stock of the Nebraska Central Railway and of the Nebraska Construction Company of a nominal value of \$200,000. Thereupon the suit to restrain the holding companies' plan was dismissed. Neither the Nebraska Central Railway Company nor the Nebraska Construction Company had any road or other tangible assets, and their stock is therefore considered to be without value. The conclusion is obvious that the payments to Venner were in consideration of his refraining from further prosecuting in the courts his opposition to the syndicate plans. The railway company incurred in this litigation expenses amounting to about \$17,000.

The expense of incorporating the holding companies, \$218,000 for the Iowa company and \$120,000 for the New Jersey company, was paid by the railway company, but these amounts were returned to it three years later without interest, the necessary funds having been secured by the holding companies from dividends on the stock of the railway company.

Practically the entire expense of renting, fitting up and furnishing the quarters occupied by the holding companies for the first four years of their existence was sustained by the railway company. During the next four years, or until 1910, the proportion of this expense borne by the holding companies was slightly increased, the balance being distributed between the railway company, the Frisco, the Chicago & Eastern Illinois, the Evansville & Terre Haute Railroad, and the Chicago & Alton. From 1910 to 1914 the expenses of the offices were prorated on the basis of 50 per cent. to the railway company, 37½ per cent. to the New Jersey company, and 12½ per cent. to the Iowa company. On the basis of apportionment adopted in 1910, the overcharge paid by the railway company prior to that year would amount to approximately \$290,000. That amount was improperly diverted from the treasury of the railway company.

SALARIES OF AND CONTRIBUTIONS TO OFFICERS AND DIRECTORS

The salaries paid to some of the principal officers at various periods were as follows:

	Per annum.
H. U. Mudge, president.....	\$60,000
L. F. Loree, chairman executive committee (one-half to be paid by the Frisco).....	75,000
R. A. Jackson, vice president and general solicitor....	50,000
R. R. Cable, member of board of directors.....	32,000
W. B. Leeds, president.....	32,000
B. L. Winchell, president.....	40,000
B. F. Yoakum, chairman executive committee.....	30,000
Daniel G. Reid, chairman board of directors.....	32,000
C. H. Warren, first vice president.....	35,000

W. G. Purdy, upon his retirement from the presidency, was given two years' salary at \$22,500 per annum.

Mr. Mudge, president of the railway company and now one of the receivers, asserted that the troubles of the railway were in a measure due to increase of wages and governmental regulations. When asked what wages he referred to as being increased he pointed out the wages of clerks, telegraph operators, conductors and brakemen. While he regarded the wages of these minor employees as having partially sapped the financial strength of the railway, he declared that the salaries paid to the higher officers of the company had no appreciable effect on its expenses.

It appeared to be the idea of those in control of the railway that it was no concern of the public what became of the corporate funds so long as rates were reasonable. Those stating this opinion apparently did not take into consideration the fact that if the funds derived from transportation services are expended wastefully or corruptly the inevitable result must be either increased charges in order to enable the railway company to obtain money to pay operating expenses, or bankruptcy.

The contributions to officials of the railway company in excess of their salaries aggregated about a million dollars.

THE ST. LOUIS & SAN FRANCISCO

On May 6, 1903, an agreement was executed between the Iowa company, the New Jersey company, and J. P. Morgan & Company, wherein it was agreed that the common stock of the Frisco would be exchanged for securities of the Iowa and New Jersey companies.

The terms of the agreement provided that for each share of the common stock of the Frisco there would be exchanged \$60 par value in 5 per cent. bonds of the Iowa company and \$60 par value of the common stock of the New Jersey company. Pursuant to this agreement Frisco common stock in par value of \$28,940,300 was exchanged for securities of the Iowa and New Jersey companies in par value of \$34,728,360, equally divided between stocks and bonds.

The Frisco stock thus exchanged was deposited as collateral for the bonds of the Iowa company, and in December, 1909, was resold to B. F. Yoakum for \$37.50 a share, or \$10,852,000. This amount was insufficient to redeem the Iowa company bonds, which was necessary in order to make delivery of the Frisco stock, and the Iowa company, having no resources, issued to the railway company its bonds, which now appear to be worthless, to an amount in par value of \$7,500,000 and received therefor \$7,300,000 in cash, the net proceeds from a loan of \$7,500,000 made to the railway company by the First National Bank of New York. Of these bonds \$1,388,000 were subsequently retired, leaving in the possession of the railway company \$6,112,000, which the Iowa company has no assets to retire. The latter amount was thus taken from the treasury of the railway company to meet an obligation of the Iowa company for which the railway company was in no way responsible and from which it derived no apparent benefit.

The final result of this transaction is that the railway company has sustained a loss estimated to be about \$6,500,000.

CHICAGO & ALTON.

In November, 1903, an account styled "B. F. Yoakum advances" was opened on the general ledger of the railway company to cover amounts advanced by it for the purchase of stock of the Chicago & Alton, hereinafter referred to as the Alton company.

As a result of transactions in the Alton stock the railway company acquired 48,800 shares of preferred and 144,200 shares of common at a total cost of \$9,709,876.49. These shares were bought principally in 1903, but sundry purchases were made after that time until June 30, 1907, when the above total amount had been accumulated.

In October, 1907, the railway company delivered to the Toledo, St. Louis & Western 41,100 shares of the preferred and 144,200 shares of the common stock of the Alton company, receiving in exchange for the former 4,110 series "A" \$1,000 bonds and for the latter 5,047 series "B" \$1,000 bonds of the Toledo, St. Louis & Western.

On November 28, 1908, the executive committee of the railway company authorized the sale of the remaining shares of the preferred stock of the Alton company held by the railway company, together with sundry bonds, series "A" of the Toledo, St. Louis & Western Railroad Company. Pursuant thereto, 3,220 shares of the Alton preferred were sold at a loss of \$45,527.69, and the sale of 3,710 of the series "A" bonds of the Toledo, St. Louis & Western resulted in a loss of \$393,572.44.

On June 30, 1914, the railway company owned 400 series "A" and 5,047 series "B" bonds of the Toledo, St. Louis & Western,

and 4,500 shares of Alton preferred, which in the aggregate had cost it \$6,193,240.36, whereas on the date named their market value was \$1,582,400, a difference of \$4,610,840.36. In addition, the money with which the Alton stock was originally purchased was secured from the sale of bonds, the interest on which to June 30, 1914, less dividends on the stock and interest on the bonds secured, amounted to \$1,320,644.76.

From the foregoing it will be noted that the total loss sustained by the railway company as a result of the disastrous Alton deal was approximately \$6,370,000.

TRINITY & BRAZOS VALLEY.

A contract was entered into under date of March 31, 1906, between the railway company, the New Jersey company, the Colorado & Southern, and the Frisco. The last-named carrier's participation was only to the extent of through traffic arrangements. The cost of construction of the Brazos line, which is practically the entire line of the Trinity & Brazos Valley Railway, was borne by the Colorado & Southern, and under the terms of the contract the latter company and the railway company were to share equally the profits or losses of the Trinity & Brazos Valley, and on May 1, 1935, the railway company was to pay to the Colorado & Southern one-half of the entire cost of the Brazos line, receiving in return one-half of the bonds of the Trinity & Brazos Valley and one-half of other evidence of debt included in the total cost of the Brazos line. The contract further provided for the delivery to the New Jersey company of one-half of the stock of the Trinity & Brazos Valley, the former to make payment only of such amounts as are defaulted by the railway company.

A supplemental contract was entered into on June 1, 1914, wherein the railway company and the Colorado & Southern release each other from the obligation to make any further payments to or for account of the Trinity & Brazos Valley, and the railway company agrees to pay to the Colorado & Southern one-half of the interest at the rate of 4½ per cent. per annum on the total cost of the Brazos line to May 1, 1935. The total cost of the Brazos line approximated on June 30, 1914, \$11,000,000.

In accordance with these agreements the railway company advanced to June 30, 1914, to and for the account of the Brazos line, \$3,729,863.87. For all but \$35,000 of this the railway company holds certificates of indebtedness of the Trinity & Brazos Valley, on which there has accrued unpaid interest charges of \$774,918.20. The total investment of the railway company, therefore, is \$4,504,782.07, and in view of the fact that the Trinity & Brazos Valley is now in the hands of a receiver and the operation of its property has for some time resulted in a deficit, it appears that this investment is of very doubtful value.

OTHER LOSSES

As a result of coal deals the company had a total loss of more than \$1,300,000. If the advances to the coal companies can not be collected, it will result in an additional loss of nearly \$2,500,000.

On April 11, 1902, the executive committee of the railway company authorized the president and secretary of that company to engage with Speyer & Company, New York bankers, to assume a contract previously entered into between that firm and the Choctaw, Oklahoma & Gulf covering the purchase of the stock of the latter company.

Whether or not a loss has been sustained by the railway company as a result of this transaction is not demonstrable for the reason that the accounts of the carrier are not kept in such a manner as to permit the segregation of items by corporate lines. There is abundant reason to believe, however, that the disbursements made by the railway company in acquiring the Oklahoma company are far in excess of the actual value of the property and disproportionate to the returns accruing from the investment therein.

The Rock Island Improvement Company, incorporated under the laws of the state of New Jersey, is primarily a creature of the holding companies, designed to acquire on behalf of the

railway company transportation equipment and other facilities.

As an incident to these transactions, the railway company in one instance at least sold bonds of the improvement company at less than par and six months later bought them back at more than par, notwithstanding the general tendency of bonds to approximate par as they approach maturity. The only justification offered by its sponsors for the existence of the improvement company is that by means of its operations the equipment of the railway company is exempted from the lien of a bond issue of 1898 covering all property then held by the railway company or subsequently acquired by it or its successors.

In the absence of specific figures it is impossible to determine the difference between the ultimate cost of equipment furnished the railway by the improvement company and what such cost would have been had such equipment been purchased directly by the railway company, but it is plain that the procedure entailed an added cost, and that to that extent the railway company sustained a loss by reason of its affiliation with the improvement company.

AGGREGATE OF LOSSES

The aggregate losses sustained by the railway company in connection with the foregoing transactions may be summarized as follows:

Expenses of maintaining and housing holding companies, more than	\$290,000.00
Frisco deal, approximately.....	6,500,000.00
Alton deal, approximately.....	6,370,000.00
Trinity & Brazos Valley Railway deal, more than.....	4,500,000.00
Consolidated Indiana and Dering coal companies, at least	1,300,000.00
Contributions or gratuities to officers and directors, about	1,000,000.00
Venner transaction	217,000.00
Miscellaneous and unexplained expenditures.....	72,523.45

These items show an aggregate loss to the railway company of more than \$20,000,000. In addition thereto it is to be noted that prior to June 30, 1914, the railway company paid to financial institutions, in connection with the issuance of bonds, commissions aggregating more than \$1,600,000, and suffered discounts of more than \$17,700,000.

INDIVIDUAL PROFITS

The amount of gains accruing to W. B. Leeds, D. G. Reid, W. H. Moore, and J. H. Moore through their control and manipulation of the railway company are probably not ascertainable. Reid, when interrogated with a view to ascertaining his profits from the various transactions, explained that he always burned his books at the end of each month.

The quotations placed in the record from the stock market of the New Jersey company stock and the railway company stock showed wide fluctuations. Whatever have been the gains realized by these persons, it is certain that the present holders of the stocks and bonds of the holding companies have that which is of little or no value.

REPORTS TO STOCKHOLDERS

Misrepresentation of assets in reports to stockholders appears to have been a practice of the directors of the railway company. On June 30, 1904, a book surplus was claimed for the railway company of \$22,343,955.26. By June 30, 1914, the company conceded a reduction of this surplus to \$6,199,811.08, and even this amount was fictitious.

Thus the railway company included among its assets certificates of indebtedness of the Trinity & Brazos Valley carried at a book value of \$3,694,863.87. The Trinity & Brazos Valley was then in the hands of a receiver and was already facing a deficit of \$8,000,000, with a practical certainty that this amount would increase from year to year. It is apparent, therefore, that this item of more than \$3,500,000 was based upon securities which were known to be practically worthless.

In view of the fact that the reported value of the "securities" listed for the year 1914 was nearly \$18,000,000 in excess of their actual value, instead of a surplus of more than \$6,000,000 claimed by the railway company, there should have been shown a deficit of over \$11,600,000.

Another misleading and objectionable practice of the railway

company officials was the failure to state on the pay roll the true amounts paid to its officers.

The publication of misleading reports to stockholders can not be too severely condemned, and the individuals guilty of such acts should be subject to adequate penalties.

PRESENT STATUS OF THE RAILWAY

The original articles of consolidation provided that the maximum of indebtedness to which the company might subject itself should not exceed two-thirds of its outstanding capital stock. This maximum has been increased from time to time until the funded debt of the railway on June 30, 1914, was \$238,746,000, an increase of nearly \$175,208,000 over the amount outstanding on June 30, 1901. On June 30, 1914, the total capitalization of the railway company was \$313,741,000. Of this amount only \$75,000,000, or 28.73 per cent, was capital stock on which dividends might or might not be paid, according as the net earnings of the company might or might not warrant. The remaining 71.27 per cent of the total capitalization consisted of interest-bearing debt, including \$3,500,000 of short-term loans, on which interest was required to be paid regardless of earnings.

The Iowa company being wholly dependent for earnings upon the dividends paid by the railway company, the passing of the railway company dividends in May, 1914, resulted in a default of interest on the bonds of the Iowa company. Pursuant to foreclosure proceedings instituted on behalf of the bondholders, the United States district court for the southern district of New York ordered the sale in one block of \$71,353,500 par value of the railway company stock deposited with the Central Trust Company of New York as collateral for the bonds of the Iowa company.

Some time previous thereto J. N. Wallace, president of the Central Trust Company of New York, which, it will be remembered, was trustee by virtue of the agreement between the holding companies and the railway company, having been selected upon the suggestion of Daniel G. Reid, a member of the syndicate, organized a self-appointed bondholders' protective committee, the members consisting of himself and five other men of his selection. This committee advertised extensively for Iowa company bonds to be deposited in trust with it for the benefit of the bondholders, but after five months succeeded in getting only about \$23,000,000 out of \$75,000,000. Under the terms of the order of the district court the purchaser of the railway stock at foreclosure was to deposit \$1,000,000 in cash or \$10,000,000 in Iowa company bonds. In November, 1914, the circuit court of appeals permitted N. L. Amster, of Boston, a minority stockholder in the railway company, to intervene in the foreclosure proceedings, thereby postponing the sale as scheduled. Following the decision of the circuit court of appeals an adjustment was reached with the Wallace committee in the interest of all undeposited bonds, and an order was entered by the court on December 31, 1914, pursuant to which the stock was sold to Mr. Wallace, who was the only bidder, for \$7,135,350.

The syndicate decided to put the railway into a receivership. The general counsel of the railway company at the suggestion of W. H. Moore, a member of the syndicate, drew the bill asking for a receivership and engaged an attorney ostensibly to represent the other side. The bill was placed in the hands of this attorney with the name of the complainant omitted and he was instructed by the general counsel to locate some creditor of the railway company willing to act as complainant. There was an agreement between the general counsel and this attorney as to the parties the latter would recommend to the court as receivers, the general counsel agreeing to instruct the attorney appearing for the railway company to acquiesce in the recommendations so made.

The board of directors of the railway company was not informed of the intention to file a bill for receivership and at no meeting of the board was any authority ever given for such action. Members of the board of directors not in the confidence of the syndicate were kept in ignorance of the fact that such a

bill had been prepared. The stockholders had no information of the purpose to put the railway company into a receivership, although a stockholders' meeting was held after the date upon which the receivership bill was completed by the general counsel, and this general counsel attended the meeting. According to the testimony, the bill was completed by the general counsel March 29, 1915, and the fact that it was to be filed whenever desired by those in authority was known only to certain insiders. The testimony clearly establishes the fact that the railway company could easily have paid the debt of \$16,000 upon which the receivership application was based, and that arrangements probably could have been made to meet all pressing obligations of the railway company.

The creditor at whose instance the receivership application was filed appeared as complainant by request. R. P. Lamont, the president of the American Steel Foundries, the complainant, testified that he would not have thought of bringing such a proceeding against the railway company unless he had understood that it would be regarded as not unfriendly but as a friendly act to oblige the railway company. He only consented that his company should appear as complainant when he was assured that this course was in accordance with the wishes of the railway company and that his company was not to have any care or expense in the preparation of papers or payment of counsel fees. The suit was not a bona fide proceeding to collect a debt, but was instituted to carry out the purposes and schemes of the syndicate controlling the railway.

N. L. Amster, who was elected to the board of directors of the railway company by the minority stockholders at the stockholders' meeting held in Chicago, April 12, 1915, believing, according to his testimony, that no sincere effort was being made by other members of the board to finance the obligations of the railway, undertook to assist in raising about \$6,000,000 needed by the railway to meet obligations soon thereafter to mature. On April 16, 1915, he met and conferred with Messrs. James, McLean and Schumacher, all directors of the railway and members of the executive committee, and discussed the company's finances. These three expressed approval of his purpose to negotiate for the money. Amster testified that he had secured assurances for the furnishing of the money from responsible Boston bankers on securities which the railway company had. When he arrived in New York on the morning of April 20 to report this fact he went to the office of the railway company, and, quoting his testimony, "could not find anybody there that would say anything, except a lot of people moving back and forth. I left the office and found on the ticker that the Rock Island had been put in the hands of a receiver." This, Amster testified, was the first information he had of the receivership or that such a step was in preparation, yet he was a director of the road and after the stockholders' meeting in Chicago, April 12, traveled from Chicago to New York with Roberts Walker, the general counsel of the railway company.

It will be remembered that the bill was completed by the general counsel on March 29, this fact being known only to a special few. The bill was filed April 20. The records of the New York stock market reveal that the railway stock was inactive until the day this bill was completed, March 29. Then the stock began to be largely dealt in, and the price increased from \$20 to \$39 a share. When the bill was filed and receivers were appointed the stock dropped from \$39 to \$20 a share.

It is a forceful commentary on the methods by which a great railway may be manipulated into a receivership when it is noted that the general counsel, after drawing the bill for a receivership, sold his stock, and the local counsel, who represented the railway company in the receivership proceedings, owned no stock in the railway company, and that none of those directly participating in the receivership proceedings had any financial interest in the railway company. The real owners of the railway, the stockholders, the security holders, and the directors, except those composing the syndicate and in its confidence, were in ignorance of the receivership application. Mr. Mudge, former

president of the railway company, is now one of the receivers.

The general counsel for the railway company, who planned the receivership in obedience to the will of the syndicate, is now counsel for the receivers.

The property of the railway company will be called upon for many years to make up the drain upon its resources resulting from transactions outside the proper sphere in which stockholders had a right to suppose their moneys were invested. This record emphasizes the need of railway directors who actually direct. There are too many passive directors who acquiesce in what is being done without knowledge and without investigation. A director of a railroad is a quasi public official who occupies a position of trust. A director who submits blindly to the exploitation of his company is a party to its undoing and he should be held responsible to the same extent as if he had been a principal instead of an accessory before the fact. The greater his prominence the greater his responsibility and the greater his dereliction. Obviously a man of large affairs could not attend to all the details in intricate transactions, but it is inconceivable that a director of ordinary business prudence and sagacity would sanction large expenditures without an inquiry as to the purposes of such disbursements. So long as this situation exists, however, it suggests the need of a law to charge such directors with individual responsibility for the dissipation of corporate funds.

The Clayton anti-trust act, which becomes effective October 15, 1916, will make it unlawful for any person at the same time to be a director in two or more competing corporations, any one of which has a capital, surplus or undivided profits aggregating more than \$1,000,000, but common carriers are expressly exempted from its application. It should be just as grave an offense for an official of a railway to be faithless to his trust for financial gain as it is for an elected official of the government to betray his trust for money reward.

By this case the need of some limitations on the issuance of stocks and bonds by common carriers, whether directly or through holding company devices or otherwise, is again demonstrated.

REPORT ON THURMONT COLLISION

The Interstate Commerce Commission has issued a report, signed by H. W. Belnap, chief of the division of safety, dated July 30, explaining the cause of the butting collision of passenger trains on the Western Maryland, near Thurmont, Md., June 24th, when two passengers and four employees were killed and twenty-three passengers, employees and other persons were injured. This spectacular wreck, caused by the trains meeting on a high bridge, both running at fifteen or twenty miles an hour, was reported in the *Railway Age Gazette* monthly record in the issue for August 6, page 229. An abstract of the commission's report follows:

The collision occurred in broad daylight but the line approaches the bridge from both directions on sharp curves, so that neither engineman had more than a few seconds' view of the opposing train. The cause of the collision was a mistake of the train despatcher, a man of experience, with good record, in assuming that a train order, after having been superseded, could be restored by annulling the superseding order.

The despatcher first issued order No. 71, requiring the westbound train (No. 11) and the eastbound train (No. 10) to meet at Flint. Finding, afterwards, that one of the trains would be delayed, he sent order No. 74, making the meeting point Sixty instead of Flint. This advanced the eastbound train about two miles, against the westbound. Again, the eastbound train was delayed and the despatcher sent order No. 75 annulling order No. 74. This order cancelled all of the train-order meeting points between No. 10 and No. 11 and left No. 10 superior, according to the time table, to No. 11.

The westbound train received order No. 71, giving it the absolute right of road to Flint; but order No. 74, which was sent (for this train) to Thurmont, was annulled before train

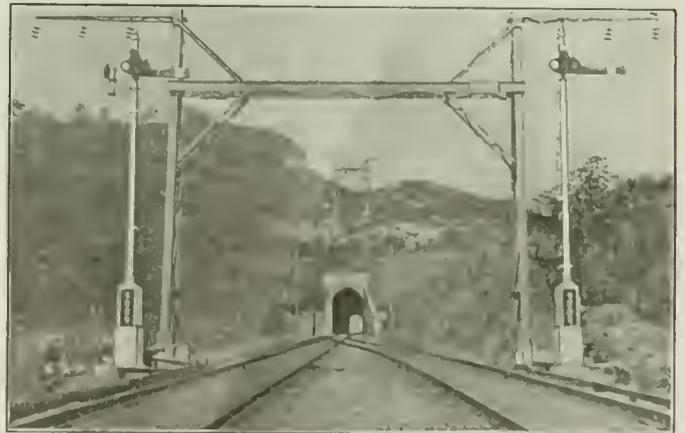

No. 11 reached that station, the annulling order, No. 75, being addressed to the operator at Thurmont. According to the order No. 75, he filed away both No. 74 and No. 75, neither being of any further effect; and so No. 11 proceeded toward Flint on the authority of order No. 71.

The despatcher said to the inspector that at the time he issued order No. 75 he was momentarily under the impression that in annulling order No. 74 he restored order No. 71 (to train No. 10); and as No. 11 had not received order No. 74, it would be unnecessary for that train to have a copy of No. 75. He was very busy with train orders and messages and did not discover his mistake until he heard of the collision. From the time he came on duty, four o'clock, until the time of the collision, 5.47 p. m., he had issued eleven train orders and had recorded sixteen acceptances of these orders. The despatcher said that he had more work than one man could properly look after, two divisions of the road having been consolidated about a year ago. Officers of the road testified that the consolidation of divisions had been justified by a simplification of the work of the despatchers. Engine failures and delays to trains had been very greatly reduced. At the time of the collision, the daily average number of train movements over the section of road where the collision occurred was twenty-two.

The report calls attention to the fact that there were three butting collisions on this road during the last three months of 1912, and that at that time the government inspector recommended the introduction of the block system. The company has installed automatic block signals on 57 miles of its line during the past year, but Mr. Belnap says that at the present rate it will be twelve years before the whole of the road will be thus protected; and, "in view of the volume of traffic, the installation of an adequate block system is urgently required."

AUTOMATIC BLOCK SIGNALS FOR GAUNTLET IN MIRAFLORES TUNNEL

During the period of construction of the Panama Canal, the trains hauling excavated material from the canal prism, and all of the regular trains of the Panama railroad, were moved through the single-track tunnel at Miraflores, under the protection of an absolute train staff system and an interlocking plant at each

Signals at Miraflores Tunnel, Panama Railroad

end. As the traffic changed toward the end of the construction period, it was possible to eliminate the interlocking at the ends and to install a gauntlet through the tunnel. It was then decided that it would be economical to replace the staff machines by automatic block signals. The tunnel is about 1,500 ft. long.

An incline had been built to a point over the tunnel for taking material up to construct a new filtration plant for the water system, and there was a material yard near the south portal of the tunnel, so that it was often advantageous to make certain movements against the current of traffic, with light engines. In addition to this, it was anticipated that it might be necessary

at some time to operate one main as a single-track. Considering these conditions, it was decided to place two automatic signals at each end of the tunnel so as to signal trains in both directions on either track. The original installation included four Union Switch & Signal Company's style B signals, operating from 0 to 90 deg. in the upper right-hand quadrant. The reverse movement signals were located to the left of the track governed (looking in the direction of the reverse movement). The circuits were arranged on the "normal danger" basis, with an approach signal located at the entrance of the clearing section, 1,500 ft. in the rear of the tunnel signals. These approach signals operated in two positions only, from 0 to 45 deg. The clearing sections for the reverse movement signals were only 150 ft. long, allowing a train traveling with the current of traffic to pass over the section in such a short time after the rear end had passed out of the gauntlet track circuit that the signal arm would not be raised from its horizontal position, even though the relay might be momentarily energized and the armature make a few revolutions.

The crossovers and switches were equipped with indicators and switch boxes, though some of the switch boxes actuate line circuits only. A crossing gong, actuated by trains running with the current of traffic, was located at the north end of the tunnel to serve as a warning to speeders and hand cars.

When automatic signals were installed through this territory recently this scheme was tied on, and all signals except the two reverse signals and the two approach signals, were made to operate in three positions.

Under the present arrangement the signals clear for trains on the "first come, first served," basis, regardless of right, class, or direction. If, for example, a second section of a train going with the current of traffic is held at one of the signals because the first section is not out of the block in advance, a train in the opposite direction will receive a proceed indication if it is standing on or has entered its clearing section prior to the time the aforementioned section enters its clearing section. This gives an even chance to trains moving in both directions, and tends to prevent congestion on either track. It also allows an engine to return for the rear end of its train after switching, and safely expedites a number of other train movements that are specially necessary in this territory. The maximum speed here is about 30 miles an hour.

This special tunnel protection was worked out and installed under the direction of W. H. Fenley, formerly superintendent of signals and telegraph.

TRAIN ACCIDENTS IN JULY 1

The following is a list of the most notable train accidents that occurred on railways of the United States in the month of July, 1915:

DERAILMENTS

Date	Road	Place	Cause of Der'nt	Kind of train	Kil'd	Inj'd
† 3.	Chc., M. & St. P.	Rainer, Wash.	Acc. Obst.	P.	3	15
7.	Pennsylvania	Ter. Park, O.	Wind.	P.	3	15
7.	Wabash	Gilmore, Mo.	Wind.	P.	0	10
9.	Atlantic Coast Line	Newark, Ga.	Malice.	P.	1	6
14.	Boston & Albany	Claverack, N.Y.	Neg.	F.	1	2
20.	El Paso & S. W.	Indiole, N. M.	Flood.	F.	5	0
28.	A., T. & S. F.	Navajo, Ariz.	h. truck	F.	1	0

30.	M., K. & T.	Lockhart, Mo.	Malice.	F.	2	0
31.	Raritan River	Parlin, N. J.	Malice.	P.	0	1

The train derailed on the Chicago, Milwaukee & St. Paul, near Rainier, Wash., on the third, was a southbound passenger, and the engine and two cars fell through a trestle bridge. These two cars lodged on a freight train of the Northern Pacific, which was passing beneath the trestle at the time. One passenger, the engineman and the fireman were killed and 15 passengers were

injured. The cause of the derailment was the weakening of the bridge (which did not alter the appearance of the track) by a derrick in the freight train, which had become loose and swung around.

The train derailed near Terrace Park, Ohio, on the 7th, was northbound passenger train No. 8, consisting of four express cars loaded with race horses, together with a postal car, passenger coaches and sleepers. It ran into a very severe rain and wind storm near Terrace Park, north of Cincinnati, and while on a high bank ran through the path of extremely high wind, which blew the first car of the train (an express car) over the bank; and the three following cars were derailed. Three attendants with the horses were killed and fifteen injured, those killed being in the car which was blown from the track. An officer of the road writes that very careful investigation showed that the accident occurred directly in the path of the severest portion of the wind storm. The train at the time was running at about 40 miles an hour, and he has no doubt that the car was blown from the track.

The train derailed near Gilmore, Mo., on the 7th, was westbound passenger No. 9, and the cause was a tornado. The four cars of the train next the engine were blown off the track and overturned. The injuries to the passengers, numbering 10, were all comparatively slight. The train was running at about 20 miles an hour. The four cars were all blown clear of the track, and the engine and five remaining cars proceeded, after a delay of only an hour.

The train derailed at Newark, Ga., on the 9th was eastbound passenger No. 58, and the engine and one car were overturned. The engineman was killed and the fireman and five passengers were slightly injured. The derailment occurred about 2 a. m., and was caused by the malicious misplacement of a switch.

The train derailed at Claverack, N. Y., on the 14th was a westbound switching engine without cars. The engine was partly turned over and one trainman was killed and two others injured. The cause of the derailment was excessive speed over soft track, and the absence of the engineman, who was at the tender of the engine getting a drink of water and was not in a position to shut the throttle and apply the brake.

The train derailed at Indiole, N. M., on the 20th was freight No. 71, and the cause was the failure of a bridge, due to washing out of foundation by a cloud burst. The engine and ten cars fell to the gulch below, and five persons were killed, the engineman, fireman, one brakeman and two tramps.

The train derailed at Navajo, Ariz., on the 28th was an eastbound freight, and the locomotive was overturned and the engineman killed. The derailment was due to insecure track caused by abnormal rains.

The train derailed at Grafton, Ohio, on the 29th, was a northbound freight and 18 cars were badly damaged. Ten of them took fire and were burned up. Four tramps are said to have been riding on an oil tank car, the car which was the first to jump the track, and they were killed in the fire, though the body of only one person was discovered. The cause of the derailment is believed to have been a broken truck.

The train derailed near Lockhart, Tex., on the 30th, was an eastbound local freight, and the engine was overturned. Eight cars were wrecked, and the fireman and one brakeman were killed. The derailment occurred about 8 p. m., at a highway crossing, and may have been due to sand or other obstruction on the track.

The train derailed on the Raritan River Railroad, near Parlin, N. J., on the 31st of July, was express train No. 10, and the engine and one car were ditched. The engineman was slightly injured. The derailment is believed to have been caused by spikes maliciously placed on the rails.

Electric Car Accidents.—Four serious accidents to electric cars were reported in the newspapers as having occurred in the United States in the month of July, but no fatal results were expected from any one of them. At Queenston, Ontario, on the 7th, a trolley car, heavily loaded, ran away on a steep grade and eleven passengers were killed.

† Abbreviations and marks used in Accident List:—rc, Rear collision—bc, Butting collision—xc, Other collisions—b, Broken—d, Defective—unf, Unforeseen obstruction—unx, Unexplained—derail, Open derailing switch—ms, Misplaced switch—acc obst., Accidental obstruction—malice, Malicious obstruction of track, etc.—boiler, Explosion of locomotive on road—fire, Cars burned while running—P or Pass., Passenger train—F or Ft., Freight train (including empty engines, work trains, etc.)—Asterisk, Wreck wholly or partly destroyed by fire—Dagger, One or more passengers killed.

TURNING FRENCH FREIGHT CARS INTO HOSPITALS

BY WALTER S. HIATT.*

On that French front of 500 odd miles, an average of 5,000 Frenchmen are killed or wounded during each 24 terrible hours of battle.

How shall the wounded be cared for? As a matter of cold-blooded calculation, sympathy aside, if this war is to go on these wounded must be saved and nursed back to health, so that they may return to the defense of their homes and their nation, and so that France, after the war, may not be a manless country. In the heat of the fighting, during the defense of a trench or in the attempt to take a trench from the enemy, a man falls, pricked by a bullet or stung in a dozen places by fragments of shell. When there is time, particularly at night, when the enemy cannot see to fire upon the life-savers, men of the hospital corps, or comrades of the fallen, crawl out beyond the trenches into the

every kindness of old men, of women, of children even, is at work in this stern business of caring for the wounded that these trains deliver.

There have been many problems for the railroads to solve in caring for these wounded. This hospital work has assumed colossal proportions and out of it has grown not only a perfection of the old means of caring for wounded on the field of battle, and in the hospital, but also in their transportation. It cannot be too frequently stated that railroad men and railroads have rendered services in this war the scope and real usefulness of which are hardly yet understood; which are taken too much for granted. A soldier wounded on the Yser, in the north, may be delivered at Paris within 30 hours of the time he was wounded, if he is in condition to be moved at all.

One phase of this service has been the evolution of a life-saving hospital car out of a rude, cheap box car. In the beginning of the war, when the railroads had rendered their first great service of launching the soldiers towards the frontiers, the prob-

A French Freight Car Transformed into a Hospital Car

open space of No Man's Land, locate the wounded man and, still crawling, drag him back to the safety of the trenches.

Then, by slow degrees, the wounded man is carried to the rear, always under cover of the deep ditches (boyaux) that connect with the front trenches, until a temporary hospital is found, often a mile or two from the trenches. There the man is given temporary treatment, after a time placed in a hospital wagon, and, if not so cut up that he cannot stand being moved, bundled off to the trains that are always waiting to whirl the wounded back to life, back into the heart of France, to Paris, Orleans, Bordeaux, Lyons, or to the seacoast at Toulon in the distant south, to Tours, or to St. Nazaire at the mouth of the Loire.

These trains of mercy have been running by thousands since the first month of the war, until now they have carried nearly a million men into the hospital country, and by the hospital country is meant the whole of France. Every palace, every chateau, every comfortable home, every comfortable public building, whether in the city or in the country, has been turned inside out, and made into a hospital. Every resource of the human heart,

lem of caring for the wounded was in a state of infancy. A great deal of ink has been wasted about the value of field hospitals. The only hospital in which a seriously wounded man can be treated effectively is one in a building away from the heat, the noise and the hurry-scurry of the camps. The only way to get the soldiers to those hospitals, when there are so many thousand to handle, is by train. Before the war there was scarcely any provision for the sanitary train. So the soldiers of Charleroi and other places lucky enough to reach a railroad station were piled into box cars, cattle cars, passenger cars or upon flat cars, helter-skelter, dead and dying together, and the trains moved as best they could towards Rheims, Châlons and other points. Sometimes it took them days where it should have taken them hours to reach a hospital, because of the congested condition of the line. Consequently it was not unusual for the soldiers to reach their hospitals dead, or so badly done-up by the time lost and the rough ride, that they died soon after they had left the train.

Gradually this condition was improved by the railroads. Sanitary first-aid stations were arranged in the depots so that the wounded could be cared for while waiting for the trains. The

* Our special European correspondent.

next step was to secure more rapid movement, and then to increase the number of trains, which by October last totaled 600 on all the roads.

The final step, which began by the swinging of hammocks, one above the other, in the cars, so the wounded could be comfortable without taking up too much of the precious space in the cars, was the so-called sanitary train. The sanitary train implies above all that it carries with it the means of saving human life while the train is moving on its way to the permanent hospital.

At first the sleeping and dining cars of the Pullman type used by the Paris Lyons & Mediterranean and other railroads were used as temporary moving hospitals for the treatment of men who would surely have died if the surgeon had had to wait until he was in a real hospital to treat them. One of these hospital cars was put on each train and those needing treatment were carried into it as it was on its way. The trouble with the Pullman cars was their weight. They rendered excellent service, but a car weighing 37 tons used too much of the tractive effort of an engine. The more cars a train for the wounded can carry just now means that more lives will be saved. Hence there was evolved the idea of converting the homely, often-despised, ill-treated box car into a little hospital. One of these cars and two other light cars could be hauled in place of one 37-ton car. Wherever the idea originated, credit must be given to Commandant E. Loiseleur, in charge of the fourth bureau of the war department, a bureau devoted to railway service, for actively carrying out the plan.

At present these light, clean, little hospitals are rolling from the front to every hospital district in France, to the number of 600; that is one to each train. War time is the hardest time of all for the advancement of an idea, no matter how good, and it was only after the greatest effort that Commandant Loiseleur was able to persuade anybody to begin re-building these cars. Among the first built was one made over with the money given by an American, Mrs. Washington Lopp. She gave the required \$220, and now her car is saving lives every day.

This 30-ft. car when rebuilt—the rebuilding consists of painting it, boarding its inside, and installing certain small-priced articles—is divided into three parts. First, there is the operating room proper, furnished with a canvas-topped table and various instruments and utensils needed in operations; second, there is a middle closet for the storing of medicines; and lastly, there is a kitchen for the boiling of water, for the making of broth, and the burning of the cloths and cottons used in treating the wounded. The entire interior of the car is painted with white enamel, the floor is covered with linoleum, and every measure is taken to preserve its aspect and usefulness as a hospital.

Recently Commandant Loiseleur showed me some reports he had received from different trains provided with these little hospitals, and to read a report was to be convinced of their usefulness. One report showed that of 350 men taken at one time to Brest, a long, slow ride from the front all the way across Brittany, there were no deaths. At different points along the route, no less than 33 men had been received into the hospital and injected with anti-tetanic serum, while 4 others had had fractured limbs set. Another report showed that of 418 wounded taken to Ronen, all badly wounded, 200 had been treated, and but one death was registered. Still another report showed that in a train with 611 wounded, the lives of 5 had been positively saved by operations, and 55 others had had their wounds dressed. There was a report from another part of the front, where the fighting was as bad as any yet seen, and of 163 men in a train, 22 underwent immediate surgical operations, had bits of shell taken from their bodies, and were otherwise cared for. So the reports ran on, some of them dealing with deliveries of wounded to the American hospital at Neuilly, a suburb of Paris.

SOUTH AFRICAN RAILWAY MEN WITH THE COLORS.—The "white," i. e., not colored, staff of the Union of South Africa Railways number 31,000, and of these 3,922, or 12½ per cent. are serving with the colors.—*The Engineer, London.*

LOCOMOTIVE GRATE WITH LARGE AIR OPENINGS

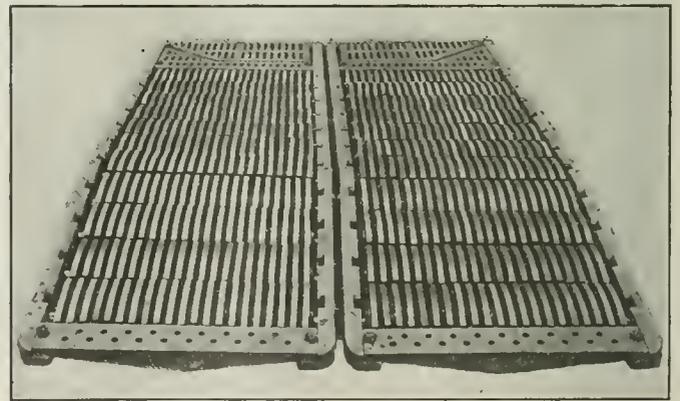

At the recent convention of the International Railway Fuel Association it was stated that from a canvass of 21 roads, it was found that the percentage of the area of the air openings in the grate to the total grate area varied from a minimum of 28.5 per cent. to a maximum of 49.6 per cent., and that the average was 37.2 per cent., with 1 in. openings between the fingers, for bituminous coal burning engines. It was also stated that the Seaboard

Parts of the Hulson Grate

Air Line strongly favored the table grate on account of its large air opening. The advantage of a large total air opening in the grates without an excessive width of opening between the fingers is generally acknowledged.

The illustrations show a grate for locomotives which provides an air opening area of 55 per cent. of the total grate area, with ½ in. openings between the fingers, and with possibilities of a larger percentage of air space where the conditions permit. This grate is made by the Hulson Grate Company, Keokuk, Iowa. It has been installed in a large number of stationary plants and has been made standard on the locomotives of one railway. The experiences of those who have it in service indicate that with the large amount of air opening in the grate it has been possible to more thoroughly consume the coal, thus producing less smoke and keeping cleaner fires. Many cases have also been found where a

The Hulson Locomotive Grate for a Firebox 108 in. by 66 in.

cheaper grade of fuel can be used with this grate. Because of the better consumption of the fuel several of the users report considerable savings in coal consumption.

Aside from the large amount of air space provided by this grate the mechanical features are of considerable interest, the purpose of the manufacturers being to provide a grate of as simple construction as possible, with a minimum amount of trouble to repair. The details of the grate are shown in one of the illustrations. No. 1 is the side bar; No. 2 the tie bar; No. 3 the finger bar, and No. 4 the finger. The fingers are all loose on the finger bar, which permits expansion or contraction without affecting the finger bar. The fingers slide on to the finger bar from the end, being held by means of a key cast into the bar and fitting into a keyway in the fingers. This construction has been adopted to make possible the renewing the fingers, should they become broken, at a very small cost, the finger bar simply being lifted from the side bar and the broken finger replaced. It will also be noted that the tops of the fingers are curved so that when the grate is rocked slightly, a rubbing action will be produced on

the fuel bed, which dislodges the fine ash without disturbing the fire or allowing the unburned fuel to drop into the ashpan. By shaking the grate for the full stroke, however, it is possible to dump the fire. The construction of these fingers also tends to raise the bed of the fire sufficiently high from the mechanism of the grate to keep it from being subjected to the severe heat. It is also claimed that the large percentage of air space in the grate permits the use of a larger exhaust nozzle, since as much draft will not be required to pull the air through the grate bars. With the $\frac{5}{8}$ in. openings there will be a more even distribution of the air through the fuel bed, which permits of a lighter fire being carried.

ADJUSTABLE HUB PLATE

The Smith adjustable hub plate is maintained at the proper distance from the hub by means of compressed grease, the adjustment being made by screwing in the grease plug shown on the outside of the wheel hub. The adjustable plate is forced into a recess in the hub, which is 1 in. deep and varies from 2 in. to $3\frac{1}{4}$ in. in width, according to the size of the wheel. It may be applied either by hammering or under a press, about 20 tons being required to press the plate into place. Patents have recently been granted on an improvement in this device designed to increase its effectiveness. The new feature is the method of preventing the grease from leaking past the plate and relieving the pressure, which would affect the adjustment. The plate is beveled to receive a No. 9 gage copper wire, which is placed around the outer and inner edges of the plate, as indicated in the illustration. This wire is soldered so as to be continuous. A

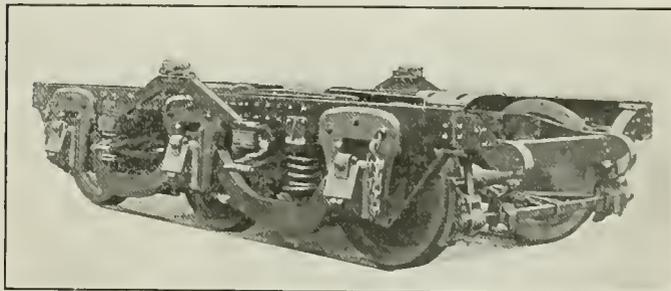

Smith Adjustable Hub Plate

No. 24 gage iron liner holds the copper wire in place as the hub plate is forced outward by the grease pressure. As the hub plate is forced into a bearing in the hub the copper wire assumes a rectangular section, thereby making a more perfect seal. The plate is kept from rotating by six $\frac{3}{4}$ -in. dowel pins screwed into the plate and fitting into the holes in the wheel hub. By the use of this device the lateral may be maintained constant and it may be taken up with comparatively little labor, it being possible to adjust all the wheels in from one to three hours. This eliminates the necessity of dropping the wheels and re-lining the face of the driving boxes when the lateral becomes too great. By the use of this hub plate much less lining material is required on the face of the driving box, inasmuch as the hub plate is $\frac{1}{2}$ in. thick on its outer flange. Excessive wear on the driving box liner is also eliminated as the lateral may be properly maintained and thus prevent pounding, due to the excessive lateral, which many times breaks away the driving box liner. It has also been found unnecessary to reline the boxes between shoppings. The plate can be applied to old as well as new locomotives. The right for its use is sold by the Smith Locomotive Adjustable Hub Plate Company, Pittsburgh, Kan.

ROLLED STEEL TRUCK FRAMES

In designs of four-wheel and six-wheel passenger trucks developed by the American Car & Foundry Co., New York, the frames have been made up almost entirely of standard rolled sections. The idea in designing these trucks was to reduce both first cost and maintenance troubles. Repairs to the frames can be made at almost any shop and experience has shown that under ordinary service conditions, heavy repairs requiring special work and tools are unnecessary.

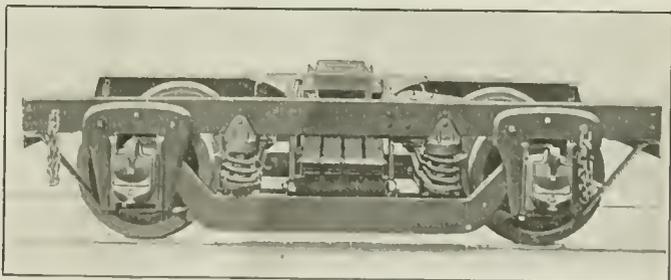

In both designs the attempt was made to secure maximum strength and service ability with a minimum weight. The frame for the four-wheel truck weighs approximately the same as the old wooden frame having iron flitch plates, while there is a marked advantage as regards strength and rigidity. All rivet holes are reamed to size and the more important rivets are ma-

Six-Wheel Truck with Rolled Steel Frame

chine driven. Large gusset plates are used to connect the cross members to the truck sides and the friction plates for the bolsters are located on the bolster hanger brackets, thus removing the lateral strain from the cross members. The brake hanger bracket is secured to a pressed arm, which is supported by the truck side and the cross member gussets. The bolster hanger is extra long and the pins are of large diameter in order to reduce wear. Either the usual design of inside hung brakes or the American Brake Company's design of clasp brakes may be used with this truck.

The six-wheel truck has been found to meet all the requirements of high-speed passenger service, trucks of this design having been used for some time under heavy passenger equipment cars, including dining cars. It is claimed that frames for the six-wheel truck are approximately 3,000 lb. lighter per car

Rolled Steel Frame Four-Wheel Truck

than the usual design of cast steel frame, this advantage being obtained because in the rolled steel design the metal can be placed to better advantage at the points of greatest stress. The American Brake Company's clasp brake arrangement can be used with this truck, as well as with the four-wheel design.

THE CENTRAL RAILWAY STATION AT LEIPSI, GERMANY.—The building of the new central station in Leipsic, which, when completed, will be the largest in Europe, is being steadily proceeded with in spite of the war. The second half, intended for the traffic of the State Railway lines of Saxony which touch the city, will, in accordance with the original plan, be finished during the present year.

PASSENGER CAR ROOF CONSTRUCTION

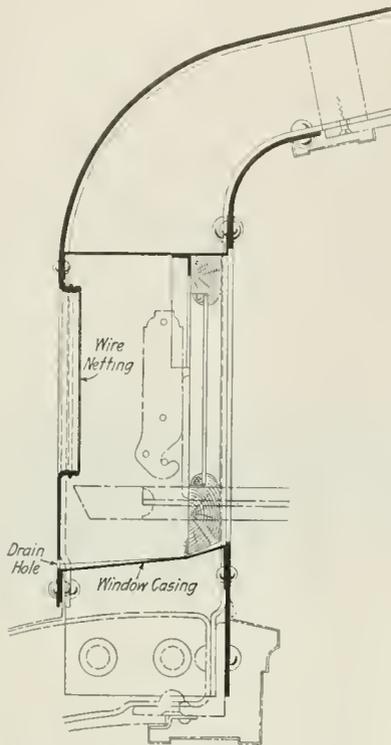

There has always been more or less difficulty in securing a satisfactory upper deck construction in passenger cars of the

be provided around the deck sash and screens. The accompanying drawings show a type of construction recently patented by Otto B. Johnson, New Glasgow, Nova Scotia, which is designed to overcome these difficulties and to simplify the securing of weather-proof connections between the lower roof and the deck of the car.

In this construction the roof frame consists of special pressed steel channel sections, forming the carlines and upper deck posts, to the outside of which the fastened the roof sheets and to the inside of which the interior finish is applied. The sides and roof of the upper deck are covered with continuous sheets formed to the contour of the roof. Flanged openings are provided in these sheets for the ventilator screens which are secured against the edge of the flange by means of a wire clamp. The deck posts are secured at the bottom to the upper ends of the lower carlines and to the deck sill angle, the three pieces being securely riveted together. The upper ends are bent to form a connection with the upper carline, with this construction the soldering of flashing around the posts is avoided, which is unsatisfactory and expensive, and continuous roof sheets from lower deck to lower deck may be used. The lower roof sheets may be formed with vertical flanges at the sides of the deck and directly riveted to the upper roof sheets.

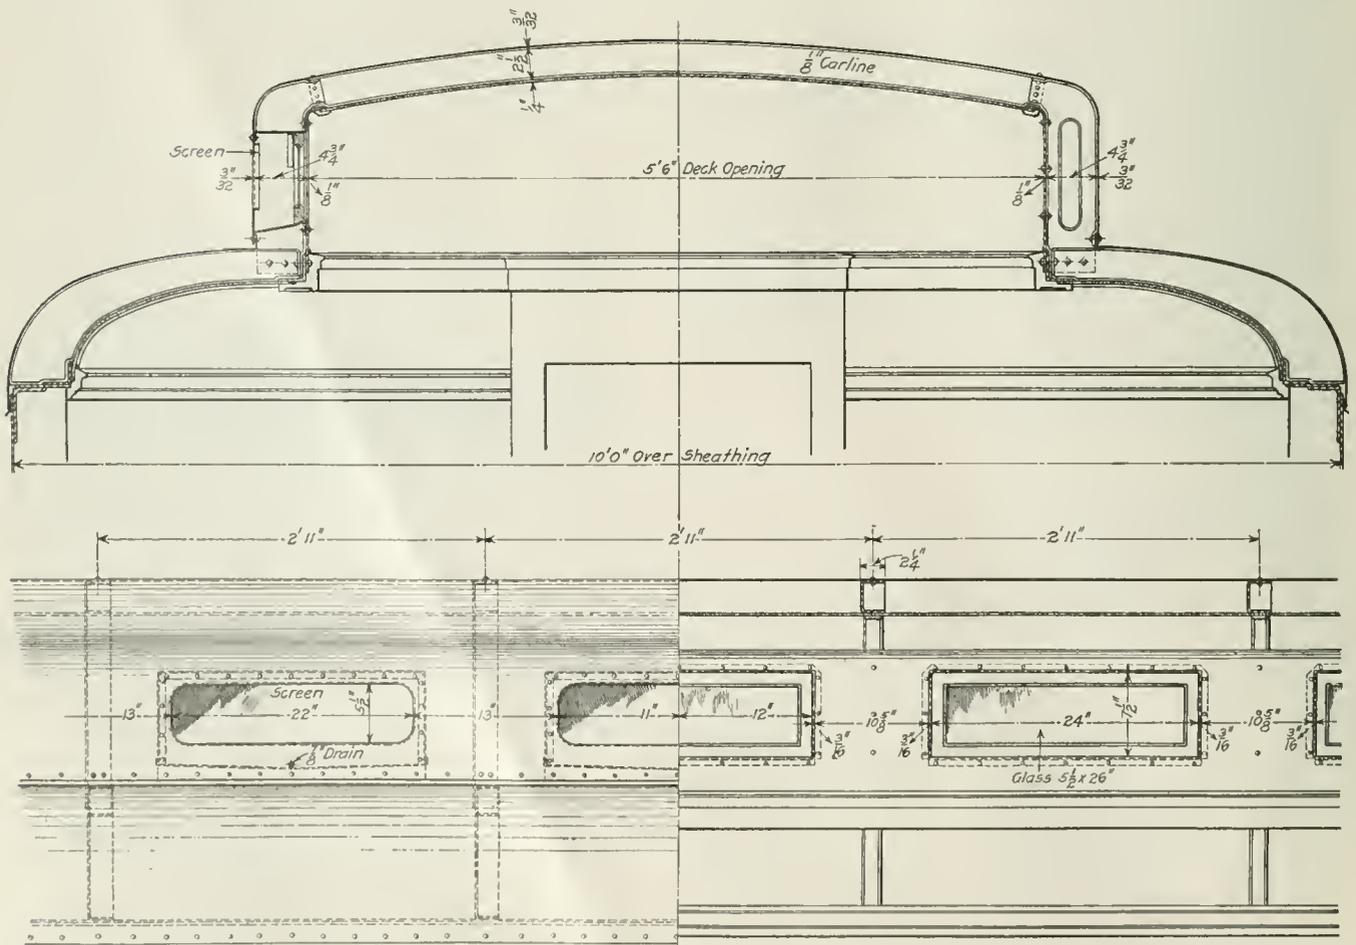

Instead of having a continuous flashing and sash frame throughout the length of the deck a combined flashing and frame is provided for each opening which completely encloses the space between the screen and the sash. The remainder of the space between the sheathing and the interior finish of the car is thus enclosed from communication with the outside air and serves as insulation. The bottom of the window casing slopes outward and toward the middle and drains through a small hole in the outside sheet.

This construction is claimed to make possible a considerable saving in weight as compared with the usual type of clere-story roof.

Detail of the Deck Sash Casing

clere-story type. The difficulty has been to secure a deck which could be cheaply built and in which a satisfactory casing could

Simple Weather Proof Passenger Car Roof Construction

Maintenance of Way Section

In spite of the reduced amount of work under way the labor situation has become quite acute on some roads during the last three or four weeks. Late last year considerable numbers of Austrians returned to their country. With the entrance of Italy into the European war, many members of this nationality, including large numbers of track laborers, have been called home and are leaving this country. The placing of large orders for ammunition and other supplies for the belligerent countries in the United States has also required the employment of additional labor in these factories, drawing still more men from the track forces of the railroads in the vicinity of these industrial centers. While this condition has not seriously affected the maintenance of way forces of the country at large, the forces of several eastern roads have been reduced considerably below the authorized quota.

The War and Track Labor

The magnitude of routine railway construction activities is frequently overlooked by railway men themselves and is seldom realized by the general public. Several months ago we called attention to the fact that the Chicago, Milwaukee & St. Paul moved over 48,300,000 yd. of earth in 1912 and 1913, or an average of over 66,000 yd. per day for the entire period. During the same interval this road placed over 563,800 cu. yd. of concrete, building 741 structures. Another railroad of less than 1,000 miles has placed over 1,521,000 cu. yd. of concrete during the 10 years from 1905 to 1914, inclusive. This is at the rate of 12,680 cu. yd. per month, or 490 cu. yd. per working day for the entire 10-year period. The minimum amount of concrete placed by this road in any single year during this period was 91,700 cu. yd., while the maximum was 236,125 cu. yd. Operations such as these are equalled in other fields only on special projects such as the construction of the Panama Canal and are one measure of the importance of our railway activities.

Every-Day Railroad Construction

It seems to be a general rule that railroad bridges in large cities are poorly maintained. This applies particularly to structural steel viaducts in densely populated or commercial districts. Excluding the special case of deterioration due to corrosive gases, the principal source of trouble with the city bridge is the accumulation of dirt, which seems to be present everywhere in the portions of large cities commonly occupied by railroads. This material is deposited on all horizontal surfaces of bridges below the floor level, on the bottom flanges of stringers and floor beams and around the bearings, frequently piling high on the bridge seats. The filthy character of the deposit makes the inspection, cleaning or repairing an exceedingly distasteful job, and probably accounts for procrastination with respect to this work. The use of modern tight pavements, with adequate drainage systems and efficient street cleaning, has had a tendency to improve conditions, but proper attention to this phase of the subject in the design and detailing of the bridges will still further relieve the maintenance forces. Dust guards completely covering the bearings and rollers should be provided and the arrangement of bridge seats and bearings should be such that all parts are readily accessible to inspection and cleaning. The bottom of the vertical web members of trusses should be filled with concrete to eliminate

Maintaining Bridges in Cities

pockets for the accumulation of dirt deposits. The maintenance department, by giving proper attention to the new bridge will avoid much work at a later date. The small details should receive special consideration. Drain pipes must be kept open, cracks or slots through which dirt and dust may be sifted should be closed, and any other preventive measures which have been overlooked by the construction department should be taken immediately. The conditions surrounding the railroad bridge in the city are such that the maintenance expense is bound to be higher than that of the bridge in rural districts, and if the city bridge does not receive attention in the proportion established by these conditions, its life will surely be shortened.

An interesting feature of this year's rail orders is the tendency to buy longer rails. At least two or three roads have ordered considerable quantities of 39 ft. rails, while one road has ordered 40 ft. rails. Other roads are seriously considering this question, and one line at least was prevented from ordering 39 ft. rails only by the fact that it did not have sufficient equipment of the proper kind long enough to carry them. A number of years ago several roads laid considerable quantities of rails up to 60 ft. in length. In some instances these proved satisfactory, but with the poor roadbed conditions and lighter ballast of that time the 60 ft. rails were difficult to maintain, and most of them have since been sawed into shorter lengths. With the improved roadbed conditions and the more liberal use of ballast in recent years, some engineers feel that the roads are now warranted in laying longer rails. In this connection it is interesting to note the conditions on foreign railways. In England the standard length is now 45 ft. One or two railways use rails 48 ft. long, while the London & Northwestern uses 60 ft. rails. French and Egyptian railways lay rails 39 ft. 4 in. long, while 59 ft. rails are coming into common use. The Northern Railway of France is now laying rails 78 ft. 9 in. long. In India and Australia, 36 ft. and 40 ft. rails are being laid in considerable quantities. Thus we have numerous precedents for adopting longer rails in this country.

The Tendency Toward Longer Rails

The economy of starting maintenance of way work early in the season has been emphasized repeatedly in these columns. Since the main reason for delaying the inauguration of active work until the middle of the summer is to hold down expenses during the latter part of the fiscal year, it is somewhat surprising at first thought to observe the increasing extent to which work was inaugurated early in the spring this year in view of the declining railway revenues. However, this is a most encouraging feature of railway operation, indicating a realization on the part of executives of the economy of this practice and a willingness to forego temporarily a "paper showing" to secure real economies. It requires courage to do as did one road, now in financial difficulties and threatened with a receivership, in starting its track work early this spring after having delayed such work until after July 1 last year. The expenditures for maintenance of way for the fiscal year just closed will, therefore, be unusually high, the savings being reflected in the reports of the following year. If a road in this condition can adopt these measures there would seem to be little reason for the stronger lines hesitating. The greatest economy in maintenance

Starting Maintenance Work Early

of way will only be secured when the work of this department is conducted without reference to the fiscal year and each problem is handled at the most favorable season.

Complete co-operation between the manufacturer and the user of any material is necessary to its highest development. Few

Co-operation in Equipment Development

devices are perfect the first time they appear; practically all have to pass through a period of initial experiment and development. The railroads of this country have aided greatly in the development of the materials and equipment used by them by offering their facilities, by encouraging tests to be made under actual service conditions and by giving the manufacturers the benefit of their observations of such tests as a means to overcoming weaknesses. By combining the practical experience of the railway man as a user with the ability of the manufacturer to concentrate on production, the latter has been enabled to produce a practicable commercial article. Although working for his own individual gain, a maker of railway supplies is able to succeed only as he makes a product which the railways can use with economy to themselves. Because of this mutual co-operation the railways of this country lead those of the world in much of their equipment and construction.

One of the relatively recent developments in construction has been the use of manganese for frogs, crossings, switch points and other parts of track which are subject to unusually severe wear. The importance of this form of construction is indicated by the statement in the article by V. Angerer, in another column, that

The Development of Manganese Track Construction

21,300 such units were manufactured in 1913. Within the past two years the manufacturers of manganese track work have determined among themselves on certain minimum standards of construction below which they will not go, and they have submitted these standards to the American Railway Engineering Association for approval. This action has been taken because of conditions which have arisen in this field jeopardizing the future of the manganese industry, as outlined in the article referred to. The special problems of manufacture, particularly with materials such as manganese which require unusual and careful treatment, are essentially those for the manufacturers to solve. The ability of such construction to stand up under the heavy pounding of traffic on busy lines is of direct interest to the maintenance of way engineer. Properly made and placed manganese track construction has demonstrated its economy, and co-operation in establishing standards which will insure an improved product, will result to the benefit of the railways and the manufacturers.

TOOLS FOR MAINTENANCE OF WAY EMPLOYEES

ON another page of this issue is an interesting discussion of the subject of tools for maintenance of way forces which includes a number of suggested lists of tools for gangs engaged in the various classes of maintenance work. Of particular interest is the agreement of the several writers concerning certain phases of the subject which indicates a similarity of experience. Each one emphasizes the importance of a sufficient supply of high grade tools, their proper maintenance by a skilled tool man, and the influence of the character of the tools on the efficiency of the men. Attention is also called to the benefit to be derived from the acquisition of the latest developments in tool manufacture.

It is well to consider the magnitude of the investment represented by tools for maintenance of way work. A decision to add one tool to the complement of each track gang on a road of any size may cause an expenditure of several hundred dollars. The Nebraska State Railway Commission, in making a valuation of the roads of that state in 1912, put the allowance for tools for a section gang at \$120, and for each extra

gang and bridge gang at \$600. Without question the money value of some of the lists of tools referred to above would far exceed the above estimate.

Of no less importance is the maintenance of tools, a phase of the subject influenced very largely by the quality of the tools acquired and the measures taken for their proper care in use. The purchase of tools at the lowest price to the subordination of quality is sure to result in larger repair bills, shorter life, and an increase in the number of accidents due to defective tools. On the other hand, having provided good tools, their proper maintenance is paramount and a definite plan for repairs, sharpening and inspection is necessary if the advantages of the higher grade equipment are to be realized.

Having determined the number and quality of the tools to be supplied to a given force, it is necessary to select the particular type of tools most suitable for the class of work, local conditions, etc. The difference of opinion as to the proper tamping tools to be used for the same class of ballast, as expressed in the discussion, indicates one of the difficulties to be met. The serious consideration of the many new devices which are introduced from time to time is also important.

THE USE OF LIQUOR IN MAINTENANCE CAMPS

RULE G of the Standard Code of the American Railway Association, which prohibits the use of intoxicants by employees while on duty and makes their use or the frequenting of places where they are sold, a sufficient cause for dismissal, is very generally incorporated in the standard books of rules of the operating departments of the different roads. The application of similar rules to the maintenance of way department is far less general, largely because of the different conditions governing the work, the varying degree of responsibility and the different classes of labor employed.

Few roads will permit open drinking among their track foremen. Beyond this, little attempt is usually made to curb the use of intoxicants. On some roads no liquor is sold in the camp commissaries, nor is it allowed to be brought into the camps. In others the commissaries are not permitted to sell it, but the men bring it in from the outside if they desire, while on other roads the commissaries sell it openly to the men. One road on which the latter plan was in force a recent investigation led to the conclusion that a large per cent of the drinking was the result of the men being exploited by the commissaries. Practically all of the men employed in the camps on this road are foreign, approximately 60 per cent of them being Italians and the remainder Austrians and Montenegrins. Starting six months ago, this road forbade the sale of intoxicants through the commissaries and also prohibited the bringing of liquor into its camps. While some is undoubtedly still brought in secretly, the open sale of it has entirely disappeared. When this rule was put into effect it was feared that considerable numbers of men would leave for adjoining roads where such regulations were not enforced. But only a few left, and there was no organized complaint.

The results of this campaign have been shown in the increased efficiency of the men, in the reduction in the amount of sickness and particularly in the greatly lessened amount of laying off. While there has been no opportunity to test the effects of this action in the ability to secure and hold men in times of labor shortage, the officers feel well pleased with the results secured thus far.

NEW BOOKS

Manual del Ingeniero por John C. Trautwine, Traducido de la 19th Edicioo por A. Smith. Published by Casa Editorial Gardnier Hermanos, Paris, France. Price \$5. On sale in America at Van Nostrand & Co., New York, and Brentano & Co., New York.

This is a translation of the 1913 edition of Trautwine into Spanish. The chief interest to American and English railroad men in the fact that this translation has been made is that the translation is a literal one. It therefore affords an opportunity for the

American engineer who is desirous of learning Spanish technical engineering terms of using this Spanish translation in connection with the English edition of Trautwine. In South America English speaking and Spanish engineers are working side by side and a Spanish translation of the American standard engineering manual is an event of importance to both the American engineer in South America and the Spanish engineer who may be working with him. The very fact that Trautwine covers such a broad field in such great detail makes the Spanish translation of particular value to the engineer who wishes to learn the Spanish language.

Manual of Surveying for Field and Office. By Raymond E. Davis. Size 4 in. by 7 in.; 395 pages. Bound in flexible leather. Published by The McGraw-Hill Book Company, 239 West Thirty-ninth street, New York. Price, \$2.50.

The author states in his preface that the book is designed for the use of civil engineering students in their preparation for field and office exercises. To the man engaged in actual railroad surveying its value would be as a supplement to the usual railroad manual, particularly as a reference to triangulation and precise measurements and for astronomical observations. There are eight chapters, arranged in the order of progress of the surveying student. The first chapter deals with field notes, note-books, accuracy and other matters of general information to the novice.

The remarks on accuracy and the method of keeping notes are well worth the reading. However, the failure to mention the loose-leaf note-book is surprising. The pages on the care and adjustment of instruments are, of course, absolutely essential to the novice, but even the experienced engineer will find them useful at times. The later chapters consist principally of typical exercises in the use of the various instruments. There are 123 pages of tables. Of these 19 cover logarithms and trigonometric functions and 19 are for use in astronomical observations.

Practical Track Work. By Kenneth L. Van Auken. Size 5½ in. by 8 in., 216 pages, 48 illustrations. Bound in cloth. Published by the Railway Educational Press, Chicago. Price \$1.50.

As its name indicates, this book is intended for the practical track man. The author made no attempt to prepare a complete treatise on maintenance of way work or to discuss features of engineering design, but has covered only the problems that are of direct interest to the track supervisor and foreman. He has taken their viewpoint throughout in his discussions, and while higher officers will not agree with him on all points, he reflects the attitude of the track men gained by extended experience as a laborer and a foreman.

The contents of the book are best indicated by noting the chapter headings. (1) Labor and Organization; (2) Track Materials and Tools; (3) Spiking, Bolting, Cutting and Curving Rails, etc.; (4) Constructing Track on a New Line; (5) Double Tracking; (6) Relaying Track; (7) Construction of Turnouts, Ladder Tracks and Crossovers; (8) Slip Switches; (9) Surfacing New Track; (10) Laying Out a Curve with a Tape Line.

Considerable space has been devoted by the author to the proper care of the laborers, especially those who are in floating gangs, and to the organization of forces for various kinds of work. The methods of putting in switches and taking care of other complicated track work are described in some detail, with sketches and organization charts.

While not covering all problems with which a track man is confronted, this book contains much information which will be of value to the average track foreman and is well worth reading by higher officers having to do with track work. It forms an important addition to the limited literature on this subject. An interesting feature is a glossary of 500 track terms in common use. The book also contains 20 tables giving practical data of use to the foreman.

Letters to the Editor

CLASSIFYING SCRAP RAIL

SAVANNAH, Ga.

To the Editor of the Railway Age Gazette:

I have read with much interest the article by L. C. Fontaine in the *Railway Age Gazette* of July 16, in regard to the classifying of scrap rail. The amounts in dollars and cents transferred in accounting for rail by reason of adjustments, as has been stated, is quite large and is entirely due to differences in opinion in classifying. To take care of rail classifications properly and to avoid these adjustments, a written classification should govern the differentiation between relay and scrap rails as removed from tracks. In addition the classification should be indicated on the rail ends with paint, different colors being used for each class. The classification should be made only by roadmasters, supervisors or others thoroughly familiar with such work, because it has been found that classifications made by the average section foreman have a tendency to vary in a great many cases from those which should properly have been assigned, by reason of the condition of the rail. By use of the paint method rail may be transferred from one division to another, without fear of the classification being changed. If originally made in accordance with specifications the expense of painting will be a small factor because of the benefits derived from an accounting standpoint.

H. E. DUGGER.

Chief Clerk to General Storekeeper Central of Georgia.

THE INCLINATION OF THE RAIL IN ECONOMIC RAILROAD PRACTICE

NEW YORK, N. Y.

To the Editor of the Railway Age Gazette:

The main object of wheel coning is the elimination, as far as possible, of the rubbing of wheel flanges against the rail as when a wheel-flange approaches the rail, the tread of this wheel is running on a greater diameter than that of the opposite wheel on the same axle. Thus the wheel-flange swerves away from the rail until the corresponding action takes place on the opposite wheel. The action of a pair of wheels passing around a curve is not referred to here. The standard coning or taper on the tread of railroad wheels throughout Europe as determined by long experience is 1 in 20, with the exception of Italy, where the Government Railways have adopted a coning on the wheels of 1 in 10. The only recognized standard for the contour of wheels in the United States is that of the Master Car Builders Association, which is 1 in 20.

The running of coned wheels on upright rails is not justified from any standpoint. A standard wheel coning having been generally adopted, the only scientific thing to do is to incline the rail normal to this coning. This practice is standard throughout Europe, with the result that rail wear there is considered generally satisfactory. Rail wear in the United States is considered as being generally very unsatisfactory; one reason for this being the general use of the upright instead of the inclined rail. Only the inertia of bad habit can be urged for the continuance of the unscientific practice of using an upright rail.

The inclination of the rail presents the following advantages: From the standpoint of the equipment it keeps the tread wear away from the flange, thereby obviously reducing flange wear; it reduces the bending stresses in car axles, so helping to eliminate hot journal box trouble, and it prolongs the life of wheels. From the standpoint of the rail it effects a reduction of the flange rubbing; it produces rail wear, under normal conditions, in the center of the head of the rail instead of on its edge. In the latter position of the load, not only is rail wear excessive, but stresses are induced calculated to accentuate the danger of broken rail from the formation of transverse fissures. It places the load on the rail in the position where the rail can exercise its function as a beam

with minimum fibre stresses. It equalizes the pressure on the base of the rail, through the base being normal to the resultant force from weight and the wedging thrust due to the coning of the wheels.

It eliminates the tendency of the rail to overturn (in railroad parlance, *to roll out*) from the wedging action of the coning. And it prolongs the life of the rail.

The subject of rail wear is increasingly occupying the attention of engineering societies and technical papers, because of the expense of rail renewal standing out so prominently in railroad operating reports. Strangely enough, although uniformly standardized in Europe, the simple expedient of inclining the rail normal to the wheel coning has not received the attention it deserves in the United States. It might as well be frankly admitted that the lack of consideration of rail inclination is due, first, to the inertia of habit; second, to timidity in putting in practice one's scientific deductions on a subject until the idea involved in that subject becomes more or less general; third, and perhaps most insidious of all, to the idea that the section of rail is responsible for much trouble, which could have been avoided by inclining the rail instead of placing it upright.

Among the fallacious suggestions made on behalf of saving the rail may be mentioned the following:

1. Reduction of the existing standard coning. This suggestion, if carried out, would be productive of dangerous side thrashing of equipment and could not be considered as a move in the direction of safety. When wheels have been worn to an average taper of 1 to 40 they are ready for attention at the shops. Reducing the coning would be an attempt to save the rail in an unscientific way at the expense of the wheels. The suggestion has been answered by the wheel committee of the M. C. B. Association at its meeting in June, 1915, as follows:

"A communication has been received from one of the roads, a member of this Association, criticising the present standard taper of tread of 1 in 20, and recommending that a change be made to 1 in 38, the claim being made that the present standard taper is responsible for increased rail renewal, and is also more severe on the wheel itself. It is the opinion of your committee as a whole that any reduction in the taper of the tread will be detrimental to the wheel, but that if it can be shown that such change would be of sufficient benefit to the rail as to more than offset any bad effect on the wheel, they would be willing to consider such change."

2. Compromising on a rail inclination of half the requisite amount, viz., 1 in 38 or 40. There is no scientific argument in favor of such a compromise. The inclination of 1 in 20 on rail would tend to return to standard the profile of old rail, and would tend to return to standard the profile of wheels worn on upright rail. All that could be said for giving rail an inclination of 1 in 40 is that it would tend to keep wheels, worn to an average taper of 1 in 40 (and thus unquestionably ready for sending to the shops), from becoming still flatter. With standard wheels running on rails inclined only to 1 in 40, there would still be a wedging thrust of one-fortieth, or 50 lb. per ton, of the wheel load, tending to overturn the rail.

The apparent abnormal effect of an inclination of 1 in 20 on old rail or on worn wheels would really be advantageous to such rail and equipment. The rail would receive the wheel load outside of the center of the head, but not more so than the load rests inside of the center with the average conditions of operation on an upright rail. This position of rail wear would gradually approach the center of the head. On old rail under such conditions the wear would be in the most economic position, in that the rail would be worn where it had not been worn before. Another point of advantage in inclining old rail and having the position of rail-wear outside the center of the head, is that during the process of the wearing position approaching the center of the head, the bending stresses in car axles would be reduced below normal for the reason that the lever arm between the center of the journal bearing and the point of bearing of the load on the wheel would be reduced considerably.

JOHN LUNDIE.
Consulting Engineer.

SPECIAL TRACK CONSTRUCTION AT WATER CRANES

PROWERS, Colo.

To the Editor of the Railway Age Gazette:

One is frequently asked for a means of preventing the burning out of ties at water cranes, and I have seen a special form of track construction used very successfully to overcome this trouble and believe that the following description will therefore be of interest.

The ground was excavated under the tracks to a depth of 32 in. below the base of rail. Forms were then built for a continuous concrete wall under each rail, 18 in. wide at the bottom and battered to 8 in. at the time. A fastening for the track rail was secured by imbedding an old rail in the wall, head down. Holes were drilled in this inverted rail every 21 in. on both sides of the base. Bolts were inserted with the heads on the under side so that when the concrete was placed the threaded ends of these bolts projected above the top of the walls. The track rails were then drilled to correspond and were bolted securely in place.

This form of construction was used for 75 ft. each way from the crane. For the safety of the employees the space between the walls was filled with earth to the level of the base of rail. The track has been kept in perfect line, surface and gage.

RALPH E. PITTS,

Section Foreman Atchison, Topeka & Santa Fe.

[The form of track construction described above undoubtedly is successful at points where all trains are operated at relatively slow speed. There would be considerable question, however, as to its durability and safety for heavy, fast traffic. It is also desirable to call attention to the fact that the method of building as described is practicable only where the tracks can be put out of service a sufficient time to permit the concrete of the walls to set properly, the trains being detoured, presumably, over adjacent passing or side tracks.—EDITOR.]

THE DISTRIBUTION OF LABOR ACCOUNTS

HAILEYVILLE, Okla.

To the Editor of the Railway Age Gazette:

As the maintenance of way department is the subject of much discussion so far as operating expenses are concerned, and since when a reduction of expenses is to be made, this department is the first to be attacked, the accurate distribution of the labor accounts to show the proper charges for all work performed is essential. There is an important factor that is sometimes not considered when arriving at a decision concerning the reduction of forces. It is simply this, the section foreman in many cases is not a good bookkeeper and in making his monthly distribution for labor he is liable to charge it all to track work when, as a matter of fact, a considerable percentage may have been spent in assisting car men repairing cars, transferring freight and many other jobs of like nature. The aggregate of such work by the section forces on a hundred-mile division during a year amounts to no little amount, and were it carefully separated from the regular maintenance of track work it would show up to an extent which would, no doubt, cause the superintendent to give the subject due credit. It is so easy to call on the section men to assist at some job around the station, at the roundhouse, car shops, etc., that it is almost second nature to put out the call.

There is a wide field for the roadmasters to impress upon their foremen the importance of charging up every nickel to the account to which it justly belongs, and by so doing they will materially decrease the maintenance of track per mile each month of the year. There is no doubt that the section foreman is imposed on many times by having to do odd jobs outside of his regular and assigned work, and many times he suffers for it by reason of his not having had the time away from these hurry up calls to attend to his track work. A good way to make a check of the foreman's distribution is to require any office to send the instructions to the roadmaster's office every time a foreman is instructed to do any work outside of his regular duties. Then when the foremen's distribution sheets come in the roadmaster or his clerk can check these instructions with the distribution, and if such labor does not appear the foreman's attention can be called to it for a correction.

J. L. COSS,

Dispatcher C. R. I. & P.

The Tool Equipment for Maintenance of Way Forces

Suggested Lists of Tools for Section and Floating Track Gangs, and for Bridge and Water Service Gangs

One of the most important essentials to the economical performance of work is the supplying of sufficient tools adapted for the work in hand. The following articles discuss tools for the different classes of maintenance of way work, giving suggested lists of equipment for gangs of varying sizes for the different classes of work.

TOOLS FOR TRACK GANGS

By "SUPERVISOR"

In no part of railroad enterprise has there been so little progress in the last few decades as in the development of tools for track work. Our men today use the same devices, slightly modified perhaps, that were in use in the seventies. The gasoline motor car has apparently come to stay, and the writer has heard favorable comment on the use of compressed air tools for some forms of track work, but the latter are still distinctly in the experimental stage. Otherwise there is little change. In the main, the tool problem is still that of the proper use and distribution of the same old articles rather than the substitution of more modern and efficient devices.

The equipment of a given roadway force with sufficient tools for the quickest and most economical performance of its duties is very largely to be governed by local working conditions and the density of traffic. Certain general requirements are common to maintenance work the country over, and in addition each locality has its own requirements for which special equipment is essential.

The gravest mistake that can be made in this matter is to under-supply the men with tools. The money saved in tool bills can be lost so quickly in labor charges that great care must be exercised to see that effort is not wasted for want of equipment. The over-supply of tools is an error which must also be watched, in order that there may be no undue expense under this heading. In the following lists the writer has endeavored to give a fair equipment for section and general purpose gangs under ordinary conditions.

As absolute requirements may be classed tools for the maintenance of line and surface, for the renewal of worn switches, frogs and rail, for the replacement of ties and switch timbers, and for the proper protection of traffic while such work is being done. The size of the section gangs and the amount of work performed by floating or extra gangs on the various sections will have great bearing upon the number and kind of tools to be furnished, but for gangs of 4 to 15 men the following should embrace all the tools necessary to keep the track in condition:

adzes	1	per 4 men
axe, chopping	1	
bars, claw	1	per 3 men
bars, lining	1	per man
brooms, corn	1	
brooms, rattan	1	per man where there is snowfall
bags, tool	1	for each track walker
barrows	1	per 4 men
bits, ratchet	2	of each diameter in use
cars, hand	1	or more as required except in dense traffic yds.
cars, push	1	or more as required
chisels, rail	6	
cans, engineers' oil	1	
cans, oil	2	for each lampman
cans, water	1	
cups, water	2	(individual sanitary cups to be preferred)
frames, ratchet	1	
flags, red	6	(Painted iron portable signals are to be preferred to flags stuck in the ground on sections where the force is light)
flags, green	6	
flags, white	2	
forks, ballast	1	per man (where stone or slag ballast is used)
gages, track	1	
hammers, spiking	2	for 3 men, 1 extra
hammers, sledge	1	
hammers, hand	1	
handles, adze	1	extra
handles, axe	1	extra
handles, jack	1	extra
handles, pick	1	extra for each 6 picks
handles, spike hammer	1	extra for each 4 hammers
jacks, track	2	(If density of traffic requires raising bars, 1 jack may be dispensed with and 1 raising bar supplied for each 2 men)

levels, track	1	
lines, ditching	1	
lines, tape	1	
lanterns, red	6	
lanterns, green	6	
lanterns, white	4	
picks, clay	2	
picks, tamping	1	per man
ratchets	1	
spike pullers	1	
squirt cans	1	
saws, hand	1	
saws, crosscut	1	
shovels, track	1	per man and 10 per cent over
shovels, scoop	1	per man in ash ballast
torches	1	per man
rail tongs	1	per 2 men
tongs, tie	1	per 3 men
wrenches, monkey	2	
wrenches, track	1	per man

In addition, where the right of way is mowed by the section men, the following mowing tools should be provided.

grindstones	1	
scythes, hrusb	1	
scythes, grass	1	per man
scythe snaths	1	per man
scythe stones	1	per 2 men

In automatic signal territory, there should be provided a bonding machine, drills, punches, pins and bondwires. Other local conditions will make it necessary to have pike poles for ice and debris in freshets, devices for using combustible compounds at interlockers, fence repair tools, telegraph wire, wire cutters and climbers, and other articles too numerous to mention. Every section should also be provided with a first-aid kit, and the foreman should have at least a superficial knowledge of its use.

For the general purpose floating gang enough tools should be provided to permit it to handle any class of work coming up on the territory. For a gang of 26 men, exclusive of the foremen, the following should prove an ample supply for general conditions:

adzes	6	
axes, chopping	2	
bars, claw	12	
bars, lining	26	
brooms, rattan	26	
barrows	6	
chisels, rail	24	
chisels, cold	4	
cans, water	2	
cups, water	4	(individual sanitary cups to be preferred)
flags, red	4	
flags, green	4	
flags, white	2	
forks, ballast	26	
gages	2	
hammers, hand	2	
hammers, sledge	2	
hammers, spiking	16	
handles, axe	1	extra
handles, adze	2	extra
handles, pick	6	extra
handles, hammer	12	extra
handles, jack	1	extra
hatchets	2	
jacks, track	4	
levels, track	1	
lines, tape	1

wrenches, track	25	

At the sub-division headquarters should be kept a supply of tools for which there is occasional use at various points on the territory but which it would be unwise to supply for the individual sections. These can be shipped out when needed and one tool will thus supply the needs of a large area. Among

the articles of this character may be mentioned rail benders, rail saws, high candle-power flares, portable electric lights for wrecking in the vicinity of explosives or inflammables, boring drills, stone drills and hammers, electric exploders, concrete mixers, pumps, ladders, ropes for rock cuts, rail unloaders, crabs, clam-shell buckets and whatever other tools of this nature the work at hand may need. A toolman should be employed to keep this material in working order, to issue new tools and to take care of the repairs of old ones, and to keep separate the old tools sent in by each foreman until the supervisor or other officer can inspect them personally. This will prevent foremen from discarding tools before they are worn out, or from abusing tools as is so often done.

The lists given above will probably be criticised severely by maintenance men both for errors of omission and commission. Some tools which are in general use have been omitted, such as sight board and raising blocks. These are, however, but poor substitutes for grade stakes set at sufficiently close intervals, and it is the experience of the writer that a regular grade will soon be badly broken if track raising is done at haphazard, relying on the foreman's eye rather than on the wye-level. The same objection holds against the string lining of curves. Tamping bars are omitted because the writer has been able to get better and more uniform results from the tamping pick and the shovel in ash, slag and stone ballasts.

It will also be claimed that certain items are overstocked. Two jacks are supplied for sections and but four for large gangs. The second jack on the section is of great use when patching, working through turnouts and crossovers, and insures better work on curves. With a gang of 26 men, under a good foreman, every man can be kept hard at work tamping up, although but two jacks per rail are doing the raising. More and better work will have been accomplished at the day's end with four jacks and grade stakes than by using more jacks and trusting to the eye of the foreman to hit the grade.

The allowance of wrenches, spiking hammers and shovels is kept high on account of winter, emergency, and rush work. It is true that often there will be idle tools, but occasions will arise when every tool will be employed most profitably. Another item which must be considered is that proper tools and enough of them are the strongest safeguards against personal injury to the men. Handling rail, ties or switch material without proper tools is bound to result in nervousness, demoralization and accident. In providing and in using tools, as in every other phase of work on the railroads, the keynote of true success is "Safety First."

TOOLS FOR SECTION AND EXTRA TRACK GANGS

By P. J. McANDREWS

Roadmaster, Chicago & North Western; Belle Plaine, Ia.

To secure full efficiency from expenditures for track labor, good tools of proper type must be used. The first cost of supplying such tools is not so important a consideration as the items of adaptability and length of service to be obtained. Unfortunately, first cost has too often been considered to the detriment of the service and at an actual net loss to the railway. Good tools being furnished, the next important step is to care for them properly, having repairs made at the right time and in a workmanlike manner.

For sections outside of terminals, where the length averages from 3 to 6 miles, a gasoline motor car is a necessity. Such a car should have a carrying capacity for the maximum number of men employed in ordinary maintenance, in addition to all the tools required for the work. The car should be simple in construction, with sufficient power to carry the gang at a speed not in excess of 15 to 18 miles per hour. A light but strong push car should be furnished each section so that the handling of ties and other heavy material need never be done on the gasoline car, nor on an ordinary hand car where gasoline cars are not provided.

For a section crew of about 10 men, the following tools are recommended:

One dozen shovels (short handled) with square points where gravel, cinder or earth ballast is used and with round points where stone ballast is used.

Four track wrenches, with an additional number where more than one size of nuts is in use on track bolts.

One track gage.

One track level.

Two track jacks, double acting, with a lifting capacity of 10 to 12 tons.

Two claw bars, weighing about 30 lb.

Six spike mauls, weighing 9 lb.

One spike puller (2 or 3 knob, depending on the height of the rail).

Seven diamond-pointed lining bars, weighing about 25 lb.

One pinch bar, weighing about 2 lb., suitable for nipping rails and may be used for a lining bar also.

Four tie tongs.

Two dozen T tamping picks for stone ballast sections, weighing 7½ to 8 lb.

Eight clay picks for light ballasted sections.

One dozen tamping bars, weighing about 13 lb., for gravel or cinder ballast.

Two adzes, clay pick eye, square or round pole, end 6 in. bit.

One double-face striking sledge, weighing 12 lb.

Four rail tongs weighing 16 lb.

Six track chisels.

One geared rail drill and 6 bits of suitable sizes. (Where two sections have headquarters at the same station, only one drill should be supplied for both.)

One broad hand axe, with a 4-in. bit.

One hand saw.

One chopping axe.

One claw hammer.

One measuring tape.

Four eight-line stone forks.

For terminal gangs add to the above:

One light rail hender or "jim crow."

One portable rail saw.

Two rail dollies.

All sections should be furnished water pails, kegs, etc., as local conditions make necessary. They should also be furnished with a portable tool grinder.

Ballasting gangs should be furnished with two 15- and two 10-ton jacks, of the double-acting type, with an 18-in. lifting bar on the 15-ton jack and a 12-in. bar on the 10-ton jack. A complement of tools, sufficient for the number of men employed, must be at hand and should include spike mauls, claw bars, lining bars, wrenches, shovels, picks, tie tongs, tamping bars, gages, levels and a spot board.

For rebalasting with gravel or cinders, the use of square pointed shovels, and the ordinary tamping bars with solid handles is thought to be most efficient, while in the application of stone or slag ballast (crushed) round-pointed shovels have advantages over the square-pointed ones, while the diamond stone tamping bars with spear ends and solid handles and weighing about 16 to 18 lb. are believed to be superior to tamping picks or the common square-faced tamping bars. Spades are used to good advantage in applying stone ballast, but the round-pointed shovels are of equal value in placing ballast under the track and also have a desirable shape for handling the ballast at all times.

For rail-laying gangs, the number of tools furnished will depend on the number of men employed, the class of tools which we would suggest as necessary being as follows:

Track laying machine, which in relaying rails can be handled with a comparatively small number of men, making a considerable saving as against the use of tong gangs.

Adzes; the use of adzes with clay pick eye and square pole end suitable for driving spike stubs, and with a 6-in. bit is considered good practice on account of the importance of adzing ties so that new rails will set to proper bearing.

Claw bars; good claw bars, *always kept in good condition*, are essential to good work in relaying rail.

Wrenches; ratchet wrenches have not come into general use, but they would be advantageous for rapid bolting of track, the tightening to be done more carefully by the use of ordinary track wrenches.

Track chisels; the frequent necessity for track chisels by a rail laying gang makes essential the supplying of first-class heat-treated tools.

The proper repairing of track tools such as chisels, claw bars, spike mauls, etc., which must go through a tempering process is a most important matter, and should be entrusted only to first-class workmen. On important divisions it has been found economical to employ a special tool man at the supervisor's headquarters to do the blacksmithing on these tools. Such a man making a specialty of track tool repairing, taking suggestions from the men who use the tools, and going carefully into details of any failures, can do much toward getting the full life from each article. It is believed that the repairing of track tools under the direction of track supervisors or roadmasters will be found a better plan than having it done at the general shop under the direction of men who are not familiar with their use.

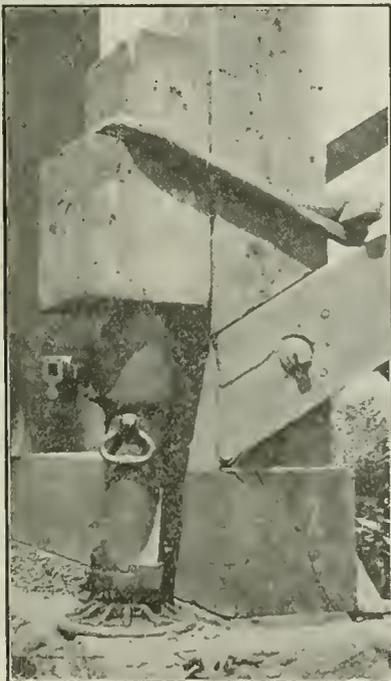

THE SELECTION AND USE OF BRIDGE AND BUILDING TOOLS

By S. C. TANNER

Master Carpenter, Baltimore & Ohio, Baltimore, Md.

The subject of tools for use by the bridge and building forces in the maintenance of way department is of much importance and is unfortunately too often neglected. To derive the greatest degree of efficiency from the labor, only the best tools should be employed and in sufficient quantities to insure uninterrupted performance of the men employed and the quick and free movement of traffic. Due to the diversified character of the work to be done by the bridge and building forces, the number of tools required is correspondingly large and while many of them can be used universally for various kinds of work, it is better economy to provide special tools for special work, as such work can then be performed more quickly, cheaply and safely.

A bridge and building gang on maintenance work usually consists of a foreman and from 10 to 14 men, who are assigned to sections with headquarters located preferably at termi-

Post Clamp in Position for Jacking

nals and junction points if not too far from the bulk of their work. The duties of the gang should include the repair and renewal of all bridges and buildings in the section and with a proper organization they should be able to do all classes of the work. It is necessary, however, to provide them with the proper tools, including the necessary construction cars, and in most cases this should include the equipment shown in the list given below. New tools should be provided from time to time as improvements are made, when it is found that they are of such a character as to make labor lighter and cheaper, bearing in mind at all times that all tools should be of such a design that their use does not involve any danger to the men or to the structures.

As the work of the section bridge gangs and the extra bridge gangs is practically the same in maintenance, the tools and equipment should be the same, except where special work requires the use of hoisting engines and derricks. These should be classed as system equipment, to be available for transfer from one gang or division to another. System equipment should consist of pile drivers, hoisting engines, derricks, concrete mixers and such tools as may be required to handle heavy work. They should be of the highest class and the latest design to be had on the market, especially where the work is to be done under traffic.

In all well organized bridge gangs there ought to be at least one man who is a good blacksmith or who is good at nearly all trades. He could be known as the tool man and should look after the tools and see that they are in a fit condition for use at all times and in safe working order. By so doing he can repair the tools when needed and avoid sending them to the shops or ordering new tools to replace them. Thus he will insure greater life of the tools and increased safety in their use.

The foreman should see that all tools are properly marked and accounted for each night. They should either be locked up in the tool boxes on the work or placed in the racks provided for them in the tool cars. The foreman should also observe personally the use of the tools to be sure that they are not overstrained or overworked and should instruct his men relative to the proper use and the safe loads which they will carry. Many bridge men will frequently overload jacks. Where one man cannot work the lever, two or three will sometimes help him, with the result that the jacks are frequently injured beyond repair. It is safer and more economical to use more jacks or other tools to lift the load than to overstrain them. This same feature should be guarded very closely when using tackle blocks and rope. This equipment is of great importance to bridge gangs and as few bridge men are familiar with them, special instructions are of material assistance. In accordance with this idea, the Baltimore & Ohio issues drawings to its bridge foremen showing the proper methods of tying knots and slings and the allowable load on blocks, ropes, etc.

EQUIPMENT FOR A MAINTENANCE BRIDGE GANG.

- One sleeping coach equipped for 15 men.
- One dining and cook car equipped for 15 men.
- One tool car.
- One material car.
- One portable tool box, 2 ft. 6 in. by 2 ft. 6 in. by 6 ft. for rough tools.
- One portable tool box, 18 in. by 2 ft. by 6 ft. for sharp edged tools.
- One gasolene motor car.
- One heavy truck car.
- One heavy truck car with mounted hoisting crab and boom as illustrated in the *Railway Age Gazette* of Aug. 16, 1912.
- Two one- or two-wheeled timber trucks or dandy cars to run on rail for handling heavy timber or other material.
- Six timber dollies.
- Five timber carrying hooks.
- Eight timber cant hooks.
- Two 50-ton ball bearing screw jacks.
- Two 30-ton ball bearing screw jacks.
- Two 20-ton ball bearing screw jacks.
- Four double screw 14-in. telescopic jacks.
- Four large pulling jacks.
- Four 10-ton double action ladder jacks.
- Four track jacks.
- Eight 10-in. track shovels.
- Five clay picks.
- Two 6-ft. clay chisel spudding bars.
- Five 5-ft. cross cut saws.
- Six chopping axes.
- Two 1-in. double crank ship augers.
- Six 13/16-in. double crank ship augers.
- Six 11/16-in. double crank ship augers.
- Two 9/16-in. double crank ship augers.
- Four track claw bars.
- Two bridge shackle bars for pulling drift bolts.
- One bridge shackle jack for pulling drift bolts.
- Six track lining bars.
- Six 1 in. by 4 1/2 ft. octagonal steel bars with one chisel point and one diamond point.
- Four 1 1/2 in. by 4 1/2 ft. octagonal steel bars with one chisel point and one diamond point.
- Two hammer bars to be used as rams for driving drift bolts in places that men cannot get to with handle hammers, made by upsetting each end of a track lining bar, making a 2 1/2-in. hammer face on one end and a 1-in. hammer face on the other.
- One double-faced, 16-lb. hammer.
- Two double-faced, 10-lb. hammers.
- Four double-faced, 8-lb. hammers.
- Four double-faced, 6-lb. hammers.
- Four track spiking hammers.
- Four 3-lb. pin hammers.
- Six rail cutting chisels with handles.
- Five 1 1/4 in. by 2 ft. octagon chisel bars.
- Two 1 1/4 in. by 4 ft. octagon chisel bars.
- One track level.
- One tripod telescope with targets for establishing line, grade and surface on bridges, as illustrated in the *Railway Age Gazette* of Dec. 20, 1912.
- One track gage.
- Six 1/2 in. by 9 ft. chains with a ring at one end and a grab hook at other end.
- Four post clamps for jack supports, as shown in the accompanying photograph.
- Two 3-sheave 12-in. tackle blocks for 1 1/4-in. manila rope.
- Two 2-sheave 12-in. tackle blocks for 1 1/4-in. manila rope.
- Two 3-sheave 10-in. tackle blocks for 1-in. manila rope.
- Two 2-sheave 10-in. tackle blocks for 1-in. manila rope.
- Two 3-sheave 8-in. tackle blocks for 3/4-in. manila rope.
- Two 2-sheave 8-in. tackle blocks for 3/4-in. manila rope.
- Two 10-in. hinge snatch blocks for 1 1/4-in. manila rope.
- Two 8-in. hinge snatch blocks for 1-in. manila rope.

Equipment for a Maintenance Bridge Gang (Continued.)

Two 6-in. hinge snatch blocks for $\frac{3}{4}$ -in. manila rope.
 600 ft. of $1\frac{1}{8}$ -in. manila rope for tackle blocks.
 600 ft. of 1-in. manila rope for tackle blocks.
 600 ft. of $\frac{3}{4}$ -in. manila rope for tackle blocks.
 Two $1\frac{1}{2}$ in. by 200 ft. manila rope for hand lines.
 Two $1\frac{1}{4}$ in. by 200 ft. manila rope for hand lines.
 Four 1 in. by 200 ft. manila rope for hand lines.
 Four $\frac{3}{4}$ in. by 200 ft. manila rope for hand lines.
 Six $1\frac{1}{4}$ in. by 6 ft. manila rope for slings.
 Four 1 in. by 6 ft. manila rope for slings.
 One portable blacksmith's forge.
 Two sets of blacksmith's tongs.
 One blacksmith's anvil.
 One combination bench and blacksmith's vise.
 One set of machine bolt stocks and dies from $\frac{1}{2}$ in. to 1 in.
 One ratchet drill and bits from $\frac{1}{2}$ in. to 1 in.
 One press drill for tool car with a set of bits from $\frac{1}{4}$ in. to 1 in.
 Six 24-in. S wrenches for $\frac{5}{8}$ -in and $\frac{3}{4}$ -in. bolts.
 Four 16-in. monkey wrenches.
 Two 12-in. monkey wrenches.
 One large grindstone.
 One tool grinding machine.
 One oxy-acetylene torch for cutting iron.

The adze and small tools should be furnished by the men and maintained as their personal tools. The list each good bridge man should have is as follows:

One adze with $4\frac{1}{2}$ -in. bit.
 One hand ax.
 One hand hatchet.
 One claw hammer.
 One 2-ft. steel square.
 One 10-in. try square.
 One 10-in. T bevel square.
 One ratchet brace with bits.
 One set of framing chisels.
 One jack plane.
 One fore plane.
 One smooth plane.
 One block plane.
 One $4\frac{1}{2}$ -point rip saw.
 One 7-point cut-off saw.
 One 12-point cut-off saw.

TOOLS FOR THE WATER SERVICE AND BRIDGE AND BUILDING DEPARTMENTS

By E. M. GRIME

Supervisor of Bridges and Buildings, Northern Pacific; Dilworth, Minn.

On most railways the bridge and building department is responsible for the care and frequently for the construction of practically everything pertaining to the physical property of the railway except the roadway, track and signals. It is therefore always necessary to have available an organization capable of handling a large variety of work comprising many different trades. In order to handle this work economically it is usually found advisable to divide the organization into crews, each of which makes a specialty of certain lines, and the first essential for effective work is to provide each crew with sufficient tools of the kind and character best suited to the work.

A good arrangement of crews and the tools required by each may be stated as follows:

A water service crew, consisting of a foreman, assistant foreman and two helpers, augmented by additional laborers when needed for heavy work, will handle everything pertaining to water stations, the plumbing and heating of buildings, fire lines, hydrants, sewers, steam lines and air lines, as well as the maintenance of coal dock machinery. In addition to the kit of personal tools carried by the men, a gang should be provided with:

Taps and dies for all sizes of pipe from $\frac{1}{4}$ in. to 8 in.
 Bolt taps and dies $\frac{3}{8}$ in. to 1 in.
 Pipe cutters for various sizes of cast pipe up to and including 14 in.
 One pressure tapping machine for corporation cocks up to 1 in. size.
 One No. 3 Edson diaphragm pump with two extra diaphragms.
 One No. 2 Myers force pump with 100 ft. of rubber hose.
 Two 5-ft. chain pipe tongs.
 Two 24-in. Stilson wrenches.
 Two 36-in. Stilson wrenches.
 Two sets of calking irons.
 One 12-in. lead melting pot.
 One 8-in. lead pouring ladle.
 One small blacksmith forge.
 One anvil.
 One each of 3-lb., 4-lb. and 5-lb. blacksmith hammers.
 One 8-lb. sledge hammer.
 One differential chain hoist of two tons capacity.
 An 8-in. bench vise.
 Ten clay picks with six extra handles.
 Ten No. 2 shovels.
 Ten long-handled, round-pointed shovels.
 Five pairs of leather-soled hip rubber boots.
 One hoiler test pump.
 Two 8-in. ratchet jacks.
 One 5-ft. V-tooth cross cut saw.
 Five steel tray wheelbarrows.
 Two hack saws with 24 extra blades.
 Two sets of $\frac{3}{4}$ -in. wood tackle blocks.
 300 ft. of $\frac{3}{4}$ -in. four-strand manila rope.
 One push car.
 One 4-hp. gasoline motor car.

Concrete crews, consisting of a foreman, four carpenters and 15 to 20 laborers, handling all kinds of concrete work and particularly bridge abutments, concrete arch and box culverts, concrete trestle bridges, etc., should be provided with:

$\frac{1}{2}$ or $\frac{3}{4}$ yd. concrete mixer, direct connected to a steam or gasoline engine.
 One No. 3 Edson diaphragm pump with four extra diaphragms.
 One No. 2 Myers force pump.
 Twelve pairs of leather-soled hip rubber boots.
 Twelve steel tray concrete wheelbarrows.
 Two sand screens.
 100 ft. of $\frac{3}{4}$ -in. garden hose.
 Three 8-lb. mauls.
 Two 8-in. ratchet jacks.
 Three 5-ft. V-tooth cross cut saws and 12 10-in. saw files.
 Four spading shovels.
 Two sets of $\frac{3}{4}$ -in. wood tackle blocks.
 500 ft. of 4-strand manila rope.
 Six lantern frames—four each of yellow, red and white globes.
 Four red and four yellow flags.
 24 torpedoes.
 Four 24-in. steel claw bars for nails.
 One grindstone.
 One push car.
 Two hand cars.
 One gasoline motor car.

Carpenter crews, consisting of a foreman and 6 to 10 house carpenters and helpers, to handle repairs or construction of second class stations, freight depots, section houses, stockyards, grain and station platforms and all light carpenter work should be provided with:

Three 5-ft. V-tooth cross cut saws and twelve 10-in saw files.
 Twelve 16-in. common screw jacks.
 Two track jacks.
 One small wrench.
 Two sets of $\frac{3}{4}$ -in. wood tackle blocks.
 One set of 1-in. wood tackle blocks.
 Two $\frac{3}{4}$ -in. snatch blocks.
 300 ft. of $\frac{3}{4}$ -in. 4-strand manila rope.
 300 ft. of 1-in. 4-strand manila rope.
 Four 5 ft. 4 in. by $1\frac{1}{2}$ in. octagonal steel pinch bars.
 Five peavies with two extra handles.
 Five carrying hooks, one extra handle.
 Two pairs leather-soled hip rubber boots.
 Ten No. 2 shovels.
 Six clay picks.
 One grindstone.
 Ten long-handled, round-pointed shovels.
 Two 24 in. by $\frac{3}{8}$ in. steel claw bars for nails.
 Two post hole diggers.
 One No. 3 Edson diaphragm pump with one extra diaphragm.
 Two 8-ft. chains of $\frac{3}{8}$ -in. iron with ring and hook.
 Six lantern frames with four each of white, red and yellow globes.
 Four red and four yellow flags.
 24 torpedoes.
 Two 8-lb. mauls.
 Two 12-lb. mauls.
 One No. 3 Merrill's saw set for single tooth cross cut saws.
 One push car.
 One 4-hp. gasoline motor car.

A painting crew, consisting of a foreman and six to eight painters, to handle all painting, except high steel trestles, should have constantly on hand:

Twelve $4\frac{1}{2}$ -in. round paint brushes.
 Twelve $4\frac{1}{2}$ -in. flat paint brushes.
 Twelve stencil brushes.
 Twelve lettering pencils.
 Twelve scraping knives.
 Six steel wire brushes.
 One belows for sanding.
 Four kalsomine brushes.
 Two 16-ft. extension ladders.
 Four 5-ft. staging books.
 Four sets of $\frac{1}{2}$ -in. tackle blocks, single and double sheave.
 500 ft. of $\frac{1}{2}$ -in. manila rope.
 Two sets of $\frac{3}{4}$ -in. tackle blocks.
 300 ft. of $\frac{3}{4}$ -in. four-strand manila rope.

A bridge crew, consisting of a foreman, pile driver, engineer and seven bridge carpenters and helpers, is required to handle repairs or the rebuilding of timber pile and trestle bridges, wooden water tanks and coaling stations, the placing of steel girder bridges, moving buildings, repairing washouts and sometimes clearing wrecks. This is the most important crew, as it is depended upon for practically all heavy work. To it is assigned a pile driver, and frequently a wrecking crane. The tools required by this crew are as follows:

Four 10-ton ratchet jacks.
 Four 15-ton ratchet jacks.
 Eight 8-in. ratchet jacks.
 Twelve 16-in. common screw jacks.
 Two track jacks (Barrett No. 1).
 Two ratchet pulling jacks.
 Eighteen 6-in. maple rollers.
 Two sets of 1-in. tackle blocks, single and double.
 One set of $\frac{3}{4}$ -in. tackle blocks, single and double.
 400 ft. of 1-in. four-strand manila rope.
 200 ft. of $\frac{3}{4}$ -in. four-strand manila rope.
 200 ft. bell cord.
 Two 1-in. snatch blocks (steel).
 One $\frac{3}{4}$ -in. snatch block (steel).
 Six octagonal steel pinch bars $1\frac{1}{2}$ in. by 5 ft. 4 in.
 Two claw bars for track bolts.
 Two 24 in. by $\frac{3}{8}$ in. steel claw bars for nails.
 Two shackle bars for $\frac{7}{8}$ -in. drift bolts.

Ten peavies, 12 extra handles.
 Six carrying hooks, 2 extra handles.
 Two hand axes.
 Six chopping axes.
 Two adzes.
 Four spike mauls.
 Twelve No. 2 shovels.
 Twelve long-handled, round-pointed shovels.
 Twelve clay picks, 4 extra handles.
 Two post hole diggers.
 One No. 3 Edson diaphragm pump.
 One No. 2 Myers force pump with 100 ft. water hose.
 Three 5-ft. V-tooth crosscut saws.
 Three 6-ft. V-tooth crosscut saws.
 Twelve 10-in. saw files.
 One No. 3 Merrill's saw set for crosscut saws.
 Four 8-ft. chains of $\frac{3}{8}$ -in. iron with ring and hook.
 Two 8-lb. mauls.
 Two 12-lb. mauls.
 Two 16-lb. mauls.
 Six extra maul handles.
 Six lantern frames with four each red, white and yellow globes.
 Four lanterns with reflectors.
 Four red and four yellow flags.
 24 torpedoes.
 Two chisel bars, $3\frac{1}{2}$ in. by 1 in., 6 ft. long.
 Two 16-in. monkey wrenches.
 Two track wrenches.
 Two 24-in. Stilson wrenches.
 Four S wrenches to fit bolts in general use on bridges.
 Six $1\frac{1}{2}$ -in. bridge augers.
 Three $\frac{5}{8}$ -in. bridge augers.
 Three $\frac{1}{2}$ -in. bridge augers.
 Two $\frac{5}{8}$ -in. steel drifts, 24 in. long.
 Four 5-ft. staging hooks.
 Grindstone.
 One set of bolt taps and dies, $\frac{1}{2}$ in. to 1 in.
 One track level.
 One track gage.
 Four timber dollies.
 One track dolly.
 Six pairs of leather-soled hip rubber boots.
 Four track chisels.
 Small blacksmith forge.
 Anvil.
 Bench vise.
 Four 2-gal. oil cans.
 One 1-qt. oiler.
 One Buckeye light of 1,000 c.p.
 Four straight edges of clear white pine, $1\frac{1}{2}$ in. by 10 in. by 16 ft.
 One push car.
 One 4-hp. gasoline motor car.

The work of sharpening or repairing tools in all crews should be reserved for stormy days, when little can be accomplished in the field. The foreman should be required to turn in such tools as cannot be readily repaired and they should be promptly replaced from the storekeeper's stock or by order on the purchasing agent. To avoid personal injuries a defective tool should never be allowed to remain in use and the men should be encouraged to report any defects. Successful contractors provide their men with plenty of first class tools and equipment and experience has shown that the best results are obtained in the bridge and building department by following the same practice.

DESIGNING MANGANESE STEEL TRACK WORK

By V. ANGERER

Vice-President, William Wharton, Jr., & Company, Inc.,
 Philadelphia, Pa.

When manganese steel was introduced into special track work such as frogs and crossings on steam railroads 15 years ago, it necessarily took a long time before its economic value was generally appreciated. It was a new proposition for a railroad to install a manganese steel track structure costing $2\frac{1}{2}$ or even 4 times as much as the material it had been using theretofore, and to expect economical results. Each railroad that ventured a trial on the representation of the manufacturer, or on what it had heard concerning the results obtained elsewhere, wanted a demonstration under its own observation. This consumed time. Within the last 8 years, however, the important economies that can be effected by the use of manganese steel frogs, crossings and switches in maintenance have been more fully recognized and the demand for them has greatly increased. It has been estimated that in 1913 approximately 18,000 manganese steel frogs, 1,300 manganese steel crossings and 2,000 manganese steel pointed switches were bought by the steam railroads of this country, and while in 1914 these figures have fallen off, owing to the general condition of business and the retrenchment of the railroads in particular, there is

no doubt but that they will be exceeded in the next few years.

Unfortunately, when the demand grew, and numerous track work builders took up the manufacture of manganese steel track structures, the tendency was displayed to try to cheapen the work at the expense of the product. The hesitation of the railroads to make so much larger first investment in track structures over what they were accustomed to pay in ordinary work, made it appear desirable to reduce the ratio of difference to promote the use of manganese steel work. It was a mistake, probably due to the inexperience of some manufacturers, but into which even some of the older track work manufacturers fell, in their endeavor to meet competition. The result was almost the opposite to that intended.

Also in some cases the railroads who had found manganese steel work entirely satisfactory induced the track work manufacturer to undertake to make more difficult pieces than they had ever made before, for the elimination of joints and other anticipated maintenance advantages. Under the pressure from both sides, the manganese steel founders allowed themselves to attempt the making of castings of proportions which were not productive of the best results. The consequences were some failures and cases where manganese steel did not prove a success. Every such case apparently stood out prominently against the use of manganese steel work, notwithstanding the hundreds of other cases where it had given perfect satisfaction and effected great economy, paying for itself several times over in comparison with ordinary work.

The critical stage which was brought about by these causes has now been passed. The manganese steel founders and track work manufacturers have gotten together and secured the interest and co-operation of the railroads, through the track committee of the American Railway Engineering Association. This has resulted in certain minimums being established in the proportions of the manganese steel castings for the various track structures below which satisfactory results can hardly be expected. The founders of manganese steel have also profited by experience and improved their methods toward making the castings suitable for the hard service for which they are intended. Patterns and designs are scrutinized more closely now as to whether they suit foundry practice, and whether a casting of proper quality in manganese steel can be produced from it.

The main mistake frequently made in designing manganese steel track work was that they were based on theoretical calculations as to the necessary strength and an endeavor to provide for a large amount of wear without due regard to the foundry problem. The shrinkage of manganese steel from the fluid to the solid cold state is considerably more than that of other metals, such as iron and ordinary steel. Roughly speaking, it is $\frac{5}{16}$ in. to the foot. This means that a casting of 10 ft. in length is over 3 in. longer when poured in the mold than after it has cooled. Thick portions take longer to cool than thin portions and therefore do not contract as quickly. This presents a problem that must be taken care of, not only by the foundry practice, but by the design, otherwise uneven shrinkage, shrinkage cracks, and resulting segregation and unsoundness of metal or internal strains are unavoidable, and an improper design may defeat all the ingenuities of the foundryman. These dangers are aggravated by the fact that manganese steel is what might be called red short, i. e., in the red hot state it is extremely brittle and weak and subject to cracking. This requires special treatment of the castings in the molds, only gained by experience, and being quite different from the treatment of ordinary steel castings.

When the castings undergo the subsequent heat treatment, further problems are met. Thin castings are affected differently from thick castings when both are subjected to exactly the same heat treatment. Consequently thin portions of a casting may be differently affected than the thick portions of the same casting, if the variation in thickness is considerable. It is for this reason that the practice to cast coupons on the castings for

the determination of physical properties, which is the usual practice with ordinary steel castings, is not followed in manganese steel castings, as the difference in heat treatment required by the thin coupon, when attached to a casting of greater thickness, would result in different properties being developed in the test coupon from those of the main casting. Thus, the treatment given a casting must be gaged by experience, according to the nature of each individual casting, or group of castings, particularly in reference to the thickness of metal.

The castings come out of a heat treatment usually very much distorted and bent, and have to undergo a straightening process, under powerful presses, to put them back into shape. The degree of this distortion often depends largely upon the design, and in long, complex and spider-like track castings, is often quite aggravated, so that the straightening process becomes very difficult and hazardous. Internal strains and, in fact, internal fracture, with no outside indication thereof, may be the consequence, destroying all theories as to the strength of the piece. All such difficulties and dangers should be given due consideration in the design. By special precautions the foundry can overcome the detrimental effect which may be due to some feature of the design, but may not be able to avoid it altogether.

Heavy or thick portions in some parts of a casting may be just as objectionable as too thin portions. Ribs intended to strengthen portions of a casting may have the opposite effect, producing incipient cracks. No actual fixed rules can be laid down for designing manganese steel track castings, except a few cardinal principles which might be summed up as follows:

Make the sections of a casting and the thickness of metal in the section as uniform as possible.

Make changes from one section to another and from one thickness of metal to another gradual. Avoid abrupt changes and all sharp corners.

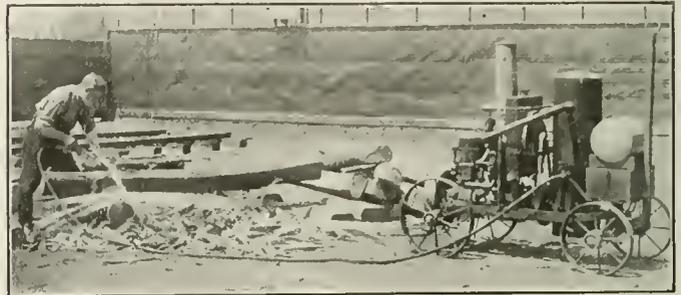

Avoid all possible projections, brackets or cross members which may form a serious impediment to the free contraction of the casting in cooling in the mold. Before deciding upon an unusual design, consult the foundryman.

After a piece has been cast successfully, the wearing qualities so essential to track work have to be imparted to it through the heat treatment. Manganese steel derives its remarkable wearing qualities through a combination of hardness and ductility. It may be of interest to the designer and maker, as well as to the user of manganese steel track work, to have pointed out a few peculiarities of this remarkable metal. The hardest castings may not always be the best wearing ones. The particular value is in its great resistance to abrasion. In its toughest and most ductile state, manganese steel has somewhat of a tendency to flow under cold rolling or pounding. In track work this sometimes causes the appearance of initial wear, due to this action of the skin, which usually is slightly tougher than the rest of the castings. Such initial wear is no criterion of the subsequent wearing qualities of the piece. Blow holes are a rare occurrence in manganese steel castings, as, owing to the chemical composition of manganese steel, it is quite free from gases in the molten state. While never desirable, small cracks need not cause any such apprehension as in an ordinary carbon steel casting. It is a very well known fact, and pointed out by eminent authorities as Dr. H. M. Howe, that owing to the toughness of manganese steel, cracks do not readily propagate. A sudden parting of a manganese steel casting, properly heat-treated and toughened, need never be apprehended under almost any strain to which the pieces are subjected in the track. Even if physical tests for ultimate tensile strength or elastic limit could be made readily, in view of the difficulty of machining test pieces to proper sizes, they would form no criterion for the strength of the pieces. The necessary strength and solidity of a manganese steel track casting depends mostly upon the design and its wearing qualities upon the proper heat-treatment given to it by the metallurgist.

A PNEUMATIC TIE PEELER

In the past the removal of bark from railroad ties has always been a costly and laborious hand operation. From information gathered from contractors it has been found that when working on fresh timber the most expert tie peeler is capable of peeling by hand an average of but 100 ties per day of 10 hours, for which production he receives comparatively high wages. The output of the average tie peeler is from 40 to 60 ties per day, and he also receives a wage considerably in excess of that demanded by the ordinary laborer. The generally prevailing price paid is 5 cents per tie.

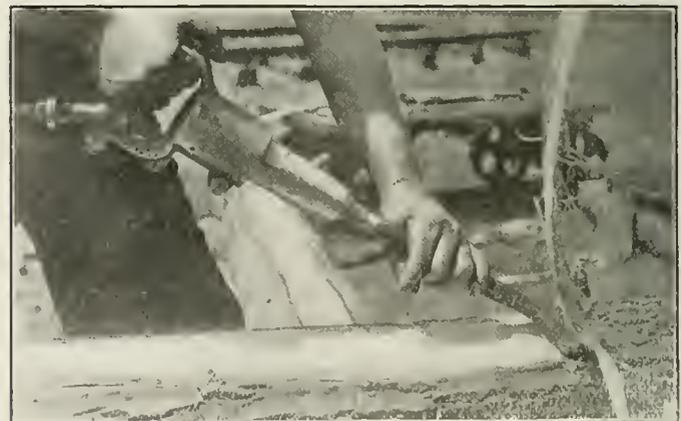

The search for means to reduce this cost led to the develop-

Portable Plant for Peeling Ties

ment by the Ingersoll-Rand Company, New York, of the "Imperial" tie peeling tool, used in conjunction with an "Imperial" pneumatic hammer. Experiments have shown that with this tool an ordinary laborer had no difficulty in thoroughly peeling from 150 to 200 ties per day, and at a wage rate far below that received by the expert hand peeler. Inexperienced men who had never used an air hammer nor seen a tie peeled were used in the tests. They were able to peel a standard seasoned tie with this tool in an average time of less than three minutes.

A complete installation for pneumatic tie peeling comprises the two tools already mentioned and a small "Imperial" vertical sin-

Pneumatic Tie Peeler in Use

gle-acting air compressor, with 6 in. diameter by 6 in. stroke, a small air receiver, suitable valves, piping, hose, etc. It costs approximately \$300. The compressor has sufficient capacity to operate the two tools simultaneously if necessary. An accompanying photograph shows the pneumatic tie peeler at work. The compressor may be installed in some convenient place and is driven by a belt from the line shaft. The extra load imposed upon the power plant is scarcely perceptible. Another illustration shows a portable plant.

By the insertion of other tools the hammer also has other useful applications, such as the chipping and calking of metals, while by the addition of other pneumatic tools the air compressor can be used for such work as portable drilling and boring and general repair work.

The Chattanooga Creek Bridge of the N. C. & St. L.

Interesting Substructure Work on a 15-track Structure Involving the Use of a Drag Line for Excavation

By C. H. JOHNSON

Engineer of Construction, Nashville, Chattanooga & St. Louis, Nashville, Tenn.

The Nashville, Chattanooga & St. Louis has recently completed high masonry abutments for a 15-track deck girder bridge across Chattanooga creek at the point where it flows into the Tennessee river, which involved interesting construction methods. Only four of the girder spans have been placed at present, two of which replace a three-track pile trestle, one replaces a main line truss bridge, while one is for new second track.

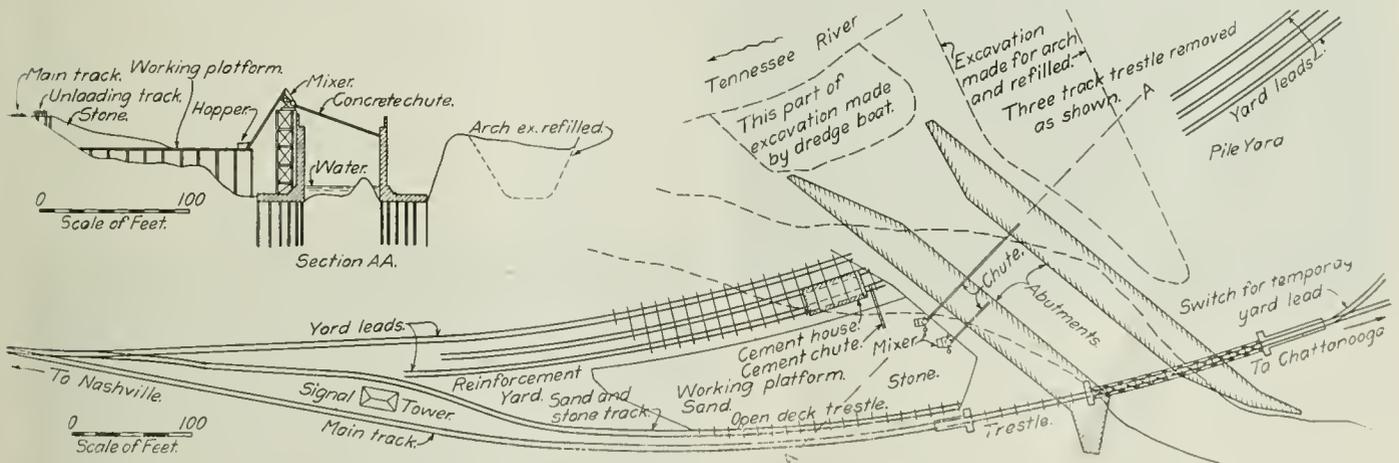

The creek originally flowed under the tracks at a very acute angle, and the first plan adopted for the new structure provided for changing the channel to permit the use of two 25-ft. arches at right angles to the main track. After considerable excavation had been made to carry out this plan, objections were raised by certain citizens of Chattanooga on the ground that the proposed structure would interfere with the navigation of the stream. The matter was taken up with the War department, the objections of the citizens were sustained, and a change in plan was ordered. This resulted in the adoption of plans providing for deck girders resting on concrete abutments. The abutments are of the cantilever type. The base is 5 ft. thick by 31 ft. wide, and the vertical wall 5 ft. thick by 56 ft. high, while 5-ft. fillet connects the vertical wall and the base. Reinforcement consists entirely of second-hand 56-lb. rail spaced 9 in. center to center in both the base and vertical walls. The

excavation had to be taken out to about 5 ft. below the water surface and the maximum depth of cutting was 42 ft. A Bucyrus drag line with a working radius of 70 ft. horizontally and 50 ft. vertically was rented from a contractor, who also furnished the men to operate it. The excavation made for the two arches as originally planned was refilled by this machine, a half-inch stream of water being thrown on the material as it was dumped from the bucket. As the material was already wet, part of it coming from below the water surface, this stream proved sufficient to make it flow so as to fill the entire excavation. The expense of operating the machine was as follows:

Rent of machine.....	Per day,	\$25.00
Foreman	"	4.00
Engineer	"	6.00
Fireman	"	3.60
Six laborers	"	10.50
Pumper	"	2.00
Watchman	"	3.00
Machinist	"	4.00
Coal, repairs, oil, etc.....	"	5.90

Total..... \$64.00

The total cost of excavating 40,000 cu. yd. was \$9,739.87 or 24.4 cents a yd. However, about half the material had to be handled twice on account of the difficult location of the work, and allowing for this the cost was 16.2 cents per yd. of material

Plant Layout at the Chattanooga Creek Crossing of the Nashville, Chattanooga & St. Louis

fillet is reinforced with short pieces of rail placed 18 in. center to center on a batter of 1 to 1. No reinforcement was used in the walls above the tops of the 30-ft. rails, which were carried to the bottom of the foundation slab, the tension in the wall above this point being taken care of by the concrete.

The girders are placed parallel to the tracks which they support, and, as there is a difference in the angles which the various tracks make with the walls, these girders vary in length. They are floored with creosoted timber and the regular track construction on rock ballast is used across them.

One of the piers of the old truss bridge was directly in the line of the north wall, which necessitated a special design at this point as it was impossible to place the horizontal reinforcement for a footing. Consequently a gravity section was used to a height of 30 ft. and the old pier was incorporated in the new wall.

EXCAVATION

The plans as finally adopted called for the excavation of 40,000 cu. yd. of material, about two-thirds of which was on

handled. This rather high price for drag line work was due to the fact that it was necessary to pull the old piles with the machine and also because of the many boulders which were encountered.

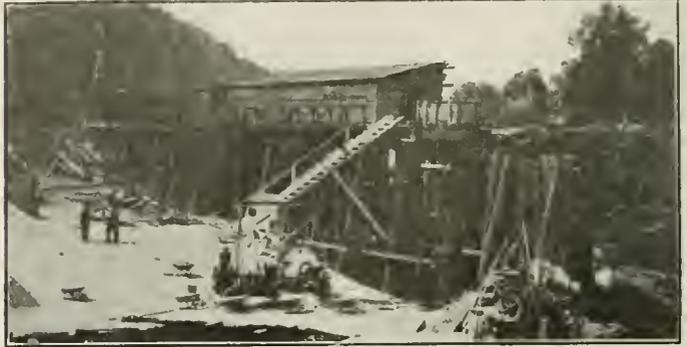

PILE DRIVING

No suitable natural foundation could be secured, the creek bed being made up of boulders from the mountain side for a great depth, so it was necessary to use piles. The specifications for the piles provide for any kind of timber 8 in. tops and 12 in. butts. The cut off of the piles is at the old low water line so that they will be submerged at all times. The piles were driven with a 4-ton steam hammer handled by a 20-ton locomotive crane, operating on a short section of trestle work built on foundation piles sufficiently high to keep the track above any expected stage of water. An attempt was made to use a floating driver, but as the only barge available proved too small, and the men demonstrated their inexperience in handling boats, the attempt was abandoned, after 24 hours' trial. The failure of this plan occurred at a critical time. The excavation

for the new wall having been completed behind the old pier and under the main line approach trestle, the mountain side above began to slide and endanger the main track. It was necessary to build a short section of the wall promptly in order to stop the slide, and before this could be done the foundation piles had to be driven. As an emergency measure, the drag line was moved into position, the bucket was taken off and the machine used as a crane to handle the 4-ton hammer. This was a heavier load than the machine was designed to handle, but it did the work very well. Piles were driven day and night and the short section of wall was completed in time to prevent serious results from the slide. In the meantime the locomotive crane was provided to finish the driving.

The pile driving gang consisted of 14 men and a foreman, and 2,700 piles were driven, the penetration varying from 5 ft. to 30 ft. sometimes in adjacent piles. This great variation made the driving slow, as it was necessary to use piles long enough for the greatest depth, and they had to be cut off if they failed to penetrate the full distance before the adjacent pile could be driven. The pile driver expense was about \$50 a day, and with an average of 35 piles driven a day the cost of driving per pile was \$1.40. On account of the great variation in pene-

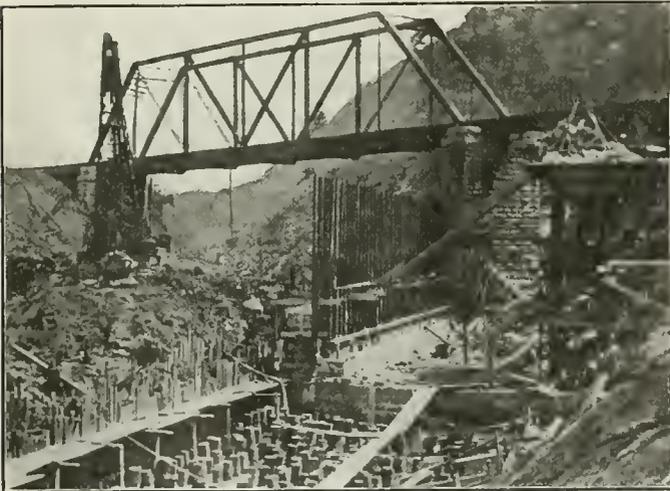

tration no accurate estimate can be given of the cost per foot, but assuming an average penetration of 15 ft. the cost would be 9.3 cents a driven foot. The above prices include the cost of temporary trestle work, the cost of installing the machine and the cost of unloading the piles, framing them in the yard and transporting from the yard to the machine.

The Concreting Plant

This was accomplished by extending the guides for the charging hoppers enough to reach the new position of the mixers and using a larger cable for hoisting.

Old car sills 30 ft. long were used for posts and braces for the lower part of the wall, to which the casing, consisting of 2 in. dressed lumber for the face and 2 in. rough lumber for the back of the wall were nailed. Above a height of 30 ft. the casing was nailed to studding 5 ft. long and was bolted into place by rods running through the wall. After the concrete

General View Showing Construction Progress

tration no accurate estimate can be given of the cost per foot, but assuming an average penetration of 15 ft. the cost would be 9.3 cents a driven foot. The above prices include the cost of temporary trestle work, the cost of installing the machine and the cost of unloading the piles, framing them in the yard and transporting from the yard to the machine.

CONCRETE WORK

All concrete work was of 1-3-5 mixture, the aggregate being crushed limestone. Sand and stone were delivered on the work in drop-bottom cars, which were dumped from a trestle built over the material bin. Soaked cement was unloaded by hand into a cement house built on the three-track trestle referred to above. Two No. 6 Chicago Cube mixers equipped with charging hoppers were placed on a wheeling platform which was formed by extending the floor of the sand and stone bins, and which was about 20 ft. below the bridge seat. Sand and stone were placed in the hoppers from measured wheel-barrows and the proper amount of cement added. For a large part of the work the mixers dumped directly into chutes, consisting of wooden troughs lined with sheet iron. It was found by experiment that the best inclination for chutes of this kind was 4 in. vertical to 12 in. horizontal, any steeper slope than this had a tendency to separate the mixture, while a lighter slope was not sufficient to make the concrete flow readily. A tram track was built just outside of each wall, and when the wall became too high for the chutes the concrete was delivered in

The Drag Line Excavator at Work

had set the casing was taken off in sections and used again, while the rods were simply cut off at the face of the concrete, no provision having been made for removing them. The 5-ft. wall required considerable yardage per square foot of form surface, and it was possible to keep ahead of the concrete work with a small force of form men. This term is used for the reason that there was no carpenter on the job, the form gang consisting of an experienced concrete man assisted by 4 or 5 common laborers. The mixing gang was composed of 21 men for the two mixers working as follows: 8 hauling stone, 4 haul-

ing sand, 2 on the charging hoppers, 2 dumping mixers, 1 hauling cement and 4 hauling concrete. From 2 to 6 men, depending on speed of mixing, were used for placing concrete and spading it away from the forms.

A large part of the concrete was placed with the temperature about 20 deg. F., necessitating the heating of the sand and stone to prevent freezing. This was done by building a grid-iron consisting of 1½ in. pipe laid about 30 in. center to center on the full length of the bin floor and passing steam through it. Steam was supplied from a small vertical boiler belonging to a hoisting engine.

The abutments contain 8,071 cu. yd. of concrete, and cost \$5.03 a cu. yd., exclusive of excavation and pile foundation, this figure being made up as follows:

Labor mixing and placing concrete	\$1.22
Concrete material, including unloading, etc.....	3.12
Labor building forms33
Material for forms33
	\$5.03

The cost of placing about 30,000 lin. ft. of 56-lb. rail and 5,550 lb. of rods is included in the above figure. The pile foundation cost \$1.10 a cu. yd. of concrete.

PORTABLE GRAVEL SCREENING AND WASHING PLANT

By MAC RAE D. CAMPBELL.

Although nature has been very lavish in distributing materials suitable for use as aggregate in concrete construction, nevertheless most, if not all, bank-run material should be screened so that fine and coarse volumes may be properly reportioned before using in concrete mixtures to secure dense, hence water tight concrete. Likewise, many bank deposits contain foreign matter such as clay or loam, rendering the material unfit for use unless washed. Sand and gravel may be found near the site of the contemplated work, but if facilities for washing dirty material are not available haul of varying length is involved to bring suitable materials to the site of the work.

Engineers now realize the important part that aggregates play in concrete construction. Economies resulting from applying any simple and practical method to make otherwise unsuitable material available for concrete work will soon represent a sum that would absorb the cost of a portable gravel screening and washing plant such as shown in the accompanying plan. The plant shown in the accompanying drawing is estimated to cost about \$2,000 for a capacity of screens of 350 cu. yd. per day.

Timber used in this construction should be selected stock that will permit the repeated setting up and dismantling of the plant with the least injury to the units of which it is composed. Working out the details of the design carefully for the cutting and hoisting of timbers will insure that most, if not all, of the units can be assembled by bolts, dowels and lag screws. Materials forming bin bottoms and sides or ends can be assembled so as to make units of these portions of the construction that in turn can be erected quickly, and dismantled with equal ease. The size of bins will be regulated by the necessity for storing any considerable quantity of material, also by the capacity of the plant. An additional amount of bracing beyond that shown in the drawing will take up any lost motion that might result from poor fit of the parts, although proper detailing at the time of laying out the work will prevent the necessity for this.

A suitable area should be cleared off at the pit or site of the deposit where such a plant is to be erected and bridge timbers or cribbing used for a foundation. It will be well to mark every piece of timber or unit of the plant, either at the time of erection or just before dismantling the plant for the first time, to designate its proper place in the construction and thus insure economy of time when necessary to re-erect the structure. Portability and convenience are prime requisites if the design is to serve its intended purpose. Many short cuts will, no doubt, suggest themselves while detailing the construction preparatory to cutting timber and erecting.

The method of charging the elevator will depend upon the conditions and upon the amount of money that it is desired to invest in loading equipment, or on the kind of loading equipment that may already be available. The drawing shows team runways leading to the hopper, but the hopper can also be loaded by means of a derrick, and a clam-shell or orange-peel bucket, a locomotive crane, a small steam traction shovel or industrial cars. The last would hardly be employed unless it was intended to use the plant at one locality for a considerable length of time. Screens, shafts, sprockets, pulleys, etc., can be obtained in the open market, yet most of such equipment could be turned out in the railroad shop. Sprockets, spur gears and pinion gears can, in nearly every case, be obtained of suitable size from a manufacturers' standard stock.

The general operation of preparing sand and gravel for use as concrete aggregate consists first of excavating the material from the bank deposit or elevating it from the beds of streams, transporting it to the washing plant, where it is elevated to a hopper located directly above suitable screens, dumping it into these screens, and playing upon the material water under pressure, which, in connection with the agitation of screens, causes rolling and tumbling of material and accomplishes its cleansing. From screens the material may be passed into bins unless used as coming from the hoppers.

Screening, washing, and, where necessary, crushing, are accomplished by using any one of several types of screens and a type of crusher that seems most desirable for the material to be handled. Screens can be grouped under the head of gravity, reciprocating, and rotary. Gravity screens are so named because the material rolls down their face by weight alone, the screens being fixed. Experience has generally proved that gravity screening plants are not as satisfactory in all cases as other types in securing a product possessing all desirable qualities. This is due largely to the great variety of material found in different pits and even in different parts of the same pit.

Reciprocating screens are a marked improvement over gravity screens, especially as regards subsequent sizing of the materials. They have long been used successfully in coal and ore mining plants. The application of reciprocating screens to gravel and sand sizing and washing has, however, been limited. Such screens are at times arranged so that the operating angle may be changed to meet different requirements arising through variations in the composition of material. In using reciprocating or vibrating screens the material to be handled must be distributed evenly across the face of the screens and be fed upon it at a uniform rate; also, the oscillating or vibrating motion must be greater at the feed than at the discharge end because of the greater quantity handled. When properly designed and erected, such screens will produce satisfactory separation of fine and coarse materials.

Rotary screens are of four general kinds: Straight-cylindrical, conical (used in an inclined as well as in a horizontal position), the combined cylindrical and conical, so-called because incorporating both forms, and the multiple conical. Cylindrical screens are made by attaching perforated sheet metal or wire cloth to circular metal frames, the size of the perforations being governed by the grading of the output desired.

To obtain material properly sized for construction which requires coarse aggregate from ¼ to 1½ in. and washed sand from ¼-in. to that which will be retained on a No. 100 mesh screen, perforations are, in the majority of cases, 1½-in. round holes in the first conical screen, the same size in the inner skirt, or screen, and ¾-in. diameter in the next screen. Material from this last screen should then be discharged into a settling tank.

Wherever a grading of material is required which lies between ¼ and ½ in. or ¼ and 1 in., the material must pass through a screen with 1-in. or ½-in. perforations, and be retained on a screen having 5/16-in. perforations. It must be remembered, however, that unless a very large percentage of the material lies between ¼ and ½ in. or ¼ and 1 in., as it comes from the pit, this grading cannot be secured in the same operation that pro-

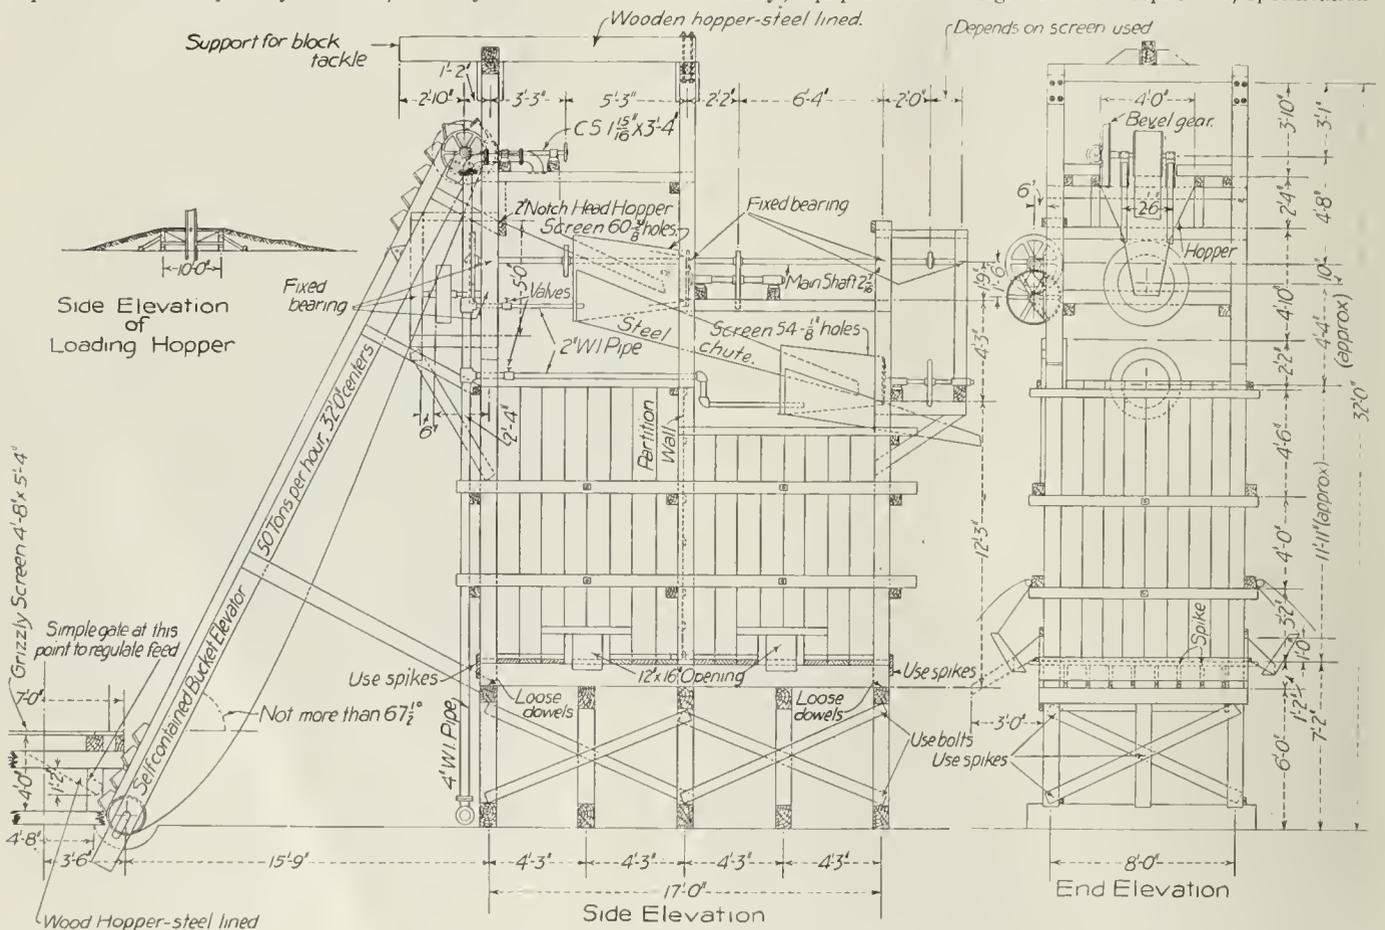

duces the coarse aggregate ranging from 1/4 to 1 1/2 in. When specifications refer to material retained on a 1/4-in. screen, the screen meant is a testing screen, which is simply 1/4-in. wire mesh stretched over a circular frame of small diameter. Testing screens of this type are held in a horizontal position when the material is screened through them, the screens being shaken by hand sufficiently to force all material under 1/4 in. through the openings. Hence, the perforations or openings in screens used in washing or screening plants must be of such diameter as experience and experiment have proved will produce materials conforming to the hand-screen test. It will readily be appreciated that sand and fine aggregate can be made to pass over instead of through a 1/2-in. mesh screen if the angle at which it is set and the speed of travel are made great enough.

The successful operation of a sand and gravel washing plant requires a sufficient quantity of water, not only to remove the silt

If materials are not used as coming from the washing plant, then storage facilities must be provided. Bins can be made of timber, steel or concrete, but if they are to be portable or semi-portable they should be constructed of timber or steel, preferably timber, as such bins can be moved around readily on trucks. Stationary bins are usually constructed only for permanent plants having large capacity.

The horse power required to operate this plant will vary considerably, depending upon modifications of design and capacity. Gasoline motive power is very convenient, economical and adaptable.

The particular advantages of the plant shown in this design are that preparation of sand and gravel for use in concrete, or by slight modifications, the preparation of ballast that in its natural state is unsuited for use, may be accomplished very readily; equipment and design are not complicated; specifications

Semi-Portable Gravel Screening and Washing Plant

from the material, but also to assist in sizing it. Every screen should be supplied with a separate water-supply spray, which also serves to rinse the material as it leaves the screen. The quantity of water required to thoroughly wash and size sand and gravel varies from 1/2 gal. to 1 gal. per minute, per cubic yard of material prepared per day. That is, if the capacity of the plant is 500 yd. of prepared material per day, from 250 to 500 gal. of water per minute will be necessary at the pump. This apparent wide range in figures is due to variations in the sand and gravel that will have to be handled. In determining pump capacity it is necessary to know, of course, the quantity of water required, length of pipe between the pump and the point of discharge, size of pipe, total distance from the surface of the water at the suction end to the point where water is discharged, and the pressure of water desired at the point of discharge. In many gravel pits, large stones or boulders are found that cannot be used in concrete without crushing. Material which is over size and rejected by the first screen should be passed to a spout which will convey the large size stones to a crusher.

covering coarse and fine aggregate, as regards sizing and cleanliness, are easily met; such a plant can readily be made to produce coarse aggregate grading from 1/4 to 1 1/2 in. that will contain not to exceed 5 per cent of material passing through a 1/4-in. hand-testing sieve, nor containing more than 3 per cent of silt; aggregate graded from 1/4 to 1/2 in. can be produced so that not more than 10 per cent will pass through a 1/4-in. hand-testing sieve.

RAILWAY CONSTRUCTION IN JAPAN.—A recent consular report says that the Japanese Government has laid down a general policy for railway construction. If the plan be adopted, the country's railway webs will be completed within ten years, with the addition of 1,219 miles to the mileage already operated. During the present fiscal year new lines of 79 miles will be completed and opened to traffic. Within the succeeding six years 238 miles will be completed, while the remainder is not yet assigned for the lack of capital. All the light railway lines, with a total length of 331 miles, are postponed until the year 1916-17, or later.

Practical Bridge Erection and Maintenance Methods

Second Series of Contest Papers Describing Solutions of Various Common and Special Problems by Bridge Men

The two prize winning papers and five other contributions received in the contest on Bridge Construction Methods, which closed March 10, were published in the *Railway Age Gazette* of May 21. The following contributions received at the same time cover other phases of interest to railway men engaged in building, maintaining and renewing bridges. Five additional articles for which space is not available in this issue will appear in an early maintenance section.

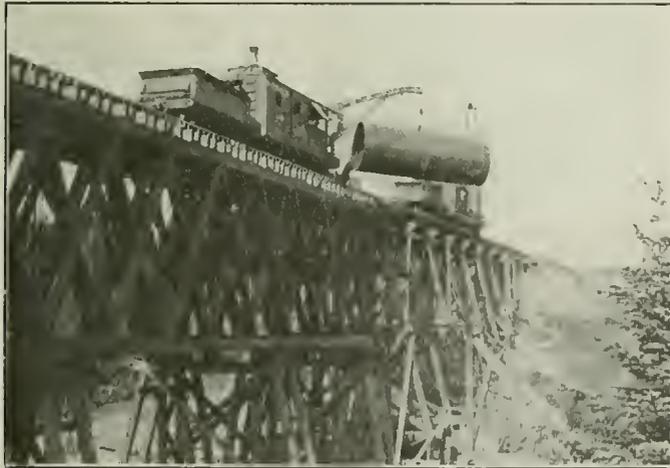

RECENT CYLINDER PIER CONSTRUCTION

By J. E. BEBB

Office Engineer, Duluth, South Shore & Atlantic, Duluth, Minn.

Metal cylinders, either of steel, wrought, or cast iron, have been used extensively by European engineers for piers and abutments of bridges, particularly by the British throughout the colonies of India, South Africa and Australia. American engineers, however, have been rather backward in adopting steel cylinders for this purpose, and until comparatively recent years they were used only under highway bridges or railroad structures of the lightest type. The following description covers two recent examples of cylinder pier construction on the Duluth, South Shore & Atlantic.

Bridge D-94, $9\frac{1}{2}$ miles south of Houghton, Mich., on the Houghton Division, which was originally a pony Howe truss span 107 ft. long with a 50-ft. timber trestle approach at each end, was replaced by one 100-ft. through plate girder span and

Derrick Car Lowering 8-ft. Steel Cylinder for D. S. S. & A. Bridge over the Waiska River

two 50-ft. through plate girder spans, one at each end of the long span. The stream spanned is known as the Sturgeon river, which drains a large territory lying to the west and south of the right-of-way. The stream is approximately 130 ft. wide at this point and 17 ft. deep, and is subject to annual floods. Soundings showed that the bed of the stream consisted of 5 to 6 ft. of sand and silt overlying red clay. Embedded in the silt were found logs and driftwood in large quantities. This fact made it seem probable that the driving of sheet pile cofferdams would be attended by considerable difficulty, so that the construction of piers by this method was abandoned as uneconomical. It was finally decided to use two $5\frac{1}{2}$ -ft. steel cylinders 26 ft. long filled with concrete, for each pier with a supporting cluster of 7 piles driven inside each cylinder. The cylinders were made of $\frac{3}{8}$ -in. steel plates, with lap joints and rivets spaced 4 in. vertically and horizontally. Each pair of cylinders was joined at the top by 8-ft. girder diaphragms.

The bottom of the stream at each pier location was thoroughly dragged to remove all logs and driftwood. Excavation was begun with a $1\frac{1}{4}$ -yd. orange peel bucket operated from a boom derrick on the shore before the cylinder was placed in position. About one-half of the total depth was excavated in this manner. The tube was then lifted by the derrick and placed in position, the remainder of the excavation being handled by means of a $\frac{1}{2}$ -yd. orange peel bucket operating inside the tube. All of the cylinders settled quite uniformly under their own weight or by blocking between the cylinders and the stringers of the old bridge, after the latter had been raised by jacks, and then allowing the weight of a locomotive to force the tubes downward. Slight inequality in settling was corrected by swinging a stick of timber in the falls of the derrick and using this timber as a ram or hammer along the edge of the tube. No obstacle in the form of logs or boulders was encountered during the placing of the first three cylinders. When the fourth cylinder was within 2 ft. of grade, a large log was struck lying diagonally across the cylinder's location 13 ft. below water level. Attempts to remove the log by grappling hooks and dynamite proved of no avail. A large chisel was then made by forging and sharpening the end of an 80-lb. rail. This rail was suspended between the leads of a track pile driver and a section cut from the log by striking the rail with the hammer.

When all the tubes were down to grade and thoroughly cleaned out, seven 40-ft. piles were driven in each one and cut off just above the water line. The water was then pumped from the tubes and the interior filled with concrete. In only one instance was it necessary to deposit a seal of concrete in the bottom of the cylinder before pumping out. The concrete filling was carried to within 14 in. of the top of the tubes and levelled. Four bolts, $1\frac{1}{4}$ in. in diameter and 15 in. long, were set in the concrete, 6 in. of the bolt protruding above the surface of the concrete. The upper ends of these bolts had been threaded and provided with nuts. Circular concrete cap slabs had been cast with an I-beam grillage in each slab for the girder bearings, before the work on the bridge began. These caps were placed in position on the four bolts by the derrick. The exact elevation of each cap slab was obtained by adjusting the nuts on the four bolts that supported each slab. Two pieces of 3-in. iron pipe had been cast into each slab extending from top to bottom, and through these two openings cement mortar was forced, after the slab had been set to line and grade. This mortar filled the 6-in. space between the concrete deposited in the cylinder and the under side of the slab, also the small annular space between the sides of the cylinder and the slab.

The usual concrete abutments were then built at the ends of the bridge, the girders placed in position and the bridge completed. The bridge was built in mid-winter, concrete being placed when the temperature was as low as 10 deg. below zero. The water and concrete aggregates were heated and the interior of the cylinders kept warm by steam coils.

Bridge No. 6, 12 miles west of Sault Ste. Marie, Mich., on the main line to Marquette, was originally a timber frame trestle, with a deck Howe truss 129 ft. long on pile piers spanning the stream. The total length of the bridge was 452 ft., and the height above normal water 49 ft. This bridge was replaced by a steel trestle 436 ft. long, with a 104 ft. 6 in. girder over the stream. The tower spans are 31 ft. long. The two towers on each side of the stream rest on concrete filled steel cylinder piers. The remaining towers rest on concrete piers of the usual type. The stream is known as the Waiska river, and is 155 ft. wide and 17 ft. deep at the crossing.

Soundings showed that the bed of the stream was composed of

stiff red clay to a great depth. Large quantities of logs and driftwood were found on the bottom. The cylinders were made 8 ft. in diameter, and were built of $\frac{3}{8}$ -in. steel plates. This enabled a $1\frac{1}{4}$ -yd. orange peel bucket to work inside the cylinder, which hastened the sinking. The toughness of the clay rendered the excavation more difficult than in the case of the Sturgeon river bridge. Also the friction along the sides of the cylinders was great enough to prevent their sinking, as the interior was excavated. A frame of heavy maple timber was made and placed on top of the cylinder. An old pile driver hammer was fastened to the falls of a small boom derrick and used to drive the cylinders by striking the timber frame. A hand line fastened to the hammer made it possible to place the blows on various parts of the frame, which kept the cylinder plumb and the settlement uniform.

Seven piles were driven in each cylinder, which was then pumped out without sealing the bottom with concrete. Leveling bolts with sleeve nuts were set in the top of the concrete. An I-beam grillage was used on each cylinder instead of the concrete cap. This grillage was brought to proper level by the leveling bolts and to proper line by shifting the grillage on the bolts. The grillage was then concreted in to form a cap for the pier.

The cylinders were handled and placed by a steam derrick working on the deck of the old bridge. This derrick also handled the concrete mixer. When each cylinder was ready for concrete, the mixer was placed by the derrick upon a staging directly over the cylinder and the concrete discharged into the interior without handling. The same method was used in placing the concrete in the piers under the towers on the shore. The boom derrick and hoisting engine which operated the orange peel bucket were handled by the derrick and moved from place to place as necessary.

This steam derrick was built from an old steam shovel which had been badly damaged by rolling down a steep embankment and was not considered worth repairing for shovel work. The work of remodeling was done by the motive power department. Its present lifting capacity is 20 tons. It is self propelling and is used on bridge work in place of a work train.

To utilize the second class timber released from bridges recently rebuilt, a small portable saw-mill has been purchased and set up at Marquette in the building which houses the rail saw. During the winter months when the rail saw is not much used, the electric power is utilized to saw this timber into smaller sizes for building purposes. Practically all of the rough building lumber used for the past two years in building construction has been resawed from used bridge timber.

RENEWING TRESTLE STRINGERS WITHOUT DELAY TO TRAFFIC

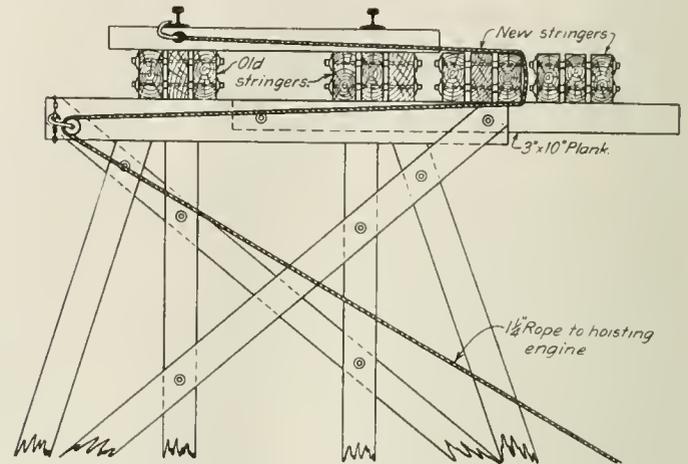

By S. C. TANNER

Master Carpenter, Baltimore & Ohio, Baltimore, Md.

In renewing the stringers in the trestle approach to the Baltimore & Ohio coal pier at Curtis Bay, Md., it was essential that the work be handled without delay to the trains of coal which pass over this trestle to the pier every 10 or 15 min., day and night. Any interference to these trains would have meant considerable delay in the yard operation and to the traffic on the road, as well as inconvenience in the loading of ocean liners.

