- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.
- NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.
- NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
- RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.
- RAILROAD MEN'S IMPROVEMENT SOCIETY.—J. B. Curran, Erie R. R., 50 Church St., New York. Meetings, alternate Thursdays, October to May, Assembly Rooms of Trunk Line Association, 143 Liberty St., New York.
- RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December, 1915, Waldorf-Astoria Hotel, New York.
- RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.
- RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.
- ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
- SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.
- TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.
- TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Agt., Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings, bi-monthly, Pittsburgh.
- TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings, October to May.
- TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.
- UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.
- WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.
- WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Building, Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.
- WESTERN SOCIETY OF ENGINEERS.—E. N. Layfield, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

Traffic News

The railroads which carry hay to New York City have removed the embargo on that commodity which has been in effect in New York State for several weeks.

The mayors of Yonkers, Mount Vernon and other cities have complained to the New York State Public Service Commission against the proposed advance in passenger fares by the New York Central.

The United States and the Texas agricultural departments are running a demonstration car over the Missouri, Kansas & Texas in Texas on an itinerary extending from November 9 to December 23. Lectures are given on the different branches of farming and horticulture.

The total freight transported through the canals of Sault Ste. Marie, Mich., and Ontario during November, amounted to 9,168,431 tons, of which 7,536,552 tons were transported through the United States canal. The total freight eastbound was 7,418,067 tons and westbound was 1,750,364 tons.

There is constant complaint among receivers in New York of the large percentage of damaged eggs arriving over all roads. Since the disclosure of dishonest settlements and false claims made some months ago, the carriers require sworn affidavits naming the percentage of damage in each shipment.

The Ann Arbor has announced that the car ferry between Frankfort, Mich., and Menominee, Mich., and Marinette, Wis., will be discontinued January 1. During the period the route is closed freight for Menominee and Marinette will be handled via Manitowoc, Wis., on the Chicago & North Western or via Kewaunee and the Chicago, Milwaukee & St. Paul.

The Panama-Pacific International Exposition at San Francisco, which has been open since February 20, closed on December 4, after having had a total attendance of approximately 18,750,000. The Panama-California Exposition at San Diego, which has been open since January 1, is to be kept open for another year, and many of the exhibits from the San Francisco exposition are to be taken to the San Diego exposition.

The Alabama Public Service Commission has denied the petition of the Louisville & Nashville for a rehearing on its request for permission to continue the advanced freight rates which the commission has ordered put back to the former basis, ten per cent below the rates now in force; but has granted similar petitions of six other roads, the Southern, the Atlantic Coast Line, the Atlanta, Birmingham & Atlantic, the Central of Georgia, the Seaboard Air Line and the Western of Alabama. These six roads were also permitted an extension of time to continue the present increased rates to December 31.

To oppose the increase in freight rates from northern and eastern cities to points in the southern states, which is announced to take effect in January, the freight bureaus of ten southern cities are taking united action, a meeting held in Birmingham, December 3, having resolved on this course. The cities represented at the conference were Birmingham, Montgomery, Atlanta, Memphis, Chattanooga, New Orleans, Nashville, Jacksonville, Selma and Jackson. The conference was presided over by J. T. Slatter, manager of the freight bureau of the Birmingham Merchants' & Manufacturers' Association; and action was taken looking to the formation of a permanent organization.

The railroads of the Trunk Line Association, taking action similar to that which was taken by the Erie some time ago, have issued tariffs, to take effect January 1, prescribing limitations which will be enforced in dealing with claims for eggs broken in transit. Present rules will continue in force on lots of 300 cases or more which have been rehandled and repacked and so declared by shippers; but on all other shipments claims for broken eggs will be considered or paid only where the number of broken eggs in any case or crate is not in excess of 5 per cent of the contents of each such crate or case. Where the quantity of broken eggs in any case or crate exceeds 5 per cent

of the contents thereof, claims will be considered only on the excess above 5 per cent.

"Land Bulletin No. 1" has just been issued by the colonization department of the Missouri Pacific-Iron Mountain system. It is to be issued periodically for the purpose of putting the man who is seeking land in the West, South and Southwest in touch with information about the best farming lands that are for sale in Missouri Pacific-Iron Mountain territory. The field men of the colonization department keep in close touch with conditions, especially as regards the possibilities of locating settlers. Whenever a particularly attractive land bargain is found, it is at once reported to headquarters in St. Louis. The size of the farm, price asked, amount and condition of equipment, adaptability of the soil for the production of different crops and all other desirable facts are obtained and later appear in the land bulletin. The paper is given wide circulation, and whenever an inquiry is received the owner or agent of the property and the prospective purchaser are placed in communication through correspondence. Many sales are brought about in this way.

Further Embargoes at New York

The congestion of freight at New York City terminals continues, and the number of loaded cars on hand (within 500 miles) is reported now to be considerably above the forty thousand reported last week. On December 3 five other roads followed the Pennsylvania in putting an embargo on flour and lumber billed through for export, namely, the Lehigh Valley, the Lackawanna, the Central of New Jersey, the Erie and the New York Central. Not a little of the delay now troubling the railroads is due to their own leniency in allowing shippers to load c. l. freight for as many as three different vessels in the same car; delivery being made by the carrier at the three different docks without extra charge.

Additional embargoes were placed on Tuesday of this week. C. C. McCain, chairman of the Trunk Line Association, said:

"The embargoes previously announced have relieved certain of the roads to only a limited extent, and additional embargoes have been found necessary by the Lehigh Valley and the Central Railroad of New Jersey. The Lehigh Valley has placed an embargo on export, domestic and coastwise shipments of hay and straw; export, domestic and coastwise carload shipments of wire, all kinds; nails, all kinds; iron and steel rails; export and domestic carload shipments of locomotives and parts thereof, machinery, and all iron and steel articles.

"The Central of New Jersey has placed an embargo on all export traffic; also on hay and straw, and on locomotives and parts thereof, consigned to all New York deliveries."

The Philadelphia & Reading has joined the other roads in placing an embargo on grain for export.

Progress of Committee on Uniform Classification

C. C. McCain, chairman of the Uniform Classification Executive Committee, has furnished a statement of the progress of the work of the Committee on Uniform Classification in a letter to the Committee on Uniform Classification of the National Association of Railway Commissioners. The statement is in part as follows:

"An examination of the proportion of the total number of items in the respective territorial classifications which have been reviewed and rewritten upon a uniform basis by the Uniform committee discloses the following:

"The total number of items in each of the territorial classifications are: Official 5765, Western 6918, and Southern 4780. Of these, the Uniform committee has reviewed and recommended uniformity for the following number: Official 4207, Western 4887, and Southern 3959, these numbers representing, for Official 73 per cent, Western 71 per cent, and Southern 83 per cent, such percentages indicating the proportions of the number of descriptions in each classification which have been reviewed and brought to a uniform basis by the Uniform committee. The difference between these percentages and 100 per cent represents items not finally acted upon by the Uniform committee, although a large proportion of same are in various stages of completion.

"The foregoing indicates the progress of the work assigned to the Uniform committee in reviewing, rewriting and harmonizing the descriptions in the several classifications.

"As to the extent to which the separate territorial classifica-

tion committees have accepted the recommendations of the Uniform committee, the following may be stated:

"Of the recommendations made by the Uniform committee, the Official has accepted 89 per cent, the Western 80 per cent, and the Southern 89 per cent. These accepted recommendations for uniformity are the following percentage proportions of the total number of items in each classification, viz., Official 66.9 per cent, Western 54 per cent and Southern 65 per cent.

"The varying number of items in the different classifications make difficult any very accurate check as to the precise condition of the work; besides, there are a large number of articles which are already substantially uniform in the three classifications.

"The work of taking over the recommendations for uniformity as made by the Uniform committee is proceeding as rapidly as same can be absorbed by the public, and the successive issues of the respective classifications will show an increasing number of descriptions which are uniform for all. The changes recommended by the Uniform committee and adopted by the respective classification committees necessitate republishing periodically the several classifications. These publications are employed in great numbers by the shippers for the purpose of learning the rates, rules and regulations under which their shipments are to be transported. In addition to the changes recommended by the Uniform committee, a great many other changes necessarily arise from the currently changing commercial and traffic requirements. The inclusion of both of these classes of changes in the new classification publications has been found to be somewhat burdensome to shippers and the transportation companies, in that the number and character of changes were greater than could be readily adjusted to business and shipping requirements, and while as rapid progress as possible towards completion of general uniform freight classification is being made, it is evident that the changes resulting therefrom are now being published as rapidly as commerce can be adjusted thereto.

"No arrangements have been concluded for the construction of uniform ratings by which an article found in the classification will be assigned to the same numbered or lettered class in all territories. This is a matter which may receive attention following the completion of the present work in hand, if it shall then be found feasible or practicable to adopt any plan for uniform rating which shall be workable and meet the requirements in the respective territories."

Panama Canal Traffic

A total of 6,706,915 tons of cargo had been carried through the Panama Canal up to the time the canal was closed by slides on September 18. This is at the average rate of 496,808 tons a month, or 16,318 tons a day, according to statistics published by the Canal Record. Traffic through the canal in September was considerably less than in the month immediately preceding, amounting to 456,317 cargo tons. The tolls collected in September amounted to \$348,730. This makes a total of \$5,754,073 collected in tolls since the canal was opened on August 15, 1914. The traffic through the canal by months since August 15, 1914, is shown in the following table:

Month	Atlantic-Pacific		Pacific-Atlantic		Total	
	Vessels	Cargo tons	Vessels	Cargo tons	Vessels	Cargo tons
August	13	49,106	11	62,178	24	111,284
Sept.	27	141,762	30	180,276	57	322,038

Sept.	49	181,380	51	274,937	100	456,317
Total	761	2,874,007	738	3,833,968	1,519	6,706,915

ELECTRO-BENZINE FIELD RAILWAY—The Austro-German forces on the Italian front are now using an electro-benzine field railway, which they have found very effective in the quick transportation of stores and munitions.

COMPLETION OF THE KABELIAN RAILWAY—The Kabelian Railway, which was opened to limited traffic in January last, has now opened to traffic of every description, having been officially declared incorporated in the Russian railway system.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission has denied the application of the G. B. Markle Company and the railroads for a rehearing of the anthracite rate case. The operators in the former petition asked the commission to modify its decision as far as the smaller sizes of coal are concerned. In its order the commission ordered reductions in the rates on the prepared sizes, but not in the rates on the smaller sizes.

Examiner Thurtell, of the Interstate Commerce Commission, began a hearing at Dallas, Tex., on November 29, in what is known as the Dallas-Ft. Worth rate case, on which preliminary hearings were held in Dallas several weeks ago. The case involves a complaint filed by the commercial organizations of Dallas and Ft. Worth, charging discrimination in the rates to those points from St. Louis and Kansas City as compared with the rates to Shreveport, La., and Texarkana, Ark. Shippers' organizations of a number of other cities in Texas, Arkansas, Oklahoma and Missouri intervened in the case.

STATE COMMISSIONS

The Railroad Commission of Tennessee has suspended until January 30 certain tariffs proposing increases in freight rates from Nashville and Memphis to stations on the Illinois Central and the Yazoo & Mississippi Valley, and also numerous local rates.

The Missouri Pacific has notified the Missouri Public Service Commission of its intention to file a motion for a rehearing of the case in which the commission ordered the road to reinstate sleeping car service between St. Louis, Carthage and Joplin, as furnished prior to April 11, 1915, when service was discontinued. The commission's order, which is effective on December 15, provides that the company shall have the right at the end of one year to file with the commission an account in detail showing the number of passengers carried, and all receipts and expenditures arising from furnishing the service, and shall also have leave at that time to move that the order be set aside.

PERSONNEL OF COMMISSIONS

Edward E. McCall, chairman of the New York State Public Service Commission, First district, has been removed by the Governor, and Commissioner William Hayward has been designated as acting chairman. Chairman McCall's removal was made because of the finding of a legislative investigating committee that he had retained his ownership of shares of stock in an electric light company, contrary to law, the light company being subject to the supervision of the commission.

COURT NEWS

The Chicago, Rock Island & Pacific has filed an application to be allowed to intervene in the suit of the Missouri Pacific to enjoin the two-cent fare law in Nebraska.

The hearing before the United States District Court at Oklahoma City on the application of the railroads for an injunction against the Oklahoma two-cent fare law was adjourned last week for about two months.

Judge Trieber, of the United States District Court at Little Rock, Ark., has rendered a decision that the freight tariff of the Arkansas Railroad Commission, as applied to the St. Louis & San Francisco and the Kansas City Southern, is confiscatory, and he has therefore declared it inoperative. The court directed that a court tariff now being used be continued, pending the decision of the United States Supreme Court on a similar suit now pending against another tariff of the commission.

J. E. Sexton, of Palisade, Nev., a stockholder of the Atchison, Topeka & Santa Fe, who some months ago complained of the action of the road in carrying, on its trains, without com-

pensation, the members and employees of the California Railroad Commission, when these state officers were engaged on other than railroad business, has taken his complaint into court. He entered suit in the Superior court for the county of San Francisco, November 27. Mr. Sexton declares that the law of the state requiring railroads to carry state employees without compensation is unconstitutional. The suit is against not only the railroad company but each of its directors, and also against the members of the railroad commission. It is charged that at least \$5,000 worth of transportation has already been thus granted, and that the directors not only have done this, but intend to continue the same course; and that they have formally ignored this stockholder's complaint. Mr. Sexton is general manager of the Eureka Nevada Railway, 84 miles long.

Struck by Train—Contributory Negligence

In an action for personal injuries it appeared that the plaintiff went to a station to board a train, and, in order to signal his train with a lantern, stood in a space of 3½ feet across between two tracks, on one of which a passenger train distant about a quarter of a mile was approaching, and on the other a freight train distant about a mile was approaching. The trains passed each other where the plaintiff was standing. He became panic-stricken and stepped away from the freight (which was running between 30 and 40 miles an hour) far enough to be struck by the beam on the passenger engine. The trial court directed a verdict for the defendant. On appeal this was reversed, the Arkansas Supreme Court holding that the question of the plaintiff's contributory negligence in standing where he did should have been submitted to the jury.—Cook v. St. Louis, I. M. & S. (Ark.), 179 S. W. 501.

Rutland Suit Dismissed

In the United States District Court at Rutland, Vt., December 7, the suit of the Estate of A. C. Spring and other minority stockholders of the Rutland railroad against W. Seward Webb, Chauncey M. Depew and other majority interests for an accounting of profits alleged to have been made through a conspiracy to defraud, was dismissed. The case has been pending for several years. Judge Hough, dismissing the suit, said that the majority stockholders had proved that the plaintiffs had inexcusably delayed action, which justified the court in refusing relief. He spoke of "the utter inapplicability of the evidence to sustain a bill for conspiracy to defraud." The profits for which the minority interests sought an accounting were alleged to have amounted to \$2,000,000 and to have resulted from a conspiracy to purchase various small railroads and sell them to the Rutland at considerable advances.

Disorderly Passenger—Negligent Conductor

Suits were brought against the L. & N. by two colored women for damages on account of the misconduct of another colored woman in a coach in which all were riding. In the lower court each of the plaintiffs was awarded \$500. It appeared that the accused woman was drunk and used vulgar and indecent language. The conductor had his attention called to the facts, but merely remarked, with a smile, that the woman was drunk, and passed out of the car. It was held by the Kentucky Court of Appeals that this was not a compliance with the duty of the carrier to the other passengers. He should have either ejected the woman at the next station or he should have notified the police officers. This was his duty under the Kentucky statutes, one of which provides for the punishment of this offense and another prohibits drinking on trains. The awards of damages were held not to be excessive, as they did not in themselves indicate passion or prejudice.—L. & N. v. Bell (Ky.), 179 S. W. 400.

Inspection of Records of Liquor Shipments

The local agent of an express company in a "dry" town in Kentucky was acquitted of the offense of unlawfully refusing to keep open to public inspection during business hours the company's book in which was kept a record of shipments of intoxicating liquors. The agent had refused to allow a private citizen of the town to inspect the record, relying on the interstate commerce law. On appeal, the Kentucky Court of Appeals held that the Kentucky statute prohibiting the sale or possession of

intoxicating liquors in local option districts does not prohibit all shipments of liquor; and one may lawfully have liquor which has been bought where its sale is lawful. The courts will not presume, in the absence of proof, that a record of interstate liquor shipments kept by a carrier as required by the Kentucky statute contains a record of an unlawful shipment. Where interstate shipments are for lawful use the carrier cannot divulge information of them to private persons, and the Kentucky statute, making refusal to divulge such information unlawful, cannot apply to lawful interstate shipments.—*Commonwealth v. White* (Ky.), 179 S. W. 469.

Demurrage—Private Cars on Private Tracks

The federal District Court, N. D. Ohio E. D., holds that under a contract between plaintiff railroad and defendant consignee providing that a certain track shall belong to the railroad, and that it shall be used only for receiving and delivering shipments made to or by the defendant, and by the railroad for any purpose not unreasonably interfering with defendant's shipments, the defendant could not use it as a storage track for its own cars without being subject to demurrage charges. A tariff made private cars on private tracks of the owners of the cars subject to demurrage charges, even when engaged in transportation of commodities produced by their owners, if they are then "in railroad service." The court holds that such cars of the defendant on the track were in railroad service, for they not only stood to interfere with the use of the track by the railroad under the provisions of the contract, but the railroad's obligation with reference to them had not ceased, in that it was compelled to haul them to the initial point and pay mileage thereon to the defendant company.—*St. Louis, I. M. & S. v. National Refining Co.*, 226 Fed. 357.

Demurrage—Private Cars on Private Sidings

As applied to interstate commerce the law is that private cars are subject to demurrage rules. The Pennsylvania Superior Court holds that the principle also applies to intrastate shipments. If consignees may detain loaded private cars at pleasure an advantage is afforded them which is not accorded to consignees receiving freight in cars owned by the railroad company, and this is inconsistent with the Pennsylvania statute forbidding undue or unreasonable discrimination. Where the cars did not belong to the defendant consignee in an action for demurrage, it had no standing to inquire what were the circumstances under which the railroad obtained possession of them from the owners, the consignors. The fact that the consignee's private siding was used did not give it control over the cars of other corporations or persons. If this were so the owners of private sidings would have a great advantage over shippers who were obliged to accept their freight from the tracks of the railroad, and one of the discriminations which the law prohibits would be thus afforded. Cars are not intended for storage of freight.—*Pennsylvania v. Waverly Oil Works*, 58 Pa. Sup. Ct. 154.

Injury to Engineer—"Comparative Negligence"

An engineman on a dark and foggy morning ran so fast that he could not stop before passing a block signal which was set at "stop." To save himself from being caught in an impending collision with the rear of another train a short distance beyond the signal, he jumped off and was injured. The company had failed to include the other train in the order furnished him, listing the trains he would meet and pass, thus "leading the engineman to expect no other than a clear signal at that place." The Kansas Supreme Court, in an action against the railroad, held that the issue became, in effect, one of comparative negligence, under the statute providing that contributory negligence of an employee shall not be claimed by the employer as a defense, but shall be considered by the jury in assessing the amount of recovery. The jury found the plaintiff's damages were \$6,000, and deducted one-fourth of that on account of his own negligence. The railroad put in a counterclaim of \$1,312 against him for the destruction of its property and the jury charged him with one-fourth of that amount. In effect, the jury decided the railroad's negligence was three times as great as that of the plaintiff. The Supreme Court held that the findings as to \$6,000 and \$1,312 damages should stand, but ordered a new trial on the issue of comparative negligence, its incidents and consequences.

Two judges dissented in part, holding that judgment should be

ordered for the railroad because its negligence in furnishing the plaintiff an inaccurate list of trains did not contribute to the collision; that the sole cause of the collision was running by a stop signal in disobedience of a rule which was imperative, whatever train list the plaintiff had received.—*Ballou v. Atchison, T. & S. F.* (Kan.) 152 Pac. 284.

Recovery of Undercharge from Consignee, Agent of Undisclosed Principal

In an action against a consignee for a balance of freight charges which had not been claimed at the delivery of the goods, 15 months before, it appeared that the goods were consigned to the defendant to be sold on commission, he to remit the proceeds to his principal, less commission and freight charges. Before the carrier demanded the additional freight the defendant had settled with his principal. The New York Court of Appeals holds that neither the delay nor the settlement affected the railroad's right to recover. It had the right to treat the consignee as the owner of the goods, and the consignee, in allowing the railroad to act on that assumption and deliver the goods, impliedly agreed to pay the transportation charges. The delay was immaterial, since the rate filed is the lawful, arbitrary and immutable rate, all parties concerned being charged with knowledge of it and its unescapable force. And for that reason payment of part of the freight charge could, under no circumstances, relieve the consignee from full payment.—*Pennsylvania v. Titus* (N. Y.) 109 N. E. 857.

The Central Pacific Suit

A hearing in the suit of the government to require the Southern Pacific to give up its control of the Central Pacific was held at St. Louis on December 1 and 2, before Judges Sanborn, Hook and Carland of the United States Court. The government was represented by Edward F. McClennen of Boston, as assistant counsel. He asserted that the Pacific railroad law provided that the continuous line of the Central Pacific and the Union Pacific should be operated without discrimination against either line, but that the Southern Pacific has endeavored to send as much as possible of the California traffic through the New Orleans gateway rather than through the Ogden gateway, although the latter route was the shortest from points on the Atlantic seaboard and in the central western states.

Mr. McClennen, referring to the bearing of the decree in the Union Pacific case on the present litigation, said that there is still a monopoly of traffic through the Ogden gateway, as there was when the Union Pacific suit was filed; that the proper course for the government was first to separate the Southern Pacific from the Union Pacific, and then to separate the Central Pacific from the Southern Pacific.

Peter F. Dunne, representing the Southern Pacific, argued that the government having effected the dissolution of the Union Pacific-Southern Pacific merger, on the contention that thereby competition between the Ogden route and the Sunset route would be restored, cannot now come in and ask the severance of the Central Pacific and the Union Pacific on the ground that competition cannot exist between the Ogden and the El Paso route, so long as the Southern Pacific controls the Central Pacific. Counsel for the Southern Pacific also said:

"It would seem that if the government wins in this case it will establish a precedent justifying the breaking up of all the railroad systems of the country that have been built up by the acquisition of lines, often competing, and by leases, ownership of stock, etc., prior to the passage of the Sherman law.

Flooding—Extraordinary Rains or Floods

The Kentucky Court of Appeals holds that one who builds a bridge over a stream is liable for flooding only in the event that the bridge obstructs the passage of water that accumulates from such ordinary and usual rainfalls in the vicinity as might have been anticipated by persons of ordinary prudence and experience. He is not liable for damages growing out of overflows caused by extraordinary rains or floods. Where it was shown that the waters of a creek and its tributaries were higher and wider than they had ever been before in the memory of the oldest inhabitant, it must be regarded that the rains and flood were extraordinary and could not have been anticipated, so that the railroad building the bridge was not liable.—*Louisville & Nashville v. Cohen* (Ky.), 179 S. W. 195.

Railway Officers

Executive, Financial, Legal and Accounting

Charles Boettcher has been elected president of the Denver & Salt Lake and Lawrence C. Phipps has been elected chairman of the board. Fred G. Moffat has been elected assistant treasurer, Gerald Hughes has been elected secretary, and William Wadden has been elected vice-president and assistant secretary.

Howard S. Palmer, statistical accountant of the New York, New Haven & Hartford, at New Haven, Conn., has been appointed auditor of disbursements of the New York, New Haven & Hartford, the Central New England and the New England Steamship Company. Mr. Palmer succeeds S. C. Fleetwood, who, after 45 years of continuous service, at his own request has been assigned to other duties. John J. Ward, Jr., has been appointed statistical accountant, vice Mr. Palmer.

E. F. Kearney, president of the Wabash, was re-elected at a meeting of the board of directors on December 1. William H. Williams, vice-president of the Delaware & Hudson, was chosen chairman of the board and of the executive committee; W. C. Maxwell, general traffic manager, was elected vice-president in charge of traffic; James L. Minnis, general solicitor, was elected vice-president and general solicitor; J. C. Otteson was elected treasurer, and Winslow S. Pierce, general counsel.

W. A. Gore, superintendent of the Carolina, Atlantic & Western at Charleston, S. C., has been appointed vice-president and general manager of the Orangeburg Railway, with office at Orangeburg, S. C., in charge of traffic, transportation, maintenance, accounting, claims and purchases, effective December 1.

Frank P. Crandon, whose retirement from the position of tax commissioner of the Chicago & North Western was announced last week, was born at Portsmouth, R. I. He entered railway service in 1873, as clerk in the land department of the North Western, and was soon placed in charge of assessment and tax matters. In 1878, when the tax department was made a separate department of the company's business, he was placed in charge as tax commissioner. He was also appointed tax commissioner of the Fremont, Elkhorn & Missouri Valley and the Sioux City & Pacific, when these roads were assimilated by the North Western. He was retired under the pension rules of the company after being continuously in its service for over 42 years. Mr. Crandon is a member of the board of trustees of Northwestern University, and has held the position of secretary of the board since 1891.

F. P. Crandon

Operating

Edwin H. Buhlman has been appointed trainmaster of the Eric, with office at Marion, Ohio.

Albert M. Kelly has been appointed trainmaster of the Eric, at Jersey City, N. J., vice H. R. Cole, promoted.

E. D. Cotterell has been appointed acting superintendent of car service of the Canadian Pacific Western Lines with office at Winnipeg, Man.

C. E. McMullen has been appointed superintendent of the Rio Grande division of the Texas & Pacific at Big Spring, Texas, vice L. M. Dooley, who has been appointed superintendent of

transportation. R. B. Ayres, inspector of transportation at Dallas, has been appointed trainmaster of the Baird sub-division with office at Big Spring.

W. P. McHugh has been appointed night trainmaster of the Terminal Railroad Association of St. Louis, vice H. L. Burlingame, deceased.

C. H. Doorley, acting superintendent of the Gary division of the Elgin, Joliet & Eastern, has been appointed superintendent, to succeed John Kirk, deceased.

John T. Jarvis, general inspector of dining cars for the Union Pacific Railroad, has been appointed general inspector of dining cars for the Union Pacific System.

E. M. Wrenne, acting superintendent of transportation of the Nashville, Chattanooga & St. Louis at Nashville, Tenn., has been appointed superintendent of transportation.

M. J. McDonald, road foreman of equipment for the Chicago, Rock Island & Pacific, with office at Eldon, Iowa, has been appointed trainmaster with headquarters at the same place.

E. A. Sollitt, acting superintendent of the Peru division of the Wabash, has been appointed superintendent, vice James Sullivan, retired on a pension. Mr. Sollitt's headquarters will continue to be at Peru, Ind.

D. N. Bacot, trainmaster of the Seaboard Air Line at Americus, Ga., has been appointed superintendent of the East Carolina division, with headquarters at Charleston, S. C. This division comprises the lines of the Carolina, Atlantic & Western, which have been consolidated with the Seaboard Air Line. These lines are as follows: between Hamlet, N. C., and Charleston, S. C.; Poston and McBee; Hartsville and Sumter; Lydia and Timmons-ville; Georgetown and Lanes.

Howard Elliott, chief clerk to the general manager of the San Pedro, Los Angeles & Salt Lake, and secretary to the road's central safety and efficiency committee, has been appointed inspector of transportation with office at Los Angeles, Cal. He will "closely observe the loading, packing, marking, bracing and movement of freight with a view to discovery and remedying the causes of freight claims," and perform such other duties as may be assigned by the general manager.

Carl D. Van Hecke, who has been appointed general manager of the Muscatine & Iowa City, entered railroad service with the Chicago & North Western in 1900, as a call boy. In 1905, he entered the service of the Chicago, Rock Island & Pacific as secretary to the general manager, and in 1907 left to enter the employ of the Denver & Rio Grande. He returned to the Rock Island and held various positions in the general manager's office until 1910, when he accepted a position with the Duntley Manufacturing Company of Chicago. In the same year he returned to the Rock Island as contract clerk in the general manager's office. In 1911 he was made assistant chief clerk in the office of the second vice-president, which position he held at the time of his recent appointment. His headquarters are at Muscatine, Iowa.

Thomas W. Hansell, who has been appointed superintendent of the Atlantic Coast Line, at Sanford, Fla., as has already been announced in these columns, was born on January 20, 1871, at Nettleton, Miss., and was educated in the common schools. He began railway work in January, 1886 as station agent and telegraph operator on the Mobile & Ohio. In the summer of the same year he went to the Memphis & Charleston as freight clerk and telegraph operator, and left that road later in the same year to go to the Louisville & Nashville as telegraph operator. He was subsequently promoted to train dispatcher at Birmingham, Ala., on the same road, leaving that position in November, 1901. The following January he entered the service of the Gulf, Colorado & Santa Fe as train dispatcher at Cleburne, Tex. From September, 1902, to June, 1903, he was train dispatcher at the City of Mexico, on the Mexico National, now a part of the National Railways of Mexico. Since June 28, 1903, he has been in the continuous service of the Plant System, and its successor, the Atlantic Coast Line, consecutively as train dispatcher at Montgomery, Ala., general yardmaster, foreman of engines, trainmaster, superintendent of terminals and assistant superintendent at various places.

Traffic

R. A. G. Barnes, traveling freight and passenger agent of the Atlantic Coast Line at Washington, N. C., has been ap-

pointed commercial agent at Wilson, N. C., and his former position has been abolished. J. D. Wright has been appointed commercial agent at Memphis, Tenn.

John T. Wray, district freight solicitor of the Pennsylvania System at Atlanta, Ga., has been promoted to southern freight agent with office at Atlanta.

George L. Leitner, traveling freight agent of the St. Louis Southwestern at Chicago, Ill., has been appointed commercial agent, with headquarters at Detroit, Mich.

C. H. Stinson, general freight agent of the Wabash at St. Louis, Mo., has been appointed freight traffic manager. H. E. Watts, assistant general freight agent at St. Louis, has been appointed general freight agent.

E. M. Westervelt has been appointed real estate and industrial agent of the Chicago, Burlington & Quincy Lines West of the Missouri river, with office at Lincoln, Neb. J. A. Saxon has been appointed assistant real estate and industrial agent for the lines west of the Missouri river, with office also at Lincoln.

John M. Cornatzer, general passenger agent of the St. Louis & San Francisco, will have his office at St. Louis, Mo., instead of Memphis, Tenn., after January 1. A. P. Johnson, chief rate clerk in the passenger department at St. Louis, has been promoted to division passenger agent, with headquarters at Memphis, Tenn.

O. S. Lewis, division freight agent of the Baltimore & Ohio Southwestern at Cincinnati, Ohio, has been appointed assistant general freight agent of the Cincinnati, Hamilton & Dayton and the Baltimore & Ohio Southwestern, to succeed J. W. Allison, resigned to become a member of the Official Classification Committee. Mr. Lewis' headquarters will continue to be at Cincinnati, Ohio, his promotion having taken effect on December 1.

William H. Johnson, general western agent of the Erie & Western Transportation Company, has been appointed manager of the Star Union Line, with office at Chicago, Ill. He was

born at Buffalo, N. Y., on February 28, 1866, and began his career in 1882 as a messenger boy for the Anchor Line in the same city. Within two years he was made paymaster and four years later chief clerk of the Buffalo office. In 1898 he became the Buffalo agent of the Anchor Line, and in 1899 was appointed superintendent of the Connecting Terminal Railroad, owned by the Anchor Line. A little more than 10 years ago he was transferred to Chicago to become the general western agent of the line. He assumed his new responsibilities on December 1.

Mr. Johnson was formerly president of the Chicago Lake Line Agents' Association.

Charles Carroll Graves, who has been appointed assistant general freight agent of the Seaboard Air Line, with headquarters at Charleston, S. C., was born on April 8, 1873, at Somerset, Orange county, Va. He was educated at Locust Dale College and began railway work in March, 1893, on the Seaboard Air Line in the general auditor's office. In October, 1900, he was transferred to the general freight agent's office, and from March, 1904, to July of the following year was traveling freight agent of the same road at Norfolk, Va. From August, 1905, to December, 1909, he was chief clerk to general freight agent on the Virginian Railway, and from January, 1910, to the following June was traveling freight agent of the Chesapeake & Ohio and the Cleveland, Cincinnati, Chicago & St. Louis at Wilmington, N. C. From May to July, 1910, he was general freight and passenger agent of the Raleigh & Charleston at Marion, S. C.

In August, 1910, he was appointed traffic manager of the Carolina, Atlantic & Western at Hamlet, N. C., which position he held until the recent consolidation of that road with the Seaboard Air Line, when he was appointed assistant general freight agent of the Seaboard Air Line, as above noted.

Arthur Mackenzie, chief clerk to the first vice-president of the Chicago, Rock Island & Pacific, has been appointed assistant freight traffic manager, effective December 1. Mr. Mackenzie entered railway service in 1888, with the Grand Trunk; in 1890 he was employed by the Michigan Central at Buffalo, N. Y., in a clerical capacity, and in 1892, entered the service of the Atchison, Topeka & Santa Fe, as a clerk in the commercial agent's office at Buffalo.

In 1894, he went to Chicago, Ill., to become a tariff clerk in the general freight office of the Santa Fe, and two years later went to Indianapolis, Ind., as a record clerk in the office of the superintendent of car service for the Cleveland, Cincinnati, Chicago & St. Louis. In the same year—1896—he removed to Rochester, N. Y., to become chief clerk to the division freight agent of the Lehigh Valley, and shortly after, he again went to Chicago, to become chief clerk to the general agent of the St. Louis & San Francisco. In 1897, he entered the employ of the Iowa Central as chief clerk to the assistant general freight agent at Peoria, Ill. In July, 1897, he returned to the service of the Santa Fe, as a stenographer in the general freight office at Chicago. He remained with this road until December 14, 1909, in the consecutive capacities of claim clerk, chief rate clerk, assistant chief clerk and chief clerk to the freight traffic manager. Since December 15, 1909, he has been chief clerk to the first vice-president of the Rock Island. His office will continue to be at Chicago.

A. Mackenzie

removed to Rochester, N. Y., to become chief clerk to the division freight agent of the Lehigh Valley, and shortly after, he again went to Chicago, to become chief clerk to the general agent of the St. Louis & San Francisco. In 1897, he entered the employ of the Iowa Central as chief clerk to the assistant general freight agent at Peoria, Ill. In July, 1897, he returned to the service of the Santa Fe, as a stenographer in the general freight office at Chicago. He remained with this road until December 14, 1909, in the consecutive capacities of claim clerk, chief rate clerk, assistant chief clerk and chief clerk to the freight traffic manager. Since December 15, 1909, he has been chief clerk to the first vice-president of the Rock Island. His office will continue to be at Chicago.

Engineering and Rolling Stock

Charles K. Scott has been appointed supervisor of maintenance of way for the Erie with office at Huntington, Ind.

L. C. Ord, assistant works manager, Angus car shops, Montreal, Que., of the Canadian Pacific, has been granted leave of absence to enter active service, as lieutenant in No. 1 overseas battery of the siege artillery, Canadian expeditionary force.

J. J. McNeill, road foreman of engines for the Erie at Cleveland, Ohio, has been appointed supervisor of locomotive operation with office at Youngstown, Ohio, vice D. J. Madden promoted. Joseph Blutzge has been appointed road foreman of engines at Cleveland, to succeed Mr. McNeill.

P. Coniff, superintendent of shops of the Baltimore & Ohio, at Mount Clare, Baltimore, Md., has been appointed special inspector of the mechanical department, E. J. Brennan, division master mechanic, of the Buffalo, Rochester & Pittsburgh at Du Bois, Pa., has been appointed superintendent of shops of the Baltimore & Ohio, at Glenwood, Pittsburgh, Pa.

F. J. Yonkers has been appointed road foreman of equipment for the Colorado division of the Chicago, Rock Island & Pacific, with headquarters at Goodland, Kan., and J. W. Tenney has been appointed road foreman of equipment, with jurisdiction over that portion of the Missouri division west of Eldon, Iowa, with headquarters at Trenton, Mo., vice M. J. McDonald, promoted.

Purchasing

E. J. Alexander, second assistant to receiver, has been appointed fuel agent of the Chicago & Eastern Illinois, vice C. G.

W. H. Johnson

Hall, resigned to become secretary of the Northern Indiana Coal Trade Bureau, effective December 15.

A. S. Brown has been appointed storekeeper of the Salt Lake & Ogden with office at Salt Lake City, Utah, vice W. H. Bliss, resigned.

OBITUARY

Edward Rathbone Bacon, vice-president of the Baltimore & Ohio Southwestern, with headquarters at New York, died on December 2, in the John Hopkins University Hospital at Baltimore, Md., following an operation for appendicitis. Mr. Bacon was born on November 22, 1846, at New York, and was educated at Phillips Exeter Academy, Exeter, N. H. In November, 1869, he was admitted to the bar at Buffalo, N. Y., and for 18 years was counsel for different railroad companies. In 1881 he was vice-president of the Cincinnati, Washington & Baltimore, now a part of the Baltimore & Ohio Southwestern. He served as president of the Baltimore & Ohio Southwestern Railway and the reorganized road, the Baltimore & Ohio Southwestern Railroad, from its organization to 1902, and since that time was vice-president of the same road. He was one of the reorganizers of the Baltimore & Ohio and was one of its directors, also a director of the Kansas City Southern and the Cincinnati, Hamilton & Dayton.

Henry C. Diehl, at one time general freight agent of the Chicago, Burlington & Quincy, died at Montclair, N. J., on December 8 at the age of 73.

Ariel B. Copley, assistant general manager, Third district, of the Chicago, Rock Island & Pacific, died at Mitchellville, Iowa, on November 27. Mr. Copley was born at Geneseo, Ill., on November 10, 1862. He attended the public schools for two years at Geneseo, and for 13 years at Mitchellville, Iowa. At the age of 19 he entered railway service as a messenger for the Rock Island, and remained in that capacity until 1886. From 1886 to 1893, he was brakeman and conductor on the Iowa division of the Rock Island. In 1893 he was appointed yardmaster of the same railroad at Des Moines, Iowa, and continued in that position for ten years. In 1903 he was appointed trainmaster, with headquarters at Estherville, Iowa, and in 1904 was transferred in the same capacity to the East Iowa division. In 1905 he was transferred to the Colorado division, and in 1906 was promoted to superintendent, with office at Kansas City, Mo. In 1907 he went to Haileyville, Okla., as superintendent, and in 1909 became superintendent, with office at Little Rock, Ark. On July 1, 1914, he was promoted to assistant general manager of the third district of the Rock Island, with headquarters at El Reno, Oklahoma.

A. B. Copley

Equipment and Supplies

LOCOMOTIVES

THE PULLMAN RAILROAD is inquiring for one switching locomotive.

THE FAIRCHILD & NORTHEASTERN has issued an inquiry for one Prairie type locomotive.

THE INLAND STEEL COMPANY is inquiring for prices on 5 switching locomotives.

THE IRONTON RAILROAD has ordered one eight-wheel switching locomotive from the Baldwin Locomotive Works.

THE LEHIGH & HUDSON RIVER recently placed an order with the Baldwin Locomotive Works for 4 Mikado locomotives.

THE AKRON & BARBERTON BELT RAILROAD has ordered one Mogul type locomotive from the Baldwin Locomotive Works.

THE TEMISKAMING & NORTHERN ONTARIO is inquiring for prices on two Mountain type locomotives and 4 Consolidation locomotives.

THE YOUNGSTOWN SHEET & TUBE COMPANY has ordered one four-wheel switching locomotive from the Baldwin Locomotive Works.

WORTH BROTHERS COMPANY, Coatesville, Pa., has ordered 3 four-wheel switching locomotives from the Baldwin Locomotive Works.

THE ERIE, reported in the *Railway Age Gazette* of November 12 as being in the market for 10 Pacific type locomotives, has ordered these locomotives from the American Locomotive Company.

THE NORFOLK & WESTERN, reported in the *Railway Age Gazette* of October 1 as being in the market for 10 Mountain type locomotives, is building 8 locomotives of this type in its Roanoke shops.

THE MONONGAHELA RAILWAY has ordered six superheater Consolidation locomotives from the American Locomotive Company. These locomotives will have 22½ by 30-in. cylinders, 51-in. driving wheels and a total weight in working order of 200,000 lb.

THE SOLVAY PROCESS COMPANY, Syracuse, N. Y., has ordered one superheater six-wheel switching locomotive from the American Locomotive Company. This locomotive will have 21 by 26-in. cylinders, 51-in. driving wheels and a total weight in working order of 156,000 lb.

THE LEHIGH VALLEY, reported in the *Railway Age Gazette* of October 22 as having ordered 10 Mikado locomotives from the Baldwin Locomotive Works, has increased the order to 20 locomotives. Like the former 10 engines the additional locomotives will be equipped with superheaters and with Street stokers.

THE CINCINNATI, INDIANAPOLIS & WESTERN, reported in the *Railway Age Gazette* of November 26 as inquiring for 5 ten-wheel locomotives has ordered 6 superheater ten-wheel locomotives from the American Locomotive Company. These locomotives will have 21 by 28-in. cylinders, 69-in. driving wheels and a total weight in working order of 194,000 lb.

THE LAKE SUPERIOR & ISHPEMING has ordered 4 Consolidation locomotives from the Baldwin Locomotive Works, one of which will be used on the Munsing, Marquette & Southeastern. The engines will have 26-in. by 30-in. cylinders, a weight on the driving wheels of 240,000 lb., a weight on the trucks of 30,000 lb., and a total weight of 270,000 lb. Cardwell friction draft gear has been specified for the tenders.

THE DETROIT TERMINAL has ordered two superheater six-wheel switching locomotives and one superheater eight-wheel switching locomotive from the American Locomotive Company. The six-wheel locomotives will have 21 by 26-in. cylinders, 57-in. driving wheels and a total weight in working order of 172,000 lb.; and the eight-wheel locomotive will have 25 by 30-in. cylinders, 58-in. driving wheels and a total weight in working order of 240,000 lb.

FREIGHT CARS

THE GRAND TRUNK will repair 1,500 steel freight cars.

THE CHICAGO GREAT WESTERN is inquiring for 500 40-ton box cars.

THE DENVER & RIO GRANDE has revived its inquiry for 1,000 box cars.

THE LEHIGH & NEW ENGLAND is in the market for 550 hopper and 200 flat cars.

THE RAY CONSOLIDATED COPPER COMPANY is in the market for 20 dump cars.

THE COAL & COKE RAILWAY is contemplating the purchase of 1,500 coal cars.

THE NEW JERSEY ZINC COMPANY, New York, is in the market for 40 hopper cars.

THE UNITED STATES GOVERNMENT, DEPARTMENT OF THE INTERIOR, is asking bids on 50 dump cars.

THE PENNSYLVANIA RAILROAD has revived its inquiry for 6,000 freight cars for the Lines East of Pittsburgh.

THE CHICAGO & NORTH WESTERN has ordered 250 ore cars from the American Car & Foundry Co.

THE ILLINOIS CENTRAL has ordered 40 air dump cars from the Western Wheeled Scraper Company.

THE AMERICAN SHEET & TIN PLATE COMPANY is reported to have ordered 6 tank cars from the German-American Car Company. This item has not been confirmed.

THE ATCHISON, TOPEKA & SANTA FE reported in the *Railway Age Gazette* of December 3 as inquiring for 25 concentrate cars has ordered these cars from the Pullman Company.

THE PENNSYLVANIA LINES WEST have ordered 1,000 110,000 ton capacity gondola cars from the American Car & Foundry Company, and 1,150 of the same type from the Haskell & Barker Car Company.

THE NATIONAL RAILWAYS OF MEXICO are understood to be contemplating the purchase of a large number of cars. The finances of the company are such that it may be necessary to purchase second-hand equipment.

THE CANADIAN PACIFIC reported in the *Railway Age Gazette* of November 26 as being about to build 250 refrigerator cars in its shops at Montreal, is also planning to build 800 box cars in its own shops.

THE NEW YORK, ONTARIO & WESTERN, reported in the *Railway Age Gazette* of November 12 as contemplating the purchase of 500 freight cars, has issued inquiries for 450 50-ton coal cars and 100 low side gondola cars.

THE ERIE has ordered 500 55-ton drop end steel underframe gondolas from the American Car & Foundry Company and 1,000 50-ton triple hopper gondola cars from the Pressed Steel Car Company.

THE NEW YORK, NEW HAVEN & HARTFORD, reported in the *Railway Age Gazette* of November 12 as being in the market for 20 milk and 50 refrigerator cars, is also understood to be contemplating the purchase of 500 coal cars.

THE DULUTH & IRON RANGE, reported in last week's issue as having ordered 250 50-ton ore cars from the American Car & Foundry Company, has also ordered 500 50 ton ore cars from the Standard Steel Car Company and will soon place an order for 100 30-ton all-steel flat cars.

THE IMPERIAL OIL COMPANY, LTD., will assemble in its own shops at Sarnia, Ont., during 1916, 200 single compartment, 15 two compartment and 20 three compartment tank cars, the bodies and trucks being purchased from the Canadian Car and Foundry Company and the National Steel Car Company and the tanks being made by the company itself at Sarnia.

PASSENGER CARS

THE NEW YORK CENTRAL has issued inquiries for 30 to 60 70-ft. coaches.

THE LEHIGH VALLEY has ordered 2 dining cars from the Pullman Company.

THE CHESAPEAKE & OHIO has issued inquiries for 12 express cars and 6 coaches.

THE GREAT WESTERN RAILWAY has ordered one 60-ft. all-steel postal car from the American Car & Foundry Company.

THE DELAWARE, LACKAWANNA & WESTERN has ordered 10 express cars from the Pullman Company.

THE NEW YORK MUNICIPAL, reported in the *Railway Age Gazette* of November 26 as being about to order an additional 100 subway cars for its Sea Beach Line, has issued inquiries for these cars.

THE PENNSYLVANIA RAILROAD was reported in last week's issue of the *Railway Age Gazette* as having ordered 12 combination baggage and mail cars and 6 dining cars from the Pullman Company. These cars are for the Lines West of Pittsburgh which have also ordered 22 coaches and 7 passenger and baggage cars from the Pullman Company and 24 baggage cars from the Standard Steel Car Company. Of the 12 baggage and mail cars ordered of the Pullman Company, 4 are for the Vandalia. The latter will also receive 3 of the passenger and baggage cars ordered from the Pressed Steel Car Company and 4 of the baggage cars ordered from the Standard Steel Car Company.

IRON AND STEEL

THE MISSOURI PACIFIC is reported to have ordered 25,000 tons of rails.

THE NEW YORK, CHICAGO & ST. LOUIS is inquiring for prices on 5,000 to 10,000 tons of rails.

THE INTERBOROUGH RAPID TRANSIT is in the market for 4,500 tons of running rails and 3,000 tons of contact rails.

THE ST. LOUIS & SAN FRANCISCO has ordered 43,000 tons of rails from the Tennessee Coal, Iron & Railroad Company.

THE CHICAGO & NORTH WESTERN has ordered 5,000 tons of bridge material from the Chicago Bridge & Iron Works.

THE PENNSYLVANIA LINES WEST have ordered 650 tons of steel from the Hanke Iron Works for miscellaneous steel work on the new freight house at Chicago, Ill.

THE PENNSYLVANIA RAILROAD has ordered 600 tons of steel from the Lackawanna Bridge Company for use in connection with the company's Chestnut Hill electrification.

MACHINERY AND TOOLS

THE FORT SMITH & WESTERN is reported to be preparing plans for the equipment of car and machine shops at Oklahoma City, Okla.

SIGNALING

THE WABASH RAILWAY plans during the coming year to install automatic block signals on 43 miles of its road, single track.

THE CHICAGO & NORTH WESTERN plans during the coming year to put in an electric interlocking plant at Deering, Ill., of 44 levers. This is at the crossing of the Chicago river. Another electric interlocking of 100 working levers is to be put in at Washington street, Milwaukee, to take the place of two mechanical interlockings.

THE NORFOLK & WESTERN plans during the coming year to install automatic block signals on 62 miles of line, as follows: On the new line now under construction between Burkeville, Va., and Pamplin, 37 miles; and on lines now operated under the manual block system, 25 miles, as follows: Poe to Jack, Jack to Church Road, Pepper to Belspring and Pembroke to Ripplemead. The company proposes also to install four electric interlocking plants; Burkeville, Va., 15 working levers, a c; Pamplin, Va., 33 working levers, a c; Jack, Va., 19 working levers, a c, and Low Grade Tunnel, Va., 26 working levers, d c. At City Point, Va., an electro-mechanical plant is to be installed, 11 mechanical and 5 electric levers.

Supply Trade News

Clifton H. Whall, senior member of C. H. Whall Company, Boston, Mass., died at Atlantic, Mass., on December 2.

Henry C. Kloos, of the electrical staff of the Pullman Company, Boston, Mass., died at Atlantic, Mass., on December 2.

The American Steel Foundries have taken over the Elliott brake beam safety hanger hitherto made by the Elliott Company of Philadelphia.

Leon S. Moisseiff, until recently chief of the division of design of the department of bridges of New York City, has opened an office for the practice of consulting civil engineering at 69 Wall street, New York.

Edward N. Lake, formerly in charge of the Chicago office of the Stone & Webster Engineering Corporation, has become a partner in the Krehbiel Company, engineers and contractors, with offices in the Marquette building, Chicago.

A new corporation has been formed with a capital of \$5,000,000, half of which will be preferred and half common stock, to take over the business and property of the New York State Steel Company, Buffalo, N. Y., recently acquired by William H. Donner, president of the Cambria Steel Company, for \$2,750,000. The new company will be known as the Donner Steel Company, and its directors will be Harry Yates, Frederick Slee and Ralph S. Kent, all of Buffalo.

Interests headed by R. B. Phillips, treasurer and general manager of the American Steam Gage & Valve Manufacturing Company, Boston, Mass., have purchased the National Acme Manufacturing Company, Cleveland, O., and the Windsor Machine Company, Windsor, Vt., two of the largest manufacturers of spindle automatic screw machines in the country. It is understood that a new company will be organized under the name of the Phillips Corporation to take over these two companies, the American Steam Gage & Valve Manufacturing Co. and the R. B. Phillips Manufacturing Co. of Worcester and Lowell, Mass.

J. Leonard Replogle, who recently acquired a large interest in the Cambria Steel Company, held a conference at Johnstown, Pa., on Wednesday last with persons representing the plans and shares of the company. The conference was called by Mr. Replogle to consider a proposition made by him to the stockholders asking for an option on the shares at \$80. It is understood that Mr. Replogle is promoting a plan for a merger of a number of independent steel companies, including the Cambria and Lackawanna Steel Companies, the Newport News Shipbuilding Company, the Youngstown Steel & Tube Company and either the Inland or the Iroquois Steel Company.

At a meeting of the board of directors of the Cambria Steel Company recently held in Philadelphia, Herbert F. Black of Pittsburgh, J. Leonard Replogle of New York and Arthur E. Newbold of the firm of Drexel & Co., of Philadelphia, were elected directors succeeding Samuel T. Bodine, Theodore N. Ely and Childs Frick, son of Henry C. Frick. Mr. Replogle is vice-president and general manager of sales of the American Vanadium Company. Mr. Black is special agent of the Cambria Steel Company and in charge of the buying and distribution of ore, coal, scrap and supplies. Messrs. Replogle and Newbold have been made members of the executive committee.

The Pressed Steel Car Company announces the following changes in its organization, effective December 1: N. S. Reeder has been elected vice-president with headquarters at New York. J. B. Rider has been elected vice-president with headquarters at Pittsburgh, Pa., and will continue to perform the duties of general manager in charge of operations. J. F. MacEnulty, formerly general sales manager, has been elected second vice-president with headquarters at New York. C. E. Postlethwaite, formerly manager of sales, central district, at Pittsburgh, has been appointed general sales manager of the Pressed Steel Car Company and the Western Steel Car & Foundry Company with headquarters at New York. H. F. Hoffstet has been appointed assistant manager of sales of the central district with headquarters at Pittsburgh, Pa.

Railway Construction

ANTHONY & NORTHERN.—Work on the extension of this road is now under way between Trousdale, Kan., and Kinsley, 24 miles, also on a line between Trousdale and Larned, 24 miles. Frank Thompson Byers is the contractor.

CANADIAN PACIFIC.—The Lake Erie & Northern, which is an electric line, leased to the Canadian Pacific, laid 31.4 miles of track during 1915. The line is now completed between Galt, Ont., and Port Dover, 53 miles.

CAROLINA, GREENEVILLE & NORTHERN (ELECTRIC).—This company which plans to build a line from Bristol, Tenn., west to Kingsport, thence southwest via Newport and Sevierville to Knoxville, about 140 miles, has sold bonds, it is said, to secure funds to build the line and to buy equipment. A contract for some of the work was let in July to A. H. Jacoby, Greeneville, Tenn. It is understood that construction work will be started soon. H. S. Reed, president, Los Angeles, Cal.; F. A. H. Kelley, chief engineer, Greeneville, Tenn. (July 2, p. 38.)

CINCINNATI, HAMILTON & DAYTON.—Ferguson & Edmonson, Pittsburgh, Pa., have been awarded a contract for double-tracking between Dayton, Ohio, and Cincinnati.

EAST ST. LOUIS & SUBURBAN.—This company has projected an extension from Alton, Ill., to the state insane asylum, one mile.

EDMONTON, DUNVEGAN & BRITISH COLUMBIA.—Grading work on the Grand Prairie branch building from Spirit river, Alta., south to Grand Prairie City, 50 miles, is about finished. The company does not expect to start track laying on the branch until next year.

FORT SMITH, POTEAU & WESTERN.—This company, which operates a three-mile line from Poteau, Okla., to Wittville, has projected an extension from Poteau south for ten miles.

GRASSE RIVER.—This company which operates a line from Childwold, N. Y., to Cranberry Lake, 15 miles, is owned by the Emporium Forestry Company, Conifer, N. Y. The company is building a line from Cranberry Lake towards the Carthage & Adirondack branch of the New York Central, on which track has been laid for one mile. The line may eventually be extended to connect with the New York Central at a point between Benson Mines and Newton Falls. Construction work has been suspended until next spring.

GREEN BAY & EASTERN.—This company has been incorporated to construct a railway from Green Bay, Wis., through Manitowoc to Sheboygan, a distance of 70 miles. Charles Frazier and Rude Stockinger, Manitowoc, are among the incorporators. Capital stock, \$50,000.

GULF, FLORIDA & ALABAMA.—This company has surveys completed for an extension from Kimbrough, Ala., north to Jasper, 158 miles. (September 3, p. 448.)

GULF & INTERSTATE.—The L. J. Smith Construction Company, Kansas City, Mo., has been awarded the contract for the reconstruction of 23 miles of this road which was destroyed by the recent Galveston (Tex.) flood.

HENRYETTA, OKLAHOMA & WESTERN (ELECTRIC).—This railroad is being built from Henryetta, Okla., through Dewar, to Kusa, with a branch north to Colton and Pleasant Valley, and from Henryetta to Creek mines, making a total of 10 miles. The grading contract has been let to Ally Brothers, but the contract for track laying has not yet been awarded. The maximum grade will be about 2 per cent.; approximately 8,000 cu. yd. of material are being handled per mile. One bridge and one viaduct will be built. W. T. Croslen, president, Oklahoma City, Okla.

JEFFERSON & NORTHWESTERN.—This company which operates a line from Jefferson, Tex., to Camp, 31 miles, and a branch to Linden, 5.5 miles, has amended its charter to provide for building an extension from the present northern terminus to Kildare, where connection is to be made with the Texas & Pacific.

It is announced that construction work on the proposed extension will be started as soon as the survey is finished.

INTERBOROUGH RAPID TRANSIT.—This company during 1915 laid 2.58 miles of track which was put in operation in June, 1915, on the Queensboro subway, which is 1.47 miles long. On the Manhattan division elevated line 15.38 miles of track was added which has not yet been put in operation.

KANAWHA, GLEN JEAN & EASTERN.—This company is making surveys to build an extension from Tamroy, W. Va., south to Beckley, 8.05 miles. (June 4, p. 1181.)

KANSAS & OKLAHOMA SOUTHERN.—This company, which was organized to build a line from Caney, Kan., to Vinita, Okla., 61 miles, is now making active preparations for resuming construction work. About 35 miles of the line has been graded and is ready for track laying. There has been spent about \$320,000 for the right of way and for grading the line, also for grading the terminals in the city of Caney. The company is preparing for another trusteeship, also an issue of \$2,000,000 of bonds, and expects to use the proceeds to finish work on the 61 miles of railway. S. M. Porter, president, Caney, Kan.; B. J. Dalton, chief engineer, Lawrence.

LAKE ERIE, FRANKLIN & CLARION.—This company is building with its own forces a line from a point near Coleman's spur, Pa., to Reed Mine, 1.5 miles.

LAKE ERIE & NORTHERN.—See Canadian Pacific.

LOUISIANA & ARKANSAS.—This company has projected an extension from Wildsville Junction, La., to Vidalia, 22.59 miles. This company now operates a line from Hope, Ark., southeast to Alexandria, La., with a branch from Packton east to Wildsville Junction, and another branch from Minden west to Shreveport, in all about 278 miles.

MARLIN & TEMPLE INTERURBAN.—Organized in Texas with office at Marlin, to build an interurban electric railway between Marlin and Temple, about 30 miles. A survey for the proposed line was made recently, and arrangements for the construction work are about completed.

NASHVILLE, CHATTANOOGA & ST. LOUIS.—An officer writes regarding the report that an extension is to be built from Centreville, Tenn., to Totty's Bend, about five miles, that this refers to an old track which has not been in use for a number of years. This track has been rebuilt recently.

NEW YORK, NEW HAVEN & HARTFORD.—This company has projected extensions of first track at various points aggregating 1.48 miles, and has also projected extensions of second, third and fourth track aggregating 69 miles.

NEW YORK SUBWAYS.—Booth & Flynn, Ltd., New York, submitted the lowest bid at \$6,631,000 for the construction of the tunnel under the East river between Fourteenth street, in the borough of Manhattan, to North Seventh street in the borough of Brooklyn. (Nov. 19, p. 986.)

PACIFIC ELECTRIC.—This company during 1915 built new main track from Arlington, Cal., to Corona, 7.77 miles, and short extensions at Highland and at Riverside, in all 8.51 miles. Work is now under way on an extension to Hawthorne, 4.77 miles. This company also laid 2.03 miles of second track during 1915.

PHILADELPHIA ROADS.—The lowest bid for building the foundations of the Frankford Elevated line from Unity street to Dyre street, Philadelphia, Pa., was submitted by Edwin H. Vare, Philadelphia. He offered to do the work for \$17,700. (Nov. 26, p. 1032.)

RADFORD-WILLIS SOUTHERN.—Grading work is now under way on the line to be built from Radford, Va., southeast to Willis, about 25 miles. J. L. Vaughan, president, Shawsville, Va. (July 9, p. 81.)

RAILWAY VALLEY.—This company, which operates a line from Roselle, N. J., to Summit, 8.8 miles, is building a three-mile extension. Grading work is in progress, also masonry work on the extension. The construction work is being carried out by the company's forces. (November 12, p. 923.)

RICHMOND, RAPPAHANNOCK & NORTHERN.—Contracts are to be let on December 13, it is said, to build from West Point, Va., northeast to Urbanna, 17 miles. (Aug. 20, p. 369.)

ROBY & NORTHERN.—Surveys are now being made by this

company for an extension to be built from Roby, Tex., to Longworth, 7 miles.

SAN DIEGO & ARIZONA.—Work is now under way on a section from Campo, which is on the international boundary between the United States and Mexico to a point two miles east of Campo. Contract let to Robert Sherer & Co., Los Angeles, Cal. Surveys have already been made to build from a point two miles east of Campo to Corriso Pass, Cal., 36 miles.

SAVANNAH & SOUTHERN.—This company, which now operates a line from Lanier, Ga., south to Willie, 12.6 miles, plans to build an extension from Willie, southwest to Glenville, about 16 miles.

SOUTHERN NEW ENGLAND.—This company, building a line from Palmer, Mass., southeastward to Providence, to give the Grand Trunk a line into Rhode Island, has petitioned the Massachusetts legislature to extend the time within which the road must be completed. Its time expires August 3, 1916, and President Edward C. Smith says the work cannot be finished by that date. (April 30, p. 955.)

ST. LOUIS & SAN FRANCISCO.—This road has awarded a contract to the J. W. Murray Contracting Company, Kansas City, Mo., for 4,000 ft. of revetment work on the Red river, above Arthur City, Tex.

TAMPICO & PANUO VALLEY.—This company has work under way on an extension from Panuco, Mexico, to El Higo, 25 miles. The work is being carried out by company forces.

TUCSON, CORNELIA & GILA BEND.—Work is now under way from mile post 35 to mile post 44, Ajo, Ariz., 9 miles. This is the last section to complete the line from Gila Bend south to Ajo. J. H. Maxey, Gila Bend, Ariz., has contracts for grading, bridges and tracklaying. R. H. Jones, chief engineer, Warren, Ariz. (August 13, p. 301.)

YANKTON & NORTHERN.—This company has been organized for the purpose of constructing a railway from Yankton, S. D., north through Turner county, through Salem, McCook county, and through Lake county to Lake Preston, Kingsbury county; thence northeast through Hamlin county to Watertown, S. D. Grading work has been deferred until the spring of 1916. President, E. S. Johnson, and secretary, D. M. Finnegan, Yankton, S. D.

RAILWAY STRUCTURES

ASHLAND, WIS.—The Chicago & North Western is about to let a contract for the extension of two coaling docks. Fifty-six pockets will be added to one dock and 44 to the other, adding 23,000 tons to their present combined storage capacity of 107,000 tons. The docks are timber structures of modern type and both carry four tracks. The improvement will cost about \$300,000.

COWAN, TENN.—The Nashville, Chattanooga & St. Louis is making extensive improvements on the Chattanooga division. Considerable enlargement of the facilities at Cowan have been authorized, and grading work has been started for new yards at Cowan. The capacity of the old yards has been increased to 100 cars, and grading is under way for laying additional tracks to bring the capacity of the yards up to 275 cars. Work has been started on a new automatic coaling station which will serve engines on three tracks. The coaling station will be operated by electricity, and the chutes will later be extended so that four tracks may be served. The company contemplates improvements on about two miles of track just north of the new yards to reduce the grade from 1 per cent to one-half of 1 per cent. This work will involve a cut of 14 ft. through the hill just north of Cowan and making an 18-ft. fill further north.

DALLAS, TEX.—The Union Terminal Company has secured building permits from the city for the following buildings, which will represent a total investment of \$102,675, divided as follows: engine house, \$42,000; turntable, \$12,000; central power house, \$8,500; boiler house, \$10,000; two service buildings, \$6,600; oil delivery tank, \$1,000; engine supply house, \$1,200; double tool house, \$500; single tool house, \$350; water tank, \$5,500; sand house, \$725; coaling dock, \$1,800; ice house, \$500; toilet building, \$1,000; hose reel house, \$100; north signal tower, \$4,000; south signal tower, \$3,500; oil pump, \$3,000; blow-off boxes, \$400.

DYERSBURG, TENN.—The Illinois Central is asking for bids on

the construction of a frame 4-stall, 100-ft. roundhouse, to cost about \$10,000. Adjoining buildings for storage, tool and locker purposes are also contemplated.

JOPLIN, MO.—The Horton Construction Company, Kansas City, Mo., has received a contract for the erection of a reinforced concrete viaduct, to cost approximately \$19,000. The structure will have a 24-ft. roadway and will be paved with wood blocks. The cost will be borne jointly by the city and the Joplin Union Depot Company.

READING, PA.—The Philadelphia & Reading has given contracts to John Donahoe, Mahanoy City, Pa., to build an overhead bridge carrying Fourth street to consist of one 33-ft. 6-in. span, also to build an overhead bridge carrying Schuylkill avenue to consist of one 28-ft. span and two 17-ft. 6-in. spans on the Lebanon Valley branch of the Philadelphia & Reading. These bridges are to be of concrete steel construction.