A scaffold was built along one side of the trestle by bolting 3-in. by 10-in. planks to the caps and the new stringers were hoisted to this scaffold by the derrick shown in the accompanying illustration. The ties were then turned with the framed side up in order to make a smooth surface over the tops of the stringers, after which the track was spiked to the ties and the ties spiked to the stringers on the side opposite the scaffold. By jacking up the track on the side adjacent to the scaffold the new stringers on the scaffold were pulled under the ties between trains. A $1\frac{1}{4}$ -in. rope run from a hoisting engine on the ground

through a snatch block at the opposite end of the cap, around the new stringers and back to the opposite rail, was used for pulling in the stringers, the old ones being pushed ahead until they touched the stringers on the opposite side. The second new set was then pulled under in the same way until they touched the first set, making a solid tier of timbers under the ties. After removing the spikes from the old stringers on the opposite side and jacking up the track on that side, the first set of old stringers was pulled out to the ends of the caps and the other set of old stringers and the first set of new ones pulled over to replace them. This allowed the second set of new ones to be pulled into the permanent location. The bolts were then removed from

Sketch Showing Method of Pulling in New Trestle Stringers Without Weakening the Structure

the first line of old stringers and the timbers dropped to the ground, after which the second set of old stringers was pulled out to the end of the cap and the first set of new stringers pulled into its permanent location. Any parts of the old stringers that were worth saving were snubbed down to the ground with a rope to prevent their being damaged.

This method insured safety, as the new stringers took some of

Hoisting New Stringers to Scaffold Alongside Trestle

the load from the old ones and had a tendency to make the structure stronger rather than weaker during the renewal. The ties were turned back with the framed side down, and the work completed without the necessity for even reducing the speed of any train. A stretch of 580 ft. was renewed in this way at a cost less than would have been possible by any method I know of.

PLACING THROUGH GIRDER SPANS BY LATERAL MOVEMENT

By E. W. FAIR

Supervisor Bridges and Buildings, Buffalo, Rochester & Pittsburgh,
Du Bois, Pa.

The Buffalo, Rochester & Pittsburgh has replaced a number of steel bridges in the past three or four years by assembling the new structure on falsework alongside the old and pulling it laterally into place, using heavy bridge dollies bolted to the ends of the girders in place of the bridge shoes. This method of supporting the new spans is objectionable, however, on account of the delay involved in jacking up the bridge and removing the dollies after the new structure has been put in place before traffic can be carried over it. For this reason a method has been developed by which the span is moved on rollers between two sets of rails. In this case it is only necessary to block the rollers to allow traffic to pass over the new structure, the permanent shoes being placed later.

In the case of bridge No. 202.01, the old structure was a double-track through plate girder span 62 ft. 6 in. long, with a middle girder between tracks and a spacing of 31 ft. 2 in. center to center between outside girders. This bridge was replaced by a through girder span of the same length without a middle girder, carrying a solid concrete floor. On account of the dense traffic the new span was assembled and riveted up on falsework west of the old track, the concrete floor, ballast and ties being put in place on the new bridge. As it was necessary to cut down the masonry abutments and place new concrete bridge seats, pile bents were driven to support the old span and these were capped at an elevation low enough to allow jacks to be placed on them after the new span had been rolled into place to remove the rails and place the shoes.

Three 100-lb. rails were placed on the falsework under the new span at each end close together with the ball of the rail up, and extending over the new bridge seats. The new span was assembled on two 100-lb. rails with the ball of the rail down, these rails being fastened together with bolts extending through joint holes with wooden filler blocks to keep them from turning. Steel rollers 2 in. in diameter were laid between the two sets of rails at 18-in. intervals and were also placed in position on the lower rails ahead of the new structure ready to receive it in rolling into place. The end floor beams were in line with the sole plates, providing a support for the two rails carrying the new span. The center rails on the bridge seat were extended out over falsework on the east side erected to receive the old span when moved out to make room for the new.

Two wrecking cranes were used to make the movement, the cars being placed as close as possible to the ends of the bridge. The old span was raised and girder dollies placed under each corner, after which it was pulled out on the falsework at the east side and the new span pulled in from the west. This change was made between 6:10 a. m. and 7:25 a. m., the actual time of pulling the new structure into line being only 8 min. The steel in this bridge weighed 315,220 lb., and the concrete deck 180,000 lb. In addition to this the span carried the limestone ballast and ties. A similar bridge 76 ft. 6 in. long in which the steel weighed 452,778 lb., and the concrete deck 225,000 lb. in addition to ballast and ties, was rolled into place on old 5-in. bridge pins, the track being out of service only 1 hour and 45 minutes.

No trouble was experienced in rolling these bridges into place and a probable saving in time of at least one or two hours was effected in addition to the greater convenience and security of this method. The difficulty experienced with the dollies was that they had a tendency to skew and bind on the flanges of the dollies, causing one or more of them to slide, which gave considerable trouble in moving heavy spans. With the free movement of the load on rollers it was found that by hitching the pulling lines near the center of the span the bridge could be moved evenly at both ends, although there might be a stronger pull on one line than on the other. The ease with which the heaviest of these two spans could be moved was

demonstrated by placing a No. 6 Barrett track jack at each end and moving the span without difficulty with six men.

REPLACING HOWE TRUSS SPANS WITHOUT FALSEWORK

By J. B. SHELDON

Supervisor Bridges and Buildings, New York, New Haven & Hartford,
Providence, R. I.

When it became necessary to renew the New York, New Haven & Hartford double-track bridge over the Blackstone river in Woonsocket, R. I., the two Howe truss spans of 146 ft. and 91 ft., respectively, were replaced by three deck plate girder spans, one of 91 ft. and two of 73 ft. The intermediate bearing for the girder spans replacing the long trusses was provided by a steel tower supported on a concrete pier built up a few feet above the water level.

The base of rail was about 47 ft. above the river and the water was about 11 ft. deep. In order to reduce the cost of falsework to the minimum consistent with safe operation of the bridge during construction, a number of changes were made in the old Howe trusses. The old trusses, which had been built in 1876, had been strengthened in 1890 by placing pile bents at each end under the second panel to reduce the chord strain. In order to permit raising the bridge seats at the ends of this span to receive the new girders the main braces at the ends of the old trusses were changed to incline away from the bridge seats and the bottom chord was cut in front of the bridge seats, making cantilever spans at the ends of the old trusses, the temporary pile supports serving as

Renewing a Howe Truss with Two Girder Spans. The New Span on the Right Is in Place, the Other Is Supported from Overhead Bents During the Removal of the Old Floor System

abutments. Also to permit the erection of the tower on the new center pier to support the new girder span the bottom chords of the trusses had to be cut and to carry the load mud sills were placed on each side of the new pier foundation and frame bents erected, after which the counter braces for two panels at each side of the center of the trusses were reinforced to act as the main braces of the two spans which were formed by the cutting of the bottom chord. The top chords of the old trusses were not cut until after the girders had been placed and the old trusses removed.

The new girder spans were riveted up on a nearby siding and taken to the bridge on flat cars. When spotted above their permanent location they were raised from the cars by manila rope lines and tackle blocks hung from overhead timber bents, supported from the piers below. The lead lines to these hoisting blocks were handled by a locomotive at each end of the structure, the lines being long enough to allow the flat cars to be pulled out one at each end, and to stand on the structure between the girders and the locomotive. With the new span held by the locomotives the floor system of the old bridge was dropped into the river and the girder spans were then lowered into position between the outside and the middle trusses of the old bridge. These girders were placed on three successive Sundays when traffic over the line was the lightest. About 20 trains were operated over a single track during the 10 hours that the one track was blocked, while removing the floor of the old bridge and placing the new girder span. The cost of temporary falsework for carrying traffic was thus avoided. The cost of all work in connection with installing the new steel, riveting the girders, towers, etc., was \$7.20 a ton. The work was handled by the company's maintenance forces under the direction of the writer.

RENEWING A BUSY MAIN LINE BRIDGE ON THE SANTA FE

By L. C. LAWTON

Division Engineer, Atchison, Topeka & Santa Fe, Newton, Kan.

During the latter part of 1914 the three-span deck girder bridge carrying a double track over the Cottonwood river at Florence, Kan., was replaced by a four-track through girder structure of the same span length in order to provide additional waterway without a raise in grade, and additional tracks to carry a heavy main line traffic and numerous yard movements. This bridge is located between the east and west yards of an important freight junction, the new tracks forming a part of a new yard plan which will be the beginning of a four-track system. This is a coal and water station for all freight trains and the new arrangement will permit two or three trains to come into the yards from either direction and take coal and water without blocking the main line. These tracks will also serve as switching leads to both yards.

As in most trunk line work, it was necessary that traffic should not be interfered with, and to prevent it, falsework for one track on the north side was driven. This was located so as to carry one of the new tracks and crossovers were so arranged that any two of the three tracks could be used as part of the double-track main line. All falsework was built to carry any train under ordinary control in yard limits.

The old masonry was of local limestone in large blocks, well cut and pointed, and with the exception of the west abutment and several pedestal blocks was in very good shape. The east abutment, however, had been built on the fill, and had to be taken out and a concrete gravity abutment placed on solid rock 37 ft. below the base of rail. To carry the ends of the girders while this was being done, a double bent was driven to clear the toe of the new abutment, and to carry the track over the excavation falsework was driven back of the abutment and was connected to the girders by boxing in a frame bent between the ends of the girders to carry the stringers from the last bent. The same method was used on the west abutment, as the entire top had to be removed.

On account of the change in depth of girders, the old masonry had to be raised several feet. This, together with the fact that the old piers were much thinner than the present standard requires, made necessary the adding of a jacket of concrete 2 ft. thick on each side of the piers. Holes 36 in. apart in horizontal rows, 18 in. apart vertically and 12 in. deep, were drilled in both sides of the old piers and hooks made of reinforcing bars were placed in these holes, wedged with track spikes, and later grouted. To these hooks were fastened a network of 5/8-in. bars spaced 36 in. horizontally

and 18 in. vertically at a distance of 4 in. from the forms. This frame work was so well set that it was used as a ladder by the carpenters in completing the forms. These bars were carried around the ends of the old masonry into concrete extensions and above it, where the pedestal blocks and coping had been removed, into a solid cap 5 ft. thick. The concrete under the girder shoes was reinforced in the usual way.

On the south side a temporary material track was built up to the west end of the bridge, with its end elevated on frame bent so that rock and sand for concrete could be unloaded from dump cars. A cement shed was also built adjacent to it, of old roundhouse doors framed so as to be easily put up, taken down and transported. A light roof of tar paper on sheeting went with it. A floor of old boiler plate was placed for stone under the end of the material track, which made the shoveling much easier and quicker. A cantilever runway was built along this side of the bridge for handling all material on barrows from this end to the mixer set up over the forms on bents. Both piers and the abutment were built up for the full length as high as concrete could be run under the girders from this side.

While this was being done, material for the falsework first mentioned was received and placed, after which the north

Placing 70-ft. Through Girder with Wrecking Crane and Derrick Car

ends of the piers and abutments were completed by using this for a runway. It was not practical to spout or wheel concrete across the tracks, nor could material be unloaded except at one end of the bridge. This made a long barrow haul for part of the material, but the relatively small amount of the work, 3,300 cu. yd., did not justify a more expensive outfit. The labor cost of unloading, mixing, and placing concrete was \$1.08 per yard. This included the piping of water and steam, building of runways and scaffolds, moving mixer and unloading all material, but not the building of forms or placing reinforcement, other than that laid during pouring of concrete. The labor on forms was \$0.52 per yard of concrete, which was rather high on account of their enclosing much old masonry.

There are three new girders in each span. To make room for the center one, the south track had to be thrown 22 in. This was done by moving the deck girders onto new frame pedestals by lifting and pushing with heavy jacks and by lining the falsework and track with them. This allowed the bridge seat in the center to be completed, its top being nearly 2 ft. above the bottom of the old girders. The remainder of the top course of the piers and abutments was not finished until the old girders had been taken out.

On account of the narrow space in which to work, only one mixer could be used. The work was laid out so as to keep this working as much as possible, by keeping the excavating out of the way of the forms, and the latter well ahead of the concrete. It was necessary to move the mixer oftener in this way, so as to allow time for building forms after the foundation had been poured, as it was found that by getting the forms nearly completed and well braced from top to bottom before pouring, a big saving in form work could be effected.

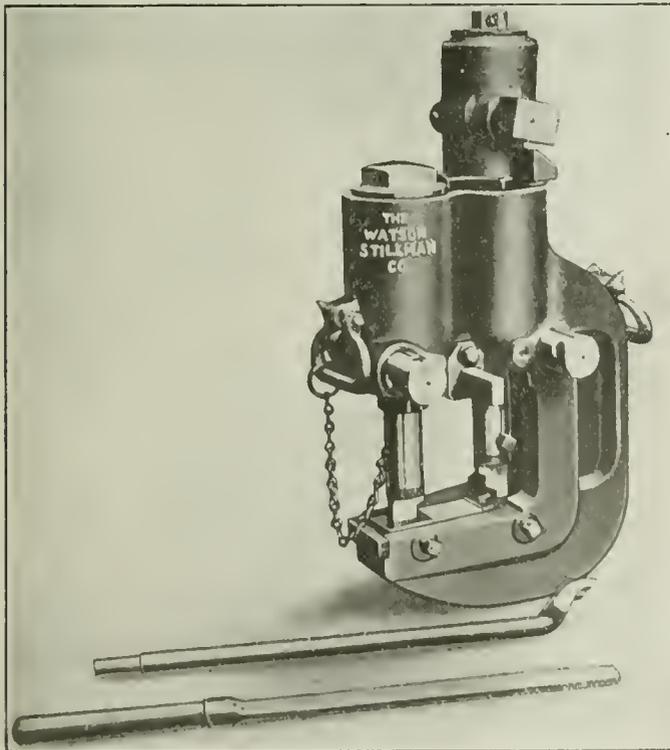

All concreting was completed well before freezing weather except that part placed under the center girder after the old

bridge was shifted. As this had to hold up the major portion of the bridge, it was especially important that it should not be frozen and that it should be well cured. This work was done during a very cold spell in December, as it could not be held up, on account of the schedule of the steel gang. The concrete was mixed with hot water and was still warm when placed in the form. Over this section in each abutment and pier was erected a shelter of canvas, and two oil stoves were placed in each. These were kept going for three weeks on account of the unusually cold weather for that month. The heat was not great enough to dry out the concrete—in fact, it was kept damp by melting snow on the bridge and canvas, but it did let it set under very favorable conditions, and proved to be as hard as any when points for shoes were set.

The steel was placed by company force, which has been found much cheaper than by contracting it. All work was done by a large derrick car with a capacity of 45 tons, except the placing of the new girders, where the division wrecking crane took one end and the derrick the other. A creosoted floor for ballast deck was placed after the laying of the floor beams, and the track put in service on the south bridge while the floor was being put in on the north side.

A NEW DUPLEX SPIKE SLOT HYDRAULIC PUNCH

The Watson-Stillman Co., Aldene, N. J., has brought out a new hydraulic punch for cutting out two spike slots in railroad or conductor rails at one setting. The advantages of this tool are that two holes can be punched on opposite sides of the rail at

Duplex Spike Slot Punch

one operation in exact alignment, thus saving in the time usually consumed in laying out centers and changing the machine from one side of the rail to the other.

By referring to the illustration it will be seen that one punch is attached to a chain. To use the machine this punch is removed, the tool is then placed against the rail and the loose punch replaced in position. The punches are then run down to the rail by pinions which mesh into racks on the rams, and a few strokes of the pump lever completes the operation, the return being effected by means of the racks and pinions. The whole action

takes only two minutes and requires but a small amount of effort.

The punch is built compactly and is designed to give maximum strength for minimum weight, so that it may be easily and quickly handled when time is a factor. The working parts are readily accessible for cleaning and the punches and dies are removable for sharpening, renewal, etc.

THE ROADMASTERS' CONVENTION

The thirty-third annual convention of the Roadmasters' and Maintenance of Way Association will be held at the Auditorium Hotel, Chicago, from September 7-10 inclusive. From the interest already shown, this meeting should be one of the largest attended in the history of this association. In addition to individual papers, several committee reports will be presented, including those on new and experimental track accessories and tools, and on the proper organization of section forces and methods for handling and policing track (1) for high-speed, heavy traffic railroads; (2) for lightly constructed railroads carrying heavy traffic; (3) for large terminals.

The program in detail is as follows:

Tuesday, September 7, Morning—Convention called to order at 10 a. m.

Afternoon—2 p. m. to 6 p. m. Business session. Reading of committee reports and general discussion.

Evening—7:30 to 10 p. m. Business session. Reading of committee reports and general discussion.

Wednesday Morning—9 a. m. to noon. Business session. Reading of committee reports and general discussion.

Afternoon—12:45 p. m. Members will leave the Chicago & North Western Terminal on a special train at 1 p. m. to inspect various terminals, including the new clearing yard.

Thursday Morning—9 a. m. to noon. Business session. Reading of committee reports and general discussion.

Afternoon—1:30 p. m. to 6 p. m. Business session. Election of officers. Selection of the next convention city.

Evening—A theatre party for the ladies will be given by the Track Supply Association. The fourth annual banquet will be given by the Track Supply Association for the members and guests of the Roadmasters' and Maintenance of Way Association at the Auditorium Hotel.

Friday Morning—9 a. m. to noon. Business session. Reading of committee reports and general discussion.

Afternoon—1:30 p. m. to 6 p. m. Business session. Reading of committee reports and general discussion.

Equally promising is the outlook for the exhibit of the Track Supply Association. Up to August 12, 59 firms had made reservations for space as compared with a total of 51 last year, which exhibit was the largest up to that time. As in the past the exhibits will be confined exclusively to tools and appliances for the track department and will consist almost entirely of full sized units rather than models. In addition to the regular track accessories ordinarily found, such as rail anchors, guard rail clamps, tie plates, splices, switchstands, etc., there will be other exhibits such as acetylene lights, motor cars, track tools, etc. As in previous years the exhibit will be located on the top floor of the Auditorium Hotel, adjacent to the convention hall.

The following firms will exhibit:

Aeme Supply Company.
American Flexible Bolt Company
American Guard Rail Fastener Company
American Hoist & Derrick Company
American Steel & Wire Company.
American Valve & Meter Company
The Anchor Company
Ajax Forge Company
T. B. Bowman.
Carnegie Steel Company.
Commercial Acetylene Railway Light & Signal Company
Composite Tie Plate Corporation
Bruce V. Crandall.
Creep Check Company
Cretar Adams Company
Dalton Risley & Associates
Daniels Safety Device Company
The Duff Manufacturing Company
The Efficiency Rail Anchor.
Elliot Frog & Switch Company
Fairbanks, Morse & Co.
Fairmont Machine Company
Franco Manufacturing Company

Exhibitors at Roadmasters' Convention (Continued.)

- Frictionless Rail.
- Hathfield Rail Joint Company.
- Hayes Track Appliance Company.
- Harry C. Holloway.
- Hubbard & Company.
- Indianapolis Frog & Switch Co.
- Ingersoll-Rand Company.

THE ANNUAL COST OF TIES

By J. G. SULLIVAN

Chief Engineer, Canadian Pacific, Winnipeg

Formula (2), submitted by the Tie committee of the American Railway Engineering Association last March, gives the annual cost to maintain a tie as follows:

$$I + A = \frac{CR(1+R)^N}{(1+R)^N - 1}$$

Where C = First cost of tie in place.

A = Amount at compound interest which will provide for renewal at the end of the life of the tie.

R = Rate of interest.

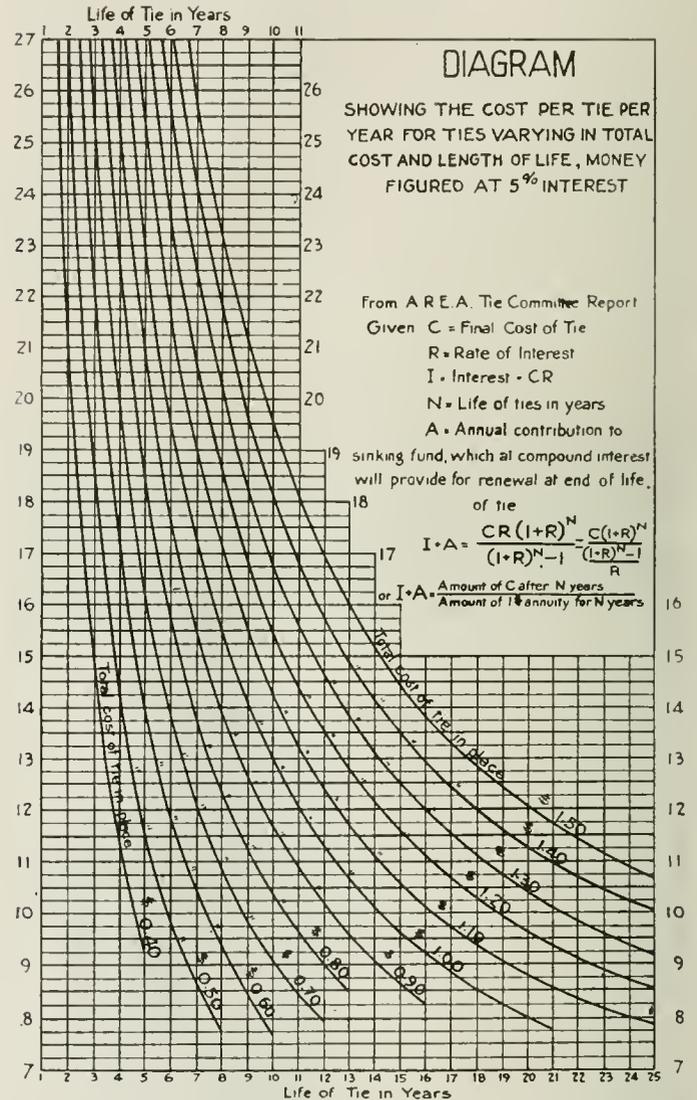

N = Life of tie in years.

I = Interest on the first cost.

While this formula appears somewhat complicated, it is not

so formidable if it is divided up into factors which can be taken from compound interest tables.

For the use of our tie department and engineers, I have had three diagrams made up, showing the value of I plus A, from which the annual cost per tie can be taken for ties costing from \$0.40 to \$1.50, and varying in life from 2 to 25 years. These diagrams would be much easier to use if they showed only the value of "A"; that is, the amount required to be subscribed annually to form a sinking fund which would purchase a tie. To this would be added direct the interest on the first

Curves Showing the Cost Per Tie Per Year for Varying Original Costs and Life

cost of the tie. This would have a slight advantage over the present form in a case where the cost of the present tie will differ from the estimated cost of the new tie. The same result, however, can be obtained by taking from the diagram the annual cost, using the estimated value of the new tie, deducting from this the interest per annum at the given rate on this difference. For example, if we estimate that it will cost \$0.80 to renew a tie which cost \$0.75 in place, and will last 8 years, money figured at 5 per cent, we take from the diagram the annual cost of an \$0.80 tie lasting 8 years, which is \$0.124 and deduct from this the interest at 5 per cent on the difference in the actual cost and the estimated cost of the renewal, 5 cents, which is \$0.25, making the annual cost \$0.1215 instead of \$0.124.

ANNUAL COST OF TIES													
LASTING VARIOUS LENGTHS OF TIME, COSTING IN PLACE VARIOUS SUMS													
MONEY FIGURED AT 5% INTEREST													
LIFE IN YEARS	COST IN PLACE												
	\$0.40	\$0.50	\$0.60	\$0.70	\$0.80	\$0.90	\$1.00	\$1.10	\$1.20	\$1.30	\$1.40	\$1.50	
1	0.420	0.525	0.630

The Annual Cost of Ties of Various Life and Original Cost

THE UGANDA RAILWAY.—The new Port Bell-Kampala Railway in Uganda was opened for all classes of traffic on July 1.

Laying Rail with the Help of Locomotive Cranes

Lehigh Valley Finds That Laying Rail with Cranes Is More Economical and Interferes Less with Operation

The Lehigh Valley has been employing locomotive cranes experimentally when relaying rail to throw out the old rail and place the new, thereby doing away with the customary tong men. One of the early trials of this method was made on the Beaver

Heeling in a Rail on the Beaver Meadow Branch

Meadow branch in the anthracite coal territory on June 28. On this day $2\frac{1}{2}$ track miles of 76-lb. and 80-lb. rail was replaced with 90-lb. rail in 14 hours actual working time, with one crane. A total of 832 33-ft. rails were laid in 840 minutes, the machine also throwing out the old rail as it moved forward.

Eighty-six men were employed on this work. Fourteen men

Throwing Out the Old Rail

pulled the spikes from the old rails in advance of the machine. It was necessary to pull both rows of spikes on the greater portion of the work and many rail braces had to be removed from the old rail. Six men assisted the machine in handling the rail, one operating the rail clamps, one man spiking each end of the rail in place, one man forcing the rail in against the row of old

spikes with a bar, and one man on each end to guide the new rail in place. Two men cut the joints on the old rail at intervals of about 15 rail lengths. On curves, eight men adzed the ties on both sides of the rail and removed a large number of small tie plates. Twenty-five men spiked and gaged the new rail, 25 put on the splices and six men with picks and shovels moved the ties to enable these splices to be inserted.

The line was double tracked at this point and the rail gang was given the use of the eastbound track while the work was under way. The locomotive crane worked on a heavy descending grade with a maximum of 2.5 per cent. for 5,000 ft. This grade was for the most part on curves up to 13 deg. Under these severe conditions no trouble was experienced in operating the locomotive crane. An old locomotive tank was placed back of the crane to provide sufficient water, as there were no water stations in this vicinity.

As this was the first time that this gang had worked with a maeline in this manner, some delay was experienced. Also, as the new rail had a considerably larger base than the old it was necessary to remove the old tie plates and to adze the ties before the new rail could be laid. About five rail lengths of old rail was thrown out at a time.

Based on this experience, a stretch of 4.7 track miles, including four switches, was relaid with 100-lb. rail and all the old material

Working on the Buffalo Division

loaded on cars on the Buffalo Division on July 15. Four locomotive cranes were employed for this work, one starting on each rail at the outer limits of the work and all working towards the center. The organization was similar to that described previously. A foreman, six laborers and a crane operator accompanied each crane, while other men followed the cranes, full bolting and spiking the new rail and uncoupling the old rail.

The first crane started work at 6:23 a. m., and the last crane at 7:45 a. m. The last crane completed work at 12:51 noon. The four cranes were employed 20 hours and 27 minutes, including 73 minutes total detention. In this interval 1,313 rails were laid, or an average of 64 per crane hour. The maximum average per crane hour was 76.5.

Following these cranes were air loaders picking up the old material. After the locomotive cranes had completed laying the rail they returned and assisted in this work, all material being loaded ready for shipment at 6:30 p. m.

Based on these results the Lehigh Valley now proposes to

adopt the standard practice of unloading all new rail with machines, laying it with locomotive cranes and picking up the old rail by machinery the same day. This will not only result in the work being done faster and more economically, but will reduce very materially the interference with operation.

This method has been devised under the general direction of G. L. Moore, engineer maintenance of way.

THE ITALIAN-ENGLISH COURSE OF THE PENNSYLVANIA RAILROAD

Of the 140,000 employees of the Pennsylvania Railroad east of Pittsburgh and Erie, over 11,000 are Italians. Practically all of these men have entered the service of the road in the last few years and their numbers are increasing steadily. They are found in nearly all branches of the service as is illustrated by the following census taken on the Manhattan Division:

Conductor	1	Stoker operator	1
Engineer	1	Laborers	344
Clerks	3	Stvedores	14
Foreman	1	Boiler cleaners	2
Assistant foremen	0	Coal trimmer	1
Stenographers	2	Sweeper	1
Telegraph operator	1	Assistant doorman	1
Signalman	1	Wiper	1
Painters	4	Repairmen	4
Riggers	16	Car builder	1
Watchmen	2	Wireman	1
Scalemen	4	Blacksmith helpers	2
Shop hand	1	Track walkers	5

The greatest number are to be found in the maintenance of way department. This is illustrated more particularly by a similar census of 553 Italian workmen employed on the West Jersey & Seashore Railroad and the Camden Terminal Division.

Subdivision foremen	7	Crossing watchmen	73
Subdivision assistant foremen	11	Bridgemen	7
First laborers	4	Station laborer	1
Track watchmen	57	Car cleaners	15
Laborers	380		

A considerable number of these men are advancing from the ranks of laborers to positions of responsibility. A canvass several months ago showed that there were 75 Italian section foremen and 187 assistant foremen on the road. On the Pittsburgh Division 27 of the 53 track foremen and 42 of the 52 assistant foremen were Italians. Men of this nationality take to track work readily and many other efficient workmen would be promoted to assistant foremen and foremen if they were able to read and write the English language. To assist these men to acquire a knowledge of English, the railroad is preparing an Italian-English correspondence course for all who desire to avail themselves of

THE TRACK GAUGE
Fig. 4

Inglese

THE TRACK GAUGE

The track gauge shown in Fig. 4 is to ascertain the correct distance between rails. Its length is four feet eight and one-half inches. Anyone using it must take care to place it across the track, at right angles to the rail, as shown in Fig. 5. This shows how to use the gauge to determine the proper distance between rails. The end of the single point of the gauge is placed first on one of the rails and the forked end on the other. The two points of contact of the forked end of the gauge should each be against the rail.

Italiano

LA MISURA DELLE ROTAIE

The track gauge è la misura per ottenere la distanza esatta tra le rotaie. Essa è lunga quattro piedi e otto inches e mezza. Chi l'adopera deve aver molta cura a collocarla a traverso le rotaie, a guisa ad angolo retto con la rotaia, come è dimostrato nella Fig. 5. Questo dimostra come si usa la misura per determinare la dovuta distanza tra le rotaie. L'estremità della punta semplice della misura è posta prima su d'una delle rotaie, e poi l'estremità che termina a forza sull'altra. Ciascuna delle due punte di contatto della forza dovrebbe essere contro la rotaia.

CORRECT WAY TO USE TRACK GAUGE
Fig. 5

A Typical Page Illustrating the Use of Track Tools

the opportunity of educating themselves in this regard, and over 2,000 men are already enrolled. This course is conducted by an Italian, the lessons being prepared with the co-operation of officers of the road experienced in the various subjects covered.

At the present time 12 pamphlets have been prepared. The first three give corresponding English and Italian words side by side and also short elementary sentences, including common track terms. The next five give descriptions and instructions regarding the use of the common tools, such as the jack, the gage and the ballast fork, with photographs showing the right and wrong ways of using them. Lesson 10 gives in detail the various signal rules,

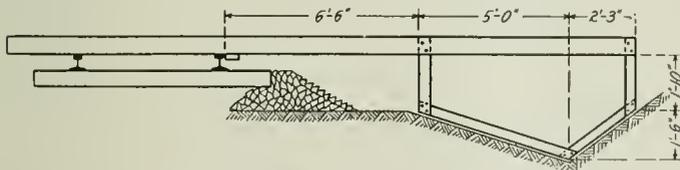

with illustrations, taken from the standard book of rules. Lesson 11 is devoted to the procedure of naturalization, while lesson 12 is a general discussion of the elementary rules for the preservation of the health. In these books the English and the Italian are placed side by side, so that the men can learn the corresponding terms to express the same idea. All illustrations and lessons refer directly to track work, incorporating the standards of the road.

DIGGING TRACK DITCHES

BY KENNETH L. VAN AUKEN.

Some track men do not take the trouble to do a first-class job of ditching, but leave the ditch with poor lines on the sides, an uneven bottom and various other irregularities which are not only unsightly, but greatly reduce the actual drainage afforded to the track. In most cases it is just as easy and cheap to do a good job. The whole problem is to organize the gang and to arrange the work so that no extra dirt is excavated and so that a correct line and bottom are assured. The foreman should take advantage of the ability of his best laborers to raise the standard of the entire work. In any gang there will be some men who are more conscientious than the rest, and who do much better work. The organization should be based, if possible, on a nucleus of such men with the idea that they will serve as guides to the others, and also as a measure by which the foreman can ascertain if the work is being done correctly.

Next to the correct placing of the men the efficient use of good tools and appliances is of the greatest importance. One of the most necessary implements for a ditching gang is a template to insure uniformity in the shape and gradient of the ditch. The template, or ditch gage, usually consists of a long plank or board to the end of which is attached a framework consisting of four strips, shaped to the standard ditch section. If available an old

A Simple Ditch Gage

spot board containing a level bubble may be utilized. When this template is placed across one or both of the rails in proper line and level, the gage will give the correct position of the ditch cross section. To insure correct line of the ditch a cleat or block may be nailed on the top strip of the gage at a point that will accurately center when this block is in bearing against the outside of the rail head.

While the ditch gage is an excellent tool, it is not always possible to use it on roads where the cuts are not all of standard width. In many cases it is necessary to change the alignment of the back of the ditch to prevent digging into and loosening the slope, or it may be necessary to vary the distance between the front line of the ditch and the track, while it is sometimes required to change the slope of the sides or the shape of the ditch entirely. When the front of the ditch has to be changed the ditch line should be set so that there will be no abrupt turn.

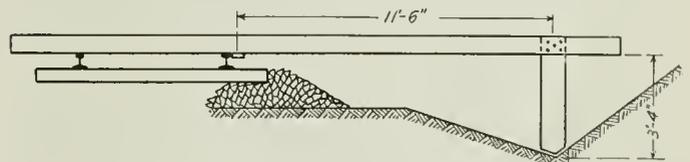

Where the ditch gage described above cannot be used a modification of this tool is found very useful. This consists of a straight board or strip similar to that used with the ditch gage, to which a single board is nailed on the outer end in a perpendicular position, to indicate the depth of the bottom of the ditch below the top of rail. A thumb screw may be used to fasten the short piece to the top strip, and then the depth of the ditch may be gradually increased or decreased as desired, by raising or lowering the perpendicular strip by means of the adjusting thumb screw.

The regular ditch gage is usually made for the shallowest depth of ditch. When it is desired to make a ditch deeper than this, a rule is used to measure down below the bottom of the framework. Where the standard practice of the road

requires the ditch to be widened as the depth increases, the increase in width should be obtained by moving the back ditch line further away from the track; the front ditch line should be kept straight and parallel with the track line if possible.

Ordinary No. 2 shovels are usually furnished for ditching. These can be used fairly well in loose material, but in hard clay special shovels or heavy bladed spades can be used to much greater advantage. One has only to note the kind of shovels used by the experienced excavators in large cities to realize what kind of a tool is best fitted for digging in hard material. These laborers, who follow excavating as a trade, will cut about three inches off the bottom of an ordinary No. 2 shovel, and cut the sides on a bevel to make the bottom about two inches narrower than the top. It is surprising how much dirt one of these excavators can handle with a shovel of this kind. They keep their shovels well sharpened, and use some sort of a metal plate on their shoes, which enables them to put more pressure on the shovel. The use of spades also results in a marked economy, provided the spades have backs of sufficient weight and strength. A cheap spade will be bent or broken a few minutes after it is placed on the job, particularly if it gets into the hands of an unskilled laborer.

It is much better to use some special kind of shovel or spade for excavating than to use ordinary No. 2 shovels supplemented by picks, in fact the use of picks should ordinarily be prohibited in ditching. A man will spend more time choosing between his shovel and pick than he does in actual work; and will frequently use the pick in material which is so soft that

A Depth Gage for Irregular Ditches

it is not needed, which means of course that he is wasting time.

The ditching gang on one division was organized somewhat as follows:—Two men were furnished a ditch gage like the one described and started out ahead of the gang, digging holes to the proper depth and line at intervals of about ten feet. Their work served to indicate the proper depth and slope of the sides of the ditch to the other laborers of the gang. The two best men in the gang were assigned to this work so that the foreman was sure that it would be done right. His supervision was thereby reduced to seeing that the rest of the laborers dug out the ditch between, in accordance with the holes excavated by the leaders.

This organization obviated the necessity for a gang of finishers and kept the laborers from digging out the dirt too deep. Two tie lines, one on each side of the ditch, insured good alignment. The traffic was quite heavy where this work was in progress and when it was impossible to have the loading train continuously on the work, the laborers were kept busy digging the ditch and piling the dirt on the shoulder. Then when the work train again came out the men were all used to load the material on cars. Although this involved handling the dirt twice it resulted in the most efficient use of the work train as the loose dirt could be loaded much quicker than it could have been taken directly from the ditch. Where the traffic is heavy the main problem is to get the greatest efficiency out of the work train. The foreman did not push the men on the work of digging out the ditch when the work train was away, but rather encouraged them to take it easy. Then when the train arrived the work of loading was pushed as rapidly as possible.

It is extremely difficult to do good ditching in a wet clay cut by hand—it may even require men on the cars to take the clay off the shovels. While there may be some question as to the use of a ditching machine in a dry cut where there is not much material to be moved, its use is surely advisable in wet cuts

where a large amount of excavation is required. At such a place the use of a ditcher will result in an immense saving, and in fact it is about the only way in which a real job of ditching can be done. It is almost impossible to keep a gang of laborers at all where the work becomes very disagreeable.

It is hardly necessary to state that ditching should always be started at the lower end of a cut, and yet one often sees this rule violated. If the ditch is begun at the upper end of the cut and there is a rain before the work is completed the water which cannot drain out will put the ground in such condition that it may be impossible to do any work for several days; while if the ditch is started from the lower end of the cut the water which finds its way to the ditch will have a ready outlet.

ABSTRACT OF ENGINEERING ARTICLES

The following articles of special interest to engineers and maintenance of way men, to which readers of this section may wish to refer, have appeared in the *Railway Age Gazette* since July 16, 1915:

New Lehigh Valley Passenger and Freight Terminal at Buffalo.—The Lehigh Valley has started construction recently on a comprehensive terminal development at Buffalo. This work was described in an illustrated article in the issue of July 23, page 158.

The Metropolis Bridge Over the Ohio River.—The Chicago, Burlington & Quincy and the Nashville, Chattanooga & St. Louis have joined in the construction of a railroad extending from Metropolis, Ill., fifteen miles east to Paducah, Ky., including a bridge across the Ohio River. This structure is 5,442 feet in length, with a channel span 723 feet long. The general details were given in an illustrated article in the issue of July 23, page 160.

The Pennsylvania's 1915 Rail Specifications.—The Pennsylvania has been engaged for two years in the preparation of specifications for carbon steel rails and in the design of a new 125-lb. section, both of which embody several unusual features. These specifications and a diagram of the section were published in the issue of July 23, page 165.

The Engineer in Maintenance Work.—The relative opportunities offered to the engineer in construction and maintenance work were discussed editorially in the issue of July 30, page 183, the trend of the editorial being that greater opportunities for promotion and for continuous employment are presented in the maintenance of way department.

The Essential Qualities of Good Steel Rails.—A frank discussion of the present status of rail manufacture and of some of the difficulties now confronting the securing of rails of the proper quality was presented by Gustav Lindenthal in the issue of July 30, page 187. Mr. Lindenthal also suggests a new section of rail which is better adapted to rolling than the present T-rail.

The Railway Lines of Syria and Palestine.—The seldom heard of lines of these countries were described in an illustrated article in the issue of July 30, page 199. This article was largely devoted to the physical characteristics and the types of construction of these roads.

The Alaskan Government Railroad.—The progress on the construction of this line from Seward to Fairbanks was outlined in an article in the issue of August 6, page 230.

Ventilating the Stampede Tunnel of the Northern Pacific.—The Northern Pacific has recently placed in service a ventilating system at its Stampede Tunnel, two miles long, located at the summit of the Cascade Mountains near Easton, Wash. The equipment installed here was described in an illustrated article in the issue of August 6, page 234.

Canadian Pacific Draw Span Over the Lachine Canal.—An electrically-operated double track deck plate girder swing bridge over the Lachine Canal near Montreal, Que., has recently been opened to traffic by the Canadian Pacific. This bridge, which includes a deck plate girder swing span 239 feet 7 inches long, was described in the issue of August 6, page 239.

New Pittsburgh North Side Freight Station of the P. R. R.—The Pennsylvania Railroad has recently completed a new freight station for the handling of local and transfer freight in Pittsburgh, embodying a number of interesting features, which were described in an illustrated article in the issue of August 6, page 245.

Underground Cables on the Pennsylvania Railroad.—The Pennsylvania has recently completed the placing of its telephone, telegraph and signal cables underground from Jersey City to Rahway, N. J. The details of this interesting work were presented in an illustrated article in the issue of August 13, page 269.

A New Coal Dock for the Cincinnati, Hamilton & Dayton at Toledo.—During the season of closed navigation last winter, the Cincinnati, Hamilton & Dayton constructed a modern coal handling plant at Toledo. This, the most recent of the lakes' coal handling plants, was described and illustrated in the issue of August 13, page 273.

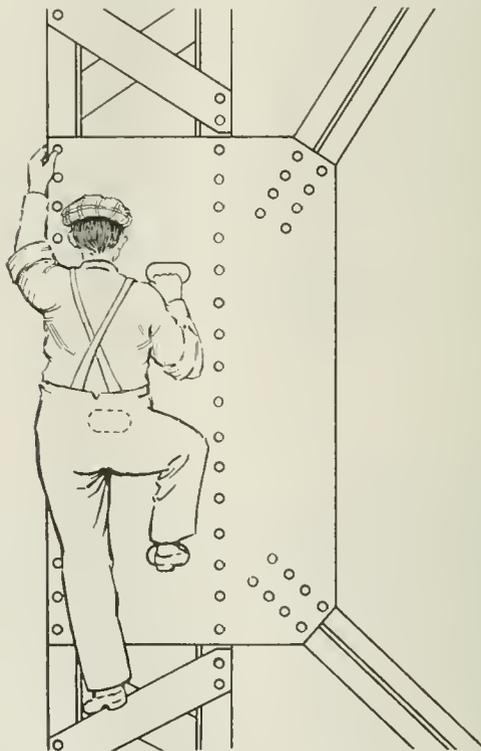

Solid Deck Trestles and Bridges on the Illinois Central.—In the construction of 34 miles of second track north of Memphis, Tenn., the Illinois Central built about 9,500 feet of concrete trestles. The interesting details of the design and construction were presented in an illustrated article in the issue of August 13, page 279.

A New Bridge Over the Missouri River at Kansas City.—The Chicago, Burlington & Quincy has recently let contracts for the construction of a new bridge across the Missouri River at Kansas City to replace the old Hannibal bridge originally built in 1869. The new structure is designed for a live load consisting of two E-90 engines followed by 7,500 lb. per ft. of track. Nickel steel will be used for the eye-bars and silicon steel for all main truss members. The details of this structure were presented in an illustrated article in the issue of August 13, page 284.

SAFETY FIRST IN BRIDGE INSPECTION

Bridge inspection must be made with a minimum of scaffolds if it is to be done quickly and efficiently, and it requires a cool head and well knit muscles. A bridge inspector is thrown almost entirely on his own resources in his effort to gain access to all parts of the structure, for, as a rule, little thought is ever given by the designer to the arrangement of details, or the addition of special devices which will be of assistance to the inspector in climbing around on a large steel bridge or viaduct.

On the Chicago, Milwaukee & St. Paul a special effort has been made to make all parts of steel bridges accessible to inspection with the minimum of risk. One feature of high viaducts which has always been a formidable obstacle to anyone who has found it necessary to climb tower columns is the large gusset plates used for bracing connections which are frequently from 6 to 8 ft. deep. This has been overcome satisfactorily as shown in the accompanying sketch. Handholes are provided in

Sketch Showing the Use of Hand Holes in Gusset Plates

the plates at convenient intervals as a substitute for the lacing which is interrupted by the presence of the large plates. The idea was originated by C. F. Loweth, chief engineer, after having observed personally the risk to which men were subjected in climbing by these plates.

Another serious matter for the inspector has been the inspection of plate girder spans more than 5 ft. in depth. This has been overcome at very little expense by providing 15/16-in. holes in the outstanding legs of the web stiffeners, to be used as holds either for a finger or a hook as the man walks along the bottom flange of the girders.

Devices such as these can be had at very little additional expense aside from the exercise of thoughtfulness on the part of the designer, and as a rule require no particular refinement of workmanship. For instance, in the case of a handhole, all that is necessary is the removal of burrs and sharp edges which would tend to cut the hands.

General News Department

The New York Central, which has in New York City three private telephone exchanges, at Grand Central Terminal, at Mott Haven passenger car yard, and at the West Side Freight Terminals, is introducing the automatic or "girlless" exchange.

The Interstate Commerce Commission has withdrawn the option which railroads heretofore had under the commission's accounting rules of charging the cost of additions and betterments amounting to \$200 or less to either property account or to expenses. These small expenditures must now be charged to property account.

The Pennsylvania Railroad reports that the Broadway Limited, the 20-hour train of that company, running daily between New York and Chicago, 908 miles, arrived in Chicago on time on 92 per cent. of its trips during the first six months of 1915, and was more than two minutes late only on 15 out of the 181 days. The eastbound train was on time 163 days; and on time or not over 5 minutes late over 90 per cent. of its trips. Throughout the month of June it arrived in New York on time every day.

The Pacific Mail Steamship Company has sold five of its largest steamships to the Atlantic Transport Company. This is in preparation for the discontinuance, heretofore announced, of the line between California and Asia, made necessary by the severe requirements of the new "seamen's law." The last sailing from San Francisco for the Orient will be August 25. The new owner expects to operate two of the ships through the Panama Canal and the others on the Atlantic.

The Committee of Engineers which has been organized to present matters to the New York Constitutional Convention, and whose report on the qualifications of public service commissioners was noticed in the *Railway Age Gazette*, August 6, page 244, has written a letter urging the adoption of an amendment introduced by A. R. Latson providing for the abolishment of a number of existing state departments and their consolidation into a department of engineering and public work, which would have charge of all public lands, state buildings, parks, roads and canals, and of the conservation and development of the natural resources belonging to the state. The office of state engineer and surveyor, commissioners of the land office and the canal board would be abolished, their duties being transferred to the new department. The plan would insure continuity of policy by the provision of three commissioners instead of a single head to administer the department, the incumbents to serve for long overlapping terms.

The United States Civil Service Commission announces an examination, September 14, for candidates for the position of assistant supervisor of accounts in the division of valuation, Interstate Commerce Commission, salaries from \$3,600 to \$4,800. Applicants must be not over 50 years old. In the rating of candidates experience will count 85 per cent. and the announcement issued by the Commission prescribes the following conditions: "Applicants must show in their applications that within the last seven years they have had at least five years' responsible practical accounting experience in railroad or other common-carrier service, as controller, assistant controller, auditor or assistant auditor, or in public practice (as certified public accountant) in the direction of the examination of accounts of common carriers or other important public utilities, and drawing and presenting, by written report, conclusions from the facts developed in the investigations of the accounts of such utilities, or in the supervision of the accounting work of the Interstate Commerce Commission; or that they have had five years' combined experience in the several services indicated; or that they have had within the two years last past satisfactory responsible experience for at least six months with a State commission in the supervision of the accounts of common carriers, or in charge of such commission's valuation accounting work of common carriers, reporting to a state commission engaged in the effectual regulation of the

accounts of such carriers, and that immediately preceding such experience they have had at least five years' responsible accounting experience in common-carrier corporate, fiscal and general accounts, or in the supervisory examination of the accounts of public utilities, or that within the last seven years they have had at least five years' combined experience in the services indicated. Certified public accountants applying for this examination must show, in their applications, that they hold certificates obtained as the result of examination. Accounting experience acquired in the position of auditor of small steam or electric railroads or of other common carriers with limited operations, or accounting experience of a routine or non-responsible character with larger carriers, or public accounting experience along commercial lines, will not be considered. No exception can be made to these requirements."

Disastrous Flood at Galveston

The city of Galveston, Texas, on August 16, 17 and 18 suffered from a hurricane and tidal flood which is reported to rival in costliness the disaster of 15 years ago. More than a score of persons were drowned and hundreds of buildings were destroyed, including large grain elevators. By the destruction of a part of the bridge or causeway by which all trains enter the city, railroad communication will be suspended for probably two weeks. In south and central Texas half the crops have been ruined, involving losses of many millions.

New Locomotive Inspection Rules

In accordance with the Act of Congress, passed last March, to extend the authority of the Interstate Commerce Commission over the inspection and testing of the entire steam locomotive and tender, rules and instructions have just been formulated by the Division of Locomotive Boiler Inspection. These will be considered at a conference with a railroad committee on August 23, at which time it is hoped that an agreement may be reached before presenting the rules to the Commission for approval. These rules are set forth in a 15-page pamphlet and cover ash pans, brake and signal equipment, cabs, warning signals and sanders, draw gear and draft gear, driving gear, lights, running gear, tenders and throttle and reversing gear.

The Ticket Seller's Best Asset

[By Oscar L. Mitchell, General Southern Agent, New York Central, in *L. & N. Passenger Bulletin*.]

Having been in the harness of the passenger traffic department for almost 25 years, I would like to say a word to the beginners. . . . It should be your pleasure to see to it, as far as you possibly can, that every single passenger or party using your line is made comfortable and happy all the way, whether his journey starts on your road, ends there or whether you are one of the intermediary lines; when you satisfy and please this man you earn his friendship, that of his family and of his friends, and he is always glad to see you and to help you. Let me tell you, you need the help and friendship of everyone possible. Of course, you can't have everybody strong for you, but try to have no one strong against you. The best asset you can have is a pleased and satisfied customer. A Hebrew friend of mine once told me, when you shake a man by the hand, put your heart in it, so that he can feel the beats are for him, and that you do not want to beat him. Getting through with a man quickly and getting rid of him, as some agents are prone to do, is bad business not only for your company but for yourself. Whatever you do don't argue with a customer. You know, very likely, what his wishes are. It is an old story to you, but he may not travel more than once a year and is absolutely in the dark and cannot always grasp your ideas and terms readily. . . . Take good care of the little things and you will get a chance at some of the big ones. . . .

Operations began May 1, 1915. Figures shown here are for two months, ending June 30, 1915.

REVENUES AND EXPENSES OF RAILWAYS

FISCAL YEAR ENDING JUNE 30, 1915—Continued

Table with columns: Name of road, Average mileage operated during period, Operating revenues (Freight, Passenger, inc. misc., Total), Maintenance of Way and equipment, Operating expenses (Traffic, Trans. portation, Miscel. laneous, General, Total), Net operating revenue (or deficit), Railway tax accruals, Operating income (or loss), Increase (or decrease) comp. with last year.

* Operations began January 1, 1915. Figures shown here are for six months, ending June 30, 1915. † No figures reported for year. Operations began July 8, 1914.

The "Old Guard" of the B. & O.

About a thousand members of the "old guard" who have served the Baltimore & Ohio Railroad for a generation, held their first annual reunion at Berkeley Springs, W. Va., on Thursday, August 12, the Martinsburg division of the Veterans' Association being the host.

The reunion brought together many of the older employees from all parts of the system, some of whom have spent more than 50 years in railroad service and had not met since they separated during the Civil War. There were 60 men present who had worked for the railroad a half century.

General Manager C. W. Galloway was the leader of a large delegation from Baltimore, who were carried in a special train, with members of their families and their grandchildren. Mr. Galloway is the third generation of his family to see service on the Baltimore & Ohio, and is the grandson of the first horse-driver and later the first locomotive engineer of the road.

Z. T. Brantner, superintendent of the shops at Martinsburg, W. Va., is the president of the Veterans' Association.

Conemaugh Division Roll of Honor

The "roll of honor," adopted as a substitute for bulletins telling of punitive discipline, as put in use by Andrew Keiser, superintendent of the Conemaugh Division of the Pennsylvania Railroad, was noticed in the *Railway Age Gazette* of March 26 last, page 689. With a view to reducing the number of cases requiring discipline, Mr. Keiser posted a bulletin showing the names of all conductors, enginemen, brakemen and firemen whose record of freedom from discipline was clear for the whole twelve months of the year 1914, omitting from the list men who had not been in active service throughout the whole year. About 400 men out of 700 found their names on the list.

Mr. Keiser has now reported the results for the first six months of 1915, and he shows, as compared with the first half of 1914, a decrease of 62 per cent. in the number of cases requiring discipline; 71 per cent. decrease in the total number of days' suspension of employees, and 72 per cent. reduction in the amount of wages lost by employees because of suspension. This last item represents a saving to employees and their families of \$5,666.

Low-Cost Life Insurance for Employees

The Brooklyn Rapid Transit Company, operating and controlling extensive surface and elevated street car lines in Brooklyn, N. Y., has issued a circular to employees announcing that if a sufficient number of persons employed by the company and its subsidiaries shall take advantage of the offer, the company will have their lives insured by the Travelers Insurance Company, of Hartford, and the employer will pay half the premium on a policy of \$1,000. The insurance will be what is known as term insurance, insurance taken for one year, but renewable from year to year. Under this arrangement, the premium to be paid increases each year. For example, for a person of eighteen years it is \$7.47; twenty-one years, \$7.59; thirty years, \$8.14; thirty-five years, \$8.65; forty years, \$9.46; fifty years, \$13.64; sixty years, \$27.72; sixty-five years, \$42.65, and so on. These represent the gross sums, paid by the railway company, one-half in each case to be subsequently deducted from the employee's pay on the payroll. Term insurance is not usually favored by insurance companies, but in this case, apparently, the Brooklyn Rapid Transit Company has secured concessions by promising a large contract. Employees will have the privilege of changing to ordinary forms of policies, with cash surrender privileges, etc., and will not have to take a new medical examination; that is to say, will have the same privileges as though the final contract had been made when insurance was first taken out. The company's offer to bear one-half the expense applies only to a policy of \$1,000, but employees may take larger policies, at their own expense, within certain limits. If 5,000 employees accept this offer, no medical examination will be required. If less than 5,000, but more than 1,000, the insurance company will ask a certificate of the railway company's physician, but no rigid medical examination will be required. The employee must be over fifteen years of age, and must have been in the employ of the company for two years or more; and it is said that there are over 8,000 persons thus eligible. Employees must be members of the Employees' Benefit Association, if eligible thereto, so that there may be no competition between the two schemes of insurance. In the case of pensioned

or disabled employees, the railway company expects to pay the entire premium on \$1,000.

The plan will not go into effect unless at least 1,000 employees desire to join.

Chief Interchange Car Inspectors and Car Foremen

The seventeenth annual convention of the Chief Interchange Car Inspectors' and Car Foremen's Association of America will be held at Murphy's Hotel, Richmond, Va., September 14-16. This is the first time that the meeting of the association has been held so far south, and it is suggested that this will offer a good opportunity for southern railroad men to attend.

Foundry and Machine Exhibition

The Foundry and Machine Exhibition will be held on Young's Million Dollar Pier, Atlantic City, from September 25 to October 1. This is the first time in three years that the exhibit has been held in the east and there will be a keen interest in it in that section particularly. Business conditions in this line are improving everywhere, and the attendance promises to be large and the exhibit a profitable one for the exhibitors. From all indications, therefore, the exhibit should be as successful as the one in Chicago last year. C. E. Hoyt, the secretary, has opened an office in the Bourse, Philadelphia, for the convenience of exhibitors and others desiring information or help of any kind.

Master Blacksmiths' Convention

The twenty-third annual convention of the International Railroad Master Blacksmiths' Association was held at the Walton Hotel, Philadelphia, Pa., August 17 to 19, T. F. Buckley, foreman blacksmith, Delaware, Lackawanna & Western, presiding. The meeting was opened with prayer by the Rev. Father Stapleton, followed by the president's address and the address of welcome, by Edward J. Catel, statistician of the city of Philadelphia. C. E. Chambers, superintendent of motive power, Central Railroad of New Jersey, spoke on the "Progress of Foremen Blacksmiths in Railroad Service," and Charles E. Carpenter, president of E. F. Houghton & Co., gave a talk on general subjects, concluding with a brief reference to heat treatment of steel. A further report of the convention will appear in a later issue of the *Railway Age Gazette*.

The following companies have exhibits at the convention:

Acme Machinery Company, Cleveland, Ohio.—Machine forgings manufactured with Acme machines. Represented by C. W. Durschlag.

Ajax Manufacturing Company, Cleveland, Ohio.—Machine forgings, products of Ajax forgings machines. Represented by J. R. Blakesley, A. L. Guilford, J. A. Murray and C. E. Wicks.

Anti-Borax Compound Company, Fort Wayne, Ind.—"E-Z" welding compound. Represented by Chas. O. Kahre.

Houghton, E. F., & Company, Philadelphia, Pa.—Case-hardening materials, quenching oils and compounds, finished heat-treated products and a line of mechanical leathers. Represented by Emil Nissen, W. J. Boyd and J. W. Kelley.

MEETINGS AND CONVENTIONS

The following list gives the names of secretaries, dates of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next meeting, October 21-23, 1915, Boston, Mass.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next meeting, August 19-20, 1915, San Francisco, Cal.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burrett, 8 W. 40th St., New York. Annual convention, October 4-8, 1915, San Francisco, Cal.

AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—H. G. McConaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 19-21, 1915, Detroit, Mich.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.

ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Annual meeting, 2d Tuesday in October, 1915, New York.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—JOS. A. ANDREUCCI, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual meeting, October, 1915.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, C. H. & D., Lima, Ohio. Annual meeting, August 17, 1915, Philadelphia, Pa.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next meeting, October 19-21, 1915, St. Louis, Mo.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 14-16, 1915, Detroit, Mich.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.

RAILROAD MEN'S IMPROVEMENT SOCIETY.—J. B. Curran, Erie R. R., 50 Church St., New York. Meetings, alternate Thursdays, October to May. Assembly Rooms of Trunk Line Association, 143 Liberty St., New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1063 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Next meeting, October 5-7, 1915, Chicago.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Annual meeting, September 14-17, 1915, Salt Lake City, Utah.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Annual meeting, September 14-16, 1915, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, C. R. I. & P., 1134 La Salle St. Sta., Chicago. Annual meeting, October 19-21, Colorado Springs, Colo.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.

TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEWARK.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, 559 Broad St., Newark.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Hotel Astor, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Agt., Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., East Buffalo, N. Y. Annual meeting, September 7-10, 1915, Chicago.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.

WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Building, Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

Traffic News

A regular meeting of the Southern Classification Committee will be held at the Hotel Sherman, Chicago, on November 8. The docket closes 30 days prior to that date.

The Canadian Pacific expects to carry 15,000 harvest workers to the northwest provinces between August 19 and August 28. Reduced fares are provided and special trains will be run where necessary.

The troublesome Shreveport rate situation may bring on a clash between the Interstate Commerce Commission and the Texas Commission. Railroad Commissioner Earle B. Mayfield, of Texas, threatens to have the state attorney general file suit against the Texas railroads to enjoin them from obeying the recent order of the federal commission commanding them to apply the same freight rates to Dallas and other points in Texas as are applied to Shreveport.

The express companies operating in New York state have filed with the Public Service Commission, Second District, new tariffs for the transportation of merchandise showing increases similar to those which have been allowed for interstate traffic, the changes to take effect September 1. In Georgia the express companies have presented a petition, asking similar authority, to the State Railroad Commission, and that body will give a hearing on the subject August 25.

A committee of Texas shippers has requested of the Interstate Commerce Commission a suspension until January 1 of its supplementary order in the Shreveport case. The basis of the request is stated to be: First, that great confusion is certain to follow the establishment of new rates; and second, that the Texas Commission has now before it applications from Texas carriers for an advance in rates which are likely to be decided before the end of the year.

The Southern Railway and its affiliated lines are to make exhibits at thirty state, district and county fairs in the North and Middle West during the coming fall. A fine collection of grains, grasses and forage crops will be shown. From the wheat-growing section of the South, grain sheaves will be shown from fields yielding as high as 40 bushels to the acre. The first two exhibits will be shown at fairs in Indiana. For all fairs in the middle west a special exhibit tent has been provided, arranged so that a large number of people can see the exhibit at the same time.

Duluth shipping interests are preparing to contest before the Interstate Commerce Commission the general advance in rail and lake rates recommended on July 14, at a meeting in Chicago between representatives of eastern trunk lines, boat lines and Duluth-Twin City lines. The hearing will begin in Chicago on September 29. The shippers propose a scale of lake class rates from Buffalo to Duluth, based on 35 cents first class. The Duluth interests rely upon the latest decision of the commission to the effect that any class rates that exceed 83 cents, first class, from New York to the Twin Cities, rail-lake-and-rail, with corresponding rates from other points, would be unreasonable.

To show the magnitude of automobile traffic on Long Island General Manager McCrea, of the Long Island Railroad, has had a count made of the motor cars driven across his tracks. On Sunday, August 8, at the Merrick Road crossing, in Springfield, 9,408 automobiles passed between midnight and midnight. Of these 4,245 were eastbound and 5,163 westbound. At the Barnum Island road crossing, on the Long Beach branch, 4,739 cars passed in the same period, of which 2,620 were eastbound and 2,119 westbound. In the single hour from 11 a. m. to noon on Sunday, 845 motor cars passed over the Merrick road crossing. This is at the rate of more than 14 cars a minute, or about one every four seconds. Nearly all of these cars must have crossed the Long Island tracks at other points, not once but several times. Heavy pole gates similar to those recently put up on the Long Beach branch have been installed at Central Islip. The road has been authorized by the supervisors of Nassau county to install at certain points traffic posts similar to those used by the New York City traffic squad, to serve as route indicators for motorists.

The Arkansas Rate Situation

W. B. Biddle, receiver and chief traffic officer of the St. Louis & San Francisco, has issued a statement concerning the rate situation in Arkansas, appealing especially to "any person who believes in a square deal."

The Arkansas state freight rates have been in litigation for nearly eight years, and have twice been reviewed and passed upon by United States courts. In the first place it was held by the courts that the rates that the railroads were permitted to charge, taken in connection with the passenger rates then in force, did not give the carriers a reasonable compensation; that the roads were entitled to an increase of 33 1/3 per cent in their revenue. This decision of the courts was followed by a conference between the commission and the railroads, which resulted in the so-called "court tariff." The court tariff gave the Frisco road an increase of only 13 1/2 per cent in its freight revenues, but it was accepted in good faith, as an experiment, with the intention of asking for a revision if the results were unsatisfactory. This tariff remained in effect until the decision of the supreme court in the Minnesota rate case.

At that time the Frisco voluntarily reinstated its previous commission tariff, the one condemned by the court as affording inadequate revenue, so that pending the final hearing for the Frisco's application for higher rates the public might have the benefit of the low rates. This tariff was again taken into court and a decision rendered in April, 1915, which declared that under the rates established by the commission business was done at an actual loss. The Frisco then prepared and issued a new tariff, having in mind that the decision gave the road opportunity to submit a tariff that would represent the carrier's views of reasonable and defensible freight rates. Officers of other important Arkansas lines were consulted and changes were made at their suggestions. The Arkansas commission was advised of the terms of the tariff and a conference was requested for the purpose of securing an expression from the commission; but the tariff was rejected without any analysis of its terms. Thereupon the new tariff was put into effect by the Frisco. It was at once attacked by the commission; and, upon hearing, the court held that the new rates were unreasonable wherever they were in excess of the interstate rates then in effect into or out of Arkansas. The court, however, did not say that the revenue derived from the new tariff was excessive, either as a whole or as applied to the rates that were higher than the interstate rates; nor did the decision say that the new rates were unreasonable in and of themselves. Another new tariff was consequently prepared and went into effect on July 26, 1915.

In explanation of Frisco Tariff No. 2806, the one which was rejected by the commission, Mr. Biddle emphasizes the fact that it was intended to represent the views of experienced and responsible traffic men as to what constitutes fair and defensible freight rates. As it was, confessedly, a tariff made by the railroad itself, the rates shown therein could probably be held to be the maximum rates that the carrier felt that it should be permitted to charge. Mr. Biddle says:

"The rates carried by other lines in the state of Arkansas are not voluntary rates; they are made by the Arkansas commission and are protested by the roads. Many of the interstate rates into or out of the state of Arkansas are not voluntary rates; many of the rates carried in the surrounding states are not voluntary rates; so that in submitting what was believed to be a reasonable tariff some of these conditions were ignored to a large extent."

It is further stated that while the new tariff represented the judgment of the road's officers as to a reasonable basis of rates, the Frisco did not then and does not now hold that every rate in the new tariff is the proper one. The road is prepared to discuss the rates with the commission or with interested shippers, and make such modification as may be reasonable. In the matter of joint rates with other lines, the Frisco has never desired nor intended to discontinue making joint rates. It is ready to make them today; but so long as a different basis of rates prevails on different lines it is difficult to see how this can be accomplished. In conclusion, the statement insists that this is a plain business proposition; the road believes itself entitled to greater compensation than it is receiving and is preparing to use all honorable means to accomplish this result.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Rates on High Explosives to New England Points

Nitro Powder Company v. West Shore et al. Opinion by the Commission:

The commission finds that the present C.L. and L.C.L. rates on high explosives from Kingston and Port Ewen, N. Y., to Boston, Mass., and to other New England points, are unreasonable to the extent that they exceed the first-class and double first-class rates, respectively, between these points. One reason for these high rates is the lack of joint rates. The commission, therefore, describes through routes and joint rates for the future, and awards reparation. (35 I. C. C., 77.)

Cement Rates from Cape Girardeau, Mo.

Cape Girardeau Portland Cement Company v. St. Louis & San Francisco et al. Opinion by Commissioner Meyer:

The commission finds that the rates on cement in carloads from Cape Girardeau, Mo., to points in southern Arkansas, which are not at least three cents per 100 lb. lower than the rates from St. Louis, Mo., to the same points are discriminatory. In like manner it is found that the rates from the same point to points in Louisiana west of the Mississippi, to points in Mississippi, except points on the Mississippi river, and to points in Kentucky and Tennessee, west of the Tennessee river, except Paducah, Ky., and Memphis, Tenn., which are not at least two cents per 100 lb. lower than the rates from St. Louis, are discriminatory. Combination rates on cement in carloads from Cape Girardeau to points in southern Illinois are found unreasonable and discriminatory in favor of competing points in Missouri, Illinois and Indiana, and reasonable maximum joint rates are prescribed. (35 I. C. C., 109.)

The Ogden Gateway Case

In re increased passenger fares via the Denver & Rio Grande through the Ogden and Salt Lake City gateway. Opinion by Commissioner Harlan.

A very brief resumé of this case was given in this column last week. The Union Pacific has proposed to cancel the joint passenger fares in effect since 1897 in connection with the Denver & Rio Grande between points in the territory of the Oregon Short Line and points east of and including Colorado common point territory. The issue originally dealt with a proposed cancellation of through rates, which would have eliminated an option whereby patrons traveling between the eastern points designated and points on the Short Line could use the Denver & Rio Grande between Denver and Ogden or Salt Lake City. The decision was enlarged, however, to include all the joint rates in effect with the Rio Grande mentioned.

The route via the Union Pacific and the Short Line from Omaha to Pocatello, Idaho, is 383 miles shorter than the shortest route over the Burlington to Denver, thence by the Rio Grande to the gateway and the Short Line beyond. The Union Pacific in addition to operating the most direct route to this and similar points, also operates the faster and more adequate service. The route of the Rio Grande has been used very extensively by passengers to and from points on the Short Line, the reason being that the scenic effects over the former are among the best in the country.

The Union Pacific contends that it has a legal right under Section 15 of the act, to cancel the through route arrangements and joint passenger fares in question because the route over the Rio Grande requires it to short haul itself. It wishes to give its system a longer haul than it now enjoys on this traffic and alleges that the rates (made on the basis of its own direct line) over the circuitous Denver & Rio Grande route are not sufficiently remunerative to either system.

The commission agrees with the carriers' contentions and will allow the cancellations proposed. It meets with approval a sug-

gestion that the round-trip tickets to Yellowstone Park be made available in one direction over the Rio Grande, and suggests itself that a through service still be maintained over the latter, although at higher rates than the present ones.

The commission does not perceive from the language of the act that it has any larger or different powers when dealing with tariffs by which it is proposed to cancel an existing through route than it has in connection with establishing a through route and just rates applicable thereto where no such route has already been established. The long continuance of a through route and of joint rates on traffic moving over it is often a fact of substantial importance and one that must always be considered; it has never been held, however, to be a controlling factor in any case. "Our authority in such matters is statutory and can not be enlarged by the previous course of the carriers. We think it clear that we have no power under Section 15, nor should we assume the power, to prevent the cancellation of through routes and joint rates voluntarily established by the carriers when, as in this case, the circumstances and conditions are such as would not warrant an order to compel such arrangements if not already in effect."

Commissioner McChord dissents (35 I. C. C., 131.)

The Cummins Amendment

The commission has issued the following:

"On May 7, 1915, the commission issued a report expressing tentatively its views upon various questions arising in connection with the Cummins amendment (*Cummins amendment*, 33 I. C. C., 682). Among other things, attention was called to the provision of Section 10 of the act penalizing any person who by false statement as to value, or by any other device, obtained or attempted to obtain transportation for property at less than the regular rates. The numerous inquiries regarding this matter indicate confusion in the minds of many as to the application of Section 10, and seem to render desirable a further expression of opinion by the commission upon this point.

"There is no provision in the act to regulate commerce, including the Cummins amendment, that requires a declaration as to the value of property shipped in interstate commerce; nor has the commission issued any ruling that requires such declaration.

"The Cummins amendment does, however, provide that if the goods are hidden from view by wrapping, boxing, or other means, and the carrier is not notified as to their character, 'the carrier may require the shipper to specifically state in writing the value of the goods.' In such cases rates and charges for transportation, dependent upon the value of the property shipped as specifically stated in writing by the shipper, may be established and maintained.

"It is the view of the commission that, so far as declarations as to value are concerned, the prerequisites for the application of Section 10 are—First, the election of the carrier to require a shipper to state in writing the value of the goods; second, the existence of graded rates or charges dependent upon the value of the property shipped; and, third, that the shipper shall knowingly and wilfully by false statement as to value obtain or attempt to obtain transportation for such property at less than the regular rates."

Anthracite Coal Rates to Chicago

Opinion by Commissioner McChord:

The commission finds that the carriers have justified a proposed increase of 25 cents per gross ton on anthracite coal, prepared sizes, all-rail in carloads from anthracite mines in north-eastern Pennsylvania to Chicago and Chicago rate points and to points of connection between eastern and western lines near Chicago, such as Joliet, Kankakee, Griffith and others, and to the other points of connection between such lines, Peoria, East St. Louis and St. Louis.

Through rates are effective on all of the lines from the mines to Chicago and to Chicago rate points and to Peoria, East St. Louis and St. Louis. Of the through rates, \$1.75 formerly constituted the division accruing to the trunk line carriers for the haul from the mines to Buffalo as opposed to the local rate of \$2 on all lines for that haul. But to points intermediate to Chicago and to other points in Ohio, Indiana and Michigan, to which no through joint rates apply, the rate applicable is made by the combination of the local \$2 per gross ton rate from the

mines to Buffalo and the local or reshipping rate from Buffalo west to destination, by which combination there is brought about a freight charge of 25 cents a gross ton more to those points which commonly take the same rate as Chicago than the former joint through rate to Chicago.

The entire increase of 25 cents is apportioned as compensation for that part of the through haul between the mines and Buffalo on shipments via Buffalo on the lines running to Buffalo, so that on such shipments carriers will receive no increase for that part of the through haul between Buffalo and the named points of destination, and the rate to Buffalo will be uniformly \$2, regardless of the destination of the shipments. But as to shipments moving west, not via Buffalo, over the Erie or Pennsylvania railroads, which extend by their own rails from the mines to Chicago, the increase is necessarily apportioned over the entire mileage from the mines to Chicago.

Respondents assert that they have proposed the increased rates in view of a complaint that certain discriminations against dealers in and consumers of anthracite coal in Ohio, Indiana and Michigan have been created by the effective rates.

This issue is determined by the commission's finding in the *Rates for Transportation of Anthracite Coal* (35 I. C. C., 220), where a rate of \$2 per gross ton was found to be reasonable for the haul from the mines to Buffalo. Nothing has been made to appear here that would warrant the commission's requiring the trunk-line carriers to accept less revenue on the transportation here involved than they receive to the intermediate points in Ohio, Indiana and Michigan. (35 I. C. C., 702.)

Rates on Railroad Fuel in Southeastern Territory

In the matter of rates, divisions, rules, regulations and practices governing the transportation of railroad fuel and other coal. Opinion by Commissioner Meyer:

The Seaboard Air Line, the Atlantic Coast Line and the Charleston & Western Carolina purchase the greater part of their fuel coal from the Clinchfield Fuel Company and other mines on the lines of the Carolina, Clinchfield & Ohio (owned by the same interests that own the Fuel Company) or its connections.

In 1914 these three carriers purchased something over 800,000 tons of coal from mines on the Clinchfield or its connections. The total tonnage of bituminous coal hauled by that railroad was 1,206,000; the railroad fuel coal constituted about two-thirds of this traffic, and about one-half of the total tonnage of all kinds. This shows how important it is that producers on the Clinchfield should secure the contracts of these three roads.

The fuel coal purchased by the Seaboard and moving via the Clinchfield is received at various junction points. Much of the Seaboard coal is delivered to it by the Clinchfield Railway at Bostic. The coal is billed to Ellenboro, but all of it is transported to Charlotte, Munroe, Hamlet, and Wilmington, N. C., which are points on the Seaboard beyond Ellenboro. Ellenboro is a small town of three or four hundred inhabitants, about 5 miles from Bostic, the junction point. The haul from the point of origin to Bostic performed by the Clinchfield Railway is approximately 240 miles, and so to Ellenboro the haul is approximately 245 miles. The joint through rate on coal between the points of origin and Ellenboro, the billed destination, is \$2.15 per ton. Under the divisions in effect at the present time the Clinchfield Railway receives 99 cents for its haul of 240 miles and the Seaboard receives \$1.16 for its haul of 5 miles. Below are shown the distances from Bostic, the junction point, to Ellenboro and to the points of consumption, together with the joint rates and divisions now effective from the mines to these points:

Station.	Miles from junction.	Rate per ton.	C., C. & O. division.	Seaboard division.
Ellenboro	5.7	\$2.15	\$0.99	\$1.16
Charlotte	72	2.25	1.35	.90
Munroe	97	2.25	1.35	.90
Hamlet	149	2.40	1.32	1.08
Wilmington	260.8	2.05	.92	1.13

The coal moves over the Clinchfield on a revenue waybill reading to Bostic, final destination Ellenboro. Upon the arrival of the coal at Bostic it is "reconsigned" by the agent to the various points of actual consumption, and the agent at Bostic takes into his accounts the Ellenboro waybills and issues from that point what are known as company deadhead waybills. That agent pays to the Clinchfield Railway its division of 99 cents of the Ellenboro rate. The coal is moved from Bostic to Ellenboro in through trains without stopping at that point. There is nothing in the entire transaction to indicate that the coal was at any time

destined to Ellenboro, except that that point was named in the initial waybill. The other two carriers receive their coal under like arrangements.

The findings of the commission are as follows:

The character of a shipment and not formal incidents, such as billing, determines the rate and divisions applicable. The rates and divisions to points of actual destination must be applied to railway fuel coal shipments here involved, and the application of rates and divisions to fictitious billed destinations is unlawful and can not be justified by the theory that such rates and divisions would be proper rates and divisions to the average point of actual destination.

A railroad company as shipper is entitled to the same consideration as any commercial shipper and no more, even when the shipment moves in part over the rails of such railroad company. It follows that in such case the carrier is entitled to a division of the joint through rate. But the division must be fixed by the same considerations which would determine divisions upon a through commercial shipment in which the railroad had no interest other than that of carrier. The divisions now received out of the joint rate on supply coal by the Seaboard Air Line, the Atlantic Coast Line, and the Charleston & Western Carolina for the hauls from their junctions are special and abnormal divisions.

The commission may fix divisions when a railroad company is the shipper or is owned by the shipper so that the division of a through rate might be the means of indirectly reducing transportation charges or effecting discriminations. Divisions here involved will not be fixed by order at this time, but carriers will be expected to adjust them to meet views herein expressed.

The commission may order that such divisions be filed with it and it is so ordered as to the divisions applicable to fuel coal shipments herein involved.

The commission states:

"The question of the proper method of handling fuel-coal rates and divisions is an old one, and the commission is impressed with the fact that some of the carriers have not endeavored to meet the views heretofore announced. We shall therefore look with great care to the steps taken by the carriers to meet the views herein set forth, and the next time we have to deal with a situation like that here presented we will do so under the criminal provisions of the act." (36 I. C. C., 1).

STATE COMMISSIONS

The Chesapeake & Curtis Bay Railroad Company has applied to the Public Service Commission of Maryland for authority to exercise its franchise, the purpose of the company being to take over the tracks in Baltimore which are owned by the United States Asphalt Company. It is proposed to extend these tracks to serve additional industries; but the Baltimore & Ohio is objecting to this proposal, claiming that the territory in question has been developed by the B. & O.

The Missouri Public Utilities Commission and the railroads of the State on August 10 reached an agreement under which grain rates will be increased approximately five per cent., subject to the approval of the Interstate Commerce Commission. The rates agreed upon are substantially the old schedule of interstate rates that were effective before the statutory rates were put in force. They are made applicable to both St. Louis and East St. Louis, without bridge toll, and will absorb necessary switching charges at points of origin and destination; and they also will permit milling-in transit or re-handling at intermediate points in Missouri without additional charge.

COURT NEWS

Railroad Not Liable for Injuries Caused by Ditch Constructed but Not Owned by It

A railroad company built its road through an unimproved street of a town, and its franchise from the town required it to square up the sides and bottom, and construct concrete retaining walls for the sides and bottom, of a certain ditch running along the street, which supplied its natural drainage. The ditch had no connection whatever with the railroad, and its improvement as required by the town was of no benefit to the railroad. The Alabama Supreme Court holds that the railroad was not liable for injuries to a pedestrian from falling into the ditch.—*Bush vs. Seaboard Air Line* (Ala.) 68, So. 1011.

Liability for Injury to Stalled Automobile

Through some unknown cause an automobile engine stopped on a railroad crossing in the open country. A heavy passenger train was speeding towards the crossing at 55 miles an hour from a point in plain view half a mile away. The occupants of the car stepped out and began to try to crank it and push it from the track. The engineer of the train made an emergency application of the brakes as soon as he had a chance to discover that the car was stalled on the track, but the train was not stopped in time to prevent a smash. The court held that, as the train could not have been stopped in time to avoid a collision with the automobile without serious injury to the railroad's property by the abrupt stoppage, the company was not negligent nor liable for the value of the car.—*McBeth v. Atchison, T. & S. F.* (Kan.), 148 Pac. 621.

[Liability for Assaults by Fellow Passengers

In Massachusetts a passenger sued a carrier for damages for an assault by another passenger in a train, where the conductor, and later a trainman, saw and knew that the passenger who was complained of, Peters, threatened plaintiff and did him some little violence, yet took no measure to protect plaintiff. The trial court directed a verdict for the defendant. In reversing and ordering judgment for the plaintiff, the Massachusetts Supreme Court said that a railroad company is not obliged to foresee the impossible or highly improbable, and it is not called upon under ordinary circumstances to expect that one passenger will assault another; or that because one passenger is engaged in frolic or sport with another, such conduct will result in injury to one of them. But where the circumstances and surroundings, conduct, speech or manner of one passenger toward another is such that violence or harm is likely to result, and the carrier has reasonable notice of such circumstances and conduct, and has the opportunity to take measures to prevent the threatened violence, then it becomes its duty to protect the threatened passenger. The conductor's knowledge alone might not have been sufficient to indicate the recurrence of trouble; but when the trainman came upon the scene, knew the plaintiff's complaints and saw Peters' conduct and heard his speech and did nothing, it became a question for the jury whether the company complied with the obligation resting on it of using the highest degree of caution in looking forward to and preventing injury to passengers, from all sources, consistent with its undertaking. *Lenberg v. New Haven* (Mass.), 108 N. E. 1046.

Steamship Owned by Railroad—Status Under Federal and State Liability Acts

In an appeal from an award of the New York Workmen's Compensation Commission for the death of an employe of the Southern Pacific while unloading a steamship berthed alongside a pier in the Hudson river, the New York Court of Appeals was called upon to decide as to the applicability of the act to the facts of the case. The steamship was owned by the railroad and plied between New York and Galveston. It did not appear that it was in any way operated in connection with a line of railroad. The railroad contended that the federal employers' liability act applied, and not the State compensation act. The court held that, as far as the present case was concerned, the railroad was a carrier by water. The act applies only to carriers by railroad. There is nothing in it indicative of a purpose to apply it to carriage by water if such carriage happen to be conducted by a railroad corporation, and not otherwise—to apply one rule of liability to transportation by a steamship line, if owned and operated by a railroad corporation, and a different rule to precisely similar transportation not thus controlled. The federal act provides a rule of liability of carriers by railroad for injury or death resulting "by reason of any defect or insufficiency due to its negligence, in its cars, engines, appliances, machinery, track, roadbed, works, boats, wharves or other equipment." It was held that the words "boats" and "wharves" might be given due effect by applying them as adjuncts or auxiliaries to transportation by railroad. The employment in which the deceased was engaged was not governed by the federal statute and the workmen's compensation act applied to it. At the same time the court held the latter statute to be constitutional. Decided July 15, 1915.

Railway Officers

Executive, Financial, Legal and Accounting

Asa G. Chandler, vice-president of the Atlanta & St. Andrews Bay, has been elected president, with headquarters at Atlanta, Ga., succeeding A. B. Steele, resigned.

Benjamin S. Crow has been appointed assistant general counsel of the Oregon Short Line, with headquarters at Salt Lake City, Utah. He will assume his new duties on September 1.

B. F. Bush, chairman of the board and president of the Missouri Pacific and the St. Louis, Iron Mountain & Southern, at St. Louis, Mo., has been appointed receiver for both these roads.

Operating

Paul F. Keating, superintendent of the Breckenridge division of the Great Northern, at Breckenridge, Minn., has been transferred to the Willmar division, with headquarters at Willmar, Minn.

John Bose, assistant superintendent of the Louisville & Nashville, at Mobile, Ala., has been appointed superintendent of the Louisville division, with headquarters at Louisville, Ky., vice E. E. Snyder, deceased.

A. V. Burr, superintendent of the Pullman Company at Houston, Tex., has been transferred in the same capacity to St. Louis, Mo., and H. J. Clark, district superintendent at New Orleans, La., succeeds Mr. Burr. Effective September 1.

E. M. Wrenne, assistant superintendent of transportation of the Nashville, Chattanooga & St. Louis, at Nashville, Tenn., has been appointed acting superintendent of transportation, succeeding to the duties of his father, M. J. C. Wrenne, deceased.

Joseph A. Caviezel, superintendent of the Alabama, Tennessee & Northern, at York, Ala., has been promoted to general superintendent, with headquarters at York, in charge of the operating and maintenance departments, and the office of superintendent has been abolished.

Traffic

R. J. Darnley has been appointed general agent of the Chicago, Burlington & Quincy, at Rockford, Ill., succeeding A. G. Everett, resigned.

William T. Price has been appointed commercial agent of the Union Pacific, with headquarters at Pueblo, Col., succeeding L. M. Tudor, assigned to other duties.

The jurisdiction of C. A. Fullen, general agent of the Chicago Great Western at Winnipeg, Man., has been temporarily extended to include the territory of the Fargo agency.

Thomas J. Kenniff has been appointed commercial agent of the Chicago, Milwaukee & St. Paul, with headquarters at Minneapolis, Minn., succeeding Truman H. Clark, resigned to engage in other business.

Omar Sanders, traveling freight agent of the Atlanta, Birmingham & Atlantic, at Birmingham, Ala., has been appointed commercial agent, with offices at Atlanta, Ga., vice Walter I. Middleton, granted leave of absence.

G. H. Corse, Jr., general passenger agent of the San Francisco Overland Routes, with headquarters at Yokohama, Japan, and Hongkong, China, has resigned to become special agent of the passenger department of the Union Pacific, with headquarters at Chicago.

The jurisdiction of the general freight agent of the First division, of the Atlantic Coast Line, has been extended to include all points north of the Savannah river. James F. Mead, assistant general freight agent at Jacksonville, Fla., has been appointed assistant general freight agent with office at Savannah, Ga., with jurisdiction in Georgia, Florida and Alabama, and his former position has been abolished. Robert Taylor, citrus fruit agent at Jacksonville, has been appointed division freight agent with office at Jacksonville.

E. W. Johnson has been appointed general dairy agent of the Merchants' Despatch (New York Central), with office at Chicago, and the position of general western agent has been abolished. G. B. Horr has been appointed western dairy agent, with office at Chicago, and the position of assistant general western agent has been abolished. S. D. Parkhurst has been appointed eastern dairy agent, with office at New York, vice E. E. Overpeck, deceased, and David P. Skinner has been appointed dairy agent, with office at Chicago, vice Mr. Parkhurst.

Purchasing

Edward J. Price, whose appointment as general storekeeper of the St. Louis & San Francisco, with headquarters at Springfield, Mo., has been announced, was born at Marion, Ill., on June 28, 1870. He was educated in the common and night schools and entered railway service on September 21, 1888, as messenger boy with the Union Pacific at Kansas City, Mo. He left the Union Pacific in June, 1891, and went to the Atchison, Topock & Santa Fe, which road he remained with until November, 1913, when he was appointed traveling storekeeper of the St. Louis & San Francisco, from which position he is now promoted as above noted.

OBITUARY

Elmer E. Snyder, superintendent of the Louisville Division of the Louisville & Nashville, at Louisville, Ky., since 1902, died on August 4, at the age of 53.

Mendes Cohen, a former well-known railroad engineer, died at his home in Baltimore, Md., on August 13, at the age of 84. Mr. Cohen began his career in the locomotive works of Ross Winans at Baltimore. From 1851 to 1855 he was in the engineering department of the Baltimore & Ohio Railroad. From 1855 to 1875 he served the following companies as superintendent, assistant superintendent, controller or president: The Hudson River Railroad, the Ohio & Mississippi and the Philadelphia & Reading; the Lehigh Coal & Navigation Company, and the Pittsburgh & Connellsville Railroad. He was long president of the Maryland Historical Society, retiring only two years ago.

M. J. C. Wrenne, superintendent of transportation of the Nashville, Chattanooga & St. Louis, at Nashville, Tenn., died in that city on August 10. He was born in August 1847, at Limerick, Ireland, and began railway work in May, 1861, as a clerk in the superintendent's office of the Nashville & Decatur, now a part of the Louisville & Nashville. Since May of the following year, he had been in the continuous service of the Nashville & Chattanooga, and its successor, the Nashville, Chattanooga & St. Louis, having served consecutively as clerk in the transportation department, trainmaster, superintendent, and then as general superintendent until January, 1899, when he was appointed superintendent of transportation.

THE RAILWAY ACCIDENT RECORD OF AUSTRALIA.—The various Australian states come out well in the matter of railway accidents, the latest five years to which statistics extend showing an average of 0.10 fatalities per 1,000,000 passengers carried in New South Wales. The corresponding average in Victoria was 0.09 per 1,000,000 passengers, and in South Australia 0.11. In the United Kingdom the average was 0.08 per 1,000,000 passengers carried; in Germany, 0.08 per 1,000,000 passengers; in Austria, 0.08 per 1,000,000 passengers; in Hungary, 0.26 per 1,000,000 passengers; in Belgium, 0.09 per 1,000,000 passengers; in Sweden, 0.08 per 1,000,000 passengers; in Hungary, 0.26 per 1,000,000 passengers; in the Netherlands, 0.07 per 1,000,000 passengers, and in Switzerland, 0.12 per 1,000,000 passengers. In the United States the average came out at 0.51 per 1,000,000 passengers carried. The worst showing was, however, made in Russia in Europe, which figured with an average of 1.47 fatalities per 1,000,000 passengers, and Asiatic Russia with an average of 4.19 per 1,000,000 passengers. The number of persons injured per 1,000,000 passengers carried was 2.36 in New South Wales, 3.37 in Victoria, and 3.68 in South Australia. In the United Kingdom the average came out at 2.15 per 1,000,000 passengers, in Germany at 0.44, in Austria at 1.92, in Hungary at 1.24, in Belgium at 3, in Sweden at 0.25, in Norway at 0.16, in the Netherlands at 0.48, and in Switzerland at 0.93.—*Engineering, London.*

Equipment and Supplies

LOCOMOTIVE BUILDING

THE ATLANTIC COAST LINE has ordered 10 Pacific type locomotives from the Baldwin Locomotive Works.

THE NASHVILLE, CHATTANOOGA & ST. LOUIS has ordered 3 Mallet (2-8-8-2), 5 Mikado and 2 Pacific type locomotives from the Baldwin Locomotive Works.

THE WISCONSIN & NORTHERN has ordered 1 superheater ten-wheel type locomotive from the American Locomotive Works. This locomotive will have 20 by 26 in. cylinders; 63-in. driving wheels and a weight of 168,000 lb.

THE SOUTH DAKOTA CENTRAL has ordered one ten-wheel and one Mikado type locomotives from the American Locomotive Company. The ten-wheel locomotive will have 18 by 24 in. cylinders, 60-in. driving wheels and a total weight of 136,000 lb. The Mikado type locomotive will have 20 by 28 in. cylinders, 52-in. driving wheels and a total weight of 178,000 lb.

CAR BUILDING

THE VIRGINIA-CAROLINA is in the market for 120 30-ton box cars.

WELLS, FARGO & Co. are inquiring for 35 express refrigerator cars.

THE PENNSYLVANIA LINES WEST are in the market for 100 underframes for caboose cars.

THE PITTSBURGH & LAKE ERIE has ordered 20 underframes from the Merchants Despatch Transportation Company.

THE NEW YORK CENTRAL has ordered 500 50-ton all steel automobile cars from the Haskell & Barker Car Company for the Michigan Central.

THE ATLANTIC COAST LINE is in the market for two 74-ft. coaches, one 70-foot combination passenger and baggage cars and two 70-foot baggage and mail cars.

IRON AND STEEL

THE SOUTHERN has ordered 4,000 tons of rails from the Maryland Steel Company.

THE PHILADELPHIA & READING has ordered 8,000 tons of rails from the Pennsylvania Steel Company and 2,000 tons from the Bethlehem Steel Company.

THE WESTERN PACIFIC has ordered 164 tons of steel for four 75-ft. single track deck plate girder spans in California, from the American Bridge Company.

THE CHICAGO GREAT WESTERN has ordered 167 tons of steel for three 70-ft. through plate girder spans, from the American Bridge Company.

THE CHICAGO RAILWAYS COMPANY has ordered from the American Bridge Company 309 tons of steel for girders and tie rods for the Van Buren street tunnel.

THE DENVER UNION TERMINAL COMPANY has ordered 419 tons of steel for passenger, baggage and express subways at Denver, Colo., from the American Bridge Company.

THE CHICAGO & WESTERN INDIANA has ordered 2,650 tons of rails from the Illinois Steel Company and 3,500 tons of steel for track elevation bridges, from the Morava Construction Company.

THE HANKOW-SZECHUAN GOVERNMENT RAILWAY of China, Robert W. Hunt & Co., Pittsburgh, Pa., consulting engineers, will receive bids until September 25 for 845 tons of steel for eight bridges on the Hankow-Ichang section. Specifications may be obtained from Robert W. Hunt & Co., Pittsburgh, Pa., for \$2.50.

Supply Trade News

It is reported that the French government is negotiating for the purchase of 6,000,000 white oak ties for railroad building in France.

The Walter A. Zehnick Supply Company, St. Louis, has purchased the stock and good will of the Bintliff Supply Company (successor to Bintliff & Herb), who were engaged in a general railway, mill and factory supply business and specialized in railroad track tools.

W. K. Millsapps, southwestern representative of the Grip Nut Company, Chicago, with headquarters at Houston, Tex., died on August 6, at Houston. Prior to his connection with the Grip Nut Company he was for several years general storekeeper of the Sunset Central Lines.

Charles B. Ellis, assistant to J. L. Replogle, vice-president and general manager of the American Vanadium Company, with office in New York, has become associated with the Bartlett-Hayward Company, Baltimore. Mr. Ellis was for many years with the Cambria Steel Company.

The Virginia Bridge & Iron Co., Roanoke, Va., has opened a branch office in the First National Bank building, Denver, Colo., to cover the territory embraced in the states of Kansas, Colorado, Arizona, New Mexico and Utah. The office will be in charge of A. R. Peyton, who has been associated with the Virginia Bridge & Iron Co. for some years as contracting engineer.

The Mesta Machine Company, Pittsburgh, Pa., has recently received an order from James B. Ladd, consulting engineer, Philadelphia, for a 1,500 H. P. mill engine for the Broken Hill Proprietaries Company, Ltd, New Castle, N. S. W. The engine is for rolling mill service, and is to be of the heavy-duty tandem compound Corliss valve type. This engine, when installed, will make the fourth unit that the Mesta Machine Company has built for the Broken Hill Proprietaries Company.

Arthur M. Torry, for the past four years in charge of the soliciting department of Hildreth & Co., recently resigned from that position to take charge of the engineering contract department of W. S. Barstow & Co., New York. This company is engaged in engineering and construction work in various parts of the country, and also controls the General Gas & Electric and the Eastern Power & Light corporations, operating some 40 public utilities in the eastern and middle western states.

Joseph T. Ryerson & Son, Chicago, have recently completed a new warehouse on Westside avenue, Jersey City, N. J. The company has maintained an office at 30 Church street, New York, and a warehouse at Boonton for some time. The new plant in Jersey City will put it in a much stronger position for handling its iron, steel and machinery business in the New York district and the east in general. The warehouse is located on a ten-acre site at the junction of the Hackensack river and Newark bay, thus affording facilities for making water shipments to all parts of New York harbor and adjacent waters. The building is 350 ft. by 250 ft. and covers a ground area of 87,500 sq. ft.

The Bethlehem Steel Company has purchased the plant of the Detrick & Harvey Machine Company, Baltimore, Md. The directors of the latter have elected the following officers: A. D. Mixsell, president; W. F. Roberts, vice-president; J. W. Neidhardt, vice-president and general manager, B. F. Jones, secretary and treasurer, and F. A. Shick, auditor. Mr. Neidhardt, as vice-president and general manager, will be the local representative of the Detrick & Harvey Company at Baltimore. This company was formed in 1884 by John S. Detrick and Alexander Harvey, and these two occupied the positions of president and secretary and treasurer, respectively, until Mr. Harvey's death last November, when Curran W. Harvey, his son, succeeded his father. The company manufactures planers, horizontal drill-

ing and boring machines, vertical boring and turning mills and special machinery. It will continue to engage in this business.

The Harrisburg Water Laboratories have been organized for the chemical and bacteriological examination of water, sewage, trade wastes and other associated substances. The organization consists of Lesley McCreath, junior member of the firm of Andrew S. McCreath & Son, analytical and consulting chemists, Harrisburg, Pa., who still retains his interest in said firm; Dr. George R. Moffitt, city chemist and bacteriologist, pathologist to the Harrisburg Hospital and head of the Moffitt Bacteriological Laboratory, and Farley Gannett, consulting engineer and late engineer of the Water Supply Commission of Pennsylvania. The laboratories are equipped and prepared to test and analyze samples of the above substances, submitting reports with interpretation of same.

The New York Air Brake Company, on August 18, declared the regular quarterly dividend of 1½ per cent. Following the meeting President Charles A. Starbuck made the following statement: "In addition to its regular business the company has undertaken orders for high explosive shells and cartridge cases aggregating \$16,581,500 for delivery within the next twelve months, on which substantial payments have been made and in which there is no cancellation clause. The orders taken are for material which is simple to manufacture, and deliveries already have commenced and are giving satisfaction. The company is fully equipped to take on large additional orders for high explosive shells and cartridge cases, and negotiations are pending which are likely to result in large additional business running into 1917."

The United States Circuit Court of Appeals for the seventh circuit has just handed down a unanimous opinion in the suit of the O & C Co. against Otto R. Barnett and the P & M Co., affirming the decision rendered last April by Judge Sanborn of the United States District Court for the Northern District of Illinois, Eastern Division, sustaining the exclusive selling contract of the O & C Co. for the Vaughan rail anchor and enjoining the P & M Co. from selling the same anchor. This decision is based upon a contract of April 30, 1907, between the O & C Co. and the parties controlling the patents for the Vaughan rail anchor, granting the former company the exclusive sales rights. The owners of these patents gave a selling license to the P & M Co. on April 1, 1915. In this decision this license is declared void.

TRADE PUBLICATIONS

TRACK SUPPLIES.—The Track Specialties Company, New York, has issued a book containing simple rules for the computation of shortened switch leads and rules for the location of derailleurs. This book also contains information and illustrations of the various track accessories made by this company.

DRAG-LINE BUCKET.—The Brown Hoisting Machinery Company, Cleveland, Ohio, has issued a booklet describing the Brown-hoist-Shnoble drag-line bucket which it is now making. This book shows a number of photographs of this bucket in actual service and gives considerable data concerning its performance.

BUMPING POSTS.—The Railway & Traction Supply Company, Chicago, has issued a pamphlet showing illustrations of its Hercules steel bumping posts, 39 of which were installed by the United States government at the ends of the towing tracks used by the electric towing engines at the locks along the Panama canal.

GASOLINE MOTOR CARS.—The McKeen Motor Car Company, Omaha, Neb., has issued a new booklet describing its various types of railway motor cars and also a new highway motor car with rubber-tired wheels for street and road service and with railroad flanged wheels for operation on urban railroad lines. This car has a seating capacity of 27 and a new spring pneumatic cushion chair for every passenger. The booklet also describes this company's new 300-hp. motor car for railway service containing a 70-ft. post office compartment and express and baggage compartments. It is designed to pull a standard steel railroad coach for passengers, with a capacity to supersede locomotive train service consisting of five units, locomotive, tender and three cars.

Railway Construction

ATLANTIC COAST LINE.—This company has under consideration plans for the construction of a line, it is said, from St. Stephen, S. C., southwest via. Ridgeville and Walterboro to Yemassee, about 75 miles.

CANADIAN ROADS ELECTRIC.—Engineers of the Hydro-Electric Power Commission of Ontario are now at work south of Hamilton surveying for an electric line from Hamilton to Port Dover and other points on Lake Erie. The plans call for building also to St. Catherines and all intermediate points, including a branch line to Dunnville and Cayuga. F. Gaby, Toronto, Ont., chief engineer of the Hydro-Electric Power Commission. (October 30, p. 818.)

CHATTANOOGA TRACTION.—This company is planning to build an extension, it is said, from Chattanooga, Tenn., north to Hixson, about 8 miles. The company now operates a line from Chattanooga to Signal Mountain.

CLEVELAND & OHIO CENTRAL ELECTRIC.—The amended articles of incorporation changing the name of the Cleveland, Barberton, Coshocton & Zanesville to the Cleveland & Ohio Central Electric, which have been filed, provide also for changing the route authorized under the charter from Cleveland, Ohio, to Zanesville, through Barberton and Coshocton to a line running from Cleveland to Wooster, through Brooklyn, Parma and Royalton townships in Cuyahoga county, and Kinckley, Granger, Sharon and Wadsworth townships in Medina county, and Milton, Chippewa, Green, Wayne and Wooster townships, in Wayne county, through the towns of Sharon, Wadsworth, Rittman and Smithville and into the town of Wooster.

CLEVELAND, BARBERTON, COSHOCTON & ZANESVILLE.—See Cleveland & Ohio Central Electric.

FAIRMONT HELEN'S RUN.—See Western Maryland.

MAINE ROADS (ELECTRIC).—The question of building 33 miles of electric line in Maine is now under consideration, it is said. The projected route is from Topsham, Me., north to Monmouth. F. B. Teeling, Litchfield, Me., is interested.

NEW YORK SUBWAYS.—The New York Public Service Commission, First district, has given to the Dock Contractor Company, the lowest bidder, for \$1,692,370, the contract for building Section No. 2 of Route No. 29. This section is to be a two-track subway under Nostrand avenue, from Church to Flatbush avenues, in the borough of Brooklyn. (July 30, p. 219.)

OREGON ROADS.—Plans are being made by Kendall Brothers, Pittsburgh, Pa., to build a line from Roseburg, Ore., north to Umpqua, about 30 miles. The City of Roseburg will issue \$300,000 of bonds, the proceeds of which are to be used in aid of the project.

PACIFIC & IDAHO NORTHERN.—A public meeting was held recently at New Meadows, Idaho, and resolutions were adopted favoring the construction of a new north and south railroad between New Meadows, Idaho, and Lewiston, or the construction of an extension of the Pacific & Idaho Northern, from New Meadows north to Lewiston, about 120 miles.

PETERSBURG & APPOMATTOX (ELECTRIC).—A contract has been let to the Vaughan Construction Company, Incorporated, of Shawsville, Va., and Roanoke, it is said, to build the electric line from Petersburg, Va., northeast to City Point, about 12 miles. The construction work is to be finished by February, 1916. (April 2, p. 767.)

RAPID TRANSIT COMPANY OF ILLINOIS.—Incorporated in Illinois with \$100,000 capital and headquarters at East St. Louis, Ill. The plans call for building an interurban line from East St. Louis southeast, via Chester, Murphysboro and Carbondale, and northeast through the coal fields. J. Vonnahme, D. P. Roberts, C. B. Vonnahme and M. Harned, all of East St. Louis, and L. T. Hoeltman, Collinsville, are incorporators.

RICHMOND, RAPPAHANNOCK & NORTHERN.—Surveys are now being made and construction work is to be started soon, it is said, on a line from West Point, Va., northeast to Urbanna, 17 miles. The company was incorporated with \$300,000 capital on July 30 by capitalists of Richmond, Va. Warner Moore, president; H. L. Lewis, O. J. Sands, C. Thompson and C. Wortham are said to be interested. This is an independent enterprise, and is not connected with the Richmond & Rappahannock River, which plans to build an extension to Urbanna in the near future.

RICHMOND & RAPPAHANNOCK RIVER.—See Richmond, Rappahannock & Northern.

ROLLA, OZARK & SOUTHERN.—This company will build a line from Rolla, Mo., on the St. Louis & San Francisco, to Anutt, a distance of about 18 miles. There will be one bridge across Dry Fork Creek. About one-third of the work has been completed. J. Ellis Walker, Rolla, Mo., is secretary of the company.

SOUTHERN OREGON TRACTION COMPANY.—This company has taken over the Rogue River Valley Railway, which operates about six miles of line between Medford and Jacksonville, Ore., and will electrify it. A portion of the overhead equipment has been purchased. The line at present is operated by gasoline motor cars and steam locomotives.

WESTERN MARYLAND.—The route of the line now being built under the name of the Fairmont, Helen's Run, is from a connection with the Baltimore & Ohio near Chiefton, Marion County, W. Va., in a general northerly direction, crossing West Fork river, thence up Helen's Run to Ida May shaft, with a spur line up Martin's Run to Carolina shaft. The grading contract was let recently to A. L. Anderson Brothers, Altoona, Pa., and bids are now being asked for the steel on bridges, including one steel structure 560 feet long. There will also be five trestles on the line, and a storage yard is to be constructed at Chiefton. Most of the construction will be side hill work; the line is to be built through a mountainous country. The maximum grade to mines will be 1.8 per cent. and maximum curvature 12 degrees. (August 13, p. 301).

RAILWAY STRUCTURES

ALGIERS, LA.—Work has been started on the substructure of the new shops to be built at Algiers for the Morgan's Louisiana & Texas Railroad & Steamship Company. The cost of the improvements will be about \$250,000. (May 28, p. 11140.)

CHICAGO, ILL.—The Chicago & North Western has awarded a contract for the substructure of the bridge over the north branch of the Chicago River south of the Deering station to the Great Lakes Dredge & Dock Company, Chicago. A new interlocking plant will also be built.

DALLAS, TEX.—The city commission has engaged John F. Wallace, of Chicago, to make a survey looking to extensive grade crossing elimination and to prepare a program. The proposed improvements will involve an expenditure of several million dollars. The railroads entering Dallas are now building a new union station, which, with other improvements, will cost about \$5,000,000.

OELWEIN, IOWA.—A fire on August 2 destroyed the store house of the Chicago Great Western at this place, and most of the contents. The estimated loss is \$75,000. Plans are now being prepared for a new structure.

PITTSBURGH, PA.—A contract has been let for building a combined freight house and storehouse for the Pittsburgh & Lake Erie, in Pittsburgh. The new building will be of steel, brick and concrete construction, 188 ft. by 320 ft., and seven stories high.

WEST TULSA, OKLA.—The St. Louis & San Francisco has awarded a contract to Fairbanks, Morse & Co. for a concrete conveyor type coaling and sanding station, to be erected at this place.

WILLOW SPRINGS, MO.—The St. Louis & San Francisco has awarded a contract to Fairbanks, Morse & Co. for a large capacity concrete conveyor type coaling and sanding station, to be erected at this place.

Railway Financial News

CANADIAN NORTHERN.—Wm. A. Read & Co., New York, have bought from the Canadian Northern and have sold to the public, at 98½, \$11,500,000 two-year 5 per cent collateral notes dated September 1, 1915. At this price the notes yield about 5.75 per cent on the investment. These notes are secured by the deposit of \$15,333,334 Canadian Northern general mortgage 4 per cent bonds due 1934. The Dominion Government unconditionally guarantees both principal and interest of the pledged bonds. The notes are convertible at par into bonds at 85 on or before maturity.

CHICAGO, ROCK ISLAND & PACIFIC.—The receivers have asked the court for permission to abrogate the lease under which the Keokuk & Des Moines is operated.

KANSAS CITY, VIADUCT & TERMINAL.—The first mortgage 4½ per cent bonds protective committee proposes to extend the protective agreement which expires by limitation January 1, 1916, for a period of two years, within which time the committee expects to find a purchaser for the property. The committee consists of William C. Lane, R. Walter Leigh, Lawrence E. Sands, Richard C. Storey, with William C. Dooley, secretary.

KEOKUK & DES MOINES.—See Chicago, Rock Island & Pacific.

LAKE ERIE & PITTSBURGH.—Authority has been received from the Ohio Public Utilities Commission to issue \$3,540,000 first mortgage 5 per cent refunding bonds to be guaranteed by the Pennsylvania and New York Central.

MACON (GA.) TERMINAL Co.—The company has sold \$1,600,000 of an authorized issue \$3,000,000 first mortgage 5 per cent bonds of July 1, 1915-1965. These bonds are guaranteed principal and interest jointly and severally by the Central of Georgia, the Georgia, Southern & Florida, and the Southern Railway. The terminal is to be used as a union passenger station, for which the three roads will pay rental on a wheel-
age basis.

MISSOURI PACIFIC.—B. F. Bush, president, has been appointed receiver of the Missouri Pacific and of the St. Louis, Iron Mountain & Southern.

NEW YORK, NEW HAVEN & HARTFORD.—Counsel for the directors who have been accused by the Government of violating the Sherman Anti-Trust Law have asked Judge Hunt to direct the Government to give more details in its bill of particulars, claiming that the Government was holding back important evidence to be used as a surprise against the accused directors.

PITTSBURGH, SHAWMUT & NORTHERN.—The New York State Public Service Commission has authorized Frank Sullivan Smith, receiver, to issue \$1,700,000 certificates of indebtedness, bearing interest at 6 per cent. and running for two years. The issue has been authorized by the Supreme Court of New York State and the United States District Court, for the Western District of Pennsylvania. The new certificates will be used solely for exchange at par for certificates outstanding which mature on August 1 and September 1. The older certificates have paid 5 per cent.

ST. LOUIS, IRON MOUNTAIN & SOUTHERN.—See Missouri Pacific.

ASIA MINOR RAILWAYS.—Press despatches report that the Turks have begun to construct a railway line in hot haste between Zungulduk, on the Black sea—the coal port which has been repeatedly shelled by the Russians—and Ada Bazar, a town near the head of the Gulf of Ismid, in the Sea of Marmora. This is for the purpose of transporting coal owing to the difficulties of doing so by sea. Five thousand Greeks and Armenians are engaged on the work, under the supervision of German engineers and surveyors. Another line is being constructed from Angora, on the Bagdad Railway, in Anatolia, towards Erzerum, in Armenia—over 300 miles. So far about 7 miles have been laid. These works have been paid for by moneys taken from the agriculture banks.

ANNUAL REPORT

THIRTIETH ANNUAL REPORT OF THE BUFFALO, ROCHESTER & PITTSBURGH RAILWAY COMPANY

The Directors of the Buffalo, Rochester and Pittsburgh Railway Company submit to the Stockholders the following report for the year ending June 30, 1915:

ROAD OPERATED.

	1915. MILES.	1914. MILES.	INCREASE. MILES.
Owned	367.06	367.06	
Leased	89.90	89.90	
Trackage rights	129.52	129.52	
Total length of road operated....	586.48	586.48	
Second track:	208.33	207.32	1.01
Sidings	372.71	360.48	12.23
Total miles of tracks, all steel rails	1,167.52	1,154.28	13.24

The tracks were increased by 1.01 miles of second track, constructed at Creekside, Pa., and 12.23 miles of new sidings.

INCOME.

OPERATING INCOME:	1915.	1914.	INCREASE OR DECREASE.
Revenues	\$9,479,935.75	\$10,734,691.00	—\$1,254,755.25
Expenses	6,935,252.30	7,965,117.27	—1,029,864.97
Net revenue	\$2,544,683.45	\$2,769,573.73	—\$224,890.28
Tax accruals	230,000.00	234,000.00	—4,000.00
Uncollectible revenues	596.27	596.27
	\$230,596.27	\$234,000.00	—\$3,403.73
Income	\$2,314,087.18	\$2,535,573.73	—\$221,486.55
Miscellaneous income	450.48	Dr. 362.89	813.37
Total operating income.	\$2,314,537.66	\$2,535,210.84	—\$220,673.18
Non-operating income	718,195.23	820,587.10	—102,391.87
Gross income	\$3,032,732.89	\$3,355,797.94	—\$323,065.05
DEDUCTIONS FOR INTEREST AND RENTALS	2,120,013.33	2,001,013.78	118,999.55
Net income	\$912,719.56	\$1,354,784.16	—\$442,064.60
APPROPRIATIONS:			
Pension and Fire Insurance Funds	21,508.47	16,432.49	5,075.98
Special appropriations.....	111,211.09	348,351.67	—237,140.58
TOTAL APPROPRIATIONS:	\$132,719.56	\$364,784.16	—\$282,064.60
Surplus available for dividends.	\$780,000.00	\$990,000.00	—\$210,000.00

A special appropriation of \$111,211.09 was made from Net Income, being part of the \$125,000 paid into the Sinking Funds under Equipment Agreements Series A, B and C, out of which \$45,797.26 was applied to retire \$46,000 of Equipment Bonds Series C, and the balance was reserved for the purchase of new rolling stock.

Profit and Loss account was charged with \$536,380.61. Of this amount \$14,284.45 is the remaining part of the payments into the above mentioned Sinking Funds, including accrued interest, and is also available for the purchase of new rolling stock; \$216,298.83 represents the cost of Equipment Bonds Series D, E and F paid off during the year, less one-half of the principal refunded by 4½% Consolidated Mortgage bonds held in the Treasury of the Company; \$180,797.33 covers the full amount paid into the Sinking Funds, including accrued interest, to retire bonds under Equipment Agreement Series G; and \$125,000 is the principal of Series H bonds paid off during the year.

DIVIDENDS.

Dividends in cash were paid on:		1915.	1914.
Preferred stock	\$6,000,000	6% \$360,000	6% \$360,000
Common stock	10,500,000	4% 420,000	6% 630,000
Total	\$16,500,000	\$780,000	\$990,000

Since the close of the fiscal year, your Board of Directors has declared semi-annual dividends of three per cent. on the preferred stock and two per cent. on the common stock, payable August 16, 1915.

CAPITAL STOCK.

There has been no change during the year in this account. The total outstanding Capital Stock of the Company amounts to \$16,500,000, and consists of \$6,000,000 preferred stock and of \$10,500,000 common stock.

FUNDED DEBT.

In accordance with the provisions of the Consolidated Mortgage of 1907, \$1,020,000.00 4½% bonds were received from the Trustee to apply on payments made for improvements and betterments, and the securities placed in the Treasury of the Company. The Trustee also delivered to the company \$205,000.00 Consolidated Mortgage 4½% bonds, representing 50% of Equipment Bonds, Series D, E and F, retired during the year.

These bonds, added to those in the Treasury of the Company, made a total of \$2,400,000.00, of which \$1,000,000.00 were sold during the year for corporate purposes, leaving a balance of \$1,400,000.00 held in reserve.

Under the terms of the Sinking Funds for the redemption of Equipment Bonds, \$640,000.00 were retired, as follows: \$46,000.00 Series C; \$115,000.00 Series D; \$117,000.00 Series E; \$178,000.00 Series F; and \$184,000.00 Series G.

Also the first annual installment of \$125,000.00 Series H bonds was paid, as provided for in that Equipment Agreement.

The net result is an increase of \$235,000.00 in the bonded debt of the Company, outstanding on June 30, 1915.

COST OF ROAD.

Capital account has been charged during the year with \$882,008.80 for investment in road, as follows:

Lands for yard tracks, Rochester, N. Y.....	\$121,617.64
Other lands	4,639.65
Storage warehouse, Rochester, N. Y.....	163,318.88
Subway, Saxton St., Rochester, N. Y.....	24,931.36
Elimination of grade crossing, Scottsville, N. Y.....	23,431.00
Increased weight of rails, frogs and fastenings.....	64,856.87
Stone ballast	18,459.05
Improving bridges and culverts.....	80,272.97
Automatic block signals.....	70,641.45
Power plant building and machinery, Du Bois, Pa.....	128,711.00
Power transmission and distribution system, Du Bois, Pa.....	27,954.35
Shop machinery	16,453.94
New station, Sykes, Pa.....	6,237.88
Yard extensions, sidings, etc.....	130,482.76
Total	\$882,008.80

The six-story concrete storage warehouse at Rochester, N. Y., referred to in last year's report, was completed and is now in operation.

Automatic electric block signals were installed between Buffalo Creek, N. Y., and Ashford, N. Y., a distance of 45 miles, making 139.64 miles of single track and 137.68 miles of double track, a total of 277.32 miles, under this system, being 47% of the entire main line mileage of the road.

The new power house at Du Bois Shops, Pa., was completed April 1, 1915. It accommodates new electric machinery now furnishing sufficient power to meet the growing needs of the plant at that point.

A new station was constructed at Sykes, Pa.

Among the important work still in progress may be mentioned:

Subway, Saxton Street, Rochester, N. Y.

Strengthening of steel bridges.

Replacing of timber bridges, trestles and culverts in permanent form.

COST OF EQUIPMENT.

Expenditures were made for new rolling stock as follows:	
Seventeen locomotives	\$407,639.91
Five hundred steel underframe box cars.....	433,145.32
Five hundred steel underframe gondola cars.....	454,630.33
One locomotive crane hoist.....	7,524.80
Steel underframes applied on two thousand two hundred and twenty-four freight cars	149,542.13
Steel side stakes applied on one thousand eight hundred and fourteen freight cars	26,840.86
Sundry other betterments, including re-classification or transfer of three passenger cars and eighty-four freight cars.....	122,958.18
There was credited for equipment sold, transferred or destroyed, the following values, charged in part to Operating Expenses, and the balance representing the depreciation since June 30, 1907, charged to Accrued Depreciation account:	
Seven passenger train cars.....	\$59,838.99
Nine hundred and ninety-eight freight train cars..	472,970.63
Ten work equipment cars.....	4,374.62
	537,184.24
Making a net increase of.....	\$1,065,097.29

The total tractive power of engines aggregates 11,627,535 pounds, an increase of 984,280 pounds over last year.

The average tractive power of each engine increased 1,217 pounds, being 35,999 pounds as against 34,782 pounds last year.

The total carrying capacity of cars in freight service now amounts to 751,531 net tons, an increase of 14,033 tons over last year. The average carrying capacity or efficiency of each freight car increased .90 ton, being 43.19 tons, as against 42.29 tons last year.

The reserve for accrued depreciation of equipment on June 30, 1915, is as follows:

On equipment owned.....	\$2,149,524.00
On leased equipment.....	203,377.98
Total	\$2,352,901.98

PASSENGER REVENUES.

The gross passenger revenue amounted to \$1,101,980.50, a decrease of 6.96 per cent., or \$82,436.49, caused chiefly by the shrinkage of local travel in the mining regions.

The average rate received per passenger per mile increased .057 cent, being 2.186 cents, as compared with 2.129 cents a year ago.

The average distance each passenger was carried decreased .07 mile, being 26.94 miles, against 27.01 miles last year.

Passengers carried in 1915.....	1,871,322
Passengers carried in 1914.....	2,059,683
A decrease of 9.15 per cent., or.....	188,361
Passengers carried one mile in 1915.....	50,415.391
Passengers carried one mile in 1914.....	55,632,097
A decrease of 9.38 per cent., or.....	5,216,706

FREIGHT REVENUES.

The average rate received per ton per mile increased .15 mill, being 4.77 mills, as compared with 4.62 mills last year.

The average distance each ton was hauled decreased 7.21 miles, being 153.83 miles, against 161.04 miles a year ago.

The revenue tonnage moved was as follows:

	1915.	1914.	INCREASE.	DECREASE.
Bituminous coal	7,107,857	8,176,430		1,068,573
Coke	362,403	393,358		30,955
Iron ore	417,178	699,702		282,524
Pig and bloom iron.....	258,461	265,521		7,060
Other freight	2,782,136	2,760,038	22,098	
Total	10,928,035	12,295,049		
A decrease of 11.12 per cent., or.....				1,367,014

Tons moved one mile in 1915.....	1,681,022,418
Tons moved one mile in 1914.....	1,980,012,951
A decrease of 15.10 per cent., or.....	298,990,533

The result for the year is a loss of 12.36 per cent., or \$1,131,251.63 in gross freight revenue.

Coal and coke traffic decreased 1,099,528 tons, or 12.83%, due to the disturbed business conditions in the territory served by your shippers.

The depression in the iron and steel industry existing throughout the year, caused a reduction of 289,584 tons, or 30.00% in iron ore, pig and bloom iron.

Other freight shows a slight increase. The decision of the Interstate Commerce Commission, granting an increase of not over five per cent. in freight rates, became effective at various dates after December 16th, 1914. This did not apply to coal, coke, iron ore and other specified commodities. A careful estimate indicates that such increases added about 41,000 to our revenues this year.

EXPENSES.

Operating Expenses decreased \$1,029,864.97, or 12.93 per cent., in which each primary expense account participated, as follows:

	Decrease.	Per Cent.
Maintenance of way.....	\$180,698.99	12.48
Maintenance of equipment.....	80,839.83	3.65
Traffic	8,786.70	5.84
Transportation	735,562.36	18.96
Miscellaneous operations	12,396.13	45.82
General	11,580.96	4.76
Total	\$1,029,864.97	12.93

The reduction of train mileage was a large factor in accomplishing the above decrease, but the increased efficiency resulting from previous improvements, and the enforcement of economies wherever practicable, contributed their share to the saving made. In attaining this result the Company did not depart from its policy of maintaining roadway and equipment at its usual high standard.

The operating ratio decreased 1.04 per cent., being 73.16 per cent., against 74.20 per cent. last year.

The percentage of each group of operating expenses to operating revenues for the past five years, is as follows:

	1915.	1914.	1913.	1912.	1911.
Maintenance of way.....	13.17	13.49	14.23	12.52	12.57
Maintenance of equipment....	22.53	20.65	19.74	18.94	19.35
Traffic	1.50	1.40	1.30	1.26	1.44
Transportation	33.17	36.15	32.71	32.88	32.11
Miscellaneous operations.....	.15	.25
General	2.44	2.26	2.05	2.14	1.81
Total.....	73.16	74.20	70.03	67.74	67.28

The average cost per ton per mile is 3.21 mills, being .02 mill less than last year.

The average number of revenue tons carried one mile per revenue freight train mile, excluding the mileage of helping engines, increased 13.56 tons, being 707.16 tons, against 693.60 tons a year ago.

The average number of revenue tons carried one mile per revenue freight engine mile, including the mileage of helping engines, increased 23 tons, being 477, against 454 a year ago.

The averages for the past ten years are as follows:

YEAR.	TRAIN LOAD.	ENGINE LOAD.
1906	525	418
1907	543	435
1908	530	371
1909	597	400
1910	638	420
1911	635	430
1912	647	439
1913	710	462
1914	694	454
1915	707	477

The average number of revenue passengers carried one mile per revenue passenger train mile is 37, being 3 less than last year.

The non-revenue traffic, not included in any of the other figures of this report, is as follows:

	1915.	1914.
Number of passengers.....	275,504	323,720
Number of passengers carried one mile..	11,522,375	13,098,629
Number of tons.....	867,023	1,106,032
Number of tons carried one mile.....	83,299,093	108,941,868

FIRE INSURANCE FUND.

The assets of this fund were increased \$1,468.03 during the year, and now amount to \$283,975.50 in interest-bearing securities and cash.

PENSION FUND.

The assets of this fund, created July 1, 1903, were increased \$9,623.70 during the year, and now amount to \$207,199.62 in interest-bearing securities and cash.

There were sixty-one pensioners upon the roll on June 30, 1915, a net increase of four during the year.

GENERAL REMARKS.

The Ontario Car Ferry Company, Limited, paid a dividend of 5 per cent for the year ending December 31, 1914. The sum of \$12,485 received on the \$249,700 of this Company's stock was credited to Non-operating Income account.

The second boat under construction for the Ferry Company, referred to in last year's report, is to be delivered about September 1st, next.

On November 16, 1914, Mr. O'Donnell Iselin was elected a Director to fill the vacancy in the Board caused by the resignation of Mr. Lewis Iselin.

Comparative statements and statistics of the operation of your road for the year, in which the figures for the preceding year were recast as far as possible to agree with the new Classification prescribed by the Interstate Commerce Commission effective July 1, 1914, are submitted herewith.

The acknowledgments of the Board are renewed to the officers and employees for their faithful and efficient services.

By order of the Board,

WILLIAM T. NOONAN,
President.

Not all railway men will agree with Mr. Garner in his condemnation of the practice of handling tonnage on local freight trains, in an article on this subject on another page. No one will approve of the practice of overloading local freight trains in the direction of light tonnage, as was done in the instance he cites, but

Handling Tonnage on Local Freight Trains

any cars which a local train can haul in the direction of prevailing tonnage not only help the division tonnage statement, but also reduce the amount of light train movement in the opposite direction. The problem is purely an economic one. On a run over a long district or in which a train has a great deal of switching to do, it may be difficult for it to get in to its terminal without overtime without bringing in any additional cars. In

such a case the advisability of loading the train down will depend on the relation between the amount of overtime created and the value of the additional service performed. On most roads many local freight trains can haul considerable tonnage in addition to their local cars without creating much overtime. The extent to which such trains should be loaded requires special consideration in each case. No general rule can be laid down because the length of engine district, the number of opposing trains, and the amount and character of the local work to be done may make utterly impracticable on one district what is entirely economical on another.

A clear-headed superintendent, explaining recently a butting collision which occurred on his road, where the conductor,

Difficulty of Weeding Out All Bad Men

the engineman and the fireman, of an extra, all forgot a regular passenger train, the schedule of which they well knew, said that the collision was due to the fact that three "weaklings" had been assigned to the same crew. The conductor had once been dismissed for causing a collision, and was not a strong character. The engineman had been suspended three times, and was known to indulge to some extent in gross immoralities. Both were cigarette smokers. The fireman had no flaws in his record, but had had a scandalous domestic difficulty. "And," says the superintendent, "having in the service such men as these, the best way to frame up a collision is to get them together in the same crew." This is a very interesting lesson. It suggests that a superintendent has important responsibilities in the handling of his men which cannot be delegated. Only the superintendent himself, aided by trainmasters of strong character, can extirpate such faults as these. Reports by the Interstate Commerce Commission and other public authorities are pretty sure to stop short of any profitable investigation of men's habits off duty (unless they get drunk); and yet these may be elements of grave danger; and the public remains in ignorance. Most superintendents, no doubt, will reflect that it is impossible to keep a large force of trainmen free from a small percentage of weak men, and, unless full of courage to follow the matter constantly and of ambition to make the most creditable possible record, will be contented with that reflection. Perhaps it would be a good rule (not to be published, however) to make sure of at least one wholly trustworthy man on every train. This would be far from ideal, and when we say this we shall not be accused of dealing in counsels of perfection; but it is a condition, not a theory, that confronts us.

The report of H. W. Belnap, chief of the division of safety, to the Interstate Commerce Commission on the butting collision of passenger trains on the Western Maryland at Thurmont, Md., in June, noticed in our last issue, is a forceful document. He describes the circumstances with but little waste of words, and the cause of the disaster is clearly indicated. He places the immediate responsibility on the dispatcher, where it belongs. He gives that officer whatever benefit can accrue to him, from the claim that he had been overworked, but also puts in the testimony which weakens this claim. The report does not decide how far the dispatcher's claim should be accepted; neither does it discuss the weakness in the code of rules by reason of which an experienced dispatcher can fall into such a dangerous error; but so far as concerns the lesson for the future, these features are not important. The inadequacy of the American train despatching system, as a means of securing satisfactory safeguards against butting collisions, has long since been demonstrated, and the report, wasting no words on this point, goes directly to the main issue, the need of the space interval system. Mr. Belnap had recommended the introduction of the block system, on this road, three times, in connection with three butting collisions, over

The Lesson of Four Collisions

two years ago, and he says now that that system is "urgently required." He might have used equally strong language in 1912. And he gives the road ample latitude. He does not call for automatic signals, costing \$1,500 to \$2,500 a mile. He does not commit the government to any plan or method or apparatus; he simply calls for an adequate block-signal system; not necessarily any costly devices. Station agents, with nothing but red flags and lanterns, can and do maintain an "adequate block-signal system." Automatic signals do, indeed, constitute the ideal system; but the non-automatic system was introduced last year on over 8,000 miles of railway in this country, much of it by such companies as the Southern Pacific, the Chicago, Milwaukee & St. Paul, the New York Central Lines, and the New York, New Haven & Hartford. This report contains instructive reading for all railroads which do not use the space interval.

ALTON, NEW HAVEN, FRISCO—AND NOW ROCK ISLAND

ALTON, New Haven, Frisco, and some more, and now Rock Island! The Interstate Commerce Commission has written some unpleasant reports as a result of its investigations of the managements of various railways. But one of the most disgusting of them is the one issued last week regarding the Rock Island. Persons may differ as to the construction that should be put on a number of details which the commission mentions, such as the salaries and bonuses paid to certain officers. But these are minor matters. The only way the interpretation put on them affects the picture as a whole is to make it a little blacker or not quite so black. Regarding the important and essential points covered by the commission's report, there is room for difference of opinion. Taken together, they make up a record which for sordidness and dishonorableness in corporate management has hardly been surpassed.

There are two separate and distinct aspects of the Chicago, Rock Island & Pacific case which should be and must be kept separate, if any fair judgment is to be passed on it. One is the relation between the railway company and its management and the public served by its 7,000 miles of line. The other is the relation between the controlling interests in the company and the other security holders.

The Interstate Commerce Commission, in its report, which was printed in last week's issue of the *Railway Age Gazette*, almost in full, failed to keep these two aspects of the case separate. This may be partly due to the fact that it is doubtful whether the commission can with propriety make an investigation of the relations between the various class of security holders of a railway company. Consciously or unconsciously, the commission may have felt it necessary to drag in a measure of wrong to the general public, which no line of the very voluminous testimony taken justifies. There was not one shred of evidence to show that the actions of D. G. Reid or W. H. Moore, reprehensible as they may have been in some cases, and undoubtedly bad railroading as they were in other cases, had any effect on the freight or passenger rates or any important effect on the service of the Rock Island. Confusing the question of rates and service with the disposition of profit, does a positive harm. On the other hand, it has been a good thing to put before the investing public an account of methods pursued by these men in their control of the railway company.

It is not enough that the railways of the United States should be beset by increasing expenses and taxes, and by unfair regulation which aggravates the increases in their outgo while denying to them adequate additions to their income. Some of them must also, at this critical juncture, be subjected to ruinous forms of financial mal-administration.

Alton, New Haven, Frisco, and some more; and now Rock Island. What next?

But the people who are sensible and have the welfare of both the railways and the public at heart will not let their indignation be excited by the story of what the Diamond Match and tin plate magnates have done to the Rock Island blind them to the facts as to how the mismanagement of the property came about,

as to who was responsible for it, as to who suffered from it, and as to the means which should be adopted to prevent such mismanagement in the future.

The initial wrong was done when a small group of men, by a comparatively small investment, acquired control of the management of a property representing a very large investment. The difference between the small investment they made and the large total investment which the Rock Island system represented, was property which belonged to other people. There is a flagrant defect in the government of a country whose laws permit a man or set of men to acquire autocratic control of a property by any means except actual purchase of at least a majority interest in it with their own money. But if the law allows this the man or men who get control will, if they have a sense of honor, recognize the fact that this vests in them a trusteeship; and it is the well-recognized moral and legal duty of a trustee to manage the trust property with the greatest care. He has no right to take even such risks with it as he would take with his own.

Apparently the notion that the peculiar character of their control of the Rock Island imposed on them special duties and obligations never entered the heads of the Reid-Moore crowd. They used its resources—which belonged mainly to other people—in the most reckless manner. They used them to get control of the Frisco, and lost \$6,500,000 belonging to those who owned the Rock Island. They used them to buy into the Alton, and lost \$6,370,000 more of the same people's money. They lost still more by frequent changes in the operating management, which made it necessary to pay bonuses to various persons. The real owners of the property—those who owned stock and bonds representing the bulk of the actual cash investment in it—had a right to have their property carefully and judiciously managed and developed. But those in control, whose investment was only a fraction of the total, managed the road and used its financial resources as if they owed no responsibility or duty to anyone on earth. The commission charges that even the reports of the directors to the stockholders were misleading. The method of bringing the receivership proceedings in the Chicago, Rock Island & Pacific case indicates strongly that Messrs. Reid and Moore don't give a hang whether the other security holders suffer or not. Those who oppose the increased intervention of government in business often make use of the phrase "rights of property." In view of Alton, New Haven, Frisco, Rock Island and other such transactions, the question naturally arises, "Whose rights of property?" Those who owned a majority interest in the Rock Island clearly had some rights of property. These were disregarded and trampled under foot by the minority owners. The term "rights of property" becomes a misfit when used as an argument against government interevention to prevent ruthless and unscrupulous minorities from dealing with a property as if it were their own and so managing it as to ruin if not actually to loot the majority. The time has come to recognize in this country the principle that men who want to speculate should be restricted to speculation with their own money, and that one of the inalienable "rights of property" is to have it protected from use as a speculative football by those who do not own it.

The worst feature of the Rock Island fiasco is the one above touched on—the injury done to innocent investors by a controlling faction apparently devoid of any sense of duty. But it has other bad features. From President Mudge down the personnel of the Rock Island's working organization is excellent. It includes some of the finest, cleanest, ablest railway officers in the United States. Nobody familiar with the facts doubts that Mr. Mudge and his subordinates have run the road as well as it could be run with the resources at their disposal. But financial mismanagement has unduly and unnecessarily restricted their resources. In consequence, they have been unable to make the improvements in the plant and operating methods required in the interest of the most efficient and economical working. Again, the Rock Island scandal has reflected odium on the managements of all the railways of the United States.

Along with the Alton, New Haven, Frisco and other similar offenses against good business and good morals it has contributed toward so prejudicing the public and regulating authorities against the railways as to render it impossible for them to get fair treatment.

It is to be wished that such mismanagement of railways could be stopped by publicity and the voluntary concerted action of railway financiers and executives. But experience shows that the hope that it will ever be stopped in this way is illusory. There is no way to keep unscrupulous financiers out of the railway business. There is no means except government intervention by which to keep them from committing depredations after they get into it. Therefore, as the commission points out, "by this case the need of some limitation on the issuance of stocks and bonds by common carriers, whether directly or through holding company devices, or otherwise, is again demonstrated." And legislation should go still farther than this. Some steps should be taken to hold directors up to the recognition and performance of the duties of their trusteeship. As the commission says elsewhere in its report, "This record emphasizes the need of railway directors who actually direct. * * * It suggests the need of a law to charge such directors with individual responsibility for the dissipation of corporate funds."

We don't want management of the railways of this country by the Interstate Commerce Commission or any other government body or bodies. We want management of them by their directors and officers. But the law and its administration should be made such that no man who accepts a position of trusteeship on our railroads can fail to perform his duties without being held responsible. When it is known that strict responsibility and accountability will go with every duty assumed there will be fewer outrageous and successful attacks made upon the "rights of property" by those who voluntarily assume the duty of managing large concerns.

FREIGHT TERMINAL CHARGES AT NEW YORK

THE railroads centering in New York City appear to have decided to acquiesce in the decision of the Interstate Commerce Commission disapproving a large part of their proposed increases in charges for lighterage, storage and other terminal services at that city. Some of the increases are approved, and the traffic managers seem disposed to go on for a while with what the commission has given them; though all of the proposed changes were the result of a careful attempt, made in good faith, to carry out the suggestions of Mr. Brandeis and of the commission, that this feature of the freight business should be put on a paying basis. There is no question but that a thorough investigation will show that many services are still unremunerative, and it will be the duty of the railways to put their evidence in better shape and to renew their application as soon as practicable.

The decision of the commission leaves the way open for a new application. As reported in the *Railway Age Gazette*, July 30, page 213, the significant part of the decision is in the last two paragraphs, in which it is said that (1) the tariffs are ambiguous, inconsistent and lacking in desirable uniformity, and (2) that as lighterage and other local charges have come to be understood as a part of the through freight rate, they must not be increased without considering the whole freight rate. Both problems are easily dealt with. We do not mean that it will be a small task to make uniform tariffs of terminal and harbor charges, or that it will be easy to convince the commission that a freight rate from St. Paul or St. Louis to Brooklyn or Astoria ought to be advanced, when the proof that it is too low involves such a complicated study; but in both cases it can be said that the men who are familiar with the field will know just what to do. A satisfactory degree of uniformity of tariffs may be unattainable, but the traffic men will know when they have done all that can reasonably be done; and with that the commission will, no doubt, be satisfied. As to the feasibility of showing that

many of these services are done too cheaply, there is no doubt in the minds of those best acquainted with the business; it is only a question of patient study.

To appreciate fully the New York terminal situation, it is necessary to read Commissioner Meyer's full report. The document is so full of facts that it is not susceptible of satisfactory condensation. As a brief outline, we print in another column the statement made by Mr. McCain before the commission. This complicated freight-traffic field, with its 68 stations in New York and Brooklyn, besides many others on the New Jersey side, largely dependent on water transportation, constitutes perhaps the most costly and confused aggregation of dissimilar units to be found anywhere in the world. The present customs, under which the railroads do a vast amount of non-railroad service, are the result of strenuous competition among a half dozen powerful railway carriers; and this competition is a growth of 30 years and, in some of its elements, 40 or 50 years. In those years of railroad wars, when passengers were carried for a cent a mile, livestock a thousand miles for a dollar a car, and thousands of cars of all kinds of goods at rates below cost, the recklessness of spirit that was cultivated in traffic managers' minds pervaded all branches of the service, lighterage and storage among the rest. Why should a railroad terminating in Jersey City be doing business in Brooklyn? Or, assuming that a rail carrier, like a tramp steamship, may do anything under the sun, why perform the service at cost or less? Excessive competition; no other reason. A great ship needing a full load cannot sail for Europe until she is filled with 500 cars of grain; but why should the railroad, to accommodate the ship, hold these cars from a week to a month for nothing? Excessive competition. In the old days the New York Central would at times have three thousand cars of corn and wheat standing on its tracks in New York at once; and make not a cent of charge. Why? The same reason as before.

Commissioner Meyer, in his decision, includes a scientific, legal and precise statement of the principles which govern this business; but about the only principle that exercises the traffic manager's mind is to get down to a reasonable basis—a fair price for what he gives—as rapidly as possible. Flour used to be stored in railroad warehouses a whole year for nothing! At last a time limit was imposed, 60 days. Then this was reduced to 30 days, then 20, then 10; and now, in the face of the solemn declaration of the dealers that their business will be ruined, the commission agrees to a limit of five days.

Much of the confusion and disagreement connected with this business is due to one simple cause, the bigness of the city. The business of carting freight through the streets of Manhattan suffers from the same cause, and is very costly. A mere glance at the list of stations, showing their locations, explains many things otherwise inexplicable. The costliness of all kinds of freight transportation in and around the city and the baffling nature of the problem of reducing this cost are strikingly indicated by the magnitude of the engineering and construction schemes which during the past 20 years have been proposed for relieving the situation, and the entire failure of all of them, thus far, to secure acceptance.

The Interstate Commerce Commission's report throws very little light on the financial problem as a whole. The proposed charge of 12 cents a ton for handling freight at shippers' and consignees' docks was shown to be low, but it was disallowed; evidently because of the radical nature of the change which would be effected. That the city would be put to an additional expense of \$100,000 for unloading steel for new subways was one of the striking passages in the report; but Commissioner Meyer does not say but that a charge should be imposed after this subway contract shall have been completed. An adequate charge for unloading may indeed amount to an increase of eight per cent in the freight bill on a shipment from Pittsburgh or St. Paul; but on many commodities, very likely, such an increase is needed, to abolish a discrimination against other cities. Indeed, a thorough study may show that the long-continued and

tremendous competition at New York has resulted in the permanent establishment of many rates which give it undue preference as against smaller cities. As equity between different cities is a cardinal point in the Interstate Commerce Commission's creed, this case certainly merits further study.

The financial problem as a whole is not perhaps susceptible of very satisfactory treatment; it is too big to be comprehended. The freight brought to and taken from New York city and harbor by the railroads in a year aggregates 25 or 30 million tons, a very large part of which has to take a water journey in the harbor, long or short. At the most common rate, 60 cents a ton, this means 15 to 18 millions of dollars for lighterage; and the value of the storage, on very costly ground, whether it is or is not charged for, adds other untold millions. Some freight is lightered for less than 60 cents, and some is not lightered at all; but there is a large volume on which the 60-cent allowance is less than cost. Thus, we see, the freight business of New York harbor, measured by gross cost, is equal to half the total traffic, both passenger and freight, of a railroad as large as the Michigan Central, the Lackawanna or the Lehigh Valley.

"DEPARTMENT OF PUBLIC POLICY AND RELATIONS"

THE executive committee of the Associated Railroads of Pennsylvania and New Jersey recently made an interesting report, recommending the establishment by the railways of the United States of a permanent "department of public policy and relations." This is the committee which carried on such an energetic and skilful campaign a few months ago for the repeal of the extra crew laws in Pennsylvania and New Jersey. Part of its report was published in the *Railway Age Gazette* of July 30, page 210. The proposed department, which should have a branch on each railway, should "represent the railroads in matters of public interest and in such other respects as may be deemed proper along the lines adopted by this committee in the recent campaign."

There can be no question as to the need of the railways for better organization to handle their public relations. They are beset with criticisms and attacks. Formerly there was a general and successful agitation for reductions of their rates. This having abated, efforts are being made from numerous sources to secure various kinds of regulation of their physical operation. Certain of their organized employees are especially active, their main aim being to get legislation to force the roads to employ more men than they need. There is, however, another side to the matter. The managements of individual railways permit, or cause to be done, many things which are impolitic or wrong and which incense the public, and much of the regulation proposed or adopted is provoked by such conduct on the part of the railways.

The railways have at present different organizations which are performing more or less successfully some of the functions that would naturally belong to a department of public policy and relations. The Special Committee on Relations of Railway Operation to Legislation has done good work in developing a constructive policy in regard to the regulation of operation, in conducting on behalf of the railways hearings before public bodies, and in carrying on negotiations with the Interstate Commerce Commission and other regulating authorities. Similar committees in many of the states have done good work. The Bureau of Railway Economics has been useful and effective in compiling and publishing accurate statistical and other information bearing on numerous railway matters. A number of very effective advertising and publicity campaigns have been carried on through different organizations, some of them permanent, others temporary. In many ways the most important organization of all is the Railway Executives' Advisory Committee on Federal Relations, which has been doing constructive work in harmonizing the points of view of the railway managements themselves and trying to bring about better relations between them and the federal authorities. The American Railway Association has never concerned itself much with regulation, although certain committees have co-operated with the regulating authori-

ties and shippers in solving knotty problems relative to demurrage and kindred matters.

It would be a mistake to form a new department, such as that proposed, in addition to all the organizations now dealing in one way or another with public relations. Its functions would overlap those of existing organizations, and there would result a waste of energy and money, and probably friction. But it is worth while considering whether it is not desirable to create such a department, and substitute it for some of the existing organizations and co-ordinate it with the rest.

There would be several very serious obstacles in the way of its success. If it were understood to be intended to police the management of railways themselves, to promote fair and constructive regulation as well as oppose unfair regulation, and to use only legitimate and avowable methods in doing so, it might be favorably received by the press and public. It would not be so received if there was not manifested any purpose to use it to correct the shortcomings in the public policy of the railways themselves. It may be said that the reason why some organizations for more or less similar purposes have met with criticism, and been even blacklisted by the newspapers, has been that they were not well or tactfully managed. But how the proposed department would be managed would depend on who managed it, and to make it a success would require fairness, honesty, executive ability, knowledge of railway matters and diplomatic talent.

A very serious question is as to the attitude which would be assumed toward such an organization by the executives of the railways. The managers of our railways are very able men, but in the railway business great minds do not always run in the same channels. In consequence, the task of representing them in negotiations or speaking for them is a different matter from that of representing and speaking for a unified organization such as the American Telegraph & Telephone Company. Any one who in acting or speaking for them pleases some of them is apt at the same time to displease others. Furthermore, there are still differences of opinion among them as to the value of such work as would be done by the "Department of Public Policy and Relations." There are many railway executives who fully appreciate both the importance of educating public opinion and the ability, skill and special training required to do such work. There are others who have little appreciation of its importance and difficulty or of the special attainments required for it.

Even though it were feasible to get the railways to support some such central organization, it is questionable if they could be prevailed on to let it police their own acts. A committee of the American Railway Association a few years ago recommended that the association undertake the investigation of important accidents on behalf of all the railways. The report was pigeon-holed just as quickly as the association could reach it. Finally, it is questionable if the roads could be induced to establish departments of public policy and relations in their own organizations. Every large railway ought to have an officer of high rank charged exclusively with the studying and handling of its public relations; but many of them have not even competent publicity agents; and there is not one which has learned to use its advertising appropriation so as to derive the most benefit from it.

The committee of the Associated Railroads of Pennsylvania and New Jersey has done a good service in making recommendations adapted to cause discussion as to what the railways should do to improve their public policy and relations. Probably some step ought to be taken toward co-ordinating all the work now being done by different organizations in respect to national and state regulation. But the best results will never be obtained until the railways individually, and groups of railways in the same territory, make greater efforts to improve their local conditions and public relations. If the railways individually and in groups would take more advantage of the many opportunities constantly open to them to establish better relations with the public by remedying defects of services by having their officers meet and talk with the citizens more, by making more and better use of the various channels available to get before the public the

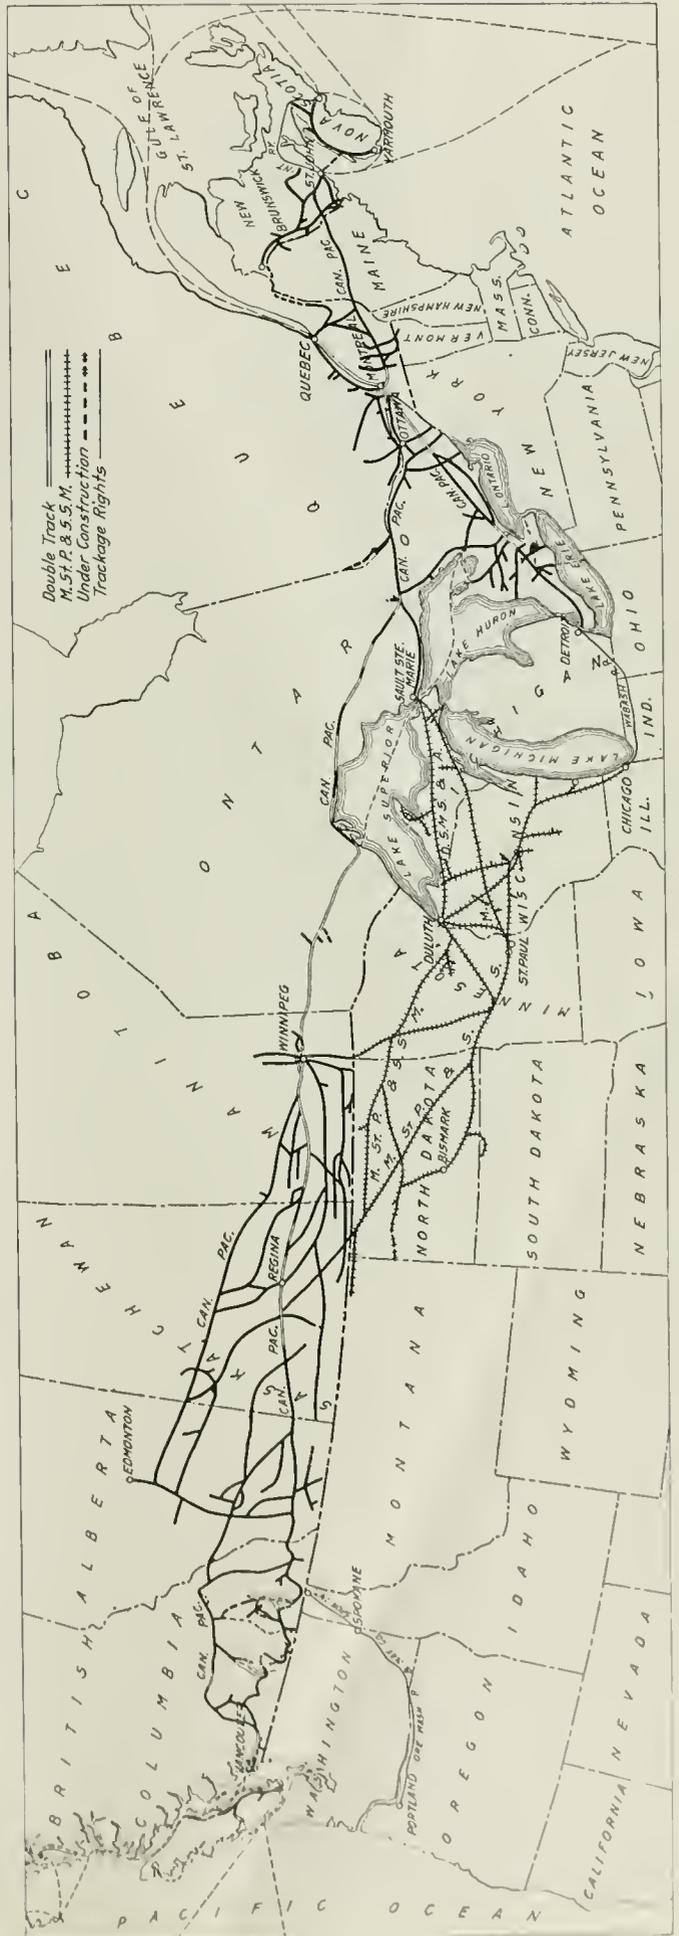

facts regarding the railway situation in general and the situation of the individual lines in particular, the various national railway organizations now in existence or that may be created, would be able to do more effective work. They could then serve better as clearing houses for good ideas and methods and as sources of statistics and information for general use. But so long as a majority of managements take so little interest in the problems of public relations that they have no specially trained and competent officers or departments to deal with them; so long as the local public relations of many roads are left in an unsatisfactory condition; so long as the managements do not even keep informed as to what the organizations they have created to improve public relations are doing—just so long will it do comparatively little good to form another organization of national scope to deal with public relations.

The greatest danger to the future of the railways consists in the fact that, while the attitude of the public toward them has changed greatly, it is still so prejudiced against them that it is inclined to receive favorably almost any additional restrictive regulation of them. The greatest problem of the railways, as respects their public relations, is, therefore, not merely to devise means of more energetically fighting such proposed regulation, but to devise and carry out a program which will so completely change the attitude of the public to one of friendliness and sympathetic interest that instead of its first impulse being to favor every proposal for restrictive regulation, its first impulse will be to oppose it. In carrying out such a program strong organizations representing and working for all the roads can help a great deal. But they cannot carry it out alone, and they cannot be raised to their maximum practicable efficiency unless the various individual roads and groups of roads carry out those parts of the program which they alone can under any circumstances carry out.

CANADIAN PACIFIC

TWO or three months ago there was some speculation as to whether the Canadian Pacific would earn its dividend, and whether, if it did earn it by a small margin, the directors would see fit to declare the full 10 per cent rate. The full 10 per cent is made up from two sources; seven per cent is paid from the operation of the railway lines and facilities directly connected with their operation, such as sleeping cars, and 3 per cent is paid from "special income," which is made up of the interest and dividends received on securities owned, earnings of steamship lines, hotels and commercial telegraph. The company by heavy cuts in expenses succeeded in earning the 7 per cent from the operation of the railway lines, and through the receipt of larger special income, which not only paid the 3 per cent, but left a substantial margin over, had a final surplus of \$3,300,000.

It was generally known for some time before the close of the fiscal year that the Canadian Pacific would show a very much smaller gross income from railway operation in the year ended June 30, 1915, than in the previous year. The question, therefore, was as to the ability of the management to cut down expenses correspondingly to the falling off in earnings, and as to how much effect the business depression had had on the company's special income. Even to a good many who have followed the recent history of the Canadian Pacific it will come as a surprise that with a reduction in gross earnings from \$129,815,000, earned in 1914, to \$98,865,000, or 24 per cent, expenses could be held down more than correspondingly, so that the operating ratio was 66.04 in 1915, as against 67.32 in 1914. The loss of \$31,000,000 in revenue is serious enough to tax the resourcefulness of any railroad management in America, even if it had occurred under ordinary conditions and had been spread over two or three years. To have this loss occur, however, all in one year and at the same time have exacting demands made on the company for military service is a problem so vast as to be not easily comprehensible. There have been railroad managements in the United States which have had very great losses in gross revenue and which have in a period of two or three years reduced their

The Canadian Pacific System

expenses to correspond, but seldom, if ever, has the problem been met so quickly and on such a large scale.

It is remarkable that the management was able to divide this drastic saving in expenses quite evenly between maintenance and transportation. The following table shows the percentage of gross earnings consumed by each class of operating expenses which are usually shown in United States reports, the Canadian Pacific showing separately certain other expenses mentioned later:

	1915	1914
Maintenance of way and structures.....	11.5	12.6
Maintenance of equipment.....	11.4	12.8
Traffic expenses.....	3.0	2.8
Transportation expenses.....	32.5	32.6
General expenses.....	4.0	3.3

The classes of expenses which the Canadian Pacific shows separately are parlor and sleeping car expenses, lake and river steamers and commercial telegraph. The expenses in 1915, as compared with 1914 for these accounts, are as follows:

	1915	1914
Parlor and sleeping car.....	\$1,111,253	\$1,348,979
Lake and river steamers.....	1,051,782	1,183,397
Commercial telegraph.....	1,382,507	1,613,688

The revenue from sleeping cars, express, telegraph and miscellaneous in 1915 was \$12,694,000, as compared with \$15,069,000 in the previous year.

In 1915 the Canadian Pacific carried 7,734,400 ton miles of revenue freight, a decrease of 27.04 per cent as compared with the previous year. The mileage made by freight trains was 16,896,000, which is less by 30.08 per cent than the mileage in 1914. Thus the average trainload of revenue freight was 411 tons in 1915, as against 407 tons in 1914, and this despite the fact that whereas loaded car mileage decreased 23.17 per cent, empty car mileage decreased only 14.94 per cent. It is true that there was a large decrease in the tonnage of non-revenue freight carried, due to the comparatively small construction work carried on last year, and that the average non-revenue freight per train-mile was 52 tons, as against 57 tons in 1914, so that the total trainload was about the same in the two years—463 tons in 1915 and 464 tons in 1914. The actual load behind the drawbar including weight of equipment, was very materially increased because of the greater proportion of empty cars. Undoubtedly a part of the freight handled in 1915 was for the use of the British government and had to be handled on very fast schedule.

Revenue passengers carried totaled 13,086,000 in 1915, a decrease of 15.30 per cent; but there was a big falling off in through travel, so that the average passenger journey was 88 miles as against 102 miles the year before. This made a reduction in passenger mileage of 26.44 per cent. Passenger-train mileage amounted to 17,977,000 and was less by 16.48 per cent than passenger-train mileage the year before. There was, therefore, apparently no drastic cutting of service, and the movement of troops, of course, had to be done on special schedules, with the consequent danger of congestion and probability of higher cost.

Even a management that has set as high standards for itself as the Canadian Pacific might well feel that it had made a new record in the year ended June 30, 1915.

The ease with which earnings from outside operations could be made to supply the necessary margin of safety which even the remarkable cut in expenses could not effect is not so much of a surprise to most people who are at all familiar with the vast resources which the Canadian Pacific has in addition to its 12,917 miles of railroad. The statement of this special income from outside operations is not made in exactly the same way in 1915 as in 1914, which prevents an exact analysis of how the increase was made. In 1915 the earnings from ocean steamships were combined with that from hotels and the total amounted to \$4,370,000. In 1914 the earnings from ocean steamships are shown separately and amounted to \$784,000. In 1915 the net earnings of Pacific coast steamships, commercial telegraph and news department are combined and amount to \$1,494,000. In 1914 these earnings from Pacific coast steamships, commercial telegraph and news department are added to the earnings from

hotels and amount to \$2,134,000. If there is no significance to the fact that the word "net" is left off from the earnings of hotels in 1915, and apparently there cannot be any, since in the table showing receipts and expenditures the special income is shown as a net figure against which there is no expenditure, the combined earnings of ocean steamships, hotels, Pacific coast steamships, commercial telegraph and news department for 1915 amount to \$5,864,000, as against \$2,918,000 in the previous year.