TWO HARBORS, MINN.—The Duluth & Iron Range will soon begin the construction of an ore dock to have 228 pockets, a total capacity of 68,400 tons and a total length from the innermost pocket to the extremity of the dock of 1,368 ft. The structure will carry four tracks and will be built of steel to rest on a concrete foundation. Concrete pocket linings have also been specified. The road has ordered 650 tons of steel from the American Bridge Company for ore spouts.

VISALIA, CAL.—E. E. Etherton, Monadnock building, San Francisco, Cal., has been awarded a contract by the Southern Pacific for the construction of a passenger depot, to cost about \$43,000.

YANKTON, S. D.—The Yankton County Bridge Company will build a combination wagon and railroad bridge across the Missouri river, to have a total length of about 1,600 ft. and an average length between piers of 350 ft. The piers will extend about 80 ft. to hard pan. Construction work will not begin until the spring of 1916. E. A. Bruce, Yankton, S. D.

A GOOD EXAMPLE.—The American Association of Passenger Traffic Officers sets a good example to all the other railway associations. We refer to the resolution looking to the elimination of the usual addresses of welcome by state and city officers and the curtailment of entertainment features. The perfunctory address of welcome and the social feature can be classed together only in that they take up time and attention. Beyond this point, they appear as entirely different things. The social feature is everywhere a wholesome prompting of nature, and the conventions can time it so it will not interfere with their work proper. The address of welcome by the mayor is under no such control. Being an official personage, compels recognition but does not make an entertaining speaker of a man. The Governor must also be invited to speak, and here hope is again blasted because when the curtain rises we usually find that His Excellency a few days ago caught a bad cold and that his Cheap Clerk has been sent to deliver the welcome on the part of the State. And thus the average convention is in for a waste of the best part, if not all, of its first morning session. An opening prayer by a local minister is sufficient. If the Lord is with us, and the hotels don't run up their rates on us, there is no need of the mayor and the Governor. And, is it a certainty that these events afford much enjoyment to the governors and mayors? Not if they are asked to be on hand promptly at 10 o'clock, and have to wait till 10:30 or 11 for the convention to be called to order. . . . —*Railroad Herald.*

ENGLISH RAILWAY CLERKS' BONUS.—The Railway Clerks' Association announces that practically all the large railway companies and a number of the lesser ones in England and Scotland have now granted additional war increases to their male clerical staffs, bringing total war bonus up to 5s. (\$1.25). The new concessions are on the same scales as those recently granted to railwaymen. Men receiving a 3s. (75 cents) bonus obtain an extra 2s. (50 cents), and those in receipt of 2s. just now are granted an additional 3s. Clerks below 18 years of age have their bonus increased to 2s. 6d. (38 cents). All the Scottish companies have also granted the bonus to their permanent women employees, while the London & North-Western and Great Western Companies have given an additional 1s. to those women previously in receipt of bonuses. None of the Irish railway companies has so far seen its way, owing to financial considerations, to make an additional grant at the present time.

Railway Financial News

BALTIMORE & OHIO.—The Ohio Public Utilities Commission has given its approval to the issue of \$60,000,000 refunding and general mortgage 5 per cent bonds which were recently sold by the Baltimore & Ohio subject to the approval of state commissions having jurisdiction over the Baltimore & Ohio.

BUFFALO & SUSQUEHANNA.—The bondholders' committee, which bought the Buffalo & Susquehanna at the foreclosure sale, has resold the property to Charles A. Finnegan of Buffalo, Theodore Hofeller of Buffalo, and A. Weber of Louisville, Ky. The price is said to be \$800,000. The road is now being operated and the purchasers are quoted as saying that they expect to be able to continue its operation at a profit. The company has trackage rights only into Buffalo, but owns 2,500 ft. of dock front and about 25 acres on the lake front.

IDAHO SOUTHERN.—The Commercial & Financial Chronicle says that this road, running from Gooding, Idaho, to Jerome, 24 miles, has been placed in the hands of D. C. McWalkers as receiver.

MISSISSIPPI, HILL CITY & WESTERN.—This road was recently sold at auction for \$200,000 to representatives of the Armour interests. The road runs from Hill City, Minn., to Swan river, on the Great Northern, 18 miles.

MISSOURI PACIFIC.—Receiver B. F. Bush, of the Missouri Pacific, has been authorized by the United States District court in charge of the receivership, to institute suit against George J. Gould for the recovery of valuable real estate in the neighborhood of St. Louis and Mt. Pleasant, Mo., title to which it is alleged had been vested in Gould as trustee for the railroad and which he had refused to turn over to the road.

NEW YORK CENTRAL.—General mortgage bonds of the Cleveland, Cincinnati, Chicago & St. Louis to the amount of \$4,000,000, owned by the New York Central, have been sold to J. P. Morgan & Company. These bonds came into the treasury of the New York Central in connection with the consolidation of the Central and the Lake Shore & Michigan Southern.

RUTLAND RAILROAD.—See an item in Court News in regard to the dismissal of the suit against the directors and former directors.

ST. LOUIS & SAN FRANCISCO.—The syndicate which is to underwrite the reorganization plan of the St. Louis & San Francisco is understood to include Speyer & Co., J. & W. Seligman & Co., the Guaranty Trust Company, all of New York, and Lee, Higginson & Co., Boston.

ST. LOUIS & SAN FRANCISCO.—In the testimony presented to the Missouri Public Service Commission in the effort which is being made to obtain their consent to the St. Louis & San Francisco reorganization plan, Frederick Strauss, a member of the firm of J. & W. Seligman & Co., New York, testified that B. F. Yoakum, formerly chairman of the board of directors of the St. Louis & San Francisco, had asked to be given the chairmanship of the executive committee or a place on the voting trust committee of the reorganized company, but the bondholders and bankers under whom the reorganization is being carried out refused to grant this request.

WABASH-PITTSBURGH TERMINAL.—It is understood that about \$4,000,000 of the \$9,000,000 that was to be raised under the reorganization plan has been subscribed for by the first mortgage bondholders on whom an assessment was made of \$300 per \$1,000 bond. A syndicate has been formed, headed by Sutro Brothers & Co. and H. P. Goldschmidt, to underwrite the remaining \$5,000,000.

LARGE RECEIPTS OF CUBAN ORES.—In three days last week five ore vessels from Cuba arrived and were unloaded at the dock of the Maryland Steel Company, Sparrows Point, Md., setting a new record. The total amounted to 29,500 tons. Part was reshipped to the Steelton plant of the Pennsylvania Steel Company.—*From the Iron Age of December 2.*

ANNUAL REPORT

REPORT OF THE DIRECTORS OF THE SEABOARD AIR LINE RAILWAY FOR THE FISCAL YEAR ENDED JUNE 30, 1915

PORTSMOUTH, VA., October 28th, 1915.

To the Stockholders of the Seaboard Air Line Railway:

The Board of Directors submits the following report of the operations of the property for the year ended June 30, 1915:

INCOME ACCOUNT FOR YEAR ENDED JUNE 30, 1915.

	1915	1914	Decrease
Gross Revenue	\$21,280,462.79	\$25,420,503.24	\$4,140,040.45
Operating Expenses and Taxes	15,984,781.03	18,462,705.92	2,477,924.89
Net Operating Revenue (after Taxes)	\$5,295,681.76	\$6,957,797.32	\$1,662,115.56
Uncollectible Railway Revenue	8,902.94	8,902.94†
Operating Income	\$5,286,778.82	\$6,957,797.32	\$1,671,018.50
Other Income	348,227.69	298,996.38	49,231.31†
Hire of Equipment.....	(Cr.)85,616.97	(Dr.)266,223.68	351,840.65†
Gross Income	\$5,720,623.48	\$6,990,570.02	\$1,269,946.54
Rents and Other Charges..	200,735.63	172,418.35	28,317.28†
Applicable to Interest.....	\$5,519,887.85	\$6,818,151.67	\$1,298,263.82
Fixed Interest Charges....	3,928,255.49	3,893,935.91	34,319.58†
Balance	\$1,591,632.36	\$2,924,215.76	\$1,332,583.40
Full 5% Interest on Adjust- ment (Income) Bonds....	1,250,000.00	1,250,000.00
Net Income	\$341,632.36	\$1,674,215.76	\$1,332,583.40

† Increase.

NOTE.—Revenue and Expense figures for the year 1914 have been revised for comparative purposes to agree with the Interstate Commerce Commission's classification effective July 1, 1914.

The Gross Revenue decreased 16.29 per cent., Operating Expenses decreased 14.55 per cent., Taxes increased 6.33 per cent., Operating Expenses and Taxes decreased 13.42 per cent., and Operating Income decreased 24.02 per cent.

The Operating Expenses, exclusive of Taxes, were 70.12 per cent. of the Gross Revenue, as compared with 68.70 per cent. the previous year; and including Taxes, 75.11 per cent. of Gross Revenue as compared with 72.63 per cent. for the preceding year.

MILEAGE OPERATED.

The mileage of the Seaboard Air Line Railway in operation on June 30, 1914, was	3,097.55
Extensions, etc., constructed during the year as detailed on page 5	26.41
Less Spur Tracks taken up.....	.82

Mileage in operation June 30, 1915.....	3,123.14
Made up as follows:	

MILEAGE OWNED

The owned mileage of the Seaboard Air Line Railway and branches on June 30th, 1914, was.....	3,021.83
Extensions, etc., constructed during the year.....	26.41
Less Spur Tracks taken up.....	.82

TOTAL

CAPITAL STOCK

There has been no change in the capital stock during the year.

FUNDED DEBT UNMATURED

There has been no change in the funded debt during the year.

EQUIPMENT

An Equipment Agreement, Series "Q," was entered into July 1st, 1914, for the purchase of:

- 10 Mountain Type Passenger Locomotives,
- 19 Mikado Type Freight Locomotives,
- 7 All Steel Passenger Coaches, with reclining chairs,
- 8 All Steel Passenger Coaches, with Walkover Seats,
- 5 All Steel Mail and Baggage Cars,
- 7 All Steel Postal Cars,
- 9 All Steel Passenger and Baggage Cars,
- 9 All Steel Express Cars,
- 462 Steel Upper and Underframe Ventilated Box Cars,

for which \$160,043.81 was paid in cash and equipment trust obligations aggregating \$1,440,000.00 were issued, payable in twenty consecutive semi-annual instalments of \$72,000.00 each, bearing interest at the rate of 5% per annum. All of this equipment was received during the fiscal year.

EXTENSIONS

Extensions to the Company's lines in Florida were completed during the year as follows:

From Bartow, Fla., to Baynard, Fla. (Lake Wales Extension)...	22.04
Connor & Shallenberger Spur off Lake Wales Extension.....	0.78
Pembroke, Fla., to Jumeau Phosphate Plant.....	3.59

Spurs Removed during the year.....	26.41
	0.82

Net Increase

MAINTENANCE OF WAY AND STRUCTURES ROADWAY, TRACK AND STRUCTURES

Roadway, track and structures of the railway have been properly maintained at a cost of \$2,414,866.20, which represents an expenditure per mile of road of \$777.59. (See general remarks page 8.)

SIDE TRACKS

13.07 miles of new sidings and extensions of existing sidings were constructed, and there were deducted by removal and changes of old sidings, 5.33 miles, making a net increase over previous year of 7.74 miles.

There were also added 1.75 miles leased sidings.

TIE RENEWALS

Tie renewals were 1,328,761 cross ties and 745 sets of switch ties, and the cost, \$583,594.83, was charged to Operating Expenses.

RAIL

11.67 miles of new 85-lb. steel rail were laid in the main line, releasing therefrom 68 and 80-lb. worn rail, and there was charged net to Operating Expenses therefor \$8,904.66, and to Capital Account \$21,906.86.

In addition, 11.31 miles of released 80-lb. steel rail were laid on branch lines, releasing 60-lb. and lighter rail, and there was charged to Operating Expenses therefor, \$3,117.62, and to Capital Account, \$14,898.98.

There has also been received and distributed along the main line ready to lay 34 track miles of new 90-lb. and 26.5 track miles of new 85-lb. steel rail.

BALLAST

73,269 cubic yards of gravel and slag ballast were put under main line track and of the total cost thereof \$27,108.11 was charged to Capital Account.

TRESTLES FILLED

990 lineal feet of wooden trestles were filled in during the year and of the total cost thereof, including culverts, \$11,141.48, was charged to Operating Expenses.

TRESTLES REBUILT AND BALLAST DECKED

There were built during the year out of creosoted timber, 2,904 lineal feet of ballast decked trestles, replacing old open deck trestles, and the cost thereof, \$40,427.95, was charged to Operating Expenses.

TRESTLES STRENGTHENED

Additional stringers were put in 19 trestles between Columbia, S. C., and Jacksonville, Fla., on the South Carolina Division, during the year to provide for use of heavier power, the cost of which, \$1,768.37, was charged to Capital Account.

BRIDGES

Work has been done on sixteen bridges, repairing, adding signals, replacing with steel or strengthening them for heavier power. Of this number, fourteen have been completed.

Seven of the above bridges were authorized during this year and five of the seven have been completed. One of the uncompleted bridges is a reinforced concrete viaduct for highway and street railway traffic, on Duval Street, Jacksonville, Fla., over Hogan's Creek, and the tracks of the Seaboard Air Line Railway and the St. Johns River Terminal Company. This viaduct will be completed during the coming year and will be approximately 1,418 feet long, with a total width of 42 feet.

Of the bridges completed the principal ones are:

	Length.
Fourth Street, Wilmington, N. C., reinforced concrete highway overpass	70 feet.
Alston Avenue, Durham, N. C., highway underpass, deck girders on concrete masonry	90 "
Eleventh Street, Charlotte, N. C., highway overpass, creosoted timber, concrete foundations	89 "
Armour, Ga., reinforced concrete double-track extension, Southern Railway overpass	78 "
Whitford Avenue, Atlanta, Ga., highway underpass, eyebeams on pile foundations	56 "
Howells Mill Road, near Atlanta, Ga., highway overpass, plate girders on creosoted timber foundations.....	120 "
Gaston Street, Chester, S. C., highway overpass, timber construction with concrete masonry.....	80 "

The total expenditures for bridge work during the year were \$72,776.47, of which \$71,046.92 was charged to Capital Account and \$1,729.55 to Operating Expenses.

RAIL IN MAIN LINE

The total operated main line single track mileage of the system, 3,123.14 miles, are laid with steel rails of the following weights:

Miles.	Weight.
11.45	90 lb. rail.
361.08	85 "
84.41	80 "
1,211.76	75 "
163.48	70 "
201.05	68 "
18.87	65 "
60.48	63.5 "
3.95	60.5 "
493.55	60 "
34.95	60 " (resawed)
221.38	58 "
256.73	56 " and lighter.

The above does not include second track, etc. (next page).

SECOND TRACK

Northward from Hamlet, N. C.:	9.00 Miles	90 lb. rail
	.52 "	75 "
At Birmingham, Ala.:	1.43 Miles	75 "
	1.62 "	60 "
Raleigh, N. C., to Cary, N. C.:	5.88 Miles	85 "
	1.71 "	75 "
At Tampa, Fla.:	1.32 Miles	75 "

LEASED LINES

Silver Springs Branch:	1.20 Miles	60 "
	.70 "	56 "
Amelia Beach Branch:	2.00 Miles	50 "

MAINTENANCE OF EQUIPMENT

The equipment of the Railway was properly maintained during the year at a cost of \$3,175,642.45. (See general remarks, page 8.) Included in the cost of maintenance is \$28,614.49, representing value of equipment destroyed or retired from service during the year and credited to Cost of Equipment.

There was also included in the Cost of Maintenance \$412,626.00 for depreciation, which was credited to Reserve for Accrued Depreciation.

The cost of maintenance per article owned was as follows:	
Average cost per annum per Locomotive owned.....	\$2,095.69
Average cost per annum per Passenger car owned.....	733.77
Average cost per annum per Freight car owned.....	54.11

GENERAL REMARKS

On account of the European war the important agricultural and industrial activities served by your lines were affected, resulting in a decrease in gross revenues of \$4,140,040, or 16.29 per cent. as compared with the previous year.

This decrease was largely caused by the interruption of the exportation of certain commodities consisting principally of cotton, phosphate rock and naval stores, and the importation of fertilizer materials. The business depression resulting from the war also caused decreases in movements of lumber, fertilizer, general merchandise and practically all other commodities. Weather conditions in Florida unfavorable to trucking also caused a decrease in the perishable vegetable shipments.

The general business depression caused also a decrease in passenger business.

As an offset against the decrease in revenue above shown, a reduction was made in Operating Expenses amounting to \$2,541,172, or 14.55 per cent. The greatest item of reduction was made in Transportation Expenses, consisting of \$1,577,776, or 16.8 per cent.

Realizing at the outset of the European war that there was a necessity for the greatest possible economy consistent with safety and proper upkeep, a careful and searching analysis was made of the proposed expenditures for Maintenance of Way and Structures and Maintenance of Equipment for this fiscal year, and a plan laid out by which only such expenditures were made as were absolutely necessary to comply with the conditions above outlined. By these means your property has been fully maintained.

Extensive improvements and additions have been made to the General Office building at Portsmouth, Va., which consisted of remodeling, with fireproof construction, the original building, adding two stories thereto, and thereby providing modern office facilities. No promise has been made for the occupancy of these offices for any stipulated period, but it is felt that as long as the present conditions last the arrangement is of advantage to the company.

During this year a contract was entered into with the Southern Railway providing for the joint use of the Seaboard Air Line and the Southern Railway's tracks between Raleigh, N. C., and Cary, N. C., as a double track, these tracks being immediately parallel for the entire distance.

1.32 miles of double track has been put into service at Tampa, Fla., from Tampa Northern Junction to Twigg Street.

A Union Station at Bartow, Fla., has been built during the year, and the one at Hurtsboro, Ala., mentioned in last year's report, has been completed.

A passenger station has been completed at Marston, N. C., and the one at Rockingham, N. C., mentioned in last year's report, has been finished.

Combination passenger and freight stations have been constructed during the year at North, S. C., Terra Ceia, Fla., and Kingsland, Ga.

The freight depot at Carrsville, Va., has been extended, providing passenger facilities therein. A freight depot has been built during the year at Hawthorne, Fla.

At Apex, N. C., both a passenger station and a freight station have been provided, together with necessary track changes and additions to serve same.

The passenger shelter shed and granolithic walks at Portsmouth, Va., mentioned in last year's report, have been completed.

At Wake Forest, N. C., an umbrella shed has been provided in connection with present passenger facilities.

A passenger shed has been provided at South Clinton, S. C.

A car repair shed has been provided at Cayce, S. C., in connection with other shop facilities.

Necessary dredging has been done at Jacksonville, Fla., in slip between Warehouse No. 2 and No. 3, to maintain proper depth of water, and necessary dredging is now in progress in slips 1, 2 and 3, and river front, at Hutchinson's Island, Savannah, Ga.

The reinforced concrete coal elevator with 300-ton storage bin at Savannah, Ga., mentioned in last year's report, has been completed.

The 100,000-gallon capacity steel tank, together with pipe lines for auxiliary fire protection at Hutchinson's Island, Savannah, Ga., mentioned in last year's report, has been completed and put into service.

Modern interlocking plants have been provided at Burroughs, Ga., and Bartow, Fla., and the one at Pembroke, N. C., mentioned in last year's report, has been completed.

A wooden cotton platform has been provided at Greenwood, S. C., and a reinforced concrete cotton platform at Maxton, N. C.

Paving and street work has been done at Henderson, N. C., Columbia, S. C., Cordele, Ga., Columbus, Ga., Manatee, Fla., Bradentown, Fla., and at several other points on the system, to comply with municipal requirements.

Crossing gates have been installed at Hermitage Road, near Richmond, Va., and on Elmwood Avenue, Columbia, S. C.

A coal trestle has been built jointly with the Durham & Southern Railway at Durham, N. C., during the year.

Additional storage tracks have been provided during the year at Nitro-lee, S. C.

Interchange tracks have been provided with the Maxton, Alma & South-bound Railroad at Alma, N. C., with the Norfolk Southern Railroad Co. at Charlotte, N. C., and the Southern Railway at Franklin, Va.

Three track scales were rebuilt with concrete foundations and steel "I" beams replacing wood.

Three old water tanks at McKenny, Va., Collins, Ga., and Palmetto, Fla., were replaced with modern 50,000-gallon tanks and suitable pumping facilities provided.

New water station has been provided at Schofield, S. C. 65 industrial sidings and extensions to industrial sidings already existing have been constructed or are in process of construction.

40 depots and freight stations have been constructed or substantially added to during the year.

17 passing tracks have been constructed or extended or are in process of construction.

The use of creosoted piling has been continued in maintenance work on docks, wharves and trestles.

The work of the Valuation Committee, created in connection with Section 19-A of the Federal Act to Regulate Commerce, referred to in the last annual report, was continued during the year at a cost of \$57,215.39, which was charged to General Expenses,—an increase of \$42,232.10 over the preceding year.

The accounts for the fiscal year were examined by Messrs. Haskins and Sells, whose certificate appears on page 11.

There were no changes in the organization during the year.

The Directors wish to record herein their appreciation of the loyalty, efficiency and co-operative spirit displayed by the officers and employees of the company during this trying year.

By order of the Board: W. J. HARAHAH, President.

CAPITAL EXPENDITURES FOR ROAD AND EQUIPMENT

SUMMARY OF EXPENDITURES:

Additions and Betterments on Existing Mileage.....	\$346,603.78
Equipment Acquired.....	1,419,342.90
Expenditures for Extensions.....	255,834.13
TOTAL	\$2,021,780.81

*Illustrated.

A combination of the splendid showing which the Baltimore & Ohio has been making and an improvement in the railroad bond market made it possible for Daniel Willard, president of the Baltimore & Ohio, recently to sell \$60,000,000 of his company's bonds at a price that was advantageous to the railroad. This provided the company with \$40,000,000 to refund notes which will fall due in the near future and new capital for additions and betterment work. The negotiations for the sale of these notes were carried on between Mr. Willard and the bankers rapidly, as this kind of negotiation so often is. Mr. Willard found on a certain day that he could get his price for the bonds. The deal was closed. If he had stopped to get the consent of the state public service commissions, which was necessary before the bonds could be issued, he would in all probability have lost his market. Another set of negotiations would have had to be begun and the price might have been by no means so advantageous for the company. Mr. Willard went personally before the Maryland Public Service Commission and the Ohio Public Service Commission and explained the situation to them. Both commissions gave their approval to the issue. There was, of course, no reason why they should not. However, the spirit in which the approval was given was highly praiseworthy. Co-operation of this kind from state commissions is rare and when it occurs deserves notice and commendation. Contrast this with the attitude of the Missouri commission in the Wabash reorganization. Security holders of the Wabash have accepted very heavy sacrifices. The new company has been formed on a sound and conservative basis and it is of the utmost interest to the territory served by the road as well as to its security holders that the new company should have every opportunity to make good. The secretary of state of Missouri has refused to give permission to the road to operate at all for a reason, which if valid, is entirely technical and trivial. This is the danger that is continually inherent in the control of interstate railways by the states.

A Contrast in State Regulation

Window dressing is a term applied to a good showing made by a corporation preparatory to the sale of an issue of securities to the public. Probably a majority of American railway presidents have been under the necessity of window dressing at some time in their lives in order to sell through their bankers a large new issue of securities. When a good showing in net is made at the expense of maintenance appropriations, or when dividends are paid that are not justifiable in order to strengthen the market for the company's securities, the effect of window dressing is objectionable. When it is simply a marshaling of the facts it is part of the art of salesmanship which every seller has to resort to to some extent. The Seaboard Air Line has sold to a syndicate headed by the Guaranty Trust Company and the National City Bank, both of New York, \$22,894,000 first and consolidated mortgage, series A, 6 per cent bonds of September 1, 1915-1945. This is the first issue of bonds under the new mortgage which is to provide for the comprehensive future financing of the property. The bonds are offered to the public at 99 1/2. The annual report of the Seaboard for the fiscal year ended June 30, 1915, was recently reviewed in these columns. Properly interpreted, the report was a remarkably good demonstration of what the property could be made to earn even in a year of wholly extraordinary depression in every line of industry in the South. Taken superficially, however, it showed a great loss of revenue as compared with the previous year. The railroad bond market is now good. In the fiscal year ending June 30, 1916, there is every prospect that the Seaboard will make a showing which will contrast in a strikingly favorable way with that made in 1915. The fact that the bankers were willing to undertake the sale of a large issue of new bonds without window

An Unusual Bond Offering

Window dressing is a term applied to a good showing made by a corporation preparatory to the sale of an issue of securities to the public. Probably a majority of American railway presidents have been under the necessity of window dressing at some time in their lives in order to sell through their bankers a large new issue of securities. When a good showing in net is made at the expense of maintenance appropriations, or when dividends are paid that are not justifiable in order to strengthen the market for the company's securities, the effect of window dressing is objectionable. When it is simply a marshaling of the facts it is part of the art of salesmanship which every seller has to resort to to some extent. The Seaboard Air Line has sold to a syndicate headed by the Guaranty Trust Company and the National City Bank, both of New York, \$22,894,000 first and consolidated mortgage, series A, 6 per cent bonds of September 1, 1915-1945. This is the first issue of bonds under the new mortgage which is to provide for the comprehensive future financing of the property. The bonds are offered to the public at 99 1/2. The annual report of the Seaboard for the fiscal year ended June 30, 1915, was recently reviewed in these columns. Properly interpreted, the report was a remarkably good demonstration of what the property could be made to earn even in a year of wholly extraordinary depression in every line of industry in the South. Taken superficially, however, it showed a great loss of revenue as compared with the previous year. The railroad bond market is now good. In the fiscal year ending June 30, 1916, there is every prospect that the Seaboard will make a showing which will contrast in a strikingly favorable way with that made in 1915. The fact that the bankers were willing to undertake the sale of a large issue of new bonds without window

dressing of any kind in the showing made by the railroad company, when this showing was superficially not favorable, speaks a confidence which has not in the past generally been shown by bankers in the intelligence of investors. The underlying conditions of the Seaboard Air Line are sound, and by making an offering of bonds now, the bankers are relying on investors to make more than a superficial study of the company's showing and to appreciate what these underlying conditions really are.

President Ripley of the Santa Fe has written a strong letter advocating the creation of a permanent tariff commission. The

**For a Non-
Partisan Tariff
Commission**

railways do not sell anything that is directly affected by the tariff; but their prosperity is greatly, although indirectly, affected by tariff-making. Every important revision of the tariff compels a general readjustment in business affairs; and such readjustments almost always cause periods of depression which seriously reduce the traffic moved and curtail railway earnings. The railways, therefore, have as much reason for wanting to see tariff-making taken out of politics as any other large business interest. The reasons for turning the framing of tariff schedules over to a permanent, expert commission are as numerous and convincing as the reasons for delegating the regulation of railway rates to such a commission. It is true that the Interstate Commerce Commission can actually fix rates, while a tariff commission could only recommend to Congress the schedules it ought to adopt; but a permanent commission could at least do much better than committees of Congress the preliminary work of investigating conditions and framing the tentative schedules. The Tariff Commission League, which recently has been organized, deserves, we believe, the support of business men in all lines, including railway men.

WORK FOR A COMMISSION ON REGULATION

THE recommendation of President Wilson for the creation of a federal commission to investigate fully the subject of railroad regulation shows that the President is alive to the unsatisfactoriness of the present situation. Regulation has come to stay. It will never be made less firm and comprehensive than it is now. But it can and must be made more consistent, scientific and fair. Its past and present deficiencies are largely due to the fact that the legislation providing for it has been adopted by a large number of different bodies piecemeal and without any co-operation; that the legislation usually has been enacted without any real investigation, and that its administration often has been neither consistent, expert nor fair. The experiment of effective regulation will soon have been carried on for 10 years. In view of the large mileage of railways in the hands of receivers and of the fact that new construction is now at the lowest ebb for at least 50 years, the results cannot be regarded as entirely satisfactory. The end of the first decade of effective regulation will be a good time to pause, take stock, and, having taken stock, adopt measures for a more constructive, enlightened and salutary policy.

If a commission, such as that suggested by the President, is created it should have no difficulty in selecting the subjects to which it should devote most of its attention. One of these would naturally be the relations of state and federal regulation. When state and federal regulation conflict one of them must go down. Under present conditions, especially in the regulation of rates, it is usually federal regulation which goes down. But, obviously, the one which should give way is state regulation. The constitutional authority of the federal government over interstate commerce is paramount to that of the states over state commerce. The welfare of the nation is paramount to the selfish interests of the people of any state. Therefore, our system of regulation should be so altered that no state regulation

which directly or indirectly conflicts or interferes with regulation by the federal authorities will be permitted. The states will, of course, retain control over their local public utilities. Probably they will be allowed to continue to regulate railway matters of merely local consequence. But a commission which thoroughly investigated the situation could hardly fail to conclude that the existing relations between state and federal regulation are unwholesome in their effect upon both the railways and the public, and should be radically changed.

The proposed commission would naturally investigate the subject of suspensions of advances in rates by the Interstate Commerce Commission. It is extremely doubtful whether the authority to suspend should ever have been given to the commission. Probably it cannot now be taken away, but the length of the periods during which rates are kept under suspension should be reduced. The law, as it now stands, does injustice to the railways. If an advance in rates goes into effect and is subsequently found to be unreasonable the shippers and travelers affected can secure reparation. But if an advance in rates is suspended and subsequently found to be reasonable the railways have no means of obtaining redress. There have been numerous cases where the Interstate Commerce Commission has suspended rates for long periods and finally found them reasonable. In these cases taken together the losses unjustly inflicted upon the railroads in the United States have amounted to millions of dollars. The law and the procedure regarding the suspension of rates need to be reformed.

While this is being done the fact should be recognized that rates may be made too low as well as too high, and that, therefore, the Interstate Commerce Commission should be given authority to suspend reductions and fix minimum rates, in addition to its present authority to suspend advances and fix maximum rates.

The proposed commission would naturally go into the subject of regulation of the issuance of securities. The *Railway Age Gazette* believes that the Interstate Commerce Commission should be given this authority, but only on condition that it will thereby be entirely taken from the states. Regulation of the issuance of securities is too delicate a function to be performed by 48 different state commissions, and the situation certainly will not be improved by having it performed by both the state and the interstate commissions. If it is to be performed at all it should be by the Interstate Commerce Commission alone.

The proposed commission would naturally give great consideration to the necessity for a reorganization of the Interstate Commerce Commission. One of the most important steps needed is a separation of the legislative, the judicial and the prosecuting functions now united in the commission. The salaries of its members should be increased, their terms should also be lengthened, and either their functions should be so changed as to lighten their work or the number of commissioners should be increased.

One of the most important and difficult problems now confronting the country is presented by the relations between the railways and their employees. At this moment the four strongest of the railway brotherhoods are co-operating in a movement to secure a maximum working day of eight hours without any reduction in pay. This movement follows others which in the last decade have caused increases in wages aggregating over \$300,000,000 a year. The employees are publicly announcing that they will not arbitrate their new demands, but will strike and tie up all the roads in the country unless they are granted. The public would be very seriously affected by such action. Does it intend to take no step to prevent it? The proposed commission would find plenty of work ready to its hand—work of such a character that the ablest men in the country will be none too big for it. Senator Newlands, who advocates President Wilson's policy in a general way, seems to favor the creation of a joint committee of Congress to deal with the matter. Doubtless the commission should include some members of Congress. Perhaps, also, it should include some members of the Interstate Commerce

Commission. But it ought also to include some representatives of the railroads and other business interests. It should be a commission with a personnel that would deserve as much respect and confidence as did the personnels of the Railroad Securities Commission, the National Monetary Commission and the commission that arbitrated the controversy between the eastern railways and their engineers and firemen in 1912.

TO PROMOTE SAFETY AT HIGHWAY CROSSINGS

THE railroads of the United States, through the American Railway Association, have undertaken a campaign for the prevention of accidents at highway crossings. President Mudge, on the recommendation of the executive committee, has appointed a special committee, consisting of seven railroad officers representing the railroads of the country territorially, to consider the entire question.

The members of the committee are: James A. McCrea, general manager, Long Island, chairman; J. Q. Van Winkle, assistant to general manager, Cleveland, Cincinnati, Chicago & St. Louis; C. L. Bardo, general manager, New York, New Haven & Hartford; L. E. Jeffries, general attorney, Southern; Howard Elliott, inspector of transportation, San Pedro, Los Angeles & Salt Lake; W. J. Towne, assistant general manager, Chicago & North Western, and W. R. Scott, vice-president and general manager, Southern Pacific.

This committee will present recommendations, after a thorough investigation, for action to bring about a reduction of one of the most numerous classes of railway casualties, and one which is rapidly increasing in spite of the many millions that have been expended by the railroads for the elimination of grade crossings.

The importance of the problem is indicated by the fact that in the last 10 years for which the statistics are available the Interstate Commerce Commission has reported a total of 9,479 persons killed and 21,917 injured by being struck or run over by cars or locomotives at highway crossings. The figures by years are as follows, with those for 1910, when the Interstate Commerce Commission did not report them, estimated by taking the average of the figures for 1909 and 1911:

Year.	Killed.	Injured.
1905	837	1564
1906	926	1884
1907	933	1797
1908	832	1755
1909	773	1830
1910	882	2132
1911	992	2434
1912	1032	2506
1913	1125	3080
1914	1147	2935
Totals	9479	21917

These figures show an increase fairly consistent with the development of railway traffic, although the increase in the number of persons killed is less in proportion than the growth of the railway business, but since 1909 there has been a steady increase unaffected by the falling off in traffic in 1914. This is doubtless largely due to the increase in the use of automobiles, especially in the rural districts, and this phase of the situation will necessarily assume an important place in the committee's investigation.

Naturally, the chances for grade crossing accidents increase with the number of trains run, and the railroads by heavier trainloading have prevented the number of trains run from increasing in proportion to the traffic, thereby holding down the chances of grade crossing accidents. Nevertheless, many legislators during the past year voted for bills to require the railroad companies to run shorter, and consequently more trains, because the labor leaders told them that it was in the interest of safety.

The standard remedy of the public authorities for crossing accidents is elevation or depression of the tracks—if the railroads can be made to stand the expense. If there is a chance that the community may be required to share the cost of an im-

provement made for its benefit, the zeal of the public officials for grade separation frequently wanes. The separation of grades as rapidly as practicable is much to be desired, but at an average cost of probably \$50,000 per crossing even the most affluent railroad corporation can afford to eliminate only a small part of its grade crossings. Complete separation of grades would cost most roads more than they are worth and in many places the expense is so great as to raise the question whether the same amount of money would not bring about a greater reduction of accidents if expended in other ways.

In Chicago the roads have been required to spend about \$80,000,000 to date for the elevation of their tracks, with practically the sole object of reducing the danger of accidents at crossings, and the work is hardly more than half done. As was shown in a recent issue of this paper the number of people killed by trains at street crossings in Chicago has been reduced from 99 in 1905 to 31 in 1914, while the number of people killed by vehicles in the city streets has increased from 34 to 143, and in 1914 100 other persons were killed by trains at points not on the city streets, practically all of them while trespassing and many of them while trespassing on the elevated tracks of the railways.

A common reply of public officials to the objections of railroads to grade separation work because of its cost is that the improvement will save the roads large sums they would otherwise have to pay for damages. The amount thus saved will not go far toward paying the interest on the expenditure involved. If, however, the public authorities would co-operate with the roads to eliminate some of the accidents for which the victims themselves are chiefly responsible they might cause a saving that would contribute a considerable amount toward the cost of grade separation.

Mr. McCrea, the chairman of the American Railway Association committee, is especially qualified for the position by reason of experience gained by him in prosecuting a vigorous campaign to instill safety first ideas into the motorists of Long Island. The committee can undoubtedly accomplish some results well worth while by working along the lines followed by the Long Island and some other roads that have made special efforts to reduce crossing accidents. The Long Island, after having spent \$15,000,000 for the elimination of grade crossings, still has a large number, and had experienced so much trouble with reckless automobile drivers that it has installed signs as large as 50 ft. by 10 ft. to warn drivers of the necessity for carefulness in approaching some of its crossings. It has even found it necessary to install some crossing gates the size of telegraph poles because automobilists persisted in breaking through ordinary gates when set against the highway traffic on account of the approach of a train.

Many roads have placed large warning signs or signals at approaches to their crossings, but even where protective devices are in service they depend for their efficiency largely on the attitude of the public using the highways. Enginemen are trained to be careful and are impressed with the importance of sounding whistle signals at crossings, but many automobilists approach railroad tracks without any effort to ascertain whether it is safe to cross.

To what a large extent highway crossing accidents are due to carelessness is demonstrated by observations, made by the Southern Pacific, of the actions of the drivers of 17,021 motor vehicles on approaching railroad crossings in a number of widely separated localities. Of the total, 11,836 drivers, or 69½ per cent, looked neither to right nor left before crossing the tracks; 2.7 per cent looked only one way and only 27.8 per cent looked in both directions, while 3,301, or 19.3 per cent, ran over the crossing at a reckless rate of speed, and only 35 stopped before crossing. Of 4,889 drivers of teams, 39.4 per cent looked in neither direction, 8.6 per cent looked only one way and only 52 per cent looked in both directions. Similar observations taken a year later at the same places, after the road had given a great deal of publicity to its efforts to reduce this kind of acci-

dents and had appealed for the co-operation of local authorities and automobile clubs, showed a considerable improvement.

The Baltimore & Ohio has had similar observations made, and at Uniontown, Pa., on September 12, when 729 automobiles crossed the tracks at one street in 12 hours only 28 stopped to ascertain whether or not a train was approaching, and 505 were not even slowed down. There were but 135 drivers who looked in both directions, while 542 did not look at all before crossing.

As the country develops it will be necessary for the railways to continue to eliminate grade crossings as rapidly as they can, and the increases of population and industry that make such expenditures necessary should naturally tend to so increase earnings as to enable the roads to meet them, but meanwhile a great deal can be accomplished to make conditions safer if the roads can secure the interest and co-operation of the public and of its representatives.

HIGHER PASSENGER FARES APPROVED

THE decision of the Interstate Commerce Commission allowing increases in western passenger fares is one of the most favorable the roads have ever received at its hands. This was to be expected from its previous utterances as well as from the evidence in the case, but it is gratifying to find that the commission has so clearly sustained the position taken for a long time by railroad men as well as by most others who have studied the subject.

The commission has not given the roads all that they asked for, but it has come near to doing so. In Illinois, Wisconsin, the upper peninsula of Michigan, Minnesota, Iowa, Nebraska, Missouri north of the Missouri river, and Kansas on and north of the main line of the Union Pacific, where the tariffs filed by the roads proposed a basis of 2.5 cents a mile, the commission authorizes a basis of 2.4 cents; in Missouri south of the river and in Kansas south of the Union Pacific, where the roads had asked for 3 cents a mile the commission authorizes 2.6 cents.

Proposed increases in fares from the territory described to the east, which may be arrived at by combination of the rates authorized and the existing fares in eastern territory, now on a basis of 2½ cents, are justified, but to points outside the territory directly involved on the main lines of the respondent carriers in California, Utah, Nevada, Colorado, Wyoming, Arizona, New Mexico, Arkansas, Oklahoma and Texas, the commission limits the proposed increases to the combination of the 2.4 and 2.6 cent basis and a basis of 2.5 cents in North and South Dakota, and a basis of 3 cents a mile west and south of the territory described.

However, the commission has approved the full advance asked on mileage books from 2 to 2¼ cents in the northern territory described and from 2 to 2½ cents in the southern territory.

There is nothing in the opinion to explain why the commission finds a rate of 2.4 or 2.6 cents reasonable and 2.5 and 3 cents too high; it simply states that the carriers have "failed to justify" the higher rates proposed. Nor is any reason given why lower rates are approved for the western states than were allowed in the east. The commission points out that "on all sides of the territory principally affected the standard fares are generally upon a higher level" and that in the territory to the east the population per square mile and per mile of railroad, as well as the density of passenger traffic "are notably greater . . ." But while finding that "there is some justification for a lower basis of fares in this territory than in the states west and south thereof" it does not apply this remark to the eastern states, although using language from which it may be inferred that the various factors tending to reduce the average receipts per passenger mile in the east are considered as not conflicting with a higher standard rate in the east.

Many of the commission's findings of fact completely support the contentions long made by the railroads. For example, it says:

"All these influences (higher expenses and lower rates) have been reflected in the diminished rate of return per dollar of investment in the

railroad property of the railroads here affected. These railroads, like other industries, have felt the rising cost of living, to a certain extent due to an increased price of some of the articles necessarily required in the conduct of their business, but to a large extent due also to the increased wage paid to their employees and to increased taxes."

The commission finds that substantial improvements in passenger service have been made at large expense, that the conditions under which the passenger service is performed do not admit of economies in operation corresponding to all those that have been effected in the freight service, that the increased cost of service is entitled to consideration and that the passenger business in the territory affected is less profitable than the freight business.

With reference to statements regarding the alleged operation of a greater number of passenger trains between competitive points than the necessities of the public require, the commission calls attention to the fact that the intermediate territory must be considered. "Neither competition nor the unreasonable demands of the public," however, must be made the excuse for waste and extravagance in the passenger service.

As the official announcement that a rate higher than 2 cents a mile in the west is not unreasonable hardly brings much of a surprise, after the commission had allowed the eastern 2½ cent fares to go into effect last year without suspension, interest in the decision naturally turns at once to the effect it will have on intrastate rates. That the commission has also had this phase of the question in mind is indicated by the following significant paragraph in the opinion:

"This increased revenue which apparently should come from the passenger traffic should not, however, be altogether imposed upon the interstate traffic. Manifestly a person journeying by rail within the boundaries of a state cannot expect to travel at the expense, in any degree, of the interstate passenger. . . . The revenue of respondents from intrastate passenger traffic within these states is approximately 96 per cent of that from the interstate traffic. While we should permit reasonable interstate fares, we cannot sanction fares that are higher than are reasonable for the service performed because intrastate fares are alleged or shown to be unduly low."

Of the states included in the territory directly involved in the case, Wisconsin, Michigan, Illinois, Iowa, Missouri, Minnesota, Nebraska and Kansas now have 2-cent intrastate fares, and the interstate rates in effect are generally on a 2-cent basis. In North and South Dakota the general basis for both state and interstate fares is 2½ cents; Louisiana and Texas have 3-cent intrastate rates and the interstate rates through these states and Arkansas, Missouri and Oklahoma are generally 3 cents, the latter rate having been approved by the Interstate Commerce Commission in a previous decision.

In the face of these two decisions, approving rates ranging from 2.46 to 3 cents a mile for interstate fares it is difficult to see how the 2-cent fare states can maintain their present low rates. In Missouri the restriction to 2 cents, except for mileage books, will be removed by the recent decision of the state commission.

The railroads have been planning to use the Interstate Commerce Commission's decision as a lever to raise some of the state rates, but just what form the procedure will take will undoubtedly depend on the outcome of the case now pending before the commission on the complaint of the Business Men's League of St. Louis, asking the removal of the discrimination created by the interstate freight and passenger rates between Illinois points to St. Louis higher than the intrastate rates and fares between the same points and East St. Louis and other border points. If the interstate fare of \$7.50 from Chicago to St. Louis is reasonable the St. Louis man is certainly discriminated against by a fare of \$5.62 from Chicago to East St. Louis for a distance only four miles less.

Outside the territory directly affected the only states that have maximum 2-cent fares are Oklahoma, Indiana and Ohio; and in all these states the Interstate Commerce Commission already had permitted higher interstate fares to go into effect.

Annual Report of the Interstate Commerce Commission

Commission Recommends the Enlargement of Its Membership and Extension of Its Powers

The following is a very much condensed abstract of the report of the Interstate Commerce Commission, which was submitted by the commission to Congress on December 13. The report covers the period from November 1, 1914, to October 31, 1915. There were 6,500 informal complaints received during the year as compared with 7,880 in the previous year. There were 6,690 applications filed by the roads to make refunds, an increase as compared with the previous year of 1,176. The number of formal complaints filed during the year was 964, a decrease as compared with the previous year of 190. There were 902 cases decided and 205 dismissed, a total of 1,107 cases disposed of, comparing with 864 disposed of in the previous year. The decrease in the number of complaints filed during the year has been more than offset by the complex nature of the cases that have been presented. The rate structures between various communities are now more often the subject of complaint than was the case in earlier years.

The number of proceedings under the suspension of schedules, part of the act, was 199, a decrease of 4 as compared with the previous year. There were 210 cases disposed of, an increase of 51 as compared with the previous year. In 56 instances the tariffs were voluntarily withdrawn by the carrier; in 3 instances protests were withdrawn and suspension order vacated; in 1 instance reductions were made in the proposed rates and then suspension vacated; in 50 instances proposed changes were allowed; in 38 instances they were allowed in part; in 59 instances they were disallowed, and in 3 instances orders of suspension were vacated.

The commission refused to suspend schedules in respect to 368 cases, an increase of 157 as compared with the previous year. The commission's duty is to determine as fully as possible whether the proposed tariff schedule represents an appropriate exercise of the carrier's right to initiate rates or whether it appears to go beyond the legitimate exercise of this function.

[The principal investigations made by the commission have been covered in these columns at the time they were made public.]

THE FOURTH SECTION

There were 673 applications for a suspension by the commission of the long and short-haul clause, a decrease of 277 as compared with the preceding year. There were 822 orders entered, 260 of which were permanent and 562 were temporary. Since the opening of the Panama Canal, water carriers have materially reduced their rates, shortened the time of transportation and increased the frequency of sailings. There were 49 ships, with a capacity of 380,000 tons in service between the Atlantic and Pacific coast. The total tonnage from the Atlantic to the Pacific coast and Hawaiian Islands was 397,974 tons in 1911, 451,592 tons in 1912, 434,115 tons in 1913, and for the month of September, 1914, the tonnage was 77,915 tons, or more than twice the average monthly tonnage for the preceding year. The tonnage handled by water lines included a great deal originating in the interior. Thirty-two cars of cast iron pipe moved by rail from Birmingham, Ala., to New Orleans, La., and thence by water to the Pacific coast. Catsup moved from Rochester, N. Y., by rail to New York and thence by water to the Pacific coast. It was evident that the degree of competition between the rail carriers and water carriers was greatly increased and it was necessary for the rail lines to make material reductions in their rates if they expected to obtain any considerable percentage of the coast to coast traffic. The reductions extended to Pittsburgh, Chicago and Missouri river territory and the commission granted additional relief in respect to the rates on commodities included in schedule C, but in addition to this a second application has been filed with the commission for further modification of the orders relating to trans-continental rates.

RATE SCHEDULES

There were 149,449 tariff publications containing changes in rates filed. This is an increase of 418 over the previous 11 months. Complaints have been received of failure to post tariffs at stations at which freight and passengers are received, and it appearing that no uniform or adequate plan was being followed, an order was issued requiring the agent at every station to stamp on a new tariff the date received and to keep a record showing the date posted at the station. The rate work of the division of tariffs continues to increase, notwithstanding the fact that, due to the commission's regulations, tariff publications are far more understandable than heretofore. This increase is largely accounted for by the fact that during the last two years a great many changes in rates and fares have been made.

CLASSIFICATION OF FREIGHT

The Western classification committee has now been in continuous session for 21 months demonstrating the practicability of placing freight classification in the hands of a limited committee whose members represent no particular lines and are not interested in soliciting traffic. Progress has been made in getting state commissions to adopt western classification.

The official classification committee is to be reorganized along the lines on which the western committee is organized. At present it consists of 15 members who meet quarterly and whose recommendations are submitted to individual lines for approval. A permanent committee is to be appointed but, unlike the western committee, its action will not be final. The southern classification committee holds fewer meetings than either of the other committees.

A committee of the carriers has been working for several years to bring about uniformity of classification, and since this involves changes in ratings and rates on practically all articles moving under class rates, it must apparently come slowly, and after uniformity has been attained with regard to rules, packing requirements and minimum carload rates. The following table shows the uniformity as of October 20, 1915:

	Total items in classification.	Uniform classification committee has passed—		Uniform classification committee has not written.	
		Number.	Per cent.	but not yet passed.	has not written.
Official classification	5,765	4,582	80.00	5.00	15.00
Southern classification	4,780	4,181	87.50	3.50	9.00
Western classification	6,917	5,291	76.50	5.00	18.00

The commission has previously suggested that it be given authority to require uniformity in classification, which authority could be exercised so as to hasten the adoption of uniformity and at the same time do no harm to any interests.

EXPRESS COMPANIES

After one year's experience under the new rates for express companies ordered by the commission, effective February 1, 1914 the four principal companies doing 95 per cent of the express business filed a petition for a modification of the order, which petition if granted they estimate would increase their gross revenue 3.86 per cent. The number of shipments handled under the commission's rates increased 2,225,000, but gross transportation revenues decreased \$13,680,810. The modification sought the commission thought, would not result in unreasonable rates and was therefore granted, the new rates becoming effective September 1, 1915. A universal block system of express rates was not adopted because it would increase rates materially in

some sections and decrease express company revenues materially in other sections.

DIVISION OF INQUIRY

This division has to do with the investigation of seeming violations of the commerce act or the Elkins act. About 90 per cent of the matters investigated were disposed of without resort to the courts. There were 72 indictments, and the number of defendants is much greater than this, many indictments being against two or more defendants. Of these, 22 were against carriers or carriers' agents and 50 against passengers, shippers or other interested parties. During the year 48 cases were concluded. These included 31 cases in which pleas of guilty or *nolo contendere* were entered. In 7 cases verdicts of guilty were rendered and in 2 cases verdicts of not guilty. The principal court decisions have been summarized from time to time in the *Railway Age Gazette*. Various indictments were found against roads for granting to individuals favors or free passenger service. Several instances were discovered where large shippers were affiliated with carriers and were thus enabled to secure advantages from other shippers. A tendency to revise all leases at less than a fair rental in order to avoid granting concessions to shippers in this indirect way has been observed. Several prosecutions have arisen as a result of the failure of carriers to observe strictly their tariffs.

False billing of shipments by shippers has continued to require much attention. In misbilling cases it is common for shippers to plead guilty and thus escape with a smaller fine than would result if the case were contested. The courts, however, have recently imposed substantial fines in cases of this kind where the defendant admits his guilt. Thus, in an indictment of 20 counts brought against the Standard Brewing Company for false billing of a carload of beer a plea of guilty was entered and the court fixed the fine at \$16,000. A large number of shippers have also been prosecuted for filing false claims for loss and damage. This practice has been most prevalent in the case of shippers of perishable articles who, on suffering damage, frequently file excessive claims against the responsible carrier. Several prosecutions have also been instituted against shippers who claimed that their property had been damaged when no damage occurred. There have been evidences that the laxness of the carriers in recognizing and paying such false claims sometimes amounts to granting rebates. This question is now under review.

The larger part of the field investigations made by the division did not disclose violations of law. It is proper to state that in many instances investigations of complaints made by shippers and others against carriers disclosed that the complaint was groundless and that the carrier's practice was beyond criticism. Indeed, in one or two cases it was found that the carrier was not only complying with the law but that the very efficiency of its policing arrangements was the real reason for the complaint. As to several other matters investigated, while the practice involved was found to be questionable, the subject was handled by correspondence or conference and the objectionable features thus eliminated. As the strict requirements of the law become more completely appreciated it may be anticipated that the number of cases in which questionable practices can be corrected by conference rather than prosecution will increase.

The practice of carriers in having their fuel coal so billed as to effect a discrimination in their favor against other purchasers of coal has been the subject of numerous prosecutions in previous years. An unlawful practice in connection with the purchase of fuel coal by carriers has been the subject of several field investigations. This practice consists in the carrier buying its fuel coal from large coal producers at a higher price than the fair market price in order to influence the routing of the preferred operator's commercial shipments. Certain attendant circumstances in each case suggest the conclusion that the price paid by the carrier included a bonus which was intended to reduce the published rates. Of course such a practice is unquestionably a device for defeating the lawfully established rates on commercial shipments of the favored coal producer,

DIVISION OF LAW

The division of law, as at present organized, represents the commission in injunction and other proceedings brought by carriers in the federal courts against orders of the commission and in such civil actions as the commission approves to enforce statutory forfeitures incurred by failure to comply with its orders. It co-ordinates and supervises the work of the valuation attorneys in the several districts, and participates, when so directed, in special investigations instituted by the commission.

Since the period covered by the last annual report eight cases involving orders or practices of the commission have been decided by the Supreme Court of the United States. Of these, five, the New Castle switching case, two Meeker reparation cases, the Nashville grain case, and the Nashville coal rate case were decided in favor of the commission. In two others, the Louisville & Nashville mandamus case and the Erie pass case, the decisions were adverse to the commission, while in one, the Ellis compulsory testimony case, the decision of the Supreme Court was substantially in favor of the commission, although adverse in certain respects.

Since the period covered by the last annual report decisions involving orders or requirements of the commission have been rendered in courts other than the Supreme Court of the United States in 14 cases, 13 in favor of the commission and 1 adverse. Of these, 13 were decided in district courts of the United States and 1 in the court of appeals of the District of Columbia. In addition, motions for interlocutory injunctions against orders of the commission have been denied by district courts in 2 cases, and 6 cases have been dismissed in district courts, 5 on motion of complainant carriers and 1 at the instance of the commission. One case was dismissed in the court of appeals of the District of Columbia on motion of the appellant.

During the same period 23 cases involving orders or requirements of the commission have been instituted in district courts of the United States. One of these was an action against a carrier to recover the penalty prescribed by section 16 of the act to regulate commerce for failure to obey an order of the commission.

Twenty-six cases involving orders or requirements of the commission are now pending, 8 in the Supreme Court and 18 in district courts of the United States.

DIVISION OF CARRIERS' ACCOUNTS

During the constructive period in which the systems of carriers' accounts have been developed it has been necessary to revise and reissue a number of accounting classifications for the purpose of more nearly meeting the practical needs of the carriers and the requirements of the commission. The underlying principles of the systems, however, are now well established, and it is believed that no extensive revision of the classifications will be required for some years to come.

The regulations to govern the issuing and recording of passes of steam roads will be revised and amplified to include instructions for the guidance of electric railway companies and carriers by water. Material progress has been made toward standardization of accounting practices. Examinations of carriers' accounts, an important function of the division, are being carried forward by the corps of examiners. Studies of particular phases of accounting practices have been made through the medium of special reports required of carriers. These have proven so satisfactory as an auxiliary to the work being done by examiners of accounts in the determination of accounting practices that it is the intention to increase the number of studies during the coming year. The special work done by examiners and the results derived from the studies mentioned have yielded information of great value which has materially contributed to enhancing the good effect and beneficial results accomplished through examinations of carriers' accounts. The establishment of branch offices at New York, Pittsburgh, Chicago, St. Paul, St. Louis, New Orleans, and San Francisco has resulted in considerable economy of time and in sufficient reduction of traveling expenses to permit a substantial increase in the number of employees.

CLAIMS AGAINST CARRIERS

Since the last annual report the complete results of the special inquiry as to the time required by steam railway carriers to investigate and adjust claims received by them from shippers have been obtained. There follows a tabulation of claims presented to carriers having annual revenues exceeding \$1,000,000, and the number of these claims adjusted by them during the period indicated.

Claims presented to carriers during the calendar year 1914.

Interstate:	Loss and damage.	Over-charge.	Total.
Local	\$713,245	\$219,404	\$932,649
Interline	1,615,494	757,406	2,372,900
Total	2,328,739	976,810	3,305,549
Interstate:			
Local	765,764	224,894	990,658
Interline	181,087	86,144	267,231
Total	946,851	311,038	1,257,889
Grand total	3,275,590	1,287,848	4,563,438

Number of above claims that were adjusted by carriers between Jan. 1, 1914, and March 31, 1915.

Character of claims.	Manner of adjustment.			Total.
	Paid.	Declined.	Withdrawn.	
Loss and damage.....	2,800,399	298,189	56,858	3,155,446
Overcharge	1,003,824	207,217	22,611	1,233,652
Grand total	3,804,223	505,406	79,469	4,389,098
Percentage	86.674	11.515	1.811

Division of time in which the adjustments were accomplished between Jan. 1, 1914, and Mar. 31, 1915.

After receipt: Period of adjustment.	Loss and damage claims.	Over-charge claims.	Total.	Percentage
				relation of each period.
Within 15 days.....	1,574,712	548,140	2,122,852	48.366
Within 30 days.....	532,982	248,401	781,383	17.803
Within 60 days.....	456,213	208,201	664,414	15.138
Within 90 days.....	236,056	97,276	333,332	7.595
Within 120 days.....	155,883	61,240	217,123	4.947
Within 6 months.....	112,358	39,567	151,925	3.461
Within 1 year.....	83,421	29,608	113,029	2.575
Over 1 year.....	3,821	1,219	5,040	.115
Total	3,155,466	1,233,652	4,389,098	100

Claims that remained unadjusted on March 31, 1915.

Loss and damage.....	120,144
Overcharge	54,196
Total	174,340

It will be observed that of the 4,563,438 claims presented to carriers, 4,389,098, or 96 per cent, were adjusted. Of the claims adjusted nearly 50 per cent were adjusted within 15 days after receipt by carriers, more than 65 per cent within 30 days, and all but 6 per cent within 120 days. From these figures it appears that much progress has been made by carriers in the matter of handling claims, and there are reasons for believing that their claims' departments are now organized on a more efficient basis than formerly.

DIVISION OF STATISTICS

In addition to its usual work of the past few years the division has devoted considerable time to other important matters, the principal results of which are here stated. In this connection the commission held general hearings and sought the co-operation of committees, representatives of the American Railway Association, state commissions, and other interested parties.

The annual report forms pertaining to steam and electric railway companies were recast for the year ended June 30, 1915. In this revision many changes were necessary to provide for returns in accordance with the revised accounting classifications that became effective at the beginning of the year. Various other changes resulted from new requirements or modifications, the purpose of the changes being to secure information that would be of greater usefulness.

The preparation of annual report forms pertaining to carriers by water having annual operating revenues above \$500,000 and to telephone companies having annual operating revenues above \$250,000 was completed, and these two classes of carriers made

annual reports to the commission for the first time covering the year ended December 31, 1914.

Rules governing the classification of steam-railway employees with respect to occupation and compensation were prescribed by the commission, effective July 1, 1915. As the number of classes of railway employees concerning which returns are now required in the annual reports of steam railway companies was increased from 18 to 68, the need of a detailed classification became urgent in order to secure uniform returns.

Revised rules governing monthly reports of railway accidents were also prescribed by the commission to take effect July 1, 1915, and suitable forms were devised for the required reports of such accidents. These rules, superseding those of 1910, pertain to both steam and electric railway companies, and were deemed necessary principally to obtain more comprehensive and uniform returns of railway accidents.

Following the developments in connection with the separation of operating expenses, described in the last annual report, a new circular outlining a method for separating operating expenses between freight and passenger services was prepared. An order was issued, effective as of July 1, 1915, requiring all carriers having operating revenues in excess of \$1,000,000 to classify each of its various items of disbursement relating to operating accounts according to the relation which such item bears to the freight service or to the passenger and allied services of the carrier, rules being given for apportioning items of expense common to both classes of service, except as to certain items under maintenance of way and structures, which are for the present to be left undivided. Decision as to these items was reserved until a further study of them could be made. The data resulting from this order will not be available until after the close of the fiscal year ending in 1916. It is expected that this class of information will be of assistance not only in rate cases but also in making comparisons of changes in operating costs from year to year and among various railroads in a given year.

The commission has always considered it inadvisable to make publication of statistical matters in permanent form until after the reports on which such publications are based have had, as far as practicable, the benefit of careful scrutiny and correction of errors.

The monthly bulletins of revenues and expenses of steam roads with annual operating revenues above \$1,000,000 were discontinued with the publication of Bulletin No. 69 for the month of August, 1914, but the issuance of a daily bulletin of revenues and expenses of this same class of carriers by railway, chiefly for the benefit of the press, has been continued. This press bulletin shows the cumulative revenues and expenses of the more important railways as reported for the latest current month for which reports are received.

DIVISION OF SAFETY

This division has continued its work as in previous years, and the usual separate report will be issued. During the fiscal year 161 cases of violations of the safety appliance act were prosecuted in the courts, and as in former years, a large majority of the prosecutions were successful. A considerable number of cases appealed to the Circuit Courts of Appeals were decided in favor of the government, as were cases appealed from the latter tribunals to the Supreme Court. Carriers confessed judgment as to 613 counts. The number of violations of the safety appliance act during the year was nearly 50 per cent less than in the preceding year, indicating better inspection and more efficient repair facilities; but there is still much room for improvement. The commission is considering the propriety of extending beyond July next the time within which carriers must equip freight cars with the standard appliances prescribed in 1911. About 900,000 freight cars still remain deficient, in some respects, as related to these requirements. A summary is given of the court decisions recently issued interpreting the safety appliance acts.

Prosecutions for violation of the hours of service act have been begun in 125 cases, involving 1,950 counts. In the cases

brought to trial during the year, 187 counts resulted in verdicts in favor of the government and 138 against. The carriers confessed judgment as to 1,189 counts. Suits before the Circuit Court of Appeals were decided in favor of the government in a large majority of cases. The total number of instances of men working beyond the statutory period during the year was 78,940. This is less than half the number reported in the preceding year, and only about one-third the number in the year before that. Penalties for violations have ranged from one cent to \$250, and the commission again recommends that the minimum penalty be \$100. A summary is given of the decisions of the Circuit Courts of Appeals interpreting the hours-of-service act.

The inspectors of the commission investigated 66 train accidents during the year; 40 derailments and 26 collisions. Eight of the collisions occurred under the block system. Attention is called to the fact that collisions are very much less numerous, as compared with derailments, than in former years. The commission believes that the decrease in collisions has been due largely to the work of safety committees and to public investigations of accidents. Bad operating conditions still prevail, however, in too many cases. The former recommendation that train rules be described by law, is repeated, as is that for more thorough investigation of the causes of broken rails. Derailments caused by malicious tampering with track, now, as heretofore, are so numerous as to furnish cause for alarm. Six accidents under this head, during this fiscal year, caused the death of 20 persons and the injury of 92.

The inspectors of the commission have examined, during the year, 342 plans of devices intended to promote safety, of which 35 were considered to possess some merit. Two automatic train control devices have been tested and reported on, and another is now being tested. Arrangements have been made for testing still another, and also an automatic straight air-brake system. The use of the block system increases year by year, but this increase has not kept pace with the increasing need.

BOILER INSPECTION

The work of the division of locomotive boiler inspection will be the subject of a separate report. The number of engines inspected during the year, 73,443, is 19,273 less than the number in the preceding year, and the number found defective, 32,666, is only about two-thirds as many as were found defective in 1914. The number ordered out of service was 2,027, as compared with 3,365 in the preceding year. The number of accidents reported was 424, which is a fourth less than the number in the preceding year, and 50 per cent less than the number in 1912. The casualties connected with these accidents in 1915 were 13 killed and 467 injured, as compared with 23 killed and 614 injured in the preceding year. During the year 284 roads presented 1,099 applications for extension of time for the removal of flues, of which 638, or 58 per cent, were granted. The remaining 42 per cent were refused or granted only after defects disclosed by inspection had been properly repaired. This division is preparing rules for the inspection of locomotives and tenders (other than the boiler and its appurtenances) in accordance with the law passed this year.

DIVISION OF VALUATION

The report contains a six-page review of the work of this division. Twelve roadway and track parties have now been continuously at work since June 1 last in each of the five districts. For five months the mileage covered has exceeded 4,000 miles a month. This rate will be maintained, except in December, when the field men have their vacation. By the first of next month surveys will have been finished on nearly 50,000 miles of road, and it is estimated that in four years more the whole country will have been covered. For the valuation of bridges, buildings, signals, cars and engines, separate parties are organized, and these are now able to carry on their work in proper relation to that of the survey parties.