The only sales of securities which the Canadian Pacific made during 1915 were the issue of £504,914 (\$2,524,570) 4 per cent preference stock, for which it received \$2,182,763, and £611,797 (\$3,058,985) consolidated debenture stock, for which it received \$2,781,731, and the Victoria Rolling Stock & Realty Company bonds, which were held in the treasury in 1914, and for which the company received \$13,630,000. The company redeemed £2,074,000 (\$10,370,000) first mortgage 5 per cent bonds and deposited funds for the redemption of the remaining bonds, so that the Canadian Pacific has the unique position among large railroads of having almost no funded debt except its equipment obligations. The total paid for the redemption of bonds or deposited against their redemption in 1915, was \$13,875,658. In addition the company paid off \$1,570,000 equipment trusts and spent \$9,090,000 for additions and improvements to its main line and branches and \$1,596,000 for additions and improvements to its leased lines. At the beginning of the year the company had \$36,778,000 cash on hand, with total current liabilities of \$22,035,000. At the end of the year the company had \$17,055,000 cash on hand, and \$12,552,000 current liabilities.

The following table shows the principal figures for operation in 1915, as compared with 1914:

	1915	1914
Mileage operated.....	12,917	12,044
Freight revenue.....	\$60,737,737	\$81,135,295
Passenger revenue.....	24,044,283	32,478,147
Mail revenue.....	1,389,334	1,132,715
Sleeping car, express, telegraph and miscellaneous.....	12,693,856	15,068,667
Total operating revenues.....	98,865,210	129,814,824
Maintenance of way and structures.....	11,400,539	16,426,582
Maintenance of equipment.....	11,307,965	16,617,247
Traffic expenses.....	2,990,164	3,626,612
Transportation expenses.....	32,083,170	42,250,286
General expenses.....	3,963,204	4,322,104
Parlor and sleeping car expenses.....	1,111,253	1,348,979
Lake and river steamer expenses.....	1,051,782	1,183,397
Commercial telegraph expenses.....	1,382,507	1,613,688
Total operating expenses.....	65,290,582	87,388,896
*Net operating earnings.....	33,574,627	42,425,928
*Net railway income.....	23,128,117	32,198,617
Special income.....	9,475,181	6,472,028
Net available for dividends.....	29,294,906	38,670,645
Dividends.....	29,169,906	26,031,654
Pension fund.....	125,000	125,000
Surplus.....	3,308,392	12,513,991

*It is not plain whether the taxes are deducted before arriving at net earnings or are included with fixed charges and deducted before arriving at net railway income.

NEW BOOKS

Universal Directory of Railway Officials. Compiled under the direction of S. Richardson Blundstone, Editor of *The Railway Engineer*. Bound in cloth; 580 pages; size, 6 in. by 9 in. Published by the Directory Publishing Company, Ltd., 15 Farringdon Avenue, London, E. C. Price, 10s.

The twenty-first edition of this directory of railway officers of the entire world does not seem to have suffered very appreciably because of the war. The compiler, however, has found it necessary to omit the sections relating to the railways of Germany, Austria, Hungary and Turkey and it has not been possible to correct the sections dealing with the railways of Belgium and certain parts of France. The information in the directory has been compiled from official sources. It is remarkably well arranged and includes not only the names of the officers of the railways, but also the gage of each railway, the number of its cars and locomotives and the location of its general and other officers. The roads, naturally, are classified in alphabetical order by countries and the latter by continents, but there is an alphabetical index of all the lines and also an alphabetical list of all the officers mentioned. The book is indispensable to railway supply firms doing a foreign business. It is unfortunate that copies are not on sale in this country.

American Association of Railroad Superintendents

Abstracts of Committee Reports and Papers Presented at the Twenty-Eighth Annual Convention at San Francisco

The twenty-eighth annual convention of the American Association of Railroad Superintendents was held at the Sutter Hotel, San Francisco, Cal., on August 19 and 20, with an attendance of nearly 150. President Charles Burlingame, superintendent of the Wiggins Ferry Company, St. Louis, presided. After an opening prayer by Dr. George E. Burlingame, pastor of the First Baptist Church of San Francisco, J. Emmet Hayden gave an address of welcome in behalf of Mayor James Dolph, Jr.

MR. SPOULE'S ADDRESS

William Sproule, president of the Southern Pacific, then addressed the meeting on "The Public Influence of the Railroad Superintendent," in which he said in part:

If I were asked to point to any branch or phase or activity of the railroad service for the typical railroad man I would without question point to the superintendent. He has to deal with all phases of human nature, either directly or indirectly, either under his personal touch or his official control. He has to deal alike with the mechanism of railroading, and with the minds of men. In the great stress of his duties and the personal strain that is on him during all of his waking hours, he is apt to be so wrapped up in his business that there is obscured to his mind the fact that he is a personage in his walk of life, exercising a wide influence of which he is largely himself unconscious.

Not only does he control the mechanical organism which makes his division a living thing, serving the purposes of the public and of the owners at the same time, but he deals, through his organization, with the traveling public and the shipping public and the thinking public in general. Of the community, the largest percentage, for example, form their opinion of the railroad and its service by the people connected with the railroad with whom they come in contact. I might perhaps say, and you will probably agree with me, that a very large proportion of the public form their opinion from their contact with the clerk in the ticket office, to whom they come for information; the ticket clerk, when he sells them their tickets; the baggageman, the trainmen, the conductor, the enginemen, and last, but not least, the redcap. The handling by these men of the public gives the stamp of approval or disapproval on the part of the public, in large measure, and these men are all under the influence and control of the superintendent.

To-day, more than any other period, is a time when business men have to meet the minds of other men. Never was communication so swift, so broad and human intercourse so active as to-day. It has made the minds of men correspondingly active. We are, so to speak, in a condition of mental fermentation all of the time. It makes us a nervous sort of people. Now, when we, as railroad men, do business, we have to remember this, not only with respect to the men in the service, but more particularly with respect to the people out of the service, as they are the people to whom we wish to sell the only wares we have to offer, transportation. In doing it we have to meet their minds. They expect of us service, not as a private corporation, not as the representatives of private capital, but as the representatives of private capital devoted to public service, and they expect our conduct toward them to be that of public servants.

This is not altogether an undesirable attitude of the public mind. The more we adapt ourselves to it the better railroad men we are, the more useful are we to the public and the more likely are we to get results for the stockholders and the security holders with results satisfactory to the public. It is true that in the transition period, which has run along now for a generation, between the time when railroads were regarded as

strictly private property, to the present, when they are regarded as private property under public control, we have learned that a continuance indefinitely of the policy of regulation, without recognition of responsibility with it, will not make for the service of the public or meet the public needs. And to you it falls to help us to make that difficulty plain to the public mind. Their minds need to meet ours upon that question. In proportion as the public come to realize that the railroads are endeavoring to give the public good service and are actuated by direct motives, with direct methods, in the same proportion will they accord us, I believe, their confidence and will realize that the railroad business is in precisely the same situation as any other business and as the business of every other concern, namely: there must be such a margin between the income of the railroads and the expenses of the railroads as to make the railroad business attractive for capital, which is merely the savings of the people, and to make those savings secure when invested in the railroad business.

In the process of bringing that conviction home to the public, I know of no factor greater than the influence of the division superintendent. His attention to the public wants, his desire to meet the wishes of the shippers, to serve the traveling public well, to make them feel at home upon his road and upon his division; that influence of the superintendent is bound to extend into every avenue of the service, into every phase of employment within the railroad service, and the influence of the superintendent extending throughout his jurisdiction, will be felt by a greater number of people than any amount of literature, so-called, circulated through pamphlets and the public press. This widespread influence will help greatly to give living effect to the things that we are trying to impress on the public, so that the public may see things in our way and we at the same time look into the public mind to see wherein we can stand on common ground. In the railroad business this is of great importance, because a railroad, once built, is laid, for the purposes of men to-day, forever. And we to-day are laying the foundations for the future in the public attitude toward the carriers, which finds reflection in governmental attitude toward us, and we are laying, above all, the foundation for an efficient public service, one of growing and of increasing efficiency of which this nation can well be proud. Let us build so well that private ownership may accomplish all that good government should desire.

I am delighted to say that in my own railroad career, which is now getting gradually to be a long career, I have always found the division superintendent to be co-operative with other departments, anxious to find out the wise thing to do for the company, thinking about it, developing his own theories and plans, full of initiative, anxious about his men, desirous for them and besides this so self-sacrificing, as to himself, that he constitutes in that fact a tribute to the service.

Gentlemen, in these manifold influences of yours the attention which you give to the shipping and traveling public and to the people generally is of growing importance, and together with the technical and active and human attention you necessarily give to the company, within its own organization, constitute the superintendent a man of increasing force in the service and in the community; a man of increasing importance to the company, and that increasing importance will redound to your interest and inevitably be recognized by the companies you serve.

THE SUPERINTENDENT

W. R. Scott, vice-president and general manager of the Southern Pacific, read a paper on "The Superintendent, Past, Present and Future," in which he reviewed the course of development

from the days when the superintendent was in entire charge of all departments and through the period of more intricate organization when the traffic department came into existence and competition in rate-making came into play. He then continued:

Competition in rates is past; but that does not mean that competition is dead. Competition in service remains, and herein appears at once the opportunity and the responsibility of the superintendent. This competition of service will represent something finer and higher than the usual things which we have expected from struggles. It will not be secret and conspiring, seeking its ends by unfair means, but will be open and square in the sight of all men. Its motto will bear no such brutish legend as "The survival of the fit." Its method will not be to kill the unfit, but rather to teach him how to be fit. Your association is one of the evidences of this form of competition.

The orderly progress of the work demands that the railroad superintendent of the future be greater in his accomplishment than the superintendent of the present or of the past. New and complex problems will confront him and to him will be assigned the duty of satisfying the public. With rates handled and approved by government, the existence of the present day traffic department, as such, will not be necessary, but it will be organized along different lines. We will have our rate bureaus for the purpose of assisting in hearings on rate matters before commissions and tribunals and for the co-ordination of connecting lines for the proper divisions of rates, and we will have solicitors for traffic. Inasmuch as no favor can be given to shippers to induce traffic to travel by any particular channel, the only thing that will govern the securing and movement of traffic will be service in addition to solicitation, and service the most important of all. The superintendent is responsible for the service rendered and the cost of it, about 75 per cent of the total expenses of railroads being disbursed under his direction. The solicitors for service, therefore, should be on the superintendent's staff, as he is the man charged with the responsibility of rendering the service and is in constant personal touch with the patrons of the line and for this reason can best serve and satisfy them. Competition will be measured by the quantity and quality of service rendered the public for the published price. As illustrative of my meaning, you and your predecessors have so trained your forces that railroad travel on many lines is perhaps more safe so far as danger or risk of accident is concerned than is the ordinary life at home.

But there are other matters to be considered. Loss of freight between origin and destination; loss of freight at originating point due to improper marking or checking; damage to freight as a result of rough handling. There are constant drains on railway revenues. All such matters are within the superintendent's jurisdiction, and correction of these defects and the rendering of perfect service will be the best advertisement that any railroad can have. And this, together with courteous treatment of the public by officers and employees, will be the determining factor in the railroad's popularity.

The superintendent of the future will probably see quite a change in the relation of government to railroads. It may take one of two forms. If the public is satisfied that the business of the railroads is efficiently and economically administered it is possible that additional earnings will be permitted to enable the railroads to make improvements and add the facilities that are so much needed to keep up with the growth and development of the country, as well as to overcome the constantly increasing expenses of the railways, which will continue through increased wage allowances and the increasing cost of materials. The other form would be government ownership if the public continues to be misled by politicians who insist upon harassing the railroads and clamoring for their further repression. This has had the effect of misguiding a good many railway employees and the tendency now is for presentation on their part of the choice of granting extravagant wage increases for a day's work or having the service paralyzed. If the latter policies are adopted it will do much to hasten government ownership of railroads.

The superintendents of to-day can do more than any other set of men to counsel the great organizations of railroad employees along the lines of reasonable action, which in the end must mean so much for their welfare. Much good has been done by these organizations in the past in controlling their men and improving the service of the railroad. But the most can be done by such treatment of the public and such service to the patrons that the last lingering resentment against railroads will be buried with the past.

PRESIDENT'S ADDRESS

President Burlingame in his address referred to the rapid growth of the association, both in membership and in usefulness, since its reorganization in 1911, when the membership was changed from railroads to individuals. He recommended an amendment of the articles of association to include in the membership general superintendents of transportation, superintendents of transportation, general inspectors of transportation, assistant superintendents of transportation, assistant general superintendents and assistant trainmasters. He also recommended an increase in the number of members on committees. He spoke of the increasing recognition on the part of general officers of the value and importance of the association, saying he had adopted the policy of asking the approval of superior officers to the appointment of their superintendents as committee members in order to insure their co-operation, and that of 50 vice-presidents and general managers so addressed, 41 had given favorable replies.

He outlined the field for the work of the association toward improving the efficiency of operation as follows: Reducing the number of cars handled in proportion to the amount of freight and the number of passengers transported; reducing the consumption of fuel and other supplies; reducing to a minimum the amount of labor necessary to the movement of freight, to be brought about by a careful analysis of the conditions surrounding the transportation of freight at different points, and watchful supervision of the various elements necessary to bring about maximum results with minimum expense; creating in the minds of the employees an enthusiastic spirit and morale; reducing hazards to both life and property; bettering the working condition of employees; providing service satisfactory to the patrons; standardizing practices as far as possible and preventing loss and damage to freight.

The members of the Superintendents' Association, he said, being directly connected with operation, should be the best qualified to recommend changes in operating rules and methods, to be referred to the American Railway Association, in the interest of standardization. One of the important subjects for the superintendents to consider is the waste in wrong routing of good order empty cars and the setting back of bad order cars. At St. Louis a plan is being tried by which each superintendent will keep a record of all cars wrongly delivered by each connection from day to day, and at the end of the month reports showing wrong deliveries with the date, number, initials, cause of set-back and percentage of cars set back to the total of cars delivered will be sent to the superintendents of delivering lines under personal cover. If proper action is not taken to reduce the number of set-backs the matter will be taken up by the general managers of the lines involved.

TRAIN DESPATCHERS AND DIVISION OFFICIALS

J. P. Finan, despatcher, Atchison, Topeka & Santa Fe, read a paper on "Train Despatchers and Division Officials," in which he said in part:

There is no test of man's ability in any department of the railroad more severe than service as a train despatcher. There is no position where so little consideration is shown for the rights and feelings or failures of man as the train despatcher's, yet they are a class upon whom a great deal depends for the safe and efficient operation of the division and their duties are such that no man can perform them without meriting, at times, even just criticism.

If the train despatcher makes a mistake, which he sometimes

does, he usually pays for it with usurious interest. He is often criticised and censured in a manner not conducive to safe and efficient operation. When such criticism or censure borders on abuse, as it sometimes does, it results in discontent and reduced efficiency. It unnerves the despatcher and makes him dissatisfied, afraid and uneasy, and while in that mental attitude he is not capable of doing good work. Any official who thinks such a method is the best way to deal with his train despatchers, thereby confesses his inability to wisely govern and efficiently direct other men of intelligence and moral rectitude.

When a train despatcher must be criticised or censured, the object should be prevention and not punishment. He should be admonished or corrected in a way that will still leave him a useful and loyal employee, whose sense of justice and self-respect remains unscathed. It costs railroads something to make a train despatcher. If he has done good work for a year or so, he is too valuable a man to be driven out of the service by harsh treatment or thrown in the scrap heap because of some slight mistake or oversight.

The ever present expectation of being called to account is a most wholesome check upon a train despatcher. It makes him watchful and furnishes an incentive which inclines him to hold others to a strict accountability and carefulness in the discharge of their duties. But he expects and appreciates, and I may venture to say, deserves, consideration and courteous treatment.

Division officials should remember that the arbitrary power they exercise is delegated to them in the interest of the company and should never be wielded except to advance its affairs. The best interests of the company demand that you accord to the train despatcher about the same kind of treatment you expect and wish to receive from your superior officers. When the train despatcher is harshly criticised, or severely censured, he loses his mental equilibrium for a time, much to the detriment of the service, and if such treatment continues to be a regular thing, he becomes dissatisfied and begins to look around for another position.

It is highly important that those who fill positions of responsibility should remain uninterruptedly in the service. The train despatcher is no exception to this rule. Without continuity of service on the part of its train despatchers, a division can never hope to maintain a very high degree of efficient operation. Wherever this principle is practiced, you will find a safe and efficient service and where there are constant deviations from it, you will find just the reverse.

Frequent and abrupt changes of despatchers should be avoided as they tend to disturb the minds of the men and lessen their interest in the service. They should not be censured or criticised needlessly. To do so is to unsettle the service and lessen the zeal and loyalty of the men. Mistakes that are not discredit-able, or that do not result from inherent wrong, should not be judged too severely. Those who are supposed to pass judgment should be considerate of the conditions which contribute to bad results.

Failure to recognize these plain principles, of which I speak, has, upon two occasions, aggravated an attempt to form a protective organization for train despatchers. In 1892 the attempt dismembered and disrupted the Train Despatchers' Association. In 1911 a considerable number of members left the association, following the Baltimore convention, because that convention wisely, and practically unanimously, defeated the resolution which was intended to change the constitution in a manner which would have made of the Train Despatchers' Association a protective organization.

The cause of such dissension, remember, was not so much a question of wages or hours of service, but that a great many train despatchers felt that they were not treated with the same fairness and consideration accorded other railway employees, nor that which was due their standing as train despatchers, and smarting under a sense of discrimination, looked towards labor unionism as a remedy, mistakenly, as I believe.

Train despatchers easily adapt themselves to their income,

whatever it may be, and do so cheerfully and happily, as long as its permanency is assured. But when doubts develop, that moment they become afraid, uneasy, discontented and open to improper suggestions.

It may not be well known to you, but it is a regrettable fact, nevertheless, that a considerable proportion of train despatchers are criticised and censured in such a manner that they do not feel secure in their positions. And while, perhaps, such fears may be largely groundless, they do exist and tend to disturb the minds of many train despatchers, thereby lessening their usefulness. And until this feeling is removed, until this apprehension is entirely eliminated from the lives of train despatchers, railway operation will be the loser in the value of the service rendered by this class and the element so affected will still contend that concerted action on the part of train despatchers, through some organized effort, is necessary in order to secure them the fair treatment they feel they deserve and should have.

There should be no more reason for a protective organization for train despatchers than there is for such an organization for superintendents. Train despatchers may not be formally recognized officials, on all railroads, but they cannot be divorced from the intimate relationship they hold with the division officials. It can readily be seen that their positions should be considered from every standpoint of official capacity and are not similar, in any sense, to the positions held by other employees who are affiliated with and obligated to organizations demanding from them a loyalty paramount to the loyalty they owe to the company.

It is only fair to admit, however, that some railroads do consider their train despatchers as members of their official family and treat them as such, according to them every kindness and courtesy that is consistent and possible to give, such as two weeks' vacation, at full pay, once a year, sending one despatcher from each division to the annual convention of the Train Despatchers' Association, compensating such men for time and expenses while absent from duty on that mission; granting system annual passes to despatchers and dependent members of their families, all of which fully establish a substantial recognition of the official status of the train despatcher.

I point with pride to the Santa Fe as one of the great railway systems which have adopted this policy of dealing with their train despatchers, and whatever it may cost them to maintain such a policy, they do not look upon it as an expenditure, but as an asset—an investment which yields large and important returns in increased loyalty and devotion to the service on the part of their train despatchers.

Is it not, therefore, worth while for all railroads to adopt some uniform method of dealing with train despatchers and to inaugurate some definite plan which will insure justice and fair treatment? Then this "protection" idea, which seems to be sticking in the minds of so many train despatchers will soon fade away—those fears of arbitrary dismissal will soon be banished and you will have a force of train despatchers contented with their positions, zealous and efficient in the performance of their duties and of unquestionable loyalty to the service.

COMMITTEE REPORTS

A sub-committee of the transportation committee consisting of F. L. Meyers, superintendent, Atchison, Topeka & Santa Fe, Las Vegas, N. M., and E. Richards, superintendent of the St. Louis Southwestern at Pine Bluff, Ark., presented a report on marking and packing of freight, arriving at the conclusion, from a review of the rules issued or recommended by the various associations or departments, that practically every requirement has been covered, but that there remains the essential of securing the enforcement of the rules. The committee, therefore, offered a resolution, which was adopted, recommending that the enforcement of rules covering the marking and packing of freight be placed under the jurisdiction of the weighing and inspection bureaus in different sections of the country and that they employ such additional force as is required to properly conduct the work.

In connection with the report of this committee W. S. Williams, superintendent of the St. Louis division of the Illinois Central, submitted a paper on "Methods of Checking Transportation Expense," describing a plan adopted on the Illinois Central in September, 1914, by which each superintendent makes out in advance a monthly allotment to cover transportation expenses and secures approval for it.

The committee on nominations, in addition to its selection of officers for the ensuing year, presented a supplementary report on "How to Get Train and Enginemen to Take More Interest in Their Work to Protect Themselves and the Company." Summing up, the committee said, the desired results can best be obtained by:

Elimination by careful selection in employing. Elimination of careless, slothful and undesirable employees as opportunity presents itself. Just discipline, tempered with mercy when conditions warrant, and absence of favoritism. Personal contact and cultivation of *esprit du corps* and feeling of personal responsibility for results.

A. E. Boughner, superintendent, Missouri, Kansas & Texas, Sedalia, Mo., chairman of the arbitration committee, reported that no disputes had been referred to it. Two subjects assigned to the committee were discussed in papers by individual members.

W. Smith, assistant superintendent, Indiana Harbor Belt, submitted a paper on "How to Obtain Better Results in Handling Cars in Yards and in Trains by Switchmen and Trainmen," and A. Shepherd, superintendent terminals, Missouri Pacific, Kansas City, submitted a paper urging the establishment of uniform charges for reconsigning freight shipments. This was referred to the transportation committee.

The committee on membership submitted a paper by W. N. Cox, late superintendent of transportation and machinery of the Western Railway of Alabama, on "How We Can Increase the Membership of this Organization, Thereby Making It More Useful," and a paper by F. C. Syze, assistant superintendent, Baltimore & Ohio, Staten Island, N. Y., on "How to Bring About a Better Feeling Between Yard and Train and Enginemen."

The committee on interchange car inspection, M. Marea, general superintendent, St. Louis, Troy & Eastern, chairman, presented resolutions making recommendations to the American Railway Association which were adopted, as follows:

That the American Railway Association again be urged to consider the matter of uniform lettering, it being the recommendation of this association that the sides of cars be lettered at the seal pin as follows: Facing the "B" end of car the left-hand side door to be lettered "L," the door on the opposite side to the right facing the "B" end to be lettered "R."

That the American Railway Association be asked to establish as uniform practice the plan of stenciling all car department information on the ends of cars and only information pertaining to the transportation department on the sides.

That end doors on box car equipment be abolished.

That the American Railway Association be requested to urge upon its members a closer observation of M. C. B. Rule 1, that each railway must give to foreign cars the same care as to lubrication, repairs, etc., as to its own cars.

That a uniform steam hose coupling with a maximum sized port opening be adopted as standard.

That the delivering road shall pay cost of transfer or re-arrangement of lading when due to defective equipment unsafe to run according to M. C. B. rules, unless without transfer repairs can be made in 24 hours as per M. C. B. Rule 107.

That the rules adopted by the American Railway Association for the inspection and certification of box cars before loading with freight subject to damage be adopted locally by interested carriers at interchange points and that the plan be extended to provide for a uniform inspection certificate to make the delivering line responsible for the fitness of cars delivered; cars delivered without certificate cards to be considered as having been delivered in error.

The association thereupon recommended that all defects on freight car equipment be declared car owner's, except defects growing out of accidents such as wrecks, collisions, etc., and that a general adjustment committee be appointed to arbitrate car damage claims.

The association also adopted a resolution which had already been sent to the American Railway Association and the Master Car Builders' Association, recommending that there be no changes in the existing M. C. B. rules until October, 1916, to afford an opportunity of fully developing the effect of the rules put into effect last year.

The committee on train rules, J. E. Scott, train dispatcher, Gulf, Colorado & Santa Fe, chairman, presented a progress report and was authorized to continue its work of formulating proposed changes in the standard code.

The committee on resolutions, D. S. Farley, superintendent, Atchison, Topeka & Santa Fe, Amarillo, Texas, chairman, presented a report on "Cost Per Day of an Engine and Crew in Road and Yard Service," and a resolution, which was adopted, that it is impracticable to recommend any uniform price per day for the rental of an engine and crew, and that further action be taken by the association to establish a minimum rate of charge for rental of locomotives and that other costs, incidental to wages, supplies, etc., obtain in accordance with the rates of pay and expenses of the owning company. The committee presented a table for eight roads for the month of October, 1914, showing that the cost of operating switch engines 10 hours a day varied from \$26.17 to \$39.33.

The committee also presented a paper by E. D. Devans, general superintendent of the Buffalo, Rochester & Pittsburgh, on "Efficiency or Discipline Systems," describing the modification of the Brown system adopted by his road in 1912. This aroused some discussion, in which various members described the methods of discipline used on their roads. The consensus of opinion was that the system of record suspensions was greatly superior to the plan of actual suspensions.

At the request of the Cincinnati division a resolution was discussed that a suitable receptacle be placed on the side of each car in which home route cards may be placed. The general opinion was that the card should go with the car, but one or two members thought it should accompany the billing and the subject was referred to the transportation committee.

E. H. Harman, secretary, presented a report showing the rapid increase in membership, which was 12 in 1911, 74 in 1912, 145 in 1913, 266 in 1914 and 501 in 1915.

W. E. Williams, general manager of the Missouri, Kansas & Texas, delivered an address on "The Railroad as a Public Servant."

E. W. Camp, attorney for California of the Atchison, Topeka & Santa Fe Coast lines, presented a paper on "The Railroad and the Hobo."

The following were elected officers for the ensuing year: President, Charles Burlingame, superintendent Wiggins Ferry Company, St. Louis (re-elected); first vice-president, W. S. Williams, superintendent Illinois Central, Carbondale, Ill.; second vice-president, C. E. Rickey, superintendent terminals Queen & Crescent, Cincinnati, Ohio. Executive committee: A. G. Smart, superintendent Chicago, Burlington & Quincy, Aurora, Ill.; B. B. Tolson, superintendent Mobile & Ohio, Murphysboro, Ill.; O. F. Clark, superintendent of transportation Grand Trunk, Chicago, Ill.; J. E. Taussig, general superintendent Texas & Pacific, Dallas, Tex., and H. R. Saunders, superintendent Chicago, Rock Island & Pacific, Kansas City, Mo.

Members of the association and their families went to the convention in a special train by courtesy of the Atchison, Topeka & Santa Fe and the Southern Pacific. Saturday, August 21, was Railroad Superintendents' Day at the Panama-Pacific International Exposition and the members were entertained at the exposition grounds. On August 22 the party was taken for a trip on the bay for the purpose of inspecting the docks and various points of interest, followed by a trip to Mt. Tamalpais via the Northwestern Pacific and the Mill Valley & Mt. Tamalpais.

Building Concrete Caissons in the Platte River

The Burlington Used This Construction at Ashland, Neb., and Also a New Type of Reinforced Concrete Pile

By J. H. MERRIAM,

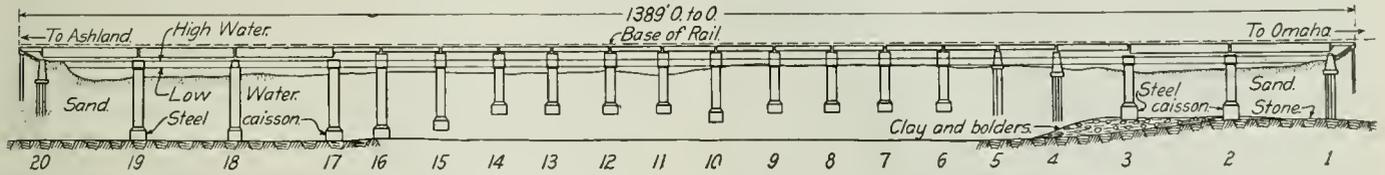

Resident Engineer, Chicago, Burlington & Quincy, Kansas City, Mo.

The Chicago, Burlington & Quincy has recently completed a permanent bridge over the Platte river on the Chicago-Denver main line, near Ashland, Neb. This is the first permanent structure of its kind on the lower Platte river, and consists of deck plate girder spans varying from 50 to 105 ft. in length and supported by 20 concrete piers of various types. The most satisfactory design from the construction standpoint was the cylindrical caisson, with a square base, which was sunk by means of open dredging.

Because of the shallow water in the Platte river it was possi-

The inside of the base is pyramidal in shape, converging into a cylinder 8 ft. in diameter at a height of 9 ft. above the cutting edge and forming an open well 8 ft. in diameter. After removing the forms, excavation was carried on through the open well by means of a clam shell bucket and a stiff-leg derrick or by the use of a track derrick with either a clam shell or an orange-peel bucket.

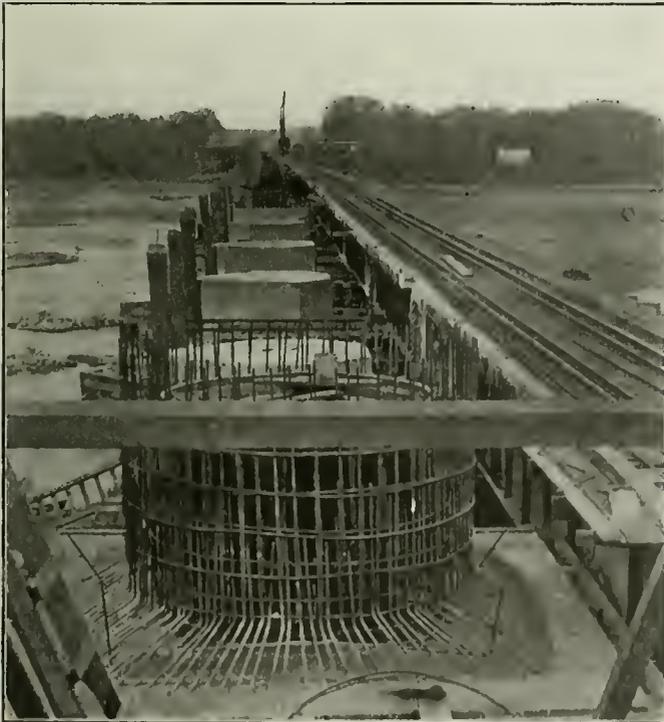

The time required to sink these caissons was materially influenced by various obstructions encountered, some of which required the services of a diver, who was lowered inside of the

General Elevation of the Platte River Bridge

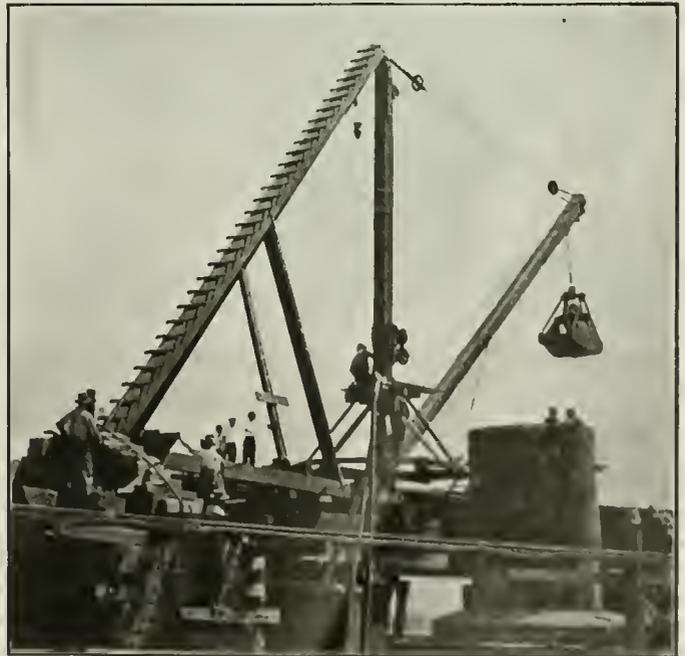

ble to build a diversion dam of brush and rock above the proposed locations of each pier, in this manner obtaining still water in which a wooden cofferdam measuring 24 ft. square and 4 to 6 ft. in depth was placed and anchored in position. By filling this with sand to the surface of the water, a bar was formed on which forms for the bottom section of the caisson were placed and filled with concrete. The outer sides of this section are vertical for a

caisson to remove logs, rocks and other obstacles. The caissons were sunk an average of 8 ft. per 10-hour day, the best time made being 20 ft. in 20 hours' continuous dredging. When it was necessary to start dredging after it had been discontinued over night or for a period of 5 or 6 hours, considerable excavation was necessary to start the movement of the caisson. The use of dynamite exploded in the excavated pit in the bottom of the caisson after each 5 to 8 cu. yd. of sand had been removed was found to assist materially in the sinking. A drop of from 2 to 10 in. was accomplished at times in this manner, using a ½-lb. stick

Looking East from Pier No. 11, Pier No. 10 in Foreground Showing Reinforcement of Bottom Section

distance of 10 ft. and then converge to form a cylinder 11 ft. in diameter at a height of 12 ft. above the cutting edge. This cylinder was extended upward in 13-ft. sections as sinking progressed. Wooden forms lined with galvanized iron were used for both the inside and outside, and were constructed to permit their removal and use on other piers.

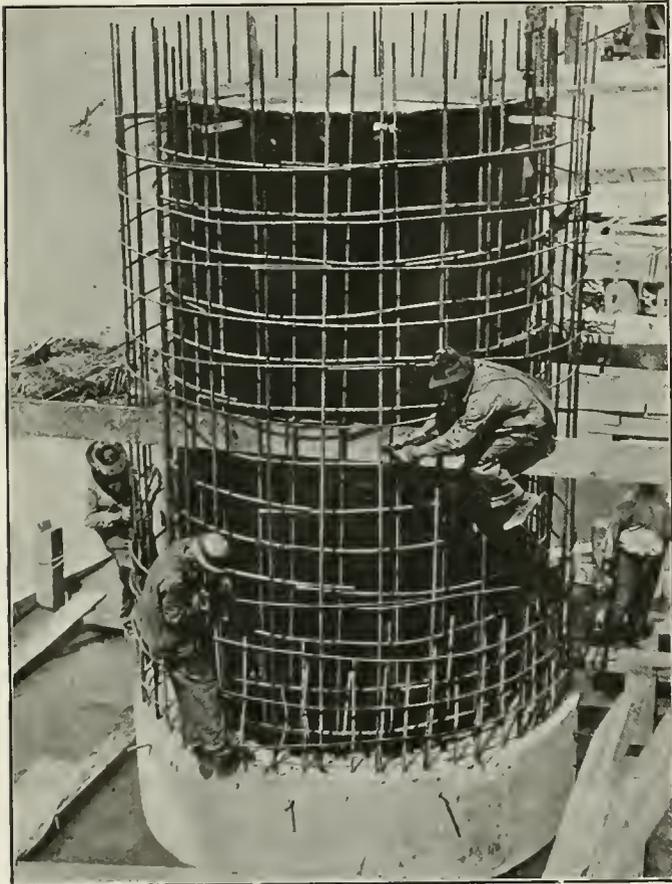

Excavating Inside of Steel Caisson by Use of Stiff-Leg Derrick and Clam Shell

of 40 per cent. dynamite. The use of dynamite also reduced the amount of excavation necessary for sinking as these shots kept the cutting edges well down in the sand and prevented the sand from running in from the outside.

Very little trouble was experienced in keeping these caissons in a vertical position except when some obstruction was encount-

tered under one side of the cutting edge. When this happened it was sometimes necessary to place a shore or brace, usually a 12-in. by 12-in. timber, against the low side, and as sinking progressed this brace would force the caisson back to its proper position. Quite often it was possible to keep the caissons plumb by regulating the excavation in the bottom.

In order to found the cutting edge on bed rock the last 3 or 4 ft. of sinking was accomplished by lowering the water on the inside. The resultant reduction in the pressure caused the sand to be forced in under the cutting edge, at the same time permitting the caisson to settle by its own weight to within a few inches of bed rock. Sand around the cutting edges which could not be removed was thoroughly grouted with Portland cement. The bottom was then sealed with a 5-ft. course of 1:2:4 concrete placed through the water in a 3/4-yd. drop-bottom bucket. After this had set for 12 hours a second course was placed, making a

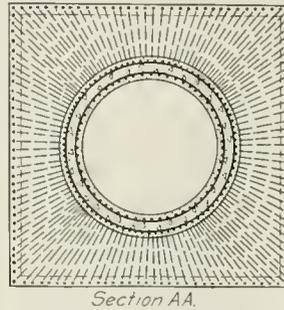

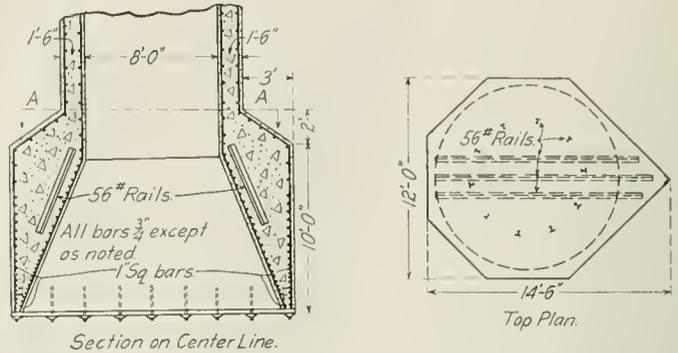

Inner Form and Reinforcement of Upper Section of Concrete Caisson

total of 10 to 14 ft. of sealing material. This was then allowed to set for 24 hours, when the caisson was unwatered and the filling of concrete was carried on in the dry. A 1:3:6 mix was used to fill the core above the sealing course. Piers were then completed to the proper height with a reinforced concrete cap of octagonal shape, with the upstream side carried out to a point, to form an icebreaker.

Piers 6 to 16 inclusive, except pier 11, were built in this manner. At pier 11 the water was too deep to admit using the diversion dams and it was necessary to erect forms, and concrete the bottom section of this caisson on a suspended platform. This was accomplished by spanning the location of the new pier with two 60-ft. girders placed 13 ft. center to center on pony bents built on old bridge seats. Crosswise of these girders two pairs of smaller girders were placed from which a platform was suspended by means of six 2-in. lowering screws 24 ft. long. Forms were erected on this platform and concrete was placed to a sufficient depth properly to embed and anchor six eye-bars to which six 2 1/2-in. lowering screws were attached. This method was fol-

lowed to aid in supporting the load as the concreting progressed.

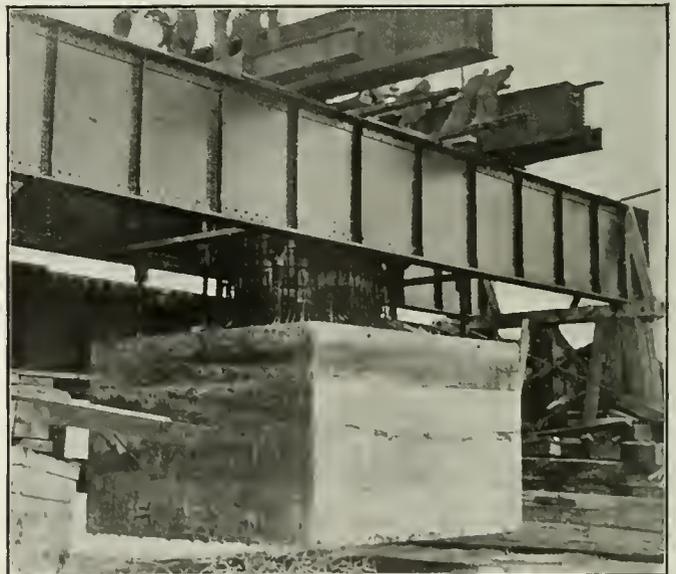

After the forms were removed the six 2-in. screws were released and the platform was removed from under the caisson, throwing the entire weight of approximately 175 tons on the six 2 1/2-in. screws. The caisson was then lowered to the bed of the

Details of Concrete Caisson and Caps for the Piers 6 to 16

stream by means of these screws operated with wrenches on top of the cross girders. After landing on the bed of the stream the screws were moved and sinking was carried on, as with the piers previously described.

Caissons for piers 2, 3, 17 and 19 are of steel construction, cylindrical in shape, and measure 18 ft. in diameter at the base.

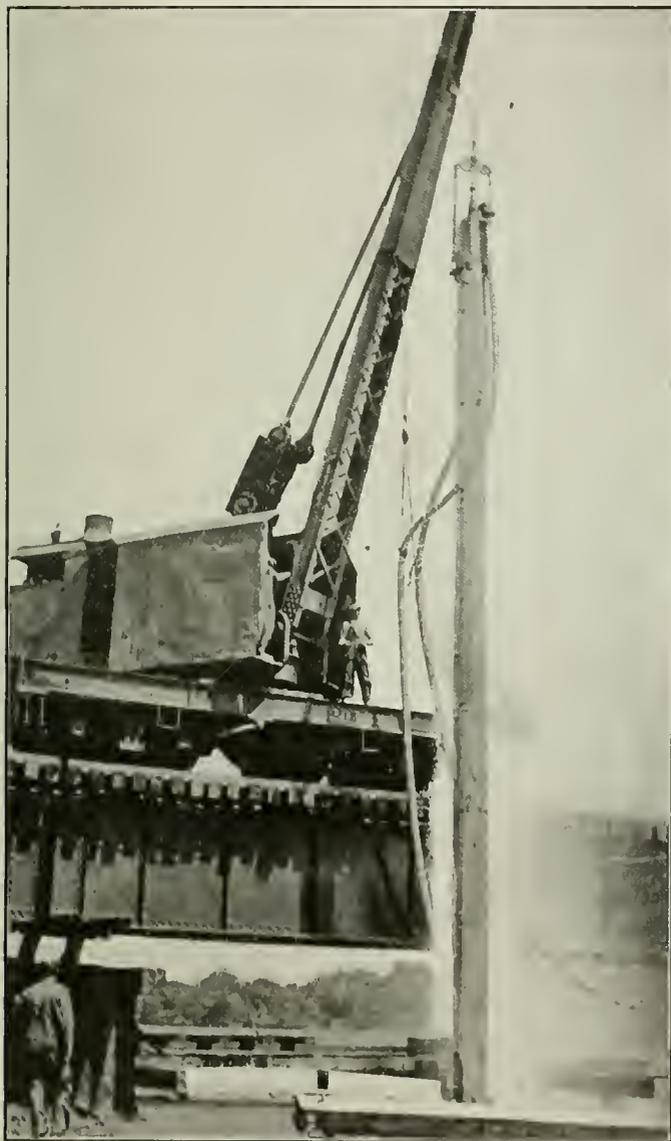

Pier No. 11. Lowering Bottom Section of Caisson by Means of Screws

They have vertical sides to a height of 16 ft., where they converge to a cylinder 11 ft. in diameter. This steel shell was lined with 18 in. of concrete, leaving an 8-ft. well through which a dredge bucket was operated. The bottom sections of these caissons were assembled and riveted together on the bank and were then carried out and set in place by a locomotive crane. Addi-

tional sections were added in 20 ft. lengths. This type of caisson was concrete reinforced with 15-in. I-beams placed vertically in the 18-in. lining wall. These caissons were used for deep foundations, although the concrete type of caisson was later found to be equally satisfactory. These piers were finished to proper height with an octagonal cap similar to those described previously except that icebreakers were designed differently in order to afford greater protection because these piers are somewhat lower than those built in midstream.

Piers 1, 4 and 5 are built on Bignell concrete piles; piers 1 and 4 resting on 36 piles each, and pier 5 on 21 piles, sunk to depths of 57, 62 and 50 ft., respectively, below low water. The tops of

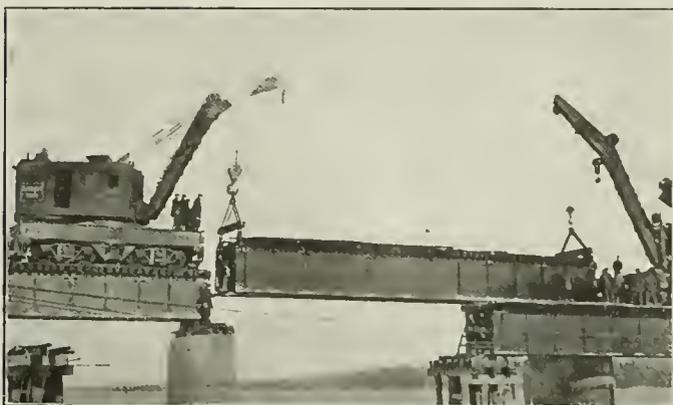

The Bignell Concrete Pile. The Spray Is Due to Discharge from the Water Outlets in the Sides of the Pile

these piles were embedded in a concrete cap on which the piers were built in the ordinary manner. These Bignell concrete piles are a new type and these are the first of their kind to be used. They are 16 in. square, 50 ft. long, weigh 12,300 lb. each, and are made of reinforced concrete. Each pile has a 4-in. pipe through its entire length, reducing to 2 in. at the bottom. This pipe is tapped at intervals of 1½, 2, 4, 8 and 12 ft. from the bottom or point of the pile by ¾, ½ and ¾-in. pipes, which are fitted with elbows turned up on the faces of the pile, thus furnishing 5 openings on each side. In addition a 2-in. pipe extends through the 4-in. pipe and fits into the reducer at the point, the 2-in. pipe being fitted with a brass nozzle to reduce the opening to 1½ in.

Water is applied at the top of the pile through two ¾-in. hose;

one, with water at a pressure of 100 to 150 lb. per sq. in., was connected to the 4-in. pipe and the other, with water at a pressure of 250 to 300 lb., was connected to the 2-in. pipe. The high pressure water was used at the point of the pile through the inner pipe, to loosen and displace sand in front of the pile in sinking. The lower pressure in the 4-in. pipe supplied the side openings with enough water to keep the sand loose and to give it an upward movement to overcome the side friction. The piles sank by their own weight. The high pressure water was supplied by one Knowles Special 20 in. by 8 in. by 18 in. duplex pot valve pump through 800 ft. of 6-in. wrought iron pipe and the low pressure water was supplied by one Dean Brothers 16 in. by 8 in. by 18 in. duplex pump, through an 8-in. pipe of the same length.

The east bank block is also supported on 50-ft. Bignell concrete piles, 12 of which were sunk to a depth of 35 ft. below low water and were capped with concrete. They support the east end of a 25-ft. slab, weighing 80 tons. Two of these slabs are used, one at each end of the bridge. They were manufactured at the Burlington concrete plant at Havelock, Neb., each slab being made in two parts, measuring 3 ft. deep, 7 ft. wide and 25 ft. long. The west bank block is similar to the east one, except that it is supported

Moving Girder Spans from Temporary Piers to New Piers

by twelve 30-ft., 14-in. by 14-in. solid concrete piles. Pier 20 is similar to pier 1, except that foundation piles are white oak instead of concrete.

Pier 18, which was the last pier to be completed, presented many difficult problems, owing to the nature of obstructions in the river bed through which it was sunk. A cofferdam 19 ft. square, was planned, but before driving a Davis calyx core drill was used to drill holes 18 in. apart on the proposed line of the cofferdam to penetrate through the obstructions. Each hole was blasted with 5 to 15 lbs. of 60 per cent. dynamite and sheet piling was then driven with but little trouble. By the use of dynamite, divers, dredge buckets and sand pumps, this cofferdam was finally cleaned out and the obstructions were removed. It was then filled to the surface of the water with sand on which forms were erected for a concrete caisson similar to those used at piers 6 to 16. Thereafter work proceeded without interruption until the pier was completed.

Three new spans were placed at each end of the new bridge. The remainder of the spans were obtained from the old bridge, and it was necessary to divert traffic for 34 hours while they were shifted from the old to the new piers. This was accomplished by the use of one 75-ton and one 100-ton derrick, which picked up each entire span with ties and rails in place, raised it 7 ft., moved it longitudinally 25 ft. and swung it to place on the new piers 14 ft. out. These three movements required from 20 to 45 min. for each span. Thirteen spans were moved in this manner, during the worst storm of the winter, the high wind and heavy snow greatly retarding the work. The actual time for changing all the spans was 10½ hours.

The entire bridge is covered with a reinforced concrete ballast deck. The deck slabs were pre-molded and placed on the bridge in 5-ft. sections. Each slab measures 14 ft. wide by 10½ in.

thick, and is provided with two 1¾-in. drain holes. Joints between slab sections are calked with oakum, tar and cement. Expansion joints at the ends of each span are covered with apron plates.

Fascine type willow mattresses were constructed to protect the new fill at the east end of the bridge and to maintain a channel under the long spans at this point. A peculiar characteristic of the Platte river is that it has invariably, adjoining one bank, a main channel and against the other bank a secondary channel. These channels are from ¼ to ½ mile apart, with stretches of extremely shallow water and a sand bar between. The banks are low and overflow only at times of ice gorges in the early spring. The fall is great and the current rapid and during the high water the amount of silt carried is considerable. As might be expected in a stream of so great a fall, the sand is rather heavy, although it is readily scoured when the stream is confined. For this reason it has been found the better practice to narrow the stream to as great an extent as prudence will permit, thereby causing the channel to scour and provide wider and deeper openings at the time of the spring break-up for the passage of the very heavy ice which often forms, and to reduce the width of the sand bars between the channels to a minimum. These characteristics determined the design of this bridge in a large measure.

It will be noted that on either side very deep foundations were carried to bed rock or hard pan, while in the middle of the bridge, where the depth would be the greatest in ordinary streams, the foundations are carried only to a stratum of coarse sand or fine gravel. This material has demonstrated its bearing power and the probability of scour in this location is thought to be extremely remote.

The narrowing of the original bridge by about 300 ft., as anticipated, has resulted in slightly increasing the depth of the channel in low water and it is believed that a further increase in channel depths will be secured during the next floods.

Work was begun in July, 1912, and completed in June, 1915. It has been handled under the general direction of C. H. Cartledge, bridge engineer, and C. R. Fickes, assistant engineer, with the writer as resident engineer on the ground.

ACCURATE FREIGHT BILLING

The method of making out way bills with machines on a piece-work basis employed at the Chicago, Rock Island & Pacific freight station at Burr Oak, Chicago, was described in the *Railway Age Gazette* of May 14, page 1008. One unusual feature of the results secured at this point is the high degree of accuracy attained. Since the publication of this article the following information has become available, concerning the record made by one of the men employed in making way bills. From January 1 to August 1, this man made an average of one error for each 357 tallies billed. In July his record averaged one mistake in 500. Out of 67,733 tallies billed in one period, 190 errors were made. This is a record for errors of 0.0028.

Under the system employed any mistakes made in the billing of any tally, including the advance or prepaid charges, commodity items, destinations, car references, block loading numbers, consignees, consignors, weights and special notations, are charges against the billers. Any man making a record of 0.005 is penalized two points for all errors made, while any man making a record better than 0.005 is not penalized. In this way the careful biller is encouraged, while the careless one is penalized. It is believed that the record referred to above is one of the best which has ever been made in regular routine work.

THE RAILWAYS OF THE BELGIAN CONGO.—The final link in the railways and river line of communication between the mouth of the Congo and Lake Tanganyika has just been completed. Now ocean-going vessels can go up as far as Matadi, 85 miles from the mouth of the river; thence a railway of 260 miles runs to Stanley Pool; from there the river is navigable again to Stanleyville, a distance of 1,000 miles, and so on, the river being used wherever possible.—*The Engineer*, London.

HOW A DESTROYED FRENCH RAILROAD HELPS ITS EMPLOYEES

By WALTER S. HIATT.*

The whole-hearted sacrifices made by the entire French nation in the present war are astonishing, and not the least astonishing of these sacrifices is the financial one made by the railroads on behalf of their employees. If one did not understand the spirit of unity and brotherhood awake today in France, it might be believed that in time of war the railroads were preparing for peace, cementing now the goodwill that should exist between employer and employee.

The Eastern Railroad (chemin de fer de l'Est), with the single exception of the Northern Railroad (chemin de fer du Nord), has and still is suffering more severe physical and financial disaster because of the German invasion than any other of the French lines. A good half of the 500-mile line of trenches, beginning at Laon, running south to Rheims, and thence to Verdun, Nancy, and Belfort, is in territory adjacent to the tracks of the Eastern Railroad. The latter, in consequence, is seriously crippled. On half of its system it can do no business at all, and that half is the part which brought in its greatest revenue because of its connections with the Belgian and German railroads and because of the mines and manufactures of the north of France. It will be unable to rebuild its burnt stations, replace its dynamited bridges, repair the road bed and re-establish its service until many months after the cessation of hostilities. On a rough count nearly 300 of its stations lie to the north of the French lines; it has had 49 steel and stone bridges destroyed.

The traffic receipts of the company during 1914, these figures taking in only the first six months of the war, fell off 25 per cent., or \$15,000,000, counting the \$6,500,000 paid as transport charges by the war department. Unlike four of the other five French railroads, it has sustained not only this vast physical damage but it has also not had any considerable passenger or freight receipts to draw from, except during last August, when it had more passengers than it could well handle.

However, its operating expenses, normally \$6,000,000 for six months, did not diminish in proportion, being for this particular half year only a little over \$1,000,000 less than usual. One of the many reasons for this is found in the increased expense entailed in the operation of military trains, the operation of these trains being much more complex than that of the ordinary trains.

In the face of these conditions, this railroad from the very beginning of the war has done its best to provide for those of its employees who have suffered and are suffering loss of work because of the war, or who have been mobilized as active soldiers under the flag when there was no positive need of them on the railroad. As a French soldier is paid a cent a day, it can be understood that his family or dependents cannot live without help. Some 400 of the railroad's employees are now soldiers and to these employees the company is paying one-half their regular salaries. In case the employee is married, it is paying the other half to the wife with an additional ten cents a day for each child in the family. The railway is paying regular salaries to those employees thrown out of work by the German occupation. It is also paying additional sums to those employees who have been given work away from their regular stations.

Further, this railroad at its annual meeting voted the usual annual sum of nearly \$5,000,000 for the benefit of its employees, and even this does not include pensions for accidents, salaries during vacations (each employee is allowed 52 days of vacation each year), bonuses for meritorious service, or the free fares given both to employees and their families. Of this total \$3,250,000 goes into a pension fund for retired employees, their widows and orphans. The rest is divided among the many established branches of the company's paternal or welfare work. Among these branches are funds for funerals, for medicine, for employees with large families, for child birth expenses, for orphan children, for loans without interest, and other purposes.

* Our special European correspondent.

The Railroad Master Blacksmiths' Convention

Flue Welding, Steel Treatment, Piecework, Reclaiming
Scrap, Spring Making, Drop Forgings, Electric Welding.

The twenty-third annual convention of the International Railroad Master Blacksmiths' Association was held at the Hotel Walton, Philadelphia, Pa., August 17-19. The opening exercises were briefly reported in the *Railway Age Gazette* of August 20, page 361.

ADDRESS BY C. E. CHAMBERS

C. E. Chambers, superintendent motive power of the Central Railroad of New Jersey, addressed the convention in part as follows:

No part of the railroad organization is more interesting to me than the blacksmith department; from the time I was a boy on an Illinois farm I have never ceased to be keenly interested in that work. No part of our great railroad organization has undergone more revision than the smith shop. True, many things are done nearly the same as in former years; flue welding still resembles the practice of many years back, excepting slight changes in scarfing and preparation. But spring making and repairing has been simplified and perfected by improved devices for assembling and banding, so that much of the manual labor has been reduced, and a much better spring is produced. The oil, acetylene, electric and thermit welding processes have entirely revamped some of our smith shop practices. Where formerly it was necessary to always remove an engine frame and take it to the smith shop for repairs, such a practice now would be almost an impossibility by reason of the extreme size and many complications of construction, which would not only increase the cost of repairs, but would hold the locomotive out of service very much longer. Quite frequently we can make a weld and return to service the same, or next day, what with our old system would require from 7 to 10 days, or possibly longer.

One of your subjects for consideration at this convention, that of Heat Treatment of Metals, is deserving of careful study; not only is it desirable for new material, but annealing adds much to the life of many parts of locomotives and cars by periodically following up this practice while in service. No subject to be considered at this convention should receive more careful attention than reclaiming scrap. Everything must in time find its way to the scrap bin, but should not until it has served its last purpose. But there is a dividing line beyond which it is more economical to cast aside the old and use the new.

Your conventions, as all others, are returning to us the best service that is in man. You are always able to go back to your home road with some new idea, or new process, which is just a little better or more economical than your former practice.

FLUE WELDING

E. J. Haskins (New York Central) stated that 400 modern engines were maintained at the Elkhart, Ind., shops, and that the flue welding and wedging was handled in the blacksmith shop. He gave in detail the procedure of handling the tubes from the boiler through the shop and back to the boiler again. About five men are used in the tube department to handle from 6,000 to 8,000 tubes per month of nine working hours per day. All safe ends are made from new stock and no difficulty has been experienced in successfully welding steel on steel, or steel on iron. When bringing the tubes to a welding heat great care should be exercised to heat uniformly and not too rapidly, thus not overheating the safe ends and making them brittle. Superheater flues and the two-inch tubes are electrically welded in the back tube sheets and when so welded are expected to last three years. Several other members in referring to this subject stated that all flue welding on the roads with which they were connected was handled in the boiler shop.

CARBON AND HIGH SPEED STEEL

H. W. Loughridge (Pittsburgh & Lake Erie) called attention to the need of literature on the subject of heat treatment of high carbon and high speed steel couched in plain practical terms which would be of use to the blacksmith. From the fact that most carbon steel has a very limited range of treatment more difficulty is encountered in handling it than in handling the high speed steels, which are less sensitive and less easily ruined in forging and hardening. Owing to the growing use of high speed steels the tendency is to heat carbon steels too high because high temperatures are required when handling the high speed steels. The majority of failures in carbon steel may be traced to excessive temperatures either in the forging, annealing or hardening operations. A temperature of 1,400 deg. F. to 1,600 deg. F. is sufficient for forging and hardening most carbon steels, while high speed steels require from 1,800 deg. F. to 2,300 deg. F. Where such instructions are available it is best at all times to follow the instructions of the steel makers.

In tempering taps and dies at the McKees Rocks, Pa., shops of the Pittsburgh & Lake Erie, two muffle furnaces are in constant use. One is kept at 1,400 deg. to 1,450 deg. F., while the other is kept between 2,000 deg. and 2,200 deg. F. Carbon steel taps and dies are hardened in the low temperature furnace and are cooled in clean water at about 60 deg. F., being then drawn in oil at 450 deg. to 500 deg. F. High speed steel is first preheated in the low temperature furnace and then put into the high temperature furnace and held at about 1,900 deg. to 2,000 deg. F., then quenched in oil and drawn to 500 deg. or 600 deg. F.

In the discussion the necessity for evenly heating all hardening steels was emphasized. Although care on the part of the blacksmith is necessary to prevent warping of tools in hardening and ruining of metal, it was the general opinion that many failures are charged to him for which he is not responsible. This is because he does not have sufficient information as to the quality of the steel and the treatment it requires.

MAKING AND REPAIRING FROGS AND CROSSINGS

F. A. Watts (Delaware, Lackawanna & Western) described at some length the methods used in the frog and switch shop of the Lackawanna at Dover, N. J., where a large amount of work is handled. The shop is divided into three departments; a blacksmith shop where all forging, plate work, rod work and switch stand shafts are repaired, the planing and drilling room, and the erecting floor where the work is assembled, bolted up, riveted and finished ready for shipment. The plan is so arranged that a minimum amount of handling is required from the rail pile to the finished frog and switch storage and special facilities for handling are installed. A 16-ft. 6-in. switch of 101-lb rails can be turned out at a labor cost of approximately \$4.00. The cost of cutting up old stock, handling of scrap material to and from the hammer and placing it in piles ready for shipment never exceeds 20 cents per frog. All material fit for future use or which can be reclaimed is saved and again placed in service at a net saving to the company of \$25,000 per year more than would be received if the material were used for scrap.

PIECEWORK

P. T. Lavender (Norfolk & Western) laid stress on the value of the piecework system in bringing out the best in a man, teaching him how to handle himself efficiently and making him self-reliant. Piecework prices are established on the Norfolk & Western on all standard work which will be ordered in sufficient quantities. Dies and formers are first made for the drop hammer, the forging machine or bulldozer, and then tried out to see that they finish the work in accordance with blue prints. The workman and the foreman then agree on the price to be paid.

A. W. Ackley (Delaware, Lackawanna & Western) spoke of the erroneous ideas which some foremen hold that piecework is simply a means of increasing wages and that they are at liberty to alter the prices in a way which shows favoritism. He emphasized the necessity of promptly adjusting the price when new tools or new methods of turning out a certain piece of work have been devised. The blacksmith foreman should see personally all work coming to the shop and be in a position to say just what work is necessary in each case, otherwise where several prices obtain for certain classes of repair work, depending on the extent of the repairs, unnecessary work will be done and the highest price will prevail. In setting prices care should be taken to see that work is being performed in accordance with the methods given in the instructions, otherwise too much time may be consumed and an unduly high price established.

J. H. Daltry (Erie) said that after a man has worked on piecework he does not want to return to day work. Very little work has to be done over, since under such conditions it must be done on the workman's own time, thereby creating a tendency toward greater care in the future.

RECLAIMING SCRAP

Thomas M. Ross (Buffalo, Rochester & Pittsburgh) stated that old arch bars, drawhead pockets, truss rods, etc., were being rerolled into different sizes of round iron, which is then used in the manufacture of bolts, grab irons, etc. Old steel crank pins are used for making wrenches and small forgings, and coil springs are extensively used in the manufacture of car repair drift pins and pinch bars. Car repairers, hammers and coal picks are made from tire steel, but it is not suitable for tools that must withstand blows from sledges, owing to the tendency to break off chunks.

J. Tootell (Chicago & North Western) said that the North Western has been sorting out scrap for about 20 years, each year going into the practice a little more extensively. About five or six years ago the reclaiming of everything having a usable value was taken up and two shops built. From 20 to 25 cars of scrap are now unloaded each day, about five old cars are burned and seven broken up each day. All scrap is sorted as it is unloaded and is then distributed to the various shops where the reclaiming is to be done.

C. L. Gay (Atlantic Coast Line) stated that all round iron used on the Atlantic Coast Line from $\frac{1}{2}$ in. to 1 in. is provided from rerolled material. A large quantity of manufactured material which has been used and thrown on the scrap pile is also sorted out and straightened, and then returned to service. Mr. Gay presented statements showing the output and the saving effected by the rerolling mill at the South Rocky Mount, N. C., shops of the Atlantic Coast Line. On an output of 51,803 lb. of rerolled iron from $\frac{1}{2}$ in. to 1 in. in diameter, which was reclaimed in the month of December, a net saving of \$14.98 was effected. This covered only 11 days during which the rolls were in operation.

SPRING MAKING

Thomas E. Williams (Chicago & North Western) described at some length the process of spring making as carried out at the Chicago shops. He stated that so far as possible all spring work for a system should be concentrated at the main shop of the railroad because spring work should under no conditions be attempted without proper machinery. As a rule it is not advisable to install such machinery at outlying points on account of the small amount of work to be done. When sufficient spring work is handled to justify the installation and operation of proper spring making machinery, expansion is very easily taken care of by merely adding to the force. At the Chicago shops four machines are required to prepare the steel for use and these are operated by one man and two helpers. Should the amount of work increase the capacity of the plant could be increased without additional equipment. Mr. Williams stated that all spring bands on the North Western are machine made, the material being bent into a U-shape on a bulldozer and welded in a forging machine. No broken bands are repaired,

as the machine bands are so cheap as to make this practice inadvisable. The bands are applied to the spring at a temperature of about 1,850 deg. and squeezed into place in a press, where they are held until cool.

C. V. Landrum (Nashville, Chattanooga & St. Louis) found that springs rolled with a convex roller on the bottom were cupped so that when loaded the edges of the plates were in tension and the centers in compression. By reversing these conditions and placing the edges of the plates in compression he stated that the number of failures had been considerably reduced. The plates are rolled and hardened at the same heat and another hot plate is then rolled on the adjoining cool plate, which is all the drawing the plates get. The quenching is done in crude oil, cooled by an air blast. Mr. Landrum emphasized the necessity of always getting the same grade of steel and believes that if this were possible spring failures could be reduced to a large extent. When different grades of steel are mixed together, calling for different treatment, the blacksmith cannot tell one grade from the other and some of the steel of necessity receives the wrong treatment.

George P. White (Missouri, Kansas & Texas) described the process used on the Missouri, Kansas & Texas, stating that all springs are repaired on a store department shop order. A stock of springs is thereby kept on hand and those repaired are not necessarily returned to the engine from which they were taken. They go through the shop in lots of not less than six of each class. After the springs are entirely fitted up they are turned over to a helper to flash the temper. This is done in a muffle chamber at a much lower temperature than the fitting furnace, thereby eliminating a large number of broken plates caused by the edges of the steel being drawn while the center remains hard. Less trouble is also experienced from the springs not standing up under the load due to the temper being drawn too far.

In the discussion the need of proper appliances on the manufacture of springs was emphasized and the question of tapering the ends of the leaves received considerable attention. This practice has been abandoned on the Pennsylvania and the Lehigh Valley, but many of the members still believe that tapering is justified.

CASE HARDENING

C. V. Landrum (Nashville, Chattanooga & St. Louis) gave an outline of the practice which he follows in case hardening. The old method is used, the work being packed in a mixture of bone meal, old leather, pulverized charcoal and a sprinkling of prussiate of potash. A drum, 12 in. in diameter, is used for packing the work, the length varying from two to four feet, depending on the amount of material to be hardened. A slight flange is turned on the end of the drum which is placed on end and a piece of $\frac{1}{4}$ in. or $\frac{3}{8}$ in. iron cut to fit is dropped into it. About two inches of fire clay is placed on top of this and the packing is done in the usual manner. Space is left at the top for two or three inches of fire clay which is held in place by another $\frac{1}{4}$ in. or $\frac{3}{8}$ in. iron plate, held by a bolt passing through holes in the drum. This drum is then placed in the furnace and a temperature of 1,600 deg. to 1,700 deg. F. is maintained for about eight hours, the carbonized case under this treatment being about $\frac{1}{8}$ in. deep. For quick work, such as is required in a roundhouse job, a mixture of $\frac{3}{4}$ lb. of prussiate of potash to one gallon of pulverized charcoal is used, the work being packed in a pipe just large enough to accommodate it and kept at the highest practicable temperature for a period of 1½ hrs. Under this treatment a penetration of carbonization of 1/16 in. will be effected.

J. W. McDonald (Pennsylvania Railroad) presented photographs of several forgings, and of the dies and blocks used in their manufacture which were formed under the steam hammer. Many forgings can be successfully made in this manner, some of them at a cost nearly as low as would result from the use of a drop hammer, but usually at a somewhat higher cost. Dies for this purpose are usually cup blocks, which are closed by top and bottom blocks, which are driven into position by the

ram of the steam hammer. After this operation the only additional labor is that required to trim off the flash and this may often be done by placing the forgings in the flue rattler for a few hours. It is necessary in forming work in cup dies that just the right weight of material be used, otherwise the tools are subjected to a severe strain caused by the surplus stock finding its way between the cup and the plunger or block. The cup blocks are made from billet steel or scrap axle steel, while the top and bottom blocks are made of tool steel.

In the discussion, H. E. Gamble stated that the drop hammers at the Juniata, Pa., shops of the Pennsylvania Railroad were being run night and day. The largest dies in use in this shop measure 12 in. by 30 in. by 36 in. and weigh 3,560 lb. each, being made of vanadium cast steel. Difficulty is still experienced, due to the breaking of hammer rods and dies, heat cracks appearing in the latter because of continuous use.

ELECTRIC WELDING

Joseph Grine (New York Central) stated that in the opinion of the committee on electric welding, operators of this equipment in locomotive shops should be placed under the supervision of the blacksmith foreman, because of his knowledge of the properties of and the effect of heat on iron and steel. Owing to the specialized nature of this work it can be handled better by one man with access to all departments than by each department separately, thus facilitating standardization of welding practice. Because he handles work from all departments the blacksmith foreman is in an advantageous position to balance the welding work in the various departments. Blacksmith foremen were criticised for trying to avoid or shirk this responsibility.

Welding machines are used at the Depew, N. Y., shops on a large number of operations and it is conservatively estimated that the annual saving is approximately \$30,000 at that shop alone. A list of some of the operations handled by the electric welder is as follows: Broken frames, cracked cylinders; front deck castings; fireboxes; tubes welded in back tube sheet; sharp flanges filled in on tires; flat spots filled in on tires; mud rings welded and reinforced. The method of welding frames was described in the report. A plate is secured to the bottom of the rail after the crack has been cut out to an angle of 45 deg. on both sides, upon which the weld is built. After completely filling in the V's the weld is reinforced by welding on a layer of $\frac{5}{8}$ in. round bars, the ends of which extend beyond the filled-in material. Considerable data was presented relative to the strength of electric welds in boiler plates, the efficiency of the welds ranging from 82 to 99 per cent. of the strength of the unwelded material.

C. A. Slenker (Long Island) described a method of electrode welding, using a "weldrode," which is a metallic rod covered with slag. With this type of electrode it is claimed to be unnecessary for the operator to carefully hold the rod, as the slag on the end rests on the work and excludes the air from the molten metal. As the wire melts away the slag is also melted. After the application of each layer of metal the slag forming on the surface is broken away with a scaling hammer and the surface is cleaned with a wire brush, leaving the metal clean and bright for the application of the next layer. This system is controlled by the Quasi-Arc Weldrode Company, Newark, N. J.

P. T. Lavender (Norfolk & Western) said that the metal electrode method was employed at the Roanoke shops, a softer weld being produced than with the carbon electrode and separate filling piece, since there is no tendency for carbon to be carried into the weld. The action of the arc in carrying the metal from the electrode to the work makes it possible to weld on a vertical wall or overhead, this method being largely used in overhead repairs in fireboxes and welding tubes in locomotive boilers. Mr. Lavender presented the results of a test made at the Roanoke shops to determine the relative tensile strength of coke butt welded, electrically butt welded and new unwelded boiler tubes. The electrically welded tubes showed an average efficiency of

90.6 per cent., the minimum efficiency out of six specimens being 80 per cent. The average efficiency of the coke welded tubes was 87 $\frac{2}{3}$ per cent.

The discussion brought out the fact that lamination in electric welds may be avoided by applying each successive layer of metal against the direction of application of the preceding layer. Trouble has been experienced by some of the members in welding tubes into back tube sheets from the cracking of the bridges. Troubles of this nature are overcome in some cases by skipping about the sheet to points a considerable distance apart, thus tending to equalize the expansion and giving a better opportunity for the sheet to cool.

HEAT TREATMENT OF METAL

No papers were presented on this subject, but it brought forth considerable discussion. Some members doubted the advisability of heat treating large parts under present conditions. The difficulties of handling heat treated parts in the repair shop were touched on. Where heat treated side rods are brought into the shop to be slightly lengthened or shortened the heating of the material to do this work destroys the effect of the heat treatment and unless it is again subjected to the heat treating process it will return to service without its original properties and the advantages of the heat treatment are lost.

OTHER BUSINESS

The following officers were elected for the next year: President, T. E. Williams, Bettendorf Company; first vice-president, W. C. Scofield, Illinois Central; second vice-president, John Caruthers, Duluth, Missabe & Northern; secretary-treasurer, A. L. Woodworth, Cincinnati, Hamilton & Dayton; assistant secretary-treasurer, George B. White, Missouri, Kansas & Texas; chemist, G. H. Williams, Boston, Mass. Chicago received the largest number of votes as the place of meeting for the next convention.

GOVERNMENT MONEY TO GO BY MAIL AT EXPENSE OF RAILROADS

The treasury department, acting in concert with the post office department, has decided that all public moneys transported between the treasury, the sub-treasuries and the banks shall be carried by registered mail, instead of by express. The express companies have hitherto earned about \$500,000 yearly by the performance of this service, and approximately half of this sum or \$250,000 annually, was paid by them to the railroad companies for the facilities of transportation. Both the railroads and express companies will be deprived of these revenues, but the railroads, unlike the express companies, will not be relieved of the service, since the facilities of the railroads must be used as before. Setting forth this injustice, the committee on railway mail pay (Ralph Peters, New York City, Chairman) has issued a circular, which says:

For carrying the public moneys and securities as mail the railroads will receive no compensation whatever until the government again weighs the mails to ascertain the tonnage being carried. This is done only once in four years. Even then the rates the railroads will receive for transporting the funds will be so utterly inadequate, by comparison with the unusual value of such shipments and the fair worth of the service to the government, as to amount practically to nothing.

The rates paid the railroads for carrying the mails are based upon the service of transporting such things as letters, printed matter and small merchandise. Rates commensurate with service of this character cannot, by any recognized economic principles, be held commensurate with the service of carrying enormous sums in money and negotiable securities, the shipments of which by the government probably exceed two billions of dollars annually.

The new arrangement has enabled the treasury department to claim a saving equivalent to the entire amount hitherto paid to the express companies; but it would be a great error to suppose that the revenue loss to the carriers will be a real saving to the

government. There is to be imposed upon the post office department the performance of important new duties hitherto regarded as lying wholly outside the proper scope of the postal service. The cost of insuring moneys in transit, hitherto borne by the express companies, and included by them in their charges, must now be assumed by the treasury department. The net results of the change, therefore, seem to be:

1. To oblige the railroads to render for practically nothing the actual transportation service required in effecting transfers of the public funds.

2. To separate the risk of insurance in transit from the general transportation duty and turn this business over to new interests, at rates not as yet disclosed.

3. To transfer from the express companies to the post office department the duties involved in the actual handling, collection, delivery and custody of thousands of extremely valuable packages not hitherto carried in the mails.

The only tangible saving to the government lies in the substantial elimination of payment to the railroads for the transportation service. In other respects nothing but a change in agencies is effected, which is as likely to increase as to decrease costs. This must be held true unless the post office department is to be credited with the ability to operate more efficiently, and at lower labor costs, than the express companies, or unless the treasury department is enabled to obtain abnormally low premium rates from the insurance companies, by reducing the risk in transit at the expense of the railroads. The risk assumed, in the case of money shipments, certainly depends largely upon the degree of physical protection afforded, and it may well be anticipated that the railroads will be called upon, from time to time, to carry not only the government's money, but also to carry, free, armed guards as "agents in charge of the mails," or even to furnish special cars without additional compensation.

When the treasury department last summer shipped \$100,000,000 in gold from Philadelphia to New York, as "parcel post," the post office department required four special cars, for which no additional payment was made, and also the transportation for the round trip of 100 guards without payment of fare.

The laws of this country limit the post office department to the payment of an indemnity "not to exceed \$100 for any registered piece." The indemnity on the parcel post, upon payment of an extra insurance charge, is limited to \$50 per package. In the International Postal Union mails the indemnity limit is 50 francs per piece, or about \$9.35.

Does it not seem apparent, from the small amount of indemnity permitted by law, that Congress has never intended that the mails should go beyond a service of ordinary convenience to the general public?

If the treasury department can use the post office department, and consequently the railroads, in the manner contemplated by the order respecting the shipment of public moneys, what is to prevent the war and navy departments from shipping their supplies by mail, with United States troops and marines as armed guards, to be carried free by the railroads as "agents in charge of the mails"?

BUSINESS MEN STUDYING MAIL-PAY QUESTION

The Railway Business Association, George A. Post president, has issued a pamphlet appealing to business men in every state to study the mail-pay question and take it up with senators and congressmen. The space method, advocated by the postoffice department, is vigorously opposed. In ten years, according to this bulletin, the postoffice receipts increased 100.5 per cent and total railway mail pay only 27.7 per cent. "It is our earnest hope," says Mr. Post, "that the government which requires that rates of transportation to private shippers shall be reasonable shall free its own procedure from all suspicion of unreasonableness and unfairness."

The association urges that mail pay shall not again be made a rider on an appropriation bill or dealt with at the crowded end of a session. Continuing, Mr. Post says:

1. Mail pay ought to be adjusted according to some fair standard fairly applied.

2. Mail pay ought not to be affected by the postoffice department balance-sheet. The roads should receive not what the department is willing to pay them, but what the service is worth. Two successive postmasters-general have advocated government ownership of certain public utilities. These considerations ought not to enter into the fixing of compensation.

3. Congress should lay down the rule that compensation shall be equivalent to what private shippers would pay for similar service. There is no more reason for taking the postal deficit out of the railways than out of letter carriers or building contractors. Congress should not hold the roads down to the lowest possible limit. Poor railroads make a poor country.

4. Fixing of rates and measurement of service to be paid for should be subject to review by some government body not directly interested in showing a surplus for the postoffice department. The postmaster-general is an interested party. He should not have final arbitrary authority over matters in dispute between the railroads and his department.

5. Amount of railway service to be paid for should be determined by measurement of actual service performed over a test period, never by arbitrary estimate not subject to a check-up by the facts. Under the weight system now in use department subordinates report what the scales record. Under the proposed space system they would perform a function involving judgment and putting a much greater strain upon their impartiality as between the carrier and the government.

6. Weight should be a factor as well as car-miles and should be taken at least annually. The present law provides for quadrennial weighings. This is too seldom. Increase of actual weight between weighings involves a great loss to the carriers, as notably shown following the establishment of the parcel post.

7. Total mail pay for each road should be large enough to include fair compensation for every facility furnished, and for every service rendered. . . .

A CAR DUMPING MACHINE WITH IMPROVED FEATURES

Conneaut Harbor, Ohio, is an important port on Lake Erie for the transfer of ore coming from the Minnesota ranges to cars which are hauled by the Bessemer & Lake Erie to the steel mills in the Pittsburgh district. In common with the practice at other

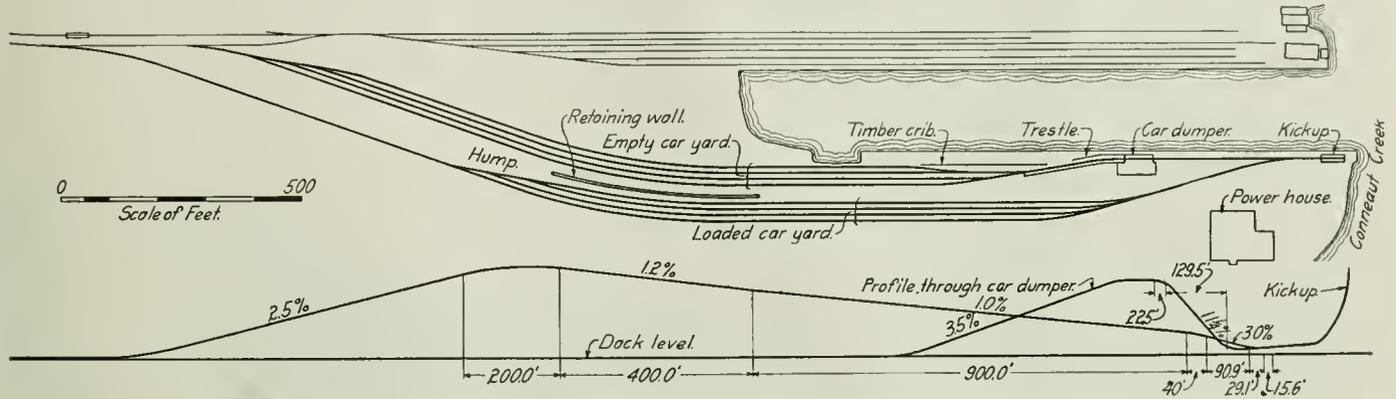

The New Load and Empty Yards from the Top of the Dumper

ports, many of the boats bringing ore in are loaded with coal for the return trip to Duluth or other upper lake ports. In order to do this loading more quickly and economically a new dumper was built at Conneaut Harbor last year, which is designed to

unload 100-ton capacity cars at the rate of one a minute. The improvement included a rearrangement of the yard serving the dumper and the construction of a new concrete dock. The Pittsburgh & Conneaut Dock Company owns and operates the dumper in conjunction with the Bessemer & Lake Erie.

Coal intended for loading boats at this point is left in the

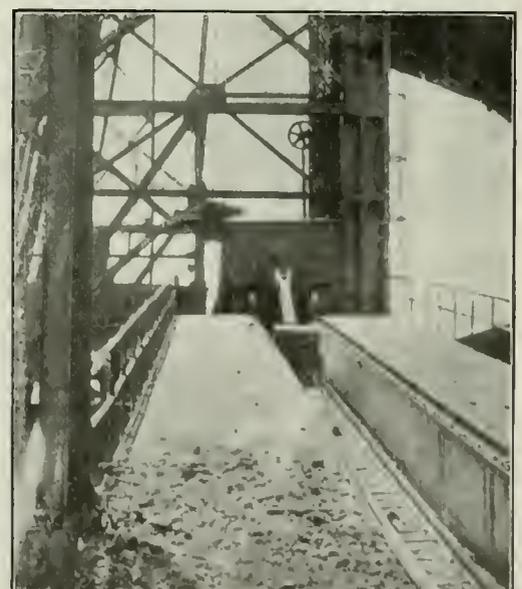

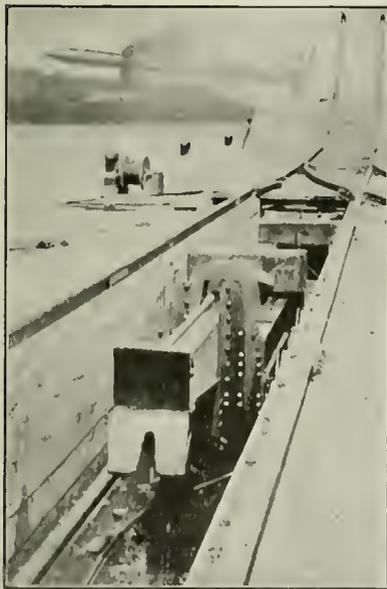

sashes being of this material. It is located on a concrete foundation containing about 1,900 cu. yd., which is supported on piles 35 ft. to 40 ft. long, driven through hardpan for a loading not to exceed 10 tons per mile. The entire foundation is reinforced heavily with bars and in addition the piers supporting the cradle are reinforced with rails. The foundation and the concrete dock

Track Plan and Profile at New Conneaut Coal Dumper

Albion yard, about 15 miles from the dock, and is brought from there as needed. The new yard adjacent to the dumper provides four storage tracks for loaded cars, each about 1,200 ft. long and four empty car tracks, each about 1,300 ft. long. The grade in the load yard rises at the rate of 2.5 per cent. to a summit from which it descends at the rate of 1.2 per cent. and then at 1 per cent. to the kickup beyond the dumper. A heavy switch engine pushes 20 cars to the top of this dump and leaves them on the descending grade with the brakes set. When they are wanted at the dumper they are started one at a time, running under the guidance of a rider down to the kickup, which throws them back over the mule pit. They are pulled by the mule up the 11.25 per

are protected by Carnegie steel sheet piling. The steel superstructure is 40 ft. by 62 ft. at the base, and 89 ft. high. The engine room is enclosed in the base of the structure back of the cradle foundation. The top of the rail on the cradle is 13 ft. 9 in. above the top of the main foundation and about 20 ft. above the water level in the slip alongside. The platen rail on the cradle is 52 ft. long and the dumping machine is designed to hoist and dump a load of 280,000 lb. In order to insure clean dumping the platen is turned through an arc of 160 deg. The power required for elevating the car and its contents is considerably reduced by counterweights amounting to 60 tons, consisting of two large steel cylinders filled with iron punchings and four

Three Positions of the Mule Car. 1—With the Arm Lowered. 2—With the Arm Raised, and 3—Pushing a Loaded Car Onto the Dumper

cent. grade to the platform of the McMyler dumper and after being elevated and dumped they run by gravity down a 3.5 per cent. grade to the empty yard. The load and empty yards are separated by 430 ft. of concrete retaining wall alongside the dump, and are lighted by a row of electric lights supported on poles set between the two yards. The indirect feed, as the system of reversing the direction of movement of the cars before they reach the dumper is called, was worked out for this location to reduce the elevation of the yard tracks somewhat and also to allow the dumper to be located nearer the lake, thus requiring a shorter slip.

The dumper is constructed entirely of steel, even the window

smaller weights, which are suspended from cables on the rear of the framework, operating on suitable guides attached to the steel columns.

The difference between the highest and lowest dumping elevations is 27 ft. 9 in., which is covered by the travel of the apron girder. The apron is set at an angle of 37.5 deg. with the horizontal, the center of the discharging spout being 33 ft. 5 in. from the center line of the front column to the dumper frame. A trap door is provided near the end of the pan to allow coal to be dropped through when loading unusually high vessels. The load on the vessel is trimmed by a special rotating nozzle. The framework of the dumper is designed with a view to safeguarding the

men working around it, all ladders having safety guards and all dangerous edges being protected by steel fences.

The approaches to the dumper are of concrete and steel trestle construction, with a special reinforced concrete kickup extending about 17½ ft. above the dock level at the end of the receiving track. The coal is wet down in the cars, just before they are pushed up the incline to the dumper, by an automatic tank supported over the mule car tracks.

The "mule" car is of a type especially designed for this installation, running on a track which is depressed for the full length of the incline, thus preventing the possibility of a loaded car coming down from the kickup and striking the mule before it has returned to its pit from the last trip. The top of the mule car rails is 3 ft. 8 in. below the top of the main rails and except when pushing the car up the incline the entire mule is below the level of the upper rails. To make this possible and also to allow it to engage the coupler of a car to push it up the grade, a pivoted and counterweighted arm about 17 ft. 6 in. long is provided. This arm is automatically raised to a position to engage the coupler of a car, when the mule is started forward, by a link connecting the counterweight to a friction bearing on the rear

The Completed Dumper

axle of the truck. When running on the 11.5 per cent. grade the counterweight is just sufficient to balance the parts so that the entire force exerted by the cable is transmitted to the car in pushing it up to the dumper. As a vertical curve is used in the main track at the upper end of the incline and the mule car track continues straight, two auxiliary rails inside the rails of the lower track are used to engage rollers on the counterweights of the arm and thus to alter its position to conform with the difference

in elevation between the two tracks. A rear cable is used to drag the mule down the grade rapidly. This important adjunct was developed by P. J. Fickinger, master mechanic of the dock company.

The new plant is operated from the old power house some distance away, the steam being piped to the engine room in the base of the structure. The larger units are operated by steam, the main dumping engines being 22 in. by 30 in., with two cylinders, and the mule engine 18 in. by 24 in., also with two cylinders. A new feature of this installation is the electrical operation of all the smaller movements, including the pan, the trimmer and the

The Reinforced Concrete Kickup

elevator screws. This enables one man located on the end of the pan to control all movements of the pan and chute. In this way it is possible to deliver the coal in the hold of the vessel with the minimum breakage and delay. With a steam operated machine the man on the end of the chute controls only the telescopic chute and the trimmer and it is therefore necessary to signal the operator in the house on the end of the machine when it is necessary to change the elevation of either end of the pan. This requires so much delay that the pan is usually placed at a high position and the coal allowed to run. With this dumper at Conneaut, the chute operator delivers this coal exactly as he wishes. He can raise or lower the inner or outer ends of the pan, swing the telescope back and forth and revolve the trimmers separately or simultaneously.

In addition to this operator, one man is required to control the mule car, one for the cradle, and one in the engine room. This machine has transferred 315 loads from cars to vessels in seven hours, an average rate of 45 cars an hour. It has also transferred 53 cars of coal in one hour.

The foundation for the new plant was built by the dock company with its own forces and the superstructure was erected by the McMyler-Interstate Company, Cleveland, Ohio.

LILLE-WARSAW EXPRESS.—The German military authorities, only 11 days after the capture of Warsaw, put on through passenger trains, connecting the extremes of occupied enemy territory. A train leaves Lille at 6:40 a. m., Brussels at 8:30, and Berlin at midnight, arriving at Warsaw in time for luncheon the next afternoon. The first trip of the new train eastward from Berlin carried a party of seven American war correspondents. From Lille, northern France, eastward to Warsaw, is about 800 miles.

EFFECTS OF THE WAR ON SWISS RAILWAYS.—The Swiss railways are suffering severely from the effects of the war. In June the State railways' receipts for passenger traffic amounted to \$901,200, as compared with \$1,474,409 for the corresponding month of 1914, and the revenue from the goods traffic receded from \$1,981,397 to \$1,688,200.—*Engineering, London.*

FLOOD DAMAGE TO RAILROADS IN MIDDLE WEST

After an interval of 15 years the city of Galveston has been visited with a hurricane closely approximating in severity that of 1900. The storm commenced about 9 a. m. Monday, August 16, after a number of days of severe wind from the southeast which backed the water through the jetty and through San Luis Pass into Galveston Bay. The fury of the storm extended inland for a distance of 75 to 80 miles and continued at its height for 12 hours, ending 7 a. m. Tuesday. Compared to the storm

(Courtesy of St. Louis Globe-Democrat)

Gravois Road, St. Louis, near crossing of the St. Louis, Iron Mountain & Southern

of 1900, the damage to property was relatively small, a condition which may be very largely accounted for by the fact that the Galveston seawall withstood the storm. The only water entering the city was that resulting from the increased level of the water in Galveston bay and West bay.

Contrary to early reports, no damage was done to the bridge portion of the Galveston Causeway. The rumor of damage to the bascule span came about through the fact that a derrick

very largely washed out, though it is expected that the track will be rebuilt in a very short time on timber cribbing. On the Virginia Point end the filling was washed out for a length of 4,200 ft., allowing the concrete protection slabs, railing, etc., to cave in, while the tracks were washed away. The sheet piling, however, suffered no damage. It will be necessary to build a pile trestle for almost the entire distance in order to open rail communication.

Water damage on the rail lines extended as far as Seabrook on the G. H. & S. A. (20 miles); Texas City Junction on the G. H. & H. (4 miles), and Hitchcock on the G. C. & S. F. (8 miles). The damage to the tracks consisted very largely in washing them off of the embankments. The decks of the trestles on the Santa Fe line had been anchored down to the bents in anticipation of

(Courtesy of St. Louis Post-Dispatch)

The Delmar, St. Louis, Station of the Wabash

flood conditions, and except in cases where the trestles were entirely washed out, the damage to them was slight. The lines were reopened for operation as far as the causeway the middle of this week, and through rail connection with the city will be had within the next ten days or two weeks as soon as the break in the causeway can be closed.

The damage to railway property on the island was slight. The new Southern Pacific 1,000,000 bushel elevator sustained

(Courtesy of St. Louis Post-Dispatch)

Water 20 ft. over Main Line of the Missouri Pacific at Valley Park, 21 miles West of St. Louis, on Sunday, August 22.

barge slipped its moorings during the height of the storm and drifted toward the bridge, making it necessary to raise the lift span to avoid damage. The barge became stranded in the channel so that it was impossible to close the bridge. The embankment approach on either end of the Causeway was seriously damaged. Nineteen hundred feet on the Galveston end was

practically no injury, while the other elevators of older construction suffered small damage to carriers and spouting systems. A number of freight cars were carried away, as well as a considerable quantity of cotton and other freight, but the damage was by no means as serious as in 1900.

The storm which attacked Galveston reached St. Louis at 7

p. m. Thursday, August 19, and resulted in the greatest rainfall ever reported in the Mississippi valley for a corresponding length of time. The official rain gage on the roof of the Chemical Building recorded 7.2 in. for the 24 hours ending 7 o'clock Friday, August 20. By 11 o'clock that night it registered 8 in. Corresponding observations were noted elsewhere in the vicinity. The greatest damage to the city resulted from the overflow of the River des Peres, a small stream running through the western part of the city and discharging into the Mississippi near the southern city limits. The banks of this stream are occupied at various places by the Wabash, Missouri Pacific, Iron Mountain, Rock Island and Frisco lines. The storm did not interfere with the operation of any trains Thursday evening, though the water in this stream was rising fast, the mail trains leaving St. Louis shortly after midnight getting away without much delay.

By daylight on Friday the water was 4 ft. over the tracks of the Wabash at the Delmar station located about 5 miles from the Union Depot, and the tracks of all of the other railroads leaving St. Louis on the west side, except the Missouri, Kansas & Texas, and the Burlington, were submerged in many places.

As the storm abated in Missouri it moved across the Mississippi into Illinois, causing trouble to the railways entering St. Louis from the east. The conditions were reported to have been worse than they were following the cyclone of May 27, 1896. Freight traffic was virtually tied up, every effort being directed to arrange detour routes for the passenger trains.

Practically no trains could reach the St. Louis Union Station Friday morning from the west and few attempts were made to get out the westbound trains Friday night. By the time trains were started running west on Saturday, nearly all lines were closed for eastbound passenger trains, except by long detours. The only lines east out of St. Louis which were not interrupted were the Clover Leaf and the Illinois Central, the latter being used by most of the roads to Litchfield, or beyond. Traffic was restored on most of the lines by Sunday evening, though through traffic on the Frisco and the Iron Mountain could not be resumed for a considerably longer time on account of washouts in the path of the storm southwest from St. Louis, particularly on the Meramec and Black rivers.

THE KAISER'S WAR TRAIN.—According to a report from a correspondent of one of the London papers at Zurich, Herr Paul Schmeder has just written a large volume in which he tells the German public all about the life which their war lord leads at the front. The Kaiser's special train, in which he makes his famous and frequent rushes from one front to the other, consists, according to Herr Schmeder, of 10 coaches constructed on modern lines—comfortable certainly, but not luxurious. At the beginning of the war the special train was painted a whitish-blue color, so that the troops and civilians were always able to recognize and cheer the emperor as he passed. But the fear that hostile aviators might find the task of dropping bombs upon the war lord made easier if they were aware of that fact has resulted in the periodical repainting of the train in various colors. "The necessity for this precaution," adds Herr Schmeder, "will be obvious when I mention that a train, purposely made to resemble in color and in form that of the Kaiser's, was promptly bombarded by French flying men shortly after leaving the Frankfort Railway station."—*Railway Gazette, London.*

BULGARIA AND THE DEDEAGATCH RAILWAY.—It is reported that a convention ceding to Bulgaria the Turkish portion of the Dedeagatch Railway was signed in Constantinople on July 22. Under the new arrangement Bulgaria obtains the whole extent of the line traversing Turkish territory, together with the stations Karagach, Demotika and Kuleli Burgas. The Bulgarian frontier will coincide with the course of the River Maritza, all territory west becoming Bulgarian. Round Karagach Station, Adrianople, Bulgaria claims a zone of one mile, 1,522 yards. If this is conceded the new line will be constructed, affording Turkey independent access to Adrianople.

THE LOCAL FREIGHT TRAIN

By F. H. GARNER,

Inspector of Transportation, Union Pacific, Omaha.

One of the knottiest problems that confronts the operating official to-day is the satisfactory handling of local freight trains. It is of the greatest importance that local freight trains move out of the initial terminal absolutely on time. As a rule they are carded so that, if running on time, they will not interfere with passenger trains and time freight trains. Much care should be exercised in getting a crew that understands every phase of local work. The brakemen should be thorough switchmen and above all things, must not be afraid of plenty of good, hard work.

I have in mind a district on a certain railroad where a local train was scheduled to leave a station at 6 a. m. While the switching was not heavy, this train was handling generally from eight to ten cars of merchandise, with merchandise for every station loaded in all of the cars. The train crew was getting in from three to five hours' overtime unloading merchandise every day. After checking up the movement of the train for several days it was arranged to have these eight or ten merchandise cars which came from three directions, placed at a transfer platform and worked during the night into cars that could be set out with all the merchandise for the heavier stations. These set-out cars averaged about 10,000 lb. of merchandise each, and resulted in the handling of seven merchandise cars over the district instead of ten, and the crew setting out practically every pound of freight that they had been unloading. The result was that the train was at a good many stations waiting for time instead of being from one to five hours behind schedule.

I have never been in favor of handling tonnage on local freight trains. I believe if the local freight train does the local work and gets over the district on schedule time without overtime, it is doing all that can be, and should be, expected of it. The mistake is too often made by chief dispatchers and trainmasters of hanging on a few extra cars to help their tonnage statement. In checking up the tonnage I have found instances where local freight trains were so overloaded that the crews were getting in from two to three hours' overtime for the sake of hauling a few extra cars over the district, while at the same time, through trains were being run light in the same direction. I also believe it is a good plan where the local switching is heavy and where the local has a good many cars to pick up which will bring it into the terminal with 45 to 50 cars, that after it has accumulated some 10 or 15 loads, these should be set out at some point on the district for through trains to pick up and haul into the terminal.

On many lines, especially in the West, chain gang crews are being used on local freight trains. This is a mistake. Crews should be assigned to locals, as the men in an assigned crew become familiar with the work and are able to handle it with much greater celerity than a crew not accustomed to local switching. Furthermore, in checking up the damage to freight, caused by its being improperly handled and investigating claims incident to perishable freight being carried by stations, I have found that an assigned crew carries very little freight by, and that the men are more particular when unloading to see that the freight is properly broken down so that it will ride without damage between stations. The station switching is also handled more satisfactorily by an assigned crew. This is probably due to the fact that the members of the chain gang crew know that they probably will not catch the local again for two weeks, and everything they can pass on to the next man they usually do. It is a good plan where one local is run in each direction daily to have the westbound local do the station switching for both directions up to a designated point, instead of having both locals switch until they meet.

ROLL OF HONOR IN AN ENGLISH STATION.—In the main booking hall (ticket office) at Liverpool Street Station in London, nearly the whole of one side has been taken up with a roll of honor of the 3,800 employees of the Great Eastern Railway who have joined the colors.

NEW YORK FREIGHT TERMINALS, 1914

In connection with the recent hearings held by the Interstate Commerce Commission on the application of the railroads terminating at New York harbor for authority to make advances in rates for lighterage, storage and other terminal services, Mr. McCain, chairman of the Trunk Line Association, described the principal features of the situation, as they existed at the time the railroads' application was made, in a statement the substance of which follows:

A—New York City Freight Stations

Because of the location of the boroughs of Manhattan, Brooklyn, Queens and the Bronx across New York harbor from their rail terminals on the New Jersey shore, the trunk lines have 68 freight stations on and adjacent to the Manhattan, Bronx and Brooklyn waterfront, which are (with a few exceptions) served inwards and outwards by through cars by means of car-floats, equipped with tracks of capacity of 8 to 24 cars each, these car-floats being towed across the harbor by tugs. As many of these stations are merely piers, with no inland tracks, the freight is necessarily received from and delivered to shippers' or consignees' drays on the piers or bulkheads, and the railroad performs the labor of loading or unloading the cars upon the piers upon both carload and less than carload shipments.

These stations are owned or leased and operated by the individual roads, except those on the Brooklyn waterfront operated by the Bush Company, New York Dock Company, Jay Street Terminal and Brooklyn Eastern District Terminal, each of which so-called "contract terminal companies" furnishes car-load service and station facilities at the expense of several competing railroads. The Harlem terminal, on the waterfront near 138th street and Park avenue, also jointly serves several competing roads.

The same general rates as apply to or from the New Jersey shore stations are applied to or from these New York and Brooklyn stations, except upon short-haul business, where the rates are too low to absorb the harbor and station expense.

The trunk lines also handle freight across the harbor in cars on car-floats in conjunction with the Long Island Railroad and the South Brooklyn Railway, and serve numerous stations in the eastern and southern sections of Brooklyn one-half to six or eight miles inland, applying the same rates as to or from stations on the Brooklyn waterfront.

By means of this car-float and station service the trunk lines in effect have extended their rails across New York harbor.

B—Lighterage Service on Domestic Carload Freight

There are many private and public piers in New York harbor, as indicated in paragraph "O," which are at or nearer the factory or warehouse of shipper or consignee than carriers' pier stations, and many years ago the practice of lighterizing freight to or from these special piers was inaugurated. This lighterage is performed by lighters or barges, some of which operate with their own steam, but are generally towed by tugs in the same manner as car-floats, and the service on inbound freight (*vice versa* upon outbound freight) involves transfer from car to lighter at the rail terminal pier on the New Jersey shore, the towage of the lighter across the harbor and the unloading from the lighter to the floor of the wharf at destination, substantially the same rates being applied as to or from adjacent stations.

A considerable list of articles and commodities is excluded from lighterage service because their weight or character involves excessive handling cost or damage to lighters or other freight. These excluded articles and commodities are either received from or delivered to shippers or consignees at certain specified New York or Brooklyn stations, or from or to the lighters of shippers or consignees at the rail terminal piers on the New Jersey shore.

C—Freight Interchanged with Coastwise Vessels

Carload shipments (other than those excluded from lighterage) are interchanged at the vessel's pier—less quantities are handled via the New York or Brooklyn station nearest the vessel's pier, the intervening service being performed by dray.

Most of the trunk lines operate through rates via New York in connection with several of the southern coastwise lines, in which event the lighterage or cartage expense is absorbed upon both carloads and less quantities in both directions. In the absence of through rates, the local rates North and South of New York apply, plus (in the case of L.C.L.) the cost of transfer drayage.

D—Import and Export (Other than Bulk Grain)

Carload shipments (other than those excluded from lighterage) are interchanged at the vessel's pier; the lighterage-free rate includes handling to or from the vessel or floor of the pier. Less quantities are handled via the New York or Brooklyn station nearest the vessel's pier, the cost of intervening drayage being absorbed by the inland carriers on import shipments (with certain exceptions specified in tariffs) to competitive western points, but is not absorbed on L.C.L. export shipments.

E—Car Float Service in Lieu of Lighterage

Fruits, fresh meats and various other commodities or articles liable to damage from exposure or handling by lighter, also certain articles and commodities which are excluded from free lighterage, are given free service in cars on floats, in lieu of lighterage to or from private or public piers, when in quantities of six carloads or more in one shipment; this six-car minimum being applied because of the expensive equipment and service involved. If this freight is loaded or unloaded at the private or public pier by shipper or consignee, an amount not exceeding 12 cents a ton, minimum \$2 per car, is allowed shipper or consignee for the labor expense, except on fresh meats in bulk and articles excluded from free lighterage.

F—Carload Freight Excluded from Free Lighterage

The railroad transportation rates on this freight apply to or from the piers at the rail terminal on the New Jersey shore, and private lighters which perform harbor service on such freight are in the category of drays performing equivalent land service, at expense of shipper or consignee.

G—Auxiliary Lighterage Equipment

When any trunk line has not the requisite species or number of lighters to handle certain freight offered, "outside" or independent lighters are temporarily hired or chartered, on a basis not exceeding 60 cents a ton (except on lumber and heavy articles on which higher rates are allowed), subject to agreement by the owner of the lighter that no part of the allowance shall be rebated, directly or indirectly, to the owner of the freight.

H—Free Storage of Inbound Lighterage-Free C.L. Package Freight for Domestic Delivery

This freight is granted 10 days' free time in the covered piers at the New Jersey rail terminal (exclusive of day of arrival, Sundays and holidays), after which it may be reordered to lighterage or station delivery, and New York rate protected; when reordered to an ultimate delivery station it is granted three additional days free time (exclusive of day of arrival, Sundays and holidays), so that the same carload of freight may get an aggregate of 15 days' free time, exclusive of Sundays and holidays. If the freight remains at the rail terminal piers beyond the 10 days' free time, nominal rates of storage are assessed.

I—Free Storage of Lighterage-Free Export Package Freight in Carloads

This freight is allowed 30 days free time at the New Jersey terminal; if not then ordered for export, nominal rates of storage are assessed, unless the freight is under through bills of lading to foreign countries.

J—Free Storage of Less-than-Carload Export Freight

This freight is granted 10 days free time at stations on the New York or Brooklyn side, pending cartage to steamer; if not removed within the 10 days free time it is placed in public store.

K—Hay and Straw

Owing to inflammable character and peculiar conditions, this traffic is handled under a different set of rules.

L—Grain, in Bulk, for Domestic Delivery

This traffic, under agreement with the New York Produce Exchange, is unloaded from cars into railroad elevators or

PLANT FOR SAND BLASTING STEEL CARS

Sand blasting is generally conceded to offer an effective means of cleaning steel cars from old paint, mill scale, rust, etc., leaving an ideal surface to receive and retain paint. To meet the demand for an economical means of sand blasting steel cars the plant shown herewith has been developed by the Mott Sand Blast Manufacturing Company, New York and Chicago. In designing this system the purpose has been to so arrange the apparatus that the sand may be handled by gravity, thus eliminating the use of elevating machinery, and reducing the cost of the structure required to house the equipment, and to provide an effective system of ventilation with a minimum expenditure of power.

The plant is installed in a building consisting of a sand blast room 12 ft. long inside, and of sufficient width to allow operators to work on both sides of the car, to each end of which is connected a shelter bay of sufficient length to house a car of the

Sectional Views of the Sand Blasting Room, Showing the Arrangement of the Apparatus

The companies owning or operating freight stations in New York and vicinity, as shown in this table, are the following:

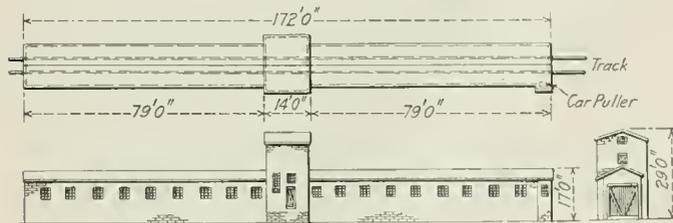

Baltimore & Ohio R. R.	Manhattan Terminal Company
Brooklyn Eastern District Terminal	National Docks Ry.
Bush Terminal Company	New York Central R. R.
Central Railroad of New Jersey	New York New Haven & Hartford R. R.

Hoboken Mrs. R. R.	Staten Island Rapid Transit Co.
Jay Street Terminal Company	West Shore R. R. (N. Y. C.)
Lehigh Valley Railroad	
Long Island Railroad	

greatest length which the plant will be required to handle. The portion of the building containing the sand blast room is a two-story structure with a basement, the latter containing the sand blast machines and the motor-driven double exhauster, while the second story contains the dust arrester.

The openings between the sand blast room and the shelter bays are closed by soft curtains designed to conform closely to the outline of the sides and roof of the car. The entire floor of this room is a steel grating, below which are hung two steel hoppers for collecting the abrasive material as it drops from the cars and

directing it to the top of the two sand blast machines, one of which is placed directly below each hopper. The sand blast machines are fitted with screens and automatic filling valves, and by this arrangement all elevating machinery is dispensed with. Sectional grating platforms extend along either side of the room, near the bottom of the car body. These are for the use of the operators working on car bodies; in order to provide access to the underframes or the trucks, or to make the room available for cleaning structural work, the sections are hinged to the side walls so that they may be either in part or all raised against the sides of the building.

The dust arrester in the second story of the blast room is of the manifold cloth screen type and removes all dust from the air passing through it. Hoppers for the collection of the dust are built in below the screens, and are suitably connected to waste chutes extending out through the sides of the building. Suction pipes from the dust arrester lead to a double exhauster in the basement below the blast room. The cleaned air is discharged from these exhausters into the shelter bays, about 10 ft. back from the blast room, thus causing a slight increase of pressure in the shelter bays and inducing a steady flow of air from them into the sand blasting room. The air passes through the small

Type of Building Required to House the Mott Sand Blasting Plant

openings between the curtains and the car body and prevents dust from entering the shelter bays. To the intake side of the dust arrester are connected a number of pipes with slotted openings running down either side of the room and across the roof of the car. Eight of these branches are used, and through them the dust is collected and withdrawn to the arrester. Other suction pipes are placed in the hoppers above the sand blast machines for withdrawing the dust from below the floor.

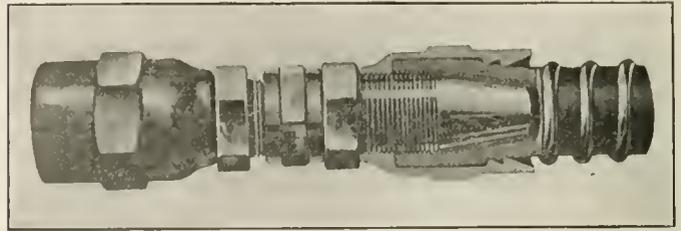

By closely confining the sand blasting operations in a 12 ft. room and by collecting the dust close to its point of origin it is possible to secure adequate ventilation with a low requirement for power. It is claimed that only 25 h.p. is necessary to effect eight changes of air per minute in this room. The ventilation is also materially benefited by the return of the clean exhaust from the fans into the shelter bays on either side of the sand blast room.

The sand blast machines are fitted with $\frac{3}{8}$ -in. or $\frac{1}{2}$ -in. nozzles, and when supplied with air at a pressure of 80 lb. per sq. in. will clean from 4 to 8 sq. ft. of surface per minute, or a total of 8 sq. ft. to 16 sq. ft. per minute for both machines. The apparatus is designed to use any abrasive material, preference being given to metal abrasives as being cheaper and decreasing the amount of dust created.

THE AUSTRALIAN GAGE QUESTION.—The question of the unification of the railway gages of Australia continues to retain an important position. At a recent conference of state premiers, called to consider this subject, a resolution was adopted proposing that a commission of two leading railway experts, preferably from outside Australia, should be appointed to consider this matter from all points of view. It is suggested that the appointment should be made by the commonwealth and the mainland states. The commissioners would be asked to advise upon the need of a uniform gage, the most suitable gage in view of the present circumstances and future prospects, the best method of carrying out unification, the benefits that will accrue to the states and the probable cost. But the most interesting proposal is that one expert should be brought from the United States and one from the United Kingdom. Various suggestions have been made as to nominations.

HOSE COUPLING

A coupling has recently been developed by the National Hose Coupling Company, People's Gas Building, Chicago, which provides a positive means of application to a rubber hose. As indicated in the illustration, the hose is inserted in the corrugated

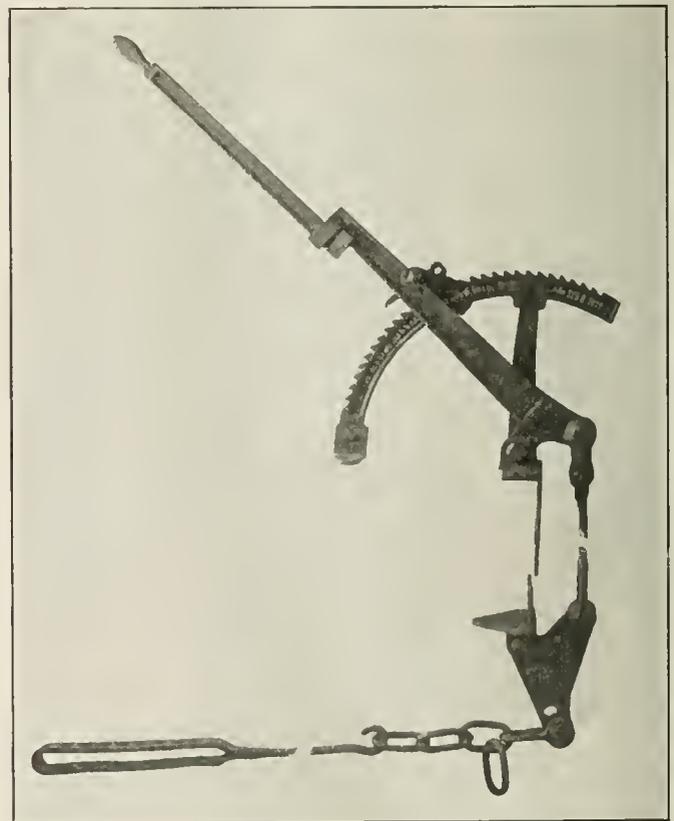

National Hose Coupling

socket and a steel taper expander is screwed into the socket, forcing the hose out against the corrugation. The ends of the socket and the expander are rounded to prevent injury to the hose. No special tools are required for application.

QUICK ACTION LEVER HAND BRAKE

The lever hand brake shown in the photographs has been in service on a number of cars for more than a year and a half. It is known as the Klasing car brake and in place of the usual type of brake shaft and hand wheel employs a lever and tension rod. The lever has an extension handle and to it is secured a pawl, engaging ratchet teeth on a vertical quadrant. The lever is pivoted to the quadrant, the latter being secured to the top of the car so that the short end of the lever projects over the end of the

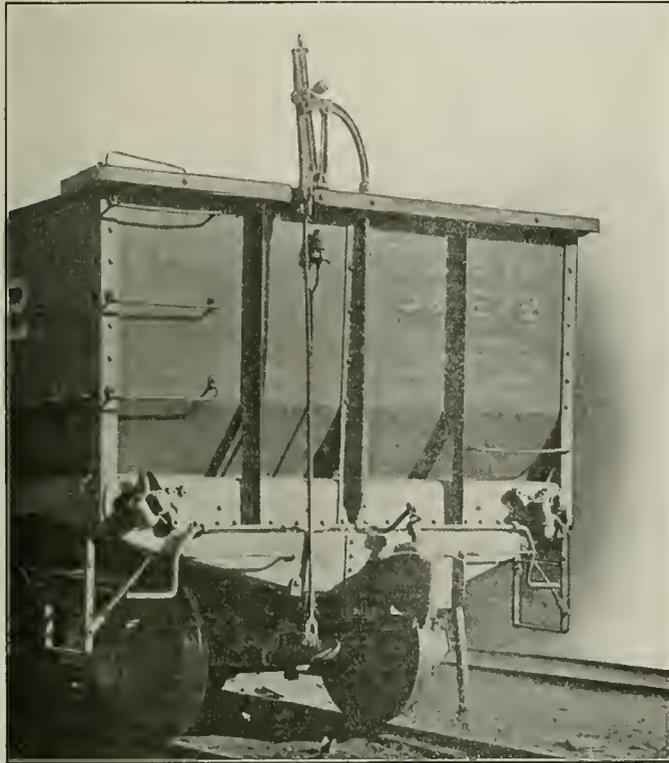

Details of Klasing Car Brake

roof. A bell crank is secured to the end sill directly below the end of the operating lever, to which one of its arms is connected by a tension rod. The other end of the bell crank is connected to the brake rod, which is provided with an adjustable jaw for taking up slack.

The purpose of this design is to facilitate quick action in the application of the brake, and it is claimed to eliminate an element of danger to the brakeman incurred in changing his position when operating the usual type of hand brake. The pawl is controlled by a small weight, thrown forward by hand to engage the ratchet.

This brake is sold by D. R. Niederlander, successor to the Adreon Manufacturing Company, Security Building, St. Louis,

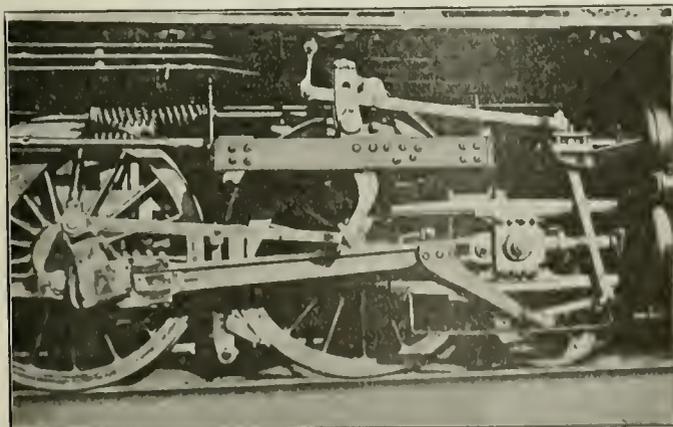

The Brake Applied to a Gondola Car

Mo. It may be applied to the top of box cars, to the top of gondolas, and to the end sills of baggage and tank cars, and it is equally suitable for application to box or gondola cars with end steps. The travel of the bell crank is 13 in., which is more than provided by the air brake. The maximum height of the lever above the roof of a box car is about 15 in. with the extension handle collapsed.

KINGAN-RIPKEN VALVE GEAR DEVICE

The engraving shows a new feature that is applied to outside valve gears for the purpose of overcoming the slow action which the combination lever imparts to the Walschaert and similar valve gears. The bottom connection to the combination lever is made to the main rod, as indicated in the illustration, instead of

Application of the Kingan-Ripken Device to the Walschaert Gear

to the crosshead, as is customary. This gives the combination lever a different movement, in that it responds to the up and down movement of the main rod. As the piston is on the last half of the stroke this causes the release, compression and pre-admission to occur later in the stroke with the same cut-off, thereby giving a longer period of expansion, less compression and less pre-admission with the same amount of lead. At the end of the piston travel, the main rod being in the center of its oscillatory movement, the arrangement will have no effect upon the lead, but as the piston leaves the end of its travel and the main rod again assumes an angle, a quicker, larger and longer-maintained port opening is obtained with the same cut-off, and also a longer cut-off with the reverse lever in the same position. It is also claimed that this arrangement will give a more even distribution of steam to the cylinders; it will permit more uniform valve events and allow the use of a shorter cut-off with its consequent saving of steam. This fact, combined with the longer maximum cut-off obtainable, should provide a quicker starting, faster, more powerful and more economical engine.

A number of locomotives on the Minneapolis, St. Paul & Sault Ste. Marie have been equipped with this device. The patents are controlled by the Kingan-Ripken Company, 2627 Lincoln street, N. E., Minneapolis, Minn.

HOW TO TREAT THE PUBLIC

Dr. Frank Crane, a clergyman, whose wisdom is being circulated by the New York, New Haven & Hartford, discourses on politeness as follows:

"It is a great temptation for the busy clerk to drop into machine-like ways. It does not require so much vitality. But it is a mistake. I do not refer so much to the feelings of the customer. . . . Let us go to the strictly business and selfish side. Do you know that your greatest asset is being human? 'Ah!' you reply, 'I'm so tired and worn out that I have no vitality left to palaver over people.'

"Then put on politeness. I mean it. Act the part, if you cannot feel it. Form the habit of smiling, pretend to be deeply interested in each person, learn how to make your voice sympathetic, lay in a store of agreeable phrases to hand out to each one. This is not hypocrisy. It is business. Do you realize that it is the human clerk that is in demand, that attracts customers, that stands the best chance for promotion?

"The public is a great baby,' somebody said. It's true. I'm one of 'em. I confess I flee a sour-ball clerk as I would a soured glass of milk. Why not humor the public, then?

"I know a ticket agent in Worcester, Mass. His name is Jim Healy. I consider him the best agent in the United States. Because you can't get him out of humor. I used to go into his office and pretend to want a railway ticket just to get under his delightful influence. . . ."

DINING SERVICE ON THE INDIAN RAILWAYS.—The following is part of a communication which recently appeared in the Indian press. "It is an open secret that except on the State Railways no arrangements have been made by the railways in general to supply food to the Mohammedan passengers, and on almost all lines they have to be content with the Hindu food, which is supplied on railways or at some big stations. They have either to take the food provided in the restaurant cars, which, however, is repugnant to their religious feelings, or to carry it with them if they want a better fare. On the state railways, especially on the North Western Railway—which is a model in this respect—there are most convenient arrangements for the supply of an excellent food to Mohammedans at modern rates; indeed, the refreshment rooms there are as commodious and well-furnished for Hindu and Mohammedan passengers as for European passengers, where the best food is obtainable at moderate rates. The Great Indian Peninsula Railway has taken the lead in the matter of reform and has arranged to provide a better food for the Mohammedans at important stations of its system, and all its new waiting rooms will be provided with Mohammedan and Hindu refreshment rooms separate from each other."

General News Department

It is reported that at a meeting of the Eastern Association of Trainmen, comprising representatives of the Brotherhood of Railroad Trainmen and the Order of Railway Conductors, which will be held in Cleveland beginning October 19, action will be taken looking to the starting of a demand for an eight-hour day. It is expected that other brotherhoods will unite with those named.

The city of Baltimore has a City Planning Commission, and the mayor has laid before it an elaborate plan for a belt railroad, connecting all the railroads entering the city. The proposed belt would cost about \$17,369,000, but the mayor says that none of this money would come out of the taxpayers. Much of the proposed line is underground and the motive power would have to be electricity. It does not appear that the railroad companies have been consulted concerning this extensive scheme.

The Governor of Pennsylvania announces that the state must make a beginning in the enormous task of abolishing highway grade crossings throughout the state, and he proposes that the 36 grade crossings on the Lincoln highway be attended to first. This highway runs through Lancaster, York, Gettysburg, Chambersburg, Bedford and Greensburg. Following the governor's announcement the chairman of the Public Service Commission has directed the engineers of the commission to make a careful examination of the 36 crossings mentioned.

The New York State Civil Service Commission announces that applications will be received at the office of the commission in Albany until September 8 for the position of expert appraiser and special agent for the Bureau of Special Franchises of the State Tax Department; salaries for appraisers \$3,000, and for special agents \$1,800 to \$2,100. Candidates for appraiser must be between 30 and 50 years of age. They must have education as engineers and knowledge of the tax law of the State in its relation to special franchises, with ability to appraise physical property and special franchises of steam railroads; also telegraph and telephone, and water, gas and electrical properties.

South Carolina Grade Crossing Law

The Legislature of South Carolina, at its last session, passed a law giving the Railroad Commission "full authority to provide such rules and regulations with reference to the crossing of railroad tracks by public highways as in its judgment will be conducive to the public safety; and furthermore, upon complaint, shall investigate and may require that any necessary crossings be made either above or below grade, so as to avoid, as far as possible, any grade crossings." This is the only law pertaining to railroads passed in South Carolina this year.

Progress on the Rogers Pass Tunnel

Material progress is being made on the Rogers Pass tunnel, 26,400 ft. long, which is being driven through the Selkirk mountains by the Canadian Pacific, and which has been under construction since September, 1913, described in *The Railway Age Gazette* of December 11, 1914. The pioneer headings which were driven 50 ft. to one side of the main tunnel have been driven 10,740 ft. from the east end and 8,870 ft. from the west end up to July 29. On this same date, 6,544 ft. of main heading had been completed on the east side and 7,469 ft. on the west side. The full section of the tunnel has been taken out for a distance of 5,216 ft. from the east portal and 3,754 ft. from the west portal.

Telegraph Typewriter on the Seaboard Air Line

Telegraph typewriters, made by the American Telegraph Typewriter Company, are being tried on the line of the Seaboard Air Line between Norfolk, Va., and Jacksonville, Fla., 657 miles. The machines are operated duplex over an iron wire, with regular Morse repeaters at Savannah, 527 miles from Norfolk. The transmitting machine is a typewriter operated by keyboard, while the receiving apparatus is automatic. The

electric impulses are as simple as those of Morse sending, and at times the printer is used on one side of the duplex while Morse sending goes on on the other side. Provision is made in this system for the use of perforating machines and an automatic transmitter.

Panama Canal 50 Years Ahead of Time

"We have recently completed the Panama Canal, a work which it would have been better to have left for 50 years rather than to have put it through with the speed with which the government has done it, because we find that we are not prepared to handle the questions of transportation arising by virtue of the completion of the canal at this time, bearing in mind the fact that the cities in the West, tributary to the coast, east as far as the eastern section of Montana, have a population of only 7,000,000 people. Last year the freight shipments from the Atlantic seaboard to Western territory amounted to 170 train loads, and shipments eastbound about half that amount."—F. R. Hanlon, traffic manager of the port of Seattle, Wash., address before convention of United Yardmasters' Association at Seattle.

General Baggage Agents

The meeting place of the General Baggage Agents' Association has been changed from Los Angeles to Kansas City. The date is October 11.

The Roadmasters' Convention

On page 351 of the issue of August 20 we published the program of the Roadmasters' Association, which will be held in Chicago from September 7-10, inclusive. Since this date the program has been changed to the extent that Wednesday will be devoted to an inspection of the various terminals and the Stock Yards, Chicago, a special train leaving the North Western terminal at 9 a. m. and returning at 5 p. m. Otherwise the program remains as announced.

International Association for the Prevention of Smoke

The tenth annual convention of the International Association for the Prevention of Smoke will be held at Hotel Sinton, Cincinnati, Ohio, September 8, 9 and 10. Of the papers to be presented those which will be of special interest to railroads are the following: Value of Publicity in Smoke Abatement Work and Methods of Obtaining It; Smokeless Locomotive Operation Without Special Apparatus; Various Methods of Eliminating Smoke From Roundhouses in Chicago; How Smokeless Operation of Locomotives Was Obtained in Washington, D. C.; What the Railroads Have Done to Abate Smoke in Cincinnati, and Enforcing a Smoke Ordinance.

MEETINGS AND CONVENTIONS

The following list gives the names of secretaries, dates of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next meeting, October 21-23, 1915, Boston, Mass.
- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, Room 101, Union Station, St. Louis, Mo.
- AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 8 W. 40th St., New York. Annual convention, October 4-8, 1915, San Francisco, Cal.
- AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—H. G. McConaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 19-21, 1915, Detroit, Mich.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Annual meeting, 2d Tuesday in October, 1915, New York.
- ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual meeting, October, 1915.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel—La Salle, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, C. H. & D., Lima, Ohio.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next meeting, October 19-21, 1915, St. Louis, Mo.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 14-16, 1915, Detroit, Mich.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberg, 623 Brishane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.

RAILROAD MEN'S IMPROVEMENT SOCIETY.—J. B. Curran, Erie R. R., 50 Church St., New York. Meetings, alternate Thursdays, October to May. Assembly Rooms of Trunk Line Association, 143 Liberty St., New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1063 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Next meeting, October 5-7, 1915, Chicago.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Annual meeting, September 14-17, 1915, Salt Lake City, Utah.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Annual meeting, September 7-10, 1915, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, C. R. I. & P., 1134 La Salle St., Chicago. Annual meeting, October 19-21, Colorado Springs, Colo.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.

TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Booddy House, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Rainapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEWARK.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, 559 Broad St., Newark.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Hotel Astor, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Agt., Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Verson, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., East Buffalo, N. Y. Annual meeting, September 7-10, 1915, Chicago.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.

WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Building, Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

Traffic News

The Pacific Northwest Demurrage Bureau went out of existence on July 31, and its work has been taken over by the Pacific Car Demurrage Bureau.

A new steamship service from Los Angeles and San Francisco to Panama has been established by the Mexican National Steamship Company. A boat leaves Los Angeles every two weeks stopping at 14 ports on the round trip.

The Traffic Bureau of the Houston (Tex.) Chamber of Commerce, is to be reorganized and, beginning September 1, J. A. Morgan, heretofore traffic manager of the National Co-operation Association, is to be at the head of the bureau. Mr. Morgan was formerly for many years on the Missouri Pacific, where he was agent at important stations.

The Southern Railway has finished its new coal handling plant at Charleston, S. C., and it will be put in operation September 1. It will have a capacity of 40 cars an hour, which is as fast as any ship now in the coal carrying trade can take it. In preparation for a greatly increased movement of coal to Charleston, the Southern has provided storage room for 400 cars.

The New York State Public Service Commission announces that the principal railroads have issued new regulations to go into effect September 15, under which motion picture films will be transported in baggage cars and charged for at the regular excess baggage rate for gross weight, with minimum collection of 25 cents for any shipment, upon presentation of proper transportation and provided that at the time of checking shipper declares in writing the value of the property and that payment is made for such value in excess of \$25 in accordance with the rule.

The Lehigh Valley, with a view to bringing farmers and commission merchants in closer relation with each other, has issued a directory of farm products grown along its lines. This directory, which will be sent to the markets in New York, Philadelphia, Boston and the far western cities, as well as to the farmers and merchants themselves, is so arranged that the names of those dealing in a certain product are listed under that head. For example, all the farmers, commission merchants and dealers handling apples are shown under "Apples;" those handling potatoes under "Potatoes," etc.

The Interstate Commerce Commission has authorized the Atchison, Topeka & Santa Fe, in connection with the Mallory Steamship Company, to make low rates on freight from California points to the principal cities on the Atlantic seaboard, to meet the competition of the Panama Canal. These rates are the same as those recently announced by the Southern Pacific and noticed in the *Railway Age Gazette* of August 13, page 294. On asphaltum, beans, peas, canned goods and barley, in carloads, the rate is 40 cents per 100 lb.; dried fruit, in boxes, 60 cents; in sacks, 80 cents. In these special tariffs the Interstate Commerce Commission allows the suspension of the long and short haul rule, the rates from California to some intermediate points being from 30 cents per 100 lb., or more, higher than the through rate.

THE PRODUCTION OF PIG-IRON IN GERMANY.—The Union of German Iron and Steel industries reports that the production of pig-iron within the German Customs Union in the month of April (30 working days) amounted to 938,679 tons against 938,438 tons in March (31 working days). The daily production for April averaged 31,289 tons against August, 1914, 18,925 tons; September, 19,336 tons; October, 23,543 tons; November, 26,299 tons; December, 27,545 tons; January, 28,198 tons; February, 28,701 tons and March 30,272 tons. The production during April comprised:—Foundry pig, 210,488 tons; Bessemer pig, 14,426 tons; Thomas pig, 561,381 tons; steel, etc., 125,023 tons; puddle pig, 21,361 tons. The Rhenish-Westphalian district produced 410,054 tons; Lorraine, 143,510 tons; Luxemburg, 125,432 tons.—*Engineering, London.*

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission has issued a ruling to the effect that freight tariffs on import and export freight must show the names of the countries to or from which such freight rates apply.

The commission has ordered a second suspension, until March 14, of proposed advances in the freight rates on berries from certain points in North Carolina to New York City and other Eastern points, filed by the Seaboard Air Line. These advances were originally suspended from May 17 last to September 14, but the commission has not had time within which to complete its investigation of their reasonableness.

Increased rates on coal by the Pennsylvania Railroad from Clearfield and other points in Pennsylvania to Providence, R. I., have been suspended from September 21 to March 21.

Increased rates on coal by the Illinois Central and the Chicago & Alton from Wenona and other points in Illinois to various destinations in Iowa have been postponed from September 15 to March 15; proposed by the Illinois Central and the Chicago & Alton railroads.

Rates on Ice to New Jersey Stations

In re Ice Rates to Long Branch and Other Stations in New Jersey. Opinion by the Commission:

The commission finds that the carriers have not justified proposed increases in carload rates on ice from points in New Jersey and Eastern Pennsylvania on the Lackawanna to points in New Jersey on the New York & Long Branch. It also finds that the carriers' carload rates on ice from Tobyhanna, Pa., to various points on the Seashore branch of the Central of New Jersey are unreasonable to the extent that they exceed \$1.32 a ton in box cars, and \$1.48 in ice cars. A fourth section application is denied to the extent that it seeks authority to continue rates on ice from points on the Lackawanna in New Jersey and Eastern Pennsylvania to Long Branch, N. J., and points south thereof on the New York & Long Branch lower than the rates concurrently in effect to intermediate points. (35 I. C. C., 73.)

Rates on Tanning Material

National Association of Tanners et al. v. Lehigh Valley et al. Opinion by the Commission:

Rates on mangrove bark, myrobalans and valonia from ports on the Atlantic seaboard to destinations in trunk line and central freight association territories are found to be unreasonable to the extent that they exceeded the sixth-class rates. (35 I. C. C., 175.)

Rates on Cottonseed Meal and Cake

Imperial Valley Oil & Cotton Company v. Southern Pacific et al. Opinion by the Commission:

The commission finds that the rates charged by defendants on cottonseed meal, cake and hulls from El Centro and Calexico, Cal., to El Paso, Tex., and on cottonseed meal and cake from the same points to Galveston, Tex., are unreasonable. Reasonable rates of 40 cents per 100 lb., minimum 40,000 lb., are prescribed for the future. (35 I. C. C., 215.)

The Pennsylvania's Steamer Lines on Chesapeake Bay

Opinion by Commissioner Clements:

Upon applications of the Pennsylvania Railroad and certain of its subsidiary companies, and of the Baltimore, Chesapeake & Atlantic and the Maryland, Delaware & Virginia for authority to continue the operation of steamers on the Chesapeake bay and rivers tributary thereto; and it appearing that the Maryland, Delaware & Virginia, which directly owns and operates some of the steamer lines involved, is controlled through stock ownership by the Baltimore, Chesapeake & Atlantic, which directly owns and operates the other steamer lines involved, and that the latter company is likewise controlled through stock

ownership by the Pennsylvania and its subsidiary companies, it is held that substantial competition does or may exist on the eastern but not the western shore of the Chesapeake bay between the rail lines of the petitioners and the steamer lines the subject of the applications; and that the steamer lines operating between Baltimore and Claiborne and Love Point, respectively, are necessary extensions of the rail lines of their directly owning carriers as to all other lines, the application is denied. (35 I. C. C., 692.)

The Tap Line Case

Opinion by Commissioner Harlan:

The Sibley, Lake Bisteneau & Southern was one of the parties to the original proceeding in the *Tap Line case*. In the commission's report on that proceeding, 23 I. C. C., 277, 594, it recognized the Sibley, Lake Bisteneau & Southern as a common carrier tap line, but found that it could not lawfully receive divisions from its connecting trunk lines on the product of the proprietary mill in excess of 1 cent per 100 lb. Upon rehearing the commission now holds that this finding should not be modified. (35 I. C. C., 485.)

Chattanooga Log Rates

Suspension Docket No. 256. Opinion by Chairman McChord:

Upon rehearing, it is held that rates and carload minimum weight for certain distances prescribed in the original report, 30 I. C. C. 36, should be modified. It is ordered that on or before September 15, the rates for the transportation of logs (except cedar), in carloads, to Chattanooga, Tenn., from points on the Alabama Great Southern, 71 to 90 miles, inclusive, and 181 to 250 miles, inclusive, distant from Chattanooga, shall not exceed the following, with a carload minimum of 40,000 lb.

Rates per 100 lbs. Cents.		Rates. per 100 lbs. Cents.	
75 miles and over	70 miles.. 4½	210 miles and over	200 miles.. 7½
80 miles and over	75 miles.. 5	220 miles and over	210 miles.. 7½
85 miles and over	80 miles.. 5	230 miles and over	220 miles.. 7½
90 miles and over	85 miles.. 5	240 miles and over	230 miles.. 8
190 miles and over	180 miles.. 7	250 miles and over	240 miles.. 8
200 miles and over	190 miles.. 7		(35 I. C. C. 163)

Coal and Coke Rates in the Southeast

Opinion by Commissioner Clark:

The commission finds that the carriers have justified proposed increased rates on bituminous coal from mines in Illinois, Kentucky, Tennessee and Alabama to the various Mississippi crossings, New Orleans, La.; Memphis, Tenn.; Greenville, Natchez and Gulfport, Miss.; Baton Rouge, La., and certain other points in Mississippi and Louisiana. The increases proposed are 15 cents a ton, and are allowed principally because the present rates are abnormally low and much below the average for like distances in the same territory.

The commission also finds that proposed increases from the Alabama mines to Vicksburg are not justified, but it is held that increases may be made in the rates to this point from the Illinois and Kentucky mines. Increases of but 5 cents are allowed from Illinois and Kentucky to Jackson, Milan and other junction points in Tennessee. These points will henceforth take the \$1.25 rate to Memphis. Certain increases are also allowed to Meridian and other Mississippi points.

The commission will also allow the carriers to make the rates on coke to points in the Mississippi valley 25 cents higher than the proposed rates on coal. In most cases the present rates on coal and coke are the same; to New Orleans the coke rate is 50 cents higher, and will henceforth be 35 cents higher. (35 I. C. C., 187.)

Rates to Lebanon, Ky.

Lebanon Commercial Club v. Louisville & Nashville et al., on rehearing. Opinion by Commissioner Clark:

In its original report in this case (25 I. C. C., 277) the commission found that the class rates from Louisville to Lebanon, Ky., were unreasonable, as applied as parts of through interstate rates, and reductions were ordered from 45 cents on first class to 28 cents, etc. The commission now believes from facts not before it at the former hearing that the rates prescribed were too low. It appears that the adjustment of rates in central Kentucky is the result of competitive conditions which the carriers have to a certain extent inherited or been unable to control, and those

rates cannot fairly be used as the only basis for comparison in determining whether or not rates immediately beyond that territory are reasonable. Rates to and from points just outside the territory must bear a proper relation to these rates, however. It is found that the rates from Louisville to Lebanon should not exceed 35 cents on first class, etc., and it is ordered that the rates in the opposite direction, which were not reduced, should be placed at the same standard.

Rates between Springfield, Ky., and Louisville are found discriminatory to the extent that they exceed the rates prescribed between Lebanon and Louisville. The rates between Lebanon and Springfield should not exceed the combinations on Louisville. The maintenance of rates between Cincinnati and Junction City, Ky., lower than the rates between Lebanon and Springfield and Cincinnati, are not found discriminatory against Lebanon or Springfield. (35 I. C. C., 204.)

Rail and Lake Rates Ordered

Port Huron & Duluth Steamship Company v. Pennsylvania Railroad et al. Opinion by Commissioner Hall:

Through routes and joint rates between points in trunk line territory and Duluth, Minn., and points west thereof, ordered to be established on the lines of defendants in connection with complainant's water line.

This proceeding demanded the establishment of through routes and joint rates which defendants had refused and neglected to voluntarily establish between points in trunk line territory on the one hand and Duluth, Minn., Superior, Wis., and points west thereof on the other, by way of the water line of the complainant steamship company from Port Huron, Mich., to Duluth and Superior. Complainant is an incorporated common carrier, entirely independent of railroad ownership or control, operating a line of freight and passenger steamers regularly between Port Huron and Duluth. The record shows that during each season it moves a considerable volume of general package merchandise and some bulk freight, the heavier movement being eastbound. During the summer it carries passengers and baggage. Its tariffs are and for several years have been on file with the commission. It operates three steamers of the approximate value of \$300,000 and aggregating 6,171 gross tons. At Port Huron its facilities for interchange of traffic consist of docks, warehouse and trackage yards, with ample space for any needed extension of these facilities. Its docks and warehouse there are reached by the rails of the Grand Trunk and during the season of navigation it is constantly engaged in receiving and delivering freight there from and to that carrier. The Grand Trunk filed an answer admitting the material averments of the complaint.

In connection with the Grand Trunk, its only outlet to the east, it has for some years maintained through routes and joint rates to and from Buffalo, N. Y., and all points in Eastern trunk line territory reached by the line of that carrier or by the lines of any of its connections, except the Pennsylvania. Negotiations have been had looking to a voluntary establishment of through routes, with joint rates equal to those concurrently in effect via the so-called standard lake lines, and have failed only because the parties were unable to agree upon divisions. The Pennsylvania has not absolutely refused to participate in through routes and joint rates on the basis of those in effect via other lake-line routes and states that it will not oppose, although it does not advocate their establishment. Its counsel states, further, that its difficulty in the matter of divisions has been with the Grand Trunk rather than with complainant. The commission orders through routes and joint rates established, the rates not to exceed the joint rates now in effect between the same points via other rail-and-lake and rail-lake-and-rail routes.

"We cannot in this proceeding prescribe the divisions of said rates. The parties will be required to establish the through routes and joint rates herein prescribed. They should endeavor to agree upon the divisions of such rates. If they cannot agree they may present the matter of divisions to the commission in a supplementary proceeding." (35 I. C. C., 475.)

Sample Baggage Defined; Articles May Be Sold

Jewelers' Protective Union et al v. Pennsylvania Railroad et al. Opinion by Commissioner Hall:

The defendants' present regulation defining sample baggage

is held unreasonable and the commission prescribes the definition given below. This proceeding was instituted by 15 national and section associations of wholesale jewelers against 69 railroads operating in all parts of the country. The plaintiffs charged lack of uniformity in the regulations and questioned the reasonableness of the excess baggage charges at 16½ per cent of the first-class passenger fares on baggage checked at owner's risk; and complained of the definition of sample baggage, particularly the restriction and limitation of such baggage to samples "not for sale or free distribution."

The first point is dismissed without consideration, as the carriers claim that they are endeavoring to establish uniform baggage rules, and it appears that much progress has already been made. As to the reasonableness of excess charges on baggage checked at owner's risk, the so-called Cummins amendment has replaced the Carmack amendment and it applies to baggage. The initial carrier is now made liable for the full actual loss or injury to baggage caused by it or by connecting carriers, and because of the changed conditions no action is taken.

It has been the custom of traveling salesmen for many years to sell or otherwise dispose of samples upon occasion. Complainants testify that, although this practice was known to the carriers, they did not object until issuance of the report by the commission on regulations restricting the dimensions of baggage. Witnesses for defendants deny that the practice was ever countenanced by the railroads and testify that every effort has been made to abolish it. Its persistence and the difficulty of properly policing the enforcement of any regulation designed to prevent it have their bearing upon the reasonableness of such regulations.

It is said to be impracticable to sell high-grade jewelry by sample, although the great majority of houses in other lines of business pursue this method, delivering the goods at some future date. The interveners emphasize the difficulty said to exist in selling candy or cigars by mere inspection of samples. Other lines of business, such as the dealing in millinery, hardware, crockery, blankets or drug sundries, are cited, in which it becomes necessary to make the best disposition possible of soiled, worn, deteriorated or out-of-date samples and replace them by fresh samples which better represent the stock. All of the instances cited illustrate the commercial need for elimination of restrictions as to "sale or free distribution."

No restriction exists as to sale or free distribution of birds, dogs, newspapers, steamer chairs, baby carriages, tool chests, peddlers' packs, paraphernalia for golf, baseball or cricket, adding machines, balloons and other articles which are carried in baggage service and charged excess baggage rates on the gross weight; but it is intimated in the brief for the Western defendants that they propose to apply the restrictive rule to such articles. Particular mention is made of peddlers' packs. It is said that the business of a peddler and that of a traveling salesman are the same in essence, but the peddler can sell articles checked as baggage, while the traveling salesman cannot. Cancellation of the unrestricted rule on these articles would not benefit complainants or interveners. The articles so carried occupy relatively little space in the baggage car, and if excluded therefrom, would tend to encumber passenger cars, with resulting inconvenience and annoyance to the traveling public.

It has been held in a long line of decisions with respect to freight that circumstances and conditions arising before receipt of a shipment by the carrier at point of origin, or after delivery of the shipment by the carrier at destination, cannot justify differences in rates or classification of property for transportation. But the act itself, in the amendment of 1910, recognizes a distinction between personal and sample baggage. That distinction seems to lie in the use to which the baggage is put, whether personal or commercial, and if so, use becomes the criterion by which, unlike freight, it should be classified. "Sample baggage" had a meaning well understood, although perhaps not well defined, at the time those words were incorporated in the statute. They must be construed in that meaning, and the evidence of use which is before us in this record does not exclude occasional sale or free distribution of the samples carried.

In the light of these decisions and considerations the commission finds that defendants' present regulations defining sample baggage as that "carried by commercial travelers * * *

and not for sale or free distribution" are unreasonable, and that a reasonable regulation defining sample baggage would be as follows:

"Sample baggage consists of baggage for the commercial, as distinguished from the personal, use of the passenger, and is restricted to catalogues, models and samples of goods, wares or merchandise in trunks or other suitable containers tendered by the passenger for checking as baggage to be transported on a passenger train, for use by him in making sales or other disposition of the goods, wares or merchandise represented thereby."

Defendants claimed that the removal of the restriction against the sale of sample baggage would tend to increase the volume of baggage and thus interfere with the safe and efficient operation of passenger trains; but this contention is rejected.

Commissioner Harlan took no part in the decision of this case. (36 I. C. C., 71.)

Rates on Live Stock

In re live stock rates from points in Colorado, South Dakota and other states to Omaha, Neb., and other points. Opinion by Commissioner McChord:

The carriers have proposed to increase their rates on cattle and sheep in carloads from points in New Mexico, Colorado, Utah, Oregon and Wyoming on or west of the Colorado common point line, and from points in Montana, North Dakota and South Dakota to markets on the Missouri and Mississippi rivers and to Chicago. Some increases are also proposed from points east of the Colorado common-point line.

The proposed increases average about 2 cents per 100 lb. on both cattle and sheep. From Montana, North Dakota, South Dakota and certain points in Wyoming the increase is 1 cent on cattle and 2 cents on sheep. The increased rates on sheep apply only to shipments in double-deck cars. There are a few points from which the increases differ from the above figures, but the differences are due to an effort by the carriers to bring about uniformity in the rates from all this general territory.

The commission holds that the proposed increases are not justified, thus adhering to its former decision in 1905 (11 I. C. C., 296, and 12 I. C. C., 1) and its decision in 1908 (13 I. C. C., 418). The commission agrees that the carrying of stock requires special effort and care, but it argues that conditions have not changed sufficiently to justify a modification of the former decisions.

The commission notes that the rates from South Dakota are on a higher plane than in any other part of the territory involved, and the proposed rates are higher than those found reasonable in *Investigation of Alleged Unreasonable Rates on Meat* (22 I. C. C., 160, 177). The present interstate rates are higher than the intrastate rates in the same territory, and it is urged that the proposed increases will only widen the spread between the two. In judging of the propriety of new schedules, the commission is charged with a broader duty than when simply passing upon the reasonableness of particular rates. The incongruity between the proposed interstate rates and the intrastate scale is a circumstance which goes vitally to the propriety of the rates under suspension. To dispose of this issue it is necessary to have before us the facts and circumstances surrounding the establishment of these intrastate rates. The record, however, in this respect is insufficient.

Commissioner Daniels dissents, noting that the increased rates in issue are, on the contrary, generally lower than intrastate rates in territory comparable with that here affected. (35 I. C. C., 684.)

Withdrawal of Regulations Covering Concentration and Storage of Dairy Products

Investigation and Suspension Docket No. 518. Opinion by Commissioner Daniels:

A proposed cancellation of rules providing for readjustment of aggregate charges on shipments of dairy products concentrated in transit in Western territory is found to be justified, and orders of suspension vacated; proposed cancellation of rules as to storage in transit not justified.

This proceeding has to do with traffic on certain lines which for many years have published special rules and regulations with regard to shipments of butter, eggs and poultry. These are divided into two general groups: (1) Rules providing for

the readjustment of aggregate charges on these products shipped in less than carload quantities from points of origin in Nebraska, Kansas, Oklahoma, Missouri and the northwestern corner of Arkansas, to concentration points, and thence in carload lots to the Mississippi river crossings and points east thereof, and to Pacific coast terminals; (2) rules providing that the through carload rate from point of origin to point of ultimate destination, plus a charge, usually \$5 per car, will be protected on carload shipments of these commodities stored in transit at intermediate points.

The respondent carriers filed tariffs designed to cancel these rules and regulations and to discontinue the practices thereunder, but protests were made by the Live Poultry & Dairy Shippers' Traffic Bureau and numerous other organizations.

Butter, eggs and poultry move from country stations to concentration points in small lots, averaging about 200 lb., and the less-than-carload rate is paid. At these concentration points, which are usually the larger towns, the shippers or concentrators maintain extensive plants for storing and subjecting these commodities to processes, such as the re-working, grading and re-packing of butter; the drying, desiccating, freezing, grading, candling and re-packing of eggs, and the feeding, dressing, grading, freezing and packing of poultry.

The products are shipped forward in carloads, and the carload rate from the concentration point to destination is applied, with a minimum weight of 20,000 lb. The shipper at concentration point thereupon files a claim with the carrier for a refund and there is a readjustment by which the carload rate from the point of origin of each less-than-carload shipment to destination is applied on each less-than-carload shipment in the car sent forward, with the addition of 5 cents per 100 lb. Only when the outbound carload moves within one year from the date of the inbound shipment will refund be made. Then, too, there is a minimum rate of 10 cents per 100 lb. prescribed on each inbound less-than-carload shipment and a minimum charge of 25 cents on each shipment. The actual weights of the inbound shipments as shown on paid expense bills are to be reduced by varying percentages stated in the tariff because of the reductions suffered in the treatment of the products at the concentration point. The shipper is required to keep a record of the transit and non-transit tonnage received at concentration points, and what is forwarded, and to make sworn yearly statements of the total tonnage on hand as compared with that represented by unexpired expense bills.

The carriers propose to discontinue this readjustment of the aggregate charge and this action will compel the application of the less-than-carload rate to points of concentration and the carload rate thence to destination, and while it advances no particular rate, it will result in an increase in the total transportation charges. The resulting charges are estimated by the respondents to be generally about 14 per cent in advance of the present charges and by the protestants from 30 to 35 per cent.

A special arrangement for the encouragement of the concentration of dairy products was first instituted about 1890 by the St. Louis & San Francisco along its lines in Kansas and Missouri. It was later established by the Missouri Pacific and Chicago, Rock Island & Pacific along their lines in these states and in Nebraska. The practice was established for the purpose of building up the industry. The method adopted, however, has not been without opposition. It appears that some of the carriers believing that the practice was wrong in principle established it on their lines only because they were forced to do so under stress of competition.

The average number of less-than-carload shipments to make up the carload moving from the concentration point is from 30 to 40, but frequently a car contains as many as 150 and each one of these small shipments requires the making out of a waybill, an expense bill and all of the other clerical work required by the ordinary less-than-carload shipment. The carload shipments from the concentration point, while loaded and unloaded by the shippers, are not only given all of the services incident to the usual carload shipment, but are made in refrigerator cars furnished by the carriers and given an expedited service. Loss and damage is heavy. In 1914 the Chicago & North Western paid upon eggs 9 per cent of the total gross revenue from the traffic; upon butter and cheese, 1.3 per cent, while the amount paid upon all carload freight was 0.8 per cent. Claims for readjustment require a great deal of detail work in handling;

the charges shown on each expense bill presented must be verified; care must be taken to see that the proper amount of tonnage has been surrendered and that the storage time permitted by the tariffs on that surrendered has not expired. In view of these facts respondents contend that there is no good reason why they should readjust the charges on two separate and distinct transactions on the basis of the carload rate from the point of origin of the less-than-carload shipment to the destination of the carload shipment.

On behalf of protestants it is claimed that the industry in question still needs the help of the readjustment practice, particularly in certain sections of the states where it now prevails and that for this reason it should not be withdrawn at this time. * * * The commission will not require the practice to be continued merely because of alleged commercial necessity. The local class rates in all the states, except Kansas, in which the readjustment practice in issue prevails have been reduced by legislative authority since the institution of the practice. These rates are presumed to reflect local conditions in the various states and so far as this case is concerned are applied on shipments which begin and end within those states. * * * The respondents have justified the proposed application of less-than-carload rates upon less-than-carload shipments and carload rates upon concentration carload lots from concentration points to destination.

The conclusions of the commission are without prejudice to the right of any party to contest the reasonableness of any rates affecting the commodities here involved by appropriate proceedings. Respondents have justified the proposed cancellation of the concentration practice.

The proposed cancellation of storage-in-transit rules is not approved, the carriers having failed to justify their proposal. (35 I. C. C., 469.)

STATE COMMISSIONS

The Public Service Commission of West Virginia has authorized all express companies to increase rates for the transportation of merchandise, following similar action by the federal commission.

The Pennsylvania Public Service Commission has adjourned until September 7. In the intervening time the commissioners will prepare opinions in a large number of cases. Before adjourning on August 14 the commission granted a certificate of public convenience to the City of Philadelphia, approving the plans for the Broad Street Subway and the Northeastern Elevated Railway, from Callowhill to Rhawn street, so far as covered by plans on file with the commission.

The Ohio Public Utilities Commission has appointed a committee of experts to investigate the coal rate disputes between the Hocking Valley and the Sunday Creek Coal Company. Beman Thomas, of the Stock and Bond Bureau of the commission, is in charge, and he will be assisted by C. W. Hillman, William J. Purdy, W. J. Warren and William Wyand. The attorney for the railroad objected to the personnel of the special examiners except Thomas, and it is said that an injunction may be asked for.

The Pennsylvania Public Service Commission has ordered the Philadelphia & Reading to instal, within 30 days, passenger train service on the Middle Creek branch between Swatara Junction and Newtown. The road contended that the branch was built as a mine lateral, and not for the purpose of carrying passengers and that, therefore, the commission was without authority to make any order. The decision holds that though the branch might have been built for the purpose of carrying coal, the act of Assembly creating the branch railroad placed no such limitation upon it and that therefore it may lawfully carry passengers. The order further holds that it is not an answer to a demand for passenger service to show that the particular train would be operated at a loss.

PERSONNEL OF COMMISSIONS

William D. B. Aincy, a former congressman, has been appointed chairman of the Pennsylvania Public Service Commission. He has been acting chairman since early in June when the present members of the commission were sworn in. Mr. Aincy is a lawyer.

In accordance with the provisions of the recently enacted structural engineers' license law of Illinois, E. N. Layfield, acting secretary of the Western Society of Engineers, Chicago, has been appointed president of the State Board of Examiners of Structural Engineers; John T. Hanley, Chicago, secretary, and Prof. I. O. Baker, University of Illinois, Urbana; John W. Musham, secretary Condron Co., Chicago, and C. C. Stowell, civil engineer, Rockford, Ill., members.

COURT NEWS

Tariff—Application to Switching

The Minnesota Supreme Court holds that the state statute requiring railroad tariffs for transportation to be based upon distance applies to movement of cars or commodities between stations and not to switching or like movements within a shipping point, such as a village or city.—Washed Sand & G. Co. v. Great Northern (Minn.), 153 N. W. 610.

Failure to Fence—Damage to Crops

The Oklahoma Supreme Court holds that a railroad is not required to fence its right of way to protect landowners whose land is immediately adjacent to the right of way from the trespass of cattle on such adjacent land over the right of way. The object of the fencing statute is only to prevent animals from going on the right of way. If additional liability had been intended the legislature would have so provided.—Missouri, O. & G. v. Brown (Okla.), 148 Pac. 1040.