Some details are given concerning the method of carrying on

the work. It is desirable that a single district organization shall attend to the valuation of the whole of any given company's line, and, for example, the Chicago, Rock Island & Pacific, which extends into two or three districts, cannot be finished until next spring, although work was begun in November, 1914. After the surveys are completed, a further time will be required for collating the facts in the office. In the winter the field parties in the colder regions have to go to the southern states; so that although the work, as a whole, is proceeding at a satisfactory rate, the valuation of particular railroads is not finished.

A great amount of work has been done toward fixing unit prices, and other items of valuation, and accountants have examined the records of the carriers, but no attempt has yet been made to put an actual money value on the inventories, which have been prepared. The valuation of land has not kept pace with the work of the engineers, largely because it has been impossible to obtain suitable land appraisers through civil service channels; but it is not believed that this will result in ultimate delay.

MISCELLANEOUS

The report summarizes the work of the division of indices, the condition of the library of the Commission, in which there are now 13,000 bound volumes and 10,000 pamphlets, and the doings of the commission in Porto Rico. The commission holds that the safety-appliance act should be complied with in Porto Rico, except that cars used in trains exclusively for the transportation of sugar cane might be excepted from the requirement for the use of power brakes. The report ends with a summary of the expenditures of the commission for the fiscal year ending June 30, 1915; total, \$3,933,925.

RECOMMENDATIONS

"The variety and volume of the work already devolved upon the commission necessitate, in its opinion, early enlargement of its membership and express statutory power to act through subdivisions designated by the commission to perform its duties with regard to specified subjects or features of its work, subject, of course, to retention by the commission of its control, as a commission, of all duties and powers delegated to the commission. This recommendation is submitted pending, and without prejudice to, deliberation appropriate to more comprehensive and constructive legislation which the Congress may later deem it wise to consider. The recommendation for enlargement of the membership of the commission is directly connected with and dependent upon the authority to act through subdivisions.

" . . . for the purpose of uniformity and to prevent injustice, there should be provided by law one period, which in the commission's opinion should be three years, for the beginning of all actions relating to transportation charges subject to the act.

"The commission . . . should have right of access to the carriers' correspondence files.

"There should be appropriate and adequate legislation upon the subject of control over railway capitalization.

"In the interests of economy and efficiency and proper protection for records, the commission should be authorized to enter into a lease arrangement, covering a term of years, for suitable quarters, which can thus be secured through the construction of a building for that purpose.

"The use of steel cars in passenger train service should be required, and the use in passenger trains of wooden cars between or in front of steel cars should be prohibited."

BRITISH COAL ABROAD.—The British export trade in coal in October, 1915, amounted to 3,530,546 tons, as compared with 3,944,497 tons in October, 1914, and 6,739,473 tons in October, 1913. In the ten months ended October 31, this year, British coal was shipped to the extent of 36,944,758 tons, as compared with 62,060,846 tons and 61,257,261 tons in the corresponding periods of 1914 and 1913 respectively.

The Cost of Electrification of Chicago Terminals

A Summary of the Items Entering Into the Expenditure for New Equipment. Effect on Operating Expenses

The general conclusions of the committee of the Chicago Association of Commerce on Smoke Abatement and the Electrification of Railway Terminals in Chicago were presented in the *Railway Age Gazette* of December 3, page 1047. The engineering problems involved in this project, the mileage of tracks included and the amount of traffic handled in this area, were given more in detail in the issue of December 10, page 1089. In the present article the estimated cost of this work and also the effect of electrification on operating expenses, as determined by the commission, will be given somewhat in detail.

Detailed estimates were prepared on the basis of the overhead contact system with 2,400 volts direct current and with 11,000 volts single phase alternating current. Estimates of cost were also made for the electrification of the Chicago & North Western by the third rail system with 600 volts direct current, as well as by the two other systems. By the relations found to exist between the total cost of electrification of this one road by the third rail system and by the two other systems, an estimate of the total cost of electrification of all the terminals by the 600-volt third rail system was obtained.

For the purpose of estimates, after the trackage to be electrified had been determined, it was assumed that the work would proceed under a single administration, regardless of the ownership of tracks, and the power and substations were located on this basis. If electrification were to proceed under the management of individual roads, the expenditures would undoubtedly be considerably larger than those shown here. All estimates of the costs of labor and material were based upon figures for 1912. For the purpose of estimates, it was assumed that actual work would begin in December, 1916, and that six years would be required for the completion of the project. All figures given below are, therefore, for the complete cost of electrification on December 31, 1922, making proper allowances for the normal growth in traffic expected during the period of construction. Because of the many elements of uncertainty, such as the possible increases in the costs of labor and material, an allowance of 20 per cent was added for contingencies. An allowance of 10 per cent was added for engineering on all items of the work except rolling equipment, where 5 per cent was added and a flat rate of 1.75 per cent per annum for the entire construction period was allowed for interest.

ELECTRICAL FACILITIES

The load center of the power requirements falls within the limits of the Union Stock Yards. The commission decided that a single power station should be built and selected a location near the south branch of the Chicago river in the vicinity of Ashland avenue, close to this center of power demand. The details of the power station design for both the 2,400-volt d. c. and the 11,000-volt a. c. systems are the same in all essential characteristics. It was estimated that seven 20,000-kw. steam turbine generating sets would be required in each plant.

Estimates for the transmission system provide for 33,000 volts on all circuits; for duplicate circuits between the power station and all substations; for interconnection of substations with transmission lines to a reasonable extent; for overhead wire construction located on the rights of way of the railroads; for 3-phase circuits for the 2,400-volt system and single-phase circuits for the 11,000-volt system, and for supporting the transmission conductors on the structures of the contact system.

The estimates for the substations provide for 11 substations for the 2,400-volt d. c. system and for 31 substations for the 11,000-volt single-phase a. c. system.

The overhead contact system for main track construction for the 11,000-volt a. c. system was designed with a 5/8-in. stranded

steel messenger cable of extra high strength, supporting a secondary messenger cable of No. 4/0 steel wire, which in turn supports a No. 4/0 grooved solid copper contact wire. In yards, the overhead construction consists of a 3/8-in. stranded steel messenger cable supporting a No. 00 grooved copper contact wire. For the 2,400-volt d. c. system a 3/4-inch. stranded steel messenger cable will support a No. 4/0 steel secondary messenger cable, which in turn carries two No. 4/0 grooved copper contact wires for main track construction. For yard tracks a single No. 4/0 copper contact wire will be supported from a 7/16-in. stranded steel messenger cable.

Before determining upon the number of locomotives required, a careful study was made of the schedules of trains and of the number of locomotives now used. On roads having 20 or more scheduled passenger trains, one locomotive for each 12 schedules was regarded as sufficient to provide against exigencies outside of ordinary inspections and repairs. It was also assumed that an electric passenger locomotive would be available for service 20 hours per day and that it would be sent to the shops for heavy repairs and overhauling after running 60,000 miles. On this basis such a locomotive would be in service 80 per cent of the time.

It was assumed that an electric freight locomotive would be available for service 20 hours per day and that it would require heavy repairs and general overhauling every 44,000 miles. To provide for these periods and also for the exigencies of special service demands and the bunching of trains, the daily freight locomotive requirement was increased 25 per cent. An allowance of 20 per cent was added to the daily locomotive requirements for yard and transfer service to provide for ordinary inspections, cleaning and repairs, and for extra service and accidents.

On these bases the commission determined that, to handle the traffic existing in 1912, would require 688 yard, 100 freight and 228 passenger locomotives, or a total of 1,016. In addition, the suburban traffic would require 470 motor and 251 trailer cars. Of this number the Chicago & North Western would require 156 locomotives and 248 motor and trailer cars, the Chicago, Milwaukee & St. Paul would require 105 locomotives and the Illinois Central would require 55 locomotives and 203 motor and trailer cars.

ALTERATIONS IN EXISTING FACILITIES

Coincident with electrification, numerous changes in existing facilities would be required. To secure the minimum clearance of 16 ft. 6 in., 70 overhead structures must be modified either by raising the structures and their approaches or by depressing the tracks. It was also assumed that all existing wires and cables which cross above or parallel the tracks in such a manner as to threaten physical interference with the contact system or transmission line would be removed or re-arranged to eliminate any possibility of this interference. All estimates were based upon plans for carrying underground all cross wires except those carrying 11,000 volts or more, while no wires paralleling the tracks were to remain where, if the supporting pole were broken at the ground surface and the wires fell toward the tracks, they would not clear the contact and transmission wires by 3 ft. This latter requirement would make necessary the changing of 197.16 miles of parallel lines.

The installation of electrification would also make necessary the adaptation of the existing signal systems to the use of alternating currents, while it would be necessary to raise many existing signal bridges to give the required overhead clearance.

The elimination of the steam locomotives from the Chicago terminals would result in the dismantling of all engine houses, coaling stations, cinder pits, turntables, water tanks and other

TOTAL ESTIMATED COST OF ELECTRIFICATION FOR 2,400 VOLT D. C. SYSTEM ON DECEMBER 31, 1922

Table with columns: Power Station, Roads, Transmission System, Substations, Switching Stations, Overhead Contact System, Bridge Warnings, Return Circuit, Telephone System, Electric Rolling Equipment, Spare Parts, Changes in Overhead Structures, Wire Lines, Changes to Signal Systems, Cost of Transferring Terminal Facilities, New Terminal Facilities, Total Expenditure.

TOTAL ESTIMATED COST OF ELECTRIFICATION FOR 11,000 VOLT A. C. SYSTEM ON DECEMBER 31, 1922

Table with columns: Power Station, Roads, Transmission System, Substations, Switching Stations, Overhead Contact System, Bridge Warnings, Return Circuit, Induction Prevention, Telephone System, Electric Rolling Equipment, Spare Parts, Changes in Overhead Structures, Wire Lines, Changes to Signal Systems, Cost of Transferring Terminal Facilities, New Terminal Facilities, Total Expenditure.

*Included in the estimates for the Chicago Junction Railway. †Included in the estimates for the Chicago & Western Indiana R. R.

equipment incident to the operation of steam locomotives. In determining whether a facility should be entirely abandoned or transferred to a new location, it was necessary to consider not only the character and condition of the facility, but also the conditions on the individual roads. A road like the Chicago & Western Indiana, for instance, which would operate all of its trackage electrically, would have no further use for any such equipment, while the trunk lines would continue to operate with steam beyond the limits of the electrification, and might transfer portions of such facilities to new locations. However, the extent to which such procedure may be applicable to individual roads cannot be determined without considerable investigation, and no allowance was made for such facilities beyond a salvage value. It was, however, assumed that much of the machinery now used for steam equipment could be transferred to the new locations at considerably less than the cost of new equipment, and that a considerable portion of such equipment might be retained in its present location for the maintenance of electrical equipment. The first cost of such facilities as would be abandoned was estimated at \$3,502,530, the present value, \$2,596,837, and the salvage value, \$278,880, leaving a net amount of \$2,317,957 which would be lost. This latter amount could not be charged to capital and must therefore stand as an independent item representing property wholly dissipated.

The electrification of the Chicago terminals would necessitate a considerable amount of new construction of facilities, such as engine houses, ash pits, machine shops, water tanks, coaling stations and other equipment at transfer yards at the limits of complete electrification. It would be necessary to provide entirely new facilities at 18 such transfer points, while some facilities exist at 15 other points which could be remodeled and enlarged. In all, 54 yards would require some modifications of track arrangements to meet the new conditions imposed by electrification.

From a study of operating conditions, it was determined that approximately 2½ hours would be saved per passenger locomotive daily by the shortening of the steam locomotive run. From a study of the scheduled requirements, it was considered possible to reduce the number of steam locomotives required for this service by 37. Similarly 20 freight locomotives, 151 suburban locomotives and 742 suburban passenger coaches would be released in addition to the 140 locomotives now required for transfer service and 612 for yard service. On the basis of the increased traffic and the increased amount of equipment thus necessary to handle this traffic, on December 31, 1922, the release value of this equipment on that date would be \$9,496,806.

The costs given above cover only the equipment necessary for the electrical operation of the facilities included in the zone under consideration with the normal growth which may be expected up to December 31, 1922. For operating reasons, many of the railroads would deem it expedient to extend the electrification zone further from the city, thus increasing the cost. Likewise, any improvement of this magnitude would precipitate other betterment work, such as track elevation, which might otherwise be deferred for a number of years.

EFFECTS ON OPERATING COSTS

The electrification of the railway terminals of Chicago would introduce a new system of operation over all electrified trackage. Those roads with trackage entirely within the city would discontinue all use of steam locomotives. Those operating beyond the proposed limits of electrification would, however, continue to use steam locomotives outside the city after the electrification had been accomplished in Chicago. The changes in operating conditions which would result are of a three-fold character: (1) Those incident to the introduction of electric operation on trackage within the proposed limits of electrification; (2) those incident to the operation of transfer stations at which a change in motive power would be made from steam to electric and vice versa; (3) those resulting from the shortening of the steam-operated divisions at present terminating in Chicago.

To arrive at an accurate comparison of the cost under steam and electric operation, the commission analyzed the expenses in

accordance with the classification of the Interstate Commerce Commission. Considering only the 2,400-volt d. c. and the 11,000-volt a. c. systems, the effects on the expenditures for maintenance of way are negligible except for the item of buildings, fixtures and grounds, for there is a heavy increase resulting from the greater expenditures for the power house, substations and other buildings required for electric operation.

The comparison of steam and electric locomotive repairs shows a reduction of over \$700,000 in favor of the latter. In arriving at this figure the cost per locomotive mile for repairs to steam locomotives was ascertained from reports furnished by 25 roads for a period of five years, the data furnished by these roads being applied to the respective locomotive mileages of those roads. For comparative purposes, unit figures per locomotive mile for electric locomotives were assumed as \$0.055 for passenger and freight locomotives, and \$0.050 for yard and transfer locomotives.

With the operation of multiple unit equipment for suburban passenger service, it was estimated that 50 per cent of the present locomotive switching in connection with the handling of suburban passenger trains would be eliminated, causing a reduction of nearly \$27,000 in the transportation account for yard conductors and brakemen, and \$21,000 in the account for yard enginemen. The elimination of steam locomotives would, of course, also remove all charges for fuel and water for locomotives.

Based upon reports furnished by the roads, it was determined that the average expense for enginemen and firemen for suburban passenger locomotives in 1912 was 8.54 cents per locomotive mile. The estimated expense of a motorman on suburban multiple unit trains was fixed at 4.675 cents per mile, or \$4.25 per hundred miles, with 10 per cent for overtime and terminal delay. This was based on present rates of pay of engineers on self-propelled cars. This is equivalent to a reduction of \$163,842 in this account.

Based on figures furnished by the roads, showing engine-house expenses for road locomotives per locomotive mile in comparison with data for similar expenses on electrically-operated roads, it was assumed that the expense chargeable to this account for electric locomotives and electric multiple-unit motor cars would be one-fifth of the present enginehouse expense involved in caring for steam locomotives, showing a saving of over \$525,000 in favor of electric equipment. A summarized comparison of these accounts for steam and electric operation for the items affected is shown in the following table:

SUMMARY OF ANNUAL OPERATING EXPENSE UNDER AFFECTED ACCOUNTS, FOR STEAM AND FOR ELECTRIC OPERATION (Basis of 1912)

Acct. No.	Item	Steam	2,400-volt d. c.	11,000-volt a. c.
3	Ties	\$463,183	\$463,183	\$463,183
6	Roadway and track	243,663	243,663	243,663
7	Removal of sand, snow and ice	240,740	240,740	240,740
11	Grade crossings, fences, cattle guards and signs	42,608	42,608	42,608
13	Signals and interlocking plants	405,512	431,090	430,060
14	Telegraph and telephone lines	39,864	44,384	44,384
15	Electric power transmission	997,879	986,710
16	Buildings, fixtures and grounds	139,116	642,623	642,623
25	Steam and electric locomotive—			
28	repairs	1,746,395	1,036,852	1,036,852
31 A	Passenger train trailer-cars—			
	repairs	207,313	67,041	67,041
31 B	Multiple-unit motor cars—repairs	168,909	167,515
37	Electric equipment of motor cars—			
	repairs	106,439	106,439
47 A	Substations—operation and main			
47 B	tenance of equipment	90,000	17,050
86	Power station—operation and			
86	maintenance of equipment	2,065,827	1,932,894
68	Yard conductors and brakemen	53,636	26,818	26,818
71	Yard enginemen	42,539	21,270	21,270
72	Engine house expense—yard	633,482	126,696	126,696
73	Fuel for yard locomotives	4,076,978
74	Water for yard locomotives	147,044
79	Road enginemen (steam) and			
	motormen (electric) in subur			
80	ban passenger service	362,020	198,178	198,178
81	Engine house expense—road	659,912	131,982	131,982
82	Fuel for road locomotives	1,206,178
94	Telegraph and telephone opera			
	tion	117,373	209,589	213,789
	Totals	\$10,934,064	\$7,355,771	\$7,140,495

In studying the effect of the operation of transfer stations for

the changing of motive power from steam to electric and vice versa, it was found that in 1912, 704 passenger trains and 488 freight trains would be required to stop at these transfer stations to change power daily. The principal expense would be that involved in the operation of these terminals, although a value was also assigned for delay and damage incident to such stops, this being fixed at 45 cents for passenger trains and \$1.28 for freight trains. The cost of the operation of these terminals was estimated as follows:

	Per Annum
Increased cost of handling supplies.....	\$30,000
Handling locomotives, supplying water, inspecting trains and exchanging motive power, and maintaining tracks, contact system and bonding.....	1,126,587
Telegraph and telephone operation at transfer stations.....	45,900
Delay and damage incident to stops at transfer stations.....	343,626
Total	\$1,546,113

The electrification of the railroad terminals of Chicago would have the effect of creating additional operating divisions. Where the engine districts as now operated are short, this would have the effect of creating constructive mileage. The conditions existing on the individual roads were considered to ascertain to what extent this would be reflected in increased operating cost. This was placed at \$450,000. The estimated net operating result of electrification on the basis of the traffic of 1922 is shown in the table below.

ESTIMATED NET OPERATING RESULT OF ELECTRIFICATION
(Basis of 1922)
All Services

System of Traction	Expense under affected accounts for operation within the proposed limits of electrification	Increase in operating expenses due to the new transfer stations and to the reduced length of steam-operated divisions immediately beyond the limits of electrification	Net decrease as compared with the cost of steam operation.
Steam	\$14,214,283		
11,000-volt a. c. overhead..	9,282,644	\$2,594,947	\$2,336,693
2,400-volt d. c. overhead..	9,562,502	2,594,947	2,056,834
600-volt d.c. third rail..	10,974,987	2,594,947	644,349

There are also certain indeterminate results of electrification which should be considered, as, for instance, the increased capacity of those terminals which are now approaching their limit under steam operation. The commission also stated that another benefit to be expected is increased reliability of service. From the standpoint of safety, electrification introduces an added hazard, while it also permits the introduction of compensating influences, with a net result so slight as to be negligible.

SUMMARY

As stated previously, the estimated cost of electrification on the basis of a 11,000-volt a. c. system was \$178,929,241. Applying no depreciation to those accounts for alterations to bridges and buildings, changes in line wires and changes in signals, and allowing 4 per cent depreciation on power house and substation equipment, and 5 per cent on rolling equipment, on the transmission and overhead contact system, and also on the new transfer and locomotive facilities, gives total depreciation charge of \$7,808,278. The net result of electrification as determined by the commission is, therefore, as follows:

ACCOUNTING STATEMENT FOR DISCLOSING THE FINANCIAL PRACTICABILITY OF ELECTRIFICATION

I. Annual Charges:	
1. Interest	\$8,906,362
2. Depreciation	7,808,278
3. Replacement of dissipated assets.....	231,796
Total charges	\$16,946,436
II. Annual Revenues:	
1. Increase in net revenues.....	\$2,336,693
2. Indeterminate benefits
Balance, annual deficit on investment.	\$14,609,743

SETTLING RAILROAD WAGES*

BY ELISHA LEE

General Superintendent, Philadelphia, Baltimore & Washington.

A serious problem confronts both the railroads and the public today. It is a subject upon which much statesmanship must be expended in the next few years if the problem is to be solved to the credit of our nation. It is a problem that you younger men will have to wrestle with as citizens. I refer to the labor problem and particularly the railroad labor problem. . . . The arbitrators between the locomotive engineers and the Eastern railways, in 1912, gave a warning to which the public has been singularly indifferent. They said:

"The food and clothing of our people, the industries and the general welfare of the nation, cannot be permitted to depend upon the policies and the dictates of any particular group of men, whether employers or employees, nor upon the determination of a group of employers and employees combined. The public utilities of the nation are of such fundamental importance to the whole people that their operation must not be interrupted, and means must be worked out which will guarantee the result."

Adjustment of working conditions has been considered a matter of private concern affecting only employer and employed. Yet the railway provides a service which is a necessity of the entire people, and the interruption of this service would prove to be a national calamity. Wage increases are sooner or later shifted to the shoulders of the people and the public's interest in railway labor controversies is supreme and should assert itself far more effectively than it has thus far.

At the present time we see very little in the papers about labor movement on the railroads, but as a matter of fact the pot is seething hot. A movement is now on foot to secure the association of all the train organizations in one united demand upon the roads. On many of the railway systems federation of the four brotherhoods is in effect and on others working agreements exist between two or three of the organizations. Faced by this new idea of a united labor force in an undivided country, the public may well give heed and devote its best thought to a consideration of its own interest in the outcome.

In recent negotiations and arbitration proceedings, among other arguments, a demand for standardization has been more or less vigorously pressed—the same pay for the same work in the same class of service, whether train operation is on single or double track, in mountainous or level country, in branch or main line service, on lines of heavy or light traffic. But the standardization wanted is standardization upward, as was very frankly stated in a recent controversy by one of the labor leaders, and leaves the high spots plainly in view.

The result of such standardization is to raise the lower end of the wage scale regardless of work performed or responsibility incurred. Results obtained under such conditions have been attained in a haphazard fashion and are attended by much discrimination.

There has been little in the process up to the present time that could be designated as scientific, such questions often being settled from the standpoint of immediate expediency.

No final solution of so perplexing a problem as that of the relations of capital and labor is expected within the near future, but we should begin at once to give serious thought to the whole question and thus lay the foundation for a larger participation on the part of the public in the settlement of disputes in which its interest is paramount.

Do not understand me as criticizing the individual or the great mass of railroad employees. I know of no finer body of men generally than the employees of the railroads today. They are hard-working, conscientious men, who are sincerely and devotedly doing their work. I would venture the guess that we have very slight, if any, fault to find with 98 per cent of the employees, and I am proud of the fact that it is my good fortune to work with them.

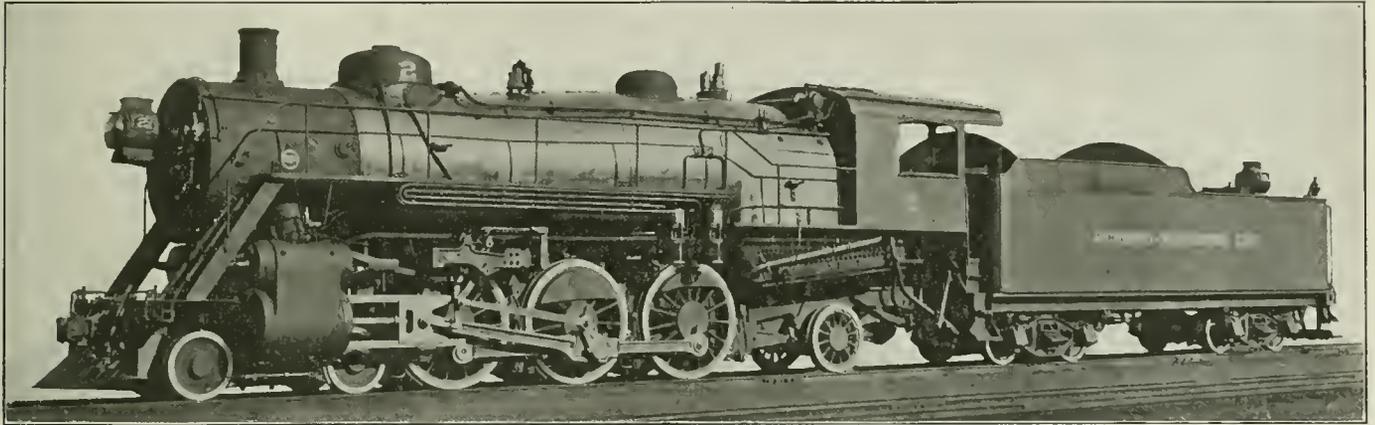

*From an address delivered at Delaware College, Newark, Del., December 9.

Powerful Pacific Type Locomotive for the R., F. & P.

Exceeds All Previous Pacific Type Engines in Tractive Effort and is Among the Largest in Boiler Capacity

The Baldwin Locomotive Works has recently completed for the Richmond, Fredericksburg & Potomac two Pacific type locomotives which are the most powerful of their type in hauling capacity thus far constructed by the builders. They have a

board Air Line and the Atlantic Coast Line. These trains, especially during the winter tourist season, are frequently very heavy, and are hauled at an average speed, including from two to six stops, of 36 to 42 miles an hour. Including the new

Richmond, Fredericksburg & Potomac Heavy Pacific Type Locomotive

tractive effort of 47,400 and a comparison of their principal dimensions with those of several other large Pacific type locomotives exerting a tractive effort of about 42,000 lb. or over, is given in the table.

engines, four classes of Pacific type locomotives have been built for this service by the Baldwin Locomotive Works. Compared with the first of these, which were built in 1904, the new locomotives show an increase in tractive effort of 82 per cent.

unlawful rebates, offsets, or preferences, especially within the last six years; and to report the dates and amounts thereof to the Senate for its information in case the commission finds that such unlawful rebates, offsets, or preferences have been given or received.

It appears that one David H. Lamar and one William H. Green had claimed to be in possession of information showing violations of law on the part of the steel corporation through the receipt by it of secret rebates amounting to millions of dollars, and it is understood that the resolution of the Senate was based upon their representations. It further appears that Mr. Lamar had previously made similar intimations to a member of this commission and had inquired whether the commission would undertake an investigation and permit him to direct the form and manner in which it should be carried on. He was advised that upon being put in possession of any definite information of any such violation of law it would be the duty of the commission to investigate, but that it would do so only in its own way, pursuing such course as the facts disclosed might require. Repeated efforts having failed to elicit any statement from Mr. Lamar in support of his assertions, further conference with him was declined.

After the passage of the resolution by the Senate and after the order of investigation had been entered by the commission, Mr. Lamar and Mr. Green were requested at a personal conference with a member of the commission to state the facts within their knowledge so that the scope of the investigation might be outlined by the commission and affirmative steps taken, through public hearings and by the commission's examiners, to ascertain whether any unlawful rebates and preferences had been received by the steel corporation or by any of its subsidiary companies. But they declined to reveal their information except at a public hearing. They were accordingly served with subpoenas and a public hearing was had on March 3, 1914, Mr. Green being first sworn and called as a witness. The questions put to him at once developed the fact that he had not been a student of transportation matters; that he had attended some of the hearings before the so-called Stanley committee of the House of Representatives, the report of which he had read; that he had also read reports of the bureau of corporations and of this commission in which matters relating to the steel corporation were considered; that he had also examined the record in the government's suit to dissolve the steel corporation; but that he had no independent information, or indeed any information respecting the affairs of the steel corporation and its subsidiaries that was not already of public record in one form or another. Having referred during his testimony to an individual who was in possession of facts not heretofore known, he at first declined to name him, but being required to state who he was he finally named Mr. Lamar.

Mr. Lamar was then called as a witness and, being put under oath, was subjected to examination as to his information about the relations of the steel corporation with the railroads of the country. His testimony shows that he knew nothing that was not already generally known to the public, and that such information as he had was of a perfunctory and superficial nature and had been derived from reading the reports of various public bodies, and especially of this commission, in which the affairs of the steel corporation are discussed. He named several of the subsidiaries of the steel corporation and asserted that "offsets," by which it is understood he meant rebates, had been received from the carriers by the steel corporation in the form of dividends on its holdings of stock in these companies, the stock being based, as he asserted, upon an entirely fictitious valuation.

In *Pittsburgh Steel Co. v. L. S. & M. S. Ry. Co.*, 27 I. C. C., 173; *Vulcan Iron Works Co. v. A., T. & S. F. Ry. Co.*, 27 I. C. C., 468; *Industrial Railways case*, 29 I. C. C., 212, 32 I. C. C., 129; *Coal and Oil Investigation*, 31 I. C. C., 193; *Lum v. G. N. Ry. Co.*, 33 I. C. C., 541; and *Joint Rates with the Birmingham Southern R. R. Co.*, 32 I. C. C., 110, the relations of the steel corporation to various of its subsidiary railroad and steamship companies have been made a matter of public record. An even more complete record of all such facts has been made in the

proceeding by the government, heretofore mentioned, in which it was sought to dissolve the United States Steel Corporation under the so-called anti-trust law. *United States v. United States Steel Corporation*, 223 Fed., 55. The commissioner of corporations has also made an extended investigation, the results of which are incorporated in three printed volumes entitled "Report of the Commissioner of Corporations on the Steel Industry."

The commission comes into constant contact with the records and accounts of railroads and other public carriers through its examiners of accounts, and has reason to believe that there is no basis for the allegation that wholesale rebates have been paid to the steel corporation during the period of six years mentioned in the resolution; apparently in alleging that "offsets" and rebates have been received by the steel corporation during that period the witnesses mentioned had in mind the dividends on the stock of the numerous subsidiary railroad and steamship lines owned by it, and as to this all the facts have been ascertained and are accessible in the various public records just mentioned. Under these circumstances we venture to believe that the resolution of the Senate is sufficiently complied with for all practical purposes by the reference to those investigations in connection with the foregoing statement. (36 I. C. C., 559.)

THE LABOR DEPARTMENT AND THE RAILROADS

BY W. L. STODDARD

Washington, December 14, 1915.

Hardly a branch of the Federal Government fails to come into some sort of contact with the railroads. Congress legislates for or against them, the courts decide their cases, a special commission adjusts their rates and values their property, a postmaster general negotiates for payment to them for carrying mails, the military arm of the executive plans for the utilization of the roads in case of war, and this week along comes Secretary of Labor Wm. B. Wilson with several suggestions about the railroads which show that their functions are appreciated from the head of the President's cabinet table down to the foot.

During the last fiscal year, no less than six important railroad cases were adjusted through the mediators of the Labor Department. These cases were those of the freight clerks of the New York, New Haven & Hartford, the car builders of the Pennsylvania Lines West of Pittsburgh, the shopmen of the Seaboard Air Line Railway, the shopmen of the Kansas City Terminal Railway, the clerks of the Chicago & Eastern Illinois, and the terminal clerks of the Southern Railway. In the first named instance it is interesting to know that besides effecting a settlement with the railroad and its freight clerks, the commissioners of mediation, at the request of the railroad company, brought about an arrangement with the officials and employees of the New England Steamship Company whereby conferences are to be had between the company and its clerks over any future differences that may arise between them.

Commenting on this work, Secretary Wilson declares that it has "furnished further proof of the value of the act of Congress under which the department operates in behalf of industrial peace. . . . In administering this authority I have regarded it as contemplating a development of diplomatic duties with reference to labor disputes analogous to those of the Department of State with reference to international controversies."

Secretary Wilson is not content with recounting history—he has a new scheme which involves the railroads. This is to secure from Congress an authorization such that the Interstate Commerce Commission may charge "exceptional rates of railroad fare" so as to enable the department to place the unemployed in employment, particularly in the harvest fields. According to the plan as outlined at considerable length, the idea is that if low railroad rates could be secured, it would be possible to ship large groups of workers to the grain belt at the season when they are most needed there. The department uses the phrase, "labor vacations" to describe the excursions which

it wishes to inaugurate for the relief of the harvest labor situation. An experiment would have been made this year, it seems, but for the expense of transportation.

"Inasmuch as railroads," says the Secretary, "can not give special rates to this department for the promotion of its labor-distribution work without thereby making those rates universal, the department found it impossible to arrange for transporting workers on practicable terms, no matter how willing the railroads themselves might have been to co-operate. This is one of the reasons the department is asking in its recommendations for an amendment to the interstate commerce law enabling the commission in its discretion to approve such special arrangements as the department may find it possible to make between itself and railroad companies for the transportation of workers under its official charge or guidance."

It is expected that a bill will be introduced into Congress embodying the department's suggestions.

Also of interest to the railroads in the Labor Department's report is the request for legislation for the utilization of large areas of land hitherto held by the land-grant railroads, but now, under a decision of the Supreme Court, about to return to the Government. This decision both empowered and obligated Congress to treat with the land-grant railroads regarding the terms of the restoration of the very extensive tracts said to be easily available for farming. In these areas the Labor Department sees a possible outlet for the unemployed, and to this end quite an elaborate scheme has been drawn up, the fundamental idea being to stimulate "back-to-the-land" movement for the relief of congestion in the cities and for the revival of the old era of homesteading.

Up to the present writing Congress has given little promise that it will tackle railroad legislation, or any legislation at all, till after the Christmas recess. Not much hope is held out by leaders at the Capitol for any enactments except appropriations and national defense bills. Some incline to make an exception of the Administration's shipping bill. But in general it is true that few believe that even a small percentage of the many departmental suggestions and recommendations will be considered by Congress with the attention that they deserve.

The personnel of the three Senate Committees which have to do with railroads, as announced early this week, is as follows:

On Railroads: Messrs. Phelan (chairman); Reed, Smith, of Arizona; Williams, Smith of South Carolina; Lewis, Oliver, Norris, Goff, du Pont, and Clark of Wyoming.

On Pacific Railroads: Messrs. Brandegee (chairman); Callinger, McCumber, Jones, Townsend, Shively, Reed, Stone, Johnson of South Dakota, Robinson and Thomas.

On Interstate Commerce: Messrs. Newlands (chairman); Smith of South Carolina, Pomerene, Myers, Robinson, Saulsbury, Thompson, Lewis, Gore, Underwood, Clapp, Cummins, Oliver, Lippitt, Townsend, La Follette and Poindexter.

FOUR-WHEEL TRUCKS FOR PASSENGER CARS

The paper on four-wheel trucks for passenger cars, which was presented at the annual meeting of the American Society of Mechanical Engineers last week by Roy V. Wright, was discussed by several members. An abstract of the paper appeared in the *Railway Age Gazette* of December 3, 1915, page 1055. Extracts from the more important parts of the discussion follow:

C. D. Young, Pennsylvania Railroad.—The railroads have been too prone in recent years to use six-wheel trucks, based upon their experience with wooden trucks. Due to the flexure in these trucks, it was necessary to go to the six-wheel truck, simply on account of the wheel load. Obviously, as far as cost, and probably maintenance, is concerned, due to the fewer parts, the four-wheel truck is preferable to the six-wheel truck, provided it gives satisfactory service. With the advent of the steel truck, I believe that the total weight of the car which will be satisfactorily carried on the four-wheel truck can be materially increased. The practicability of this is proved by

the use of four-wheel trucks under, say, 98 per cent of the heavy passenger locomotive tenders in this country.

Axle loads as high as 45,000 lb. are permitted on passenger tenders, yet when we design a passenger car it is with fear and trembling that we put 31,000 lb. on the same axle.

In order to ascertain what effect on the train's resistance the two extra axles of the six-wheel truck would have we made three round trips each, with a dynamometer car on a ten-car train, using four-wheel trucks, and a ten-car train using six-wheel trucks, the car bodies being the same in both trains. The difference in total weight per car was due entirely to the difference in weight of the trucks, the cars with six-wheel trucks weighing 66 tons and those with four-wheel trucks weighing 59 tons. The tests indicated that the only material difference in resistance was due entirely to the difference in weight of the vehicles. With the cars in question we would have the same resistance in 13 cars with six-wheel trucks as would be offered by 14 cars, with four-wheel trucks.

The development of the clasp brake outlined in the paper was the result of observation of the clasp brakes used on the Philadelphia & Reading. They were tested in 1912, a complete report of the tests already having been made to the American Society of Mechanical Engineers by S. W. Dudley, of the Westinghouse Air Brake Company.* The single shoe brake had a total weight of 3,682 lb. per car, and the movable parts weighed 3,084 lb. The clasp brake had a total weight of 4,433 lb. per car, the movable parts weighing 2,852 lb., showing an increase in total weight of the clasp brakes of 24 per cent., whereas there is a decrease in the weight of the movable parts of the clasp brakes of 8 per cent. It was developed in our brake tests that it was desirable to have as low weight in the moving parts of the brake rigging as possible, to overcome the effect of inertia, for obviously the heavier the moving parts the more inertia and the longer time it takes to get full braking pressure at the wheel with a given pressure in the cylinder. By reducing the weight of the parts of the clasp brake we therefore have the right to expect that we develop the full braking power slightly quicker than we do on the single-brake car.

At sixty miles an hour, with 125 per cent nominal braking power, the clasp brake car made a stop in the brake shoe tests in 808 feet, which I believe is the shortest stop ever made on a passenger car under that braking power. The corresponding length of stop with single shoes is about 1,250 feet, showing a distinct gain in the length of stop by the use of two shoes per wheel, with an increase in the total weight of the brake rigging of only about 24 per cent.

The use of the clasp brake is economical in shoe brake material. We have recently made a series of road tests of brake shoes, considering the wear under single and clasp brake conditions. On the five different runs on which the test was made the clasp brake shows a saving in brake shoe material of about 30 per cent as compared with the single brake.

S. G. Thomson.—The Philadelphia & Reading has had one hundred cars equipped with clasp brakes in service for a number of years. The brake is very highly efficient; the stops with the clasp brake seem to be very much shorter than where the higher pressures are used to get nearly equal braking power.

G. R. Henderson.—It is well known that the Pennsylvania track is nearly perfect and it is a question whether the Pennsylvania four-wheel passenger trucks would give satisfactory service on average track with the loads which they now carry. The abandonment of the equalizers accounts for considerable saving in weight, as the equalizers and spring seats are quite massive for heavy cars. It is still the practice of many roads to use equalizers under tenders of passenger locomotives and also under high speed electric cars, and it is an interesting question as to just how far we can go in abandoning them and still not interfere with the comfort of the passengers. The condition of the track is a very important factor and should not be overlooked when considering this question.

*See *Railway Age Gazette*, February 13, 1914, page 311; also February 20, 1914, page 352.

Six-wheel trucks have been developed more generally in the West than in the East and it is only in recent years that their use has become general on ordinary passenger coaches. I desire to speak particularly with reference to passenger coaches, not sleeping cars or diners or heavy weight cars.

Some of the reasons why the six-wheel truck was applied to cars which would be considered quite light today were that from 60-lb. to 70-lb. rails with very light gravel ballast, in some cases nothing but gumbo ballast, were used, and further because of the use of cast-iron wheels. At one time the Chicago, Milwaukee & St. Paul was using cast-iron wheels even on parlor cars, these wheels being considered absolutely safe under six-wheel trucks, but not under four-wheel trucks.

Under ordinary conditions of service there is no justification for a six-wheel truck under a suburban car, and yet there are a great number of suburban cars which are running on six-wheel trucks. I will go further. I have never yet seen a 70-ft. car of the ordinary passenger coach type where the six-wheel truck was justified with the track we have today.

The following instance is given because of its bearing upon the difficulty from hot boxes. On a certain railroad, where, from the weight point of view, the 5 in. by 9 in. journal was perfectly satisfactory, and they were maintaining their journals in good shape, they were having trouble from hot boxes. They substituted the next larger M. C. B. axle, and still had trouble from hot boxes. An analysis of the situation brought out the fact that with the new form of high-speed brake the pressure with one shoe per wheel was such that it caused the brass to tilt and prevented the proper contact on the journal. When the clasp brake was applied no trouble was experienced with the 5 in. by 9 in. journal.

Mr. Pomeroy presented data showing the weights of a number of typical four-wheel and six-wheel trucks, the former varying from 26,400 lb. per car for 5 in. by 9 in. journals, to 31,400 lb. per car for 5½ in. by 10 in. journals and the latter varying from 41,200 lb. to 45,900 lb. per car. Using an average weight of 27,000 lb. per car for the four-wheel trucks he called attention to the saving in weight which could have been effected on a number of coaches with six-wheel trucks now in service, had four-wheel trucks been used.

S. G. Thomson.—We made some tests on the Atlantic City Railroad to determine the cause of hot boxes in very high speed service, up to 80 or 90 miles an hour on some parts of the road. We took some temperature readings of the boxes and were led to believe that there was not much of a film of oil between the journals and brasses. The trains would come into the terminal with the boxes almost at the flashing point. In the rush season we had to turn these trains back on the reverse trip at once, and no doubt the accumulated heat in the wheels and journals had something to do with the hot boxes on the way back. We ran these trains sometimes six trips during a day and occasionally the boxes would heat up, without any apparent reason, having had careful attention at both ends of the route on all trips. The cars were all-steel, weighing about 118,000 lb., and in my judgment were about at the limit for the four-wheel truck for that speed. We took the same cars on our New York division, where we have a couple of stops, and do not run at such high speeds, and they gave us no trouble whatever. The speed seems to be a factor in the question of using the four-wheel truck, and when our last cars were designed we considered very seriously the use of six-wheel trucks. We concluded to stick to the four-wheel truck and have done so with fairly good results.

G. W. Rink (C. R. R. of N. J.).—I would like to ask Mr. Thomson whether it was with the type of truck with the springs directly over the journal boxes that the trouble with hot boxes occurred. We had a few cars built with trucks of that type, and eventually went to the one-piece Commonwealth truck, because of trouble from hot bearings. On the trucks without equalizers, having the coil springs placed directly over the journal boxes, there is a tendency for the boxes to tilt and bind in the pedestal, producing uneven distribution of bearing pressure and wearing the box flanges. These trucks weighed 15,200 lb.

each and the Commonwealth trucks, which we now use, weigh 17,000 lb. each. Both types of trucks have clasp brakes, with beams across the truck.

S. G. Thomson.—The trucks we made our test on were not the ones with the springs over the journal boxes, although that type has given us more trouble than the other type.

INCREASES ALLOWED IN WESTERN PASSENGER FARES

The Interstate Commerce Commission, in a decision given out last Monday, holds that the carriers in western territory have justified certain increases in their interstate passenger fares, but the increases approved are not as great as those proposed. The decision appears in 37 I. C. C. 1 and is rendered "by the commission." Briefly, the commission's findings are as follows:

The carriers are allowed to increase from 2 cents to 2.4 cents a mile their interstate fares in Illinois; Wisconsin, the upper peninsula of Michigan, Minnesota, Iowa, Nebraska, Missouri north of the Missouri river and in Kansas on and north of the main line of the Union Pacific from Kansas City to the Colorado state line. The tariffs had proposed rates of 2½ cents.

In Missouri south of the Missouri river and in Kansas south of the Union Pacific, an increase from 2 cents to 3 cents a mile is not found justified, but a rate of 2.6 cents is allowed.

Proposed increased fares from points in the territory in which these fares are authorized to points on the main lines of the carriers in California, Utah, Nevada, Colorado, Wyoming, Arizona, New Mexico, Arkansas, Oklahoma and Texas are held not justified in those instances where such proposed increases result in higher fares than would be obtained by using for the construction of such fares the bases now authorized in Michigan, Illinois, Wisconsin, Kansas, Minnesota, Iowa, Nebraska, and Missouri, and a basis of 2½ cents a mile in the states of North and South Dakota, and a basis of 3 cents a mile in the states south and west thereof.

Proposed increased charges for mileage tickets in the territory north of the Missouri river in Missouri and on and north of the main line of the Union Pacific in Kansas to 2¼ cents a mile, and in territory south of the Missouri River in Missouri and the main line of the Union Pacific Railroad in Kansas to 2½ cents a mile are found justified.

Proposed increased fares from points in Michigan, upper peninsula; Illinois, Iowa, Minnesota, Wisconsin, Nebraska, Missouri and Kansas, to points in states east thereof, which result from the construction of such fares by the use of the bases herein found reasonable and the use of the existing fares in eastern territory are held to be justified.

The increased tariffs were filed to become effective on or about March 1, 1915, but were suspended until June 29, 1915, and subsequently resuspended until December 29, 1915.

This case may be considered as in large part complementary to the 1915 Western Rate Advance Case, 35 I. C. C., 497.*

To the 41 roads concerning which testimony was developed by the carriers in the freight case there were added six other roads, the Great Northern, Northern Pacific, Union Pacific, Toledo, Peoria & Western, Duluth, South Shore & Atlantic and the Texas Midland, and one road, the Chicago, Indiana & Southern, has been eliminated, for the reason that interstate fares on this line have been recently increased. Some of the railroads included in the 46 roads or systems lie largely or wholly without the territory in which the increases in basing fares are sought.

In the decision considerable attention is paid to the data used in the Western freight rate decision, the figures for the 41 roads being revised for the 46 roads and reference being made to the roads in group in particular. Increase in cost of operation and decrease in income for the past 12 years are set forth.

The evidence of both carriers and protestants is adduced to show an increase in the ratio of operating expenses to operating revenue, a rising scale of taxes and diminished compensation for service as measured by the average return per ton-mile or the average return per passenger-mile.

*Abstracted in the *Railway Age Gazette* of August 13, 1915, page 285.

SEPARATION OF EXPENSES BETWEEN FREIGHT AND PASSENGER

The separation of maintenance of equipment, transportation and traffic expenses, as between passenger and freight, presents no insurmountable difficulties. The separation of the expenses incident to the maintenance of way and structures, however, is more difficult. The weight and length of freight trains necessitate a certain degree of compactness of roadbed, weight of rail, strength and stability of bridges, culverts and other structures. The weight and speed of passenger trains have also necessitated in the interest of safety a higher degree of excellence as indicated in the strengthening of track structures, and a certain higher degree of upkeep of the track and structures, while both alike have induced the installation of block signals. The maintenance of way and structures expenses are large and form a great proportion of the total expenses. * * * To this problem a large part of the testimony of both carriers and protestants has been directed.

One of the interrogatories sent out by the commission inquired as to methods used by each carrier in the separation of passenger and freight expenses. The carriers were invited to make this apportionment for 1913 and 1914. Replies were received from 32 carriers making the apportionment for 1914; and 28 also made the apportionment for 1913.

We shall discuss first the method proposed by the carriers for the apportionment of these expenses. The commission here reproduces pages 67 and 68 of Exhibit No. 1 filed by L. E. Wettling, who was a witness for the carriers in this case as

upon this basis compare closely with the results obtained by the use of basis No. 3, shown on the same exhibit. This basis proposed the division of the maintenance of way and structures expenses between passenger and freight in the proportion which the revenue passenger train-miles bear to the revenue freight train-miles. This basis may be said to rest in the main on the assumption that these expenses should be divided according to the use that is made of the track. It does not directly take account of the fact that passenger trains move faster than freight trains, nor does it take account of the fact that freight trains are heavier and longer than passenger trains.

Basis No. 4 is an attempt to separate these expenses between passenger and freight upon the proportion existing between the direct train costs as represented by repairs to locomotives, fuel, water, lubricants and supplies for trains and the wages of engine-men and trainmen.

Basis No. 5 is the same as the engine ton-mile basis except that it includes a proper proportion of switch or yard engine ton-miles, while basis No. 6 is the average of the five foregoing bases.

But little testimony was directed to support basis 4. Bases 2, 3 and 5 were criticised by protestants upon the ground that the results thereby reached vary so widely from the division of the expenses which are directly allocated. It may be said that practically all of the maintenance of equipment, transportation, traffic and general expenses are either directly allocated or no material difference of opinion appears to exist concerning their proper division. These expenses assignable to the passenger service are approximately 30 per cent of the total expense included in these three divisions, while on the revenue train-mile or the locomotive ton-mile method the amount of expenses of maintenance for ways and structures assignable to the passenger service is usually more than 40 per cent of the total of these expenses. It is asserted that these unallocated expenses of maintenance of way and structures should be divided between passenger and freight upon some basis which more nearly accords with the known ratio that exists between the other expenses. . . . We are not prepared to approved in its entirety any of the methods offered.

The protestants through their witnesses, Hillman and Warren, have made a division of the operating expenses for 1913 and 1914 on the Chicago & North Western and a number of other roads. Six different bases are presented. The first method uses the product of the total weight of passenger trains multiplied by the distance moved as compared with the product of the total weight of freight trains times the distance moved. This method assumes the proper relation between these expenses to be due solely to the weight and distance moved. In other words, the total tons moved 1 mile in a passenger train is compared with the total tons moved 1 mile in a freight train. The second method is the locomotive ton-mile method as used by the carriers and heretofore explained. The third method is called the locomotive tractive power method; the sum of the products of the tractive powers of the locomotives used in the passenger service multiplied by the number of miles moved is compared with the result obtained by a like computation for the freight service. Inasmuch as the tractive powers of locomotives are nearly proportional to their weights, the results derived by this method in most instances are not materially different from those derived by the locomotive ton-mile method.

The fourth method is called the car-mile method; it divides these common expenses on the ratio that exists between the total passenger car miles and the total freight car-miles.

The fifth method proceeds to make certain assumptions that of some of these expenses one part constituting an assumed proportion of the total expenses is due to action of the elements and the balance is due to wear. The expense due to wear is distributed upon a gross ton-mile basis and expense due to weather is distributed on a car-mile basis.

The sixth method entertains the same presumptions as to the amount due to wear and weather of the various items and proceeds to distribute the wear on a gross ton mile basis as in

Maintenance of way and structures.....	57.93	42.07
Total operating expenses.....	67.22	32.78

well as in the freight case. The table herewith gives the several bases used in the apportionment and the resulting per cents for maintenance and total operating expenses respectively.

The first basis shown is that ordinarily used by these carriers in the division of maintenance of way expense accounts for their own purposes. Basis 2 rests on the claim that the greater speed of the passenger trains creates a greater degree of wear upon the track and other structures. Inasmuch as this greater speed necessitates more power it is asserted that the weights of the passenger locomotives bear some direct relation to both the weight and the speed of the trains they draw. The locomotive ton-mile therefore to a certain extent measures the work done by the engines in each class of service, and the wear on track and structures. There is, however, a large proportion of the expenses incident to the maintenance of way and structures that is influenced only to a small extent and certain expenses are not influenced at all by the weight and speed of the trains that pass over the track. The action of the elements and deterioration of materials will go on whether trains pass over the tracks or not. It is uncertain how much of any particular item of expense is due to action of the elements and how much to wear. Various assumptions are indulged, as that 60, 70 or 80 per cent of such expenses are due to action of the elements and the remainder to wear. These assumptions rest on uncertain ground.

The testimony of a number of operating and accounting officers of long experience supports the locomotive ton-mile method as in their judgment the most logical and practical method for the division of these expenses. The results of apportionments

the fifth method, but the expense due to weather is distributed upon a net ton-mile basis.

Herewith is shown the results of the application of these six methods to the maintenance of way and structures expenses on the Chicago & North Western for 1913. The total amount of these maintenance of way and structures expenses for 1913 was \$11,501,186.

Protestants; assignment of M. W. expenses to passenger service, C. & N. W., 1913.

Method of assignment.	Portion charged to passenger service.	Per cent.
Gross weight basis.....	\$3,299,072	28.68
Locomotive ton-mile basis.....	4,666,768	40.58
Locomotive tractive power basis.....	4,719,703	41.04
Car-mile basis.....	2,475,570	21.52
Wear on gross ton-mile, weather on car-mile basis.....	2,771,701	24.10
Wear on gross ton-mile, weather on net ton-mile basis...	1,961,269	17.05

Out of a total of \$45,158,736 for transportation, traffic, and maintenance of equipment expenses for the year 1913 there was assigned to the passenger business on the gross weight basis \$13,258,743, or 29.34 per cent. Approximately the same proportion of the expenses under these three general accounts was assigned to the passenger business under the remaining five methods. There was no material difference of opinion between carriers and protestants regarding the division of expenses in these three groups.

Methods 5 and 6 rest on unverified assumptions concerning the amount of expenses in the various items due to the action of the elements. This record is not convincing as to the accuracy of these various assumptions. Method No. 4, the car-mile basis, takes no account of speed, and would charge to the average freight train, say 24 cars, four times as much of the maintenance of way and structures expenses as to the average passenger train, say 6 cars, although the service performed by track and structures in carrying the passenger train may be as great or nearly as great as that performed in carrying the freight train.

Methods 2 and 3 may be considered as the methods advocated by the carriers. Method No. 1 is urged by protestants. We have some difficulty in accepting the locomotive ton-mile method, for while it does to a certain extent give consideration to the speed of the trains as well as to their weight, we are not convinced that this is in all respects more certain in its foundation than is the gross ton-mile method.

These expenses for maintenance of way and structures should be divided between passenger and freight as nearly as possible upon the basis of their respective utilization of this part of the plant. What is the best measure that can be obtained of this utilization of the track by these respective services? In the absence of any certainty that the scale of passenger fares and that of freight rates is properly proportioned, the revenue derived from the respective services can not form a fair measure of this utilization. The absence of such a known relation between these charges, however, leads to an examination of certain expenses as probably indicative of the utilization of the track and structures. The fuel consumed by road locomotives; the lubricants, water, and other supplies for these locomotives; the train supplies; the wages of trainmen and enginemen, are all separated between passenger and freight, and each by itself, or the aggregate of all will constitute an index of the utilization of the tracks by these two branches of the service. Other accounts such as the repairs to locomotives might also be regarded as indicative of the proper apportionment. This expense, however, is not segregated as between road and yard locomotives. We shall, therefore, for the purpose of obtaining a basis for division, regard only the items which are shown below as per our classification of operating expenses in effect during the fiscal year ended June 30, 1914.

80. Road enginemen.	85. Other supplies for road locomotives.
82. Fuel for road locomotives.	86. Road trainmen.
83. Water for road locomotives.	87. Train supplies and expenses.
84. Lubricants for road locomotives.	

The common expenses are divided on this method between the two services in the proportion of the actual division of the seven preceding accounts. Our decision to use this method in this case must not be regarded as conclusive on our part of

the method that should ultimately be used for the division of maintenance of way and structures expenses between passenger and freight. The objections that may be urged against the direct charge method are known and appreciated.

From the 32 carriers which in answer to our interrogatories supplied information concerning methods of division of expenses between passenger and freight for 1914 we have eliminated those whose lines lie wholly or almost entirely without the territory in which the principal increases are proposed. There are 20 of these railroads whose lines lie in territory which would be directly affected by the proposed increases. For the purposes of this case the divisions furnished by carriers of all of the operating expenses have been used except those due to maintenance of way and structures. The maintenance of way and structures expenses have been divided between passenger and freight upon the basis of the allocated train expenses named above. (A table showing the results of this method for each of the 20 roads involved and a comparison of these results with the results of the division furnished by the carriers for the year 1914 has been prepared. The totals cover 20 roads which operate 80,159 miles of line.)

The record does not indicate what proportion of the total maintenance of way and structures expenses are due to the upkeep of yards, but it is easy to determine how the results shown in the above table are affected by dividing these yard maintenance expenses upon the basis of the direct yard costs. Let it be assumed, for example, that 10 per cent of the maintenance of way and structures expenses were incurred in the upkeep of the yards. It follows then that the correct formula representing the per cent of total maintenance of way expenses assignable to the passenger traffic is 0.9 of 38.5 per cent plus 0.1 of 11 per cent, or 35.75 per cent. Since on these roads the maintenance of way and structures expenses constitute almost exactly 20 per cent of the total operating expenses, it is evident that the proportion of total operating expenses which may have been improperly charged to the passenger traffic is 20 per cent of the difference between 38.5 and 35.75 per cent, or 0.55 per cent. The total operating expenses of these roads for the year 1914 were approximately \$616,000,000. A variation in the assignment of these expenses of 0.55 per cent amounts to \$3,388,000. Under the method used by witness Wettling, of dividing the property account, this affects the amount of cost of road and equipment assignable to the passenger traffic by \$27,433,000, and affects the percentage of net income from the passenger traffic to cost of property devoted to the passenger traffic by 0.29 in the percentage. It also affects the percentage of income derived from the freight business to assumed property investment by 0.15 in the percentage. The passenger traffic on these roads earns 3.39 per cent upon the value of the property assumed to be devoted to the passenger traffic, which, in round numbers, is \$1,465,000,000; while the freight traffic earns 5.07 per cent upon the value of the property assumed to be devoted to the freight traffic, which, in round numbers, is \$3,157,000,000. To allow the passenger traffic to earn the same ratio of return upon investment as the freight traffic the passenger earnings of these roads would have to be increased by \$24,600,000. If, however, these yard maintenance costs are as much as 10 per cent of the total cost of maintenance of way and structures it would then appear that the passenger traffic is earning 3.68 per cent on the cost of the property assumed to be devoted to the passenger traffic, which, in round numbers, would be \$1,438,000,000; while the freight traffic is earning 4.92 per cent on the cost of the property assumed to be devoted to the freight traffic. In order to permit the passenger traffic to earn the same percentage upon the investment as the freight traffic, it would require an increase in net income from the passenger traffic of approximately \$18,000,000.

BOOK COST OF ROAD AND EQUIPMENT DEVOTED TO PASSENGER SERVICE

The book cost of that portion of the road and equipment which is devoted to the passenger traffic has been assumed by the carriers to be the same proportion of the entire book cost as

the passenger operating expenses for the year 1914 are of the entire operating expenses. The liability of error in accepting the book cost of property as the basis for the computation of return on investment is fully realized. This arbitrary method of assignment of this or that portion of the book cost of the entire property to passenger traffic is also quite unsatisfactory. The carriers have assumed that the expenses chargeable to each of the services for the year 1914 form a measure of the value of the property devoted to such services. If, for example, the passenger operating expenses for the year 1914 were 30 per cent of the total expenses, 30 per cent of the book cost of the property is assigned to the passenger service.

The 20 lines here used have a large percentage of their mileage in territory outside the region principally affected by these increases and passing through territory where higher fares apply. This is notably true of the Atchison, Topeka & Santa Fe, Great Northern, Northern Pacific, Illinois Central and the Chicago, Milwaukee & St. Paul railroads. In the territory principally affected by these increases the carriers are seeking to increase their fares by approximately 25 per cent. The total gross passenger revenue of the 20 lines we have here taken for the year 1914 was approximately \$205,000,000, while the carriers' estimated maximum increase accruing to these lines from the increases proposed is not quite \$16,000,000, or something less than 8 per cent of their gross passenger revenue. Should these increases be permitted and the increased fares not result in any appreciable diminution in the number of passengers who travel in and through that territory, the effect would be to raise the percentage earned upon the net cost of property assumed to be devoted to passenger service by approximately 1 per cent.

DIVISION OF EXPENSES BETWEEN INTERSTATE AND INTRASTATE SERVICE

Protestants complain that the carriers have made no attempt to segregate the costs of doing the intrastate passenger service from the interstate service. The intrastate passenger service in these states is approximately 50 per cent of the total, and if this service is much more expensive than the interstate it would follow that whereas the passenger service as a whole paid from 3.39 to 3.68 per cent upon the cost of road and equipment devoted to passenger service in 1914, the interstate passenger service paid a greater per cent of return. There is no definite and convincing proof that the intrastate passenger service is much more expensive than the interstate. The intrastate and interstate passenger service is intermingled. It is largely done upon the same trains over the same roadbed, with the aid of the same employees. There are, it is true, two terminals involved in all state journeys and usually only one in any one state in an interstate journey. But the average haul for the interstate passenger is greater, and the character of the equipment used in the interstate business will average somewhat higher than in the strictly intrastate business.

The task in this case is not the fixing of fares for each kind of passenger traffic. A different and more elaborate investigation would be necessary if an attempt were being made to ascertain the appropriate relation between the various classes of passenger traffic, such as commutation, Pullman, local and through trains, long hauls and short hauls. The question here is whether an increase in the passenger fares has been justified.

Upon the whole record the carriers have sustained their contention that the business done by passenger train service is less profitable on the whole than is the freight service in this territory. A suggestion has been made that the mail service and express service may not be carrying their full proportion of the total expenses of operation of these properties. No evidence was offered, however, to show that this is a fact.

The report goes on to discuss possible economies in passenger service, quoting data presented by the carriers as to costs, and concludes that:

"Substantial improvements in the passenger service have been made since 1900 at large expense to carriers, resulting in a greater degree of comfort, convenience and safety to the traveling public.

"The conditions under which the passenger service is now performed do not admit of all the corresponding economies in operation that have been effected in the freight service.

"The increased cost of service due to greater costs for labor, materials and taxes not offset by corresponding economies which are practicable in operation is entitled to consideration.

"The passenger business in the territory principally affected by the proposed increases is less profitable than the freight business.

"The basis for the fares now applied for the transportation of interstate passengers is less in this territory than in the states south, east and west thereof.

"There is some justification for a lower basis of fares in that territory than in the states that are west and south thereof."

This increased revenue which apparently should come from the passenger traffic should not, however, be altogether imposed upon the interstate traffic. Manifestly a person journeying by rail within the boundaries of a state cannot expect to travel at the expense, in any degree, of the interstate passenger. The revenue of respondents from intrastate passenger traffic within these states is approximately 96 per cent of that from the interstate traffic. While we should permit reasonable interstate fares we cannot sanction fares that are higher than are reasonable for the service performed because intrastate fares are alleged or shown to be unduly low.

It is contended on behalf of some of the protestants that if a carrier obtains a fair return upon the whole of its business it cannot reasonably complain of a public policy affording cheap travel . . . Whatever may be said in support of this policy we can find no justification in approving it in connection with interstate passenger service under a statute which does not authorize us to prescribe rates or fares less than are reasonable for the service rendered. These words clearly point to a service which is to be rendered in consideration of the charge. We think, therefore, that the principle embodied in the law is that each class of service should bear reasonable charges therefor. . . .

Cognizant of the infirmities of alleged book value as indicative of actual investment . . . we have felt justified in using so-called book value as a basis of showing tendencies as to costs of service and net results. . . . The position that each service should be self-supporting seems substantiated by the Supreme Court of the United States. *Norfolk & Western Ry. Co. v. Conley et al.*, 236 U. S., 604; *Northern Pacific Ry. Co. v. North Dakota*, 236 U. S., 585.

Where intrastate fares in the territory principally affected by the proposed increases are compared with similar fares elsewhere it is found: First, that in practically all of the states where increases are proposed the state controlled fares are 2 cents a mile; second, that in only four or five other states, to wit, Ohio, Indiana, Illinois, Arkansas and Oklahoma, at the time of the hearing was a similarly low fare in force; third, that in Rhode Island and New York the fares range from 2 cents to 2½ cents, with a very high density of passenger traffic; that in West Virginia, Alabama, North Dakota and South Dakota the fare for intrastate travel is 2½ cents; that in Maine, Massachusetts, Vermont, Connecticut and New Hampshire the state fare ranges from 2 cents to 4 cents; that in Kentucky, Tennessee, Mississippi, Louisiana, Washington, Texas, Montana and more recently in Arkansas by reason of injunctions of a federal court, the state fare is 3 cents; that in the Carolinas, Georgia and Florida the fare is in no case less than 2½ cents a mile; and that in California, Colorado, Oregon, Utah, Idaho, Arizona, Wyoming and Nevada the range is from 3 cents to 6 cents. . . .

Commissioner Hall dissents.

ELECTRIC HEADLIGHT CASE

With the filing of the reply brief by the railroads on Tuesday, December 14, the long-fought "electric headlight case" was closed so far as the railroads are concerned. The labor union interests have until December 24 to file a reply brief and the case will then be submitted for decision to the Interstate Commerce Commission.

Labor union leaders have conducted an active campaign to induce the Interstate Commerce Commission to adopt a rule that would force the removal of all acetylene and oil-burning headlights and install a high-power electric "searchlight" on every locomotive in the country. The railroad representatives have strenuously fought the sweeping change provided by such a universal rule, contending that the dazzling glare of the electric "searchlights" is confusing and dangerous in railroad operation on double-track and four-track lines, where many fast trains are constantly passing one another, where operation now is entirely by block systems of colored signal lights, and where traffic is exceedingly dense. The high-power electric headlights are being used on parts of some western and southern single-track roads, but the big eastern lines operating multiple-track systems have refrained from installing them after extensive tests and now resist the labor leaders' effort to force their adoption by a governmental rule.

Operating experts are a unit in opposing the "searchlights" for dense traffic. So unanimous has been their opposition that 156 railroads, embracing 215,000 miles of trackage, were combined in the case before the Interstate Commerce Commission, which heard oral arguments on December 4. Extensive evidence to support their claim that the electric "searchlights" not only are *not* safety devices, as claimed by the labor leaders, but that they have repeatedly caused accidents and failed to prevent wrecks, and that they are positively dangerous on the multiple-track eastern lines, was introduced by the counsel for the railroads. This mass of evidence included testimony covering tests and experiments conducted over a period of more than five years by the Master Mechanics' Association, and showed that the high-intensity lights caused misreading of signal lights, creating "phantom" or false signals by reflection from roundels; also failure by engineers to catch classification signals. They also seriously confuse and blind engineers whenever trains bearing the searchlights approach one another, preventing observers from seeing reliably when caught between the intense opposing light beams. The railroads' counsel also cited the conclusions of the commissioners after extensive tests by the Wisconsin Railroad Commission, which supported their contentions, and enumerated many cases taken from the accident reports of the Interstate Commerce Commission itself.

Charles C. Paulding, solicitor of the New York Central lines, has led the fight against the proposed electric headlight rule as chairman of a special committee of counsel including also Stacy B. Lloyd, of the Pennsylvania, and Duane E. Minard, of the Erie.

Chief W. S. Stone, of the Engineers' Brotherhood, and President W. S. Carter, of the Firemen's Brotherhood, have had charge of the campaign for the electric headlights, making personal arguments before the Interstate Commission, submitting signed briefs and examining witnesses. Officially, the electric rule was filed by Frank McManamy, chief inspector of the Division of Locomotive Boiler Inspection of the Federal Government, but the labor leaders carried on the case and not until the final oral arguments did the chief inspector file a brief in support of the rule. Counsel Paulding was granted leave to make further reply to this late brief by Inspector McManamy, which reply has just been filed as the closing paper in the case. In this Messrs. Paulding, Lloyd and Minard merely reply to Mr. McManamy's attack on the good faith of the railroads' opposition.

The issue now submitted lies between two rules, involving also the principle of establishing reliability and definiteness in governmental inspection. The labor leaders' proposed rule provides that "each locomotive shall have a headlight which will enable

persons with normal vision, in the cab of the locomotive, under normal weather conditions, to see a dark object the size of a man for a distance of 1,000 feet ahead of the locomotive."

This language is objected to by the railroads as being utterly indefinite and worthless for the purposes of accurate inspection and for specifications by which to build headlights with certainty that they will fulfill the demand. They claim that the "eye-test" merely assures the necessity of a tremendous and excessive quantity of light, such as only a very high-intensity electric lamp would provide. They advocated an alternate rule providing for a test of headlights by "candle-power" with scientific exactness, at minimums that would not create a dangerous glare nor restrict equipment to electric lamps. The terms "normal vision" and "normal weather" vary with every individual or geographical section, as shown by repeated tests, and are valueless as guides in a legal requirement and for inspection. Many "surprise tests" of enginemen with asserted "normal vision" showed a wide disparity in the distances they could see objects under various conditions of light, color and surroundings.

As many of the government inspectors are members of the union labor organizations which occasionally are in controversy with the railroads on other matters, it is considered important that whatever rule regarding headlights is adopted should be definite and exact enough to make the matter of inspection proof simple and uniform.

Manufacturers of headlight equipment have taken much interest, inasmuch as the adoption of the rule urged by the labor leaders would involve the discarding of a vast number of acetylene and oil lamps and the purchase of electric equipment at an outlay of more than \$6,000,000. At present there are 67,869 locomotive headlights in use in the United States, of which number 42,213 are oil-burning, 2,904 are acetylene, 22,120 are electric arc and 632 are electric incandescent.

The acetylene interests, through the International Acetylene Association, represented by Oscar F. Ostby, were permitted by the Interstate Commerce Commission to intervene in the case, and strongly opposed adoption of the labor leaders' electric rule. It was urged that the acetylene headlights have been used with satisfaction to both railroads and their employees, chiefly in New England, and that "adoption of the rule restricting choice to electric lamps would stifle free competition and create a government-protected monopoly" for the electric manufacturers.

In the vigor of the railroads' rebuttal of the labor leaders' claim that the electric headlight would prove a safety device has been reflected the intense interest and pride in their extensive "safety first" endeavors of recent years, Chief Counsel Paulding contending that the tremendous strides made by the operating officers in safeguarding life and property and reducing the number of accidents, together with the responsibility for safety keenly felt by railroad officials, merits support from the government by leaving questions of operation to their experts when the possible benefits of a sweeping change are, at best, very doubtful.

An early decision in the headlight case is expected.

THE AUSTRALIAN TRANS-CONTINENTAL LINE.—The question of a uniform gage is still receiving attention in Australia and negotiations are proceeding between the South Australian and Western Australian governments with a view to the construction of railways on a 4-ft. 8½-in. gage from Kalgoorlie to Fremantle, and Port Augusta to Adelaide, in order to provide a uniform track between Fremantle and the South Australian capital. It is anticipated that the east-west line will be open to traffic by the end of 1916.

RAILWAY CONSTRUCTION IN INDIA.—The Peuch Valley section of the Itarsi-Nagpur Railway, which is expected to be finished shortly, will open up a valuable coalfield. This branch forms part of a triple project of which the northern section from Itarsi to Amla is now open throughout. As regards the third, or southern section, which is to run from Amla to Nagpur, the length from Pandurnah to Nagpur is expected to be opened for public traffic in October next year, and the length between Amla and Pandurnah some time in April in the year following.

Maintenance of Way Section

Railroads frequently lose property through adverse possession as a result of undisturbed encroachments on the right of way.

Preventing Right of Way Encroachments

These encroachments take various forms, including the shabby hut of the still more shabby squatter, the misplaced fence of the adjacent property owner, or the gradually established traveled way of the trespassing public. To a certain extent the roads may be said to encourage encroachments by failure to give this subject proper attention. The importance of the problem and the relation of the maintenance officer thereto are outlined in an article appearing on another page in this issue. As custodian of the railroad's fixed property, the maintenance officers are charged with the protection of the right of way against encroachments. Being constantly on the ground, the roadmaster and foreman are best able to detect and report encroachments. They can, however, do little without the co-operation of the real estate department in giving them proper records and of the division engineer in thoroughly establishing right of way lines. If records of sales and purchases are not properly indexed, if station maps and right of way maps are not up to date, and if monuments are not established, those charged with the protection of the right of way are handicapped. The situation is more serious in cases where changes of line have destroyed the most authentic tie to the property line, namely, the original center line of the track, or in cities, where property is acquired by lots and blocks in irregular shapes, and particularly where the lines are not established by improvements. Next to the complete monumenting of the property, complete station maps, with adequate ties from all fixed physical features to the right of way lines, are of particular value, but only a more general attention to all phases of the subject will materially reduce the losses to which railroads have been subjected in the past.

The unloading of track materials, particularly for renewals on an operated line, is commonly done in a rather loose and inaccurate fashion. Although it is given careful and conscientious consideration by some men, the principal tendency is toward speed to the subordination of everything else. There are a number of reasons for this.

The Distribution of Track Materials

Roadmasters are admonished continually to release cars as quickly as possible and to reduce work train service to a minimum. On a line with a fairly large traffic the work of unloading materials suffers long delays because of the necessity for work trains to get out of the way of regular traffic, and in consequence an effort is made to unload as much as possible in the short periods of time available between regular trains. Another reason arises from the difficulty of controlling a large gang, composed mainly of foreigners, distributed in a number of cars. It must also be admitted that some men are given to considerable inertia of mind when it comes to making the calculations necessary for the accurate distribution of materials. It cannot be questioned that the per diem on cars and the cost of work train service will assume undue proportions unless watched very closely. However, it is very easy to lose sight of the fact that the cost of rehandling materials along the tracks as a result of improper distribution from cars may also assume undue proportions. Careful comparisons of costs will usually show that it will prove cheaper to hold a work train longer and unload the material where it is to be used than to dump it off in a haphazard manner and use an extra gang in carrying or trucking the material back and forth along the tracks to obtain the desired distribution.

Recent progress in chimney design and construction is described in an article in this issue. No phase of the subject is more

Modern Chimney Construction

notable than the rapid development which has been made in this branch of construction engineering during the last 10 or 15 years. It is not long since chimney design and building were considered entirely within the province of the skilled brick mason or the boiler-maker, and, in consequence, chimneys usually were nothing more than high brick walls or large stove pipes, except in those cases where an architect sought to embellish them with heavy capitals or other ornamentation. To-day chimney design has been placed definitely under the jurisdiction of the engineer and the chimney specialist and the use of scientific principles of design and expert construction methods are almost universal. These things, of course, have resulted in safer chimneys, but the principal gain has been in economy, resulting partially from the healthy competition which exists between the advocates of the various materials used. While the present knowledge of the subject of wind pressure, the all-important item in chimney design, leaves much to be desired, the information available is used to the best advantage and the chimneys of to-day are at least of uniform strength throughout. This has resulted indirectly in improving their appearance, for esthetics are best satisfied in that structure which fulfills its useful purpose in the most direct and obvious manner. Exactly in so far as the advance in the art of construction has made it possible to conform to the theoretically correct outline, has it been possible to obtain the best appearance, and instead of the meaningless imitation of a classic column with a heavy purposeless capital, there has been evolved, unconsciously perhaps, the more graceful chimney of the present.

A common practice in distributing ties for renewal is to unload them along the track by work train in the fall and stack them

Distributing Ties

in piles of 50 to 75 until required. One roadmaster is planning to unload and stock his ties this year on the station grounds, where no work train service will be required. His section forces will then distribute them with motor cars in the spring as desired. He believes that not only will his cost of distribution be no greater with this method, but that he will secure a more uniform tie renewal. With ties stored in piles at intervals along the line, it is entirely natural to expect that the renewals will be made more thoroughly near these storage piles, where the trucking distance is less, while if the ties are distributed by motor car this will not be the result. It will be interesting to note by an examination of the adjoining sections before and after the tie renewals have been completed to what extent this theory will be borne out by the facts.

Differences of opinion are to be expected among any group of men regarding any matter requiring the exercise of mature

Limiting Individual Judgment

judgment. In most cases the average of the opinions of experienced men will not be far wrong, but some individual ideas will be wide of the mark. One of the details affecting the safety of travel regarding which it is difficult to fix an arbitrary limit is the time at which worn rail should be taken out of the track. A similar problem, the effect of errors in solving which are felt directly in financial losses, arises in connection with the renewal of ties. If left to the individual foremen there will be almost as many

standards in regard to these and other details as there are foremen. To escape these variations in practice regarding important matters it is necessary that standards be prepared, that the men may be thoroughly instructed regarding them and that there be sufficient intelligent inspection to see that these standards are observed. The standards will, of course, be prepared by the supervising officer in charge of the department, the judgment of this officer thereby replacing that of the less experienced individual foreman. Such standards should not be carried too far, for it is difficult and unwise, in many instances, to limit the initiative of men directly in charge of work. On the other hand, it is a wise precaution to restrict this initiative where the results of an error in judgment may be serious.

THE QUALIFICATIONS OF A GOOD FLOOR

FLOORS are commonly selected from habit or prejudice rather than from a consideration of the adaptability of the materials to the given situation. No individual type of floor can fulfill all requirements under all circumstances. In fact, no single ideal floor is conceivable, because requirements under different conditions are conflicting. To illustrate, it is always desirable that a floor be economical, durable and easy to repair; under various circumstances it may also be desirable that it be hard, resilient, smooth but not slippery, a non-conductor of heat, non-absorbent, non-resonant, waterproof and fireproof. No floor has all these qualities; neither are they all necessary in any given case. The problem is to determine the desired qualities and then to select the material which possesses them.

There have been many floor failures, some of them the result of poor design and poor workmanship, but many have resulted from improper selection. The fact that one class of floor has been found successful under given conditions does not necessarily prove that it will be a success in different circumstances. On the other hand, one should not form the habit of associating a certain class of material with a certain class of service and leave that material out of consideration for entirely different services.

Having selected the type of floor, it becomes necessary to secure materials of a grade suited to the service to be performed and installed according to approved standards of workmanship. Foundations are frequently a cause of failures of floors, these usually being the result of lack of experience or expert knowledge. The higher cost of the newer types of high-grade floors naturally results in a tendency to substitute cheaper materials or inferior methods. These usually result in failures. All these considerations show beyond question that there is as much need of the services of a competent engineer in the selection, design and supervision of the construction of a floor as in the design and superintendence of the construction of the building of which it is to be a part.

A SYSTEMATIC PROGRAM

MAINTENANCE of way officers are unanimous in the contention that the most successful and economical work is possible only through the consistent prosecution of a well-prepared program throughout the season of good weather. Unfortunately, a number of influences interfere seriously with the efforts of the maintenance department to follow a definite plan of campaign. The effect of commencing the fiscal year on July 1 has been discussed previously in these columns and elsewhere and remains the most important obstacle to efficient track maintenance.

Another obstruction in the way of the proper prosecution of a regular program lies in the vacillating and erratic policies followed on some roads in the conduct of maintenance expenditures after the season has opened. Instead of consistent conduct of the work from month to month, according to the program outlined, frequent changes of policy take place. Orders issued to rush the work faster than the schedule are followed by others cancelling plans, and so on in infinite variety. Aside from the tangible losses accompanying such changes of policy, there is

a loss of esprit de corps, because such changes mean hardships to every member of the force. They work a hardship also on those small contractors who do ditching, bank widening, etc., which is no doubt reflected in the bids which they will tender on subsequent work.

No better example can be used to illustrate this condition than gravel pit operation. Here the same processes are repeated day after day, and with good equipment and a uniform output it is possible to obtain very low production costs. If, however, the men are rushed almost to exhaustion one month in order to obtain a maximum output and the worked on half time the next when the pit is all but shut down, it is impossible to get the best work out of them.

It is to be expected that changes in business conditions, or more particularly, in the current earnings of the railroad, must be considered in apportioning expenditures, especially when conditions have been as abnormal as in the last two years. There can be little question, however, that a too solicitous attention to the monthly showings has a harmful influence, and it has been well said that "the constant use of emergency language is an indication of poor management."

The prolonged reduction of railroad earnings naturally called for material reductions in maintenance expenses, and a number of instances can be cited where railroads have succeeded in making marked reductions in expenses and at the same time have obtained increased efficiency by taking the minor officers, and even the employees, into their confidence and making it clear to them why the curtailment of expenses has been necessary. Granting that a certain amount of fluctuation in the prosecution of the season's work is unavoidable, it would seem that much would be gained by telling the maintenance men definitely why a change in program has been necessary and letting them know, if possible, how long the new policy will remain in effect.

THE WATERPROOFING OF BRIDGES

REVISED specifications for the waterproofing of solid floor railroad bridges appeared in the August, 1915, Proceedings of the American Society of Civil Engineers. The author of these specifications has had extensive experience in this work, and the specifications as they now appear have been subject to some modifications as the result of extensive discussion of the subject by various members of the society in whose proceedings the original draft of the specifications appeared some months ago.

The present state of the art of waterproofing may be considered very largely the result of study and experimentation covering the period of 15 odd years since the introduction of the solid and ballast floor bridge. Waterproofing is not an exact science. Success has come about only through repeated trials and the diligent study of the many failures with which these years of effort have been marked. From time to time the various underlying principles have been discovered and recorded, notably by the engineers who designed and built the structures for the elevation of the many miles of railroad track in Chicago. It was there that much of the pioneer work was done.

Success in waterproofing is attained only by minute attention to details, combined with an accurate and complete trade knowledge. This is in reality a field for the specialist who has a remedy at hand for every contingency. The quality of the materials is important. Nevertheless there are materials on the market which will serve equally well, or nearly so. There is no substitute, however, for the best workmanship available, combined with the most painstaking supervision, and scrupulous care of the completed work until it is fully protected. The needs of good waterproofing must be taken into account in the design of the structure. Drainage in particular must be taken into consideration, and, in fact, all details must be such as to make good workmanship really possible.

Because of the rather extensive use of membrane waterproofing in recent years, a knowledge of the subject should have become pretty generally diffused among the railway engineers

of the country. The observation of not infrequent instances of faulty practice at this late day is therefore somewhat disappointing, but may be explained in each case either by a lack of experience or of adequate knowledge, or by an attempt to accomplish the impossible. These instances of poor practice point to the need of employing an expert or of the engineer in charge becoming thoroughly conversant with the literature on the subject.

Much had been written about waterproofing before the preparation of these specifications. They have the advantage of presenting a concise statement of the salient features, and, while many engineers may differ as to some of the details, there can be little question as to the most important points. The specifications will be read with interest by all who have had anything to do with this perplexing subject.

Letters to the Editor

INCREASING THE SECTION FORCES

PROWERS, Colo.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

In this day of advanced railway work, one of the most serious problems confronting railway managers is the increasing cost of track maintenance. In the past it has been the practice on most roads to put on a number of extra gangs in the spring to make heavy repairs and to do that portion of the track work that the section crews are unable to accomplish. I believe that if the roads would give each section foreman 25 to 30 men in the spring and permit them to do the work necessary on their own sections, they will find that the cost of maintenance will decrease considerably. A section foreman who is interested in his work will do more and better work on his own section than any extra gang foreman will, for in most cases the latter are moving from place to place and they do not take the care with their work that the average section foreman will on his own section.

R. E. PITTS

Section Foreman, Atchison, Topeka & Santa Fe Ry.

NEW BOOKS

Safety Engineering Applied to Scaffolds. 6 in. by 9 in.; 339 pages; 127 illustrations. Bound in cloth. Published by the Travelers' Insurance Company, Hartford, Conn. Price \$3.

Vital statistics available in this country contain little information concerning scaffold accidents, but data gathered by insurance companies from newspaper items show that these accidents are worthy of serious consideration. This book is written as a result of a study of the subject and with the hope that the information it contains will result in the construction of better scaffolds and more safety appliances around construction work. In scope the book is limited to building work, and the treatment is practical rather than scientific, but almost all conceivable types of scaffolds and phase of the subject are covered in detail. The illustrations and the typography deserve special notice.

Elements of Railroad Track and Construction. By Winter L. Wilson, professor of railroad engineering, Lehigh University. Size 5 in. by 7 in., 396 pages, illustrated, bound in cloth. Published by John Wiley & Sons, New York City. Price, \$2.50.

This is a revision of an earlier edition and a large portion has been rewritten. As the book covers the subjects of railroad maintenance, surveying and construction in 400 pages, the treatment is brief. About 100 pages are descriptive of the permanent way. Seventy pages are devoted to turnouts, containing the usual information given in the railroad surveying hand-book, with additional descriptive matter on the details of frogs and switches. Considerable portions of the book are grouped

under the headings, Maintenance of Way, and Railroad Construction, and short sections are devoted to sidetracks, yards, terminals, signals, etc.

Practical Surveying. By Ernest McCullough. Size 5 in. by 7 in., 400 pages, illustrated, bound in cloth. Published by D. Van Nostrand Company, New York City. Price \$2.

The object and character of this book are best stated by the author in the preface: "This book is a serious attempt on the part of the author to meet the needs of students whose mathematical preparation does not extend beyond the arithmetic given in the grade schools." As a result, about 100 pages of the book are devoted to elementary algebra and trigonometry. The book may be also said to be a combination of a text on surveying and a field manual, as the chapters on chain surveying, leveling, compass surveying and transit surveying, which comprise the larger part of the book, contain many detailed examples and explanations of field methods known only to the practical surveyor of long experience. Forty pages are devoted to surveying law and practice and 32 pages to what is called engineering surveying. For subjects treated lightly in this chapter, the author refers the reader to other texts. The explanations are given with painstaking care and the language is suited to those for whom the book is intended.

Railway Maintenance Engineering. By William H. Sellev, non-resident lecturer on railway engineering, University of Michigan. Size, 5 in. by 7 in., 360 pages, 194 illustrations, bound in cloth. Published by D. Van Nostrand Company, New York City. Price, \$2.50.

This book is intended primarily for the student and the author states in the preface that it has been prepared from notes used in his classes. However, the frequent references and the extensive bibliography make it a valuable reference book for the maintenance of way officer, especially in view of the author's experience in responsible positions in the engineering department of the Michigan Central. The book treats primarily of materials, devoting 32 pages to ties, 35 pages to rails and their manufacture, 31 pages to miscellaneous track materials, etc., while it gives little information concerning methods of conducting work. The book is well prepared and gives a large amount of information concerning stations, shops, ice houses, water stations, etc., not commonly found in a book of this nature. The chapter headings include: Engineering; Land; Grading; Bridges, Trestles and Culverts; Ties; Rails; Other Track Material; Ballast; Maintaining Track and Right of Way; Station and Roadway Buildings; Water Stations; Fuel Stations; Shops and Engine Houses; Icing Stations, and Signals and Interlockers.

ABSTRACT OF ENGINEERING ARTICLES

The following articles of special interest to engineers and maintenance of way men to which readers of this section may wish to refer have appeared in the *Railway Age Gazette* since November 19, 1915:

Transverse Fissures the Result of Rail Gapping. The cold straightening of rails is receiving considerable notice at this time. P. H. Dudley points out the relation between gapping and interior transverse fissures, in an illustrated article in the issue of November 26, page 1001.

The Chicago Association of Commerce Smoke-Abatement Report. After more than four years of study and an expenditure of \$600,000, the Chicago Association of Commerce Committee of Investigation on Smoke Abatement and Electrification of Railway Terminals has presented a 1,200-page report showing electrification to be technically practical but financially impracticable. This report is abstracted in an illustrated article in the issue of December 3, page 1047. An editorial on this report appears in the same issue.

A Large Track Depression Project at Minneapolis. The Chicago, Milwaukee & St. Paul has just completed the fourth year's work on the depression of tracks for a distance of three miles in the city of Minneapolis, which will eliminate 37 grade crossings. This work is described by C. N. Bainbridge in an illustrated article in the issue of December 3, page 1059.

The Elimination of Grade Crossings in Dallas, Tex. A report by John F. Wallace on the situation in that city favors a belt line as a better solution than track elevation. This report is abstracted in an illustrated article in the issue of December 10, page 1087. An editorial note on this report appears in the same issue.

The Electrification of the Railways of Chicago. The report on this subject referred to previously is a very exhaustive treatment. The technical features as presented in this report are abstracted in some detail in the issue of December 10, page 1089. An editorial on the subject appears in the same issue.

Protecting the Right of Way From Encroachments

A Study of the Legal Protection of a Railroad and Practical Means for Retaining Title to Its Property

BY W. F. RENCH

Supervisor, Pennsylvania Railroad, Perryville, Md.

Literally defined, the right of way is that by virtue of which the railroad holds its permanent way. It is usually land owned in fee simple or obtained by condemnation, but may include an easement over another's land or the right to cross or occupy the streets of a municipality or the privilege from the federal government of bridging a navigable river. Land which is not used for railroad purposes or that which is vacant and not intended for such use is not right of way and is usually in charge of the real estate department and only of incidental concern to the maintenance officer. The supervisor is the natural custodian of the right of way; the foremen are his lieutenants and the patrolmen the roundsmen. It is quite essential that all of these should know the extent of the company's ground and the rights that are otherwise enjoyed. It is further necessary that the supervisor should definitely understand the legal principles of property tenure, in order to be able to meet promptly and decisively such questions as they arise. Not infrequently while a legal question is being determined occupation is becoming established and is growing increasingly difficult to resist. It is an old adage that possession is nine points of the law and it is a legal axiom that he who would sue to dispossess another must first show a better title. The surveyor fully understands that in tracing property corners he must if possible make a location in accord with the record and yet not in conflict with possession. The importance of resisting a trespass is thus self-evident.

It is a rule of law that an individual may obtain title to land by adverse possession for a term of years, but that a corporation cannot thus gain an ownership, although a continuing easement for the use of a right of way may be so acquired. It is not correct, as is generally supposed, that lines do not under any circumstances become fixed by acquiescence in a less period than 20 years. Road lines may by statute become conclusively fixed in 10 years and there is no particular time for concluding ownership between private parties who tacitly agree to a particular line of division.

Property rights are so simple that they may nearly always be determined by the rule of common sense. There are, however, certain distinctions which can only be determined by a working knowledge of the principles of legal technology. Thus, the error is quite plain of permitting the public to gain by adverse use a right of passage over the company's land for either foot or vehicle travel, but when these ways are the approaches to public facilities of the railroads such use is not adverse and no permanent easement would result. It is very necessary to understand fully the legal meaning of the term adverse user or adverse possession. In the case of traveled ways an acquiescence without objection in the public use would indicate an intention to dedicate, and as regards possession of ground the use must be adverse to the interest of another and it must be continued in the manner prescribed by the statute as well as for the required time.

The boundaries of the right of way are usually parallel with the center line, which is then known as the center line of right of way. Although this line originally bore a direct relation to the tracks it does not, as some suppose, shift with them. Since the descriptions in the deeds are referred to it, its position is fixed and it should be permanently located by means of monuments and by reference data. In these cases where the property limit is a stream, with the single exception of navigable rivers, ownership extends to the middle of the stream, no matter what changes in its course the stream may undergo. In the case excepted, the federal government owns the bed of the stream between low water lines and the direct control is vested in the

secretary of war. The railroad as owner along an inland river can resist an attempt of a proprietor below to raise and thus set back the water lines and, in fact, possesses all the natural rights that are common to riparian owners. The matter of conserving the natural means of discharge for storm drainage is scarcely less important than the protection of title; every water course should be shown on right of way maps, to be used as evidence in case an attempt is made to close such an outlet.

When a street forms the boundary of a property, ownership ends at the house line, but certain rights in the sidewalk attach to the abutting owner, and for this reason repairs of the sidewalk are generally the duty of the owner. When a public street or road is vacated the abutting owners take by law to the middle of the abandoned highway. If local acts do not impose upon the railroad the entire burden of maintaining fences, the law requires that the expense be equally shared, but participation cannot be demanded until the owner has a bona fide need for the enclosure.

When trees or artificial objects close beside the right of way endanger the company's operation, request may be made for their removal, and in case of refusal damages could be claimed, if such result, provided the cause of the injury is not an unusual and unforeseen circumstance. The principle is the fundamental one that an owner must so use his property as not to injure his neighbor. When branches of trees overhang and threaten interference with the telegraph line the railroad has the right to trim them, but it is always best to obtain the owner's permission in writing, since in the event of damage to the tree the courts are inclined to make a liberal allowance for sentimental value.

MARKING RIGHT OF WAY LIMITS

The importance of having the limits of the right of way visibly defined is becoming better appreciated, and upon several divisions of the Pennsylvania this work is already completed and it is expected that it will be finished upon others within the present year. The plan adopted where no buildings or fences indicated the lines was to plant wooden posts at corners and 400 ft. apart on tangents and 200 ft. apart on curves. The posts are 5 in. square, 4 ft. 6 in. long and protrude 2 ft. above the ground, this portion being painted white. The posts were set after a careful survey by a party from the division engineer's office. It is the practice of many divisions to thus establish all property lines, and this is certainly safer than a location by the supervisor, since property records are seldom entirely correct outside the division offices. While it is important that the supervisor know the exact extent of the company's holding, there is always the possibility that new conveyances may not be promptly certified to him. The law in cities usually requires that street lines shall be defined by the city surveyor and it is customary for this official also to establish lot lines when so desired. Such a survey is both reliable and authoritative.

The marking of the right of way is not of maximum use unless care is taken to correct the lines for subsequent property acquisition or surrender. It is the practice on some roads to plant monuments at the corners of new conveyances. This is based on a sound principle since the existence of a monument is evidence of the original survey whether or not it is called for by the recorded plat. These marks should still be supplemented with the attention-compelling white painted post.

BENEFITS FROM THE RE-SURVEY

As a result of defining the right of way lines on the Pennsylvania a surprising number of small irregularities and several that were of greater consequence were found. Many gateways

were noted opening upon the right of way; paths were located crossing the railroad, and just as frequently extending longitudinally, a more difficult trespass to resist; and the edges of the company's land were here and there going under the plow. At one point the fence along a homestead was several feet within the line and occupation could be proven for nearly the required time. The saving of this ground allowed the cut to be widened to the standard section. Just opposite, where land is needed for this purpose, the owner names a price of \$2,000 per acre for farm land in a country district. Encroachment by permanent structures was not encountered, as there almost always is proper diligence in this respect.

Vigorous efforts were made to discontinue the intrusion through the gateways and where this could not be done agreements were insisted upon. The driveways were effectively blocked by heavy posts and signs forbidding trespass erected at the paths. Where title to the land being farmed was through purchase, leases were obtained, thus establishing the company's ownership, when ultimate recovery of possession was rendered easy. Care was taken that no land obtained by condemnation was leased, as, except for purposes incident to the company's operation, such leasing is unlawful. Where unrecorded wire crossings or other similar facilities were found they were quickly brought under agreement.

The advantages in having the lines defined are thus manifold and the disadvantages are few. In addition to the main object of preventing encroachment there are economic benefits which are quite measurable. In rugged country where the right of way is usually unfenced, the mowing and cutting of brush whose main object at such points is the maintenance of a clean right of way as a defense against fire claims is usually done over a wider swath than necessary because the property limits are not known and this increase of roadway expense accrues year after year. The performing of work outside the property limits is not only wasteful, but such action sometimes leads to embarrassing complications. The fact of work having been done upon a private roadway by company forces, even though done by misconception, would in the event of an accident operate to deprive the railroad of a non-suit.

The expense incident to a property survey is, of course, widely different for dissimilar situations. But there can be no doubt that the advantages derived exceed the cost many times over. Then there is the fact of stewardship, which alone would justify the means taken to guard the company's holding even if not one irregularity were uncovered.

THE EFFECT OF ENCROACHMENTS

The great difficulty that is experienced in dislodging squatters should emphasize the importance of preventing encroachments and, if they should occur, of removing them as expeditiously as possible. The consequence of an occupation permitted to continue until title is endangered or perhaps lost is sometimes quite far-reaching. The case of an important grade separation project being held up for two years during which the million dollar investment was inactive is a striking illustration in point. Cases are not uncommon wherein the railroads have had to buy back for important work land that the right of way sheets indicated as already owned. There have, indeed, been cases where it was impossible, by reason of the lost property having become part of a homestead, to repossess at any price. Important improvements are thus prevented by lack of attention on the part of those who should protect the company's possession.

There is the other item of encroachment by the railroad upon the property of adjoining owners. Such encroachment is undesirable from all standpoints, and the moment it appears should be effectually remedied. The old saying of a stitch in time is aptly illustrated in such cases. If the means are afforded promptly to observe the approach of an erosion to the line a simple construction may arrest its progress, but if it is allowed to continue nothing short of money compensation or the purchase of additional width generally at an exorbitant price will settle the claim.

THE PARTY WALL LAW

A party wall is a wall upon the line between the premises of adjoining proprietors which each has a right to use as a support for his structure. It is a form of exercise of police power for the economic use of property, and is mainly applied in cities. While the regulation is of ancient origin it is in most states distinctly defined by statutes. These usually provide that it shall be built equally upon the lands of the adjoining owners, with its maximum width limited by different conditions, and its original expense of construction borne by the proprietor who first uses it, but with half the expense a charge against the adjoining owner when he builds to it.

The application of the law is sometimes misunderstood since not all walls between adjoining properties are included. In fact, the only wall to which it applies is that supporting a building. A wall forming or supporting a fence or one used to retain the ground is not within its purview.

There can be no question of the equity of the statute as between owners presumed to hold for a common object. But it cannot be held to apply against the property of a railroad owned and intended to be used for a right of way for tracks. To thus apply the law with no reciprocal benefit possible to the railroad would plainly amount to confiscation. In the writer's somewhat extensive acquaintance with conditions surrounding a considerable section of the city of Philadelphia only one case is known of occupation of the right of way under the party wall law, and this is recognized as an error. The mistake is a serious one, as the use of present facilities necessitates the operation of one track with a limited clearance. A knowledge of this point may serve to avoid other disadvantages of similar nature. In those cases wherein the acquirement of property for a right of way necessarily involves the continuation of an existing party wall it is well to know that the adjoining owner could be enjoined from making use of it for displaying a sign of any kind, even one painted thereon.

LATERAL SUPPORT

The common law requires that an owner shall be protected in the use of property at the contour that nature has provided, or that which it held at the time of his purchase. An adjoining owner is thus prohibited from raising or lowering the level of his ground without supplying adequate support for his own or the adjacent land, and this support must be provided without any sacrifice whatever by the neighbor. No act of a municipality can abridge or change this duty. Such a circumstance in railroad practise most commonly occurs when an adjoining owner lowers the contour of his yard to obtain increased storage capacity. For whatever depth there is below the natural level of the ground he could be compelled to provide a sufficient retaining wall entirely upon his own ground.

The obligation between a municipality and the railroad company is not so clearly defined, and such cases are usually disposed of by a mutual agreement. It may safely be stated that in the absence of such understanding the railroad company must be afforded the advantage of its day in court.

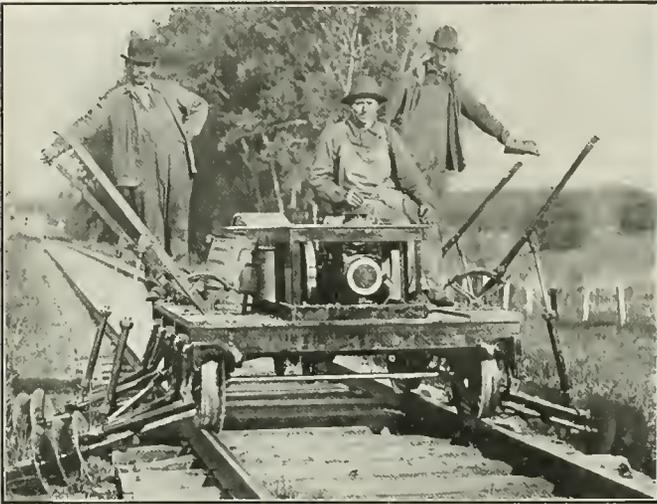

THE DAY IN COURT

When it is necessary for the municipality to take property for public use a day is appointed for a hearing before the jury of view or the commission, as such bodies are now more generally constituted. At this hearing both the damages and benefits are assessed. If an owner suffering damage fails to appear he is prevented ever after from bringing forward his claim and must also accept his assessment for benefits. It therefore becomes a matter of great consequence to the railroad not only to have its representatives present, but to delegate this duty to those who are familiar with all the various questions involved. Counsel is most essential, but the real estate expert is an important participant, and the supervisor, who, by reason of his intimate detailed knowledge of the local situation, is generally selected as the engineer, will have a responsible function in the proceeding.

MOTOR CARS FOR WEEDING AND MOWING

The Fairmont Gas Engine & Railway Motor Car Company, Fairmont, Minn., has developed special motor car attachments during the past season for mowing and weeding on railroads.

The mowing machine consists of a motor car equipped with mowing knives on each side capable of cutting a 6-ft. swath outside of the ballast line on each side of the track. It is operated by three men, one to run the car and two to handle the knives, which may be raised and lowered readily to conform to the contour of the banks to avoid obstructions. The machine is geared to run about three miles an hour when operating the

The Weeding Car at Work

mowers and 15 miles an hour on the high gear with the cutter bars raised.

The weeding car is equipped with four sets of disc plows of three discs each, attached to the four corners of the car. The machine is also operated by three men, but the absence of power connections make it somewhat simpler. The position of each set of discs is controlled by a lever to which it is attached by a rod working in a 2½-in. tube 2 ft. long. This contains a compression spring to maintain a "give and take" pressure between

The Mower Car With Knives in the Cutting Position

the lever and the disc shaft. If the discs strike a stone the spring allows them to raise and then pushes them back again.

A fender keeps gravel from being piled too high at the ends of the ties and three drag chains smooth down the disc furrows and pull out the uprooted weeds. With the discs working, this car operates at three miles an hour, but when they are raised, the car is capable of making 20 miles an hour on the high gear. By removing the disc arms and levers the car is available for ordinary motor car service.

Both of these machines have been in use on the Chicago, Milwaukee & St. Paul during the past season. A mower made two cuttings over a division 150 miles long at a total cost of \$170 for labor and fuel, or \$0.57 per mile of cutting. Three cuttings were made over the same division with the discer at a cost of \$196 for labor and fuel, or \$0.44 per mile of cutting.

The Mower Car With Knives Raised

The results obtained with these machines are said to be as good, if not better, than those obtained by hand work. The discing machine cleans out the weeds thoroughly and gives a straight, uniform grass line. The mower cuts weeds and heavy stalk vegetation as well as grass.

BRIDGE AND BUILDING ASSOCIATION COMMITTEE APPOINTMENTS

The following subjects have been selected for committee work for the American Railway Bridge & Building Association for the ensuing year, and the president has appointed members on these committees as indicated:

Water Supply. (A) Intakes and Intake Lines; (B) Internal Combustion Engines. Chairman, C. R. Knowles, I. C.; C. A. Lichty, C. & N. W.; James Dupree, C. T. H. & S. E., and J. J. Murphy, S. P.

Floors for Shops, Etc. Chairman, D. Rounseville, C. & N. W.; J. S. Robinson, C. & N. W.; G. A. Mitchell, G. T.; R. M. Bowman, L. E. & W., and G. E. Boyd, D., L. & W.

Paint and Its Application to Railway Structures. Chairman, C. E. Smith, Mo. Pac.; F. E. Schall, L. V.; J. E. Greiner, B. & O.; H. B. Stuart, G. T., and C. Ettinger, I. C.

Caring for and Handling Creosoted Material. Chairman, E. T. Howson, *Railway Age Gazette*; F. D. Mattos, S. P.; D. A. Shope, A. T. & S. F., and J. S. Lemond, Southern.

Blank Forms for Bridge and Building Department Use. Chairman, R. C. Sattley, C., R. I. & P.; G. W. Hand, C. & N. W.; B. F. Ferris, S. P., and G. A. Rodman, N. Y., N. H. & H.

Modern Method of Driving Piles. Chairman, Maro Johnson, I. C.; J. P. Canty, B. & M.; R. H. Reid, N. Y. C.; J. P. Wood, P. M., and O. F. Dalstrom, C. & N. W.

Fireproofing Roofs of Wooden Buildings. Chairman, J. N. Penwell, L. E. & W.; Niles Searls, S. P.; E. C. Morrison, S. P., J. W. Miller, C. & N. W., and F. O. Draper, I. C.

Efficient Methods of Handling Work and Men. Chairman, F. E. Weise, C., M. & St. P.; E. R. Wenner, L. V.; S. C. Tanner, B. & O., and J. F. Pinson, C., M. & St. P.

Station Buildings for Passenger Service Only. Chairman, M. A. Long, B. & O.; E. B. Ashby, L. V.; G. W. Andrews, B. & O., and J. B. Gaut, G. T.

Economical Handling of Concrete on Smaller Jobs. Chairman, L. D. Hadwen, C., M. & St. P.; J. W. Wood, A. T. & S. F.; C. F. Green, S. P., and G. H. Stewart, B. R. & P.

Small Coaling Stations. Chairman, Lee Jutton, C. & N. W.; W. F. Strouse, B. & O.; J. H. Nuelle, N. Y. O. & W., and G. W. Kinney, D. & R. G.

OIL FUEL IN INDIA.—Tests to determine the economy of oil as fuel for railway service have now been going on in India for over a year, with results so favorable that the question of substituting oil for coal is merely a question of comparative prices.

Creosoted Wood Block Floors for Railroad Buildings

Precautions Which Are Being Observed and Results Which Have Been Secured With This Modern Material

The successful use of treated wood block street pavement dates back to 1874, when 75,000 sq. yd. of creosoted long leaf pine blocks was laid in Galveston, Tex. These blocks remained in use 29 years. Since that time this type of pavement has come to be widely used throughout the country, particularly in dense traffic business sections of large cities where the paving requirements are the most exacting. In recent years this material has also been given extensive use for the floors of buildings devoted to a variety of industrial purposes. The wide range of its usefulness in buildings is indicated by its use in machine shops, foundries, print shops, fire stations, bakeries, stables, hotels and hospitals. On railroads they have given favorable

or the proper manner of laying wood block pavement had been developed. Under traffic the fibre ends of the timber flatten out, forming a compact wear-resisting cushion which tends to close up the joints between adjacent blocks and also effectively protects the body of the blocks. The many advantages of this pavement arise from the peculiar texture of the surface, which while it is sufficiently hard to class high among high-grade pavements from the standpoint of small rolling resistance, possesses a resilience which makes it particularly valuable for industrial use. It is quiet, and it does not tire the feet like the hard surfaces of concrete or steel plates. Brittle objects dropped on it are not so easily broken as on the harder floors, nor is the

Wood Block Floor in South Chicago Freight House of Pennsylvania Lines, Laid in 1912

results in freight stations, shop buildings and roundhouses, the Chicago & North Western having used them in 19 separate buildings, aggregating in excess of 31,000 sq. yds. of floor.

The use of properly treated and laid creosoted block floors in railroad buildings has extended over a period of only five or six years, by far too short a period to demonstrate even approximately the total useful life to be expected of them. While unfortunately, a number of the oldest installations are so inferior as to material and manner of laying that they do not represent good work according to the present standards and have long since been discredited, all of the floors laid according to proper specifications are giving excellent service.

The resistance which even a soft wood offers to compressive or abrasive agencies on the ends of the fibres was recognized long before methods of wood preservation had been discovered

floor subject to chipping or cracking from the dropping of heavy objects on it. Two other advantages from a physiological standpoint result from its insulating quality which makes it warm to the feet in cold weather and the fact that it is a poor reflector of light, thus doing away with the glare experienced with many classes of floor.

The cost of the block floor as built for interior use with blocks not over three inches thick and a stone concrete base ranges from \$1.75 to \$2.50 per sq. yd. in place. Floors with a 4-in. cinder concrete base have been laid for \$1.05. These figures are based on installations under average conditions. Very small installations with unfavorable conditions would cost more. Wood block floors have been built on sand and gravel foundations at prices somewhat lower, but in general the omission of the concrete base is to be recommended only in cases where

the floor is subject to foot traffic alone. Attempts to reduce the cost by resorting to inferior methods and materials have usually resulted in dismal failures. The service exacted of floors used for diverse industrial purposes is subject to such variations that there is as much if not more need of expert super-

other hand, blocks supported on a concrete or earth foundation are exposed only to the upper face, which has been found to be highly fire-resistant. This was demonstrated in the Baltimore fire, where a section of experimental wood block pavement withstood the conflagration with an inconsiderable

Block Floor in Locomotive Erecting Shop of Michigan Central at Jackson, Mich.

vision than in the case of the street pavement. Difficulty has been experienced at different times with swelling from the absorption of water on one hand and from the presence of oil or pitch on the surface of the block on the other hand, conditions which could have been avoided, without question, if the blocks had been prepared and placed under the direction of an expert

charring on the surface, while the adjacent sections of brick and granite block pavements were spalled and cracked by the heat. A severe fire test of wood block pavement took place in the burning of the Philadelphia & Reading pier No. 36 at South Wharves, in October, 1914, which is reported as follows: "This fire was so hot that a large portion of the structural steel was

Severe Service on a Floor in the Allegheny Shops of the Pennsylvania Lines

having adequate knowledge of the service to which the floor would be subjected.

A number of disastrous fires in the creosoted wood block floors of bridges, which have received considerable publicity during the past year, have caused no little apprehension in the minds of many as to the fire hazard of creosoted floors in buildings. While creosoted lumber is highly inflammable once it becomes ignited, ignition does not take place as readily as in untreated lumber. Investigation has shown that in all the bridge floor fires reported the creosoted blocks were supported on wooden planking, a condition highly favorable to fires. On the

fused, the whole pier shed was destroyed and the greater portion of the burnt wreckage was thrown down on the wood block floor. After the removal of the debris, it was found that the wood blocks, which had been subjected directly to the flames were only charred $\frac{3}{8}$ to $\frac{1}{4}$ in. deep, but where the fused structural steel had come into contact with the wood blocks, they were charred from $\frac{3}{4}$ in. to 1 in. deep.

WOODS USED

A number of varieties of woods have been used in block floors. The report of the Committee on Wood Block Paving of

the American Wood Preservers' Association for 1915 records the use of long leaf and short leaf pine, yellow pine, black gum, tamarack, Washington cedar, Norway pine and red fir. Tests made by the city of Minneapolis included Norway pine, tamarack, birch, larch, Douglas fir, long leaf pine and eastern hemlock. The use of hard maple has also been reported in one or two instances. The principal requirement in a wood is resistance to wear, compressive strength of fibres endwise and susceptibility to impregnation by preservatives. Hard woods such as maple, which are peculiarly adapted to use in flooring

Installation of Wood Blocks in Lackawanna Roundhouse at Elmira, N. Y.

because of resistance to wear and compression perpendicular to the grain, seem to possess no advantage over the softer woods when subjected to conditions of end grain wear obtaining in a block floor.

Southern pine, particularly long leaf, enjoys the most extensive use for this purpose. Specifications for the use of southern yellow pine usually provide definite limits as to the amount of sap wood and frequently specify definitely the use of long leaf pine only. From the following quotation from a report on wood paving in the United States by C. L. Hill, assistant forester, United States Department of Agriculture, it would seem that these restrictions are not warranted. "The true long leaf pine has usually so narrow a sap wood that it could be neglected without danger to the life of the pavement. In loblolly, the sap wood is often very wide, but loblolly pine is one of the species for which it has been proved that sap wood under equal conditions of moisture contents is as strong as heart wood. Therefore, when effective seasoning of paving material can be assured before the creosote treatment, the prohibition of sap wood in Southern pine material is needless and should be omitted from specifications." It would seem that a specification establishing the density of the timber along the lines recently adopted by the Southern Pine Manufacturers' Association by limitation of the minimum number of rings per inch would be all that is necessary. Soundness is of prime importance and blocks must be inspected rigidly to detect knot holes, decay, bark, large or loose knots, shakes and checks. The blocks must also be truly rectangular and free from irregularity in sawing.

Many sizes of block have been used. As a rule commercial blocks are from 3 to 4 in. wide and from 4 to 10 in. long. A single thickness for a given piece of work is, of course, essential, but uniformity in the length of the blocks is not necessary, though occasionally specifications provide for a definite

length as well as width. In a number of cases railroads have been making their own blocks by sawing up the ends of waste lumber, and, under those circumstances, almost any size of timber has been used. In depth, blocks vary from $2\frac{1}{4}$ in. to 6 in., but for ordinary interior use there seems to be little call for a thickness greater than 3 in. There are on the market blocks $2\frac{1}{4}$ in. thick for use under light service. Aside from the service to which the blocks are subjected, the depth of blocks is governed by the ratio between depth and greatest dimension across the grain. Owing to the characteristic weakness of timber in shear and tension in planes parallel to the grain, there is danger of a high percentage of broken blocks whenever the length of the block exceeds three times the depth. For this reason a reduction in the thickness should be accompanied by a limitation of the length. Most specifications permit the variation of $\frac{1}{16}$ in. in the depth and thickness of the blocks. Manufacturer's specifications sometimes call for a tolerance of $\frac{1}{8}$ in. in the thickness. A small variation in the depth is readily adjusted in the cushion bedding, but variation in the width affects the width of the joints and the regularity of the laying.

TREATMENT

The subject of timber treatment is too broad for more than a brief discussion here. It suffices to say that creosoting under pressure is the only preservative process seriously considered at this time for the treatment of blocks. Some railroads have reported favorably on the use of dipped blocks, but their use has covered so short a time that it does not constitute a real test. The treatment of blocks for interior use is a matter of

Creosoted Block Floor in Lackawanna Car Repair Shops at East Buffalo

greater complexity than is the case with blocks in street pavement, because of the diversity of service to which the former are subjected and while the methods of treating the blocks for street pavement have been widely discussed, little publicity has been given to the detailed method of treating blocks for interior use.

Block pavement on open freight house platforms is subjected to much the same condition as in street pavement. This is true to a certain extent also of floors in roundhouses and in certain classes of shops where much water is frequently spilled, particularly around hydrants. In such cases security against swelling is an important consideration. In warehouses, on the other hand, the blocks have a tendency to shrink. In general, bleeding of creosote and pitch is much more objectionable in

building floors than on streets. This is true particularly of freight house floors, where, for instance, flour may be stored. In general blocks for interior use receive a lighter treatment, hence, open-cell processes rather than full-cell processes of treatment are the rule and the admixture of coal tar or other ingredients than creosote oil must be done with the exercise of much greater care than is necessary with street pavement blocks.

FOUNDATION AND CONSTRUCTION

To be a success, any pavement must have an unyielding foundation. A concrete base is almost universal with the creosoted block pavement, though there have been cases where the blocks have been used successfully on a well-packed sand and gravel bed. Similarly, instances may be cited where certain cities have built brick pavements which have stood years of traffic with no other foundation than the natural sandy soil, but these are exceptional cases where the soil conditions were ideal and it cannot be considered good practice in connection with either brick or creosoted block pavements. This is particularly true in building work, where the ground surface usually has been disturbed for the purpose of installing pipes, drains, etc., just previous to the placing of the floors. For floors subjected to loads not exceeding 1,500-lb. concentrations, cinder concrete foundations may be used with safety and economy.

Practice in placing a concrete foundation needs little comment here, as it is governed by the principles covering the use and production of good quality of concrete. For ordinary interior use the base need not exceed 3 to 5 in. in thickness. Precaution should be taken to insure a well-compacted foundation bed with special attention to places where the ground has been disturbed recently. In addition, care should be exercised to secure a level and reasonably smooth surface at the desired grade.

In European practice, the surface of the concrete foundation is finished with such exactness that the blocks may be and generally are laid directly on the concrete. While this practice has never prevailed in this country for street pavements, it is used for interior floors in connection with the use of a thin bitumen cushion. In other cases a sand cushion $\frac{1}{2}$ in. to 1 in. in thickness is used between the base and the blocks. The primary object of the cushion is to provide a smooth surface which is sufficiently soft to allow adjustment for slight variations in the depth of the blocks. Incidentally, the layer of sand is said to serve as a resilient bed for the blocks, with a resulting decrease in surface wear. Its disadvantage lies in its tendency to shift under condition of saturation, heavy gradients and heavy load on restricted areas.

In certain localities the use of a dry mortar, usually 1 part cement to 4 parts sand, has come into use. This is sprinkled with water just before or after the blocks are placed. The advantage of a bitumen cushion is not so much in its superiority as a cushion but results from the fact that it works up between the blocks when pressure is applied and serves as a filler. The usual method is to apply one coat of pitch to the concrete and squeegee to give it a smooth surface. A second coat is applied just before the blocks are placed, so as to be soft when the blocks are laid down.

Expansion joints ordinarily are required only along the walls of a building and around machine foundations or other obstructions which project through the pavement. The following specification represents good practice: "Expansion joints shall be formed by placing a 1 in. by 4 in. board on edge against the sides of the building and around foundations. After the blocks are laid, and after tamping or rolling, the strips shall be removed and the voids filled with a low-melting-point pitch to within $\frac{1}{4}$ in. of the wearing surface of the floor."

Because of the difficulties encountered with the swelling and contraction of the blocks under different circumstances the filler is an important item in a successful pavement. Three materials commonly used for this purpose are sand, cement grout and pitch. The latter is the most commonly used and is

giving the best satisfaction. The following quotation from the proceedings of the American Wood Preservers' Association for 1915 expresses the views for and against the bituminous filler: "Those favoring the bituminous filler argue that the joints filled with a tar or asphaltic preparation constitute individual expansion joints between each block, thereby allowing for expansion throughout the pavement. Moreover, it is claimed that the pavement is made waterproof and that no moisture can enter between or under the blocks. On the other hand, advocates of the other fillers argue that a bituminous material becomes soft and sticky from the oils that exude from the blocks and may add to the bleeding trouble." Sand filler is said to have a tendency to work down under the blocks and thus leave the joints open. The pitch filler is usually applied by pouring it between the blocks at a temperature sufficiently high to make it thoroughly fluid. After the joints are filled, squeegees are used to force pitch into the cracks and scrape away the surplus from the surface of the blocks. The latter object is also accomplished readily by an application of hot sand. In cases where a bitumen cushion is used under the blocks all that is necessary is to tamp or roll the blocks thoroughly, which will press the cushion up and completely fill the joints from below.

Practice as to a sand dressing does not differ from ordinary outdoor pavement work.

EXPERIENCE WITH WOOD BLOCKS

Railroads have used creosoted block floors extensively in erecting and machine shops, boiler shops, and in some cases in wood-working shops. Among installations for this purpose have been those of the Pennsylvania Lines at Allegheny and Conway, Pa., the Baltimore & Ohio at Mt. Clare, Md., the Illinois Central at Memphis, Tenn., the Chicago, Milwaukee & St. Paul at South Minneapolis, Minn., the Michigan Central at St. Thomas, Ont., the Central of Georgia at Macon, Ga., the Lackawanna at Scranton, Pa., and East Buffalo, and the Northern Pacific at Brainerd, Minn.

The Central of Georgia has an extensive installation of creosoted wood blocks in its engine terminal buildings at Macon, which has been in service for 5 and 6 years. The machine shop and boiler shop together contain 12,140 sq. yd. of 3-in. blocks laid on a concrete base 5 in. deep with a $\frac{1}{2}$ -in. sand cushion. All of the blocks are 3 in. by 8 in. and the joints are filled with a sand and cement grout. This floor cost \$2.70 per sq. yd. complete in place. The round house contains 5,000 sq. yd. of 4 in. blocks laid on a concrete base $4\frac{1}{2}$ in. thick with a $\frac{1}{2}$ -in. sand cushion. The cost of this floor in place was \$3.05. All of the blocks are long leaf yellow pine treated with 18 lb. of creosote oil per cu. ft. No expansion joints have been provided and no trouble has been experienced with swelling. The blocks in the round house were laid in 1909 and those in the other buildings in 1910, and have been subjected to hard usage, particularly from falling castings. They show little wear, no sign of decay and the surface is excellent.

The Michigan Central placed a block floor in its general locomotive repair shops at St. Thomas, in 1913, using creosoted hard pine blocks 3 in. by 8 in. by 14 in. They were laid on a concrete foundation with a 1-in. sand cushion and expansion joints 1 in. wide, spaced 50 ft. apart and filled with asphalt. The floor is subject to heavy usage from the dropping of heavy castings, etc., but has thus far shown little wear. Some trouble was experienced with swelling of the blocks in places where they became wet.

The Northern Pacific has several installations of blocks made of the waste ends of Douglas fir lumber in the shops at Brainerd, comprising about 2,164 sq. yd. These are cut 4 in. long, but are not sized up to any particular dimension, leaving the blocks as they come from the timber, to save as much labor as possible. After accumulating about a car load of blocks they are sent to the tie-treating plant for and given about a 12-lb. treatment. They are laid on a concrete base from 3 to 4 in. thick with a 1-in. sand cushion. The first installation of these floors was made in 1911, no repairs have been made up to the present time and the floors are said to be in perfect condition. The area

of this type of floor is being extended as fast as the material is available.

The Lackawanna has used the blocks in a machine shop at Scranton, Pa., since 1912, a car repair shop at East Buffalo and in a roundhouse at Elmira, N. Y., containing 30 stalls. In 10 stalls the blocks were laid with a cement grout filler and in the other 20 with a coal tar filler, the latter giving the best results.

The Oregon-Washington Railroad and Navigation Company installed a creosoted block floor in a new 10-stall roundhouse in 1912 that is giving very good service.

In the Mt. Clare boiler shops of the Baltimore & Ohio, 4,700 sq. yd. of 3-in. by 4-in. by 8-in. blocks were used on a 6-in. bed of concrete, which is holding out better than any type of floor previously used. This floor has been in service about two years. A machine shop at that place contains 1,940 sq. yd. of the same type of construction. This road has also used wood block floors in freight houses, the largest installations being at the terminal freight house at Cincinnati and the inbound freight house at Washington, D. C., which have been in service for four years. The Washington installation covers an area of 50 ft. by 300 ft., on a sand bed, and while not giving as good service as blocks placed on concrete, it has given better service than the ordinary type of flooring. The blocks used on earlier installations on this road were treated with 16 lb. of creosote per cu. ft., but it was found that the oil came out of the blocks and damaged freight, especially flour. In subsequent installations the treatment has been reduced to 10 lb. and the results are very satisfactory.

There is an installation of wood block floors in the Allegheny shops of the Pennsylvania Lines, placed on a 6-in. concrete base with a sand cushion of the unusual thickness of 2 in., the joints being filled with pitch. This floor has been in use for seven years and is in good condition. Around boring machines where pieces of metal are frequently dropped, some repairs have been found necessary. At the Conway shops, wood block floors were laid with a 4-in. concrete base and a 1/2-in. layer of fresh cement, the joints being filled with pitch. This floor has been in use since 1913, and is in excellent condition. Blocks are also used in the South Chicago and Erie freight houses, the former laid in 1912 and the latter in 1914. Both floors are giving entire satisfaction. On the South Chicago floor, some trouble was experienced at first on account of excessive pitch, but this has since been remedied. The floor in the Erie house was laid on a 6-in. concrete base with a 1-in. sand cushion. Expansion joints were provided around the walls one inch wide, filled with pitch. The floor cost \$2.53 per sq. yd. in place.

An installation previously mentioned is that of the Philadelphia & Reading in ferry houses and wharves at Philadelphia. In the Chestnut street ferry house the blocks were laid on a creosoted plank floor embedded in cement mortar and thoroughly grouted with sand and cement. The paving has been in service for three years and stands up well under traffic. At freight pier No. 8, South Wharves, the driveways are paved with wood blocks cut from old car sills which were treated with Carbo-lineum and dead oil of coal tar by the open tank process. At piers 34 and 36, South Wharves, the blocks are laid on a concrete base. These blocks are creosoted and the experience with the blocks on pier 36 when that pier was destroyed by fire has been described previously.

COMMITTEES OF THE ROADMASTERS' ASSOCIATION

The following committees and subjects have been selected by the Roadmasters' and Maintenance of Way Association for the ensuing year:

Recommended Practice Regarding the Anchoring of Track, the Uniform Spacing of Ties and the Elimination of the Slot Spiking of the Joints: P. M. Dinan, L. V., chairman; P. H. Madden, C. M. & St. P.; L. C. Ryan, C. & N. W.; G. H. Prentice, L. S. & M. S.; G. A. DeMore, N. Y., N. H. & H.;

J. G. Hutchinson, C., R. I. & P.; W. E. Davin, P. & L. E.; A. E. Hansen, A., T. & S. F.; M. J. Connerton, C. N. O. & T. P., and L. Coffell, C. & E. I.

Seasonable Distribution of Maintenance Work' and Forces: M. P. Condon, N. Y., N. H. & H., chairman; J. H. Cummings, B. R. & P.; John Shea, D. & I. R.; J. B. Oatman, B. R. & P.; J. Dougherty, St. L. & S. F.; D. McCooe, G. T.; F. H. Hansen, C. & A.; N. McNabb, M. C., and J. B. Killy, M., St. P. & S. M.

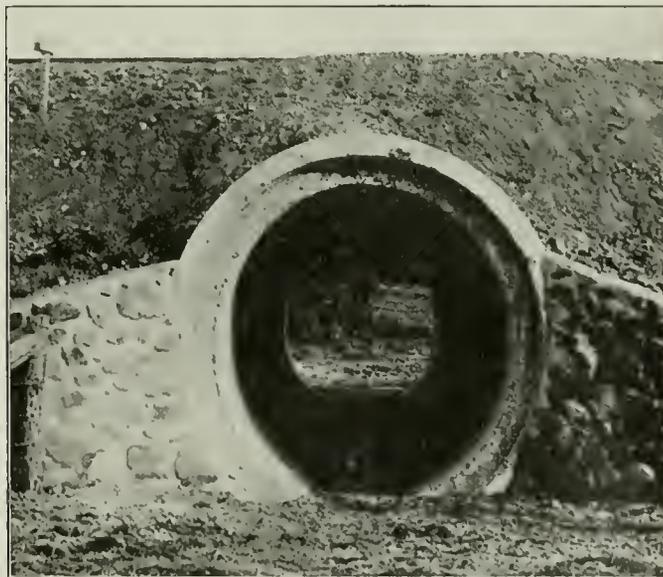

Equating Track Values: A. Grills, G. T., chairman; P. J. McAndrews, C. & N. W., vice-chairman; W. Shea, C. M. & St. P.; C. J. Coon, N. Y. C.; A. J. Neafie, D., L. & W.; A. E. Hansen, A. T. & S. F.; D. McNabb, M. C.; C. E. Erwin, A. C. L.; J. O'Connor, M., St. P. & S. S. M.; M. Donahue, C. & A., and George Beckingham, G. T.

Paper on Standard Report Forms for the Roadmaster's Office, by E. T. Howson, *Railway Age Gazette*.

Paper on Brooms for Snow Service, by T. Thompson, A. T. & S. F.

CONCRETE CULVERT PIPE FOR CATTLE PASSES

In the extensive use of concrete culvert pipe for openings under railway embankments a diameter of 5 ft. has usually been the maximum size used and for this reason these culverts have served almost exclusively for waterways. As a departure from this practice, P. Swenson, bridge engineer of the Minneapolis,

One of the Culvert Cattle Passes

St. Paul & Sault Ste. Marie, has recently conceived the idea of using reinforced concrete pipe of adequate inside dimensions to satisfy the usual contract requirements as a substitute for the usual box or arch culvert for cattle passes. Ten installations of this kind have been made thus far on the line between Minneapolis and Superior, one of which is shown in the accompanying photograph. The opening consists of several sections of culvert pipe 6 ft. 5 in. long with bell and spigot joints. The inside diameter is 7 ft. horizontally and about 7 ft. 5 in. vertically. A flat surface 2 ft. wide at the bottom serves as a walk. The structure is finished off at each end by rubble masonry wing walls; these units were designed and constructed to resist the loads imposed due to the usual dead load and a live load equal to Cooper's E 60 loading. The pipes were installed by company forces at a cost of \$7.50 to \$9.00 per lin. ft., not including manufacturer's price, freight or train service. They were manufactured and furnished by the C. F. Massey Company, Chicago. We are indebted to C. N. Kalk, chief engineer of the Minneapolis, St. Paul & Sault Ste. Marie for the above information.

HINTS FOR THE ORDERING OF LUMBER*

By T. O. Wood

Purchasing Agent, Gulf, Colorado & Santa Fe, Cleburne, Texas

Don't order everything 16 ft. long. Remember almost everyone makes this mistake and orders that length. Consequently about seven-eighths of the orders on mills call for 16-ft. lumber, and all logs are not 16 and 32 ft. long. As a matter of time, your requirements, if made in lengths 12, 14, 16, 18 or 20 ft. long can be filled by a mill in less than half the time required if 16-ft. lengths only are called for. If you cannot possibly use all those lengths, use as many as you can.

Don't order any lengths longer than 20 ft. if two shorter lengths will do; especially try to avoid ordering such expensive lengths as from 28 to 40 ft. if two shorter lengths can possibly be made to answer. Remember that all lengths over 20 ft. cost additional, the present rate of increase on a 20-ft. basis being as follows:

20 ft.....	\$20
22-24 ft.....	21
26 ft.....	22
28 ft.....	23
30 ft.....	24
32 ft.....	25
34 ft.....	26
36 ft.....	27
38 ft.....	29
40 ft.....	31
Over 40 ft.....	Special prices

These additional prices do not cover car sills.