Carrier's Risk and Shipper's Risk—Shipper's Option

A carrier had published a tariff of interstate rates on shipments of live stock, containing two rates, one at shipper's risk and the other at carrier's risk. A shipper demanded the rate at carrier's risk. The agent refused him the option and forced upon him a bill without stamping on it "At carrier's risk." The Texas Court of Civil Appeals holds that the company was liable in damages, since by the exercise of the shipper's option the contract became one at the carrier's risk regardless of the terms of the bill of lading, and the carrier could have collected the higher rate at destination.—Chicago, R. I. & G. (Tex.), 176 S. W. 778.

Assumption of Risk

A fireman, pushing back a crane after taking water, stepped on a bolt 6 or 8 in. long and thereby sustained injuries. There were also on the tank a piece of rubber hose, an iron bar, about 2 in. of cinders, and two lumps of coal which had fallen over the lattice work supporting the coal. The engine had no tool box, and it was shown to be customary when engines carry no tool box to place on this platform about the manhole the three articles mentioned. It was held by the Arkansas Supreme Court that the risk of stepping on the bolt was one of those incident to the fireman's employment and was assumed by him.—Kansas City Southern v. Livesay (Ark.), 177 S. W. 875.

Proximate Cause of Injury—Rescuing Property

A section foreman, while with his crew on a hand car, saw a train approaching behind him when it was at such a distance that he had time to get out of its way. When the train was within 200 or 300 feet he thought he had time to remove the car, and would have had but for the fall of one of his men, delaying the removal. He was injured and in an action against the railroad the Montana Supreme Court held that the failure to give a warning signal was not the proximate cause of his injury, and he could not recover. While he was not guilty of contributory negligence in his attempt to save the railroad's property, it would be necessary to his recovery that he show precedent negligence toward himself after the attempt was begun.—Nelson v. Northern Pacific (Mont.), 148 Pac. 388.

State Regulation of Relief Associations

The Indiana Supreme Court holds that the Indiana statute providing that no railroad, domestic or foreign, operating in the state, may establish or maintain any relief association, the rules of which shall require any employee becoming a member thereof to enter into any contract surrendering or waiving any

right to damage against the railroad for personal injury or death, or agree to surrender or waive any right whatever, in case he asserts such claim for damages, and declaring any such agreement void, is within the scope of the police power of the state; is not invalid as an interference with interstate commerce (in the absence of any congressional action), and is not unconstitutional class legislation because applicable to railroads alone.—*B. & O. S. W. (Ind.)*, 109 N. E., 194.

Duty as to Sectionmen at Work

In an action for the death of a section foreman at a crossing which was at the time enveloped in steam and smoke, the Kansas Supreme Court holds that railroad companies in the operation of their roads may rightfully assume that their sectionmen while at work on the track will look out for the approach and passage of trains at all times, and ordinarily such companies owe to their sectionmen no duty to warn them of the approach of trains save when such employees are found to be in a place of danger and it becomes apparent that they will not or cannot protect themselves. Crossing signals are not intended or required for the benefit of sectionmen at work, and the failure to give such signals is not negligence as to such employees. This rule is not changed by the fact that a preceding train going in the opposite direction has left the other track enveloped in steam and smoke. This condition requires added vigilance on the part of the employees to protect themselves.—*Land v. St. Louis & S. F. (Kan.)*, 148 Pac. 612.

Assumption of Risk

A railroad employee lost his life by falling from a track which hung suspended over a washout for about 90 feet, while assisting in preparations for its repair. In an action for his death the jury returned a verdict for the plaintiff, but in reply to a question requiring them to state the particular negligence of the employer that caused the death, they answered that it was the failure to give the deceased proper instructions. The only neglect pleaded in this regard was the omission to instruct the deceased how to walk on the ties—to step on them close to the rail. Specific findings were made that the foreman, after examining the bridge, said in the presence of the deceased that the ties were unsafe to walk on; that he warned the workmen to plank the ties; that he directed them to do this by pushing the planks ahead of them on the rail, then turning them over on the ties, one on each side of the rail. It was held by the Kansas Supreme Court that these findings required a judgment for the defendant.—*Spinden v. Atch., T. & S. F. (Kan.)*, 148 Pac. 747.

When a Person Becomes a Passenger

In an action for injuries caused by being allowed to sit in a cold station the question arose as to when the plaintiff became a passenger. Intending to go to Kilkenny, Minn., from Union, Iowa, he bought a ticket to Mason City and arrived there about 10:30 p.m. He then tried to buy a ticket to Kilkenny. The ticket agent told him that he was busy and could not wait on him then; that the station would be open all night; that the plaintiff's train was due to leave at 3:35 a.m.; and that he could buy his ticket at any time before train time. He left the station, returned about midnight, and remained in the waiting room until about 3 o'clock, when he bought a ticket to Kilkenny. The Minnesota court held that as he was not a through passenger from Union to Kilkenny recovery could only be had for injuries received after he bought his ticket at Mason City. In the language of the court in the prior case of *Barnett v. M. & St. L.*, 123 Minn. 153: "A person is not a passenger all night because he intends to take a train the next morning, even though he asks to buy a ticket the night before, and even though he came the evening before from another station on the same road for the purpose of taking passage on that train."—*Barnett v. M. & St. L. (Minn.)*, 153 N. W. 600.

Federal Employers' Liability Act—"Engaged in Interstate Commerce"

The Illinois Supreme Court holds that a machinist who was sent by his superior officer to repair the whistle rod on an engine engaged in switching and handling interstate commerce, and who while on his way stepped in front of another engine engaged in switching all classes of freight, interstate as well as intrastate, was "engaged in interstate commerce" within the

federal employers' liability act. It also holds that the Illinois workmen's compensation act does not apply to a railroad employee injured while engaged in interstate commerce.—*Staly v. Illinois Central (Ill.)*, 109 N. E. 342.

A youth of 17 years was employed by a railroad engaged in interstate commerce, to fire an engine preparatory to its being attached to a train scheduled to run from Wechawken, N. J., to Ravenna, N. Y., and he assisted in operating the engine in the yard, for the purpose of taking on a barrel of oil to be carried on the engine to Ravenna. It was held by the New Jersey Court of Errors and Appeals that he was engaged in interstate commerce.—*Tonsellito v. New York Central (N. J.)*, 94 Atl. 804.

The Kentucky Court of Appeals holds that a fireman at work on a switching engine attached to a car destined to a point within the state, and going on to a yard track to remove some cars thereon, so that an interstate car could be reached and placed on another track in a train to proceed to an interstate destination, was not engaged in interstate commerce.—*L. & N. v. Parker's Admr. (Ky.)*, 177 S. W. 465.

Unloading for Rest, Water and Feed—Some Decisions Under the 1906 Act

The Federal District Court, E. D. Pennsylvania has handed down the following decisions under the rest, water and feed act:

A railroad placed cars of live stock in unloading positions at the consignee's private unloading chute, and notified the consignee thereof, nearly two hours before the expiration of the time limit prescribed by the law; but the stock was not unloaded until nearly three hours overtime. The carrier had no reason for believing the animals would not be promptly unloaded, and it was held that his responsibility as such for the shipment terminated within the time limit.—*U. S. v. Reading*, 223 Fed. 206.

A railroad delivered a carload of hogs on the consignee's private track opposite a runway for unloading, and notified the consignee to unload within the legal time limit. The hogs, however, were not unloaded until about six hours after the expiration of the time limit, because the consignee's place of business was closed at the time, and because stormy weather rendered unloading impracticable. The railroad had notice of the conditions prevailing at the place of delivery. It was held that the railroad was not subject to the penalty, though the act it committed was knowingly done. It was not guilty of willfully confining the animals in cars beyond the time limit, for the word "willfully" carries with it the thought of an intentional ignoring of the law or of indifference to its provisions.—*U. S. v. Reading*, 223 Fed., 207.

A contract called for the delivery of live stock at the consignee's private siding, but custom required the railroad to place the cars at a point opposite a runway provided for unloading. The railroad did not place the cars at this point within the time, though they reached the siding within the time limit. Nothing prevented the carrier from unloading the stock, and he was held liable to the penalty, for the delivery of the stock was not complete until each car was placed opposite the runway for unloading.—*U. S. v. Reading*, 223 Fed., 202.

In another case the cars were placed on the consignee's siding for delivery and notice given, but consignee refused to unload because his place of business was closed and because of the cold weather. The railroad had provided proper unloading pens, but they were not within available distance. It confined the animals in the cars beyond the time limit. Hauling the cars to the railroad's pens would not have released the animals sooner than was done. The railroad knew of the conditions of the consignee's siding and had refused to erect a shed there. The railroad was held not liable for a penalty. The act did not impose a duty to provide shelter pens at every place of delivery of carload shipments of animals. The railroad did not confine the animals beyond the time limit in cars while in transit, and there was no willful failure on its part to comply with the act.—*U. S. v. Reading*, 223 Fed., 211.

The same court also holds that a railroad confining animals in cars beyond the time limited through a clerical error of the receiving clerk failing to note the loading time at initial point and to mark the shipment for unloading at a point for unloading for rest, water and feed, is not subject to the penalty, because the railroad's act was not knowingly and willfully committed.—*U. S. v. Reading*, 223 Fed., 213.

Railway Officers

A Robertson, vice-president of the Missouri Pacific-Iron Mountain System, has been appointed chief operating officer for the receivers, with headquarters at St. Louis, Mo.; J. M. Johnson, vice-president, has been appointed chief traffic officer, with headquarters at Chicago; J. G. Drew, vice-president, has been appointed chief accounting officer, with headquarters at St. Louis, Mo.; F. J. Shepard, vice-president, has been appointed assistant to receiver, with headquarters at New York; H. L. Utter, secretary and treasurer, has been appointed treasurer, with office at New York, and F. M. Hickman remains local treasurer, with headquarters at St. Louis.

Operating

H. J. Simmons, since June, 1905, general manager of the El Paso & Southwestern System at El Paso, Tex., has resigned, and G. F. Hawks, general superintendent at El Paso, has been appointed his successor to take effect September 1.

J. T. Ransom, superintendent of the Pullman Company at Philadelphia, has been appointed general superintendent, with headquarters at Chicago, and O. P. Powell, assistant to vice-president, has been appointed assistant general superintendent, to succeed F. M. Bostwick. J. A. Rittenhouse, district superintendent at the Pennsylvania Railroad Terminal, New York City, succeeds Mr. Ransom as superintendent at Philadelphia. F. E. Cook, superintendent at St. Louis, Mo., has been transferred to the Grand Central Terminal at New York, N. Y., to succeed A. J. Grant; W. H. Waite, district superintendent at the Union Depot, Chicago, succeeds Mr. Rittenhouse at the Pennsylvania Terminal, New York; F. A. Cooke, district superintendent at Seattle, Wash., has been transferred to Chicago to succeed Mr. Waite; T. C. Olney, district superintendent at Chattanooga, Tenn., has been transferred to New Orleans, succeeding H. J. Clark, promoted. H. M. Allen has been appointed district superintendent at Seattle, Wash., to succeed Mr. Cooke; J. F. Green has been appointed district superintendent at Chattanooga, Tenn., succeeding Mr. Olney; F. W. Millsbaugh has been appointed agent at Nashville, Tenn.

Engineering and Rolling Stock

A. M. Hilborn has been appointed general car foreman of the Illinois Central with office at Memphis, Tenn., succeeding E. A. Nix.

J. A. MacRae, whose appointment as mechanical engineer of the Louisville & Nashville, with headquarters at Louisville, Ky., has already been announced in these columns, was educated at the University of Illinois, where he took a course in mechanical engineering, graduating in 1896. The following year he began railway work as a draftsman in the office of the mechanical engineer of the Chicago & Northwestern, remaining with that company until 1899, when he entered the service of the New York Central & Hudson River. There, until 1904, he was engaged in special work and as draftsman at Albany, and at New York City. From 1904 to 1906 he was mechanical engineer of the Boston & Albany, at Boston. Then until January, 1915, he was mechanical engineer of the Michigan Central at Detroit, Mich., and now becomes mechanical engineer of the Louisville & Nashville, with headquarters at Louisville, Ky., as above noted.

J. A. MacRae

A. J. Himes, valuation engineer of the New York, Chicago & St. Louis, has been appointed engineer of grade-crossing elimination, with headquarters at Cleveland, Ohio.

OBITUARY

J. W. Eber until recently general manager of the Toronto, Hamilton & Buffalo, died on August 18, at Hamilton, Ont.

Patrick A. Gorman, formerly general manager of the Waco & Northwestern, died at Waco, Tex., on August 15th.

E. B. Pleasants, chief engineer of the Atlantic Coast Line, with headquarters at Wilmington, N. C., died on August 22, at Washington, D. C., at the age of 65 years.

T. S. Moise, general manager of the Central of Georgia, with headquarters at Savannah, Ga., died on August 17, at Temagami, Ont. He was born on June 13, 1862, at New Orleans, La., and began railway work in 1880, serving in various clerical positions in agency work and as conductor and yardmaster at Montgomery, Ala., and Macon, Ga., until February, 1890, when he became trainmaster of the Savannah & Western division of the Central Railroad & Banking Company of Georgia, at Columbus, Ga. He was later transferred in the same capacity to the Southwestern division at Macon, Ga., and then was consecutively superintendent of the Savannah & Atlantic division of the same road at Savannah, Ga.; superintendent of the South Carolina division at Au-

T. S. Moise

gusta, and from February, 1893, to September, 1898, was superintendent of the Savannah & Western division at Columbus, Ga. From September, 1898, to December, 1903, he was superintendent of the Savannah division at Savannah; then to February, 1904, was general superintendent of transportation and later served as general superintendent until January, 1905, when he was appointed general manager. His entire service had been with the Central Railroad & Banking Company of Georgia and its successor, the Central of Georgia Railway.

THE BAGDAD RAILWAY.—The Bagdad Railway, if it is completed according to present plans, will extend from Konieh, in the province of Konieh in Asia Minor, southeast of Constantinople, through Aleppo, Mesopotamia, and Bagdad to Busra near the mouth of the Euphrates and Tigris rivers, a total distance of something like 1,314 miles. At the present time the railway is in disconnected sections. There have been about 175 miles of line constructed to the west of the Cilician Taurus, about 105 miles (including a branch line about 36 miles long) in the plain from Adana, about 158 miles between the Amanus mountains and the Euphrates and 79 miles in the neighborhood of Bagdad. In addition to this there is a small branch line in the Adana plain, from Adana to Mersina, 40 miles long, which the Bagdad company has acquired, and which until the opening of the port of Alexandretta for the Asia Minor portions of the Bagdad railway, represents the only access to the sea. This makes an aggregate of 556 miles of the Bagdad Railway so far opened for traffic. In spite of the war, or as it is asserted in some quarters, owing to military considerations connected with the war, the work is being pushed with no small amount of energy. Recently the most important tunnel on the Bagdad Railway, the Bilemedik tunnel, has been pierced and is approaching completion. The sections upon which work is most active are in the Cilician Taurus and the Amanus mountains, which are associated with the military advantages that will be obtained when there is a direct railway connection from the Bosphorus to the Egyptian frontier. The work also comprises more easterly portions which cannot be deemed to be of any direct military moment.—From an article in *Engineering, London*.

Equipment and Supplies

LOCOMOTIVE BUILDING

THE CHICAGO, BURLINGTON & QUINCY has ordered one 18 in. by 26 in. 12-ft. cut scoop wheel rotary snow plow from the American Locomotive Company.

THE COPPER RIVER & NORTHWESTERN has ordered 2 locomotives from the American Locomotive Company.

CAR BUILDING

THE BUTTE, ANACONDA & PACIFIC is inquiring for 100 50-ton ore cars.

WELLS, FARGO & Co. has ordered 35 refrigerator cars from the Pullman Company.

THE CUBA COMPANY is in the market for from 500 to 600 sugar, box and flat cars.

THE CHICAGO & NORTH WESTERN has ordered 50 caboose cars from the American Car & Foundry Company.

THE CHICAGO, ST. PAUL, MINNEAPOLIS & OMAHA has ordered 100 refrigerator cars from the Haskell & Barker Car Company.

THE ATLANTIC COAST LINE has ordered 750 ventilated box cars from the Mount Vernon Car Manufacturing Company.

THE ATCHISON, TOPEKA & SANTE FE is reported to be inquiring for 500 stock cars, and has ordered 50 ore and concentrate cars from a Chicago builder. This item has not been confirmed.

IRON AND STEEL

THE GULF, FLORIDA & ALABAMA has ordered 6,000 tons of 80-lb. rails from H. F. Wardwell, Chicago.

THE CHESAPEAKE & OHIO has ordered 6,000 tons of rails from the Illinois Steel Company, and 500 tons each from the Cambria Steel Company and the Pennsylvania Steel Company, also 600 tons of structural steel from the Virginia Bridge & Iron Company and the Mount Vernon Bridge Company.

MACHINERY AND TOOLS

THE DELAWARE, LACKAWANNA & WESTERN is in the market for a 42-inch coach wheel lathe and for three or four smaller machine tools.

RAILWAY EXTENSION IN ECUADOR.—Just before the war broke out, a German firm secured a contract from the Ecuadorian Government to build a railway line from Huigra to Cuenca. If the undertaking can be proceeded with—and it is doubtful whether without the active co-operation of United States firms this can be the case—it will mean a great deal for the Guayaquil & Quito Railway, both during and after construction. The whole of the requisite building material must pass over the company's lines, and subsequent traffic must be shared with the new system in generous proportions. Unfortunately, the lack of funds has prevented the existing railway company from maintaining the track in a proper state of repair, with the consequence that breakdowns, and even more serious accidents, are of frequent occurrence. The line, which is 288 miles in length, is, from the engineering point of view, one of the most remarkable in the world; it connects Quito, the capital of the republic, with Guayaquil, the only important port in the country. From the day of its opening in June, 1908, the line has been worked at a heavy loss, not sufficient revenue being received even to pay the interest upon the bonds. It is believed that this constitutes a record in railway working in any part of the world.—*The Engineer, London.*

PRODUCTION OF PIG-IRON DURING WAR IN GERMANY.—The production of pig iron during the war has for each month amounted to the following percentage of the normal peace production: August 1914, 37.84 per cent; September, 37.42 per cent; October, 47.08 per cent; November, 50.90 per cent; December, 55.11 per cent; January, 56.39 per cent; February, 51.85 per cent; March, 60.54 per cent and April, 60.55 per cent.—*Engineering, London.*

Supply Trade News

G. F. Riddell, superintendent of the Chicago Heights Works of the Inland Steel Company, died of heart failure at his home in Chicago on August 12.

The Keuffel & Esser Company, New York, has been awarded three grand prizes at the Panama-Pacific International Exposition at San Francisco for its exhibit of drawing instruments and slide rules; surveying instruments, and telescopic sights and periscopes, respectively.

The Mesta Machine Company, Pittsburgh, Pa., recently shipped a 1,500-ton quick-acting steam-hydraulic forging press of its standard four-column type to the Pressed Steel Car Co. The valves on this press are so arranged as to permit the use of a single controlling lever and to cause the press to stop automatically at any point the operator desires.

Robert M. Smith, assistant mechanical engineer of the Acme Supply Company, Chicago, has been appointed mechanical engineer. Mr. Smith was formerly chief car draftsman for the Illinois Central and went to the Acme Supply Company last January as inspector. In March he was appointed assistant mechanical engineer, and on August 1 mechanical engineer.

The Chicago & Alton has closed a contract with the Hupp Automatic Mail Exchange Company, Chicago, for the installation of automatic mail exchange apparatus at all of its main-line stations between Chicago and St. Louis which are not regular stops for through passenger trains. This contract was awarded after exhaustive tests extending over a period of six months. This device was described in the *Railway Age Gazette* of November 27, 1914.

The Hoeschen Manufacturing Company, Omaha, Neb., maker of highway crossing alarms, has recently been reorganized and has moved its factory and office into larger quarters with the Paxton & Vierling Iron Works, at Seventeenth street and Union Pacific tracks. This change has greatly increased the capacity of the factory and will facilitate the handling of future orders. F. K. Davis, until recently office engineer in the signal department of the Grand Trunk at Montreal, has been appointed general manager, with headquarters at Omaha.

Bertram Smith, who has been in the storage battery business for the past 15 years, has been appointed manager of the Detroit office of the Edison Storage Battery Company, Orange, N. J. About a year and a half ago Mr. Smith became assistant manager of the Edison Storage Battery Supply Company of San Francisco, Cal., the distributor for the Edison Nickel-Iron-Alkaline Battery on the Pacific Coast. Directly previous to his connection with the Edison company he was manager of the battery department in the Chicago branch of the United States Light & Heating Co. He was formerly secretary and treasurer of the National Battery Company of Buffalo, until its consolidation with the United States Light & Heating Co.

Edward A. Everett, formerly signal engineer of the Michigan Central, has opened an office at 50 Church street, New York, for the sale of railway supplies and signal material. He represents the Hobart-Allfree Company, Chicago, derailleurs and car replacers; E. J. Clark, Philadelphia, Pa., T. C. Cypress Trunking and Capping; the National Concrete Machinery Company, Madison, Wis., concrete fence post machinery and supplies; the Detroit Twist Drill Company, Detroit, Mich., high-speed bonding drills; the J. Frederick Schroeder Air Felt Company, Newark, N. J., high-grade air felt used in refrigerator car construction, steam pipe covering and as a cushion under relays and electrical apparatus; the Cincinnati Electrical Tool Company, Cincinnati, Ohio, portable electric drills, grinders and reamers; the Keller Pneumatic Tool Company, pneumatic drills, hammers, riveters and chippers; the Reliable Electric Company, Chicago, signal, telephone and telegraph specialties. Mr. Everett also has charge of the sales of the electric release train annunciator, which is one of his patents and which has been sold for several years by the Railroad Supply Company, Chicago. He also has a line of copper clad and bond wires and high strength non-corrosive bond wire.

Railway Construction

ATLANTA & ST. ANDREWS BAY.—This company has under consideration the question of building an extension, it is said, from Dothan, Ala., north via Eufaula. The company now operates a line from Dothan south to Panama City, Fla., 82 miles.

BELLINGHAM, MOUNT BAKER & SPOKANE.—It is reported that work on 288 miles of track for this company will be started within 90 days. This line is to form part of a through line to Port Nelson on Hudson Bay. C. E. Wingate, chief engineer of surveys and construction, Bellingham, Wash.

BALTIMORE (MD.) ROADS.—A plan for a municipality-owned electric belt railroad connecting with the Pennsylvania; Baltimore & Ohio; Western Maryland and Maryland & Pennsylvania railroads, with provision for new tunnels through the city and a union station at the Fallsway and Biddle street, was sent to the City Planning Commission recently by Mayor Preston. William H. Maltbie and Daniel B. Banks are interested in the project.

CHARLESTON SOUTHERN.—Application is to be made in South Carolina on September 17 for a charter to build from the Carolina, Atlantic & Western, in Charleston, S. C., southwest through the counties of Charleston, Colleton, Beaufort and Jasper to a point on the north bank of the Savannah river, thence across the Savannah river to a connection with the Seaboard Air Line on Hutchinson Island in the county of Chatham, Georgia. The incorporators include George E. Dargan, 112½ Cashna street, Darlington, S. C.; Bright Williamson and James D. Evans.

CLEVELAND & OHIO CENTRAL ELECTRIC.—Most of the right-of-way, also terminal rights, have been secured, and the contract to build and equip the first section of 55 miles has been let to the Lathrop-Shea interests; J. J. Shea, Buffalo, N. Y., is president of the three construction companies involved. The contract calls for the completion of the work in 1916. The amended route extends from Cleveland, Ohio, south to Wadsworth, thence via Rittman and Smithville, to Worcester, which will be the southern terminus of the first division. The line is to be extended south to Columbus. (August 20, p. 368.)

LOUISVILLE & NASHVILLE.—The branch of the Louisville & Nashville, which now extends from Pineville, Ky., to Benham, is to be extended, it is said, to a connection with the line in operation to Middlesborough and to Norton, Va.

WILLIAMSPORT, NESSLE & MARTINSBURG.—Construction work is reported under way on a section of this line, and the work is to be continued as far as rights of way have been obtained towards Martinsburg. The plans call for a 15-mile line between the Potomac river and Martinsburg. John Carmichael, president, Hagerstown, Md. (April 9, p. 811.)

RAILWAY STRUCTURES

BALTIMORE, MD.—The Pennsylvania Railroad expects to ask for bids soon for building a new pier at Canton, Baltimore. (June 25, p. 1498.)

CHICAGO, ILL.—The new freight house and warehouse of the Pennsylvania lines will be a five-story building, 745 feet long and 420 feet wide. It will have a pile and concrete foundation, steel frame, concrete fireproofing and brick curtain walls as announced previously. The foundation contract has been awarded to Blome-Sinck Company, Chicago, and the structural steel contract to Thompson-Starrett Company, Chicago. The general contract will not be let for several months. Foundation work is now in progress.

GRAND FORKS, B. C.—Construction work was started recently by the Great Northern, it is said, on a new bridge over North Fork canyon on the railway spur into Granby smelter. The new bridge, which is to be 692 ft. long, with stone and concrete abutments, will cost \$65,000, and is to be built to replace the present structure. Until the new bridge is completed the Great Northern will use the spur and bridge of the Canadian Pacific into the smelter. About 2,000 ft. of track will be laid to connect the two lines.

Railway Financial News

BOSTON & MAINE.—In a notice issued by President Hustis urging holders of the notes due September 2 to notify the Old Colony Trust Company, Boston, as to whether they will extend their notes or extend part of them, and receive in exchange Maine Railways notes, President Hustis says: "During the fiscal year ending June 30, 1915, by strict economy, and with the partial benefit of increased passenger and freight rates recently granted, the road was able, notwithstanding a decrease in operating revenue of \$1,489,236, to come within about \$334,000 of meeting its fixed charges, as against a deficit of \$2,044,742 for the previous year. While this improvement does not remove the necessity of reorganization, it strengthens our belief that if a consolidation with the leased lines can be effected on equitable terms, a financially strong corporation will result which will be to the greatest advantage of all."

CHICAGO, ROCK ISLAND & PACIFIC.—The time for the deposit of the 5 per cent debentures with the committee, of which Seward Prosser is chairman, has been extended to October 15.

CHICAGO & WESTERN INDIANA.—J. P. Morgan & Co., the First National Bank and the National City Bank, all of New York, have bought from the Chicago & Western Indiana and are offering to the public \$12,935,000 two-year 5 per cent collateral notes of September 1, 1915-1917. The offering price to the public is 99, yielding about 5½ per cent on the investment. The notes are secured by the deposit of \$17,247,000 Chicago & Western Indiana first and refunding mortgage 5 per cent bonds, which are part of the \$18,497,000 bonds outstanding under the first and refunding mortgage. This mortgage is an absolutely direct and first lien on the company's clearing yard, which includes approximately 18,010 acres of land and which yard is used by the following companies: Pennsylvania Company, Atchison, Topeka & Santa Fe; Illinois Central; Chicago, Burlington & Quincy; Chicago, Rock Island & Pacific; Chesapeake & Ohio; Minneapolis, St. Paul & Sault Ste. Marie; Chicago & Eastern Illinois; Chicago, Indianapolis & Louisville; Erie; Grand Trunk Western; Wabash. The mortgage is also a junior lien on the remainder of the company's property, which includes a passenger station in Chicago, used by the last five named companies and by the Atchison, Topeka & Santa Fe.

MINNEAPOLIS & ST. LOUIS.—This company has completed the purchase of its subsidiary company, the Des Moines & Fort Dodge.

NEW ORLEANS, MOBILE & CHICAGO.—This company was recently sold under foreclosure and was bought in by C. H. Murphey, representing, it is said, the reorganization committee, of which J. W. Platten, New York, is chairman.

MILITARY TRAFFIC ON THE P. L. M. RAILWAY OF FRANCE.—When the mobilization of the French Army was ordered, the Paris, Lyons & Mediterranean was not taken unawares, for, acting on the advice of the minister of war, steps had previously been taken to put the system in a condition suitable for handling heavy military traffic. On the night between August 2 and 3, the ordinary service was entirely suspended and more than 3,000 special military trains were provided in four days. This was the mobilization proper, but concentration went on during the whole month, and required another 4,000 trains up to the thirtieth day of mobilization. After the mobilization and concentration of the army were finished, there began what may be called the third stage of military transportation, embracing the victualling of the troops, the supply of stores and depots, the carriage of supplementary troops, the conveyance of the wounded, etc., and in one period of five weeks 1,600 trains were run for these and similar purposes. The P. L. M. Company already owned two complete hospital trains, but it was necessary to improvise very many more, and there are actually about 1,600 cars now engaged in the transportation of the wounded between the front and the hospitals, of which 670 are passenger coaches.—*Railway Gazette, London.*

ANNUAL REPORT

CANADIAN PACIFIC RAILWAY COMPANY—THIRTY-FOURTH ANNUAL REPORT

To the Shareholders:

The accounts of the Company for the year ended June 30th, 1915, show the following results:—

Gross Earnings	\$98,865,209.78
Working Expenses	65,290,582.49
Net Earnings	\$33,574,627.29
Deduct Fixed Charges.....	10,446,509.83
Surplus	\$23,128,117.46
Contribution to Pension Fund.....	125,000.00
	\$23,003,117.46

Deduct Net Earnings of Pacific Coast Steamships, Commercial Telegraph, and News Department, transferred to Special Income Account	1,494,151.49
	\$21,508,965.97

From this there has been charged a half yearly dividend on Preference Stock of 2 per cent., paid April 1st, 1915.....	\$1,605,412.80
And three quarterly dividends on Ordinary Stock of 1¼ per cent. each, paid January 2nd, 1915, April 1st, 1915, and June 30th, 1915	13,650,000.00
	15,255,412.80
	\$ 6,253,553.17

From this there has been declared a second half yearly dividend on Preference Stock, payable October 1st, 1915.....	\$1,613,638.42
And a fourth quarterly dividend on Ordinary Stock of 1¼ per cent., payable October 1st, 1915	4,550,000.00
	6,163,638.42

Leaving net surplus for the year..... \$ 89,914.75
In addition to the above dividends on Ordinary Stock, three per cent. was paid from Special Income.

THE FOLLOWING ARE THE DETAILS OF SPECIAL INCOME FOR YEAR ENDED JUNE 30TH, 1915.

Balance at June 30th, 1914.....	\$ 5,046,812.46
Less Dividend paid October 1st, 1914....	1,950,000.00
	\$3,096,812.46
Interest on Proceeds Land Sales.....	64,587.54
Interest on Deposits and Loans.....	1,466,096.67
Interest from Minneapolis, St. Paul & S. S. Marie Ry. Bonds.....	159,720.00
Interest from Mineral Range Ry. Bonds.....	50,160.00
Interest from Toronto, Hamilton & Buffalo Ry. Bonds.....	10,840.00
Interest from Montreal & Atlantic Ry. Bonds and other Securities	107,902.09
Interest from Berlin, Waterloo, Wellesley & Lake Huron Ry. Bonds	17,040.00
Interest from St. John Bridge & Railway Extension Co. Bonds	6,200.00
Interest from Esquimalt & Nanaimo Ry. Bonds.....	193,280.00
Interest from Dominion Atlantic Ry. Extension Debenture Stock	56,940.00
Interest from Dominion Atlantic Ry. 2nd Debenture Stock..	36,986.67
Interest from Hull Electric Railway.....	75,000.00
Dividend on Esquimalt & Nanaimo Ry. Stock.....	125,000.00
Dividend on St. John Bridge & Railway Extension Co. Stock	70,000.00
Dividends on Minneapolis, St. Paul & S. S. Marie Ry. Common Stock	890,645.00
Dividends on Minneapolis, St. Paul & S. S. Marie Ry. Preferred Stock	445,326.00
Dividends on West Kootenay Power & Light Co. Common Stock	55,000.00
Dividends on West Kootenay Power & Light Co. Common Preferred Stock	3,850.00
Dividends on Consolidated Mining & Smelting Co. Stock..	209,520.00
Dividend on Berlin, Waterloo, Wellesley & Lake Huron Ry. Stock	12,500.00
Earnings from Ocean Steamships and Hotels.....	4,370,280.41
Revenue from Company's Interest in Coal Mine Properties..	544,294.26
Extraneous Mail Earnings.....	364,733.61
Net Earnings of Pacific Coast Steamships, Commercial Telegraph, News Department.....	1,494,151.49
Received for space rented in Office Buildings.....	139,277.95
	\$14,066,144.15

Less:—Payments to Shareholders in dividends:
January 2nd, 1915, April 1st, 1915, and June 30, 1915

\$8 216,144.15

From this a dividend has been declared payable October 1st, 1915

1,950,000.00

2. The working expenses for the year amounted to 66.04 per cent. of the gross earnings, and the net earnings to 33.96 per cent., as compared with 67.32 and 32.68 per cent., respectively, in 1914.

3. Four per cent. Consolidated Debenture Stock to the amount of £611,797 was created and sold, and the proceeds were applied to the acquisition of the securities of other railway companies whose lines constitute a portion of your system, the interest on which had, with your sanction, been guaranteed by your Company.

4. Four per cent. Preference Stock to the amount of £504,914 was created and sold for the purpose of meeting capital expenditures that had previously been sanctioned by you.

5. During the year 231,297 acres of agricultural land were sold for \$3,742,115.00, being an average of \$16.17 per acre. Included in this area there were 6,550 acres of irrigated land which brought \$55.22 per acre, so that the average price of the balance was \$15.04 per acre.

6. All of the Company's outstanding First Mortgage 5% Bonds, amounting at the end of the last fiscal year to £2,638,900, were satisfied and retired at or before their maturity, July 1st, excepting a few that had not been presented for redemption. An amount sufficient to take up these Bonds, as they come in, has been deposited with your bankers, and the Trustees have been asked to certify the satisfaction of the debt and to have the mortgage securing them formally cancelled. Outstanding Bonds, to the amount of

£233,200, of the Shuswap and Okanagan Railway Company, whose line is leased to your Company for 999 years, were also acquired during the year, and have been deposited with your Treasury securities.

7. As you were informed at a previous meeting, your Directors have had under consideration for some time the desirability of transferring to a Steamship Company your steamships engaged in traffic on the Atlantic and Pacific Oceans, so as to more effectually separate your railway and steamship finances and operations. To that end, a Company has been organized under the laws of Great Britain, known as "The Canadian Pacific Ocean Services, Limited," with an authorized capital of £2,000,000 sterling, having for its purpose, amongst other things, the acquisition and operation of ocean steamships and the interchange of traffic with your railway lines and others. The requisite extension of your Company's charter powers has been secured to enable it to hold stock and securities of the Canadian Pacific Ocean Services, Limited, and to guarantee payment of the principal and interest of such securities as may be issued with your consent. It is proposed that the Canadian Pacific Ocean Services, Limited, shall purchase and take over your interest in all of the steamships and their appurtenances engaged in ocean traffic, as well as those of the Allan Line Steamship Company which has been under your control for some time. A moderate estimate of the value of the steamship property involved in the transaction, after making due allowance for depreciation, is \$23,500,000. Your Directors recommend that as a consideration for the steamships and their appurtenances to be sold and delivered by your Company, and for the Capital Stock of the Allan Line Steamship Company, carrying with it all that Company's steamship and other properties, you accept as fully paid the Capital Stock of the Canadian Pacific Ocean Services, Limited, namely, £1,962,910, being all excepting the shares necessary to qualify the Directors of the Steamship Company, and in addition, 5% First Debentures of the amount of £2,865,860 sterling. The transaction has been completed on this basis, subject to your approval at this Meeting.

8. Six of the Company's older class steamships, namely, the "Montrose," "Mount Royal," "Montezuma," "Montcalm," "Tyrolia" and "Ruthenia," were taken by the Imperial Government in November last, at a price that has not yet been fixed by the Admiralty, and the steamship "Empress of India," after twenty-five years service on the Pacific Ocean, was sold for £85,000 and converted into a hospital ship. Two large modern steamships that were under construction at Belfast, were purchased by the Company at a cost of about £700,000, for delivery in July and October of this year. Pressure of other work, however, delayed their completion, and it will be probably some months before they are ready for service.

9. The appropriations made by your Directors for expenditures on capital account during the calendar year were comparatively small, aggregating only \$3,546,600. In this amount are included the estimated expenditure on Roger's Pass Tunnel in the Selkirk Mountains, \$1,350,000; Passenger and Freight Terminals at Quebec, \$300,000; and Passenger Station with approaches, at North Toronto, \$400,000. The balance of the amount is made up of works of minor importance on all sections of the Railway.

10. The Victoria Rolling Stock and Realty Company's equipment securities, to which reference was made in the last Annual Report, were disposed of during the year at a price sufficient to repay the amount advanced by the Company.

11. Uncontrollable conditions caused an abnormal decline in the gross revenue of your railway lines for the year, and, although the working expenses were very substantially reduced, the net earnings were \$8,851,300 less than in the previous year, leaving a margin barely sufficient to meet the customary distribution to shareholders. Against this your Special Income, from which a portion of the dividend is paid, was \$2,381,461 greater this year than last.

Your Directors were of the opinion that in the circumstances there was no good reason for making any change in the rate of dividend, and acted accordingly.

12. Vice-President McNicoll, after more than 40 years' continuous connection with the Company and one of its acquired lines, was compelled by failing health to relinquish the arduous duties of his office, and he, therefore, resigned in December last. The resignation was accepted after the Directors had expressed in a most pronounced way their high appreciation of Mr. McNicoll's services to the Company, and their personal esteem and regard for him. Mr. George Bury, Vice-President in charge of the Company's Western Lines, was promoted to fill the vacancy caused by Mr. McNicoll's retirement, and he was also elected a member of the Board of Directors.

13. The under-mentioned Directors will retire from office at the approaching Annual Meeting. They are eligible for re-election:—

SIR WILLIAM C. VAN HORNE, K.C.M.G.,
MR. RICHARD B. ANGUS,
SIR EDMUND R. OSLER, M.P.,
SIR HERBERT S. HOLT,

For the Directors,
T. G. SHAUGHNESSY,
President.

MONTREAL, August 9th, 1915.

SCHEDULE "C"

DETAILS OF EXPENDITURE ON ADDITIONS AND IMPROVEMENTS FROM JULY 1ST, 1914, TO JUNE 30TH, 1915.

I. G. OGDEN,
Vice-President.

AUDITORS' CERTIFICATE.

We have examined the Books and Records of the Canadian Pacific Railway Co., for the fiscal year ending June 30, 1915, and having compared the annexed Balance Sheet and Income Account therewith, we certify that, in our opinion, the Balance Sheet is properly drawn up so as to show the

true financial position of the Company at that date, and that the relative Income Account for the year is correct.

PRICE, WATERHOUSE & CO.,
Montreal, August 6th, 1915. Chartered Accountants (England)

Not long ago the Central of Georgia revised the form which it uses to send out monthly statements of earnings and expenses.

Railroads and the Local Public

In addition to the usual columns of figures showing the month's earnings and accumulated earnings for the fiscal year to date, with comparisons for the previous year, this form contains a statement showing the percentage of total operating expenses which were distributed on payrolls to approximately so many persons, "substantially all of whom reside on the company's lines," and also a statement of the amount spent for materials and supplies, "the cost of which includes large payments for labor expended

on them before they were consumed." Fairfax Harrison, shortly after returning to the Southern Railway as its president, pointed out in an address to business men of the South how large a proportion of all of the money collected by the Southern Railway from the southern people is almost immediately distributed again in the same territory. Ordinarily the monthly earnings statements of railway companies are of primary interest to investors and to bankers; but the Central of Georgia's new form of statement suggests a way in which they can be made of interest to local newspaper editors and of value in promoting a better understanding between the railroads and their patrons. The fact that of the hard-earned dollars which a farmer pays on a freight bill or through the ticket agent's window little more goes out of the county than of the dollars he pays to his hands cannot be reiterated too often.

A committee of the Association of American Railway Accounting Officers has been making inquiries as to the attitude of the railroads in regard to the desirability of changing the fiscal year, insofar as reports to the Interstate Commerce Commission and to state commissions are concerned, from June 30 to December 31. The committee made inquiry of 200 roads, with an aggregate of 271,857 miles of railroad. Of these, 130 roads, operating 212,542 miles, or 78 per cent of the total mileage of which inquiry was made, voted in favor of changing the period for making reports from June 30 to December 31; 32 roads, with a mileage equal to 5 per cent of the total, did not vote, and 38 roads, with a mileage equal to 17 per cent of the total, voted against the change. The *Railway Age Gazette* has for some time past advocated a change in the fiscal year both for reports to the Interstate Commerce Commission and state commissions, and for reports to stockholders. One of the most important reasons why this change should be made is that there will then no longer be the same temptation that there is now to delay maintenance work in May and June so as to keep the expense of it out of the fiscal year about to close. Presumably the roads operating 17 per cent of the mileage from which inquiry was made either desire to have this opportunity to make a showing by delaying maintenance work left open to them or do not think that the advantages to be gained are equal to the cost and trouble of making the change. This appears to be a shortsighted or a rather selfish point of view. Even if a particular company is so prosperous as to never feel the temptation to delay maintenance in May and June, it ought to be willing to put its accounting department to the comparatively small expense and temporary trouble to make the system uniform and to carry out a reform which is for the good of the great majority of companies.

Changing the Fiscal Year

The Pennsylvania Railroad, in its last publicity pamphlet, noticed on another page, tells one of the most striking facts that have come

A Remarkable Gang of Freight Handlers

to light in connection with the railroad service for many a day, the operation of the Pittsburgh freight transfer station, with a force of 318 laborers, for 23 months, with practically no change in personnel; only one new man being taken on in all that time. George F. Wagner took charge of the station 30 months ago, and it is his personal efforts or genius to which this result is to be credited. Any railroad man acquainted with freight-house work will readily accept the statement in the pamphlet that it "would be most difficult to duplicate" this record of efficiency and of physical and moral character of the individual men. The story, as printed, is all too short, and the railroad world will be eager to learn about the "other diversions" that have made this work so attractive. And who shall say that the music is not one of the main elements in this remarkable "uplift?" As everybody knows, the unique social successes that have been recorded at the Isthmus of Panama during the last ten years have been due largely to the

wise management of recreation. Paternalism in the management of large enterprises has its occasional virtues, in spite of its dangerous nature. Railroad men will recall that one of the best records ever made in railroad building was that made by the paternal—the despotic—Russian government, beyond the Caspian sea, 25 years ago. Music, by well-trained bands, was a permanent feature of the off-duty life of the workmen there, and the morale of the forces was notable. This paternalism at Pittsburgh evidently is of a kind that anybody can safely copy; anybody, that is, who, like Mr. Wagner, “believes in” welfare work. A “belief” in the mind of a strong leader, is essential in any important work.

ELECTRO-MECHANICAL INTERLOCKING

THIS term, as used by signal engineers, means an interlocking plant where the switches are moved manually—by means of the ordinary “mechanical” machine, with its long levers and its rod connections along the ground—while the signals are worked by electric motors, a motor at each signal, controlled from the cabin, as in a power apparatus. With electric motors the signalman has to put forth no more physical effort than he does to turn a doorknob; and a succession of operations can be performed almost as fast as the mind can decide on them. The description of the interlocking at Trenton, N. J., printed on another page, will attract the attention of many readers not particularly interested in signal engineers’ technicalities, and it has seemed desirable, therefore, to explain this somewhat arbitrary use of terms. This combination of man-power and electric-energy is now so common in the signaling field—there being over 40 plants on the Pennsylvania alone—that the subject should be of general interest, and a brief comparison between this and the older arrangements will be found profitable. In passing, the reader should be cautioned concerning another arbitrary use of terms—a misnomer, in fact; the universal use of “lever” for the handle by which a signalman causes the movement of a switch or signal. In power interlocking the “lever” may be a sliding bar, to open or close an electric circuit, or a little crank to turn a spindle on its axis; but it is a “lever” all the same, so strong is the force of habit.

Electro-mechanical interlocking, when compared with mechanical interlocking which has no electrical features, presents a complexity of electrical devices and circuits, and involves increases in the cost of installation, of maintenance and of operation; and it is justified only by the increased safety and facility of operation that is obtained. That the improvement is believed to be justified is evident from the extensive use already noted. The 44 plants on the Pennsylvania have been put in use during the last six years; some of them new and some reconstructed plants. And there are numerous similar plants on other roads. The electro-mechanical plant, like the purely mechanical, is subject to the limitation of the distance at which switches can be operated, but the speed of operation is somewhat greater because of the smaller size of the machine and the smaller number of heavily loaded levers to be thrown for a given movement. In the nature of things, electro-mechanical cannot displace complete power interlocking to any great extent. The latter has its own field, where either some of the switches are too far from the machine for manual operation or the number of train movements is so great that ease and quickness of operation are essential.

Electro-mechanical interlocking is simply the result of the gradual addition of electrical devices to mechanical interlocking plants and the substitution of electrical for mechanical operation or control of certain parts of such plants. Probably the first step was electric locking, in the nature of approach locking or approach and route locking to prevent the movement of switches and derails when trains for which the signals had been cleared were approaching and passing through the plant. Next came power-operated distant signals, installed because it was practically impossible to move signal arms by either rods or wires at the long distances required to admit the fastest trains being stopped between the distant and home signals. As a third step, home signals were made semi-automatic when the plant was

within the territory of an automatic block system. At first the “electric slot” in the mechanical connections on the signal post, was used for this purpose. But, particularly where the home signals were made three-position and controlled by automatic signals in advance, power mechanisms were also used. It was then that some of the levers in the machine in the cabin ceased to be “mechanical” levers and began to control electric circuits only—a function for which the smaller levers, used in power-interlocking machines, were better adapted. The electric locking of individual switch levers, or facing-point-lock levers—section locking—followed, and finally electric locking, or control, designed to prevent the clearing of the signal for any given route, unless the actual position of the rails of each switch in that route corresponded with that of the lever for that switch.

Now a mechanical plant to which some or all of these electrical features had been added, might, perhaps, properly be called an electro-mechanical plant. But the final development was the electro-mechanical machine, combining mechanical levers for operation of the switches (and for facing point locks, where these are used) with small levers, of the type used in power-interlocking machines, for the operation of the signals and, in many cases, for control of the mechanical levers. In practice a plant is not usually called an electro-mechanical interlocking unless it has an electro-mechanical machine and all, or nearly all, of the electrical features mentioned.

The electro-mechanical machine, for a given plant, has the advantage over a mechanical machine equipped with electrical devices on the mechanical levers, that it can be more readily and rapidly operated on account of its smaller size; and, in the opinion of some signal engineers, the electrical parts of the machine are better suited to their purposes and more reliable. At the same time a saving in first cost is sometimes possible because the machine occupies much less floor space, and a smaller cabin can therefore be built.

From this brief outline it will be seen that this elaboration of what was at first a simple process—the insuring that a signal lever should not be moved to “clear” until its corresponding switch lever was surely set right—has been a logical and, we may say, an inevitable process. At each point where the original interlocking mechanism of 1860-1875 fell short of affording everything that the operating officer could demand, the signal engineer was called upon to provide something new; and he has responded with notable promptness and efficiency. He has perfected his interlocking with marked resourcefulness and economy. And here, as in so many other questions of the railroad plant and its maintenance, economy is the final test. Not that “safety first” is neglected; not by any means. Indeed, in the signal engineer’s office safety first goes without saying.

ARE OUR GOVERNMENTS PERFECT?

IN the *Railway Age Gazette* for August 13, there was published an editorial entitled “Our Inefficient Governments.” We pointed out therein that government regulation of business usually is inefficient and fails of its purpose. The Eastland disaster, occurring in spite of government inspection of steamships, was cited as an illustration. Our esteemed contemporary, the Topeka Capital, says that the *Railway Age Gazette* “therefore concludes as a logical proposition that the government should quit attempting to regulate business.” We beg to say to the esteemed Capital that its statement regarding our conclusion is not true. The conclusion which we drew was, we thought, as clearly stated as the English language would permit. It was not that government regulation should be abolished, but that there ought to be a movement to make our governments more efficient so that regulation would be more intelligent, and in consequence would secure the results which it aims at.

The concluding sentences of the editorial in this paper, to which the Capital refers, were as follows: “When shall we have an honest, energetic and widespread movement for making our governments competent to perform the functions they

already have? Raising them to this plane of efficiency is absolutely prerequisite to raising them to the still higher plane of efficiency where they will be fit to perform large and important additional functions. The advocates as well as the opponents of further increases of government functions ought to be able to unite in such a movement; for by far the strongest argument at present against further increases of government functions is the almost imbecile inefficiency which most of our governments display in most of the things that they now undertake."

This is not, as the Topeka Capital strangely asserts, "an argument for anarchy." It is not an argument for no government but for better government. Does not the Capital agree with us that we need better management of our governments, as well as of our railways? Or does the fact that the editor of the Capital is also the governor of Kansas make all governments entirely satisfactory to it?

THE RAILWAYS MUST MAKE THEIR OWN FIGHT

THE worst part of government regulation of railways in this country is the regulating done by the states. There is, and doubtless always will be, a good deal of complaint and criticism regarding federal legislation and the way the Interstate Commerce Commission performs its duties. But the regulating done by the federal government is in intelligence and fairness as far above that done by the states as the heavens are above the earth.

There have been some state commissions whose performance of their functions has been on a high plane. This formerly was notably true of the Railroad Commission of Massachusetts. It has been and is still true of the Railroad Commission of Wisconsin. The Wisconsin commission is strict to severity in controlling the concerns subject to its authority, but its expertness and justness command confidence and respect. The same used to be true of the Public Service Commission of the Second district of New York. But most state regulation, whether by legislatures or commissions, is as inexpert as it is unfair. Besides, as to most matters, there is no consistency between the policies of the various states, except that most of them squeeze the roads as hard as the constitution and the courts will let them. Finally, regulation by the federal government and by the various states involves much duplication and therefore much waste of energy and money on the part of both the railways and the governments.

State regulation ought to be either eliminated or brought into harmony with and subjection to federal regulation. In the Shreveport case the Interstate Commerce Commission found that there was unfair discrimination between the state rates from jobbing points in Texas to consuming points in east Texas and the interstate rates from Shreveport, La., to the same consuming points, and held that the railways must correct this by raising the state rates or reducing the interstate rates. The commission made clear that the discrimination resulted chiefly from the fact that the state rates were unreasonably low. Subsequently, when the eastern railways raised their interstate passenger fares to 2½ cents a mile, while leaving many state rates at 2 cents, the commission let the higher interstate rates go into effect. These and other developments seemed to indicate not only that the commission looked with disfavor on unremunerative state rates fixed by public authority, but that it might even take the aggressive in attacking them.

The decision in the Western freight rate case seems to show that the commission is not disposed to adopt any such policy. It refused advances in interstate livestock rates, not because they were unreasonable, but because there were corresponding state rates that were lower. Instead of state regulation being compelled by the federal government to conform to interstate regulation, or instead of interstate regulation being carried on regardless of state regulation, state regulation was allowed to exert a controlling influence on interstate regulation.

The *Railway Age Gazette* has criticized the attitude assumed by the commission in this instance as inconsistent and lacking

courage. But there is something to be said on the other side. The railways themselves show inconsistency and want of courage when they ask the commission to allow advances in interstate rates, and at the same time fail vigorously to attack state rates which are lower. It is primarily the business of the railways, and not that of the Interstate Commerce Commission, to attack unremunerative state rates. Furthermore, in the long run, it will probably be better that the railways rather than the Interstate Commerce Commission take the initiative in this matter. If the commission goes on letting the roads make interstate rates higher than the corresponding state rates it may become the object of attacks for permitting unfair discrimination against interstate traffic. If it should take the initiative in an attempt to force up the state to the level of the interstate rates it probably would be accused of going out of its way to aid the railways and to attack state regulation. Many persons might suspect and allege that it did this mainly to increase its own power. It seems not improbable that if it should show much aggressiveness in attacking state regulation it might so array the state commissions, state politicians and advocates of state's rights against it as to do harm to federal regulation.

It would seem that in the long run the best and most certain way to get the legislation, or the action by the commission and the federal courts, essential to securing the needed limitation or abolition of state regulation would be for the railways to take the initiative in bringing squarely before the commission and the courts, and if necessary also before Congress, the situation created by unjust state regulation in such a manner as practically to force the federal authorities to assert and exercise their paramount power. This may be done in various ways. For example, there are many state passenger fares which are lower than corresponding interstate passenger fares. There are also some state freight rates that are lower than the corresponding interstate rates. Why should not the railways advance some of these state rates fixed by public authority to the same basis as the corresponding interstate rates, and then when the states proceed against them appeal to the Interstate Commerce Commission for protection on the ground that the states are trying to compel an unjust discrimination against interstate commerce? If the commission should hold that the advanced state rates were reasonable the federal courts, it would seem, could be relied on to uphold the railways in persisting in charging them.

There is no question that in almost every instance where a state rate is being charged which is lower than a corresponding interstate rate an unjust discrimination is being worked against interstate commerce. This is a condition which ought not to be allowed to continue. It is wrong in itself and causes unnecessary and unfair losses to the railways. It would appear that the Interstate Commerce Commission does not intend to take the initiative in attacking this condition. Therefore, it is for the railways to open the attack, and the sooner and the more vigorously they begin it the earlier and the more satisfactorily the problem of regulation will be advanced toward a solution.

NEW BOOKS

Purchasing. By C. S. Rindsfoos, C.E. Bound in cloth; 165 pages; size, 6 in. by 9 in. Published by McGraw-Hill Book Company, Inc., 239 West 39th Street, New York. Price, \$2.

This book might well be called a psychological study of the art of purchasing. While it does deal to some extent with the department organization of the purchasing office, its main emphasis is placed rather on the elemental things for which the department is created. This is best explained by a citation of the following chapter heads: How to Obtain the Right Article; How to Obtain the Lowest Price; How to Obtain Prompt Delivery; How to Obtain Favorable Terms, and Strategy. The chapter on some of the Legal Aspects of Purchasing, written by William W. Taylor, is especially valuable, dealing as it does with the contract, the passing of title, etc. Nearly 60 pages of the book are devoted to specimen forms and contracts, thereby making the volume a useful reference book.

Letters to the Editor

THE UNNOTICED UNORGANIZED EMPLOYEES

REDSTACK, Ark.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The trenchant discussion of "The Rising Wage Differential and Its Cure," signed "Division Engineer," in your issue of June 18, contains many suggestive points for every member of the non-organized class of railway employees, to which class I belong.

During a varied experience of ten years handling a train sheet or a chief dispatcher's desk I have never belonged to any protective organization; but there have been many times when I have wondered if I should not be justified in joining six or eight of them if they were available. Everybody in the operating department, outside of the brotherhoods, should think seriously on this subject. The solution proposed would certainly appeal to all non-organized employees. The matter, however, is beyond the province of division officers, and my impression of general managers is that they do not usually consider such radical measures; yet I sincerely hope that some of them may give thought to the letter written by Mr. Division Engineer.

The management of a railroad should see that some supervision is made of the treatment accorded all classes of employees, and that non-organized employees should be accorded protection and treatment that would tend to promote their loyalty, rather than alienate them; or, in other words, induce them to shun, rather than seek, protective organization. Instead of having so many inspectors, minor officers, etc., to see that a man toes the mark all the time, endow at least one officer with authority to see that they are given proper credit for the good that they achieve, and are not criticized too severely for the errors that human beings are bound to make now and then.

For an example: A train dispatcher is subject to all the whims and erratic criticisms of not only all the minor officers, but also of their chief clerks. An unjust criticism cannot be designated as such without a man imperiling his means of making a living. Too often a man is hounded for a week over some matter that does not amount to a hill of beans, simply because he overlooked some unimportant paragraph in a bulletin book containing 795 pages of instructions; instructions which he is told he must know by heart. I know of a case where a section foreman—who happened to be the general manager's brother-in-law and was promoted to train master because of his remarkable ability—discharged a train dispatcher for sawing a passenger train at a non-telegraph station, regardless of the fact that the saw was directly caused by a drawbar failure.

In such cases, for an employee whose interests are bound solely to the company which he serves, there is no redress. Such things are altogether too common in various division headquarters to need much citing of individual instances. If some self-respecting general manager, who also had some respect for his railroad, would step into some of the offices where I have had the honor of serving, and look over some of the data by which the dispatching force were governed, he would no doubt call the janitor to dump it all into a bushel basket and make a bonfire of it; and tell the boys to start over.

Several years ago my employers were threatened with labor difficulties, and the superintendent called each dispatcher into the office and impressed upon him the fact that he was considered an officer of the company, and as such would be expected to submerge all his personal interests and give his undivided support and service to the company during the trouble. I am proud to say that every one of us responded nobly to the occasion, although it was exactly what I would have done without any preliminary coaching or reference to my being a member of the official staff. But, a short time later when I requested some courtesies in the way of transportation, I was informed that such

were not granted to employees less than three years in service, which was about six months more than I could claim. This was an arbitrary ruling applying to all employees regardless of whether the employee's allegiance was divided between the company and some other institution or not.

I pondered deeply the question whether I was an "official" or not, and if so, what an official consisted of, and came to the conclusion that if I was an official, an official in such cases consisted of at least two-thirds jackass for ever thinking that to dub a dispatcher an "official" carried any distinction except when it served the company's interests.

The rooms provided for the dispatching force in some instances are not fit for the habitation of swine; their working equipment is dilapidated and consists of pieces discarded by other departments patched together; and their sanitary conveniences—if there are any—are of inferior grade and inconveniently located. Great improvements could be made in this respect on almost any railroad, but if the dispatchers were to formulate a petition on the matter, it would be considered rank insubordination.

Let some railway company, as an experiment, create a new office. Select a responsible man with a keen eye and reliable judgment in such matters. Give him some such title as "inspector of methods," a fair salary, and instructions to canvass the system and take up for correction all cases that he may find of unjust criticisms or discipline, criticism or discipline rendered in such a way that it humiliates, insults and angers a man; unfavorable physical working conditions; shirking of responsibility and shifting of responsibility to subordinate shoulders by those who are designated to assume, and expected by the management to assume, that responsibility; and general injustice and arbitrary treatment accorded men who must either submit or resign. He would find enough of it to keep him busy for 365 days in the year.

There are many other ways in which railway companies can serve their own interests by devoting a little thought to the welfare of those employees who do not belong to fraternal orders. I hope to live long enough to see some of them put into operation. If I do not, I know that I shall live—if the life insurance companies guess correctly as to my prospects—to see a great many more men driven into organization in self defense.

HOMER PIGEON.

HANDLING OF CLAIMS FOR PERISHABLE FREIGHT

CHICAGO.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The purpose of this letter is, first, to protest again a practice which is throwing unnecessary expense upon all lines handling perishable freight; and, secondly, to further protest against a growing disposition on the part of the arbitration committees of the Freight Claim Association to settle cases otherwise than in accordance with the rules of the association, and contrary to provisions of the tariffs under which the goods move.

During the last few years several loss and damage claims filed against one commodity, viz., peaches in carloads, have been reviewed. The shipments were handled under stated refrigeration charges and the investigations as a rule developed that the cars failed to maintain schedule; that periods of over 24 hours' duration between re-icing operations were permitted to elapse, and that the condition of the lading on arrival at destination indicated through handling in transit. *There is no published rule to the effect that perishable freight must or should be re-iced every 24 hours.* In fact, the use of such a rule is condemned by transportation authorities.

It has been the practice of many freight claim agents to apportion claims of that description entirely on the refrigeration record, adjudging each road guilty of negligence which had permitted over 24 hours to expire between re-icings, although the freight was in possession of such road during only part of such 24 hours. Freight Claim Association arbitration committees are disposing of appeal cases in the same manner.

Practically all cars of fruit disposed of in Chicago have, at some time between the start of loading and completion of unloading, exceeded the 24-hour limit.

Indications are that bills of lading are made out by railroad agents and re-icing instructions inserted in accordance with some well-defined plan. This is wrong, as the shipper should tender the bill of lading complete for the railroad agent's signature, and, when stated refrigeration charges apply, without icing instructions.

Shipments arrive at destination in bad condition, checking, say, "over-ripe, rotten and mashed," and are taken in charge by consignees, who must pay for all ice furnished at destination and, therefore, have undertaken to regulate the time of icing and amounts supplied. It does not seem reasonable to say that failure to re-ice a car of "over-ripe, rotten and mashed" peaches every 24 hours after arrival at destination, regardless of all other conditions and circumstances, constitutes negligence.

Here is a case in point: A car arrived at destination with ice-boxes three-fourths full and unloading was completed in about 48 hours. It was handled under a tariff which carries the following rules:

Carriers' obligation to re-ice shipments moving under refrigeration charges ceases on arrival of cars at destination," etc.

"Upon arrival at destination of carload perishable freight under refrigeration if shipment is not unloaded immediately carriers will see that cars are properly iced and will examine tanks daily, filling to full capacity whenever tanks get below half full."

Nevertheless the terminal road was penalized for exceeding the unwritten and unauthorized 24-hour limit at destination. (Arb. claim A 3345 Appeal Claim No. 566.)

Following is an example of the extremes to which some freight claim agents are going:

A car was loaded at a point on a Western road and bill of lading issued to Pittsburgh, Pa. The initial line erroneously waybilled it to Philadelphia, Pa. In the actual movement it passed through Pittsburgh on schedule. The consignee was not located until three days after the car passed the correct destination and it was then in Philadelphia. In the meantime there was a heavy run of peaches. The markets at both Pittsburgh and Philadelphia became glutted, prices fell and the consignee refused to furnish disposition. On account of the large supply, peaches were being diverted away from the Philadelphia market. This carload was sold by the carrier to the best advantage, but at a loss. No complaint was made on account of their condition. In fact, the record showed the peaches were in good condition. It is clear that the loss was the result of excessive delay caused by the car going astray. The road responsible for the improper billing insisted on a complete investigation of the handling. It was developed that one period of 27 hours had elapsed in transit between re-icings. The 24-hour limit was then introduced and the road responsible for failure to re-ice within the limit was requested to assume 50 per cent of the claim, although damage to the shipment was not claimed.

Tariffs of recent issue provide that where shippers are not satisfied with the standard rule, *i. e.*, "re-ice to capacity at all regular icing stations," they must specify the points where ice is to be furnished and the amounts to be used. Such notations as "Re-ice every 24 hours," "Re-ice when necessary," "Keep fully iced," etc., have been defined by competent authorities as indefinite and unreasonable and their use prohibited by tariff publication. The propriety of the carriers' position in refusing to accept perishable freight with such notations in bills of lading was approved by the Interstate Commerce Commission in a decision rendered last winter (I. C. C. case 6097, *Providence Fruit & Produce Exchange v. New York Central & Hudson River Railroad*). While this decision is in connection with ice furnished on a rate per ton basis, still it would apply with equal force anywhere that the shipper had a voice in regulating the refrigeration. Carriers should consistently use the same rules they insist on shippers using, *viz.*, standard rules. In view of the fact that carriers may refuse to accept notations described above from shippers on account of their unreasonableness, the

same principle should apply when offered by one carrier to another.

Tariffs which publish stated refrigeration charges usually publish certain rules in connection therewith. In the past they have stated in effect that the acceptance of re-icing instructions from shippers was optional with the carriers and even when shippers did furnish instructions they were disregarded. The refrigeration tariffs now carry specific instructions to all agents not to accept re-icing instructions from shippers.

Agents of terminal roads comply literally with re-icing instructions published in tariffs in connection with refrigeration rates and the roads are then adjudged guilty of negligence and penalized accordingly. This is brought about by the arbitration committees of the Freight Claim Association reading the before-mentioned unauthorized 24-hour re-icing limit into the rules.

As between penalizing the initial lines for accepting or using instructions such as are prohibited by tariffs, and distributing liability amongst connecting carriers for failure to comply with such instructions, the former would seem to be more reasonable.

The establishing of a 24-hour limit has broadened the field for the "rate sharks" of the country, and even now consignees are requesting carriers to show the exact hour and date of icing in freight bills as well as the names of stations at which cars are re-iced.

It would seem that there can be no excuse for railroads deliberately violating their tariff provisions on the one hand or, on the other, for the committees of the Freight Claim Association to base decisions upon their own precedents instead of upon the tariffs and rules.

JOHN F. BOYLAN.

OFFICERS MUST BE TRAINED IN THE SCHOOL OF EXPERIENCE

KANSAS CITY.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The address of Mr. Basford before a meeting of Burlington officers, published in your issue of July 23, and the supplementary article by Mr. Wright in the following issue, most forcibly portray the fundamental importance of the matter of organization in building up the personnel of the railway service, and make some splendid suggestions that should be very carefully considered by the executives and managers of all railroads. This most important work of conservation of men for posterity has been and is neglected by most railroads; evidently for the same reason that it has been neglected by other corporations, and even our government: *i. e.*, the mad rush for quick returns; the drawing on the bank of futurity; in short, selfishness. On some roads the trouble is due to stock jobbing by the financiers which often has resulted in too frequent changes in management.

Mr. Basford has done a good thing to show up the mistake of putting college or technical men too freely into official positions. The practice, I believe, is still in vogue on some roads. With very rare exceptions the college man has no ballast whatever. Not only is he without experience, he neglects to learn from the experience which is available all around him. Too often he assumes an attitude of superiority that freezes the very sources of confidence, and promotes distrust and suspicion on the part of the rank and file.

Empiricism, in its better sense—true study of experience—has been one of the foundation rocks of every eminently successful career, and the sooner railroad managements realize the fact the better. No man is qualified to be put in charge of men who has not served in the ranks himself.

And even the men who have fairly won their way will at times discriminate in the promotion of men, so there must be a central governing head or body which must make it its business to know that justice is done.

Mr. Basford said a timely word about clerks: "Clerks are a neglected crowd of competent and incompetent men; usually in blind-alley jobs with no training and no outlook." "Blind

alley" here is the right word. The clerk is so busy and so closely confined in his dark alley that he has no acquaintance with officers and is therefore left out of consideration; and even when he makes himself known he is likely to be pushed aside on the pretext that unfortunately he lacks outside experience, etc. My opinion is that officers who got their start as clerks have proved on the whole to be more thorough going and systematic than the man whose experience has been mostly in outdoor jobs.

Is it not possible that the managements have kept so busy for the past few years in dealing with the brotherhoods that their loyal body of clerical men have in consequence been largely overlooked? Is it not also a fact that the outside man who fortunately rubs up against the officers occasionally, is frequently promoted to official position simply through fancy or on account of his coming to notice on account of some one act? Men are promoted without being subjected to a real character or efficiency test. This is wrong.

Some such scheme as Mr. Basford suggests ought to be put in practice. It would help to liberate these loyal clerks, and put a check on nepotism as well as favoritism. As Burke remarked of our forefathers—the rebels of 1776—"Treat men as though they are what you want them to be and they will rise to it; and in no other way." When managements rise to this high plane there will be no need for the numerous committees, "safety first" or otherwise. Intelligent, sincere, loyal men are always safe men, and such men can be evolved only in the way that Mr. Basford points out.

OUTSIDE MAN.

COMMENDING GOOD SERVICE *versus* CONDEMNING BAD

NEW YORK CITY.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I noticed in your issue of August 20, page 361, an account of a "roll of honor" which is kept on the Conemaugh division of the Pennsylvania Railroad, wherein every employee in the train service who has made a perfect record—that is, freedom from suspensions or reprimands—for a year, has the fact made known to other employees by having his name printed on a bulletin.

Undoubtedly every active railroad man will look upon this as a good move. Publishing only the bad and unpleasant things, even when no names are mentioned, does not in all respects satisfy the demands of justice and equity. It is depressing to be constantly reading lessons and trying to absorb the admonitions contained in the lessons. On the other hand it is difficult to formulate and classify the good things that a superintendent feels disposed to say to the employees and so the whole situation remains in a sense unsettled. This attempt to cure the difficulty by means of the honor roll is therefore of general interest. If there must be publicity, it will be a good thing to try, for a time at least, the idea of publishing the good rather than the bad.

But publicity is not the only means of straightening out our discipline. There is a superintendent of a large division, of a large railroad, not a thousand miles from New York, who carries out the same idea as that embodied in Mr. Keiser's honor roll; but without having a roll. He writes an individual letter to each employee who is worthy of commendation. The commendatory statement is not rolled up, neither is it unrolled. It is folded, and put into an envelope. And when the recipient of such a letter unfolds it you can rest assured that he sits up and takes notice. He is not reading a tedious list of names. He has in his hand a statement that is of particular interest to him, himself. When he gets home he shows it to his wife, inside of ten seconds. If there is need of diplomacy—feminine or other—in getting the fact of the receipt of the letter properly circulated among the neighbors he does not need to hunt far for the necessary assistance in that direction.

I give you two or three samples of letters of this kind, slightly disguised:

John Smith, Brakeman,

Dear Sir:

In making a personal examination of your record I find that during the last twelve months no disciplinary action, of any kind, has been taken in connection with your service; no suspension and not even a reprimand. It is a pleasure to note this satisfactory service and I trust that you will succeed in making an equally creditable record during the current year.

Yours truly, ———.

Peter Jones, Engineman,

Dear Sir:

In making a personal examination of your record, I find that no suspensions, reprimands or other disciplinary action have been recorded against your name since January 1, 1913. This satisfactory service for a period of more than two years is evidence of good work on your part, and I shall hope to be able to record, next January, the fact that you have extended the two-year record to three years.

Yours truly, ———.

Benjamin Baker, Conductor,

Dear Sir:

In looking over your record recently I find that no unfavorable disciplinary action has been taken in connection with your service as conductor since January 1, 1912. This satisfactory record for a period of three years may justly be taken as evidence of excellent service; and such excellence is appreciated by the management.

Yours truly, ———.

It will be observed that the style of the letters differs somewhat in proportion to the length of the uneventful record. But, whatever the style, the notable thing is that the superintendent himself does look into the individual records. I think I am safe in saying that results, in the way of a reduction in the number of cases of discipline, are as satisfactory as those reported in your article of August 20, or as reported by other roads which have received mention in your columns now and then as making great advance in the matter stated, but I will not venture to enlarge on this feature of the matter, for the slackening in the volume of freight traffic on most of the roads of the country in recent years makes all comparisons somewhat deceptive. As you have remarked in some of your editorials, the weeding out of the less competent and less cautious men which follows a diminution of freight traffic often results, automatically, in a marked improvement in the service.

C. C.

CONDITIONS THAT NEED CORRECTING

NEW YORK.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

When riding in some of the suburban trains on even our leading railroads, one cannot but wonder at times whether the passenger department does not spend its entire time looking after the interests of the traveling public on only the high-class through trains. On one of the most important suburban trains on a large system operating into New York City, the train crew very frequently permits smoking in day coaches other than the smoking cars, and cases are not infrequent where ladies entering the train have to spread newspapers on the floor between the seats where smokers have been spitting and throwing cigar ends, while window sills are at times covered with ashes knocked from cigars. It is another common occurrence on this train for the trainmen to omit the calling of important stations in some of the cars and for passengers to have to open vestibule doors and raise the trap doors because of no trainman being in attendance at that end of the car. Conditions of this kind are a disgrace to any railroad and it is scarcely believable that the officers in charge are aware of their existence.

Electro-Mechanical Interlocking at Trenton

Electric Power for Signals, Manual for Switches; No Plunger Locks, No Detector Bars; Novel Locking

By W. M. POST

Supervisor of Signals, Pennsylvania Railroad, Jersey City, N. J.

On account of a change in the arrangement of the tracks of the Pennsylvania at Trenton, N. J., during 1913, the wornout mechanical interlocking of 66 working levers was replaced by an electro-mechanical interlocking, U. S. & S., style P, of 22 working mechanical levers and 28 working electric levers. In considering the type of interlocking to be adopted, it was found that both the installation cost and the maintenance of an electro-mechanical plant would be somewhat less than for other types. The compactness of an electro-mechanical, as compared with a mechanical machine, as shown graphically in Fig. 2, was con-

parture from general practice for mechanically operated switches has been found safe and practicable on account of the use of the "indicating lock lever" in connection with the mechanical switch lever. As the function of the indicating lock lever may not be generally understood, its operation is described somewhat in detail with reference to Fig. 4.

The indicating lock lever, when normal, locks the mechanical lever normal at A; when the indicating lock lever is on center, the mechanical lever can be moved and the crossover operated; when the mechanical lever is reversed, the indicating lock lever can be moved from center to reverse position, locking the mechanical lever reversed at A, provided the crossover switches

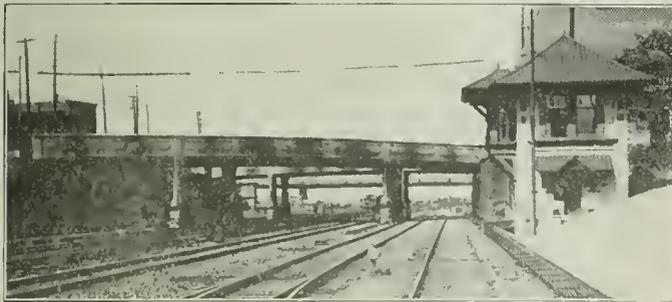

Fig. 1—Pennsylvania Interlocking at Trenton, N. J.—Looking East

sidered in connection with its operation, and the space saved in the interlocking station. The factor of safety of an electro-mechanical interlocking resulting from the actual mechanical connection between a switch and the lever operating it, and the electrical safeguards which are essential in a power interlocking, applied through the electric levers, was also considered.

The machine is shown in Fig. 3. Indication lights are located below the electric levers to show which track circuits are occu-

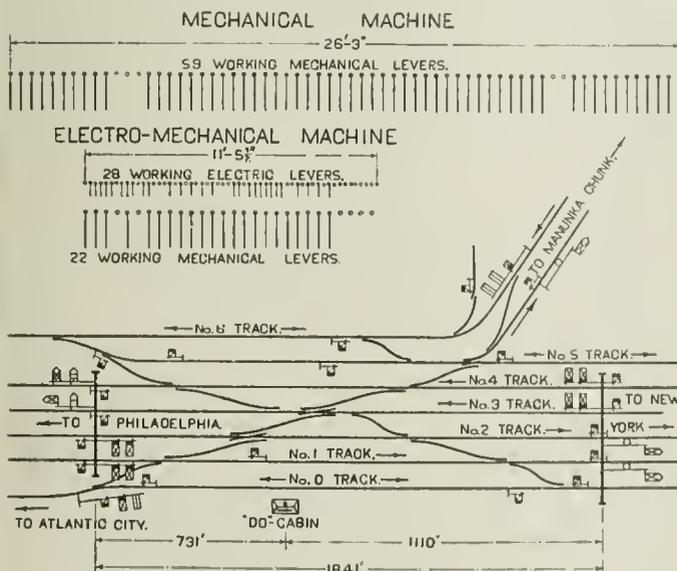

Fig. 2—Trenton Interlocking; Comparison of Old and New Machine

ped. A diagram showing the track layout is mounted directly over the machine, and clockwork slow releases are placed at each end of the machine. Mercury slow releases are connected to levers controlling dwarf signals located close to switches.

The switches are operated through switch and lock movements, eliminating the plunger facing point locks, detector bars, their pipe connections and levers. This somewhat radical de-

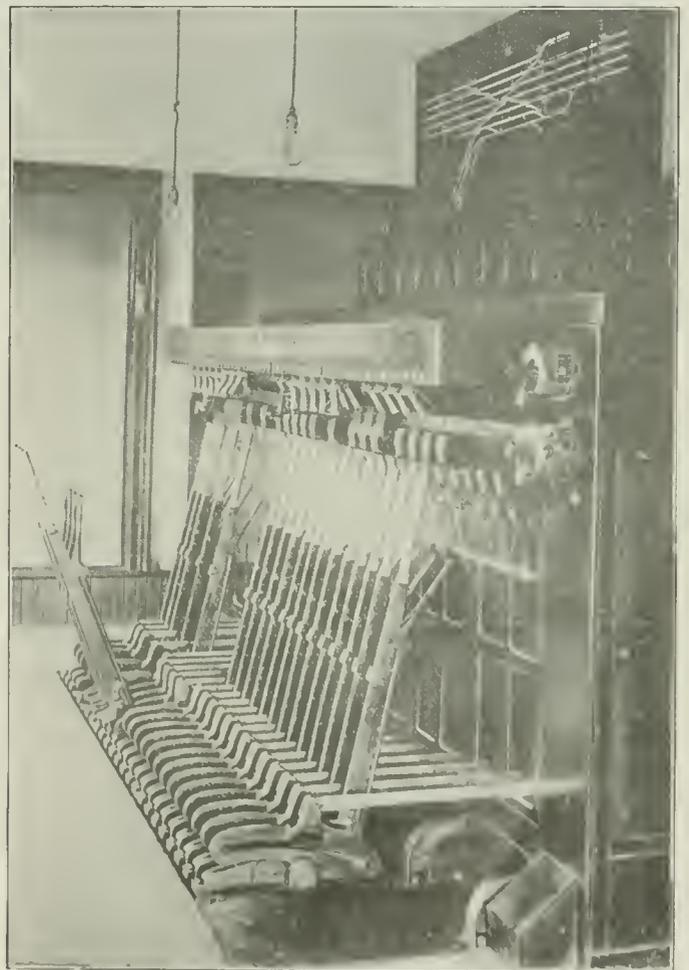

Fig. 3—Electro-Mechanical Interlocking Machine

have responded to the movement of the mechanical lever, are locked, and the indication is received. If the indication is not received, the indication lock lever cannot be moved from its center position, and as this lever actuates the mechanical locking and unlocks signal levers only when its stroke is completed, all signal levers are mechanically locked normal and a proceed signal cannot be given. The detector lock prevents the indication lock lever from being moved from either the normal or reverse positions when the track circuits controlling the crossover are occupied, which, in turn, prevents the mechanical switch lever from being moved because it is locked at A.

It will be noted that all vital parts of the machine, namely, mechanical locking, spring combination, indication and detector locks, are actuated by the small levers, resulting in a minimum amount of wear and strain on these parts. The mechanical lever and the pipe connections are merely to transmit the power applied by the leverman to the switch. A counterweight, W, is applied to the tail levers of the mechanical levers to assist in moving the lever to the normal position. As a leverman can apply more power to move a lever to the reverse position than to the normal, it was found that the addition of the weight evened up the effort on the part of the leverman. It was also found that a switch moves easier during the first part of the lever stroke, and the momentum gathered by the weight while moving the lever about half-way helps to carry the switch to

versed, and should the pipe line be pulled by something dragging, the first movement of the slide rod would lift the armature and the locking dog would engage the projection on the slide rod, thereby locking the switch movement against further movement. If the indicating lock lever is on center, as is the case when the switch is to be thrown, the magnet is energized, and the first movement of the slide rod would lift the locking dog, allowing the switch to be moved in the usual way.

This electric lock is very rugged. Several tests proved that the pipe line would break should it be caught, and the electric lock still hold and prevent the switch from being pulled open. The same tests were applied on a switch equipped with the usual mechanical connections to see if the plunger lock and lock rod would hold the switch closed if the operating pipe line was

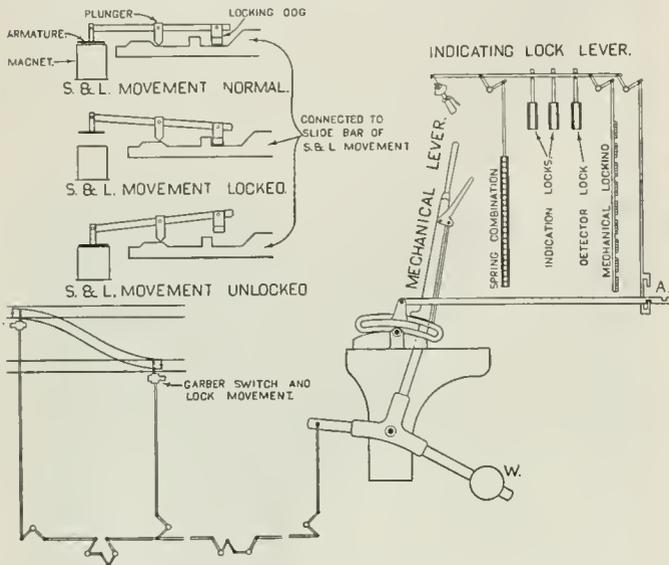

Fig. 4.—Connections of Levers and Switch Movement

the completion of the movement and lock it. In other words, the addition of the weight smoothes out the lever movement in both directions. The furthest crossover at the east end of the plant, between Nos. 1 and 0 tracks, is 1,040 ft. from the machine. It is operated with one mechanical lever and is easily thrown.

The Garber switch-and-lock movement, which was designed for electro-mechanical interlocking, was used for each switch and movable-point frog. The pipe connection to this switch-and-lock movement is in the direction of the movement of the switch, and is operated by a direct thrust or pull on the operating rod of the switch, instead of through an escapement crank or a motion plate. This reduces to a minimum the power re-

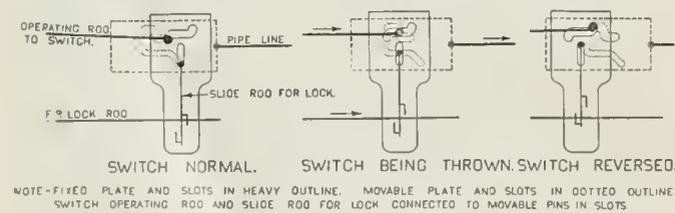

Fig. 5.—Garber Switch and Lock Movement

quired to operate the switch. A diagram showing the mechanical movements for unlocking, throwing and locking the switch, is shown in Fig. 5. A view of this switch-and-lock movement is shown in Fig. 6.

In mechanical and electro-mechanical interlockings, it is possible, although the probability is very remote, that something dragging from a passing train may catch the cross pipe lines and pull a switch open. On account of pipe lines crossing so many tracks at this point, it was thought best to lock electrically the facing point switches which might be pulled open when in the normal position. An electric lock for switch-and-lock movements has been designed to accomplish this. The magnet is de-energized when the indicating lock lever is normal or re-

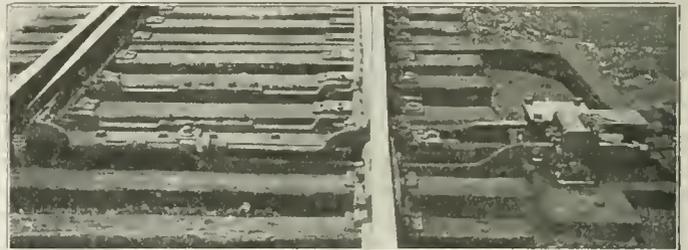

Fig. 6.—Garber Switch and Lock Movement

caught and pulled. The results showed that the front and lock rods bend and the switch can then be pulled open. These locks are only placed on switches where a track intervenes between the switch and the pipe line, and which face the normal direction of traffic. Fig. 4 shows the mechanical movements of this lock.

The electric current is obtained from the 3,300-volt, 60-cycle, underground signal feeders which supply the signal system between Trenton and Holmesburg Junction, about 20 miles. The generators for this system are situated in the pumping station at Bristol, 10 miles from Trenton. Suitable transformers are placed through the interlockings to furnish current for the track circuits and lights. A 14-volt storage battery of 150 ampere hours capacity, charged through a mercury-arc rectifier, furnishes direct current for the signals and indicators.

There are, on an average, 1,350 signal and 1,900 switch movements at this plant each day. The results of two years of service show this type of interlocking to be entirely practicable at a busy point. There are now 44 such plants in service on the Pennsylvania Railroad.

LEHIGH VALLEY'S NEW YORK ORE DOCK

The Lehigh Valley is building at Constable Hook, Bayonne, on New York bay, 5 miles south of the Battery, a long pier which will be the northern terminus of a line of ore-carrying steamships, to be used by the Bethlehem Steel Company to bring iron ore from Chile by way of the Panama Canal. Ore will be brought also from Cuba.

The new pier will be 1,060 ft. long and 67 ft. wide, and there will be a basin 200 ft. wide. A channel which will insure 35 ft. of water at low tide will be dredged. The pier will have four railroad tracks running its whole length, and will be equipped with modern unloading machines, two of them, which can work on one vessel at the same time, each with a maximum capacity of 500 tons an hour, or both together, 300 cars of ore a day.

The site of the new pier adjoins the plant of the Standard Oil Company. Plans of the Bethlehem Steel Company contemplate an annual importation of 750,000 tons of ore from its beds in Chile (Coquimbo). The Chilean deposits of iron ore, grading very high, are said to be the largest known in the world.

The foundation of the pier includes a section of cribbing work 710 ft. long and 46 ft. wide.

Construction of the New York Connecting Railroad

Material Progress Is Being Made on the Ten-Mile Line Which Will Connect the Pennsylvania and New Haven

Encouraging progress is being made on the East River Bridge division of the New York Connecting Railroad. All masonry work has been completed except the top portions of the abutments of the 1,000-ft. Hell Gate arch and the neat work of several viaduct piers on either side of the latter, which would interfere with the erection of the arch and which cannot be built until after it is completed. The erection of the four inverted bow-string trusses of the Little Hell Gate bridge and of the Hell Gate arch bridge is now in progress, all other portions of the steel work of the three and one-half miles comprising this section being now in place except the girders of the Ward's Island and Long Island viaducts, most of which are in temporary use in the back stays for the erection of the 1,000-ft. arch.

From the standpoint of the magnitude of the expenditure, together with the formidable character of the engineering prob-

lem and under the Hudson river through the Pennsylvania tunnel to connect directly with the main line for the West. A double-track freight line will leave the passenger line at Stenler street, Long Island City, the southern end of the East River Bridge division, and will continue east and south to a connection with the old Manhattan Beach road of the Long Island system near Fresh Pond Junction. The freight line then continues over the Long Island branch to Bay Ridge, directly opposite the Greenville (N. J.) freight yards of the Pennsylvania,

Map of New York and Vicinity, Showing Location of the New York Connecting Railroad

lems involved in the accomplishing of a definite strategic purpose, this project compares favorably with the entrance of the Pennsylvania on Manhattan island. An account of this undertaking, together with a record of the earlier progress on the various structures, was given in the *Railway Age Gazette* on November 13, 1914.

The four-track line of the New York Connecting Railroad leaves the New Haven's Harlem River branch at One Hundred and Forty-second street, in the Bronx, crosses Bronx Kills to Randall's Island, then crosses Little Hell Gate to Ward's Island, then turns sharply to the left across Hell Gate to Long Island on an arch bridge having the longest span in the world. A connection is made in Long Island City with the Pennsylvania system, through the Sunnyside yard. Passenger trains will use this connection, passing under the East river to Manhattan

Skew Crossing of New York Connecting Tracks Over New Haven Tracks in the Bronx

with which there is connection by means of ferries. A contract for the construction of the new work on the freight line has recently been let to the Wilson & English Construction Company, New York, and to P. McManus, Inc., Philadelphia.

THE BRONX AND RANDALL'S ISLAND VIADUCTS

The four New York Connecting tracks join the four New Haven tracks at One Hundred and Forty-second street in the Bronx, the New Haven tracks being spread to allow two new

West Abutment of Hell Gate Arch, Showing Stayback Structure

tracks to be located in the middle. The other two new tracks are constructed on the east side of the old line, all four tracks being laid on an earth fill between retaining walls as far south as One Hundred and Thirty-eighth street. From that point to One Hundred and Thirty-second street, where the difference in elevation between the new and the old tracks is too great to allow

the use of the retaining walls and earth embankment, rectangular concrete piers are used under each of the two double-track portions of the line, which carry 64-ft.-deck girder spans.

The girders are provided with ballast floors, I-beams spanning transversely across the girders and imbedded in concrete, forming the support for the ballast. The top flanges of the girders are equipped with what are known as dam angles, one being riveted to each edge to form a channel-shaped trough for the

very flat skew. The manner of handling this problem is shown in the accompanying photograph. No change from the standard construction is made for the two east connecting tracks, nor is the span length of the girders for the two west tracks modified. The girders are supported at their ends by heavy double-webbed cross girders, in turn supported on the east by the piers for the east tracks and on the west by heavy section columns placed between the two east and the two west New Haven tracks. The

Hell Gate Arch, East Abutment and Backstay. First Set of Ties in Position

reception of the concrete. The I-beams of the floor are supported over these channels on small cast-iron blocks, while clip angles riveted to the beams and to the dam angles secure the beams rigidly in position. Every third beam projects beyond the edge of the concrete imbedment to support plank walks between and outside the tracks, the outside walks being protected by iron pipe railings.

girders in the lower foreground carry the New Haven tracks over One Hundred and Thirty-third street. The vertical cross bracing on the right is not a truss, but serves as longitudinal sway bracing to take the traction forces from the tracks overhead. A rocker column is shown in the distance.

In the Bronx, south of the skew crossing, and on Randall's Island, the viaduct girders are carried on piers consisting of two

Progress on the Erection of the Hell Gate Arch. Second Set of Ties in Position on the East Side

Between One Hundred and Thirty-second and One Hundred and Thirty-third streets the New Haven tracks curve to the right to follow westward along the north shore of Bronx Kill. In consequence it is necessary for the two inside connecting tracks to cross over the two easterly New Haven tracks on a

heavy shafts or columns connected by an arched diaphragm or girder. The piers vary from 50 to 90 ft. in height. On Randall's Island the girders are from 80 to 87 ft. in length, the details corresponding very closely to those in the Bronx Viaduct. The girders for the two center tracks were erected first, and with

tracks in place on these an opportunity was afforded for very rapid erection of the girders for the outside tracks, a condition of which the erectors took advantage, as witnessed by the attainment of a record for steel erection, 1,500 tons in a period of six and one-half hours. The equipment consisted of a 68-ton capacity derrick car and a 50-ton capacity locomotive crane, which worked facing each other on one center track while the girders were delivered on cars on the other. The girders arrived completely riveted up in pairs, forming a complete span which weighed about 87 tons.

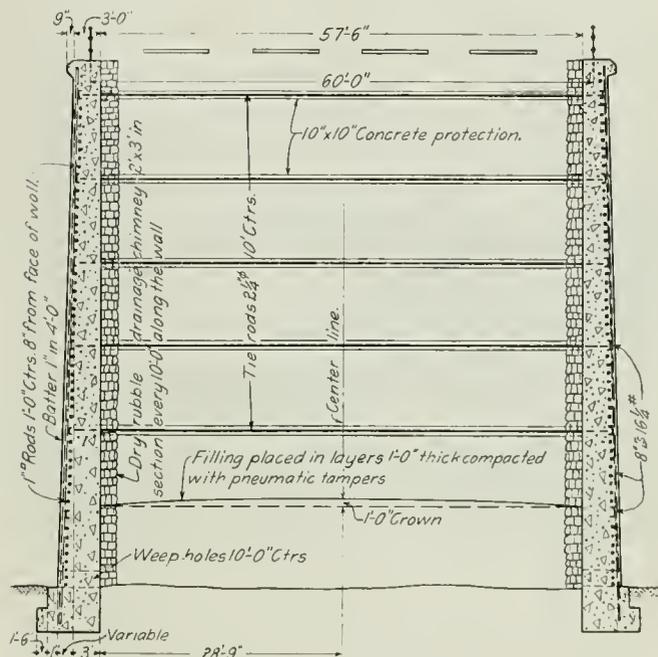

THE HELL GATE BRIDGE

The most important feature of the entire project is the 1,000-ft. span steel arch over Hell Gate, noteworthy among the world's greatest bridges as the longest steel arch and as a structure of unusual proportions, designed for four railroad tracks with concrete ballast floors. It consists of two spandrel-braced, two-hinged trusses, 60 ft., center to center, with chords separated vertically 140 ft. at the springing line and 40 ft. at the crown. The rise of the bottom chord is 220 ft. and the roadway, between chords at the springing line and suspended below the bottom chord in midspan, is 135 ft. clear above high tide. The abutments consist of monumental masonry towers of great size and weight to give the necessary verticality to the resultant thrust on the foundation, particularly on the Ward Island side, where the rock surface is from 58 to 120 ft. below the ground level. In all, 19,000 tons of high-carbon steel are required. The structure is characterized by the unusual proportions of many of the details. Rivets are 1 1/4 in. diameter, many of them 11 in. long. The bottom chord consists of a double rectangular section having a uniform width of 6 1/2 ft. with a depth varying from 11 1/2 ft. at the springing line to 7 1/2 ft. at the crown and involves the use of webs 2 in. thick. The maximum total stress is 28,650,000 lb., for which a section of 1,385 sq. in. is provided. The top chord consists of built-up I-beams 48 in. deep, spaced 60 in. apart, with cover plates on top and angle-bar lacing on the bottom.

A feature of particular note is the floor. The eight lines of

forces. This traction truss will transmit its load to the bottom chord at the third panel point, where the bottom chord and the floor intersect by means of horizontal traction girders 8 ft. deep riveted between the chords.

The fabrication and erection involve many unusual conditions. There are gusset plates 10 ft. by 17 ft. by 1 1/4 in. thick. Some of the members are heavier than any previously handled in structural steel erection. The largest section of the bottom chord weighs 185 tons, ready to erect. However, the gusset plates are of such dimensions as to preclude their shipment assembled with the section, so the weight of the pieces as shipped was 150 tons.

Typical Cross Section of the Eastern Viaduct

Erection of First Section of the North Pedestal of the West Abutment

stringers for the tracks and the four lines of stringers for the cantilevered sidewalks are supported by floor beams spaced 42 1/2 ft. apart, eight of which are riveted to members of the arch trusses and the remaining 16 suspended below the bottom chord by box-shaped hangers to which the beams are attached by pins 16 in. in diameter. These suspended beams are 93 ft. 1-in. x 9 ft. deep over all in the middle and consist of two plate girders with webs 24 in. apart, covered top and bottom by 48 in. cover plates. They weigh 86 tons each. As the floor is not located between the chords of the trusses it is necessary to provide a horizontal truss in the plane of the floor to take care of the traction and braking

In order to make sure of correctness of shop work the arches were assembled in a horizontal position in the shop yard, an operation which had to be performed in several stages because the shop yard was too small to permit the entire arch to be assembled at one time. Rivet holes for the chord splices were drilled out of the solid while the pieces were in the assembled position.

The structure is being erected by cantilevering from the towers by means of backstay structures built behind them, which are shown in the accompanying photographs. These and the counterweights at their extremities consist almost entirely of material to be used in the Long Island and Ward's Island viaducts and of stringers and hangers of the arch structure. These backstays stand on natural foundations with bearing pressures not exceeding five tons per square foot, save in one case on Ward's Island, where piles were necessary. The footings are of timber under I-beam grillages. Directly upon these footings are placed four lines of girders continuous from the piers to the counter-weight, which are provided to take the horizontal component of the backstay pull. On these are placed the columns, consisting of girders and railroad floor stringers. All members of the backstay structure which will be used eventually in the permanent bridgework are designed to require little modification after the temporary use has been completed. All members used in compression as columns or struts have been provided with milled ends. The members used in tension are provided with extensions to allow for bolted splices which can be cut off with an oxy-acetylene flame after the arch is completed. Several angle connections are made by special structural parts which will be discarded after the work is completed. Most of the sway bracing is for temporary use only.

In order to permit erection of the arch by the method chosen it has been necessary to stop the masonry of the towers temporarily at the level of the tracks. The backstay structure was

erected by means of a stiff-leg derrick set on a platform with long legs in the rear to permit it to stand on and advance up the inclined plane of the backstay as the erection progressed. When the work had advanced to the stage shown in the photograph of the west abutment, the erection traveler was set up on the first tie of the back stay directly over the top of the abutment in the position shown. It was then ready to proceed immediately with the erection of the arch. The general method followed is shown in the photograph of the east abutment. The

Debevoise Avenue Arch, Long Island Eastern Viaduct

erection had just been completed to the sixth panel point, one short of the point for attaching the second set of ties. The first set of ties is shown in position over the front face of the abutment, temporary I-beams being used to make the connection between the backstays and the ends of the top chords of the arch. With the traveler off the arch the other derrick can proceed with the completion of the top of the backstay to make ready for the second tie. In a third photograph, showing later progress on both cantilevers, the second ties are seen in position on the east side.

The traveler consists of a stiff-leg derrick on a platform sup-

ported on a tower carried on fur-wheel carriages rolling on tracks laid on the top chord. The rear of the traveler is raised or lowered to keep the platform level with the varying inclination of the top chord by means of pin holes set at various elevations in the rear legs.

The arch will be erected as a three-hinged structure. The ends of all bottom chord sections are milled to give bearing on the middle third of the section only, the complete joint being made by splices riveted to from 60 to 80 per cent of the strength of

the section. The crown joint will be left unriveted to serve as a hinge until all the dead load has been applied, after which the splices will be completed to make a two-hinged arch for live loading. It has been necessary to provide considerable allowance for deformation for the structure during erection. The length of all arch members has been corrected for dead load stress, while the tower of the backstay is tilted backward so that the elongation of the long tension members will bring it to a vertical position when the full load is applied. Frequent observations are taken for the deflection of the panel points of the arch ring, and as these are inaccessible to direct measurement or leveling it is necessary to determine their absolute position by triangulation from base lines at the foot of each abutment, perpendicular to the axis of the bridge.

A photograph shows the erection of the first section of the north pedestal for the west abutment. This weighs 117 tons and is composed of six separately-cast sections bolted together. The complete pedestal consists of three tiers, weighing in all 275 tons. The upper face of the top tier forms a seat for the cast shoe on the end of the bottom chord, the shoe having a slightly curved bearing face to form a hinged joint. As the great weight of this pedestal is carried on the steep slope of the skewback it must be supported by tie-bars projecting from the abutment until the full arch thrust is obtained. These tie-bars connect by means of pins to ears projecting from the rear of the top section of the pedestal and will be cut off after the arch has been fully erected. The maximum bearing of the pedestal on the skewback, which is of granite masonry, is 800 lb. per sq. in. Material is delivered to the site on car floats and is unloaded by a derrick to cars standing on temporary tracks.

THE EASTERN VIADUCT

East of the Long Island viaduct, which extends for 2,868 ft. east of the Hell Gate bridge, there is a structure 3,480 ft. long known as the Eastern viaduct. This consists of an embankment between vertical retaining walls, interrupted at the intervening streets by concrete arches and steel bridges and embodies a number of special features. The tracks are from 35 to 60 ft. above the street level, and, although this is a formidable height for retaining walls, they were adopted in place of open-viaduct construction because certain features embodied in the design resulted in a more economical structure than it was possible to obtain with other designs. The walls are 3 ft. thick at the top with a face batter of 1 in 40, the back being vertical. They are

Potter Avenue Crossing, Long Island Eastern Viaduct

ported on a tower carried on fur-wheel carriages rolling on tracks laid on the top chord. The rear of the traveler is raised or lowered to keep the platform level with the varying inclination of the top chord by means of pin holes set at various elevations in the rear legs.

The arch will be erected as a three-hinged structure. The ends of all bottom chord sections are milled to give bearing on the middle third of the section only, the complete joint being made by splices riveted to from 60 to 80 per cent of the strength of

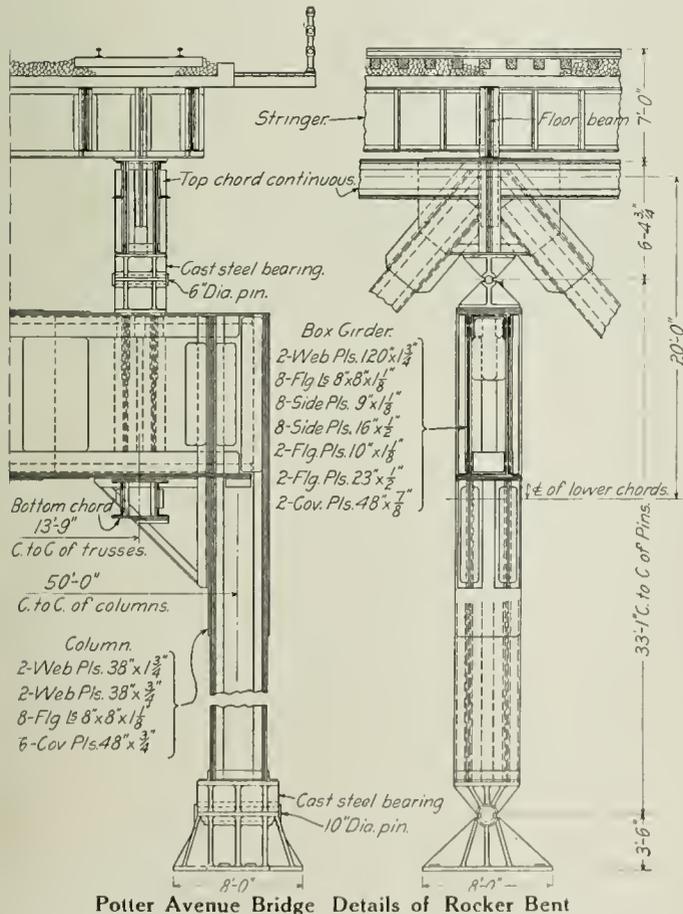

tied together through the fill, giving a form of construction similar to the reinforced concrete U-abutments frequently used by some railroads. However, as the walls are 57½ ft. apart the concrete protection for the tie rods, as ordinarily placed in the form of cross walls, would have added a large volume of concrete, which would require heavy reinforcement for flexure on account of the heavy superimposed four-track load and the wide span. This has been avoided by the use of a special form of construction made possible by careful preparation of the filling

which insures almost absolute security against settlement and has also permitted a large reduction in the assumed lateral earth pressure in design.

The transverse ties consist of 2¼-in. diameter steel rods spaced 10 ft. centers, both vertically and horizontally and anchored at each end to horizontal and vertical 8-in. 16¼-lb. channels through their intersection. The channels are imbedded in the walls 6 in. from the exterior faces. The walls are reinforced in addition by 1 in. square horizontal rods, spaced 1 ft., center to center vertically between the horizontal channels. The tie rods are protected by a covering of concrete 10 in. square, except that every 70 ft. along the viaduct one vertical tier of the rods is enclosed in a solid transverse wall, which serves as a diaphragm to give the structure the desired transverse stiffness and divide it into convenient units for filling.

The filling is a natural mixture of sand and clay obtained from a shovel cut in the Sunnyside yard of the Pennsylvania, three and one-half miles distant, a material which stood practically vertical in the cut. It was concluded that if this material could be placed in the fill as compactly as it was found in its natural state there would be ample insurance against settlement, and if proper precautions were taken to provide drainage a material reduction in the assumed lateral earth pressure for the design of the walls would be justified.

The fill was placed in layers 1 ft. thick, with a crown of 1 ft.

surface or established grade. These consisted of rubble stones piled up loosely to give a 2-ft. by 3-ft. cross section and carried to the top of the walls. The concrete protection for the tie rods was placed as the filling was brought up to the level of the rods. The fill was delivered in trains consisting of eleven 3.8-yd. capacity dump cars handled by a dinky engine. These were moved over the structure on trestle work supported by transverse timber trusses, the bottom members of which extended only 20 ft. below the top of the wall, thus avoiding the burial of any appreciable amount of timber work in the fill.

The viaduct is pierced by a number of concrete subways spanning the entire width of the street with simple concrete arches, all of which are on a skew and semi-circular in section, except the ones over Debevoise avenue and Stemler street, which are flat arches. The arches in all cases are reinforced concrete rings supported on abutments consisting, except in the case of Debevoise avenue and Stemler street, of thin-faced walls braced by deep counterforts. The viaduct structure, including the arches, is built monolithic without expansion joints, sufficient steel having been provided in the side walls to take care of temperature changes.

In addition to the seven arch subways there are three steel-deck truss structures crossing one or more streets on sharp skews, where the arches would have been impracticable. The line crosses Potter avenue, a street 80 ft. wide, at an angle of about 20 deg., resulting in a structure consisting of three 135-ft. spans, the intermediate support being provided by two rocker bents of two columns each, each having one column in the center of the street, the other column in each case standing outside of the street line on opposite sides. The superstructure consists of a Warren riveted truss having a top chord continuous over the top of the bents from end to end of the bridge, with an expansion joint at one abutment only. For this reason the bents act as rockers, the truss load being applied on top of the cross girders through heavy cast-steel pin bearings, while the columns are supported at their bases on cast pedestals equipped with 10-in. pins. The bents are of very heavy construction, consisting of heavy box-section columns made up of built-up I-beams connected by cover plates on both sides. The box girders which carry the load of the four trusses to the two columns are 10 ft. deep, with heavy double diaphragms at each truss concentration. Fillet brackets, 7 ft. on a side, stiffen the connections of the girders to the columns.

The floor system consists of floor beams and stringers resting on the tops of the top chords. The stringers have their top flanges level with the tops of the floor beams to facilitate the use of a solid concrete floor designed for ballast track construction. A plank sidewalk, protected by a pipe hand railing, is provided on either side of the four tracks.

A two-span deck truss structure has been provided at Frankfort and Steinway streets, and a four-span deck structure between Albert street and Flushing avenue. These are similar in design to the structure at Potter avenue, except that the intermediate supports are masonry piers to which the load is applied from the bottom instead of the top chord. Consequently, the bottom chords are continuous from end to end of the structure, instead of the top chords.

The American Bridge Company has the contract for fabricating and erecting the arch bridge and the Long Island and Ward's Island viaducts. The McClintic Marshall Construction Company furnished and erected the other viaducts and the Bronx Kills bridge, and is now erecting the Little Hell Gate bridge. All the work on the East River division is under the direction of Gustav Lindenthal, chief engineer; O. H. Ammann, assistant chief engineer, and H. W. Hudson, construction engineer, New York Connecting Railroad.

in the width between the walls and was rammed in place by Ingersoll-Rand foundry tampers. In general the tamping was conducted by shifting the tools one-half the width of the hammer face with each blow, so that an equivalent of two blows on each square inch of the area was obtained. The result was a surface that would scarcely take an impression from a boot heel and the filling was made so compact that the volume measurements in place agreed to within less than 1 per cent with the measurements in the cut. Simultaneous with the placing of the fill, drainage chimneys were built along each wall over weep holes piercing the walls every 10 ft. at the level of the natural ground

VALUATION OF RAILROADS IN WYOMING.—The Wyoming State Board of Equalization has fixed the total assessed valuation of all railroads in the state for 1915 at \$55,120,350, an increase over the valuation of last year of \$3,235,110

RULES FOR INSPECTION OF LOCOMOTIVES AND TENDERS

As noted in the *Railway Age Gazette* of August 20, page 357, a conference of representatives of the railways, of the Bureau of Locomotive Boiler Inspection and of organized labor was held August 23 to discuss the rules and instructions for the inspection and testing of steam locomotives and tenders submitted by the Bureau of Locomotive Boiler Inspection. Sixty-one rules were considered and all but rules 18, 29 and 31 were finally so drafted that they were accepted by the representatives of the railways subject to the final approval of the railways themselves. All of the rules are published in Bulletin 70, recently issued by the Special Committee on Relations of Railway Operation to Legislation. These rules will be presented to the Interstate Commerce Commission by the Bureau of Locomotive Boiler Inspection for acceptance. The railways will probably present substitute rules for rules 18, 29 and 31. The following is a list of the more important rules, those printed in italics being the rules not accepted by the representatives of the railways:

Rule 1.—The railroad company will be held responsible for the general design, construction and maintenance of locomotives and tenders under its control.

Rule 2.—The mechanical officer in charge, at each point where repairs are made, will be held responsible for the inspection and repair of all parts of locomotives and tenders under his jurisdiction. He must know that inspections are made as required, and that the defects are properly repaired before the locomotive is returned to service.

Rule 4.—Each locomotive and tender shall be inspected after each trip, or day's work, and the defects found reported on an approved form to the proper representative of the company. The form is shown herewith:

Locomotive	Number
	Initials
..... Railroad.	

DAILY LOCOMOTIVE INSPECTION AND REPAIR REPORT.

Instructions.—Each locomotive and tender must be inspected after each trip or day's work and report made on this form whether needing repairs or not. Proper explanation must be made hereon for failure to repair any defects reported, and the form approved by foreman before the locomotive is returned to service.

Inspected at.....timem.
Date.....191

Repairs needed:

.....
.....
.....
.....
.....

Condition of injectors?..... Water glass?.....
Condition of gauge cocks?..... Brakes?.....
Condition of piston rod and valve stem packing?.....
Safety valve lifts at.....lbs. Seats at.....lbs.
Main reservoir pressure.....lbs. Brake pipe pressure.....lbs.

Signature

Occupation

The above work has been performed, except as noted, and the report is approved.
..... Foreman.

Note.—Additional items may be added to this form if desired.

Rule 5.—* * * * Locomotives built subsequent to January 1, 1916, shall have the ash pans supported from mud rings or frames. Locomotives built prior to January 1, 1916, which do not have the ash pans supported from mud rings or frames shall be changed when the locomotive receives new firebox. * * * * No part of ash pan shall be less than 2½ in. above the rail.

BRAKE AND SIGNAL EQUIPMENT

Rule 7.—The compressor or compressors shall be tested for

capacity by orifice test as often as conditions may require, but not less frequently than once each three months. The diameter of orifice, speed of compressor and the air pressure to be maintained for compressors in common use are given in the following table:

Maker.	Size compressor	Strokes per minute	Dia. of orifice (inches)	Air pressure maintained
Westinghouse ...	9½	70 complete	9/64	To within 5 lb. of the adjustment of the low-pressure governor.
Do.....	11	70 complete	11/64	
Do.....	8½ C.C.	70 complete	9/64 & 11/64	
New York.....	2a	100 single	3/16	61 lb.
Do.....	6a	100 single	7/32	62 lb.
Do.....	5b	100 single	5/16	50 lb.

Rule 8.—Every main reservoir before being put into service and at least once each 12 months thereafter shall be subjected to hydrostatic pressure not less than 25 per cent above the maximum allowed air pressure. The entire surface of the reservoir shall be hammer tested each time the locomotive is shopped for general repairs, but not less frequently than once each 18 months.

Rule 10.—Distributing or control valves, reducing valves, triple valves, straight-air-double-check valves, dirt collectors and brake cylinders shall be cleaned and brake cylinders lubricated as often as the conditions require to maintain them in a safe and suitable condition for service, but not less frequently than once each six months.

Rule 12.—The minimum piston travel shall be sufficient to provide proper brake shoe clearance when the brakes are released. The maximum piston travel when locomotive is standing shall be as follows:

Cam type of driving-wheel brake	3½ in.
Other forms of driving-wheel brake	6 in.
Engine truck brake	8 in.
Tender brake	8 in.

Rule 14.—Main reservoir leakage shall not exceed an average of 3 lb. per minute in a test of 3 minutes duration. Brake pipe leakage shall not exceed 5 lb. per minute. Brake cylinder leakage shall not exceed 5 lb. per minute per cylinder from an initial cylinder pressure of 50 lb.

Rule 15.—The train signal system, when used, shall be tested and known to be in safe and suitable condition for service before each trip.

CABS, WARNING SIGNALS, AND SANDERS

Rule 16.—* * * * Road locomotives used in regions where snowstorms are generally encountered shall be provided with what is known as a "clear-vision" window, which is a window hinged at the top and placed in the glass in each front cab door or window. These windows shall not be less than 5 in. high, located as nearly as possible in line of the enginemen's vision, and so constructed that they may be easily opened or closed. * * * *

Rule 18.—Each locomotive shall be provided with a bell, so arranged and equipped that it may be operated from the engineer's cab by hand and by power. (*Rule 18 objected to by the Committee representing the Carriers.*)

DRAW GEAR AND DRAFT GEAR

Rule 22.—The draw gear between the locomotive and tender, together with the pins and fastenings, shall be maintained in safe and suitable condition for service. The pins and drawbar shall be removed and carefully examined for defects not less frequently than once each three months. Suitable means for securing the drawbar pins in place shall be provided. Inverted drawbar pins shall be held in place by plate or stirrup. * * * * Lost motion between locomotives and tenders not equipped with spring buffers shall be kept to a minimum, and shall not exceed ½ in. * * * *

DRIVING GEAR

Rule 25.—Crossheads shall be maintained in a safe and suitable condition for service, with not more than ¼ in. vertical and 5/16 in. lateral play between crossheads and guides.

Rule 28.—* * * * Autogenous welding of broken or

cracked main and side rods not permitted. Bearings and bushings shall so fit the rods as to be in a safe and suitable condition for service, and means be provided to prevent bushings turning in rod. Straps shall fit and be securely bolted to rods. The total amount of side motion of rods on crank pins shall not exceed ¼ in. On locomotives used in road service the bore of the main rod bearings shall not exceed pin diameters more than 3/32 in. at front end, or 3/32 in. for back end. The total lost motion at both ends shall not exceed 5/32 in. The bore of side rod bearing on main pin shall not exceed pin diameter more than 3/16 in. * * * *

LIGHTS

Rule 29.—Each locomotive used in road service between sunset and sunrise shall have a headlight which will enable persons with normal vision in the cab of the locomotive, under normal weather conditions, to see a dark object the size of a man for a distance of 1,000 feet or more ahead of the locomotive; and such headlights must be maintained in good condition. Locomotives used in road service, which are regularly required to run backward for any portion of their trip, except to pick up a detached portion of their train, or in making terminal improvements, shall have on the rear a head-light which will meet the foregoing requirements. Nothing in the foregoing rules shall prevent the use of a device whereby the light may be diminished in yards and at stations to an extent that will enable the person or persons operating the locomotive to see a dark object the size of a man for 300 feet or more ahead of the locomotive under the same conditions as set forth above. When two or more locomotives are used in the same train, the leading locomotive only, will be required to display a head-light. (Rule 29 was objected to by the committee representing the carriers.)

Rule 31.—Each locomotive used in yard service between sunset and sunrise shall have two headlights, one located on the front of the locomotive and one on the rear, each of which will enable persons with normal vision, in the cab of the locomotive, under normal weather conditions, to see a dark object the size of a man for a distance of 300 ft. or more; and such headlights must be maintained in good condition. (Rule 31 was objected to by the committee representing the carriers.)

RUNNING GEAR

Rule 33.—Driving, trailing and engine truck axles with any of the following defects shall not be continued in service: Bent axles; cut journals that cannot be made to run cool without turning; seamy journals in steel axles; transverse seams in iron axles, or any seams in iron axles causing axles to run hot; or unsafe on account of usage, accident or derailment; main driving, trailing truck or engine truck axles more than one-half inch under original diameter; other driving axle more than three-fourth inch under original diameter.

Rule 34.—Diameter of tender truck axle journals shall be governed by axle loads. The minimum diameter of journals for various axle loads shall be as follows:

	Axle load. Minimum diameter of journals.
50,000 lb.	5½ in.
38,000 lb.	5 in.
31,000 lb.	4½ in.
22,000 lb.	3¾ in.
15,000 lb.	3¼ in.

Rule 35.—Tender truck axles with any of the following defects shall not be continued in service: Bent axle; cut journals that cannot be made to run cool without turning; seamy journals in steel axles or transverse seams in journals of iron axles, or unsafe on account of usage, accident or derailment; collars broken or worn to one-fourth inch or less in thickness; fillet in back shoulder worn out.

Rule 36.—Crank pins shall be securely applied. Shimming or prick punching crank pins will not be allowed. All crank pins allowed after January 1, 1916, shall have the date applied and kind of material used legibly stamped on end of pin. Crank pin collars and collar bolts shall be maintained in a safe and suitable condition for service.

Rule 37.—Driving boxes shall be maintained in a safe and suitable condition for service. Broken and loose bearings shall be renewed; not more than one shim may be used between box and bearing.

Rule 40.—The total lateral motion or play between the hubs of the wheels and the boxes on any pair of wheels shall not exceed the following limits:

For engine truck wheels (trucks with swing centers).....	1 in.
For engine truck wheels (trucks with rigid centers).....	1½ in.
For trailing truck wheels.....	1 in.
For driving wheels (more than one pair).....	¾ in.

These limits may be increased on locomotive operating on track where the curvature exceeds 20 deg. when it can be shown that conditions require additional lateral motion. The lateral motion shall in all cases be kept within such limits that the driving wheels, rods or crank pins will not interfere with other parts of the locomotive.

Rule 42.—Springs and equalizers shall be arranged to insure the proper distribution of weight to the various wheels of the locomotive; maintained approximately level, and in a safe and suitable condition for service. Springs or spring rigging with any of the following defects shall be renewed or properly repaired: One long leaf or two or more shorter leaves broken; springs with leaves working in band; broken coil springs; broken driving box saddle, equalizer, hanger, bolt or pin.

Rule 43.—The minimum height of flange for driving and trailing wheel tires for locomotives used in road service, measured from tread, shall be 1 in. except for locomotives originally constructed for plain tires when the minimum height of flange on one pair of wheels may be ¾ in. The maximum taper for tread of tires from throat of flange to outside of tire for driving and trailing wheels for locomotives used in road service shall be ¼ in. and for locomotives used in switching service 5/16 in. The minimum width of tires for driving and trailing wheels of standard gage locomotives shall be 5½ in. for flanged tires and 6 in. for plain tires When all tires are turned or new tires applied to driving and trailing wheels of locomotives, the diameter of the wheels on the same axle or in the same driving-wheel base shall not vary more than 3/32 in. When a single tire is applied the diameter must not vary more than 3/32 in. from that of the opposite wheel on the same axle. When a single pair of tires is applied the diameter must be within 3/32 in. of the average diameter of the wheels in the driving-wheel base to which they are applied. Driving and trailing wheel tires with any of the following defects shall not be continued in service: Slid flat spot 2½ in. or more in length; flange 15/16 in. or less in thickness, gaged at a point ⅜ in. above the tread, or having flat vertical surface 1 in. or more from tread; tread worn hollow 5/16 in. on locomotives used in road service or ⅜ in. on locomotives used in switching service; flange more than 1½ in. from tread to top of flange.

Rule 46.—Wheels shall be securely pressed on axles. Prick punching or shimming the wheel fit will not be permitted. The diameter of wheels on the same axle shall not vary more than 3/32 in. Wheels used on standard gage track will be out of gage if the inside gage of flanges, measured on base line, is less than 53 in. or more than 53¾ in. The distance back to back of flanges of wheels mounted on the same axle shall not vary more than ¼ in.

Rule 47.—Cast-iron or cast-steel wheels with any of the following defects shall not be continued in service:

Slid Flat.—When the flat spot is 2½ in. or over in length, or if there are two or more adjoining spots each 2 in. or over in length.

Broken or Chipped Flange.—If the chip exceeds 1½ in. in length and ½ in. in width.

Broken Rim.—If the tread, measured from the flange at a point ⅝ in. above the tread, is less than 3¾ in. in width.

Shelled Out.—Wheels with defective treads on account of cracks or shelled out spots 2½ in. or over, or so numerous as to endanger the safety of the wheel.

Brake Burn.—Wheels having defective treads on account of cracks or shelling out due to heating.

Seams.—Seams $\frac{1}{2}$ in. long or over, at a distance of $\frac{1}{2}$ in. or less from the throat of the flange, or seams 3 in. or more in length, if such seams are within the limits of $3\frac{3}{4}$ in. from the flange, measured at a point $\frac{3}{8}$ in. from the tread.

Worn Flanges.—Wheels on axles with journals 5 in. by 9 in. or over, with flanges having flat, vertical surfaces extending $\frac{7}{8}$ in. or more from the tread, or flanges 1 in. thick or less gaged at a point $\frac{3}{8}$ in. above tread. Wheels on axles with journals less than 5 in. by 9 in. with flanges having flat, vertical surfaces extending 1 in. or more from the tread, or flanges $\frac{15}{16}$ in. thick or less, gaged at a point $\frac{3}{8}$ in. above the tread.

Tread Worn Hollow.—If the tread is worn sufficiently hollow to render the flange or rim liable to breakage.

Burst.—If the wheel is cracked from the wheel fit outward. Cracked tread, cracked plate or one or more cracked brackets. Wheels out of gage. Wheels loose on axle.

Rule 48.—Forged-steel or steel-tired wheels with any of the following defects shall not be continued in service:

Loose wheels, loose, broken or defective retaining rings or tires, broken or cracked hubs, plates, spokes or bolts.

Slid flat spot $2\frac{1}{2}$ in. or longer, or if there are two or more adjoining spots each 2 in. or longer.

Broken flange.

Defective tread on account of cracks or shelled out spots $2\frac{1}{2}$ in. or longer, or so numerous as to endanger the safety of the wheel.

Flange worn to $\frac{15}{16}$ in. or less in thickness, gaged at a point $\frac{3}{8}$ in. above the tread, or having flat vertical surface 1 in. or more from tread; tread worn $\frac{5}{16}$ in.; flange more than $1\frac{1}{2}$ in. from tread to top of flange. * * * *

Wheels out of gage.

Rule 51.—Driving and trailing wheels with any of the following defects shall not be continued in service:

Driving or trailing wheel centers with three adjacent spokes, or 25 per cent. of the spokes in wheel broken.

Loose wheels, loose, broken or defective tires or tire fastenings, broken or cracked hubs or wheels out of gage.

TENDERS

Rule 52.— * * * * The difference in height between the deck on the tender and the cab floor or deck on the locomotive shall not exceed $1\frac{1}{2}$ in. The maximum width of the gangway between locomotive and tender while standing on straight track shall be 16 in.

Rule 53.— * * * * Not less frequently than once each month the interior of the tank shall be inspected and cleaned if necessary. * * * *

Rule 55.—Tender truck center plates shall be securely fastened, maintained in a safe and suitable condition for service, and provided with a center pin properly secured. Where shims are used between truck center plates the male center plate must extend into the female center plate not less than $\frac{3}{4}$ in. Truck bolsters shall be maintained approximately level. * * * * Friction side bearings shall not be run in contact. The maximum clearance of side bearings on rear truck shall be $\frac{3}{8}$ in. and if used on front truck $\frac{3}{4}$ in., when the spread of side bearings is 50 in. When the spread of the side bearings is increased the maximum clearance may be increased in proportion.

FILING REPORTS

Rule 58.—Not less than once each month and within 10 days after inspection a report of inspection, Form No. —, shall be filed with the United States inspector for each locomotive used by a railroad company, and a copy shall be filed in the office of the chief mechanical officer having charge of the locomotive.

Rule 59.—A copy of the monthly inspection report, Form No. —, or annual inspection report, Form No. —, properly filled out, shall be placed under glass in a conspicuous place in the cab of the locomotive before it is put into service.

Rule 60.—Not less than once each year and within 10 days

after required tests have been completed a report of such tests, showing general condition of the locomotive, shall be submitted on Form No. —, and filed with the United States inspector, and a copy shall be filed in the office of the chief mechanical officer having charge of the locomotive. The monthly report will not be required for the month in which this report is filed.

ACCIDENT REPORTS

Rule 61.—In the case of an accident resulting from failure, from any cause, of a locomotive or tender or any appurtenances thereof, resulting in serious injury or death to one or more persons, the carrier owning or operating such locomotive shall immediately transmit by wire to the chief inspector, at his office in Washington, D. C., a report of such accident, stating the nature of the accident, the place at which it occurred, as well as where the locomotive may be inspected, which wire shall be immediately confirmed by mail, giving a full detailed report of such accident, stating, so far as may be known, the causes, and giving a complete list of the killed or injured.

GREAT ACHIEVEMENTS OF GERMAN STATE RAILROAD LINES

BY FREDERIC WILLIAM WILE
Author of "Men Around the Kaiser"

The war has been called, at various times, the "trench war," the "motor war" and the "shells war." But, as far as Germany and the German armies are concerned, it is a "railroad war," pure and simple. The amazing ability of the Kaiser's staff and field marshals to fling not only regiments, brigades and divisions, but entire army corps and even whole armies, from East to West and back again from West to East, as emergency requires, is due exclusively to the marvelous system of state-owned railroad lines which honeycomb the fatherland from end to end in all directions. When the history of the war is written the achievements of German railroad men will deserve to be inscribed in letters of red, for the triumphs of the Teuton legions in both the western and eastern theatres of war stand to their credit no less than to the credit of the engineers who built the deadly 42-centimeter howitzer or the strategists of Berlin, who have so skilfully directed the activities of the mighty German war machine.

When regiments which were fighting in Flanders, April 1, are next heard of in Southern Galicia, April 15, or when Germans who were resisting the onslaughts of Joffre's Frenchmen around Arras late in June, pounded at Warsaw on the 4th of July, it means that the lines of communication at the command of the German military authorities have approached something resembling mechanical perfection. We of the United States can perhaps somewhat visualize the problems the German railroad authorities are solving every day if we conjure up the vision of our own country resisting invasion, let us suppose, simultaneously in the Southwest—Texas—and in the Northeast—Maine. The distances with which the German railroad staff must deal are not, of course, as magnificent as those which separate Bangor from Galveston—all Germany is not as large in area as Texas alone—but Germany has expanded, temporarily at least, since last August, for she now occupies five-sixths of Belgium, 25,000 sq. miles of France and 30,000 sq. miles of Russia.* Her railroad system today contemplates an area, one of whose farthest eastern points is Libau on the Baltic coast of Russia, and which stretches to the west to the Belgian coast of the Channel, and internally to within 50 or 60 miles of Paris.

Put in American terms, the Kaiser's railroad strategists have to concern themselves with an area which embraces, roughly, the states of Ohio, Michigan, Indiana, Illinois, Iowa, Kentucky, Missouri, Wisconsin and Tennessee. I am sure that many an American traffic manager will acknowledge that the job of switching a couple of million armed men, with full artillery

*This article was written in London on July 3.

equipment, back and forth, incessantly, week in and week out, through territory of such ramifications, represents as big a piece of "railroading" as was ever tackled. I heard H. W. Thornton, the gifted and popular American general manager of England's Great Eastern Railway, tell an after-dinner audience not long ago that American traffic managers think they are handling "some traffic" when they successfully deal with a national convention, an Epworth League conclave or a G. A. R. encampment.

I present herewith the official narrative of "The Railway War," as prepared for publication in Germany by the great general staff. It is necessarily somewhat stilted in form, in the English translation, but complete idiomatic rendering of the facts in our own language is almost impossible:

"THE RAILWAY WAR"

"In order to obtain a survey of the preparations for the 'Railway War' one must remember the conditions in Germany during the critical days at the beginning of August, 1914. It was the holiday and tourist season. The large manœuvring grounds in every military district were filled with troops. The freight traffic was normal. Everybody believed till the last moment that peace would be maintained; moreover, war preparations could not, for political reasons, be carried out by the railways.

"War was declared on August 2. Everybody who was away hastened to the railway to reach home before the movement of the military transport began. Relatives visited their sons and brothers to take leave of them before they left for the front. The troops taking part in the manœuvres were sent back to their garrisons as quickly as possible. The mobilization of our armies had to take place partly in the western industrial district. Thousands of long military trains had to be despatched there. By this time the railways had to be cleared of the large number of loaded and unloaded freight cars in order that there might be no hitch in the forward movement.

"At the same time other transport movements began throughout the entire fatherland. Long trains of empty cars and lines of locomotives coupled together were sent to those places where, after careful consideration, cars and engines were greatly needed at the beginning. It is easy for anyone to understand the reason for all this railway traffic. First of all, there was the transport of millions of reservists and 'landwehr' men to their respective posts; then followed the transport of provisions and material for the troops and the armaments for the fortresses. In the districts of Germany which provided the horses, trains ran at specified times in every direction where the full complement of horses was needed as against the number under normal conditions in time of peace. Long trains filled with meat proceeded to the army preserving factories from the districts providing cattle. Finally, from the very beginning of the war there was a constant flow of coal trains from the collieries to the naval ports.

"A very few hours after mobilization there was the first great rush of troop trains. These were filled with men bound for the frontiers in order to guard them against enemy invasion. From day to day this traffic grew until our armies stood at the frontiers and numerous depots behind the first line of troops were filled with provisions, ammunitions, etc. This was, indeed, a great traffic in Germany! The movement of transports was carried out without a hitch. How easily might a very serious accident have happened at any one place on our vast railway system, through human neglect or by criminal hand, which would have seriously delayed the arrival of troops at the frontier! The railway authorities had, therefore, in their primary preparations to take into consideration our geographical position and see where the most vulnerable positions lay. In time of peace train trains were run to these various positions, so that if war broke out there should be no hitch in the transport of troops. Preparations were made, therefore, for all eventualities.

"The organization of the military railways has already proved

successful during the present war. When the commander of a force on the march receives news of the enemy's whereabouts and has to proceed elsewhere, trains are in instant readiness to take him to the scene of operations. The ability of the officers and employees organizing the transport of troops by rail materially contributed to our great successes on the eastern and western frontiers, but their greatest reward was reaped in the latest victories in Galicia.

"The essential condition for the prompt transport and mobility of troops by rail is to have at one's disposal a well-developed railway system. When the mobilization of our armies to the frontiers was complete and the forward march had begun, the chief of the railway section, as 'Chief of the Military Railway Organization,' and his staff proceeded to the field with His Majesty, the Kaiser. From the day of mobilization the relations of the so-called 'military railway authorities' with the German railway administration proper were completely changed. Numerous railways in Germany have since then been amalgamated with the 'war section,' that is to say, the various individual railway administrations are now subject to the orders of the 'Chief of the Military Railway Organization, in respect to everything relating to the running of trains. This chief issues to the railway commando ('working notices') for regulating the war traffic. He has also at his disposal for this work the machinery of the railway section of the great general staff in Berlin.

"To the German railway system were soon added the railway districts in conquered territory. Our troops penetrated very quickly far into the enemy's country, yet, on practically all battlefields the enemy still found time to blow up most of the large bridges and numerous tunnels before retreating. Our railway tracks had, of course, to follow very closely behind the advancing armies, so as not to impede their forward march. This required the prompt repairing and putting into working order the enemy's dismantled railways. To this end, when mobilization took place, two military railway administrations were forthwith formed to organize railway traffic in the conquered districts exactly similar to railway administrations in the fatherland itself.

"One of these two administrations waited at Aix La Chapelle (Germany) for the time when it could proceed to Belgium. The officers of the railway regiments accompanying the first line of troops immediately reported all damage done to lines and buildings entirely deserted by the enemy right into the districts of Hasselt, Louvain, Namur and Marloie. Apart from numerous minor damages, such as tornup rails, overturned engines, etc., thirteen bridges were found blown up, while a tunnel was blocked with several engines which had been made to telescope one another at full steam. Telegraph and telephone wires had been destroyed and all instruments in the stations were rendered unserviceable. Moreover, the railway roadbeds in Belgium in most cases were in a sadly neglected state and the rails were bad. Very often the sleepers broke under the weight of our engines.

"Here our regular railway troops had to commence work. They labored with almost superhuman effort so as to facilitate the bringing up of provisions and ammunition for the advancing armies. Very often long troop trains in close succession had to be brought over these lines, after one line had been cleared, and the working of the stations was taken over by railway officers with a few men. For instance, never before had a German engine been west of Liege until the first train filled with German troops going to reinforce their comrades fighting hard around Brussels ran into the station and had to proceed to Louvain. The lines between Liege and Louvain were repaired one at a time. Staff, there was none. The telegraph and telephone communications between the stations had not yet been restored. Nevertheless, train after train proceeded to Louvain and the empty trains returned the same way. Although the trains were fired on from the houses by the infuriated population and continual cowardly attacks were made, the troops were brought up in time against the enemy and could still participate in the deciding victory. The repairing and putting in order of the railways

proceeded little by little. On September 1 the military railway administration arrived in Brussels and proceeded to Lille toward the end of October. The last-named administration was taken over by newly-formed railway commandos in Liege and Brussels.

"To the south of Military Railway Administration No. 1, Military Railway Administration No. 2 was set up on August 20 in Ulfingen; on August 25 at Libramont and on September 4 at Sedan.

"A newly-formed railway commando followed in Luxembourg. The district covered by these various railway administrations was in time so extensive that a third was pushed forward between them, controlled from Charleroi. In the East, presently, a railway commando was set up in Lodz for the conquered districts of Russian Poland.

"All these authorities are organized by the military administration. The railway traffic is essentially of a military nature and is carried on in the districts close behind the front by railway troops; and, farther in the rear, by ordinary individuals transferred from the German railway administrations.

"The constructional operations of the railway troops consisted during the first months of the war chiefly in restoring damaged railway buildings so as to provide as quickly as possible complete railway communications for the army. New lines were laid where the military authorities needed them most or where our railways had no extensions in the conquered territory. Owing to the unfavorable country and the bad conditions of the roads after such a wet winter, we were obliged to construct a railway system comprising innumerable small 'field railways' so as to bring up ammunition and provisions to the particular place where our troops were located.

"In the place of emergency bridges we had to build later bridges of a permanent character so as to give greater security to the ever-increasing traffic. These operations at the seat of war were carried out by the railway troops and farther back by private German firms.

"During the course of the war up to the present 104 large bridges have been built, 8 tunnels restored and 14 lines opened to traffic. Owing to increased number of lines over 160 stations have been enlarged for the purpose of loading and unloading; also numerous crossover points have been built.

"The following table will give an idea of the development of this military traffic in the enemy country conquered by us with the exception of the Russian lines bordering on East and West Prussia, east of the Vistula:

TRAFFIC IN THE CONQUERED RAILWAY TERRITORIES (BELGIUM AND FRANCE) FOR THE MONTH OF APRIL, 1915 (In round figures)

1. Distance in Kilometers at the end of the Month:		Single line	Double line	Total
A. Used by military.....	3,000	4,100	7,100	
B. Leased.....	450	150	600	
C. Not in use.....	550	20	570	
D. Not restored.....	90	29	110	
E. Under construction.....	400	15	415	
Total.....	4,490	4,305	8,795	
2. Traffic Management:				
A. Traffic officials.....			75	
B. Engineers.....			25	
C. Workshop officials.....			10	
D. Stations occupied.....			1,200	
E. Workshops.....			70	
F. Gasworks.....			55	
G. Power stations.....			350	
3. Benevolent Institutions:				
A. Isolation hospitals.....			20	
B. Bath establishments.....			130	
C. Hospitals.....			35	
D. Red Cross establishments.....			30	
E. Dormitories for railway staff.....			135	
F. Convalescent homes.....			5	

"In considering the above table one must remember that only eight months have elapsed since the railways were taken over under the conditions described previously and the public passenger and freight traffic is still in its infancy. The railways can now, no doubt, respond more efficiently to the demands of public traffic."

WELFARE WORK ON THE PENNSYLVANIA

The Pennsylvania Railroad has issued a pamphlet containing a half-tone reproduction of a photograph of a group of about a hundred of the workmen at its Pittsburgh (Pa.) freight transfer station, all in their hot-weather working clothes; and in connection with the picture the statement is made that the whole force has been kept together, unchanged, for almost two years. The statement explains, further:

"The whole force of laborers numbers 318. Two and one-half years ago the transfer came under the management of George F. Wagner, as agent. Mr. Wagner believed in welfare work. Through his efforts a locker was provided for each man. A large number of wash basins and about 40 shower baths were installed. At the noon hour Victrola music is furnished. Other diversions are provided, and in many ways work at the transfer has been made attractive. The result is that in the last 23 months only one new man has been employed, and he was taken on as an addition to the force because he was a good worker and his services were needed. A working force has been built up at the Pittsburgh transfer that in point of efficiency and the physical and moral character of the individual men would be most difficult to duplicate."

The leaflet which gives this information concerning welfare work at Pittsburgh is itself an instrument in "welfare work"; it contains notes commending a number of employees for fidelity to their duty. Mention is made of another Wagner, track foreman on the Philadelphia division, now 61 years old, who when an unusually heavy rain and electric storm occurred recently in the night, went out, as his custom was, to take a walk over his section; he came across a washout, which very likely would have wrecked a freight train, which soon came along, had he not been there to display his red light.

Another item mentions locomotive engineman O. G. Bloom of the Sunbury division, who, when taking an excursion home one night recently, was delayed by the breakage of some parts of his engine, and who was so skillful and speedy in making temporary repairs, so as to get the excursionists to the end of his run in time to make desired connections, that he aroused great admiration among the passengers; so much so that a committee was appointed and a purse of \$76 was raised, and the next day was given to Mr. Bloom. He accepted it with great reluctance.

Another article, accompanied by a portrait, tells how Harry E. Ducey, a brakeman on the Tyrone division, on July 13, last, riding on the fireman's seat of the locomotive of his freight train, descending a steep grade, suddenly saw a four-year-old boy sitting on the track, only about 200 ft. ahead of the train. Instantly dashing out of the cab and along the running board, Ducey reached the pilot in time to lift the boy clear of the wheels and save his life. Some freight cars on a side track had hidden the boy from the view both of the brakeman and the engineman until they were close to him; and then there was not time to stop. Ducey is 27 years old and son of a former employee; active in the Young Men's Christian Association and in athletics.

THE RUSSIAN IRON INDUSTRY.—The production of pig-iron in Russia in the six years ended with 1914 inclusive was:—1914, 5,207,000 tons; 1913, 4,756,000 tons; 1912, 4,111,000 tons; 1911, 3,630,000 tons; 1910, 2,999,000 tons, and 1909, 2,821,000 tons. Half-finished products were turned out during the six years as follows:—1914, 4,594,000 tons; 1913, 5,110,000 tons; 1912, 4,433,000 tons; 1911, 3,885,000 tons; 1910, 3,482,000 tons and 1909, 3,079,000 tons. The output of finished products was: 1914, 4,617,000 tons; 1913, 4,224,000 tons; 1912, 3,676,000 tons; 1911, 3,272,000 tons; 1910, 2,965,000 tons, and 1909, 2,628,000 tons. These figures illustrate the decided progress which Russian metallurgical industry has been making of late years.—*Engineering, London.*

Humidity-Control Process for the Drying of Lumber

Norfolk & Western Dry Kiln at Roanoke, Va., Embodies Features Developed in Recent Government Investigations

By W. H. LEWIS

Superintendent Motive Power, Norfolk & Western, Roanoke, Va.

There has been recently put in operation at the Roanoke shops of the Norfolk & Western a dry kiln embodying features worked out in recent government investigations into the principles of the kiln drying of lumber. The kiln represents the direct results of the experiments of the United States forest products laboratory at Madison, Wis., the staff of this laboratory acting with the mechanical department of the Norfolk & Western in designing the kiln and its equipment.

The general principles of drying are based on what is known as the humidity-control system. It was found by the forest products laboratory that the maximum rate at which moisture should be removed from the surface of lumber at any temperature is not greater than that at which it will be drawn through the fibres of the wood to the surface. The only practical way of controlling such evaporative speed is by controlling the

lumber. The heated air rises and passes through the stacked lumber to the top of the kiln. Along the top of the air legs are spray nozzles which by means of a fine mist of spray chill the air at the top of the kiln, causing it to drop by gravity down the air legs to the bottom of the kiln, where it again comes in contact with the heated steam pipes, thus performing continuous cycles. As the heated air passes through the stacks of lumber the moisture from the lumber is taken up by the air and when this air is chilled at the top of the air legs the excess moisture is precipitated and mingles with the water from the spray nozzles.

Thermostats are provided for regulating the amount of steam to the steam pipes, by which means the temperature of the drying chamber is controlled, and further means are provided for controlling the temperature of the spray water, by which means the

Front View of Norfolk & Western Dry Kiln

humidity of the current of air passing over and through the lumber; hence the term "humidity-control," as applied to this kiln.

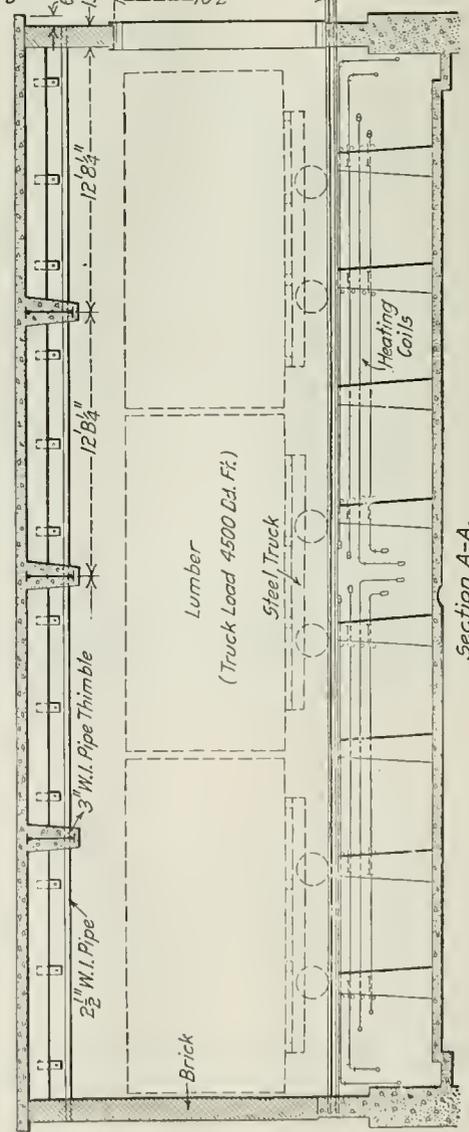

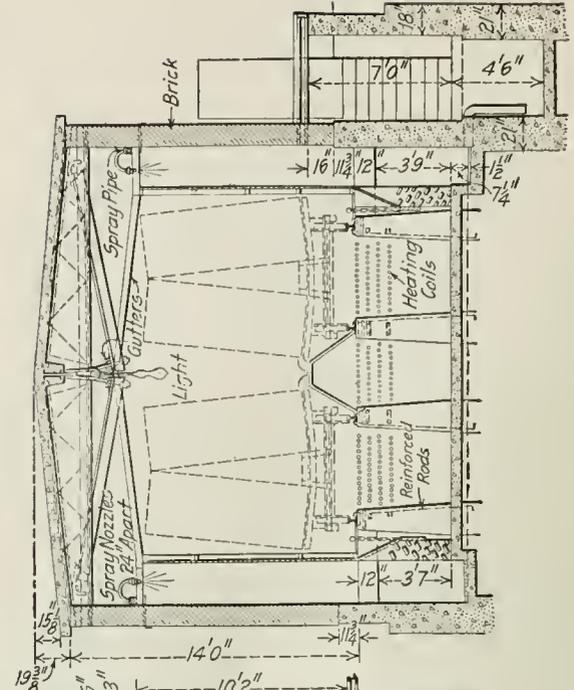

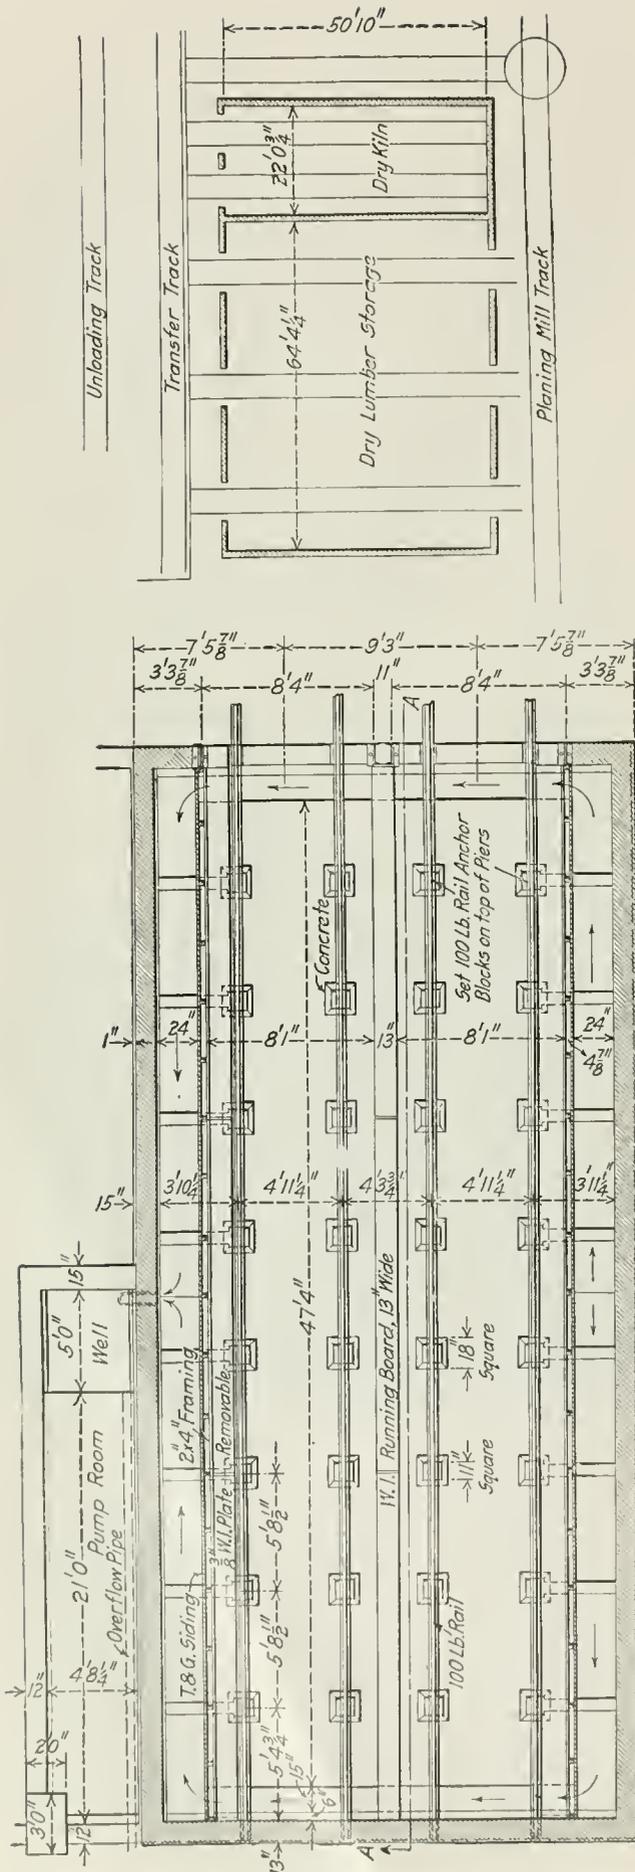

The kiln is unique in that it has no stack and no regular air inlets or outlets. The same heated air is used over and over and the moisture is removed from the air by means of a spray of water which lowers the temperature of the air and causes precipitation of the moisture, the same as natural precipitation of rain in external air; thus the only discharge from the kiln is a small stream of water.

The kiln consists generally of a drying chamber with air legs or spray chambers at either side and with a heating chamber immediately under the drying chamber. The air passes over a bank of steam pipes which are located just under the loads of

temperature and humidity of the air before it reaches the steam pipes are controlled. The spray water is circulated by means of a suitable pump, so that this water is used over and over, an overflow being provided so that excess water will drain off to the sewer.

The kiln is susceptible of very delicate control, and by controlling the humidity of the drying air the speed of drying may be regulated to a nicety. By this means the most rapid consistent rate of drying may be attained without danger of injuring the lumber.

In connection with this kiln there has been provided a dry lumber storage building so that the kiln itself may be of smaller dimensions and kept in continuous use. The kiln is built at one end of the storage building and a transfer car runs on a suitable

Details of Construction of Norfolk & Western Dry Kiln

track along the front of the buildings. The lumber or kiln cars run into either the kiln or the storage building from the transfer car. The location is convenient to the planing mill.

Lengthwise piling of the lumber is used in the kiln, and the kiln cars are of steel and not of the customary knockdown type. A peculiar method of piling the lumber on the car is used, as shown in the illustrations. A tapered central channel is formed for the upward passage of the air, and the strips between the layers of lumber from slightly upward inclined air passages. By this means the current of air passes uniformly through the entire stack of lumber, and uniformity of drying throughout the pile is obtained. The clearance dimensions of the drying chamber of the kiln are as follows: Length, 50 ft. 10 in.; width, 17 ft. 3 in.; height, 10 ft. 2 in.

The kiln holds six kiln cars of lumber, the capacity being

Interior of Humidity Controlled Dry Kiln

approximately 27,000 board feet of 1-in. material. It is supplied with approximately 3,300 sq. ft. of heating surface. The building is of brick laid in cement mortar; the foundations and pipe chamber are of concrete, while the roof is of cinder concrete.

This kiln has been in successful operation drying all kinds of lumber for some time and fully meets the expectations of the designers. A number of patents on the principles involved have been issued to Harry D. Tiemann, of the Forest Products Laboratory, all of which have been dedicated to the public.

REPORT OF COMMISSION ON INDUSTRIAL RELATIONS

The United States Commission on Industrial Relations has given out a report of Basil M. Manly, its director of research and investigation, containing findings of fact and recommendations of the staff with reference to conditions of employment in public utilities, including the Pullman Company and the railroads. It is suggested that the commission recommend the extension of the Newlands act to cover not only all classes of railroad employees, but all employees of public service corporations engaged in interstate commerce, that the functions of the Board of Mediation and Conciliation be extended to provide for the creation of boards of investigation and that the board should be

authorized by Congress to create an advisory council composed of equal numbers of employers and employees for the purpose of creating a panel of names from which impartial arbitrators may be chosen.

The report says that "conductors and porters are employed by the Pullman Company under conditions which seem to require radical readjustment and are admitted by officials of the company to be underpaid;" that the salary of the porters is such that they are obliged to secure tips from the public in order to live, and that the Pullman Company is the direct beneficiary of the tips to the extent of the difference between a fair wage and that which is now paid; that the hours of service are extremely long and that the employees of the company are subject to many other abuses, among which are mentioned, "the arbitrary deductions in their salaries for such time as they may not be needed for the actual service of the company, although required to report at the office each morning; the requirement that porters shall furnish blacking, although they are not permitted to charge passengers for the service of shoe cleaning; the system of arbitrary penalties for the infraction of multitudinous rules."

Criticism is made of the company's bonus system, by which employees who have a clean record for the year receive an extra month's salary, on the ground that this penalizes with extra severity any infraction of rules which occurs during the latter half of the year and puts into the hands of officials and inspectors a means of discrimination. It is stated that the effect of the tipping system is not only to degrade those who are obliged to accept tips, but to promote discrimination in the service to the public; that the employees of the company are unable to improve their condition through organization, as employees known to be members of labor unions are discharged; that the company is "tremendously over-capitalized," and that on the basis of cash actually paid in, the annual dividends of the company are not less than 29 per cent.

It is suggested that the commission recommend: the enactment by Congress of a statute prohibiting the tipping of any employee of a public service corporation engaged in interstate commerce, and providing a proper fine for both the giver and the recipient of the tip; the amendment of the existing law regulating the hours of service of train employees to include the employees engaged in the Pullman service; the extension of the Newlands act to cover the Pullman Company.

With reference to railroads, it is suggested that the commission recommend:

Thorough investigation by the public health service of railroad construction camps as well as other labor camps, and the preparation of definite plans for such camps and a standard code of sanitary regulations.

The enactment by Congress of a statute expressly prohibiting corporations engaged in interstate commerce from inducing or compelling their employees to sign releases of liability for accidents.

Congress should enact a statute prohibiting interstate employers from requiring their employees to contribute to benefit funds, and providing for the participation of employees engaged in interstate commerce in the management of all benefit funds and other funds to which they contribute.

The regulation by federal statute of the employment of police on interstate railroads. The statute should not only provide for the organization, personnel and powers of such police, but should definitely provide that during labor disputes such police should be subject to the proper civil authorities and paid out of the public treasury. The statute should also provide that such corporations should be permitted to have firearms only under license, requiring that a definite record be maintained showing the character of each firearm and to whom it is issued.

The assumption by the states of full responsibility and definite provision not only for protecting the property of railroads, but for preventing trespass upon their property.

The report is signed only by Commissioners Frank P. Walsh, John D. Lennon, James O'Connell and A. B. Garretson

The Qualifications of a Terminal Superintendent

An Analysis of the Essential Elements Necessary to Secure Maximum Results from His Organization

By S. W. ROBERTS

General Superintendent of Passenger Transportation, Pennsylvania Lines,
Pittsburgh, Pa.

To accept as correct the theory expressed by the adage, "That which is worth doing is worth doing well," is an implied, if not an actual acknowledgment that individuals of equal ability and experience performing similar service under identically the same conditions produce dissimilar results; the attainments of each being dependent largely upon the degree of interest in the task at hand. This quality is the inevitable outgrowth of regular systematic education by study, observation, contact with persons possessing superior minds, or through all of these channels. Since a terminal yard organization is composed of individuals, many of whom must perform similar duties and have had similar experience and training, logical reasoning seems to justify the belief that the successful operation of a terminal yard must follow the adoption and application of a plan, the underlying principle of which is represented by continuous active interest on the part of individual members of the organization, because interest is the unmistakable evidence of properly utilized education (mind development) and the latter is indicative of progress.

Mind training of the individual member of a department of whatever nature may of itself be classified correctly as the elementary step of the series of steps essential to the various stages of development in connection with the formation of an organization or working plan. The moulding or crystallization of this available mental energy of any number of members into a compact and powerful mental force capable of effectively resisting opposition to desirable or necessary methods and practices is the result which the head of a department must be able to accomplish. These two factors, namely, continuous active interest on the part of individual members of an organization in their respective positions and duties, and proper utilization of the available energies of all members form the true basis of a terminal yard operation plan.

The executive head of a railway, who is responsible, morally at least, to its stockholders, for the satisfactory management of their affairs, should possess qualifications that will enable him to perfect an organization arrangement efficient not only when applied to one detail, but when subjected to tests involving maximum demands and extreme conditions. The assumption that this reasoning rests on the right principle appears to be ample ground for the conclusion that the head of a terminal yard organization must be as capable an executive in his limited sphere as is the president of a railway whose responsibility extends to the operation of a complete system. Hence the standard of a terminal yard organization, be it good, bad, or average, as indicated by its acts, must thus reflect directly the ability of its head and, perhaps, indirectly the strength or weakness, as the case may be, of the entire organization scheme of which it is a component part.