Don't order boards and dimension lumber 12 in. wide if less will do; remember the price increases on lumber over 8 in. wide. This can perhaps be shown better by giving an illustration as follows:

100 pc., 1 in. by 12 in. by 16 ft., 1,600 ft., at \$17.....	\$27.20
120 pc., 1 in. by 10 in. by 16 ft., 1,600 ft., at \$14.....	22.40
150 pc., 1 in. by 8 in. by 16 ft., 1,600 ft., at \$13.....	20.80

While getting the same quantity in board measure, the above shows the difference in cost to the company.

Don't order boards and timbers over 12 in. wide if you can avoid it, because the price increases rapidly with the extra width as follows, using the former figures as a basis:

On less than 2 in. thick.		On 2 in. thick and over.	
12 in. wide.....	\$17	12 in. wide.....	\$17
14 in. wide.....	20	14 in. wide.....	19
16 in. wide.....	23	16 in. wide.....	21
18 in. wide.....	26	18 in. wide.....	24

The higher price for timber less than 2 in. thick is owing to the loss in manufacture, from splits, breaks, handling, etc. It would be much better to use two pieces if possible, and you may find it possible in a great many cases.

In ordering surfaced lumber for buildings, if possible order all in rough sizes, or all in finished sizes, the latter being much preferred. Sometimes requisitions show both, and in succeeding lines, and it is very difficult for the person purchasing it to know what to obtain.

Don't forget in all cases of surfaced lumber to state whether S1S, S2S, S1S1E, etc., is desired, as the case may be. Calling for it as dressed, finished or surfaced without stating how this is required, is like calling for boards and giving no size. Where grades are not known by those ordering lumber, the purpose for which the lumber is required should be stated on the requisition. In recent years the cost of surfacing lumber has been reduced somewhat, and to-day the extra cost over rough sizes on 1-in. and 2-in. lumber of standard widths and lengths is 50 cents, and on timbers \$1.00 per M ft. It would help immensely also if those ordering lumber to be furnished by mills in the southwestern territory would remember that the S1S, S2S or 1-in. lumber is 13/16 in. instead of 7/8 in. This latter size is the old northern standard, and is not standard in southern pine.

In ordering lumber for stations, dwelling houses, hotels, etc., don't order the flooring all of one kind. To do this is expensive, and results in having some lumber unnecessarily good and other perhaps not sufficiently good for the purposes required. It will be well to remember that 4-in. flooring runs

on an average \$2 per M less than 6-in., and in my opinion makes a better floor. Never order 6-in. flooring edge grain. It is almost impossible to get it, and if obtained at all, is exceedingly expensive. Also remember edge grain costs \$9 per M more than flat grain of the same grade.

I will venture the suggestion here that for repairs of buildings, houses, etc., good judgment may suggest that something less than the best grade of lumber be used, especially for flooring, on the ground that it is not worth putting in 25 to 50-year lumber as repairs to any building. Also it is well not to use too expensive lumber in a building that may not be in existence in 10 to 20 years' time.

When 1-in. or 2-in. lumber is required, and where wane and sound red heart are not objectionable, by all means order No. 1 Common. No. 1 Common is known at the mills as yard stock, and millions of feet are always on hand, therefore, almost immediate shipment can be obtained. All square edge and sound lumber has to be sawn especially, and no stock is kept on hand at the mills; therefore, it comes much more slowly. No. 2 Common follows the same rules as to thickness as No. 1, but, of course, carries more defects. At the same time it can be used to advantage for many purposes where No. 1 is sometimes ordered, as, for instance, for snow fencing, and it costs from \$1 to \$2 less per M than No. 1, according to the stock on hand at the mills. Of course, there is not as much No. 2 on hand as No. 1.

Just one more little kink about No. 1 Common. You frequently order No. 1 Common S1S up to and including 1 in. by 12 in. Next time you start to do this, don't do it, but order it S2S. You will get more even lumber, just as thick and get it more promptly, and also sometimes at a shade lower price. You will also get more lumber per M ft. than if ordered S1S. A mill prefers to work lumber S2S because that thickness is in accordance with commercial requirements, while S1S is not. Therefore, any degradés will naturally fall into commercial lumber No. 2 grade, without reworking. Be sure and remember that this only covers No. 1 Common up to 1 in. by 12 in.

All stacks should be from two to three feet above ground, to allow free circulation of air, and should be pitched on a slope of one inch per lineal foot, with the front end higher than the rear end; thus in piles of 16-ft. lumber the front end would be 16 in. higher than the rear end. Each piece should be exactly over the piece underneath it and from 1 in. to 1½ in. apart from pieces on each side, for say 4-in. lumber, increasing this space up to 3-in. or 4-in. in lumber up to 12 in. wide. Cross pieces should be the same as the balance of the stack in lumber and timber 1 in. to 4 in. thick; in timber 6 in. thick and over this plan would run the stack too high, and 1-in. or 2-in. strips of waste lumber can be used. These cross pieces should be put on every layer, about 4 in. apart, and the front piece should project ½ in. to ¾ in. over the ends to protect the stack from sun and rain.

Be sure that the center bearings of each stack are not lower than the end bearings. The lines should be straight to avoid sagging and the consequent accumulation and retention of dampness. Be sure that the cross pieces are exactly over each other, else you will have crooked lumber. And be sure and don't use decayed or rotten lumber for cross pieces or foundations, as doing so will contaminate the good lumber.

WORK ON THE BAGDAD RAILWAY.—The American vice-consul at Aleppo, reports that despite the great crisis prevailing there has been no diminution in the railroad progress of the country. The Jaffa-Jerusalem line, controlled by a French company, but whose 25 years' lease is about to expire, was taken over by the military authorities at the outbreak of the war. Work was immediately begun to connect this line with the Haifa-Damascus line, and in this way link the system with Aleppo (on the Bagdad line), and eventually connect with Constantinople. Equal energy has been displayed in the extension of the line from Aleppo toward Bagdad, on the German or Bagdad Railway.

*Abstracted from a paper presented before the storekeepers of the Atchison, Topeka & Santa Fe at Albuquerque, N. M., September 28, 1915.

Tables for the Distribution of Track Materials

Information Enabling a Gang to Unload Ties, Bolts, Spikes and Other Supplies from a Moving Train

By KENNETH L. VAN AUKEN

While unloading material cheaply and easily is important, it is equally important that the correct quantities be unloaded and that they be distributed so as to require a minimum of rehandling later. This is especially true when relaying rail, laying second track or putting in switches. A correct distribution can be obtained by noting the standard length of track rails and spotting the work train each time with respect to the rail joints; or by reference to the location of telephone or telegraph poles. The poles usually afford the more accurate and ready means for gaging distribution.

When unloading rails, whenever the work train is on the siding waiting for trains the gang should be kept busy setting the rails up end to end. If it is possible to have all the rails set up in this way, the distribution of angle bars and base plates, or joints can be gaged by the newly distributed steel. The tables given in this article have been worked up to give figures which can be used in distributing material by noting either the telegraph poles or the rail joints, for both 30 and 33-ft. rails. The figures in most cases have been carried out only to the nearest quarter keg, box, etc., so that they can be easily used by men who are not used to handling fractions.

Table 1 is for distributing ties for a new track. It is customary to take out several carloads at once and distribute the

TABLE 1: DISTRIBUTING TIES ACCORDING TO TELEPHONE POLES.

No. per rail Length	30-ft. Rails.		33-ft. Rails	
	Telephone Poles 150 ft. Apart	Telephone Poles 200 ft. Apart	Telephone Poles 150 ft. Apart	Telephone Poles 200 ft. Apart
15	75	100
16	80	107
17	85	114	78	103
18	90	120	82	109
19	95	127	87	115
20	91	121
21	96	128

gang on the various cars. The train is generally moved about one train length for each spotting, a man being sent ahead to make a chalk mark on the rail joint at intervals which give the nearest

should be on that basis; then, if it is unnecessary to replace all of the joint ties, the new ties can be kept for ordinary renewals near the same location.

Possibly the best method of distributing ties for relaying (unless some parts of the section need more renewals than others) is to count the number of ties and distribute them uniformly over the entire section. Or the number per telegraph pole may be computed and that number should then be thrown off one at a time at approximately equal intervals between every two poles.

Table 2 gives the number of angle bars required per rail length, and per telegraph or telephone pole whether located 150 ft. or 200 ft. apart. It is sometimes easier to gage the distribution by telephone poles than by rail lengths, but if the rails have already been distributed, the best method is to throw off four angle bars and two joint plates, or two joints, for each rail.

TABLE 2: DISTRIBUTING ANGLE BARS OR JOINTS.

Angle bars..... Joints (or joint plates for angle bars).....	Per Rail Length	Per Telephone Pole 150 ft. Apart	Per Telephone Pole 200 ft. Apart
	4	30-ft. rail 20	33-ft. rail 18*
	2	10	9†
			14
			24**

* 2 extras at every 10th pole.
† 2 extras as every 20th pole.
** 2 extras at every 8th pole.
‡ 2 extras at every 16th pole.

It is not necessary to distribute any extra pieces, because these appliances are not so easily lost as spikes or bolts.

Table 3, for the distribution of track bolts, gives in its various columns the number of joints which one keg will full-bolt for either 30 or 33-ft. rails, and for either 4-hole or 6-hole joints. For instance, if 4 3/4-in. by 7/8-in. bolts are to be used on 100-lb. 33-ft. rails with 6-hole angle bars, column 2 in the table shows that there are 141 bolts to the keg, and column 8, that these will full-bolt 11 1/2 joints, and column 9, that it will bolt the joints between 2 1/2 telephone poles 150 ft. apart, or column 10, 1 3/4 telephone poles 200 ft. apart. In making the distribution

equivalent to the train length. The number of ties to be unloaded from between telephone poles for various spacings can be determined from Table 1. The table is not directly applicable to the distribution of ties for relaying. It is rather general practice to provide new ties for every joint, and the distribution

is impossible to divide up the kegs, so that with telephone poles 150 ft. apart, one keg should be thrown off first with an interval of two telephone poles and then with an interval of three telephone poles, alternating this way throughout the distribution. The table provides for a small surplus in each case

The kegs should be thrown off as nearly as possible at equal intervals, and should be rolled off the car endways; if they hit on the sides they may run down the embankment into the ditch. Nut locks are usually furnished in boxes of 1,000. Table 4

TABLE 4: DISTRIBUTING LOCK NUTS.

	4-hole joints—8 nut locks		6-hole joints—12 nut locks			
	Telephone Poles 150 ft. Apart	Telephone Poles 200 ft. Apart	Joints	Telephone Poles 150 ft. Apart	Telephone Poles 200 ft. Apart	Joints
33-ft. rail..	124	27½	83	18½	14½	83
30-ft. rail..	124	25	83	16½	12½	83

gives the number of joints, measured by telegraph poles, for which one box will provide nut locks, the left half for 4-hole joints requiring 8, and the right-hand half for 6-hole joints requiring 12. A few nut locks are likely to be lost, so it is advisable (for instance in columns 3 and 4, top row of figures) to unload a box of nut locks every 27 telegraph poles 150 ft. apart, or every 20 telegraph poles 200 ft. apart.

Table 5 gives the number of track spikes, of the sizes commonly used, in an average keg of 200 lb. The number of rail lengths which one keg will full-spike is shown in columns 4 to 10, inclusive. This is for building a new track. For relaying it is the practice to provide new spikes for only part of the work and to require the gangs to use many of the old spikes.

TABLE 5: DISTRIBUTING TRACK SPIKES.

Size, Length Measured Under Head	Average No. of Keg of 200 lb.	Rail Used. Weight per Yd. lb.	One keg will full spike-rail lengths						
			15 tics per rail	16 tics per rail	17 tics per rail	18 tics per rail	19 tics per rail	20 tics per rail	21 tics per rail
5½ in. x 5/8 in. . . .	300	75 to 100	5	4½	4¼	4	3¾	3½	3½
5½ in. x 9/16 in. . .	375	45 to 75	6¼	5¾	5½	5	4¾	4½	4¾
5 in. x 9/16 in. . .	400	40 to 56	6½	6¼	5¾	5½	5¼	5	4¾

It is best to make the distribution in the same way as for ties—to count up the number of kegs and distribute them at equal intervals. If, however, it is planned to provide all new spikes except for the one row which was left in the ties, one keg will spike a third more rail lengths than is given in the table.

For relaying, the cheapest and best way to distribute the joint ties, spikes, angle bars and base plates or joints, bolts and nut locks, is to make up one train and do all this work at once. With careful work it is possible to make all this distribution without stopping, with the train traveling at a speed of 8 or 10 miles an hour. The cars of ties should be placed in the rear to reduce the damage of a possible derailment resulting from the ties falling on the track. The writer has used this method many times, however, without a single derailment.

Sometimes it will be policy to include the joint ties in the general tie distribution and wait until after rail is relaid to make tie renewals. In this case the section foreman will probably distribute the ties where needed previous to relaying.

WOOD PRESERVERS' CONVENTION

The annual convention of the American Wood Preservers' Association will be held at the Hotel Sherman, Chicago, January 18-20, 1916. The indications are that this convention will reflect the continued growth of this association.

Reports will be presented by standing committees on: Preservatives, Specifications for the Purchase and Preservation of Treatable Timber; Wood Block Paving; Plant Operation; Service Tests of Cross Ties; Service Tests of Wood Block Paving; and Service Tests of Bridge and Structural Timbers.

In addition, individual papers will be presented on the subjects of Wood Block Floors by Clyde H. Teesdale, Forest Products Laboratory, Madison, Wis., and also by F. W. Cherrington, chief engineer, the Jennison-Wright Company, Toledo, Ohio; Woods Suitable for Cross Ties by R. VanMetre, the Joyce-Watkins Company, Chicago; The Quantity of Zinc Chloride Required per Tie or Per Cubic Foot of Timber and the Method of Determining the Strength of the Solution by W. F. Goltra, president of the

W. F. Goltra Company, Cleveland, Ohio; The Types of Fungi Which Attack Railroad Ties by Herman Von Schrenk, consulting timber engineer, St. Louis, Mo.; The Creosote Oil Situation by G. A. Lembcke, Lembcke, Von Bernuth Company, New York City; The Zinc Chloride Situation by William Townsley, Jr., the Grasselli Chemical Company, Cleveland, Ohio, and Creosoted Douglas Fir Bridge Stringers by O. P. M. Goss, consulting engineer, Seattle, Wash.

The annual banquet will be held on Wednesday evening. F. H. Newell, professor of civil engineering, University of Illinois, and formerly chief engineer, United States Reclamation Service, will be the principal speaker.

THE VALUE OF ORGANIZATION AND SYSTEM FOR MAINTENANCE OF WAY GANGS

By J. T. BOWSER

Maintenance of Way Dept., Queen & Crescent Route, Danville, Ky.

The success or failure of a maintenance of way department foreman, as of any other man in charge of men, probably depends as much on his ability to organize the forces under his supervision and to systematize their efforts, as it does upon his knowledge of the work to be undertaken. That being true, is not a great field being neglected through the lack of systematic effort on the part of operating officers to cultivate the organizing and systematizing ability among their foremen. There are, of course, many railroad officers who have adopted a definite policy along this line, and many more who handle their foremen along similar lines, but have no definite and clear cut motive, following habit and instinct rather than clearly established reasons.

It is the purpose of this article to attempt to crystallize what is, very probably, the general impression or opinion as to the value of having foremen who organize their gangs for the work at hand and systematize routine. What railroad officer has not a familiar mental picture of the straggling, hesitating manner in which many section gangs resume work after the passage of a train, or the confusion and multiplicity of orders when the gang arrives at the work. Compare this picture with one of the gang, the foreman of which knew or had been taught the value of system. Each laborer then has a definite duty in each class of work, and he starts by force of habit. There is no loss of time arranging men, and there is no interference with each other. The foreman probably states what class of work is to be done and the laborers drop naturally into their places.

The work of an organized gang is not only done faster but better. Who will say that a man who has plenty of room to work, who knows what he is doing and what he is going to do, will not do better work than the man crowded up through lack of proper spacing, who skips from one thing to another, and who never knows or cares what comes next. From these men come the foremen and such training is invaluable. Discipline is better; a man is more contented and takes more pride in his work when his efforts are well directed and when he is accomplishing something.

Many foremen handle their gangs in this manner without really knowing what they are doing. They simply know they can accomplish more. Explain it to them, get them to thinking. If first efforts come spontaneously they should be able to make a great deal more progress when they know the reason, and begin to think about it. Such men are valuable and should be cultivated carefully. Watch apprentices and young foremen, get them started right, and explain; the whys are often as important as the hows.

The foremen's meetings afford excellent opportunities for officers to explain such methods to the foremen. It cannot be expected, however, that the seed planted at such a meeting will bear fruit without cultivation. It is probable that the supervisors are more or less gifted along this line. With a few talks and some encouragement the idea will crystallize in their minds and they will then be able and anxious to create and foster the growth of organized and systematic work among the foremen.

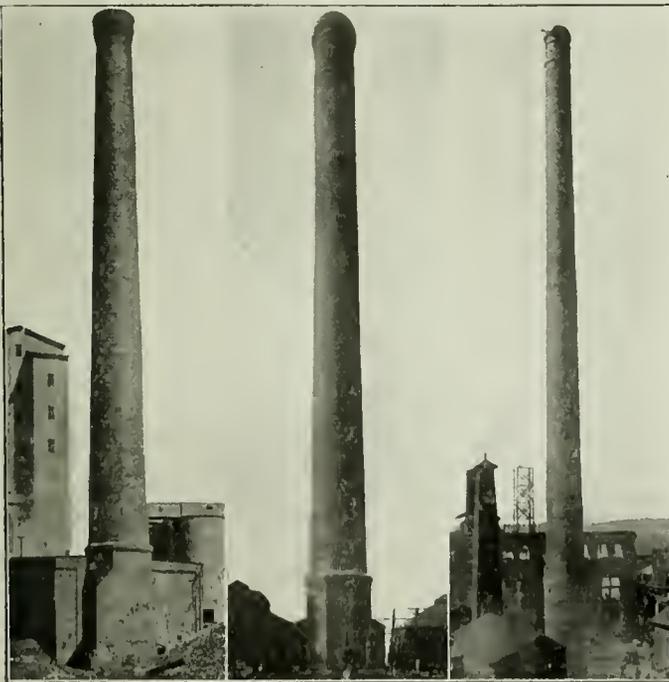

Design and Construction of Chimneys for Railways

Discussion of Types in Use and Points Considered in Deciding on Details of Chimneys for Boiler Plants

A great deal of power is generated by railways in steam plants exclusive of that in locomotive boilers. These stationary installations at engine terminals, docks, stations, shops, pumping plants, elevators, etc., depend on chimneys for the necessary draft, so that, in the aggregate, the problem of selecting a type of construction for such chimneys that will be dependable under all conditions and will have the lowest annual charge becomes one of considerable importance. On account of the special features involved in the design of chimneys and the relatively small number built by any one road, few railway men consider the subject thoroughly, depending to a considerable extent on the reputable builders of chimneys for details. It is hoped, therefore, that the following discussion will be of interest and value.

TYPES

In general, chimneys for the purpose considered are of three types, steel, brick and concrete, although at least one combination type has been developed, utilizing masonry and reinforced

- (A)—A Tapering Radial Brick Chimney 163 ft. High and 7 ft. in Diameter, Built for the Atchison, Topeka & Santa Fe Grain Elevator, Chicago, by the Heine Chimney Company, Chicago.
- (B)—A Radial Brick Chimney 175 ft. High and 9 ft. 6 in. in Diameter, Built for the Consolidated Gas, Electric Light & Power Company, Baltimore, Md., by Bergen & Lindeman, New York City.
- (C)—A Radial Brick Chimney 200 ft. High and 7 ft. 6 in. in Diameter, Built at the Chesapeake & Ohio Shops at Huntington, W. Va., by the Wiederholdt Construction Company, St. Louis, Mo.

concrete. Of these, steel and brick date back the farthest. Independent chimney structures were developed about the beginning of the nineteenth century at practically the same time in several European countries. The early structures of brick were usually square and were designed by "rule of thumb," in spite of which condition chimneys 90 years old are not uncommon in some parts of Europe. In the development of this type of construction, octagonal and later circular designs were adopted, the latter being the most economical in the use of material and the most advantageous in producing draft, as all dead air space in the corners is eliminated. It also offers less resistance to wind and has a greater moment of resistance than the square section.

The radial brick was a natural result of the development of circular chimneys in order to facilitate the construction of a

satisfactory wall. Also, an account of wide variations in the quality of ordinary brick, some of the builders began making special brick with perforations to insure thorough burning and the elimination of soft centers, resulting in a product of uniform quality. The various companies building such chimneys date the beginning of this type from 25 to 50 years ago, the first ones in this country being built about 15 years ago. Among the first in the United States are four 287-ft. by 17-ft. chimneys built about 1900 by the Alphons Custodis Chimney Construction Company, New York, for the Manhattan Elevated Railway in New York and still in service. Brick chimneys are generally recognized to be thoroughly satisfactory when properly designed and built.

Guyed sheet iron chimneys without lining are the cheapest type in use and are also the least durable. They can frequently be set directly over the boilers, being carried by a breeching hood. Permanent, self-sustaining, brick-lined steel chimneys are also used, being more expensive and requiring a flue of some sort to connect the boiler and the chimney. There is no definite dividing line as to size between guyed steel plate chimneys and self-supporting steel or masonry chimneys, according to the experience of George I. Bouton, consulting mechanical engineer, New York City. Some 5,000 to 6,000 hp. plants use the former, while others with only 500 or 600 hp. use the latter. Considering individual chimneys, the upper limit for a guyed steel chimney is about 7 ft. by 150 ft., the great majority of such installations being of a size not to exceed 5 ft. by 125 ft. In some locations it may be impossible to guy a chimney of large size, thus eliminating that type, or in other cases, it may be necessary to use a strut or stiff leg if the location and construction of adjacent buildings is favorable and the chimney is not too large.

In considering the advantages of steel chimneys in comparison with the more permanent types, it is important to estimate the probable life of the plant. For example, it might not be economy to install a permanent chimney with a life of more than 30 years in a plant which will be abandoned or entirely remodeled in 10 or 15 years. The average life of a guyed steel chimney is variously estimated up to 10 years. In some cases such chimneys built of 3/16-in. or 1/4-in. plates have failed in six or seven years, while in other cases chimneys with even lighter metal have been in service for 12 to 15 years. It is not customary to paint a chimney on the inside after it is put in service, and for this reason one used continuously will have a longer life than one which is out of service during a part of the year, or for considerable periods at a time. A chimney should be painted externally at least every two years. Local atmospheric conditions must also be considered in adopting a steel chimney as under certain conditions, such as proximity to salt water, the steel plates are attacked more quickly.

Concrete chimneys have been built in this country for about 25 years, although it is only in the last 12 to 15 years that their use has been extensive, and only during the last 7 years that tapering concrete chimneys have been developed. In general, the cost of concrete construction is from 10 to 30 per cent less than brick and about the same as self-supporting steel. On account of the thinner walls, concrete is lighter than brick, making it easier to provide suitable foundations under some conditions. In order to secure greater permanence, concrete chimneys have been used in some cases to replace steel stacks where brick could not be considered on account of its cost. When properly built, concrete has proved entirely satisfactory, some of the oldest chimneys still being in service and having withstood windstorms, fires, etc.

A combination type built of special fire clay tile filled with

concrete and reinforced with horizontal and vertical steel bars, is built by the Wiederholdt Construction Company, St. Louis, Mo. The advantages claimed for this chimney are that it does away with forms used in building concrete chimneys and has the advantage of steel reinforcement over many brick chimneys. This type has been built for about eight years.

The size of a chimney depends on the size of the boiler plant and the amount of draft required. For the average flue gas temperature the height of a chimney should be about 160 ft. for each inch of draft. The cross section is fixed by the amount of gas to be passed at a velocity that will not be excessive. This area varies directly as the weight of coal burned per unit of time and the number of pounds of air supplied per pound of coal and inversely as the square root of the draft. It is customary in figuring on the capacity of a chimney to assume a 2-in. film of gas lining the stack. Ordinarily no difference in dimensions is made between the different types, although the advocates of steel and concrete construction lay stress on the absence of leakage and in addition the builders of steel emphasize the decreased friction in that type, while those who favor brick call particular attention to the low factor of radiation and convection in a masonry wall, tending to reduce the loss of heat in this way. Municipal regulations, particularly where smoke departments are maintained, occasionally govern chimney sizes and must be investigated. As the details of design are comparable only for chimneys of the some general type, the following discussion is divided to cover the three forms of construction in most general use.

STEEL

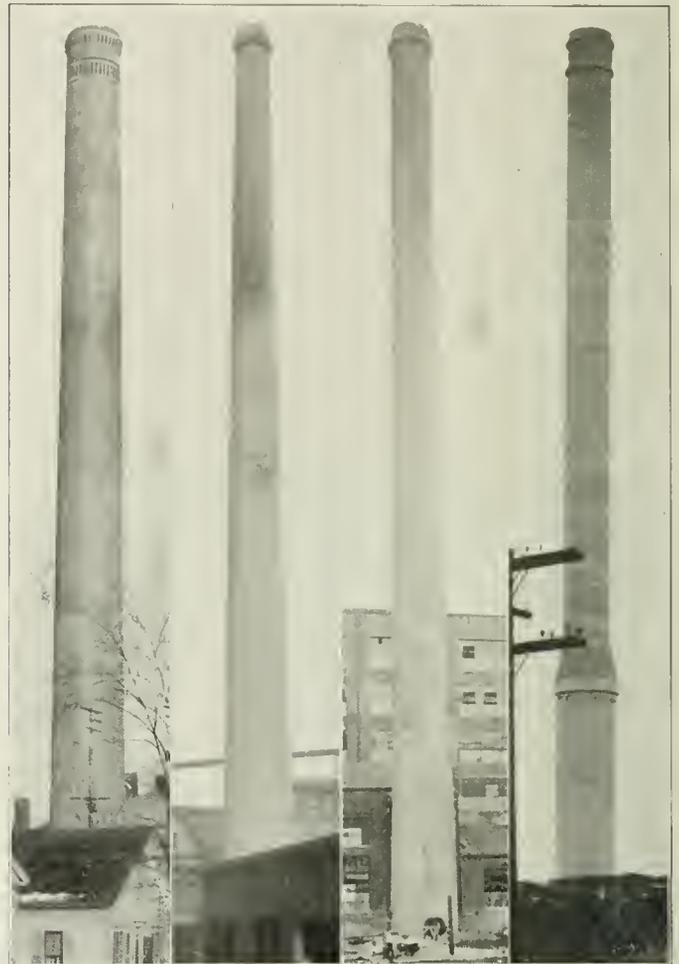

The thickness of the plates used in guyed steel chimneys varies with the diameter. Ordinarily good practice fixes this standard at No. 12 B. W. G. for 30-in. to 36-in. diameters, No. 10 B. W. G. for 42-in. to 54-in. diameter, 3/16-in. for 60-in. to 72-in. diameters and 1/4-in. for 78-in. diameter and larger. Lighter plates may be used if the plant is of a temporary nature, but the saving is inconsiderable, as, for instance, the difference between 3/16 in. and 1/4 in. plates for a 6-ft. by 150-ft. chimney would only amount to about \$250. The wind pressure is ordinarily assumed at 30 lb. per sq. ft. of exposed area. The load on the guy wires can be readily calculated on this basis from the diameter of the chimney, the exposed height, the distance from the base to the center of pressure and from the base to the connection with the guy and the angle of inclination of the guy with the horizontal. A 6-ft. by 150-ft. chimney with the lower 25 ft. protected, for example, would require two sets of guys placed 90 ft. and 120 ft. from the base, each set having four wires. For such a chimney the ordinary 1/2-in. galvanized steel wire strand frequently used for chimney guys, having an ultimate strength of about 8,500 lb., would be rather light and it would be advisable to use special strands of high tensile strength steel. On small chimneys, one set of three or four guys is sufficient.

The method of anchoring the lower ends of the guys varies widely and faulty anchorage has been the cause of many failures of chimneys of this type. Parts of buildings are frequently used for anchorage, in which case the details vary with local conditions. When a guy is anchored by connection to the ground but it is necessary to attach it above the surface, a stub, usually consisting of a heavy timber with planking across it, is used. This stub may be placed 7 to 10 ft. in the ground as required by local conditions. Where the guy can be brought to the ground a convenient anchorage is a block of concrete perhaps 3 ft. by 3 ft. and 6 ft. deep with an eyebolt projecting from the upper surface. If the chimney is not carried on the boiler setting, a concrete slab is usually used for the foundation, this slab ordinarily being 12 in. greater in diameter than the chimney and extending about 6 in. above the adjacent surface. Its depth, of course, depends on local conditions, a total thickness of 4 or 5 ft. being common.

BRICK

For brick chimneys the perforated radial brick has come into wide use. The blocks are ordinarily much larger than common

brick, thus reducing considerably the number of mortar joints which are the critical point in this type of construction. Various sizes of these blocks allow a wide range in wall thicknesses and radii and the perforations, in addition to securing a more even burning of the interior of the blocks, provide a means of locking the blocks together as the mortar is worked into them in laying up the wall, and they also provide a dead air space in

- (A)—Tapering Concrete Chimney 225 ft. High and 12 ft. in Diameter, Built by the General Concrete Construction Company, Chicago, for the Indiana & Michigan Electric Company, South Bend, Ind.
- (B)—A Tapering Concrete Chimney 185 ft. High and 6 ft. in Inside Diameter at the Top, Built by the Weber Chimney Company, Chicago, at the Nonconah Shops of the Illinois Central, Memphis, Tenn.
- (C)—A Tapering Concrete Chimney 184 ft. High and 7 ft. in Inside Diameter at the Top, Built by the John V. Boland Construction Company, St. Louis, Mo., for the Excelsior Manufacturing & Supply Company, Chicago.
- (D)—Cylindrical Concrete Chimney 175 ft. High and 6 ft. in Inside Diameter at the Top, Built by the John V. Boland Construction Company, St. Louis, Mo., for the American Box, Board & Paper Company, Grand Rapids, Mich.

the wall, decreasing the rate of heating and cooling. A radial brick chimney weighs less than one of ordinary brick.

Frequently an engineer or architect desires a chimney to conform to the architecture of the station or other building for which it is constructed and in such instances other than circular shapes may be adopted. While this introduces difficulties especially with the use of radial brick the improved appearance frequently justifies the added trouble. The inside lining of the chimney is laid in the ordinary manner.

The large builders of radial brick chimneys either operate or control the brick yards in which their product is manufactured. In general, the clay used in the process must be highly refractory, and be low in iron and lime content and the blocks must be burned until well vitrified, producing a hard, non-porous material of high crushing strength. The crushing strength required by various makers ranges from 4,000 to 7,000 lb. per sq. in. One company has tried burning them until their crushing

strength was increased to about 11,000 lb. per sq. in., but this discolors the surface and makes them so hard that they will absorb no water, thus preventing the mortar from adhering well. H. R. Heinicke, Inc., New York City, uses bricks of four different lengths, 4, 7, 8 and 10 in., with a uniform height of 6½ in. and a width of 4½ in. at the face, this dimension varying at the back with the diameter of the chimney. These bricks absorb less than 10 per cent of water in 24 hours immersion. In the base, at least every fourth course is a header and in the shaft every second layer interlocks to break the joints in every layer. Horizontal steel bands are used in the base.

Bergen & Lindeman, New York City, use brick 4½ in. high and 6½ in. wide in five lengths, ranging from 4 in. to 10½ in. Each size is made with different radii for use in chimneys of different size. The Alphons Custodis Chimney Construction Company, New York City, makes bricks ranging from 4 in. to 13 in. deep, having holes not to exceed 1 in. square, so that the mortar cannot fill up and destroy the air space. These bricks are made both with and without corrugations.

The Heine Chimney Company, Chicago, use a brick 4½ in. high, made in six sizes, four of which are ordinarily used, the dimensions varying by 1 in. These bricks are made to interlock and are laid with horizontal reinforcing bands and vertical mortar pins, alternate courses being headers.

The stability of a chimney depends upon the assumptions made in design as to the wind pressure and allowable stresses in the material. The most generally recognized standard of wind pressure, 50 lb. per sq. ft. on a flat surface, is quite commonly

and 20 tons per sq. ft. for a height of 300 ft. This variation is made on the ground that in tall chimneys the rate of progress is slower and the mortar sets harder. The maximum allowable compression used by other companies varies between 15 and 25 tons, some of them allowing as high as 3 tons per sq. ft. in tension, while others are more conservative in this respect. On account of the variations in assumed pressures and allowable stresses the factor of safety in the various designs of radial brick chimneys ranges from 8½ to more than 20.

Chimneys are designed according to ordinary principles of mechanics, making a tentative selection of the taper and determining the required thickness of the walls at intervals of about 20 ft. The selection of the taper giving the most economical design is a matter of repeated trial designs and experience, and the various chimney companies have evolved empirical rules for tapers and thickness for use in preliminary designs.

The minimum thickness of a brick wall is ordinarily fixed at 7¼ or 7½ in., this thickness being increased one or two inches in steps which are ordinarily 20 ft. apart. The variable sizes of perforated blocks allow almost any desired thickness of wall to be built. One company uses a minimum wall thickness of 7¼ in. for diameters of 6 ft. and less, 8¼ in. for diameters between 6 and 12 ft., and 10¼ in. above 12 ft. The thickness of the wall at the base of the chimney when radial

brick is used is determined by this company by the rule $\frac{H}{9} + 6$ in. where H equals the total height of the chimney.

Chimneys from 100 to 200 ft. high are tapered, the amount of this taper varying considerably. One company adds from 20 to 60 per cent of the top diameter to secure the bottom diameter; another increases the outer diameter ¼ in. per ft. when the ratio of height to top diameter is 10, and increases this increment as the ratio increases, up to ⅝ in. per foot for a ratio of 40. Another company figures an average taper of about 4 ft. per 100 ft. for both sides, and another uses from 3 to 6 per cent taper on both sides. A variable taper has been used in several cases in order to improve the appearance and save material. The weight of a wall laid up with perforated radial brick averages 120 lb. per cu. ft.

Linings in vitrified brick chimneys are only required to protect the chimney walls from the extreme differences in temperature where the gases impinge against it. This leads to the general practice of lining only the lower part of the chimney and the space around the flue opening, though building ordinances in some cities definitely specify the height of lining to be used. It is common to use radial brick for the lining with an air space between the lining and the wall, though fire brick is sometimes specified.

The breech opening is a source of weakness. For this reason, one company tries to make the width of the breech opening less than one-third the diameter of the chimney at that height, while another finds that this width should not exceed 0.6 of the clear diameter at the top, while the height of the opening is usually made 1.45 times that diameter, giving an area about 10 per cent larger than the top opening. This takes care of the greater volume of gases at the bottom of the chimney than at the top, due to the higher temperature.

Independent chimneys are ordinarily set on concrete foundations, which may be square, octagonal, round or of various other shapes. For round shaft, a round foundation gives the most uniform support, but, on account of the expense of building forms for such foundations, an octagonal shape is ordinarily preferred. One company usually builds square foundations, only cutting off the corners to form an octagon when the chimney is round from top to bottom. In order to minimize the danger of damage from lightning, chimneys are frequently equipped with lightning rods, differing greatly in detail. An ordinary rod costs \$200 to \$300, while some of the more elaborate forms exceed this cost greatly. Platinum tipped points, copper rods and cables leading down to a plate buried in the ground are some of the details frequently adopted. In some cases, interior

adopted although this is modified in many instances. One company uses 30 lb. per sq. ft. on the projected area, reducing this by 29 per cent for octagonal surfaces and 33 per cent for round. Another uses 50 lb. for flat surfaces, 35 lb. for octagonal and 25 lb. for round, while still another varies the assumed wind pressure and stresses with the height, the limiting figures for a round surface being 17 lb. per sq. ft. for a height of 50 ft., and 23 lb. per sq. ft. for a height of 300 ft. This company varies the allowable stress between 7 tons per sq. ft. for a height of 50 ft.

ladders are provided when the chimney is built to gain access to the top and clean-out doors are usually required in the base.

CONCRETE

Concrete chimneys are ordinarily built with a minimum wall thickness of 4 to 8 in. at the top, depending on the size of the chimney. This thickness is increased toward the bottom at a rate depending on the stresses, one company using ratios of 3/16 in. to 1/2 in. for every 5 ft. of height. The companies building concrete chimneys figure the batter in different ways, one using an average of 3/4 in. for 4 ft. in height, another 0.3 in. to 0.45 in. per ft., and another a batter of 1 to 56 for small chimneys and 1 to 80 for large ones.

The design of the section and the reinforcement required in the wall are ordinarily based on an allowable compression in the concrete of 350 lb. per sq. in., and a tension in the steel of 16,000 lb. per sq. in. One of the companies keeps the ratio of steel to concrete below 1 per cent.

The John V. Boland Construction Company, St. Louis, never places the vertical reinforcement more than 12 in. apart at the top, and usually from 3 to 4 in. center to center at the base. This company uses a horizontal reinforcement of one or two layers of A. S. & W. No. 23 triangle mesh or 1/2-in. or 5/8-in. rods laid 10 or 12 in. center to center, and provides additional reinforcing at the foundation, around the breech opening and at the top of the lining. Another company uses wire mesh for the horizontal reinforcement, the concrete being of a 1:2 1/2:3 mixture, placed wet. The assumptions as to the wind pressure and the designs of foundations are practically the same for concrete chimneys as those described above for brick.

Concrete chimneys are ordinarily lined, although some have been built without lining, special provision being made in the design of the reinforcement to take up the temperature stresses. One company recommends a reinforced concrete lining built at the same time as the chimney wall, with a 4-in. air space at the bottom. Some linings of this type have been in service as much as 10 years with satisfactory results. Such a lining, however, costs more than a brick lining which is ordinarily used for one-third to one-half the height of the chimney and is covered by a concrete cap. The breech opening is ordinarily made with a width less than two-thirds the top diameter of the chimney, when wider openings are required, buttresses may be used. One company estimates that lightning rods for concrete chimneys cost from 2 1/2 to 7 1/2 per cent of the total cost of the chimney.

CONSTRUCTION

In the construction of brick chimneys, inside scaffolds are ordinarily used, the material being hoisted either inside or outside the chimney. If inside, a temporary opening must be provided at the bottom for entrance of material. In most cases the scaffolding is supported by cross pieces laid in niches in the wall, or by vertical timbers. These scaffolds are raised as soon as the walls have been built up to a height of 4 to 6 ft. above the platform. Brick chimneys can ordinarily be built at the rate of 6 to 8 ft. a day, although as much as 18 ft. has been completed by some companies. Specifications often limit the rate of construction to prevent application of too great a load on new brickwork. A maximum rate as low as 5 ft. per day has been specified.

In the construction of concrete chimneys, either wooden or steel forms may be used in addition to a scaffold similar to that described. The General Concrete Construction Company uses a scaffold of 4-in. by 4-in. or 6-in. by 6-in. verticals and 2-in. by 4-in. or 2-in. by 6-in. cross bracing and steel forms made in sections 5 ft. or 7 ft. 6 in. high according to the size of the chimney. This form is adjusted to the desired diameter by radial bolts, a new joint being formed for each move by punching the plates and bolting up the sections. As soon as one of the small plates which form the ring entirely overlaps the adjacent plate it is thrown out and the joint made with the next plate. These small plates are 33 in. wide and the adjustment is made with two bolts in each plate. These forms are practically

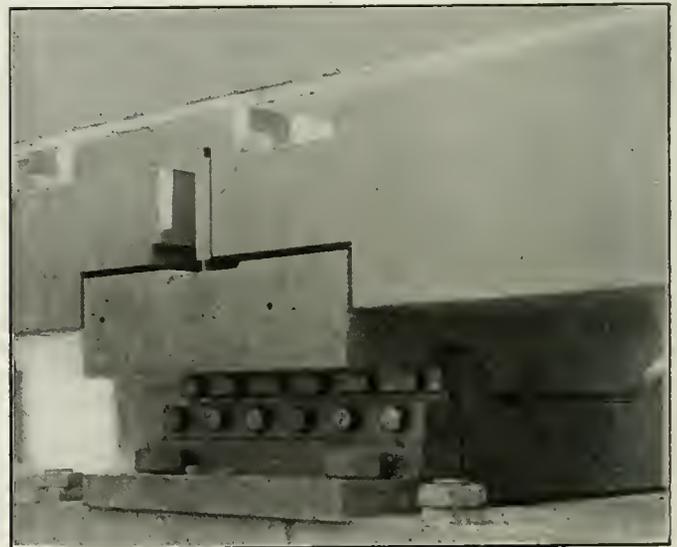

water-tight, allowing the use of a wet mixture. The surface is ordinarily washed with cement to give it a uniform color.

The Weber Chimney Company, Chicago, which has built many reinforced concrete chimneys, uses a unit form consisting of a series of wooden staves held together by castings and cables. Two complete forms are used, each 4 ft. 6 in. deep, which are placed one above the other alternately. Ordinarily the forms are moved once a day, although in the best weather on a single wall two moves may be made in one day. An inside scaffold is carried up with the work and the material is hoisted on the inside. The concrete is placed wet and spaded away from the face, the slight irregularities being finished off and the surface washed with Portland cement. A mixture of 1:2 1/2:4 is used in the shaft, the gravel having a maximum size of 1 in., while in the foundation 1:3:5 concrete is used with 2-in. gravel. The work on concrete chimneys can be carried on successfully during the winter by covering the concrete with heavy canvas until it has set and providing heaters under the canvas and at the bottom of the shaft.

A PLATE FULCRUM TRACK SCALE

The Pennsylvania Railroad has installed in its gravity yard at East Tyrone, Pa., a track scale of a new type, which is a radical departure from previous practice in that neither pivots, knife-edges, bearing steels, loops or links are employed in the vibratory system to transmit the platform load to the indicating poise beam. The design of the scale was worked up jointly by A. H. Emery, of Glenbrook, Conn., and the engineering departments of E. & T. Fairbanks & Company and the Pennsylvania Railroad.

While this scale was installed as a matter of experiment, it has been in daily service since August 16, weighing from 400 to 500 cars a day, and the results so far obtained indicate the suc-

Connection Between Main and Longitudinal Levers

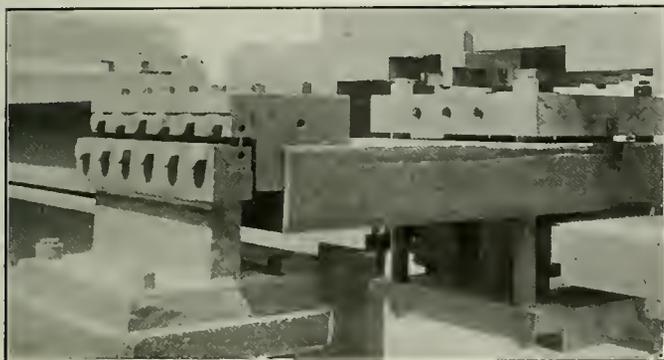

cess of the design. What is known as the "plate fulcrum" has been substituted for the regular knife-edge, pivot and bearing. This form of construction has been used successfully for years in large testing machines and in the dynamometer of the locomotive testing plant of the Pennsylvania Railroad at Altoona, but its application to a track scale is evidently new.

Since the scale has been completed a series of exhaustive tests, under both concentrated and distributed loads, have been conducted, and surprisingly accurate results have been obtained. The experiments thus far seem to have demonstrated that the plate fulcrum construction possesses many advantages, principal among which is the fact that the sensibility does not materially change under varying increments of load, it being almost the same under maximum load as under an empty balance.

The possibility of change in the power or adjustment of the

lever system of this scale is very remote, as there is no breaking down of the members forming the fulcrums, so that changes which ordinarily result from wear are eliminated, and after a scale of this type has once been properly installed and adjusted it is expected that little or no change will occur from usage. It should be understood that there is no motion whatever, either transverse or longitudinal, to the bridge or platform supporting the weighing rail, and, as a result, the action of the lever system is not affected by change in repose of the weighing platform, as the latter does not oscillate under moving loads.

The checking of the bridge is a unique feature. It is accomplished through the medium of massive stay-plates, instead of check-rods, the bridge being stayed from one end only to

Connection of Longitudinal Levers to Fifth Lever

take care of the longitudinal thrust and from one side only to take care of the transverse thrust. Hence the lengthening or shortening of the stay-plates (due to expansion or contraction) will not be reflected in the indicating poise beam by a change of balance, to the extent that is possible in a pivot and knife-edge scale with the generally accepted form of checking. The effect of the elastic bending of these stay-plates is not apparent in the calibration of the scale.

Another departure from previous construction, as ordinarily applied to track scales, is found in the fact that no parts of the scale are permanently bolted to the scale bridge proper. The bridge is supported by rollers which engage hardened plates, the rollers being placed intermediate between the bridge and the lever system, so that the load is centrally distributed on the plate fulcrums in the main levers. This feature also eliminates to a large degree the change in balance which is ordinarily manifested in a knife-edge and pivot scale as the result of change of position of the bearings when permanently bolted to the bridge. Another advantage is that the plate fulcrum is not disturbed by traffic over the platform, consequently neither dead-rail nor relieving gear are necessary, and the elimination of these factors simplifies the installation of the track arrangement, greatly reducing the element of danger, especially where motion weighing is practiced.

The scale installed at East Tyrone is 54 ft. long. It is located on a grade of 0.8 per cent. There are four sections in the scale, the primary system or main levers being arranged transverse to the direction of traffic, while the secondary system is arranged longitudinally. The total multiplication of the lever system up to the butt of the beam is 1,000, and the arrangement of the lever system is such that the load from each pair of main levers is transmitted independently to the fifth lever through the medium of the longitudinal levers, while the fifth lever is connected direct to the indicating poise beam. There are no compound levers in the scale which perform the function similar to what is known as the middle extension lever, a feature which simplifies the adjustment when calibrating the scale leverage.

The poise beam is directly connected to an indicator which moves over a graduated arc, the total travel of the indicator being about $2\frac{1}{2}$ in. on either side of zero. This facilitates the work of the weighmaster in obtaining a true position of the main poise when weighing cars in motion, the vibration of the

indicator being largely controlled by a dash-pot with liquid displacement. The main beam is graduated to 240,000 lb. by 1,000-lb. subdivisions and the fractional beam to 1,000 lb. by 50-lb. subdivisions. An ingenious device has been applied to the beam, so that its capacity can be increased from 240,000 lb. to 440,000 lb. by the simple action of a lever, without the addition of loose weights.

The main girders are provided with slotted openings in the web, through which pass the girders for supporting the deck or platform. This is of the rigid type to permit the top flanges of the girders to project through the scale platform, thereby furnishing a continuous rail support, as well as a suitable water table, the aim being to secure a waterproof deck.

It remains to determine the effect of continued usage on the action of the scale, but its operation to date and the results so far obtained seem to justify the experiment to such an extent that the Pennsylvania Railroad has worked up another design of track scale of the plate fulcrum type having only two sections. This will not only simplify the design by the elimination of many levers and fulcrums, but is expected to determine the

The Scale Mechanism in Place in the Pit

relative merits of continuous articulated bridge girders. It will also simplify the methods at present employed when testing scales of four or more sections, where the distributing effect must be taken into account in connection with the final result.

ARGENTINE FLOODS.—The past two years have been a time of flood trouble in Argentina. Rain has generally been regarded as a great desideratum in the Argentine Republic, but during the past year the Argentine had far too much wet, with the result that the rivers and ordinary channels could not carry it off, and great lakes were formed. This did not tell adversely upon the track of the railways so long as there was no wind, but when high winds arose they raised the flood-water into waves, and the track was rapidly undermined and washed away. The engineering staff of the Buenos Aires Western Railway grappled with energy with the difficulties which had arisen, piling with wood laying sheets of galvanized iron where the banks were most exposed, and filling in washouts with cement in bags and brick-bats in wire netting. They managed in consequence to keep trains running in most cases, but this was done at considerable expense, the works carried out involving the company in a loss of \$64,125. What was done upon the Buenos Aires Western system was also done, more or less, upon the Buenos Aires Great Southern and the Central Argentine Railways.—*Engineering, London.*

Repairing a Tunnel Lining Under Difficult Conditions

Seepage Through a Disintegrated Brick Lining Prompted Repairing It, Using a Concrete Atomizer

The Chicago Great Western recently solved a difficult tunnel lining problem by means of the concrete atomizer. The tunnel is one-half mile long and is located at Winston, Ill., at the crossing of the divide between the Mississippi and Rock river drainage areas. Originally lined with timber, it was relined in 1886 with a semi-vitrified red brick without completely packing the space between the shell of brick and the old lining. The soft clay through which the tunnel was driven contains much water and, because of the extensive voids behind the brick work, the lining is subjected to considerable hydrostatic pressure. This resulted in excessive seepage and dripping of water. Weep holes were provided at various places to eliminate the water pressure and carry the water away, but, nevertheless, the bricks of the arch were constantly saturated. The portals are located favorably for the formation of drafts through the tunnel with the prevailing winds and for the last two years a fan ventilating system has been in service. As a result, freezing temperatures prevail within the tunnel throughout the winter months, as evidenced by the formation of great masses of ice.

Whether the result of freezing or of the chemical action of the combination of locomotive gases and water, the brick work has seriously disintegrated throughout the entire length of the tunnel, particularly in the arch, in certain portions of which large sections of the inner ring have been completely destroyed. The problem of remedying this condition was a matter of serious consideration on the part of the railway officers for some time. The present lining gives only the normal vertical and horizontal clearance, so that a new lining inside of the old one was out of the question. At the same time, the removal of the old lining, preparatory to replacing it with a new one, would have been a very expensive and hazardous undertaking because of the treacherous character of the ground through which the tunnel was driven.

As previously described in the *Railway Age Gazette* on March 19, 1915, page 675, the concrete atomizer is a device for the application of concrete in the form of finely separated particles in a blast of superheated steam, producing a concrete unusually hard, dense and impervious. The superheat prevents condensation of the steam in the presence of the wet concrete and hastens the chemical action of the cement. The atomizer consists of a mixer drum containing revolving paddles, which communicates by means of a piston valve with an "atomizing chamber" where the concrete and steam are brought together. A discharge pipe leads from this chamber to the place of application of the concrete. The concrete materials: 1 part cement, 3 parts sand and 2 parts pebbles to which 10 per cent. by weight of water is added, are placed in the mixing drum, where they are subjected to the ordinary agitating process by means of the paddles.

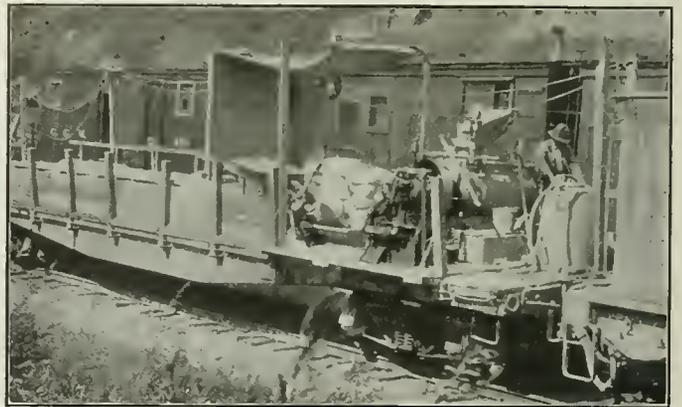

During the process of mixing, steam is admitted at a pressure of 80 lb. per sq. in. superheated about 50 deg. F. When the contents of the mixer drum are ready to be discharged, steam is admitted to the atomizing chamber from which it discharges freely through the discharge pipe. With steam pressure in the atomizing chamber at 30 lb. per sq. in. also superheated, the valve on the mixer drum is opened and the greater steam pressure within the drum, together with the worm-action of the paddles, causes the contents of the drum to discharge into the atomizing chamber. The latter is arranged in such a way that the concrete is "atomized" in the steam at an equalized pressure of about 40 lb. per sq. in. and immediately discharged into the discharge line. One interesting feature of the machine is the piston valve between the drum and the atomizing chamber, which is arranged in such a way as to give a minimum opportunity for the accumulation of small quantities of concrete which can set when the machine is not in use. Another feature is the con-

nection of small steam pipes to the shaft glands at each end of the mixer drum. By means of these the glands are kept at a higher pressure than the pressure within the drum, hence there is no tendency for the concrete materials to work outward along the shaft into the bearings.

The mixer is operated by a direct-connected V-type, 4-cylinder single acting steam engine. Wire-wound rubber hose of 1¾ in. inside diameter is used for transmitting the material, the hose couplings also being rubber lined. The use of this material seems especially suitable for wet concrete, as the wear is inconsiderable.

As the work on the Winston tunnel had to be carried on without interruption to traffic, it was necessary to place the entire plant on a construction train so that it could be taken in and out of the tunnel as required. This, of course, necessitated continuous work train service. The presence of a signal tower at the east portal, which was used in connection with the operation of a staff block through the tunnel, greatly expedited the movements of the work train.

The construction train consisted of three cars besides the engine and caboose and is illustrated in a number of the accompanying photographs. The mixer was located on the forward end of a

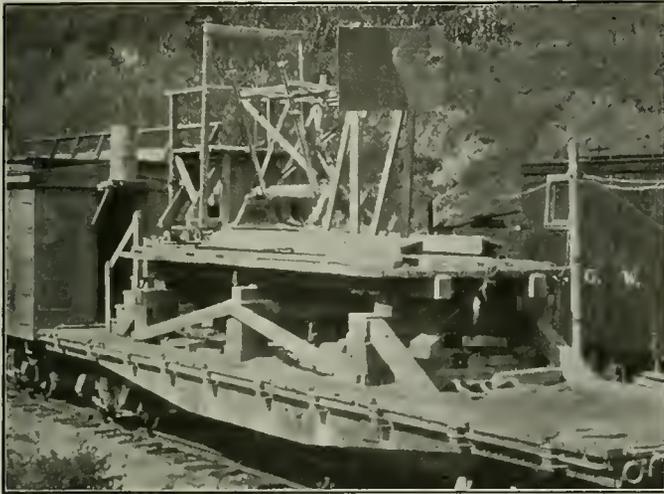

The Atomizer Car

flat car adjacent to the engine for convenient steam connection steam being supplied at 90 lb. by means of a reducing valve. The larger part of this car was utilized for the storage of the concrete materials which were measured and supplied by hand into the hopper of the mixer. Behind the mixer car was another flat car rigged up for the application of the concrete to the tunnel lining. A wooden platform about 20 ft. long was raised about 4 ft. above the floor of the car by means of blocking. Two light rails secured to this platform served as a track for a carriage containing the apparatus for the discharge of the concrete. On this carriage was a platform for the operator and a nozzle consisting of a piece of straight wrought pipe attached to a piece of reinforced rubber hose connected to the discharge line which ran along the side of the flat car. The nozzle was supported on a framework pivoted on a horizontal axis coincident with the center line of the car. By means of a small 2-cylinder reciprocating steam engine, this framework supporting the nozzle was made to swing from side to side in the arc of a circle. The entire carriage was also arranged for a longitudinal travel of about 10 ft. along the platform track by means of a windlass and rope which were operated by hand. A box car at the rear of the nozzle car was equipped with a platform protected by a wooden hand railing. This was used to clean the roof of the tunnel before the concrete was applied. Wire brushes and light pneumatic hammers were employed for this purpose, with the assistance of

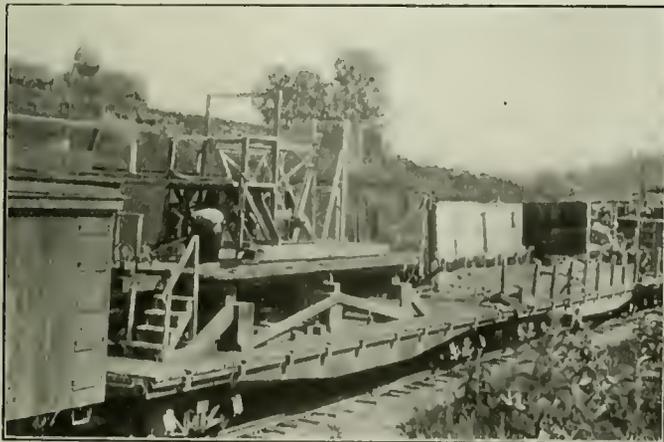

water which was supplied by a steam pump on the engine tank.

With the exception of an expert furnished by the owner, the work was carried on by the division carpenter crew of the railroad, which consisted of a foreman, three men cleaning the roof, one man at the nozzle, one at the carriage windlass, one at the atomizer and two loading and measuring materials. The concrete was applied on a 10-ft. length of the tunnel for a single position of the train. Water was run through the pipe and nozzle as a

The Nozzle Car

preliminary operation to clean the discharge pipe and wash off the soot deposited from the passage of the trains after the roof had been cleaned by the men on the box car. Steam was then run through the line to heat it to the required temperature and to insure flow through the pipe before the concrete was admitted. As soon as the flow of concrete was started, the nozzle operator started the engine which controlled the swing motion of the nozzle, while the windlass man slowly turned the windlass which moved the nozzle carriage along its track. The concrete was

The Construction Train. Nozzle Car and Part of Cleaning Car in the Foreground

thus deposited uniformly over a given width of the tunnel arch for the length of 10 ft. The nozzle operator controlled the flow of concrete, steam or water by means of a set of steam whistle signals.

In application the sand blows away until enough neat cement is deposited on the surface to make the sand stick. In a like manner, the pebbles bound off until enough mortar has been deposited to permit them to imbed slightly upon striking the surface. The pebbles and sand, however, perform an important office, even though they do not stay upon the surface. The impact resulting from the high velocity of the particles serves to compact the material solidly. This is evidenced by the manner

in which the fresh concrete was made to adhere to the dripping saturated surface of the old tunnel lining.

The speed of the concrete blast was controlled by the rate at which the hoppers in the mixer could be filled by hand, which was about one batch in five minutes. At this rate the concrete was applied as fast as three men could clean the old lining. The actual progress made in the tunnel was dependent almost entirely on the time that the tunnel was available for working between trains. A typical record was 262 ft. of lining for a width of 11 ft. in 6 hours. This required the use of 35 bags of cement. The entire work was completed in 41 days and has proven entirely

Placing SteamJetted Concrete on the Tunnel Lining

satisfactory thus far. The concrete presents a smooth surface and the leakage is negligible. The total cost of the work was \$4,600, of which \$1,700 represents rental of the machine and expert services and \$2,900 covers the labor, material, repair parts, work train service and expense of plant.

The concrete atomizer process is owned by Harold P. Brown, New York City, who leased the apparatus to the Chicago Great Western and had general supervision over the work. For the railway company, the work was under the direction of C. G. Delo, chief engineer, and I. F. White, division engineer, maintenance of way.

TURKEY'S RAILWAY STRATEGY.—According to an article in a recent issue of the *Journal des Debats*, Meissner Pasha, the German engineer who built the Hedjaz Railway, has been entrusted with the construction of a new strategic line, which it is hoped to use in connection with a second attack on Egypt. As far back as last May, this railway was already said to have reached Lydda, on the Jaffa-Jerusalem line. Rapid construction has been made possible by taking up tracks already laid on other railways, and 270 miles of track intended for the Medina-Mecca section of the Hedjaz Railway have similarly been "lifted" for the construction of this line. Green eucalyptus sleepers have been used.

Efficiency in the Bridge and Building Department*

A Discussion of Some of the Important Principles Governing the Successful Prosecution of this Work

BY GEORGE W. REAR

General Bridge Inspector, Southern Pacific, San Francisco, Cal

The work of the bridge and building department is of such great variety that it covers almost all of the building trades and some of the mechanical trades as well. As the work is scattered over a large territory it is hardly to be expected that as great efficiency can be secured as where the work is concentrated.

THE MAN IN THE GANG

Before going into the conditions of labor, let us look at the personnel of the department, beginning with the men in the ranks. The mature man one hires usually has some drawback: He is a wanderer, or a chronic kicker, or has one or more of the many faults human nature is heir to. He often expends more energy hunting a job than he does in doing it after he secures it. He has probably made up his mind that a railroad job is a snap and tries to make it one. When men are scarce and work must be done, these men must be tolerated, but at a great loss of efficiency in the work.

The only alternative is to keep the good men that we have and hire young men and train them ourselves. This is the foundation on which we must build the department.

Why do men leave us? Assuming that we have trained the man, what do we lose when we lose his services? Perhaps the railroad does not lose much in dollars and cents, as he has probably earned all he received while being trained, but it has lost a very material part of the organization and the benefit of his service in the years to come.

One reason his training has not cost much is because no special pains have been taken to train him. He begins as a laborer, works a year or two and becomes a handy-man, then secures a few tools and becomes a mechanic. Is he encouraged to advance? Probably not. If he is energetic, smart or likely to become a valuable man, is he dropped or "hidden under a bushel" for fear he will displace some older man? Is he kept away from home for weeks at a time and considered a nuisance if he asks for transportation home often enough to keep up an acquaintance with his family or associates? Are his wages anywhere near what they ought to be? Are his living conditions good or even fair? Is he laid off whenever work is slack? In other words, is his job worth having? These are questions that must be looked squarely in the face. They have little or nothing to do with what work a man will accomplish, but they are of vital importance in determining whether or not we have any men at all.

Thousands of young men of fair education are looking for a start on a life career every year. Are we getting our share of them? Have we anything to offer them? On the answers to these questions depends the future efficiency of the Bridge and Building Department.

It is efficient now, probably more so than other departments, but it is so largely in spite of conditions, except where proper methods are in force. Conditions are nowhere ideal, but much has been done, mainly by individual effort.

If we are to get and keep good men we must: hire young men of good health, good habits and fair education; we must put them at unskilled work (if there is such a thing) and give them a chance to learn the work, for it is a trade or profession of its own; we must also pay them proper wages. What proper wages are, is open to discussion, but it does not help the department to have boys leave the farm and get more pay as brakemen to begin with than bridge and building men ever hope to get.

We must make their living conditions agreeable. If required to be away from home they should have good living accommodations. Some of these men spend half their lives in an outfit car. Don't crowd too many men in a car, but provide some privacy and arrange so that men who are congenial can be grouped together. We must not forget to feed them. Quantity and variety of provisions are not the only things to consider, for the way that they are served is an important item.

Let the men go home often. The man who sticks closest to civilization is the best citizen and the most valuable man. If circumstances permit, let him go home every night; don't keep him away for fear that the boarding camp will lose money or to save some clerk the trouble of writing passes. Consider transportation as a man's right and do not try to make him think that he is getting it as a favor. Treat the man as a human being and as an equal in everything except responsibility and authority, and make his job as secure as that of any other employee. He will be proud of his job and it will be easy to keep him.

Do not drive too close a bargain with him and do not expect to get more than you pay for. Men should be hired with as great care as those for any other department. A fair education should be insisted upon and a physical examination given. This examination should be governed somewhat by the trade he is to follow, without blindly turning down all applicants who are not perfect, but it should be strict enough to cull out all those not physically fit to do a day's work.

These employees should be considered as employees of the railroad and not of a gang. They should be transferred frequently from gang to gang and given an opportunity to learn the standards of work and the methods used by different foremen. The man himself should show a desire to become a real railroad employee, to learn the business and to put up with its inconveniences without "growling."

If the men in the gang are not congenial and willing to work together as a team, an effort should be made to locate the reason and change the men around or discharge those who are not willing to pull with the rest. When there is friction in a gang there is always some cause, and this should be located and removed.

It is not to be expected that any method of handling men will eliminate all dissatisfaction, for the millenium is not yet at hand, and while human nature is what it is there will be men who look on every action of their superiors with suspicion. However, if the gang is treated in the spirit of fair play, the majority of the men will play fair.

THE FOREMAN

The gang must be made to pull together, for co-operation is the real reason for working men in gangs. The older men should be given charge of the apprentices, and if the gang is large enough it should be divided into groups of five or six men each, each group in charge of one of the older men, who, in addition to being a good workman, has shown some of the qualities of leadership.