Having indicated that the true basis of a terminal yard organization plan are, first, a maximum degree of continuous active interest on the part of each unit (member) in his particular service assignment, and the general results; and, second, a proper utilization of the maximum degree of combined energies of all units (members); and having placed the head of a department or organization, irrespective of what his title may be, in the same relation to each of his assistants as is the president of a railway company to each member of his staff, the foundation is thus laid for the question, "What should be the qualifications of a man capable of perfecting an efficient yard organization and obtaining the maximum service from it?" The answer to this question must deal with the standards of many attributes, the more prominent being morality (including temperance), honor, in-

tegrity, perseverance, patience, knowledge (including experience), and the innate desire and ability to grow along the right line and influence others to do so.

While a high standard as applied to each of the attributes specified, and each of numerous others of lesser prominence, but of a distinctly kindred nature, has always been recognized as a desirable and valuable asset of a representative of a railroad, particularly one vested with a considerable measure of governing or supervisory authority, too often those qualities which cannot be absent from the life of that type of man whose services are exemplary, and therefore, educational and inspiring to his associates (assistants and others) have been disregarded in the interest of greatly over-estimated ability based upon practical experience only. This statement is not made with the view of depreciating the value of experience to the head of an organization, but to emphasize the fact that since "like produces like" the development of members of a terminal yard organization in accordance with instructions and examples of a head, deficient with respect to qualifications other than knowledge acquired by experience could not possibly conform to the standard of efficiency demanded by conditions of the present age.

The general prevailing tendency in almost all branches and departments of the business world is to employ, as far as practicable, methods which have back of them principles harmonizing with the results of scientific study and research; and that policy, indicating as it does, the growing need of earnest and persistent, but fair competition among individuals, to the end that reforms in the direction of development may be assured regularly, removes completely the basis for arguments favorable to the assumption that a man whose mind is not clear and active and whose moral character is not clean could meet so much as the preliminary requirements of a successful terminal yard organization head.

This conclusion is not expressed either for the purpose of thus conveying the impression that a man with a ripe experience to his credit is incompetent because his moral character is clouded; but in defense of the theory that the highest standard of usefulness and service of any man to his family, his friends, his employer, his community, or his country, must involve the highest standards of development in the attributes heretofore mentioned. Since serious, unprejudiced study, observations and discussions do not disclose many, if any, permanent benefits which accrue from lax morals and all they embrace, but do disclose divers substantial benefits attributable to the reserve condition, we are reasonable in declaring that the dominating influence for good in a terminal yard organization will not emanate from a head with lax morals as a qualification, regardless of the extent of his experience and educational training; the fact that he may possess a pleasing personality, or be able to boast of an enviable physical development, or justly claim credit for recognized social leadership among certain classes in a community.

GENERAL DUTIES

The duties of the head of a terminal yard organization are executive and supervisory in character. The limitations of the former are in general so clearly defined that unauthorized deviations therefrom would be the outgrowth (barring exceptions on account of emergencies) of willful disobedience or ignorance only, the first of which is a true indicator of disloyalty and the second of incompetency.

The supervisory duties of a terminal yard organization head, however, are practically without limitations other than his capac-

ity as measured by the standards heretofore described, and his ability to create among his assistants that degree of personal interest in their respective service assignments, which will insure not alone the transmission of a corresponding degree of interest to their subordinates or fellow members, but the proper utilization of the energy thus developed.

The supervisory duties are both comprehensive and important, involving, as they do, results dependent on services contributed by many employees and bearing a direct relationship to transportation expenses and net earnings. The member of an organization who is interested in his work and who knows the purpose of his existence and appreciates the opportunity to employ his faculties toward the accomplishment of something worth while, combines knowledge with theory and practice and gauges his progress by comparative results. The application of the principle supporting that method or system to all members of a department or division thereof suggests immediately as the foundation of supervisory duties, systematic education of employees and accurate measurement of member, branch and department efficiency.

The term "systematic education" implies training regularly in accordance with a stated course, embracing those features of terminal yard operation, which must undergo changes frequently to keep pace with progress, reference being made especially to new or improved methods, improved facilities including equipment and reforms affecting working regulations or the policies of a company.

It is true that different methods of training may be successfully employed by different men, and likewise true that the same methods will not produce the same results when applied to different organizations (qualifications of individual members representing one of the most common factors responsible for variations in training methods and practices); but that a head fully conversant currently with conditions under his jurisdiction may intelligently analyze his forces and their obligations, and prescribe instructions required for their development, is certain.

To be of the greatest possible value to an individual, a branch, a department, or a system as a whole, this training must extend from the unit of service in all cases to the final conclusion, with the relationship of each to each direct and indirect kindred detail clearly established; and the object of efforts and energy expenditures in that direction made manifest through deserved promotions and recognitions otherwise, and statistics disclosing the grades of unit efficiency determined by the employment of accurate measures.

The oft-repeated statement that a certain terminal yard is operated as economically as possible, consistent with the character of demands on it, because the head, a man of long experience is in close contact constantly with the services of each of the members of the organization, no longer has any weight or standing among progressive railroad men, it having been rightfully superseded by the principle that no matter how insignificant may be a position, the services involved by it should be performed under the supervision of some one who is able to judge, using as his guide a reliable measure, whether the services are or are not satisfactory.

Details, knowledge concerning which should be contemplated by a system of education adapted to the needs of terminal yard employees under the direction of the head are numerous, a few of the more prominent being:

The direct and indirect functions of a terminal yard; the relation of the yard to other parts of a railway system, and the relation of its organization to other departments and the public.

The value of loyalty and efficiency to the individual employee and an organization, and their probable rewards.

The meaning of the word "discipline"; the necessity for discipline, and the method of administration which is most effective.

The value of harmony among members of an organization.

Effect of dissensions and discord among members of an organization on operations.

The purpose and value of accurate reports relative to service;

extraordinary conditions affecting operations; prospective traffic movements (passenger and freight); personal injury and other accidents; classified cars on hand, cars damaged and cars repaired or relieved of lading by transfer; prospective new or enlarged industries and any other matters bearing upon some feature of terminal yard operation with which a head should be familiar.

Courteous treatment of passengers, shippers and receivers of freight and other patrons of the company contrasted with the reverse policy.

The connection of originality of the individual employee with success.

Punctuality, system and self-control; their value to the individual employee and an organization.

Team work contrasted with the reverse organization arrangement.

Patience and sympathy; when necessary, and why.

Economy contrasted with extravagance or near-extravagance.

Service measures; the necessity therefor and their value to the individual, branch (or sub-department), and an organization.

Harsh, rough language, and its effect on loyalty and efficiency.

Train and personal injury accidents; the common causes therefor and precautions necessary to prevent them.

The light loading of cars and the light rating of locomotives; the adverse effect of such practices on yard and train operations.

Rough handling of cars in yards, and the results as applied to freight claims and car maintenance expenses.

Detentions to foreign cars within yard limits; the common causes therefor and the character of reports and records, and individual employee interests, necessary to reduce detentions to the minimum.

The result of improper or late assignment of work to branch (or sub-department) heads of an organization, reduced to an efficiency loss representing abnormal operating expenses.

While each of these details, as well as each of various others, has a definite place to fill in the educational program of the head of a terminal yard organization, they are of unequal utility, of which fact through study and practice an individual employee will learn in the same manner as his knowledge concerning the function of each of the parts of his body, their service value to him, and the relationship to life, is acquired.

Summarizing briefly the substance of the foregoing, the head of a terminal yard organization must himself be a real man, which type cultivates interest and harmony, inspires confidence, encourages ambition, influences loyalty and capability, and condemns vice in every form, by acts founded upon honor, equity, fairness and frankness; the enforcement of intelligent and reasonable instructions, and the exhibition of results of precise unit service measurements.

RAILWAY CONSTRUCTION IN CHINA.—A recent British consular report says that the Chekiang Railway has been formally taken over by the Chinese Government and placed under the control of the Shanghai-Nanking Railway management. It is now known as the Shanghai-Hangchow-Ningpo Railway. Apart from a heavy deficit in the funds handed over it is found that, as a result of Chinese construction and management, the whole of the rolling stock will have to be replaced and the road bed relaid. The problem of bridging the Chientang river is still unsolved. The possibility of crossing near Fuyang has been debated, but the shifting bottom of the river presents a well nigh insuperable obstacle. Material held up at Tsingtau during the siege has now been delivered, and progress is being made with the construction of the bridge near Paikuan. The line beyond Hangchow will, it is surmised, eventually run via Chiakon and Fuyang to Chuchi, Shaohsing and Paikuan. Another branch will probably run from Fyang to Lanchi, the junction from Chihuahua and Wenchow in one direction, and Ch'uchow, Changshan, Yushan, and the Ning Hsiang Railway (Nanking Hunan) in the other.

General News Department

Members of the Order of Railway Telegraphers employed on the Chicago Great Western, who have been negotiating with the management for increases in pay, have broken off negotiations and are said to be preparing for a strike.

The Department of Labor and Industry of Pennsylvania holds that women may not be employed as telegraphers or telephone operators more than six days in a week. The request for a ruling came from women employed in railroad work.

The Pennsylvania Railroad has notified the heads of departments that employees who wish to attend military training camps may be allowed two weeks' vacation for that purpose, in addition to the ordinary vacation, but the company will not pay any salaries or wages during this military vacation.

The Stockton division, the Shasta division and the Sacramento shops have been awarded the 1915 safety banners awarded annually by the Southern Pacific Company for the greatest progress shown during the fiscal year in the furtherance of "safety-first" work on the company's Pacific system.

The Pacific & Eastern, a 33-mile railroad running from Medford, Ore., to Butte Falls, Ore., has established passenger service between Medford and Eagle Point, a distance of 12 miles, with a gasoline motor car, formerly used for inspection service, on which has been mounted an omnibus body that will accommodate 8 or 10 persons.

The Agricultural Department at Washington reports that during the month of July railroads and shippers were fined \$18,000 for violations of the 28-hour law concerning transportation of animals, and the quarantine law. Fines aggregating \$5,100 were imposed on the Rock Island in 51 cases of violations of the 28-hour law; and similar fines, aggregating \$1,800, against the Chicago, Burlington & Quincy.

Pending the reconstruction of the damaged approaches of the Galveston causeway ocean-going traffic is moving through the port of Texas City. The steamships of the Mallory line will take on and land cargoes there and it is expected that cotton shipments will suffer comparatively little curtailment. All the Galveston railroads are running trains into Texas City. It is thought that it will probably be September 20 before trains can run into Galveston.

It is announced in Buffalo that arrangements for the sale of the Buffalo & Susquehanna Railway to the Western New York & Pennsylvania Traction Company have been finally completed, and that the auction sale of the property, which was to have been held on September 13, will not take place. The new owners are expected to run passenger trains with gasoline motor cars, while using steam locomotives for freight.

The board of arbitration appointed under the Newlands act which arbitrated the controversy between the western railways and their engineers and firemen, has recently been in session in Chicago, and on August 30 rendered a supplemental award deciding a large number of disputed points regarding interpretations of the original award, which had been submitted to the board by both sides.

The building of the "Salt Lake Route-Union Pacific" route at the Panama-California Exposition at San Diego has been awarded a gold medal for its unique features. This building was put up to provide information to world travelers and comfort to exposition visitors. It contains a rest room for ladies and children, with a maid in attendance, information bureau and telephone booths, smoking room for gentlemen and other accommodations. The special rest room provided for the entertainment of visiting railroad men is one of the prominent features.

The Massachusetts Terminal Commission, appointed by the governor of Massachusetts and the mayor of Boston, under authority of the Massachusetts legislature (*Railway Age Gazette*, July 9, page 71), is making an exhaustive study of railroad ter-

minals in some of the leading cities throughout the United States for the purpose of being able to recommend improvements in the terminal facilities in Massachusetts and around Boston. After visiting some of the principal Eastern cities, the commission spent two days, August 23 and 24, inspecting the St. Louis terminals, belt lines, etc., and on the following day visited the terminals at Kansas City, planning to visit New Orleans on the return trip.

Robert J. Bailey of Pittsburgh, Pa., secretary of the Individual Car Owners' Association, has issued a circular announcing that renewed efforts are to be made to secure for the 150,000 freight cars in the country not owned by the railroads better rates for use of cars, better means of preventing misuse, lower prices for repairs made on these cars by the railroads and better regulation of demurrage; and he invites all owners of such cars to join the association and to come to the annual meeting, to be held in Pittsburgh next Tuesday. There will also be considered at that time a proposal to form a corporation with \$200,000,000 capital, to acquire, hold and operate private cars of all classes, and to own shops and build and repair cars.

The Streets Company

The Streets Company, of Chicago, having purchased and taken over the cars and business formerly owned by the Street's Western Stable-Car Line, announces its officers as follows: F. J. Reichmann, president; M. L. Marston, vice-president and treasurer, to succeed H. Kiper, who held that position in the old corporation; Robert J. Mills, assistant to the president, and F. H. Sweringen, master car builder.

Valuation Order No. 20

The Interstate Commerce Commission has issued valuation order No. 20 regarding information concerning the corporate history of the carriers as follows:

It is ordered that every common carrier owning or operating a steam railroad whose property is to be valued by the commission under the valuation act of March 1, 1913, and every receiver or operating trustee of any such carrier, shall prepare and file in the office of the commission at Washington, D. C., on or before six months after the service of this order upon it, a statement showing the following facts as to each corporation, company or firm, at any time connected with said railroad.

1. Give name of corporation, company or firm; date of incorporation and date of organization. If a corporation, state whether incorporated under the general law or by special act. If incorporated under the general law, state where the articles of incorporation were filed. If incorporated by special act, give reference to the act.

2. Describe the railroad, or portion of the railroad, constructed by each corporation, company or firm and show as to each such railroad, or portion of railroad, as so constructed, the termini, the mileage of main line, the mileage of any branch or branches and the date of construction.

3. State the length of time any such railroad or portion of railroad was actually operated by any such corporation, company or firm, giving, in each instance the date of beginning and date of conclusion of such operation.

4. If any such corporation has gone out of existence, describe the proceedings by virtue of which the dissolution took place. If any such corporation is still in existence, state where its records are kept and give the name and address of the person who has custody of them.

5. State fully the chain of title by which the present corporation has acquired the property which it now owns or operates. In this connection, prepare and file with the commission, as aforesaid, a schedule of all deeds, leases, reorganization proceedings and other instruments bearing upon the corporate his-

tory and assemble and arrange the same for inspection and examination by representatives of the commission.

The carrier shall file with the commission copies of the above documents and records or extracts from the same as may be designated by the director of valuation within 30 days after notice.

6. Prepare and file with the commission a diagrammatic chart similar to and containing information like that given on the sample chart hereto attached.

Operating Revenues and Expenses of Express Companies for April, 1915

The following statement, which is subject to revision, has been compiled by the Interstate Commerce Commission from the monthly reports of operating revenues and expenses of the principal express companies for April, 1915. (The express companies have three months in which to make reports):

of the Air Brakes on Our Modern Trains?" C. M. Kidd, chairman; "Difficulties Accompanying Prevention of Dense Black Smoke and its Relation to Cost of Fuel and Locomotive Repairs," Martin Whelan, chairman; "The Electro-Pneumatic Brake," W. V. Turner; "The Effect of Properly Designed Valve Gear on Locomotive Fuel Economy and Operating," W. E. Preston; "Scientific Train Loading, Tonnage Rating, the Best Method to Obtain Maximum Tonnage Haul for the Engine Over the Entire Division, Taking Into Consideration the Grades at Different Points on the Division," O. S. Beyer, Jr.

In accordance with the usual custom there will be a goodly number of instructive exhibits furnished by the supply companies. On Wednesday the entire evening will be devoted to inspection of the exhibits. Thus far 43 companies have reserved space. They are as follows:

American Aereh Company; American Locomotive Company; American Steel Foundries; Ashton Valve Company; Barco Brass & Joint Company; Chambers Valve Company; Chicago Car Heating Company; Commercial Acetylene Company; Crane Company; Dearborn Chemical Company; Dela-

Traveling Engineers' Association

The twenty-third annual convention of the Traveling Engineers' Association will be held at the Hotel Sherman, Chicago, commencing at 10 a. m., Tuesday, September 7, and continuing four days. The subjects to be discussed are as follows: "What Effect Does the Mechanical Placing of Fuel in Fireboxes and Lubricating of Locomotives Have on the Cost of Operation?" W. L. Robinson, chairman; "Recommended Practices for the Employment and Training of New Men for Firemen," L. R. Pyle, chairman; "The Advantages of the Use of Superheaters, Brick Arches and Other Modern Appliances on Large Engines, Especially Those of the Mallet Type," J. E. Ingling, chairman; "How Can the Road Foreman of Engines Improve the Handling

ware Railway Specialty Company; Detroit Lubricator Company; Equipment Improvement Company; Galena Signal Oil Company; Garlock Packing Company; Greene, Tweed & Co.; Hunt Spiller Mfg. Corp.; Jerome-Edwards Metal Packing Company; Kelley Wood Safety Locomotive Side Curtain Company; Liberty Manufacturing Company; Locomotive Stoker Company; Locomotive Superheater Company; Manning, Maxwell & Moore, Inc.; Mudge & Co.; Nathan Manufacturing Company; National Boiler Washing Company; National Graphite Lubricator Company; National Railway Devices Company; Ohio Injector Company; O'Malley Beare Valve Company; Paxton Mitchell Company; Pillow Company; Pocket List of Railroad Officials; Pyle-National Electric Headlight Company; Railway Age Gazette; Robinson Company; William Sellers & Co., Inc.; Southern Locomotive Valve Gear Company; Standard Heat and Ventilation Company, Inc.; United States Graphite Company; Harry Vissing Company; White American Locomotive Sander Company, Inc.

Railway Signal Association

The twentieth annual convention of the Railway Signal Association will be held at Hotel Utah, Salt Lake City, Utah, September 14, 15 and 16. The program is made up of the committee reports noted below:

Tuesday

Committee I: Signaling Practice.—The use of switch indicators or signals to serve the same purposes; economics of signal maintenance; capacity of single track.

Committee VII: Relays.—Report on resistance and other data obtained on various types of relays.

Report of Committee III: Power Interlocking.—Revised specification for electro-pneumatic interlocking, including ten typical circuit drawings (were discussed at May meeting); revised specifications for fiber conduit; specifications for incandescent electric lamps.

Committee VI: Standard Designs.—Twenty-six drawings showing details and assembly of signal apparatus.

Wednesday

Committee II: Specifications for electro-mechanical interlocking.

Committee V: Manual Block.—Instructions for testing and maintaining dry cells; instructions for maintaining gravity cells; instructions for maintaining caustic soda cells.

Special Committee on Lightning Protection.—Requisites for lightning arresters for signaling; requisites for choke coils for signaling; specifications for vacuum gap lightning arresters.

Wednesday afternoon: Trip to Saltair.

Thursday

Committee VIII: Electric Railways and Alternating Current Signaling.—Specifications for reactors for line and track circuits; historical data on alternating current signaling.

Committee X: Storage Battery.—Specifications for nickel-iron-alkaline storage battery.

Special Committee on Electrical Testing.—Progress report on recording apparatus.

Thursday afternoon: Ball game.

The annual dinner will be on Wednesday evening.

International Engineering Congress

The International Engineering Congress, organized and conducted under the auspices of the American Society of Civil Engineers, the American Society of Mechanical Engineers, the American Institute of Mining Engineers, the American Institute of Electrical Engineers, and the Society of Naval Architects and Marine Engineers, will convene at San Francisco on September 20 for a six days' meeting. All sessions will be held in the Auditorium Building, Hayes and Larkin streets.

At the opening session on Monday morning, September 20, General Goethals and others will address the convention. Monday afternoon will be devoted to discussions relating to the Panama Canal. Among the papers presented will be one on the Commercial and Trade Aspects of the Panama Canal, by Dr. Emory R. Johnson, professor of transportation and commerce, University of Pennsylvania. On the following four days separate sessions will be held to discuss Waterways, Irrigation, Railway Engineering, Municipal Engineering, Materials of Engineering Construction, Mechanical Engineering, Electrical Engineering, Mining Engineering, Metallurgy and Naval Architecture and Marine Engineering.

The program of the Railway Engineering Congress is as follows:

RAILWAY ENGINEERING

Tuesday, 10 a. m.

Railways.—William Barclay Parsons, consulting engineer, New York.

The Status of the Railways of North and South America.—F. Lavis, consulting engineer, New York.

Italian Railways.—Luigi Luiggi, president of the Italian Society of Civil Engineers and former member of the Italian State Railway Board, Rome, Italy.

The Status of Indian Railways.—Victor Bayley, assistant secretary Railway Board, India, Simla, India.

The Status of Chinese Railways.—Charles Davis Jameson, supervising engineer and architect to the Imperial Chinese Board of Foreign Affairs, Peking, China.

The Status of Russian Railways.—V. A. Nagrodsky, Petrograd, Russia.

The Status of Railways and Tramways in the Netherland East-Indies.—E. P. Wellenstein, Netherlands Indian Government Railways' Engineer, The Hague.

Afternoon

Economic Considerations Controlling and Governing the Building of New Lines.—John F. Stevens, New York.

The Locating of a New Line.—William Hood, chief engineer, Southern Pacific, San Francisco.

The Locating of a New Line.—David Wilson, Johannesburg, South Africa.

Tunnels.—Charles S. Churchill, assistant to president, Norfolk & Western, Roanoke, Va.

Tunnels in Italy.—Luigi Luiggi.

Tunnels in Switzerland.—R. Winkler, Direktor der technischen Abteilung der Schweizer Eisenbahndepartements, Berne, Switzerland.

Thursday, 10 a. m.

The Reconstruction of the Panama Railroad.—Frederick Mears, Lieut. U. S. A., formerly chief engineer, Panama Railroad; member Alaska Engineering Commission, Washington.

Railway Construction Methods and Equipment in Australia.—Maurice E. Kernot, chief engineer for Railway Construction, Victoria, Australia.

Track and Roadbed.—George H. Pegram, chief engineer, Interborough Rapid Transit Company, New York.

American Railroad Bridges.—J. E. Greiner, consulting engineer, Baltimore, Md.

Afternoon,

Recent Locomotive Development.—George R. Henderson, consulting engineer, Baldwin Locomotive Works, Philadelphia.

Rolling Stock (other than Motive Power).—A. Stucki, president Engineers' Society of Western Pennsylvania, Pittsburgh, Pennsylvania.

The Floating Equipment of a Railroad.—F. L. DuBosque, New York, N. Y.

Railroad Terminals.—B. F. Cresson, Jr., New Jersey Harbor Commissioners, Jersey City, N. J.

Friday, 10 a. m.

Electric Motive Power in the Operation of Railroads.—William Hood, San Francisco.

Electric Motive Power in the Operation of Railroads.—E. H. McHenry, consulting engineer, New Haven, Conn.

Signals and Interlocking.—Charles Hansel, New York.

Among papers to be presented on other subjects will be those on the Preservative Treatment of Timber, by Howard F. Weiss and Clyde H. Teesdale, Forest Products Laboratory, Madison, Wis.; Aggregates for Concrete, by E. S. Thompson, Newton Highlands, Mass.; Alloy Steels in Bridge Work, by J. A. L. Waddell, consulting engineer, Kansas City, Mo.; Testing Full-Size Members, by Gaetano L. Lanza, Philadelphia, Pa., and Equipment, Processes and Methods for Boiler Shops, by E. C. Meier, Phoenixville, Pa.

Central Railway Club

The next meeting of the Central Railway Club will be held at the grounds of the Automobile Club of Buffalo on Friday, September 10, and will consist principally of the annual outing of the club. Members will assemble at Statler's hotel at 10 a. m. J. W. Gibney and H. C. Edson are a special committee on sports. There will be a dinner at the club house. The only business on the program is the reading of a short paper, on "Rivers and Canals," by William Elmer, superintendent of motive power of the Pennsylvania Railroad at Buffalo.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, date of next or regular meetings, and places of meeting.

AIR BRAKE ASSOCIATION.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 2-5, 1916, Atlanta, Ga.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontious, 455 Grand Central Station, Chicago.

- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next meeting, October 21-23, 1915, Boston, Mass.
- AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, Illinois Central, East St. Louis, Ill.
- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.
- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, Room 101, Union Station, St. Louis, Mo.
- AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Buttritt, 8 W. 40th St. New York. Annual convention, October 4-8, 1915, San Francisco, Cal.
- AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—H. G. McConaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.
- AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPEFITTERS' ASSOCIATION.—W. E. Jones, C. & N. W., 3814 Fulton St., Chicago.
- AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next meeting, November 17, 1915, Chicago.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 19-21, 1915, Detroit, Mich.
- AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 21-23, 1916, Chicago.
- AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Building, Chicago. Annual meeting, June, 1916.
- AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—Owen D. Kinsey, Ill.
- AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 7-10, 1915, New York.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, Supt. Timber Preservation, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 18-20, 1916, Chicago.
- ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—E. R. Woodson, Rooms 1116-8, Woodward Bldg., Washington, D. C. Annual meeting, June 28, 1916, Detroit, Mich.
- ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Annual meeting, 2d Tuesday in October, 1915, New York.
- ASSOCIATION OF RAILWAY CLAIM AGENTS.—C. W. Egan, B. & O., Baltimore, Md. Next meeting, May 19, 1916, Atlantic City, N. J.
- ASSOCIATION OF RAILWAY ELECTRIC ENGINEERS.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual meeting, October, 1915.
- ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 20-22, 1916, St. Paul, Minn.
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York. Next meeting, December 14-15, 1915, St. Louis, Mo.
- BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.
- FREIGHT CLAIM ASSOCIATION.—Walter P. Taylor, Traffic Manager, R. E. & P., Richmond, Va. Annual session, May 17, 1916, Washington, D. C.
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.
- INTERNATIONAL RAILWAY FUEL ASSOCIATION.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago.
- INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1126 W. Broadway, Winona, Minn.
- INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, C. H. & D., Lima, Ohio.
- MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. I. Goodwin, C. R. I. & P., Elkhon, Mo. Next meeting, October 19-21, 1915, St. Louis, Mo.
- MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York.
- MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dunc, B. & M., Reading, Mass. Next convention, September 14-16, 1915, Detroit, Mich.
- MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Building, Chicago. Annual meeting, June, 1916.
- NATIONAL RAILWAY APPLIANCE ASSOCIATION.—C. W. Kelly, 349 People's Gas Bldg., Chicago. Next convention, March, 1916, Chicago.
- NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.
- NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
- RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.
- RAILROAD MEN'S IMPROVEMENT SOCIETY.—J. B. Curran, Erie R. R., 59 Church St., New York. Meetings, alternate Thursdays, October to May. Assembly Rooms of Trunk Line Association, 143 Liberty St., New York.
- RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December, 1915. Waldorf-Astoria Hotel, New York.
- RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.
- RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1063 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.
- RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Next meeting, October 5-7, 1915, Chicago.
- RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Annual meeting, September 14-17, 1915, Salt Lake City, Utah.
- RAILWAY STOREKEEPER'S ASSOCIATION.—J. P. Murphy, N. Y. C. R. R., Box C, Collingwood, Ohio.
- RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders' and Master Mechanics' Associations.
- RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.
- RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.
- ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Annual meeting, September 7-10, 1915, Chicago.
- ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
- SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.
- SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.
- SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, C. R. I. & P., 1134 La Salle St. Sta., Chicago. Annual meeting, October 19-21, Colorado Springs, Colo.
- SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. R. R., Atlanta, Ga. Annual meeting, January, 1916.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.
- TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boady House, Toledo.
- TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.
- TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.
- TRAFFIC CLUB OF NEWARK.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, 559 Broad St., Newark.
- TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 201 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Hotel Astor, New York.
- TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Agt., Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.
- TRAFFIC CLUB OF ST. LOUIS.—A. F. Varsen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.
- TRAIN DISPATCHER'S ASSOCIATION OF AMERICA.—J. F. Mackie, 7122 Stewart Ave., Chicago. Next convention, June 21, 1916, Toronto, Ont.
- TRANSPORTATION CLUB OF DETROIT.—W. R. Huiley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.
- TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., East Buffalo, N. Y. Annual meeting, September 7-19, 1915, Chicago.
- UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.
- WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.
- WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Building, Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.
- WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF JULY, 1915.

Table with columns: Name of road, Average mileage operated during period, Freight, Passenger, Total inc. misc., Way and structures, Maintenance of equipment, Traffic, Trans. portation, Miscellaneous, General, Total, Net operating revenue (or deficit), Railway tax accruals, Operating income (or loss), Increase (or decr.) comp. with last year.

Traffic News

The Toledo Traffic Bureau has filed a complaint with the Interstate Commerce Commission, charging that the roads in putting into effect the order of the commission allowing them to increase rates five per cent have advanced rates from Toledo to Michigan points to a much greater extent.

The National Industrial Traffic League will hold a meeting at Toledo, Ohio, in the Zenobia Auditorium, on September 9 and 10. An informal dinner has been arranged for the evening of September 9 at the Toledo Club, at which E. E. Clark, of the Interstate Commerce Commission, will give an address.

The Eastern roads have filed tariffs showing advances in east-bound grain rates, and the Interstate Commerce Commission, suspending the tariffs, will hold a hearing on the subject at Washington, October 13. The most important advances are those on grain for export. Proposed changes in classification of freight will be heard at the same time.

For the movement of the Georgia peach crop to Eastern markets this year (May 27 to August 17), the Southern Railway ran 187 special trains from Atlanta to Washington, 649 miles, on fast passenger schedules, and 98.3 per cent of them reached destination on time. The total number of cars was 3,636; and 219 cars were sent to Western markets by 35 special trains from Atlanta to Chattanooga, all of which arrived on time.

The Union Pacific has announced that hereafter but one coupon will be required on tickets reading over two or more lines of that system. When this arrangement is fully effective it will be applicable to foreign interline, home interline and intersystem tickets. It will be some time, however, before tickets can be reprinted, and meantime the old forms with two or three coupons, as the case may be, will be honored. The object of this arrangement is to popularize the route with ticket agents of other roads.

Since its current passenger tariffs went into effect, the Boston & Maine has experienced a very notable diminution of travel. According to the Boston News Bureau there is one station near Boston where revenues have slumped to less than \$100 a month from \$400 formerly. At various stations traffic has disappeared altogether, or has gone to trolley companies or automobiles. In June the passenger revenues of \$1,186,000 represent a decline of \$164,000, or 12 per cent from June, 1914. Revenue passenger-train mileage was practically unchanged.

The steamship "Pennsylvanian," of the American-Hawaiian line, recently set a new record for time of transit from Philadelphia to San Francisco via the Panama canal, making the voyage in 14 days 17 hrs. 25 min. The distance is 5,130 nautical miles, making an average speed of about 348 miles a day. The Canal Record points out that if this vessel had made the voyage by way of the strait of Magellan, a distance of 13,003 miles, at the same speed, the voyage would have required approximately 37 days and 8 hours, or two and one-half times as long as the trip by way of the canal, and that the use of the canal saved about 5,965 bbl. of fuel oil, which would cost \$4,772.

Three judges of the United States district court at San Francisco, Cal., heard arguments on August 17 and 18 on the petition filed by the chambers of commerce of San José, Stockton, Santa Clara and Sacramento, Cal., for an injunction to restrain the enforcement of the Interstate Commerce Commission's order in the intermountain fourth-section case, effective July 15, which denied the four cities named the advantage of terminal rates. The commission held that terminal rates should be made only to ports of call. Joseph W. Folk, general solicitor for the Interstate Commerce Commission, and Blackburn Esterline, special assistant to the attorney general of the United States, argued that the issuance of the injunction would upset the entire order, which is the result of years of litigation, and which permits the railroads to some extent to meet the competition of the Panama Canal. The railroad lawyers present agreed to stand by the argument made on behalf of the commission. The case was taken under advisement.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Kentucky Cattle Rates Justified

Rock Spring Distilling Company, et al. v. Louisville, H. & St. L., et al. Opinion by Commissioner Clark:

Rates on cattle in carloads from Owensboro, Ky., to Chicago and New York, and points taking New York rates not found unreasonable or unjustly discriminatory; complaint dismissed. (36 I. C. C., 35.)

Discrimination at Henderson

Henderson Commercial Club v. Illinois Central, et al. Opinion by Commissioner Meyer:

The present adjustment of rates at the Evansville-Henderson river crossing is found unjustly discriminatory, and defendants are required to remove the discrimination. The carriers are required to provide for the rehandling of grain at Henderson, Ky., under the through rates from points in Illinois to Virginia cities, upon the same terms as at Louisville. (36 I. C. C., 20.)

Rates to Phoenix Regulated

Edward Eisle v. Atchison, Topeka & Santa Fe et al.

Complaints filed in 1912 attack rates to Phoenix, Ariz., from various points of origin on different kinds of groceries, hardware and other commodities. It is held that certain of defendants rates on potatoes and onions are unreasonable; that the complaint against the other rates under attack has not been sustained, and that reparation will be denied. (This proceeding also embraces complaints in a half-dozen other cases. (36 I. C. C., 18.)

Lumber Rates From Wilson, Ark.

In re lumber rates from Wilson, Ark., and other points to Cincinnati, Ohio, and other points. Opinion by the commission:

The commission finds that the carriers have justified a proposed withdrawal of through rates on lumber from points of origin in Arkansas to Louisville, Ky., Cincinnati, Ohio, and Evansville, Ind. The rates from producing points west of the Mississippi to these destinations are normally on the basis of the lowest combination on Memphis or Thebes. The rates in issue are abnormally low, and were established to meet the competition of the barge lines. (35 I. C. C., 179.)

Rates on Wooden Building Material

Yellow Pine Sash, Door and Blind Manufacturers' Association et al. v. Southern Railway et al. Opinion by Commissioner Clark:

The commission finds that the rates on wooden building material from and to points in southern classification territory should bear a uniform relation to the rates on lumber. It is unable to establish or order the establishment of proper differentials from the facts of record. The matter is being taken up, however, in the general investigation of the rates on and classification of lumber and lumber products in docket No. 8131. (35 I. C. C., 151.)

Southern Pig Iron Rates Reduced

Gloss-Sheffield Steel & Iron Company et al. v. Louisville & Nashville et al. Opinion by Chairman McChord:

Following the principle of the original report in this case, 30 I. C. C., 597, it is held that the rates on pig iron in carloads from points in Alabama and Tennessee to points reached by defendants' lines in Central Freight Association territory, to which pig-iron rates were not reduced on October 1, 1914, are unreasonable. Reasonable rates are prescribed for the future,

and divisions of such rates between the carriers operating north and those operating south of the Ohio river are prescribed. (35 I. C. C., 460). [The list of carriers who are defendants in this case fills ten pages.]

Coal Rates From Oak Hills, Colo.

Opinion by the Commission:

In its original report (30 I. C. C., 505) the commission required the establishment of joint rates on bituminous coal from Oak Hills, Colo., on the Denver & Salt Lake through Denver to stations on the Rock Island in Kansas, Nebraska and Missouri. The rates were to be on the basis of the rates then in effect from the Walsenburg, Colo., coal district, via Pueblo and the Rock Island to the same destinations. The carriers being unable to agree as to divisions, the commission finds that the Moffat road * * * to divisions on coal, soft, all kinds, but not slack and pea, of \$1 18 a ton, and on coal, soft, nut, slack and pea of \$1.12 a ton. (35 I. C. C., 456.)

Stopping Cars to Complete Loading

Investigation and Suspension Docket No. 549. Opinion by Commissioner Daniels:

Carriers in Central Freight Association and Western classification territories proposed to discontinue generally the practice of stopping cars in transit to complete loading, or partially to unload; but protest was made by the National Industrial Traffic League, and others, and the commission now finds that the proposed withdrawal of the practice is not justified. Small manufacturers and small merchants testified that only by means of the stop-over privilege could they fairly compete with large concerns; and the commission finds that the stop-over privilege tends to engender wholesome competition. Commissioner Harlan dissents, and will later file a separate report. (36 I. C. C., 130.)

Foreign Commerce Not Touched by I. C. Law

John S. Seymour v. Morgan's Louisiana & Texas et al. Opinion by Commissioner Hall:

Following U. S. v. P. & R. (188 Fed., 484) it is held that the transportation of sugar from Germany, through the United States, in bond, to destinations in Mexico, is not subject to the jurisdiction of the commission. This case had to do with 1,200,000 lb. of sugar shipped from Germany through New Orleans in 1913 for final delivery at points in Mexico. In a similar case—a cargo of sugar from Hamburg, Germany, shipped to Philadelphia on its way to Raymond, Alta.—the United States District Court for the Eastern District of Pennsylvania, decided that such a transaction would not be within the mischief which the act to regulate commerce was intended to remedy, and would not come within the language of the statute. (35 I. C. C., 492.)

Atlanta and Nashville Treated Alike

W. S. Duncan & Company et al. v. Nashville, Chattanooga & St. Louis et al. Opinion by Commissioner Clements:

This decision concerning rebilling privileges at Nashville, Tenn., and discrimination against Atlanta, Ga., and nine other places virtually revives the commission's decision of June 9, 1911, which was suspended by the Commerce Court, but later approved by the Supreme Court. The Supreme Court of the United States announced its decision on December 7, 1914, reversing the order of the commerce court, which order set aside the order of the commission requiring the removal of unjust discrimination resulting from the granting to Nashville, and the denial to Atlanta and nine other complaining cities in Georgia of the privilege of rebilling or reshipping grain, grain products and hay transported from the Ohio and Mississippi river crossings or beyond, and destined to points in the southeast, at the through rate from origin to final destination. Upon consideration of the record in the original hearings and in the recent hearings, and on the applications of the carriers under section 4, it is now held that the granting of the said privilege to Nashville and the denial of it to Atlanta and the other complaining cities results in a violation of section 3, and that no showing has been made, under

either section 3 or section 4, why the commission should not enter an order in substantial conformity with the order of June 9, 1911, and it is so ordered. (35 I. C. C., 477.)

Reconsignment by Telephone Disapproved

S. F. Scattergood & Co. v. Erie & Western Trans. Co., et al. Opinion by the Commission:

Messrs. Scattergood complained of a reconsignment charge of \$2, made at Renovo, Pa., on a carload of bran which came from Minneapolis, Minn., but the commission justifies the railroad and dismisses the complaint. Complainants, in Philadelphia, telephoned the railroad company, the Pennsylvania, in Philadelphia, June 17, to divert the car to New York; and confirmed the order in writing two days later. This delay of two days necessitated a charge of \$2. Complainant contends that the Pennsylvania Railroad's receipt of the telephone message of June 17, to reconsign the shipment, within 24 hours after the date of the arrival of the car at Renovo, satisfied the requirements of the tariff for free reconsignment. But the commission, finding that the tariff requirement of a written order was not observed, and that carriers never can be certain that the person speaking a diversion or reconsignment order by telephone has control of the bill of lading, holds that the charge assailed was lawfully applicable; and the complaint is dismissed. (36 I. C. C., 15.)

The Iron and Steel Cases; Advances Approved

Commercial Club Traffic Bureau (Salt Lake) v. Atchison, Topeka & Santa Fe et al. Opinion by Commissioner Harlan:

Proposed readjustment of the rates on iron and steel articles moving from Mississippi river points, Missouri river points, Chicago and territory intermediate to Chicago and the Missouri river, on the one hand, to Utah and Colorado points and to points in Kansas, on the other, found justified except as to the rates on certain iron and steel articles to Colorado points. Existing rates on iron and steel articles from Pittsburgh and St. Louis to Hutchinson, Wichita and Topeka, Kans., not shown to be unreasonable or unjustly discriminatory. Proposed readjustment of rates on iron and steel articles from St. Louis and from Pittsburgh and other points in Central Freight Association territory to points in Oklahoma and to Fort Smith, Ark., found justified.

This is a group of cases involving substantially all the rates on iron and steel articles from Central Freight Association, Mississippi river, Missouri river, Chicago, and territory intermediate to Chicago and the Missouri river on the one hand, to points in Utah, Colorado, Arkansas, Kansas and Oklahoma on the other hand.

The opinion fills 20 pages and deals with everything made of iron, from boiler plate to woven wire fence, hay bale ties, hinges and sucker rods. Twelve different orders have been issued. (36 I. C. C., 86.)

Water and Rail Rates from Yonkers

Federal Sugar Refining Company v. Central of New Jersey et al. Opinion by Commissioner Hall:

Yonkers is 16 miles north of New York City. Complainants send sugar to Pennsylvania and other points west by way of the New York Central to Sixtieth street, New York, whence it is transferred across the harbor by boat to the Central of New Jersey. Complainants desire to send by boat direct from Yonkers to the New Jersey terminus, declaring that there is much delay at Sixtieth street. Sometimes cars have to wait ten days before they can be taken across the harbor. They ask that through rates be made by the Central of New Jersey with the Ben Franklin Transportation Company, a responsible concern operating boats on the Hudson river and in the harbor; and this request is granted, the commission ordering the railroad to join the boat company in through rates; the rates to points 90 miles and more distant from Jersey City to be the same as from New York; which is what is provided for by the through tariffs over the New York Central and the Central of New Jersey now in effect; and it is ordered that the rates by the new route shall be no higher than those made by the two railroads. Rates are ordered for only one com-

modity, sugar. The railroad argued that a single shipper, sending a single commodity, could not legally demand the establishment of a through route; but the commission finds that there are other shippers who may take advantage of the new route. The railroad also claims that the same issues had been decided by the courts in former proceedings, but the commission says that this technical plea has no application to an order of the commission; moreover, it is held that the question of establishing a through route and joint rates was not determined in the former case cited.

Rates Prescribed for Valuable Animals

Iowa State Board of Railroad Commissioners, et al. v. Atchison, Topeka & Santa Fe, et al. Opinion by Commissioner Hall:

Applying to the present record the principles enunciated in The Cummins Amendment, 33 I. C. C., 682, Held: (a) That, taking each class of animals by itself and making due allowance for the minimum, maximum and average values of each as shown by this record, the scheduled valuations carried by these defendants in their live stock shipping contracts are unjustly and unreasonably low and not representative of the average actual values of the animals shipped thereunder; (b) that defendants' rates for the transportation of certain specified animals, the actual values of which do not exceed the amounts set forth in the report, are, and will be for the future, unreasonable to the extent that such rates exceed the present rates based upon the present scheduled valuations; (c) that defendants' excess rates for excess valuations are unjustly and unreasonably high, and (d) that reasonable rates for the transportation of any animal of actual value exceeding the amount specified in the report will exceed said present rates by not more than 2 per cent of said present rates for each 50 per cent or fraction thereof of actual value over and above that named in the report. This proceeding was brought by the Iowa State Board of Railroad Commissioners and by the American National Live Stock Association, the Corn Belt Meat Producers' Association, and the Cattle Raisers' Association of Texas, organizations whose members are producers or shippers of live stock. Some 45 carriers are named as defendants. The railroad commissioners of South Dakota, Colorado and Arizona and a number of live stock exchanges and associations intervened in support of the complaint.

The commission finds that the average values of the different kinds of live stock at the present time are greatly in excess of the valuations named in the carriers' printed contracts. . . . The percentage of increase in rate for excess value has varied from 10 to 25 per cent of the released rate for each 100 per cent or fraction thereof of excess value. These excess rates for excess value have seldom been used.

It has long been the claim of the carriers that the amounts paid by them for damage incident to the transportation of live stock are disproportionately high as compared with the damage claims incident to the transportation of other freight. It does not appear, however, that all such claims are affected by these particular contracts. A large proportion—perhaps 85 per cent in amount—is on account of loss of market and incidental shrinkage in weights and value of the live stock. Such losses never do and never can equal the valuations named in the contracts. Only about 15 per cent of the total claims paid by the carriers for loss of or injury to live stock are, therefore, in any way affected by the rules and regulations here in issue. The amount of money actually paid by these defendants because of such loss or injury does not average more than 25 cents a car.

During the last two years long established insurance companies have entered the business of insuring shipments of live stock in transit. Their policies protect against loss by death or other total loss in excess of the legal liability therefor of the railroad or carrier caused by wreck, derailment, fire or lightning while on cars in transit. The rates of these companies are 50 cents per single-deck and 75 cents per double-deck car, and the indemnities specified are \$50 for each steer, \$30 for each cow, \$10 for each calf, \$10 for each hog and \$5 for each sheep or goat. The insurance rates are flat rates per car, regardless of whether the haul be long or short. For an additional premium of 25 cents or 50 cents per car, making in all 75 cents

or \$1 per car, the indemnity on steers is made, respectively, \$75 or \$100 per head. While there are no statistics of such insurance operations before us, the testimony as to the amounts paid for commissions and overhead expenses would indicate that the business is profitable.

It is of record that the average haul of live stock in the United States pays the carriers about \$50 per car in freight charges.

The defendants did not contend that the excess rates charged on account of excess value were reasonable, and they offered another schedule of rates in lieu thereof. That offer is in substance that for a 3 per cent excess rate the carrier will assume a 50 per cent excess liability, and that for a 5 per cent excess rate the carrier will assume a 100 per cent excess liability. These figures are not based upon the cost of additional insurance alone. They rest also upon the theory that the carriers' service on the higher valued animals is a more valuable service and should be compensated by a higher rate.

This proposal is rejected and the commission finds, as above, that the charge for excess value must not exceed normal rates by more than 2 per cent for each 50 per cent of actual value. (36 I. C. C., 79.)

STATE COMMISSIONS

At a hearing before the Railroad Commission of Michigan on August 24, on the application of the express companies for permission to increase their intrastate rates to conform to the interstate rates allowed by the Interstate Commerce Commission, the Grand Rapids Chamber of Commerce was the only protestant.

Application has been made to the California Railroad Commission by the Southern Pacific, the Atchison, Topeka & Santa Fe, the San Pedro, Los Angeles & Salt Lake, the Western Pacific and the Western Association of Short Line Railroads for such relief as the commission can grant under a state law prohibiting railroads from requiring their trainmen to receive or transmit train orders over the telephone.

COURT NEWS

Limitation of Time for Commencing Action for Damage to Freight

The Kansas Supreme Court holds that a stipulation in a contract for an interstate shipment of cattle that an action by the shipper to recover damages because of injuries and delays occurring during the transportation must be commenced within 91 days after the happening of the injuries and delays is not unreasonable nor invalid. Mere negotiations between the parties as to settlement or compromise of the claim did not waive the contract limitation nor estop the railroad from insisting that the right to sue had been lost by lapse of time. *Ray v. Missouri, K. & T.* (Kan.), 153 N. W. 397.

Measure of Damages for Injuries to Live Stock

A shipment of cattle was negligently delayed so that the cattle suffered excess shrinkage. The cattle brought the market price; the only loss suffered by the shipper was in lost weight. The Texas Court of Civil Appeals holds that, as the measure of damages is the difference between the market value of the cattle at the time and in the condition in which they were delivered and their value if delivered in time, the shipper, having recovered for shrinkage, could not also recover for loss in selling appearance. That would allow a recovery of double damages for the same item. *International & G. N. v. Rhoden* (Tex.), 177 S. W. 984.

Crossing Accident—Contributory Negligence

In Missouri a pedestrian in crossing a railroad at night along a board walk was struck and killed by a train going 40 miles an hour. He had an unobstructed view when 9 feet from the track. The train had been running every night for years, near his place of business, at a greater speed than 30 miles an hour. There was an ordinance of the town through which the line ran, which consisted of about 651 inhabitants, limiting the speed of trains to 8 miles. It was held that the deceased had no right to assume that the train was going no more than 8 miles an hour

and was guilty of contributory negligence as a matter of law.—*Vandeventer v. Chicago & A. (Mo.)*, 177 S. W. 834.

Hours of Service Act—Deduction of Lay-Off Time

In an action for penalties for permitting a train crew to remain on duty for more than 16 consecutive hours, in violation of the hours of service act, the Circuit Court of Appeals, Ninth circuit, holds that where a train is delayed en route to its destination, and the members of the train crew are laid off and released from duty during the period of the delay, the lay-off or release breaks the continuity of the service, and the period of such lay-off should be deducted in determining whether there has been a violation of the act, if it is for a substantial and opportune period of rest.—*Southern Pacific v. United States*, C. C. A., 222 Fed. 46.

Hours of Service Act—Omissions in Reports

A railroad inadvertently and honestly omitted from its report, required by order of the Interstate Commerce Commission, pursuant to the interstate commerce act, instances in which employees were permitted to remain on duty for a longer period than that prescribed by the hours of service act. The Circuit Court of Appeals, Ninth circuit, holds that the company was not subject to the penalties imposed by the interstate commerce act, but any omissions must be scrutinized, so as to prevent any evasions of the requirements to make reports in such instances.—*Oregon-Washington R. & Nav. Co.*, C. C. A., 222 Fed. 887.

Notice of Intention to Claim Damages

The Arkansas Supreme Court holds that a provision in a bill of lading requiring written notice of intention to claim damages to be given to the carrier is reasonable. Where no written notice is given, the burden is on the plaintiff to show that the railroad had such actual knowledge. Compliance with the rule was not excused by the fact that some employee of the carrier whose duties did not include the investigation of such matters or the report thereof to the agent, knew of the damaged condition of the goods, no agent in authority knowing that the shipment was damaged or that a claim would be made.—*St. Louis, I. M. & S. v. Cumbie* (Ark.), 177 S. W. 910.

Caretaker of Stock a Passenger for Hire

A shipper of horses was handed a live-stock contract which contained the condition that the shipper should feed and care for the animals and exempted the railroad from liability for their escape from the car. The shipper, who accompanied the stock as caretaker, was injured by a derailment. In an action against the railroad the circuit court of appeals, Fourth circuit, holds that the contract showed that it was in the interest of the railroad to have a caretaker in charge and that this was a sufficient consideration for his transportation. He was, therefore, a passenger for hire and the railroad could not by a further provision exempt itself from liability for his injury through its negligence. *Norfolk Southern v. Chatman*, C. C. A., 222 Fed. 802.

Drainage Assessment Apportionment

A railroad company was assessed \$1,500 towards the cost of a drainage system on about two miles of right of way within the drainage district. The total cost of the drainage system was \$91,000. The district court reduced this assessment to \$800. On appeal, the Iowa Supreme Court affirmed this judgment, holding that where the total cost of a drainage system is less than the total benefits therefrom, the tax on a particular taxpayer should bear the same proportion as the total cost bears to the total benefits; and, therefore, where the benefits were considerably in excess of the cost, but the assessment against the right of way was for the full benefit accruing to the railroad, the assessment was properly reduced in proportion to the excess. *Chicago & N. W.* (Iowa), 153 N. W. 110.

Liability for Injuries Received While Extinguishing Prairie Fire Caused by Sparks

A prairie fire was negligently caused by a railway company, and the wife of a homesteader who was left at home with her

daughter used every reasonable effort to put out the fire. In so doing she overworked and strained herself so that permanent injuries ensued. In an action against the railroad the North Dakota Supreme Court holds that she could recover damages from the company provided she did not unreasonably and recklessly expose herself to the injury. Whether she was reckless and negligent in this respect was primarily a question of fact for the jury and not of law for the court. The jury found for the plaintiff.—*Wilson v. Northern Pacific* (N. D.), 153 N. W., 430.

Order of Commission Compelling Operation at Loss— Reasonableness

Action was brought by the Saline River Railway Company against the Arkansas Railroad Commission to restrain the commission from proceeding to compel the company to operate its line. It appeared that the road, which was primarily built to haul logs, was nine miles long, running between two small towns, through sparsely settled territory. It had originally cost \$75,000, owed between \$100,000 and \$150,000, owned no property except tracks and rolling stock, the track being badly out of repair. The company had tried unsuccessfully to sell the franchise and property for \$18,000. The Arkansas Supreme Court holds that an order of the commission requiring the company to run one passenger and freight train each way daily, at an expense of \$50, while its greatest possible revenue per day was not more than \$10, was so unreasonable as to be void.—*Rowland v. Saline River* (Ark.), 177 S. W., 896.

"Railroad Hazard" Defined

An employee, engaged in taking old brasses out of journal boxes of cars, used, instead of a jack, a pole to force down a wheel. This is a less safe method, but customary when all available jacks are in use. The pole slipped and struck him in the side. In an action for his injury the Arkansas Supreme Court holds that he assumed the risk thereof, since, appreciating the danger, he deliberately chose this manner of doing the work. The Arkansas act of 1911, fixing the liability of railroads for injuries to employees, and abolishing the defense of assumption of risk, did not apply to the plaintiff. The act does not include all railroad employees engaged in every department of the service, but only those whose duties expose them to the characteristic dangers connected with the operation of railroads known as "railroad hazards," which are those peculiar dangers to which employees are exposed while engaged in work connected with, and necessary to, the operation or running of trains.—*St. Louis, I. M. & S. v. Wiseman* (Ark.), 177 S. W. 1139.

Safety Appliance Act—Automatic Couplers

Through an accident the automatic coupling on the front end of a locomotive became inoperative to the extent that the uncoupling device was out of commission, though the coupling feature remained intact and operative. The engine was used for some time in this condition, employees being notified that the front coupler should not be used, and no car was coupled to the front end. Had a car been so coupled to the front end it would have coupled automatically and could have been uncoupled, without going between the car and the engine, by the use of the uncoupling device on the car. In an action for the statutory penalty the Federal District Court, E. D. Pennsylvania, held that the company violated the safety-appliance act, since, while a locomotive engine need not be so designed that cars may be coupled at its front end, if intended in its use to be coupled at either end, it must have an uncoupling device at each end.—*United States v. Reading*, 223 Fed., 215.

Contract Exemption from Liability for Injury to Pullman Porter

The Pennsylvania Supreme Court, following its decision in *Coleman v. Pennsylvania* (1913), 242 Pa. 304, 89 Atl. 87, 50 L. R. A. (N. S.) 432, holds that a Pullman car porter, though not a passenger in the ordinary sense, is entitled to the rights of a passenger to safe transportation, and, though his employment contract purports to release the Pullman Company and railway company, he may recover from the latter for injuries resulting from the negligence of its servants. *Murray v. Reading* (Pa.), 94 Atl., 558.

The great weight of authority upholds the contrary doctrine sustaining contracts exempting railroad companies from liability for negligent injury to sleeping-car employees or others maintaining a similar relation to the carriers, such as employees of express companies, circus proprietors or news companies. The latest case on the subject holding such a contract valid is that of *Robinson v. Baltimore & Ohio*, recently decided by the United States Supreme Court, 35 Sup. Ct., 491, an abstract of which appeared in our issue of April 23, page 907.

Passenger Entering Wrong Train

In an action for damages by a passenger who had got on the wrong train and was carried six miles to the next stopping place notwithstanding his request to be let off when his mistake was discovered, the Alabama Supreme Court stated the law as follows: Where a person has regularly bought a ticket to a definite destination, and mistakes, in good faith, the train on which he has the right to be carried, and enters the wrong train, he is a passenger until, after being informed of his mistake, his conduct renders him a trespasser; and is entitled to the protection accorded passengers against negligence for which the railroad is responsible. It cannot be affirmed, as a matter of law applicable under all circumstances, what would be or is a proper place for affording the passenger an opportunity to disembark or to eject him. The schedule of the train, with reference to which nearby trains opposed or following were being operated, might suggest, in all proper prudence, the danger of stopping the trains between stations. The nearness of the next station after the discovery of the passenger's error might, in and of itself, entirely justify the conductor in taking the passenger to that not remote station. Other illustrative circumstances may be readily supposed.—*Southern v. Farquhar* (Ala.), 68 So. 289.

Local Assessment of Station Property for Street Improvement

A city attempted to assess the station property of a railroad for the widening of an adjacent street. While the authorities in the various jurisdictions are not in accord as to whether station property can be assessed for the improvement of an adjoining street, the New York Appellate Division holds that the sounder rule is that which denies the right. There were two offices on the property, one rented to a news company and the other to a real estate dealer. The court said: "The theory of local assessment is benefit. And the reason for exemption rests in the inability to perceive how such premises are made by the improvement any more valuable for the purposes for which the railroad company can use them. The widening of the street presumably improves it for travel and for access; but the railroad is not benefited in that it carries more passengers or receives a greater compensation. To assess this railroad station property for the reason that the widening of the street might make such office space in its station more valuable is, I think, assessing for benefits too remote and too speculative, and is to destroy the rule by refinement." *People v. Waldorf*, 153 N. Y. Supp., 1072.

Safety Appliance Act—Moving Defective Car to Shop

A switchman, employed by a railroad engaged in interstate commerce, was injured because of a defective grabiron on a boxcar which was waiting to be taken to the shop for repairs. There was nothing to prove that the defect could not have been repaired without taking the car to the shop. It was held by the circuit court of appeals, Fifth circuit, that the railroad was liable under the safety-appliance act.

Pardee, C. J., dissented on the ground that the act is intended to apply only to cars, etc., *in use* at the time. "It could hardly have been intended by the Congress," he said, "that a railroad company under heavy penalties should keep its cars in perfect order, with certain specific safety appliances and otherwise, and yet that, after a disabled car has been taken entirely out of commerce, not to be used for any traffic whatever, the railroad company is to be penalized in favor of employees fully advised and warned that the car was in bad order or was to be moved only to the shop for repairs, for taking the only practical means at hand to have the car repaired and put in order." *Texas & P. v. Rigsby*, C. C. A., 222 Fed., 221.

Railway Officers

Executive, Financial, Legal and Accounting

H. J. Simmons, who recently resigned as general manager of the El Paso & Southwestern on account of ill health, will continue as a director and vice-president of the El Paso & Northeastern and the El Paso & Southwestern of Texas, and as a director of the Tucson, Cornelia & Gila Bend.

E. A. Murphy, assistant freight auditor of the Chicago, Milwaukee & St. Paul at Chicago, has been appointed freight auditor, and W. W. Scannell, chief clerk to the freight auditor, succeeds Mr. Murphy. Francis J. Owens, connected with the accounting department of the Chicago, Milwaukee & St. Paul, has been appointed auditor of the Chicago Union Station Company, and F. E. Allen, traveling accountant of the Chicago, Milwaukee & St. Paul at Chicago, has been appointed auditor of expenditure, vice C. E. Dudley, resigned. Mr. Dudley retires after forty-seven years of service. Effective September 1.

Perry McCart, who has been appointed general attorney for the Chicago, Indianapolis & Louisville, to succeed H. R. Kurrie, was born near Orleans, Orange county, Ind., November 5, 1864. He was educated in the common schools of Orange county, in Orleans High School, Southern Indiana Normal College, Mitchell, Ind., and in the law department of the University of Tennessee, Knoxville, Tenn. In 1897 he was a member of the house of representatives of the Indiana legislature. For a number of years he has served as local attorney for the Chicago, Indianapolis & Louisville. He will make his headquarters in Chicago.

Operating

J. J. Sexton, trainmaster of the Northern Pacific at Glendive, Mont., has been transferred to Billings, Mont., vice R. R. Auerbach, promoted. William C. Sloan has been appointed trainmaster with headquarters at Forsyth, Mont., vice Thomas M. Flynn, transferred.

Thomas B. Turner, trainmaster of the Louisville & Nashville, at Mobile, Ala., has been appointed assistant superintendent with headquarters at Mobile, succeeding John Bose promoted, and J. P. Semmes has been appointed trainmaster of the New Orleans & Mobile division, with headquarters at Mobile, succeeding Mr. Turner.

F. C. Huntington, trainmaster of the Northern Pacific at East Grand Forks, Minn., has been appointed superintendent of the Fargo division, with headquarters at Dilworth, Minn., vice F. R. Bartles, who has been appointed superintendent of the Minnesota division, with headquarters at Staples, Minn., vice T. F. Lowry, transferred. T. F. Lowry has been appointed superintendent of the Rocky Mountain division, with headquarters at Missoula, Mont., succeeding F. L. Birdsall, resigned. Effective September 1.

Traffic

S. A. Williams has been appointed general agent, traffic department of the Chicago & Alton, at Peoria, Ill., vice E. J. Naylor, resigned.

William T. Price, traveling freight agent of the Union Pacific, with headquarters at Denver, Col., has been appointed commercial agent at Pueblo, Col.

A. C. Littlejohn, traveling freight agent of the Queen & Crescent Despatch, has been appointed commercial agent, with headquarters at New Orleans, La., vice A. B. Collins, transferred.

Frank Roach, chief clerk of the advertising department of the Union Pacific Railroad at Omaha, has been appointed advertising agent of the road, to succeed John T. Cummins, promoted.

T. O. Jennings, general freight agent of the Chicago & Eastern Illinois, has been appointed freight traffic manager, with headquarters at Chicago; E. S. Stephens, assistant general freight agent, has been appointed general freight agent, with headquar-

ters at Chicago; G. H. Kummer, coal freight agent, has been appointed assistant general freight agent; F. E. Webster, chief of the tariff bureau, has been appointed assistant general freight agent, and J. J. Clask has been appointed chief of the tariff bureau, effective September 1.

Engineering and Rolling Stock

W. W. Warner, general foreman of the Erie car repair shops at Marion, Ohio, has been promoted to the general foremanship of the steel car repair shops at Cleveland. Effective September 1.

E. S. Mudge, division engineer of the Atchison, Topeka & Santa Fe at Wellington, Kan., has been appointed assistant engineer in charge of valuation of the western lines, with headquarters at Amarillo, Texas.

C. D. Perry, assistant road foreman of engines of the Delaware & Hudson, has been appointed road foreman of engines with office at Oneonta, N. Y., vice O. E. Ackart, assigned to other duties.

R. D. Starbuck, special engineer on the staff of J. J. Bernet, vice-president of the New York Central at Chicago, has been transferred to New York as special engineer on the staff of A. T. Hardin, vice-president in charge of operation at New York.

OBITUARY

Robert Finney, general agent of the Baltimore & Ohio at Pittsburgh, Pa., died on August 24 at the St. Francis hospital in that city.

W. F. Stevenson, general agent of the freight department of the Canadian Pacific at New York, died on August 21, in that city, at the age of 60.

John Finnell, roadmaster of the Northern Pacific at Tacoma, Wash., was killed recently when the track motor car on which he was riding left the rails.

Edward F. McCrea, division engineer of the Northwest System of the Pennsylvania Lines West of Pittsburgh, with headquarters at Cleveland, died of cancer at the home of his parents in Logansport, Ind., on August 29.

Sidney T. Emerson, formerly well known as a civil engineer in railway construction work, died at his home in Chicago on August 30, aged 88 years. He served as consulting engineer for the Pennsylvania, the Missouri Pacific, Northern Pacific and the St. Louis, Kansas City & Colorado.

John H. Warder, secretary Western Society of Engineers since January 10, 1901, died at his home in Chicago on August 30, following a short illness. He was born in Cincinnati, Ohio, on January 21, 1846, and graduated from the Polytechnic College of Philadelphia in 1867 as a mechanical engineer. He was for some time connected with the Cincinnati Southern and with the bridge department of the Chicago, Milwaukee & St. Paul. He was also engaged for some time in bridge inspection at various points throughout the United States. He designed the water-works system for West Pullman, Ill., in 1893, and following this he was in charge of sewer construction in Lake View and other parts of Chicago, until his election as secretary of the Western Society of Engineers.

J. G. Metcalfe, formerly president of the Mexican International (June, 1902, to April, 1904), and then for one year vice-president of the National Lines of Mexico, died on August 31 at Pocono Summit, Pa., at the age of 67. He had lately been connected with Speyer & Company, bankers, New York City. He was born in Cambridge, Ohio, and began railway work as a telegraph operator. He subsequently served as superintendent of the Louisville & Nashville and lines now forming part of that road. From July, 1900, to November, 1901, he was general manager of the Denver & Rio Grande; then to June, 1902, was general manager of the Evansville & Terre Haute, when he became president of the Mexican International and subsequently vice-president of the National Lines of Mexico. In 1905, Mr. Metcalfe became a consulting expert on railroad matters and was appointed vice-president of the Manila Railway Company, which position he held at the time of his death. He was also vice-president of the Bolivia Railway Company, and a director of the Missouri Pacific.

Equipment and Supplies

LOCOMOTIVE BUILDING

THE CHICAGO & NORTH WESTERN is in the market for 34 locomotives.

THE ERIE has ordered five Santa Fe type locomotives from the American Locomotive Company.

THE SERBIAN GOVERNMENT has ordered 15 Prairie type locomotives from the American Locomotive Company. These locomotives will have 19 by 24-in. cylinders, 53-in. driving wheels and a total weight of 143,000 lb.

THE UTAH COPPER COMPANY has ordered six 6-wheel switching locomotives from the Baldwin Locomotive Works.

THE GARDEN CITY WESTERN, Garden City, Kan., has ordered one Mogul type locomotive from the Baldwin Locomotive Works.

THE AMERICAN RAILROAD COMPANY OF PORTO RICO has ordered three Consolidation type locomotives from the American Locomotive Company. These locomotives will have 14-in. and 20 by 20-in. cylinders, 37-in. driving wheels and a total weight of 83,000 lb.

CAR BUILDING

THE SAN PEDRO, LOS ANGELES & SALT LAKE is inquiring for five caboose cars.

THE WYOMING COAL COMPANY has ordered 50 mine cars from the Pressed Steel Car Company.

THE ATLANTIC COAST LINE has contracted with the Pullman Company for a private car.

THE INTERBOROUGH RAPID TRANSIT has ordered 489 sets of trucks from the Pullman Company.

THE WESTERN MARYLAND is in the market for 1,000 all-steel hopper cars and also for a few box cars.

THE MAINE CENTRAL has ordered 1,500 center constructions from the Standard Steel Car Company.

THE TENNESSEE COAL, IRON & RAILROAD has ordered 10 tank cars from the Pressed Steel Car Company.

THE ILLINOIS STEEL COMPANY has ordered 10 tank cars from the American Car & Foundry Company.

THE PITTSBURGH CRUCIBLE STEEL COMPANY has ordered 18 flat cars from the Pressed Steel Car Company.

THE UTAH COPPER COMPANY has ordered 50, 30-yd. extension side dump cars from the Clark Car Company.

THE NASHVILLE, CHATTANOOGA & ST. LOUIS has ordered 200 box cars from the American Car & Foundry Company.

THE CENTRAL STEEL COMPANY has ordered one 20-yd. extension side dump car from the Clark Car Company.

THE ANACONDA COPPER MINING COMPANY has ordered ten 20-vd. extension side dump cars from the Clark Car Company.

THE JONES & LAUGHLIN STEEL COMPANY has ordered 20, 100-ton side dump, side hopper cars from the Clark Car Company.

THE EDMONTON, DUNVEGAN & BRITISH COLUMBIA has ordered 10 stock cars from the National Steel Car Company, Hamilton, Ont.

THE ALBERTA GREAT WATERWAYS and the Edmonton, Dunvegan & British Columbia have ordered 100 box cars from the Canadian Car & Foundry Company.

THE CLEVELAND CLIFFS IRON COMPANY has ordered six center dump ore cars from the Clark Car Company. These cars will be built by the Cambria Steel Company.

THE ILLINOIS CENTRAL has ordered 300 underframes from the Haskell & Barker Car Company and has let the contract for

repairing 1,000 gondolas to the American Car & Foundry Company.

THE ATCHISON, TOPEKA & SANTA FE, reported in an unconfirmed item in the *Railway Age Gazette* of August 27 as having ordered 50 ore and concentrate cars, has ordered 25 concentrate cars from the Pullman Company and 25 ore cars from the Western Steel Car & Foundry Company.

IRON AND STEEL

THE SEABOARD AIR LINE has ordered structural steel work amounting to about \$50,000 for its new shops at Portsmouth, Va., from the Virginia Bridge & Iron Company.

THE VANDALIA has ordered from the Wisconsin Bridge & Iron Co. five 113-ft. 3-in. single-track through-riveted truss spans, totaling 560 tons, for a bridge at Logansport, Ind.

THE CENTRAL OF NEW JERSEY's order for 800 tons of fabricated steel for a pier to be built on the North river, New York, has been given to the Pennsylvania Steel Company.

THE PHILADELPHIA (PA.) SUBWAYS has ordered 8,500 tons of steel from the Keystone Construction Company for the first section of this line and an additional 24,000 tons will be ordered shortly.

THE CHICAGO, MILWAUKEE & ST. PAUL has let a contract for 314 tons of steel to the American Bridge Company, to be used on track elevation work for subways at Pratt avenue, Ashland avenue and Fargo avenue, in Chicago. The St. Paul has also ordered 134 tons from the same company for steel work on substations in various locations.

THE NEW YORK PUBLIC SERVICE COMMISSION, FIRST DISTRICT, has awarded contracts for track materials, to be used upon various lines of the Dual Rapid Transit System, as follows: Untreated ties and timber, J. H. Burton & Co., \$1,273,856; treated ties and timber, Long Leaf Pine Company, Inc., \$100,362; special work, order No. 3, Ramapo Iron Works, \$54,960; order No. 4, Wm. Wharton, Jr. & Co., \$41,907; cast iron, American Brake Shoe & Foundry Company, \$10,528; screw spikes, American Iron & Steel Manufacturing Company, \$25,741; felt pads, The Q. & C. Co., \$9,957; malleable iron, Foran Foundry & Manufacturing Company, \$36,118; tie plates, type A—Herbert W. Lockwood, \$123,975; type B—L. D. Rockwell, \$13,267; type C—L. D. Rockwell, \$5,140; type D—Herbert W. Lockwood, \$8,239; types E, F, G and H—Herbert W. Lockwood, \$17,139; types E-2, W and X—Ramapo Iron Works, \$2,901; cut track spikes, Herbert W. Lockwood, \$34,338; bolts and nuts, Oliver Iron & Steel Company, \$117,910.

MACHINERY AND TOOLS

THE AMERICAN CAR & FOUNDRY COMPANY is in the market for a number of engine lathes, axle lathes and other equipment for its Detroit plant.

FRENCH RAILWAYS IN TURKEY.—Press despatches report that the Turkish government authorities have been authorized to buy back the following French railway and tram lines in Syria, the purchase money to be provided by the ministries of finance and the Wakuf Pious Foundations: The narrow gage railway from Beirut to Zeirib; the tramway from Beirut to Hamslekin, in the Lebanon; the Rejak-Aleppo line to the junction with the Bagdad Railway; the line from Homs-Tripoli to the harbor of Muavene; the line from Jaffa to Jerusalem, and all the rolling stock, workshops and other properties of these lines.

HUNGARIAN RAILWAYS.—The Hungarian State Railways operate 5,505 miles of line and in April earned \$5,961,068, comparing with \$6,593,088 in April, 1914. The total receipts from July 1, 1914, to April 30, 1915, were \$60,774,001, comparing with \$69,369,838 for the corresponding period of the previous year.

A SAMPLE OF RUSSIAN FREIGHT RATES.—A new tariff has been put into effect on shipments of tanning materials from Vladivostok to railway points west of Omsk. The rate on L.C.L. shipments is from 2.7 cents to 1.6 cents per ton per mile. For carload shipments the rate varies from 2 cents to 7 mills per ton per mile.

Supply Trade News

The Chicago Malleable Castings Company, West Pullman, Chicago, is enlarging its plant.

Bertram Smith has been appointed manager of the Detroit office of the Edison Storage Battery Company, Orange, N. J. For the last year and a half Mr. Smith has been assistant manager of the Edison Storage Battery Supply Company, San Francisco, Cal., which company acts as the Pacific coast distributor for the Edison nickel-iron-alkaline battery. Previous to his connection with the Edison company he was manager of the battery department of the Chicago branch of the United States Light & Heating Company, New York. He had been secretary and treasurer of the National Battery Company, Buffalo, until its consolidation with the United States Light & Heating Company. The Edison Storage Battery Company recently moved its office from Cleveland to Detroit. The company's business in this territory has been rapidly increasing.

Bertram Smith

The Boss Nut Company, Chicago, has moved its offices from the Railway Exchange building to 1744-48 North Kolmar avenue.

C. B. Bouton, formerly president of the Union Foundry Works, Chicago, died at his home in that city on August 26.

William Graver, president of the William Graver Tank Works, East Chicago, Ind., died at his home in Chicago on August 26.

The Thorn Railroad Tie Company of Indianapolis, Ind., has been incorporated with a capital of \$80,000, and will manufacture railroad ties.

The Franklin (Pa.) plant of the American Steel Foundries, which has been closed for several months, opened on September 1.

Alexander Wilson, for many years superintendent of the railroad department of the Cambria Steel Company, died at his home in Johnstown, Pa., on August 30 at the age of 75.

J. W. H. James, for many years connected with the American Bridge Company, and a civil and mechanical engineer of broad experience, died at his home in Chester, Pa., on August 29.

Under the plan and agreement of May 12, 1915, of the Westinghouse Electric & Manufacturing Company, stockholders have taken all but \$457,000 of the \$20,710,000 new convertible bonds offered to them.

The Selby safety flag, described in the *Railway Age Gazette* of July 16, page 106, has been adopted as the standard flagman's outfit by the Mobile & Ohio, Illinois Southern, and St. Louis & San Francisco, and is now under service test on 15 other railroads.

David Newhall has opened an office in the Lincoln building, Philadelphia, Pa., and represents in the eastern district the National Boiler Washing Company and the National Waste Company, both of Chicago. Mr. Newhall will handle also various lines of railway and mill supplies.

A new corporation, Johnson, Sharp & Co., has been formed, with office in the Commercial Trust building, Philadelphia, to deal in iron and steel and their by-products, scrap material

and coal and coke. George T. Johnson is president and Sydney T. Sharp is secretary and treasurer.

A. Q. Tucker, vice-president of the Hydraulic Press Manufacturing Company, Mt. Gilead, Ohio, has been elected president, succeeding M. Burr Talmage; W. G. Beebe has been elected vice-president, succeeding Mr. Tucker; F. B. McMillin continues as general manager and secretary, and M. W. Spear has been elected treasurer, succeeding H. B. McMillin.

The Chicago Great Western has awarded a contract to the Roberts & Schaeffer Company, Chicago, for building a fireproof standard counterbalanced locomotive bucket coaling plant with automatic operation at Clarion, Iowa. The Chicago Great Western has in operation three plants built by the Roberts & Schaeffer Company a year ago. The contract price for the plant at Clarion is \$10,000.

Robert W. Hunt & Co., Chicago, has been commissioned to make what is known as their special inspection of the 115,000 tons of rails and accessories which, as mentioned previously in these columns, has recently been ordered by the Russian Imperial Railways Commission from the Cambria Steel Company, the Pennsylvania Steel Company, the Illinois Steel Company and the Tennessee Coal, Iron & Railroad Company.

H. V. Jamison, advertising manager of the American Sheet & Tin Plate Company, Pittsburgh, Pa., has been awarded a gold medal by the Panama-Pacific International Exposition Society in recognition of his services in the installation of the exhibits of the United States Steel Corporation and its subsidiaries. The United States Steel Corporation decided to make an extensive exhibit at San Francisco and Mr. Jamison was appointed director of exhibits. The corporation was accorded a grand prize for its exhibit and the gold medal was awarded to Mr. Jamison.

Edward M. Grove, treasurer of the McConway & Torley Company, Pittsburgh, Pa., died on Thursday, August 26. Mr. Grove was born in Chambersburg, Pa., on October 12, 1857. He went to Philadelphia when 14 years old and worked for a time in a printing office. In 1876 he became a telegraph operator. After three years of work as operator he was made district superintendent of the Pullman Company at Cincinnati, Ohio, and was later transferred to Jersey City, N. J. In 1886 he became assistant general manager of the Wagner Palace Car Company, with office in New York. In 1889 he resigned to become associated with the McConway & Torley Company. He has thus been 26 years with that company and for the last 15 years has been treasurer. Mr. Grove was president of the Railway Supply Manufacturers' Association in 1910 and in 1911 and devoted his time and thought generously to the interests of that association.

E. M. Grove

TRADE PUBLICATIONS

CAST IRON PIPE—The Central Foundry Company, of New York, has issued a small pamphlet entitled, Cast Iron Soil Pipe vs. Wrought Pipe, which is devoted to a discussion of the relative durability of the two kinds of pipe as ascertained from samples of wrought iron pipe taken from the Waldorf-Astoria and of cast iron pipe taken from the old Astor House.

RESULTS OF ELECTRIFICATION.—This is the title of Circular No. 1505, which has recently been issued by the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa. This

so-called circular is a book 9 by 11 inches in size, containing 72 well-illustrated pages. It aims to show the results obtained by electrification on some of the important steam railways of the world, and to give information of interest and value to steam railroad operators on electrification work. Contained in the publication are well-illustrated descriptions of the Norfolk & Western, the Pennsylvania, the New Haven, and other electrifications installed by the Westinghouse company. The Westinghouse Electric & Manufacturing Company has also recently issued the first number of "Westinghouse Electrification Data," which is to be a periodical chronicling the latest advances in the field of heavy traction. The present number contains a discussion of electric locomotive characteristics, some interesting figures on the comparative maintenance costs of steam and electric locomotives, as well as data on the New York terminal electrification of the Pennsylvania.

SAND DRYERS.—The Roberts & Schaefer Company, Chicago, has issued Bulletin No. 30, illustrating and describing the "Beamer" patent steam sand dryer, made by that company for drying sand for locomotive use.

POWER TRANSMISSION MACHINERY.—The Mesta Machine Company, Pittsburgh, Pa., has issued Bulletin Ka, containing a horsepower chart for determining the variables for rotating parts transmitting power, such as gears, pulleys, rope wheels, etc.

PNEUMATIC TOOLS.—Bulletin No. 130, issued by the Chicago Pneumatic Tool Company, Chicago, deals with the lubrication of pneumatic tools and treats also of Airoilene grease and oil, Chicago Pneumatic Oilers and the Little Grant Grease Machine.

PIPE ACCESSORIES.—The William Powell Company, Cincinnati, Ohio, has issued a booklet relative to the company's line of oil and air vents, expansion joints, valves and other accessories for oil wells and refineries.

POWER HAMMERS.—Beaudry & Co., Boston, Mass., have recently issued a booklet relative to the Beaudry Champion and Peerless power hammers, respectively. The booklet describes the hammers in detail and contains tables of sizes and dimensions.

BALL BEARINGS.—The S. K. F. Ball Bearing Company, New York, has recently issued a very attractive booklet relative to the economies of the light car in electric street railway service and the saving to be obtained by the use of ball-bearing journals on such cars.

AUTOMATIC MAIL EXCHANGE SYSTEM.—The Hupp Automatic Mail Exchange Company, Washington, D. C., has issued a booklet describing its system for taking on and delivering material at high speeds and giving in detail the nature of the equipment and its performance.

OPTICAL INSTRUMENTS.—The Bausch & Lomb Optical Company, Rochester, N. Y., has issued a pamphlet describing its microscope for the inspection and testing of materials. The various instruments manufactured by this company for this purpose are described in detail with illustrations.

METAL SHEARS.—The Canton Foundry & Machine Company, Canton, Ohio, has recently issued a catalogue entitled Canton Alligator Shears, describing and illustrating the company's line of metal cutting shears. These shears are equipped with double gears to counteract torsional strain. They are furnished with either belt or motor drive, but the belt drive is advocated as being more flexible.

UNIONS.—The Jefferson Union Company, Lexington, Mass., has issued a catalog describing the Jefferson unions of various types. The booklet contains views of the different kinds of unions and shows for what purposes they are made. The patented feature of this company's product is the brass seat ring, placed in a recess away from the runway of the fitting.

CORROSION:—THE CAUSE, THE EFFECT, THE REMEDY.—The Stark Rolling Mill Company, Canton, O., has issued a 100-page pamphlet which calls attention to the marked increase in the tendency to corrosion attending the introduction of sheet steel manufactured by the Bessemer or open hearth processes. An account is also given of the various causes of corrosion and describes also the manner in which these troubles have been overcome in Toncon metal. Fifty pages describe and illustrate the various uses for this product.

Railway Construction

CANADIAN PACIFIC.—The report of this company for the year ended June 30, 1915, shows that the company has 60 miles of new line under construction, on which work is now under way, as follows: On the Interprovincial & James Bay from Kipawa, Que., north 10 miles; on the Alberta division, the Stirling East branch, from Stirling, Alta., east 25 miles, and on the Swift Current North branch from Coronation, Alta., northwest 25 miles.

CUMBERLAND TRACTION.—Organized in Kentucky with \$50,000 capital to build a line between Edmonton, Ky., and Elizabethtown. Right of way has been secured and the first section to be built will be between Edmonton and Hiseville, 16 miles. G. H. Greenup, Elizabethtown, is back of the project.

DAYTON & ST. MARY'S (ELECTRIC).—This company was organized recently, it is said, to build an electric line from Covington, Ohio, north to Ft. Loramie, about 16 miles. The surveys have already been started. D. Dwyer, president, Dayton, Ohio.

GEORGIA ROADS.—The Chamber of Commerce of Rome, Ga., is conferring with the Seaboard Air Line, it is said, to secure the construction of a railroad from Rome south to Fish, 14 miles.

GULF, FLORIDA & ALABAMA.—Construction work is being pushed it is said, on the extension from Broughton, Ala., north to Kimbrough, 52 miles, and it is expected that a connection with the Southern Railway at Kimbrough will be made early this fall. Abutments for the drawbridge over the Alabama river at Yellow Bluff, Ala., are nearly ready for the steel work, for which a contract has been given to the American Bridge Company. An additional pier is also being built at the marine terminal at Pensacola. (April 23, p. 913.)

HELENA & SOUTHERN.—Incorporated with \$500,000 capital, it is said, to build from Helena, Mont., to Yellowstone Park. A section of the proposed route is to be over a partly graded line of the Three Forks, Helena & Madison Valley, which started work in 1912, on a line from Helena south to Yellowstone Park, about 150 miles, and up to January of this year had grading work finished on about 20 miles. E. A. Tennis, Salina, Kan., and formerly of Three Forks, Mont., is an incorporator.

HURON & NORTHEASTERN.—The Huron Investment & Construction Company is engaged in preliminary work on the proposed line to be built from Huron, S. D., north to Wahpeton, N. D., and eventually east to Duluth, Minn. It is expected that construction work will be started next month. The company filed articles of incorporation in South Dakota early this year with a capital of \$25,000 and headquarters at Huron. The incorporators include F. W. Henderson, Summit, S. D.; W. Pelham, Sioux Falls, S. D.; C. E. Wolfe and F. Budack, Wahpeton, N. D., and C. B. Adams, Chicago, Ill. At the same time the Huron Investment & Construction Company, with a capital of \$50,000 was incorporated by the same interests.

ILLINOIS CENTRAL.—The extension of the Illinois Central from Benton, Ill., to Old Ben Mine, a mile and a half out of West Frankfort, has been completed. It will be used solely for freight purposes.

LEXINGTON & EASTERN. See Louisville & Nashville.

LOUISVILLE & NASHVILLE.—Engineers are locating a branch of the Lexington & Eastern, it is said, up Colly creek near Whitesburg, Ky., to reach a rich coal and timber field in Letcher county. It is expected that a contract to build the branch will be let before November.

MORGAN-FENTRESS.—An officer writes that the plans call for building a line from Nemo, Tenn., northwest to Jamestown, 56 miles. A contract has been let to the Cumberland Construction Co., Harriman, Tenn., to build a section of 13 miles. The first section of 15 miles from Nemo via Castoosa, Parker and Mantrin is now in operation. The company expects to develop a traffic in forest products, coal, etc.

NASHVILLE, CHATTANOOGA & ST. LOUIS.—Work is now under way, it is said, on an extension of the valley line from Centerville, Tenn., to Totty's bend.

NEWTON, KANSAS & NEBRASKA.—This company, which was organized in 1912, to build from Milton, Kan., north via Newton and Abilene to Fairfield, Neb., will start work soon, it is said, on the line. A construction company has been organized at Newton to carry out the work. S. O. Waddell, chief engineer, Newton, Kan.

NEW YORK SUBWAYS.—The New York Public Service Commission, First District, has authorized the New York Municipal Railway Corporation to award the contract for the erection of steel, construction of track, etc., for the third tracking of the Broadway elevated railway in the borough of Brooklyn between Myrtle avenue and Aberdeen street to the Johnson-Gifford Company, the lowest bidder, at \$400,441. (July 23, p. 181.)

OZARKS RAILWAY.—Incorporated to build a railroad from a point in Ozark County, Mo., 10 miles from the Arkansas line, to Rothville, Baxter County, Ark., a distance of 36 miles. The capital stock is \$900,000, and the stockholders are: K. V. Lobbs, H. S. Wickersham, S. C. Bates and E. C. McAfee, of Springfield, Mo., and C. C. Feuster, of Mountain Home, Ark.

PETERSBURG & APPOMATTOX (ELECTRIC).—An officer writes that work is now under way building from Petersburg, Va., northeast to City Point and Hopewell, ten miles. The contract has been given to the Vaughan Construction Company, Roanoke, Va. The plan includes building a station, also a sub-station. T. M. Worthan, president, Richmond, Va.; W. W. La Prade and E. Wortham, engineers. (Aug. 20, p. 358.)

PHILADELPHIA (PA.) ROADS.—Contracts for the construction of the city hall station and tunnel section of the Broad street subway, and for the construction of foundations for the Frankford elevated in Philadelphia, Pa., have been signed, and the work is to be started on September 13. The Keystone State Construction Company was awarded the city hall station contract at \$1,700,000. The contract for the foundations for the Frankford elevated, extending from Callowhill street on the south to Unity street on the north, was awarded to James D. Dorney at \$142,590. (July 23, p. 182.)

SALEM & PENNSGROVE TRACTION.—Under this name a line is projected from Salem, N. J., north via Pennsville to Pennsgrove, about 12 miles. No action will be taken for the construction of the line until the engineers now at work make a preliminary report. A. B. Smith, secretary and treasurer of the Smith, Davis Lumber Company, Salem, is interested.

SALINA NORTHERN.—Contracts have been let for the equipment and for materials for building, from Salina, Kan., through Saline, Lincoln, Mitchell and Osborne counties to Downs and Osborne, 90 miles. Three miles of track has been laid and grading work is about finished between Salina and Lincoln, 35 miles. Several bridges are under construction. The Keystone Construction Company, Salina, Kan., of which E. A. Tennis is president, is building the line.

SHENANDOAH, FRACKVILLE & POTTSVILLE.—A contract is reported let by this company to J. B. Trexler, Reading, Pa., to build a line to connect Frackville, Pa., with St. Clair, five miles.

SOUTH DAKOTA ROADS.—A new company has been incorporated in South Dakota with \$2,000,000 capital by residents of Yankton to build a railway from Yankton, S. D., north through the counties of Yankton, Turner, McCook, Lake, Kingsbury, Hamlin and Codrington to Watertown, 145 miles. The incorporators include Edward S. Johnson, W. J. Fantle and W. E. Heaton, of Yankton. The same interests have incorporated the Yankton County Bridge Company, with a capital of \$1,000,000, to build a bridge over the Missouri river at Yankton.

SOUTHERN RAILWAY.—Bids have been asked for double-tracking work, it is said, between Greenville, S. C., and Central, 26 miles, and contracts for the work will be let about September 6. Plans are also being made for double-tracking work between Charlotte, N. C., and Spartansburg, S. C., and it is understood that contracts for the work south of Charlotte, which will involve very heavy construction, will be let soon.

TAMPICO & PANUCO.—According to press reports from Tampico, Mexico, a large force of men is now at work grading this

line and track-laying will be started soon. The projected route is from Tampico, Mexico, to Panuco, 46 miles, and the plans call for extending the line eventually for a total distance of about 250 miles. The line is to be built to provide the Topila and Panuco oil fields an outlet in addition to the water route of the Panuco river. The project is backed by British capitalists.

THREE FORKS, HELENA & MADISON VALLEY.—See Helena & Southern.

RAILWAY STRUCTURES

ANACORTES, WASH.—The Great Northern is building a two-stall frame engine house.

BALTIMORE, MD.—An officer of the Baltimore & Ohio writes that plans have been made to build a new steel coal pier at Curtis Bay, Baltimore, but authority has not yet been given to begin the construction work.

CHICAGO, ILL.—The Illinois Central has awarded the contract for subways at Forty-eighth, Fifty-second and Fifty-sixth avenues, Cicero, to the Pleas Concrete Construction Company, of this city. The Bates & Rogers Construction Co., of Chicago, has been awarded the contract for the reconstruction of three bridges on the Indiana division of the Illinois Central.

CLARION, IOWA.—The Chicago Great Western has awarded the contract for a new 100-ton coal chute in this city to Roberts & Schaefer Co., Chicago. The coaling station will be a steel-balanced bucket type equipped with scales and reversible Ogle automatic hoist, operated by a distillate oil engine.

DALLAS, TEX.—The city commission of Dallas has passed an ordinance extending to December 20 the time in which to begin construction work on a union interurban railway passenger station in Dallas, to be built jointly by the interurban lines centering in Dallas. The Stone & Webster Engineering Corporation, Boston, Mass., it is said, has already secured a site for the proposed station and terminals.

DESHLER, OHIO.—A contract has been let to George Georgenson, Hamilton, Ohio, and it is expected that work will be started soon on a new union station in Deshler, to be used jointly by the Baltimore & Ohio and the Cincinnati, Hamilton & Dayton. The new station will be of brick construction with a tile roof.

FT. DODGE, IOWA.—The contract for remodeling the mechanical terminal of the Illinois Central at Ft. Dodge has been let to the Stoddard Construction Company, Chicago.

KENSINGTON, ILL.—The Illinois Central has let the contract for a new passenger station in Kensington to T. S. Leake & Co., Chicago.

LOGANSPORT, IND.—The Vandalia has let the contract for the construction of a bridge over the Wabash river on the Michigan division to the Wisconsin Bridge & Iron Company, North Milwaukee, Wis. The bridge will consist of five riveted Pratt truss spans 113 ft. 3 in. long on stone piers and abutments reinforced with concrete. The superstructure will contain about 200 tons of steel. The estimated cost of the superstructure, including erection, is \$60,000.

MACON, GA.—The Central of Georgia is making plans for a viaduct to be built over Pine street. The work has not yet been authorized.

MOUNT VERNON, N. Y.—Contracts for the elimination of the Mount Vernon avenue and Oak street grade crossings and the erection of a new station on the West Side will be let by September 20, according to an order just issued by the New York Public Service Commission, First district. The order also provides that the work of removing the tracks from the present right of way to the right of way, 350 feet eastward, must be commenced on or before October 1, 1915.

NEW YORK.—The New York Public Service Commission, First district, has awarded the contract for the construction of station finish on Section No. 2 of Routes Nos. 36 and 37, the Astoria elevated line, in the Borough of Queens, to Charles Meads & Co., the lowest bidders, for \$268,102. (August 13, p. 302.)

The Altoria Realty & Construction Co. submitted the lowest bid at \$80,636, for the station finish work on Routes Nos. 16 and 18, being respectively the Jerome avenue and White Plains

elevated line, in the Borough of Queens, to Charles Meads & Co., the lowest bidders, for \$268,102. (August 13, p. 302.)

The Altoria Realty & Construction Co. submitted the lowest bid at \$860,636, for the station finish work on Routes Nos. 16 and 18, being respectively the Jerome avenue and White Plains road elevated lines in the borough of the Bronx.

The New York Municipal Railway Corporation has awarded to John Thatcher & Son, the lowest bidders, at \$320,325, the contract for the construction of eight stations in connection with the third-tracking work on the Broadway elevated line in the borough of Brooklyn.

PORTSMOUTH, VA.—The Seaboard Air Line has given a contract to the Christian Construction Company, Durham, N. C., to build additional shop facilities at Portsmouth. The work will include a machine and erecting shop, blacksmith shop, flue shop, engine carpenter and paint shop, also a sub-station. The work will be pushed to completion, and it is expected that it will be finished early in 1916. There is considerable steel work involved in the construction of the main buildings, and hy-rib walls or similar material will be used in the machine and erecting shop.

ROCKFORD, ILL.—The Illinois Central has let a contract to the H. W. Nelson Company, Chicago, for the concrete work in rebuilding a bridge over the Rock river.

ROYSTON, GA.—Bids are wanted by the Southern Railway for building a new station of frame construction at Royston to replace the structure destroyed by fire.

SAN ANTONIO, TEX.—The directors of the San Antonio Belt & Terminal Company have formally accepted a 25-year franchise from the city commission authorizing the construction of new passenger and freight terminals.

SAN DIEGO, CAL.—The San Diego & Arizona will erect a steel bridge across Campo Creek at the end of Tunnel No. 4. Charles W. Corbaley Company, Los Angeles, has been awarded the contract for the construction work and the Llewellyn Iron Works of Los Angeles will furnish the steel.

ST. PAUL, MINN.—Work on the proposed St. Paul Union Depot has been delayed by the refusal of the United States board of army engineers to approve certain changes in the river channel suggested by the Union Depot Company.

THE DALLES, ORE.—The Oregon-Washington Railroad & Navigation Co. has let contracts for building roundhouses and machine shops, it is said, at The Dalles and at Pilot Rock. The estimated cost of the work is \$95,000.

WATERLOO, IOWA.—The Waterloo, Cedar Falls & Northern has given a contract to the Black Hawk Construction Company, it is said, to build a freight house on Utica street, near Mulberry street, in Waterloo. The building will be 40 ft. by 200 ft., and will be of steel, brick and concrete construction. It will cost about \$50,000.

WILMINGTON, DEL.—Contracts have been let by the Baltimore & Ohio to the James F. Brogan Company, Philadelphia, Pa., for the concrete foundation and to the King Bridge Company for the superstructure of a bridge to carry Lancaster avenue over the tracks in Wilmington. Work will be started on the improvement at once.

YANKTON, S. D.—See South Dakota Roads under Railway Construction.

EXTENDING AMERICAN COAL TRADE.—The first cargo of American coal that there is any record of as having reached Patras, Greece, was received there late in July. The cargo, consisting of 6,000 tons of Pocahontas coal, was shipped from Norfolk and 3,400 tons was for use on the Piraeus-Athens-Peloponnesus Railway (locally called the Pap). It is said that the price of the coal at Patras was \$15.07 a ton.

PORT CONDITIONS AT MARSEILLES.—Almost since the beginning of the war there has been congestion at Marseilles, France, and a large number of ships have had to wait in the harbor for an opportunity to discharge cargo. There are now only about three ships in the outer harbor and 22 in the basins awaiting berths. It is expected that conditions will become normal in about six weeks. New warehouses, with a total capacity of 80,000 tons, have recently been completed.

Railway Financial News

DELAWARE & HUDSON.—A meeting of stockholders is to be called September 30 to authorize an issue of \$14,451,000 5 per cent 20-year convertible bonds to be offered to stockholders of record as of September 9 at par. The offering is to be made subject to the necessary approval of the New York Public Service Commission and has been underwritten by Kuhn, Loeb & Co. and the First National Bank, both of New York. The bonds are convertible for 10 years beginning October 1, 1917, on a basis of \$1,500 face value of bonds for 10 shares of stock, the total par value being \$1,000.

LAKE ERIE & PITTSBURGH.—The Public Utilities Commission of Ohio has approved the issue of \$3,540,000 first mortgage 5 per cent bonds of 1915-65, guaranteed jointly by the New York Central and the Pennsylvania Company.

LOUISIANA, TEXAS & MEXICO.—See New Orleans, Texas & Mexico.

MISSOURI PACIFIC.—A new protective committee has been formed to represent the trust 5 per cent bonds, due January 1, 1917, and the first collateral mortgage 5 per cent bonds, due August 1, 1920. The committee consists of Moreau Delano, of Brown Brothers & Co., New York, chairman; Willard V. King, president, Columbia Trust Company, New York; Asa S. Wing, president, Provident Life & Trust Company, Philadelphia, Pa., and L. Edmund Zacher, treasurer, the Travelers' Insurance Company, Hartford, Conn. Bondholders are requested to deposit their bonds with the Columbia Trust Company, New York. The interest due September 1 on the trust 5 per cent bonds was not paid by the receivers and the committee has arranged to advance to depositing bondholders the amount of the coupon due September 1 and has also arranged to advance the interest due February 1, 1916, on the collateral mortgage 5 per cent bonds in case that interest is not paid by the receivers.

NATIONAL RAILWAYS OF MEXICO.—The annual meeting is to be held October 6 and at that time it is proposed to ask authority from the stockholders to issue prior lien and general mortgage bonds as is found expedient, and at that meeting also will be presented the report of the board of directors for the two years ended June 30, 1915.

NEW ORLEANS, TEXAS AND MEXICO.—Arrangements are understood to be nearly completed for the formation of a new company to be called the Louisiana, Texas & Mexico, to take over the New Orleans, Texas & Mexico, which went into the hands of a receiver along with its parent company, the St. Louis & San Francisco. Stock of the New Orleans, Texas & Mexico is held by the St. Louis & San Francisco, but will receive nothing in the reorganization. Holders of the \$28,582,930 first mortgage 5 per cent and 4½ per cent bonds will be asked to subscribe to the extent of 20 per cent of their holdings to new first lien collateral trust 6 per cent bonds and will receive in exchange for this subscription and their present holdings, beside the first lien collateral 6s, 50 per cent of their present holdings in 5 per cent income bonds and 50 per cent in stock. Bondholders who do not subscribe for the new first lien 6s will receive but 40 per cent of the income bonds and 50 per cent new stock. It is said that the Guaranty Trust Company and the Columbia Trust Company, both of New York, are to underwrite the plan.

PENNSYLVANIA.—The Public Utilities Commission of Ohio has approved of the issue of \$1,222,050 special guaranteed 4 per cent stock of the Cleveland & Pittsburgh, a subsidiary of the Pennsylvania, to the Pennsylvania to reimburse that company for expenditures made for capital purposes.

ST. LOUIS & SAN FRANCISCO.—It is understood that a syndicate is being formed to lend to the St. Louis & San Francisco stockholders \$45 of the \$50 assessment which the plan of reorganization calls for from the holder of each share of stock. Stockholders will, of course, put up as collateral for this loan the securities which they are to receive in the new company.

Is it not true that the greater proportion of engine failures in the last analysis are "men" failures, due to poor judgment and lack of knowledge? This condition in turn may be charged to poor and inadequate supervision. To remedy it each failure must be carefully and thoroughly investigated. One great trouble on some roads is that the officers in charge are satisfied with superficial investigations and reports. These are useless and often result in having one branch of the service or department unjustly pass the blame to another, with resulting friction and waste of energy; meanwhile the real cause of a failure is overlooked and similar failures

Responsibility for Engine Failures

may continue to take place with more or less frequency. Conditions of this kind require an iron hand and can best be handled by a committee or board of responsible officers, selected from the different departments interested, which will insist on such thorough and complete reports of each failure as to enable the blame to be properly placed. This board should also be charged with the responsibility of seeing that defects in either equipment or organization are remedied and that abuses are removed.

D. C. Buell, director of the Railway Educational Bureau, makes several suggestions in a letter on another page which demand

Make the Service More Attractive

consideration from those who are interested in the necessity of giving more attention to training railway employees. To attract and hold desirable young men the work should be made as attractive as possible and means provided by which those who are ambitious to fit themselves for promotion may do so. This does not mean that the work should be made easier or the responsibilities lightened. Hard work and responsibility have an attraction for live, wide-awake young men if they can see that their efforts count and are appreciated. Nothing is more disheartening than to grind along with the feeling that their work is unimportant or that their efforts are being overlooked and that there is little opportunity for advancement; and yet, considering the general atmosphere and conditions in many railroad offices, it is not surprising that this feeling should prevail. Railroad work, because of its very nature, has a fascination for most young men and it should not be difficult to make the service still more attractive by developing a comprehensive scheme for training the young men to increase their knowledge and efficiency and helping them to fit themselves for more important positions and greater responsibilities.

The address on "Train Despatchers and Division Officials," presented by J. P. Finan at the convention of the superintendents' association and published in the issue of August 27, page 380, calls attention to a situation with reference to the treatment and status of the train despatcher that has rankled in the minds of the despatchers

The Status of the Train Despatcher

for a long time and has caused considerable agitation in the conventions of the Train Despatchers' Association for several years, without having attracted much notice elsewhere. In brief, Mr. Finan urges a better recognition on the part of division officers of the difference that exists, or should exist, in the relations between the company and the despatchers and other employees, and of the fact that the despatchers' relation to the company is, or should be, just a little broader than that comprehended by the word "employee." He shows that, rightly or wrongly, there exists in the minds of a great many despatchers a feeling that their superior officers consider, or at least treat them, no differently from what they do the employees who are affiliated with organizations that demand from their members a loyalty paramount to the loyalty they owe the company, and that possibly their condition might be improved by the formation of a "protective association" like others that have been able to force concessions from the railways. The Train Despatchers' Association has never been such an organization. Its aims and functions have been the same as those of other organizations of railway officers, being directed toward the increase of efficiency in the work of its members. However, only the most heroic efforts on the part of its officers have prevented turning it into a "protective organization," in other words, a labor union. Even now there is a strong movement on foot to affiliate the train despatchers with one of the great labor brotherhoods, and it is understood that many of the despatchers are in a receptive mood. As Mr. Finan says, there should be no more reason for a protective organization of despatchers than of superintendents, and the idea of the despatchers owing allegiance first to a union, and second to the railway, is almost unthinkable. It is gen-

erally recognized that railway officers and other employers in the past have been to a large extent responsible for the present strength of the labor unions, and it would be unfortunate if their treatment of the dispatchers should lead to the formation of another labor union affecting so vital a branch of railway operation.

"Why do you suffer our ignorance, which so fatally injures your business?" This frank, forceful question tersely sums up "A

**Inefficiency
in
Railroad Offices**

Clerk's Plea," which appears in another part of this issue, and which should be carefully studied by every railway officer who is interested in cutting out waste and inefficiency in office work—and this means

the entire service, for men engaged in the actual work of carrying on transportation and looking after maintenance may be, and often are, seriously handicapped and discouraged in their efforts by inefficiency and lack of team work on the part of the office forces. The "clerk's plea" is an indictment of the thoughtlessness of the railroads in overlooking the vital necessity of providing for the proper instruction and training of the office forces. Agitation of this question, which is now going on, would indicate that many railway officers are awakening to the seriousness of the situation. The problem will be half solved if railway executives generally will recognize the necessity of taking steps to solve it and will concentrate their energies on improving the conditions which now exist. It is true that the criticisms made in the article may not apply to all roads, but the indications are that such conditions exist to a greater or less degree on most of them.

THE LICENSING OF ENGINEERS

ALTHOUGH the licensing of engineers has been the subject of much discussion among the technical associations for several years, Illinois is the first state which has actually passed a law providing for this. Prompted by dissatisfaction on the part of consulting structural engineers with the broad provisions of the existing state architects' law, a committee of the Western Society of Engineers procured the enactment at the last session of the state legislature of a similar law governing the licensing of structural engineers. Briefly, this law requires that any person engaged in designing or supervising the construction, enlargement or alteration of any structures other than buildings, shall have a license or be under the employ of a licensed engineer. The act defines structures as including coaling stations, elevators, docks, bridges, reservoirs, shops, roundhouses, power houses, etc. Provision is made for the licensing of any person now practising structural engineering in Illinois without examination upon the payment of a fee of \$50. No arrangement is made, however, for the licensing of non-resident engineers without examination regardless of professional standing or experience.

Thus, the chief engineers and bridge engineers of railroads with headquarters outside the state must pass an examination before the state examining board or arrange for some subordinate, resident in the state, to take out such a license and do work in the state over the latter's signature. Likewise, a consulting engineer or a manufacturer located without the state and engaged in the design and erection of structures coming within the limits of this law must pass an examination before he can compete on an equality with resident engineers. While the law contains a reciprocal provision authorizing the granting of licenses to engineers of other states in which similar laws are in effect, since Illinois is the only state which has passed such a law, this measure is of no consequence. Carried to its logical conclusion, the engineering executive of a railroad will be required to procure a license from every state through which the road passes and the expense, whether borne by the individual or by the road, will be considerable.

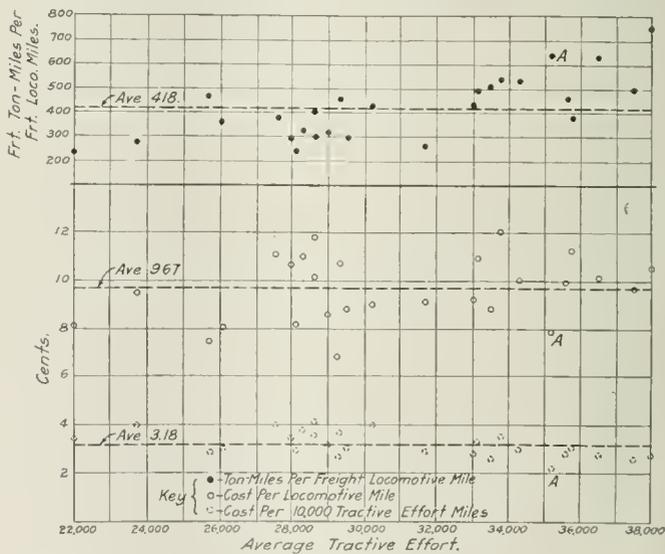

Even more serious is the confusion resulting from a variety

of laws with different provisions and requirements which may be expected if this movement becomes general. Thus, to improve a purely local situation, with only a secondary desire to improve the safety of design, this restrictive measure has been enacted. The licensing of engineers has never been favored by the majority of the engineers themselves, and it is not expected that this measure will meet with any greater degree of approval.

LOCOMOTIVE MAINTENANCE

IN order to secure a comprehensive idea of what the large capacity locomotives have done toward reducing the operating expenses of the railroads of this country, data taken from the 1913 report of the Interstate Commerce Commission is plotted on the accompanying chart. Twenty-seven representative roads whose locomotive repairs amounted to over a million dollars each were considered, and the cost of locomotive repairs per locomotive mile and per 10,000 tractive effort miles, and the freight ton-miles per freight locomotive mile were computed for each road. These results were plotted according to the average tractive effort of all the locomotives on the respective roads.

The upper set of points shows how those roads that have increased the capacity of their freight locomotives have been able to increase the ton-miles per locomotive mile; the middle set of points shows that the cost of locomotive maintenance per locomotive mile increased with the heavier engines, and the lower set of points shows that even though there was an increase in the cost of maintenance per locomotive mile there was, in reality, a decrease in the cost of locomotive maintenance if the hauling capacity of the locomotives is considered—that is, the cost of locomotive maintenance per 10,000 tractive effort miles was less for those roads having locomotives of the higher average tractive effort than for those roads having the lesser. While it would have been desirable to compare the cost of locomotive maintenance with the

ton-miles, it was impossible to do this as the statistics presented in the Interstate Commerce Commission's report do not differentiate between the cost of repairs for passenger and freight locomotives. However, by referring to the top and bottom set of points a clear conception of what is being accomplished may readily be obtained

Although there is considerable variation among the "ton-miles per locomotive mile" set of points, it does not necessarily mean that all the roads that are low in their performance are inefficient, for the operating conditions will, to a large extent, affect this figure. The road which appears to have the best record in all these sets of points is marked with the letter A. This road is a low grade line and has a large amount of through business, its main line being over 500 miles long. The usual "cost per locomotive mile" basis of figuring the cost of locomotive maintenance

does not reflect the actual conditions, as does the cost per 10,000 tractive effort miles. The former shows an increase in maintenance cost for the larger locomotives, where there is in reality a decrease from the standpoint of the total work the locomotives are capable of doing.

The chart shows that the higher capacity locomotives are relatively cheaper to maintain and that they are being used, in most cases, to good advantage, but it should not be understood that the larger locomotives will be suitable in all cases. Heavy power has a big field of usefulness, but the traffic conditions must warrant it. Three large roads of the West and Southwest having locomotive maintenance costs much in excess of those shown above, according to both bases, have been omitted for the reason that their conditions are so different from the average road.

WHILE OTHER ACCIDENTS DECLINE TRESPASSING ACCIDENTS STILL INCREASE

RAILWAY travel has not for many years been especially hazardous and it is becoming safer every year. Working on a railroad, while properly classed as a more or less dangerous occupation, according to what department an employee is in, is also each year attended with a reduced degree of risk. But trespassing on railway tracks and trains has always been and still continues to be a very unsafe occupation, and is not growing less so.

While regulating bodies of all kinds have been very busy passing laws and issuing orders to prevent railway accidents, the railways themselves have exerted the most strenuous efforts to remove one of the most serious blots on their record, with the result that fatalities to passengers as well as to employees have been steadily decreasing. To the most numerous class of railway casualties, however, the fatalities to trespassers, the same bodies that have been most vigorous in regulating the railways have shown indifference; and this in spite of the fact that the number of people killed while unlawfully using the railroad tracks as a short cut or stealing rides on cars and engines, has continued to grow from year to year.

E. W. Camp, attorney for California for the Atchison, Topeka & Santa Fe, in his address before the convention of the American Association of Railroad Superintendents at San Francisco, described some of the experiences of the roads in their recent futile efforts to interest the legislatures of the various states in a bill to make trespassing a misdemeanor. For example, he showed that in some states the bill could have been passed with a proviso that it should not apply to pickets during a strike!

It is interesting, therefore, to contrast the tendency shown by the kind of accidents for which the railways may be held responsible with the tendency of those for which no one is to blame but the victims themselves and the public and its representatives who refuse to lift a finger to stop the slaughter.

The number of railway casualties is so greatly affected by the volume of traffic and other factors that comparisons of individual years, or that fail to take such factors into consideration, are liable to result in very misleading conclusions, and it is far safer to compare periods of years. The statistics needful for such comparisons are available in the reports of the Interstate Commerce Commission for the years 1890 to 1914. For many years railway casualties increased very rapidly, mainly because the number of people exposed to railway accidents of all kinds, the mileage of railroads, the number of trains run and the volume of traffic handled, were increasing very rapidly. The fact that the increase in accidents was less than the increase in the chances of accident is frequently overlooked.

Comparing the last five-year period for which we have the figures, 1910 to 1914, with the period 1890 to 1894, the number of passengers killed increased 8 per cent, while the mileage of railroads increased 58.9 per cent and the number of passengers carried increased 86 per cent. The passengers carried one mile increased 153 per cent. The number of employees killed in the last five-year period was 30 per cent greater than in the first

period mentioned, but the number of employees was 114 per cent greater, and the tonnage of freight handled was 185 per cent greater, while the number of tons carried one mile was 225 per cent greater. These are the accidents with which railroading as a business is fairly chargeable. The number of trespassers killed during the last five years, however, was 52.6 per cent greater than during the period 1890-1894, the increase in fatalities to trespassers being twice as great in proportion as the increase in fatalities to employees and over seven times as great in proportion as the increase in passengers killed.

Such comparisons go back to the unregulated days of railroading. What are the facts for more recent years? Comparing the period of 1910-1914 with the preceding five-year period, 1905-1909, we find that the number of passengers killed was 19.3 per cent less in the latter period than in the former; and the number of employees killed was 4 per cent less, in spite of an increase in railroad mileage, in the number of employees and in the volume of both freight and passenger traffic. While there were these absolute decreases in the numbers of fatalities to passengers and employees, there was an absolute increase of 1.7 per cent in the number of trespassers killed.

If the improvement in respect to the safety of railway travel and employment be largely attributable, as some maintain, to regulation, to what must we attribute the continued increase in the number of fatalities to trespassers? As a matter of fact, the reduction in other accidents is mainly creditable to the managements of the railways, while the continued increase in fatalities to trespassers is mainly due to bad government. The railways have policed their tracks and arrested trespassers by thousands, only to see them turned loose because the judges have refused to convict them and because local communities have declined to stand the expense of their incarceration.

That the percentage of increase in fatalities to trespassers has not been larger is due rather to the activities of the railways in keeping up an agitation regarding the evils of trespassing than to any assistance they have received from legislatures, courts or commissions.

A few years ago C. C. McChord of the Interstate Commerce Commission called attention to the fact that from 1890 to 1909 a total of 86,733 trespassers had been killed on American railways. This represented 53 per cent of all railway fatalities. Since then many laws have been directed against the 47 per cent, but none against the 53 per cent. In the five years since 1909 the total fatalities to trespassers has been swelled to 113,480, an increase in five years of 26,747, and in 1914, 5,471 trespassers were killed. The percentage of trespassing fatalities to all railway fatalities is now slightly over 53 per cent.

In 18 years out of the last 25 more trespassers were killed than during the year before. In the five-year period, 1890-1894, the total was 17,523; from 1895-1899 it was 19,464, an increase of 11 per cent; from 1900-1904 it was 23,455, an increase of 20 per cent; from 1905-1909 it was 26,291, an increase of 12 per cent, and from 1910-1914 the increase was 1.7 per cent. While the railways have succeeded in reducing their own accidents in spite of the increase in mileage and traffic, the number of trespassers killed has almost invariably fluctuated with those factors. In other words, it has been governed almost entirely by the increase in the chances of accident. The more railroads there are and the more trains there are run the greater is the hazard that they will kill persons who insist in walking on the track, and apparently the more people there are in the United States the more trespassers there are.

The railway accident record is bad enough without being exaggerated. It has always been widely published and hence has received more than its proper share of attention as compared with the casualties in other industries. We sometimes read of an accident in which people have been "slaughtered like sheep." But the American railway accident record can never be properly understood nor adequately dealt with until some action is taken by the constituted authorities to separate the sheep from the goats and protect the goats from the consequences of their natural propensity.

Letters to the Editor

FACTOR OF ADHESION

ST. MARY'S, Pa.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The letter published in your issue of May 7, 1915, on the above subject, was written along the lines that appealed most forcibly to the writer at the time, without a thought of evading the direct issue on the question. To satisfy the criticism of Mr. Baxter, published on page 1463 of your issue of June 25 1915, he will endeavor to show why he does not believe in factors of adhesion higher than from 4 to 4.25.

The adhesion of a locomotive is the resistance which prevents or opposes the slipping of the driving wheels on the rails, and is due to the friction of the former on the latter. When we consider the process of starting a locomotive there is, at any instant, as we gradually apply the effort, an amount of friction called into play just sufficient to balance the effort; as the effort increases so does the friction, until it reaches a certain limiting value beyond which it cannot go. Any increase, then, causes the slipping of the driving wheels. Therefore, the logical conclusion is that the limiting friction should just balance or slightly exceed the tractive effort for the most economical condition of the rails. As the limiting friction is governed by the same laws as the friction of motion, with, however, a slightly greater co-efficient in most cases, it stands to reason that the factor of adhesion should be chosen from the analysis of the values obtained from these laws; the values of which can be easily demonstrated if one chooses to go to the trouble of making a few simple experiments. These values for the four most important rail conditions are nearly as follows:

On a dry sanded rail	3
On a dry rail	4
On a wet, sanded rail	5
On a wet or frosty rail	6

The most economical factor of adhesion is the one that will give the greatest earning power the year round at the least cost per pound of locomotive. There is no use in spending time on the factors 3 and 6, as we are all aware that they are unreasonable; the former because a locomotive could not carry enough sand to sand the rails every trip from start to finish, and even if this were possible, the cost of tires and rails would prohibit its use; the latter because we do not have wet or frosty rails the whole year round and the loss in tonnage is excessive. The advent of the trailing wheel types, such as the 4-4-2, 4-6-2 and 2-8-2 in late years is probably responsible for increasing the factor of adhesion to from 4.5 to 5 or over. These types were primarily developed to obtain boiler capacity, but it has been found that they are more slippery than the non-trailer types on grades with a factor of 4, consequently the wheel arrangement has possibly forced the increase in the factor of adhesion.

Now, let us decide upon a factor, say 4 or 5, by working out an example. Suppose we have two locomotives weighing 200,000 lb. on the driving wheels, one with a factor of 4 and the other with a factor of 5. The locomotive with the factor of 4 would have 50,000 lb. tractive effort, and the one with 5 would have 40,000 lb. Suppose that it requires 50 lb. per ton of locomotive and train to start on the controlling grade; then the two locomotives would handle 1,000 tons and 800 tons respectively, of locomotive and train, the one with the factor of 5 losing 25 per cent in tonnage. It is a well-known fact that a locomotive can handle considerably more tonnage after the train is in motion than it can start, consequently the locomotive is only valued for what tonnage it will start. Therefore, starting power, limited only by the dry-rail condition, is what is needed. It may be said that the locomotive with the factor of 4 cannot always handle the 1,000 tons. True, but the tonnage can be cut to suit the conditions and still it will usually handle more tonnage than the locomotive with the factor of 5. On the other hand the

locomotive with the factor of 5 cannot take advantage of dry rail conditions to the fullest extent because dry rail conditions will utilize a lower factor of adhesion than the locomotive can attain.

The conclusion is that the factor of adhesion should be slightly greater than the ratio between the limiting friction in pounds, and the weight on the driving wheels in pounds which, for the most economical rail conditions would be from 4 to 4.25.

As the writer is very much interested in Mr. Baxter's communication appearing in the issue of June 25, he would be pleased to see a further analysis by Mr. Baxter of the statements made therein to show why a high factor of adhesion is necessary.

E. F. GIVIN

Pittsburgh, Shawmut & Northern.

THE TRAINING OF RAILWAY EMPLOYEES

OMAHA, Neb.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The article "How to Select and Promote Your Men," written by Roy V. Wright, which appeared in your issue of August 6, is a very timely one.

I have been closely in touch with Dean Schneider's work and agree with him largely. While there no doubt is something in phrenology, character reading, etc., the fundamental truths underlying such a science as character reading—if it may be so spoken of—are not yet known, and, consequently, attempts to work out anything but very general results along these lines are as apt to fail as to succeed.

Railroad work is not as attractive to young men as it was ten years ago. One of the important problems today is to make the work more attractive to the younger generation so that there will be a better class of material to select from.

One who has had experience in trying to interest railroad men in increasing their efficiency by study and thus fitting themselves for promotion, finds that from this particular point of view railroad employees can be divided into several main classes:

There are those ambitious fellows who deny the right of seniority, so-called lack of "pull" or any other condition to stop them for a moment in their strenuous efforts to reach the top of the ladder.

Then, there is another class that sit back and say, "What's the use. You've got to have a pull; you can never get any further without it."

Still a third class is impressed with seniority promotions in the office. They plug along, impatiently waiting for the man ahead of them to die or get fired so that they will get another \$5 a month. There is an appalling number of such men in our railroad general offices today. They need to be reached to increase general office efficiency more perhaps than any other class of men.

Again, we have a considerable number of men who fail to realize the fundamental principles which their unions stand for and misuse their affiliation, depending on it to hold them in their jobs and get them the highest possible wages for the work, irrespective of its quality. The characteristic of this class of man is that he does not aspire to a higher position than a workman at his trade and depends upon his affiliation to hold him where he is. He is not going ahead, and, consequently, the procession is passing him.

Then there is another large number of railroad employees that are not affiliated with railroad organizations and that have not been intelligently handled by their immediate superiors. Promotions of this class of men have been more or less guesswork, and such guesswork promotion breeds inefficiency as is the case with those depending upon seniority.

Of all the educational work that is being done by railroads, either directly or through co-operation with outside educational institutions, the greatest success has been obtained where officers of the railroad have been sufficiently impressed with the educational work so that they have kept in touch with it closely, and have encouraged those who are ambitious enough to study by promoting them as their increased efficiency justifies and opportunity offers.

There is no doubt that a very important feature of railroad

work should be the intelligent selection and training of new men. It is also true that these men should be watched as outlined by Dean Schneider. Henry Ford has worked out a practical solution of the problem of transferring a man to work at which he will be successful rather than firing him because he does not make good at some certain job. A railroad with its many different lines of work should be able to do this.

On the other hand, the question arises as to whether the railroads give sufficient encouragement to the men in their employ who are ambitious and would be willing to increase their efficiency if they felt the effort would be appreciated.

At present railroad employees can obtain educational service at a nominal charge. With such service available to its employees, a railroad might well use the money, otherwise necessary to spend for a comprehensive scheme for the education of their men, on a department that would be responsible for the employment and proper placing of employees.

If it was understood that only those sufficiently ambitious to take time to study the literature of their business, as outlined in a recent editorial in the *Railway Age Gazette* entitled, "The Student in the Railway Business," could reasonably expect advancement, practically every man worth while would be anxious to become a student. Then the department responsible for the men could keep in touch with their studying on one hand and their practical work on the other, so that promotion would become more or less of an exact science instead of a hit-and-miss proposition, and something would be accomplished toward a solution of the problem at a cost ridiculously low compared to the results which it is possible to obtain.

D. C. BUELL

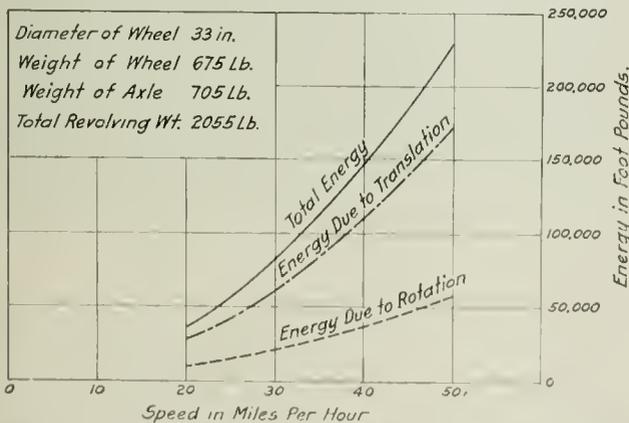

Director, Railway Educational Bureau.

ENERGY CONTAINED IN REVOLVING WHEELS AND LOCOMOTIVE SIDE RODS

CHICAGO, Ill.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Recently I had occasion to prepare some data on the energy contained in the revolving parts of locomotives and freight car wheels for different rates of speed, and as it may be of interest to your readers I am glad to submit it herewith. The diagram shows the energy contained in one pair of freight car wheels, including the axle, for speeds ranging from 20 to 50 m.p.h. Each wheel was 33 in. in diameter and weighed 675 lb.; the axle weighed 705 lb., making a total weight of 2,055 lb. To

Energy Contained in a Pair of Mounted Car Wheels at Different Speeds

obtain the total energy per car for all the revolving parts the results shown should be multiplied by four. In switching movements the average engine speed may be far below the minimum here shown, and the speed at which cars actually come in contact is below that of the engine used in accelerating them to speed. From the figures given, however, it should be clear that the destructive effect of impacts, or shocks, from switching, particularly to detached cars when brakes are not used to decelerate speed, is far in excess of the generally accepted estimates among railway men.

ENERGY CONTAINED IN MOUNTED DRIVING WHEELS OF DIFFERENT WEIGHTS AT VARIOUS SPEEDS

Road	Size of Locomotives Considered	Speed in M.P.H.	Foot Pounds of Contained Energy		
			Rotation	Translation	Total

	Cylinders....20 in. by 28 in.	40	237,240	453,290	690,530
	Revolving unit wt...8,480 lb.	50	361,050	709,840	1,070,890
D	Type 4-4-2	10	20,030	39,190	59,320
	Weight.....105,000 lb.	20	88,100	158,060	246,170
	Boiler pressure.....185 lb.	30	198,290	356,200	554,510
	Cylinders....27 in. by 28 in.	40	284,580	631,860	916,440
	Revolving unit wt...11,860 lb.	70	1,079,550	1,936,670	3,016,220
E	Type 4-4-2	10	17,640	32,160	49,800
	Weight.....105,400 lb.	20	72,320	129,700	202,020
	Boiler pressure.....200 lb.	30	162,170	292,340	454,510
	Cylinders....21 in. by 26 in.	40	289,300	518,530	807,830
	Revolving unit wt...9,700 lb.	70	899,910	1,589,580	2,489,490
F	Type 4-4-2	10	21,460	36,630	58,090
	Weight.....93,000 lb.	20	84,630	147,750	232,380
	Boiler pressure.....225 lb.	30	189,530	332,900	522,520
	Cylinders....21 in. by 24 in.	40	336,140	550,650	886,790
	Revolving unit wt...11,100 lb.	80	1,343,770	2,366,550	3,710,320

The table gives the foot-pounds of energy contained in mounted driving wheels of six different locomotives at speeds varying from 10 to 80 m.p.h. The weight of each revolving unit in the table represents one pair of wheels mounted on an axle, plus the proportionate amount of side and main rod weight. This sum multiplied by the pairs of wheels would give the total weight of the revolving parts. In the last column of the table is given the total foot-pounds of energy contained in each revolving unit, due to both rotation and translation. Attention is called to the fact that in a freight engine (Road A) with small drivers, the total foot-pounds of energy at 40 m.p.h. in the revolving parts alone, is in excess of one-half million while the large passenger engine (Road F), with 84-in. drivers, at a speed of 80 m.p.h., the total foot-pounds of energy is in excess of three and one-half million and this, together with the many additional millions in the complete engine, must be absorbed by the brakes each time the engine is decelerated from the speeds shown to a state of rest.

A careful study of the foregoing cannot fail to lead one into profitable fields of investigation that hold much in store for those who have to do with the design, maintenance and operation of railway equipment, and through whose acts of omission or commission standards of efficiency are not as high as they should be. To those who advocate, or use, special brands of high-grade material in the revolving and reciprocating parts of engines, for the purpose of reducing weight and increasing the factor of safety of those parts, these figures serve as an unqualified endorsement and inversely offer a mild rebuke to those who have not recognized this potent factor in engine design. If the transportation men who handle freight cars will study the diagram in conjunction with the paper* on this subject presented at the last convention of the Master Car Builders' Association by Professor Endsley of the University of Pittsburgh, they cannot fail to see that by handling equipment carefully many millions of dollars may be saved to the carriers annually in the item of reduced cost of freight car maintenance, and many millions more in the items of personal injuries, damaged freight, and increased freight car mileage. The writer is indebted to the Baldwin Locomotive Works for weights of parts of locomotives from which these calculations were made.

Important Realignment Problem on the Pennsylvania

Three Tunnels Will Eliminate 12.23 Miles of Line;
One Involved Unusual Difficulties with Falling Rock

The Pennsylvania is completing some heavy realignment work on the Allegheny division, consisting almost entirely in the construction of three tunnels with a combined length of 8,703 ft., which will result in a saving of 12.23 miles. The portion of the Allegheny division, comprising that part of the system between the junction of the Allegheny and the Kiskiminetas rivers, 28.9 miles north of Pittsburgh, and the town of Oil City, Pa., is located on the left bank of the Allegheny river, which flows in a

average of 25 freight trains in each direction. It was concluded that this traffic justified the construction of tunnels at three points where the river makes wide detours around high bluffs, the topography lending itself to a relocation of the railroad, eliminating distance, and incidentally a considerable amount of curvature. The tunnel at East Brady is 2,468 ft. long and will result in a saving of 5.36 miles of line; the tunnel at Wood Hill is 2,730 ft. long, saving 3.4 miles of line; and that at Kennerdell is 3,505 ft. long, effecting a saving in distance of 3.47 miles.

View of Roof After Rock Fall

very winding and tortuous course between two ranges of bluffs varying from 100 to 700 ft. in height for practically the entire distance of about 102.8 miles. When the railroad was built, between 1855 and 1870, the demands for cheap construction resulted in a

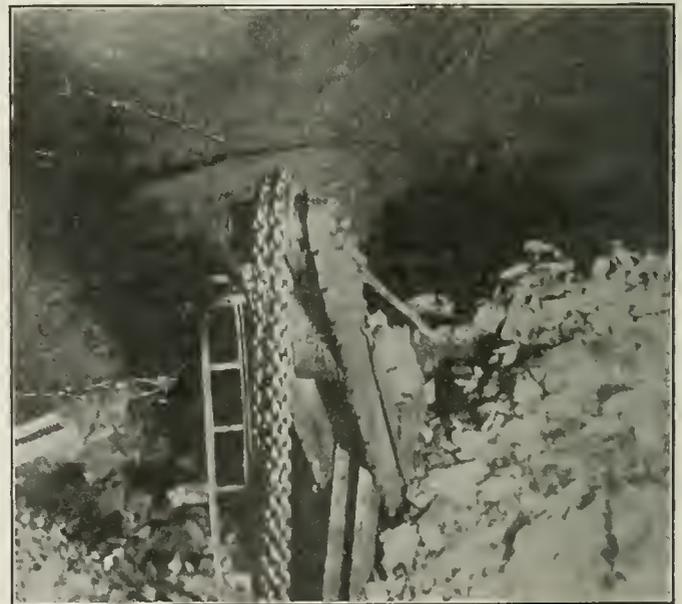

Steam Shovel at Work at South Portal

location following the winding course of the river on a bench on the sides of the bluffs.

Since this line was acquired by the Pennsylvania the traffic has increased to such an extent as to justify double tracks from Pittsburgh to East Brady, a distance of 68.9 miles. The traffic at the present time consists of five passenger trains, and an

THE EAST BRADY TUNNEL

This article will deal entirely with the tunnel at East Brady, which is the shortest of the three, although it cuts off the most distance and eliminates 363.7 deg. of curvature. As shown in one of the illustrations, the situation is one that would naturally suggest a tunnel. In fact, a tunnel was considered at this location at the time that the line was built by the Allegheny Valley Railroad Company, but the idea was abandoned because of the pressure brought to bear by the Brady's Bend Iron Company, whose plant was located and operated on the opposite side of the river, near the middle of the loop, which the tunnel would

Shovel Buried Under a Fall of Rock

have eliminated. The project was kept alive, however, and surveys were made from time to time. In November, 1912, new surveys were made and in February, 1913, actual construction was commenced. The scheme originally authorized involved approach lines at each end of the tunnel considerably closer to the river than the original alinement. This was of advantage because it afforded a much better alinement through the tunnel and gave an economical and convenient location for the spoil from the tunnel excavation. In March, 1913, however, an extraordinary flood in the Allegheny river caused the Secretary of War to make provision for extensive revision of harbor line limits of that river, which precluded the construction of the realignment on the location originally intended. In consequence, it was necessary to bring the approaches closer to the bluffs, resulting in a sharpening of the curve at each end of the tunnel. The final alinement consisted of a 3-deg. 16-min. curve, 2,393 ft. long, through the central portion of the tunnel, with 4-deg.

curves on either end, that on the south being 439 ft. long and that on the north 560 ft. long.

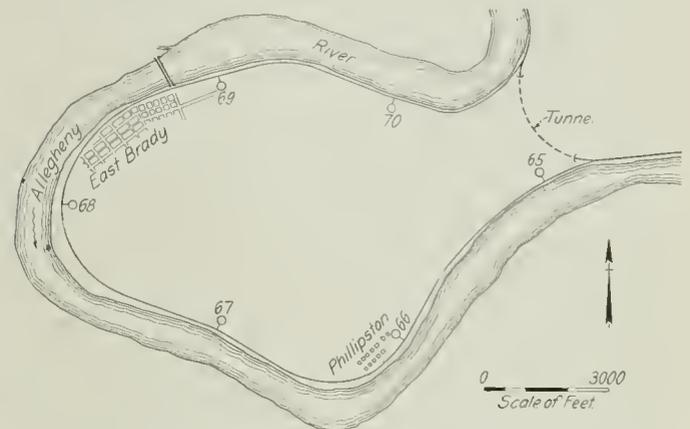

The approaches consist of side-hill cuts ranging in height from 10 to 100 ft. These consisted mostly of sandstone and were taken out by steam shovels, the material being disposed of along the river banks. Under-crossings were provided at each end, so that the material could be hauled away without interference with main line traffic. After 4,000 cu. yd. of material had been excavated at the south approach, the contractor was enjoined from disposing of any more material on the river banks until the harbor line was permanently established by the Secretary of War. During this delay the spoil from the excavation at the south end was turned over to the maintenance of way department of the railroad, on standard-gage flat cars, and hauled to various points on the division. The approach cuts required the removal of 55,800 cu. yd. of material.

TUNNELING METHODS

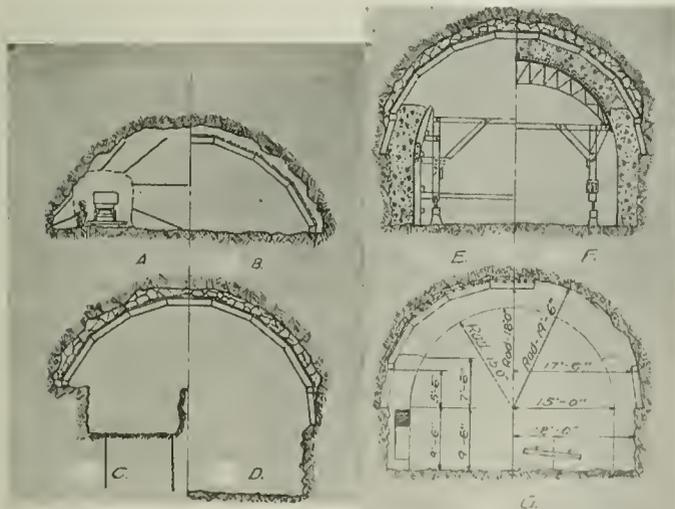

The headings were started in July, 1913, and in order not to wait for the completion of the approach excavation it was necessary to enter the tunnel proper through two side drifts from the face of the hill on a line at right angles to the center line. The drifts were 2,378 ft. apart and were carried to the center line of the tunnel proper, and then driven in both directions from that point. By the time the approach cuts were completed the heading at the south end had been driven and timbered 330 ft. and at the north end 135 ft. The headings were worked by driving two 8-ft. by 8-ft. side drifts adjacent to each side of the full tunnel section, at the elevation of the wall plate of the arch, 15 ft. above subgrade. They were driven from 15 to 20 ft. ahead of the timbering. The drill holes in the face of the drifts were in four horizontal series; four sub-cut holes 6 ft. deep were

allow the setting of one ring of timber at a time. The timber ring was cut on an 18 ft. radius and consisted of seven segments of 12-in. by 12-in. or 10-in. by 12-in. hard wood. Two-inch hard wood lagging was placed over the ring and the remaining space was packed with one- and two-man stone, except where there from the knuckles of the ring and then packed. The record for lineal feet of heading timbered in one month at both ends, working day and night shifts, was 310 ft.

The bench material was worked by digging trenches, usually 6 ft. deep and of a sufficient width to permit the erection of a tripod drill and leave, at the same time, a sufficient width in the center to support muck tracks. Three holes were drilled to sub-grade, one near the center line of the bench and one on either side 6 or 7 ft. from the wall plates. It was necessary to spring the holes several times, using 40 to 45 sticks of dynamite per hole, and thus obtain a pocket large enough for the final shot of

Map Showing Location of the East Brady Tunnel

Typical Sections, Showing Various Stages in the Construction of the Tunnel

loaded with four sticks of dynamite, four cut holes 8 ft. deep were extra large breaks, where the roof was supported on posts were loaded with six sticks, three straight holes 8 ft. deep were loaded with three sticks and two dry holes at the top 8 ft. deep were loaded with two or three sticks, all of 60 per cent dynamite. Muck was loaded into one-yard cars, pushed to the end of the bench by hand and dumped onto the muck pile, from which it was removed by a steam shovel. This haul varied from 100 to 600 ft., depending upon the progress of the bench excavation. Wall plates for the arch timbering were of 12-in. by 12-in. by 16-ft. hard wood timber and were set 15 ft. above sub-grade, 17½ ft. to either side of the center line.

As the material was of such a nature that the roof would not support itself for more than 4 or 5 ft., the core between the two side drifts was taken out in sections just large enough to

125 or 175 sticks per hole. These charges shattered the bench material sufficiently for ready handling by the shovel without any further shooting. The rock was loaded into 4-yard dump cars by a steam shovel operating by compressed air, and hauled to the respective dumps. The cars were placed one at a time at the left of the shovel by Porter 18-ton and Vulcan 20-ton locomotives, but wherever possible a siding was maintained 100 ft. or more in the rear of the shovel, upon which the empty cars were placed by the locomotive, three drum hoists being used to switch them to and from the shovel. By this method 100 cars of bench rock were removed in a 10-hour shift. In front of the shovel 12-in. by 12-in. plumb posts were placed under the wall plates from 1 to 7 ft. long, according to the distance to solid footing. In several instances the posts extended to sub-grade; the condition of the wall plates and the overhead timbering governing the number of posts, which were placed on an average of 3 ft. apart. Frequently it was necessary to provide additional posts and renew old ones at the time of trimming. After the bench was excavated a variable amount of trimming was necessary to give a minimum thickness to the masonry of 3 ft., the trimming being done by means of Ingersoll-Rand Jap drills.

LINING AND PORTALS

The tunnel lining is of concrete, using a 1:3:6 mixture for the side walls and a 1:2½:5 mixture in the arch. The materials used were Lehigh Portland cement and Allegheny river washed sand and gravel, and in addition, 120 deg. of the arch crown was faced with a single layer of Mack vitrified paving brick as a protection against the disintegrating action of gases. The side wall forms were built of timber 42 ft. long, extending up to the edge of the brick lining. These forms were supported from a frame traveler which moved on a track laid on 12-in. by 12-in. timbers 2 ft. 3 in. above subgrade. The forms were adjusted laterally by means of turnbuckles and screwjacks between the forms and the traveler, which were supplemented by timber bracing to take up the concrete pressure. The concrete was placed by Pneumatic Concrete Placing Company's mixer and

conveyors. A mixer was set up at each portal until the lining was completed for a distance of about 750 ft. inside the tunnel, then the mixer was placed at a convenient point within the finished tunnel and the bins were fed by a conveyor. Delivery pipes were connected up and the material was placed from the top of the forms at either side, an average record for concreting the side of walls being 20 cu. yd. per hour. The forms were allowed to stand from 24 to 48 hours, according to weather conditions, before they were moved ahead.

The arch form consisted of steel lattice truss ribs supported on a traveler similar to that used for the side walls and running upon the same tracks. A platform was built at the elevation of the top of the traveler for handling the brick material for the brick work, which consisted of a single course laid in 1:2 cement mortar, one header course to four stretcher courses. The entire brick lining for a 32-ft. section of the tunnel was usually laid in about six hours. The brick work was allowed an initial set of from four to six hours, during which time bulkheads of bags of sand braced with planks were built to retain the concrete about to be placed. The concrete of the arch ring was generally placed at the rate of about 16 cu. yd. per hour. The forms for the arch were left in place from two to six days, according to weather conditions, before they were removed. A workman's retreat 5 ft. wide, 7 ft. 6 in. high and 2 ft. deep was provided in the side walls every 50 ft., and 4-in. cast-iron drain pipes were usually placed 13 ft. center to center, but were omitted where there was no leakage.

Both the north and south portals are of ashlar sandstone with concrete backing. The face of the portal has a batter of 3 in. to the foot, and the sandstone construction extends into the barrel of the tunnel a distance of 14 ft. at subgrade, reducing to 8 ft. at the crown of the arch because of the face batter. The parapet walls are 8 ft. high above the intrados at the arch crown and are capped with a 24-in. coping, 3 ft. wide. On the inside of the curve the end of the portal joins neatly with the rock cut of the approach, while on the outside a wing wall 38 ft. long is built parallel to a tangent to the curve at the face of the portal, the tops of these wings being finished in steps on a 1½:1 slope, with a batter of 1 in. to 1 ft. on the face.

The power plant for the work was located at the south end of the tunnel. One Aimes locomotive type and two Fitzgibbons stationary boilers furnished steam for two Sullivan compressors having a capacity of 1,380 cu. ft. of free air per minute, a reservoir of 191 cu. ft. capacity being placed near the compressor. The air was piped to the south portal by a 6-in. line and over the top of the hill to the north portal by a line consisting of a 6-in. pipe for two-thirds of the distance, then reducing to 4-in. From the portal 4-in. lines were run to the shovels taking out material at the bench and reducing there to 2-in. lines, which were carried on to the drills. Electric lights were supplied at the south heading by a generator operated by a steam engine, which furnished light for the entire tunnel as soon as it had been holed through. Up to this time the light in the north heading was provided by a generator operated by a gas engine, and located at the north portal.

DIFFICULTIES ENCOUNTERED

The material encountered in the tunnel was of a varied nature. Extending for about 400 ft. from the south end it was a gray sandstone. This dipped down to the north and the remainder of the material in the heading was of various formations. A bluish shale rock that was broken with irregular thin veins of coal and small outcrops of sandstone prevailed, while near the middle of the hill there was a pocket of glassy soapstone resembling fire clay that dipped into the heading abruptly and after some distance disappeared. The blue shale rock, after coming in contact with the atmosphere, had a tendency to decompose, with the result that more weight was thrown on the timbering than had been anticipated. Whenever settlement of the timbering indicated this condition, measures were taken to strengthen it. False rings were erected between the original

rings and posts were also placed. In spite of these precautions, a number of very serious falls occurred, the rock in some places continuing to drop until a natural arch had formed with the top as much as 35 ft. above the top segment of the timbering. In all, 425 ft. of timbering fell, requiring 9,000 cu. yd. of extra excavation, 2,000 cu. yd. of additional concrete in the arch ring and 7,000 cu. yd. of slag packing.

The worst features incident to these falls were the delay and loss of plant. In August, 1914, two separate breaks in the roof several hundred feet in the rear of the shovel at the north end tied up the work of this shovel until the one from the south end could be brought around to uncover it. After a delay of two and a half months in the work of this shovel, another fall in January, 1915, fell directly on the shovel, partly covering it and causing serious damage. On May 2, a fall of 101 lin. ft. of the tunnel roof buried the shovel and completely wrecked it.

The restoration of the tunnel after the falls involved painstaking and skillful effort. The arch rings under the larger falls were greatly strengthened by increasing the thickness of the ring by 4 ft., but in addition to this great care was exercised in packing the space between the ring and the top of the void resulting from the fall. Of particular interest in this connection is the use of granulated slag (formed by quenching hot slag with water) for this purpose, and the application of this material by the use of the pneumatic concrete mixer. The material was simply blown dry, using the mixing and transmitting apparatus without modification from the arrangement when concreting. It was found possible to place and pack the materials solidly much more conveniently and cheaply than would have been possible with any other material or method. In fact, the slag packed so solidly that there was a shrinkage of 45 to 50 per cent from the volume as delivered in cars.

At the present time the heading has been holed through, and the tunnel is completed, including the lining, except for a distance of about 700 ft., where the bench has not been removed.

The construction of the East Brady tunnel has been handled by the engineering department of the Pennsylvania Railroad, A. C. Shand, chief engineer, and H. C. Booz, assistant chief engineer, with N. F. Brown, assistant engineer, in direct charge of the work. We are indebted to the engineers in charge of the work for much of the above data. The Allegheny Construction Company, Arthur McMullen, president, New York City, has the contract for the entire work.

THE WORLD'S PETROLEUM.—The production of petroleum throughout the world in 1914 was 400,483,489 gallons, as compared with 384,667,550 gallons in 1913. The United States headed the list very decidedly last year, the American yield having been 265,762,535 gallons in 1914, as compared with 248,446,230 gallons in 1913. Russia ranked second with a yield last year of 67,020,522 gallons, as compared with 62,834,356 gallons; while Mexico came third with 21,188,427 gallons, as compared with 25,902,439 gallons. India produced 18,000,000 gallons of petroleum in 1914, as compared with 7,930,149 gallons in 1913; Roumania, 12,826,579 gallons, as compared with 13,554,568 gallons, and the Dutch Indies, 12,705,268 gallons, as compared with 11,966,857 gallons. It will be seen that the United States last year contributed 66.36 per cent to the world's yield of petroleum, while the corresponding contribution of Russia was 36.74 per cent, and that of Mexico 5.29 per cent.

SCOTTISH RAILWAY DISCONTINUES BRANCH LINE.—The Highland Railway closed on August 7 the Keith and Buckie branch line, including the stations of Buckie, Rathven, Drybridge, Enzie and Aultmore. Through traffic from the coast line will not be interfered with, as passengers going east can go through Cullen and Portsoy, and those going west through Forchabers-on-Spey and Elgin. The general manager has explained that the branch has been closed because of a scarcity of motive power, and that unless the southern companies send help in the shape of locomotives and men other branches will have to be closed.

A CLERK'S PLEA

By M. S.

"Clerks are a crowd of competent and incompetent men—usually in blind-alley jobs, with no training and no outlook."

So much truth is contained in this simple statement that no one who feels the vital importance of having an army of competent and efficient workers, instead of an incompetent crowd, can help from memorizing it at the first glance.

The subject touched on by George M. Basford in the *Railway Age Gazette* of July 23, 1915, page 150, is almost of national importance since the stockholder, the employer, the employee and also the public, which has acquired the habit of holding the railroads to account, are concerned by it. This concern is often equally shared by many of that competent and incompetent crowd, and if the existence of such a crowd is too costly to be permitted the incompetent man is really the one paying the highest price for it. He is doomed to the average job which is filled at any time by anybody, therefore commanding a relatively small salary; the job which requires (not principally, but under the existing circumstances) no responsibility, where individuality is a quality uncalled for, hard work the source of fun for the fellow coworkers, who have long ago banished the desire to do something for the company so as to have something done for themselves, or who have never had such a desire. It reduces his productiveness, his ability—therefore individuality; it makes him a living automat with no desires to be fulfilled, no task to be accomplished. It gradually produces a man incapable of thinking, deprived of his sense of duty to do his best, deafens his conscience; in short, it makes him a degenerate, a man who does not actually steal nor commit crime, and yet is touched by the underlying factors of both evils. His task in life is to be at the office "on time," stay until quitting time, do enough to look busy and keep out of trouble, gossip whenever the chief clerk leaves the room, expect promotion with every vacancy for a higher position, and very naturally blame "the company" for not getting it.

Of course, there are hardworking, conscientious fellows who have the interests of the company at heart, but they are few, and it is only a question of time before unrecognized ability prompts them to look for another field.

Do not understand this as a personal plea, though I am a clerk, a railroad clerk with heart and soul, who entered railroad service, not because of lack of opportunity in other fields, but for the recognition of opportunities offered by a railroad, for the desire to study this vast industry which has made progress a reality. It is in behalf of the hundreds of my type that I venture to speak, not because we are better than the rest, but for the reason that we choose what the others consider a burden and therefore are a type of our own.

Among us are those who took up railroad work to make it their profession, to make the best of it. Have we succeeded?

To answer this question we must first analyze the meaning of the word profession. What is a profession? Is it not trained ability intelligently and successfully applied in a certain direction? If so, have we attained that high degree of training and intelligence in our daily work which will enable us successfully to apply our energy in the chosen direction? We have not; and therefore we are the unfortunate professionals without a profession.

We may be honest and earnest in our efforts, but the lack of skill, specific knowledge, proper experience and cultivated and trained self-confidence nullifies the results of our efforts, decreases the value of our energy, reduces our productiveness, removes the possibility of development, and we gradually join the undesirable class, which is inclined to exaggerate its value.

Is it our fault? If it is, our failure to do the right thing has not as yet been pointed out to us.

Not to praise ourselves, we are honest, conscientious, eager to accomplish something, to work for the benefit of the company and not merely for the salary; furthermore, to work because we consider ourselves fit for that kind of work better than for

any other, because (excuse the expression) we consider that work our life-mission. Will all of that make us efficient, masters of our profession? Positively not. Our ignorance—unpreparedness—does not permit us to fulfill our task.

Where can we get that needed knowledge and training? One knows where to learn the trade of a blacksmith, a carpenter, a tailor, the profession of a physician, a lawyer, but where must one go to study the profession of a railroad man?

You, men above us, we know that it is not your intention to hurt us by calling us a crowd of incompetents, that you fully sympathize with us; but why don't you help us to get rid of this incompetency? Why don't you require a standard amount of knowledge before giving us employment? Why do you blindly promote us on our supposed merits instead of applying the iron test of the standard examination? Why do you suffer our ignorance, which so fatally injures your business?

Of course, it is impossible to require a standard as long as there is nothing provided for its attainment, but why are there no schools for us? Why don't competent men in railroad science write books for us, thereby enabling us to make better workmen and employees? If such books are written why are they not placed within our reach—in the office, public library; why are they not recommended by our superiors? Why is our professional education left entirely to ourselves when it is of equal importance to our employer and when previous experience has shown that we totally neglect it? Why are such a few magazines published on railroads, and those published read by such a few men? Why is the literature of enlightening the man on the small job so limited? Why is there no co-operation between a man and his superior? Why should we not be made devoted friends, co-operators in the corporation giving us our bread and butter, instead of an ungrateful crowd habitually knocking the railroads, secretly talking about government ownership, about rebates to shippers of which the I. C. C. is ignorant, about watered stock, too large profits, and all the nonsense which is originated by the politician, cultivated by the shipper, and delivered to the public ignorant of such affairs by the daily press, whose editors dare not make suggestions to a doctor or electrician, but feel quite at home talking (spell same as knocking) a railroad? Why overlook the fact that before entering railroad service we were a part of that public whose sentiments, for reasons too numerous and various to mention, are antagonistic to the railroad, and that while there may be an excuse (if there is, I am ignorant of it) for not pointing out to the public their erroneously formed ideas, it is an absolute necessity to point out such ideas to us since we are employed by the railroad.

I am not suggesting that the railroad regulate our opinions, but would it not be fair to let us take a glance at this great issue from the railroad point of view? Furthermore, is it not as improper to employ a man who is not serving to the best of his capability, as it is to render service for a corporation considered unjust? Why not permit us to see the railroad issue from a point of view other than that inherited from our fathers and give us a chance justly to create public sentiment based on personal experience and study, not on baseless theories inspired by anything but truth and knowledge?

Of course, I am not entirely blaming the railroad for our unfitness, but are we not almost helpless in our struggle? While the requirements of a railroad man can roughly be described by many, who can say, "Go there, young man, there you may secure the knowledge essential for a good railroad man"?

It is an irony of life to neglect the greatest things. Take the greatest industry of the country—agriculture—and it is surprising to learn how few are the institutions teaching us to be good farmers. Step to the next largest field, the railroad field, and you find no school at all.

We are professionals without a profession, ignorant, incompetent, inefficient; yes, we take the blame, we deserve it. But have we ever rejected the remedy? Were we given a chance to do better and did we refuse it? Have our employers taken sufficient interest in us—the necessary links of their business—

to make us, at least to help us, to become what we ought to be?

It is a tragedy when under the pressure of correct as well as erroneous legislation, and of economic and political conditions the railroads, the greatest and the least appreciated contributors to the nation's present growth and wealth, are facing a crisis never witnessed before and are eagerly looking for the trained, intelligent and earnest men, whereas, on the other end, a crowd of incompetents, fully aware of their incompetency, are vainly stretching out their hands for training and intelligence of that kind which will give the restless brain rest, the unlimited ambition realization, the country good citizens and the employers efficient and useful men.

Help us. If there are schools in existence direct us to them. If there are none, create them. It will be an investment, not an expenditure. Help us to render you the service which you deserve.

THE RAILROAD AND THE HOBO*

By E. W. CAMP

Attorney for California; Atchison, Topeka & Santa Fe Coast Lines

Some weeks ago a brakeman while in discharge of his duty was killed by a hobo. Within 30 days the brakeman's heirs had put in a claim under the state compensation act. No strenuous effort has been or will be made by the state to find the hobo; but the state would have forced the railroad to pay for the hobo's crime except for the fact that the brakeman was engaged in interstate commerce.

But when a brakeman, instead of getting killed, gets the hobo off the train there is turned loose on the right of way a source of peril to train crews, freight and passengers. Dynamite is not hard to come by and bridges are numerous. Likewise a can of phosphorus may produce interesting results. Especially when tramps move through the country in organized bands the railroads cannot safely refuse to let them ride. But if the hobo could be kept off the trains the whole tramp problem would be much nearer solution. On the other hand, the railroad is a serious danger to the hobo. Hundreds of them are lured to death every year by the chance of a free ride. Apparently the states care little for either hobo or brakeman, otherwise they would long ago have found means to keep the wandering gentry off the tracks.

What shall be said, however, of the failure to protect children, women and old men who now use the tracks in the daily walks of life—and death—more than 10,000 a year paying the penalty of life and limb? Would not one suppose the governments might at least adopt measures to save the lives of their own citizens? And all these lives would be saved and injuries avoided were trespassers kept off the right of way, as in other countries. But what are the facts?

Three years ago a campaign was inaugurated by public-spirited railroad officials for laws to prevent this wastage of life, a wastage greater than that of all our wars except the civil. Bills were prepared for the legislatures of some 40 states. They were short and simple; simply prohibited under penalty all trespassing on railroad rights of way—confining the use of the roadbed to the purposes to which it is adapted. Were they welcomed and gladly passed? No, they were rejected in every single state. In one at least the railroad commission, when asked to advise the legislature, recommended that the bill be killed. That was rather astonishing, for the commissioners are able, fair and fearless, but after reflection we may conclude that they were right. They probably reasoned that the law if passed would not be enforced and did not wish to see another added to the multitude of dead statutes.

The capacity to make laws in our states and cities has far outrun the machinery and especially the energy of enforcement. I greatly fear that if in every one of those forty-odd states the bill had become law the number of trespassers and the dead and injured trespassers would be no less. In other words, no serious,

persistent effort to enforce would have been made. For the very statements which were used to support the bills to which I have referred showed conclusively that where laws or ordinances against trespassing exist they are not enforced, and the police and courts not only do not initiate steps to enforce them, but refuse to act when cases are brought to their attention. What is needed is not more laws but more law, better performance of the primary duties of government. We have become soft, flabby and think altogether too much of the suffering of the criminal. A law that does not mean suffering to its violator is no law at all and any expectation to enforce law without suffering is foolishness. I doubt if in any other civilized country there is such disregard of law, such a state of undiscipline and absence of respect for law, as exists in the United States.

But there were other and less worthy reasons for refusing passage to these bills. In one state at least representatives of certain unions demanded to know the author of this damnable attempt to prevent strikers from wrecking trains and killing scabs. To secure favorable action it would have been necessary to insert a proviso that trespassing shall be permitted during strikes.

We must surely wish all success for every effort to shorten the roll of death along the rails. But, in my humble opinion, there is in this and other respects only one hope, and that lies in putting into the hands of the federal government everything pertaining to the regulation of railroads. That these trespassers are an interference with interstate commerce there is no doubt. You pay damages in many cases where men, women and children are run down on the track. Hundreds of emergency stops are made in attempting to avoid injury to trespassers, and emergency stops mean damage to engines and cars, injuries to passengers, bruising and death of livestock, even damage to common freight. Stops must be made to pick up men killed or hurt, and a stop on the main line means danger of another accident. Trespassing means pilfering of cars and burning of structures not fireproof.

Now, the Supreme Court of the United States has held that the railroads are national highways, and that any railroad doing interstate commerce must have all its engines and cars equipped with all safety appliances as required by the federal law. Every railroad must keep all its accounts, whether of interstate commerce or not, according to the rules of the federal commission. There can be no doubt that the general government may regulate everything pertaining to the maintenance and use of the roadbed and incidentally forbid its use by any other persons than railroad employes and for any other purpose than the rolling of cars. In fact, when it is once conceded that the federal government has power to own and operate railroads it must be admitted that it has power to do anything short of that. In this, as in other matters, your hope lies in replacing by a single national control the conflicting, shifting, multitudinous regulation of states, cities, counties and villages.

THE PARIS NORD-SUD RAILWAY.—Last year was the fourth during which the Paris Nord-Sud Railway had been worked. This line, which may be described as the younger sister of the "Métro," has just issued its annual report, which shows how gravely it has been affected by the war, like the larger and older undertaking. Mobilization exercised an extraordinary effect on the Nord-Sud. If the military authorities had not granted a brief stay, the company would on the eleventh day of mobilization have been left with only one motorman; and, as a matter of fact, the traffic had for a time to be worked with no more than 153 employees, of whom 64 were women, compared with the 1,096 who figured on the pay sheets at the beginning of last year. Nevertheless—and largely owing to the zeal of the wives of employees called to the colors—it was possible to maintain an uninterrupted though restricted service to meet the requirements of the public, and at the end of the year the staff had grown to 691, of whom 231 were women.—*Railway Gazette, London.*

*Address before the American Association of Railroad Superintendents at San Francisco on August 21, 1915.

The Railways and the California Expositions

First of Two Articles on the Preparations Made by the Roads, Attendance, Passengers Carried and Exhibits

The Panama-Pacific International Exposition at San Francisco and the Panama-California Exposition at San Diego, held this year in celebration of the opening of the Panama Canal, are of interest to railway men in several ways. The opening of the canal was itself a great transportation event. The expositions have stimulated travel to California and the West in general in such proportions as to require a great deal of preparation for it on the part of the Western railways, and during the past few weeks to such an extent as to tax the facilities of the lines serving the Pacific Coast. It is believed that the expositions have introduced large numbers of Eastern people to the attractions and opportunities of the far West in such a way as to have a permanent effect both in the way of stimulating future travel and in attracting settlers. Moreover, the railways themselves have taken an active part in the effort to make the expositions a success, spending large sums in advertising them and making low rates, and the transportation exhibits at the San Francisco Exposition, of the railways and of the railway supply companies, are among the most interesting features.

The Panama-Pacific International Exposition was opened on February 20 and will close on December 4, while the Panama-California Exposition at San Diego was opened on January 1, and is to remain open through the calendar year.

RATES AND ROUTES

On account of the expositions the railroads early announced round-trip rates to California on a basis lower than has been made for summer travel to the coast for several years; \$50 from

miles and the \$80 rate well over 6,000 miles, making the rates per mile approximately 1.25 cents and by some routes as low as 1.12 cents.

PREPARATIONS MADE BY THE RAILWAYS

The railways have been preparing for handling the exposition business for two or three years. The first preparations consisted mainly of arrangements for adequately advertising the event, and a vast amount of literature has been prepared by the railway advertising departments on the exposition and the points of interest to which the special exposition rates would naturally attract many visitors.

The Atchison, Topeka & Santa Fe also built a new passenger station in San Diego and the Southern Pacific built new stations at Los Angeles and at Third and Townsend streets in San Francisco, partly to accommodate the increased travel expected this year. These stations are illustrated herewith. The new Santa Fe station at San Diego, completed on December 31, 1914, is an adaptation of Spanish colonial architecture to the commercial requirements of a railway, the chief features of the plan consisting of an open-air waiting room or patio and a long covered concourse uniting the different elements of the station. This building cost \$260,000, and with the covered concourse occupies an area 106 by 650 ft. The main waiting room is 55 by 170 ft. The architecture is in harmony with the exposition buildings. The covered concourse consists of an arcade 650 ft long and 27 ft. wide connecting the passenger station with the baggage and express departments. This, with the patio and the two towers

Southern Pacific Station at Los Angeles and Santa Fe Station at San Diego; Both Built to Accommodate the Exposition Crowds

the Missouri river, \$62.50 from Chicago and from \$94.30 to \$98.80 from New York, the lower rate applying via the differential lines. These rates were made effective from March 1 to November 30, with a final return limit of three months from date of sale, but not later than December 31. Liberal stop-overs have been allowed on both going and return trips and many free side trips were offered, so that considering the total mileage thus made possible the rates offered have probably been the most liberal ever offered for travel to the Pacific Coast. The rates were made available by a great variety of routes and with an additional fare of \$17.50 via Portland, Tacoma and Seattle almost any combination of routes, including steamship lines along the Pacific Coast, could be selected. Several of the roads published booklets outlining 40 or more routes which were available from the Middle West. Tickets via most of these routes included the round trip from Los Angeles to San Diego and return and free side trips were offered to Denver, Colorado Springs or Pueblo, Salt Lake City, Seattle and Tacoma, and many other points from the routes which do not reach them directly. Low rates were also made for side trips to many other points of interest. With the free side trips added the \$62.50 rate from Chicago covers from 5,000 to 5,400

flanking the arch at the entrance to the waiting room, forms the principal architectural features of the exterior.

The Southern Pacific station at Los Angeles replaced the old Arcade station and is especially interesting on account of the convenience of its arrangement. Indicators are placed at all entrances to trains for the information of passengers, and the trains are reached by inclines and a subway, which does away with the necessity of crossing any track and makes it unusually easy to locate the right train. The main concourse is large, light and airy. At the north is a rest room for women, at the south a smoking room, and the mezzanine floor is fitted up as a lounging room for men.

The ticket office represents an innovation in station architecture. It is located in the center of the main waiting room and instead of the clerks waiting on the public through windows from a closed-in ticket office they are placed behind a low counter which puts them in a more approachable position. Instead of the usual ticket cases the tickets are kept in a revolving drum at the clerk's side, so that he does not have to turn his back to a customer. This plan the management believes will result in better service, and it has also been adopted in the new station in San Francisco.

This is the terminus of the company's lines running through the old mission towns, and, therefore, the mission style of architecture has been adopted. This is also a very attractive and convenient station.

Several of the transcontinental roads put on new trains in anticipation of the exposition travel. The Atchison, Topeka & Santa Fe, on February 7, put in service a new train called "The Missionary" from Chicago to Los Angeles and San Francisco, and also a new train between New Orleans and California. On April 12 a new train called the "Scenic Limited" was put in service between St. Louis and San Francisco by the Missouri Pacific, Denver & Rio Grande and Western Pacific. New service was also established on May 30, June 19 and June 20 by the Chicago & North Western, Chicago, Milwaukee & St. Paul, Chicago, Burlington & Quincy, Chicago, Rock Island & Pacific and Wabash in connection with the Union Pacific and other Western lines, the Union Pacific putting on three additional trains in each direction.

ATTENDANCE AND PASSENGERS CARRIED

With the exposition period only partly over it is, of course, impossible at this time to accurately gage its success as compared with other expositions as measured by attendance or the number of passengers carried by the railways, but some figures are available covering July and a part of August.

On August 20, after the San Francisco exposition had been open for six months, the total attendance as given out by the exposition officials was 10,813,153, an average of nearly 60,000 a day. The attendance figures by months are as follows:

February	830,980
March	1,690,042
April	1,439,777
May	1,677,947
June	1,584,198
July	2,157,661
August (20 days)	1,432,545
Total	10,813,153

On September 4 it was reported that the attendance had passed the 12,000,000 mark. About one-third of the attendance has been free, including employees, exhibitors, press representatives, etc. The attendance at first was very large and during the first few days, after the special rates went into effect, the travel from the East was very heavy. The attendance during the opening week was 519,599, but after the first month both the attendance and the passenger traffic from the East were considerably reduced until the vacation season, toward the end of June, when both the attendance and the number of passengers from the East began to increase rapidly. From July 1 on, the attendance increased at an average rate of about 10,000 a day for a time, and the increase continued through August. The highest recorded attendance for a week was 559,936, for the week ending August 8, which exceeded that of the opening week by about 40,000.

The attendance at the San Diego exposition for the first six months was 1,265,718.

During the first days after the special rates went into effect all of the roads out of Chicago ran their trains with extra cars and in several sections, and during the vacation period some trains were run with extra sections every day. Practically all of the lines participating in the transcontinental business have shown a considerably increased travel, but for a time, between the first rush and the heavy summer travel, business was so light that many of the roads were greatly disappointed with the results. Considering the entire season to date, while the California terminal lines, which are all fed by a number of intermediate lines, have enjoyed an unusually large traffic, the more easterly lines that have had to divide the business to a greater extent have not fared so well and many have reported that business has not been up to their expectations. No statistics are available showing the total number of passengers carried to the expositions by the railways, but the number handled on the special rate round-trip through tickets from the East is indicated by the fact that 218,000 of these tickets from points east of the Rocky mountains had been validated at San Francisco, Los Angeles, San Diego and other points on the coast up to August

25. As the heaviest travel was during the months of July and August, a large number of Eastern people were in the West at that time who had not yet had their tickets validated for the return trip.

Figures compiled by individual railways show a large amount of duplication because so many passengers took advantage of the wide variety of routes offered to go out by one line and return by another, and most people rode over two or three lines in California or took a steamboat trip for part of their journey. Also, of course, the number of passengers carried by single lines gives no indication of the length of haul.

CALIFORNIA TERMINAL LINES

The lines to San Francisco, which have handled all the through passengers to the exposition in that city, except those carried by the steamship lines, are the Southern Pacific, the Atchison, Topeka & Santa Fe and the Western Pacific. The Southern Pacific, with its Shasta route from the north; the Ogden route from the east, and the Sunset route from the south, connecting with the various lines running from the Middle West, naturally has handled the bulk of the passengers into and out of San Francisco, and has probably handled a very large percentage of all of the through passengers over at least a part of its lines. This road, therefore, showed the remarkable increase of 300 per cent in its trans-

Southern Pacific Station in San Francisco, Built to Accommodate the Exposition Crowds

continental passenger business for the month of July as compared with July, 1914. From February 20, the date of the opening of the exposition, until July 31, the Southern Pacific received from or delivered to its Eastern connections a total of 280,095 passengers traveling on the special exposition excursion tickets, of which 120,777 were handled in the month of July, and 75,083 during the last two weeks of July. During the same period a total of 212,100 passengers to the exposition were handled on local tickets, the heaviest movement also being for July with a total of 64,354. During March the Southern Pacific handled on its system 33,238 westbound transcontinental passengers, as compared with 21,016 in March, 1914; in April the total was 29,118, as compared with 20,337 for the corresponding month in 1914, in May 32,042, as compared with 14,528, in June 49,171, an increase of about 30,000, and in July 78,582, an increase of 59,683. Most of these passengers visited southern California as well as San Francisco. Up to August 16 the Southern Pacific had handled 117 special trains averaging at least 125 passengers each, and 190 special car parties, averaging at least 20 passengers to a car, in addition to special parties handled on extra sections of regular trains. On July 16 there were 24 special trains and special car parties on the system. Between Los Angeles and San Francisco the Southern Pacific in July handled 99,340 passengers, as compared with 17,962 between the two cities in July, 1914. Between San Francisco and Portland 39,471 passengers were carried in July, 1915, as compared with 9,573 in July, 1914. During July and August

the Overland Limited, the Pacific Limited, the San Francisco Limited and frequently the Atlantic Express were run in two sections between Ogden and San Francisco, and between Los Angeles and San Francisco "The Lark" was run in three or four sections every day northbound and in two sections southbound, while the Shore Line Limited was run in two sections northbound, and extra equipment was run on all other trains. On July 20 "The Coaster," a day train from Los Angeles to San Francisco carried 692 passengers. For a time it was necessary to deadhead empty trains between the two cities.

The Atchison, Topeka & Santa Fe, which is the only single through line from Chicago to California, and which also reaches both San Francisco and Los Angeles, as well as being the only line to San Diego, also participated to an unusually large extent in the exposition travel. On March 1 the California Limited was run in eight sections. During July the passenger business west of Albuquerque showed an increase of 40 per cent, and 54 special trains were handled westbound and 43 eastbound.

The Grand Canyon on this line was also an added attraction,

As the Santa Fe had the only rail line San Diego, it enjoyed an unusually profitable business between that city and Los Angeles. Nearly all of the round trip tickets from the East to California included a coupon for the trip from Los Angeles to San Diego without extra charge and a large percentage of the tourists took advantage of the opportunity. Figures showing the number of passengers handled by the Santa Fe on this line were not available, but the total attendance from January 1 to July 1 was 1,265,718. With six regular scheduled trains in each direction many trains were run with extra sections, and as a large percentage of the travel was on day trains this was an unusually profitable business, capable of being handled in an economical way. With day coaches it was possible to seat 80 passengers in a car, as compared with almost 24 in a Pullman, and it was also possible to accommodate the number of cars in a train to the number of people who wanted to go on that train so that the trains were just comfortably filled.

Officers of the Western Pacific estimated that this line had handled over 400 through passengers a day into San Francisco during June, July and August, and a slightly larger number

Railway Buildings at the Panama-Pacific Exposition

and during July and August three trains a week were run directly to the Canyon in each direction. On some days as many as 1,500 people visited the Canyon, the average for July being 575 a day, requiring the installation of temporary facilities, such as tents and parking cars. During the first months after the opening of the exposition the travel was of course largely westbound and equipment was moved east empty, but since June the business has been well balanced, although it has been necessary to deadhead equipment in both directions in order to maintain the standards for certain trains. During the first two weeks in July the Santa Fe handled more Pullman equipment in Los Angeles than was handled in New York City by both the Pennsylvania and New York Central lines.

The heavy travel also made the problem of serving meals an important one, and during recent weeks the experiment has been tried of stopping the limited trains at eating houses in addition to carrying dining cars.

in the reverse direction, in connection with the Gould lines and other connections east of Salt Lake City. July showed the largest passenger business in the history of the company, and as the local passenger traffic is comparatively small, the increase is attributable to the exposition travel. In addition to three regular trains each way a day, filled to capacity and with frequent extra sections both eastbound and westbound, the Western Pacific handled about one special train a day on the average in each direction.

The heaviest train was the Scenic Limited, running solid from St. Louis over the Missouri Pacific and Denver & Rio Grande, which was put on to accommodate the extra travel early in the season. The Western Pacific also handled four sleeping cars from Chicago every day, two from the Chicago, Rock Island & Pacific and two from the Chicago, Burlington & Quincy.

The San Pedro, Los Angeles & Salt Lake also experienced an unusually large increase in passenger traffic on account of

the expositions. During July this road handled 35,707 through passengers between Los Angeles and Salt Lake, including 16,966 received from connections, westbound. August promised to show even higher figures. In June the total was 24,835, and in May 16,604. This road has three regular through trains in each direction a day, which were run in sections several times a week during July and August, and up to August 15 had handled 112 special trains and sections for organized parties. At the beginning of the season this company took over all the eating houses on its line in order to make sure of good service and turned over their operation to the dining car department. On the Pacific Limited train the plan was tried of serving an attractive 50-cent club luncheon in the dining car, which proved very popular and increased the dining car receipts. Its subsidiary, the Pacific Navigation Company, operating the steamships Yale and Harvard, which during the summer make four trips a week in each direction between San Francisco, Los Angeles and San Diego, carrying from 600 to 900 passengers each per trip.

Low rate excursion rates were also made during the summer for local travel between Los Angeles and San Francisco and between Los Angeles and San Diego. To San Diego rates as low as \$4 and \$5 for the round trip were made for special occasions, for a distance of 250 miles, while tickets good for three months were sold for \$6.25. Between San Francisco and Los Angeles a round trip rate of \$18.75 was made on certain days, while a rate of \$22.50 was effective every day.

The westbound exposition traffic was balanced to some extent by "back east" excursion rates—\$72.50 to Chicago and return, \$110.70 to New York and return, and \$60 to the Missouri river and return.

An illustration of the concentration of traffic at San Francisco is afforded by the fact that 449 Pullman cars were brought into San Francisco in three days in July by all roads, and the Pullman Company's laundry in San Francisco during July washed from 75,000 to 82,000 pieces of linen a day.

STEAMSHIP LINES

Steamship lines on the Pacific coast also have enjoyed a large passenger traffic on account of the expositions. In addition to the Pacific Navigation Company, already mentioned, the Pacific Coast Steamship Company operated two steamships between Seattle, San Francisco, San Pedro and San Diego and two between San Francisco, San Pedro and San Diego. The North Pacific Steamship Company also operated a weekly service with two boats between Portland and San Diego, calling enroute at San Francisco, Santa Barbara and Los Angeles, and service every five days with two boats between Portland and San Francisco, calling at Astoria, Coos Bay and Eureka.

The San Francisco & Portland Steamship Co. also operated three boats, making trips every five days in each direction between Portland, San Francisco and San Pedro.

RAILWAY EXHIBIT BUILDINGS

Four railway companies have exhibit buildings of their own at the San Francisco Exposition, which are illustrated herewith. Chief of these is the Southern Pacific Building, of modern Renaissance architecture, 200 ft. square, well located at the head of Palm avenue, near the Fillmore street entrance to the grounds. This building is kept open daily from 9.00 a. m. to 8.00 p. m. for the convenience of visitors, and among its features are comfortably furnished rest rooms for women and men, provided with desks, writing materials and files of newspapers, a spacious foyer which is a convenient place in which to arrange to meet friends, a ticket office and information bureau where are located representatives of the Southern Pacific and of its principal eastern connections, and a validation office. The building also contains a central court called "The Glade," where at frequent turns in the pathway appear natural panoramic views depicting scenes along the Southern Pacific lines. In a small theater, patterned after the Little Theater in New York, three

lecturers alternate in giving travel talks. These lectures, given eight times a day, have been attended by from 100 to 500 persons each.

The Canadian Pacific has a building on the Marina devoted to the products and resources of Canada, which includes a rest room and lecture room in which motion pictures are shown, a model of the company's supply farm at Strathmore, Alberta, and a model of the irrigation dam at Bassano, Alberta.

The Great Northern building, also located on the Marina, contains writing tables for the convenience of visitors, samples of the products of the Northwest, a lecture room in which are shown motion pictures accompanied by lectures on the resources of the Northwest, and illustrations of scenes in Glacier National Park. Eight full-blooded Blackfeet Indians from Glacier National Park, sent to the exposition as delegates from their tribe, make their headquarters here and entertain visitors with their ceremonies and dances.

The Grand Trunk and the Grand Trunk Pacific also have a building on the Marina, in which are shown samples of the products of Canada and illustrations of scenes along the lines of these companies, and motion picture lectures are given.

The Canadian Pacific, Great Northern and Grand Trunk exhibits were each awarded a gold medal.

There are few railway exhibits at the San Diego exposition. The Atchison, Topeka & Santa Fe has a concession on the "Isthmus," called the "Painted Desert," an interesting reproduction of the conditions existing in the Spanish provinces of New Mexico and Arizona at the time of the coming of the Spaniards in the sixteenth century, which to some extent continue to the present day. The exhibit consists of an Indian village of Pueblos, in which a number of Indians live and go about their work, making pottery, baskets, blankets, etc.

The Union Pacific and the San Pedro, Los Angeles & Salt Lake have a building conforming architecturally to the general plan of the exposition structures, containing rest rooms and an information bureau for visitors and a traffic exhibit showing the opportunities for settlers along the line of the two roads. This exhibit was awarded a gold medal.

Wells, Fargo & Co. have an exhibit in the Varied Industries building, including an office, one of the old Wells Fargo coaches built in 1863, one of the company's safety trunks used for the transportation of express packages, and photographs of scenes and incidents illustrating the history of the company and its present methods.

The second article, describing the exhibits of the railways and of the railway supply companies in the Palace of Transportation and other exposition buildings and on the "Zone" at San Francisco will follow in a later issue.

ADVANTAGES OF MOBILIZABLE PROPERTY.—For the first time in many years The Official Guide appears without the sailing schedule of the Pacific Mail Steamship Company. The service of that company has been discontinued owing to legislation last winter in Washington. It is reported that the ships are to be sold to companies which will operate them on other routes. It would doubtless be a not unwelcome circumstance to many owners of railroads of they, too, were able so easily to move their property under its own steam out from under the strenuous hand of full-crew laws and such iniquities of regulation.—*Official Railway Guide.*

CANADIAN SHIPBUILDING.—The Canadian Department of Marine and Fisheries reports that Canadian shipbuilding represented last year an aggregate new displacement tonnage of 43,346 tons—the largest annual total attained during the last fourteen years. Of last year's total, 23,167 tons were credited to the province of Ontario, which has been advancing as a shipowning and shipbuilding province since the development of trade upon the Great Lakes began to require a larger class of steamers.

An Interesting Structure Over the Buffalo River

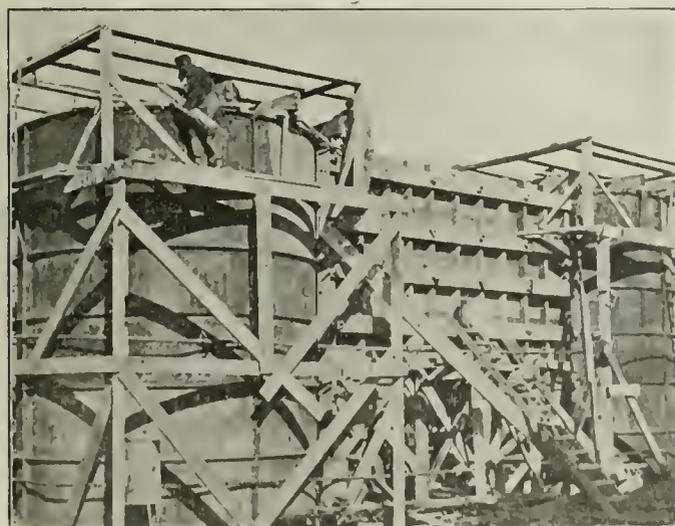

The Lackawanna Is Now Building a Strauss Bascule Span Involving Complicated Foundation Problems

In the *Railway Age Gazette* of January 31, 1913, there appeared an article describing three lift bridges built over the Buffalo river, Buffalo, by the Lake Shore & Michigan Southern, the New York, Chicago & St. Louis and the Pennsylvania jointly, and the Buffalo Creek Railroad. These bridges were made necessary by the deepening of the Buffalo river to 23 ft. at mean water level, to allow navigation by the deep-draft vessels travers-

General View of Bridge Site, Showing Completed Cylinder Pier and Diverted Westbound Track

ing the Great Lakes. Since then the deep-water navigation of this stream has been authorized to its junction with Cazenovia creek, a little over a mile beyond the crossing of the Buffalo Creek Railroad, the present terminus of the deep-water dredging. This improvement will necessitate three additional lift bridges over the

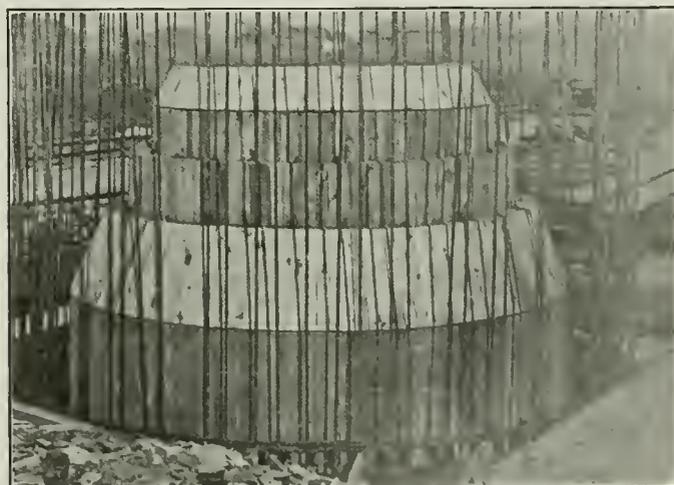

Forms in Position to Concrete Transverse Strut of Cylinder Piers

Buffalo river, two to be built by the Delaware, Lackawanna & Western and one by the city of Buffalo, on the line of Abbott road.

This article describes the double-track lift bridge which the Delaware, Lackawanna & Western is now building a short distance east of the present grade crossing of the New York, Chi-

cago & St. Louis, the Pennsylvania and the Buffalo Creek railroads. The present bridge consists of two double-track plate girder fixed spans, each about 116 ft. long, supported by two abutments and one central pier of coarsed ashlar stone masonry, with a track elevation about 18 ft. above mean river level, which conforms very closely with that of Lake Erie, into which the Buffalo river empties, about five miles farther down stream. In rebuilding the bridge the rail elevation is being raised 22 ft. at the river crossing to cross the joint tracks of the New York, Chicago & St. Louis and the Pennsylvania, and the tracks of the Buffalo Creek railroads overhead. The track was raised 26 ft. at the crossing to give ample head room. At the same time the river crossing was moved about 200 ft. farther east to rectify the existing channel of the Buffalo river, which is now being dredged by the Great Lakes Dredge & Dock Company, under contract with the city of Buffalo.

An examination of the map shows that the river is very sinuous at this locality, three sharp "ox-bow" bends doubling upon themselves. The proposed new channel shown in dotted

Inside Form for Cutting Edge of Cylinder Pier. Reinforcing Bars in Place

line was never constructed mainly on account of the opposition of the riparian owners.

An embankment adjoins the east end of the new bridge, which carries the railroad to the next river crossing, a little over half a mile farther east. A short embankment will join the west end of the new bridge, followed by a short bridge span, and then by two longer spans over the railroads mentioned.

After the type of bridge and spans had been decided on five test holes were put down on the site of the new piers, four on the east side and one on the west side of the river. One of the four holes was only put down part way because of an obstruction, necessitating a new hole in another position close by. These borings were made by contract. Steel pipe was first driven and the material inside brought up in its natural condition by earth augers instead of by the wash-drill method. It is claimed that the "dry method" gives by far the best information as to the actual character of the material penetrated and encountered.

The crossing of the river is square or at right angles to the river current. The main channel span of the new bridge is a Strauss bascule, with a 114-ft. opening between the pier faces. There is an auxiliary fixed deck-plate girder span on the west with an opening of 107 ft. between pier faces. In addition there is a short girder span at the east end 36 ft long between masonry faces and one at the west end with a 39 ft. opening, the slightly

longer span being due to the change in plan of the west pier. Until the new channel is excavated the old one must be maintained and it will be crossed on temporary plate girder spans secured from other work.

As the new bridge occupies the present alignment the plate girder spans for each track comprising the old crossing were each moved outward 41½ ft., or 83 ft. between centers to allow working space for the new structure.

Pile bents were driven for the end and center supports of these old girders. The spreading of the old tracks was also continued for a considerable distance east and west of the bridge crossing to allow the building of the embankment, made necessary by the raising of the grade. As the base of this new embankment

Map Showing Channel Change and Location of Bridge

occupies a greater width than that available between the tracks temporary lines of piling and timber cribbing were placed to prevent the encroachment of the embankment.

The superstructure of the bridge is carried by two abutments and four piers. The abutments have no wing walls, the embankments spilling around them at the ends. They are founded on piles driven to rock. The height of the east abutment to base of rail is 43 ft. and that of the west abutment 49 ft., the lengths of the supporting piles being respectively 55 and 49 ft.

The piles for the east abutment were driven by a land driver, after suitable excavation had been made, the material being removed by locomotive crane with an orange-peel bucket. The

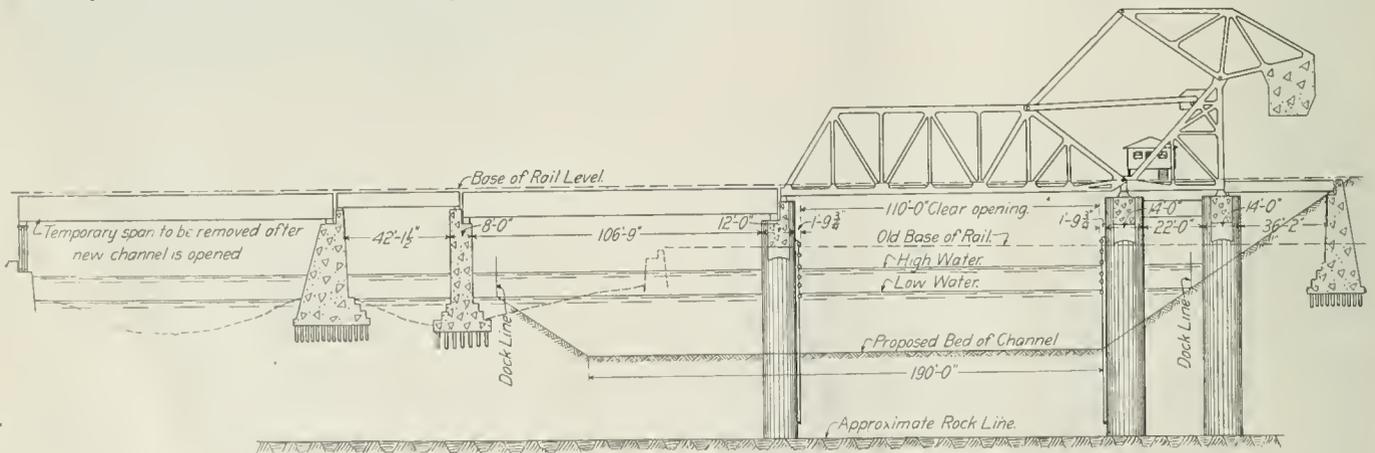

of the piles for the west pier are 12 ft. below water and were also driven with a follower. All piles are of Southern pine with the smaller end 8 in. and the larger 14 in. in diameter.

After the foundation piles had been driven the cofferdams were constructed, the larger one being about 55 ft. long and 30 ft. wide, and the smaller one 55 ft. long and 21 ft. wide. They were built of Wakefield sheet piling, driven by the same pile-driver that drove the foundation piles. It was about 27 ft. long and projected about 3 ft. above water level. In driving the sheet piling an imbedded butternut log was encountered which gave considerable trouble, causing much leakage, which was finally overcome. Interior bracing was added as the cofferdam was unwatered.

The main or tower piers of the bascule span consist of four concrete cylinders in pairs, connected at the top both transversely and longitudinally by heavy concrete struts. The cylinders are 14 ft. in diameter and average about 90 ft. in height. The rest pier is composed of two cylinders of similar construction, each 12 ft. in diameter.

The cylinders were sunk through about 70 ft. of material, consisting of 6 ft. of filled-in ground, 14 ft. of black clay, 12 ft. of sand and gravel, 28 ft. of clay and, finally, 10 ft. of sand and clay overlying the limestone bedrock. After the location of the pier was established, an excavation about 4 ft. deep and 20 ft. square was made, which was lined with cribwork, built up of 12 in. by 12 in. timbers. Upon the prepared bottom of the excavation was placed a steel ring with a diameter 6 in. larger than that of the finished cylinder pier and forming the cutting edge for sinking it. This ring was 20 in. high and a shelf 8 in. wide was riveted to its inner edge. A wooden form having roughly the shape of a truncated cone, was then fitted to the ring and formed the inside of the concrete cutting edge. This consisted of a series of inclined and stepped surfaces, intended to control and accelerate the sinking of the piers.

The outside forms were steel rings 5 ft. high, stiffened both horizontally and vertically by angles and built in halves with angles at the abutting vertical edges to serve as flanges for bolted connections. Before filling the form the outside ring was securely held in position by struts braced against the timber cribwork lining the excavation. This steel-concrete cutting edge was reinforced by two concentric rows of plain steel rods, spaced

Elevation of New D. L. & W. Bridge Across Revised Channel of the Buffalo River, Buffalo

sides of the excavation were vertical, supported by sheet piling, which was first driven and then braced as the excavation proceeded, and which stopped at an elevation about 2 ft. below water level. The piles were then driven with 3-ft. intervals each way to bed rock and cut off at an elevation of 1 ft. below low-water level.

The piles for the west abutment, as well as those for the west pier, were driven by a floating piledriver. The west abutment occupies the site of the central pier of the old bridge, which was removed. The top of the supporting piles are 7 ft. below water level and were driven to this depth with a follower. The tops

about 12 in. between centers. The bars of the outer row were carried up vertically about 4 in. inside the outer circumference to the top of the pier, while the bars of the inside row, which start adjacent to the outside row at the bottom, were bent to come within 4 in. of the inner circumference and terminate at the top of the first course or section of concrete.

The cutting edge formed the lower or initial course of the cylinder pier, being an annular ring of concrete 14 ft. in outside diameter for the large piers, and 12 ft. for the smaller ones, with central concentric openings or wells 7 ft. in diameter. To build the second course, the outside steel form was raised 5 ft.,

and a cylindrical concentric inside form was hung from timbers resting upon the upper edge of the outer form. After several sections had been built in this manner, a locomotive crane was employed to remove the material inside the well and underneath the cutting edge, using an orange-peel bucket. It was aimed to secure an average daily settlement of about 10 ft., successive courses of concrete being added to give the necessary weight until bedrock was reached. After the surface of the rock was thoroughly cleaned the space under the cutting edge was sealed with concrete, which was also used to fill the central well.

No difficulty was experienced in sinking cylinder 4 N, but some trouble was encountered in cylinder piers 3 S, 3 N and 4 S. After cylinder 3 S had reached a point within 8 ft. of bedrock, a large amount of material was removed without any corresponding settlement. Investigation developed that material of a soft nature was flowing in at the bottom from a northeasterly direction, between cylinders 3 N and 4 N, and which caused a subsidence of the surface of about 9 ft. between them. This subsidence caused cylinder 4 S, which was within 12 ft. of bedrock at the time, to move in a northwesterly direction, affecting its perpendicularity. The cylinder was restored to its normal position by means of a 35-ton jack braced against the side of cylinder 3 S with wooden struts. After cylinder 3 N had reached within eight feet of bedrock, further movement was prevented when the northwest side of the cutting edge encountered a very large boulder which could not be removed by excavation from within the cylinder. To overcome this a well drill was used to drill a hole close outside the cylinder to the boulder, and the latter was then shattered by a heavy charge of dynamite. After these mishaps, air locks were installed on cylinders 3 N and 4 S, and the sinking continued under compressed air at a pressure of about 28 lb. After reaching bedrock it was found that cylinder 4 S had righted itself and was in its proper position within a small fraction of an inch. The deviation of the other three cylinders from the exact location was also negligible.

The top ends of the tower piers and the connecting transverse strut are of monolithic construction, but the longitudinal struts between the cylinders were placed later, the ends resting in niches left for that purpose.

The concrete mixing plant was located at the east end of the bridge. To facilitate the construction of the embankment at this end a pile trestle had been driven, and the spaces between the bents immediately behind the east abutment were utilized for a storage bin for broken stone and gravel. These aggregates were dumped directly from gondola cars into the bins. A house built of corrugated iron for the storage of cement adjoined the material bins, alongside the present low railroad tracks, so that the cement could be unloaded directly into the house.

A Smith mixer was located adjacent to the bins and track, the whole arrangement of the plant being admirable for quickly charging and discharging the mixer. For the transportation of the mixed concrete, small cars were used, running on a 2-ft. gage track and laid parallel to the present westbound railroad track, extending to about the middle of the river. The cars on this narrow gage line were operated by an endless cable, with a hoisting engine stationed near the mixer. At the end the concrete was handled by a derrick into the west pier and abutment. The concrete for the cylinder piers was handled by the locomotive crane, which was used for excavating the material from within the cylinder piers.

Below the ground level the concrete was made of 1 part Portland cement and 5 parts of Niagara river sand and gravel, natural mixture. Above the ground level the mix was 1 part Portland cement, 2 parts sand and 5 parts broken stone.

Simultaneous with the construction of the new lift bridge work was undertaken on the elimination of the grade crossing of the New York, Chicago & St. Louis, the Pennsylvania and the Buffalo Creek railroads. The crossing consists of two main double track through spans over the several railroads mentioned,

each composed of three plate girders, 106 ft. long center to center and one shorter span, 30 ft. in the clear, over a private road to the works of the Contact Process Company.

This section of work extends from the overhead crossing of the Lake Shore & Michigan Southern easterly to the overhead crossing of Abbott road, a distance of 1.4 miles. The elimination of this crossing required the elevation of what is known as the Nickel Plate interchange yard, where all the freight and passenger traffic between the Lackawanna and Nickel Plate is interchanged.

The contractor for the substructure was Walter H. Gahagan, Inc., Brooklyn, N. Y., and the piledriving was done under a subcontract by the D. E. Horton Construction Company, Buffalo, N. Y. The Strauss bascule bridge superstructure was fabricated and erected by the Pennsylvania Steel Company, Steelton, Pa. The grade elimination work was all done by the Lackawanna Railroad Company's own forces. All of the work is being done under the direction of G. J. Ray, chief engineer, Delaware, Lackawanna & Western, under the immediate supervision of A. E. Deal, bridge engineer, and George E. Boyd, division engineer.

AN AUTOMATIC FREIGHT TRUCK COUPLER

The success of power trucking in freight houses is dependent largely on the perfection of the details of operation and the elimination of lost motion wherever possible. This has led to the development of an automatic coupler for freight trucks by Edward Fitzgerald, general foreman of the Twelfth street freight house of the Chicago & Eastern Illinois, at Chicago.

As shown in the photographs this coupler consists of a yoke on the forward end of the truck, consisting of a $\frac{3}{4}$ -in. round rod bent in the shape of a U and slightly pointed in the middle of the loop to form a groove. The device on the rear of the truck consists of a malleable-iron fork equipped with a trigger suspended from the upper arm and seated against a projection on the lower arm to keep it from swinging backwards while

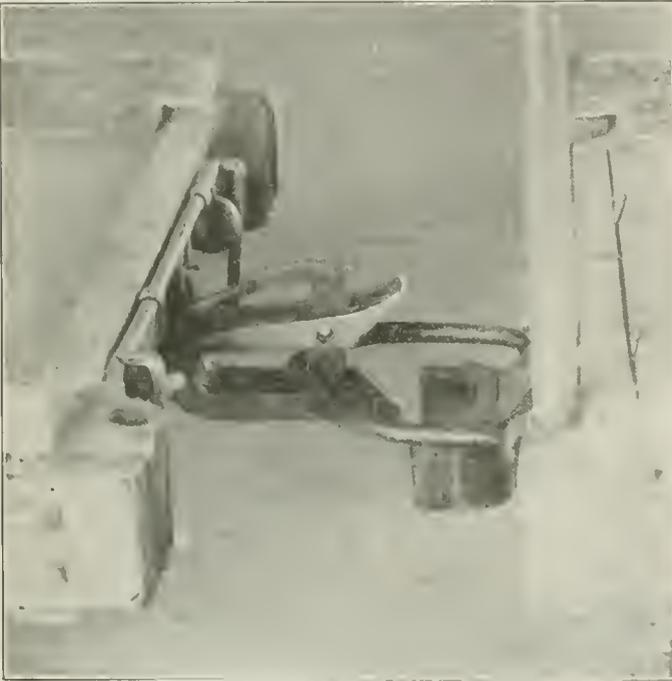

Automatic Coupler Cars Separated

allowing it to swing freely forward. In operation, as the trucks are brought together, the yoke on the front of the rear truck comes in contact with the trigger in the fork on the rear of the forward truck, which it swings forward, allowing the yoke to enter the fork. As the yoke passes the trigger the latter drops back into place, locking the two trucks together. The point of the yoke cannot come in contact with the base of the fork because the point of the lower arm of the fork strikes a U-shaped bumper located on the forward end of the rear truck

just under the yoke. A hand lever similar to that on standard M. C. B. couplers raises the trigger and permits the release of the yoke to disconnect the trucks. On the motor car a cord attached to the hand lever enables the motorman to uncouple his car without leaving his position.

The principal advantage of the device is that the trucks may be coupled without requiring that they be accurately centered and alined. A reasonable variation is allowed by the spread of the yoke which is $7\frac{1}{4}$ in., and the spread of the bumper which is $4\frac{1}{2}$ in. After the trucks are coupled, they are lined up by the trigger as it slips along the yoke until it reaches the groove at the point.

Any difference in elevation of two trucks is adjusted by means of the $5\frac{1}{4}$ -in. vertical spread of the fork. The inclined faces

Automatic Coupler Cars Coupled

on the ends of the fork serve to deflect the yoke upward or downward into the slot. The yoke is pivoted on two eye-bolts attached to the truck sill and has an extension which bears against a pivoted counterweight attached under the truck. By means of this the yoke is normally held in a level position, but may be deflected up or down with variations in the relative elevation of the two adjoining trucks.

These couplings have been in use about two months in the outbound freight house of the Chicago & Eastern Illinois at Chicago on 125 four-wheeled trucks with 3-ft. by 6-ft. platforms and three motor trucks. The cars are ordinarily handled in trains of three to seven trailers each, over a trucking length of about 1,700 ft. The motor car operators very quickly developed skill in handling the couplers, which have materially increased the efficiency of the trucking. The couplers are manufactured by Guilford S. Wood, Chicago.

RAIL SHIPMENTS FROM THE UNITED KINGDOM.—The shipments of rails from the United Kingdom have necessarily been much reduced by the great European war. They showed, however, rather more strength in July. The exports for that month came out at 33,224 tons, as compared with 43,133 tons in July, 1914, and 53,570 tons in July, 1913. The aggregate exports to July 31, this year, were 157,190 tons, as compared with 303,991 tons and 308,185 tons. The United Kingdom has been sending scarcely any rails this year to the Argentine Republic, the shipments to that country to July 31, having been only 569 tons, as compared with 20,823 tons and 32,602 tons in the corresponding period in the preceding years.—*Engineering, London*

FRENCH RAILROAD EXCURSIONS IN WAR TIME

BY WALTER S. HUNT*

One of the curious aspects of the war in France is the effort of the railroads to encourage the customary tourist and excursion travel of peace times. While the number of American tourists is limited this year, because of the ungrounded fear of traveling in a country at war, there are a good many English tourists. It is common to see notices in the newspapers and elsewhere, "Welcome to France," stating that behind the armies France works and lives as usual. The Touring Club of France, the Automobile Club of France, the hotel associations, together with the railroads, are issuing their customary booklets. That of the Touring Club was printed in English and 300,000 copies sent broadcast. Much of this work is useless, however, as addressed to the American public, which certainly will not venture abroad until peace comes; and then there will not be enough ships to accommodate the people who will flock to see the new ruins of Europe.

Domestic France is traveling, not in the customary numbers, but nevertheless in surprising numbers to take the usual summer rest away from home. The French man and woman work hard the year around; employees work their ten and twelve hours a day, and this past year has been such a nerve-racking one for all that the needed rest is being taken whenever possible. It is not the lack of money that is preventing those not engaged in army work from going, so much as the short-handed conditions that prevail everywhere.

The travel is taking the direction opposite to the trench country, for two reasons: First, the army regulations prevent free movement in the so-called army zone to the north and east of Paris, and the traveler must have a pass before he can buy his ticket. Then public opinion is strong against idle visitors to any part of the country where so many thousands of Frenchmen have lost their lives. Recently a party of French excursionists took an automobile in Paris and rode out beyond Meaux, where the fighting was severe during the battle of the Marne. At the present time trenches are being perfected all through that region, as a precautionary measure, and when an army captain spied the party of visitors he stopped it and asked why they had come there. One of the men of the party explained the reason. "Very well, I'll give you a chance to see what a trench is like," said the captain, with pleasant irony. "Get down, every man of you, and dig." The men of the party were thus forced to dig all through a hot afternoon, and when night came they were permitted to go home. "Now you can say that you have done something for France, and I hope you will go home better Frenchmen," the captain told them sternly.

There are two interesting features of French railroad travel that are not familiar to the American manner of encouraging excursionists and travelers. One is the so-called family ticket, issued as usual this year. A family of three may get reduced rates that cut the usual rates in half, and a family of five may travel at 40 per cent of the ordinary rate. The father of the family, in buying the ticket, if he desires, may arrange to travel, going and coming, at a different time from the other members of his family. In addition, any member of the family may go and come at any time at half fare between the points named on the ticket if at the time the original family ticket is purchased an identification card is asked for.

The second feature adopted in France to encourage travel is the organization of an automobile service by the railroad at points of interest, by which the traveler can see readily and cheaply the country adjacent to the railroad. For instance, the Southern Railroad (chemin du fer du Midi), which operates in that part of France lying next to Spain and connects the Atlantic ocean with the Mediterranean sea, has begun the organization of such automobile service. It has this service at the springs of Biarritz, in the gorges of the Tarn river, and elsewhere. Despite the war this service is running this year.

Still another feature of French tourist travel is the existence

*Our Special European Correspondent.

all over France of narrow-gage railroads that run where it would not pay a broad-gage road to go, or else where broad-gage roads could not be built except at heavy expense. These railroads, known as the "Economiques," act as feeders to the large railway systems in that they bring travel and freight to them from out-of-the-way districts.

SUPERHEATER LOCOMOTIVES AND GRADE REVISION

BY PAUL M. LA BACH

Assistant Engineer, Chicago, Rock Island & Pacific, Chicago, Ill.

In these days of tight finances probably more schemes are investigated with the idea of saving money than at any other time. Many projects also, which would have shown a profit a few years ago, will not pay under the present revision downward of freight and passenger rates by railroad commissions. The idea is best expressed by the formula:

$$\frac{R - E}{C} = p$$

Where R = annual revenues from operation.
 E = annual operating expense (including depreciation and taxes).
 C = cost of construction.
 p = per cent of profit.

It is evident that if R is decreased and E is increased at the same time, the profits expressed in percentages will decrease very rapidly. This is exactly what has been going on for a number of years. The revenues from operation have been cut down by the reduction of rates, while the cost of operation has been increased by full crew laws, taxes, special equipment, etc. It becomes necessary, therefore, to fix the value of p before making any investigation as to anticipated profits. A term of years of interest rates should be used and not the low rate which has been prevalent for some time. To this should be added promotion fees, discounts, etc., which decrease the amount actually received.

One writer, who has been feeling pessimistic about the outlook, said, not long ago, that it did not pay to make any improvements of any kind because a commission of some sort or an extra crew law would rise up and take the profits away as soon as they were earned. When one sees a public official urged to get a public appropriation for an uneconomic improvement, in order that the money may be spent in his district, and at the same time exhorted to secure the reduction of rates or the passage of bills that will increase operating expenses, when a safe margin between R and E would cause a much greater expenditure for improvements in the same district, the situation can hardly be said to possess much logic. This is a condition and not a theory, and has resulted in a state of affairs such that paying improvements cannot be made on light traffic lines. If railroad building were now in its infancy it is probable that 25 per cent. of the steam lines now constructed would never be built with present returns contemplated. On lines with heavy traffic many improvements may still be made that will show a profit. The medium traffic lines are the ones that present the most difficult problems, as a misconception of the method of operation may cause an assumption which is not justified by the facts and operation under the new conditions will not show sufficient profits to justify the expense of changes. For this reason 6 per cent. is chosen as the interest rate.

A thorough understanding of the present working conditions is essential. It may be found that although a change in grade alone might not effect a sufficient saving, when a superheater is added to the locomotives in use, then a saving will be made. To illustrate this point the profile in Fig. 1 will be assumed. The length of the engine district is such that the rating of the locomotive is dependent on time rather than on distance. The 16-hour law makes it imperative to reach the destination in that time. The engine crew will draw the same amount of wages in any event, as the men have their choice between payment by hours or by miles. Passenger trains will not be affected by a change in the grade line except as they may make faster time. On a short line they might add a car, but on a long line between two important

points they would not be able to do so, as competition governs the time. The same is true of time freight. No addition in train load is to be expected. This will narrow the tonnage affected down to the slow freight, which we will assume is handled by Consolidation engines in this case.

The method adopted by the American Railway Engineering Association, and published in its Manual for 1911, has been used for calculating the draw-bar pull of this locomotive. Without going into details* the results are given in Table I, which shows the drawbar-pull of this locomotive on a level grade for different speeds. It will be noted that the fuel used has a heat value of 11,000 B. T. U., and that 4,000 lb. per hr. is taken as the capacity of the fireman. With the present method of operation each slow freight loses 3 hrs. at meeting and passing points, waiting for orders and taking coal and water. Allowing one hour for emergencies this would make the maximum running time allowable 12 hrs. This is for summer conditions. Train resistance for 32.5-ton cars, which is about the average car weight in the Mississippi Valley, is taken at 5.4 lb. per ton at speeds of 4 m. p. h. to 30 m. p. h., which is believed to be a fair average. An inspection of the profile shows that the hardest work must be performed and that the longest time will be needed for westbound trains on account of the greater rise in that direction. While for very accurate work a speed curve should be calculated from acceleration tables, this will be omitted in this case, as the profile will make it unnecessary. The 4 hr. delayed time given includes the time needed to decrease from rated speed to a stop and from a stop to the rated speed for those points where this must be taken into account. The train will therefore be treated as though when rated properly it will travel at uniform speeds on the different sections of the profile.

TABLE I

Drawbar-Pull of Saturated Steam Locomotive, Consolidation Type.			
M. P. H.	Lbs.	M. P. H.	Lbs.
0	38,980	18	14,985
1	38,512	19	14,082
2	38,043	20	13,179
3	37,574	21	12,334
4	37,104	22	11,561
5	36,634	23	10,869
6	33,328	24	10,197
7	30,567	25	9,617
8	28,259	26	9,074
9	26,324	27	8,565
10	24,669	28	8,103
11	23,221	29	7,687
12	21,870	30	7,298
13	20,577	31	6,932
14	19,345	32	6,584
15	18,168	33	6,256
16	17,041	34	5,954
17	15,992	35	5,672

Grate area, 50 sq. ft.
 Heating surface, 3,318 sq. ft.
 Diameter wheels, 63 in.
 Steam pressure, 200 lb.
 Coal consumption, 4,000 lb. per hour (while working steam)
 Coal at 11,000 B.T.U.
 Cylinders, 22 in. by 30 in.
 Weight locomotive and tender with coal and water, 172 tons.

For a saturated steam Consolidation locomotive (see Table I) the drawbar pull at 5 m. p. h. will be 36,634 lb. At 5 m. p. h. on a 0.5 per cent. grade the rating will be found as follows:

$$10 \text{ lb. grade resistance} + 5.4 \text{ lb. train resist}$$

$$= 2267 \text{ gross tons, including the caboose}$$

The resistance of this load on a level grade will be 2,267 x 5.4 = 12,242 lb. By consulting Table I this is about equal to the drawbar-pull at 21 m. p. h. For a train moving westward the following schedule will be had when 35 m. p. h. is the maximum speed:

18 miles at 21 m.p.h.	0.71 hours
20 miles at 35 m.p.h.	8.00 hours
60 miles at 21 m.p.h.	2.86 hours
28 miles at 5 m.p.h.	5.60 hours
40 miles at 31 m.p.h.	1.90 hours
Total	11.94 hours

* The calculation of tables of acceleration and retardation for the plotting speed curves showing train movement is treated in "Tables for Finding Proper Tonnage Rating" by the author in *Railway Age Gazette*, August 23, 1912.

As the total is below the 12-hour limit set and the speed is only 5 m. p. h. on the adverse grade, it is apparent that there are only two ways of increasing the train load. Either reduce the grade or get more efficient engines. The profile in Fig. 2 is known to be possible from a topographical point of view; the dotted lines indicate the changes.

The following is the rating of the locomotive on a 0.3 per cent. grade at 7 m. p. h.:

$$\frac{30,567 - (6 \times 172 \text{ tons})}{6 + 5.4} = 2,590 \text{ tons}$$

The train resistance on a level grade will be 2,590 x 5.40 = 13,986. This is equal to the drawbar-pull at 19.1 m. p. h. This would provide the following:

42 miles at 7 m.p.h.	= 6.00 hours
33 miles at 35 m.p.h.	= .94 hours
95 miles at 19.1 m.p.h.	= 4.98 hours
Total	
11.92 hours	

The time necessary to haul this load is just inside the limit set. The increase in tons per train due to the change in grade will be 2,590 - 2,267 = 323 tons when the element of time over the division is considered.

Within the last few years the locomotive superheater has come into general use on new locomotives. These superheaters can also be applied to the saturated steam locomotives already in use.

Fig. 1—Assumed Profile Before Revision of Grade

The Pennsylvania Railroad has made numerous tests of superheaters at the Altoona testing plant, and the report of the subcommittee on Stokers and Superheaters of the committee on the Economics of Railway Location of the American Railway Engineering Association* makes this information available for use when the heating value of the coal, hourly coal consumption and heating surface are known. This makes it possible to calculate the additional tonnage which one of the saturated steam locomotives, given above, would haul if equipped with a superheater. Table II gives the resulting drawbar-pull for parallel conditions of coal consumption, heating value of coal and heating surface of boiler. If Table II is used in the same manner as Table I, then,

M. P. H.	Pounds.	M. P. H.	Pounds.
0	39,071	18	18,750
1	38,778	19	17,919
2	38,484	20	17,087
3	38,190	21	16,392
4	37,895	22	15,695
5	37,600	23	15,102
6	37,304	24	14,507
7	37,008	25	13,947
8	36,711	26	13,388
9	36,412	27	12,909
10	36,113	28	12,428
11	35,817	29	12,014
12	35,520	30	11,608
13	35,223	31	11,218
14	34,926	32	10,840
15	34,629	33	10,500
16	34,332	34	10,169
17	34,035	35	9,841

This locomotive is the same as shown in Table I, with the exception that it has been equipped with a superheater.

for the 0.3 per cent. grade, the rating of the superheater locomotive at 7 m. p. h. would be:

$$\frac{37,008 - (6 \times 172)}{6 + 5.4} = 3,155 \text{ tons.}$$

The resistance of this tonnage on a level would be 3,155 tons x 5.4 = 17,037 lb., or the drawbar-pull of the superheater locomotive at 20 m. p. h., making a schedule as follows:

42 miles at 7 m.p.h.	= 6.00 hours
33 miles at 35 m.p.h.	= .94 hours
95 miles at 20 m.p.h.	= 4.75 hours
Total	
11.69 hours	

* American Railway Engineering Association's December, 1914, Bulletin, page 135.

By a similar process the tonnage rating (including the caboose) of the superheater locomotive on the 0.5 per cent. grade at 5 m. p. h. would be:

$$\frac{10 + 5.4}{37,600 - (10 \times 172)} = 2,329 \text{ tons.}$$

The drawbar-pull on a level grade would be 2,329 x 5.4 = 12,577 lb., which could be maintained at 27 m. p. h. This would give the following schedule:

25 miles at 5 m.p.h.	= 5.00 hours.
25 miles at 35 m.p.h.	= .57 hours.
115 miles at 27.7 m.p.h.	= 4.15 hours.
Total	
9.72 hours.	

The last case shows a considerable advantage in time, but as the loading on the adverse grade reduces the speed to as low a point as could be considered feasible, there will be no method of increasing the size of a given train. Subtracting the weight of the caboose, the following results are obtained:

	Rated tonnage on		Increase tons.
	0.5 per cent gradient.	0.3 per cent gradient.	
Saturated steam locomotive.....	(A) 2249	(B) 2572	323
Superheater steam locomotive....	(C) 2311	(D) 3137	826

	Time, hours		Drifting.
	Delays.	Working steam.	
Saturated locomotive—			
(A) on 0.5 per cent grade.....	4.0	10.47	.57
(B) on 0.3 per cent grade.....	4.0	10.98	.94
Superheater locomotive—			
(C) on 0.5 per cent grade.....	4.0	9.15	.57
(D) on 0.3 per cent grade.....	4.0	10.75	.94

The savings or increases will be in fuel, train wages due to difference in the total engine mileage and caboose mileage and the release of locomotives. For this case the cost of the fuel will be considered at \$2 per ton and the following rates of combustion will be used:

- 4,000 lb. used per hour while working steam.
- 1,500 lb. firing up each trip.
- 400 lb. per hour while standing still.
- 700 lb. per hour while drifting.

A gross slow freight tonnage of 7,500,000 tons per year in each direction will also be assumed. This will give the following train miles for each case:

- A 6,666 trains x 160 miles = 1,066,560 train miles.
- B 5,832 trains x 160 miles = 933,120 train miles.
- C 6,525 trains x 160 miles = 1,044,000 train miles.
- D 4,782 trains x 160 miles = 765,120 train miles.

Figuring that the road enginemen and firemen will average 10.1 cents per engine mile, and the trainmen 11.9 cents per engine mile,

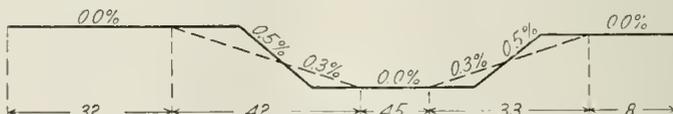

Fig. 2—Assumed Profile After Revision of Grade

the differences in enginemen's and trainmen's wages per year will be:

	Saving in Miles.	Saving in Wages.
A-B.....	133,440	\$29,356
A-C.....	22,560	4,963
A-D.....	301,440	66,316
B-D.....	168,000	36,960
C-D.....	278,880	61,353

The cost of fuel per year for case A will be, \$302,504; for case B, \$278,070; for case C, \$260,249, and for case D, \$223,605. The difference in the cost of fuel and supplies will be:

	Fuel.	Water, Oil and Supplies.	Total.
A-B.....	\$24,434	\$1,879	\$26,313
A-C.....	42,255	3,143	45,398
A-D.....	78,849	6,069	84,918
B-D.....	54,465	4,189	58,654
C-D.....	36,644	2,926	39,570

There will be 18.3 locomotives required to handle the business as outlined in case A, 15.9 in case B, 17.8 in case C, and 13.1 in case D. The saving in the cost of the locomotives and their interest and maintenance charges will be as follows:

No. Locomotives Released.	Cost.	Interest 6 Per Cent.	Interest 5 Per Cent.	Repairs \$0.09 Engine Mile.	Depreciation and Repairs.
A-B..... 2.4	\$36,000	\$3,960	\$12,010	203	\$15,970
A-C..... 5	7,500	825	2,500	45	1,028
A-D..... 5.2	78,000	8,580	27,130	466	35,710
B-D..... 2.8	42,000	4,620	15,120	252	19,740
C-D..... 4.7	70,500	7,755	25,099	423	32,854

The following recapitulation shows the actual saving of one case over the other:

Trains.	Train Wages.	Fuel, Water and Supplies.	Release of Locomotives.	Total.	Totals Capitalized at 6 Per Cent.
A-B.....	\$29,356	\$26,313	\$15,970	\$71,639	\$1,193,983
A-C.....	4,963	45,398	1,028	51,389	856,483
A-D.....	66,316	84,968	35,710	186,994	3,116,566
B-D.....	36,960	58,654	19,740	115,354	1,922,566
C-D.....	61,353	39,570	32,854	133,777	2,229,616

The estimated cost of building the line with the 0.3 per cent. grade is taken at \$41,000 per mile, or \$3,075,000. The capitalization amounts in the above table show that the expenditure of \$3,075,000 would not be justified if the same saturated steam locomotives are to be used, as the capitalized saving (A-B) of \$1,193,983 is much less. The only one of these capitalized savings in excess of the construction cost is (A-D). That is, if the grade is reduced to 0.3 per cent. and superheaters are added to the locomotives, at a cost not to exceed \$2,000 each, the improvement will be justified.

The largest return on the outlay will be found in (A-C), as nothing will be required except the expense necessary to equip the engines with superheaters. The savings will be largely in fuel per ton-mile, although a small saving is made in the other items. The expenditure needed to make these alterations should not exceed \$40,000. The designers of superheater locomotives have the choice of using the additional power by increasing the size of cylinders and getting a larger drawbar-pull at low speeds,

NEW ENGLAND RAILROADS IN 1845

The accompanying map is a reproduction of one which appeared in Dickinson's Boston Almanac, showing the railroads diverging from Boston, as they were in the year 1845. At that time there was no through rail route between Boston and New York, the nearest approach to this being the Boston & Providence and the Stonington railroads from Boston to Stonington and thence by ferry 30 miles to the eastern terminus of the Long Island Road at Greenport. It does not appear, however, that this route was much patronized. Steamers from Stonington direct to New York were popular for some years prior to 1845.

The names of the railroads on the map show that the editor of the almanac did not take much pains to acquaint himself with the official titles. What he calls the Maine Railroad then, as now, went by the name of "Boston & Maine." The Worcester Railroad was the Boston & Worcester, and the Hartford Railroad was the Hartford & New Haven. The Lowell was the Boston & Lowell and the Norwich was the Norwich & Worcester.

The line which is shown as the "Brattleboro Railroad" was never built, if, indeed, any line was ever proposed over the route here shown. The railroad from Springfield northward lies on the west side of the Connecticut river. It was opened to Greenfield in 1845, and four years later to the Vermont

Railways in New England in 1845

provided the weight on drivers permit, or using the same cylinders and getting greater efficiency at higher speeds.

It may be argued that the profile is not typical. There cannot be a typical layout for guidance in all cases. The speed over a profile depends upon the percentage of down, level and adverse grades. The adverse grade in this case is only about 25 per cent of the distance and may be found in many cases where engine districts are a succession of up and down maximum grades. The well known fact that superheater locomotives are more efficient at higher speeds than the saturated steam would seem to indicate that this fact should be taken advantage of especially when the district involved is a long one.

The "Hudson Railroad" was the Hudson & Boston, which was owned in the interest of the Western Railroad, now the Boston & Albany. Between New York and Albany the water route, in 1845, had everything its own way.

The two names most familiar on this map are those in the extreme margins, the Long Island and the Erie; but the Long Island alone is the only name in the whole list which still survives, both as an owner, and as operating its own line; for the Erie which existed in 1845 died and was long since buried. The present Erie might be called, perhaps, the grandchild of the original Erie.

The total mileage shown on the map is apparently the total railroad mileage in the States of Connecticut, Rhode Island, Massachusetts, Vermont, New Hampshire and Maine, and on Long Island. Leaving aside the railroads shown in New York, there is a total mileage on the map of 1,120. In these same States and Long Island to-day the total length of railroads is 8,472 miles, much of it, of course, double-track and a considerable proportion four-track road.

SOUTH AFRICAN RAILWAY RECORD. The reconstruction of the railway establishing the Union gage in what was formerly German Southwest Africa, is now completed between Walvis Bay and the Union. The last section of 32 miles was accomplished in 50 hours, constituting a new South African record.

SHOWING THE TRAIN NUMBER ON THE ENGINE

BY W. E. WATTS

Tram Despatcher, Atchison, Topeka & Santa Fe, Raton, N. M.

The use of indicators on locomotives showing the designation of the train is a practice that should be more widely adopted. The standard code of train rules provides that "Regular trains will be designated in train orders by their number . . . adding engine numbers if desired." A large number of railroads do use engine numbers in train orders, while an equally large number do not. Very few of those roads using engine numbers have made any special provision for illumination of the engine number by night, outside of placing the number in the headlight. On some lines this is shown across the face of the headlight; on others in small spaces provided for that purpose on each side of the headlight. On yet others the number is not illuminated at night in any manner whatsoever, and at stations it is often necessary for the engineman or fireman to hold a light so it will shine on the number on the side of the cab or the tank.

The train indicator has been generally adopted by the Union Pacific and the Southern Pacific with great success. They use the indicators as an additional means of identification of a train, as the dispatchers also incorporate engine numbers in train orders when possible.

These indicators are arranged to show six figures, e. g. 401 or 2-155 or X-1705. These letters and figures are about six inches high and three inches wide, white against a black background and illuminated by a small electric light connected with the cab circuit. On some portions of these systems acetylene or oil is used with good results, but the electric light is best. These numbers are also a useful means of identification in the day time.

Some officers have advanced the objection, "what about the indication getting clogged up with snow and ice in the winter time?" Very little trouble has been experienced from this cause. The indicators are usually placed in a horizontal angle of 45 degrees, and neither snow nor sleet will stick to the face of the indicators as would be the case if they were placed broadside towards the front. Even if there is a little interference from snow and sleet at times, it is less than that which actually occurs every winter season now in that respect as regards obscuring the numbers in the headlight.

Quite often in present practice it is necessary to use the form "Eng unknown" in train orders, when the engine number is not known at the time the order is placed, as a good many train and engine men will refuse to accept an order unless the number is shown or this form is used. This, of course, where the rules require numbers to be given. And again, quite often it is necessary, for some cause or other, to change engines on a train which is all ready to depart, and it is then necessary to inform all trains concerned that "No. 1 has Eng. 1 instead of Eng. 2," or "Orders Nos. — should read Eng. 1 instead of Eng. 2," etc. If indicators showing train numbers were used on all locomotives thus used, engine numbers would be unnecessary. It is but a moment's work to change the display of an indication to any other designation.

From the standpoint of "safety first" the indicator is a valuable asset. There are numerous contingencies whereby one train may mistake another train for something else than what it is, as all railroad men well know. But with the indicator there is very little chance for doubt or mistake. The number of the train is shown in good sized figures, much larger than the usual headlight number, and when properly placed, these indicators are much more easily "picked up" by the crew on another train, whether standing or moving, than are the engine numbers as usually displayed.

Nowadays, when it is the practice to run several trains in the same direction closely following each other, and the equipment of one looks practically the same as that on the others, a crew in the siding for 1, 3 and 7 cannot know which is which, if they are on time, or nearly so (the train in the siding having no orders regarding them which would give the engine numbers), and if No. 7 comes first it may be taken for No. 1, etc. If they all come

along carrying no signals the train in the siding may proceed, but if one should be carrying green signals the man in the siding does not know who's who, and there is some little confusion.

It is true that those roads which do not require the use of engine numbers get along very well, but the indicator, I reiterate, is a strong factor in "safety first."

RAPID-FIRE REGULATION

The Cincinnati Enquirer quotes J. M. Davis, general manager of the Baltimore & Ohio Southwestern, in the following interview on the vexations of regulation, given just after a long session with the road's legal department:

"Every railroad officer who looks at the matter of public relations in a broad-minded way agrees that regulation has been beneficial up to a certain point. The law prohibiting rebates which undermined commercial concerns, the law to protect railroad employees by means of safety appliances, the anti-pass law and numerous others have helped us serve the people better and enabled the public and the carriers to understand the rights of each other. So I say that, considered from this viewpoint, the railroad officials do not and would not return to the methods of the old days.

"But while the laws which I have mentioned have been placed on the statute books, the way has been smooth for the demagogues and the unscrupulous, who have taken advantage of their opportunities to harass the railroads with laws which not only were unjust, but which saddled large expense upon them without benefit to the public or the service.

"In an address before the American Bar Association, Senator Elihu Root, of New York, decried the indiscriminate passing of laws and stated that this country makes too many laws. The speaker said that 62,000 statutes had been passed in five years and a big percentage of these affected the railroads.

"These new laws are being written on the statute books so rapidly that an attorney is often unable to give counsel promptly because of being unable to keep up with the pace of the legislatures.

"Of the more important laws pertaining to the railroads which we have with us always are the hours of service law, employers' liability, ashpan laws, caboose, full crew and semi-monthly payroll statutes, two-cent rate, electric headlight, automatic block signal, train limit and automatic fire-door laws. One legislature had up for consideration last year a bill to compel the railroads to provide air-tight and dust-proof locomotive cabs—about as practicable as the bill introduced in Colorado to compel bulls when traveling alone at night on the public highways to wear lanterns and the bill in Kansas to revise the Ten Commandments. I have in mind conflicting laws of states which the railroads are required to comply with. One of these states requires a cuspidor between every two seats in passenger coaches, while the adjoining state through which the trains travel on the same run requires that the cuspidors be removed.

"The safety appliance law has been a great help to the railroads, but with the changes which have been made and the modifications which have taken place and continue it is difficult to carry out the provisions. At a recent staff meeting the question was asked whether anyone present could name the parts of a car subject to defect, and it could not be done, because there are 257 defective possibilities on a passenger or freight car and 30 on a locomotive."

TASMANIA COAL.—There are abundant seams of marketable coal in Tasmania. They belong to the permo-carboniferous and mesozoic measures, and range from 20 in. to 12 ft. in thickness. In the basin of the Mersey the seams belong to the older measures. In the eastern part of the island those of younger age prevail. Eleven collieries are now engaged in producing coal in Tasmania. The output in 1910 was 82,445 tons, valued at \$250,000.

Traveling Engineers' Association Convention

Report of the Proceedings Covering the First Two Days' Sessions, Held on Tuesday and Wednesday of This Week

The twenty-third annual convention of the Traveling Engineers' Association was held in Chicago, September 7-10, J. C. Petty, of the Nashville, Chattanooga & St. Louis, presiding. The opening prayer was made by Bishop Fallows, after which the president made a brief address of welcome. He also directed special attention to the economies that may be obtained by the co-operation of the traveling engineers with the other departments of a railway.

As is customary at the meetings of this association several special addresses were included in the program, in addition to the committee reports and technical papers. For Tuesday and Wednesday these included addresses by C. H. Markham, president, Illinois Central; F. W. Brazier, superintendent rolling stock, New York Central Lines east of Buffalo, and Frank McManamy, chief inspector of locomotive boilers, Interstate Commerce Commission.

Mr. Markham took occasion to pay tribute to the courage, skill and intelligence of the engineer. He also spoke of the unfair attacks on railroads and the fact that there was entirely too much regulation. He urged unity of all railroad forces in the great movement toward securing a better understanding of railroad problems and better treatment of the railroads. He emphasized also the necessity of seeing that the internal relations of the railroads should be amicable, stating that a great strike that would stop all trains would be followed by government ownership.

Mr. Brazier sketched briefly the development of locomotives and cars in recent years. He mentioned several prominent railway men that had started their railway careers on the locomotive, calling attention to the opportunities of the traveling engineer for advancement.

Mr. McManamy spoke of the necessity of obtaining good intelligent men as firemen, and called attention to the necessity of keeping locomotives in safe and serviceable condition. Since the boiler inspection law has been in effect accidents causing injury have been reduced to 51 per cent; the number killed from these accidents has been reduced 86 per cent, and the injured 54 per cent. This also must indicate a reduction in engine failures. He spoke of the locomotive inspection rules as being designed to protect the enginemen from injury due to defective equipment.

SMOKE PREVENTION WITH OIL BURNING LOCOMOTIVES

The committee on smoke prevention confined its report this year to the consideration of oil burning locomotives with the purpose of determining whether or not this fuel can be used with less smoke than coal. From the report, and the discussion which followed, it is evident that as much and possibly more difficulty may be experienced in securing smokeless firing with oil burning than with coal fired locomotives.

The amount of smoke produced by an oil fired locomotive depends to a great extent on the condition of the locomotive and the way in which it is handled by the crew. Although little difficulty is experienced in firing stationary boilers with oil, there being a large furnace volume and a low pressure draft, the conditions on a locomotive are not such that smokeless firing can always be obtained readily. The variations in draft, due to the intermittent use of steam, especially in switching service, greatly aggravate the problem. When a locomotive boiler is forced it is practically impossible to eliminate smoke when oil is used as fuel, either because of insufficient air supply or the fact that the temperature cannot be raised sufficiently high to insure complete combustion. This is especially true when locomotives are fired up at terminals.

The oil should be preheated before it is delivered to the

burner in order that it may be thoroughly atomized; dry steam should be used in the burner as wet steam, caused by carrying the water too high in the boiler, will sometimes extinguish the flame entirely, causing explosions which damage the combustion arch. The consumption of oil should be carefully regulated, the fireman being careful to gage the oil supply with the working of the throttle. Ashpans should be as large as possible and air openings should be large enough to provide a plentiful supply of air for complete combustion with a minimum amount of draft. The brick work should be arranged to provide for an equal distribution of heat, and where this is done the brick arch can be used to good advantage. If smokeless firing is to be realized the engine must be carefully maintained and the firebox and tubes must be kept clean. The temperature of the firebox should be maintained as nearly constant as possible with the aid of dampers in order to prevent harmful effects to the various parts of the boiler because of sudden contraction and expansion.

TRAINING OF NEW MEN FOR FIREMEN

Nothing will so well repay the time and money spent as the education and development of railway employees in general and of locomotive firemen in particular. The locomotive firemen are using many million dollars' worth of coal, a great percentage of which is wasted through improper methods of firing and indifference to the fact that this coal represents so much money to the companies they work for.

Years ago when the number of men employed on one division was comparatively small, the fireman came into direct contact with the master mechanic and often with the superintendent of motive power. As a result the enginemen were more interested in the welfare of the company and took interest enough in their work to find out the correct methods to use in performing their different duties.

It is an admitted fact that the class of men employed as firemen during the past few years have not been up to the desired standard. Instead of enginemen working for the interest of the railways, we now find them promoting adverse legislation in every state. This legislation will cost, or has already cost, the railways much money in many ways. If the engineman could be made to see that his interest is directly connected with the welfare of the company that pays him, this condition would be eliminated.

We believe that the one thing which leads all others in causing this lack of interest, and oftentimes real opposition against the railways is the fact that in most cases the rank and file of the enginemen only know their superior officer through the chairman of the order to which they belong. The men and officials have grown apart until there is a great lack of confidence on both sides. Right here is where the traveling engineer can be of the greatest help in regaining this lost confidence, if he has the proper backing.

Every company should have a distinct policy regarding the education and development of firemen from the day they are employed until they have passed all examinations to make them full-fledged engineers. This system should be as clean cut and as vigorously maintained as the best of other operating systems are maintained. The new man should by all means have some special training before starting to fire a modern locomotive with its multitude of special appliances. He should be well grounded in the reasons for doing the work.

The work of educating the firemen should be placed in the hands of a broad-minded man who believes in this work, and is willing to give the best there is in him to it. He should have a practical knowledge of firing a locomotive and should thoroughly understand the burning of coal (or other fuel which may be

used) on the locomotive. He should have a general knowledge of all fuel used on the road and how it should be fired. He should have the knack of imparting his ideas to others on the locomotive or in class talks at terminals. Then, last, but not least, he should have the confidence of the officers of the road and be given full charge of the work, so that there will be no interference from any source.

Lesson papers should be prepared covering a course in elementary combustion, standard firing practice, boiler feeding, care of firebox on the road and at terminals, use of special equipment on the locomotive, rules and signals, instruction in safety first and locomotive running and breakdowns. Class instruction should be given at the different terminals. The class-room should be fitted with a portable moving picture outfit. Several roads now use the moving picture and speak very highly of it as an educational item of great value. A dummy firebox of standard size and shape, equipped with a brick arch so that the conditions will be the same as on the locomotive, should be used for giving practical instruction.

The employing of new men is very important and should be given the attention of some one capable of judging and handling men. We would suggest the type of man wanted as locomotive fireman as one who is twenty-one years old, with a bright, clean-cut appearance. It is necessary that he should have a common school education and be able to assimilate instruction. He should have good habits and if married so much the better. Such a man will repay any time spent on him if he has the right spirit. The prospective fireman should be given a position around the roundhouse in some capacity, such as wiper, mechanist helper, or on the cinder pit. If there are shops near or at the terminal, the new men can be placed there. With the men in the shops and in the roundhouse we will have them where we can start their education at once. There they will get experience which will be of great value to them after they get on the road as firemen and even after they go running.

When a man is employed he should be given a letter which will outline the position of the company with regard to his future. It will be explained to him that the company intends to educate him along the best lines of standard practice pertaining to his work; that if he will devote his time during working hours and some of his time out of working hours to the best interests of

the classes each day he should have been under the observation of some one who is interested to know if he is the right kind of man for the work. As soon as the new men are through the course in firing practice they should start on the locomotive running course. The traveling engineer should have charge of this work.

By following this system you first have picked men to start with. Then the company will have a chance to instill into their minds right thoughts about the position of locomotive fireman, and rights thoughts about the position of the company toward the men. They will be ready to fire an engine from the start instead of probably never learning to fire. In the end it will give us a body of firemen on our locomotives who are interested in their work, who know how their work should be done, and who are looking forward to better positions on the road.

The report is signed by L. R. Pyle (M., St. P. & S. S. M.), chairman; J. C. Heyburn (St. L. & S. F.); J. C. McCutcheon (Wabash); J. Fred Jennings (M. C.), and W. H. Davies (Sou. Schools of Railway Science).

Discussion.—The presentation of the report was followed by an exhibition of moving pictures, as used by some of the roads in connection with instruction in firing. Martin Whelan laid particular stress on the necessity of making the enginemen feel that they are a very important part of the railway organization and that the officers have their best interests at heart. As a general thing the men do not appreciate the interest that is taken in them. A great deal more care should be taken in educating the enginemen, as with the changed conditions they do not now receive the benefit of individual instruction from a single engineer.

The closing sessions of the convention will be reported in next week's issue.

LOCOMOTIVES FOR THE RUSSIAN STATE RAILWAYS

Early in the summer it was announced in these columns that orders had been placed in America by the Russian State Railways for 400 locomotives of the Decapod type, 250 with the Baldwin Locomotive Works, 100 with the American Locomo-

Decapod Type Locomotive Built by the American Locomotive Company for Russian State Railways

the company, the latter will give him an education in everything pertaining to his work as a fireman and as a future engineer; that the company expects, as a reasonable return, that the man will give, first, loyalty to the company's interest in every way, striving to promote the welfare of the company whenever possible; then, that he will do his work energetically and according to instructions. If these things are kept before the new man from the beginning, always showing him that the company is taking an interest in him, we will be able to combat a great deal of the other influence at work among the men.

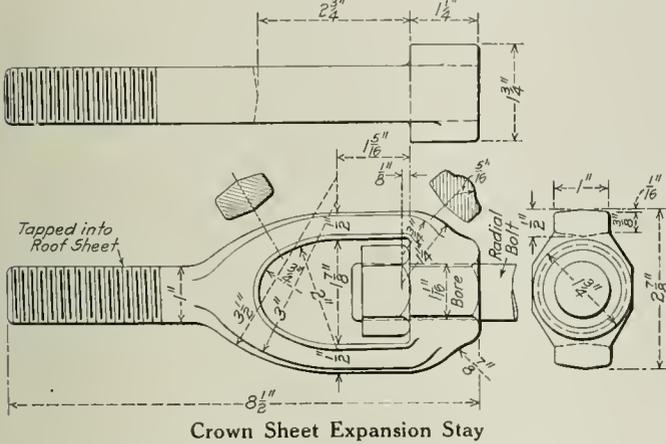

During the time this man has been in the shops and attending

tive Company, and 50 with the Canadian Locomotive Company. Apart from the magnitude of the order, these engines are of interest because of their design and the urgency with which they are being built. The orders were placed during the latter part of June, and the first of the locomotives were ready for shipment soon after the middle of August. During this time much of the designing was done, the engines were built and tested and then knocked down and packed for shipment.

The locomotives are designed for operation on track of 5 ft. gage, which is used on a large part of the mileage of the Russian State Railways. The axle loads are light as compared with

American practice, but the locomotives are of considerable capacity, the tractive effort being 51,500 lb. The ratio of adhesion, however, is unusually low. They are designed to haul 1,000 metric tons up a grade of .8 per cent at a speed of approximately 8 to 10 miles an hour, which they should readily do by working at a reasonably economical cut-off.

Although special materials and equipment have been used to a considerable extent in the construction of these locomotives,

Crown Sheet Expansion Stay

the designs were prepared by the builders and the construction in each case is largely in accordance with the builders' practice. The illustrations show the engines built by the Baldwin Locomotive Works and the American Locomotive Company, and while many of the details of the two orders have been made interchangeable, it is apparent that few restrictions as to details were placed on the builders. The fuel used is an inferior grade of bituminous coal, and this is burned on a rocking and drop grate with an area of about 64½ sq. ft. The firebox is placed

screwed into the roof-sheet. The thread on the stay is set into the nut with a punch after the bolt has been adjusted to secure the proper tension. This arrangement has ample flexibility and utilizes ordinary staybolt taps in the boiler and firebox sheets, leaving the water space above the crown unobstructed.

The locomotives are equipped with Schmidt superheaters and outside steam pipes. The superheaters have 28 elements, with a superheating surface of 563 sq. ft. in the Baldwin locomotive, and 553 sq. ft. in those built by the American Locomotive Company. Both orders have power reverse gears. The Baldwin engines are equipped with the Rushton reverse mechanism, which may be arranged without difficulty for manual operation. A screw reverse gear is applied to the engines built by the American Locomotive Company, the power reverse in both cases being operated by an air motor in the cab.

The cylinders, frames and running gear closely follow American practice in design. The pistons have rolled steel heads with cast iron rings sprung in, and are carried on extended piston rods. Single bar guides and crossheads are used, in accordance with Russian practice. The main driving wheels have plain tires which are necessary in order that the engines may traverse curves of 350 ft. radius.

The locomotives are fitted with wide running boards, in accordance with Russian practice, having railings around the outer edge. A railing is also applied across the front of the bumper. The cabs are of steel and the front end of the tender is enclosed to protect the engine crew from the weather. The couplers and bumpers are arranged in accordance with Russian practice, which follows that generally used in Europe. The locomotives are equipped with the Russian-Westinghouse automatic air brakes.

The tender is carried on two four-wheel trucks, which are of the arch-bar type, with rolled steel wheels. The frame is of longitudinal sill construction, the sills being of 12-in. channel section.

After being erected and tested by the builders, the locomotives

Freight Locomotive for the Russian State Railways Built by Baldwin Locomotive Works

above the driving wheels and is equipped with a security brick arch supported on water tubes. The boilers of the two designs are somewhat different. The Baldwin engine has a straight mud ring and is provided with an auxiliary dome for the safety valves and whistle. The ends of the mud ring of the American Locomotive Company's engine slope toward the longitudinal centerline, and the whistle and safety valves are placed directly on the main steam dome.

The inside fireboxes are of copper, and copper stays are used in the water legs. The front end of the firebox crown sheet of the Baldwin engines is supported by three rows of expansion stays of the type shown in the drawing. The nut on the upper end of the radial stay is seated in a die-forged stirrup, which is

are dismantled and packed for shipment, to be re-erected after delivery.

The principal dimensions of the locomotives are shown in the accompanying table:

GENERAL DATA		
	Baldwin Loco. Wks.	American Loco. Co.
Gauge	5 ft.	5 ft.
Service	Freight	Freight
Fuel	Soft coal	Soft coal
Tractive effort	51,500 lb.	51,500 lb.
Weight in working order	196,000 lb.	195,300 lb.
Weight on drivers	175,000 lb.	174,600 lb.
Weight on leading truck	21,000 lb.	20,700 lb.
Weight of engine and tender in working order	338,000 lb.	330,600 lb.
Wheel base, driving	18 ft. 8 in.	18 ft. 8 in.
Wheel base, total	37 ft. 4.10 in.	27 ft. 10 in.

* Equivalent heating surface equals total evaporative heating surface plus 1.5 times the superheating surface.

COAL SHORTAGE IN EUROPE

By WALTER S. HIATT*

With the war expected to last until next year the coal shortage in Europe is going to be a distressing subject this winter. It means that the railroads will have a hard time because of the increased cost of coal; it means that many families will have to go without heat; it means that coal may be slightly higher in price in the United States if the American coal merchants are able to deliver all the coal they have contracted to deliver in Europe. If American railroad terminal methods and machinery for handling coal rapidly and in large quantities existed at Italian and French ports, American coal merchants would this year sell upwards of 50,000,000 tons.

Belgium normally produces 20,000,000 tons, more than enough for home consumption, but these mines are not being worked now except in the interest of the Germans. Italy, France and Russia will suffer for want of coal because of the limited home output and lack of the normal amount of importations. Italy produces little coal, Russia barely over 30,000,000 tons and France just over 40,000,000 tons. Of the powers at war England and Germany are the most favored. While the price of coal has already gone up in Germany, its mines are being worked and its production this year will still, despite the number of soldiers taken out of the mines, be adequate for home consumption, though far less than its average production of about 200,000,000 tons. Austria produces almost its normal coal consumption.

The railroads of Germany certainly will not suffer in their war activities from lack of coal, since they consume in normal times but slightly over 11,000,000 tons per year. The increased consumption of coal due to the intricate war movements of trains will not raise this figure to more than 25,000,000. In Russia, however, which because of the blockaded seas has been forced to bring its imports of all kinds of war materials from the Far East on its Siberian railroad, the coal question will further hamper the railroads, which have been working none too smoothly.

The situation in France is typical of many European countries.

* Our Special European Correspondent.

While France has, of course, all the seas open to her, to date she has been unable to import or obtain at reasonable prices the quantity of coal required either for her railroads or for her civil population. As early as last December coal for domestic uses almost doubled in price, going from \$6 to \$11 a ton, and the majority of families went without heat rather than pay the extra price. The railroads were not seriously hampered in this respect because of supplies on hand, and the situation was eased somewhat later in the winter by English imports.

France normally consumes 60,000,000 tons a year, of which amount she herself produces 40,000,000 and the other 20,000,000 she imports either from England or Belgium. But the German invasion cut off the Belgian supply and at the same time cut off the 20,000,000 tons of coal that France normally gets from her northern district on the Belgian frontier.

The French railroads normally consume about 15 per cent, or nearly 9,000,000 tons of the total of 60,000,000 required each year in France. The other 85 per cent is normally distributed as follows: Private use, 20 per cent; industries and manufactures, 28.6 per cent; gas factories, 7.5 per cent; mine industries, 8.9 per cent; metal factories, 17.9 per cent; tug boats, canal barges and ships, 2.2 per cent. This year the railroads will consume about twice the normal quantity because of the necessity of the rapid and quick movements of troops, which require more than the normal number of engines either attached to trains or else always held in readiness for unexpected movements.

In this connection, as a curious fact worthy of note, I counted one day recently in the Paris yards of the Western Railroad no less than 45 locomotives with steam up and merely held in reserve. While a German attack on Paris, or even a general movement to break through the line of trenches 50 miles from Paris, is no longer plausible, the military authorities are today ready for any emergency. For that reason they hold in reserve an army at Paris variously estimated at from 100,000 to 300,000 men, ready either to defend Paris proper or to be launched rapidly out of Paris on a few hours' notice to any part of the trench line that may be overwhelmed.

For the same reason and merely as a precaution the railroad tracks that run out toward Compeigne, Soisson and Reims are either themselves part of a line of reserve trenches or are flanked by a vast network of trenches. In short, the country between Paris and the German line of trenches is protected by some 20 immense lines of reserve trenches spreading out from Paris like a fan and each trench line increasing in length as it is removed from Paris until it may be a hundred miles in length.

Because of the enormity of the importance of railroads in this war, which cannot be overstated, so far as concerns France, a country of short distances, where a false move might wreck her entire plan of campaign, where the loss of a mile or two of territory even, might prove irreparable, it is certain that there will be no coal shortage so far as concerns the railroads. As an arm of the government any available coal will first be placed at their disposition.

The coal question for these various railroad and military uses, as well as for private family consumption, was carefully gone over lately by the Central Committee of the Collieries of France. It pointed out that the miners mobilized in the early part of the war to the number of 4,500 have been returned to the mines and that 3,000 workmen among the refugee Belgians have been employed, and that these workmen, together with others never mobilized, were now working in the mines of central and south France, so that the coal production was now being carried on at the rate of 20,000,000 tons a year, or about half the normal supply, and which supply is directly under the control of the government. The railroad coal, that costs \$3 a ton in the United States, is quoted at \$10 for French coal and \$12 for English coal. It would appear that the first sufferers from the coal shortage will not be the railroads, but the private consumer, who at present is unable to secure deliveries at any price. Despite the high cost of ocean transportation, it is expected that American coal deliveries will ease the situation for all classes of consumers and will tend to keep down prices.

General News Department

United States Consul Silliman, telegraphing from Vera Cruz, September 4, reports the wreck of a railroad train near Mexico City, in which 200 persons were killed.

The Chesapeake & Ohio reports that on its line between Richmond, Va., and Old Point Comfort, 85 miles, more than 300 convictions for trespassing were secured in one month.

The Rock Island Lines have made arrangements with the Railway Educational Bureau, of Omaha, Neb., to extend the privileges of the bureau to Rock Island employees.

The Missouri, Kansas & Texas is reported to have let a contract to Dorset Carter of Oklahoma City for a large part of its coal supply from the southern Oklahoma fields for a term of years.

Trains were run into Galveston, Tex., September 1, the damage to the causeway occasioned by the hurricane of August 16 having by that time been sufficiently repaired to allow the laying of one track.

Sir William MacKenzie, president of the Canadian Northern, announced in Winnipeg last week that that road would be opened for passenger and freight traffic through between the Atlantic and the Pacific in the month of October.

Between Broad street, Philadelphia, and Paoli, 20 miles, the Pennsylvania Railroad is now running a few trains by electric power. The equipment of this section of the road for electric traction has been going on for about two years and the expenditures have amounted to about \$4,000,000. Current is supplied by the Philadelphia Electric Company.

Near Uno, Man., on the morning of September 2, about two o'clock, a trestle bridge of the Grand Trunk Pacific, 1,700 ft. long, and in the middle 85 ft. high, was completely destroyed by a cyclone; and a freight train, coming to the bridge a half hour afterward, was wrecked, resulting in the death of the engineer. A passenger train had passed over the bridge a short time before the storm.

The 57 railroads in Texas which pay taxes under the gross receipts tax law are to receive a refund amounting to \$76,343 out of a special appropriation by the legislature. Some of the larger roads contested the law and had it declared unconstitutional, but many of the smaller roads paid the tax and the state controller refused payment of the refund. The attorney-general of the state has recently rendered an opinion that there is no legal impediment to such payment.

New York Port Improvement Commission

The City of New York, acting through the Board of Estimate and Apportionment, has adopted the proposal made some time ago by the Merchants' Association and endorsed by the Chamber of Commerce to appoint a board of engineers to investigate the freight transportation facilities of the city; and it is announced that the commission consists of John F. Stevens, George F. Swain and William C. Loree. The plan contemplates a study extending over two or three years, at an expense of \$125,000 a year. The estimate includes annual salaries of \$15,000 for each commissioner, \$5,000 each for five assistants; \$2,000 each for five assistants of lower grades, etc. The commission will not organize until the appropriation for its support shall have been approved by the Board of Aldermen. A member of the commission outlines the proposed work as follows:

"We understand that the problem is the study of the terminal facilities of New York City, and the formulation of some plan which will correlate, simplify and facilitate the methods of collection, storage and distribution of freight in New York City. This problem involves the study of the various railroad and steamship terminals, their relation to business centers, the method of carrying freight through the streets, the interchange

of freight between railroad and steamship lines; in general, the entire terminal facilities of the city.

"It is hoped that a feasible plan may be developed by which existing congestion and inconvenience may be removed, cost of handling reduced, and in general the terminal facilities of New York, both as a port and as a manufacturing and consuming center, may be improved and provision made for future growth."

Mr. Stevens is well known as a railroad officer, having been engaged in engineering work in the West from 1874 to 1902, when he became general manager of the Great Northern, with which road he remained, in that and higher offices, until 1905, when he went to the Rock Island. Later he was chief engineer of the Panama Canal, and an officer of the New York, New Haven & Hartford. Dr. Swain is the well-known civil engineer of Boston, consulting engineer of the Massachusetts Railroad Commission since 1887, and member of the Boston Transit Commission for the past 21 years. Mr. Loree was superintendent or general manager in the Baltimore & Ohio System from 1903 to 1914, having before that served 19 years in the engineering department of the Pennsylvania lines west of Pittsburgh. Since January 1, 1914, he has been out of the railroad service.

Newport News Elevator Burned

The grain elevator of the Chesapeake & Ohio at Newport News, Va., was destroyed by fire on the night of September 4, with about 500,000 bushels of grain; estimated loss \$2,000,000. An office building was also destroyed.

New York Railroad Club

At the next regular meeting of the New York Railroad Club, to be held in the Engineering Societies Building, 29 West 39th street, New York, on September 17, a paper will be presented by C. M. Himmelberger, superintendent of the Raritan River Railroad, entitled, "The Freight Terminal."

Traveling Engineers' Association

The twenty-third annual convention of the Traveling Engineers' Association at the Hotel Sherman, Chicago, commenced on Tuesday, September 7, and lasts four days. Abstracts of some of the papers presented and the discussion of them appear elsewhere in this issue. The following is a list of the exhibitors:

American Arch Company, New York.—Represented by Le Grand Parish, W. T. Allison, H. D. Savage, J. P. Neff, A. W. Clokey, G. M. Bean, R. J. Himmelright and J. T. Anthony.
American Locomotive Company, New York.—Photographs. Represented by C. A. Delaney.
American Steel Foundries, Chicago.—Vulcan trucks, Simplex couplers, Economy draft arm, Vulcan brake beams and Simplex truck column. Represented by W. A. Wallace, W. G. Wallace and J. G. Russell.
Ashton Valve Company, Boston, Mass.—Gages, safety valves, whistles and gage-testing devices. Represented by J. W. Motherwell, J. F. Gettrust and H. O. Fettinger.
Barco Brass & Joint Company, Chicago.—Barco engine and tender, flexible connection for air, steam and oil, Barco automatic smoke box blower fitting, Barco flexible joints and Barco gage bracket. Represented by F. N. Bard, C. L. Mellor and L. W. Millar.
Bird-Archer Company, New York.—Boiler compounds. Represented by L. E. Wilson, J. M. Robb and W. S. Reid.
Boss Nut Company, Chicago.—Lock nuts. Represented by J. A. MacLean.
Chambers Valve Company, New York.—Photographs. Represented by F. H. Clark.
Chicago Car Heating Company, Chicago.—Steam hose couplers, pressure-reducing valves, steam traps, stop valves, steam gages and end train pipe valves. Represented by E. A. Schneider, R. P. Cooley and E. E. Smith.
Chicago Pneumatic Tool Company, Chicago.—Pneumatic tools.
Commercial Acetylene Railway Light & Signal Company, New York.—Headlights. Represented by H. G. Doran.
Crane Company, Chicago.—Valves. Represented by F. D. Fenn and F. W. Venton.
Dearborn Chemical Company, Chicago.—Represented by J. D. Purcell, G. R. Carr and J. H. Cooper.
Delaware Railway Specialty Company, Wilmington, Del.—Automatic drifting device for superheater locomotives. Represented by W. H. Savery.
Detroit Lubricator Company, Detroit, Mich.—Detroit automatic flange lubricator. Represented by A. D. Homard.
Economy Devices Corporation, New York.—Rushion screw reverse gear, Casey Cayn reverse gear, Ragonnet reverse gear, Universal valve chest and radial buffer and engine truck. Represented by H. E. Ball and J. L. Randolph.

Edna Brass Company, Cincinnati, Ohio.—Injectors, valves and fittings. Represented by E. O. Corey and H. A. Glenn.

Equipment Improvement Company, New York.—Market locomotive devices, Wine side bearings and Trojan packing. Represented by E. E. Sawyer and C. W. Cross.

Franklin Railway Supply Company, New York.—Franklin fire-door. Represented by C. W. F. Coffin, W. H. Coyle, R. Coburn, J. Sinkler and S. Rosenfelt.

Galena Signal Oil Company, Franklin, Pa.—Represented by J. E. Linahen, W. J. Walsh, W. Holmes, I. A. Roosevelt, G. E. McVicar, W. O. Taylor, D. L. Eubank, C. B. Royal, W. E. Brumble, M. M. Meehan, J. S. Brown, J. P. Ferguson, F. B. Smith, J. A. Graham and J. G. Arn.

Garlock Packing Company, Palmyra, N. Y.—Garlock packing. Represented by J. P. Landreth, G. H. Green and M. E. Hamilton.

Greene, Tweed & Co., New York.—Packings. Represented by N. B. Nickerson.

Henry Manufacturing & Grease Cup Company, Terre Haute, Ind.—Grease cups. Represented by M. Henry.

Hunt-Spiller Manufacturing Corporation, Boston, Mass.—Hunt-Spiller gun iron and Hunt-Spiller cylinder and valve packing. Represented by J. G. Platt, V. W. Ellet, J. M. Monroe and H. B. Parker.

Jerome-Edwards Metallic Packing Company, Chicago.—Metallic packing. Represented by G. C. Jerome and R. L. McIntosh.

Kelley-Wood Safety Locomotive Side Curtain Company, Chicago.—Locomotive side curtain. Represented by W. F. Kelley.

Leslie Company, The, Lyndhurst, N. J.—Presto coupling nuts and regulators. Represented by S. I. Leslie and J. Cizek.

Liberty Manufacturing Company, Pittsburgh, Pa.—Locomotive tube cleaners. Represented by C. L. Brown and C. T. Davis.

Locomotive Pulverized Fuel Company, New York.—Represented by J. E. Muhlfield.

Locomotive Superheater Company, New York.—Model of welded superheater unit, pyrometer, and grinding tools. Represented by John Bell, W. Boughton, W. A. Buckbee, G. Fogg, C. D. Hilferty, B. G. Lynch, S. MacDonald, A. C. McLachlan, J. E. Morn, R. M. Ostermann, R. R. Porterfield, G. E. Ryder, G. E. Spangler, W. G. Tawse and C. N. Wickerham.

Long, Jr., & Co., Charles R., Louisville, Ky.

Manning, Maxwell & Moore, Inc., New York.—Inspirators, valves and gages. Represented by C. L. Brown and F. J. Wilson.

McCord & Co., Chicago.—Journal boxes and lubricators. Represented by O. H. Neal.

Mudge & Co., Chicago.—Mudge-Slater Iron end. Represented by G. W. Bender and B. W. Mudge.

Nathan Manufacturing Company, New York.—Injectors, lubricators, boiler checks and boiler supplies. Represented by A. S. Work, J. S. Seeley, W. R. Walsh and G. Royal.

National Boiler Washing Company, Chicago.—Safety-first fire door. Represented by H. A. Varney.

National Graphite Lubricator Company, Scranton, Pa.—Represented by L. S. Watres.

National Railway Devices Company, Chicago.—Shoemaker fire door. Represented by J. G. Robinson.

Okadee Company, Chicago.—Blow-off cocks, tank hose and strainer drain valve. Represented by A. G. Hollingshead.

Ohio Injector Company, Chicago.—Ohio injector, Chicago injector and Chicago flange lubricator. Represented by W. S. Furry, F. W. Edwards, F. B. Wiperman and A. C. Beckwith.

O'Malley-Bear Valve Company, Chicago.—Multi-plate valves. Represented by E. O'Malley and T. O'Malley.

Paxton-Mitchell Company, Omaha, Neb.—Metallic packing. Represented by C. A. Coons.

Pilliod Company, The, New York.—Baker valve gear. Represented by R. H. Weatherly.

Pocket List of Railroad Officials, New York.—Represented by C. L. Dinsmore.

Pyle-National Electric Headlight Company, Chicago.—Young locomotive valve gear and Pyle-National electric headlight. Represented by R. C. Vilas, W. Miller, J. E. Kilker, C. W. Young, W. T. Bretherton, L. H. Steger, F. Kersten and C. E. Miller.

Robinson Company, Boston, Mass.—Exhaust nozzle. Represented by H. M. Parker.

Sellers & Co., Inc., William, Philadelphia, Pa.—Injectors and boiler fittings. Represented by S. L. Kneass, G. W. Wilson and L. H. Burns.

Simmons-Boardman Publishing Company, New York.—*Railway Age Gazette* and *Railway Age Gazette, Mechanical Edition*. Represented by R. E. Thayer, L. B. Sherman and F. H. Thompson.

Southern Locomotive Valve Gear Company, Knoxville, Tenn.—Southern valve gear. Represented by E. L. Chollman and J. A. Murrain.

Standard Heat & Ventilation Company, New York.—Represented by C. H. McCormick.

Storrs Mica Company, Owego, N. Y.—Represented by C. P. Storrs.

United States Graphite Company, Saginaw, Mich.—Graphite and graphite paint. Represented by J. W. Ediston and J. G. Drough.

United States Metallic Packing Company, Philadelphia, Pa.—Metallic packing. Represented by M. Brewster, H. M. Wey and J. C. Mace.

Vissering & Co., Harry, Chicago.—Metallic packing and bell ringer. Represented by Harry Vissiering, G. S. Turner and W. H. Heckman.

Western Railway Equipment Company, St. Louis, Mo.—Locomotive devices. Represented by Louis Hoerr.

Westinghouse Air Brake Company, Pittsburgh, Pa.—Represented by L. M. Carlton, W. M. Sleet, A. K. Homeyer, J. A. O'Malley, W. V. Turner and S. J. Kidder.

White American Locomotive Sander Company, Roanoke, Va.—Represented by W. H. White.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, date of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the *Railway Age Gazette* for each month.

AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next meeting, October 21-23, 1915, Boston, Mass.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 8 W. 40th St. New York. Annual convention, October 4-8, 1915, San Francisco, Cal.

AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—H. G. McConaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next meeting, November 17, 1915, Chicago.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 19-21, 1915, Detroit, Mich.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.

ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Annual meeting, 2d Tuesday in October, 1915, New York.

ASSOCIATION OF RAILWAY ELECTRIC ENGINEERS.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual meeting, October, 1915.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next meeting, October 19-21, 1915, St. Louis, Mo.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Danc, B. & M., Reading, Mass. Next convention, September 14-16, 1915, Detroit, Mich.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.

RAILROAD MEN'S IMPROVEMENT SOCIETY.—J. B. Curran, Erie R. R., 50 Church St., New York. Meetings, alternate Thursdays, October to May. Assembly Rooms of Trunk Line Association, 143 Liberty St., New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1063 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Next meeting, October 5-7, 1915, Chicago.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Annual meeting, September 14-17, 1915, Salt Lake City, Utah.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, C. R. I. & P., 1134 La Salle St. Sta., Chicago. Annual meeting, October 19-21, Colorado Springs, Colo.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.

TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEWARK.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, 559 Broad St., Newark.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Hotel Astor, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Agt., Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., East Buffalo, N. Y. Annual meeting, September 7-19, 1915, Chicago.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.

WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Building, Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF JULY, 1915

Name of road	Average mileage operated during period.	Operating revenues			Operating expenses				Net From Operation.	Railway tax accruals.	Operating income (or loss).	Increase (or decr.) comp. with last year.

Traffic News

Western Railroads to Ask Rehearing of Rate Case

C. C. Wright, general solicitor of the Chicago & North Western and chairman of the committee of railroad lawyers that had charge of the western freight rate advance case for the railways, announced, after a meeting on September 3, that the roads had decided to petition the Interstate Commerce Commission for a rehearing of the case. The petition is to be filed with the commission this week.

Low Freight Rates Between New York and California

At hearings held in New York City, September 1, 2 and 3, by Examiner Thurtell, of the Interstate Commerce Commission, L. J. Spence, director of traffic, and other officers of the Southern Pacific, presenting their request for the approval of reductions in the freight rates on 20 or more commodities from New York to Pacific coast seaports, gave testimony concerning what they had heard relative to rates at which freight is carried by water all the way from New York to Los Angeles and San Francisco through the Panama canal. The principal items in this statement are shown below:

COMPARISON OF RATES SOUGHT TO BE ESTABLISHED BY SUNSET GULF-ROUTE, WITH LOWEST KNOWN WATER RATES SINCE THE OPENING OF THE PANAMA CANAL.

Commodity	Mon. Weight	Proposed		Lowest Known Rates Via Panama Canal
		Rate via Sunset-Gulf Route	Rate	
Calcium, Chloride of.....	80,000	45	30	
Canned Corn.....	70,000	50	40

Wire, Telephone, etc.....	60,000	50	50	

* Contract rate.

Counsel for all-water freight lines running through the canal, objecting to a reduction of rates by the Southern Pacific, questioned the figures of all-water rates given by the Southern Pacific, claiming that in some cases they were too low.

The Southern Pacific laid before the commission data showing that with the present facilities of its water line from New York to Galveston and the rail line from Galveston to the Pacific coast the rates proposed, with goods moving in full carloads, would produce revenue in excess of the out-of-pocket cost of handling the goods.

The rates proposed apply to westbound shipments. Similar reductions have already been made on important commodities eastbound.

Of the commodities named in the foregoing list, it was said that the total volume in the last fiscal year was 296,000 tons, of which the Southern Pacific estimated that its water and rail line secured about one-fourth.

Testimony was introduced tending to show that some of the steamship lines operating through the Panama canal are making good profit, and that they have taken large quantities of numerous classes of goods, which before the opening of the canal went by more northern routes; and they expect to take still more.

As to the application of the long-and-short-haul clause of the Interstate Commerce law, Mr. Spence said that none of the commodities named in his application is produced at any point on the Southern Pacific's Sunset-Gulf Line.

The westbound freight traffic of the Sunset-Gulf Line has fallen off greatly since 1907, and it appears that some of the loss occurred before the opening of the Panama canal, being due to the inroads of the Tehuantepec route.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission has postponed from October 1 to December 1 the date on which the reductions will go into effect in the rates on anthracite coal from the mines in eastern Pennsylvania to tidewater and other Eastern points. The commission's decision ordering these reductions was abstracted in the *Railway Age Gazette* of August 20, page 313.

Midcontinent Oil Rates

Milliken Refining Company v. Missouri, Kansas & Texas et al. Opinion by Commissioner Harlan:

This proceeding, which is numbered 6129, also embraces a large number of other complaints, and in connection with it the commission reopened ten other cases that were decided sometime ago. The midcontinent field includes the oil territory of Kansas and Oklahoma, though in Kansas the wells no longer flow and the business there is made up of the shipments from refineries which receive crude oil largely through pipe lines from Oklahoma wells. Railroad rates from this field have been a source of complaint for many years. The report in this case fills 20 pages, separate chapters being devoted to the tariffs to different cities, St. Louis, Chicago, Milwaukee, St. Paul, Winnipeg, Des Moines, Omaha, Sioux City, Salt Lake City, Denver, Kansas City, Joliet, New Orleans, Hannibal, and a number of other places. The situation is so complicated that the demand for reparation is denied; and, indeed, all of the formal complaints are dismissed, but without prejudice; and the carriers are simply directed in a general way to carry out the ideas of the commission, as set forth in detail. These require many increases as well as reductions. The decision is summarized in the headnotes as follows:

1. Reasonable rates are fixed on petroleum oil and its products from the midcontinent oil field, in Kansas and Oklahoma, to Kansas City, St. Louis, Chicago, and various other points.
2. All points in the midcontinent field are grouped with respect to rates to the Mississippi River and points beyond, including St. Paul territory, Winnipeg, Salt Lake City and Denver.
3. Reasonable maximum rates prescribed on low-grade products from midcontinent points to St. Louis and Chicago.

Hoboken Demurrage Charges Reasonable

Plymouth Coal Company v. Delaware, Lackawanna & Western Railroad. Opinion by Commissioner Hall:

Defendant's demurrage regulations governing anthracite coal awaiting transshipment at or near tidewater at Hoboken, N. J., are found reasonable. For many years prior to 1904 the defendant maintained at Hoboken a large number of bins and piers set apart for the storage of anthracite coal. These facilities were open to all shippers without other charge than the regular rates for the transportation of the coal from mine to tidewater. They were destroyed by fire on May 29, 1904, and were not rebuilt. Thereafter shippers obtained the substantial equivalent of this service by what was known as the "borrow and loan account." Under this arrangement shippers would "loan" to defendant the excess stock of any size of anthracite coal which they might have at tidewater. When stock conditions were reversed, the shippers would "borrow" coal from defendant. This system was in vogue until, in 1909, the Delaware, Lackawanna & Western Coal Company was organized by defendant as a result of legislation and litigation in respect of the commodities clause, and took over the coal sales business theretofore conducted by defendant.

From this time until the establishment of the demurrage regulations now in question, shippers were given free storage of coal in cars at the transshipment point for indefinite periods, subject to occasional endeavors by defendant in times of congestion to effect the release of cars by embargo of further shipments to designated consignees until the congestion was relieved. In its brief defendant admits that "prior to the effective date of the

tariff attacked in this proceeding, no demurrage was ever charged on tidewater coal held for transshipment at Secaucus or Hoboken."

Complainant asserts that the present situation is exceptional in that the business of complainant and other shippers has been built upon a system which permitted free storage of coal at Hoboken for an indefinite period; that any system of demurrage regulations inevitably operates for the benefit of the largest shipper because it can more readily meet the varying demands for the eight sizes of anthracite coal and is thus able promptly to dispose of its coal; and that the interest of the consuming public requires the continued maintenance of free storage at or near tidewater at Hoboken in order to prevent coal shortages in the New York market. If the present regulations are found to be just and reasonable, the commission is asked to reduce the rates for the transportation of anthracite coal to tidewater. It is undoubtedly the right of defendant to establish and maintain demurrage regulations under which a reasonable charge will accrue for detention of cars beyond a reasonable period. Defendant's facilities for transferring coal to vessels at tidewater are modern and are more than adequate to meet any demands thus far made upon them. The free storage is purely a commercial convenience and not a transportation necessity. Upon this record, and in accordance with the cases cited, we conclude that the demurrage regulations in issue are reasonable. The complaint will be dismissed. (36 I. C. C., 76.)

STATE COMMISSIONS

The hearing before the Texas Railroad Commission on the application of the Texas railroads for authority to increase freight rates 15 per cent throughout the state was resumed on September 1 at Austin. Testimony prepared for the commission was introduced in rebuttal to the testimony given by the carriers at the previous hearing, which was held at Dallas. Attorneys for the railroad commission issued a statement contending that the railways are not entitled to any general increase because they are already earning a sufficient revenue on state business and upon the value of their property as apportioned to use in state traffic.

The New York state public service commission, second district, announces that, at a conference held in Albany on Wednesday of this week, it induced the railroads to modify their requirement as to certificates of value of baggage. Hereafter the passenger need not declare a specific value unless it is high enough to incur the extra charge; that is, unless it is over \$100 in interstate travel and over \$150 for a journey within the state of New York. Passengers will still be required to sign a slip declaring that it is below these limits, or, if above them, to specify the value and pay the extra charge. The commission, according to its announcement, is determined to do justice both to actresses who travel with wardrobes worth \$30,000 and to gentlemen hurriedly departing with a toothbrush and another rubber collar. "No man can, and no woman wants to tell what the things in his or her trunk are worth," says Chairman Van Santvoord; and he is determined that the up-state citizens, whose consciences are declared to be exceedingly sensitive, will not be required to subscribe to any falsehood, even a potential one.

PERSONNEL OF COMMISSIONS

C. P. Howard has been appointed field engineer of the valuation department of the Interstate Commerce Commission for the Central district, with headquarters at Chicago.

COURT NEWS

Interstate Shipments—Presentation of Claims—Waiver

An interstate shipper, required by a contract of shipment to give notice of any claim for loss within a specified time, gave notice of claim after the expiration of the time. The railroad's auditor asked for particulars and stated that the records showed a delivery of the freight with billing instructions. The shipper did not comply with the request for particulars and did not reply to the auditor. In an action or damages for injury by weather in transit the Texas Court of Appeals held that the act of the auditor did not constitute a waiver by the railroad of the shipper's failure to present notice of claim within the time stipulated. A

stipulation or written notice of claims for loss, damage or delay within four months after delivery, was held valid notwithstanding the provision of the Carmack amendment, making the initial carrier liable for any loss caused by it, or any connecting carrier, and providing that no contract shall exempt the initial carrier from the liability imposed.—*Stevens & Russell v. St. Louis S. W. (Tex.)*, 178 S. W. 810.

Power of State Commission to Change Passenger Rates

The Supreme Court of Nebraska holds, by a divided court, that the power conferred in general terms on the state railway commission does not authorize the commission to increase the maximum passenger rate of two cents a mile as fixed by the legislature in 1907. The rule is that a particular intention expressed in a legislative act, if in conflict with a general intention expressed in a later enactment, should be given effect, leaving the later act to operate only outside of the scope of the former.—*State ex rel. Mo. Pac. v. Clark (Neb.)*, 153 N. W. 623.

Crossing Accident—Physical Facts

In an action for injuries to an automobile in a crossing collision the driver of the automobile admitted that though he had a clear view he did not stop, look, or listen, and did not look at the tracks until within 25 feet of them. It appeared that he was struck by cars which were kicked from some distance down the track. It was held by the Texas Court of Appeals that he was, as a matter of law, guilty of contributory negligence, though he testified to seeing the engine standing quiet on the tracks before he attempted to cross (*Ft. Worth & D. C., Tex.*, 178 S. W., 795).

Validity of Contracts with Labor Union

Suit for injunction was brought by switchmen against the Texas & P. and other railroads to prevent their carrying out contracts which, it was alleged, substantially provided that no switchmen should be employed who were not members of the Brotherhood or Railway Trainmen. The Texas Court of Civil Appeals holds that the fact that a contract between a railroad and a labor union providing for the employment of a specific percentage of employees from members of such union, and preference of such members in employment, was one-sided, wanting in mutuality and unenforceable at law, could not be complained of by strangers to the contract not in privity with the parties thereto. Such a contract was not void as against public policy. The railroads by entering into the contracts did not unlawfully create a monopoly which interfered with or prevented others from exercising the freedom of contract in relation to the sale of labor. There was reason in contracting with the Brotherhood, for its membership greatly exceeded the membership of any other particular union, which was a guaranty of keeping a full working force. But the contract was not exclusive; it provided for only a certain per cent of Brotherhood men, and the evidence showed that the railroads have a larger percentage of other classes employed than of the Brotherhood, in proportion to membership. The injunction was denied (*Underwood v. Texas & P., Tex.*, 178 S. W., 38).

Gross Earnings Tax—Double Taxation—One Company Agent of Another

Where one carrier enters into arrangements with other carriers by which the first becomes practically the hiring and disbursing agent of the others in the performance of duties partly owing by both principals and agents, paying out for and receiving from the others only the actual cost of the service, with no intention of making a profit out of the transaction, the Minnesota Supreme Court holds that, if such arrangements are made in good faith and not in fraud, subterfuge or evasion of the obligations of either party to the state or to the public, such moneys are not subject to the gross earnings tax. Where such services are included in the freight charges of the other railroad companies, which pay a gross earnings tax thereon, to compel the agent company to pay a tax on these same receipts would be in the nature of double taxation, exacting the commutation taxes on the same property twice, which cannot lawfully be done.

The defendant and certain navigation companies agreed that the defendant should employ stevedores to perform certain work

part of which it was defendant's duty to perform; the navigation companies paying to the deendant the actual cost of the labor. The defendant, in hiring the men to do the work, really acted for the boat companies as hiring and disbursing agent, paying for the actual cost of the work and receiving back from the boat companies what is expended. Under the rule above stated the moneys so received back were held not subject to the gross earnings tax.—*State v. Northern Pacific* (Minn.), 153 N. W. 850.

Free Pass—Assumption of Risk

A contract with an express company provided that messengers should render service to the railroad and in consideration thereof receive a sum of money and also two passes a month for the use of his family. In an action for injuries to the wife of a messenger while traveling on a pass, the New Jersey Court of Errors and Appeals holds that such a pass is a "free pass," in the sense intended by the interstate commerce law, and a clause printed on the pass, whereby the passenger undertakes to assume all risks, is binding on the party using it (*Morris v. West Jersey, & S., N. J.*, 94 Atl., 593).

Guarding Low Bridges to Protect Brakemen

A railroad maintained standard "telltale" at a proper distance on each side of a low bridge. The bridge gave about three feet headway above the cars. A brakeman was killed by striking his head against the bridge. In an action for his death the New Jersey Court of Errors and Appeals holds that a railroad is not chargeable with negligence as regards brakemen on its freight trains, in failing to illuminate at night a low bridge over its tracks, in the absence of proof that such a provision was customary in railroad practice (*Raub v. Lehigh Valley, N. J.*, 94 Atl., 567).

Crossing Accident

Employees, seeing a person standing to one side of the track at a crossing, in a place of safety, are not negligent, the Oklahoma Supreme Court holds, in assuming that he will remain in that place of safety, and not heedlessly run upon the track in front of moving cars. If he does so, and it is impossible to stop the train in time to avoid killing him, the company cannot be held liable for his death. In such circumstances failure to ring the bell and sound the whistle on approaching the crossing would not make the company liable, for such failure would not be in any manner responsible for the deceased's going on the track (*St. Louis, I. M. & S. v. Gibson, Okla.*, 150 Pac., 465).

Crossing Accident—Testimony Contrary to Physical Facts

In an action for personal injuries it appeared that plaintiff crossed a railroad of seven tracks in a rubber-tired open buggy at 8:45 on an ordinary July evening. There were no obstructions, the tracks were straight, and he was familiar with the locality. He testified that he looked and listened all the time while crossing, without seeing or hearing the locomotive, bearing a red light, which struck his buggy on the last track. The St. Louis Court of Appeals held that his evidence would be treated as of no effect, as being contrary to the established physical fact that by looking and listening, an object of the size and attributes of a moving locomotive may be detected before collision. Judgment for the plaintiff was reversed (*Landrum v. St. Louis, I. M. & S., Mo.*, 178 S. W., 273).

Taxation of Railroad Property

A railroad was forced to construct a subway to carry a street under its roadbed and overhead bridges to carry streets over it. In its application to be relieved from items of an assessment, the New York Court of Appeals holds that its share of the cost of the work was improperly included in the assessment of its special franchise on the theory that the subway and bridges were tangible property of the road "situated in, upon, under or above any street, highway, public place or public waters" in connection with the special franchise made assessable by the New York tax law. In such a case the structure, the cost of which was attempted to be assessed, was part of a public street and belonged to the municipality, though there was physical connection between the struc-

ture and the road's right of way.—*People ex rel. New York, O. & W. v. State Board of Tax Comrs. (N. Y.)*, 109 N. E. 547.

Sufficiency for Claim of Damage

A bill of lading provided that claims for loss must be made in writing within four months after delivery. On the arrival of the freight at its destination the consignee notified the consignor by telegram that it had arrived in bad order. The consignor immediately went to the place of delivery and notified the claim agent of the terminal carrier that he would file a claim, but no claim was filed. The yard agent was also notified by an employee of the consignee that a claim for damages would be filed. A notation made on the expense bill by the agent of the terminal carrier at the point of destination recited that the freight was more or less damaged. It was held by the Texas Court of Appeals that there was a failure to give notice of a claim for damages and there could be no recovery of damages.—*St. Louis S. W. v. Overton (Tex.)*, 178 S. W. 814.

Evidence as to Reasonable Time for Run

In an action for damages to live stock by delay in transit the Texas Court of Civil Appeals holds that the admission of testimony of the plaintiff as to what, in his opinion, was a reasonable time for the run of the train, was erroneous, since what is a reasonable time to make a given trip is a mixed question of law and fact for the jury, under proper instructions. A duly qualified witness might give evidence as to what was the usual or customary time required to make the run, such testimony not being matter of opinion infringing the province of the jury, "usual time" being a matter of fact. "Reasonable time," on the other hand, is the time necessary under the circumstances to do conveniently what the contract or duty requires should be done in a particular case, a question of law depending on the subject-matter and situation of the parties (*Gulf C. & S. F. v. Bogy, Tex.*, 178 S. W., 577).

Manager's Right to Salary While on Leave of Absence

A general manager appointed an assistant general manager to hold the position at his discretion at a fixed salary per month. On the ground of ill health from application to his duties, the assistant was granted a leave of absence from October 13, 1911, to January 8, 1912, on salary and subject to orders and directions. The railroad's by-laws then contained no provisions as to leave of absence or deduction of salary. The assistant general manager during his absence had written daily letters relative to the business of his office. On his return on January 8, and on his request, he was relieved of his position and appointed to another. In an action for the balance of his salary the Texas Court of Civil Appeals held that the relation of employer and employee continued, and that the assistant general manager could recover his fixed salary for the period of his absence. Payment thereof was not prohibited by the Texas statute of 1911, providing that no corporation shall employ or use its means except in the legitimate objects of its creation (*Missouri, K. & T. v. Bryant, Tex.*, 178 S. W., 685).

Termination of Relation of Passenger

In an action for personal injuries it appeared that the plaintiff, traveling on a ticket which entitled him to ride from New York to South Orange, stayed in the train after it left that station stop, without the payment of extra fare, for the purpose of alighting at a place in the company's yard about three-quarters of a mile beyond. This place was nearer to his residence than the station. He was thrown off when about to alight by a lurch of the train going through a switch. He and others frequently got off at the place in question, which was covered with cinders between the tracks, though there was no station or platform there. The New Jersey Court of Errors and Appeals held that, after leaving the South Orange station, the man ceased to be a passenger and became only a licensee on the train. The company no longer owed him the high degree of care due to a passenger, but only the exercise of ordinary care against inflicting injury upon him. It was held, further, that the trial judge was right in granting a nonsuit, because the question at issue arose upon uncontroverted proofs, and was therefore one for the court and not for the jury.—*Keeney v. D., L. & W. (N. J.)*, 604.

Railway Officers

Executive, Financial, Legal and Accounting

A. A. Holmes, assistant to president and purchasing agent of the Atlanta & St. Andrews Bay, has been appointed auditor, with headquarters at Panama City, Fla.

H. A. McLaurin has been appointed auditor and car accountant of the Gainesville & Northwestern, with headquarters at Gainesville, Ga., succeeding Robert E. Farmer, who has resigned to go to another company.

William G. Wheeler, who was appointed general solicitor of the Chicago & North Western on September 1, was born on November 11, 1861, in Janesville, Wis. After his graduation from Janesville High School he studied law in the offices of practising attorneys and was subsequently admitted to the bar. He entered railway service on April 1, 1909, when he became Wisconsin attorney for the Chicago & North Western. On January 1, 1912, he was appointed assistant general counsel for the same road, which position he held until August 31 of this year. Mr. Wheeler's headquarters will continue to be in Chicago.

W. G. Wheeler

The following have been elected officers of the East & West Coast Railway: Allen W. Jones, president; W. B. Wilson, vice-president; J. L. Strong, auditor; M. A. Clyburn, treasurer, all with headquarters at Bradentown, Fla.

Operating

W. T. Griswold, trainmaster of the Atlanta & St. Andrews Bay, has been appointed superintendent, with headquarters at Panama City, Fla.

Thomas M. Flynn, trainmaster of the Northern Pacific at Forsyth, Mont., has been transferred to Glendive, vice J. J. Sexton, transferred.

John J. Mulroy, chief dispatcher on the Northern Pacific, has been promoted to trainmaster, with headquarters at Jamestown, N. D. Effective September 1.

W. H. Smith has been appointed inspector of transportation of the Nashville, Chattanooga & St. Louis, reporting to E. M. Wrenne, acting superintendent of transportation at Nashville, Tenn.

C. E. Benjamin has been appointed chief train dispatcher of the Buffalo division of the New York, Chicago & St. Louis, with headquarters at Conneaut, Ohio, vice J. T. Callahan. Effective September 1.

Edward J. Moran, chief dispatcher of the Northern Pacific, has been appointed trainmaster, with headquarters at Pasco, Wash., vice Francis M. Smith. Mr. Smith has been transferred to East Grand Forks, Minn., vice F. C. Huntington, promoted. Effective September 1.

M. B. Bayer, assistant superintendent of the Oregon-Washington Railroad & Navigation Company at Tacoma, Wash., has been transferred to Portland, Ore., where he will join the staff of the joint facilities committee which supervises the operation of lines used in common by the O.-W. R. R. & N. and other companies.

F. W. Brown has been appointed assistant to general manager of the Southern Railway, the Virginia & Southwestern and the

Northern Alabama, with headquarters at Washington, D. C., in general charge of train tonnage and efficiency and such other duties as may be assigned to him. William M. Netherland, assistant to general manager, will continue as heretofore in charge of dining car, stores and test departments.

P. J. Flynn, manager of the Winnipeg Union Terminals, has been appointed superintendent for the Canadian Northern at Winnipeg, Man., vice M. B. Murphy, who has been transferred to Calgary, Alta. Mr. Murphy succeeds J. L. Bloomer, who has been transferred to Brandon, Man., vice W. E. Roberts. Mr. Roberts has been transferred to Dauphin, Man., vice J. Irwin, who was transferred to Toronto, Que. H. J. Hunt, trainmaster of the Winnipeg Terminals, succeeds P. J. Flynn as terminals manager.

C. A. Hodgman, whose appointment as superintendent of car service of the Minneapolis & St. Louis, with headquarters at Minneapolis, Minn., has been announced, entered railway service with the Chicago & North Western at Chicago. In the spring of 1909 he left the Chicago & North Western to go with the Minneapolis & St. Louis. After varied experience as reclaim clerk, chief record clerk and car distributor he was made yard clerk of the Cedar Lake yards at Minneapolis. In 1910 he was appointed traveling car agent, which position he held until July 1, 1913, when he was made chief clerk to the superintendent of car service. In March, 1914, when the office of superintendent of car service was abolished, he was made chief clerk to the general superintendent, in charge of the car service department, from which position he is now promoted.

G. F. Hawks, whose appointment as general manager of the El Paso & Southwestern was announced in these columns on August 27, was born on August 28, 1857, at Kirkland, Ohio. Following his graduation from high school at Rockville, Ind., he entered railway service in August, 1874, as a brakeman on the Logansport, Crawfordsville & Southwestern, now a part of the Vandalia System. Since that time he has held the following positions: brakeman of the Wabash System and other lines until 1878, conductor on the Pekin, Lincoln & Decatur, Chicago, Peoria & Southwestern, Canadian Pacific and Atchison, Topeka & Santa Fe from September, 1878, to May, 1890; trainmaster of the Panhandle and other divisions of the Santa Fe from May, 1890, to March, 1896; train inspector of the Mexican Central from October, 1897, to May, 1898; superintendent of the San Luis division of the same road until November, 1900; from that date until October, 1901, superintendent of the Mexico division; trainmaster of the Texas & New Orleans and Louisiana Western roads of the Southern Pacific System, from November, 1901, to February, 1902; assistant superintendent of the Louisiana lines of the same system from February, 1902, to March, 1903; superintendent of the El Paso division of the Galveston, Harrisburg & San Antonio from March, 1903, to April, 1904; superintendent of the Texas & New Orleans and the Galveston, Houston & Northern from April, 1904, to May, 1905; general superintendent of the Houston & Texas Central, Houston East & West Texas and Houston & Shreveport from May, 1905, to April, 1907; from April, 1907, to September, 1915, general superintendent of the El Paso & Southwestern.

Traffic

Frank Waterhouse has been appointed foreign freight agent of the Union Pacific, with headquarters at Seattle, Wash.

A. A. Boyle has been appointed commercial agent of the Missouri & North Arkansas, with headquarters at Birmingham, Ala.

Charles M. Andrews has been appointed district freight and passenger agent of the Southern Pacific at Seattle, Wash., to succeed Charles G. Chisholm, resigned.

W. H. Leahy has been appointed general freight and passenger agent of the Atlanta & St. Andrews Bay, with headquarters at Panama City, Fla., succeeding L. J. Rowell.

John T. Cummins, advertising agent for the Union Pacific Railroad, at Omaha, has been appointed general advertising agent for the Union Pacific System, and the advertising department of the system has been transferred from Omaha to Chicago. Mr. Cummins assumed his new duties on September 1.

F. S. Davis, chief of the joint tariff bureau of the New York, New Haven & Hartford, the Boston & Maine, the Maine Central, the New England Steamship Company and the Central New England has been appointed general western freight and passenger agent of the New York, New Haven & Hartford, the Central New England and the New England Steamship Company, with headquarters at Pittsburgh, Pa.

W. A. Hopkins, division freight agent of the Wahash at Toledo, Ohio, has been promoted to general live stock agent, with headquarters at St. Louis, succeeding J. L. Harris, resigned to accept service elsewhere. D. E. Gilbert, commercial agent of the same road at Cleveland, Ohio, has been promoted to division freight agent, Toledo, Ohio, vice W. A. Hopkins, promoted. R. A. Brown, traveling freight agent, Buffalo, N. Y., has been promoted to commercial agent, Cleveland, Ohio, succeeding D. E. Gilbert. J. E. Sunderland, traveling freight agent, Springfield, Ill., has been promoted to commercial agent, Peoria, Ill., succeeding James Gouran, deceased.

Edwin S. Stephens, who was appointed general freight agent of the Chicago & Eastern Illinois September 1, was born August 21, 1874, at Kansas City, Mo. He was educated in the public schools and entered railway service in 1892 as a clerk on the Kansas City, Ft. Scott & Memphis. Since that time he has been consecutively timekeeper in the shops of the Atchison, Topeka & Santa Fe, clerk in the auditor's office and stenographer in the transportation department at Albuquerque, N. M., and division clerk and chief clerk at Gallup, N. M., from 1893 to October, 1898; from October, 1898, to January, 1900, he was secretary to the president of the Kansas City, Ft. Scott & Memphis; from January, 1900, to June, 1903, chief clerk of the same office and with the St. Louis & San Francisco at St. Louis, Mo.; from June, 1903, to December 31, 1907, commercial agent of the St. Louis & San Francisco at Kansas City, Mo.; from January 1, 1908, to April 1, 1910, freight claim agent of the Chicago & Eastern Illinois at Chicago; from April 1, 1910, to January 1, 1912, general agent of the same road and the St. Louis & San Francisco at Chicago; from January 1, 1912, to September 1, 1915, assistant general freight agent of the C. & E. I. at Chicago.

Frank E. Webster, whose appointment as assistant general freight agent of the Chicago & Eastern Illinois was recorded in our issue of last week, was born on July 9, 1879, in Charles county, Md. He was educated in the public schools and in 1902 he entered railway service as a file clerk with the Southern Railway at Washington, D. C. In 1903 he went to the Rock Island, where he held the position of revision clerk in the office of the freight department. In 1904 he entered the employ of the Chicago & Eastern Illinois as a rate clerk in the traffic department. From 1905 to 1908 he was chief rate clerk in this department. In April, 1908, he entered the service of the Illinois Traction System as assistant to the general traffic manager. In October, 1909, he re-entered the service of the C. & E. I.-Frisco Rock Island lines as traveling freight agent, with headquarters at Nashville, Tenn. When the Rock Island and Frisco lines were separated, he was transferred to Milwaukee, Wis., and Minneapolis, Minn., as traveling freight agent of the C. & E. I.-Frisco lines. In April, 1910, he was appointed chief clerk in the general freight office of the C. & E. I. at Chicago. In November, 1911, he was appointed chief clerk to the freight traffic manager of the C. & E. I.-St. L. & S. F. at St. Louis, Mo. In December, 1912, he was appointed division freight agent of the C. & E. I. at Salem, Ill. On July 1, 1913, he was promoted to chief of the tariff bureau of the same road at Chicago, Ill., and on September 1, 1915, was promoted to assistant general freight agent, with headquarters in the same place.

Engineering and Rolling Stock

J. C. Gardner has been appointed chief engineer of the East & West Coast, with headquarters at Bradentown, Fla.

R. M. Boldridge has been appointed master mechanic of the Apalachicola Northern, with office at Port St. Joe, Fla., succeeding J. P. Dolan, resigned.

W. H. Owens, master mechanic of the Southern Railway at South Richmond, Va., has been appointed mechanical member of the valuation department of the Southern Railway.

W. D. Pearce, assistant engineer of the Northern Pacific, has been appointed supervisor of bridges and buildings on the

Yellowstone division, with headquarters at Glendive, Mont., vice W. C. Sloan, promoted.

John H. Pontius, general engine inspector of the Pennsylvania Lines West of Pittsburgh at Columbus, Ohio, has retired after 50 years of continuous service with the road.

J. E. O'Brien, assistant mechanical superintendent of the Missouri Pacific and St. Louis, Iron Mountain & Southern, has been appointed mechanical superintendent, with headquarters at St. Louis, vice R. J. Turnbull, resigned. W. C. Smith, general master mechanic of the western district of the Missouri Pacific, with headquarters at Kansas City, Mo., has been appointed to fill the vacancy created by the promotion of Mr. O'Brien.

C. A. Parker, telephone maintainer of the Buffalo, Rochester & Pittsburgh, has been appointed signal supervisor on the Middle and Pittsburgh divisions, with headquarters at Du Bois, Pa., succeeding F. G. Morehart, resigned to go to another company, and J. H. Moore, general signal foreman, has been appointed signal supervisor of the Buffalo division, with headquarters at East Salamanca, N. Y. The office of general signal foreman has been discontinued.

William C. Smith, who was appointed assistant mechanical superintendent of the Missouri Pacific-St. Louis, Iron Mountain & Southern on September 1, was born on September 25, 1869, in Michigan. He was educated in the common schools and entered railway service on December 7, 1887. From that time until April, 1895, he served as machinist apprentice and machinist on the Missouri Pacific Railway; from April to November, 1895, he was a machinist on the Atchison, Topeka & Santa Fe; from November, 1895, to January, 1897, he was gang foreman on the Missouri Pacific at Kansas City, Mo.; from January, 1897, to January, 1902, machinist and shop foreman at Osawatomie, Kan.; January, 1902, to January, 1905, division foreman at Hoisington, Kan.; January, 1905, to February, 1906, master mechanic at Ft. Scott, Kan.; February, 1906, to July, 1912, master mechanic at Kansas City, Mo.; July 1, 1912, to September, 1915, general master mechanic of the Western division of the same road.

J. E. O'Brien, who has been appointed mechanical superintendent of the Missouri Pacific-St. Louis, Iron Mountain & Southern, was born on December 4, 1876, at Stillwater, Minn. He completed his education at the University of Minnesota in 1898 and in the same year entered railway service as special apprentice with the Northern Pacific at Livingston, Mont. From November 1, 1901, to November 25, 1903, he had charge of the general inspection of material and tests at St. Paul, Minn. From that time until December 1, 1904, he served as master mechanic of the Dakota division at Jamestown, N. D., following which he held the position of assistant shop superintendent at South Tacoma, Wash. From August 1, 1909, to January 1, 1910, he was mechanical engineer of the same road at St. Paul, Minn. On January 1, 1910, he became superintendent of motive power for the Western Pacific at San Francisco, Cal., and held this position until October 8, 1913, when he was appointed assistant mechanical superintendent of the Missouri Pacific, with headquarters at St. Louis, Mo. In his new capacity as mechanical superintendent Mr. O'Brien will remain in St. Louis.

Julius Edgar Willoughby, assistant chief engineer of the Atlantic Coast Line, has been appointed chief engineer, with headquarters at Wilmington, N. C., succeeding E. B. Pleasants, deceased. Mr. Willoughby was born on October 12, 1871, at Arkadelphia, Ala., and was educated at the University of Alabama. In 1887 he began railway work as a rodman on surveys on the Louisville & Nashville. From 1892 to 1899 he filled subordinate positions in the land and engineering departments of the same road. In 1900 he was promoted to assistant chief engineer of construction for the lines in Alabama, and the following year became engineer of construction of the Alabama & Florida, now a part of the Louisville & Nashville. In 1902 he was appointed division engineer of the Knoxville, La Follette & Jellico, now a part of the Louisville & Nashville, and from 1902 to 1904 he served as chief engineer of the same road. From 1905 to 1912 he was engineer of construction of the Louisville & Nashville system, also chief engineer of several of the Louisville & Nashville subsidiary lines. He then served as chief engineer of the National Railroad of Haiti, and of the Caribbean Construction Company, engaged in the development of the Island of Haiti, until 1913, when he entered the service of the Atlantic Coast

Line as assistant chief engineer, which position he held at the time of his recent appointment as chief engineer of the same road.

OBITUARY

Frederick M. Spaidal, general superintendent of the Canadian Northern Quebec, died on September 2 at Montreal, Que.

F. A. Durban, of Zanesville, Ohio, general attorney of the Baltimore & Ohio for the states of Ohio and Indiana, died on Tuesday night of this week on a train near Cumberland, Md., while on his way home from the East. He was sixty years old.

Edward B. Pleasants, chief engineer of the Atlantic Coast Line, with headquarters at Wilmington, N. C., who died suddenly on his private car in Washington, D. C., on August 22, at the age of 65, as has already been mentioned in these columns, was born on August 2, 1850, in Richmond, Va. At an early age he entered the service of the United States Coast Survey, and remained in that service for five years, attaining the rank of assistant engineer. He began railway work as an assistant engineer on the Baltimore & Ohio, remaining with that road for two years. In 1878, he went to the Baltimore & Lehigh, now a part of the Pennsylvania system, as assistant engineer, and afterwards became chief engineer of the same road. During 1886 and 1887 he was engineer in charge of construction of a railway in Maryland. He then went to the Norfolk & Carolina, now a part of the Atlantic Coast Line, and since 1902 was chief engineer of the Atlantic Coast Line system.

E. F. McCrea, division engineer of the Pennsylvania Lines, died on August 28, near Logansport, Ind. He was born in that city on November 7, 1880. He entered the service of the Pennsylvania Lines in 1899 on the Grand Rapids and Indiana division; in 1901 he was transferred to the Cleveland and Pittsburgh division at Wellsville, Ohio. In 1904 he was appointed assistant division engineer at Richmond, Ind., and from September, 1905, to July, 1908, served as assistant engineer of the C. and P. division. From 1908 until February, 1911, he was assistant engineer on the Pittsburgh division; from the latter date until February, 1912, he was division engineer on the Zanesville division; from February, 1912, to November, 1912, he served in the same capacity on the Toledo division, and from that date until January, 1913, on the Cincinnati division. From 1913 until his death he was division engineer on the C. and P. division at Cleveland.

FINNISH RAILWAYS.—At the beginning of 1914 the total mileage of the Finnish State Railways, including 207 miles of line owned by private capital, but operated by the state lines, was 2,537. Finland has 2,765 miles of navigable waterways, of which, with the present facilities, it is estimated that the freight capacity is about 1,600,000 tons a year. The waterways as well as the railways are under the administration of the state.

NEW RAILWAY LINES IN BOLIVIA.—The line from Uyuni, Bolivia, a station on the Antofagasta & Bolivia Railroad, which has been under construction in a southeasterly direction towards Tupiza, is to be extended, it is said, to the present northern terminus of the Argentine railways at La Quiaca, a point on the frontier directly south of Tupiza. The completion of the line from Uyuni to Tupiza and the construction of a line between Tupiza and La Quiaca will provide a new through rail route from the Atlantic ocean to the Pacific.

RAILROAD CONSTRUCTION IN NORTHERN CHILE.—Construction work on the Longitudinal Railway has been completed and the line is now in operation as far north as Pintados, Chile. The construction of a connecting line to connect the main line with an ocean port at Iquique was started, but work has been stopped on account of exhaustion of funds appropriated for that purpose. The government proposes to spend \$134,000 to continue this work during the coming year. The completion of the line to Iquique will open up for development some nitrate land and other mineral deposits. The construction of the proposed line to connect the Longitudinal Railway with the ports of Antofagasta and Mejillones has been postponed. This branch, which was to start from the main line at Baquedano Station, will probably be built when financial conditions improve.

Equipment and Supplies

LOCOMOTIVE BUILDING

THE NORFOLK & WESTERN is inquiring for prices on 30 Mallet type locomotives.

THE ILLINOIS CENTRAL is inquiring for prices on 50 Mikado type locomotives.

THE CHICAGO, ST. PAUL, MINNEAPOLIS & OMAHA has ordered four Pacific and six Mikado type locomotives from the American Locomotive Company.

THE TEXAS & PACIFIC, which has been in the market for 10 switching, six passenger and six freight locomotives, has ordered a number of locomotives from the Baldwin Locomotive Works.

THE CHICAGO & NORTH WESTERN is reported to have ordered 12 Pacific type, 12 Mikado type, 10 switching and one narrow gage locomotives from the American Locomotive Company. This item has not been confirmed.

THE MADRID, SARAGOSSA & ALICANTE RAILWAY of Spain has ordered 25 12-wheel (4-8-0) locomotives from the American Locomotive Company. These locomotives will have 63-in. driving wheels, 16.53-in. and 25.2-in. by 25.6-in. cylinders and a total weight of 193,000 lb.

CAR BUILDING

THE COPPER RIVER & NORTHWESTERN is inquiring for prices on 50 freight cars.

THE BALTIMORE & OHIO has ordered 200 car bodies from the Greenville Steel Car Company.

THE BOSTON & MAINE is inquiring for six coaches, two smoking cars and six baggage cars.

THE ATCHISON, TOPEKA & SANTA FE has ordered 500 stock cars from the Pullman Company.

THE WHEELING & LAKE ERIE is inquiring for 650 70-ton steel gondola cars and 200 40-ton automobile cars.

THE CHICAGO & NORTH WESTERN has ordered 100 refrigerator cars from the Haskell & Barker Car Company.

THE PENNSYLVANIA LINES WEST have ordered underframes for 200 caboose cars from the Haskell & Barker Car Company.

THE BANGOR & AROOSTOOK has ordered 100 80,000-lb. capacity steel underframe flat cars from the Standard Steel Car Company for delivery in November or December.

THE ATLANTIC COAST LINE has ordered one combination passenger and baggage car, three combination baggage and mail cars and two coaches from the Pullman Company.

THE LAKE SUPERIOR & ISHPEMING was reported in the *Railway Age Gazette* of June 25 as having ordered 400 ore cars from the Cambria Steel Company. These cars are center dump ore cars. They were ordered from the Clark Car Company, Pittsburgh, Pa., and are being built by the Cambria Steel Company.

THE INTERBOROUGH RAPID TRANSIT has been authorized by the New York Public Service Commission, First district, to use on its elevated lines the 478 composite car bodies ordered by the commission to be withdrawn from service in the subway. The car bodies with new trucks and electrical equipment will be placed in service on the Second and Third avenue lines of the elevated system, now being third-tracked and reinforced.

IRON AND STEEL

THE LOUISVILLE & NASHVILLE is reported to have ordered 43,000 tons of rails from the United States Steel Corporation.

THE NORFOLK & WESTERN has ordered a quantity of structural steel from the Virginia Bridge & Iron Company for an addition to a framing shop at Roanoke, Va.

THE PENNSYLVANIA has ordered 300 tons of bridge steel from the American Bridge Company and 400 tons from the

Eastern Steel Company. This road has also ordered 350 tons of steel for an immigrant pier at Philadelphia from the Jones & Laughlin Steel Company.

MACHINERY AND TOOLS

THE PENNSYLVANIA RAILROAD has awarded a contract to the Mead-Morrison Company, Boston, Mass., for the installation of a car dumper at Baltimore.

THE SEABOARD AIR LINE has placed orders for from 75 to 100 machine tools to be installed in the company's shops at Jacksonville, Fla., and Portsmouth, Va.

SIGNALING

THE WESTERN MARYLAND has contracted for 67 miles of single-track automatic signaling, with the Union Switch & Signal Company, in addition to the 80-mile contract mentioned in the *Railway Age Gazette* of July 30. The new installation will cover the section between Colmar, Pa., and Connellsville. This work will complete all the single-track signaling on the main line of this road between Baltimore, Md., and Connellsville, Pa.

THE PENNSYLVANIA is to put up position-light signals on the Allegheny division, to be of the same type as those between Philadelphia and Paoli, but of different form. The signals of the position-light type will be installed at the entrances of a single-track tunnel. These signals will operate in the horizontal and 90-deg. positions, with a preliminary setting section of about 2,000 ft. The lights will be normally out and will be lighted when a train enters the preliminary setting section.

THE PENNSYLVANIA will install a 24-lever electro-mechanical interlocking machine at North Eddystone, on the Maryland division. The machine will be of the General Railway Signal Company's type. The signals will be electro-pneumatic, conforming to the type of automatic signals now in service in this territory. A 16-lever G. R. S. electro-mechanical machine will also be installed at the new interlocking at Franktown, on the Middle division. The signals at this plant will be electric motor-operated.

THE BALTIMORE & OHIO has just completed an extension of automatic signals between Weverton, Md., and Engle, W. Va., six miles, together with the necessary rearrangements of interlocking plants at Weverton, Harper's Ferry and Engle. At Harper's Ferry and Engle, power signals were substituted for the mechanical signals, with provision both for unlimited and for restricted speeds. Automatic signals (allowing permissive movements) are used to facilitate the movement of freight trains westbound. The extension of automatic signals west from Engle to Cumbo, a distance of 20.1 miles, is contemplated in the near future.

THE UNION TERMINAL COMPANY of Dallas, Tex., has contracted with the Union Switch & Signal Company for electro-pneumatic interlocking for the new union passenger station in that city. This station is a joint project of the Missouri, Kansas & Texas, the Texas & Pacific, the Houston & Texas Central, the Gulf, Colorado & Santa Fe, the Trinity & Brazos Valley, the St. Louis, San Francisco & Texas, the Chicago, Rock Island & Gulf and the St. Louis Southwestern. The Texas & New Orleans will use the new station as a tenant of the Houston & Texas Central. The station is of the through type, with the various lines diverging both north and south of the station, known respectively as North and South Junction. The machine at North Junction will have 82 working levers and 21 spare spaces, and the one at South Junction 53 working levers and 18 spare spaces. Lever light indicators will be furnished for all working switch levers. Alternating-current track circuits will be installed with Union model 15 vane relays.

WAR STOCKS IN MANCHURIA.—A consular report says that the South Manchuria Railway shops at Shahoku now undertake all kinds of work in metals, even the manufacture of munitions of war and of locomotives.

A WHALE CAR. An English concern is building some cars for the South African Railways. One of these cars is designed to transport a whole whale just as it is caught. The concern is also building 500 fifty-ton box cars for 3 ft. 6 in. gage.

Supply Trade News

The Pressed Steel Car Company is reported to have secured a large order for shells.

The Edison Storage Battery Company, Orange, N. J., has removed its Cleveland office to the David Whitney building, Detroit, Mich.

E. D. Graff, for several years in the sales department of the Pittsburgh office of Joseph T. Ryerson & Sons, has been transferred to the sales department of the Chicago office.

The American Steel Foundries has reopened its plant at Granite City, Ill., which has been closed for the greater part of the year. Although only a portion of the plant will be utilized, it will be operated entirely on domestic orders.

Milliken Brothers, Inc., has removed its executive and general offices from the Whitehall building, New York City, to its plant at Milliken, Staten Island, and has also removed its sales office from the same building to the Trinity building.

Dr. N. Tucker, the founder of the company's business, has been elected president of the Hydraulic Press Manufacturing Company, Mount Gilead, Ohio, succeeding M. Burr Talmage. Other officers elected at the recent meeting of the board of directors are W. G. Beebe, vice-president, and M. W. Spear, treasurer.

The New York Air Brake Company was reported in the *Railway Age Gazette* of July 16 as having been awarded a medal of honor for its exhibit at the Panama-Pacific International Exposition. By a more recent decision of the superior jury of awards, the final official authority, the company has been awarded a grand prize, the highest award, for its "PS" electro-pneumatic equipment.

H. M. Roberts, until recently railroad representative of the General Lead Battery Company, has been appointed sales engineer of the railroad department of the Edison Storage Battery Company, Orange, N. J. Mr. Roberts graduated in 1905 from the Sheffield Scientific School with the degree of electrical engineer, and for six years was connected with the engineering department of the New York Telephone Company in power-plant work. He later spent several years in general contracting engineering on railroad and other large enterprises with James Stewart & Co., Inc., New York.

J. A. L. Waddell, consulting engineer, Kansas City, Mo., announces that his son, N. Everett Waddell, C. E., has recently become his partner under the firm name of Waddell & Son, with office at 800 Graphic Arts building, Kansas City, Mo. Robert C. Barnett will be connected with the firm as associate engineer and Shortridge Hardesty as assistant engineer. As in the previous years of Dr. Waddell's practice the field of activity will be mainly bridgework of all kinds and its allied branches of construction, but attention will be given also to the making of technical investigations and the solution of problems in engineering economics and to the preparation of reports and estimates on railroads and large engineering projects in various lines in the United States and foreign countries. J. A. L. Waddell was associated with the firm of Waddell & Harrington, consulting engineers, until it was dissolved on July 14, 1915.

The Railway Periodicals Company, Inc., has been incorporated under the laws of New York state and will henceforth publish the *Railway Master Mechanic*, *Railway Engineering and Maintenance of Way* and the *Monthly Official Railway List*, these papers having formerly been published by the *Railway List Company*, Chicago. The officers of the new company are as follows: Ernest C. Brown, publisher of *Gas Age*, president; Charles S. Meyers, vice-president and general manager, and S. A. Bates, secretary-treasurer. Benjamin Norton, at one time president of the Toledo, St. Louis & Western, has been made editor-in-chief, George S. Hodgins, managing editor, and Laurence A. Horswell, associate editor. The *Railway Periodicals Company, Inc.*, will have offices in the Vanderbilt Concourse building, New York, and that will be the office of publication.

Steel Corporation Given 46 Awards

The superior jury of awards of the Panama-Pacific International Exposition has made 46 awards to the United States Steel Corporation and its subsidiary companies for the elaborate exhibit at San Francisco. Included in the total there are a special gold medal for the "best, most complete and most attractive installation," 11 grand prizes, 10 medals of honor, one gold medal of honor, 20 gold medals and three silver medals.

Grand prizes (the highest possible regular awards) were awarded to the Steel corporation itself for its "comprehensive, educational exhibit of the steel industry and related industries" and to its bureau of safety, sanitation and welfare.

Grand prizes were also awarded to the following companies for the excellence of their exhibits, the greatest merit being recognized in certain of the products, some of which are named herein, as representing the highest development of the art: Carnegie Steel Company, armor plate, special alloy steels, railway wheels and axles, steel sheet piling, rail joints, etc.; Illinois Steel Company, ferro-silicon, electric carbon and alloy steels, railroad track specialties, axles, etc.; the Tennessee Coal, Iron & Railroad Company; the Lorain Steel Company, tadpole tongue switch, tongue-holding device and electrically welded rail joints; the American Bridge Company, sections of building columns, section of Hell Gate bridge chord, steel barges, standard railroad turntable, etc.; the American Sheet & Tin Plate Company; the American Steel & Wire Company, wire rope, wires, copper rail bonds, insulated copper wires and cables, etc.; the National Tube Company, National steel pipe and tubing, National protective coating, National Kewanee unions, valves and fittings and Shelby seamless steel tubing, and to the Universal Portland Cement Company.

Medals of honor were awarded the United States Steel Products Company, export department; the Oliver Iron Mining Company; the Pittsburgh Steamship Company; the Pittsburgh & Conneaut Dock Company; the H. C. Frick Coke Company; the Duluth, Missabe & Northern, and also to the Steel Corporation, the Carnegie Steel Company and the Illinois Steel Company.

Gold medals were awarded the Bessemer & Lake Erie, the Birmingham Southern, the Duluth & Iron Range, the Elgin, Joliet & Eastern, the Newburgh & South Shore and the Union Railroad for pictorial exhibits of typical roadbed, shops, yards, bridges, buildings and freight and passenger equipment employed in operation.

Gold and silver medals were also given to a number of the officers and employees of the various companies for their success in planning the respective exhibits.

TRADE PUBLICATIONS

WATER TUBE BOILERS.—The A. D. Granger Company, New York, has just published bulletin No. 2, sixth edition, describing its Oswego internally fired water-tube boiler. The bulletin, which is well illustrated, describes the latest improved features of this self-contained internally fired water-tube boiler. Dimensions, ratings and other data are given for both high-pressure and low-pressure boilers, and pictures of the detailed parts of the Vulcan shaking grates are shown.

RAIL REPORTS.—The Titanium Alloy Manufacturing Company, Niagara Falls, N. Y., has issued Bulletin No. 8 of its series of rail reports. This bulletin contains detailed comparative data regarding 111 standard and 101 Titanium treated open-hearth A-rails with from 8 to 10 per cent discard and rolled by seven different manufacturers in the United States and Canada. Samples for the determination of carbon were selected from the points in the head specified in the revised specifications of the Pennsylvania, and the average difference in carbon between the required points for the standard open-hearth rails is shown as 17.2 per cent, as compared with 4.2 per cent for the Titanium treated rails. Sulphur prints of these various specifications are also shown with data regarding the individual sections. Based on formulae for tensile strength and elongation developed by M. H. Wickhorst in Bulletin 170 of the American Railway Engineering Association, dated October, 1914, detailed comparisons are made for standard and Titanium treated open-hearth rails with a revised formula showing similar improvement in physical properties for the Titanium treated rails.

Railway Construction

ATLANTA & ST. ANDREWS BAY.—This road has been extended from Panama City, Fla., to St. Andrews, two miles.

ALABAMA ROADS (ELECTRIC).—Plans are being made to build an electric line, it is said, from Jasper, Ala., southeast via Ensley, to Birmingham, about 35 miles. L. B. Musgrove and associates, Jasper, Ala., are back of the project.

CHESTER & CITY POINT (ELECTRIC).—Incorporated in Virginia with \$100,000 capital to build an electric line from Chester, Va., southeast to City Point and to Hopewell, crossing the Appomattox river at or near Point of Rocks. Preliminary surveys have been made and the company expects to have the line completed by next spring. H. D. Eichelberger, president, Richmond, Va., and Chester.