The foreman looks to these leaders to keep their fellow workers properly employed while they themselves are in training for positions as foremen and should be given an opportunity to familiarize themselves with the bookkeeping required of foremen. It is not to be expected that all of these men will make good foremen, but enough of them will have the proper qualities to provide a plentiful supply, and it will not be necessary to go outside of the employees to secure them.

In picking men for foremen those should be selected who are

*A paper presented at the annual convention of the American Railway Bridge and Building Association held in Detroit, Oct. 19-21.

fair-minded, patient and good judges of human nature, in order that they may treat their men properly and secure their respect and confidence. A foreman should have the courage of his convictions, be energetic, resourceful, and have sufficient red-blood to be a leader. At the same time he should be quiet, firm and cool-headed so that neither he nor his men will "blow up" in an emergency. The loud-mouthed, profane driver may be necessary with mules and oxen, but is out of place with intelligent human beings.

A foreman should be honest, loyal, painstaking, reliable, sober and willing, so that he may be a fit representative of the company that employs him and command the confidence of his superiors. He should be studious and observing, that he may advance in his profession and become capable of added responsibility.

In considering the handling of men it may be well to remember a few established principles. There is a limit to the amount of work that can be got out of him. The value of a man does not lie in his physical force, but in his mental capacity or ability to co-operate with other men using heads as well as hands. The system of handling men and work should be such that it would not depend on any individual to carry it out. There is no use in keeping a man who is not satisfied with the job and whose work is not congenial.

Foreman should be developed along definite lines, and where the system is in proper effect this will be accomplished by making the future foremen understudy the regular foremen. It is also advisable to have the future foremen placed directly under the eye of the supervisor for a time, so that he may be advised and instructed in details that otherwise might be overlooked.

In educating men for foremen, the following points should be given consideration:

He should know that he cannot do all of the work himself, and that it would be useless to try, neither should he think that because he is foreman he should not do any manual labor. The amount of manual labor that a foreman should do has always been a matter of argument, but common sense will show that this depends on the number of men in the gang and the class of work that is being done. The foreman in the gang is employed to see that each man in the gang does his share of the work and the nearer this result is attained the more efficient is the gang.

It is neither possible nor desirable that a foreman be given strict rules and instructions for every class of work, because this results in making him a mere machine. A foreman should be given enough leeway so that he will not lose his enthusiasm, but will feel that the work depends on him and not on the fact that he is carrying out some one else's ideas and instructions.

The successful foreman is one who keeps harmony among the men. His men work "for him" and not "because of him." A good foreman does not have to stand over his men and drive them with threats, neither does he have to discharge a man occasionally to make the others fear him. No man has ever accomplished much through fear.

A foreman should arrange the work so that there will be competition among the men. Have groups of men at the same kind of work so there will be a speed contest. This contest may only be subconscious, the men hardly realizing that there is a contest or rivalry, but it will result in an increased amount of work. It must be remembered, though, that it is the steady, regular work that counts and that spectacular bursts of speed usually "fizzle" before long. These "high-speed plays" are all right if the work is of an emergency character and will be over in a few hours, but as a steady thing they are out of place. A man may be ambitious enough in the morning, but a few hours' steady work with a "number two" will serve to subdue his energy. It is the man who can select a gait at which he can keep all day who accomplishes the most.

TOOLS

A foreman should realize that he is not being paid for muscle or a strong back, but for his head and what there is in it, and should employ every opportunity to use his head to save hard

work. Human energy uselessly expended cannot be replaced and it should be conserved where possible or economical. To conserve and make human energy effective, tools have been developed. Without tools little can be accomplished, so it is a waste of labor to try to work without them.

These tools are two general kinds, hand and mechanical. The hand tools may not be exactly labor-saving, but their use makes labor effective and they should be of the best class obtainable. Keeping them in proper shape is a great aid to efficiency.

Mechanical tools are labor-saving devices, permitting the employment of steam or other power for work which would otherwise have to be done by men.

The locomotive crane is too expensive a tool for the ordinary bridge gang, but there should be enough of them on each supervisor's district to provide this equipment where needed. The modern car pile driver is a very efficient machine and each railroad should have enough of them to do their ordinary work and take care of emergencies. These drivers should be placed in the hands of efficient men and worked to as nearly full capacity as possible, as it does not pay to have them idle. With suitable attachments they can be used as light car derricks and their sphere of usefulness enlarged.

Almost every bridge gang can find efficient uses for a hoisting engine and their use should be encouraged. The gasoline engine has been developed to such an extent that it is very reliable. The present-day workmen are so well acquainted with them that there is no difficulty in finding someone to run them. They are very satisfactory for operating pumps, concrete mixers, etc.

Probably the greatest labor-saving device of the present day is the concrete mixer. An average bridge gang, doing ordinary work, will have considerable concrete to mix and to do it by hand, especially with men not used to it, is a back-breaking job. It is impossible to keep good mechanics if they are put at this kind of work very often. The small mixer taking a one-bag batch is the best for an average bridge gang. It should be self-contained and require no great amount of time to set it up. A mixer mounted on wheels or skids with a gasoline engine directly connected to it is best. It is almost criminal to mix concrete by hand when power is available.

Pneumatic riveting and boring tools are not used by the average bridge gang, but every gang doing work on steel bridges must use these tools to do good work. They are not only economical, but rivets driven by pneumatic hammers are better than those driven by hand and greater dependence can be placed on them. The motor car also adds greatly to the efficiency of a bridge gang, as the men can be taken to their work in less time and are in better physical condition when they get there. A bridge gang should be supplied with good jacks of proper size. The modern, ball-bearing screw jack is probably the best all-around jack, but each gang should also have some ratchet jacks for such work as they are suitable for.

Furnishing the tools is the duty of the superior officers, but their up-keep depends on the foreman. With proper tools and men, a gang is ready to go to work and its efficiency depends on how the men go at it. Where a gang is employed on one kind of work it is easy to get the job under way, but where the work varies in character it is usually hard to get it started so as to keep all hands profitably employed. This is where a competent foreman can make a good showing, and on the amount of headwork he uses will depend the efficiency with which he starts his work.

A foreman will soon realize that although all men are born free and equal they do not remain so. Although all of his men may be good, some of them may be better than others. Neither are all men equal in the variety of work they can accomplish. Having men of different characters and propensities, it is the foreman's duty to see that, as far as possible, each man is put at the work most suited to him, and on his ability to do so his efficiency will greatly depend.

A foreman should be careful to avoid doing one of his men an injustice. It is not enough to be just. Some things are better forgotten or overlooked.

THE SUPERVISOR

The department must have a head, and on this officer depends the efficiency of the division. To fill this position properly, a man must have special training and experience. He must be familiar with all the building trades, must keep up to date in the use of tools and labor-saving devices, and be an expert in the art of handling men. He must have all of the qualifications required of a foreman and in addition he should have the necessary qualifications to enter the diplomatic service.

His success depends on the regard in which his subordinates hold him, much more than that of his superiors. In handling men the most successful supervisor is the one who knows each man under him well enough to call him by his given name. He should see that his foremen understand his desires as to how the work is to be done, and, as few foremen are mind-readers, he should tell them explicitly.

It is always best to let a foreman handle the details of the work in his own way, if his way is anywhere near right, but there should be a clear understanding in regard to it, so that the work may go on properly from the beginning. Once the work is outlined, proper material and tools should be provided and enough material for a good start should be on hand before the gang begins work. Much inefficiency is the result of not having material and tools when required. A supervisor should go over the plans with the foreman and see that they are understood. He should see that the foremen are provided with all equipment to protect the men from injury and see that it is used. Men do much more work if they have safe stagings, stairways, etc., and are relieved from anxiety while at work. It is useless to expect a man to swing a hammer over his head if he is afraid of falling off a plank. He must have good footing to do good work.

A system of cost accounts tends greatly to efficiency. Each foreman should be required to report the labor cost of each job done and costs of similar work by the same or other foremen should be compared. It is not sufficient that these costs be taken from the auditor's accounts. They should be furnished by the foremen, as the fact that the foreman must work up the statement will cause him to be more careful in the handling of the work.

A supervisor should have gangs of proper size, properly equipped and located at the most convenient points, so that there may be no great loss of time in moving them around. These gangs should be organized to do all work of an ordinary character in their territories. Special gangs should be provided and specially equipped to handle the larger jobs of construction and reconstruction and such other special jobs that require special training and equipment.

The greatest incentive for men to do a good day's work is to have plenty of work in front of them. It is almost impossible to do efficient work when the job is about finished and no other work in sight.

The most important of all points tending to efficiency is regularity of employment. It is useless to try to perfect an organization if it is to be broken up every winter or as soon as the earnings fall off temporarily. When it is arranged so that the work can be carried on continuously and employment made permanent then, and then only, will there be a real foundation on which to build an efficient organization.

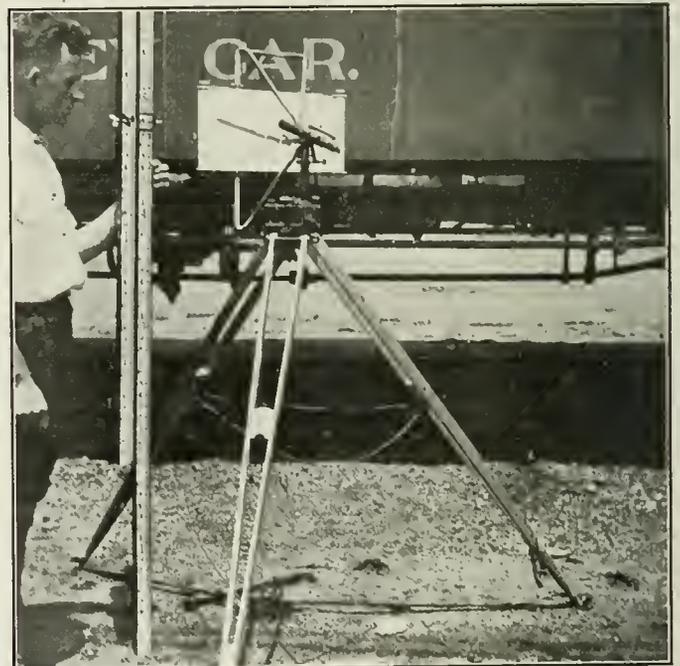

Finally, we must not lose sight of the fact that the real business of a railroad is to provide transportation, and that all other work is only incidental thereto. We must not allow our efficient methods to interfere with the running of trains. We have no money to waste, but it is nearly always necessary to depart from the most economical methods to avoid delays to trains, consequently we must consider efficiency to mean—the most satisfactory method of conducting a railroad as a whole.

INCREASED WAGES IN VICTORIA.—A request made by the Victorian Railways Union for an increase of 25 cents a day to employees, has been definitely refused.

A CROSS SECTION INSTRUMENT

The cross section work now being done on an extensive scale in connection with the federal valuation of railways has led to the invention of an instrument especially designed for the rapid taking of cross sections. This instrument consists of a telescope revolving in a plane parallel to a vertical aluminum board which carries cross section paper, and a graduated scale bearing on the surface of the paper and rotating with the telescope. The axle of the telescope is in a standard mounted on a leveling base, which also supports the frame of the board. The lower plate has a circular level, the upper one a tubular level, parallel to the plane of the board, and the instrument is mounted on a tripod with a quick leveling head. The legs are provided with shoes to rest on track rails.

The telescope is equipped with stadia wires spaced double the usual interval and readings are made from the center cross wire to the upper wire, thereby making one pointing of the instrument suffice both for direction and distance. A special rod used with the instrument eliminates corrections. It consists of a short rod hinged at the target to a longer rod, which is provided with a sight by means of which the rodman can always keep the rod

The Cross-Section Instrument and Rod

perpendicular to the line of sight. The instrument complete weighs about 18 lb.

To take a section, the instrument is set up and leveled, and the board and paper are adjusted to make the zero of the scale come to a convenient line on the cross section paper. A sight is taken on the rod, the telescope is clamped and the reading plotted on the scale. This is repeated for as many points as is necessary. When more than one setup is necessary, the procedure is to adjust the paper so that the zero of the scale will correspond to the point on which the instrument is set up.

Only two men are required to do the work, the instrument man and the rodman, thus at least one man is saved in the field party, and as the cross sections are plotted in the field, the time of plotting them in the office is saved. The instrument may also be used with a tape in place of the stadia, and with slight variations can be applied readily to tunnel cross sections. Although designed primarily for taking earthwork cross sections it would probably serve as well for topography. The instrument is being put on the market by Hoge & Flint, Louisville, Ky., and is now undergoing a test by valuation engineers of the southern district of the Interstate Commerce Commission.

General News Department

Two grain elevators of the Pennsylvania Railroad at Erie, Pa., were destroyed by fire December 10, together with about 500,000 bushels of wheat; estimated loss \$750,000.

The State of Pennsylvania has a new workmen's compensation law, and at a conference of the state board with railroad officers in Philadelphia on Monday, of this week, all of the principal railroads of the state announced their intention of accepting the provisions of the law.

The management of the Cleveland, Cincinnati, Chicago & St. Louis and the telegraph operators employed on the road have reached an agreement providing for increases in wages and changes in working conditions, which were made effective on December 1. The increase in wages will amount to about \$45,000 a year.

At Otisville, N. Y., on Monday evening last, a considerable number of passengers who had alighted from westbound passenger train No. 179, of the Erie road, were struck by east-bound passenger train No. 2, opposite, or nearly opposite, the station, and six or more were injured. Most of the passengers were thrown into a snow-bank. None of the injuries were fatal.

Senator Lea, of Tennessee, has sent to the Interstate Commerce Commission a petition asking for the investigation of charges that the Louisville & Nashville and the Nashville, Chattanooga & St. Louis furnish free passage to public officers in Tennessee, citing the report of the investigation which was made by the Interstate Commerce Commission in that state; and charging also that influential shippers receive favors.

Switchmen's Strike at Chicago

The enginemen, trainmen and switchmen of the Belt Railway of Chicago struck, on Tuesday of this week, causing a serious interruption of freight traffic. The reason given for the strike is that the railroad company had refused to run a train to carry employees to and from their work at the new clearing yard, southwest of the city; though the officers of the road had offered to provide a temporary train until such time as the men could move their homes to houses near the yards. The company had applied to the federal mediation board to take up the grievances of the men.

Newspaper "News" About a Railroad President's Salary

"SAN FRANCISCO, Dec. 10.—E. P. Ripley, president of the Atchison, Topeka & Santa Fe Railroad, whose salary is reported to have been raised from \$75,000 to \$100,000 a year, is now the highest steam railroad executive in the United States. Mr. Ripley's salary is said to have been increased on the occasion of his seventieth birthday, celebrated by a banquet of railroad officials at Chicago Oct. 30."—*Chicago Examiner, December 11.*

"E. P. Ripley, president of the Santa Fe Railroad, when questioned yesterday at his home in Santa Barbara, Cal., by a Herald representative regarding the report that his official salary had been raised from \$75,000 to \$100,000 a year, said that he knew nothing about any such increase."—*Chicago Herald, same date.*

St. Paul Electrification Tests

The Chicago, Milwaukee & St. Paul has been conducting elaborate tests during the past two weeks on its 2 per cent grades crossing the Rocky mountains east of Butte with the three electric locomotives which have been received. These tests included trials to ascertain the tonnage the locomotives would haul as well as the application of regenerative braking. Among the final tests was one on December 8, at which time two electric locomotives took a train of 48 loaded cars, 3,000 tons, from Butte up the 2 per cent grade to the summit of the Rocky mountains at a speed of 16 miles an hour and then continued down the descending grade on the opposite side. An interesting comparison with steam operation was secured by fol-

lowing this train with a steam train made up as regularly operated with 37 cars, 2,000 tons. This train was hauled by two road engines with a Mallet pusher. It ascended the grade at a speed of 9 miles an hour. The tests were conducted in the presence of President Earling and other officers and directors of the St. Paul. Until other locomotives have been received the three now on hand will be employed in pusher service over the 2 per cent grades between Piedmont at the foot of the eastern slope of the Rocky mountains and Butte on the west.

Trainmen's Brotherhoods Prepare for Eight-Hour-Day Campaign

The general chairmen of the Brotherhood of Locomotive Engineers and the Brotherhood of Locomotive Firemen and Enginemen, after a two-day meeting in Chicago, announced on December 11, that they had decided to join forces with the eastern and southern engineers and firemen and with the Brotherhood of Railroad Trainmen and the Order of Railway Conductors in the movement for an eight-hour day with time and a half for overtime. A general conference of the executive committees, including delegates from the eastern, southern and western organizations of the four brotherhoods was called to be held in Chicago on December 15, to frame the demands to be presented to the railroads.

The meeting of the western enginemen and firemen was presided over by Warren S. Stone, president of the Brotherhood of Locomotive Engineers, and W. S. Carter, president of the Brotherhood of Locomotive Firemen and Enginemen. It is understood that W. G. Lee, president of the Brotherhood of Railway Trainmen, and A. B. Garretson, president of the Order of Railway Conductors, participated in the meeting.

Timothy Shea, assistant president of the Brotherhood of Locomotive Firemen and Enginemen, who was a representative of the employees in the arbitration of the controversy between the western enginemen and firemen and the railroads, was quoted in the Chicago papers as follows:

"This time there will be no arbitration. The principle of arbitration is excellent, but it has been abused. There is no secret about what we are after. We will flatly demand an eight-hour day and time and a half for overtime. We may add other demands at our conference. If we do not get what we want we will walk out. Every railroad in the United States—more than 350,000 men—will be affected. At our meeting we will arrange details of the plan and will set a date for final action."

The New Haven Trial

The cross-examination of former president Charles S. Mellen was continued during the past week in the trial of the eleven New Haven directors in the Federal Court in New York. On December 9 Charles F. Choate, for the defense, asked of Mr. Mellen the question: "Did you at any time conspire with any one whatever to effect a monopoly?"

"I never conspired in any way, shape, or manner. I was trying to build up for New England an efficient system of transportation to obtain mileage so as to make it possible to distribute the cost of the terminals, which was tremendous, over as large a mileage as possible. We had no preconceived idea as to how this was to be brought about. It was a process of evolution. I do not know but that we should all have been scared to death if we had appreciated in our first step what the last step was to be."

On Friday the government counsel tried to offset the effect of some of the evidence brought out in the cross-examination of Mr. Mellen by the defense by showing the influence the railroad had with the state government of Massachusetts. Mr. Butts, for example, showed that Governor Draper showed T. E. Byrnes, then vice-president, a tentative draft of a message, but Mr. Mellen emphatically denied that he had helped Mr. Draper prepare the message.

Mr. Choate on Monday brought out that in May, 1908, E. H. Harriman, who then had an interest in the Delaware & Hudson

and the Erie, made Mr. Mellen an offer to buy the New Haven's interest in the Boston & Maine. Mr. Mellen at first was willing to consider the offer, particularly as at the time there was much popular opposition to the New Haven's control of the road. According to this testimony on Monday, however, he did not really want to sell the Boston & Maine, but it did occur to him that if the New Haven was not able to get from the Massachusetts legislature the legislation it required, it might find Mr. Harriman a convenient purchaser. The negotiations lasted until May, 1909, the New Haven finally declining to sell because it secured the necessary legislation.

Mr. Mellen took occasion to say at this point that if the Boston & Maine had ever fallen under the domination of Mr. Harriman, New England would have found that there are harder railroads to deal with than the New Haven. "There would have been no more independence of the trunk roads for New England if the Harriman system had managed to acquire the Boston & Maine. It would have become impossible for the New Haven to maintain its independence. New England would have come under the trunk lines."

Mr. Mellen was finally excused as a witness on Tuesday, having completed 36 days on the stand.

Wednesday, Samuel Hemingway, president of the Second National Bank of New Haven, through which institution was handled the financing of the New England Investment & Securities Company, was on the stand. He was followed by L. H. Fitzhugh, vice-president of the Grand Trunk at New London, and by Thomas B. McGovern, a shipping broker, who testified concerning the acquisition of the Metropolitan Steamship Co.

Operating Revenues and Expenses of Express Companies for August, 1915

The following statement, which is subject to revision, has been compiled by the Interstate Commerce Commission from the monthly reports of operating revenues and expenses of the principal express companies for August, 1915.

A Record Snowstorm

A snowstorm which prevailed on the Atlantic Coast from Philadelphia northward to Boston and beyond, on Monday and Tuesday of this week, caused serious delay to passenger traffic on all of the roads in that territory; and on the New York, New Haven & Hartford between New Haven and its New York City terminus electric traffic was entirely suspended for two days, the electric power line having been disabled; and the telegraph, telephone and signaling wires were broken down by the weight of snow and ice in many places. This four-track line, running 18 express trains to Boston daily, and about 70 passenger trains altogether, to and from New York, suffered an interruption more serious, probably, than any since the time of the notable storm of March, 1888 (when the traffic was much smaller in volume than now).

The storm began with rain; by Monday noon it began to snow and the snow and rain combined froze to wires and posts, the coating being three inches thick, and more, on nearly all wires. On Tuesday morning the storm had abated and the depth of snow on the ground was about 12 inches.

The New Haven road, using steam locomotives, ran about one-tenth the usual number of passenger trains on Tuesday, and not many more on Wednesday, all movements being much behind time. The block signals were out of service all the way from New Haven to the connection with the New York Central at Woodlawn, about 60 miles, and trains had to be run by time interval or with speed under control. Freight trains had been moved clear of the main track early on Tuesday at nearly all points west of New Haven.

By Wednesday evening the block signals had been restored between Woodlawn and Stamford, 20 miles, and electric motive power was available to a limited extent; but the passenger service was very deficient on Thursday.

On roads other than the New Haven, the delays were due mainly to the snow, and were serious on all lines except the Pennsylvania. At Poughkeepsie, on the New York Central, 75 miles north of New York, and at Albany, 70 miles farther

1. Discontinued operations on April 30, 1915.

north, the depth of snow was 24 inches. Passenger trains were many hours late and freight trains were not moved.

The milk dealers of New York City, receiving milk on all of the roads entering the city, reported on Tuesday evening that they had been able to deliver only about one-half the usual quantities of milk on that day.

At Philadelphia the depth of snow was about 7 inches. All roads suffered moderate delays.

Railway Earnings for September Break Record

Operating revenues, net operating revenues and net operating income per mile of the railways of the United States having annual operating revenues above \$1,000,000 were all greater than for any September in their history, according to the figures shown in the monthly bulletin issued by the Bureau of Railway Economics.

As shown by the Bureau of Railway Economics, the net operating income for September increased \$73 per mile, or 20.9 per cent, as compared with September, 1914. However, September, 1914, largely because of conditions in the South, was the lowest September in the last six years. A comparison of September, 1915, with the average September of the preceding five years, shows an increase of 17.4 per cent.

Total operating revenues amounted to \$286,403,834, an increase from 1914 of \$16,842,784. Operating expenses were \$177,140,771, a decrease of \$814,846. Net operating revenue amounted to \$109,263,063, an increase of \$17,657,630. Taxes amounted to \$11,783,145, an increase of \$336,003. This left \$97,412,193 of net operating income, available for rentals, interest on bonds, appropriations for improvements and new construction and dividends. Operating revenues per mile of line averaged \$1,251, an increase of 5.6 per cent; operating expenses averaged \$774, a decrease of 1.1 per cent; net operating revenue per mile averaged \$477, an increase of 18.6 per cent, while net operating income per mile was \$426, an increase of 20.9 per cent. Taxes per mile increased 2.3 per cent. Railways operating 228,775 miles of line are covered by this summary, or about 90 per cent of the steam railway mileage in the United States.

Operating revenues of the Eastern railways per mile show an increase of 7.9 per cent as compared with September, 1914, operating expenses decreased 0.7 per cent, net operating revenue increased 26.1 per cent, taxes decreased 1.6 per cent and operating income increased 29.9 per cent.

Operating revenues of the Southern railways per mile increased 7.8 per cent, operating expenses decreased 3.5 per cent, net operating revenue increased 41.0 per cent, taxes increased 6.4 per cent and operating income increased 48.0 per cent. But September, 1914, was far below the average. Compared with the average September of the preceding five years, the operating income for the month of September, 1915, increased 21.6 per cent.

Operating revenues of the Western railways per mile show an increase of 2.8 per cent, operating expenses decreased 0.2 per cent, net operating revenue increased 7.7 per cent, taxes increased 4.8 per cent and operating income increased 8.0 per cent.

The three months of the current fiscal year show an increase in total operating revenues per mile of line of 2.4 per cent, as compared with the corresponding period of the preceding year, a decrease in operating expenses per mile of 2.9 per cent, an increase in net operating revenue per mile of 13.6 per cent, an increase in taxes per mile of 1.9 per cent and an increase in operating income per mile of 15.4 per cent.

Operating income per mile increased 24.3 per cent in the East, increased 25.7 per cent in the South, and increased 5.0 per cent in the West.

September operating income per mile was 20.9 per cent greater in 1915 than in 1914, 19.6 per cent greater than in 1913, 9.9 per cent greater than in 1912 and 15.9 per cent greater than in the year 1911.

The American Society of Mechanical Engineers

The following is the list of the newly elected officers of the American Society of Mechanical Engineers for the coming year: D. S. Jacobus, president; W. B. Jackson, J. Sellers Baneroff and Julian Kennedy, vice-presidents; J. H. Barr, J. A. Stevens and H. deB. Parsons, managers, and W. H. Wiley, treasurer.

REVENUES AND EXPENSES OF STEAM ROADS—SEPTEMBER, 1915

Compiled from monthly returns of the railways to the Interstate Commerce Commission and covering roads of Class I, i. e., roads with annual operating revenues above \$1,000,000.

The Railway Club of Pittsburgh

At the regular meeting of the Railway Club of Pittsburgh, to be held on Tuesday, December 21, at the Monongahela House, Pittsburgh, Pa., Samuel Lynn, master car builder of the Pittsburgh & Lake Erie will present a paper on "The Life of the Steel Freight Car."

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, date of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontious, 455 Grand Central Station, Chicago. Next meeting, January, 1916, Atlanta, Ga.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, Supt. Timber Preservation, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 18-20, 1916, Chicago.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.
- NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.
- NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
- RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.
- RAILROAD MEN'S IMPROVEMENT SOCIETY.—J. B. Curran, Erie R. R., 50 Church St., New York. Meetings, alternate Thursdays, October to May, Assembly Rooms of Trunk Line Association, 143 Liberty St., New York.
- RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York. Annual meeting, January, 1916, Waldorf-Astoria Hotel, New York.
- RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.
- RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.
- ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
- SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.
- TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.
- TRAFFIC CLUB OF NEWARK.—Roy S. Bushy, Firemen's Bldg., Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, 559 Broad St., Newark.
- TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.
- TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Agt., Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings, bi-monthly, Pittsburgh.
- TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings, October to May.
- TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.
- UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.
- WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.
- WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Building, Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.
- WESTERN SOCIETY OF ENGINEERS.—E. N. Layfield, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

Traffic News

The Union Pacific has requested shippers routing freight through Seattle for export to arrange for steamer space before shipping.

From April 1, 1914, to November 16, 1915, the daily Oriental Limited express train of the Great Northern in 593 consecutive westbound summer and winter runs arrived at Seattle on time 561 days.

The Chicago & Alton freight department announces a through package car from Chicago to Shreveport, La., in connection with the Kansas City Southern via Kansas City, giving fourth morning delivery from Chicago.

The express companies have made arrangements to keep their Chicago offices open for the receipt of packages until 9:00 o'clock every evening and their depot stations all night, during the month of December, for the purpose of preventing congestion.

Figures compiled by the American Railway Association's committee on relations between railroads show that the total freight car surplus on December 1 was 60,793, as against 55,793 on November 1. The total shortage on December 1 was 22,594, and on November 1, 27,525.

The Official Classification Committee, which has recently been reorganized with four permanent members, has issued an announcement of the plan under which it will operate for the present. Requests for changes in the classification must be filed in writing with the committee. Dockets for subjects involving changes to be considered at regular meetings will be issued with reasonable advance notice and will be mailed to subscribers at a charge of \$1 per year. The committee will hear those interested in docketed subjects at meetings in Chicago and New York in January, March, May, July, September and November, as announced in the docket. Conference with the committee may be had by appointment respecting subjects not on the docket.

Additional Embargoes at New York

C. C. McCain, chairman of the Trunk Line Association, announced this week that the number of cars of freight waiting at New York to be unloaded, including those on the way, east of Buffalo and Pittsburgh, was about 45,000, or approximately 3,500 more than one week before; and that with all facilities fully engaged, including all lighters and car floats, not over 1,500 cars can be delivered daily.

The Pennsylvania Railroad, on Tuesday, put embargoes on all carload and L. C. L. freight from points off its own lines, when consigned to New York to be lightered, except perishable freight, flour and other foodstuffs for local consumption; excepting also coal for delivery at Jersey City, coal to supply railroad with fuel, and coal for public service corporations. Through freight for New England over the New York, New Haven & Hartford is not covered by the embargo. The statement says that the congestion at New York has been largely due to mills and factories shipping their products without regard to facilities for unloading. On freight not embargoed, the company will try to induce shippers to send out only such freight as can be promptly unloaded. A separate embargo includes Newark, N. J., and Waverly, the freight transfer station west of New York and all shipments going through Waverly except for the New Haven road.

The New York Central has embargoed all flour and grain products for export through New York; also lumber and hay to be lightered.

The Erie has embargoed flour for export, not only that on through bills of lading, but all other.

The Baltimore & Ohio has embargoed lumber from the South, destined to New York for export.

The Central of New Jersey has embargoed all freight for delivery to coastwise steamers at New York; all freight for delivery at New York to go to the Pacific Coast by steamer; and all freight to be delivered at Brooklyn terminals. The Baltimore & Ohio has embargoed all grain for export via Baltimore, about 4,000 carloads being now held for the elevators at that port.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Pipe Line Transportation of Petroleum

In re conditions affecting the production, transportation and marketing of crude petroleum. Opinion by the commission:

In accordance with a resolution by the United States Senate adopted in September, 1914, the commission made an investigation of the control of pipe line companies and a discontinuance of running and purchase of petroleum in 1914 and the reasons therefor. It was found that certain pipe line companies had directors and officers common with other pipe line companies. The Federal Trade Commission is making an investigation of the oil industry, and the Interstate Commerce Commission, not having jurisdiction to investigate the records of industrial concerns, leaves the subject of what disposition the purchasing agencies have made of crude oil purchased and to whom it has been turned over for refining and manufacture, in so far as such information cannot be obtained from the pipe line companies' records, to appear in the reports of the Federal Trade Commission.

As to the discontinuance of running and purchase of petroleum in 1914, the commission puts on record the letters from pipe line officers to their subordinates showing that this was done because of the conditions in the crude petroleum market caused by the war and in order to guard against having storage tanks full to capacity with no assurance of being able to get rid of the stored oil. (36 I. C. C., 429.)

Rates on Lumber to Points in Texas

Oklahoma Traffic Association et al. v. Abilene & Southern et al. Opinion by Commissioner Daniels:

The commission finds that the carriers have not justified a proposed cancellation of the application of rates on lumber to sash, doors and blinds, in carloads, from Oklahoma City and Okmulgee and other points in Oklahoma, and from Shreveport and other points in Louisiana, to points in Texas, and proposed carload rates on sash, doors and blinds from Oklahoma City and other points in Oklahoma to certain points in Texas.

The present rates on sash, doors and blinds and other wooden building materials rated with sash, doors and blinds, in carloads, from Oklahoma City and Okmulgee to points in Texas are found unreasonable and reasonable rates are prescribed for the future.

The maintenance of narrower descriptions of building materials, higher minimum carload weights and less extensive schemes of joint rates from Oklahoma City and Okmulgee, Okla., to points in Texas than from Kansas City and St. Louis, Mo., Waco, Tex., and other competing points, is held to be discriminatory.

The present relationship between rates on wooden building materials, in carloads, from Oklahoma City and Okmulgee, Okla., to Texas, and from Texas producing points to the same points is also held discriminatory.

Fourth section relief is denied. (36 I. C. C., 329.)

Eastern Live-Stock Case

Opinion by Commissioner Meyer:

In tariffs filed to become effective March 15, 1915, and later dates, suspended by the commission to January 13, 1916, the carriers proposed changes as follows:

First, a general revision of rates on live-stock, except horses and mules, between points in central freight association territory, with certain increases in carload minimum weights. A related revision of rates on fresh meat and packing house products has been made the subject of an investigation: Central Freight Association Territory Fresh Meat and Packing-House Product Rates.

Second, increased rates on live stock, except horses and mules, on fresh meat and on packing-house products, packed and loose, from points in central freight association territory to points in

trunk line and New England freight association territories, with certain increases in carload minimum weights.

The rates here sought to be increased were increased 5 per cent at the time of the decision in the Five Per Cent Case. (31 I. C. C., 351; 32 I. C. C., 325.)

The commission's findings are as follows: The carriers may establish new rates on live stock, except horses and mules, in central freight association territory higher than those at present in effect, but the increases are not as great as those proposed by the carriers. Certain of the increased carload minimum weights are also allowed. In connection with these live-stock the carriers introduced evidence intended to show that the transportation of live stock is more expensive than the transportation of other kinds of freight, because (a) the number of tons of equipment hauled per ton of live stock is greater than that for other freight; (b) greater engine energy is required to haul live stock with consequent greater cost; (c) the car efficiency of live-stock cars is less than that of other equipment; (d) terminal facilities for live stock are more expensive; (e) live stock is peculiarly subject to state and federal regulations, compliance with which directly involves additional operating expenses; (f) the expedited service afforded live stock is more expensive than slow freight service; (g) the free transportation of attendants is a source of expense peculiar to live stock; (h) the terminal expense of handling live stock is high; (i) the cost of cleaning and disinfecting stock cars and pens is high; (j) the road movement for short hauls of live stock is particularly expensive; (k) quarantine regulations applying to live stock are burdensome; (l) delay to other trains is caused by live stock, both on the road and at terminal points; (m) the live-stock movement entails special work connected with dispatching.

The commission also finds that the carriers have justified the following: Proposed increased rates on cattle and on hogs and sheep or goats in single-deck and in double-deck cars from points in central freight association territory to points in trunk line and New England freight association territories; certain proposed increased carload minima applicable to live stock shipped between the same points, certain other proposed changes not being allowed; proposed increased rates on fresh meat from points in central freight association territory to points in trunk line and New England freight association territories; and proposed increased carload minima applicable to fresh meat and packing-house products, loose, from points in central freight association territory to points in trunk line and New England freight association territories.

It is found that the carriers have not justified increased rates on packing-house products, packed, and packing-house products, loose, from points in central freight association territory to points in trunk line and New England freight association territories, which would exceed the classification rates on these commodities, nor have they justified proposed increased rates and carload minima applying on live stock and packing-house products between points in trunk line territory east of the western termini of the trunk lines. (36 I. C. C., 675.)

STATE COMMISSIONS

The Tennessee Railroad Commission has suspended new tariffs recently filed by the railroads in Nashville increasing rates for switching cars in that city.

The Illinois Public Utilities Commission has ordered a hearing on January 4 on tariffs filed by the railways imposing a charge for cleaning and disinfecting stock cars.

The New York State Public Service Commission, First district, has postponed to February 1, 1916, the time within which the Interborough Rapid Transit Company must install and experiment with automatic block signals on the elevated lines of the company, where speeds are always low; and the road is required to report the results of its test by August 1, 1916.

The Railroad Commission of New Hampshire, at Concord, December 8, continued its investigation into the acts of the Boston & Maine, in 1912, when the Grand Trunk was threatening to build a line southeastward through New Hampshire to Boston. Testimony was presented to the effect that the total expenditures of the Boston & Maine and its subsidiary line, the Concord & Montreal, to thwart the Grand Trunk, were \$78,565.

PERSONNEL OF COMMISSIONS

Hon. Oscar S. Straus, of New York City, formerly secretary of commerce and labor, and later ambassador to Turkey, has been appointed by the governor to the position of chairman of the New York Public Service Commission, First district, in place of E. E. McCall, removed by the governor last week.

Hon. Francis M. Cockrell, formerly a member of the Interstate Commerce Commission, died at his home in Washington, December 13, at the age of 81. Mr. Cockrell was an officer in the Confederate army, rising to the grade of brigadier general; and after the war was for 30 years United States senator from Missouri.

COURT NEWS

The United States court at San Francisco has issued an injunction restraining the Interstate Commerce Commission from enforcing that part of its order of April 30, on west-bound transcontinental freight rates, which removes the cities of Sacramento, Stockton, San Jose and Santa Clara from the list of cities taking terminal rates. The order became effective on July 14, and a temporary injunction at that time was denied by the court.

The Pennsylvania Company, and the Pittsburgh, Cincinnati, Chicago & St. Louis pleaded guilty in the United States Court at Chicago last week to indictments charging them with having allowed rebates by refunding \$2 a carload on shipments of grain from the B. A. Eckhart Milling Company, Chicago, to eastern points during 1912 and 1913. Counsel for the roads contended that the payments were lawful as representing switching charges which had previously been paid by the shippers on the grain, inbound. Judge Landis found the roads guilty under two indictments of five counts each, while permission was granted to present further evidence, that the court may determine the degree of guilt and fix the penalty.

Written Notice of Damage Provision Must Be Pleaded

The Nebraska Supreme Court holds that the provisions of a bill of lading requiring written notice of damage to be given to the carrier and fixing a time less than that fixed by the statute in which action shall be commenced, in order to be available as a defense, must be pleaded as such; otherwise they are deemed waived.—*Gilinsky v. Illinois Central (Neb.)*, 154 N. W. 730.

Assessment of Uncompleted Right of Way

The West Virginia Supreme Court of Appeals holds that a county assessor has no authority to assess any part of a public railroad company's right of way, not so far completed as to be fit for use, unless and until the land acquired therefor has been transferred to it from the former owner on the land books; and such assessment by him is unlawful and void.—*Clarksburg Northern v. Morris (W. Va.)*, 86 S. E. 893.

Hours of Service Act—Operator in Emergency Service

The federal District Court, Northern district of West Virginia, holds that the words "towers, offices, places and stations" in the provision in the hours of service act as to telegraph operators refer to telegraph offices generally; and that operators engaged in wrecking or relief service, though technically not members of "the crews of wrecking and relief trains" expressly excepted from the provision of the act, are engaged in emergency work, and are therefore excepted.—*United States v. Baltimore & Ohio*, 226 Fed. 220.

White and Negro Accommodations—Intrastate Trains Only

The Louisiana Supreme Court having held that the Louisiana statute requiring separate accommodations for white and negro passengers applies to intrastate passengers only, the Mississippi Supreme Court holds, in an action by a passenger on an interstate train for being forcibly deprived of his seat in a comfortable car to accommodate a negro excursion, and to ride in the caboose, that the giving an instruction on the statute in such an action was error.—*O'Leary v. Illinois Central (Miss.)* 69 So. 713.

Killing Animals—No Presumption of Negligence

Action was brought for the loss of a mule which had strayed upon a public crossing in the night time and was first seen by the enginemen when it was utterly impossible to avoid striking the animal. The Oklahoma Supreme Court reversed a judgment for the plaintiff. The plaintiff's right of recovery depends on the defendant's negligence, and there was no circumstance from which negligence might be reasonably inferred; so it is the duty of the court to direct a verdict for the defendant.—*Ft. Smith & Western v. Dixon (Okla.)*, 152 Pac. 350.

Penalty Under Hours of Service Act

The federal District Court, Northern district of West Virginia, holds that a railroad company which permits telegraph operators to work a greater number of hours than is prescribed by the hours of service act, and fails to make report of the extra hours of service rendered, is liable to but one penalty for each employee, and not for a further sum per day for each of the days the reports have been in default, where it denied liability, and where the omission was made in good faith, and under the belief that such report was not required.—*United States v. B. & O.*, 226 Fed. 220.

Liability of Intermediate Carrier for Delay

Prior to the existence of the Carmack amendment the different state courts by their decisions had adopted different rules relative to actions for damages by shippers against railroads. The purpose of the amendment was to secure simplicity in the transportation of freight carried by several railroads by localizing the responsible carrier. The Federal District Court, D. Minnesota, holds that under the amendment an intermediate carrier cannot be sued for delay in transportation of an interstate shipment of live stock where the delay was not caused by its line, regardless of whether or not it had issued a bill of lading.—*Hudson v. Chicago, St. P. M. & O.*, 226 Fed. 38.

Powers of Railroad Commission

The Louisiana Supreme Court holds that neither the Constitution nor any statute, either directly or by fair implication, confers on the Railroad Commission of Louisiana jurisdiction to assess or award against a railroad company, damages alleged to have been sustained by a shipper or consignee by reason of its observance of a freight rate authorized by the commission, but subsequently declared to be unreasonable. Whether such damages are recoverable in an ordinary action in a court is a question which was not involved in the case.—*Texas & Pacific v. Railroad Commission (La.)*, 69 So. 837.

Abandonment of Highway in Railroad's Possession

A railroad company agreed with highway commissioners of a town that it would dedicate a new road and pay \$300, which was done, in return for the abandonment of an old road on land where the railroad desired to excavate. For years no public right was exercised in the old road, but it was held (adversely to such rights) by the railroad, and with the acquiescence of the public. The highway commissioners then sought to compel the railroad to construct crossings and approaches over its tracks for the old road. The Illinois Supreme Court held that the public was bound by the doctrine of equitable estoppel, and the old road must be regarded as abandoned.—*People v. C. C. C. & St. L. (Ill.)*, 109 N. E. 1064.

Yard Accident—Assumption of Risk

A fireman was required to check in on return from each trip. Incoming engines were stopped over a cinder pit. Beside the track was an ash pit which had never been lighted. One night the fireman's engine stopped short of the cinder pit, another engine being over it. He started to the roundhouse to check in and fell into the ash pit. He had always known of the location of the ash pit and that it was never lighted, and he admitted that he knew he might fall into the pit by going the way he did. The Utah Supreme Court held that he could not recover against the railroad, since he assumed that hazard of his employment, regardless of whether the danger was ordinarily incident to it.—*Laub v. San Pedro, L. A. & S. L. (Utah)*, 152 Pac. 467.

Railway Officers

Executive, Financial, Legal and Accounting

R. E. Berger, auditor of freight accounts for the Wabash, has been promoted to assistant auditor. S. J. Parks, auditor of passenger accounts, has been appointed auditor of freight accounts. P. E. Purcell has been appointed auditor of disbursements and J. H. Rueger, auditor of passenger accounts. They will all have headquarters at St. Louis, Mo.

John D. Caldwell, whose election as secretary of the Chicago, St. Paul, Minneapolis & Omaha has been announced in these columns, was born on July 4, 1863, at Lynn, Mass. He received

J. D. Caldwell

a common school education and entered railway service in 1880, as a telegraph operator for the Delaware & Chesapeake. Later he became a clerk in the motive power department of the Northern Central and the Baltimore & Potomac, and in 1884, went to the Denver & Rio Grande as a telegraph operator, and subsequently as secretary to the superintendent of motive power. He entered the service of the Chicago & North Western on July 20, 1885, as secretary to the president, and remained in that position until January 12, 1909, when he was elected secretary of the road. For several

years he has also been assistant secretary of the Omaha. By virtue of his recent election Mr. Caldwell becomes secretary of both railroads, with headquarters as heretofore, at Chicago, Ill.

William C. Maxwell, whose election as vice-president of the Wabash in charge of traffic has been announced, was born at Keokuk, Iowa, on February 20, 1865, and entered railway service

W. C. Maxwell

in 1881, as a messenger for the Chicago, Burlington & Quincy. Later he became a clerk in the local freight offices of the same road at Keokuk, and in 1884 entered the service of the St. Louis, Keokuk & Northwestern. From 1884 to 1889, he was employed in the general freight and ticket office of this road, and from 1889 to February, 1890, was chief clerk in the general freight office. From February, 1890, to December 1, 1902, he was general agent for the Chicago, Burlington & Quincy at Keokuk; from December 1, 1902, to June, 1904, he was assistant general freight

agent of this railroad at St. Louis, Mo., and from June, 1904, to September 1, 1905, assistant general freight agent at St. Joseph, Mo. On September 1, 1905, he was appointed assistant general

traffic manager of the Wabash, and on August 1, 1908, was promoted to general traffic manager, the position he held up to the time of his recent election to the vice-presidency.

The title of George B. Elliott, assistant general counsel of the Atlantic Coast Line, has been changed to general solicitor. Mr. Elliott is also assistant secretary, with headquarters at Wilmington, N. C.

William O. Bunger, whose appointment as general superintendent of freight claims for the Chicago, Rock Island & Pacific was announced last week, was born on June 4, 1870, at Terre

W. O. Bunger

Haute, Ind. He was educated in the public schools at Burlington, Iowa. He entered railway service in October, 1884, and until 1889, was consecutively clerk in the local and general freight departments of the Burlington, Cedar Rapids & Northern at Cedar Rapids, Iowa. From 1889 to 1892, he was chief claim clerk in the general freight department of the same road; from 1892 to 1893, he was tariff clerk in the general freight department of the Illinois Central at Chicago, Ill.; from 1893 to 1902, he was chief clerk in the freight claim department of the Burlington, Cedar Rapids &

Northern Railway at Cedar Rapids, Iowa. From 1902 to 1903, he was stationed at Little Rock, Ark., as freight claim agent of the Choctaw, Oklahoma & Gulf. In 1903, he came to Chicago as assistant freight claim agent of the Rock Island, and in 1907 was appointed freight claim agent of the same railroad.

William Little Seddon, whose election as vice-president of the Seaboard Air Line, with headquarters at Norfolk, Va., has already been announced in these columns, was born on October

W. L. Seddon

14, 1862, in Stafford county, Va. He graduated from the University of Missouri in July, 1881, and from 1881 to 1898 was engaged in civil engineering. Part of this time he served as United States assistant engineer at work on the Missouri and Mississippi rivers; chief engineer of the St. Louis Electric Railway & Power Company; contracting street railway construction in Kansas and as secretary and treasurer of the Atlantic Traction Company. He entered the service of the Seaboard Air Line in 1898, in the engineering department, and was consecutively to 1905

instrument man, resident engineer, and assistant engineer. In September, 1905, he was appointed chief engineer, and in January, 1913, he was made assistant to the president. On April 1, 1914, he became first assistant to the president in charge of operation, which position he held at the time of his recent election as vice-president of the same road, as above noted.

Thomas A. Polleys, whose appointment as tax commissioner

of the Chicago & North Western and the Chicago, St. Paul, Minneapolis & Omaha was announced in our columns last week, was born at Trempeleau, Wis., on January 31, 1865. After graduating from the law school at the University of Wisconsin, he practised law at Madison, Wis., from 1888 to 1896—the larger part of that time with the firm of Bashford, O'Connor, Polleys & Aylward. On January 17, 1896, he became an attorney for the Omaha. In June, 1901, he was appointed assistant general attorney of the Chicago Great Western and remained with this road until July 1, 1903, when he returned to the Omaha, as tax commissioner. In October, 1907, he became secretary, right of way commissioner and tax commissioner of the same road. He continued to discharge the duties of these positions until December 1, 1915, when his recent appointment took effect.

T. A. Polleys

Operating

H. D. Emerson has been appointed general manager of the New Orleans Southern & Grand Isle, with office at New Orleans, La.

F. J. McKee, superintendent of the Sarnia tunnel terminals of the Grand Trunk, at Pt. Huron, Mich., has been appointed assistant superintendent of the Detroit terminals, with office at Milwaukee Junction, Mich.

D. R. Campbell, superintendent of construction for the Canadian Northern, western lines, has been appointed general superintendent of the Pacific division, with office at Vancouver, B. C. B. T. Chappell, superintendent district 2, at Saskatoon, Sask., has been appointed superintendent of the Pacific division, with office at Kamloops Junction, B. C. T. J. Brown, chief dispatcher of district 1, central division, at Pt. Arthur, Ont., has been appointed superintendent of district 2, western division, at Saskatoon, vice Mr. Campbell. J. W. Crane, chief dispatcher, district 2, Saskatoon, has been appointed chief dispatcher, Pacific division, with office at Kamloops Junction, B. C.

George Leon Candler, who has been appointed general superintendent of the Central of Georgia, with office at Savannah, Ga., was born in Talbot county, Ga., and was educated in the public schools. He began railway work on August 1, 1880, with the Louisville & Nashville, and was in the freight agency department of that road at Montgomery, Ala., until 1887. He entered the service of the Central of Georgia in February, 1887, as chief clerk to the superintendent of the Columbus division at Columbus, Ga. From 1890 to 1892 he was chief clerk to the superintendent of the combined Southwestern and Columbus divisions at Macon. In 1894 he was appointed freight agent at Columbus, and from 1898 to 1902 was trainmaster of the Southwestern division at Macon. He was then promoted to superintendent of the Savannah division at Savannah, and on March 17, 1906, was appointed superintendent of transportation at Savannah, serving in that capacity until his recent appointment as general superintendent of the same road, with office at Savannah.

Charles H. Doorley, whose appointment as superintendent of the Gary division of the Elgin, Joliet & Eastern has been announced, was born at St. Catherine, Ont., on March 24, 1866. He received his education in the public schools of Chicago, and entered railway service with the Grand Trunk as a wiper in March, 1884. He was soon made a foreman, and in April, 1886, was promoted to engine hostler. In May, 1886, he left the mechanical department to become a switchman for the

same company, and in January, 1887, entered the service of the Chicago & Alton in the same capacity. He was promoted to yardmaster in 1889, and remained in that position until 1896. In February, 1896, he entered the employ of the Chicago, Hammond & Western as general yardmaster, and continued in that capacity until March, 1898. In April, 1898, he became a switchman for the Chicago, Lake Shore & Eastern; in August, 1899, he was promoted to assistant yardmaster; in September, 1901, he was appointed night general yardmaster; in August, 1903, general yardmaster; in December, 1908, assistant superintendent; in April, 1915, superintendent of terminals of the Elgin, Joliet & Eastern at Joliet, Ill. (the E., J. & E. having absorbed the C. L. S. & E. on June 1, 1909); in September, 1915, acting superintendent of the Gary division; and on December 1, superintendent.

Traffic

W. A. Hopkins, general live stock agent of the Wabash, has been promoted to assistant general freight agent, with headquarters at St. Louis, Mo.

A. Brostedt, district freight agent of the Canadian Northern at Calgary, Alta., has been appointed district freight and passenger agent at Vancouver, B. C. B. R. Marsales, district freight agent at Regina, Sask., has been transferred to Calgary, vice Mr. Brostedt. W. A. Whyte, city freight agent at Calgary, has been appointed district freight agent at Regina, succeeding Mr. Marsales.

William M. Hardin, whose appointment as assistant general freight agent of the Minneapolis & St. Louis has been announced in these columns, was born at Independence, Mo., on May 3, 1878. He received a high school education, and early in 1895 entered railway service as a station helper for the Chicago & Alton at Independence. In the fall of the same year he was transferred to the train service of the same railroad. During November, 1897, he entered the employ of the Chicago, Milwaukee & St. Paul as a telegraph operator, and in September, 1898, took a similar position with the Minneapolis & St. Louis. He continued in the employ of this road as telegraph operator and subsequently as relief agent, until April 1, 1903, when he was appointed traveling freight agent. On January 1, 1909, he was promoted to commercial agent, with office at Kansas City, Mo., and on January 1, 1912, he was transferred in the same capacity to Minneapolis, Minn., where he has remained up to the time of his recent promotion. As assistant general freight agent he will continue to have headquarters at Minneapolis.

W. M. Hardin

William Alexander Hopkins, who has been appointed assistant general freight agent of the Wabash, with office at St. Louis, Mo., was born on February 9, 1866, at Roxboro, N. C. He attended the common schools until September, 1882, and entered railway service in April, 1883, with the Wabash Western. In 1887 he entered the employ of the Missouri Pacific at Kansas City, Mo., as a bill clerk; in 1888, he was a station agent for the Chicago, Milwaukee & St. Paul at various places, and from 1888 to 1897 worked in a similar capacity for the Wabash. From 1897 to 1907 he was live stock agent for the Wabash at Kansas City, Mo.; and from 1907 to 1909 he was commercial agent for the same railroad at Salt Lake City, Utah. From 1909 to 1912 he was division freight and passenger agent at Toledo, Ohio. He was then stationed at St. Louis, Mo., as general live stock

agent, and on December 6 was promoted to assistant general freight agent.

Ogden F. Scudder, who has been appointed land and industrial commissioner of the Chicago, Burlington & Quincy Lines East of the Missouri River, was born at Galesburg, Ill., on December 24, 1871. He received his education in the public grade and high schools at Galesburg. On October 1, 1887, he entered the service of the Chicago, Burlington & Quincy as an office boy, and has been continuously in the employ of the same railroad ever since. For several years he worked as an office boy and clerk in different departments; from 1890 to September, 1906, he was employed consecutively as stenographer and claim adjuster in the law department. Since 1906, he has been in the real estate department as right of way agent and later as assistant real estate and industrial commis-

sioner, the position he held up to the time of his recent appointment. Mr. Scudder's headquarters will continue to be at Chicago, Ill.

Stanley H. Johnson, whose appointment as freight traffic manager of the Chicago, Rock Island & Pacific has been announced, was born at Bunker Hill, Ill., on February 2, 1872. He was educated in a high school at St. Louis, Mo. In 1888, he entered railway service as a stenographer of the Southern Interstate Association at St. Louis. From that time until 1894, he held similar positions in the freight traffic department of the Missouri Pacific at St. Louis, in the offices of the East Tennessee, Virginia & Georgia at Knoxville, Tenn., and with the Chesapeake, Ohio & Southern at Louisville, Ky. From 1894 until June, 1902, he was employed in the Southwestern Freight Bureau at St. Louis, in various positions, including that of secretary. From June, 1902, to 1904, he was chief clerk to the third vice-president and freight traffic manager of the Rock Island; from 1904, to 1906, he was assistant general freight agent of the same railroad at Little Rock, Ark. From 1906, to February 14, 1909, he held the same position at Chicago, Ill. From February 14, 1909, to December 1, 1915, he has been assistant freight traffic manager. His headquarters will continue to be at Chicago, Ill.

S. H. Johnson

William S. Burley has been appointed assistant land and industrial commissioner of the Chicago, Burlington & Quincy lines east of the Missouri river. Mr. Burley was born at Aurora, Ill., and received his education in the public schools and at a business college. He also studied law for two years. In 1883 he entered railway service as a messenger in the office of the Chicago superintendent of the Burlington. In 1890 he

was appointed chief clerk in the superintendent's office at Chicago. In 1902 he was promoted to chief clerk in the general superintendent's office at Burlington, Iowa. In 1905 he was transferred to the land and industrial department at Chicago as chief clerk and right-of-way agent. His office will continue to be at Chicago, and his appointment was effective December 1.

C. H. Stinson, whose appointment as freight traffic manager of the Wabash has been announced, was born at Beaver Falls, Pa., on November 19, 1871. He entered railway service in 1885, as a messenger boy in the local freight office of the Chicago, Milwaukee & St. Paul, at Chicago, Ill. In 1888, he left the St. Paul to enter the employ of the Wabash, as a clerk in the office of one of the Wabash fast freight lines. Subsequently he filled the positions of chief clerk to the general manager of the Hoosac Tunnel Line, contracting freight agent, traveling freight agent, and agent of the Hoosac Tunnel Line, at Chicago. With the reorganization of the Wabash fast freight lines, he went to St. Louis, Mo., to become chief clerk to the general traffic manager.

Within one year he was made assistant general freight agent, and on August 20, 1908, was promoted to general freight agent. Mr. Stinson has been in railroad service for 30 years, 3 years with the St. Paul and 27 with the Wabash. His headquarters will continue to be at St. Louis.

G. H. Corse, Jr., whose appointment as foreign passenger agent of the Union Pacific system has been announced, has been in railroad and steamship service since May 11, 1890, when he entered the service of the Chicago, Milwaukee & St. Paul, as a telegraph operator at Davis Junction, Ill. On October 26, of the same year, he first became an employee of the Union Pacific, at Ogden, Utah. His experience in promoting foreign traffic dates from December 1, 1906, when he went to Hong Kong, China, as freight agent of the Pacific Mail Steamship Company. On February 1, 1909, he was appointed general Oriental agent for the Chicago, Milwaukee & St. Paul, at Shanghai, China. On December 1, 1911, he was appointed general passenger agent of the San Francisco Overland Routes, comprising the Pacific Mail Steamship Company, the Southern Pacific, the Union Pacific, the Atchison, Topeka & Santa Fe, the Chicago & North Western and the St. Paul, with office at Yokohama, Japan and Hong Kong. He resigned this position on July 1, 1915, to return to the United States as special agent in the passenger department of the Union Pacific, with headquarters at Chicago, Ill. As foreign passenger agent he will continue to have his headquarters at Chicago.

William P. Hinton, whose appointment as traffic manager of

San Francisco Overland Routes, comprising the Pacific Mail Steamship Company, the Southern Pacific, the Union Pacific, the Atchison, Topeka & Santa Fe, the Chicago & North Western and the St. Paul, with office at Yokohama, Japan and Hong Kong. He resigned this position on July 1, 1915, to return to the United States as special agent in the passenger department of the Union Pacific, with headquarters at Chicago, Ill. As foreign passenger agent he will continue to have his headquarters at Chicago.

William P. Hinton, whose appointment as traffic manager of

C. H. Stinson

G. H. Corse, Jr.

the Grand Trunk Pacific and the National Transcontinental, with office at Winnipeg, Man., has been announced, was born at Hintenburg, Ont., on August 30, 1871, and entered railway service in May, 1887. From that time until August, 1891, he was consecutively clerk of freight, passenger and car accounts, and traveling auditor for the Canada Atlantic; from August, 1891, to March, 1898, he was rate clerk for the same railroad, and accountant of the Canada Atlantic Fast Freight Line; from March, 1898, to June 30, 1901, he was assistant general freight agent of the same road, and the Canada Atlantic Transit Company; from June 30, 1901, to January 30, 1903, general freight agent of the same road; January 30, 1903, to October, 1905, general passenger and freight agent of the same railroad; October, 1905, to January, 1907, general agent, passenger department, of the Grand Trunk at Ottawa, Ont.; January, 1907, to April, 1909, assistant general passenger and ticket agent of the same road at Montreal; April, 1909, to February, 1914, general passenger agent, Grand Trunk at Winnipeg, Man.; February to October, 1914, assistant passenger traffic manager of the same railroad at Winnipeg; October, 1914, to November 11, 1915, assistant passenger traffic manager of the Grand Trunk and the Grand Trunk Pacific at Montreal, Que.

Engineering and Rolling Stock

J. W. Fox has been appointed valuation engineer of the Central of Georgia, succeeding H. D. Pollard, resigned.

Geo. Moth has been appointed district master mechanic and trainmaster of the Canadian Pacific, Alberta division, fifth district.

B. Corbett has been appointed master mechanic of the Missouri, Kansas & Texas, at Smithville, Tex., vice J. R. Greiner, resigned.

O. K. Morgan, office engineer of the Carolina, Clinchfield & Ohio at Johnson City, Tenn., has assumed the duties of the office of chief engineer.

C. N. Beckner, assistant signal engineer of the Louisville & Nashville at Louisville, Ky., has entered the service of the Federal Signal Company as superintendent of construction in western territory, with headquarters at Chicago, Ill.

C. H. Fox, assistant division engineer of the Canadian Pacific at Winnipeg, Man., has been appointed resident engineer, district 2, Manitoba division, vice E. L. Landorph, transferred. The position of assistant division engineer has been abolished.

T. L. Reed, assistant master mechanic of the Seaboard Air Line at Hamlet, N. C., has been appointed master mechanic of the North Carolina division, with headquarters at Hamlet, N. C. The position of assistant master mechanic is abolished. G. H. Langton, master mechanic at Raleigh, will have charge of the Virginia division, including Raleigh shops and roundhouse.

H. L. Vercoe has been appointed special engineer of the Canadian Northern, lines west of Port Arthur, Ont., with headquarters at Winnipeg, Man. W. T. Moodie, engineer maintenance of way, with office at Winnipeg, has been appointed division engineer, central division, with headquarters at the same city. T. Lucas, engineer maintenance of way, west of Winnipeg, has been appointed lease engineer, lines west of Port Arthur, Ont., with office at Winnipeg. A. T. Fraser, district engineer at Edmonton, Alta., has been appointed division engineer, western division, with headquarters at the same city.

G. H. Hedge, master mechanic of the central division of the Canadian Northern, has been appointed general master mechanic of western lines, with office at Winnipeg, Man. Mr. Hedge was born at Neath, Wales, on May 26, 1865, and entered railroad service in 1879 as a machinist apprentice with the Great Western in England. In 1884 he came to Canada, entering the service of the Canadian Pacific as a fitter. He worked in shops of this railroad at Ottawa, Schreiber, Montreal, Hochelaga, and again at Montreal, and in 1891 was appointed locomotive foreman at Megantic, Que. In 1893 he was transferred to Farnham, Que., and subsequently to Montreal; in 1896 he was promoted to general locomotive foreman of the same road at Farnham, Que.; from 1901 to 1902 he was locomotive foreman at Medicine Hat, Alta.; from 1902 to January, 1903, he held the same position at Brandon, Man.; from January, 1903, to June, 1908, he was locomotive foreman of the Canadian Northern at Port Arthur,

Ont.; from June, 1908, to January, 1912, he was assistant master mechanic of the same road at Winnipeg, Man.; from January, 1912, up to the time of his recent appointment, he was master mechanic of the central division of the same road at Winnipeg.

Purchasing

C. L. Bankson, has been appointed assistant purchasing agent of the Great Northern, with office at Seattle, Wash., vice A. Watson.

OBITUARY

Charles W. Lord, office engineer of the New York, New Haven & Hartford, at New Haven, Conn., died on December 11, at the age of 52.

Thomas James Hennessey, who was division master mechanic of the Michigan Central from May, 1893, to February 1, 1915, died on December 4, at the age of 70.

Ward Crosby, chief engineer of the Carolina, Clinchfield & Ohio, with office at Johnson City, Tenn., died on December 5, at his home in that city. Mr. Crosby was born on May 1, 1859,

W. Crosby

at Crompton, Que., and began railway work in March, 1880, as transitman on the Eastern Railroad, now a part of the Boston & Maine. From March, 1881, to February, 1882, he was transitman on location work of the Texas-Mexican in Texas, and then to March, 1884, was assistant engineer on the Mexican Central, now a part of the National Railways of Mexico. From September, 1885, to April, 1888, he was first assistant, and later division engineer of the Boston & Lowell, now a part of the Boston & Maine; then to November, 1889, was engineer of location and construction of the Barre Railroad, now the Barre & Chelsea. In November, 1889, he was appointed resident engineer on the Norfolk & Western, and from May, 1891, to September, 1905, was assistant and division engineer of the Concord & Montreal, and its successor, the Boston & Maine. In September, 1905, he went to the Carolina, Clinchfield & Ohio, and served consecutively as division engineer and assistant chief engineer until November, 1911, when he was promoted to chief engineer of the same road.

THE KATANGA RAILWAY.—A British consular report on the trade of Katanga (Belgian Congo) during 1914 says that the railway north from Kambove to Bukama has been actively continued during the past year. The total distance, by the route now adopted, is 204 miles. December 31 the rails were laid for 69 miles, and at the time of writing, March, 1915, 86 miles have been finished. The roadbed is completed over 96 miles. The railway has now arrived on the high Bianco plateau, which is free from tsetse fly, making it possible to land breeding stock there by rail. The headquarters of the construction has now been moved from Kambove to 66 miles beyond, and this section of the road is now being used for the regular transport of passengers and merchandise. It is at present impossible to say when the railway will reach Bukama, as on account of the war the construction has been very largely curtailed. Kambove is connected by rail with South Africa via Elisabethville, and when the line reaches Bukama there will be complete connection between South Africa and Boma by rail and water. The railway under construction between Kabalo, on the Lualaba river, and Lukuga, on Lake Tanganyika, a distance of about 250 miles, is now practically completed, but has not been pushed quite to the shore of the lake, as the Germans are masters of this latter at present.