CLINTON & OKLAHOMA WESTERN.—Surveys have been made, it is said, for an extension to be built into the Panhandle of Texas, and surveys are to be made for an extension from Clinton, Okla., southeast to Chickasha, about 75 miles. The company now operates a 51-mile line from Clinton west to Strong City.

COLUMBIA, NEWBERRY & LAURENS.—Plans are being made to build a 65-mile branch, it is said, from Newberry, S. C., south via Saluda and Edgefield to Augusta, Ga. The company now operates a 75-mile line from Columbia west via Newberry to Laurens.

ELECTRIC SHORT LINE.—A contract has been given to H. F. Baleh & Co., Minneapolis, Minn., it is said, to build an extension of about 45 miles from Winsted, Minn., west via Silver Lake and Hutchinson. (Jan. 22, p. 171.)

ETTRICK & NORTHERN.—The Railroad Commission of Wisconsin has granted permission to this company, it is said, to build a line from a connection with the Green Bay & Western southeast through the towns of Ettrick and Preston, Wis. J. C. Gaveney, president, Arcadia.

OIL FIELDS & SANTA FE.—This line has been completed from Jennings, Okla., to Oilton, Creek county, and from Cushing to Pemeta and Drumright, and at the present time is being built from Pemeta to Oilton.

OKLAHOMA UNION TRACTION.—See Tulsa Traction Company.

OREGON-WASHINGTON RAILWAY & NAVIGATION COMPANY.—This company has begun the construction of seven miles of railroad from Olympia, Wash., to Plum station, where it will connect with the water-grade line of the Northern Pacific. Grading was completed some time ago, and two tunnels are now in the process of construction. The new road already owns half a block in Olympia, which will be used for terminal facilities.

PENNSYLVANIA RAILROAD.—An officer writes that the company recently began work on a 3.5-mile extension of the Yellow Creek branch of the Pennsylvania Railroad from Homer, Pa., to the mines of the Sterling Coal Company. The contract for this work was awarded over a year ago.

SALINA NORTHERN.—This road has been opened for business from Salina, Kan., northwest to Lincoln Center, 35 miles, and is under construction on an extension to Corinth and Downs, 43 miles, also on a branch from Corinth to Osborne, 10 miles.

TEXAS ROADS.—Financial arrangements have been made, it is said, for building the line from Lamesa, Texas, south to Midland, or to some other point on the Texas & Pacific, about 55 miles. Miles Westbrook, Dallas, and T. J. O'Donnell, Sweetwater, are interested. (May 7, p. 993.)

TULSA TRACTION COMPANY.—This company was recently incorporated in Oklahoma with \$100,000 capital and plans to build from Tulsa, Okla., southwest to Sapulpa, also extensions connecting Broken Arrow, Bixby and Okmulgee and a line north to Collinsville, in all about 80 miles. The company has bought the Oklahoma Union Traction line in Tulsa. G. C. Stebbins, president; A. J. Biddison, vice-president and general counsel; I. F. Crow, secretary and treasurer, Tulsa, and B. C. Redgraves, superintendent.

RAILWAY STRUCTURES

BUREAU, ILL.—Bids have been let for the construction of a bridge for the Chicago, Ottawa & Peoria over Bureau creek to consist of five spans 34 ft. 8 in. long, with deck-plate girders designed for Cooper's E-40 loading. The cost will be approximately \$6,000.

CHICAGO, ILL.—The Chicago & Northwestern will soon build a grain elevator on the Indiana Harbor Belt in the Calumet district which will have a capacity of 2,500,000 bushels and will cost approximately \$2,000,000. It was the original purpose of the company to begin the erection of the elevator last spring, but the project was subsequently postponed.

Cravens, Tenn.—The entire mechanical plant of the Nashville, Chattanooga & St. Louis has been transferred from Chattanooga, Tenn., to Cravens yards, about four miles from Chattanooga. Additional tracks have been laid at Cravens, also a three-story stucco office building, sand houses and oil houses, and a 90-ft. turn table with concrete base, operated by electric tractor. The plans contemplate the erection of car repairing sheds, also the construction of an incline to permit the transfer of freight to and from the river.

Greenville, N. J.—The Pennsylvania Railroad asked for bids on September 8 for the construction of a new pier to be built at Greenville.

La Salle, Ill.—The Chicago, Ottawa & Peoria has let the contract for a bridge over the Vermillion river to the Joliet Bridge & Iron Company. The structure will consist of two 26-ft spans, with deck-plate girders designed for Cooper's E-40 loading. The total estimated cost is \$3,800.

McAllen, Tex.—Engineers for the St. Louis, Brownsville & Mexico are laying off the grounds for a new brick depot at McAllen, the estimated cost of which is \$7,000.

Manchester, N. H.—Plans are being made for building a new bridge at South Elm street in Manchester, to cost about \$76,000. The city of Manchester will pay \$40,000, the Boston & Maine \$24,000, and the Manchester Street Railway \$12,000 of the cost of the structure.

New York.—The New York Public Service Commission, First district, has awarded the contract for station finish on the Jerome avenue and White Plains avenue rapid transit lines, in the borough of the Bronx, to the Alton Realty & Construction Company, the lowest bidder, for \$860,363. (September 3, p. 449.)

Spartanburg, S. C.—The Southern Railway has given a contract to J. P. Pettyjohn & Co., Lynchburg, Va., for the construction of new freight station facilities at Spartanburg, to consist of a one-story in-bound freight house 40 ft. by 250 ft., with two-story office section. The building is to be constructed of brick with concrete floor and fireproof roof and is to be equipped with rolling steel doors. There will also be a modern one-story out-bound freight house 22 ft. by 250 ft., with concrete floor and base, frame construction and fireproof roof. The terminal will also include four house tracks, with a capacity of 32 cars, and four team tracks, with a capacity of 29 cars. A 20-ton Pillar crane will also be provided for the handling of heavy freight. Work on these improvements will be started as soon as the necessary material can be assembled and will be rushed to completion.

Vancouver, B. C.—An officer of the Canadian Northern is quoted as saying that work will be started soon on a terminal in Vancouver for the Canadian Northern.

COMMODITIES CARRIED ON THE MANCHURIAN RAILWAYS.—Coal furnishes the greatest tonnage of any commodity carried by the railways from Manchuria into Kwantung. Next to this come beans, of which there was 637,612 tons carried in 1914, and in addition 67,027 tons of bean cakes. There was also 62 tons of bean sauce carried, while on the other hand there was only 3,611 tons of timber and wood of all kinds carried.

Express in Russia.—The European representative of an American Express company is now in Petrograd, Russia, investigating the advisability of establishing a branch office there with agencies in other parts of Russia.

Railway Financial News

Boston & Maine.—Of the holders of \$17,083,000 extended notes of the Boston & Maine, which matured September 2, all except the holders of about \$400,000 have agreed to postpone any cash payment until March 2. About \$150,000 of these non-assenting notes are held in Great Britain and are therefore affected by the British treasury's rulings.

Chicago, Rock Island & Pacific.—Arthur Curtiss James and James McLean, both representing Phelps, Dodge & Co., New York, interests, have resigned from the board of directors of the Chicago, Rock Island & Pacific. Both Mr. McLean and Mr. James endorsed the note which the Chicago, Rock Island & Pacific gave to the Bankers' Trust Company on March 31 for \$1,600,000, which note falls due October 1.

Ft. Smith & Western.—This company has made an agreement with the Missouri, Kansas & Texas whereby it uses the M., K. & T. tracks from Fallis, Okla., to Oklahoma City, 32 miles.

Wabash-Pittsburg Terminal.—The following statement has been issued by the reorganization committee of the Wabash-Pittsburg Terminal:

"On August 24 the court at Pittsburgh made an order authorizing H. F. Baker, the receiver of the Wabash-Pittsburg, to enter into a contract with the Pennsylvania road for the construction of the so-called Bridgeville connection.

"This marks a long step forward in the rehabilitation of the terminal properties. The importance of the Bridgeville connection lies in the fact that it gives to the Terminal company a direct outlet over the lines of the Pennsylvania and permits a direct interchange of traffic with that company. The Terminal company is thus enabled to reach a territory extending from the Atlantic seaboard to the Middle West over the lines of the Pennsylvania that have for a number of years been closed to it.

"Pursuant to the authority granted by the court, the receiver has signed the agreement, and construction of the connection has already been commenced and is progressing. It will be about October 1 when the interchange of business will commence.

"The incalculable benefit to the Terminal company of this connection can best be judged by the history of the Wabash-Pittsburg Terminal on this particular point. The Terminal was a prosperous property, enjoying this connection at the time when Mr. Gould and Mr. Cassatt, the latter representing the Pennsylvania road, became estranged. The Goulds controlled the Terminal property. By reason of this dispute the Pennsylvania terminated its traffic relations with the Terminal road and the latter since that time has suffered accordingly. This renewal of traffic relations will be to the great benefit of the Wabash-Pittsburg Terminal, and it is expected will be very profitable, as it opens up an avenue of business that has been closed since the break with the Goulds."

JAPANESE RAILWAY DEVELOPMENT.—The English commercial attache at Yokohama reports that of the Imperial Government railways about 175 miles of new sections and about 150 miles of light railways were open to traffic during 1914. The most important sections were 25 miles on the Tokushima line, 23 miles on the Sakata line and 20 miles each on the Murakami and Gwanetsu lines. Two of the most interesting events of the year were the completion of the splendid new central station in Tokyo, and the opening of the new government electric railway between Tokyo and Yokohama. This railway, which runs side by side with the existing steam track, is 19 miles long and connects the two above-mentioned towns. Between the two termini there are 14 intermediate stations. Unfortunately, the railway had only been in operation for a few days at the end of the year when it became necessary for the authorities to discontinue the service. As far as it is possible to ascertain, the whole of the trouble lay with the overhead equipment, which at the time of opening to public service was in an unfinished state, so that trial running of the trains was only carried out for about two days.

Railway Age Gazette

PUBLISHED EVERY FRIDAY AND DAILY EIGHT TIMES IN JUNE BY THE
SIMMONS-BOARDMAN PUBLISHING COMPANY
WOOLWORTH BUILDING, NEW YORK.

The train accident record for August, printed in this issue, contains one collision and one derailment which together are charged with the deaths of seven passengers, a record more fatal in this respect than has been published before for ten months. Not since September, 1914, has there been a collision or derailment killing as many as four passengers. The accidents now reported, Orient, Ohio, and McCorkle, W. Va., are both typical, in that they were occasioned by well-known dangers, the prevention of which is so costly that on most railroads it is deemed necessary to accept the risk. At McCorkle, according to the inspector for the State of West Virginia, a guard rail would have prevented the fatal consequences; but the question with the railroad engineer is how to protect the right places. Guard rails would add to safety in a thousand places; which of these shall be dealt with first? We have not enough facts to judge of this particular case; but the main general fact is constantly with us: where shall the available money be spent? What road has installed guard rails (and other precautionary fixtures) at every place where they might sometime be useful? At Orient the risk was in suspending the block system, to save time. Every road, everywhere, deems it necessary, under some circumstances, to trust to enginemen to follow preceding trains according to their own judgment, not imposing an absolute space interval. In automatic block signaling this is done everywhere, almost every day. Where and when should this laxity be forbidden? In city subways, equipped with automatic stops, it is forbidden at practically all times. Where extra passenger trains are running at night, and where there are unusual and troublesome causes of delay (as at Orient) there would seem to be good reason for always imposing the absolute space interval, even though this should necessitate blocks ten miles long, or longer. But, again, who shall have authority to direct the imposition of this requirement? It may have to be done at a half hour's notice. Such a general rule would imply the employment of very high grade men for train dispatchers—or of superintendents who should be on duty night and day.

Many years ago the railroads adopted a code of locomotive whistle signals which soon became standard on all lines. The same number and length of blasts mean the same thing on every line. The whistle is expected to be used reasonably and for business purposes only; no screeching or playing with the whistle is very common; the code can scarcely be recognized. The road-crossing signal is most abused; what we usually hear is two long, one short and then one very long blast, with varying degrees of emphasis and screeches on the last blast. The call for the proceed signal at a railroad crossing (four moderately long blasts) is also greatly abused in four unreasonably long and loud blasts. We all know this from experience. We have all often "heard 'em blow" for a crossing at 4 o'clock in the morning. The whistle is a necessary device, but it should not be abused; all playful, slouchy, sloppy, vicious and abusive whistling should cease. The foregoing is an editorial, slightly condensed, from the Alton (Ill.) Evening Telegraph. It is printed here without quotation marks because it has an application in hundreds of places, and in at least 47 states; and we wish to adopt the words of the Evening Telegraph as our own. Why do not appeals like this have more visible effect? As railroad officers have been trying for half a century to abate the whistle nuisance, and yet in a multitude of instances have failed, there will be no unfairness in turning elsewhere for relief. Why not try the unpractical proposal of a New York magazine editor, to make an appeal to the locomotive engineers? Is not the engineers' brotherhood a public-spirited body, thoroughly devoted to the interests of the people? We have called this proposal unpractical, but no engineer can claim that it is unreasonable. We say unpractical because we have never discovered any way

"Sloppy, Vicious and Abusive Whistling"

to elicit the public spirit of the members of the brotherhood; but their leaders, when appealing for sympathy in case of a strike or threatened strike, seem always to be willing to be as fair with the public as they expect the public to be with them. And here is a chance to show good will. There is no question but that the public feels aggrieved at the whistle nuisance. The locomotive engineers of the United States have been called the highest class of "labor"; men of character and intelligence; members of the most enlightened labor brotherhood. It must be that a fair percentage of them have in their souls enough music to know slovenly whistling when they hear it, and enough influence, courage and regard for invalids, and critics' feelings to stir up their brethren. In asking the best engineers in this manner to lend a hand in reforming some of the second best we may seem to be ignoring the superintendent and the trainmaster; but nobody will object if the engineers get the start and attack this nuisance first. As long as the present condition continues, the feeling of the public, in the towns along the lines of the great majority of the big railroads of the country—a feeling that does not find very frequent expression, but which, nevertheless, is deep-seated—is that both the officers and the engineers are very deficient in those fine qualities of mind which are characteristic of men who do their tasks skilfully and who have a reasonable amount of consideration for the "other fellow."

THE GALVESTON CAUSEWAY FAILURE

THE storm which struck Galveston and vicinity on August 16 and 17 has attracted a great deal of attention from railway men, primarily because of the destruction of a part of the Causeway, completed in 1912. The importance of this structure lies in the fact that Galveston is located on an island and this Causeway provides the only avenue for rail communication with the mainland. Since the storm various methods of repairing the structure and of preventing a recurrence of its destruction have been suggested, but all of these appear to overlook one of the main reasons for its failure.

After several days of southeast winds such as preceded the recent storm, there is a marked increase in the water level in the gulf and also in the inland waters of West bay and Galveston bay. All adjustment of water levels is necessarily obtained by the ebb and flow of water through the Galveston jetty or via the San Luis inlet and West bay. The discharge of water through these inlets is a matter of common knowledge and strong currents have been observed even during moderate disturbances. Previous to 1900 three timber railroad trestles and a highway bridge over West bay connected Galveston with the mainland, but all these were destroyed by the storm of that year. Following this, only one trestle was rebuilt. Stimulated by a demand for a permanent structure which would afford connection with the mainland at all times, the well-known Galveston causeway was built jointly by the city, the county and the railroads at a cost of \$1,750,000 and opened in 1912.

In this structure the channel width of 10,680 ft. offered by the pile trestle was reduced to 2,437 ft. of concrete arch viaduct, the remainder of the crossing being constructed of sand fills restrained between two lines of concrete sheet piling and concrete blankets on the slopes. The grade of the new structure as established brought the crown of arches at least 2 ft. below the level of high water of 1900. Thus the waterway was cut down over 75 per cent. In the recent storm, water overtopped the embankments and washed out the sand, allowing the concrete blankets to fall in. In this way practically all of the Virginia Point approach embankment was destroyed and all but 2,300 ft. of the Galveston end went out, while the concrete structure was uninjured. Various suggestions have been made to the effect that the embankment would have stood if it had been made of heavy rip-rap instead of sand, or if the concrete blanket had extended over the entire surface. It would appear, however, that owing to the restriction of the waterway, the embankments

must have been subject to considerable static head in addition to the wave action. It is said that the water level was 2 ft. higher than in 1900. Therefore, even if the embankment had been made impregnable to wave action, it is not certain that it would have long withstood the pressure of the water as a dam, for the concrete sheet piling extended only 14 ft. below low water and rested in the sand without entering the clay found at a lower level.

Now that a considerable portion of the causeway approaches must be rebuilt, it would seem that more attention should be given to the provision of ample waterway. The construction of additional arches is doubtless the most practical solution and even a raise of grade of the entire structure appears desirable.

CAR SURPLUSES AND SHORTAGES

AN encouraging indication of reviving business prosperity, as measured by the growth in volume of railway traffic, is afforded in the latest report of the American Railway Association, just issued, showing a reduction of 76,000 in the number of surplus freight cars during the month of August. The total surplus on September 1 was only 189,919, as compared with 266,312 on August 1. The surplus on September 1 of this year was, however, still 24,000 greater than that on September 1, 1914, when the surplus was 165,244.

The increasing demand for freight cars is, of course, due primarily to the beginning of the crop movement, which, according to the latest report of the Department of Agriculture, is likely to exceed slightly the high-water mark of 1912. In 1912 similar predictions of bumper crops were usually accompanied by warnings of a car shortage. This year talk of a car shortage would seem as music to the ears not only of railway officers but of most business men also. All of which serves to call attention to the fact that for a long time the car-shortage problem has been somewhat like the snakes in Ireland.

The last period in which there was a car shortage was the month of October, 1913, when shortages in various parts of the country exceeded the surpluses in other parts by from 2,000 to 6,000 cars. It is necessary to go back three years, to the fall of 1912, to find a net shortage serious enough to constitute a problem either for the railways or the shippers.

The popular notion is that the railways are constantly being confronted by the problem of getting cars to move their traffic. The facts show that for some years their problem has been to get traffic to move in their cars. The statistics compiled by the American Railway Association demonstrate that car surpluses have been much more chronic and general than car shortages ever since there were such loud complaints about car shortages some years ago. The car shortages have always been but small, brief and local in their effect, while the car surpluses have been large, protracted and general.

The American Railway Association began to compile and publish statistics of car surpluses and shortages on January 2, 1907. It continued to make such reports fortnightly until November 1, 1914, when they were temporarily discontinued. Since February 1, of this year, the reports have been made monthly. During the period from January 2, 1907, to October 1, 1914, in only 25 of the fortnightly statements did the shortages exceed the surpluses, while in 175 the surpluses exceed the shortages. It is a matter of common knowledge that during the time when no statistics were compiled business was greatly depressed, and that there were large net surpluses, and since February 1, this year, the monthly reports have shown consecutive surpluses varying from 189,000 to 327,000. Back in 1906 and 1907 the railways were denounced from coast to coast for not providing enough facilities to handle their business. Yet in the 8 years and 8 months since the first statistics of surpluses were compiled we have had net shortages of cars only about 10 per cent of the time, while during 90 per cent of the time there have been from a few thousand to nearly a half million cars for which there was no business, but which were

costing their owners large sums in interest on the idle investment as well as for maintenance.

The car shortage "bugaboo," as it has since turned out to be to a large extent, came into prominence in the fall of 1906, when a very rapid expansion of business of all kinds culminating at the time of the heavy demand for cars for crop-moving, found the facilities of the railways seriously inadequate. There was, therefore, widespread agitation, and much ill-advised legislation was passed to penalize the roads for failure to furnish cars promptly on demand. In the fall of 1907 there was another shortage, less serious, which was followed in the spring of 1908 by a surplus which on April 29 reached 413,605 cars. In 1909 and 1912 there were also shortages, but during most of the time, as already shown, there have been large surpluses.

The prevalence of car surpluses during the last eight years has, of course, been due largely to the circumstance that the freight traffic has been growing less rapidly than formerly. It is also largely due to the fact that, when transportation facilities were found to be inadequate in 1906 and 1907, the railways, in anticipation of a continued rapid growth of traffic, began making extensive enlargements and improvements of facilities. From 1898 to 1906 the density of freight traffic—ton miles per mile of road—on the railways of the United States increased 59 per cent, while the investment in road and equipment per mile increased only 3.88 per cent. During the years since that time the situation has been decidedly different. From 1906 to 1914 the investment in road and equipment per mile was increased 20 per cent, while the traffic density increased only 19.8 per cent. When the facilities proved to be temporarily inadequate to the demands of traffic a large number of "reciprocal demurrage" laws were passed to punish the railways for not furnishing cars promptly. If the wise law-makers who passed them would devise some remedy for the true evil, that of an insufficiency of traffic to load the available cars, they would render a real public service.

CO-ORDINATION OF MECHANICAL ASSOCIATIONS

DURING July two mechanical department associations met in convention. The president of one of them went on record as favoring some scheme of co-ordination of such associations, calling attention to F. F. Gaines' remarks on this general subject at the last Master Mechanics' convention. This was President Scott, of the General Foremen's Association, who suggested that the chairman of the executive committee of the various organizations get together with a view of investigating some plan of co-ordination, believing that such a plan would be of benefit to the various organizations in that more and better co-operation would be obtained. The convention of the Tool Foremen's Association afforded an example of the possible advantages of such a plan. This association had long realized that it would be of benefit to the railways if standard reamers could be obtained for frame and rod work. Its members have spent much time in considering the subject and it was very thoroughly discussed at last year's convention. This year the association drew up and recommended definite standards, but under the present system it is difficult to get these standards adopted by the roads. Under a satisfactory plan of co-ordinating the work of the mechanical department associations the recommendations would automatically go up to those who have the power of fixing standards.

Such a scheme would be of advantage in many respects. It is always a more or less difficult matter for the minor associations to determine upon subjects for consideration at their conventions. The major organizations acting in an advisory capacity and having a familiarity with the entire mechanical department, would be in a position to suggest in many cases the matters which could be most profitably considered.

Such a plan would also bring about much more concerted action among the various associations. It would relieve the major associations of some of their work, eliminate some duplication of work, and give the minor associations more definiteness of purpose. Having thus been recognized by the major organizations it would be easier for the minor associations to obtain a larger and more comprehensive attendance at the conventions.

At present there are railroads that do not give the minor associations the recognition they deserve, whereas if they were under the control of the major associations, reporting to them the results of their deliberations at each convention, they would be in a better position to secure support. Several of the roads that send their men to the minor conventions request, on their return, reports of what they gained by their attendance. With a general report to the supervising body, the heads of the mechanical departments would thus be assured as to whether or not it is profitable to have their men attend.

The co-ordination idea is a very good one, and should not be allowed to pass with simply the recommendation of Mr. Gaines. The members of the minor organizations should be made to feel their responsibility, and in no case should these organizations be allowed to lose their individuality. They are in a position to be of material assistance to the railways, as past results have shown. But they do need the co-operation of the higher officers, and only by this co-operation can they be made to be as successful as they should be.

NORFOLK & WESTERN

With a decrease of more than a million and a half dollars in revenues, and with an increase of more than seven hundred thousand dollars in maintenance-of-way expenses due to the fact that the Norfolk & Western has begun to charge depreciation on its principal structures, the company had within a few thousand dollars of as much available for dividends on its common stock in the fiscal year ended June 30, 1915, as in the previous year. The amount in 1915 was \$9,490,000, and the 6 per cent annual rate on the common calls for \$6,477,000. There was a saving of 11 per cent made in transportation expenses, with a falling off in freight tonnage handled of but 3.63 per cent and an increase of 2.37 per cent in the number of passengers carried.

The distinguishing feature about the Norfolk & Western's annual report for some years has been the liberality of maintenance charges and of expenditures for additions and betterments and the economies which have been effected in transportation expenses. The great point about the Norfolk & Western's economies in transportation expenses is that while the average trainload of freight has increased with remarkable steadiness, the increase in transportation expenses per train mile has not offset this gain, so that the company is actually getting some return from the gain in the more effective use of its plant and its expenditures for betterment of the plant, whereas so many railroads have had the gains from these sources more than eaten up by increased wages or other expenses. Of course the Norfolk & Western has had the same increase in wages as other roads in its territory. Perhaps one explanation is that the expenditures on betterment of the plant have not only been liberal but have been quite extraordinarily free of mistakes in judgment. The steadiness with which the trainload has shown an increase is presumably an indication of the smoothness of the working of the plan of development that makes for stockholders' profits. In 1909 the trainload of revenue freight was 616; in 1910, 635; in 1911, 643; in 1912, 692; in 1913, 764; in 1914, 802, and in 1915, 841. Other roads have shown as great an increase in trainload over this period, but few, if any, have shown gains made so steadily and so uniformly. The credit for such a showing as this must be in part attributable to the foresight and wisdom of the management and in part to the constant supervision by the operating officers.

The following table shows the ratio of each class of expenses to total operating revenues in 1914 and 1915:

	1915	1914
Maintenance of way and structures	13.35	11.20
Maintenance of equipment	19.40	20.64
Traffic expenses	1.63	1.65
Transportation expenses	29.13	31.50
Miscellaneous expenses	0.25	0.45
General expenses	1.95	2.05
Total	*64.74	67.49

*A charge amounting to 0.97 per cent of operating revenues was made to expenses for transportation for investment—C., in accordance with the new rules of the Interstate Commerce Commission.

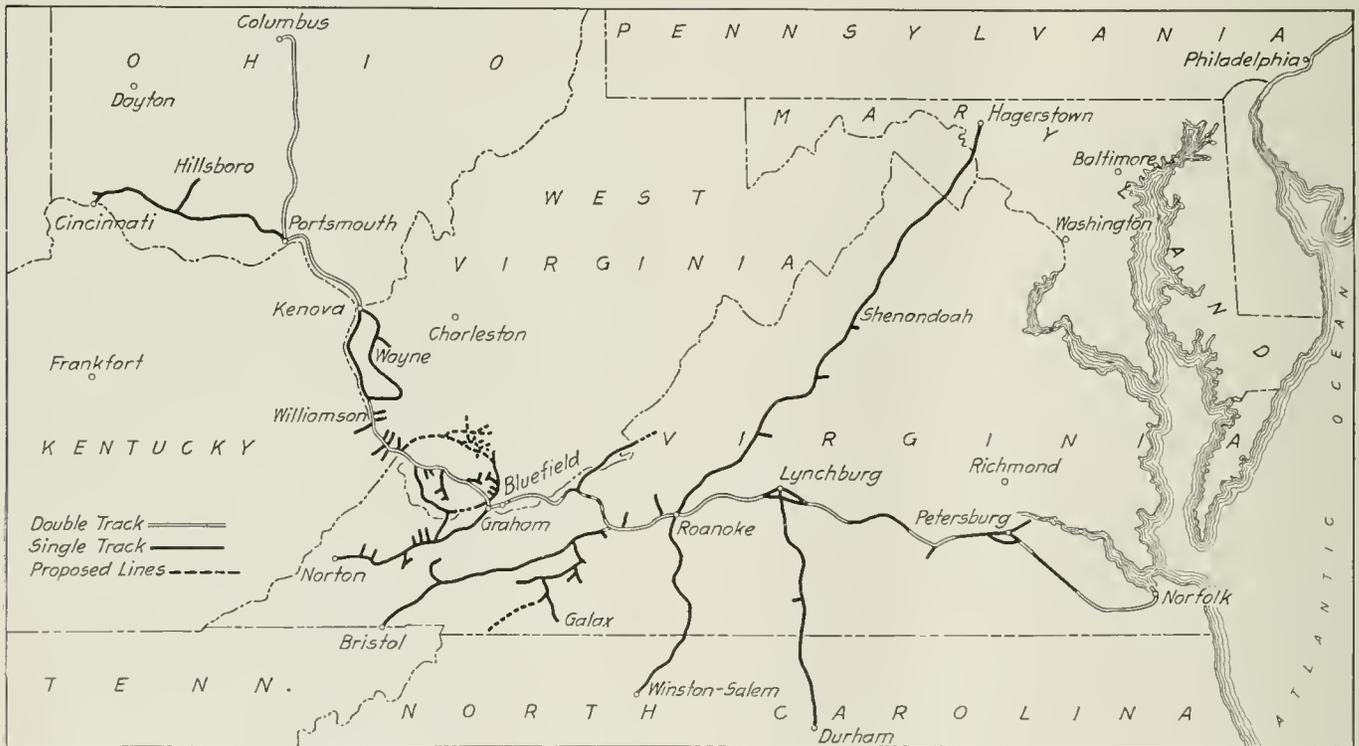

The fact that the Norfolk & Western has availed itself of the Interstate Commerce Commission's rules, which permit charging depreciation on structures in addition to the depreciation which has been charged since 1907 on equipment, has already been mentioned. The charges made are particularly interesting, because the Norfolk & Western is the first road to make a report showing in detail such charges, and only a few other roads, such as the Louisville & Nashville, have been making any such charges at all. President Johnson says in his report: "Your company has availed itself of the permission to set up such accounts [depreciation on property other than equipment], but, to begin their operation conservatively and to avoid large initial charges to operating expenses for depreciation of such property, only the larger structures have been considered, leaving the extension of the plan to cover smaller structures for consideration at a later date when experience shall have more clearly indicated the best permanent course." A total of \$643,000 was charged for depreciation under maintenance of way and structures. Roadway maintenance, on which \$525,000 was spent, was charged also under the heading "roadway depreciation," \$326,000; station and office buildings, on which \$113,000 was spent for repairs and

Per passenger-train car	826.00	870.00
Per 100 miles	1.53	1.55
Per freight-train car	91.00	108.00
Per 100 miles	0.90	1.01

The fact that the Norfolk & Western's traffic fell off and the train mileage was reduced to an even greater extent, permitting the use of only the newest and best locomotives and cars, possibly accounts for some of the decrease in repair costs.

The Norfolk & Western spent \$6,870,000 for additions and improvements to its property and equipment in 1915. Of this amount \$2,017,000 was net expenditure for new equipment, and of the remainder the two largest items were for second track, \$1,648,000, and for electric power transmission, \$1,636,000. The Norfolk & Western's electrification work was described in some detail in the issue of the *Railway Age Gazette* for June 4, 1915, page 1153.

President Johnson draws attention to the fact that from October 1, 1896, to June 30, 1915, \$123,649,000 has been spent on additions to road and equipment, and in addition to this amount \$15,474,000 was spent from income for what the Interstate Commerce Commission now classifies as additions and betterments. In other words, in these 19 years investors have put into the prop-

The Norfolk & Western

renewals, was charged also with \$40,000 for depreciation, and shops and engine houses, on which \$136,000 was spent for repairs and renewals, was also charged \$47,000 for depreciation.

Without any actual inspection of equipment it is impossible to say with absolute certainty whether smaller expenditure means economies or delayed maintenance. On the other hand, the Norfolk & Western's whole policy toward maintenance is so clearly shown in the other figures in the annual report that it is almost inconceivable that a shortsighted policy would be pursued in regard to maintenance of equipment. Furthermore, it is quite unlikely that any such showing for increased trainload could be made if locomotive repairs were not made promptly and comprehensively.

The following table shows the amount spent per unit of equipment and per 100 miles run for repairs, renewals and depreciation in 1915 and 1914:

	1915	1914
Per locomotive	\$2,855.00	\$3,120.00
Per 100 miles	13.36	12.40

erty \$139,123,000 of new money. The showing made by the company in the year ended June 30, 1915, is a good indication of how wisely this money has been spent.

The following table shows the principal figures for operation in 1915 as compared with 1914:

	1915	1914
Mileage operated	2,044	2,037
Freight revenue	\$36,550,550	\$38,038,622
Passenger revenue	4,739,538	4,908,679
Total operating revenues	42,987,044	44,650,310
Maintenance of way and structures	5,738,074	4,998,612
Maintenance of equipment	8,341,419	9,214,007
Traffic expenses	699,827	737,690
Transportation expenses	12,521,665	14,068,577
Miscellaneous expenses	109,468	199,565
General expenses	836,607	916,954
Transportation for investment—Cr.	415,245
Total operating expenses	27,831,815	30,135,407
Taxes	1,878,000	1,620,000
Operating income	13,275,462	12,894,539
Gross income	15,318,696	15,171,921
Net income	10,409,905	10,462,426
Dividends	7,396,293	7,180,592
Surplus	3,013,612	3,281,834

The Interstate Commerce Commission and Its Work*

A Reply to Some Criticisms and a Discussion of Some of the Unsettled Questions Pertaining to Railway Regulation

BY E. E. CLARK

Member of the Interstate Commerce Commission

In some quarters the tribunal of which I happen to be a member is accused of entertaining, and of exercising, a spirit of hostility toward the railroads. If a railroad, whose financial history has been little, if anything, less than a public scandal from a time that antedates the enactment of the act to regulate commerce, goes into the hands of a receiver, certain publications solemnly announce that it has been forced into bankruptcy through the hostile and unreasonable policy and actions of the Interstate Commerce Commission. If the commission finds that certain proposed increased rates are reasonable, those same writers sneeringly assert that it is a delayed and reluctant granting of but a small part of that which should be granted to the railroads. If the members of the commission disagree as to the propriety of, and justification for, the proposed increased rates, they assail those members who disapprove and laud those who approve. Thus, if a commissioner happens to be on one side in one case and on the other side in another case he is both approved and disapproved.

CRITICISM OF THE COMMISSION

From another quarter we are accused of being desirous of doing only those things that the railroads wish us to do; and the assertions and accusations from that quarter are as extreme and as violent as are those emanating from the quarters first mentioned.

And so, dependent upon the point of view, we are different beings, animated by different impulses and doing things which are diametrically opposed to each other. But is the one who will not see more than one side of a question, who attributes dishonesty to everyone who does not see as he does, and as narrowly as he does, necessarily the only one who sees rightly? Is his point of view infallible? May not some of his conclusions or deductions be wrong?

I remember reading when a boy a poem which described the trip of six blind men of Hindustan to see an elephant. The first approached the animal and happening to fall against its side exclaimed, "Why, bless me, but the elephant is very like a wall." Another chanced to grasp the elephant's tusk and asserted that the beast was like a spear. The one who came in contact with the elephant's ear declared that the animal was like a fan; the one who grasped the elephant's tail was sure that the elephant was much like a snake; the one who laid hold upon the elephant's trunk was certain that the animal resembled nothing but a tree, etc.

And so these men of Hindustan
Disputed long and loud,
Each in his own opinion
Exceeding firm and strong,
Though each was partly in the right
And each was in the wrong.

Every nation or people has a national sport, pastime or game. I have long known that in the United States we had two national games. The first is played in small parties, and generally in private. Of that one I will only remark that no one cares to play with the man who continually grumbles because he cannot win every pot. The second, baseball, is played in public; the crowd is always with the home team, and many of the on-lookers find their greatest enjoyment in roasting the umpire. Of late I have been almost inclined to think that a third pastime—finding fault with the Interstate Commerce Commission—is becoming so popular as to be almost national, and I am disposed

to pattern after the manager of a Texas baseball team, who appealed to the crowd, "Don't shoot the umpire, he is doing the best he can."

But, seriously, the questions which you gather together to discuss, and with which you deal, are parts of a problem of tremendous importance. Transportation is the very life blood of the commerce of the nation. The railroad industry of this country is probably, with the exception of agriculture, the greatest of our industries. Efficient and adequate railroads are essential to the maintenance and expansion of our commerce. Under our plan of private ownership, railroads have been, are, and will be built only when those who promote and further the enterprise have faith that in due time it will be profitable. Excepting the lands which were granted to some roads, a railroad has only transportation to sell and no other source of revenue. The railroad company, created by public grant of franchise, is obliged to assume certain obligations, among them the regulation by public authority of many of its affairs, and is given certain privileges and guarantees, among them the right of eminent domain and protection against confiscation of its property through regulation or other means.

It must submit to regulation because otherwise, as has been amply demonstrated, unjust discriminations, undue preferences and unreasonable rates would be indulged in and imposed, and commerce, instead of flowing in natural channels, would thrive or languish according to the will of those who possessed the transportation facilities. Business, manufacturing, producing and marketing would all be subject to artificial domination and control. It must be accorded the right of eminent domain, as, otherwise, spite and greed would throw insuperable obstacles in the way of its construction. It must be protected against confiscation because it is, after all, private property which the public has no right to use except upon the payment of reasonable compensation.

I do not doubt, and I have never doubted, the willingness of the great majority of the people to pay reasonable compensation for reasonable and proper service. I do not doubt the willingness of the great majority of those who manage the affairs of our railroads in these days to furnish good service in return for reasonable compensation. The difficulty comes in the difference of opinion as to what is reasonable compensation, either as a whole from all of the traffic, or in individual instances. These differences are often so acute that they must be decided by some disinterested, impartial tribunal, and manifestly they should be heard in an open forum in which all parties' rights are respected and protected.

THE COMMISSION DOING THE BEST IT CAN

Under our form of government these questions, in so far as they do not involve confiscation of the carriers' property, are within the jurisdiction of the legislative branch of the government. Acting within its lawful powers, the Congress has delegated certain authority to a body created for the purpose of deciding controverted questions of unreasonable, unjustly discriminatory or unduly preferential rates, rules, regulations or practices. That body, like the Texas umpire, is doing the best it can. I do not mean that it is doing the best it can to please everybody. It does not aspire to accomplish the impossible. It is doing the best it can to discover and establish that which is right, reasonable and just. It stands with its face to every wind that blows, decides the questions that come to it in a judicial spirit, endeavors to be helpful when it can in promot-

*Address before the National Industrial Traffic League, at Toledo, Ohio, on September 9, 1915.

ing harmony and thorough understandings between the carriers and their patrons, and does not worry about whether or not its decision or action is going to be popular.

The act to regulate commerce has been on the statute books since 1887, but it can fairly be said that real regulation under it dates back only to 1906 when by amendment the act was given vitality. The problem was not then, and is not now, to devise a model system of rates and regulations for railroads not yet built, or for industries and communities not yet located or developed. The conditions of trade and transportation that had grown up in a rapidly developing country served by railroads that had always been operated as private industries, free from governmental control, each going its own way in accord with the policy or ideas of those who for the moment were in control of it, had to be dealt with.

I think the court was perfectly right when it said that the purpose of the act was to promote and not to hamper trade and commerce. We may see situations and conditions which are wrong and which apparently should be corrected. But if, upon thorough investigation, it is demonstrated that in order to correct it other situations equally as bad, or worse, will be created, no real progress is made by forcing such action. The conditions which the law was enacted to correct or overcome did not grow up in a day and they cannot be corrected or overcome in a day without doing inestimable and irreparable injury. The evils at which the law is aimed were not created by one party to the transactions. No railroad official ever paid a rebate except to some receptive shipper. The ideal situation cannot be attained except through a general disposition and desire on the part of both railroad officials and shippers to support and observe the principles which form the foundation and cornerstone of the law. Just such associations as yours and the various traffic clubs of the country assist in getting men to think alike, and when they think alike, there is little trouble about getting them to act alike. The solution of these profoundly important and far-reaching problems must be approached and dealt with in a broad way. The foundation must be laid in sound principles of right. If a railway company imposes wrongs upon, or deals in bad faith with, an individual or a community, its owners may expect hostility against the company and its interests. If a shipper defrauds or attempts to defraud the railway company by falsifying as to his shipments or his claims he cannot expect its officers to attach much importance to his representations in a matter that is of real importance to him, and in which his contentions are right. Every temporary or transient advantage that is secured by trickery or by evasion of truth and right retards the progress toward the conditions which we all should seek to enthrone.

The law provides that the patron of the railway shall be accorded reasonable and nondiscriminatory rates and service. If he has been charged an unreasonable rate or has been damaged by an unlawful discrimination he may recover reparation. If the railway maintains an unreasonably low rate it cannot repair losses sustained as a reason thereof on past transactions. If the railway maintains unreasonably low rates as to some traffic or as to some communities, it may not recoup itself by laying unreasonably high charges against other traffic or other communities. This principle has been well established in recent decisions of the courts.

REASONABLE RATE: A QUESTION OF JUDGMENT

And this leads to the query, What is a reasonable rate? There is no statutory definition of it. No scales or yard sticks are provided by which it can be weighed or measured. It cannot be determined solely by the cost of the service, because that cost, plus a reasonable profit, might, as to some commodities, be prohibitive. It cannot be measured alone by the value of the service, because that would open the way for the railway to absorb, as to some traffic, the profits that legitimately belong to the shipper. It cannot be ascertained from a consideration of distance only, because so to do would destroy competition between producing fields and in common markets. In

the last analysis it is a question of judgment, and very properly, the judgment that finally controls is that of a disinterested, impartial tribunal, whose decisions must be made only in the light of full hearings and proper investigations, and are, as to matters of law, reviewable in the courts.

Some questions, which to my mind are of fundamental importance, remain to be decided by the commission and the courts, or to be disposed of by the Congress.

SOME UNSETTLED QUESTIONS

As I have suggested, the laws guarantee the owners of the railways against confiscation of their properties. What constitutes confiscation? What is the reasonable profit which the railway may lawfully demand? Upon what property may that profit be based? I think that the courts have clearly laid down the principle that the carrier is entitled to earn a reasonable return upon the property that is devoted to the public use, as of the time of its use. Now come the questions, What is the value of the property, and how is it to be determined? Certainly not by figuring a return upon the outstanding bonds and stocks. Two railroads may have been built in a common territory, under substantially similar conditions, at approximately the same time, and should have cost approximately the same per mile. Throughout its construction and operation one of them may have been conservatively managed and financed as a straight-out business venture, while the other one may have been the prey of graft during construction and of plunder under operation. The capitalization of the one may represent actual investment and outlays, while that of the other may represent all the money that those in control of its affairs have been able to borrow, or to raise by the sale, at ruinous rates of discount and interest, of securities far in excess of the cost or value of the property, or of stocks that can never have any value.

Being in common and competitive territory, their rates must, under the law of competition, be the same. Will any one say that the capitalization of these properties forms any reasonable basis for determining what they may properly earn from serving the public?

Within a period of two or three years in proceedings before the commission and the courts, one railway company proved by witnesses several different valuations of its property, and the differences in those valuations exceeded one hundred million dollars. The item of interest during construction was variously shown in sums which differed so widely that it seemed obvious they were not taken from any records which were considered reliable or permanent.

Such experiences as this led to the conviction that an official and dependable valuation of the railway properties should be had, and by authority of the Congress that work has been undertaken. The law which was adopted for this purpose is exhaustive and requires the performance of a vast amount of detail work and the determination of many vexed and vastly important questions. No one has blazed the path. The results ought to be sound, equitable and right. When these valuations are finally fixed they will be of great assistance to the commission and to the courts in connection with cases which involve alleged confiscation of property of carriers. It will not be possible for each railroad to earn the same return upon the value of its property, because controlling competition in transportation and in commercial life will require substantially equal charges in competitive territories, and we have so many railroads and such a vast commerce that there is not much territory that is not competitive.

THE RECENT WESTERN RATE ADVANCE CASE

There are those who think that if the railroads in a particular section of the country can, as a whole, show that their net return from operation is unusually or unduly low they should all be permitted to increase their charges on all of the traffic or upon important parts thereof. If all of those roads had been constructed, financed and operated on business principles and as

business concerns, and the net results of their operation showed an improperly low return, I would find no difficulty in accepting the view that they were justly entitled to such increases in their charges as would render their operation properly profitable. But in such a case the tribunal that authorized such an increase should have the power also to fix the minimum rate so that the burden might not be inequitably distributed. The carrier has a right to fair compensation for each service performed by it, and for its services as a whole. The public should pay such compensation. The carrier is entitled to earn a profit from legitimate enterprise and effort, but when it comes to increasing rates in general or upon an important part of the traffic, I find difficulty in accepting the theory that because certain roads are in financial straits, all roads in that section may properly increase their rates, when the greater number of those roads have for a series of years been able, under existing rates, to maintain their properties in splendid condition, pay all fixed charges and taxes, declare each year handsome dividends upon their stocks, and carry rather liberal sums to their surplus accounts.

I do not wish to draw invidious comparisons, but I want to make this point clear. I do not attempt to analyze the reasons for the conditions to which I refer as to some carriers, and I refer only to matters that are public property and common knowledge. The Burlington and the Rock Island systems are very generally strongly competing systems. They have operated in common territory and largely under common scales of rates. The one has maintained in good condition a splendid transportation system, has a strong and healthy financial standing, and has regularly paid fair, if not liberal, dividends to its stockholders. The financial condition of the other, and in general, the reasons therefor, you all know.

And so I say that, while desirous of according that which is right to the carriers as much as to the shippers, one may well hesitate about assuming responsibility for approving large increases in rates for the purpose of relieving a financial strain that is composed of the average of the necessities of such roads as the Burlington, the North Western, the Union Pacific, the Great Northern, the Northern Pacific and the Santa Fe on the one hand, and the Frisco, the Rock Island, the Alton, the Washash, the Great Western and the Missouri Pacific on the other hand.

The commission has consistently declined to prescribe rates based alone upon the favorable conditions obtaining as to the short line and the strongest, richest carrier. It should, of course, decline to approve rates based only upon the conditions and needs obtaining upon the line of the carrier that is poorest and that has an unfortunately located line.

UNITED STATES HAS BEST RAILROAD SERVICE

I have traveled some upon the railroads of Europe. They have some roads which, for those countries and for the services demanded from them, are excellent, well-equipped transportation agencies, which perform an acceptable service. They would not, however, be able to meet the demands in our country. Taking into consideration circumstances and conditions I think that we have the best railroad service in the world. There are many improvements that might be made, and some that ought to be made, but in general it is good and efficient.

The latest figures available show that the charge for the transportation of freight is much lower per ton-mile in the United States than it is in other countries. Glancing over comparative figures for recent years we find that the ton-mile revenue in various countries is: United Kingdom of Great Britain, 2.39 cents; Germany, 1.37 cents; France, 1.3 cents; Austria, 1.45 cents; Norway, 1.6 cents; Belgium, 1.14 cents; Switzerland, 2.92 cents; New South Wales, 1.76 cents, and South Australia, 1.94 cents; while for the United States it was in 1913, 7.29 mills.

These figures, however, do not tell all the story. Referring to other figures we find that the railroads of the United States move 2,737 tons of freight one mile per capita per annum, while

in Germany, where the movement by rail is heavier than in other European countries, the railroads move only 582 tons one mile per capita per annum. I believe it has been recognized by successful business men that a large volume of business with a small profit on each transaction is more desirable than a small volume and larger profits on each deal.

The railroads of Europe are capitalized much more heavily than are those of the United States. They are much more completely equipped with signal and other safety devices than are our roads, and generally their roadbed and stations are more expensively constructed and with a view to more permanency.

In many of those countries the railroads are largely or wholly owned and operated by the governments. But on the whole, such ownership and operation has not proven entirely satisfactory, and it certainly has not afforded the people cheaper transportation than could have been furnished under private ownership, properly regulated.

We have 250,000 miles of railroad, serving a broad territory in much of which the commerce and traffic is heavy, and in all of which the commerce and traffic is growing rapidly. We hear much about inducements to build new roads. In my judgment, what is needed is not so much the building of new roads, but the development of those that are already built, so as to make of each an efficient agency, properly equipped with terminals and rolling stock, all maintained in such condition as to afford prompt, dependable and safe service.

If the public demands such roads it must be willing to pay reasonable prices for the services performed by them. If the railroads desire to have and to operate with profit such roads they must convince the public that they are, and are to be, operated along business lines and at rates that fairly compensate for the service performed and yield a fair profit upon the value of the property which is devoted to the public use.

Both the railroads and the public must contribute to the effort to bring about this nearly ideal condition. Each, while guarding its own rights and interests with appropriate jealousy and zeal, must recognize and respect the rights of the other. But even when that is done there will be honest differences of opinion which must be decided by a third party, whose decisions must be based in law and in right, and in whose integrity and fair-mindedness both have confidence.

PROPOSED CHANGES IN INTERSTATE COMMERCE LAW

And now a few words as to changes in the law and in its administration. I know that you are giving attention to these questions and I disclaim any desire or intent to influence your conclusions or actions. I express a few thoughts along those lines for what they are worth.

The Supreme Court of the United States has decided that the courts have no jurisdiction to review a negative order of the commission, and some think that this gives the carriers a right that is withheld from the shippers. Personally I see no reason why the law should not give the shippers the same right of appeal that it gives to the carrier. I do not think that such right would be of great benefit to the shippers. The Supreme Court has laid down the limits within which the courts can review the findings of the commission. The court may inquire whether or not the commission has proceeded lawfully, whether or not its findings are supported by competent evidence, and whether or not its order invades the constitutional rights of the carrier. If the proceeding has been conducted lawfully, and the findings are supported by evidence, and the order does not invade the carrier's constitutional rights, the court may not set aside the order or substitute its judgment for that of the commission.

Of course the shipper has just as much right to a lawful proceeding and a finding based upon competent evidence as has the carrier. The constitutional rights of the shipper are not at all the same as those of the carrier. The law does not attempt to regulate the shippers' selling prices.

As has been seen by the annual reports of the commission,

we think that there is a defect in the law in that the periods of limitation within which the carrier may demand the payment of uncollected undercharges are much longer than the period within which the shipper may bring action for recovery of an unreasonable charge. In a few instances this has caused real hardship.

Conditions that are probably different from those that were anticipated have sprung from the most recently enacted amendment to the act to regulate commerce. It has been strongly urged that the amendment was never intended to apply to shipments by express or to the transportation of baggage. We have been unable to discover any clear indication that it attempts to draw any distinction between carriers by rail and express companies. The Supreme Court had held that that portion of the law applied to the transportation of baggage. Congress knew of that decision and it made no provision in the amendment for excluding baggage from its terms. By the canons of statutory construction, therefore, the law must be held to apply to baggage. If Congress desires to exempt the transportation of baggage and shipments by express from the operation of this provision, it can, of course, effect that by further amendment.

The question of reparation for damage suffered from the exaction of an unreasonable rate or from an unjust discrimination has been and is one upon which decided differences of opinion are entertained and expressed. The Supreme Court has made it clear that in a discrimination case the damage suffered may be more or less than that measured by the exact extent of the unjust discrimination, and the true measure of the damage suffered must, therefore, be shown by competent proof. There are those who assert that the same rule should be applied in awarding reparation because of the exaction of an unreasonable rate. The commission has not accepted this view, but has held that the one who bears the unreasonable charge has been damaged to the extent that the charge exceeded that which it has been found would have been reasonable.

REORGANIZATION OF INTERSTATE COMMERCE COMMISSION

A good deal has been said and written about the necessity for a reorganization of the work of the commission, or the commission itself. No one realizes more fully than do the members of the commission the magnitude and the complexity of the duties placed upon the commission. The system under which our courts are organized and their several jurisdictions defined is often pointed to as a pattern for organizing the work of the commission. Inasmuch as in ordinary litigation before the courts the parties affected are generally all before the court, while in matters coming before the commission the whole public is interested and many who are not before the commission in the case may be affected by the conclusion reached, we may well doubt the wisdom and practicability of dividing the jurisdiction geographically, with the certainty that at times cases involving substantially the same facts and the same principle will be decided differently in different jurisdictions. The Supreme Court pointed out the impossibility of maintaining the underlying principles of the act if the courts in their several jurisdictions were to pass upon questions of an administrative or a quasi-legislative nature.

The commission has given much thought to this subject and to the various plans that have been suggested for simplifying and expediting the work of the commission and reached the conclusion that the largest measure of relief and the best results would be secured by enlarging the membership of the commission, and authorizing it to divide itself into groups or divisions, each division to have and exercise all the powers of the commission in the matters or cases referred to it. This would give us a mobile but still a centralized body, which could change its divisions and assignments to divisions when and as circumstances might require.

Personally, I feel that the valuation work is of such magnitude and importance and of such a technical nature that a commission or a division of the commission should give their undivided attention to the new and intricate problems which

will arise in numbers as that work progresses, and especially as the time for fixing upon a valuation approaches.

The commission can perform the many duties devolving upon it only by thorough organization of its several bureaus and calling to its aid the most competent assistants available. Some features of our administrative work, as for example, the safety appliance features, are so well organized and the principles of those laws are so well defined and established that they give the commission but a minimum of trouble and demand but little of the time of the commissioners. Where work or business expands with rapidity it is not always possible to extend an efficient organization as rapidly as might be wished.

The development of effective and beneficial regulation of the affairs of an industry of such magnitude and vital importance as that of transportation in this country is absorbingly interesting. It inspires one who is actively engaged in the work to bring to it his best thought and efforts. It brings to one a tremendous responsibility, plenty of hard work, and like all public service, more or less unjust criticism. Bearing responsibility does not wear heavily on the one whose heart in is his work and who has the courage of his convictions. Hard work does not hurt one, and unjust criticism, while unpleasant at times, will never affect the judgment or influence the actions of the man whose conscience tells him that he has done the right thing in the light as it is given to him to see.

But, be he never so able, the commanding general cannot win battles without assistants and soldiers, the manager of a successful industrial concern or railroad must have the loyal co-operation of his forces, the executive or administrative official who succeeds must have the cordial support of others who desire to see and participate in his success. And so, in order that those conditions which all right-minded men would be glad to see in the transportation business may be attained and firmly established, it is necessary that you and many others contribute each his part, no matter how small. As the light grows stronger and better days dawn for railroads and their patrons as a result of these efforts, everyone who has contributed to the better order of things by some helpful word or action will experience a sense of satisfaction over a good deed done.

HOURS OF SERVICE ACT INTERPRETED AS TO TELEPHONE COMMUNICATIONS

The United States Circuit Court of Appeals, Seventh circuit, in a case against the Chicago, Rock Island & Pacific, affirms a decision of the District Court for the Northern district of Illinois, Eastern division, penalizing the road for not observing the hours of service law in relation to a switchman in a shanty who regularly telephoned to a towerman, four miles away, informing him whether or not a certain passenger train was on time. The decision is summarized in the following five headnotes, all of which, except the fifth, follow well-known points which have figured in previous decisions:

1. The remedial purpose of the hours of service act (34 Stat., 1415), to protect human life and to promote railroad efficiency, demands that despite its penal character, its provisions shall be construed and the intent of Congress found from the language actually used, interpreted according to its fair and obvious meaning.

2. Congress may well have deemed it unsafe to permit employees whose duty it is, not primarily or principally, but ordinarily and habitually, to transmit orders pertaining to the movement of trains, and in doing so to exercise whatever measure of skill, care, alertness and attention the use of either telegraph or telephone requires, to work 16 hours, however simple or non-fatiguing their ordinary tasks may be.

3. The words in the proviso of section 2 of the hours of service act, "other employee who by the use," etc., transmits orders pertaining to the movement of trains are not to be qualified by an implied limitation to those whose primary and principal duty is thus described.

4. If the particular words "operators and train dispatchers" in the proviso of section 2 do not exhaust the class and thus make the rule of *ejusdem generis* inapplicable, the only all-embracing designation covering those concededly within the proviso is an employee who ordinarily and habitually uses the telephone or telegraph for the purposes stated.

5. Switch tenders stationed at a shanty, and whose principal duty is to attend to freight-yard switches, but who also regularly and habitually transmit information by telephone affecting train movements to levermen at an interlocking tower, located at a point where there is a crossing for trains of another railroad, come within the class for whose service limits are established by the proviso in section 2 of the act.

The decision is by Baker, Kohlsaet and Mack, circuit judges; opinion written by Judge Mack. Judge Mack says:

"By this writ of error it is sought to reverse a judgment rendered on a directed verdict and based on six several violations of the hours of service act (34 Stat., 1415).

"Section 2 of the act, after making it unlawful for a common carrier subject to the act to permit employees to remain on duty longer than 16 hours.

"The section of the law applicable to this case says that no operator . . . or other employee who by use of the . . . telephone transmits, receives or delivers orders pertaining to or affecting train movements shall be . . . permitted to be on duty for a longer period than nine hours . . . except in certain contingencies not now in question. Violation of the statute is conceded if the employees in question come within the class designated and if the telephone communications made by them are included within the word 'orders' as used in the statute. Four miles north of the switch tender the B. & O. crossed defendant's main line. At this crossing there was an interlocking plant. Defendant's passenger trains were frequently held up at the crossing if it was blocked to let a B. & O. freight train pass. To obviate these delays, it was part of the duty of the switch tender to telephone the towerman at the crossing that defendant's passenger train was coming."

Defendant contended that what the switch tenders did in relation to the towerman was to impart information, not to transmit orders. It concedes, says Judge Mack, that orders are not confined to technical written train orders; that any specific direction or instruction *which a subordinate is bound to obey* would be an order; but it urges that only such orders the violation of which might result in some accident fall within the purpose and therefore within the scope of the statute.

"Unquestionably the important *object of the statute was to conserve the safety of the traveling public and of railroad employees. Not merely safety, but general efficiency, promptness of service is thereby promoted.* Concededly greater regularity in the passenger service is secured if the defendant's trains are no longer held up at the crossing. Orders designed to accomplish even this result would, therefore, be within the purview of the act.

"But who can say that the violation of any order pertaining to or affecting train movements *might* not result in some accident? That other measures obviated the possibility of a collision at the crossing is immaterial, for surely regularity of service at that point might well prevent an accident at some other point. . . ."

A similar decision was handed down the same day in a case against the Chicago & North Western.

THE URURO-COCHABAMBA RAILWAY OF BOLIVIA.—Work is in progress on the construction of the railway from Oruro to Cochabamba, Bolivia. About 300 laborers are now employed. The rails will shortly be laid as far as Orcoma, a small village approximately 5 miles from Capiota. The distance between Oruro and Cochabamba is 125 miles and Capiota is about 36 miles from Cochabamba.

A DISTANT SIGNAL FOR AUTOMOBILISTS

The Southern Pacific has put in use at Tropico avenue, Tropico, Cal., what may be called a highway distant signal—a conspicuous warning for wayfarers, set about 100 ft. back from the railway.

This signal is of unusual design. Resting on an upright, which consists of a 3-in. iron pipe about 6 ft. high, is a cylindrical tube, 8 in. in diameter and 2 ft. 6 in. long. Its axis is horizontal, in line with the street, and it is painted both inside and outside a jet black. Fixed to the tube several inches from the upright post, as shown in the illustration, is a large circular disk, the front of which is painted red and the back side black. The rear end of the tube is closed, and on the inside, about 18 in. from the open end, is a red glass lens, which fits snugly within the tube. Behind this lens is a powerful incandescent lamp, backed by a brilliant reflector. The wires for the lamp run down through the hollow post and underground to the regular crossing signal, which is a "wig-wag," and also is electrically operated.

The wig-wag and the tube, or distant signal, are both used

Distant Signal for Automobilists

in daylight as well as at night. With the red lens set so far back in the 8-in. tube the signal can be seen almost as plainly during the daytime as it is in the night. In addition to this, during the daylight hours the large red disk serves to emphasize to the motorist his proximity to the railroad crossing.

There are two of these signals at Tropico avenue crossing, one on either side of the tracks. This double system has been installed only at crossings which are especially dangerous on account of their "blind" approaches or other reason, but it seems to have found much favor already, and the company proposes to install others.

SIR WILLIAM C. VAN HORNE

William Cornelius Van Horne, one of the chief citizens and notable philanthropists of Canada, and active head of the Canadian Pacific Railway during 15 years of the most important period of its development, died at the Royal Victoria Hospital in Montreal, on September 11, at the age of 72. He had been sick but two weeks, though he had been in failing health for several years. Since he relinquished the active management of the Canadian Pacific to Sir Thomas G. Shaughnessy, Sir William has devoted himself to numerous other interests, and, in particular, to the Cuba Company and the Cuba Railroad, of which he was president; but to the readers of the *Railway Age Gazette* he will be remembered chiefly as the general manager, vice-president and president of the Canadian Pacific Railway, one of the first of that notable line of brilliant railway officers who, educated in the United States

in the school of experience, were called to official positions on Canadian railroads and rose to be leaders by the sheer force of their individual characters. The railroads of the United States, in the 25 years following the Civil War, constituted the great railroad university of the world, and the owners of the railways of Canada, having very definite needs, were in a position to survey the field impartially and make intelligent selection of the best men, and their judgment in this and other instances was fully vindicated by the results.

The subject of this sketch was born in Will County, Ill., February 3, 1843. His father, a lawyer in Joliet, died when the son was only 13 years old, and at the age of 14 he entered the service of the Illinois Central, at Chicago, as a telegraph operator. He soon went to the Michigan Central and during six years, 1858-1864, held different positions on the Joliet division of that road. From 1864 to 1872 he was on the Chicago & Alton as ticket agent, telegraph operator, train despatcher, superintendent of telegraph, and finally, for three years, division superintendent. In July, 1872, he went to the St. Louis, Kansas City & North-

ern, now a part of the Wabash, where he was general superintendent for two years. Then for four years he was general manager of the Southern Minnesota, now a part of the Chicago, Milwaukee & St. Paul, and for a time was president of this company. In October, 1878, he went back to the Chicago & Alton, where he was general superintendent, until the end of 1879, when he went to the Chicago, Milwaukee & St. Paul. Here he was general superintendent for two years, when he resigned to go to the Canadian Pacific. For the first four years he was general manager, then from 1884 general manager and vice-president. He was made president in 1888, and chairman of the board on June 12, 1899. This position he held until May, 1910.

It will be seen that he went to the Canadian Pacific about four years before the line of that company was completed to the Pacific Coast, and his name stands among the few leaders in the

affairs of the company who are accorded the credit for carrying through that great enterprise. He was knighted by Queen Victoria in the last years of her reign.

Sir William was director in a number of the subsidiary railroad companies owned or controlled by the Canadian Pacific and in numerous other enterprises; the Canadian North West Land Company, the Dominion Iron & Steel Company, the Equitable Life Assurance Society of New York and numerous eleemosynary associations. He took a great interest in art, and in many forms, and was a vice-president of the Montreal Art Association. His house in that city was filled with objects of art collected from all parts of the world; Greek statuary, Oriental pottery, paintings by Spanish and Flemish masters, Chinese porcelain and innumerable other things. He had made with his own hands finely illustrated catalogues of pottery and other things in his collection and had no little ability as an artist.

As an officer of the Canadian Pacific, Sir William was popular. He had a rough and ready way with him and was often called a hard driver; and if things did not suit him could make quite a fuss. But he had a regard for men who did their duty, and he treated them with justice. Extremely hospitable, he never let an officer of the road come to headquarters without paying him some attention, and no matter how crude the man he was pretty sure to invite him to dine at his house. There was little formality about him, either in his office or at his home. He preferred the company of men who worked—artists, artisans, scientists, authors and musicians—to that of men whose interest was solely to make money in business.

Sir William was full of burning energy, which left him few idle moments. He enjoyed perfect health until two years ago; could do with very little sleep, and often stayed up nearly all night; ate prodigiously and was impervious to the cold. He was a mine of information on many topics. In conversation he was most entertaining, though as a public speaker he failed lamentably. With children he was in his element, liking nothing

better than to have a frolic with them.

Soon after going to the Canadian Pacific Van Horne invited to follow him Thomas G. Shaughnessy, who had been one of his associates on the St. Paul, and Shaughnessy was soon made general purchasing agent of the Canadian Pacific. He was steadily promoted and in 1899 succeeded Sir William as president. Sir Thomas, speaking of the death of his friend, says:

"From the time that I came to Montreal (1882) till the date of his death, Sir William and I have been intimate business and personal associates, and although in recent years his interests have been in one direction and mine in another, there is, I feel sure, no person, apart from the members of his own immediate family, who is more grieved by his death than I am. Probably I knew him more intimately than any one else. His was a great mind, a great heart and a lofty soul."

Sir William C. Van Horne

The Railways and the California Expositions

Second Article, Describing Exhibits of Railways and Railway Supply Companies at Panama-Pacific Exposition

Most of the railway and railway-supply exhibits at the Panama-Pacific Exposition in San Francisco are housed in the Palace of Transportation, one of the main group of the exposition buildings. This building and many of the exhibits in it were described in an article by William S. Wollner in the *Railway Age Gazette* of February 26, page 373. The structure covers seven acres and cost \$500,000. Unlike the transportation collections at previous expositions it has been the purpose to make this one contemporaneous rather than historical, no display being eligible for award unless it represents a product of the last 10 years, or a product that has not been improved upon within that period. The exhibits in the Transportation Building are under the direction of Blythe H. Henderson, chief of the department of transportation.

Special concessions were offered by the railways in the rates for the transportation of exhibits, by which all articles on which full rates were paid to the exposition may be shipped back without charge, provided the ownership has not been changed.

The building, in addition to railway and supply exhibits, which occupy a little over one-fourth of its space, is also devoted to the

ply companies show the improvement that has taken place in the various appliances for making transportation safer and more efficient.

RAILWAY EXHIBITS

The Southern Pacific, in addition to the exhibits mentioned in Mr. Wollner's article, also shows in its space in the Transportation Building an interesting collection of photographs and charts illustrating its shop-welfare and safety-first work, and giving statistics showing the great improvement in its safety record. In connection with this a small working model is shown demonstrating in a non-technical way the method of operation of the automatic electric block signal apparatus. There is also an exhibit of articles manufactured in the company's shops; a 60-foot steel coach, the first all-steel passenger coach built in the United States, designed and built by the Southern Pacific in 1905, since which time the construction of wooden passenger equipment has been discontinued by this company; a 58-ft.-all-steel electric motor coach, built by the Pullman Company; a 45-ft.-all-steel street car, with center side entrance, the body built

The Palace of Transportation

exposition of the latest developments in the field of automobiles, steamships and aviation, thus covering transportation by land, water and air. The foreign countries represented include Great Britain, Holland, Japan and China. Of the individual exhibits illustrating American railway progress those of the Westinghouse and General Electric companies occupy the greatest amount of floor space, with elaborate displays of electrical appliances as applied to transportation, including electric locomotives. The exhibit of the Southern Pacific shows the latest developments in car and locomotive construction, including freight and passenger cars and electric motor cars, the latest type of all-steel postal car, and the huge modern locomotives contrasted with the locomotive first used on the Central Pacific. The Pennsylvania exhibit shows the complexity and many-sided development of the work of a great railway system in all its phases. The exhibit of the western lines formerly comprised in the Gould system illustrates some of the scenic attractions and agricultural possibilities of the West, while the various exhibits of the railway sup-

ply companies. An important contribution to the illumination features of the exposition is an Atlantic type Southern Pacific passenger locomotive, which stands at the Yacht Harbor opposite the Agricultural Building, and at night furnishes steam and smoke which are utilized in conjunction with the exposition's battery of powerful searchlights for the production of striking lighting effects. The Southern Pacific was awarded a grand prize for its exhibits.

The large and interesting educational exhibit of the traffic department of the Pennsylvania system, which was awarded a grand prize, was described in the article of February 26. All of the attendants at this exhibit have been temporarily detached from railroad service. The exhibit is located in the center of the Transportation Building and has proved very attractive to visitors. The attendance at the moving-picture lectures, depicting journeys over the lines of the system, up to August 17, was over 74,000, and it was estimated that during the first five months of the exposition over 2,000,000 people visited the exhibit. Over

70,000 booklets describing the exhibit and the system have been distributed. Among the several models of terminals is one of the proposed new Union Station at Chicago.

The "Globe" exhibit of the Missouri Pacific, St. Louis, Iron Mountain & Southern, Denver & Rio Grande and Western Pacific, shown in one of the accompanying illustrations, was described in the *Railway Age Gazette* of May 28, page 1,133. This exhibit was awarded a gold medal and has been visited by about 3,000 people a day.

The Republic of China has an interesting display of models illustrating the types of equipment and structures used on the government railways, including a typical station, block signals, wooden bridge, passenger train, reserved car, goods car, coal truck, part of Yellow river bridge and the train staff system. This exhibit also includes photographs of views on the lines, charts showing the organization and statistics of the railways, and samples of the uniforms worn by officers and employees.

The Imperial Railways of Japan show a collection of maps and photographs of the government railways and charts of statistics.

The Wells-Fargo Company has an exhibit consisting of an express office at which travelers' checks were cashed, a lecture room in which motion pictures were shown illustrating the methods of handling the express business, a model of a Wells-Fargo Express refrigerator car, one of the steel trunks used for carrying packages, a clock that was installed in the company's offices in San Francisco in 1867, photographs, old money orders, etc., illustrating the history of the company, an old Concord stage-coach built for the company in New Hampshire in 1863, which was trans-

topographical map of the park, occupying 50,000 sq. ft., and this is surrounded by reproductions of some of the principal features of the park, built up of burlap and concrete. A Yellowstone trail 1,500 ft. long winds tunnel-like through the mountains disclosing an occasional vista of the Yellowstone landscape and opposite the inn a cataract falls 85 ft., discharging 1,000 gallons of water a minute. Inside of one of the mountains is a large lecture room in which are shown moving pictures of Yellowstone Park scenes. At the close of each lecture the screen is rolled to one side disclosing a reproduction of the upper geyser basin with a number of small geysers spouting steam and every 65 minutes there is a remarkably realistic imitation of the Old Faithful geyser in eruption. An admission fee of 25 cents is charged. Up to the end of July the attendance had reached 125,000.

RAILWAY SUPPLY EXHIBITS

A large proportion of the railway supply exhibits are shown in the Machinery Building, and some in the Palace of Mines.

The official list of awards has not yet been given out by the exposition officers. Although most of them were determined upon several weeks ago there have been some protests to be acted upon, and while most of the exhibitors have been notified of their awards, all of them have not, and it has been impossible to obtain an accurate list or to show what the awards covered. The awards mentioned in connection with the following list of exhibits are therefore not to be taken as a complete list of awards.

While this is the most complete list of the railway supply

Model of New Chicago Union Station in Pennsylvania Exhibit

A Contrast in Locomotives in the Southern Pacific Exhibit

ported to California around Cape Horn, and boxes of fruits, nuts, etc., packed ready for shipment by express.

The separate buildings of the Southern Pacific, Great Northern, Canadian Pacific and the Grand Trunk were described in the issue of September 10.

Two railways, the Atchison, Topeka & Santa Fe and the Union Pacific, are represented on the "Zone" where the amusement concessions are located.

The Santa Fe has a seven-acre reproduction of the Grand Canyon, which took three years to build and cost approximately \$250,000. Visitors enter a special observation car which makes stops at seven points, at which are seen reproductions of the view from some of the special points of interest in the canyon from different parts of the rim. An admission fee of 25 cents is charged. The Santa Fe also has a reproduction of a Pueblo Indian village, to which an admission fee of 10 cents is charged.

The Union Pacific space is devoted to a reproduction of scenes in Yellowstone National Park, occupying four acres. The principal feature is a full-size replica of Old Faithful Inn, covering a ground area of 47,000 sq. ft., in which is a dining-room and auditorium, seating over 2,000 persons. Here the exposition orchestra of 80 pieces gives daily concerts and here several banquets have been held by large organizations visiting the exposition. The central space of the enclosure is occupied by a relief

exhibits at the exposition that has been published, it may not include some companies that are to some extent engaged in the railway supply field, but whose displays were shown in connection with other departments of the exposition.

EXHIBITS

The exhibits of railway supply companies in the Palace of Transportation are as follows:

Ajax Metal Company, Philadelphia, Pa.—Ajax plastic bronze engine castings on Chicago, Burlington & Quincy locomotives exhibited by Baldwin Locomotive Works. Bronze medal.

American Arch Company, New York, N. Y.—Security sectional arch installed in Atchison, Topeka & Santa Fe locomotives exhibited by Baldwin Locomotive Works. Gold medal.

American Brake Shoe & Foundry Company, New York, N. Y.—Brake shoes and parts and shop photographs showing process of manufacture. Gold medal.

American Locomotive Company, Schenectady, N. Y.—This company's exhibit, which was described in the issue of February 20, page 373, was awarded a medal of honor.

Automatic Folding Fender & Cattle Guard Company.—Cattle guard.

Automatic Transportation Co., Buffalo, N. Y.—Electric tractor trucks and trailers. Gold medal.

Baldwin Locomotive Works, Philadelphia Pa.—This company's exhibit, which was described in the issue of February 26, was awarded a grand prize.

J. G. Brill Company, Philadelphia, Pa.—No. 77 E-trucks shown in exhibit of General Electric Company.

Cambria Steel Company, Philadelphia, Pa.—Rails and special track work, structural steel and axles, special axles twisted cold, agricultural steel, wire products, fencing, automobile steel parts, shop photographs and the original Kelly steel converter used in the Cambria Iron Works in 1861 and 1862. Medal of honor.

Chambers Valve Company, New York, N. Y. Chambers throttle valve in equipment of locomotives exhibited by Baldwin Locomotive Works.

Edison Storage Battery Company, Orange, N. J.—Storage batteries, models of signal apparatus showing the application of Edison primary batteries and automatic crossing signals.

Fairmont Gas Engine & Railway Motor Car Company, Fairmont, Minn.—Fairmont motor car with photographs and blue prints.

Flannery Bolt Company, Pittsburgh, Pa.—Tate flexible staybolts. Gold medal.

Franklin Railway Supply Company, New York.—Franklin fire door shown in the exhibit of the Chinese government railways,

The Globe Exhibit of the Gould Lines

McLaughlin flexible conduits, and Franklin automatic driving box lubricator and Franklin water joint included in equipment of locomotives exhibited by Southern Pacific, Baldwin Locomotive Works and McCloud River Railroad. Silver medal.

Galena-Signal Oil Company, Franklin, Pa.—Various kinds of lubricating and illuminating oils. Gold medal.

General Brake Shoe Supply Company, Chicago. One-piece steel back brake shoes.

General Electric Company, Schenectady, N. Y.—Five types of electric locomotives, including 1280 h.p., 80-ton electric locomotives designed and built by General Electric Company, to replace steam locomotives on Butte, Anaconda & Pacific, designed for operation at 2,400 volts; 780 h.p. electric locomotive for inter-urban freight and passenger service and heavy switching, designed for operation at both 600 and 1200 volts, direct current; electric mining locomotive for 42-in. gage, 20 tons; electric mining locomotive with three 85 h.p. motors and electric industrial locomotive for yard switching. Railway motors and other apparatus for electric railways. Signal accessory electric devices, electric apparatus and equipment for railway shops, electric illumination for cars, shops, etc. All essential parts of electric traction are demonstrated in operation. Storage battery truck cranes for loading, unloading and carrying articles weighing up to one ton. Storage battery platform trucks designed to run inside of freight cars. Several hundred stereomotorgraph illustrations from photographs of important applications of railway equipment in city, suburban and heavy electrification service, and typical installations of new apparatus.

Griffin Wheel Company.—Griffin F. C. S. wheels for steam and electric railways. Gold medal.

Hewitt Rubber Company, Buffalo, N. Y.—Hewitt seat packing, stitched belting, aisle strip matting and plain belting, armored pneumatic tool hose, M. C. B. standard air brake hose, standard fire hose, water hose, suction hose, corrugated tank hose, boiler washing hose and standard steam hose.

Hupp Automatic Mail Exchange Company, Washington, D. C.

Full size mail exchange system in operation delivering and collecting pouches of mail. Gold medal.

Locomotive Stoker Company, New York, N. Y.—Type "C" Street stoker installed on Chicago, Burlington & Quincy freight locomotive exhibited by Baldwin Locomotive Works. Gold medal.

Manganese Steel Rail Company, New York, N. Y.—Various sections of manganese steel rails bent under drop test. Gold medal.

McCord & Co., Chicago, Ill.—McCord journal boxes in equipment of cars exhibited by other companies.

W. H. Miner Company, Chicago.—Draft gears and draft bearings on locomotives and cars exhibited by other companies. Silver medal.

National Brake & Electric Company, Milwaukee, Wis.—Complete installations of brake apparatus on vehicles on exhibition in Palace of Transportation. Complete line of air compressors, portable air compressor, governor reservoir mounted on trucks, 100 cu. ft. alternating current motor-driven compressor in operation supplying air for various purposes throughout the exhibit, complete line of motorman's operating valves, compressor governors, and other detail parts of brake equipment.

National Malleable Castings Company, Cleveland, Ohio. M. C. B. couplers and journal boxes for freight cars, passenger cars and locomotives; half and three quarter size couplers for industrial equipment, brake equipment castings, coupler pockets, draft gear yokes, rail braces, rail anchors and tie plates, castings of malleable iron, open hearth steel and electric steel. Medal of honor.

New York Air Brake Company, New York, N. Y.—Electropneumatic air brakes for passenger service. Complete equipment for 12-car passenger train with locomotive and tender. Grand prize.

Ohio Injector Company, Chicago, Ill.—Ohio injector, lubricator, flange oiler, cab squirt, combination boiler check and stop valves, intermediate lift check valves on Pacific type locomotive exhibited by the Baldwin Locomotive Works. Similar equipment

Union Pacific Exhibit at Panama-Pacific International Exposition

and hose strainer and Globe valves for oil burners. Chicago Class A lubricator on Mikado type.

Ohio Locomotive Crane Company, Bucyrus, Ohio.—Ohio locomotive crane used to unload and place heavy exhibits and for work in construction of exposition buildings. Bronze medal.

Parkesburg Iron Company, Parkesburg, Pa. Charcoal iron boiler tubes on Mikado locomotive exhibited by Baldwin Locomotive Works. Bronze medal.

Pennsylvania Steel Company and Maryland Steel Company, Philadelphia, Pa.—Mayari nickel chrome steel from Cuban ore, 1 1/8 in. frog bolts turned down to 1/8 in. in diameter at a tension of 2,345 lb. Bonzano rail joints, Pennsylvania 125 lb. section, rail sections; sketch of Memphis bridge over Mississippi river, of which over one-half is of Mayari steel, the first use of nickel chrome steel for bridge construction. Samples of tested steel showing physical properties, switch stand track tools of Mayari steel, frogs and shop photographs. Medal of honor.

Pressed Steel Truck Company, Pittsburgh, Pa.—Atlas pressed steel hand trucks.

Pullman Company, Chicago. This company built the all-steel postal car exhibited by the Southern Pacific, which is the first

car built under the latest revised specifications of the postoffice department.

Rail Joint Company, New York, N. Y.—Continuous, Weber, Wolhaupter, one hundred per cent. continuous insulated, Weber insulated, continuous girder and Weber girder rail joints.

Sargent Company, Chicago. Iron clad safety water gate used on Baldwin Mikado type locomotives exhibited by McCloud River Railroad. Honorable mention.

St. Louis Car Company.—Various types of electric railway street cars. Gold medal.

Standard Steel Works Company, Philadelphia, Pa. Steel tires, wheels, castings, springs and flanges used in locomotives and cars exhibited by other companies. Gold medal.

Taylor Portable Steel Derrick Company, Chicago, Ill.—Taylor portable steel derricks in operation on gondola car and photographs showing various uses.

Union Switch & Signal Company, Swissvale, Pa.—This company has two exhibits in the Transportation building, one consisting of eight "T-2" top-post, four fixed-arm and two position-light signals, illustrating the operation of the absolute block, permissive block, automatic block, distance switch and automatic position light signals, operated by alternating current. The other includes styles B and S signals, the former being a two-position lower quadrant signal and the latter a three-position upper quadrant signal, both operated by Edison primary batteries. Gold medal.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.—A 4,000 hp. articulated Westinghouse electric locomotive, as used in Pennsylvania tunnels under the Hudson river, mounted on 65 ft. steel deck turntable rotated by electric motor, and making complete revolution each minute. Photographs of electric lines, trolley line material, insulating cloth and paper, voltmeters, outdoor sub-stations, railway motors and control equipment and lightning arresters.

William Wharton, Jr., & Co., Inc., Philadelphia.—Tioga Iron & Steel Company, Philadelphia, and Taylor-Wharton Iron & Steel Co., High Bridge, N. J. Manganese steel pointed split switch. O'Brien insulated switch rods, built-up frogs, solid manganese steel 100 min. radius tongue switch and mate and 30 deg. frogs. Manganese steel center 150 minute radius tongue switch and mate and 11 deg. frogs. Manganese steel frogs. Standard manganese steel center frogs. Solid manganese steel, steam over electric crossing frogs. Gold medal.

The exhibits of the German-American Car Company, the McCloud River Railroad and the California Despatch Lines, described in the article of February 26, were awarded silver medals.

The following exhibits are located in the Machinery Building:

American Rolling Mill Company, Middletown, Ohio.—Armco Iron Culvert Manufacturers' Association. Iron culverts.

E. C. Atkins & Co., Inc., Indianapolis, Ind.—Saws, saw tools, machine knives, handles, specialties, etc.

Automatic Transportation Co., Buffalo, N. Y.—Freight, baggage and industrial trucks. Gold medal.

Barrett Manufacturing Company, New York, N. Y.—Barrett specification roofs.

Brown Portable Elevator Company, Chicago, Ill.—Portable and sectional conveyors, pilers and unloaders.

Carborundum Company, Niagara Falls, N. Y. Carborundum abrasives; materials cut, ground or finished with carborundum products. Large grinding wheel of carborundum 78 in. in diameter, 8 in. thick, weighing 2,500 lb.

Ceresit Waterproofing Company, Chicago, Ill.—Concrete waterproofing with Ceresit waterproofing compound.

Edison Storage Battery Company, Orange, N. J.—Storage batteries.

Gold Car Heating & Lighting Company, New York, N. Y.—Steam, vapor and electric heating system, thermostat control, cyclone and window ventilators.

Golden-Anderson Valve Specialty Company, Pittsburgh, Pa.—Golden-Anderson valves and steel water towers.

Hauck Manufacturing Company, Brooklyn, N. Y.—Oil burning appliances.

Joyce-Cridland Company, Dayton, Ohio.—Lifting jacks for railway and industrial service. Track jacks.

Locomotive Superheater Company, New York, N. Y.—Schmidt superheaters for locomotive and marine service.

Lunkenheimer Company, New York, N. Y.—Valves.

Maelcod Company, Cincinnati, Ohio.—Carbide lights, portable oil burners, rivets, forges, tire heaters, oxy-acetylene apparatus and paint sprayers. Honorable mention and silver medal.

Morton Manufacturing Company, Muskegon Heights, Mich.—Morton draw-cut shapers.

Muggley Wheel Corporation, New York, N. Y. Muggley differential car wheel.

Pennsylvania Metallic Tubing Company, Philadelphia, Pa.—Flexible tubing.

Pyrene Manufacturing Company, New York, N. Y.—Fire extinguishers.

Safety Car Heating & Lighting Company, New York, N. Y.—Pitsch gas and electric axle lighting systems.

St. Louis Steel Foundry Company, St. Louis, Mo.—Girder frog, mate and switch, steam over electric railway crossing. Exhibited by Parrott & Co., agents, San Francisco. Two bronze medals.

Standard Underground Cable Company, Pittsburgh, Pa.—Power cables, insulating cables and copper clad wire.

Warner & Swasey Company, Cleveland, Ohio.—Machine tools.

Waterloo Cement Machinery Company, Waterloo, Iowa.—Little Wonder concrete mixers.

Westinghouse Air Brake Company, Pittsburgh, Pa.—Air brakes and air compressors.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.—Parsons steam turbine, condensers, motors and other electrical apparatus.

UNITED STATES STEEL CORPORATION

The exhibit made by the United States Steel Corporation and its subsidiary companies is one of the largest in the entire exposition, as well as one of the most complete industrial exhibits ever made. This company's display occupies more than one-fourth of the entire exhibit space in the Palace of Mines. Twenty-six subsidiary companies are represented, 11 manufacturing, 5 mining and coke producing, 9 transportation and 1 selling corporation.

In addition the Bureau of Safety, Sanitation and Welfare presents an exhibit for all of the subsidiary companies. Every process in the manufacture of steel from the mine to the finished product is demonstrated either by photographs, models or the actual product, and in addition a series of motion pictures accompanied by a lecture gives "The Story of Steel from the Mine to the Finished Product." The exhibits of the mining, dock and steamship companies include relief maps, models and photographs illustrating the taking of ore from the mines and its transportation to the blast furnaces. Some of the exhibits by the subsidiary companies include the following:

American Bridge Company, New York, N. Y.—General view photographs and bottom chord sections of arch of the Hell Gate bridge. Photographs of the Panama Canal showing materials supplied. I-bars as used in new Quebec bridge. Locomotive turntable.

American Sheet & Tin Plate Company, Pittsburgh, Pa.—Models, specimens, photographs and lantern slides showing the sheet steel used for building construction, farm structures, railroad cars, etc.

American Steel & Wire Co., New York, N. Y.—Wires and cables as used for agricultural purposes, electric railways, signaling, aerial tramways, telegraph and telephone, reinforcing for concrete, also barbed wire, nails, spikes, staples and tacks, wire rope, electrical wires and cables, horse shoes, rail ties, round, square and odd-shaped wires and shafting for manufacturing purposes, flat wire and springs, music wire, wire hoops and sulphate of iron.

Carnegie Steel Company, Pittsburgh, Pa.; Illinois Steel Company, Chicago, Ill., and Tennessee Coal, Iron & Railroad Company, New York, N. Y.—Models of coke ovens in operation. Models of blast furnace operation. Steel making and rolling mill operation. Testing laboratory and finished steel exhibit.

Lorain Steel Company, Lorain, Ohio.—Special track work exhibit, consisting of various types and models of rails in tracks designed for use by electric street and interurban railways, track layouts and electric welding.

National Tube Company, Pittsburgh, Pa.—Samples illustrating each phase of the welded tubular industry, including Shelby Seamless steel products and Kewanee products.

Universal Portland Cement Company, Chicago, Ill.—Cement products and photographs, models, etc., illustrating the manufacture and various uses of cement and concrete. Transportation line photographs showing bridges, railroad yards, shops, tracks and trains.

United States Steel Products Company, New York, N. Y.—Models of steamships owned and operated by the company, map of location of branch offices and agencies in routes covered by steamship lines and sales booths.

The exhibit of the United States Steel Corporation was awarded a gold medal. The awards for the exhibits of the various subsidiary companies were described in the *Railway Age Gazette* of September 10, page 487.

RAILROAD AID TO GALVESTON

That railways often do notable public service outside their usual functions as carriers of persons and property, and that in many communities the public spirit of railway officers is one of the people's valuable assets, is well known to those who take an interest in matters of this kind. This was strikingly illustrated on the occasion of the recent Galveston storm and flood, officers of the Southern Pacific (Sunset Route) and the Santa Fe restoring the water supply of the city when its 40,000 people were dependent for fresh water almost entirely on supplies brought from the mainland by boats. Noticing in Texas papers commendatory references to the railroads' activities we inquired of an officer of one of the roads concerned as to what had been done, and from his reply take the following narrative:

The city is supplied with water from Altaloma, on the mainland, about 18 miles distant, through a cast-iron main 30 in. in diameter. Previous to the construction of the causeway across the bay, three years ago, the water pipe lay on the bottom of the bay about 600 ft. from the causeway. When the causeway was built a new 30-in. line was laid in the roadway, with gate valves at each end.

The storm of August 16 and 17 caused bad breaks both at the north and the south ends of the bridge. (The bridge proper is 2,437 ft. long, with earth approaches at the north end 2,647 ft. long, and at the south end 3,558 ft. long. The earth roadway was washed out in a number of places, so that the pipe had dropped and was covered with some two feet to seven feet of water.

The city government had such a multiplicity of perplexing problems on its hands that the water system was not attended to very promptly, but when finally the valves were set to turn water into the pipe on the bottom of the bay, it was found that this also was broken.

The railroad men met in Galveston on Friday evening, the 20th, F. G. Pettibone, vice-president and general manager, representing the Gulf, Colorado & Santa Fe., and I. A. Cottingham, assistant general manager, in charge of engineering, representing the Galveston, Harrisburg & San Antonio. There was also present John Sealy, a prominent banker of Galveston and president of the Galveston Wharf Company. It was at once seen that the restoration of the 30-in. pipe was a task of much magnitude, and Mr. Cottingham suggested that an 8-in. pipe be laid across the causeway. This was believed to be practicable, because although the earth roadway was badly washed the sheet piling was nearly or quite intact throughout.

While Mr. Cottingham was at the causeway about noon on the 21st a committee of citizens came out in a boat and handed to him a letter, addressed to Mr. Pettibone and himself, giving them full power in the matter of securing a supply of water and authorizing the necessary expenditures.

Measures were at once taken to secure a supply of 8-in. pipe. In the meantime it was made certain that the line across the bottom of the bay could not be used, about 800 ft. of it having been carried away.

Officers of the Southern Pacific at Houston, summoning the shop and other forces of the company at that city, had two miles of iron pipe loaded on the cars in that city on that day (Saturday) and by daylight the next morning (Sunday) had this pipe in Texas City. This was the nearest point that could be reached by rail, and from here the pipe had to be taken the eight miles to the bridge by a barge. The work of loading the barge could not be done rapidly, and the tug which towed it broke down in the middle of the bay, but the pipe finally reached the causeway Sunday night. Here there was further ill luck, the barge running aground; but the pipe was finally delivered Monday morning, and by that time large forces of bridge men and other workers with tools had been brought to the ground by the Southern Pacific and the Santa Fe.

The men began distributing the pipe at daylight Monday morning, and by 9 o'clock were putting some of it in place. The workmen were divided, and gangs of pipe layers were put at work at five places. As the gangs met the sections of 8-in. pipe

were connected by means of sleeves made of pieces of 10-in. pipe, sealed with lead joints.

The length of pipe laid at the north end was 3,700 ft., and at the south end 1,700 ft. On the bridge proper the 30-in. pipe was all right, and the 8-in. line was connected with this at the ends by plugging up the ends of the large pipe and tapping the smaller pipe in the center of the plug. The plugs were made in the Houston shops of the Southern Pacific, out of boiler plates. These plugs were finished late on Sunday night and sent to Texas City by a special train. The line was nearly completed, ready for the water to be turned in on Tuesday at 10:30 a.m., but just then there came up a heavy rain, with strong wind, which necessitated suspending the work for over two hours. Several hours more were used up because of some difficulty on the part of the forces of the city in managing the valves at the south end, but water was finally turned on about 7 p.m. Tuesday.

The 8-in. pipe was, of course, too small to meet all of the needs of the city, but it supplied more than 2,000,000 gal. a day and furnished water in the lower stories of buildings throughout the city; this enabled the electric light and the street car companies, as well as many other industries, to resume operations.

TRAIN ACCIDENTS IN AUGUST¹

The following is a list of the most notable train accidents that occurred on railways of the United States in August, 1915:

COLLISIONS						
Date	Road	Place	Kind of Accident	Kind of Train	Killed	Inj'd
4.	N. Y., N. H. & H.	Atlantic	rc	P. & P.	0	13
*4.	Atchison, T. & S. F.	Richfield	bc	P. & F.	3	6
5.	Balt. & Ohio	Wash'n. C. H.	xc	P. & F.	0	9
†12.	B. & O. S. W.	Orient	rc	F. & P.	7	16
13.	Boston & M.	Fitchburg	rc	F. & P.	0	0
27.	Int. & G. N.	Mart, Tex.	bc	P. & F.	1	14
28.	Norfolk & W.	Gary, W. Va.	bc	P. & F.	1	22
30.	Boston & M.	Revere	xc	P. & F.	0	1

DERAILMENTS						
Date	Road	Place	Cause of Derailment	Kind of Train	Killed	Inj'd
2.	Denver & R. G.	Moark, Utah	Malice	P.	0	15
3.	Pennsylvania	Church Hill	Slide	P.	2	5
4.	Ches. & Ohio	Pottomoi	Malice	P.	0	0

†27.	Atchison, T. & S. F.	Date Creek	Flood	P.	4	17
30.	Mobile & Ohio	Tibbee	F.	P.	1	0
30.	Chicago & Alton	Rush Hill	Unx.	P.	0	21

The trains in collision at Atlantic, Mass., on the 4th were a northbound local passenger train and a northbound suburban express, the express running into the side of the rear car of the local. The local was moving at low speed through a cross-over and the express was running about 35 miles an hour. The rear car of the local, a baggage car, was overturned and the next car, a combination baggage and passenger, was considerably damaged, but there were no persons in the rear car, and but a few in the next one, and the total number of injuries is reported as 13, all slight. The engineman of the express appears to have disregarded a stop signal.

The collision near Richfield, Cal., on the 4th was caused by a runaway freight car, which had escaped control on the Olinda branch and had run, at high speed, to the main line, at Richfield. Moving eastward at very high speed, it crashed into the head of westbound passenger train No. 51, consisting of a locomotive and three cars. The freight car contained oil, which immediately took fire, and the wreck was mostly burned up. An express messenger was killed, the engineman and the fireman were fatally injured, but the passengers escaped with minor injuries.

In the collision at Washington Court House, Ohio, on the 5th, westbound passenger train No. 105 of the Baltimore & Ohio

¹Abbreviations and marks used in Accident List.
 rc, Rear collision—bc, Butting collision—xc, Other collisions—b, Broken—d, Defective—unf, Unforeseen obstruction—unx, Unexplained—derail, Open derailing switch—ms, Misplaced switch—acc, obst., Accidental obstruction—malice, Malicious obstruction of track, etc.—boiler, Explosion of locomotive on road—fire, Cars burned while running—P. or Pass., Passenger train—F. or Ft., Freight train (including empty engines, work trains, etc.)—* asterisk, Wreck wholly or partly destroyed by fire—Dagger, One or more passengers killed.

Southwestern, was struck by a Cincinnati, Hamilton & Dayton freight train at the crossing of the two railroads, turning a Pullman car of the passenger train down the embankment and damaging the engine of the freight train. Seven passengers, the Pullman conductor and the engineman of the freight train were slightly injured. The collision was due to an error in judgment on the part of the freight engineman, who miscalculated the distance and the weight and speed of his train.

The trains in collision at Orient, Ohio, on the morning of the 12th, about 3 o'clock, were a southbound excursion train and a through freight train following it. The excursion had been stopped to take water and the freight train ran into the rear end of it. Seven passengers were killed and 16 injured. The collision was due to excessive speed on the part of the freight train, which had been warned that the passenger was ahead of it. It appears that the passenger train had been delayed by washouts and had consumed an hour and twenty minutes in covering a distance of 13 miles. The flagman had flagged the freight three times and, having notified the engineman of the freight that the passenger would stop at Orient for water and to let off passengers, had not thrown off fuses approaching that point; and he had not gone far, if at all, with red signals after stopping. The freight approached on a descending grade. It was running under rule 108, which allows a freight train, following a passenger train from a non-telegraph station, to leave such station ten minutes behind the passenger and to run under control to the first telegraph station.

The trains in collision at Gary, W. Va., on the 28th were westbound local passenger train and a locomotive without train which had escaped control at East Fitchburg and had run at high speed, unattended, to a point west of the station, where it struck the passenger train, crushing the rear platform. No person was injured. The passenger train had been standing in the station, but was warned of the coming runaway engine and had started forward. The rear car was empty. How the locomotive escaped control has not been determined.

The collision at Mart, Tex., on the 27th was due to a misplaced switch. A northbound passenger train ran into some freight cars standing on a side track. A trespasser was killed and 13 passengers and the fireman were injured. The responsibility for the misplacement of the switch has not been fixed.

The trains in collision at Gary, W. V., on the 28th were westbound passenger No. 1 and an eastbound freight. Both engines and several cars, including two passenger cars, were badly damaged. One fireman was killed and 21 passengers were injured.

The trains in collision on the Boston & Maine at Revere, Mass., on the 30th were a northbound passenger and a freight which was using a crossover without proper authority. Two freight cars were ditched. One trainman was injured.

The train derailed at Moark, Utah, on the 2d was the westbound "Scenic Limited" and two sleeping cars were overturned. The train was running at about 45 miles an hour, but the cars were of steel and no passengers were seriously injured, though 14 passengers and one waiter were considerably shaken. The derailment was due to malice, an anglebar being thrown under the train. The miscreant was caught and has confessed.

The train derailed at Church Hill, Pa., on the 3d was northbound express No. 63, and the engine was ditched. The train was running at full speed and four passenger cars went off the rails, but remained upright. The engineman and the fireman were killed and five passengers were slightly injured. The derailment, occurring at 1 a. m., was caused by a landslide due to a cloudburst. At stations two miles north and five miles south, the shower was not unusually heavy. August 3 was the date of the flood disaster at Erie.

The train derailed at Pottomoi, Va., on the 4th was eastbound passenger No. 46, and the engine and baggage car were overturned. The train, running about 40 miles an hour, was thrown off the track at a misplaced switch, but no person was seriously injured. The switch had been maliciously misset by a negro boy, who subsequently was arrested.

The train derailed at Swords Creek, Va., on the 5th was freight No. 86, and the locomotive was overturned. Several freight cars fell down a bank into a river. The engineman and fireman were killed and three other train men were slightly injured. The cause of the derailment was not determined, but it is believed to have been due to an obstruction on the track.

The train derailed at Olyphant, Pa., on the 5th was a switching freight and the engine was overturned. The engineman was killed. The derailment was due to insecure roadbed, made soft by heavy rains.

The train derailed on the Pennsylvania at Elders, Ind., on the night of the 9th was an eastbound express passenger, and the engine and one baggage car were overturned. The engineman and fireman were killed and four passengers were injured. The derailment was caused by an open switch, misplaced, evidently, with malicious intent.

The train derailed at Titusville, Pa., on the 12th was southbound passenger No. 66, and the engineman, fireman and 25 passengers were injured. The engine was thrown off the track at a facing point switch at a mill and demolished a freight car and a part of the building. The dining-car was ditched. The engine room of the mill was wrecked and the building took fire, but the city fire department soon extinguished the flames.

The train which was derailed on the Coal River Railway, a branch of the Chesapeake & Ohio, at McCorkle, W. Va., on the 17th, was passenger No. 214 and the baggage car and smoking car were crushed. Four passengers were killed and eight others injured. The derailment was due to a broken rail; but the chief damage was caused by a fall of rocks from the roof of a tunnel through which the train was passing. The derailed cars knocked down the props supporting the roof. The Public Service Commission of West Virginia confirmed a report, made by E. E. Winters, the commission's inspector, holding the railroad company negligent in not laying guard rails through the tunnel. Guard rails, he says, would have guided the wheels of the derailed cars so that the timber lining of the tunnel would not have been knocked down. The inspector also recommended a better system of daily inspection of tracks.

The train derailed at Halleck, Nev., on the 19th was westbound passenger No. 1 and 25 passengers were injured, all but three of the injuries being slight. The train was running about 48 miles an hour and four cars were overturned. The cause of the derailment was not determined, but was believed to be a breakage in the forward truck of the baggage car.

The train derailed near Quanah, Tex., on the 20th was northbound passenger No. 3 and two passenger cars were overturned. Eight passengers were injured.

The train derailed at Swainsboro, Ga., on the 21st was northbound passenger No. 12 and the engine, tender and two cars were overturned. One passenger, who was leaning out of a window, was killed and six passengers and two employees were slightly injured. The cause of the derailment was a low spot in the track, due to heavy rain. The train was running at about 25 miles an hour, and the tender was the first vehicle to leave the rails. Most of the damage was due to the derailed truck striking the guard timbers on a bridge.

The train derailed at Date Creek, Ariz., on the 27th was a northbound passenger. Three passengers and one employee were killed and 17 persons were injured. The cause of the derailment was the weakening of a bridge by a flood, which was due to a cloudburst. The engine and first two cars fell through to the stream below.

The train derailed at Tibbee, Miss., on the 30th was a southbound freight and six cars were wrecked. One brakeman was killed. An officer of the road advises that the cause of the derailment was not ascertained.

The train derailed near Rush Hill, Mo., on the afternoon of the 30th was eastbound passenger No. 16, and 21 passengers were slightly injured. Only two cars left the rails. The tender was the first vehicle to run off; but what was the trouble with it has not been determined.

Traveling Engineers' Association Convention

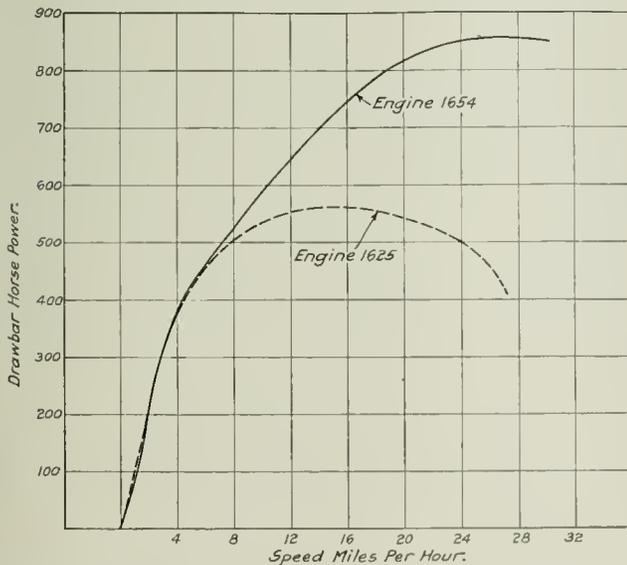

Continuation of the Proceedings Covering Papers on Tonnage Rating, Locomotive Appliances and Valve Gears

An account of the opening sessions of the twenty-third annual convention of the Traveling Engineers' Association, including abstracts of the committee reports on Smoke Prevention and Training New Men for Firemen was published in the *Railway Age Gazette* of September 10, page 473. Following is a report of the remainder of the convention:

MODERN APPLIANCES ON LARGE LOCOMOTIVES

Superheaters.—The fire-tube superheater has come to be almost universally considered as an essential part of the locomotive. The economy it affords is recognized, and it is, without doubt, one of the most important factors in the development of the locomotive, in that it has been largely responsible for the large locomotive of to-day. Two important changes that have been introduced since the last report of the committee on superheaters are a modified header design and a continuous pipe or torpedo unit. The construction of the header is such as to prevent the occurrence of stresses due to unequal expansion and contraction, by casting the saturated steam passage-ways free at one end. The continuous pipe unit is made by forging the return bends on the ends of the unit pipes. This unit reduces the restriction to the flow of gases.

The application of the superheater to the small locomotive raised the capacity limit 25 per cent to 30 per cent, and by the

(Engine 1654, superheated steam; Engine 1625, saturated steam)

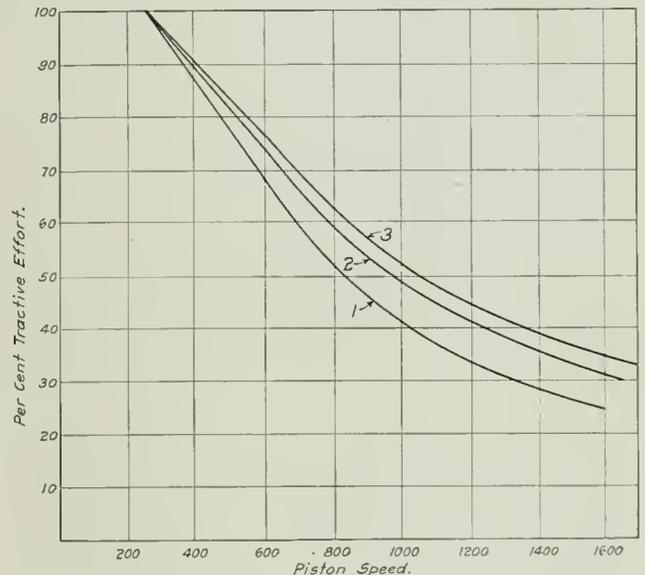

Average Drawbar Horsepower Developed by Superheated and Saturated Steam Locomotives at Different Speeds

adoption of the superheater, larger engines, greater train lengths and faster schedules have been made possible.

The superheater under actual operating conditions saves 20 per cent of the total fuel burned and from 30 per cent to 35 per cent of the water used over the saturated locomotives developing the same horsepower. The superheater locomotive may be worked at longer cut-offs and at higher speeds, making possible longer trains and faster schedules than is possible with identical saturated locomotives, under the same conditions. The comparative curves shown give the average draw-bar horsepower developed at corresponding speeds of two Class H-21 locomotives on the Erie Railroad—engine 1625 used saturated steam and engine 1654 superheated. These curves show one of the advantages of superheating a locomotive, whose ability to haul full tonnage train over a railroad on a faster schedule, is limited by

the capacity of the engine boiler to furnish steam to the cylinders.

Tests made on the Central of Georgia with a superheater and a saturated steam locomotive in passenger service under practically the same conditions showed that for the superheater locomotive the cost of fuel per hundred miles run was \$5.01, as against \$5.89 for the saturated steam engine. On a basis of the fuel used per 1,000-ton miles the performance of the saturated steam locomotive was only 80.28 per cent as good as the superheater locomotive. The Grand Trunk has applied superheaters to a good many saturated steam locomotives and the benefit derived as

Curves Showing Possibilities of Increased Capacity from Superheating

shown by tests has been so much in favor of the superheater locomotive that the management has decided to superheat all road engines as they pass through the general shops. The following is a comparative result of tests with two simple Consolidation locomotives, one (623) having been converted to a superheater:

	Engine 825 Simple Con- sol. Satu- rated Steam.	Engine 623 Simple Con- sol. Super- heat Steam.	Increase or Decrease of Superheated as compared with Satu- rat'd Loco- motive. (per cent.)
Average number of cars in train...	51.88	38.	26.07 D.
Total gross wt. of train in tons...	2,065.18	2,153.07	4.02 I.
Average weight per loaded car....	39.62	57.79	45.08 I.
Total train miles.....	125.10	125.	.15 D.
Total car miles.....	6,497.	4,759.	26.07 D.
Total ton miles.....	258,964.	269,559.	4.09 I.
Coal consumed in pounds.....	21,307.	13,400.	31.01 D.
Coal cons'd in lbs. per train mile...	170.12	106.75	37.02 D.
Coal cons'd in lbs. per car mile....	3.27	2.95	9.08 D.
Coal cons'd in lbs. per ton mile....	.084	.050	30.04 D.
Total water evaporated in lbs....	137,614.	98,213.	28.06 D.
Water evaporated per lb. of coal...	6.51	7.36	13.00 I.
Average boiler pressure.....	200.04	173.65	13.03 D.
Average speed in mile per hour....	22.31	26.00	16.05 I.
Miles run with one ton of coal....	11.82	18.76	58.07 I.
Actual running time.....	5 H. 30 M.	4 H. 49 M.	12.04 D.

The application of the superheater to the locomotive boiler, frequently inadequate as to heating surface, necessitates a reduction of about 15 per cent or 20 per cent in the tube heating surface. Notwithstanding this fact the use of superheaters has resulted in greater locomotive capacity. As an illustration of this fact, the accompanying diagram is presented. It shows cylinder tractive effort in per cent plotted against piston speed. The low-

est curve, No. 1, very fairly represents the speed factor for an average saturated steam locomotive. Curve No. 2 similarly represents the average modern superheated steam locomotive, using between 200 and 250 deg. of superheat. The greater tractive effort available is due to the fact that a longer cut-off is possible with the superheater engine than with saturated steam at the same speeds.

If the superheater designer were permitted to use a size of tube different from the two present standards, it is possible to obtain in a superheater boiler an evaporating surface practically as great as in the saturated steam boiler. With a boiler and superheater thus arranged, a greater capacity may reasonably be expected, and a curve approximately that shown as No. 3 may be confidently looked forward to in the near future. This curve is representative of locomotives using 350 to 400 deg. of superheat.

There have been several pyrometers put in service on superheater locomotives during the past year, and as the engineers become more familiar with the purpose and operation of the pyrometer, they realize more and more its importance. Those of the electrical type have been in service and operating continuously for a sufficient length of time to establish the fact that they may be depended upon in locomotive service. When the pyrometer fails to read 600 and 650 deg. when the engine is working steam, it is an indication to the engineer that he is not handling the locomotive so that the maximum saving which the superheater makes available is being obtained.

Grates.—Judging from the number of replies received there are a large number of different designs of grates, varying in air space from 25 per cent to 50 per cent of total grate area. The committee is not in a position at the present time to recommend any particular design, but special attention should be given to the amount of air opening in the grates, giving them as large a per cent of the total area as possible (40 per cent being a fair average).

Mechanical grate shakers are a decided advantage on heavy power and engines with large grate areas. They are of great assistance to the fireman in keeping the fire clean and in getting sufficient air through the grates, thus insuring thorough burning of the coal and gases. This can be accomplished without any excessive physical exertion. This device probably effects the greatest saving at the ash-pit when fires are being cleaned or dumped, as locomotives which were consuming 35 to 40 minutes from ash-pit to roundhouse are now consuming 10 to 20 minutes, and it only takes two men to handle the engine on the ash-pit, where it formerly took four with the hand shaker—a reduction of 50 per cent in labor.

Drifting Valves.—The committee believes that some means should be provided to admit a sufficient amount of steam to cylinders and valve chambers, not only on superheat locomotives, but on any locomotive having cylinders of a large diameter. This will not only prevent carbonization, but will cause the engine to drift much more smoothly. The rods will require less keying up and the maintenance of wedges and journal bearings will be easier and piston heads and cylinders will not wear as fast.

Brick Arches.—Several years ago the brick arch was looked upon and spoken of only as a fuel-saving device, but the constantly increasing demand for greater capacity has resulted in changing its recognized function from a fuel saver to a capacity increaser. The arch increases the boiler capacity directly by aiding combustion and by reducing the heat losses. Naturally this results in increasing boiler efficiency. The arch tubes which support the brick, add valuable heating surface and increase the circulation of water through the boiler. The brick arch separates the fuel bed from the tubes and forms a sort of combustion chamber in what would otherwise be a straight firebox. The efficiency of the arch increases as the rate of combustion or the amount of coal burned per square foot of grate area per hour increases. When burning 30 lb. of coal per hour per square foot grate area, we may expect an efficiency of 3 per cent; when burning 100 lb. per hour per square foot of grate area, we may expect an efficiency of 10 per cent., etc.

Tests indicate that at a rate of combustion of 100 lb. of coal

per square foot of grate area per hour, the arch will effect a reduction of 42 per cent in spark losses. This would mean an increase in boiler efficiency of 7 per cent, due to this one item. Reports from many roads indicate a smoke reduction of 50 per cent can be obtained by the use of the arch, and on most roads the brick arch, together with proper firing instructions, have proved sufficient to overcome objectionable smoke and to keep within the law.

Flange Oilers.—Ever since locomotives have been in use, the wear on the wheel flanges has been one of the, if not the greatest, sources of annoyance and expense in maintaining these powerful machines in service. The modern locomotive and high speed demanded has increased instead of decreased it. A very conservative estimate of the loss to one engine for one turning of tires on account of flange wear is \$219. The following is an estimate of the mileage a locomotive will make between turning of tires for flange wear, with and without a flange oiler :

FREIGHT		PASSENGER	
Miles Without Oiler	Miles With Oiler	Miles Without Oiler	Miles With Oiler
9,000 to 12,000	25,000 to 42,000	15,000 to 25,000	60,000 to 84,000

The rapid wear of the rails can be eliminated to a certain extent by the use of a flange oiler which positively delivers a jet of asphaltum oil against the flanges of the locomotive driving wheels. On one division of the Erie the rail saving on curves is 66 per cent. On the Delaware, Lackawanna & Western the saving on the rails on curves has warranted the equipping of locomotives with the flange oiler. While saving the rails on curves, the saving on the locomotive driving wheel tires on this road has been over 50 per cent. Positive proof is given by a number of roads that the flange oiler does prevent derailments.

It has been the impression that any crude oil would do to use with any system of flange oiling. Service tests have proven that results cannot be obtained unless the oil contains from 40 per cent to 60 per cent of asphaltum in solution and is low in grease and paraffine. All oils that are low in asphaltum and high in grease and paraffine will run down on the tread of the driving wheel, causing slipping and tending to defeat the purpose of the device.

Mechanical Stokers.—In answer to questions submitted to the membership, the following replies were received: The stoker engines burn more coal, but as the grade of coal stoker fired is usually inferior to the coal used for hand firing, this feature should not be criticised too severely. With the same quality of coal there is very little difference. The hopper sometimes becomes clogged, causing stoker engine to stop in wet and freezing weather, but this depends largely on the watchfulness of the fireman. When the stoker fails, it usually causes an engine failure, due to the light fire carried and the grade of coal used, making it impossible for a man to pick up the shovel and get the fire in condition without an engine failure, except in cases where the stoker is being worked very light.

In summing up, the advantages of the mechanical stoker are many. It is applied to heavy freight locomotives primarily to work the locomotive to its full capacity, regardless of the conditions under which it is operated, which, of course, means increased tonnage or increased average speed of freight trains under conditions where the tonnage is fixed—in other words, to increase the ton miles per hour over a division. Locomotives equipped with mechanical stokers carry a much lighter fire, which, of course, gives better combustion. A more uniform fire-box temperature is obtained, and correspondingly less flue and fire-box trouble. With the scatter system of firing a locomotive the smoke density will remain more uniform with the stoker-fired locomotive. The application of mechanical stokers to locomotives has made it possible for any fireman to handle any locomotive, regardless of the manner in which it is worked. By the use of the mechanical stoker the fireman is able to follow his engine more regularly, makes correspondingly more money, and, as a result, is better satisfied, a condition which makes it less difficult to keep a locomotive in service, especially on a division where the conditions of firing are particularly severe and the

overtime runs high, due to the relief of firemen in the hot summer months.

On a number of roads a cheap grade of fuel is purchased especially for stoker-fired locomotives, and on other lines where conditions are such that small run-of-mine coal is supplied, an economy is effected in that the run-of-mine coal is screened and the poor coal is set aside for stoker-fired locomotives, leaving a much better grade of fuel for the hand-fired locomotives.

The following is a list of number of stokers in active operation, of different types:

Street	593	Gea	1
Crawford	301	Ayres	1
Standard	28	Kincaid	1
Hanna	18		

Power Reverse Gear.—Judging from the replies received, the power reverse gear is the ideal gear and is a decided advantage in freight and switching service and will soon pay for installation, due to time saved in making up trains and switching. In some cases the power reverse gear has not given the results expected of it in fast passenger service, principally owing to the neglect of certain small but important items of maintenance. The use of the screw reverse gear is advocated by many roads for fast passenger service owing to the possibility of very fine adjustment, but its principal drawback is its slowness in reversing, making it difficult to take slack.

Coal Passer.—It has been the experience of the chairman of the committee on the railroad with which he is connected, that locomotive tenders equipped with coal passers are a valuable asset to modern power. This device places the coal within easy reach of the fireman and eliminates the furnishing of men at different points to shovel the coal ahead. It also allows the doubling of divisions without taking coal, thereby reducing the amount of coal which has to be handled to the farthest terminal. The cost of maintenance of the coal passer has been found to be very low.

Automatic Fire Door.—The butterfly type of the automatic fire door is generally preferred to either the horizontal or vertical types. It is the smoothest working door, gives the least trouble on the road, and requires less repairs at terminals. By the use of this type of door, single-shovel firing is accomplished, which prevents a large amount of cold air from entering the fire-box and materially reduces the amount of fuel required to keep up steam pressure.

The report is signed by J. E. Ingling (Erie), chairman; P. J. Miller (N. Y. C. West.); H. F. Henson (N. & W.); W. A. Buckbee (Loco. Sup. Co.), and A. G. Kinyon (S. A. L.).

DISCUSSION

Representatives from the Erie favored highly the use of pyrometers on superheater locomotives, calling attention to the fact that a loss of 20 deg. of superheat will affect the evaporation of water one pound per indicated horsepower. The pyrometer also serves to give the fireman a much closer check on the condition of the fire and shows the engineer whether or not he is getting the most out of the engine.

The graphite lubricator has been found by several roads to materially increase the life of the piston packing rings. Tests on the Delaware, Lackawanna & Western demonstrated that by its use the valve leakage was reduced 51 per cent.

The question of using superheater or perfection valve oil received considerable attention. In almost every case the superheater oil was believed to be unsatisfactory in the air compressors, some roads providing separate lubricators with perfection oil to serve these attachments, while other roads use perfection oil for both the compressors and the cylinders. A. G. Kinyon contended that if it were possible to eliminate the air from the cylinders while the engine is drifting better results can be obtained with perfection oil than with the superheater oil, inasmuch as in the manufacture of superheater oil with its higher flash point its lubricating qualities are affected. Some roads, in an endeavor to prevent air getting into the cylinders, have eliminated relief valves and substituted drifting valves with material success.

SCIENTIFIC TRAIN LOADING; TONNAGE RATING

By O. S. BEYER, JR.

Chicago, Rock Island & Pacific

Scientific train loading or tonnage rating takes into consideration, as far as may possibly be determined, every element affecting the economical movement of freight trains. These elements may be summarized as follows: Drawbar pull of locomotive; resistance of freight cars of all weights; grades; curves; condition of track; temperature, weather and wind; opposing traffic; length of division, and speed.

The object of a scientific tonnage rating system primarily is to give an engine the same amount of work to do regardless of whether a train is made up of heavy cars or light cars, or a mixture of them. Its further object is to load engines at all times in accordance with conditions of weather, temperature, wind, track, etc., so that freight will always be handled for the least expense possible per ton-mile.

The most scientific and simple system yet devised is the adjusted tonnage rating system. This system, when carried out to its logical conclusion, as its name implies, endeavors to adjust the loads of freight trains as exactly as possible to suit the conditions existing. In order to understand how the adjusted tonnage rating system accomplishes this object, its development for a division and application will be described.

The first element to be considered is the drawbar capacity of the locomotive used in hauling freight trains over the division, in conjunction, of course, with the grades and curves of the division and the desired speed of the train over the division. The sustained drawbar pull of an engine equals the sustained theoretical tractive effort of the engine less the effort of the engine lost to move itself and tender. The sustained theoretical tractive effort of the locomotive at a speed above 7 to 10 m.p.h. depends on the speed of the pistons at these higher speeds and the capacity of the boiler to furnish steam. This tractive effort, for a saturated or a superheated steam locomotive, is secured by the aid of the figures shown in Table I—first by calculating the piston speed of an engine in feet per minute at the speed at which the engine is to run over the ruling grade and then referring to Table I to determine what speed factor corresponds to the piston speed calculated. The product of the maximum theoretical tractive effort when multiplied by the speed factor will be the sustained tractive effort of the engine at the speed considered.

TABLE I
Speed Factors for Saturated Superheated Steam Locomotives at Various Piston Speeds

Piston Speeds Ft. per Min.	Speed Factor	
	Saturated	Superheated
100	1.000	1.000
200	1.000	1.000
300954	.954
400863	.863
500772	.772
600680	.682
700590	.605
800517	.542
900460	.490
1,000412	.445
1,100372	.405
1,200337	.371
1,300307	.342
1,400283	.318
1,500261	.297

Next, it is necessary to make allowance for the power lost by the engine moving itself. This depends principally upon the weight of the engine in tons. The power lost by the engine lifting itself up grade is equal to twenty times the total weight of the engine in tons times the grade in per cent. The power lost by the engine moving itself, i. e., rolling its own wheels on the rails, may be divided into three subdivisions:

- Resistance of drivers in pounds
- 22.2 lb. times weight on drivers in tons.
- Resistance of trucks in pounds
- 6 lb. times weight on trucks.
- Resistance of tender in pounds
- Resistance per ton of tender (see Table II) times weight of tender in tons.

If the locomotive is obliged to traverse a curve, then a further deduction of one pound per ton of locomotive per degree of curve should be made. Inasmuch as very high speeds do not enter into the consideration, it is not necessary to make allow-

ance for air resistance to the locomotive in determining its sustainable drawbar pull.

All those various resistances, namely, that due to grade, drivers, engine trucks, tender, and curvature, are then added together and subtracted from the sustained tractive effort which the engine is capable of maintaining at the speed at which it is to negotiate the ruling grade. Mathematically the foregoing statement may be expressed in the following formula:

$$S. D. B. = \frac{.8 F P d^2 S}{D} - W_G (20g + 1 C) - 22.2 W_D - 6 W_T - r$$

in which S. D. B. represents sustainable drawbar pull of engine in lbs.

- F — Speed factor of engine running at speed under consideration as determined from Table I.
- P — Maximum boiler pressure of engine in lbs. per sq. in.
- d — Diameter of engine cylinders in inches.
- S — Stroke of engine cylinders in inches.
- D — Diameter of engine drivers in inches.
- W_G — Total weight of engine and tender, fully loaded, in tons.
- g — Per cent of grade.
- W_D — Weight in tons of engine on drivers.
- W_T — Weight in tons of engine on trucks.
- T — Weight of tender in tons, fully loaded.
- r — Resistance in pounds per ton of engine tender considered as a car (determined from Table II).
- C — Degree of curvature.

RESISTANCE OF TRAIN.

Having found the drawbar pull the engine will sustain negotiating the ruling grade, it next becomes necessary to determine the weight of train this amount of drawbar pull will move up the grade at the speed desired. The resistance of a freight train depends directly on weight of the train, average weight of cars composing train, grade, curvature, speed at which train is required to move up grade, temperature, and wind.

Train resistance may be classified, generally speaking, under two heads: Internal resistance and external resistance.

The internal resistance of a freight train is that resistance which arises principally from the friction of the car journals in their bearings, the rolling of the car wheels on the rails, the friction of the car wheel flanges on the rails, friction at side bearings and center bearings, etc.

The external resistance of a freight train is that which arises from sources outside of the train itself and is principally composed of the resistance due to grade, wind and curvature.

Internal Resistance of Freight Trains.—The internal resistance of a freight train, or, more simply speaking, of a freight car, does not vary directly in proportion to the weight of the car in tons. For this reason an engine can haul more tonnage in heavily loaded cars than in light or empty cars. And so in loading freight trains, the adjusted tonnage rating system recognizes this feature and makes it possible to load each engine with tonnage according to the number of light or heavy or both kinds of cars composing the train. By referring to Table II it will be noted exactly how the internal resistance varies per ton of cars weighing 15 to 75 tons for different speeds.

TABLE II

Value of Internal Resistance in Pounds per Ton Gross Weight of Freight Cars of Various Weights at Different Speeds

Weight of cars in tons	Pounds of Resistance per Ton of Car at Speed of			
	5 m. p. h.	10 m. p. h.	15 m. p. h.	20 m. p. h.
15	7.62	8.19	8.82	9.56
20	6.77	7.29	7.88	8.53
25	6.02	5.50	7.01	7.60
30	5.38	5.80	6.28	6.82
35	4.82	5.20	5.64	6.17
40	4.39	4.69	5.06	5.50
45	4.01	4.28	4.60	5.00
50	3.72	3.96	4.24	4.60
55	3.49	3.69	3.94	4.27
60	3.30	3.49	3.73	4.04
65	3.16	3.34	3.57	3.88
70	3.05	3.24	3.48	3.79
75	3.00	3.18	3.41	3.71

The temperature of the atmosphere and the condition of the track affect this internal resistance. As the temperature decreases or when the condition of the track is poor, the internal resistance is greater. Consequently, when determining the proper tonnage for an engine, these facts must be taken into consideration largely according to judgment. The figures given

in Table II have been determined by a long series of tests at summer temperature on track which was in very good shape. Hence these figures should be used when determining the maximum train loads possible under ideal conditions.

External Resistance of Freight Trains.—The external resistance of freight trains or cars arises, as pointed out previously, from grade, curvature and wind. The grade resistance of freight cars is the same as that of locomotives, equaling per ton of car 20 times the per cent of grade. Curve resistance also is determined the same as curve resistance for locomotives. For purposes of tonnage rating under average conditions, an allowance of one pound resistance per ton of car for each degree of curvature has been found very nearly correct.

Wind resistance to freight cars is a variable quantity under usual railway operating conditions. Its effect is best determined as a matter of judgment in the use of the various classes of ratings established (to be described later) according to the actual conditions existing. For instance, on a windy day it would not be policy to rate trains as heavy as on a calm day.

External resistance is not affected by weather or temperature and does not vary practically except in direct proportion to the weight of the train. The length of the train, i. e., the number of cars, has a little to do with curve resistance and wind resistance, but this influence on the whole resistance is too remote to be determined accurately.

The total resistance of a freight train per ton of car weight, as explained in the foregoing, may be summarized and expressed by the following formula:

$$R = v_c + 20g + 1C.$$

in which R represents total resistance in pounds per ton of freight car, v represents internal or rolling resistance per ton of freight car, depending upon weight of freight car, as determined from Table II at speed under consideration; g represents grade, expressed in per cent and C represents degree of curvature.

DETERMINATION OF TRAIN WEIGHTS

The weight of train in tons which may be moved at a certain speed over a certain grade and curve is found by dividing the sustainable drawbar pull in pounds of the engine by the total resistance per ton of car. Mathematically expressed, this statement takes the following form:

$$\text{Weight of Train in Tons} = \frac{.8 F P d^2 S}{D} - W_G (20 + 1 C) - 6 W_T - r \div \frac{v_c + 20g + 1C}{1}$$

In order to demonstrate just how the hauling capacity of a locomotive varies according to the different weight cars making up the train, the following example will be of interest. The conditions assumed are:

Consolidation locomotive.....	40,000 lb. maximum tractive effort
Grade	0.3 per cent
Average weight of light cars.....	20 tons
Average weight of heavy cars.....	70 tons
Speed of train up grade.....	10 m. p. h.

The sustainable drawbar pull of the engine at 10 m.p.h. on straight and level track, as determined by the method described, is 35,300 lb. Deducting for grade resistance on a 0.3 per cent grade, this sustainable drawbar pull becomes 34,220 lb.

The resistances per ton of a 20-ton and a 70-ton car at 10 m.p.h. going up a 0.3 per cent grade are as follows:

For a 20-ton car—	
Internal resistance (see Table II).....	7.29 lb.
Grade resistance (.3% × 20).....	6.00 lb.
Total resistance	13.29 lb.
For a 70-ton car—	
Internal resistance	3.24 lb.
Grade resistance (.3% × 20).....	6.00 lb.
Total resistance	9.24 lb.

Consequently the tonnages and number of cars which, under most ideal conditions this 40,000-lb. tractive power Consolidation locomotive can pull over a 0.3 per cent grade at 10 m.p.h. in

20-ton cars (all lights or empties) and in 70-ton cars (all heavies or loads) are respectively:

In 20-ton cars, i. e., lights or empties—	
Weight of train.....	$\frac{34,220}{13.29} = 2,575$ tons.
Number of cars.....	$\frac{2,575}{20} = 129$ cars.
In 70-ton cars, i. e., heavies or loads—	
Weight of train.....	$\frac{34,220}{9.24} = 3,706$ tons.
Number of cars.....	$\frac{3,706}{70} = 53$ cars.

Thus it is seen that on a 0.3 per cent grade a 40,000-lb. tractive power locomotive can pull 1,131 more tons in trains consisting of 70-ton cars than it can pull in trains consisting of 20-ton cars. When this fact is fully appreciated, the advantage of adjusting the tonnage of trains according to the average weight of all the cars making up the train is completely realized.

The more steep the grade becomes the less the difference in tonnages between the light car trains and heavy car trains. This is accounted for by the fact that as the grade increases the grade resistance, which is constant per ton for all cars, heavy or light, becomes a greater proportion of the total resistance and the rolling or internal resistance, which varies per ton inversely as the weight of the car varies, becomes less in proportion to the total resistance. This is another important fact and should be fully grasped so that it will be clearly understood why the adjustment for difference in car weights becomes less and less as the ruling grade increases.

CAR FACTOR METHOD OF TONNAGE ADJUSTMENT

Having determined, as far as possible, the hauling capacity of a locomotive or class of locomotives over a division, after taking into consideration mathematically all the items which affect the problem, namely, train speed, grade, theoretical drawbar pull of engine, average car weights, curvature, etc., the final problem remains to find the best method of making up trains in the yard so that their tonnage will be equalized or adjusted to suit the hauling capacity of the locomotive, everything considered. It is felt that the best method by which this end is reached is the car factor method of tonnage adjustment.

This method simply provides for the addition of a purely imaginary figure, known as the car factor, to the actual weight of each car, including the caboose, entering into the make-up of a train until the sum of all the actual car weights plus their car factors equals the adjusted tonnage rating over the division of the locomotive to be loaded or rated. Knowing what actual tonnages and how many cars an engine or class of engines may pull over the grades of a division both in light or empty cars and in heavy or loaded cars, as determined mathematically by the process previously explained, it becomes a very simple matter to establish the car factor and the adjusted tonnage rating for the engine and division under consideration. The car factor equals the difference in the tonnages of the heaviest car train and the lightest car train the engine can haul, divided by the difference in the number of cars between the heaviest and lightest car trains. The adjusted tonnage for the engine equals the sum of the actual tonnage of the lightest car train and the number of cars in this train multiplied by the car factor, or, which is the same thing, the sum of actual tonnage of the heaviest car train and the number of cars in this train multiplied by the car factor. To illustrate, take the figures of tonnages and number of cars determined as the hauling capacity of a 40,000-lb. tractive effort Consolidation locomotive on a 0.3 per cent grade:

Weight of 70-ton car train.....	3,706 tons.
Weight of 20-ton car train.....	2,575 tons.
Difference in tonnages.....	1,131 tons.
Number of cars, 20-ton car train.....	129
Number of cars, 70-ton car train.....	53
Difference in number of cars.....	76
	$\frac{1,131}{76} = 15$
Hence car factor on 0.3 per cent grade.....	15

And so the adjusted tonnage for 40,000-lb. tractive effort

engine under ideal conditions on 0.3 per cent grade, engine moving at 10 m.p.h., equals:

$$2,575 + (129 \times 15) \dots\dots\dots 4,510 \text{ adjusted tons.}$$

Or, which is practically the same thing:

$$3,706 + (53 \times 15) \dots\dots\dots 4,501 \text{ adjusted tons.}$$

This same theoretical analysis applies to any condition of grades and size of locomotive involved. If carried out for all grades varying from 0 to 2 per cent the car factors applying to each grade will be found as per Table III:

TABLE III

Car Factor for Different Grades	
Grades in Per Cent	Car Factor
0.0	70
.1	31
.2	20
.3	15
.4	12
.5	10
.6	8
.7	7
.8	6.5
.9	5.5
1.0	5
1.25	4
1.50	3.5
1.75	3.0
2.00	2.8

Thus it is seen that the heavier the grade becomes, the less the car factor grows, while, of course, at the same time the less the adjusted tonnage rating becomes.

The significant fact to be gained from the method of tonnage adjustment is that the actual weight of trains varies indirectly in proportion to the number of cars composing the train, and directly in accordance with the average weight of all cars composing the train. This is more graphically illustrated by Table IV, which is based on the figures developed for the adjusted

TABLE IV

How Train Tonnage Varies for Different Average Car Weights Considering a 40,000-lb. T. P. Locomotive on a 0.3% Grade; Adjusted Tonnage, 4,500; Car Factor, 15		
Average Car Weights in Tons	Actual Weight of Train in Tons	Number of Cars Composing Train
20	2,565	129
30	3,000	100
40	3,270	82
50	3,465	69
60	3,600	60
70	3,705	53

tonnage rating of a 40,000-lb. tractive power Consolidation locomotive on a 0.3 per cent grade.

REDUCTIONS FOR WEATHER AND OTHER CONDITIONS

Having determined theoretically and verified practically by previous locomotive performance records, special tonnage tests and dynamometer car runs, if possible, the maximum adjusted tonnage which can be hauled over a division, it finally becomes necessary to establish certain reduced ratings to guard against weather and other conditions which make reduced ratings necessary. It has been found most practical to provide four ratings for each class of engine between principal yard points or division terminals. These four ratings may best be designated by the letters A, B, C and D; the A rating being the maximum and the B, C and D ratings reductions from the maximum or A rating according to certain percentages dependent on the ruling grades encountered.

Inasmuch as the temperature has the greatest influence on the resistance of trains and hence the hauling capacity of locomotives, this is used as the basis on which to reduce the tonnage of trains from the maximum rating. Primarily a reduction in temperature only affects the internal resistance of trains, increasing it as the temperature drops. Consequently, the greater the proportion of internal resistance of a train, the greater is the effect of a reduction in temperature on the resistance of the train. In other words, the lower the ruling grade, the greater the proportional allowance must be from the maximum or A rating for a reduction in temperature.

What the exact allowance is that should be made for certain reductions in temperature under all conditions has never been proven exactly by experiment, and in reality hardly can be proven very accurately. Experience, however, determined in the light of reason, has shown the following temperature variations to be

satisfactory upon which to base reductions in tonnage from the maximum when making up trains:

- Maximum rating—Temperature above 40 deg. F.
- First reduction—Temperature below 40 and above 20 deg.
- Second reduction—Temperature below 20 deg. and above zero.
- Third reduction—All temperatures below zero.

For purposes of simplicity these various ratings may be designated as *A* or maximum and *B*, *C* and *D* respectively. Table V is given to show what has been found, in practice, to be satisfactory working reductions for temperature changes, based on increasing grades. It should be noted that as the grade increases,

TABLE V

Grade in Per Cent	Reductions in Per Cent to be Made From the Maximum or "A" Adjusted Rating for Decreases in Temperature			
	Above 40°	40° to 20°	20° to 0°	Adjusted Ratings Below 0°
0.0	0	13.70	27.40	41.10
.1	0	11.20	22.40	33.60
.2	0	9.70	19.40	29.10
.3	0	8.70	17.40	26.10
.4	0	7.98	15.96	23.40
.5	0	7.45	14.90	22.35
.6	0	7.00	14.00	21.00
.7	0	6.70	13.40	20.10
.8	0	6.42	12.84	19.24
.9	0	6.20	12.40	18.60
1.0	0	6.00	12.00	18.00
1.25	0	5.63	11.26	16.89
1.50	0	5.37	10.74	16.11
1.75	0	5.20	10.40	15.60
2.00	0	5.00	10.00	15.00

the amount of reductions from the heaviest rating grows less and less. The reason for this has been pointed out before and is sound logic, borne out by experience.

PRACTICAL CONSIDERATIONS IN DETERMINING MAXIMUM ADJUSTED TONNAGE RATING

Inasmuch as the maximum or *A* adjusted tonnage rating for an engine is the rating from which all the others are determined—that is, forms the basis for the ratings over a division—it is quite essential that this be established as nearly accurate as possible. It will most always be found, however, that the highest rating which is considered possible by mathematical calculation is either too high (most usually too high) or too low for practical purposes. Consequently, after the theoretical determinations have been made, they should always be fully tested out by actual tonnage tests under practical conditions. If the service of a dynamometer car can be had for this purpose it will assist materially toward proving or disproving the accuracy of the calculation.

The element of train speed, necessity to get from terminal to terminal in a certain time to get the greatest number of ton-miles per year out of an engine, is another very important practical consideration. It is difficult to determine generally what the most economical speed is at which trains should move over the division. To establish this speed and demand that it be lived up to at all times is a mistake, for the many conditions on a division which affect it are changing continually. It has been found by experience that the provision of four ratings, *A*, *B*, *C* and *D*, gives the division superintendent or division chief dispatcher a sufficient number of ratings from which to choose for each day or each train, if necessary, in order to move the business best to suit the many influences which bear on this problem. And if the ratings are not sufficient, then special ones may quickly be established, according to the judgment of the official in authority, in order to meet special or emergency conditions.

The following brief explanations and instructions have been used with success by the author when he has had occasion to introduce the adjusted tonnage rating system on a railroad. They are repeated here by way of illustration:

The following two important facts and their effect on freight train operating economies will be appreciated from a study of the adjusted tonnage rating system. The first is the benefit resulting from making up trains so as to get as many loaded or heavy cars as possible into each one and thereby avoid running trains composed entirely of empty or light cars. This arrangement will often prevent the running of trains on which tonnage has had to be sacrificed on account of having reached the car limit before the train was filled out to the maximum adjusted tonnage.

The other fact which should be realized is the necessity of get-

ting actual car and thus train weights as accurate as possible. The entire benefit from the adjusted tonnage rating system will be lost unless great care is taken in determining the actual car and train weights. To this end such means and systems at yard offices and at stations where cars originate for shipment should be introduced which will result in the greatest possible accuracy in determining actual car and train weights.

INSTRUCTIONS

(1) All ratings are based on tons.

(2) To determine the proper tonnage for an engine, find first from the rating tables the adjusted tonnage in effect corresponding to the engine. Then add the car factor to the actual weight in tons of each car. Finally, add together the weights of all cars plus their car factor allowance until the total equals the adjusted rating in effect.

(3) To determine the proper tonnage for a pusher, double header, or three or more engine train, add together the adjusted ratings in effect for each one of the engines in question and proceed as outlined in paragraph 2.

(4) When rating an engine, yardmasters and conductors will consider the caboose as one of the cars of the train, adding the car factor to the actual weight in tons of the caboose and this to the adjusted tonnage of the balance of the train, the total to equal the adjusted rating in effect, exactly as outlined in paragraph 2.

(5) When dead engines are hauled in a train yardmasters and conductors will add four times the car factor to the actual weight of each dead engine, and this to the adjusted tonnage of the balance of the train, the total to equal the adjusted rating in effect, as outlined in paragraph 2.

(6) Yardmasters and conductors will add another light car to the train when the total adjusted tonnage of the train, including the caboose, adds up fifteen or more adjusted tons (that is a fraction of a car) less than the adjusted rating in effect.

(7) Dispatchers, yardmasters and conductors will place as many loaded or heavy cars as possible in every train and avoid running any trains consisting entirely of empty cars unless otherwise instructed.

(8) All classified freight trains as well as ordinary freight trains will be rated strictly on the adjusted tonnage basis.

(9) No reductions in tonnage on account of weather or other conditions are to be made unless authorized by the superintendent.

(10) Actual weights of empty or loaded cars must not be estimated or assumed when they are available from the car stencils or the way-bills.

(11) When actual weights cannot be determined, the following estimates for weight of contents and lights weights of cars are to be used, but not otherwise. Contents are to be estimated at the marked capacity of the car, except in case of light commodities, such as hay, cotton or bran, in which case the contents should be estimated at one-half the marked capacity. In the case of way freight (merchandise) cars, five tons will be used as the weight of the contents.

Light weights of cars to be estimated as follows:

Kind and Capacity of Cars	Light Weight (in Tons)
Box 40 ft., 80,000 lb. capacity.....	19
Box 34 ft. and 36 ft., 60,000 lb. capacity.....	16
Box 34 ft., 40,000 lb. capacity.....	13
Box 25 ft., 40,000 lb. capacity.....	10
Furniture 40 ft.	18
Furniture 50 ft.	21
Refrigerator	18
Refrigerator (meat)	21
Stock 30 ft., 30,000 lb. capacity.....	10
Stock 36 ft., 40,000 lb. capacity.....	11
Stock 36 ft., 60,000 lb. capacity.....	16
Double deck stock	16
Plain flat 30 ft.....	8
Plain flat 34 ft.....	12
Plain flat 40 ft.....	14
Plain flat 43 ft.....	17
Coal cars 34 ft.....	13
Coal cars 36 ft.....	16
Hopper bottom coal, 80,000 lb. capacity.....	18
Hopper bottom coal, 100,000 lb. capacity.....	21
Rodger ballast cars.....	16
Ingoldsby dump cars.....	18
Tank cars	14
Caboose	15

(12) When converting the actual weights of cars from pounds

into tons by dividing the actual weights in pounds by 2,000, yardmasters and conductors will in all cases neglect a remainder of 999 pounds or less, but will consider a remainder of 1,000 lb. or more as one ton.

DISCUSSION

J. M. Daly, formerly general superintendent of transportation of the Illinois Central, and an expert on tonnage rating, opened the discussion, speaking very highly of Mr. Beyer's paper. He believed that if in making up trains this system of adjusted tonnage were followed large economies in transportation costs would be made. He called particular attention to the fact that the resistance per ton of the loaded car is much less than that of the empty car. This of itself should justify the use of the adjusted tonnage rating system. He mentioned one road that had made a saving of 5 per cent by adopting this system. The overloading of locomotives was condemned as being more expensive than underloading. A solid and substantial roadbed and track are especially necessary where heavy car loads are handled. Mr. Daly stated that some of the new roads in Canada are establishing terminals at high points of land in order to obtain descending grades in both directions out of the terminal for the purpose of warming up the car and locomotive journals and thus saving fuel.

Several members had found by experience that the short trains with the heavy loads hauled much easier than the long trains of light cars, even though the actual tonnage was much greater. It was generally believed that while a dynamometer car was of considerable advantage in determining the rating of a locomotive the work can be very satisfactorily performed by men experienced in the performance of locomotives.

In helper service it is found to be much better practice to place the assisting locomotive at the rear of the train, especially if the grades are undulating and the curves are sharp. Mention was made by Prof. L. E. Endsley of the increase in train resistance due to badly worn wheel treads and loose trucks, the former being found, by test, to increase the resistance as much as 100 per cent.

ELECTRO-PNEUMATIC BRAKE

Walter V. Turner, assistant manager and chief engineer of the Westinghouse Air Brake Company, gave an illustrated lecture on the possibilities of the electro-pneumatic brake in the steam railway field. He called attention to the relation of the air brake to the power of the present day locomotive, showing how these powerful engines would be useless without the air brake to control them. The variable load brake has made possible to a still greater degree the heavier trains, the Virginian now operating trains of 8,000 tons with this type of brake. When considering the action of the air brake, the rail, the roadbed, the consist of the train and the foundation gear must all be taken into account, as they all have a definite bearing on how the brake will perform in service.

The piston travel is of prime importance, especially on long trains. It should be constant throughout the length of the train if "rough handling" is to be eliminated. Tests have shown that with an 8-lb. brake pipe reduction at the end of two seconds the cars with the proper piston travel (8 in.), will develop a braking power of 16 per cent, whereas those cars with a 6-in. travel of the piston will develop a braking power of 43 per cent, which naturally causes very rough handling of the train.

In speaking of the clasp brake, he gave as a rough and ready rule as to when this brake should be used, the condition where the side pressure of the shoe exceeds the downward pressure of the wheel.

The purpose of the electrically-operated brake is wholly and solely to permit the use of a more efficient air brake. With the electrical control it is possible to have the brakes on all the cars in the train operate simultaneously rather than consecutively, as in the brakes controlled by the reduction of pressure in the train line; because of this feature the surging or the running in of slack, with its attendant disastrous results, will be eliminated and, at the same time, it will be possible to make use of a greater

retarding force, thus materially decreasing the length of stop. Experiments have shown that the retarding force can be built up to 20 per cent with the electrically operated brake, whereas the best pneumatic brake will permit of only 8 per cent retarding force—good train operation being obtained in both cases.

At the present time the electro-pneumatic brake is only available for passenger trains with electrical equipment. The amount of current required for the operation of this brake practically prevents its being used on freight cars in long trains.

Mr. Turner showed various diagrammatical illustrations of the electro-pneumatic brake and pointed out the versatility of the entire system. As many and as small applications of the brake can be made as desired, and the entire system can be recharged with the brakes set. The danger of "stuck brakes" is eliminated, the service and quick-action parts being entirely separate from each other. By its use passenger trains hauled by modern locomotives that have taken 18,500 ft. to accelerate to 58 m.p.h. have been stopped in less than 1,000 ft.

VALVE GEAR DESIGN AND LOCOMOTIVE OPERATION

An interesting scientific paper on the effect of properly designed valve gear on locomotive fuel economy and operation was read by W. E. Preston, traveling engineer, Southern Railway, in which the theoretical indicator card was described and analyzed. He also presented formulæ for horsepower, tractive effort and for determining the weight of steam used per hour (for constant speed).

In speaking of the relation of the valve gear to the indicator card he described the link motion diagram and the Zeuner diagram. Taking the dimensions of a Consolidation locomotive as a concrete example he showed how the ideal card could be obtained and the theoretical speeds at various points of cut-off. From these were calculated the horsepower at different speeds, and the steam and coal consumption. In speaking of the distorted indicator cards he said in part, as follows:

There are many things that go to distort an indicator card, but a defect in the valve gear, or the setting of the valve gear, will at once become evident in the indicator card.

Figs. 1, 2 and 3 illustrate some of the defects due to faulty valve gear.

- P = Wiredrawing.
- m = Too much lead.
- r = Too early exhaust closure.
- s = Too early exhaust opening.
- x = Insufficient compression.
- n = Not enough lead.
- t = Late exhaust.
- u = Loose motion and wiredrawing.
- P = Lack of lap.
- y = Excess back pressure due to late exhaust.
- w = Blow.

These are the common defects due to the valve motion. Other defects, such as excess condensation, restricted ports, leaky valves, etc., are shown by the indicator card, but as these are not the fault of the valve motion they have no place here.

The card shown in Fig. 4 was taken from an actual test on a Consolidation engine, having a Stephenson valve gear. It is a corner card, but the cut-off on this engine measured 87.5 per cent, whereas it should have been 85 per cent if properly set. The result of over-travel of the valve is clearly seen in the very late exhaust and lack of lead. From this card it is determined that 14.5 per cent more coal was being used than necessary at this point of cut-off. Moreover, the distorted motion reduces the maximum tractive effort of the engine some 3,000 lb.

Fig. 5 shows another card from the same engine hooked up to the sixth notch. Here the cut-off measured 73 per cent on the engine, while for this notch the ideal card gives 69 per cent. The straight line is the ideal card; the bent line showing the actual card. The valve still lacks lead and has too late exhaust opening, but the back pressure drops to normal at the admission end of the card. The effect of the slack in the valve motion is clearly shown at *a*. After the port gets fully open there seems to be very little throttling effect. This also applies to Fig. 4. Hence the port openings are ample.

The mean effective pressure for the ideal card is 167 lb., while

for the actual card it is 156 lb., the increase in cut-off not being quite enough to compensate for the effect of late admission and exhaust. In this case there is 11.4 per cent more coal being burned than necessary to develop the same horsepower, the tractive effort being reduced 2,800 lb.

As the lead increases as the reverse lever is hooked back toward the center of the quadrant, we would expect the card of Fig. 5 to be better than that of Fig. 4. All of the events being earlier in the stroke, we find that the earlier release somewhat reduces the back pressure.

Theoretically the back pressure line should be parallel to the atmospheric line, and about the same distance from it for all cut-offs. At high speeds and short cut-offs, of course, more exhausts take place per minute than at slow speed, but to offset this we have a very much less volume of steam exhausted per stroke at high speed than at low speed. Practically, it is found that the back pressure increases slightly as the speed increases, the amount of condensation not being exactly constant at all speeds. However, the back pressure should not be greater than

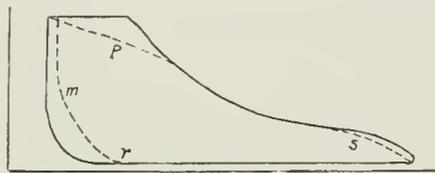

Fig. 1

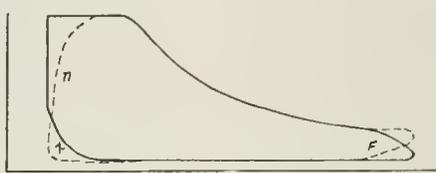

Fig. 2

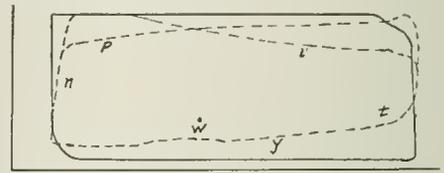

Fig. 3

10 lb. at 20 m.p.h., or 15 lb. at 15 m.p.h., according to the best authorities.

As another example of a very poor card Fig. 6 is shown. This card is a very common one for valves poorly set. The line *ed* shows a lack of lead, the line *dc* shows the wiredrawing and slack motion effect of the valve in opening the steam port, while *cb* shows this effect for the closing of this port or at cut-off. The cut-off and expansion are normal, while *gf* shows a late and

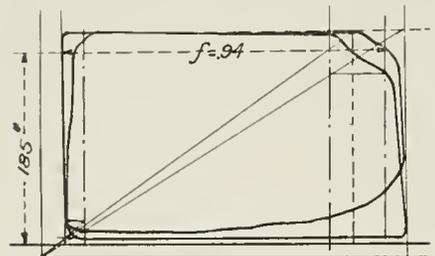

Fig. 4

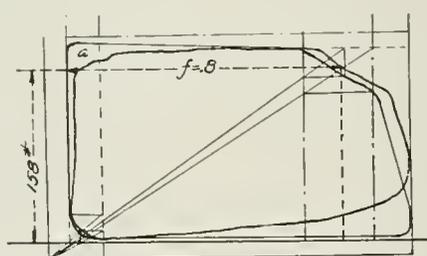

Fig. 5

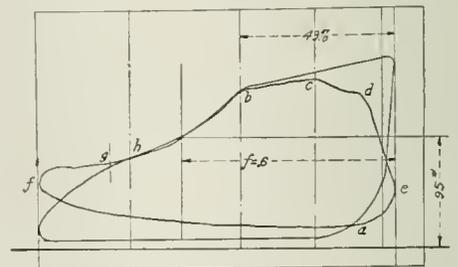

Fig. 6

restricted exhaust, and *fa* shows that the exhaust port does not get fully open until the piston is at *a* on its return stroke—hence the high back pressure and resulting small compression.

As the expansion line for the length *bh* is the same for the good and bad cards, the amount of steam and coal used is, of course, the same for both cards. The coal consumption per horsepower hour, however, is increased 14.5 per cent.

DISCUSSION

While the discussion did not bear particularly on the contents of the paper presented by Mr. Preston as above, a number of interesting points were brought out by the members. It was believed that the Stephenson valve gear would give as good results from the fuel consumption standpoint as any valve gear of the outside type. However, it was stated that with the elimination of the eccentric it was possible to better maintain the outside gear and thus insure a more constant steam distribution.

IMPROVING THE HANDLING OF AIR BRAKES

The air brake instruction car cannot be questioned for its value in detailed study of the air brake system, but the road foreman of engines can perform a great service in giving practical instruction on the road. He can pick out those engineers deficient in this work and give them individual instruction. He is also in a position to advise the shop forces as to what should be done to

provide a brake that will give the best and most desirable results.

The road foreman of engines, due to his knowledge of the road, is also in an excellent position to give valuable information to the operating men regarding meeting points, and the location of sidings, signals, water tanks, etc. He also can be of great assistance in educating the enginemen in making proper engine inspections and reports. There is in the engine a tremendous power to damage and destroy equipment, unless it is carefully handled in starting and stopping, and the traveling engineer by his constant and careful instruction can do much to keep the rough handling of trains to a minimum.

The report is signed by C. M. Kidd (N. & W.) chairman; T. F. Lyons (N. Y. C. West); George Kleifgas; J. B. Hurley (Wab.), and C. P. Cass (W. A. B.).

DISCUSSION

Discussion.—It was believed to be the duty of the traveling engineers to see that the equipment was turned over to the enginemen in proper condition for handling and then to see that the

trains were properly handled. Several roads have tried with success the posting of damage reports due to rough handling, defective brakes, etc. The engineer must be given a train properly made up, that is, the empty and loaded and also the weaker cars should be so distributed throughout the train as to provide the best possible action of the air brakes. Some members believed that better results would be obtained if the mechanical department controlled the matter of making up the trains.

SUBJECTS

The following subjects were recommended for consideration at the next convention:

What effect does the mechanical placing of fuel in fireboxes and the lubricating of locomotives have on the cost of operation?

The advantages of the use of superheaters, brick arches and other modern appliances on large locomotives, especially those of the Mallet type.

Smoke prevention.

Make up of freight trains for tangents and grades with reference to draft rigging and lading.

Assignment of power with a view of obtaining the most efficient service.

CLOSING EXERCISES

Warren S. Stone, grand chief, Brotherhood of Locomotive Engineers, made a brief address during the session Friday morning. He spoke of the traveling engineer as the intermediary between the engineer and the railway officers. Some roads are getting far better results from their enginemen than others, having obtained their implicit confidence by dealing with the men fairly and honestly. He called upon the traveling engineers to "play the game square" and to be sure and place the blame of an accident where it properly belongs, whether it be on the man, machine, roadbed, or wherever it may be.

Mr. Stone was elected an honorary member of the association.

The attendance was 404 members; the secretary reported a membership of 1,061, and the treasurer reported a cash balance of \$7,500. The following officers were elected for the ensuing year: J. R. Scott, president, St. L. & S. F.; B. J. Feeny, first vice-president, Illinois Central; H. F. Henson, second vice-president, N. & W.; W. L. Robinson, third vice-president, B. & O.; G. A. Kell, fourth vice-president, Grand Trunk; A. G. Kinyon, fifth vice-president, S. A. L.; David Meadows, treasurer, M. C., and W. O. Thompson, secretary, N. Y. C.

Chicago received the highest number of votes as the place for holding the next convention.

AMERICAN RAILWAY PERISHABLE FREIGHT ASSOCIATION

The semi-annual meeting of the American Railway Perishable Freight Association was held at the Great Northern Hotel, Chicago, on September 8. Over 100,000 miles of line were represented at the meeting.

The executive committee reported that it has continued active correspondence with traffic associations regarding the necessity and desirability of inserting in all tariffs reasonably uniform rules requiring shippers of perishable freight in carloads to give complete and definite instructions as to whether or not shipments are to be transported under refrigeration, icing, non-icing, ventilation or other authorized accessorial service, and that recommendations substantially to the same effect were made by the Freight Claims Association at its recent annual meeting. The question of securing greater uniformity of tariff rules regarding perishable freight and the possible publication of some joint issue to cover the same is being investigated by the committee, but further time is required. The committee also recommended that all member lines be requested to arrange with their respective law, traffic, operating and freight claim departments whereby they will furnish to the secretary of the association copies of all briefs, arguments and other forms of documents relating to claims, suits, cases or public hearings involving perishable freight service matters, to the end that the association files may not only be kept complete, but that results accomplished by carriers dealing with such matters in one section of the country may become a benefit and of direct practical use to carriers in other sections of the country. This plan would contemplate that the facilities of the association so far as practicable would be at the command of all member lines when they desire special information.

The report of the committee was adopted by the association.