Equipment and Supplies

LOCOMOTIVES

THE VIRGINIAN is understood to be contemplating the purchase of a number of locomotives.

THE BUFFALO, ROCHESTER & PITTSBURGH is contemplating the purchase of a number of locomotives.

THE DELAWARE, LACKAWANNA & WESTERN, it is reported, is considering the purchase of motive power.

THE CHICAGO GREAT WESTERN has ordered 5 Mikado type locomotives from the Baldwin Locomotive Works.

THE DEATH VALLEY RAILROAD has ordered one Consolidation locomotive from the Baldwin Locomotive Works.

THE CARNEGIE STEEL COMPANY has ordered 2 six-wheel switching locomotives from the Baldwin Locomotive Works.

THE TOLEDO, ST. LOUIS & WESTERN has ordered 5 Consolidation locomotives from the Lima Locomotive Corporation.

THE FAIRCHILD & NORTHEASTERN, noted in last week's issue as having issued an inquiry for one Prairie type locomotive has ordered this engine from the Vulcan Iron Works.

THE DELRAY CONNECTING has ordered one eight-wheel switching locomotive from the American Locomotive Company. This locomotive will have 22 by 28-in. cylinders, 51-in. driving wheels and a total weight in working order of 208,000 lb.

THE WAYNESBURG & WASHINGTON has ordered one Mogul type locomotive from the American Locomotive Company. This locomotive will have 13 by 20-in. cylinders, 41-in. driving wheels and a total weight in working order of 50,000 lb.

THE CUBA RAILROAD has ordered 10 superheater ten-wheel locomotives from the American Locomotive Company. These locomotives will have 21 by 26 in. cylinders, 60 in. driving wheels and a total weight in working order of 148,000 lb.

THE PUNTA ALEGRA SUGAR COMPANY has ordered one four-wheel switching locomotive from the American Locomotive Company. This locomotive will have 11 by 16-in. cylinders, 33-in. driving wheels and a total weight in working order of 39,000 lb.

THE PULLMAN RAILROAD, reported in last week's issue as being in the market for a switching locomotive, has ordered two six-wheel switching locomotives from the American Locomotive Company. These locomotives will have 21 by 26-in. cylinders, 51-in. driving wheels and a total weight in working order of 142,000 lb.

FREIGHT CARS

THE CHICAGO, MILWAUKEE & ST. PAUL is building 500 60-ton ore cars in its shops at Milwaukee.

THE NEW YORK, PHILADELPHIA & NORFOLK has issued inquiries for 45 to 60 steel underframe box cars.

THE RAY CONSOLIDATED COPPER COMPANY has ordered 50 ore cars from the Pressed Steel Car Company.

THE AMERICAN ZINC, LEAD & SMELTING COMPANY has issued inquiries for 50 100,000-lb. capacity tank cars.

THE UTAH COPPER COMPANY is reported to have ordered 100 ore cars from the Standard Steel Car Company.

THE ELGIN, JOLIET & EASTERN has given the Pullman Company an order to repair 300 steel hopper cars.

THE PRUDENTIAL OIL CORPORATION has ordered 50 tank cars from the American Car & Foundry Company.

THE MISSOURI, KANSAS & TEXAS has ordered 6,000 underframes from the Commonwealth Steel Company.

THE PERE MARQUETTE has ordered 200 center constructions from the Western Steel Car & Foundry Company.

THE ILLINOIS CENTRAL is inquiring for prices on 1,000 center sills for coal cars and 500 center sills for sand cars.

THE DELAWARE, LACKAWANNA & WESTERN has ordered 300 gondola cars from Barney & Smith Car Company and 200 gondola cars from the Standard Steel Car Company.

THE NEW YORK, ONTARIO & WESTERN has ordered 400 hopper

cars from the Cambria Steel Company, and 100 low-side gondola cars from the American Car & Foundry Company.

THE AMERICAN SHEET & TIN PLATE COMPANY was reported in an unconfirmed item in last week's issue as having ordered 6 tank cars from the German-American Car Company. This item has since been confirmed.

THE GRAND TRUNK, which was reported in last week's issue as being about to repair 1,500 steel coal cars, has closed a contract with the American Car & Foundry Company for repairs to 300 cars, with an option on an additional 1,200.

THE NEW JERSEY ZINC COMPANY, reported in the *Railway Age Gazette* of December 10 as being in the market for 40 hopper cars, has ordered 10 hopper cars from the Pressed Steel Car Company and another 10 from the Standard Steel Car Company.

THE NEW YORK, NEW HAVEN & HARTFORD, which has been reported in recent issues of this paper as being in the market for 25 milk and 50 refrigerator cars, has now issued definite inquiries for 25 milk and 500 refrigerator cars. As noted in last week's issue, will also buy 500 coal cars.

NATIONAL GUARD OF NEW YORK.—A group of steel makers and others under the lead of Elbert H. Gary, chairman of the Steel Corporation, and Charles M. Schwab, president of the Bethlehem Steel Corporation, are contributing toward the presentation of an armored train to the National Guard of New York. The train will have a battle car heavily protected with armor plate and six or seven lightly armored cars equipped with machine guns and capable of high speed. The steel makers have promised to contribute and to furnish the armor plate and other metal parts of the train at cost.

PASSENGER CARS

THE WESTERN PACIFIC recently ordered five all-steel baggage and mail cars from the American Car & Foundry Company.

THE CENTRAL OF GEORGIA has ordered four express cars and one combination baggage and mail car from the Pullman Company.

PENNSYLVANIA LINES WEST. In the item relative to this company's recent orders for passenger cars in last week's issue it was incorrectly stated that the company had ordered 22 coaches and 7 passenger and baggage cars from the Pullman Company. These cars were ordered of the Pressed Steel Car Company, the Pullman Company having received only the one order for 12 baggage and mail cars and 6 dining cars.

THE PENNSYLVANIA RAILROAD, reported in the *Railway Age Gazette* of November 12 as being in the market for 100 coaches, 20 passenger and baggage cars, 55 baggage cars and 5 horse-express cars for the Lines East of Pittsburgh, a total of 180 cars, has placed orders for 107 of these cars as follows: American Car & Foundry Company, 21 baggage and 5 horse-express cars; Pressed Steel Car Company, 6 coaches; Harlan & Hollingsworth Corporation, 47 coaches, and the J. G. Brill Company, 28 baggage cars. Of the 21 baggage cars ordered from the American Car & Foundry Company 11 are for the Pennsylvania itself, 7 for the Philadelphia, Baltimore & Washington, and 3 for the West Jersey & Seashore; the 5 horse-express cars are for the Pennsylvania. The 6 coaches ordered from the Pressed Steel Car Company and the 28 baggage cars ordered from the J. G. Brill Company are also for the Pennsylvania. The 47 coaches ordered from the Harlan & Hollingsworth Corporation are for the West Jersey & Seashore.

IRON AND STEEL

THE ANN ARBOR is inquiring for 1,500 tons of 85-lb. rails.

THE TOLEDO, ST. LOUIS & WESTERN is inquiring for 10,000 tons of 85-lb. rails.

THE SOUTHERN RAILWAY has ordered 10,000 tons of rails from the Maryland Steel Company.

THE MINNEAPOLIS & ST. LOUIS has ordered 7,500 tons of rails from the Illinois Steel Company.

THE TOLEDO TERMINAL RAILROAD has ordered 1,000 tons of rails from the Algona Steel Corporation.

THE CHICAGO, BURLINGTON & QUINCY is inquiring for 2,000 tons of bridge steel for 1916 delivery.

THE INTERNATIONAL & GREAT NORTHERN is reported to be in the market for 1,500 tons of 90-lb. rails.

THE NEW YORK, CHICAGO & ST. LOUIS has ordered 9,000 tons of rails from the Illinois Steel Company.

THE CAROLINA, CLINCHFIELD & OHIO has ordered 1,000 tons of rails from the Carnegie Steel Company.

THE LEHIGH VALLEY has ordered 820 tons of steel for bridge work from the Pennsylvania Steel Company.

THE CHICAGO & EASTERN ILLINOIS has been authorized by the Federal court to buy 10,000 tons of rails to apply on its 1916 requirements.

THE DULUTH & IRON RANGE has ordered 650 tons of steel for ore spouts for dock No. 6 at Two Harbors, Minn., from the American Bridge Company.

THE PENNSYLVANIA RAILROAD has ordered 450 tons of bridge material for its ore handling bridge at Erie, Pa., from the Pennsylvania Steel Company.

THE NEW YORK PUBLIC SERVICE COMMISSION, First district, has let a contract to the Ramapo Iron Works for special work on order No. 6, consisting of frogs and switches, for the new Lexington avenue subway in New York City. The company's bid was the lowest at \$46,195.

MACHINERY AND TOOLS

THE BALTIMORE & OHIO is in the market for 15 to 20 machine tools.

THE DELAWARE & HUDSON is in the market for approximately 40 machine tools.

THE PENNSYLVANIA RAILROAD will make extensive improvements to its docks at Erie, Pa., and will install a new ore-handling plant equipped with machinery made by the Mead-Morrison Manufacturing Company, Boston, Mass.

THE PENNSYLVANIA EQUIPMENT COMPANY, Philadelphia, Pa., is in the market for a second-hand shear, able to shear 1½ in. by 1½ in. or ¾ in. by 6 in. cold soft steel, or to punch a 1-in. hole in a ¾-in. plate, floor space 8 ft. 3 in. by 6 ft.; to be arranged for motor drive. It will also buy a roller straightener, or gag press for 6 in. by 6 in. angles.

SIGNALING

THE WESTERN MARYLAND proposes during the coming year to install automatic block signals on 106 miles of its line.

THE CUMBERLAND VALLEY proposes during the coming year to install automatic block signals on its line near Berkeley, six miles, single track.

CHICAGO, ROCK ISLAND & PACIFIC.—This company's plan for the ensuing year include the installation of automatic block signals on five miles of road, double track.

THE CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS contemplates the installation of automatic block signals during the coming year on its line from Bellefontaine, Ohio, to Anderson Ind., 106 miles, single track.

THE SOUTHERN RAILWAY proposes during 1916 to install automatic block signals on 178 miles of its line. The plans for the coming year include also two large mechanical interlocking plants, one at Charlottesville, Va., 48 levers, and one at Danville, Va., 40 levers.

THE ATCHISON, TOPEKA & SANTA FE plans during the coming year to install automatic block signals on seven miles of its line, double track, between Standish, Mo., and Carrollton; ten miles, double track, between Le Loup, Kan., and H. U. Tower, and between Claremont, Cal., and Arcadia, 20 miles, single track. Of these three installations, the two last named have already been begun. During 1916 the company proposes to install electric interlocking, 36 levers, at Arcadia, Cal., jointly with the Southern Pacific and the Pacific Electric; and at Los Angeles, Cal., electric interlocking, 80 levers, jointly with the Salt Lake Route and the Southern Pacific.

Supply Trade News

The Northern Pacific will purchase several million feet of lumber.

The Norfolk Southern is inquiring for 3,000,000 ft. of lumber to apply on its 1916 requirements.

The Chicago & North Western is inquiring for 5,000,000 ft. of lumber.

The Maryland Steel Company will erect an addition costing \$100,000 to its plant at Sparrows Point, Md.

Charles W. Cross has been appointed vice-president of the Equipment Improvement Company, New York.

The Chicago, Milwaukee & St. Paul is inquiring for prices on 15,000,000 ft. of fir, pine and hard wood for its 1916 requirements.

Fairbanks, Morse & Co., Chicago, have closed a contract with the Missouri, Kansas & Texas for the installation of a large capacity conveyer type coaling station at Osage, Okla.

The Burdett Oxygen Company completed a new plant at Ft. Worth, Tex., on December 15. This is the ninth plant to be erected by the company in various industrial centers of the country.

The Chicago & North Western has ordered 3,000,000 ft. of fir for dock extension work at Ashland, Wis. The order was divided between the Douglas Fir Sales Company and the Lumber Manufacturers' Agency.

C. N. Beckner, assistant signal engineer of the Louisville & Nashville, has entered the service of the Federal Signal Company as superintendent of construction in western territory, with headquarters at Chicago, Ill.

A. F. Huston, president of the Lukens Iron & Steel Company, Coatesville, Pa., has recently announced that his company has placed an order for a plate mill which will be able to roll a plate 200 to 204 in. wide and which will be the largest plate mill in existence in the world at the present time.

A majority of the stockholders of the Youngstown Steel & Tube Company voted last Tuesday to accept an offer made by the Replogle interests in the Cambria Steel Company, mentioned in last week's issue, for their stock, the price being \$300 a share for the common and \$80 a share for the preferred.

The Peyton Safety Rail Joint Company, St. Louis, Mo., has been incorporated with capital stock of \$200,000, with the following stockholders: C. W. Witwer, president; W. M. Grissom, Warren Perry and Isaac Peyton. The company will engage in the manufacture of rail joints and is reported to have contracts from two large railways.

The Crawford Locomotive & Car Company, Streator, Ill., has been taken over by its creditors and the property will be offered for sale at an early date. The property of the company includes several modern and well equipped shop buildings and 25 acres of land having connection with three railroads and easy access to two others that enter the city.

The Midvale Steel & Ordnance Company has announced that it will spend approximately \$6,000,000 for improvements in the plant of the Midvale Steel Company, Nicetown, Pa., and that of the Worth Brothers Company, Coatesville, Pa., and that it has acquired all the capital stock of the Buena Vista Iron Company, owning 300,000,000 tons of merchantable Cuban iron ore, containing 1 per cent nickel. The improvements to the two plants include the installation at the Coatesville plant of six 50-ton open hearth furnaces with a capacity of 180,000 tons of ingots a year, a blooming mill with an annual capacity of 200,000 tons, two 750 k. w. turbo generators, one 500-ton blast furnace with an annual capacity of 175,000 tons of pig iron, with sufficient auxiliary equipment for another similar furnace which may be authorized soon after the first of the year, a new forging department, consisting of a 2,500-ton hydraulic press, one 1,500-ton hydraulic press and two draw benches; the installation of 8, 12 and 15-in. bar mills, a steel tire department and a rolled

steel wheel department. The improvements at Nicetown include new steel manufacturing and machine shop equipment which in particular will enable the company to handle orders recently taken from the United States government for heavy ordnance, such as 14 and 16-in. guns. The company's announcement concludes: "The acquiring of this property (the Buena Vista Iron Company) will place the steel-making subsidiaries of the company, the Midvale Steel Company and Worth Brothers Company, in a strong position and will enable the company to proceed with the extensive additions contemplated at Coatesville and Philadelphia, with full assurance of a supply of raw material on a basis which will enable them to compete on even terms with any other producer."

N. S. Reeder, vice-president of the Pressed Steel Car Company and the Western Steel Car & Foundry Company, graduated from Cornell University with the degree of mechanical engineer in 1896. He then served as a special apprentice on the Pennsylvania Lines West of Pittsburgh, and in 1899 was employed by the Pittsburgh Coal Company as superintendent of the Montour and Moon Run Railroads. In 1902 he entered the service of the Pressed Steel Car Company as a mechanical engineer connected with the New York office, but in 1904 he went to Montreal as assistant general manager of the Canada Car Company. In 1906 he was made general manager, and in 1908 became second vice-president of the Canadian Car & Foundry Company. He

N. S. Reeder

returned to the States in 1909 as vice-president of the Western Steel Car & Foundry, and in 1910 was made second vice-president of the Pressed Steel Car Company in Chicago. He is now transferred to the company's New York office, effective December 1. James Brown Rider, the newly elected vice-president and general manager of the Pressed Steel Car Company and the Western Steel Car & Foundry Company, entered the service of

J. B. Rider

the Pennsylvania Railroad in 1895, and remained with it until 1899, acting successively as messenger boy, shop order clerk, invoice clerk and stenographer. In 1899 he became connected with the Pressed Steel Car Company as stenographer and clerk to the general manager, being advanced to the position of assistant to the vice-president in July, 1905. He was appointed general manager in July, 1909, and made a member of the board of directors in Jan., 1913. He was appointed general manager of the Western Steel Car & Foundry Company August, 1913. He is now elected a vice-president of the Pressed Steel Car Company and Western Steel Car & Foundry Company, with headquarters in Pittsburgh, Pa., and will also continue to perform the duties of general manager in charge of operations. His title is vice-president and general manager of both the Pressed Steel Car Company and the Western Steel Car & Foundry Company

J. F. MacEnulty, who was elected second vice-president of the Pressed Steel Car Company and the Western Steel Car & Foundry Company, December 1, entered the employ of the Pressed Steel Car Company in 1899, and has been its general sales manager since May, 1912. He was first an inspector at Pittsburgh, later being promoted to the positions of chief inspector, general chief inspector and engineer of construction. He was transferred to the sales department in New York in 1904, and in 1907 was made general superintendent of the Hege-wisch Works of the Western Steel Car & Foundry Company. In 1909 he was promoted to the position of general manager, and in May, 1912, returned to New York as general sales manager of both the

J. F. MacEnulty

Pressed Steel Car Co., and Western Steel Car & Foundry Co.

C. E. Postlethwaite, who since December 1 has been general sales manager of the Pressed Steel Car Company and the Western Steel Car & Foundry Company, with headquarters in New York, was until that date manager of sales for the central district at Pittsburgh, Pa. He was born in Mount Union, Huntington county, Pa., and after graduating from the Altoona high school in 1883 entered the service of the Pennsylvania Railroad, where he remained until 1890, acting successively as rodman on an engineer corps, telegraph operator and Pennsylvania Railroad division car clerk. For the following seven years he was connected with the Norfolk & Western as chief clerk to the general superintendent at Roanoke, and later as assistant to the general agent at Norfolk. He became connected with the Schoen Pressed Steel Car Company in October, 1897, shortly after the first steel freight cars were built, and remained with the company when it was merged into the Pressed Steel Car Company. Mr. Postlethwaite entered the sales department of the company in February, 1902.

The Youngstown Steel Car Company was recently organized at Youngstown, Ohio, to assume the business of the Youngstown Car & Manufacturing Company, designers and builders of industrial equipment. J. E. Tesseyman, formerly of the Ralston Steel Car Company, Columbus, Ohio, has assumed the duties of general manager, and plans are being formulated for enlarging the company's output. The company is entering the field of repairing steel cars, and is at present making prompt deliveries on pressed steel parts.

C. E. Postlethwaite

William Andrew Conner, first vice-president of the Standard Underground Cable Company, Pittsburgh, Pa., died suddenly in his office at Perth Amboy, on December 6. Mr. Conner was born in Baltimore, Md., September 12, 1859. In 1876 he entered the oil refining business, holding eventually the position of assistant manager for the Standard Oil Company. In 1885 he took charge of the first plant built by the Standard Underground Cable Company in Pittsburgh, and from then until his death

was in charge of the manufacturing business of the company. He was the one who planned and built the plants at Perth Amboy, N. J., and Oakland, Cal. As noted above, he became vice-president of the company in 1909. He was also a vice-president and director of the Standard Underground Cable Company of Canada, Ltd., whose factories were planned and built by him at Hamilton, Ont., in 1911-1912.

Henry Phipps Hoffstot, whose appointment to the position of assistant manager of sales, central district of the Pressed Steel Car Company, with headquarters at Pittsburgh, Pa., was announced in the *Railway Age Gazette* of last week, has been in the service of the company since 1910. He graduated from Harvard College in 1909, and in the same year entered the employ of the Canadian Car & Foundry Company at Montreal and Amherst, N. S. The following year he was appointed assistant to the general manager of the Pressed Steel Car Company, and on December 1 entered the sales department of the company as assistant manager of sales, central district, with headquarters at Pittsburgh, as above noted.

H. P. Hoffstot

C. W. Cross, from 1906 to 1914 superintendent of apprentices of the New York Central Lines, has been elected vice-president of the Equipment Improvement Company, with office at 30 Church street, New York. Mr. Cross started his railroad career as a machinist apprentice on the Cincinnati, Hamilton & Dayton at Lima, Ohio. From 1880 to 1890 he was, respectively, a machinist, draftsman, foreman and assistant master mechanic in the shops of the Pennsylvania Lines at Fort Wayne, Ind. In 1890 he went to the Lake Shore & Michigan Southern as master mechanic at Elkhart, Ind., and became superintendent of apprentices for the New York Central Lines, with headquarters at New York, when that railroad revised and centralized its apprenticeship department in 1900. Mr. Cross has been a representative for the Equipment Improvement Company since July, 1914. He takes up his new duties as vice-president beginning December 15.

C. W. Cross

James Mapes Dodge, chairman of the board of directors of the Link-Belt Company, Chicago, Ill., died at his home in Philadelphia, September 4. Mr. Dodge was born June 30, 1852, at Waverly, N. J. He studied three years at Cornell University and then took a special one-year course in chemistry at Rutgers. After spending a short time at the Morgan Iron Works in New York, he entered the shops of James Roach, the shipbuilder, at Chester, Pa., where, during a three years' stay, he was successively journeyman, foreman and superintendent of erection. About 1880 he became acquainted with William D. Ewart, the inventor of the Ewart link-belt, and soon after joined him and his associates in the development of the chain business, which at that time had not attained a very great importance. He later entered into a partnership with Edward H. Burr, under the

name of Burr & Dodge, who represented in Philadelphia the Ewart Manufacturing Company of Indianapolis, then manufacturing the Ewart detachable link-belt. Out of this partnership grew the Link-Belt Engineering Company, organized in 1888. In 1889 Mr. Dodge brought out the Dodge system of storing anthracite coal in large conical piles and reloading it by machinery. For this invention he received in 1907 the Elliott Cresson gold medal from the Franklin Institute. In 1892 Mr. Dodge was elected president of the Link-Belt Engineering Company and the Dodge Coal Storage Company (later called the J. M. Dodge Company). He became chairman of the board of directors of the Link-Belt Company when it was organized in 1906 through the merger of the allied companies—the Link-Belt Engineering Company, Philadelphia; the Link-Belt Machinery Company, Chicago, and the Ewart Manufacturing Company, Indianapolis, at which time Charles Piez became president of the Link-Belt Company. Mr. Dodge was a very successful inventor. He took out over 100 patents, among them, of course, being many relating to the construction and manufacture of silent chain.

Andrew J. Farley, vice-president of the Camel Company, and for many years secretary of the Chicago Railway Equipment Company, died on December 13, 1915, at the Hyde Park hotel, Chicago, Ill. Mr. Farley was born at Schuylerville, N. Y., in 1847, and spent his early life in Troy, N. Y., where he was, at one time, engaged in the retail business. His advent with the railway supply business was with the old Dunham Manufacturing Company. When he left this company he became connected with The National Brake Beam Company, now the Chicago Railway Equipment Company, with which he spent most of his business career. About five years ago he retired from active business and has lived most of each year at his summer place at Wheaton, Ill., spending the winters in Chicago and California. He was one of the organizers of the Camel Company, and at the time of his death was vice-president. He is survived by his wife and one daughter, Mrs. James M. Hopkins.

A. J. Farley

E. H. Poetter, who, as announced in a previous issue, has been appointed manager of the general railroad sales department of the Barrett Manufacturing Company, with office at New York City, was born on September 14, 1879, at Juneau, Wis. After graduating from the high school at Beaver Dam, Wis., in 1896, he took a business college course, and in the same year entered the service of the Wisconsin Central as a stenographer in the land department at Chicago. He later became successively bill of lading clerk, chief clerk, contracting freight agent and freight and passenger agent at Seattle, Wash., to which position he was appointed in 1903. In December, 1903, he returned to Chicago, and for two years was engaged in the insurance business with the Equitable Life Insurance Company. In October, 1905, he entered the service of the

E. H. Poetter

Barrett Manufacturing Company as traffic manager at Chicago, in charge of the western territory. Later, upon a change in the company's organization, his title was changed to assistant traffic manager, with office in Chicago, from which position he is to be promoted, effective on January 1.

TRADE PUBLICATIONS

TURBINES.—"The Terry Turbine" is the title of a new bulletin just issued by The Terry Steam Turbine Company, Hartford, Conn., giving a general description of the various turbine applications, and dealing particularly with various kinds of high, low and mixed pressure turbines.

MACHINE TOOLS.—The Covington Machine Company, Covington, Va., has recently issued bulletin No. 11 containing a number of illustrations of Covington punches, shears, bending rolls, etc., for all classes service. The sole agent in the United States for these machines is Manning, Maxwell & Moore, Inc., New York.

CULVERTS.—The Canton Culvert & Silo Company, Canton, Ohio, has issued a rather unique folder containing extracts from the company's files "proving the practicability and popularity of 'Acme' (nestable) corrugated anti-corrosive No-Co-Ro metal culverts. The folder contains specimen advertisements which appeared in various technical papers and specimens of typical inquiries, orders and letters of commendation.

WIRING DEVICES.—The Bryant Electric Company, Bridgeport, Conn., has issued an elaborate catalog of 168 pages containing illustrations, descriptions, list prices, etc., of the company's line of Superior wiring devices. In the catalog there are illustrated "New Wrinkle" and "Wrinklet" sockets and other fixtures and various types of switches, receptacles, plugs and similar fixtures. The book is exceedingly well gotten up and profusely illustrated.

CONSTRUCTION OF LIGHT RAILWAYS DURING THE WAR.—It is said that 70 miles of track can be laid in two weeks by the efforts of four German railway battalions on light railways in Belgium and that this period can actually be halved by increasing the number of men engaged on construction. Operating details in regard to these light railways are very meagre, but traffic would seem to be worked on much the same methods used prior to the block system, the trains being despatched with regular intervals of about a third of a mile between them. This particular form of light railway is not to be confused with the temporary lines used by the Germans for the removal of heavy guns and ammunition. The motive power of the latter lines is horse traction, and it has been found possible to lay about two-thirds of a mile of track in an hour. These figures are, of course, made possible by transporting the track in ready-laid sections which have only to be placed in position and joined up.

RAILWAY EXTENSION IN COREA.—A British consular report on the trade of Corea for 1914 states that the second railway program, which consisted in the building of lines connecting the capital with Wonsan (Gensan) on the northeast coast and Taiden on the Seoul-Fusan line with Kunsan and Mokpo in the southwest, was completed in 1914, the Kōnan (Honam) Railway being finished in January and the Keigen (Seoul-Gensan) Railway in August. Work on the Gensan-Yongheung line, which forms a part of the third program, was started on October 1, and that portion of the track which runs from Gensan to Mun-chong, a distance of 5 miles, is expected to be ready for traffic by September 15, 1915. There will be a station at Tokmon, 1 mile from Gensan, and at one other intermediate place. The reconstruction of the Seoul-Fusan line was begun on October 5, 1914, and is to be spread over five years, as is also the work on the Chongjin-Hoiryong Railway (58.6 miles), which was started during the same month. The total mileage of railways in operation in Corea is now 994 miles. During 1914 the following sections were opened: Seiyu to Kotciri on the Kōnan line, 35.5 miles; and Kenfutsuro to Kozan on the Keigen line, 23.8 miles; making a total of 59.3 miles newly opened to traffic. Surveying is in progress on the following lines, though it has not yet been decided when the work of laying them will be undertaken: (1) Taiku to Mokpo; (2) Hamheng to Chongjin; (3) Pingyang to Gensan; (4) a line running along the Yalu river.

Railway Construction

ALTON & SOUTHERN.—This company, which operates 11 miles of railroad as a belt line, plans to gradually extend the line around the territory near East St. Louis, Ill. Right of way has been bought for the construction of about four miles additional, but construction work has been delayed by a crossing controversy. The building of this extension in 1916 depends upon the result of the controversy.

ATHABASCA & FT. VERMILLION.—Reconnaissance reports have been made by the engineers on the projected route from Athabasca, Alta., northwest to Ft. Vermillion, about 300 miles. A charter to build over this route was granted last spring by the government of Alberta. Contingent on the completion of certain negotiations, the company hopes to begin construction work in the spring of 1916. Charles F. Law, Bank of British North American building, Vancouver, B. C., may be addressed (October 15, p. 714.)

BEULAVILLE RAILROAD.—Work is now under way by the Kinston Manufacturing Company, Kinston, N. C., on an extension from Beulaville, N. C., to Chinquapin, 7 miles. The company will also build one mile of secondary track between these two places.

CALIFORNIA ROADS.—The Board of Public Works of San Francisco has let a contract to F. Rolandi, 550 Montgomery street, for the construction of a railway from Rosasco, Tuolumne county, to the Hetch-Hetchy reservoir. The contract price is \$1,543,080. (November 5, p. 879.)

CANADIAN NORTHERN.—This company has grading work finished on about 140 miles on the Island of Vancouver, from Victoria to Alberni; also on 15.25 miles, from Victoria to Patricia Bay. Surveys are now being made from Kamloops, B. C., southeast via Vernon and Kelowna to Lumby, 141 miles, and on the Island of Vancouver, from Alberni to Nootka sound, 15.6 miles.

CLINTON & OKLAHOMA WESTERN.—Surveys are now being made for an extension to be built from Clinton, Okla., southeast to Colony, 30 miles. The company now operates a line from Clinton west to Strong City, 51 miles. (September 10, p. 487.)

CINCINNATI, HAMILTON & DAYTON.—Contracts were let during 1915 for the construction of 12 miles of second track from Carlisle, Ohio, to South Dayton. The estimated cost of the work is \$175,000. (October 29, p. 828.)

FLORIDA EAST COAST.—This company has authorized the construction of an extension of the Okeechobee division from Maytown, Fla., to a connection with the main line at New Smyrna, 17.35 miles, to cost about \$200,000. The contract for the grading work has been let to J. M. Cook, Jacksonville, Fla., and the bridge work and tracklaying will be carried out by company forces. The rail, ties and other track material have already been bought and are on hand. J. W. Wycoff is resident engineer for the construction work.

GULF COAST RAILWAY.—This company has been organized by some of the officers of the Southern Investment Company, Richmond, Va., to build a railway from a point near Venice, Fla., to Placida, about 28.5 miles. The promoters expect that construction work will be started in the near future. (November 19, p. 986.)

HOUSTON, RICHMOND & SAN ANTONIO INTERURBAN.—President Edward Kennedy, of Houston, Tex., is quoted as saying that a contract for grading the first 100 miles of this line will probably be let within the next 60 days. The projected route is from Houston west to San Antonio, about 215 miles. The general offices of the company are at San Antonio. (September 17, p. 547.)

LULA-HOMER.—Grading work is now under way between Belton, Ga., and Homer on 14 miles. William J. Redmond, Atlanta, Ga., is the general contractor. The company has projected an extension from Homer northeast to Anderson, S. C., 60 miles. D. G. Zeigler, chief engineer, Lula, Ga. (October 15, p. 714.)

NEW YORK SUBWAYS.—The New York Public Service Commission, First district, has approved the plans for the construction of the Webster avenue extension of the Third avenue

elevated railroad in the borough of the Bronx. This extension will extend from the present Third avenue line near its terminus north through Webster avenue to Gun Hill road, where a connection will be made with the new rapid transit line in White Plains road. This approval of the plans will enable the Interborough Rapid Transit Company to obtain bids immediately for the work.

The commission has awarded the following contracts on rapid transit lines in New York City: For the construction of Section No. 2 of Routes Nos. 19 and 22, to Lawrence C. Manuell, the lowest bidder, for \$2,063,877. This section is a three-track elevated railroad, and extends northerly from Whitlock avenue in the borough of the Bronx to Pelham Bay Park. For the installation of tracks on the White Plains road extension of the Lenox avenue branch of the existing subway, to the Coast & Lake Contracting Corporation, the lowest bidder, at \$53,930.

The commission has approved the award by the New York Municipal Railway Corporation to Bayly Hipkins of the contract for the erection of steel, constructing tracks, station buildings, platforms, etc., for the additional tracks on the Myrtle avenue elevated railroad in the borough of Brooklyn, between Wiloughby avenue and Palmetto street, and on Palmetto street, between Myrtle avenue and Cypress avenue. Mr. Hipkins was the lowest bidder, and offered to do the work for \$352,511.

NORTHERN OHIO TRACTION & LIGHT COMPANY.—This company during 1915 laid 3.50 miles of new first track in the cities of Akron, Ohio, and Canton, and 9.4 miles of double track cut-offs between Akron and Cleveland.

RICHMOND, RAPPAHANNOCK & NORTHERN.—A contract is reported let to the Central Construction Company, Harrisburg, Pa., for building from West Point, Va., northeast to Urbana, 17 miles. (December 10, p. 1113.)

SOUTHERN RAILWAY.—The additional main track under construction on this road, but not yet completed, is as follows: In Virginia, between Orange and Charlottesville, 28.1 miles; Arrowhead and Elma, 18.2 miles; Tye river and Amherst, 7.07 miles; Sycamore and Gretna, 5 miles; Whittles and Dry Fork, 9.7 miles. In North Carolina, between Concord and Rocky river, 5.6 miles. In South Carolina, between Hayne and Central, 55.85 miles, and in Georgia, between Cornelia and Gainesville, 24.7 miles, a total of 154.22 miles.

RAILWAY STRUCTURES

ASHLAND, WIS.—The two docks which are being extended by the Chicago & North Western are ore docks and not coaling docks, as reported last week. The Barnett & Record Company, of Minneapolis, Minn., has the general contract, and the contract for the ore chutes has been awarded the Wisconsin Bridge Company, of Milwaukee, Wis.

BALTIMORE, MD.—The Baltimore & Ohio is building a one-story addition, 30 ft. by 112 ft., at the Mount Clare shops, to cost about \$4,000. The work is being carried out by company forces.

GALLUP, N. M.—The Atchison, Topeka & Santa Fe has awarded a contract to Sharp & Gannon, Topeka, Kan., for changing the course of the Puerco river and filling in a site to be used for shops, roundhouses and tracks. The work will cost about \$67,000.

HOLLOW ROCK JUNCTION, TENN.—The Nashville, Chattanooga & St. Louis plans to enlarge its yards at Hollow Rock Junction and to increase the facilities at that place. The work of strengthening the bridges on the Nashville division has already begun between Nashville and Harding, also between Bellevue and Newson. Two bridges will be replaced with ballasted deck girders, and later it is proposed to reduce the grades on this division. The survey for this work has already been made.

LUDLOW, ILL.—The Central State Bridge Company of Indianapolis, Ind., has been awarded a contract for the construction of a 90-ft. span on the line of the Kankakee & Urbana Traction Company, north of Ludlow.

TAUNTON, MASS.—The superior court has filed a decree ordering the New York, New Haven & Hartford to complete the abolition of grade crossings in Taunton within three years and six months. President Elliott has testified that the work will cost \$2,500,000.

Railway Financial News

ARKANSAS, LOUISIANA & GULF.—See Arkansas & Louisiana Midland.

ARKANSAS & LOUISIANA MIDLAND.—This is the new name of the reorganized company which took over the Arkansas, Louisiana & Gulf.

ATLANTA, BIRMINGHAM & ATLANTIC.—Following the meeting of stockholders it was announced that an application will be made early in January to the secretary of state of Georgia for an amendment to the present charter as a first step toward reorganization.

CHICAGO, ROCK ISLAND & PACIFIC.—In an interview in the New York Times Charles A. Peabody, president of the Mutual Life Insurance Company of New York, and chairman of the protective committee for the first and refunding mortgage bonds, is quoted as saying: "My own impression is, and always has been, that a foreclosure under the first and refunding mortgage is inevitable. It must come sooner or later if the Chicago, Rock Island & Pacific is to be reorganized. I shall be glad, however, if some one else can show us a better way." N. L. Amster, who represents one of the minority factions of the stockholders, is quoted as saying: "The rumor of a foreclosure suit is only another attempt to throw confusion into the shareholders' camp. It is my view that there can be no foreclosure unless there has been an actual default of interest on the refunding bonds." The tentative plans which have been given out by the Amster interests suggest an assessment of \$33 per share on the stock. The Wall Street Journal says that application has been made to the trustees by the protective committee on behalf of holders of the first and refunding mortgage bonds for foreclosure of the mortgage. This step was taken under the clause of the mortgage prohibiting the placing of a lien on the property ahead of the refunding bonds. The violation of this provision, the committee claims, consists in the issuance of receiver's certificates.

MISSOURI, PACIFIC.—Frank J. Gould has authorized the deposit of his Missouri Pacific securities under the reorganization plan proposed by Kuhn, Loeb & Co. His holdings are not supposed to be very large, and it is not thought that this is any indication of how the Gould estate will act toward the plan.

WABASH-PITTSBURGH TERMINAL.—Representative Linthicum, of Maryland, has introduced in the lower house of Congress a resolution asking for an investigation of the Wabash-Pittsburgh Terminal.

WESTERN MARYLAND.—The directors have voted to pay interest on the coupons that have been in default on the company's notes. On January 1, therefore, there will be paid a year's interest on the coupons which were due January 1, 1915, and six months' interest on the coupons which were due July 1, 1915. These are coupons of the \$10,000,000 collateral trust notes and \$3,000,000 unsecured notes.

THE PROJECTED RAILWAYS IN GREECE.—The British consular report on the trade of the Piræus and district for the year 1914 says that the construction of the railway linking up the Piræus-Athens-Larissa line with the Oriental railways has made good progress, and according to a statement made by the minister of communications in the Greek Chamber of Deputies in Athens, the line will be ready in August, 1915. The necessary material—ties, rails, etc.—is being rapidly carried to the spot, while 20 engines and the rest of the rolling stock have been ordered in America, and will be delivered shortly. Owing to the war, several iron bridges which had been ordered in France cannot be ready in time, and in such a case temporary wooden bridges will be constructed where needed. A convention has also been signed for the purchase by the state of the old railway line. The purchase price agreed upon being \$2,600,000 less the dividend for 1913—about \$120,000—altogether \$2,480,000 as against \$3,996,000, the sum for which, according to the old convention, the Greek government was to have the right to take over the railway in 1927.

The interruption of traffic on the New York division of the New York, New Haven & Hartford by the snow and ice storm of December 13, which was briefly reported last week, was very serious for 72 hours and trains continued irregular for the rest of the week. Passengers and prospective passengers have entered a multitude of complaints, but it is impossible even now to explain more than a fraction of the reasons for the delays to trains that were run and the omission of many trains that ought to have been run but were not; for the chief operating officer himself (at the time this paper goes to press) has received no full or detailed reports of the causes of the troubles. This is because of the scanty means of communication, and, more particularly, because every man and every officer who could do anything toward restoring the electrical wires has until now expended all his energies on the outdoor work. The electric

The New Haven's Electrical Tieup

power was unavailable for about 36 hours because of the breaking at many places of the "control" wire, the wire by which the load dispatcher at the power house keeps in touch with the different sections of the line. This "control" is as important as the transmission itself; but the conductor was not so strong, physically. The steel structure, the catenary and contact conductors and the transmission wires were all of sufficient strength and withstood the snow, sleet and wind (the wind in many places blew at 70 miles an hour); except that the transmission wires failed at three places, probably from electrical disturbances; and the "control" wire failed because the load of snow and ice was too great for the physical strength of the 300-ft. spans. Those signal wires which were on wooden poles went down on long stretches of the road because of excessive weights on wires, and failures of poles; and signal wires on the steel structures went down from overweight, the same as the "control" wire above mentioned. All telegraph and telephone wires were out of service because of these same general causes, and the telephone company's lines as well as the Western Union wires at the same time failed in all directions. On a 12-mile line of the New York Telephone Company, a few miles west of the New Haven road, every pole fell. The New York division is operated largely by electric power, and there were only 25 steam locomotives (all freight engines) available on the division. Other divisions adjacent, by reason of the snow on the tracks and the delays due to the loss of communicating wires, needed all their engines and could lend none to the New York division. This, in brief, seems to be the explanation of the small number of trains in service on Tuesday and Wednesday. Only by borrowing linemen from foreign electric establishments and by getting the co-operation of a large number of Western Union men was the road able, by Thursday, to gather a force of 250 linemen; and these 250 were kept at work, as many hours as they could endure, until Monday of this week.

The Austrian reply to the United States assumes no knowledge on the part of that government of the negotiations which the United States had with Germany in regard to the Lusitania. The New York Public Service Commission, Second district, has suspended for three months, pending a hearing, the proposed increase of passenger fares from 2 to 2½ cents which was to have become effective January 1. The press bureau of the commission gave out the statement that "no date has yet been set for this hearing, but it was stated at the office of the commission that the hearing would be held as soon as the representatives of the railroads could prepare the proof which it will be necessary for them to adduce on the hearing and with due regard to the convenience of the number of civic bodies and officials," etc. Volumes of evidence have been submitted in various cases showing the cost of passenger service. The United States Supreme Court has decided that each class of service must be permitted to earn a return on the capital invested in the utilities devoted to this service; the Interstate Commerce Commission has granted the western passenger fare increases, but the New York State Public Service Commission is going to allow three months or more for the preparation of proof and the convenience of civic bodies, etc. No one can criticize the commission for proceeding in an orderly way to treat the New York state passenger fares on their own merits, but the commission is an administrative body which, unlike the Austrian government, ought to be cognizant of what is taking place in a field in which it is specifically engaged in work. Is it not a bit misleading to blame a three months' delay on the necessity for the roads to prepare proof? The roads probably made a very careful investigation long before the increase was decided on. The proof necessary to convince a fair and intelligent commission is probably already prepared. Whether it be sufficient to convince the civic bodies and officials whose convenience the commission also wishes to meet may be another question.

The Austrian reply to the United States assumes no knowledge on the part of that government of the negotiations which the United States had with Germany in regard to the Lusitania. The New York Public Service Commission, Second district, has suspended for three months, pending a hearing, the proposed increase of passenger fares from 2 to 2½ cents which was to have become effective January 1. The roads probably made a very careful investigation long before the increase was decided on. The proof necessary to convince a fair and intelligent commission is probably already prepared. Whether it be sufficient to convince the civic bodies and officials whose convenience the commission also wishes to meet may be another question.

The strike on the Belt Railway of Chicago last week involved a question which is raised nearly every time a new classification yard is placed in operation. Clearing yard, which was placed in service last July, is located in the outskirts of Chicago about six miles west of the old yard of the Belt Railway, which was adjacent to a well built-up residential section. With the opening of the new yard at Clearing, the men demanded that an employees' train be run at frequent intervals to take them to and from work, and the continued refusal of the road to install this service permanently precipitated the strike. Whenever a road builds a new classification yard it is obviously necessary to locate it beyond the settled areas, where sufficient land can be acquired at reasonable prices and where there will be room for further expansion. Whenever such a terminal is placed in service the employees working in the yard and the train and enginemen running out of it have the alternative of moving near the new terminal or of finding some means of getting to and from work conveniently. It usually becomes necessary for the employees to move to the new location. To assist their men during the period of readjustment, a number of roads have put on employees' trains temporarily with the result that in many cases the employees have made little or no effort to relocate their homes, depending on their ability to persuade the company to keep the trains in service. Because of the difficulties which have arisen when such trains have been taken off, the roads have in numerous instances refused to put on such trains at all, leaving their men to get to work the best they could rather than face the difficulty in removing these trains after they have once been started. While local conditions differ from place to place, and while it is recognized that a temporary hardship is created for the employees involved whenever their place of employment is moved away from the vicinity of their homes, their action in Chicago and elsewhere is a strong deterrent to any co-operation on the part of the railroads.

COMFORTING DELAYED PASSENGERS

DELAYING a hundred passengers a half hour may cause more ill feeling than can be counteracted by the highest grade of politeness in all the ticket offices on the road for a whole year, even though the delay may be due to an engine failure, a fallen brakebeam or some other simple accident which every one of the hundred passengers, on reflection, would admit to be practically unavoidable. This being so, J. B. Austin, superintendent of the Long Island Railroad, may not be far out of the way when he says, in a circular to stationmen and trainmen, that "nothing will contribute so much to the popularity of the road as the giving to all concerned prompt information as to cause and probable duration of delays." This circular is so well worded that it deserves to be copied. We started to italicize the most important words in its reproduction elsewhere in this issue, but gave up the attempt because there were so many of them. We will, however, note a few of them here.

"Comfort and Convenience." Making passengers comfortable is only one feature. Consulting their convenience may mean taking time, for the passenger's benefit, to study the time tables of a rival railroad, or sending a brakeman to carry a woman's hand baggage to the other road's station. Comfort includes a mind at peace. "Suitable Announcement." How many announcements of delay are unsuitable; falling far short of giving all the information that is reasonably desired! "Trainmen are to freely answer all questions . . ." What a very high standard, as compared with what is heard on passenger trains every day! Many brakemen give answers which are so brief as to seem to indicate that they value their words at a dollar each. "Trainmen will only be expected to do the best they can." Allowing the passengers to be the judges, that will be at least a hundred per cent above the usual average. And, whether they are reasonable or unreasonable, the passengers must be allowed to be the judges. Who can make it otherwise?

"The train dispatchers will keep in touch with the agents." This is one of the chief sentences in Mr. Austin's circular. If the Long Island is like most roads it is the sentence from which the most definite improvement may be expected. Educating brakemen is a slow process. It is hard to find many roads (or divisions) where the force of passenger trainmen does not include a considerable percentage of men whom the trainmaster looks upon as rather poor material for educational processes. The Long Island itself must have its full share of educational perplexities, because of the great reduction in the volume of passenger service on its lines in the Autumn and the equally heavy increase in the Spring. To maintain efficient passenger service on that road is a great accomplishment. But to keep passengers always well informed, through the medium of the train dispatcher and his telephone lines are running to every ticket office, ought to be a simple problem. Simple, because there are comparatively few men to deal with and they are (or ought to be) men of intelligence and alert minds. But this problem, though simple, has been much neglected. We could name roads where train delays are very poorly advertised; where passengers have numerous grievances—many of them rather small grievances, it is true—which alert train dispatchers could make unnecessary.

The station agents must do their part, of course. If stationmen were more wideawake to anticipate passengers' wants they could enhance the dispatchers' efficiency by asking them more questions—provided, of course, that the superintendent employs enough extra pairs of eyes to make sure that the dispatchers give suitable responses to agents' questions. When dispatchers are rushed with work they are liable to neglect passengers' convenience, with some feeling of justification, and the superintendent needs to step in and straighten matters. Again, it is to be remembered that the shortsighted and lazy dispatchers, and those who are overbearing in their attitude to agents, are not all dead.

Is there not some way to excite rivalry in this matter among dispatchers, and also among agents? Prizes for excellence are hardly practicable; and even the prize of mention by name in "efficiency bulletins" sometimes overshoots the mark, by magnifying "merits." The man who is inclined to blow his own horn must not be encouraged, surely. But, in the nature of the case, there must always be, in any body of men, some who excel; and it is one of the plainest duties of the officer to see that these men's methods are made known to others who ought to pattern after them.

Whatever the solution of the problem of perfect satisfaction of passengers' wants, it is certain that no very marked success will be achieved except as superintendents, trainmasters, dispatchers, agents, conductors and brakemen give the subject a lot of earnest and business-like attention.

5 MILLIONS FOR AUTOMOBILES BUT NOT A CENT FOR RAILROADS

THE Interstate Commerce Commission may not have sold out to the railroads, because the railroads can hardly afford to buy luxuries these days, even if their credit is as good as Clifford Thorne says it is, but the commission must at least be working in cahoots with Henry Ford—take it from the Des Moines Register and Leader, against whose advice the commission has come to the astounding conclusion that passenger fares should be somewhat higher than those now prevailing in Iowa.

"Increasing railroad passenger fares to 2.4 cents a mile," it says, "is like handing the automobile manufacturers of the country \$100,000,000. It will give enormous impetus to the movement, already well under way, to make each man furnish his own private means of rapid transit between cities, for it is the final step in giving the automobile a definite advantage in the way of cheapness."

This somewhat broad statement is based on the assertion that "two passengers in a light automobile, or four in a heavy car, can journey for less per mile than the 4.8 cents and the 9.6

cents, respectively, which parties so constituted will pay if they travel on the railways."

The Register and Leader's figures lack something of that specific quality which might be expected to characterize, say, a calculation in its own office as to whether copies of its paper which reach Chicago could be sent the more cheaply by mail or by automobile, but the advantage in favor of the automobile is seen in the fraction of a cent per mile which is to be added to the railroad fare. It may be possible to figure the cost of automobiling at less than 2.4 cents per mile, particularly if Clifford Thorne be allowed to censor the maintenance expenses and depreciation charges; in fact, we have heard that some thousands of Iowa farmers occasionally ride in automobiles in preference to paying only two cents a mile to the railroads. We have also heard of higher rates being paid, and without interference by either state or interstate taxicab commissions.

However, we see no reason why anyone in Iowa who really can't afford to buy a new car this year need forego for the present the benefits of personal transportation just because of four-tenths of a cent per mile. The Iowa legislature has not yet repealed the beneficent law which insures to present day Iowans, if not to their posterity, the blessings of liberty to buy a separate ticket at the state line for two cents a mile. It is not much more difficult to do this on a journey to or from the surrounding states of Minnesota, Illinois, Missouri or Kansas than to change a tire, for example. In South Dakota, of course, the rate is 2½ cents and those who have occasion to go back and forth between Iowa and that state would better buy a Ford, save another tenth of a cent per mile and declare a dividend.

On the other hand, there are some infinitesimal advantages in travel by rail as compared with the joys of furnishing one's own private means of rapid transit, particularly on a trip beyond the two-cent a mile radius. If the train is late one can write to the Register and Leader or file a complaint with the Iowa Railroad Commission, whereas if the automobile is late it is late. If nightfall overtakes the weary traveler en route, the Pullman Company will provide a bed for a consideration strictly regulated by a commission and no higher than would be charged in an unregulated hotel in Des Moines. We are not informed as to the make of the light automobile in which one can travel for less than 2.4 cents a mile, but the up-to-date Pullman car is provided with springs.

In comparing the cost of automobile and rail travel our Iowa contemporary has inadvertently omitted consideration of the first cost of the car. In the case of the railroads some of the cars, of course, were found growing on the bushes on the early land grants, and, therefore, the railroads do not expect their rates to cover any return on capital investment, but in the case of automobiles, as well as of gasoline, we had understood that the price usually included some modicum of dividend, the very idea of which is usually abhorrent to the Register and Leader. We do not know how it stands on the question of peace junkets.

If the Iowa automobile owners agree with this oracle as to the cost of automobile travel, it is surprising that they should allow the railroads to continue to compete with them for intrastate business. Why not either raise the state passenger rate or let the railroads discontinue their state passenger business, tax them on their interstate business for the benefit of good roads, for which the Register and Leader now sees an increased need, and turn the state railroad commission into a good roads commission? Reduce the local tax rates for road purposes in order to increase the revenue therefrom and if a railroad gets in the way of an automobile, elevate it. This plan need not legislate anyone out of a job. If road-building prove an uncongenial task for the chairman of the commission the legislature might pay him for regulating interstate rates and create a vice-chairman to take charge of the constructive end of the work.

However, if cheap transportation is really desired, the *Railway Age Gazette* has compiled some statistics of its own, which we may not be able to prove, but which we can confidently assert will demonstrate that it is cheaper to walk than to travel either by automobile or by rail, even within the confines of a

sovereign state. If this discovery is worth \$100,000,000 to the shoe trust, let the Register and Leader make the most of it.

IMPROVING RELATIONS BETWEEN RAILWAYS AND THEIR PATRONS

THE problem of railway regulation is losing none of its complexity or magnitude, but the recent annual report of the Interstate Commerce Commission contains indications of an improvement in many respects in the relations between the railways and their patrons. Since it was the unsatisfactory state of these relations which was responsible for the creation of the problem of regulation this improvement represents progress in fundamentals. The need for railway regulation arose principally from the controversies between the buyers and the sellers of transportation over the rates to be paid by the buyer for the service rendered by the seller, and most of the work of both the federal and the state commissions has had to do with one phase or another of this question.

The improvement to which we refer is manifested in the reduction in the number of such controversies. In the year ending October 31, 1915, covered by the commission's report, the commission received 964 formal complaints, a decrease as compared with the previous year of 190, and as compared with 1913 of 59. It also received 6,500 informal complaints, as compared with 7,880 the year before and 7,600 in 1913.

The commission says that the decrease in the number of complaints filed during the year has been more than offset by the complex nature of the cases that have been presented, and that the rate structures between various communities are now more often the subject of complaint than was the case in earlier years. This means that the cases involve not so much dissatisfaction with the amount of the rates as market rivalry between competing cities. The number of proceedings involving rates suspended by the commission was 199, a decrease of 4, and the number of cases in which the commission refused to suspend new rate schedules was 368, an increase of 157.

Moreover, the proportion of indictments for violations of the law returned against carriers to those returned against shippers, passengers and others was less than ever before. The report of the division of inquiry of the commission, which has to do with the investigation of seeming violations of the interstate commerce laws, shows that about 90 per cent of the matters investigated were disposed of without resort to the courts, and that the larger part of the field investigations made by the division did not disclose violations of law.

Of the 72 indictments returned during the year at the instigation of the commission, only 22 were against carriers or carriers' agents and 50 were against passengers, shippers or other interested parties. The indictments against railroads were principally for failure to strictly observe their tariffs and for granting to individuals favors or free passenger service, and while these cases receive wide publicity, the fact that the commission has caused more prosecutions of the patrons of the railways than of the railways themselves for violations of the laws is usually overlooked. Whether or not it is more blessed to give than to receive, it is true that not only during the past year but in every year but two since the commission's division of prosecution was organized in 1907 there have been more indictments of shippers and passengers for soliciting and receiving rebates, or other preferential treatment, false billing of shipments, filing false claims and for violations of the anti-pass act, than of the railways for giving favors.

The indictments for each year, as shown by the Interstate Commerce Commission reports, have been as follows:

	1915	1914	1913	1912	1911	1910	1909	1908	Totals
Against carriers or carriers' agents	22	20	28	34	29	25	16	18	192
Against shippers, passengers and others	50	38	33	54	26	19	19	28	267
Joint indictments				5	7				12

As far as rebates are concerned there are always two parties to the transaction, the giver and the receiver, but much of the

increase in the proportion of indictments against shippers is accounted for by the practice of false billing of freight in order to secure a lower rate and the filing of excessive or fictitious claims for loss and damage, practices which in many cases the railway's cannot prevent.

The commission also notes an improvement in the practices of the carriers in adjusting claims, showing that of 4,563,438 presented during the calendar year 1914, 96 per cent were adjusted, 50 per cent within 15 days after receipt, more than 65 per cent within 30 days, and all but 6 per cent within 120 days.

NEW SOUTH WALES GOVERNMENT RAILWAYS

THE annual report of the New South Wales Government Railways is always interesting because they constitute the most important railway system of Australia. The report of the chief commissioner for the year ended June 30, 1915, is especially interesting because of its indication that transportation conditions in the antipodes are subject to many of the same influences that exist elsewhere; that government ownership is no antidote for reductions in volume of traffic, or increases in wages and other expenses such as have been experienced in this country; and that it does not serve to prevent increases in capitalization and rates.

Following an increase in gross earnings in 1914 over 1913 of \$4,827,224, and an estimate that the 1915 earnings would show a still further increase of \$1,750,000, the volume of traffic was so reduced after the outbreak of the war in August that the earnings for the year actually amounted to \$37,016,000 as compared with \$37,627,000 in 1914, a loss of \$611,047, or 1.62 per cent. Operating expenses were \$25,812,247 as compared with \$26,291,725 the previous year, a reduction of \$479,477. The balance, after payment of operating expenses, was \$11,203,996, as compared with \$11,335,566 in 1914; but an increase in the interest on capital invested from \$10,318,042 in 1914 to \$11,317,384 in 1915 resulted in a deficit for the year of \$113,388, as compared with a surplus of \$1,017,523 in 1914. From the increased rates and fares put into effect on March 1, 1914, the earnings for the year benefited to the extent of \$1,083,780, as compared with \$361,263 in the previous year, when the higher rates were in operation for only four months. But for these higher rates the year's operations would have resulted in a larger deficit than that recorded.

The chief commissioner says in the report that the principal decrease in the earnings was caused by the comparative failure of the wheat crop and that there were also large decreases in the earnings from general merchandise, attributable to war and drought conditions, and from coal, coke and miscellaneous traffic. He also says that "when it became evident early in the year that the anticipated increase in earnings would not be realized, steps were taken to curtail the working expenditure in every possible way without impairing safety or efficiency. Unprofitable train mileage was reduced as much as possible and only absolutely necessary maintenance works were proceeded with." In November he made application to the court of industrial arbitration for the suspension of periodical advances in wages to salaried officers, engineers and firemen that had been awarded the year before, but the court dismissed the application. The additional expenditure during the year attributed to these advances was \$568,114. It is also stated that the cost of materials used during the year due to advances in prices increased approximately \$175,000. The train mileage for the year was 20,420,023, a reduction of 129,672 miles, the mileage of passenger trains being 9,647,652, of mixed trains 1,353,920, and of goods trains 9,418,451.

An appendix to the report shows, however, that the average number of men employed, 37,403, was 4,076 greater than for the preceding year, and although most of the increase was in the number employed on work charged to capital account the operating force was 414 larger than in 1914.

The interest requirements, which were \$999,342 larger than

for the previous year, include interest on money expended on work under construction during the year, which the commissioner says should be treated as part of the cost of the work and charged to capital, rather than to operation. But for the inclusion of this amount, he observes, the result for the year would have been a surplus of \$149,036, instead of a deficit.

The balance after working expenses, available for the payment of interest, was equal to 3.6 per cent on the capital invested, as compared with 3.9 per cent in the previous year. This is referred to in the report as a "profit." The expenditure charged to capital account during the year amounted to \$20,987,448, which increased the total cost of lines open for traffic on June 30, 1915, to \$318,734,711 for 4,134.5 miles, or \$77,094 per mile. In 1914, the capital investment was \$75,048 per mile, in 1907, \$62,917 and in 1888, \$63,734.

Of the total earnings the passenger business contributed \$14,145,924, a slight increase over 1914, and the freight business \$20,442,297, over half of the freight earnings being derived from the merchandise traffic, and approximately one-fourth from the livestock traffic. The ton miles of freight carried amounted to 916,923,022, the average haul was 78.64 miles and the average earnings per ton-mile were 1.9 cents. The average haul on general merchandise was 89.68 and the average rate per ton-mile 2.78 cents. The average rate on coal and shale was 1.08 cents, on grain and flour .74 cents, hay, straw and chaff .72 cents, wool 3.92 cents and livestock 2.12 cents. The number of passengers carried was 88,774,442, of which 79,914,452 were suburban passengers carried at an average rate of .9 cents per mile and 8,859,990 "country passengers," carried at an average rate of 1.32 cents. Extensions amounting to 163 miles were opened for traffic during the year, and 1,078 miles of extensions are under construction.

NEW BOOKS

Claims Between Shippers and Carriers. By Ralph Merriam of the Chicago Bar. Size, 6 in. by 9½ in., 1815 pages, bound in buckram. Published by La Salle Extension University, 2550 South Michigan avenue, Chicago. Price, \$10.

This book is a digest of the decisions of the American courts, both national and state, relating to claims between shippers and carriers by rail and water from the earliest times (1658) to the present day, and is said to cover every point made in each decision. The various points are concisely and clearly summarized and the arrangement is such that the rulings of the courts on the exact point at issue can be instantly located, making the book unusually valuable for ready reference.

In seeking the decisions upon any question, the reader may by a glance at the table of contents determine, first, the main division within which the point falls; and, second, the particular section covering the set of facts or circumstances involved. Turning to this section of the body of the book he will find the cases upon the point assembled, with the decisions of the United States courts coming first, followed by those of the state courts in alphabetical order. The decisions are then arranged, first, according to the rank of the court; and second, chronologically. A slight variation of this arrangement is made in the cases under "Shipments by Water," due to the fact that recent decisions of the United States courts are arranged alphabetically according to districts. At the end of each decision appear the name of the case and a reference to the official report or reports in which the full opinion is printed. As an additional aid to the reader in locating any point he wishes, there is a 50-page alphabetical index at the end of the book.

The author is known to traffic men as co-author of *Lust and Merriam's "Digest of Decisions Under the Interstate Commerce Act,"* and his new work should be valuable to all traffic men both of railroads and of industrial companies as well as to operating men and others who have anything to do with the handling of claims or the prevention of loss and damage to freight.

Letters to the Editor

ORIGINAL COST TO DATE, COST OF REPRODUCTION NEW, AND COST OF REPRODUCTION LESS DEPRECIATION

NEW ORLEANS, La.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

It is becoming increasingly evident from the trend of discussion that "cost of reproduction new" is taken to mean the problematical expense of providing a hypothetical substitute transportation plant rather than the retracing at present-day prices of the growth of the existing plant. Else why this talk of "rational programs of construction"? Perhaps a hybrid having more or less the characteristics of both parents will be the final outcome. What is the real meaning of the valuation act of March 1, 1913, in this respect? Is it intended to ascertain what it would now cost to build railroads of similar intent and purport but not necessarily identical with the present ones? Or may we lay down the principle that everything that has entered into the productive cost of the present transportation plant to date, minus the deletions, should figure in its reproductive cost in like manner and that nothing that has not should? Cannot the intimate connection between cost of production, cost of reproduction new, and existing depreciation be argued from the very juxtaposition of the phrases, "original cost to date, cost of reproduction new and cost of reproduction less depreciation"? How else will "cost of reproduction less depreciation" fit in with the depreciation in the existing plant?

The most damning feature of such "cost of reproduction new" is its necessarily theoretical and academic basis. It is not intended to be put to the acid test of accomplishment. Railroads do not spring like Minerva full-panoplied from the brain of Jove. Railroads, moreover, like castles, may be built in the air. Are we justified in making use of the experience of the past, dearly bought at the sacrifice of investors, only to the extent of avoiding proven errors, thus cheapening the estimated cost of construction? Can we assume in our program of reproduction the collective engineering wisdom of the country such as was not at the disposal of original constructors? Then, again, there are the liable false assumptions of ideal financial arrangements, unlimited and ever-ready capital; indeterminate time; ideal conditions alike as to weather, labor troubles and a market for supplies without fluctuations; the perfect co-ordination of all parts of the directing and working organization without friction or lost motion; construction without waste; continuous and contiguous construction as opposed to piecemeal growth, spotted in time and place; all of which is contrary to general railroad experience. Even where, under the proposed scheme, provision is to be made for the cost of experience and similar contingencies, it is on some percentage basis, which is highly unsatisfactory and likely to be at great odds with reality.

The valuation is entirely without meaning unless intended to be used. Of possible uses, not the least important is as a basis of criticism of existing passenger and freight rates. In any resulting revision, two parties are vitally interested, the public investing in railroad securities, on the one hand, and the traveling and shipping public, on the other. We should carefully guard against adopting valuation methods which may either confiscate private property or mulct the public according as they depress or inflate actual railroad values.

On the other hand, what more natural than, having ascertained according to law the actual original cost to date, to take these same units of talent, land, labor and material and restate them in money equivalents of the present time. "Cost of reproduction new" would thus measure the increment or decrement in the investment as wrought by the passing years. We should then have but one basic statement (by valuation sections and

recapped) of "original cost to date, cost of reproduction new and cost of reproduction less depreciation," with deletions in italics, as deductions, when they occur, and arranged in columns as follows:

1. Description of units of property broken up into elements of cost.
2. Date as of which investment was made.
3. Actual original quantities to date as proven from the records of the carriers, supplemented and checked by the physical inventories, or estimated as closely as possible when otherwise unobtainable.
4. Actual or estimated original cost to date.
5. A restatement of the above in money equivalents of the present day.
6. Ascertained existing depreciation in the present plant.
7. Cost of reproduction new less depreciation.