The rules committee reported that it had been unable to proceed with the complete revision of association circular 27-C, containing standard service rules, because some of the important subjects are still under consideration by interested traffic associations, and the committee asked further time for the revision with a view to the revised rules being compiled and put into type before January 1, if possible, for submission to all members of the association. The committee also recommended that the association bring to the attention of all traffic associations the desirability of inserting in tariffs the complete legal definition of perishable freight. The committee also recommended that the association consider the printing of an illustrated poster to illustrate clearly but briefly the proper methods of icing and reicing cars, also tamping ice. Regarding a proposed rule that carriers make notations on billing of perishable freight to show date and hour of each previous reicing, the committee reaffirmed its previous recommendation that the association take no decided position on the question other than to state that if certain roads do consider the plan feasible and practicable it sees no objection to its adoption by such individual roads. The report was adopted.

The service committee reported that it has, in addition to its other work, given consideration to the analysis of various claims for alleged loss or damage to perishable freight which have been presented by member lines to the committee for that pur-

pose and suitable replies have been made to interested carriers. The committee is continuing its investigation of the theory of using ice in the winter to prevent freezing to fruits and vegetables and other perishable goods in transit, and has received some additional information, but requested that further time be granted by the association. The committee believes it will be desirable for the association to consider the question of carriers' non-liability for loss and damage by freezing carload shipments of fruits and vegetables or other perishable goods in transit, when the shipper has not only failed to install false floors to break the frost line or to provide other protection, but has also omitted to request the carriers to furnish any protective service. The report of the committee was adopted.

Other subjects discussed at the meeting were: The present status of carriers' rules and practices covering heated car service by shippers and carriers; the use of ice in packages in the body of cars; damage to deciduous and citrus fruit due to sampling in transit; rules to govern ventilation of cars interchanged with Canadian railroads.

The officers of the American Railway Perishable Freight Association are: Chairman, J. S. Leeds, manager, Santa Fe Refrigerator Despatch, Chicago, Ill., and secretary, E. F. McPike, perishable freight service manager, Illinois Central, Chicago, Ill.

PERFORMANCE OF PENNSYLVANIA ELECTRIC LOCOMOTIVES

Electric locomotives have now been in use for about four and one-half years on the Manhattan division of the Pennsylvania Railroad, operating passenger trains through the tunnels entering New York city under the Hudson river. These locomotives* were designed to start and accelerate a train of 550 tons, in addition to the locomotive, on a 1.93 per cent grade in the tunnels. In actual operation trains of 850 tons are frequently started on this grade and 14 all-steel car trains, weighing over 1,000 tons, are handled without difficulty.

Each locomotive in service passes over an inspection pit once every 24 hours for a running inspection of the machinery, slight repairs being made where necessary. This inspection requires an average time of about ten minutes. After a locomotive has made 3,000 miles, it is taken into the shop for a general or periodic inspection, when all electrical apparatus is thoroughly inspected, tested, cleaned and the necessary adjustments and renewals made to all electrical and mechanical parts.

The shopping for general repairs is governed by tire wear, and a number of locomotives have run from 90,000 to 112,000 miles before it became necessary to turn the tires or do other general repair work. The general overhauling is handled in one of the regular steam locomotive repair shops.

In November, 1914, 33 electric locomotives had completed four years' service, and during that period had made the following mileage and detention record:

Locomotive miles	3,974,746
Total engine failures	45
Total minutes detention to trains.....	271
Locomotive miles per detention.....	88,328
Locomotive miles per minute detention.....	14,667

During this period 463,558 train movements were made, thus giving an average of about 1,300 movements per detention.

The change from steam to electric locomotives and *vice versa*, is made at Manhattan Transfer, four minutes being allowed by schedule for this operation, including the necessary testing of the air brakes. The entire operation, however, may be performed in three minutes and is said to have been done in two minutes.

MILITARY CONTROL OF RUMANIAN RAILWAYS.—Rumanian railways are said to have been ordered to place all rolling stock at the disposal of the war ministry by September 14.

*For a complete description of these locomotives see *Railway Age Gazette*, November 5, 1909, page 881.

NATIONAL INDUSTRIAL TRAFFIC LEAGUE

At the meeting of the National Industrial Traffic League held in Toledo, Ohio, on September 9 and 10, the following resolutions were adopted regarding the railway mail pay controversy:

Whereas, There is a controversy existing between the common carriers of our country and the postoffice department over the compensation due said carriers for transporting the mails, and

Whereas, In various rate advance cases the carriers have insisted that their total net income is insufficient, and their claim has been an important factor in such cases, and

Whereas, If the carriers' compensation for transporting the mails be not adequate, the burden necessarily falls upon the shipping public to make up the deficiency through higher freight and passenger rates, and

Whereas, The honor and dignity of our government demand that said controversy be brought to a speedy conclusion, therefore be it

Resolved, That it is the sense of the National Industrial Traffic League that the fact should be speedily ascertained as to whether our common carriers are receiving adequate compensation, and be it further

Resolved, That our president be instructed to memorialize the proper committees of the senate and house of representatives suggesting that the Interstate Commerce Commission is the proper body to assist in ascertaining the facts and that it be directed to investigate the entire question and report as speedily as possible its findings and recommendations for the guidance of congress in bringing said controversy to a prompt and proper conclusion.

The report of the executive committee discussed a plan for establishing league headquarters at Washington, D. C., but this subject was put over until the next meeting.

In connection with the report of the legislative committee there was a discussion of the subject of codification of the interstate commerce law as to mutual rights of shippers and carriers, and it was decided to co-operate with the American Bar Association in its tentative codification and its movement to have congress take up the subject. On the right of appeal from negative orders of the Interstate Commerce Commission the committee reported that while the shippers ought to have the same right in this respect as the carriers, a change in the law might work to their disadvantage, and it was decided to have the committee study the subject further and recommend some suggestions for a revision of the law without interfering with its present provisions in other respects.

The proposed reorganization of the Interstate Commerce Commission was discussed but no action was taken. The subject of legislation as to uniform classification was discussed but no change was made in the previous position of the league, that the initiative should rest with the carriers and that there should be no legislation on this subject. A resolution was adopted urging an amendment of the Cummins law as to limitation of liability by common carriers to eliminate express and baggage from its application. A resolution was also adopted urging an amendment to the fourth section of the commerce act so that through rates may not exceed the combination of lawful rates, even though one factor is a state rate which has not been enjoined or set aside by competent authority.

In connection with the report of the tariffs committee, the subject of consolidation of individual tariffs in Official Classification territory into association issues, which had been proposed at the last meeting, was discussed and the subject was dropped for the reason that it was believed that no economy would result. The subject of disposition of fractions in the establishment of freight rates will be given further consideration by the committee, which reported that the Interstate Commerce Commission is inclined to look with favor on a plan for

stating rates with no smaller fraction than $\frac{1}{2}$ cent, if the carriers and shippers can agree.

In connection with the report of the freight claims committee, the subject of handling of freight, packing, marking, etc., was discussed and the committee was instructed to begin work on a manual of instruction on this subject to be placed in the hands of shipping clerks.

The subject of duplicate charges on prepaid shipments was discussed, and the league complimented the action of the American Association of Railway Accounting Officers and the American Railway Association on their recommendations for the extension of through interline billing as one means of preventing duplicate charges.

In connection with the report of the bill of lading committee, the league went on record in favor of a "clean" bill of lading, to constitute a plain receipt of freight without the various contract provisions now included in the bill of lading, which it was believed are now not required since the enactment of the Cummins law. It was stated that the export millers will file a complaint with the Interstate Commerce Commission against the export bill of lading and the league also authorized the filing of a complaint on behalf of all lines of business.

A resolution submitted by the weighing committee was adopted, stating that tariffs have been filed with the Interstate Commerce Commission which do not conform to the code of rules regarding weighing agreed to by the league and the American Railway Association and approved by the Interstate Commerce Commission. The weighing committee was instructed to continue conferences with the American Railway Association, or if necessary to ask the Interstate Commerce Commission to reopen the weighing case for final settlement. This referred to a rule of the Central Freight Association lines providing for a charge for light-weighting empty cars.

Edward E. Clark, of the Interstate Commerce Commission, addressed the league at a dinner on Thursday evening at the Toledo Club. Commissioner Clark's address is published elsewhere in this issue.

OUTLOOK FOR COAL CAR SUPPLY FOR COMING SEASON

By ARTHUR HALE

The surplus of coal and gondola cars reported by the American Railway Association for September 1, 1915, was nearly 41,000. This is not far from last year's figures for September 1, (46,000), but the shortage of coal cars this year is over 2,300, while last year it was only 66.

There was no large surplus of coal and gondola cars prior to 1914 until we get back to 1909. There we find on August 18 a surplus of about 42,000.

In 1908 the surpluses were much larger until the middle of October.

It is, of course, difficult to judge from those figures what the situation in coal cars will be in October and November, but in 1909 there was quite a marked shortage of coal cars, which ran up to nearly 12,000 in the middle of November.

There is one point in which the record this year is similar to that of 1909; that is, the surplus decreased very rapidly in August, while in 1914 it came down very slowly. This would seem to point to the possibility of some little coal car shortage in the months of October and November of this year.

On the other hand, the drop this year seems to be about two weeks later than it was in 1909. Here again it is difficult to compare, because this year we have figures only for the first of the months, while in 1908 we had them for the middle of the months as well.

About all that can be said in the matter is that if we can judge this year's showing by that of 1909 there will be a shortage of perhaps 8,000 or even 10,000 coal cars on November 1.

Maintenance of Way Section

The Maintenance of Way Section for October will be delayed one week to enable a complete report of the convention of the American Railway Bridge & Building Association, which will be held in Detroit from October 19 to 21, inclusive, to be included. This section will, therefore, appear in the issue of October 22, rather than in the regular third issue of the month.

The economy of tie preservation and the importance of conserving the timber supply have been emphasized so frequently that they are generally realized. But in discussing such subjects in the abstract, or in large figures for the country as a whole, one is not impressed with their significance so strongly as by more definite statements, such as those made by F. J. Angier, in an article in another column in this issue, in which he shows that the amount expended for ties on the Baltimore & Ohio constitutes the largest single item of material cost with the exception of fuel, and that this expense amounted to \$250 per mile of track maintained in 1913, an increase of 109 per cent in ten years. Entirely aside from the significance of this rapid increase, the actual amount expended is of special significance as an illustration of the importance of careful supervision in the use of this material. The handling of ties is entrusted almost entirely to the track foremen. It is important that as full life as is consistent with safety be secured from all ties. To accomplish this the foreman must be instructed carefully regarding the limits of service and be made to realize the value of the material he is handling. In spite of the attention which has been given this subject in the past, there is still room for improvement, which is made all the more necessary by the continual increase in this item of expenditure.

The Proper Care of Ties

One of the first railway divisions in this country to be equipped throughout with motor cars was the Illinois division of the Chicago, Milwaukee & St. Paul between Chicago and Savanna. Motor cars entirely superseded handcars on this line in 1909 and the results which have been secured from their continued operation, as well as the methods adopted for their care, described in another column, are of special interest. One reason for their success here has been that the roadmaster has made himself at all times conversant with the motor cars, and therefore able to instruct the men regarding their operation. This has not always been done by roadmasters, as is illustrated by the fact that an Italian section foreman on a Western road recently received a motor car direct from the shops, crated, without any instructions for setting it up or running it. It is not surprising that this car proved a failure. Thorough instruction of the men is necessary in handling any new device, and a road owes it to itself to see that any new equipment for which it expends its money be used so as to secure the most favorable results. The motor car is no longer regarded as experimental. It has proved its economy to such a point that many roads are making it standard in place of the handcar. One large road is equipping one-third of the sections on each division with motor cars each year for three years. Another busy double-track Eastern road, with very dense traffic, has discontinued the use of handcars entirely and is using motor cars on all its lines, finding that even on the heavy traffic lines the number of cars hit has been reduced owing to the care exercised by the foremen.

The Increasing Use of Motor Cars

One of the most serious obstacles to the economical management of a large corporation such as a railroad is the lack of direct financial interest on the part of minor officers. As a rule these men are truly conscientious and have the interests of the company at heart, but many of them are prone to criticise because the company fails to supply equipment and material, which to them seems indispensable to the attainment of certain economies in operation and maintenance. They overlook entirely the interest and depreciation charges which the additional investments involve and which might very largely neutralize the savings which they expected to make. One of the Eastern railroads has adopted a practice which will tend to overcome this tendency on the part of track foremen. Each foreman is supplied with a price-list covering all equipment used by the track forces, with instructions to enter the cost of each item on all his requisitions for supplies. This serves as an object lesson in several ways. It calls frequent attention to the number of section gangs on the road, thereby enabling the foreman by only the simplest mental calculation to obtain a definite idea of what it will cost the company to supply one additional tool to each section. An appreciation of the money value of the equipment with which he is supplied will give the foreman a greater sense of responsibility for the contents of the tool house. He will guard against losses and be quicker to note improper and careless use of the tools. Taken together, there is no more faithful class of employees on the railroads to-day than the section foremen, and they offer, therefore, a fertile field for demonstrations as to the best ways in which the company's interests may be served.

An Object Lesson in Economy

THE ROADMASTERS' CONVENTION

THE convention of the Roadmasters' Association, held in Chicago last week, was the most successful in the history of this organization. While the attendance did not exceed that of last year, the reports and especially the discussions were of a higher grade than in previous years. After a long period of difficulties this association has made rapid strides during the past three or four years, so that it is now taking an important place among the maintenance of way associations and deserves the support of the railways.

Few railway associations have more important fields than this, and there is no conflict between it and the American Railway Engineering Association, as each has a sufficient number of problems coming within the special province of its members to occupy its entire time. The Roadmasters' Association should include division engineers and others directly in charge of maintenance of way work and confronted with it in its details as well as the roadmasters not now identified with it. The association confines its activities strictly to problems connected with the maintenance of track. From its very nature the American Railway Engineering Association can devote only a small amount of attention to these subjects, for it must also consider problems of design and those of interest to the bridge engineer, engineer of water service, construction engineer and other branches of the engineering department.

The membership of the Roadmasters' Association is at present confined almost exclusively to roadmasters and track supervisors. It is to the mutual interest of this organization and of the engineers that more engineers interested in maintenance problems become affiliated with this association. In this way it can be strengthened materially and its activities broadened and it can become of more real service to the railroads.

THE SELECTION OF CONCRETE MATERIALS

CONCRETE has become so thoroughly established as a construction material that its application to various uses does not call for the amount of discussion of its merits that characterized the earlier years of its development. It is true that investigations are being carried on with no less zeal, and even along much more systematic lines than formerly, and the cement industry is performing a commendable service in giving publicity to the latest developments. Still, these matters do not excite the attention that was given to concrete in its infancy. In other words, we have reached the point where we are taking things for granted as we do in regard to long-established practices in the use of lumber. Because of this there is a possibility that we are overlooking considerations of great importance in the use of concrete in much the same way that, as has been shown, the details of our use of lumber have long been faulty.

In all classes of concrete work scrupulous care is exercised to insure a good quality of cement, attainment of this object being aided by the general acceptance of well known standard specifications and the simple and tangible character of the tests and their results. On the other hand, there seems to be a general impression that almost any kind of sand or larger aggregate is good enough. Specifications for sand to the effect that it shall be clean and sharp, backed up by a casual glance by way of inspection, are ordinarily considered all that is necessary to secure a good quality of concrete, provided the cement has passed rigid tests. More careful consideration is usually given to the stone or gravel, but even in these a far greater variation in the quality of the materials is permitted than would be allowed for cement.

The influence of variations in the characteristics of sands and gravels upon the strength of mortar and concrete has been generally appreciated by students of this subject. In general, it may be said that the effects of variations in the size and grading of particles and the influences of the presence of loam, clay and vegetable matter, are fairly well understood by the users of concrete. But these things seem to be lost sight of when it comes to the selection of the materials for actual use. All too frequently we see a structure of excellent design and workmanship marred by evidence of the use of dirty aggregate, or one which suffers from porosity because of a failure to study proportions.

The importance of these considerations has recently been emphasized by C. C. Wiley, in Bulletin No. 70 of the Illinois Experiment Station, entitled, "Mortar Making Qualities of Illinois Sand." The extensive tests recorded in this paper demonstrate clearly the need of a careful selection of the sand. It points to the importance of the mineralogical composition as indicating the strength and durability of the particles and demonstrates the futility of specifying a sharp sand. Tests of a large number of samples of commercial sand indicated a variation in the strength of mortar briquettes of 300 per cent.

Construction work on a certain railroad in the Middle West was carried on at one time with gravel and sand, hauled an average distance of 300 miles, when subsequent investigation disclosed a superior material on the company's lines less than 50 miles from the work. This state of affairs would not have existed if proper study had been made of all the materials tributary to the construction district.

The use of sand cement in certain sections of this country directs attention to another phase of the economics of concrete. Sand or silica cement is a mechanical mixture of Portland cement with a pure, clean sand, very finely ground together in a tube mill or similar machine. For the best grade of Portland cement, the proportions of cement to sand are 1:1, although as lean a mixture as 1:6 has been made to compete with natural cement.

In standard Portland cement 80 per cent must pass a 200-mesh sieve and probably not more than 40 per cent of the par-

ticles of cement are chemically active. On the other hand, a blend of Portland cement and sand has shown from 90 to 95 per cent passing a 200-mesh sieve. Because of this extremely fine grinding it is probable that much more than 40 per cent of the particles in the original standard cement will be chemically active. If standard Portland cement could be so ground that 90 to 95 per cent would pass through a 200-mesh sieve, a barrel should make as much concrete as two barrels of blended cement, the ultimate strength of the concrete being the same in both cases. A sand cement should make a concrete equal in every way to that made from standard cement, no matter where used.

In the southwestern part of the United States there is a zone about 500 miles wide, extending from the center of the state of Texas through New Mexico and Arizona, and then turning to the north through the center of Nevada into Oregon, in all a total length of 1,400 miles, in which no cement is manufactured. The price of cement, at the mills, tributary to this district, except such as would come from the Kansas, Oklahoma and Texas districts, is materially higher than in the rest of the country. In 1914 the average price in the Rocky Mountain district, as given by the report of the Department of the Interior, was 40 per cent higher than in the entire country. Taking this into consideration, together with the great length of the haul to most points in the district, it would seem that the use of the sand cement would be a matter for serious consideration.

COMPARATIVE PUMPING COSTS

AN article in this issue discusses the necessity for the use of a unit adequately expressing power in any comparison of pumping costs. Special attention is directed to the error of reporting these costs in units expressing only the amount of water delivered. That the futility of such a report of pumping is readily appreciated by many who have no definite understanding of the principles of hydraulics, is evidenced by the fact that reports in terms of water pumped are frequently supplemented by statements of the difference in the elevation of the water at the source and at the point of delivery, ignoring entirely, however, the friction head which may constitute the major portion of the pumping resistance. On the other hand, the office man may set out to determine the static and friction head and calculate the cost of pumping in terms of gallons pumped against a one-foot head, perhaps reducing this finally to horsepower. This gives, without question, the best comparison of pumps that can be made without actual observation of the water horsepower, but it may be widely in error because of the opportunity for discrepancies between the assumed friction factor and the actual resistance of the pipe lines. Old pipes are rough and may be clogged with scale and sediment, the actual arrangement and size of the pipes may be different from those given in the record, and there may be other conditions, concerning which the office man has no knowledge that will seriously affect his results. The conditions outlined point to the need of a more thorough supervision of water service matters, combining practical experience with a thorough knowledge of hydraulics and allied subjects. Such a supervision will not only make for the correct determination of pumping costs, but will tend to secure better results in all phases of water service. The consumption of water at a given station may be increased threefold, yet the water is still pumped through a long pipe line, once adequate, but now entirely too small, necessitating excessive velocity and consequently a wasteful friction. Cases have been discovered where the saving in pumping in one year would pay for a new pipe line of proper size. A long neglected check of the displacement of the pump against the actual volume delivered at the tank may disclose a discrepancy which the condition of the pump valves will not permit of explanation as slip, with the result that a leak of years standing is discovered. Many other examples could be given showing the economies to be obtained by a proper attention to this important department.

The Roadmasters' Thirty-third Annual Convention

An Abstract of the Committee Reports and Discussions Presented at the Meeting Held Last Week in Chicago

The thirty-third annual convention of the Roadmasters' and Maintenance of Way Association of America was held at the Auditorium Hotel, Chicago, September 7-10, inclusive. About 200 members were in attendance. The convention was one of the most successful in the history of the association, particularly in point of interest displayed in the committee reports and in the character of the discussions. The exhibits of the Track Supply Association were also up to the usual standard.

The convention was called to order by President P. J. McAndrews (C. & N. W.) at 10:30 Tuesday morning. The association was welcomed to Chicago by Harry E. Miller, city prosecuting attorney; by W. J. Towne, assistant general manager, Chicago & North Western, and by F. A. Preston, vice-president of the Track Supply Association. In his remarks Mr. Towne particularly emphasized the increased responsibility of the roadmaster in recent years and the growing importance of developing economical methods of working, stating that it is becoming absolutely necessary to make every dollar go as far as possible, consistent with safety. Past Presidents T. Hickey (M. C.), A. E. Hansen (A. T. & S. F.), James Sweeney (C. & E. I.), T. Thompson (A. T. & S. F.), A. M. Clough (N. Y. C.), and W. Shea (C. M. & St. P.), also spoke concerning the various phases of the work of the association. In his opening address President P. J. McAndrews reviewed the activities of the association in the past year and commented upon its future.

The officers of the association for the past year were: President, P. J. McAndrews, roadmaster, Chicago & North Western, Belle Plaine, Ia.; first vice-president, Colman King, supervisor, Long Island, Jamaica, N. Y.; second vice-president, M. Burke, roadmaster, Chicago, Milwaukee & St. Paul, Chicago; secretary-treasurer, L. C. Ryan, roadmaster, Chicago & North Western, Sterling, Ill. The report of the secretary-treasurer showed that 120 new members had been received during the past year and that there is a balance of \$685 in the treasury.

THE PROPER ORGANIZATION OF SECTION FORCES AND METHODS FOR MAINTAINING AND POLICING TRACK

FOR HIGH SPEED HEAVY TRAFFIC ROADS

General Make-up of Track

Width of Subgrade.—Single track, 21 ft.; two tracks, 33 ft.

Drainage.—All cuts in clay soil or in a mixture of clay and sand should be tiled on one or both sides of the track, depending on the amount of moisture encountered. On multiple tracks in wet districts a line of tile should be placed between each set of two tracks. All tile should be laid below frost line on a level to permit proper drainage and should be covered by some porous material. The size should be governed by the amount of moisture. Surface ditches should be a standard distance from rails. In deep cuts, where the surface slopes toward the track, ditches of sufficient depth should be made on top of the cut at least 40 ft. from the track to prevent flood waters running on to the tracks and from washing down the slopes of the cut.

Ballast.—The best ballast available should be used. We recommend crusher run stone ballast of hard limestone, with a maximum size of 2 in. and a minimum size of 1/2 in., free from clay and dust when received from the crusher. Ballast should be placed to a depth of not less than 8 in. under the ties, and dressed even with the top of the ties in the center, with a slight slope to about 2 in. below the tops of the ties at the ends and sloping 1 1/2 to 1 from a point 6 in. outside the ends of the ties to the base of the ballast line.

Rail.—The best quality of rail of not less than 100 lb. to the yard should be used. Rail in this class of track should at all times be in an almost perfect condition. It should not be left in track for any length of time after it becomes battered or curve worn to any extent, as in this condition it is nearly impossible to maintain good riding track, and, if left in too long, may cause accidents.

Joints.—Joints should be of substantial plain type, with no portion protruding below the base of rail. Oil-treated steel is preferred.

Bolts.—One-inch oil-treated bolts are specified.

Frogs.—No. 12 frogs are desired for slow-speed crossovers and passing-track movements, and No. 20 frog for high-speed crossovers operated by interlocking.

Track Ties.—Ties 7 in. by 9 in. by 8 ft. 6 in. shall be placed in the track so there will be 4 in. more outside of the outer rails on double track than outside of the inner rails. For single track ties should be laid so they will extend equally outside of each rail except on curves in excess of 2 deg., where they should be placed so that 4 in. more is on the outside of the low rail than outside of the high rail. Twenty ties should be used per 33 ft. rail-length, making slightly more than 11 in. spacing between each. White oak is recommended and we believe it economical to use tie plates on each tie, such tie plates to be of the anti-creeping type.

Tie Plates.—Shoulder tie plates should be not less than 5/8 in. thick.

Anti-Creepers.—Enough should be used to hold the rails from creeping of a type easy to apply, simple in construction and that stay on.

Switch Ties.—Use 7 in. by 9 in. of various lengths of hardwood.

Make-up of Passing Tracks.—Main passing tracks should be provided with a fair quality of ties and rail of a section approximating main-track rail. It is often found economical to use the lighter sections taken from main tracks when they are being relayed with a heavier rail. The ties in passing tracks and important side tracks should never be of such inferior quality as to require labor being expended unnecessarily in frequent renewals or an element of danger to employees by derailment being involved.

Work Equipment Recommended to be Available, Possibly to be Used on More than One Sub-division

Steam ditchers, power-rail loaders and unloaders, center-dump ballast cars, a few air-dump ballast cars to use with a steam ditcher, a clam shell, ballast spreaders, ballast shapers of the most modern type, for widening and shaping the subshoulder and ballast shoulder, rail-laying machines, power subshoulder weed-mowers, snowplows and flanger cars.

The above power-driven machinery and labor-saving devices have been recommended because we think them necessary to offset the constant deterioration in quality of available track laborers. All labor-saving machinery should be given careful consideration and made use of where possible. The saving that may be made by the use of bank-widening, ballast-shaping, rail-loading, rail-laying, weed-mowing and other machinery is so apparent that we are at a loss to understand the tardiness of some railway managements in their general adoption of this practice.

Weed-killing by the application of chemicals has been proven a great labor and money-saving process. The use of air-driven rail saws and drills should be gone into and advantage taken of them as a means to attain efficiency.

A Roadmaster's or Supervisor's Subdivision Organization, the Length of Subdivision and the Length of Section

Roadmaster or supervisor—1

Length of division—100 miles of double track or its equivalent
Assistants—2

Chief Clerk—1

General Timekeeper—1

General Material Clerk—1

Foremen—34

Length of section—3 miles of double track or its equivalent
One extra foreman and from 8 to 20 laborers

One assistant foreman and track-walker combined for each section, to be paid 25 cents a day more than laborers

Blacksmith—1

Carpenters—2

Section men— $1\frac{1}{2}$ man per single-track mile in season when ballast can be worked and ties put in—1 man per mile in seasons when ballast cannot be worked or ties put in in climates where rail renewals can be made and fences can be rebuilt and repaired.

We recommend this subdivision organization on subdivisions of 100 miles in length because more supervision of the right kind is necessary to secure the maximum results in safety and efficiency.

Only a small percentage of the foremen are quick to discover and put into practice simpler and easier methods for bringing about required results. It is amazing to observe the various methods of performing each particular operation by different foremen on one division and especially to note the variation in costs for the same kind of work.

We recommend a clerk for every roadmaster or supervisor because the duties he can perform will enable the head of the subdivision to spend more of his time where he is needed, *on the road*, where he can do the most good. A general timekeeper is needed on divisions where the roadmaster or supervisor handles the time of his men. He should in no way relieve the foreman or road timekeeper from keeping the time of his men, but rather should keep a check on them, insuring correct timekeeping and proper charges being made to various operations.

A general material clerk should in no way relieve foremen from the responsibility of caring and accounting for all material under their charge, but should keep a correct record of all material handled on divisions where used, where stored, etc. He should do this by constant checking on the ground on the various sections.

We recommend a subdivision floating-gang foreman and crew of varying size, composed of picked men whose compensation should be slightly more than the regular section men. This gang should be equipped with a portable camp and tools for various track work. This crew should be employed to do various special jobs, such as building new side tracks, transferring cars, handling snow and various other jobs. At times when special work is slack it should assist some foreman in doing heavy work and give assistance to the foreman who is behind in his work.

The above section forces should be employed the year around because the practice of reducing forces to the minimum in the early fall does not appear to be the best. With certain limitations a force more nearly uniform throughout the year is most economical, for a better grade of laborers will enter and remain in service and be satisfied with a lesser wage if assured of work all the year round. In a climate that will permit, such work as relaying rail, gaging track and rebuilding fences can be done in the late fall and early spring and much other miscellaneous necessary work can be carried on throughout the entire winter. *There is much less work to be done during the summer than in cases where the force is reduced below a reasonable number early in the fall*, and consequently a less number of men may accomplish the season's work, thus greatly reducing the necessity for large extra gangs and so-called floating gangs during the summer months, if not altogether eliminating them.

We recommend a blacksmith on each subdivision to repair tools, make light repairs to section cars, etc., because such a man, working under the direction of the roadmaster, will more nearly secure the full life out of each tool, as he will be getting suggestions from the men who use them. We recommend two carpenters to relieve the section men from doing many tinkering jobs such as repairing planked crossings, wing fences, bunk cars, etc.

Recommended Methods for Doing Heavy Work

Ballasting work should be started as early in the spring as track conditions will permit and closed up early enough in the fall to permit the section men to get over the new stone, leaving it in first-class condition for winter. Old material should be removed to the bottom of the ties and spread out for widening embankments, leaving the subgrade in a rounding shape. All ditches should be cleaned and embankments strengthened where necessary in advance of ballasting operation.

All necessary tie renewals should be made and ties properly spaced. Track should then be lifted to the proper grade making the first lift to the top of the grade stakes and only tamping by filling under the ties at the ends and under the full width of the rail, using round-pointed shovels or spades for this work. After the track has been given at least a few days' settling under traffic, a second and final lift should be made and the track tamped carefully with diamond-pointed tamping bars or tamping picks from the outside ends of the ties to a point fully inside of the rail base. Center-dump ballast cars and center-ballast spreaders are recommended for handling the new ballast.

From reports coming under our observation we believe slot spiking at joints or the spacing of ties immediately under the joints is unnecessary and constitutes a waste of labor. Uniform spacing of ties and anchoring of the track by the use of anchor tie plates or anti-creepers is more economical from every standpoint. However, if some railways insist on spacing ties to conform to the angle bar slots, rail laid during the winter months, if properly anchored by anti-creepers, can wait until the condition of roadbed will permit tie spacing with no detrimental results to rail or surface.

The committee recommends that as much rail as possible be laid in the early fall, winter and early spring.

In making renewals of rail the basic principles of this work should never be sacrificed to the sometimes too insistent demand of railway managements for fast work. In other words, rail should be laid from the practical rather than from the theoretical standpoint. To lay rail right, the work must be done so that the new rails have proper bearing on each tie. This means in most cases a careful adzing of all the ties. Proper expansion is the other essential of good rail laying, while the items of careful application of joint material, immediate and continued tightening of bolts, the proper driving of spikes, immediate anchoring to prevent creeping and destruction of uniform expansion and replacing of the ties for uniform support under each rail, are so important that the neglect of any means waste.

Sufficient supervision should be provided to insure competent men overseeing all features of the work. The number of men in one rail laying gang is a factor that should be considered carefully, bearing in mind that large gangs with insufficient supervision or small gangs with frequent waste of time walking back and forth, are elements of loss that should be considered and kept to the minimum.

Handling Material

On each division of 100 miles a small, well arranged and well equipped material yard should be maintained, and if possible equipped with air or other power to operate a drill, rail saw and crane for handling rail, ties and other heavy material.

If ties for annual renewal are received in the fall and winter preceding their use, they should be distributed along the track where needed and piled in small neat piles with an aim to keep

the maximum distance of truckage from pile to place of installation, below 66 ft. Where this cannot be done, they should be piled in a material yard and distributed where needed when ready to install.

As a general rule rail is rolled only a short time preceding its installation, but if it is not to be used within a reasonable time after being received, it should be stored in a yard rather than distributed along the track. Switch ties, fence posts, crossing plank and fence lumber should be sorted and stored in a yard and only distributed as required for immediate use.

Scrap, as well as usable materials, should be cleaned up regularly and assembled until disposition is given.

At a designated time, say, once every two months or oftener, the roadmaster or his assistant should attach sufficient suitable cars to the way freight if he has no regular work train and gather up all scrap, usable rails partly scrap (accumulated by repairs), defective rails and in fact everything but a minimum allowance of emergency material such as rails on rest, a few angle bars, spike, bolts, etc., leaving anything of course that will be used immediately.

Renewal of Track Ties

This work should be commenced as early in the season as roadbed conditions will permit and continued with as few interruptions as possible until the season's requirements are all in. When track is being re-surfaced ties can be renewed at the least cost. To keep stone ballasted track in the best possible riding condition it should be surfaced out of face at least once every three years. Therefore, we recommend that, in so far as possible, tie renewals be made only in such portions of the track as are surfaced out of face each year. The matter of inspecting and indicating the ties that should come out of main track, the manner of applying new ones and the number furnished, are items of importance and should be given a great deal of attention by supervising officers.

L. C. RYAN (C. & N. W.) Acting Chairman.

DISCUSSION

In discussing the width of subgrade the committee replied to a question that it had in mind 13 ft. between track centers in placing the width of subgrade on double track at 33 ft. After attention had been called to the fact that the laws in some states require a minimum distance between track centers on new construction of 14 ft., the report was amended to provide that the minimum width of subgrade should be 21 ft. for single track and 20 ft. greater than the distance between track centers for double track.

In discussing drainage, J. O'Connor (M. St. P. & S. S. M.), opposed laying tile lower than 4 ft. below the bottom of the surface ditch even in cold climates, as he had found that running water does not freeze in these drains. It is his practice to use 8 in. bell tile and to backfill the ditch to the top with cinders or coarse gravel. With this construction he reported no difficulty with heaving. W. Shea (C. M. & St. P.), described a recent examination of a number of drains in northern Missouri. These drains have been laid 4 ft. deep and 3 ft. beyond the ends of the ties and have been backfilled with cinders. As they were not carrying off the water an examination was made, and it was found that the heavy power recently installed had forced a stratum of blue clay through the cinders above the tile, shutting off the access of the water into the tile. Under these conditions he had secured the greatest success by digging a deep ditch either with teams or ditchers and then filling it with cinders. M. Connerton (Q. & C.), emphasized the importance of making the depth at which tile is laid dependent on local conditions, being sure to go below all pockets of water in the roadbed. A. E. Hansen (A. T. & S. F.), described his practice of laying 6 in. vitrified bell-end tile below the track ditches with tees and 4 in. laterals extending 1 ft. inside the rail at intervals of about 6 ft. When laying this tile he re-

moved all the old material on the shoulder and backfilled with cinders to enable the water to reach the drains. This construction cost \$0.50 per lin. ft. of track, and has drained the roadbed as well as the ditches.

In discussing the sizes of crusher run ballast, L. C. Ryan stated that he has found very little trouble with ballast between the limits recommended by the committee. J. P. Corcoran (C. & A.), uses stone ranging from 1 in. to 2 in. in size. He has found crusher run stone too fine, the finer particles disintegrating and permitting the track to churn. T. Hickey (M. C.), stated that he had secured satisfactory results from stone ranging in size from $\frac{3}{4}$ in. to 2 in. A. M. Van Auken called attention to the fact that the proportions of stone of the various sizes varies from day to day. H. Van Gorder (C. & N. W.), thought this was caused by using stone from strata too near the surface.

There was an extended discussion regarding the point at which curve worn rail should be removed from the track. T. Hickey considered rail safe until the wheels begin to strike the angle bars. M. J. Connerton disapproved of this guide, as the dimensions of the angle bars vary on different roads. T. Thompson (A. T. & S. F.), advocated the removal of rail when worn $\frac{1}{2}$ in. on the head. W. Shea has prepared three templets for each section foreman for use with A. R. A 90-lb. rail with a $2\frac{3}{4}$ in. head. When templet No. 1 (showing a head of $2\frac{3}{16}$ in.) fits the rail, the foreman notifies him. When the rail is worn to correspond with templet No. 2 ($2\frac{1}{8}$ in. head) he inspects the rail and orders other rail to replace it. When templet No. 3 (with a head of 2 in.) fits the rail, it is taken out at once. On motion of J. Buel (Ark. Cen.), this paragraph was amended to provide that rail on the high side of curves should be removed when the head was worn $\frac{1}{2}$ in.

The recommendation of the committee specifying joints, no portion of which should protrude below the base of the rail, created a great deal of discussion. The committee stated that it had in mind the laying of rail without the spacing of ties in making its recommendation, and while there was no opposition to the practice, it was felt that the recommendation of the committee was too broad, and it was amended to recommend "joints of substantial type, no portion of which protrudes below the top of the tie to permit laying rail in the winter, oil treated steel preferred."

The first half of the paragraph relating to track ties was amended to show that this was offered experimentally and was not to be recommended as standard practice at this time.

While discussing the paragraph regarding anti-creepers, the committee stated this provision was designed to overcome the need for slot spiking joint ties.

In the discussion of switch ties, J. Buel said that in his opinion such ties should be wider than track ties, and with the size of the latter established as 7 in. by 9 in., he believed that the switch ties should be 7 in. by 10 in. J. W. Powers (N. Y. C.), said that he believed additional width was necessary only for the frog ties because of the greater impact to which they were subjected and because of the notching necessary. On the other hand, it was the experience of L. C. Ryan that more switch ties were renewed on account of cutting or decay around spike holes than because of breaking, owing to insufficient strength. With a plate covering the full width of the tie he believed that a 9 in. width is entirely sufficient.

In the discussion of work equipment recommended, J. O'Connor stated that he believed a weed burner was one of the most economical and efficient devices for getting rid of weed. His method of procedure is to make one run with the burner to kill or dry up the weeds. After an interval of two or three weeks the weeds are thoroughly dry and a second run then burns them completely. In answer to inquiries concerning trouble with fires in ties he stated that this danger was very slight. In crossing a pile trestle or a deck bridge it is not even necessary to put out the fire on the burner, but the burner is simply raised until the bridge has been crossed. Two section

hands following with a barrel of water on a push car can readily put out any fires that start in the ties.

J. Buel reported adversely regarding the use of chemical weed killers, stating that weeds were killed temporarily, but came up again. The chemical he had used was poisonous and resulted in the death of stock. L. C. Ryan stated that he had made one application on 100 miles of double track late in July, 1914, which killed all of the weeds for the rest of the season at a cost of between \$35 and \$48 per single track mile. Another application made earlier in the season this year cost only \$23 per single track mile. The cost includes the cost of fluid, labor and train service. Last year 90 gal. of the chemical was required per mile, while this year only 60 gal. was necessary. He recommends two applications of 40 gal. each per season. The chemical is diluted 1 to 25. The outfit he used covered 60 miles per day, although greater distance could have been covered if more water tanks had been available. A. E. Hansen objected to the use of chemicals to eliminate weeds from rock ballast. In his opinion it would be better practice to clean the ballast with forks. He had used chemicals to kill weeds on the sub shoulders, using a chemical prepared by the railway company consisting of creosote, potash and arsenic and making one application each season. This cost \$52 to \$53 per mile and gave good results.

In a discussion of organization and particularly of the need of interpreters, C. King stated that the Long Island and the Pennsylvania have started campaigns of education among their track forces, three-quarters of which are Italians. Most of these men can talk English, but not all of them can read and write it. Most of them are enthusiastic about the plan, which is largely of a correspondence character, although the instructor comes in personal contact with the men occasionally. The course covers the use of track terms and matters closely allied with track work and also includes the principles of "safety first."

J. O'Connor objected to the prevailing tendency to increase the size of roadmasters' or supervisors' districts, stating that with the grade of men now obtained for section foremen, much of the roadmaster's time is taken up in directing such work as the placing of a turnout or crossing which the foreman had previously been able to do without his assistance.

The recommendations of the committee regarding the laying of rail in winter and eliminating the slot spiking of joints created a great deal of discussion. The practices of the different roads which have tried this method were related. One or two members told of difficulties in anchoring light rail carrying heavy power. The consensus of opinion strongly favored the application of sufficient anchors to hold the rail from creeping without slot spiking the joints.

In discussing the method recommended for relaying rail and particularly the statement regarding the adzing of ties, the question was raised as to the merits of the canting of rails. D. O'Hern (E. J. & E.), advocated this practice based on extended experience with it. Other members opposed it. To get the question before the convention, L. C. Ryan moved that it be recommended that rail be laid vertical, which motion carried.

PROPER ORGANIZATION OF SECTION FORCES AND METHODS FOR MAINTAINING AND POLICING TRACK. FOR LIGHT CONSTRUCTED RAILROADS CARRYING HEAVY TRAFFIC

There is no item of more vital importance than the proper construction and care of the roadbed. When it becomes necessary to remove the cap soil in perfecting the grade, it should be replaced, as it will stand up and shed the water much better than earth beneath the surface. The roadbed should be reinforced at every point permissible and properly drained. No water should be allowed to stand in borrow pits or in pockets near the roadbed. The top width of roadbed should be 18 ft. for main track and 16 ft. for side track. The shoulders of fills and the lines of ditches in cuts should be regular and parallel with the track. Ditches at the ends of the cuts should be curved away

from the fills so that the slopes of the ditches will not be washed away.

Earth taken from ditches should not be thrown on the slopes or tops of cuts but should be distributed evenly on the slopes of fills. When ditching, care should be taken to keep material from falling on the ballast or at the ends of ties. Cross drains should be put in where necessary. All ditches and culverts and the ditches leading to them should be kept clear of mud, drift or other obstructions. Where water is beginning to undermine culverts or other masonry, prompt steps should be taken to stop the damage by the use of rip-rap or by some other means. Surface ditches should be cut above the upper slope of side hill cuts when the natural material is unlikely to slide on account of surface ditches. These ditches should be at least 10 ft. from the top of the slope of cuts. A 6-ft. beam should be left between the foot of embankment and the edge of borrow pit or ditch. Ditches should have sufficient slope to carry the water off rapidly but the depth should not be sufficient to weaken the roadbed.

Live cap soil makes the best ballast, if obtainable. In absence of this we would recommend the use of gravel or cinders, especially for soft, rotten spots in the roadbed.

Cross ties should be 6 in. by 8 in., by 8 ft. preferably of hard wood, uniform in size and thickness; no less than 18 ties to a 30-ft. rail in main track and 16 to a 30-ft. rail in side track. Soft wood ties should be treated with a suitable preservative. Tie plates should be used when practicable.

In laying steel, rails should be laid joints evenly broken in order to space the ties properly. The allowance for temperature variation should be from $\frac{1}{8}$ in. to $\frac{3}{8}$ in.

When center stakes are given the track should be lined accurately to them. Center stakes should be preserved. Track should be lined before it is surfaced; then when surfacing is completed the finishing should be given. Curves should be approached with uniform elevations of the outer rail on regular curves and with the elevation varying with the curvature on spiral curves. The level-board should always be used when surfacing or smoothing track.

No curve should be elevated more than 5 in. Elevation must be governed by the location, degree of curvature and speed of trains. Easements should be to 40 ft., except on reverse curves. The elevation should be proportioned according to the location and degree of curvature. The gage on curves sharper than 4 deg. should be widened from $\frac{1}{8}$ in. to 1 in., according to the degree of the curve.

Tightening Bolts

Joints should be full bolted and kept uniformly tight. In general, bolts should not be tightened in extremely hot or cold weather.

When rails creep so as to close the expansion spaces at joints along one stretch of track and open them at another, the rails should be drifted back when these spaces exceed $\frac{3}{8}$ in. To offset this, large select ties should be placed under joints and spiked in slots; good rail anchors or rail anti-creepers installed.

Sections should not be longer than 6 miles for single track. Foremen should be allowed one man for each mile eight months in the year and sufficient force during winter months with extra allowance for handling snow. When practicable, section crews should be located at the center of their sections.

Every fifth telegraph pole should be numbered. During the last months of the calendar year the track should be gone over carefully, estimating the number of defective ties located between these poles to the end that ties may be distributed where they are needed, thus saving expense of trucking as much as possible. Ties should be distributed not later than February. March, April and May are the three principal months for tie renewals. In the meantime, right-of-way fences, cattle guards and wings and crossing planks should be looked after so as not to interfere with spring work. Following the tie renewals comes the spotting up and resurfacing, cutting weeds and grass

on the track and right-of-way and then ditching and general cleaning come in order.

Section motor cars should be furnished as far as practicable.
J. BUEL (Ark. Cen.) Chairman.

DISCUSSION

At the suggestion of J. Sweeney (C. & E. I.), the paragraph on ties was amended to add after soft wood ties, "And such hard wood ties as will take treatment should be treated, etc." In the discussion of the paragraph on maximum elevation, M. Burke (C. M. & St. P.), did not think that 5 in. was sufficient elevation for all speeds. J. Buel explained that it was the opinion of the committee that the speed on light constructed railroads such as are under consideration in the report of this committee, would necessarily be restricted by such amounts as would permit safe operation around all curves at elevations not exceeding 5 in. He explained that it was his experience that mud ballast would not permit of greater elevation, that the tracks would slip, or that the ties would settle under the low rail and give excessive elevation if the track is not watched very closely. This opinion was confirmed by other members. On a motion by W. Shea (C. M. & St. P.), this section was amended to read "That the maximum speed on the class of roads covered by the title of this report shall be 40 miles per hour, and that the maximum superelevation of curves shall be 5 in."

The recommendation of the committee that the gage on curves sharper than 4 deg. should be widened, created extended discussion. The practices of several roads were described, showing that there has been a tendency during recent years to maintain the track to standard gage on curves up to 8 and even to 10 deg. A number of the members opposed the recommendation of the committee and it was finally voted down.

In discussing the recommendation regarding the length of sections, W. Kofmehl (C. M. & St. P.), stated that it was entirely practical to handle sections 7 to 8 miles long with motor cars. J. O'Connor emphasized the importance of the density of traffic on the allotments of section forces and the difficulty of establishing any uniform allowance. He favored sections with a maximum length of 6 to 7 miles on heavy traffic single-track lines, equipping such sections with motor cars. Over 500 sections on his road are now equipped with such cars.

PROPER ORGANIZATION OF SECTION FORCES AND METHODS FOR MAINTAINING AND POLICING TRACK FOR LARGE TERMINALS

We have taken as our basis for the report a terminal consisting of approximately 150 miles of track which handles on an average the following traffic each 24 hours: Freight trains, 102; passenger trains, 111; light engines, 87; passenger cars, 888; freight car loads, 2,206; freight car empties, 405.

Working on the basis of a man to the equivalent mile of main track we recommend for a summer force—0.75 man and for a winter force—0.50 man. Equivalent mileage is to be computed on the following equivalents for 1 mile of main track: 1½ miles of siding, 15 switches, 20 interlocking derails, 7 single-track diamond or right-angle crossings, 5 movable-point crossings or double slip switches, 20 single track plank crossings, 24 ft. in length.

Four miles of main line and 12 miles of side track or its equivalent is a normal section for one foreman. Each section crew should be organized to consist of 1 foreman, 1 assistant foreman, 1 track walker, 1 lamp man and yard cleaner combined and enough laborers to make the gang equivalent to 0.75 man per mile in summer and 0.50 man per mile in winter. The foreman should be allowed to employ the laborers in his own gang if it is possible. The assistant foreman should be picked from the laborers by the foreman, roadmaster or supervisor.

Each section crew should make all tie, rail, frog and switch renewals until such time as it becomes necessary to relay a cer-

tain track out of face or to relay a lead out of face when the section foreman should be given an additional allotment of men.

Cleaning Tracks

Yard cleaners should keep rubbish, coal, etc., picked up from the tracks and right-of-way and piled in places where it can be picked up at stated intervals. Team tracks and freight-house tracks should also be kept clean at all times by one or more regular men.

A sufficient amount of emergency material should be kept at one or two convenient places where it can be easily reached and quickly loaded when needed. Power derricks should be used when electricity or air is available. Rails and ties for the season's requirements should be piled in a yard so that a work train could easily and quickly load each section crew's daily requirements. This material should only be distributed the day it is to be used if it is along a track or where switchmen and trainmen have to walk.

Rail in heavy switching leads should not be lighter than 80-lb. section. Switch ties should be 7 in. by 9 in., white oak preferred and tie plated. Nothing shorter than a No. 9 frog should be used in leads or other yard tracks where frequent heavy switching is performed. Frogs should be so constructed that ordinary angle bars can be applied at either end without difficulty. Guard rails should be at least 10 ft. long and securely fastened to the main-track rails. Nothing shorter than a 15-ft. switch point should be used and a cast-steel filler should be placed in the heel of each switch point.

When making tie and rail renewals on an entire track through the yard, the track should be taken out of service. Rail, ties and other material needed should be distributed by work trains and the old material taken out should be picked up by the trains before the track is put back into service.

In a terminal as above mentioned the roadmaster or supervisor should have a regular work train. Each supervisor or roadmaster should also have one blacksmith and helper. One or more carpenters should be assigned to each roadmaster or supervisor to repair fences and gates, plank street crossings and do other miscellaneous work. Track walkers do not relieve the section foreman of the duty of personally policing his own territory.

C. S. BROOKS (T. R. R. A. of St. L.), Chairman.

DISCUSSION

In discussing the equivalent mile classification M. Burke (C. M. & St. P.), objected to 1½ miles of siding as equivalent to 1 mile of main track, as in his opinion the cost of maintaining a mile of main track is much more than for that amount of siding. On the other hand, he objected to 15 as the equivalent in railroad crossings of a mile of main track, stating that on that basis he would much prefer to maintain the latter. D. McCooe (G. T.), stated that in his experience with a terminal including 150 miles of track, a large part of the mileage classed as sidings would be subject to frequent train movements—much more than would be received by the ordinary standing track. This explanation was extended by L. C. Ryan (C. & N. W.), who called attention to the fact that the term sidings in this classification included all tracks other than main tracks. A suggestion by A. M. Van Auken that the classification should be further subdivided met with disfavor. A question by J. B. Kelly (M. St. P. & S. S. M.) as to whether traffic was to be taken into account in this classification was answered in the negative. D. McCooe made reference to the equivalent-mileage basis proposed by the American Railway Engineering Association and said that it was applied to sections on his districts with the result that one section including only 1½ miles of main track was found to be equivalent to 16 miles on the equated basis. After extended discussion regarding the number of railroad crossings equivalent to a mile of main track, the report was amended to read 7 cross-

ings instead of 15. The rest of the report was accepted as information without further comment.

NEW AND EXPERIMENTAL TRACK ACCESSORIES AND TOOLS

Miscellaneous

The gasoline motor car has been perfected so that it will now perform satisfactory work under the most severe conditions. What we mean by severe conditions are heavy grades, heavy loads, strong head winds, etc.

Rail benders have been improved so that rail can be bent or curved nearer the end than with the old style Jim Crow, making a much more desired tool.

Rail-laying machines for relaying steel are still being improved and are warranting the support they have been given.

The tool grinders now on the market with their different attachments for holding the different tools properly on the face of the stone are a decided improvement over the old grinding stones and flat files formerly used.

Track drills have been improved so that they are much more substantial. They can be released from the rail and set up with much greater ease than formerly.

The mechanical percussion tamper is now being used and perfected. This fills a long-felt want of the track department and should be encouraged by all roadmasters, especially in yards and terminals, where the machines can be operated from pneumatic signal lines without the expense of additional power.

A material improvement in steel fence posts has been made in the last year or two. There are now on the market concrete fence post machines which mold eight posts at a time. Such machines can be furnished section gangs and they can make cement posts at such times as the weather will not permit outside work. A good concrete fence post can be made for about 18 cents each, not figuring labor and sand. As timber posts are advancing in price each year we recommend the more liberal use of steel and concrete posts.

It is of the utmost importance that the railroads should use the very best tools they can secure, as they are scattered over many hundred miles of road and unless very carefully watched, the service is lost sight of. If tools fail outright they are very apt to be reported, but where they do only 25 to 40 per cent of the work they should, the chances are that the roadmasters will not hear of it. A cutting tool made from cheap carbon steel will cost less than one made from tool steel. It would, however, be ridiculous to consider it more economical.

We have not progressed in the matter of rail joints so far as some people think, even with the many new ideas presented in the last 35 years. We find many trackmen complaining that a certain kind of joint does not keep the track in good line around the joint and they lay the blame on the joint. Similar conditions, however, arise with almost any make of joints. We find that in 95 per cent of the cases the kinks are due to the improper sawing of the rails. We find such conditions exist when the rail is laid with the minimum amount of expansion. Some members of this committee have found 100-lb. rail sawed so short on top that it would cause a $\frac{1}{4}$ to $\frac{1}{2}$ -in. depression of the joint in hot weather. A crooked sawing occurs sideways also and causes 90 per cent of the line kinks. This occurs whether or not joints are spaced. New rail is sawed at the mill before it is gaged. Therefore, if the rail is sawed through a kink and afterwards straightened it becomes noticeable when rail is laid tight as many now practice.

W. SHEA (C. M. & St. P.), Chairman.

THE BANQUET

The fourth annual banquet of the Track Supply Association for the Roadmasters' & Maintenance of Way Association was held in the Auditorium Hotel on Thursday evening, with a total attendance of 271. F. A. Preston, vice-president of the Track Supply Association, acted as toastmaster. In his opening address he stated that his regard for the roadmasters could be expressed

no better than by reading an editorial taken from the Los Angeles Evening Express of November 14, 1900, upon the occasion of the Roadmasters' convention in that city. This tribute to the track men called attention to the greater publicity given to the other departments and other officers of the railways and pointed out the importance of the roadmasters and the debt which the public owes to them.

H. R. Safford, chief engineer, Grand Trunk, Montreal, Que., said that the railroads of the United States owe much to the Roadmasters' Association, a debt which he believed they appreciated because of the encouragement which the roads have been giving their roadmasters to attend the annual conventions. Track maintenance involved a great many difficult problems, not all of which can be solved by the use of mathematics or the other exact sciences, but that they all require the exercise of common sense. Although some were wont to feel that this association overlapped another, he believed that this association had a distinct field and that there should be no feeling of competition.

The next speaker was E. T. Howson, engineering editor of the *Railway Age Gazette*, who discussed the track-labor problem.

James Burke, superintendent of terminals, Erie Railroad, Chicago, called attention to the fact that the Roadmasters' Association was one of the few organizations of railway men which did not feel called upon to encourage legislation for the benefit of its own members to the disadvantage of the roads. Instead their efforts collectively and as individuals were characterized by hard work, long hours each day in an effort to do for the railroads all that is possible with the funds placed at their disposal. He urged the older roadmasters to keep in step with the recent progress in the conduct of track maintenance, believing it would be only a few years before almost all operations would be performed by mechanical means, and that this would result in great improvement, in the intelligence of the forces and the rate of pay.

P. J. McAndrews, president of the Roadmasters' Association, said that with the opportunities existing the desire for work, and the encouragement of the higher maintenance officers, the Roadmasters' Association has a future before it which should be highly encouraging to those who have long had the success of this organization at heart, stating that the most important purpose of the organization was for the mutual assistance of the members.

The next speaker was Coleman King, president-elect of the association, who paid a tribute to the section foreman, characterizing them as the most reliable and faithful employees in railway service.

The last speaker of the evening was W. C. Kidd, secretary of the Track Supply Association, who urged all members of the two associations to assist in making the next convention a success.

THE TRACK LABOR PROBLEM

By E. T. HOWSON

From its very nature the maintenance-of-way department of a railroad is a spending organization. It creates no revenue, but it is responsible for the expenditure of about 14 per cent of the gross income. Its problem is, therefore, to spend this large sum as economically as possible and its efficiency is measured by the extent to which it secures full value for every dollar expended. There has never been a time in the history of railroading when the demand for ability of this nature has been greater than in the past few years of declining railway revenues and continually increasing expenses. As a result it may be stated confidently that our railways are more efficiently managed today than at any other period in their history.

The average roadmaster is responsible for the expenditure of from \$150,000 to \$200,000 annually, of which approximately 60 per cent goes for labor and 40 per cent for materials. One would, therefore, naturally expect to find the largest amount of attention paid to the organization and handling of labor and secondary attention given to the selection of materials. On the

other hand a search through the proceedings of this and allied associations and through the pages of the technical journals will show that a very large part of the matter published therein relates to materials and to their use, and a relatively small part of the most complicated problem of all—that presented by the human element. Because of this lack of proportion, it is not surprising that those materials comprising the various units of our track construction have reached a high state of development, and that at the same time we have a labor problem of serious proportions confronting us.

The labor problem has never been studied scientifically from the standpoint of the maintenance-of-way department to the extent it deserves or to the extent that it has in other departments of our railway organization and in outside industries. Take the question of wages alone. The pay of section foremen is not based on any comparison with that in other kinds of skilled labor. The experienced track foreman receives considerably less than a green brakeman on his first run, and much less than the conductor, with whom he compares in responsibility and experience. Also, consider the application of discipline. A conductor or brakeman is given demerits for a minor offense and kept in service, while a foreman is laid off for an offense no more serious, although it takes just as long to train a good section foreman as a conductor and he cannot be spared from the service any more readily than the conductor. The tendency toward the organization of track men into unions is increasing, and unless adequate relief is granted soon, we shall soon have to deal with organized labor in the track department with all the difficulties that this implies.

No one will dispute the statement that there has been a radical change in the personnel of our track forces in recent years. We are all aware of the fact that the English-speaking or north European laborer is drifting into other pursuits, and that his place is being filled by the Italian and Slav of southern Europe. However, this does not in itself explain the problem confronting us.

An economic development has been and still is taking place in this country, affecting the railways and other large industries alike. In this rapid development it is only natural and proper that the men already here and familiar with our language and customs should prosper and move up to positions of more importance. It is to be conceded that the failure of the railway managements to recognize the importance of the track men in matters such as wages and working conditions has hastened the departure of the English-speaking laborer, but it has only hastened and has not caused this change. Any concessions which the managements could reasonably have offered would have served only to delay this transition, for it was inevitable if the country was to develop. Those of you who because of your remoteness from industrial centers are still able to secure native labor are fortunate, but you will soon be confronted with the same conditions. As an indication of the extent to which foreign labor is now employed on the railroads, attention is directed to the fact that over 11,000 Italians alone are employed on the Pennsylvania Railroad east of Pittsburgh and Erie, most of whom are in the maintenance-of-way department. On several eastern roads practically 100 per cent of the track laborers are foreign.

This is the condition to-day. These men have different racial characteristics from those who preceded them, and for this reason we must adapt our methods somewhat to their customs if we are to secure satisfactory results, just as we handle manganese steel differently from open hearth. The foreign laborer is here to stay and the efficiency of the roadmaster of the future will be measured by the extent to which he is able to secure the full results from this labor. The track laborers of today come to this country very largely from southern Europe. They are the raw material from which we must create our track men and our foremen of the future as well. One of the most serious handicaps of foreign laborers is their inability to understand and speak our language. As long as they remain in this con-

dition they can be only partially efficient. To aid them in this regard the Pennsylvania has prepared an Italian-English track course whereby they may be taught the elements of English and of track work at the same time. The Union Pacific prepared a similar course a few years ago for its Japanese track laborers. The Central Railroad of New Jersey and other roads conduct night schools for their men at various terminals.

Having acquired the elements of our language it is self-evident that they will make better and more efficient workmen. This educational work is not confined to the instruction of foreign laborers alone, for several roads are now placing similar courses at the disposal of their native track laborers and foremen as a means of instructing them in track work, increasing their efficiency and preparing them for promotion.

Another aid in the solution of the labor problem is the increased attention which is being given to the physical welfare of these employees. The day is passing rapidly when any vermin-infested old box car with a leaky roof is considered suitable to house track laborers. Even though these men may not be used to our scale of living, they appreciate care and attention, and measures taken for their physical comfort are a material aid in holding them in the service. I have in mind one supervisor, known to all of you, who fumigates and paints all of his camp cars thoroughly inside and out every spring, making them as attractive and sanitary as possible. I was not surprised when he told me that a large proportion of his floating gang laborers return to him year after year. While wages are an important consideration in holding laborers, they are not the only one. I know one road that is paying its track laborers 2½ cents an hour less than its neighbors and holding all the men it needs, largely because of such measures. This is a very good dividend in itself.

The wage problem is one on which there is a wide divergence of opinion. Most discussions of this subject have ignored the fact that labor is a marketable commodity the same as wheat and that it fluctuates according to the same law of supply and demand. For this reason, while I advocate educating and caring for labor to secure an ample amount of it and to increase its efficiency, I do not believe in paying above the prevailing market rates for temporary or floating gang laborers. While theoretically a higher rate enables the better men to be secured, in these days of large organizations when men are hired in gangs this benefit is seldom realized. Although it is true that gangs differ in ability, one will find some good and some poor men in almost every gang. Even in times of labor shortage the act of one road in paying higher than the market rates to secure labor only demoralizes the forces on all roads without increasing the supply of labor.

So much for the floating gang laborer. With the regular laborer conditions are somewhat different. A wage rate must be sufficient to encourage men to remain in the service, for the constant employment of inexperienced men is expensive. At the same time, with the prospect of steady work throughout the year, the better class of men are willing to work for less than the highest market rates. The most important single step which can be taken today for the development of an efficient organization is the adoption of permanent employment throughout the year for as large a proportion of the force as possible. When we could recruit all the track laborers we required from among the farmer boys along the line who were not dependent upon such work for their entire livelihood it was advisable to do as much work as possible during the more favorable summer season. Now, when good labor is scarce at any season, we still continue to crowd as much track work as possible in the three months from July to September, inclusive. It does not require any knowledge of mathematics to demonstrate that if this season is extended from April to September, inclusive, only half the force is required, and many roads have so extended their seasons. If this was extended further over the entire year, the forces necessary would again be reduced. You may say that this is impractical, and I will grant you that this is true in a

measure, particularly for the northern roads, but not to the extent commonly considered. The reorganization of track work, as carried out on the Long Island and the Frisco, whereby uniform section forces are employed throughout the year, may not be feasible in its entirety on the more northern roads, but they are all crowding much more work into the busy summer season than is necessary.

Another measure which will assist in holding the efficient laborer in the service is the establishment of a graded rate of pay. In its simplest form this consists in the selection of a leading laborer in each gang, perhaps with the title of assistant foreman, who receives a cent or two per hour more than the regular laborers. It has been suggested seriously that this be carried still further and that three or four scales of pay with minor gradations be established to reward men for increased length of service and efficiency. If the higher rates are awarded because of merit, they form an excellent incentive for a man to endeavor to improve his work, but if the men are selected because of favoritism or simply in order that the positions may be filled, the purpose of the plan is defeated. Its success depends almost entirely on the manner in which it is administered.

The condition as respects the foreman is more serious than as respects the laborer. The faithful and capable foreman of the old school is fast disappearing, and because of the lack of attention given the laborer, suitable material is not being developed to fill the vacancies. With the native laborer entirely gone or rapidly disappearing, it is evident that we must look to the foreigner for our future supply of foremen as well as laborers. That the foreigner has demonstrated his ability to make good as a foreman is shown by a recent census taken on the Pennsylvania Railroad east of Pittsburgh and Erie, as a result of which it was found that there were 75 Italian section foremen and 187 assistant foremen on the road.

Whether the foreign foremen will be content to remain in track work or will go into other industries which offer greater rewards when they have acquired a knowledge of our language and customs is a question. Profiting by the experiences of the past, many of the roads are adopting measures of one kind or another which will delay the repetition of any such transition. In the first place, the wages of section foremen have been raised quite generally during the past five years, but they are still considerably below what they should be. The section foreman is an officer on the railroad, responsible for the expenditure of \$5,000 or more annually, and he should receive a salary sufficient to create a desire to retain his position. Based on a comparison with other branches of the service, I believe a section foreman on a main line should receive at least \$90 a month. I do not mean that all men now filling this position are worth this amount, but that with a salary fixed at this figure men should and can be secured who are.

The section foreman should also be given an annual vacation with pay. I believe that every man should be paid for all time he works and that he should be allowed overtime. It is a hardship to ask any man to get up in the middle of the night to patrol his track during a storm when he knows he will receive nothing for this, and it is surprising that the foremen do this as faithfully as they do. If overtime is not paid, a vacation of ten days or two weeks with transportation and full pay, customarily allowed salaried employees, would compensate him for this extra work, would give him a standing in the eyes of his men and the community, and would make of him a better and broader employee. I am not suggesting an idle theory, for at least one eastern road gives its men such a vacation each year.

Another means of securing and holding good foremen is to insure them tenure of position as long as they handle their work properly. Too frequently a foreman is discharged hurriedly without a full investigation of all the facts. This not only affects the foreman directly concerned, but the news spreads along the line and serves to demoralize the entire organization. To prevent rash acts of this kind, one road requires that no man shall be taken out of service except for drunkenness and equally seri-

ous offenses, until a full report has been made to the superior officer and the recommendation of the supervisor approved.

With the continued industrial development of this country the measures outlined above will materially aid, but will not permanently solve the track-labor problem. The railways are a tremendous factor in our industrial life, requiring over 400,000 men for track work alone. The surest way to avoid a labor shortage is to reduce the number of men required by the substitution of labor-saving equipment wherever practicable. If one will compare the manner of performing work in our leading industrial establishments with that on the track, he cannot but be impressed with the fact that in their track work the railways are backward in the development of labor-saving appliances. This condition can be explained only partially by the statement that track work is varied in character. A further explanation is the inertia surrounding railway track work and the lack of really concentrated study of the possibilities of mechanical development. There is a definite field for the use of labor-saving devices which will not only reduce the number of laborers required, but will effect material economies in the cost of maintenance. I believe we are now on the threshold of a new era in track work in which there will be great improvements if we, railway men and manufacturers alike, will co-operate and give these new developments our sympathetic support.

The motor car is rapidly replacing the old hand car on main and branch lines alike. The usefulness of the tie-tamping machine has been demonstrated to you, and I believe it is still in the first stages of its development. One road has developed a machine for drilling rails and has reduced materially the cost of putting on bolted rail anchors in this way. This same road is endeavoring to perfect a device to saw the battered ends from the rails without removing them from the track. It is not a long step from the construction of a pneumatic tie-peeling machine to the construction of one that will adz ties. The Lehigh Valley has substituted locomotive cranes for tong men when relaying rails with excellent results. These are only a few of the possibilities in this direction. I, personally, believe that the present section motor car furnishes the power unit about which many of these various attachments will be grouped, and that instead of providing separate equipment for each class of work our section gangs of the future will be given motor cars with attachments to tamp ties, drill rails, etc., thereby using the motor all day instead of only for a short time at morning and night. When this time comes the amount of labor required will be reduced greatly, and that which will be employed will be of the skilled mechanic class, drawing better wages and doing more constructive work.

These various measures can be brought about primarily through the active interest and co-operation of all concerned. In many ways, the care of his men rests directly on the supervisor and the successful man is successful in this regard. It is not a special dispensation from the general office that enables one supervisor I have in mind still to retain all his native foremen, while neighboring supervisors on the same and adjacent roads have been forced to hire foreign foremen largely. In other matters such as the establishment of wage rates and the purchase of special equipment, authority must come from higher officers, but here as well the roadmaster has a very important part. It is his duty to study these problems at first hand, and having reached his conclusions to present them to his superior officers with sufficient data to prove his case. If he fails to convince them the first time, it is his duty to bring this matter up again on an opportune occasion, being sure in every instance that he is correct. It is only in this way that progress may be made; and the part to be played by the supervisor is most important.

INSPECTION TRIP

Wednesday was spent in an inspection of the railway terminals of Chicago. About 350 members and guests of the association left the North Western terminal on a special train at 9 o'clock going direct to the Stock Yards, where visits were made to the

Armour and Libby, McNeill & Libby packing houses. Lunch was served at the Stock Yards Inn, after which the train proceeded over the tracks of the Chicago & Western Indiana to the new clearing yard, where a short time was spent watching the operation of this terminal. The party returned to the North Western station late in the afternoon over the Belt Railway.

CLOSING BUSINESS

The selection of a location and date for the 1916 convention resulted in an extended discussion. New York was finally selected with a vote of 108 as compared with 26 for Chicago, and the date was fixed at September 19-22, 1916, inclusive.

The following officers were elected: President, Coleman King, Long Island, Jamaica, N. Y.; First Vice-President, M. Burke, Chicago, Milwaukee & St. Paul, Chicago; Second Vice-President, Abel Grills, Grand Trunk, St. Thomas, Ont.; L. C. Ryan, Chicago & North Western, Sterling, Ill., Secretary; W. H. Kofmehl, Chicago, Milwaukee & St. Paul, Elgin, Ill., Treasurer. Members of executive committee: James Sweeney, Chicago & Eastern Illinois, Danville, Ill.; W. Shea, Chicago, Milwaukee & St. Paul, Ottumwa Junction, Ia., and J. B. Kelly, Minneapolis, St. Paul & Sault Ste. Marie, Minneapolis, Minn.

THE TRACK SUPPLY ASSOCIATION

The annual meeting of the Track Supply Association was held on Friday morning. The officers for the past year were: President, E. M. Fisher, Fairbanks, Morse & Co.; Vice-President, F. A. Preston, P. & M. Company; Secretary-Treasurer, W. C. Kidd, Ramapo Iron Works. The reports of these officers showed the association to be in a healthy condition.

The following officers were elected for the ensuing year: President, F. A. Preston, P. & M. Company; Vice-President, R. A. Van Houten, Sellers Manufacturing Co.; Secretary-Treasurer, W. C. Kidd, Ramapo Iron Works; director for two years, E. T. Howson, *Railway Age Gazette*; director for one year, J. J. Cozzins, Union Switch & Signal Company.

EXHIBITS

The following companies had exhibits at the convention:

- The Acme Supply Co., Chicago—Exhibiting the Gosos bed. Represented by P. J. Burke.
- American Flexible Bolt Co., Pittsburgh, Pa.—U. S. track bolts. Represented by C. A. Seley.
- American Guard Rail Fastener Co., Philadelphia—Guard rail clamps. Represented by D. L. Vaughan and L. P. Burwell.
- American Hoist & Derrick Co., St. Paul, Minn.—Photographs of American railroad ditcher. Represented by Edward Coleman and C. C. Austin.
- American Steel & Wire Co., Chicago—Woven wire fence and galvanized steel fence posts. Represented by L. P. Shanahan, C. J. Boon, A. Alexander, J. W. Collins and F. B. Fraude.
- The American Valve & Meter Co., Cincinnati, Ohio—Economy switch stands, Anderson interlocking safety switch stands and safety switch locks. Represented by F. C. Anderson.
- The Anchor Co., Chicago—Exhibiting the Efficiency Rail Anchor. Represented by T. B. Bowman and C. P. Williams.
- Ajax Rail Anchor Co., Chicago—Exhibiting rail anchors. Represented by F. B. Bradley, P. Hoffman and G. Holmberg.
- The Buda Co., Chicago—Exhibiting the Buda Heavy-duty Grinder. Represented by Emil Johnson and Wm. Krause.
- Carnegie Steel Co., Pittsburgh, Pa.—Steel rails. Represented by Norman Hench and George Landers.
- The Chicago Malleable Castings Co., Chicago—Exhibiting the Thomas rail anchor, tieplate, and Thomas guard rail. Represented by J. W. Thomas.
- Commercial Acetylene Railway Light & Signal Co., New York City—Flashlight signals and acetylene signal lights. Represented by H. C. Doran and F. S. Dickinson.
- The Crepecheck Company, New York—Exhibiting Dinklage crepecheck rail anchors. Represented by W. S. Schmaltz.
- Crerar, Adams Co., Chicago—Exhibiting track drills, binding drills, track jacks, flare lights, guy starters, shovels, pumps and tools. Represented by R. W. Wallace, Geo. Bassett, Arthur Martin, Tom Barrett and W. I. Clock.
- Daniels Safety Device Co., Chicago—Exhibiting bull dog and bull pup nuts. Represented by F. M. Daniels, A. G. Wood and C. F. Ames.
- The Duff Mfg. Co., Pittsburgh, Pa.—Exhibiting genuine Barrett jacks, Duff ball-bearing screw jacks and Duff Bethlehem hydraulic jacks. Represented by C. N. Thulin.
- Fairbanks, Morse & Co., Chicago—Section and inspection motor cars. Represented by F. M. Condit, K. P. Brown, D. J. Higgins and L. H. Matthews.
- Fairmont Gas Engine & Railway Motor Car Co., Fairmont, Minn.—Exhibiting the Fairmont hand car, gasoline engine and parts and photographs of motor cars and wood cutters. Represented by H. E. Wade and W. P. Kasper.
- The Frictionless Rail, Boston, Mass. Represented by T. F. Dwyer, Jr., and G. H. Bryant.

- The Hatfield Rail Joint Co., Macon, Ga.—Exhibiting Hatfield rail joints. Represented by T. B. Bowman and C. P. Williams.
- Hayes Track Appliance Co., Richmond, Ind.—Hayes derailleurs. Represented by S. W. Hayes, E. L. Ruby and E. W. Brown.
- The Indianapolis Switch & Frog Co., Indianapolis, Ind.—Exhibiting the Eymon continuous crossing and manganese frogs. Represented by J. C. Jameson.
- Keystone Grinder & Manufacturing Co., Pittsburgh, Pa.—Grinders and attachments. Represented by H. C. Holloway, D. L. Braine and W. H. Davis.
- Lackawanna Steel Co., Buffalo, N. Y.—Abbott joint plates, hook shoulder tie plates and improved angle bars. Represented by A. H. Weston.
- The Madden Company, Chicago—Three-man track layer, Richter blue flag derails, the Blair tie spacer and Wagner switch point straightener. Represented by H. C. Holloway and T. D. Crowley.
- Mudge & Co., Chicago—Exhibiting Mudge motor cars and Mudge engine equipment for hand cars. Represented by Burton W. Mudge, R. D. Sinclair, Geo. W. Bender and Sherman C. Amsden.
- M. W. Supply Co., Philadelphia—Vaughan rail anchors, track indicators and splice straighteners. Represented by D. L. Vaughan and L. P. Burwell.
- The National Lock Washer Co., Newark, N. J.—Exhibiting nut locks and Hi-power nut locks. Represented by John B. Seymour, Jesse Hough, L. Van Thompson and John Patterson.
- The National Malleable Castings Co., Cleveland, Ohio—Exhibiting malleable rail braces and tieplates, and malleable washers and rail anchors. Represented by J. J. Byers, T. W. Aishton, J. S. Slater and L. S. Wright.
- Northwestern Motor Co., Eau Claire, Wis.—Hand car gasoline engines and motor cars. Represented by R. R. Rosholt and F. W. Anderson.
- The P. & M. Company, Chicago—Exhibiting anti-rail creepers, Betts anti creepers, tieplates. Represented by F. A. Preston, A. R. Sutter, W. W. Glosser, D. T. Hallberg, R. W. J. Harris, J. E. Mahoney and G. E. Johnson.
- The Pennsylvania Steel Co., Steelton, Pa.—New Century switch stands, Positive switch stands, Mayari heat treated bolts, adjustable rail braces and never-slip switch plates. Represented by W. H. Allen and S. H. Smith.
- Positive Rail Anchor Co., Louisville, Ky.—Exhibiting Positive rail anchors, Betts tieplates, Betts guard rail holders, Economy separable switch points. Represented by W. M. Mitchell, F. M. Robbins, L. C. Ferguson, J. A. Schoultz, B. B. Betts and W. A. Wallace.
- The Q. & C. Company, New York—Vaughan rail anchors, Bonzano joints, Bonzano step joints, guard rail clamps, insulated joints, tieplates, derails. Represented by A. Robertson, A. R. Horne, J. V. Westcott and Henry Hawes.
- The Rail Joint Co., New York City—Continuous frog and switch girder, step high tee, Weber, Standard and insulated and 100 per cent. standard rail joints. Represented by L. F. Braine, V. C. Armstrong, G. C. Isbester, F. C. Webb, G. H. Larson, F. M. Hill, W. S. Boyce, C. B. Griffith, H. C. Hickey, Charles Jenkinson, C. J. Webb, F. S. Webb, George T. Willard, J. L. Terry and J. N. Meade.
- Railroad Supply Co., Chicago—Exhibiting derailleurs and tieplates. Represented by H. G. Van Nostrand and E. H. Bell.
- Ramapo Iron Works, Hillburn, N. Y.—Automatic switch standard, guard rail clamps and rolled steel slide plates. Represented by W. C. Kidd, Thomas E. Akers, Arthur Germunder and E. P. Bigelow.
- Reading Specialties Company, Reading, Pa.—Exhibiting derailleurs, step joints and rail benders. Represented by B. J. Buell.
- Sellers Mfg. Co., Chicago—Exhibiting anchor bottom wrought iron tieplates. Represented by Geo. Sellers.
- Templeton, Kenley & Co., Ltd., Chicago—Exhibiting Simplex jacks. Represented by A. E. Barron, W. B. Templeton and John F. Stevens.
- Track Specialties Co., New York—Exhibiting insulated joints, Superior rail joints, guard rail braces and clamps, rail benders and derailleurs. Represented by W. B. Lee and W. H. Lee.
- The Union Switch & Signal Co., Swissvale, Pa.—Exhibiting Keystone insulated rail joints. Represented by J. J. Cozzins and J. D. Roett.
- Verona Tool Works, Pittsburgh, Pa.—Track jacks, tools, nut locks, levels and gages. Represented by H. Fischer, E. Woodings, H. Mull and W. D. Achuff.
- Wm. Wharton, Jr., & Co., Inc., Philadelphia, Pa.—Exhibiting W. J. switch stands and Wharton-O'Brien insulated switch rods. Represented by Thos. O'Brien, H. F. McDermott and A. S. Partridge.

ABSTRACT OF ENGINEERING ARTICLES

The following articles of special interest to engineers and maintenance of way men, to which readers of this section may wish to refer, have appeared in the *Railway Age Gazette* since August 20, 1915:

- Building Concrete Caissons in the Platte River.—The Chicago, Burlington & Quincy has used this form of construction in a long-deck girder bridge at Ashland, Neb. This work was described in an illustrated article in the issue of August 27, page 383.
- Flood Damage to Railroads in the Middle West.—On August 16 a severe storm visited Galveston, but property damage was limited almost entirely to the Galveston Causeway. During the week this storm reached St. Louis, Mo., causing damage which seriously interrupted railroad traffic. The effect of this storm upon the railroads is described in an illustrated article in the issue of August 27, page 393.
- A Car Dumping Machine with Improved Features.—The Pittsburgh & Conneaut Dock Company has installed a modern car dumping machine at Conneaut Harbor, Ohio, which is used to handle the coal traffic of the Bessemer & Lake Erie. A description of the plant which is designed to unload 100-ton capacity cars at the rate of one a minute, was described in an illustrated article in the issue of August 27, page 390.
- Construction of the New York Connecting Railroad.—Material progress is being made on the four-track railroad to connect the New York, New Haven & Hartford with the Pennsylvania in greater New York. This project includes the Hell Gate bridge, which will be the longest span steel arch in the world. The work is unusual in other respects, particularly as to the magnitude. This article which was devoted principally to a record of the progress being made on the various portions of the work, appeared in the issue of September 3, page 421.
- The Licensing of Engineers.—At the last session of the state legislature of Illinois, a law was passed providing for the licensing of structural engineers. The effect of this law upon the design and con-

struction of railway structures within the state of Illinois was discussed in an editorial in the issue of September 10, page 452.

Important Realignment Problem on the Pennsylvania.—This road has recently completed the construction of three tunnels on the Allegheny division which eliminates 12.23 miles of line and a large amount of curvature. The work on the tunnel near East Brady, Pa., is of special interest because of difficulty experienced with falling rock. A complete account of this was given in an illustrated article in the issue of September 10, page 456.

An Interesting Structure Over the Buffalo River.—The Delaware, Lackawanna & Western is building a Strauss bascule span at Buffalo which involves complicated foundation problems. These were solved by the use of open reinforced concrete caissons with interesting details. This was described in an illustrated article in the issue of September 10, page 465.

RENEWING BRIDGE TIES ON THE LEHIGH VALLEY WITH A LOCOMOTIVE CRANE

An unusual record in the renewal of bridge ties has just been made by the maintenance of way department of the Lehigh Valley on its bridge across the Susquehanna river at Towanda, Pa. Two main tracks are carried over the river on a steel bridge consisting of 14 deck plate girder spans, 13 of which are 129 ft. 6 in. long over all, and one 125 ft. 3 in.; the total length of the structure is 1,808 ft. 5 in. The five spans nearest the center are on a tangent, but the remaining spans at either end are on 3-deg. 30-min. curves of reversing direction. There are 1,522 8-in. x 12-in. x 12-ft. ties on each track. Together with the elevation blocks, amounting to 14,500 ft. B.M., there is a total of 160,612 ft. B.M. of timber in each track. The track is of 100-lb. rail, with 90-lb. guard rails. The ties had been previously framed and the superelevation blocks were attached.

All of the timber in the eastbound track on this bridge was renewed in an actual working time of 12 hours.

It had been the plan to complete the work in every detail in one day—between 6 a. m. and 7 p. m., but at 1:30 on the day selected a terrific wind and rain storm arose, which came so suddenly and raged with such fury that the gangs were unable to work. In fact, for a while the men had to hold on or lay down to keep from being blown off the bridge. Later it was necessary to send portions of the forces on motor cars in both

metal guard rails, had been completed. Between the old bridge ties the tops of the girders had been cleaned and painted previously, and as the old ties were removed the portions of the tops of the girders uncovered were treated similarly. During the progress of the work temporary crossovers were installed at each end of the bridge to provide for single track operation while one track was out of service, the pilot using a motor car.

Renewing Ties on a Branch Line Viaduct

Locomotive cranes were used to remove the old ties, to place the new ties and to handle all the rail. The new ties were on 12 cars, arranged in piles in order, each tie being numbered, so when each sling of ties was placed on the girders, each tie was within a few inches of its designated location. The cars of new ties were attached to the locomotive cranes, and the old ties were loaded on them as the new ties were unloaded. The result was that when the job was completed there were no old ties and timbers to pick up.

The total cost of the work, including the installation and removal of the temporary crossovers was \$708.90, or 46 cents per tie. Had it not been for the storm this cost would have been reduced to 31 cents per tie.

Working on a single track branch line recently the same

Renewing Ties on the Bridge Over the Susquehanna River at Towanda, Pa.

directions to look after points where trees had been uprooted, and wires blown down where the tracks were under water and where small slides had occurred.

Work was resumed about 5:30 p. m., but half an hour later the storm broke again with such violence that no more work could be accomplished that day. At 8 o'clock the following morning work was resumed and by 1 o'clock every detail, including full tie-plating and spiking and the installation of the

department renewed some of the ties on a 1,279-ft. bridge at a cost of 20.4 cents per tie, but no temporary switches had to be installed in this case. The easterly end of the bridge was on a tangent, and the westerly end on a 7-deg. curve. Using a locomotive crane to handle both the old and new ties, 359 8-in. x 12-in. x 11-ft. ties, and 6 8-in. x 12-in. x 14-ft. ties were renewed. The new ties were in rotation piles, ten being placed on the girder at one time.

The Efficiency of Motor Cars for Section Forces*

Advantages Gained by the Use of Motor Cars on the St. Paul's Illinois Division; Proper Care of These Cars

By G. R. MORRISON

Superintendent C. M. & St. P., Savanna, Ill.

The evolution from the old section handcar to a motor car was accomplished in a day on the Illinois division, 27 cars being put in service at one time in 1909. When the question first arose as to the practicability of motor handcars several tests were made on the Illinois division and it was decided that the car weighing about 700 lb. and producing $7\frac{1}{2}$ horsepower could be made to render satisfactory and economical service.

Under the old arrangement we were using 37 handcars with that number of foremen, while under the new plan with motor cars, 27 cars were employed, dispensing with 9 section gangs and lengthening the sections from 8 to approximately 12 miles per section, an increase of about one-third. Results attained so far indicate a saving and more efficient service in every respect. Although opposed at first, the foremen are now greatly in favor of their use.

An increase in pay much encouraged the men and brought out their best efforts. Foremen are expected to keep cars and machinery in good order on their own time, looking after the machinery and knowing that it is in proper working order before going out on their sections in the morning.

We find that one of the most necessary requirements for successful operation is for the roadmasters to study the mechanism and to be prepared to instruct the foremen. Roadmasters and section foremen in a short time become so conversant with the operation of a car that they are able to take care of it at all times and overcome trouble without calling on our experts.

Since the beginning, the per cent of delays altogether, including breakage of chains to flooded carbureters, etc., has amounted to only 0.4 per cent. This is more than offset by the time gained over the old method of transportation. We figured before putting the cars into service that at least one hour per day per man would be gain in time alone. The actual service quite clearly demonstrates that this was a very conservative estimate and that the gain is nearer an hour and 20 minutes per man per day.

At first a daily report from the section foremen of the service was required, showing the section number, location, foreman, miles run, gasolene used, valve oil used and delays. Later on this was made a weekly, and finally a monthly report. Reports received so far indicate that the cars are making at the rate of 29 miles per gallon of gasolene and about 80 miles per pint of valve oil.

At first the instruction of the men was done by the agents of the manufacturers, who remained with each foreman for a few hours, but not long enough to cover all or even a small portion of the points necessary to a full understanding of the cars, hence the necessity for foremen and roadmasters giving the matter careful study.

It was thought that there might be danger attendant upon the operation of these cars, especially on a fast traffic line like the Illinois division. In order to reduce this element a bulletin was issued instructing enginemen to sound one long blast of the whistle when running against the current of the traffic, and in addition the roadmasters instructed section foremen that the average speed should not exceed 10 to 12 miles per hour, and a speed limit of 20 miles per hour on straight track was ordered. In addition enginemen were advised that the chance of accident would be greatly reduced if the instructions in regard to sounding the whistle for all crossings and obscure places were complied with literally. Section foremen were also instructed that no matter in what direction they were traveling, at obscure places or against the current of traffic, on double track they must handle the car so that accidents would not occur. It has

been demonstrated that a car moving at 25 miles per hour can be stopped in 45 ft.; and at 30 miles per hour in 60 ft. Two men can remove a car from the track without trouble and expeditiously.

At first the cars were not furnished with any tools. We found that if section foremen were furnished with a certain number of appliances it would minimize delays and upon our recommendation, 1 spark plug wrench, 1 socket wrench, 1 monkey wrench (small), 1 pair pliers, 1 screwdriver, 1 gas plier, 1 small squirt can, 1 ammeter for testing batteries, 1 extra mica spark plug, 1 small coil spring and a piece of chamois skin for straining the oil were ordered for each section. It is also recommended that roadmasters carry a stock of supplies, such as batteries, spark plugs, etc., and that requisitions be made on them by section foremen for such articles as require too much time to get in the usual manner by requisition. Each foreman was furnished with a list showing the various parts of the machinery. The ammeter is very essential, as if foremen do not have this, batteries are likely to be thrown away long before they are entirely exhausted.

Wherever sections are located at or near pumping stations operated by gasolene power they receive their supply from those sources. For the balance, 60-gal. iron tanks are located at certain places along the division, where as many foremen as consistent can be supplied. These cans are kept filled by the oil companies who run wagons through the country. Tickets in triplicate are furnished for such supplies and handled through the agent, and the purchasing agent's office.

To facilitate train movement after severe rain storms or when trackmen are to go over the line preceding trains after a storm, instructions were issued to various foremen, telling them what portion of the division to cover. For instance, if one section extended both ways from a telegraph station, instead of covering such sections much time would be saved by running direct from one station to the next, and this plan was adopted. Thus we get very quick reports from foremen. One night recently, during a severe rain storm extending from Chicago to Savanna, just before important passenger trains were due, the entire division was patrolled and inspected in 30 min., and delays to passenger service on that particular night were nominal.

With the old handcar it took the section crew at Savanna one hour to go four miles eastward up grade. The distance is now covered in 15 min. It is expected with the present power that these cars will handle 10 men and a push car ahead with several men on it everywhere except on heavy grades. The cars will accommodate 14 men without tools, and 10 men with all tools.

These cars are equipped with $7\frac{1}{2}$ -hp. twin cylinder engines, 4 in. in diameter, of $5\frac{1}{2}$ -in. stroke, and a driving range between three miles and 30 miles per hour. The arrangement of the cars is such that the engine can be reversed without the use of any special device. At night in order to prevent cars being disturbed by outside persons the foremen remove what is known as the commutator bar. This is but the work of a moment and prevents anyone, no matter how expert, from running the car. During rainy weather unless the vibrators are covered the operation of the car will be affected, but if the foremen will merely cover those parts with a rubber coat or canvas the trouble is nicely overcome.

It is found that a foreman can inspect track very much better with the new cars than with the old, because of being able to give the track his entire attention. During dry weather,

*Abstracted from C. M. & St. P. Employees Magazine, August, 1915.

damage done by fire is greatly decreased because of the facilities with which the men can reach a fire after it has started.

The supervision of the entire motor car service on all divisions is under C. B. Skelton, motor car inspector, Milwaukee shops. Many delays will be avoided if the following suggestions relating to the care of cars suggested by Mr. Skelton are adopted:

See that the working parts of engines are kept clean at all times, especially the timer, contact points, chains, spark plugs, valves and piston rings. The latter may be cleaned easily by using kerosene in the engines. In addition, see that all wires are fastened securely at the terminals and that insulation is in good shape.

A great many times a foreman will have the spark plugs cleaned and will not test them before having them replaced in the cylinders. This should always be done. There is but one way to test a plug properly, viz., attach the plug to high tension cable, laying the plug on some part of the engine so that only the threads are on the switch and move the car so that the right contact is made, working the spark coil vibrator which leads to the plug being tested, then see that the spark jumps across the gap between the two points on the plug.

If a spark is not perceptible something is wrong. Either the plug is grounded through the porcelain member or insulation, or possibly the current is jumping through the wiring at some point and not reaching the plug. In a case of this kind another plug should be tried, to make sure just where the trouble lies.

Spark coil boxes should be protected from rain and snow by covering them with oil-cloth or some other covering that will keep the moisture out.

Spark coils are often damaged by connecting up too many batteries to the coil. Most coils are built for six volts on the battery circuit, or the equivalent of four cells when batteries are new, and if more batteries are added, the voltage runs over six volts, not only wearing out the vibrator points very rapidly, but very often burning coil insulation, putting it out of service.

When coils become worn out or it is found that they do not work properly, foremen should not undertake to make the repairs themselves, as these instruments are very delicate, but should send the coils to the general storekeeper, under registered baggage for repairs, and in each case the roadmaster should make requisition for the repairs and show the registered tag number on the requisition.

Carburetors should also be handled in this way, and should never be shipped to the general storekeeper by freight, for these parts cost considerable money and are often lost or stolen when shipped in this way. Under no circumstances should foremen keep extra spark coils or carburetors in tool houses for emergencies, but on receipt of a new carburetor coil should immediately ship the old one to the general storekeeper under registered baggage and advise him so he will know where it is from.

When it is found necessary to order new parts for motor cars, the foreman should first go through his catalogue and obtain the correct symbol number of the part he desires, then advise the roadmaster the part number of the motor car. If foremen will follow these instructions, it will save the storekeeper and others a great deal of trouble and will eliminate a great many delays which are caused by the wrong part being ordered.

A CORRECTION

In describing the method of laying rail with locomotive cranes on the Lehigh Valley, in the issue of August 20, the statement was made that 4.7 track miles of rail was relaid on the Buffalo division. This should have read 4.07 track miles on the Seneca division.

A CONTINUOUS RAIL CROSSING

The Hollinger & Daily continuous rail crossing, as its name designates, is a new device to provide a continuous rail at crossings. As applied to the crossing of two railroads, the rails are made continuous for whichever track is given the crossing, while the rails of the other tracks are broken to provide the necessary flangeway. For the crossing of an electric line and a steam line, the steam line tracks are not broken, but the rails of the electric line are made to form a temporary continuous line over the top of the steam road rails whenever it is necessary to pass any electric trains.

For the crossing of two steam railroads the rails of each track are cut off outside of the crossing a sufficient distance to permit the rails of the other track with full bases to pass by in front of them, as shown in the accompanying photograph. Between these cut ends, each rail is replaced by a combination of a stock and split rail designed to line up when their butt ends are in contact with the cut ends of the track rails, thus making continuous rails over the crossing. The stock and split rails are also arranged to pass by each other so that their butt ends may be drawn away from the cut rails a sufficient distance to permit the stock and split rails of the other track to be brought up in line behind them. All four sets of stock and split rails are operated by levers arranged to line up either set while the other set is drawn in to clear.

The arrangement for the crossing of a steam line and an electric line is similar, except that the steam line rails are left undisturbed while the electric line rails are raised sufficiently to bring the under side of their heads even with the top of the

Continuous Crossing for Two Steam Roads

steam line rails, the electric line rails being cut to fit the contour of the outside of the head and web of the steam rail, while the head of the former is cut back a sufficient distance to give the standard clearance for the wheel treads of steam line equipment. Inside of the crossing the electric line is provided with a stock and split rail combination, placed so that the tops of the rails are normally at a level with the tops of the steam line rails. An inclined plane is provided adjacent to the railroad rails, so that when the stock and split rails of the electric line are backed into position their butt ends are raised to the level of the electric line rail outside, these butt ends being cut to fit the inside of the web and head of the steam road rails and the head extending a sufficient amount to pass entirely over the latter and join with the head of the electric line rail outside.

In place of an interlocking plant the operating lever may be connected directly to a derail on the electric line, while, as a protection for the steam road, the operating lever may be enclosed in a cabin, so arranged that the lever cannot be moved from the position giving clear track for the steam line without closing and locking the door. Thus the motorman or conductor of the electric car is locked in until he again clears the track for the steam line.

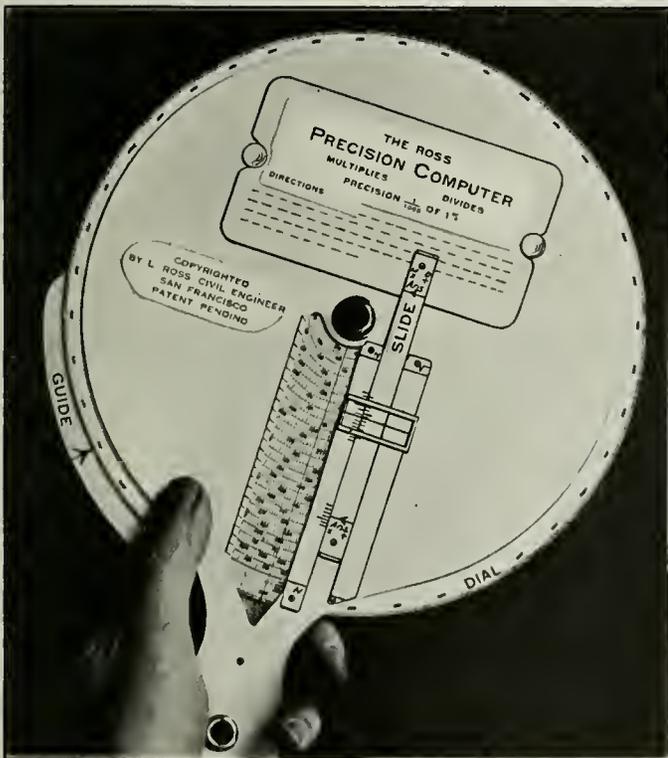

A crossing of the type suitable for two steam lines was in use on the Wheeling & Lake Erie for 21 months under a traffic amounting to 25 or 30 movements in 24 hours. During this time the crossing was subjected to very severe treatment, includ-

ing the running of cars over, with the crossing set for use in the other direction. Another rigid test was given it by placing a heavy locomotive on the crossing, so that one pair of driving wheels would be directly over the center. The brakes on its train were then set, cutting out driving brakes, and the engine was slipped in an effort to dislodge or move the slip rails. These tests are said to have caused no serious injury to the crossing. The crossings are manufactured by the Canton Frog & Crossing Company, Canton, Ohio.

A NEW FIVE-PLACE COMPUTER

A new calculator for engineers, which gives results to an accuracy of five significant figures, has been placed on the market recently. The length of the scale is 120 times as great as that of the A and B scales in the ordinary 10-in. slide-rule, and the system of graduations is uniform throughout. Provision is made also for obtaining approximate results, directly and simply, where that accuracy is sufficient.

This calculation, too, is known as the Ross Precision Computer, and consists of a graduated dial rotating under a slotted cover, a floating guide and a slide mounted at the right of the slot. The slide carries a miniature of the dial scale, and may be used alone to obtain an accuracy of three figures; it

The Ross Precision Computer

co-operates with the dial to check and point out the precise answer, and to locate its decimal point.

To multiply and divide any series of numbers it is only necessary to set each number in succession under the reading line in the slot; the answer is then read, also under the slot-line. The manipulations for setting the given numbers on the dial are simple; concise directions are given on the face of the computer.

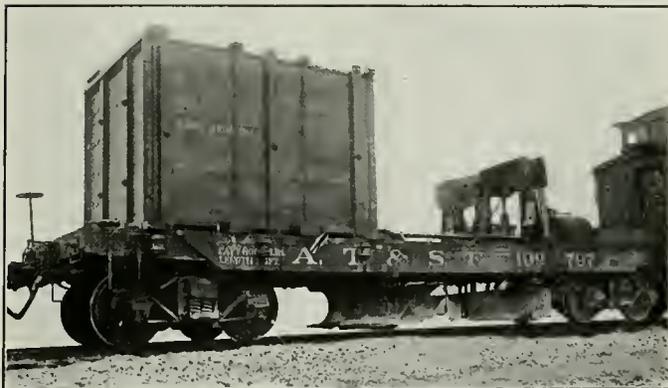

It may be used to read five-place logarithms and anti-logarithms of all numbers directly. Powers, roots and other complex operations may be carried out either approximately, or to a higher degree of precision, as desired. Trigonometric calculations made by the computer give an accuracy of from 3 to 5 seconds of arc.

The Precision Computer is made of metal throughout; the graduations are engraved on silvered metal surfaces, and it is

packed in a flexible case. It was invented by Louis Ross, and is manufactured by the Computer Manufacturing Company, San Francisco.

RESULTS GAINED WITH A BALLAST DRESSER

The Cafferty & Markle ballast dresser, described briefly in the *Railway Age Gazette* of February 21, 1913, has been used for some time on the Santa Fe with encouraging results. The spreader is essentially a plow suspended on the under side of a flat car. A middle portion 8 ft. wide is provided with notches where it crosses the rail to permit the lower edge to extend down almost to the top of the ties. Two wings extending

The Car Ready for Transit with the Plow and Middle Portion of Dresser Drawn Up and the Wings Raised

4 ft. beyond the ends of the ties are equipped with movable plates to permit adjustment to the contour of the desired ballast cross-section. The middle portion is raised or lowered by means of rods connected to air cylinders located directly above on the car platform. The wings are also connected to the cylinders by a train of levers and bell-cranks such that the travel of the cylinders necessary to raise the middle part clear of the rails will swing the wings up over the top of the car. Thus they are disposed of conveniently when not in use.

It will be seen in the accompanying photographs that an ordinary plow is used in conjunction with the spreader. It is not necessary to use the plow, but the spreader in question was

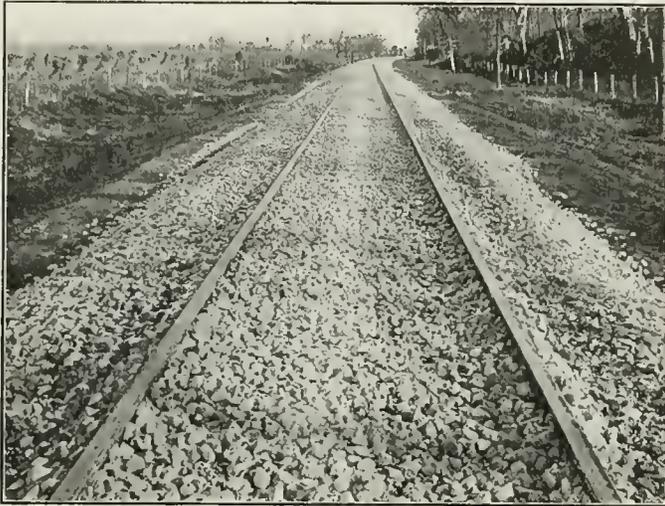

The Ballast Dresser and Sprinkler in Operation

so equipped originally, and it was found that the combination was very desirable.

When ballast is unloaded for track surfacing, it is not desired that it be removed to a greater extent than is necessary to render the track safely passable, and there is, therefore, no occasion to use the spreader. However, where track is ready for dressing, and only sufficient rock is to be unloaded to do this, the plow can be used to advantage to level off the ballast above the surface of the rails. As it is effective in disposing of most of

it and decreasing the stress on the spreading board, it is also an important auxiliary for the reason that it renders it possible to spread ballast over grade crossings, cattle guards, guard rails and switches, where it is necessary to raise the spreader to clear such obstructions.

One photograph shows the spreading board pushing an accumulation of rock, of approximately $2\frac{1}{2}$ cu. yd., which has been gathered from between the rails, and is being worked outward on each side of the plow. The ballast thus pushed along drops into sags in the shoulder where there is a deficiency of dressing material, thereby eliminating the necessity of performing the

Appearance of the Track After the Dresser Has Gone By

work by hand labor. The principal function of the wings is to shape the rock forced out by the spreading board into shoulder formation. This occurs simultaneously with the ejection of the ballast by the spreading board. The economy of this feature is determined by the fact that were an ordinary plow utilized it would be necessary to form the shoulder with hand labor.

In dressing ballast on double track it is merely necessary to adjust the wings to obtain the desired result. On curves where the sub-grade is canted to correspond with the elevation of

little rock scattered. A gang of 17 men following the ballast dresser was able to dress the track to required form. This would ordinarily have taken at least 50 men. The results to be obtained in gravel are said to be even better than in rock.

The water tank seen in the photographs was installed primarily for the purpose of loading down the forward end of the car while the dresser was in use. At a later period it was developed into a device to sprinkle the ballast as the dresser passed over it. This is especially desirable on gravel ballast, as it eliminates a source of annoyance that almost always occurs in this work. The capacity of the tank is 4,000 gal., although 2,000 gal. is sufficient to sprinkle 1,000 cu. yd. of ballast. When the car is in transit the tank should never be more than half full. To obtain the best results in spreading, the ballast dresser should not be moved at a speed to exceed five miles per hour. The track on which the work referred to in this article was performed parallels the Kaw river, where there are numerous curves, many of which have considerable elevation, and many cuts and fills. We are indebted for the above information to R. J. Parker, general superintendent, Atchison, Topeka & Santa Fe, Topeka, Kan., under whose direction this spreader has been used.

A NEW STEEL TIE

A new steel tie is being put on the market by the Standard Steel Tie Company, Dallas, Tex. It consists of a rolled channel section $\frac{3}{8}$ in. thick, 8 in. wide and 5 in. deep, and 8 ft. long, placed in the ballast trough side up with creosoted wood bearing blocks $7\frac{1}{4}$ in. by 7 in. by 18 in., each secured in place in the trough of the channel by two $\frac{3}{4}$ -in. bolts and a 2-in. by 2-in. lug, sheared from the web of the channel and bent up to bear against the block. Four holes $2\frac{1}{2}$ in. in diameter punched in the bottom of the tie near the center provide drainage and hold it in line.

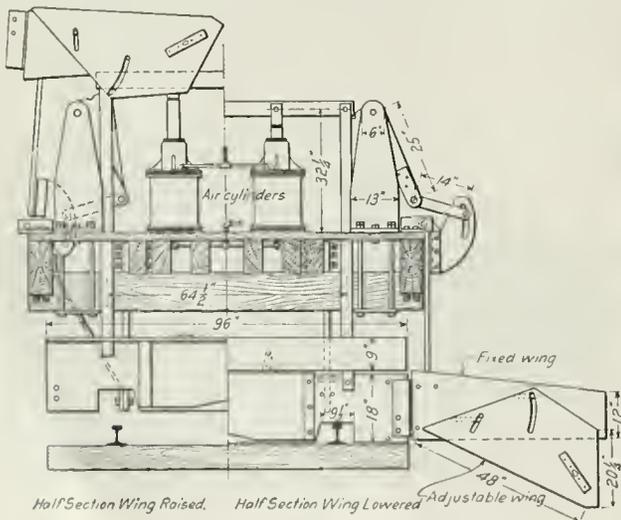

Since the rail is supported on and secured to the creosoted blocks, the manner of handling these ties in track corresponds

Standard Steel Ties in the Pennsylvania Tracks Near Parkesburg, Pa.

very closely to the operation with the ordinary ties. They permit shimming, change of rail base and gage, and any ordinary track fastenings may be used. Since there is no metal connection between the rail and the channel, perfect insulation is afforded. Furthermore, the blocks, being 18 in. long and firmly secured in the channel, reinforce the tie under the rail where it has to meet the heaviest stresses.

A number of these ties were put in the tracks of the Pittsburgh & Lake Erie, near Pittsburgh, a year ago, and others have been recently installed in the Pennsylvania Railroad tracks near Parkesburg, Pa., as shown in the accompanying photograph.

Cafferty-Markle Spreader

the track no difficulty is encountered because of the wings digging into the sub-grade, but where the sub-grade is not in conformity with the elevation, the difficulty can be easily overcome by adjustment of the wings.

A train consisting of 22 cars and carrying approximately 1,000 yd. of ballast was unloaded and spread in 48 min., leaving it as shown in the photograph of the track. It will be noted that the shoulder was fairly regular at the toe and that there was very

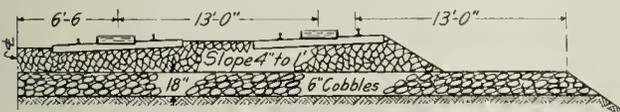

PUTTING IN SERVICE A NEW LINE WITH DENSE TRAFFIC

By W. F. RENCH

Supervisor, Pennsylvania Railroad, Perryville, Md.

It is the rule for restricted operation to continue upon new lines of road for many months after service is begun. This is, of course, an entirely proper precaution during the time the roadbed is becoming fully settled; but the interference with passenger and freight schedules, especially upon lines of intensive operation, renders desirable the early removal of this restriction. The trend of modern practice in making up time tables is to use the highest rate of speed consistent with safe movement, and schedules, once established, must be maintained thereafter. It has heretofore been considered that an extended period of slow passage over new work was a necessary evil imposed by safety considerations; but upon a careful study of the question it will be found that the required period may be greatly shortened without any risk being incurred. This cannot better be shown than by a careful analysis of a concrete example; the Bristol new line of the Pennsylvania between Philadelphia and New York.

Although the fill averaged 22 ft. in height for more than three miles, service was inaugurated at a speed of 30 miles per hour which was increased after 36 hours to 50 miles per hour, and after one month to 70 miles per hour. The operation of connecting up this new four-track line presented incidental points of interest which will be sketched briefly. The new line lies to the north of the old one, and No. 4 is the most northerly

Section Through New Embankment Under Track Tanks

of the tracks. The longest interval between scheduled trains in any daylight hour at this point was 35 min., and it was necessary as a preliminary to connecting up each track to draw it as closely to the existing tracks as possible. This effected a great saving in time not only because there was less track to be shifted, but the maximum lateral throw was greatly reduced.

In order to establish complete unity of action at the two ends of the work, which were separated about $3\frac{1}{2}$ miles, a telephone line was installed having besides these two connections only one other which communicated with the signalmen at the nearest cabin. When it is known that the necessary extension of No. 1 track at the west end was 1,500 ft. and that the extreme depth of fill necessary in building it was 4 ft., it will be seen that unflinching execution of the prearranged plan was essential, and this required close co-operation between the operating department and the track forces.

The new passenger station was a mile distant from the old one, and as will be inferred readily, the operating impracticability of having a separate station for the eastward and westward travel was avoided by using No. 3 westward freight track for such eastward passenger trains as were scheduled to stop at this station, these being run against the current of traffic by train order.

There was nothing in the construction of the road to cause its early settlement excepting that the material of the fill was a homogeneous gravel and that the various features of the work were performed with the utmost fidelity. The filling was not deposited in layers, but was dumped from trestles built to the height of the sub-grade. The tracks were back filled with stone, but the cushion beneath the ties was no deeper than 2 in.

The maintenance question was greatly complicated by the presence at the point of highest fill of track tanks 1,600 ft. long in the four main tracks, which were on a 30 min. curve with 2 in. superelevation. The care of this feature formed one of the important elements of the solution. It is a well known fact that given a set of men used to daily manipulation of a locomotive

at high speed there will be many who will violate the rules for reduction at specified points. This is particularly true at places where speed restriction is laid on account of scooping water. If high speed is used while this occurs there necessarily results a large waste of water, and careful observation showed that engine tanks were being overflowed frequently through one-third the length of the tank. The considerable volume of water that entered the roadbed through this practice introduced a grave element of danger to the stability of the new embankment. This was early recognized and partly met by a general notice limiting the conditions under which engines might take water at that station. But there still remained a rather heavy burden, and to meet this a special construction had been adopted for the sub-bed at the tanks and an extremely generous width of embankment was also provided. The former consisted of a carefully laid bed of cobbles 18 in. deep beneath the entire sub-grade throughout the length of the tanks, and for 400 ft. either way from the ends which alone cost the sum of \$15,000. The widening which was done with the heaviest material obtainable, principally dirt from the cleaning of the center ditches and containing much old ballast, extended the shoulders on both sides to a distance of 13 ft. from the gage of the rail. This construction has also been followed in other similar installations. A cross-section of the roadway is introduced as information concerning a quite effective practise.

There were nine bridges throughout the extent of the deepest fill, which limited the amount the track might safely be allowed to settle. Without the presence of these structures it would have been permissible to assign only a sufficient force to the maintenance that safe and comfortable passage at moderate speed required. But the subsidence had to be met daily as it occurred. The settlement during the night amounted to no more than 2 in., and through the cantilever support provided at the ends of the several bridges by both the service rails and the iron guard rails there was always a comfortable run-off. The total settlement of the tracks was attained at the end of six months and amounted to 18 in. The wisdom of having placed this new line in stone ballast at the start was therein fully shown since the standard depth of stone ballast was thus naturally secured.

There was assigned to the maintenance of this new railroad a force of 450 men, and this force was continued during the first ten days of service. The cost was thus \$8,000 for lining and surfacing a three-mile stretch of road for this short period. The force was gradually reduced as the embankment was compacted, and on January 1 a regular progressive decline in maintenance began. The excess cost of lining and surfacing in January was \$2,500, and this diminished uniformly \$500 per month thereafter until on June 1 the expense of maintenance was on a par with that of other main tracks.

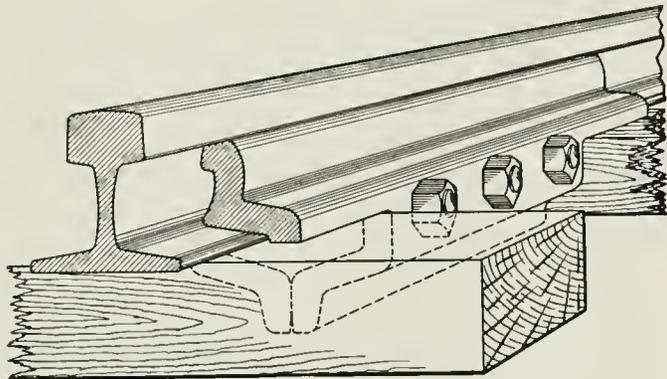

The pertinent fact developed by this somewhat unusual case is that the plentiful labor expended upon the maintenance in the early period of its use greatly hastened the final settlement of the new roadbed. In any construction a definite amount of settlement is inevitable, and as track stresses are known to be higher at fast speed it unquestionably is an advantage to fix the speed as high as practicable and then provide the necessary force to safely maintain the road. The benefit derived from an early establishing of full service upon this line of road, which carries a daily traffic of more than 200 trains, fully justified the considerable expense that was necessary to attain it

THE PEAT DEPOSITS OF RUSSIA.—The area covered by peat deposits in Russia is about 177,000 square miles. The deposits belonging to the government have been examined and are found to run about 260,000 cu. ft. per acre, equivalent to 2,300 tons air-dried. If the same ratio holds over the country as for the government lands, the total reserve is about 100,000 million tons of peat. This compares with coal reserves of about 80,000 million tons. The peat is constantly growing, and taking its heating value at half that of coal, it is evident that the peat reserves are about equal to those of coal. Around Petrograd half of the country is covered with peat bogs.

AN EMERGENCY RAIL JOINT

An emergency rail joint has been recently developed and placed in service for emergency use on the Pennsylvania Railroad. In general it consists of two heavy splice bars with depending flanges which are provided with three bolt holes so placed that the two bars may be connected by bolts passing underneath the base of rail. The two flanges come to bearing below the bolts and the fulcrum thus afforded makes it possible to bring the bars to tight bearing against the rail by tightening the bolts. By this device two rails may therefore be held together for a time with reasonable security without the necessity for drilling bolt holes through the web.

One purpose for which this joint is designed is the quick relief in the case of a broken rail, which can be reinforced with this

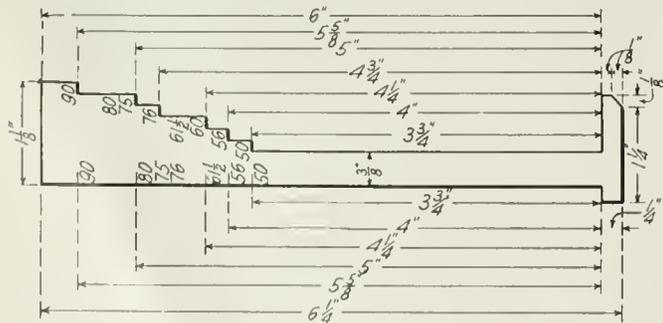

An Emergency Rail Joint Devised for Use on the Pennsylvania Railroad.

device without taking time to drill holes. A second use is to facilitate the replacing of rails in main running tracks. Frequently after several new lengths of rails have been spliced together and shifted into the opening made by removing the old rails, trouble is experienced in lining up the bolt holes in the splices at each end. In such a case the emergency splice would enable a firm, temporary joint to be secured quickly to permit the passage of trains.

The joints are made in lengths varying from 10 to 30 in., the shorter lengths not extending over the cross ties. The weight varies from 40 to 80 lbs. per pair, according to size. This joint was designed by Edwin W. Hankele, of the engineering department of the Pennsylvania Railroad, Pittsburgh.

A RAIL SCALE

The rail scale illustrated in the accompanying drawing is used on Morgan's Louisiana & Texas Railroad. The scale is cut out of brass 1/16 in. thick, notched at one side for the height of the various sections of rails used on that road and graduated on the

Placing a Concrete Lining in the Sandy Ridge Tunnel

The Carolina, Clinchfield & Ohio Is Using an Efficient Plant, with a Hopper Car for a Pneumatic Mixer

The Carolina, Clinchfield & Ohio has recently completed and placed in operation that portion of its line known as the Elkhorn extension, thus extending the line from Dante, Va., to Elkhorn City, Ky., the terminus of the Big Sandy division of the Chesapeake & Ohio (described in the *Railway Age Gazette*, November 7, 1913). Where the above extension passes under the divide known as "Sandy Ridge," just north of Dante, Va., there is a tunnel 7,804 ft. long. This tunnel passes for about one-half its length through slate and shale formations, which disintegrate upon exposure to air, and for the remaining half through sandstone badly seamed and broken. In view of these conditions, it was decided to begin the lining of the entire tunnel with concrete at once. This work requires the placing of between 50,000 and 60,000 cu. yd. of concrete while traffic is passing through the tunnel.

In addition to Sandy Ridge there are a number of other tunnels on the above extension as well as on other portions of the road which may require lining in the future under similar conditions of traffic. With this in mind the railway engineers made a special study of various plans for the above work by which it could be done with economy and rapidity, also holding in mind that much of the plant would be used for similar work after this particular job is finished.

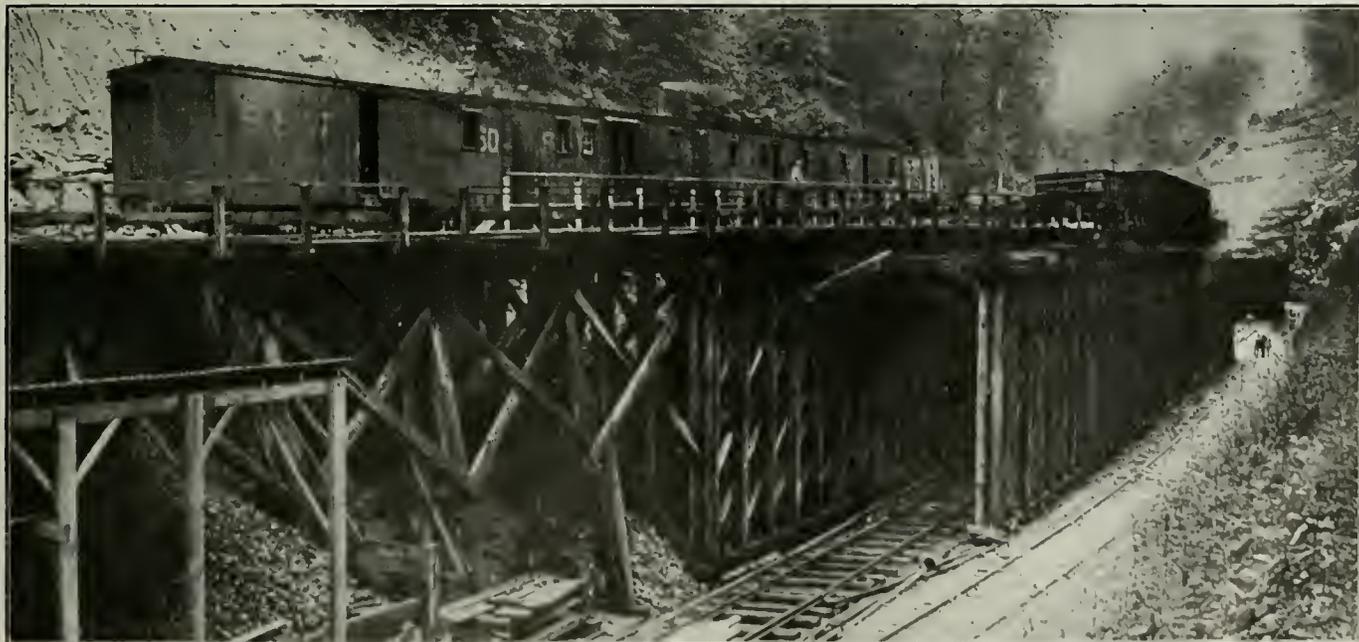

The result of these studies was the determination to use the compressed-air method of mixing and placing the concrete, and to provide for this a plant consisting of a self-propelled concreting car, a loading and storage trestle, a compressed-air plant and pipe line through the tunnel and concrete forms, which are quickly and easily movable.

THE CONCRETE CAR

On account of the great length of the tunnel it was deemed

that a car carrying the ingredients would be the proper solution. It also appeared most desirable, if not absolutely necessary, to handle the car without filling the tunnel with smoke. These premises led to the idea of a self-propelled concreting car, and finally to the gasolene engine as most nearly fulfilling all conditions for the propelling device. A gasolene engine will emit only a small amount of smoke or gas while moving and can be shut off entirely when in position for use. It occupies but small space, can be operated by one man, and contrary to general belief, is very reliable. To obtain capacity, gravity flow of materials and a convenient and desirable arrangement, the car was made as large as the standard clearance of the road would permit after allowing room for concrete forms. The dimensions are 40 ft. long over end sills, 10 ft. 4½ in. wide over braces and 17 ft. 9 in. from top of rail to top of car. It was built of steel as the material bins are high above the rail and the weight is considerable.

The principal features of the car, as shown in the accompanying drawing and photographs, are a central chamber, open on the sides, 8½ ft. long, 9 ft. 8 in. wide and 10 ft. 3 in. high, in which on one side is located the pneumatic concrete mixer and on the other side the charging skip. Over this chamber is a water tank of 1,850-gal. capacity, which furnishes water for the concrete and is also connected with the cooling system for the gasolene engine. On one end of the car facing the central chamber is a stone bin of 30 cu. yd. capacity. On the other is a sand bin of 12 cu. yd. capacity. Each bin has a chute 20 in. wide leading to the charging skip, and each chute is controlled by an under-cut gate. Under the stone bin is a space occupied by a 96 cu. ft. air receiver, standing vertically, and the storage of the cement in bags. Under the sand bin is the gasolene engine and its auxiliary equipment completely

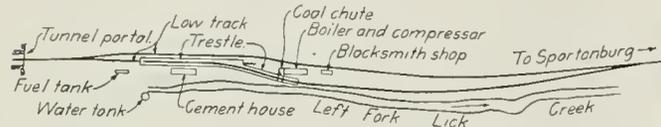

Loading and Storage Trestle from the South, with the Entrance to the Tunnel in the Background

impracticable to furnish the concrete from a mixer located at either portal of the tunnel, as too much time would be consumed in transporting the wet concrete. It was concluded at the outset that the mixing could be done inside the tunnel, where the concrete was to be deposited, and the conclusion was reached

housed from water and dust. The charging skip in its lower position stands with its top rim about 1 ft. 3 in. above the floor and travels on inclined guide rails to its upper position over the mixer, being hoisted by a compressed-air cylinder 9¼ in. in diameter. The gate of the skip works automatically by

means of a guide rail. The mixer is for a two-bag batch (0.4 cu. yd.) and has an 8-in. outlet pipe at the bottom running horizontally and curving to the outside of the rear truck, and thence vertically to near the top of the car, where it branches by means of a wye into two lines, one a 180-deg. bend to the rear for "shooting" into foundations and sidewalls, and the other going to the roof for "shooting" into the arch. The wye is a special patented device with a sliding plate controlling the movement of material into either arm. The arrangement of the pipe, traveling with the car and being in position at all times for "shooting" concrete, results in a material saving of time and expense.

Along one side of the car, level with the main floors, is a folding platform 2 ft. wide, used by the men carrying cement and to gain access to the engine room. During the ordinary

Layout of Material Plant at the South Portal

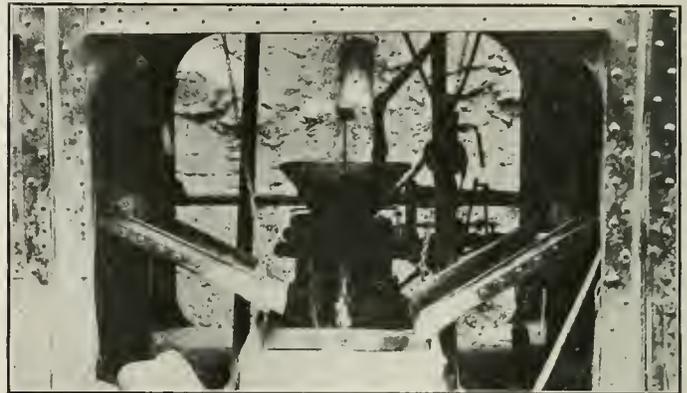

work of the car this platform remains down. The entire arrangement is compact and arranged with a view to save manual labor. One man controls the hoisting of the skip, the injection of water and the mixing and discharge of the batch. One man is placed at each chute and two men carry, open and empty the cement bags.

The gasolene engine is of the six-cylinder, four-cycle tee-head type and is rated 200 hp. at 350 r. p. m. It can be throttled to 125 r. p. m. The motor and its frame constitute one of the trucks of the car. The cylinders stand in a row at right angles to the track and the whole construction is compact but accessible. The engine is started by admitting compressed air into three cylinders, then the explosion of the gasolene takes place in the other cylinders and continues the motion. The transmission is by means of a Morse chain on to the driven axle (one only being used) and the control is through a friction clutch of special design. The general principle employed is much the same as in the ordinary automobile. The car and gasolene en-

capacity of 200 cu. yd. The general arrangement is shown in the track layout and in two of the photographs.

COMPRESSOR PLANT AND PIPE LINE

The compressor plant is exceptional for a temporary outfit. To save money on foundations and at the same time to increase the space, the floor level of the boilers and compressors was fixed 4½ ft. above sub-grade, the concrete foundations and walls were built up to this height and the cellular space under-

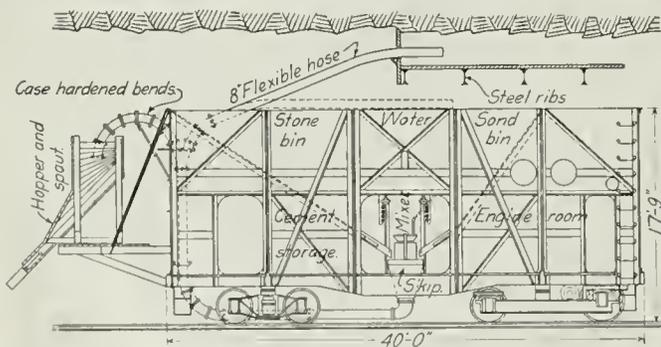

Central or Working Chamber of the Car Showing the Skip in the Foreground, the Mixer in the Rear and the Chutes on the Sides

neath was utilized for water tanks and ash pit. The building was built of 1-in. boards covered with tar paper. The arrangement chosen permits coal to be dumped from cars on the trestle to a pile in front of the boilers. There are two boilers, both locomotive type, one new, one of 150 hp., and one old one of 70 hp. The piping connections are such that either one can be cut in or out of service for cleaning or repairs. Two compressors are installed, but an extra foundation for another unit is provided, for reasons which appear elsewhere. The compres-

General View of Loading Trestle from the South Portal of the Tunnel

sors are alike and of the Ingersoll-Rand F. R. I. Rogler valve class, a high speed, single stage type with a steam cylinder 12 in. by 12 in., an air cylinder 12 in. by 14 in., a piston displacement at 250 r. p. m. equal to 528 cu. ft., an actual output of about 375 cu. ft. of free air per min. each. They work under 125 lb. steam pressure and compress air to 115 lb. They are

Elevation of the Concreting Car

gine were built by the McKeen Motor Car Company, Omaha, Neb. It was sent knocked down, was erected at the railway shops at Erwin, Tenn., and was moved to the work (105 miles) under its own power at a speed at times as high as 25 miles an hour.

LOADING AND STORAGE TRESTLE

The loading and storage trestle is of special design and so arranged that the concrete car goes under it and receives crusher-run stone, sand, bag cement and water by gravity. The sand and stone is drawn from overhead bins by means of under-cut gates. Cement is conveyed into the car by a chute. The trestle has a track over its deck upon which stone and sand in hopper cars are stored or unloaded into the bins below. There is a continuous row of 27 bins with an aggregate capacity of 324 cu. yd. and a total length of 162 ft., and five loaded cars can be stored over these bins to give an additional storage ca-

cooled by water brought by gravity from the mouth of an old coal mine. From the compressor a 6-in. pipe leads to a 150-cu. ft. air receiver, from which a 4-in. pipe line goes on a steady 0.5 per cent down grade entirely through the tunnel. At the lower end is a pet cock to draw off any water. In order to provide for expansion and contraction, the pipe line is laid alternately on the east and west sides of the track in lengths of about 1,000 ft. connected by curves of 2 ft. radius. The bottom of the pipe is at the level of the bottom of the ties and 1 ft. out from their end. About every 100 ft. a long radius tee is placed and about 20 mine cocks of 4-in. size are provided; these can be shifted to the various tees as the progress of the work demands. From the mine cock a 3-in. hose 60 ft. long connects with the 96-cu. ft. air receiver on the car, which can thus be connected to the 4-in. pipe line from any position in the tunnel.

GENERAL

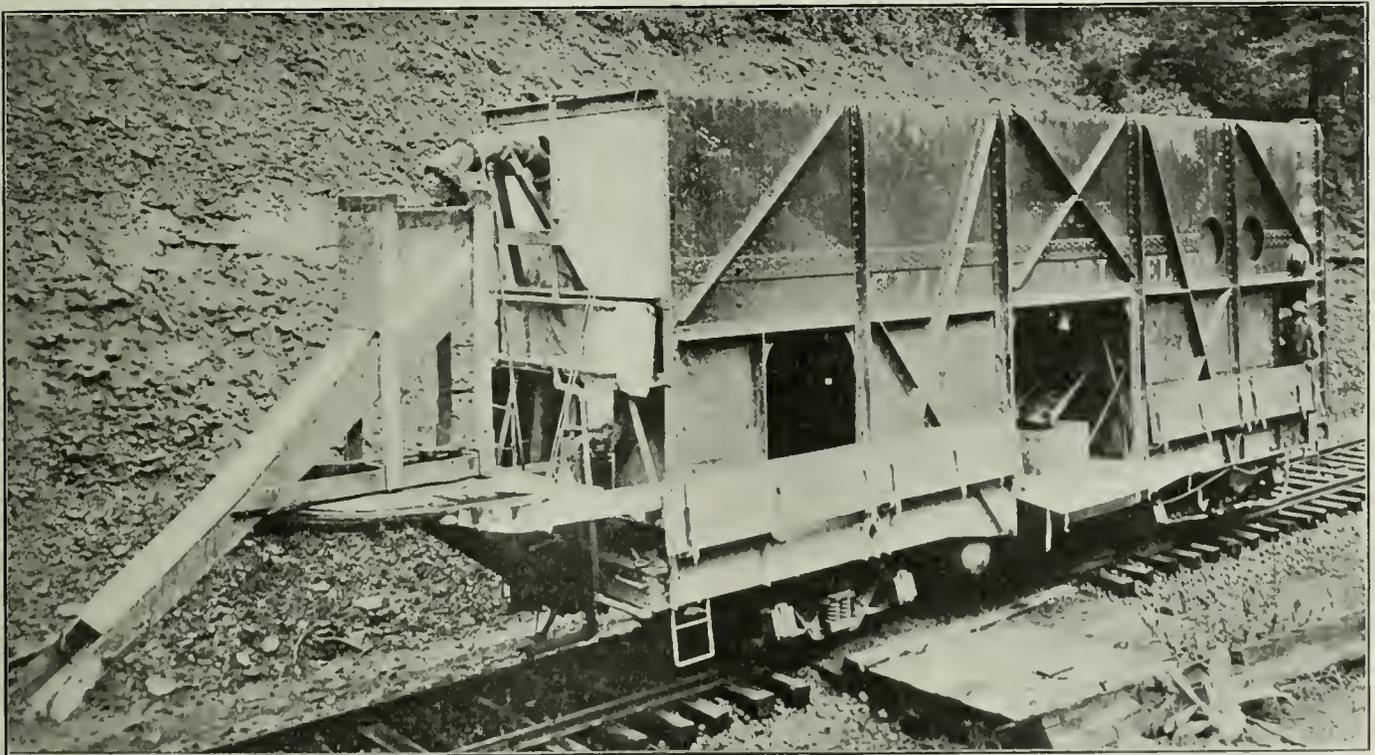

The forms are of steel except the arch ring, which is 3-in. hard pine on steel ribs. They are of the Blaw collapsible type, but of exceptionally stiff design. They are held by anchor bolts to the walls of the tunnel and are without interior bracing, so that the concreting car as well as trains may pass without interruption. They are collapsed by inserting temporary rods, which are removed when not in use. Five 30-ft. sections are provided, and it is expected that the car will fill at least one section each

in the foundation and the initial lift of bench wall 4 ft. 4 in. high, which involves moving the car more than will be necessary when "shooting" into the arch form. The performance is, however, largely dependent upon interference from trains passing through the tunnel.

Another feature of this plant is the short pipe through which the charge moves. Generally speaking, it has been held that at least 50 ft. of pipe was necessary to get a good mixture of concrete. In this case it goes through 41 ft. of pipe and 10 ft. of chute and the mixture is good. In several installations concrete has been placed through 1,200 ft. of pipe and the record for distance to date is 2,805 ft. One of the difficult problems confronting the designer is to place the charges of ingredients into the mixer fast enough to work it to its capacity. The mixer can shoot a batch every 15 sec., provided sufficient air is furnished, but to give it a charge of material every 15 sec. seems to be an unsolved problem. Time records of the device given below show the speed at which batches are discharged, giving the actual time the car is coupled to the hose and working inside the tunnel:

Aug. 17, 1915,	423 batches in 381 min.,	average 54.0 sec. per batch.
Aug. 18, 1915,	323 batches in 302 min.,	average 56.1 sec. per batch.
Aug. 19, 1915,	448 batches in 340 min.,	average 45.5 sec. per batch.
Aug. 20, 1915,	325 batches in 250 min.,	average 46.1 sec. per batch.
Aug. 21, 1915,	309 batches in 280 min.,	average 54.3 sec. per batch.

The variation is due to the condition of the material, whether wet or dry, which affects the rapidity with which it flows in

General View of the Concreting Car

day and lose no time waiting for the moving of forms or for the concrete to take its set. For the foundations and initial bench wall, wooden forms are in use. They are made in sections of 12 ft., are braced from the track, and are taken down, carried ahead and reused as required.

The car began regular operation in the tunnel on July 9, 1915, and has worked every day since, Sundays excepted. It has steadily increased its output as the men become more used to the work and better organized, as shown by the following record:

Week ended July 17, 1915,	261 cu. yd.
Week ended July 24, 1915,	379 cu. yd.
Week ended July 31, 1915,	516 cu. yd.
Week ended Aug. 7, 1915,	822 cu. yd.
Week ended Aug. 14, 1915,	928 cu. yd.

Several runs of 180 cu. yd. per day and one run of 201 cu. yd. have been made. The work so far has consisted of putting

the chutes and skip. It is believed that the operation can be speeded up to an average of about 35 to 40 sec. per batch with dry material. One should observe that the door of the skip automatically opens as the skip reaches to position and closes as it is lowered away, also that the door serves as a chute while open, and that the side slopes are steep and unbroken, so that the skip clears quickly. The material when damp has a decided tendency to arch either vertically or horizontally, and frequently this arch must be broken by hand. The hoisting of the skip, the placing of the water and the discharge of the batch are all controlled by one operator. The inside of the car is lighted by carbide lights, and the outside work by hand torches and carbide lights.

A great diversity of opinion exists among those familiar with the compressed air method of mixing and placing concrete as

to the quantities of air required. So far it appears that for the present plant a capacity of 750 cu. ft. of free air per min. is ample, but on account of this difference of opinion space has been provided in the compressor house for an extra compressor. It has been found that one compressor slowed the work down to a batch about every 1¼ min.

The plant was designed by O. K. Morgan, office engineer, under the general direction of Ward Crosby, chief engineer, of the C., C. & O., to whom we are indebted for the above.

BRIDGE AND BUILDING CONVENTION

The twenty-fifth annual convention of the American Railway Bridge and Building Association will be held at the Hotel Statler, Detroit, October 19-21. From present indications a large attendance is expected. Among the reports which will be presented are the following: Railway Water Tanks; Pile and Timber Trestle Bridges; The Protection of Grade Crossings; Coaling Stations; Costs of Structures; Efficient Methods of Handling Work and Men; Warnings for Overhead and Side Obstructions; Reinforced Concrete Bridge Work; Station Buildings for Passenger Service; Concrete Culvert Pipe and Concrete Piles.

The Bridge and Building Supply Men's Association is also planning a meeting and an exhibit at the same place coincident with this convention.

WATER SERVICE TESTS

BY PAUL M. LA BACH.

Assistant Engineer, Chicago, Rock Island & Pacific, Chicago.

The customary unit of cost of pumping water for locomotive and similar uses is the cost per thousand gallons. While this unit is useful for many purposes, it has little value when one desires to compare the efficiency of one plant with that of another. The costs of the same plant may be compared from month to month, but even then, false conclusions may be drawn as the plants are apt to deteriorate with age, or the conditions may be altered. The most accurate way of comparing costs, exclusive of the pumper's wages, is by using the water horse power hour or some multiple thereof as a unit; the water horse power hour in this case being the overall horse power hour. This will not give the relative efficiency of each unit of the plant, but when once determined, plants of different design may be compared and tests made of the different parts at the same time.

Those responsible for the design of such plants are frequently called upon to decide which is the most economical, a steam plant with a direct-acting steam pump, an oil engine, with a power pump, or a power pump with motor drive. About the only known quantity is the price of coal, oil or electric current. From this point the designer must work with percentages which are supposed to indicate average efficiencies for each of the different units, such as the boiler, pump, pipe line, etc. The present state of the art is such that not enough is known of the actual performances of these parts for anyone to form very accurate conclusions. There is great need for a series of plants, taken as a whole, which may also be divided into their component parts. This will bring out the points of good design and also show up many bad ones.

Probably one of the principal reasons why more tests are not made showing fuel consumption on a horse power hour basis is the popular impression that it is a complicated process requiring much time. If indicators are used and cards made this is relatively true, but even then it is worth the trouble. However, another method may be used which is sufficiently accurate for the purpose. All that is necessary is to install a water pressure gage in the discharge line at the pump, a vacuum gage in the suction line, and an automatic counter to record the number of revolutions of the pump. The fuel must be weighed or measured as the case may be.

All the data required is found by reading the two gages and the counter four times an hour and recording the amount of fuel used. These data are then utilized in the following formula:

$$\text{Water horse power} = \frac{P \cdot L \cdot A \cdot N}{33000}$$

P = Mean effective pressure in pounds per sq. in. in discharge line while working, plus the reading of the vacuum gage divided by 2.035, plus the vertical distance in feet between the vacuum and pressure gages multiplied by 0.434.

L = Length of stroke in feet *a*.

Multiply *a* by 1 for a single-acting simplex pump.

Multiply *a* by 2 for a double-acting simplex pump.

Multiply *a* by 2 for a single-acting duplex pump.

Multiply *a* by 4 for a double-acting duplex pump.

Multiply *a* by 3 for a single-acting triplex pump.

Multiply *a* by 6 for a double-acting triplex pump.

A = Area of piston in sq. in. This is the effective water area and the area of the piston rod should be subtracted.

N = Number of revolutions per minute.

In case it is difficult to install a vacuum gage take the difference in elevation between the water level at the suction end of the intake and the pressure gage, in feet, and multiply this by 0.434. This may be corrected for friction, but where the pipe is short it is not necessary.

A log for an hour's run will be as follows:

Pressure gage, 100 lb.

Vacuum gage, 10 in.

Revolutions, 2,400.

Pump, 6 in. by 12 in. triplex, single-acting. Area, 28.27 sq. in.

Difference in elevation between gages = 3 ft.

$P = 100 \times 4.9 + 13 = 106.2$

$L = 3.0$ ft.

$A = 28.27$ sq. in.

$N = 40$.

$106.2 \times 3.0 \times 28.27 \times 40$

33000

$= 10.91$ water horse power.

The amount of work done in 10 hours is 109 h.p. If 20 gal. of kerosene is used during the period the fuel efficiency is 0.192 gal. per water horse power hour. It will be noted that the taking of water from the storage tank by locomotives during the test does not introduce a number of unknown quantities. The pressure gage should be in view constantly and any changes in head recorded with the time.

While the test is going on it is sometimes of considerable interest to know just how much water has been put in the tank. Where possible tank measurements should be made in order to compare the displacement of the pump with the amount actually delivered. Any excessive slippage would indicate as a rule that the valves of the pump needed overhauling.

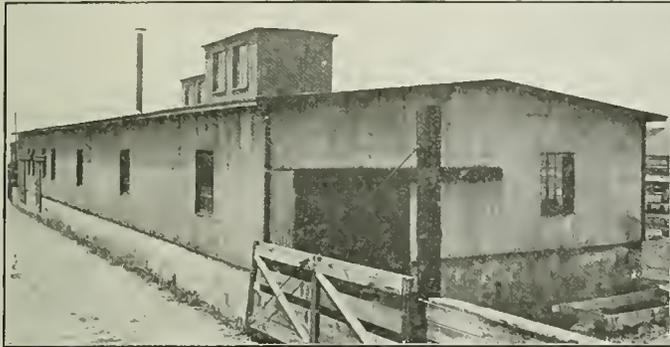

The importance of making actual tests under service conditions cannot be too strongly insisted upon. A variety of uses will be found for the data collected, which will lead to more economical operation.

MR. TAFT AND THE RAILROADS.—Mr. Taft says that we must grant increased rates to the railroads and do it quickly; that their prosperity is important to the prosperity of the country, because their expenditures create a very large part of the demand for our manufactured goods. He calls it outrageous injustice to make the railroads carry the enormous burden of the parcel post for nothing. He says the full-crew bills should be repealed because they impose the burden of employing unnecessary labor. The plight of the railroads today is largely due to Mr. Taft's action in 1910. He is fair enough to admit that he made a mistake. It was a terrible mistake, and has materially helped to keep the business of the country at low mark for five years. Mr. Taft should appear before the interstate commerce commissioners, the majority of whom he appointed, and who are still fumbling around in darkness.—*The Bache Review*.

CORRUGATED SHEET ASBESTOS CONCRETE

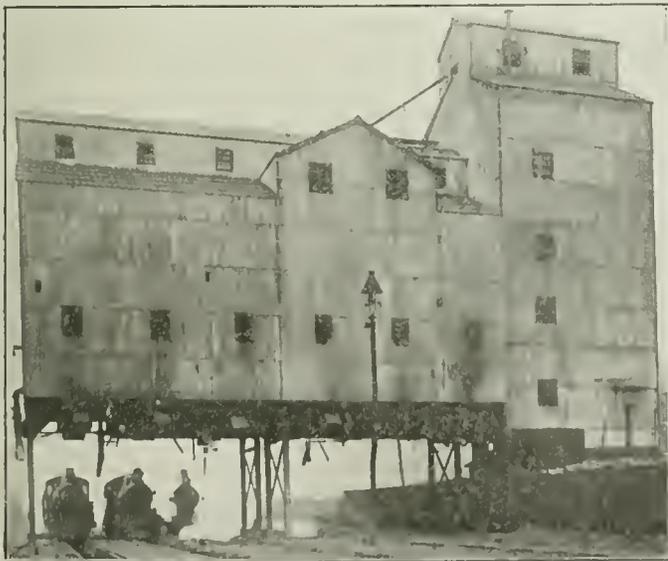

A building material of recent introduction is the Ambler corrugated roofing and sheathing, manufactured by the Keasbey & Mattison Company, Ambler, Pa. It consists of the combination of cement and asbestos fibers, known commonly as asbestos board, in the form of corrugated sheets, and is applied like corrugated iron. Its particular value is in its resistance to the action of air, water and temperature changes and its incombustibility. It possesses all the advantages of corrugated iron as to ease of erection, lightness and adaptability.

The incorporation of the asbestos fibers with the cement to form a dense, tough concrete, demands special treatment. The process may be described briefly as follows: Hydraulic cement

New York Central Sheep Sheds at Buffalo Covered with Corrugated Asbestos Sheets

is first mixed with water and asbestos fiber of the chrysolite variety, in a heating engine similar to that employed in the manufacture of paper pulp. The material then passes to the vat of a modified mill-board or paper machine, wherein it is kept in a state of agitation until picked up in thin coatings by a fine wire screen on a revolving cylinder, from which it is passed by an endless felt belt to a second rotating cylinder, upon

Corrugated Asbestos Sheets on the Coaling Station of the Terminal Railroad Association, St. Louis

which it accumulates in layers until the desired thickness has been attained. The material is then cut across and removed in the form of sheets which are piled one upon another and placed between corrugated metallic plates. The latter are then subjected to heavy pressure to compact the material, drive out excess water, eliminate all voids and fissures and give it the corrugated form, after which time is given for proper seasoning to allow for the setting of the cement.

Corrugated asbestos sheets for roofing and siding purposes are made of a uniform width of 27½ in., comprising eleven complete corrugations, and in lengths of 4, 5, 6, 7, 8, 9 and 10 ft. The corrugations are 2½ in. wide and 1 in. deep from top to bottom of corrugations. The material varies in thickness from 3/16 in. to 5/16 in. and weighs from 2.8 lb. to 3 lb. per sq. ft.

The best device for attaching roofing to steel and iron frame work has been found to be aluminum tie wires. Two holes are drilled through the asbestos, one just above and one just below the purlin. The outer end of each tie wire is provided with a head similar to that of a wire nail and holds a soft lead washer. The inner ends of the two wires are then twisted together around the purlin. In applying the material to wooden purlins, wire nails with lead washers take the place of the aluminum tie wires just described. The fastening for siding consists of a galvanized iron clip, bent so that the inner end rests over the purlin or other horizontal iron support. The clip is fastened to the corrugated material by two ¼-in. stove bolts. The siding is secured to the wooden frame work by means of nails, as in the case of roofing. For the protection of corners and ridges, rolls of the same material as the roofing and siding are used.

This material is used as a substitute for corrugated iron on railroad buildings, as illustrated in the accompanying photographs.

TIE PRESERVATION*

By F. J. ANGIER

Superintendent Timber Preservation, Baltimore & Ohio, Baltimore, Md.

On the Baltimore & Ohio, ties cost \$121 per mile of track maintained in 1904. By 1912 this cost had increased 70 per cent and in 1913 109 per cent. In other words, the cost of the ties in a mile of track had more than doubled in less than ten years. The amount of money involved is large, for next to fuel, ties constitute the largest single item of material cost on the railroad. The amount spent on the Baltimore & Ohio for ties in 1913 was over \$2,200,000. This does not include ties for construction work, or the cost of labor putting them in track.

In the campaign for the conservation of the nation's resources, the railroads can materially assist because the cheaper, inferior and more plentiful woods, such as red oak, beech, elm, etc., can be so protected by treatment to last as long as, or longer in some locations, than the best white oak. This makes it feasible to use woods otherwise not easily marketable, and prolongs the existence of white oak timber, a species which, if there were no tie-treating plants, would soon cease to exist, resulting in loss to those trades that use it.

Further, this movement which encourages the purchase of beech, maple, elm and the inferior oaks, opens up a market for such timber along the tracks of the Baltimore & Ohio, which will bring millions of dollars into circulation among persons who in turn will spend a portion of this money with this railroad for the transportation of merchandise and passengers.

The wood preserving industry in the United States has been built up largely on crossties and other railroad material. In 1913, out of a total of approximately 150,000,000 cu. ft. of wood treated, nearly 80 per cent was railroad ties, and probably another 10 per cent other railroad material.

While nearly 30 per cent of all crossties used annually received a preservative treatment, less than one-half of one per cent of the total consumption of manufactured lumber is treated. Future developments should be in the direction of more extensive treatment of all timber exposed to decay. If the crossties and the ten billion feet of lumber which fail from decay annually were properly treated, it would effect a saving of at least one hundred million dollars each year.

Chemical treatment of timber in this country, on what might

* Abstract of a paper presented before the Baltimore & Ohio Operating Officers' Association, Deer Park, Md., June 26, 1915.

be considered an extensive scale, was first undertaken by the Atchison, Topeka & Santa Fe in 1885. Up to that time there were only 3 pressure plants in existence. At the close of 1890 there were 8 plants; in 1900, 15 plants; in 1905, 34 plants; in 1910, 74 plants and in 1914, 96 plants.

The first recorded use of treated crossties was in Maryland in 1838, and the first treating plant, which was in the form of open wooden tanks, was built in Lowell, Mass., in 1848. The preservative used at this and several of the other earlier plants was bichloride of mercury. The first permanent railroad plant using creosote was built by the Louisville & Nashville at West Pascagoula, Miss., in 1876.

The total number of ties treated in the year 1885 was about 120,000, which was approximately one-quarter of one per cent of the estimated number of ties used during that year by all the railroads in the United States. The number treated annually increased amazingly, and in the year 1913, 40,260,000 ties received preservative treatment, being about 28 per cent of the entire number purchased by the steam and electric railroads during that year.

The number of ties treated in 1914 exceeded the total of 1913 by over 3,000,000. The hewed ties treated comprised about 70 per cent of the total, or about 30,000,000, while approximately 14,000,000 were sawed. Ties of the red oak family lead in the number treated, followed by southern yellow pine, then in order of importance come Douglas fir, western pine, beech, gum, tamarack, maple, birch and elm.

When we consider wood preservation in its broadest aspect we include the prevention of loss by reason of using an expensive wood, or special costly sizes, where cheaper kinds would serve equally well.

W. H. Clifton, lumber agent, in a paper read at the railway storekeepers' convention, this year, brought this out very clearly. He said: "As in other lines of industry, there are certain practices which are followed in the use of lumber in railroad shop and building work today, which have been unchanged for many years, regardless of the decrease in the supply and increase in the cost of the lumber used, or in fact that other kinds of lumber, equally well adapted to the purpose, are more easily and cheaply obtained."

After citing various incidents showing the prevalence of such practices, he concludes:

"A remedy is not hard to find or difficult to administer. Usually a little educating of the consuming forces in the possibilities of substituting, with a view of economy, brings the desired result, for the average mechanic on a railroad is not averse to saving money for the company if some one will show him how to do it and co-operate with him in accomplishing the desired result."

Ties are purchased by the purchasing department. They are inspected by the timber preservation department and put in track by the maintenance of way department. Ties for treatment are shipped direct to the treating plant, and those to be used without treatment are distributed along the right-of-way and used in track as required. Ties received at the treating plants are cribbed in piles seven and one for seasoning. The seasoning period varies from 4 to 12 months, depending on the kind of wood.

White oak is rapidly increasing in price, and within a few years will doubtless be as little used for crossties as black walnut or other expensive woods. Chestnut and cedar are too soft for crossties, except under comparatively light traffic. The alternative is to utilize the inferior woods, such as the red oak family, beech, elm, etc. These woods decay rapidly when in contact with the ground. Preservative treatment makes them as good as or even better than the more costly woods.

One naturally wants to know what is really saved by going to all of this expense and trouble to treat crossties. A number of tables have been prepared and as many different estimates made to show the enormous saving in treating timber. There are so many factors to be taken into consideration that it is difficult to show what the average saving will be on a large railroad like

the Baltimore & Ohio, which has upwards of 8,000 miles of track.

Mr. Emerson has kindly submitted the following, showing the total and annual cost of treated ties compared with untreated white oak ties:

	Treated, each	Untreated, each
Purchase price.....	\$0.547	\$0.717
Inspection015	.015
Treatment23
Freight112	.067
Unload and pile.....	.02	.02
	<hr/>	<hr/>
(a)	\$0.924	\$0.819
Truck to point of use.....	.01	.01
Install in track.....	.28	.28
Truck and burn old tie.....	.01	.01
Two tie plates.....	.24	.08**
Four spikes.....	.05	.05
Interest on (a).....	.056	.025
(6 months on untreated, 12 months on treated.)		
	<hr/>	<hr/>
(b)	\$1.570	\$1.274
Supervision on (b) 5½ per cent.....	.086	.070
	<hr/>	<hr/>
Credit salvage, one-third value tie plates and spikes.	\$1.656	\$1.344
	.097	.043
	<hr/>	<hr/>
	\$1,559	\$1,301

** Cost of one-third of two tie plates, assuming that one-third of the untreated ties are tie plated.

Annual cost per year including 6 per cent interest with assumed life of 14 years, treated each \$0.20; of eight years, untreated each \$0.24.

Annual saving: On each treated tie over white oak untreated, \$0.04.

Assume the production of treated ties to continue at its present rate, viz.:

1,000,000 per annum from Green Spring.	
200,000 per annum from commercial plants.	
<hr/>	
Total..	1,200,000 per annum.
Saving the first year 1,200,000 at \$0.04.....	\$48,000
Saving the second year 1,200,000 at \$0.04 continues and there are also introduced another lot of 1,200,000, the total annual saving then being, at \$0.04.....	96,000
Third year.....	144,000
Fourth year.....	192,000
Fifth year.....	240,000
Sixth year.....	288,000
Seventh year.....	336,000
Eighth year.....	384,000
Ninth year.....	432,000
Tenth year.....	480,000
Eleventh year.....	528,000
Twelfth year.....	576,000
Thirteenth year.....	624,000
Fourteenth year.....	672,000
From fourteenth year on, this annual saving is continuous at....	\$672,000

The Baltimore & Ohio uses more than 2,000,000 ties annually for renewals. It would not be proper to treat all of our ties because many are destroyed by mechanical abrasion, and for some years to come more or less white oak, cedar and chestnut ties will be purchased, which we use untreated. If we estimate that the number of treated ties that could be used to advantage on the Baltimore & Ohio is 1,700,000 a year, and if the saving on this number is placed at the lowest estimate, viz.: four cents per tie, the total net saving would be \$68,000 for the first year, increasing a like amount each year until all ties put in track are treated ties.

As there are approximately 25,000,000 ties in track, and if we estimate 21,000,000 are treated, the net annual saving would be \$840,000.

To centralize the tie business this department has been instructed not only to treat ties, but also inspect them before purchase, and when proper methods have been devised, it will also distribute the ties in accordance with orders from the maintenance of way department. As a further safeguard to insure the full life of ties after they are put in track this department will have inspectors travel over the road to note the condition of the ties taken out of track and determine whether or not they have been removed before their full life has been attained.

THE RAILWAYS OF CHILE.—More than half the railroads of Chile are owned and operated by the government, which has undertaken an ambitious scheme of extension. The feature of these additions is the "Longitudinal Railway." This line, from extreme north to extreme south, will be 2,132 miles long, of which 1,960 miles is already built.

General News Department

Of the 175,465 regular passenger trains run by the Southern Railway during the fiscal year ended June 30 last 155,536, or 89 per cent, made schedule time.

The members of the Russian Imperial Railways Commission, who have been in this country for some time on business for the government-owned railways of Russia, are this week making a tour over the main line of the Pennsylvania Railroad. The commission is composed of Count S. I. Schulenburg, president; Max N. Groten, Nicolas P. Kemmer, Alphons I. Lipetz and Arkadi S. Martynoff. The principal stop will be at Altoona.

The life insurance scheme, for the benefit of employees, an-