J. S. TASSIN.

THE TRAIN DESPATCHER'S LIFE, PAST AND PRESENT

CHICAGO, Ill.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

That article on "The Train Despatcher," by "One of Them" in your issue of August 20 is a fine portrayal of the strenuous life of a train despatcher on a busy single track railroad. I agree with all he has to say, except that, on the whole, I do not think the despatcher's lot is more strenuous today than it was 20 or 25 years ago. However, I have been out of harness as a despatcher for 15 years (though still in the service) and my perspective may have changed. It is true they now have the sixteen-hour law and other laws and requirements that add to their work, but I think these additional burdens are at least offset by conveniences now enjoyed in the way of better lighted and better ventilated offices, better circuits and often shorter districts, larger engines and consequently fewer trains to handle and double tracks; and, above all these advantages, more considerate railway officers, from the president down to the trainmaster.

The despatcher still is one of the most important spokes in the steering wheel. In times past despatchers were subjected to "umbrella rules"—rules that often bound them regardless of conditions—but we have got away from that; and on all of the more important roads the despatcher has, in a sense, been elevated to an officer and is actually recognized as such.

The writer was a despatcher in the latter eighties and early nineties, when the superintendent was as much of a Czar toward the despatchers, as some of the despatchers were toward the "OS" operators. I served for several years under one superintendent whom I shall never forget. This man had roughed it for many years, was familiar with adversity, rather coarse and of the driving kind, but withal a shrewd man. He came to the road as a trainmaster and succeeded to the superintendency only a few months later; this being his first position as superintendent. He was about 50 years of age, and his attitude toward most of his subordinates was that of a greatly exaggerated superiority. Everybody got out of the way and gave him a clear track when they saw him coming. The underground reports via the switch shanty were to the effect that he was a "terror" and had been run off of some road in the Southwest on account of his hard treatment of men; and his attitude from the start was anything but reassuring. He brought with him his family, including four boys, the eldest about 17 years old. I should like to tell you about how he put this boy ahead, but to make a long story short I will only say that to maintain one's rights it was necessary that we (the operators and despatchers) had to stand up with great firmness, and sometimes appeal over the superintendent's head. The boy was soon made despatcher and after one collision and a number of "close shaves" became a quite decent one.

The trouble with this old-school superintendent was that he didn't know how to treat men; and, moreover, didn't care to know. He was not interested particularly in either the men or the company; and, as was most natural, many of his subordi-

nates were of the same stripe. This man finally went the route of the selfish and arrogant. With a change in management he was dropped out and so far as I know has not had an official position since.

That kind of treatment of men was not at all uncommon 25 to 30 years ago. But that and other adverse conditions the present managements have overcome, so that railroad life is now more pleasant; not only for the train dispatcher, but for all others.

Today the train dispatcher, with other railway officers, and the employees as well, have on most roads of any consequence the assurance, not only of retention in the service, but of promotion on merit and ability; and beyond that a reward of merit in the shape of a pension. If perchance an unworthy man slips in as superintendent, the dispatcher can and does have easy access to the general officers, and even to the president, if he chooses. And the higher officer, almost without exception, has graduated from the ranks, so that he naturally frowns on nepotism, favoritism and all discrimination.

The very fact that the office of train dispatcher, or chief dispatcher, on a busy road, is a strenuous one, is what attracts strong men. The work after all is in the nature of a race and usually (as was not always the case years ago) the best man wins. It is true the dispatcher is an "inside" man; and, unfortunately, sometimes a superintendent who graduated by way of the "M. of W." route will not seem to acknowledge his persevering efforts, but will promote an outside man for performing some one piece of work to his fancy; but this, though not always right, works both ways.

After all, it is usually the wideawake, persevering man who gets there, and I think by reason of the very strenuous nature of the work, of which the officers must have some knowledge, the train dispatcher's route—all things considered—is a very favorable one.

A train dispatcher with the right kind of stuff in him will make his work strenuous. He maps out the moves, posts each conductor and engineer on what is wanted, breaks a passive rule here and crowds the devil there; but withal takes no chances, so far as real safety is concerned. As the writer of the article referred to observes, the dispatcher is often frozen to his chair for an hour or more after his relief, so absorbingly interested in his work that he can't let go. He may often do much good in obviating trouble due to errors on the part of others. In fact, the hundred point train dispatcher feels responsible for the safety of every train on his territory, and during his hours there are very few accidents due to lapses on the part of any one. He gives the crew of a train about to leave a terminal a "hunch" about a late overdue superior train that does not appear on their orders. In completing an order to another crew on the road, which puts them into a blind siding for an opposing train, he gives them a tip that number so and so is on time, etc. He keeps an eye on a new conductor or engineer, and really feels that it is up to him to get such a man over the road safely, feeling a personal pride in the work.

It is the old, old story; that feeling of self approval that we would all attain must come through sincere effort. "The divine law is very simple and automatic; we receive only as we give away."

My advice to the train dispatcher would be this: If you want a position where there are only certain specific things to do, and where you can quit on the hour, look up another calling. If, on the other hand, you are ambitious, thank your stars that you have the opportunities that a position as train dispatcher offers. See to it that you put your whole soul into the work to the extent that it meets with your own unqualified approval, whether promotion does or does not come as often as you think it should. A good dispatcher, like good men in other lines, has initiative, and makes use of it. A man of that kind compels recognition. "The law of compensation never rests." Although, as before stated, I am now out of the train-wire harness, I beg to subscribe, like your former correspondent,

ONE OF THEM.

MAINTENANCE EXPENDITURES ON THE PERE MARQUETTE

DETROIT, Mich.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Referring to the article published in your issue of November 19, concerning the operation of the Pere Marquette for the fiscal year ending June 30, 1915; you are justified in commenting that "it is by no means conclusively demonstrated that the 1915 rate of expenditure for maintenance can be continued without detriment to the property. Under present conditions of operation, with the necessity for heavy rails, ballast, etc., and probable cost of track labor, \$864 appears to be considerably less than will be required as an average over a series of years for maintenance of way and structures."

The maintenance of way work was carried on under a carefully prepared program, which called for an expenditure of approximately \$2,000,000, which we considered ample to maintain the property in normal condition; and I may state that the property is at this time, in reality, in as good physical condition as the business warrants, and in our judgment should be maintained for not to exceed \$900 per mile or \$2,082,600 per annum.

With a slight variation in the mileage, maintenance of way expenditures for the past 10 years have been as follows:

1906	\$1,627,307
1907	1,639,447
1908	1,658,834
1909	1,669,220
1910	1,932,437
1911	2,123,296
1912	2,064,891
1913	2,944,517
1914	2,996,118
1915	2,000,282
Total	\$20,656,349

This is an average of \$2,065,635 a year.

Approximately one-third of the expenditures made in the years 1913 and 1914 were on account of deferred maintenance. I am satisfied we did not receive as much value for each dollar expended in this rehabilitation work as we would have had the maintenance been kept up to normal during the previous years. In dealing with the Pere Marquette we must not lose sight of the fact that of the total mileage there are but 1,339.67 miles classified as main line, the balance being branch lines and business-producing branches.

It is the judgment of all of those who have been connected with the property since the consolidation (which occurred in 1900) that it is in better physical condition to-day than ever before.

Referring to the maintenance of equipment: The expenditure of \$3,492,973 may also be said to be a normal annual expenditure.

Below you will find the expenditures for a 10-year period:

1906	\$1,897,036
1907	1,975,221
1908	1,966,751
1909	2,018,494
1910	2,117,700
1911	2,550,859
1912	2,804,938
1913	2,987,156
1914	6,487,963
1915	3,492,973
Total	\$28,299,091

This is an average of \$2,829,909 a year.

Since May, 1914, the maintenance of equipment account includes a depreciation charge of approximately \$54,000 per month. Prior to this time the amount charged off to depreciation was small.

I have not gone into the detail to show the relative density of traffic handled covering the period under maintenance of way, nor the engine and ton miles under maintenance of equipment, but have treated the matter generally without going into detail, and I feel satisfied that both the equipment and roadway are being maintained fully up to a normal condition.

FRANK H. ALFRED
General Manager for Receivers.

Heavy Pacific Type Locomotive for the Lackawanna

Anthracite Coal Burning Engines with a Tractive Effort of 47,500 lb. and a Weight on Drivers of 197,300 lb.

About three years ago seven Pacific type locomotives* were built for the Delaware, Lackawanna & Western, by the American Locomotive Company, to replace a class of heavy 10-wheel locomotives then handling the through passenger service. The division between Scranton and Hoboken crosses the Pocono mountains and has a constant ruling grade between Stroudsburg and Pocono Summit of 78 ft. per mile for a distance of 16 miles, with curves of five and six degrees. The Pacific type locomotives were designed to handle a 460-ton train over this grade at a sustained speed of 30 miles an hour and have handled trains of eight cars weighing 530 tons at that speed.

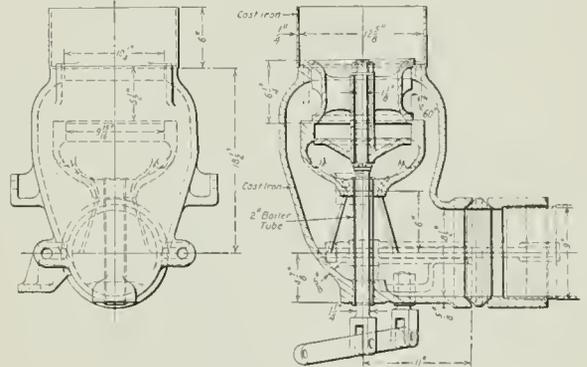

The general introduction of steel cars in passenger service has necessitated the purchase of still heavier and more powerful engines, and five Pacific type locomotives, the most powerful of this type on record at this time, have recently been delivered by the American Locomotive Company. These engines are hauling trains of nine steel cars, weighing 600 tons, over the grade referred to above, at a speed of 30 miles an hour. On other trains they are handling from one to two extra cars on schedule time on the grades, and have made it possible to dispense with all helpers on the mountain district on trains of 10 cars or less.

The new locomotives have a total weight, engine and tender, of 471,300 lb. and a tractive effort of 47,500 lb. Pacifics of the 1106 class have a total weight, engine and tender, of 449,800 lb. and a tractive effort of 40,800 lb. With an increase in weight of 4.8 per cent, an increase in tractive effort of 16.4 per cent has been obtained.

A tractive effort of 47,500 lb. from a Pacific type locomotive requires a boiler of high capacity. At the first course, the barrel

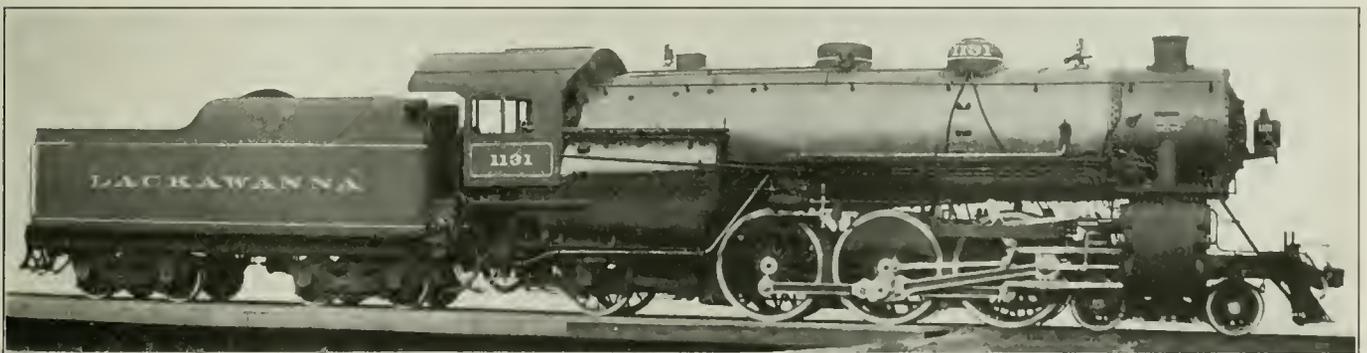

of a net increase in heating surface of 255 sq. ft. Each firebox includes a combustion chamber 44 in. long.

The engines are equipped with the Woodard throttle which has been developed and patented by the builders. In this arrangement the throttle rod is placed on the outside of the boiler shell and operates the throttle valve by means of a horizontal

The Woodard Throttle

shaft passing through a stuffing box on the side of the steam dome. The valve stem projects downward through a passage open at both ends, but closed from communication with the throttle box. At the lower end of the throttle stem is a horizontal lever, one end of which connects through a vertical rod with the inner arm of the operating shaft on the side of the dome.

Lackawanna Heavy Pacific Type Locomotive

is 79½ in. in outside diameter, while the diameter of the largest course is 88½ in. Baffle plates are installed along both sides of the dome opening to prevent water from washing into the dome when rounding curves. All longitudinal seams are quintuple riveted. Four of the engines have a total evaporating heating surface of 3,680 sq. ft., while the other, which is provided with a Riegel boiler, has a total of 3,935 sq. ft. of evaporating heating surface.

The firebox is of the Wootten type, for burning anthracite coal and has a grate area of 91.3 sq. ft. The general design is the same on all five engines, the Riegel firebox differing only in the application of a set of 2½-in. water tubes connecting each side water-leg with the crown. There are 38 of these tubes on each side, with a total heating surface of 260 sq. ft., which, after deducting for the holes in the crown and side sheets, gives

The stuffing box on the side of the dome is of ordinary construction suitable for a rotating shaft.

The throttle rod passes over the outside of the boiler jacket and in through the front of the cab. The throttle lever to which it is connected is arranged to provide a differential leverage. The leverage is greatest and the movement of the end of the lever is largest for a given motion of the throttle rod, when the throttle is closed. After the throttle valve is unseated the leverage increases, with a corresponding decrease in the travel of the lever handle for a given lift of the valve. In this way the travel of the lever handle in the cab may be kept within workable limits and a starting pull obtained sufficient to easily lift the valve.

All driving axles and main crank pins are of Cambria Coffin process steel with 3-in holes bored the entire length after the completion of the Coffin process. The frames are of vanadium steel.

*For a complete description see the *Railway Age Gazette* for July 19, 1912, page 88.

The special equipment includes Manchester-Riegel by-pass drifting valves, Walschaert direct-drive gear having the combination link attached to the wrist pin, Schmidt superheater, Security brick arch, Ragonet power reverse gear, Foulder solid back end main rod, Woodard inverted link, constant resistance engine truck, Cole long main driving-box, self-centering valve stem guides and radial buffer.

The principal data and dimensions are given in the following table:

General Data

Gage	4 ft. 8½ in.
Service	Passenger
Fuel	Anthracite coal
Tractive effort	47,500 lb.
Weight in working order	305,500 lb.
Weight on drivers	197,300 lb.
Weight on leading truck	52,200 lb.
Weight on trailing truck	56,000 lb.
Weight of engine and tender in working order	471,300 lb.
Wheel base, driving	13 ft.
Wheel base, total	34 ft. 5 in.
Wheel base, engine and tender	67 ft. 1 in.

Ratios

Weight on drivers ÷ tractive effort	4.15
Total weight ÷ tractive effort	6.43
Tractive effort × diam. drivers ÷ equivalent heating surface*	719.4
Equivalent heating surface* ÷ grate area	52.8
Firebox heating surface ÷ equivalent heating surface,* per cent.	7.7
Weight of drivers ÷ equivalent heating surface*	40.9
Total weight ÷ equivalent heating surface*	63.4

Journals, diameter and length	6 in. by 14 in.
Water capacity	9,000 gal.
Coal capacity	10 tons

* Equivalent heating surface = total evaporative heating surface + 1.5 times the superheating surface.

some of the rails were rolled so that what was the top side of the ingot as it first entered the blooming rolls, formed the head of the rail and other rails were rolled so that the top side of the ingot formed the web of the rail.

The work was done at Ensley, Ala., at the works of the Tennessee Coal, Iron & Railroad Co., who kindly furnished all the material and facilities for the investigation. The rails were made by the open-hearth process and were tested by means of drop tests, tension tests, transverse tests of the base and polishing of cross-sections.

Sixteen ingots were selected for special blooming. Eight were rolled "top in top"; that is, with the top side of the ingot as it first entered the blooming rolls, rolled into the head of the rail, and the other eight were rolled "top in web"; that is, with the top side of the ingot rolled into the web of the rail. The amounts of reduction between turning were varied in the early part of the blooming and were, respectively, 1 in., 2 in., 3 in., 4 in., 6 in., 8 in., 10 in., and regular practice, two ingots being rolled for each of the eight rolling conditions. From the standpoint of the construction of the mill, it was not considered advisable to reduce the ingot more than 2 in. in one pass, and the reductions between turning of 3 in. or more were therefore produced in two or more passes.

In the drop test, the rails rolled "top in top" gave about the same results as those rolled "top in web." With the head in tension the ductility in the drop test was about the same for the different rates of reduction. With the base in tension there was a general decrease in ductility as the rate of initial reduction in blooming increased, but there was considerable irregularity in the results, and it would take a much more extensive set of tests to be able to state this as a law.

Transverse tests of the base were made by placing the rail on two supports, 6 in. long, placed opposite each other near the edges of the flanges, and applying the load to the head of the rail at the middle. The general average results showing breaking load and transverse ductility of the rails rolled "top in top" were about the same as those of the rails rolled "top in web." The transverse results were also about the same for the various rates of reduction in blooming. The longitudinal ductility of the base in the drop test averaged 15.6 per cent, and the transverse ductility of the base in the transverse test averaged 2.7 per cent.

The thought is expressed that part of the problem of improvement of rails consists of increasing the transverse ductility of the base and particularly of eliminating the cases of very low transverse ductility. In the tensile tests the rails rolled "top in top" gave about the same results as those rolled "top in web." The tensile results were also about the same for the various rates of reduction.

Incidental to the main investigation, a comparison was made of the tensile results from three locations in the rail section, namely, the upper corner of the head, the interior of the head and the flange. For a given tensile strength, the ductility was greatest in the flange, next in the corner of the head and least in the interior of the head.

Cross-sections were cut from the head of the rails, polished with emery, etched with copper-ammonium chloride solution and finally polished with tripoli. No internal cracks were found in any of the samples examined.

In conclusion, the general results may be summarized as follows: The rails rolled "top in top" gave about the same results as those rolled "top in web," in the drop tests, transverse tests of the base and tensile tests. The results were also about the same for the various rates of reduction in making the bloom, except that in the drop tests with the base in tension there was a general decrease in ductility as the rate of initial reduction increased, but there was considerable irregularity in the results, and it would take a much more extensive set of tests to be able to state this as a law. This work had reference particularly to the transverse ductility of the base, and not specially to the production of seams, due to the tearing open of the sides of the bloom in rolling.

INFLUENCE ON RAILS OF THE METHOD OF BLOOMING*

An investigation was made concerning the influence on the rails, of the manner in which the bloom is rolled, particularly with reference to the transverse ductility of the bottom of the base of the rail. Blooms were rolled from ingots with varying amounts of reduction between turns. Some ingots were given light reductions or squeezes and turned so as to bring the other two sides in contact with the rolls, and other ingots were given successively greater reductions between turns. THE RAILROAD CLERK

By V. R. COOKE

So many articles have been written recently about the army of "competent and incompetent men in blind alley jobs," more commonly known as railroad clerks, and so much has been said deploring the conditions that exist, that it is a bit surprising that none have ventured to state *why* these conditions exist.

A clerk being in a position, drawing pay, has a right to be judged competent until he has been given an unprejudiced trial and has been found wanting. This trial the clerks have not been given. This is evidenced by the attitude of the officers towards their clerks, never giving them an opportunity to prove their worth in any official capacity, and by the failure on the part of the clerks themselves to prove by their actions in their present positions that they are competent to fill positions of greater trust.

The first reason may be explained by pointing to the time worn custom of making officers by promoting from the ranks of what have been termed "practical" railroad men. Not so very long ago, before these days of cost sheets and tonnage bureaus, officers were chosen more on account of their aggressiveness than progressiveness; more on account of their ability to handle men and keep things moving than for their ability to keep down the cost of operating expenses and show the why and wherefore in case of increase or decrease. Such men did not have time nor inclination to secure much of an education and, in fact, often prided themselves upon being considered "self made." They looked upon their clerks as a useless expense and only fit to wait upon them, to write letters, and keep nice records for the benefit of the public and the inquisitive railroad commissions. The clerks, on the other hand, were drawn from the ranks of those who had had better opportunities of securing an education and who on account of physical weaknesses or timidity did not care to follow the hardships and more dangerous occupations of the road. In a great many instances they looked down upon what they called the "outside man." Thus, when the outside man was promoted over them, there was an antagonistic spirit existing, even though it did not appear on the surface.

As an illustration we will say that Jones starts out as fireman, serves his apprenticeship and in due time becomes an engineer. As an engineer he is careful, observing and aggressive, being possessed of a sound body as a result of his years of hard work and clean living. He has a clear head and quick brain, even though he has not much book learning. He grasps an opportunity to clear the main track quickly sometime when there is a derailment, makes a hit with the division officers, and in time is made trainmaster. He assumes the duties of trainmaster; and dictates his first letter to Clerk Brown. Jones not being accustomed to dictating, makes a few grammatical errors and Brown instead of changing the letter himself thinks he will be smart and have some fun at the expense of the new T. M.; and calls Jones' attention to his errors before the boss. There immediately arises in Jones' mind a deep prejudice against clerks in general; and when he later becomes superintendent or general superintendent, that prejudice in a measure still remains. Considering the hardships he himself had to put up with to achieve his success, he would never recommend one who has had an "easy time" in an office to succeed himself or to take any such position.

So much for the official end of it. The second reason why clerks continue to be "just clerks" is due largely to their own short sightedness. Instead of specializing in whatever particular branch of the service they may have taken up or wish to advance in, they continue in the routine that has been laid out for them.

Specialize! If you are going to be a rate clerk find out all that there is to be known about rates and traffic. If you are a stenographer or secretary, be a good one. Strive to make your speed and accuracy better than that of the other fellows, not simply just as good. Learn all you can about the depart-

ment you are working in, and soon you won't be referred to as "just a stenographer."

If you are a timekeeper or an accountant strive not to be just a machine; make a statistician out of yourself. Post yourself on the per cents of increases and decreases and costs per mile so that when the boss asks you about this month's figures and how they compare with last month's, you can give him a prompt answer, containing the facts in a few words. Don't merely seek to memorize a lot of figures (a parrot can do that); know, yourself, the meaning of them. And if you have a suggestion that may save a few dollars, don't be afraid to make it. If it's a good one the boss may use it in suggesting to those higher up; and if he fails to mention your name in his report of the matter, don't get sore. The boss hasn't forgotten you. Remember, that Thomas A. Edison makes fortunes every day from the minds of men who are never heard of as individual inventors; but they, working under him, are getting rich also.

The question has been asked, "Where can we obtain that knowledge to enable us to better our condition?" Pick up almost any magazine and you will find the answer: the correspondence school, or the night school, or the business college. What stenographer would not be benefited if he took a post-graduate course in touch writing? What station accountant or timekeeper would not be improved by a course in accounting? What rate clerk would not advance himself further along the road to a position as soliciting or commercial agent were he to take a course in traffic?

We clerks must look for betterment of our condition through individual efforts. The salvation of the railroad clerk does not lie, as many seem to think, in "organization." Any clerk who will conscientiously analyze this matter can easily see why. The word "clerk" is too general; there are as many different kinds of clerks as there are departments to a railroad, and to get all the various departments upon a uniform working basis with hours that would apply to all and a schedule of salaries (emphasis upon the word salaries) that would cover each branch of clerical service would be impracticable. You might as well talk of making one schedule of wages for the operators, brakemen, conductors, engineers, firemen and shopmen and expect them to all agree to it.

Again, organization of all branches of clerks would not be fair to the companies that employ us. We, through the very nature of our positions, handle some of the most confidential affairs of the company, and as we are but human who among us could keep from using this information to our own advantage if we owed allegiance to an outside organization? Loyalty to the company is nothing more than is due. He who is not loyal is as incompetent as he who shirks his work and as untrustworthy as he who steals from the cash drawer.

Cannot both the railroad and the clerk offer a little more than they have done in the past? One of the largest eastern railroads has already made a great stride in this respect. This road now has at its head a broad-minded man who is a gentleman in every sense of the word, whose diplomacy, based on an education along *all* lines, has already won for his road many friends in a territory disposed to be unfriendly. The effects of such a broad-minded policy, so far as the clerks are concerned, are already noticeable. This road has at present on one of its districts two trainmasters, two yardmasters, and one chief dispatcher who were promoted from the clerical ranks. It behooves us all to give the best that is in us, endeavoring at all times to improve ourselves so that if by any chance opportunity should knock at our door we should be prepared. If we do our part well, it is not a very far off day before the railroad companies will do theirs.

EGYPTIAN RAILWAY TAKEN OVER.—The Egyptian State Railway administration formally took over, on December 1, the Helouan line, belonging to the Egyptian Delta Light Railway Company, Ltd.

Progress on the Erection of the New Quebec Bridge

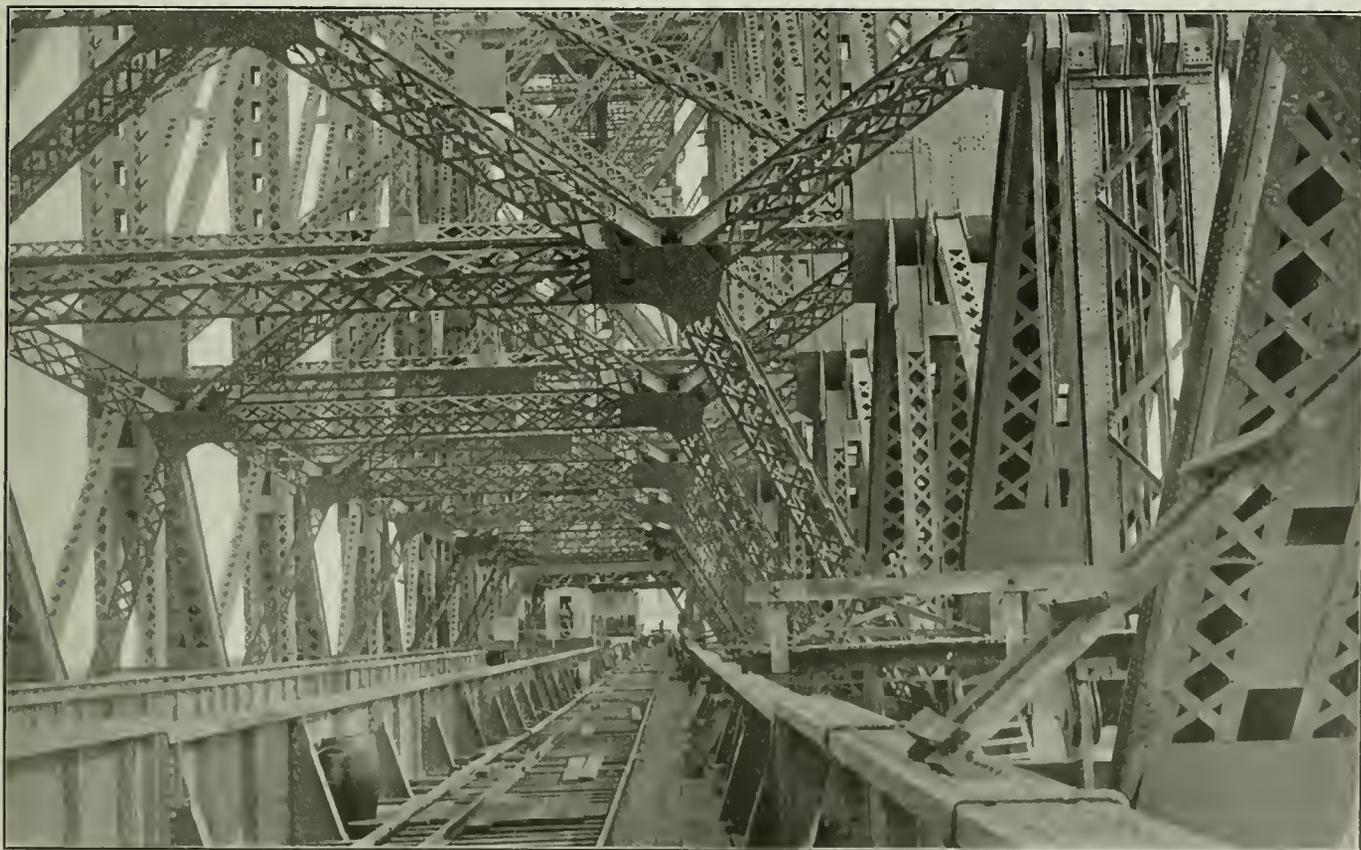

Work on This Notable Structure Is Proceeding Rapidly
and It Is Expected to Be Completed Late in 1916

By H. P. BORDEN

Assistant to Chief Engineer, Board of Engineers, Quebec Bridge,
Montreal, Que.

Satisfactory progress is being made this season in the erection of the new Quebec bridge. At the end of last year the anchor arm was entirely erected with the exception of the upper half of two panels next the main pier. During the winter the north portal was erected and a certain amount of riveting done at various points. Work was started this spring, about the middle of April, since which time the program of the contractors has been followed very closely. It was expected that the erection of the main posts would require more time than was actually the case. These posts are each shipped in 27 separate main sections, and had to be assembled with splice plates attached, necessitating very careful and accurate handling by the cranes. Both posts

capable of taking one full panel, supported at the shore end by means of pins connected to the chords, and at the river end by links attached to the upper web members. This "flying bridge" is planked over and affords ample room for jacking and riveting operations, providing a perfectly safe platform for the men to work. As each panel is completed, the bridge is taken up by the overhead cranes and moved ahead to its new position. At the present writing the fourth panel of the cantilever arm from the main pier is about half completed. The first three panels took approximately 25 days each to erect, including Sundays and lost time. As the panels progress towards the end, the members are lighter and the splices smaller, and the speed of the work will be

General View Looking Through the Bridge from the Portal

were assembled simultaneously, the entire erection being completed in thirty days. These posts weigh approximately 1,000 tons. Although there were six horizontal field splices, the length center to center of pins was as nearly accurate as it is possible to measure. From four to six gangs have been constantly engaged in riveting up splices in these members since their erection started, this work being now practically completed.

In the erection of the cantilever arm, which is progressing rapidly, each panel is completed as the work progresses, the complete bracing being put in place by the rear booms of the traveler as it advances panel by panel. On account of the fact that there is a vertical field splice in the bottom chord between the main panel points, these chords are erected in place on what is known as a "flying bridge." This bridge is a steel platform

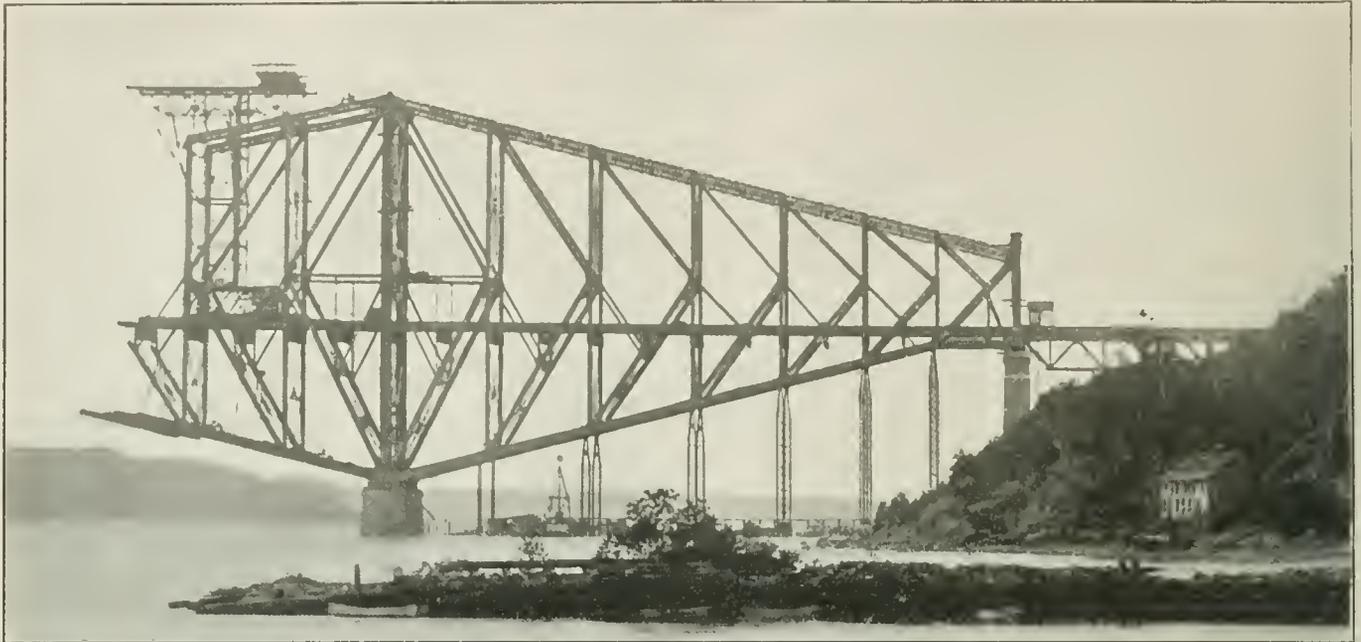

materially increased. Owing to the great accuracy of the shop work, the members go together without any difficulty in the field, and no time is lost in correcting errors.

It is expected that the entire north shore cantilever arm will be completed by the middle of November if too much time is not lost by bad weather. The traveler on this side will then be taken down, transferred to and reassembled at the site where the suspended span will be erected.

As the erection of the cantilever arm progresses, very careful measurements and observations are made to determine whether the alinement is perfectly correct. At the present time the center points of the floorbeams of the erected portion are absolutely in line with the center point of the pier on the south side of the river. The erection of the main shoe on the south shore began on

July 8 of this year. Because of the experience gained in the erection of the falsework and anchor arm on the north shore, the erection of the south anchor arm has been greatly facilitated and

weeks ahead of last year's program. It is expected that before the work closes down the anchor arm will be completely erected, including the main post. Next year there will be no difficulty in

View Showing the Progress of Erection on the South Shore

much better time has been made. Although the work was started this year at approximately the same time as work on the north anchor arm last season, the work at the present time is nearly six

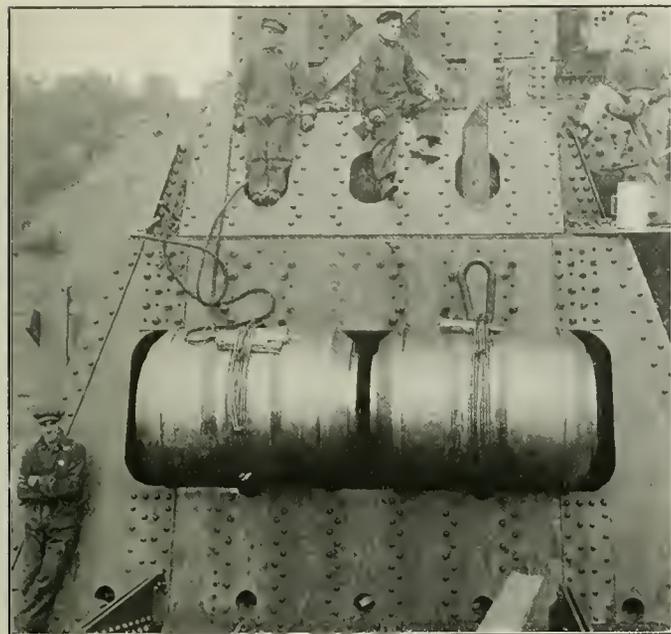

fully completing the south cantilever arm in plenty of time to connect up the suspended span.

The suspended span will be erected at Victoria Cove, a point

View of the South Shore Span Showing the Floor Supported on the Inside Falsework and the Bottom Chord on the Special Outside Falsework

about three miles below the site of the bridge. This span will be erected on falsework supported by concrete piers. It will be

View of the North Cantilever Arm, Showing the Process of Moving the "Flying Bridge" Forward One Panel

entirely erected at this site, with the exception of a portion of the floor system, and will be floated to the bridge on specially designed pontoons. Hangers connected to the four corners of the cantilever span will be attached to the suspended span of special devices, the entire span being lifted into place by means of 2,000-ton jacks placed at each corner. The suspended span is 640 ft. long, 88 ft. wide, and 110 ft. high at the center, and weighs approximately 6,000 tons. It is expected that late in October, 1916, the work will be sufficiently advanced to float this span into place. If this program is carried out, it will be possible to run trains across this bridge at the close of next season.

REORGANIZATIONS AND RAILROAD BONDS

By JOHN E. BLUNT, JR.*

The weakness of a bond, as compared with a mortgage, lies in the inability of the individual holder to act for himself in realizing on his security, and in these days, when corporate mortgages overlap to such an extent that it is seldom a single issue can act independent of others, the complications arising are extremely difficult of solution.

A reorganization is usually the outcome of a situation of which the first step is a receivership. Close upon the heels of the latter follow the "protective committees" with their bondholders' agreements. You read in the evening paper that a certain property has gone into the receiver's hands; in the morning paper you find certain parties, at the request of a large number of bondholders, have consented to act as a committee. What is a bondholders' agreement? Briefly, it is a more or less elaborate power of attorney giving to the committee authority to do what in its judgment may seem best for the bondholders' interests. There are limitations, restrictions and privileges of withdrawal, but in actual practice it amounts to a complete delegation of power.

If you desired, in the ordinary course of business, to give a power of attorney to an individual you would naturally want a man in whom you had complete confidence as to his integrity, his judgment and his ability. There is no reason why the same standard should not apply to a member of a bondholders' committee. He should really represent the bondholders and should be selected for his qualifications for the position. He should realize its responsibility and trusteeship nature and be able to give sufficient time to make his services of some value.

The practice of officers of the trustee acting on a committee is subject to criticism. There should be co-operation between the committee and the trustee, and the advice of the latter is frequently of great value, but they should not attempt to serve in what might prove a dual capacity, but rather hold themselves in readiness to act as a check on the committee when necessary. In other words, they should act with, but not on the committee. I do not know why this association should not at a future meeting outline some plans for the selection or election of bondholders' committees.

A word may be said here on the question of expenses. They often seem out of all proportion to the results accomplished. Men who devote their time to constructive work should be well paid for their services, but a corporation that is unfortunate enough to get into the hands of a receiver should not be considered legitimate prey for the avaricious.

The amount of railroad mileage in receivers' hands today is greater even than in the years following the panic of 1893, and there has been no time in recent history when reorganizations were as numerous as at present. A study and comparison of some of the plans that are now being put forth would prove interesting and profitable, but this is not possible in a paper of this length.

I will say, however, that most of those I have had occasion to examine seem to offer temporary rather than permanent relief. Fixed charges are reduced, assessments are levied and various kinds of pressing obligations are paid off, but the new securities

*From an address before the Fourth Annual Convention of the Investment Bankers' Association at Denver, Colo.

are issued in the same manner as the old, and there is nothing to prevent a repetition of the trouble in the more or less distant future.

My own opinion is that before the majority of our railroads can hope to take care of what we may call their permanent future needs they will have to undergo reorganizations more drastic than most of those now proposed. They must issue their securities along new lines that will afford every possible protection to the legitimate investor, particularly the bondholder. What is there in the average railroad bond offered today that should attract anyone who gives it careful consideration? It usually runs fifty or more years without any provision for payment of the principal. And who is there during that fifty years who is looking after the bondholders' interests? Does the management? Not always, for it represents the stockholders. Does the trustee? Not to any greater extent than provided in the trust deed. Does the bond house? Sometimes, but there is hardly profit enough to warrant any great expenditure on its part. As a rule, the bondholder is helpless until the bonds are in default, and when trouble comes receivers' certificates, equipment trusts and even notes are taken care of first, and here let me say that I think equipment trusts, as issued at present, are the greatest possible menace to railroad mortgage bonds. A New York house making a specialty of equipments is authority for the statement that while in 1900 there were only \$60,000,000 equipment bonds outstanding, the amount at the present time approaches \$600,000,000, and all of them coming due at the rate of one-tenth each year for no better reason than that this kind has been found easiest to sell. Our railroad committee is doing some excellent work in outlining improvements in railroad trust deeds, and I trust will permit me to say here that I believe that any general mortgage drawn hereafter should provide for the issue of equipment bonds thereunder so that the road and equipment can be kept together, but making the bonds issued for equipment (while not differing as to lien from the longer time bonds) mature serially in one to twenty years, which is about the average life of the equipment, having them paid out of earnings as a regular depreciation charge.

I have had occasion to look into a certain railroad, and I find that at the rate it was charging off depreciation in equipment it would have had to have lasted 582 years, and that all the dividends that were paid in ten years just about equaled the amount that should have been charged off for maintenance and depreciation.

I think that the present troubles of the railroads can be largely attributed to two causes: bad financing on the one hand; failure to receive authority to increase rates sufficiently to meet increased cost of service on the other, and the tendency is for those responsible for each of these conditions to shift the blame on the other. The greatest obstacle to railroads securing what they really need today is the questionable financial transactions indulged in by the prominent financiers and bankers.

What are some of the remedies? I am aware that it is easy to criticize, but hard to construct. There are practical questions to be faced in all these situations that make it extremely difficult to work out our ideals and theories. I have no sympathy with those who are indulging in wholesale denunciation of railroad management and I believe that this country cannot have permanent prosperity until the railroads can share it. However, we must make an effort to get this railroad financing on a more satisfactory and solid foundation.

Let us provide sinking funds for the payment of mortgages in full. It requires only $\frac{1}{2}$ of 1 per cent a year to pay off a 5 per cent mortgage in 50 years. In other words, while it requires \$50,000 a year to pay the interest on a million dollar loan, an additional \$5,000 will take care of the principal as well.

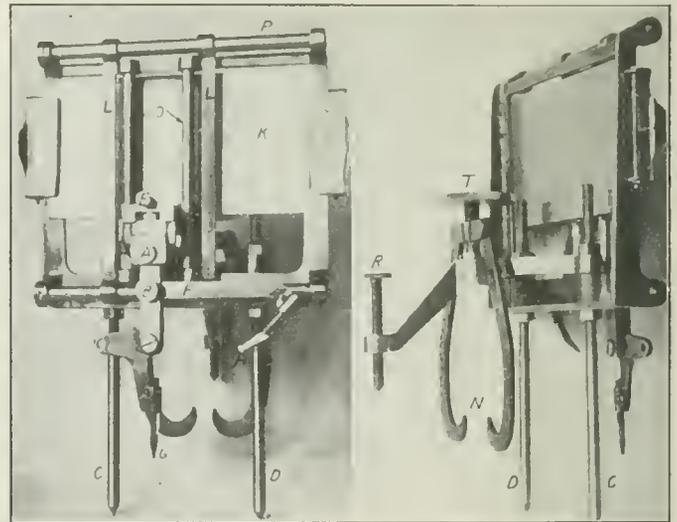

Let us have some means of taking care of the bondholders' interests during the life of the bond, either by enlarging the powers of the trustees, or possibly by giving the bonds voting power and a voice in the management of the road. I do not know why this should not be done, especially in cases where there is little equity in the stock.

We investment bankers distribute by far the greater part of the bonds issued in this country, and while most of us do not have the opportunity of originating the larger financial deals, we can nevertheless make our influences felt if we have the courage of our convictions. We ought to be in the position of an impartial judge or jury, able to put a stop to corrupt or incorrect financial practices, and at the same time as representatives of investors secure for our corporations such fair treatment at the hands of legislators as shall protect the investors' rights.

But, before we will be in a position to do this, it will be necessary to improve our own standards. I am afraid that we cannot entirely escape the responsibility for some of the conditions existing today. Has not the desire to make quick profits or the desire to participate in some large piece of financing caused many a hasty decision which should have been deferred until a careful investigation could be made? However, we cannot help the mistakes that have been made in the past, but we can turn our faces in the right direction, and while the desired results will not be obtained in a day or a year, we can make a start along the line of progress.

A RAIL PROFILE MACHINE

The accompanying photographs illustrate a rail profile machine, which embodies several advantages, of which the most important is the combination of accuracy with adaptability for rapid placing and removal of the apparatus from the rail. As shown in the photographs, it is attached to the rail by placing the points of the rods D and C on the tops of the flanges of the rail base, the point of the screw R on top of the head, and the points of the hooks N on the under side of the head, the

Two Views of the Rail Profile Machine

whole being made fast by turning the disc T. To release the machine this disc is given a quick turn in the opposite direction.

The profile is drawn on the prepared paper K by means of the brass pencil E. This is mounted in the crosshead A, sliding vertically in the rods O, which are mounted in a second crosshead L, sliding horizontally on the rod P. The arm F holding the pencil points G and H are rigidly attached to the crosshead A, secure against any rotation in the plane of the paper. As a result, any movement of the points G or H is reproduced simultaneously by all other points in the arm F and the crosshead A, and is recorded by the point E. By removing the pin D the frame F may be rotated 90 deg., permitting the point G to take the place of the point H, or vice versa, the latter being used for the underside and sides of the head, while the former is used for the top.

This machine has been in use on six or seven American railroads for the past three years with satisfaction. It was designed by C. D. Carey with Robert W. Hunt & Co., Pittsburgh, Pa.

Production of Smoke by the Railways of Chicago

Effect and Amount of the Smoke Produced by Locomotives in Chicago, and Results of Special Tests

An abstract of the complete report on Smoke Abatement and Electrification of Railway Terminals at Chicago, made to the Chicago Association of Commerce, was printed in the *Railway Age Gazette* of December 3, page 1047. In the issue of December 10, page 1089, the technical phases of the electrification were considered, and in the issue of December 17, page 1125, the cost set forth in more or less detail. The following gives in similar detail the findings of the committee regarding the amount of smoke made by locomotives in Chicago, together with the results of various scientific investigations made by the committee regarding locomotive service.

The committee pointed out that the factors affecting the formation of smoke are the combustible, the supporter of combustion (air), and the temperature at which combustion proceeds. Stated briefly, the combustible elements in coal may be grouped into two divisions, namely, volatile matter and fixed carbon, the proportion of these varying greatly in the various kinds of coal. As a supporter of combustion the air may be regarded as being composed of oxygen and nitrogen. Theoretically there must be 2.67 lb. of oxygen, or 11.55 lb. of air, for every pound of carbon. In ordinary furnace operation, however, it is necessary to provide for more than the theoretical amount of air. Regarding the third factor in combustion, namely, the temperature, it may be stated that every combustible has its critical temperature, below which it will not unite with oxygen.

The combustion of bituminous coal proceeds by stages. There is at first a period occurring at comparatively low temperature, about 500 deg. F., of so-called "destructive distillation," in which a disruption in the substance of the fuel takes place, the volatile portion being thrown out and separated from the non-volatile. The second stage of combustion involves the decomposition of the hydro-carbon, the volatile portion, and the burning of its gaseous constituents at a temperature of about 800 deg. F. This stage is a critical one, as regards smoke formation. If too little air is admitted to the furnace, or if the amount admitted is not properly distributed a portion of the carbon in the fuel is carried away unburned and visible smoke results. The third stage of combustion proceeds at a temperature which is nominally about 1,600 deg. F. It is during this stage that the non-volatile portion of the fuel, consisting chiefly of carbon, is burned. The third stage of combustion may easily be made smokeless, but if the supply of air be deficient incomplete combustion and visible smoke may result.

An important aspect of combustion relates to the economical use of fuel, which is a matter that cannot be completely separated from that of smoke prevention. As a result of elaborate tests made in recent years, it has been determined that under certain conditions resulting in apparent smokelessness there may be an escape of unburned combustible gases with a consequent loss of heat units while conditions which may utilize fuel value to a fuller extent result in a slight degree of smokiness. Careful laboratory tests have demonstrated that the amount of heat lost in black smoke is comparatively insignificant, one investigator reporting that under the worst possible conditions of combustion, if the smoke were collected there would be a saving of only 14.7 lb. from a ton of coal, provided all the smoke were burned again.

As a means of eliminating smoke at engine terminals, roundhouses, etc., the committee referred to various smoke washing devices, calling particular attention to the smoke washing plant of the New York Central at its Englewood roundhouse in Chicago. This plant was described in the *Railway Age Gazette* of September 24, page 558. Referring generally to the smoke washing process, the committee said: "The possibilities of the proc-

ess have long been understood. Its application has been retarded by difficulties encountered in maintaining the plant in the presence of the corrosive acids developed by the process, and by operating costs arising from the consumption of water and power." Smoke washing as a process of general application is still in an experimental stage. Enough has been accomplished to prove that by means of it practically all the objectionable elements in smoke can be suppressed.

The precipitation of suspended matter and gases may also be accelerated by electrical means. If the products of combustion are made to traverse an electrostatic field the solid particles may be intercepted. This principle has been employed in the removal of solids from the gases of metallurgical and other industrial furnaces. A few applications have been made in connection with the furnaces of boiler plants; the approaching soot or dust particles, responding to electrical influences, attach themselves to the grating as do metallic particles to a magnet. The grating is cleaned by interrupting the current. The New York Edison Company has experimented with this process as a means for the suppression of fuel, dust and ash from the stack of one of its stations.

COAL AND COKE CONSUMED BY STEAM LOCOMOTIVES

From a careful investigation with the co-operation of all the roads operating in the area of investigation it was determined that during the year 1912, 2,555,233 tons of coal were consumed by steam locomotives in service within this area. Of this, 1,363,503 tons, or 53.37 per cent, was consumed by yard locomotives; 258,787, or 10.13 per cent, by road freight locomotives; 479,738, or 18.77 per cent, by freight locomotives in transfer service; 21,545 tons, or 0.84 per cent, by engines in passenger transfer service; 240,288 tons, or 9.40 per cent, by engines in through passenger service, and 191,372 tons, or 7.49 per cent, by locomotives in suburban passenger service. In contradistinction to the coal and coke consumed by locomotives in service a separate investigation was made to determine the amount of fuel consumed by steam locomotives at locomotive terminals during the same year, 1912. This was found to be 260,167 tons.

In the committee's investigation in determining the relative density or visibility of the smoke the Ringelmann method was employed. In computing the smoke density for a number of stacks or for those of an entire service or district the observed results are reduced to unit values, the value of one stack for a period of one minute being termed a "stack minute," and the omission of No. 1 smoke for one minute, or its equivalent, being termed a "smoke unit." By employing these unit values the percentage of density as measured by the Ringelmann scale may be computed by means of the following formula:

$$\text{Percentage density} = \frac{\text{Smoke unit} \times 20}{\text{Stack minutes.}}$$

In the development of the committee's investigation with reference to the visible properties of smoke a corps of from 10 to 20 trained smoke inspectors under the supervision of a chief inspector, were engaged in making observations of smoke density from April 22, 1912, to March 14, 1913. Observations of smoke from locomotive smoke stacks were made at each railroad yard, at each locomotive terminal, and at various points along each line of railroad within the area of investigation. The records show that 10,653 observations were made of smoke emissions from steam locomotives in railroad yards and at points on the line, and that 1,323 observations were made of smoke emissions from locomotives at terminals, a total of 11,976 observations. It was found that more smoke was produced, or, rather, the

average density of the smoke was greater, in the outer zone, Zone B, than in the inner zone, the latter including the most congested part of the area of investigation. The average density for Zone A was 15.30 and for Zone B, 23.17, making an average of 16.79. The road freight locomotives gave the greatest trouble, the average density in Zone A for this class of locomotive service being 25.32, and in Zone B 26.91. The steam locomotives rank third in the list of the various services which produce smoke in Chicago, the complete list being given below, according to the relative amount of average density provided:

	Relative Standing Per Cent
High pressure steam, stationary power and heating plants.....	44.79
Furnaces for metallurgical manufacturing and other processes.....	29.80
Steam locomotives	21.83
Low pressure steam and other stationary heating plants.....	2.87
Steam vessels	0.61
Gas and coke plants	0.10
	100.00

SOLID CONSTITUENTS OF STEAM LOCOMOTIVE SMOKE

Information concerning the solid constituents of locomotive smoke has been derived from two series of investigations made by the committee in which the solids discharged from the smoke stack were measured. These embrace service tests con-

recorded for each test included the amount of fuel consumed, the cinders and fuel dust emitted, the ash and clinkers discharged, the water evaporated, the tractive effort exerted, the power developed, the draft at different rates of combustion, and such other facts as were needed to define completely the performance of the locomotive. A total of 76 tests were made. The maximum rate of combustion for each sample of fuel tested was more than 80 lb. per square foot of grate surface per hour, and in all except two cases was more than 100 lb. per square foot of grate surface per hour. The minimum rate of combustion for the several coals varied from 23 to 27 lb. per square foot of grate surface per hour. The accompanying diagram shows the percentage of the fuel burned which appears as solids in the smoke as averaged from all the tests made. It is shown by this diagram that the amount of solids emitted in smoke is a function of the rate of combustion. To establish these rates of combustion attending the normal operation of locomotives in through and suburban services in Chicago a series of 298 tests was made on locomotives operating within the area of investigation. The rate of fuel consumption was found by counting the scoops of coal fired, the value of the average scoopful having been carefully determined. The grate area of each loco-

TABLE I—EMISSION OF CINDERS IN YARD AND FREIGHT TRANSFER SERVICE

Service	Number of tests	Kind of fuel	Solids per ton fired (lb.)				Solids in per cent of fuel fired			
			Coarse	Fine	Dust	Total	Coarse	Fine	Dust	Total
Yard	5	Pocahontas	1.30	9.72	24.54	35.56	0.065	0.486	1.227	1.778
Yard	26	Bituminous	0.76	3.42	5.24	9.42	0.038	0.171	0.262	0.471
Freight transfer.....	3	Pocahontas	1.84	7.92	19.64	29.40	0.092	0.396	0.982	1.470
Freight transfer.....	7	Bituminous	0.62	2.16	4.46	7.24	0.031	0.108	0.223	0.362

ducted in connection with locomotives operating in yard and transfer service within the area of investigation, and laboratory tests conducted in connection with a locomotive mounted on a testing plant and supplemented by tests on locomotives operating in through passenger, through freight and suburban services in the area of investigation, to determine rates of combustion. By means of special apparatus all or a known portion of the solid emissions from the smoke stack were caught and deposited in an arrester from which they could be collected for analysis. The samples were classified as follows:

Coarse cinders—Solid particles which remain upon a coarse sieve of 20 meshes to the inch (400 apertures per square inch).

Fine cinders—Solid particles which pass through the coarse sieve and remain upon a fine sieve of 200 meshes to the inch (40,000 apertures to the square inch).

Fuel dust—Solid particles which pass through the fine sieve.

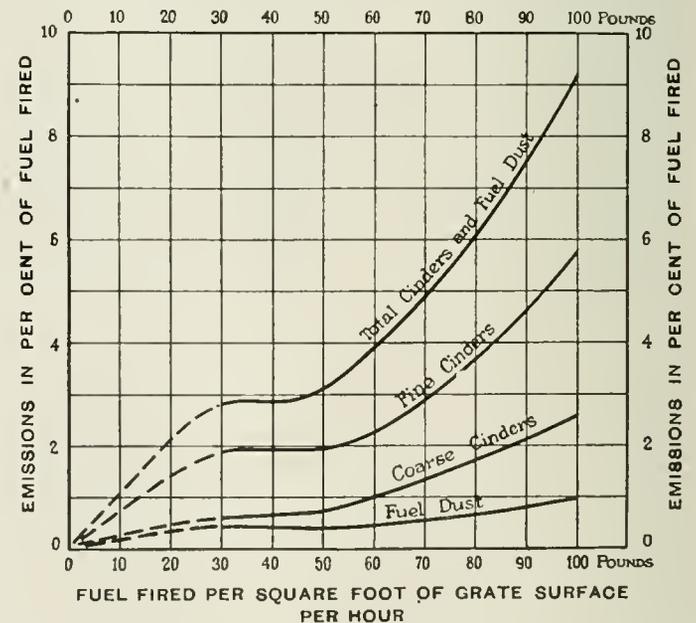

The road tests were conducted with suitable apparatus for obtaining a known proportion of the cinders emitted from the stack. A record of the number of scoops of coal fired was taken, the average weight of a scoopful of coal being ascertained by experiment, and with this information the relation between the solid constituents of locomotive smoke and the fuel consumed was established. Forty-one tests were conducted on steam locomotives operating in yard and transfer services of Chicago terminals. Bituminous coal was used for some of these tests and Pocahontas coal for others. Table I gives the results of these tests.

Since any method which could be satisfactorily applied in service was found impracticable for determining the amount of solid matter contained in smoke arising from locomotives while operating at high speed, data relating to the amount of solids emitted in smoke at various rates of combustion was secured by means of a series of tests conducted at the locomotive testing laboratory of the Pennsylvania Railroad at Altoona. The locomotive used in all laboratory tests was a Consolidation freight locomotive of the Pennsylvania type 11-8-B, weighing 238,300 lb. The coal for the test was typical of that used by the railroads entering Chicago. The locomotive firebox was equipped with a brick arch and all tests were conducted with the throttle fully open, the speed being controlled by the load. The facts

obtained from the railroad and all the rates of combustion determined. These were found to be for the several services involved, as follows:

Service	Lb. per sq. ft. grate surface per hour	Per cent of fuel fired while running
Road freight	40.6	92.7
Through passenger	52.2	98.2
Suburban passenger	62.7	96.4

By combining these rates of combustion with the values for the emission of cinders as set forth in the diagram, and by multiply-

Amount of Solid Constituents of Smoke Emitted by a Locomotive on a Testing Plant

ing the values ascertained by the percentage of fuel fired while running, the emission factors for solids emitted by locomotives operating within the area of investigation were established. The emission factors for solid constituents of locomotive smoke thus determined, and also those for yard and passenger service, as

determined by use of the cinder arrester in service tests, are presented in Table II.

RELATIVE IMPORTANCE OF THE STEAM LOCOMOTIVE AS A SOURCE OF SMOKE

Table III gives the relative information concerning the importance of the various classes of steam locomotives as a source of smoke, the individual classes being compared to each other and to all other classes of smoke producers. The questions of fuel consumption, visible smoke, solids in the smoke and gases in the smoke are considered. It was also shown that the steam locomotives consume 11.94 per cent of the total fuel consumed within the city limits of Chicago, ranking fourth as a fuel consuming service. They are responsible for 22.06 per cent of the total visible smoke discharged within the city, and rank third among all services on the basis of total quantity of visible smoke produced. They are responsible for 7.47 per cent of the total

of 13,247 B.t.u., while the other nine varied between 11,227 and 11,919, with an average of 11,598 B.t.u. per lb. In Table IV are given the general averages obtained from these tests. They

solid constituents discharged into the atmosphere in the smoke of all services within the city limits of Chicago, ranking fourth among all services on this basis, and lastly, they are responsible

third gives the results of these same coals with the brick arch.

From the results of these tests the following summary of the advantages of the brick arch in the firebox were determined:

- Increases in number of pounds of water evaporated per pound of coal from 8.6 to 9.2.
- Increases of boiler efficiency from 63.4 per cent to 67.8 per cent.
- Decrease in the amount of coal consumed per dynamometer h.p.-hour from 4.6 lb. to 4.3 lb.
- Decrease in average density of visible smoke emissions from 36.5 per cent to 24.1 per cent.
- Decrease in the total average quality of cinders and fuel dust emitted in smoke from 5.56 per cent to 4.18 per cent of the fuel fired.
- Decrease in the number of heat units per pound of cinders in fuel dust emitted in smoke from 9,610 B.t.u. to 9,064 B.t.u.
- Decrease in the amount of carbon contained in cinders and fuel dust per ton of coal consumed, from 75.8 lb. to 57.6 lb.
- Decrease in the number of heat units contained in the ash and clinker discharges per pound of fuel fired, from 6.28 to 4.98.
- Decrease in volume of air intermingled with the gases of combustion, discharged through the stack, from 26.5 per cent to 22.5 per cent.
- Increases of the portion of the carbon in the fuel which combines with oxygen to form carbon dioxide, from 51.1 per cent to 53.2 per cent.

TABLE III—CONTRIBUTIONS MADE BY STEAM LOCOMOTIVES TO THE POLLUTION OF THE AMOSPHERE OF CHICAGO

Service	Fuel consumption, per cent	Visible smoke, per cent	Solids in smoke, per cent	Gases in smoke, per cent
Road freight	0.77	2.01	1.18	0.66
Freight transfer	2.02	4.59	0.43	1.74

All other classes of smoke producers.....	88.06	77.94	92.53	89.69

for 10.31 per cent of the total gases of combustion discharged into the atmosphere, ranking fourth in this respect.

PERFORMANCE OF ILLINOIS AND INDIA COAL

The following is a more detailed description of the test made by the committee on the Consolidation locomotive at the testing plant of the Pennsylvania Railroad at Altoona. The tests were planned for the prime purpose of establishing facts with reference to the smoke discharges of steam locomotives, and to show also the value of the brick arch in the locomotive firebox as a factor promoting economy in the use of fuel, a reduction of cinders and fuel dust in smoke, a reduction of the density of visible smoke, reduction of loss of heat units in smoke and ash discharges, and boiler efficiency. The value of experience in locomotive firing as a factor in promoting economy of fuel consumption, a reduction of cinders and fuel dust in smoke, a reduction in the density of visible smoke and in boiler efficiency was also considered.

Table V gives the results obtained with experienced and with inexperienced firemen operating the locomotive at 80 revolutions

TABLE V—RESULTS OF TESTS WITH EXPERIENCED AND INEXPERIENCED FIREMEN

Test Group*	BA—9—E	BA—9—1	NA—2—E	NA—2—1
Dry fuel fired per sq. ft. grate surface per hr., lb.....	46.1	57.5	51.5	55.6

 BA—9—1 = Average of 9 different coals with the brick arch and inexperienced firemen.
 NA—2—7 = Average of 2 different coals without the brick arch and with experienced firemen.
 NA—2—1 = Average of 2 different coals without the brick arch and with inexperienced firemen.
 † One boiler horsepower = 34.5 lb. equivalent evaporation per hr.

per minute and at 25.0 per cent cut-off, burning coal with and without the brick arch in the firebox. The first column is an average of the coals obtained from Marion, Saline, Sangamon,

Vermilion and Williamson counties, Ill.; and Greene, Sullivan, Vermilion and Vigo counties, Ind. The last two columns in the table consider the coal from Macoupin and Williamson counties, Ill.

When burning the same kinds of coal in a locomotive fire-box equipped with a brick arch, firing by inexperienced firemen, as compared with that by experienced firemen, results in the following:

An increase in fuel consumption from 46.1 lb. to 57.5 lb. of fuel fired per sq. ft. of grate surface per hour.

An increase in boiler horsepower from 700.4 to 707.7.

A decrease in boiler efficiency from 73.2 per cent to 59.7 per cent.

An increase in fuel consumed per dynamometer horsepower from 3.9 lb. to 5.2 lb.

An increase in smoke density from 18 per cent to 36 per cent.

An increase in cinders and fuel dust discharged in smoke from 3.44 per cent to 4.00 of the fuel fired.

A decrease in thermal efficiency from 5.0 to 3.9 per cent.

A similar comparison of the values obtained when firing the same kinds of coal in a locomotive firebox not equipped with a brick arch shows that firing by inexperienced firemen results in the following:

An increase in fuel consumption from 51.5 lb. to 55.6 lb. of fuel fired per sq. ft. of grate surface per hour.

An increase in boiler horsepower from 684.7 to 711.0.

A decrease in boiler efficiency from 65.2 per cent to 62.7 per cent.

An increase in fuel consumed per dynamometer horsepower from 4.3 lb. to 4.6 lb.

An increase in smoke density from 27 per cent to 31 per cent.

An increase in cinders and fuel dust discharged in smoke from 2.37 per cent to 2.98 per cent of the fuel fired.

A decrease in thermal efficiency from 4.7 per cent to 4.5 per cent.

LEGISLATIVE PROPOSALS OF THE BROTHERHOODS

By W. L. STODDARD

WASHINGTON, December 22.

President Wilson will not oppose such safety legislation as may be pressed upon Congress by the representatives of the railroad brotherhoods. When, in his annual message to Congress, the President declared that before further railroad legislation is attempted the whole field of railroad law and practice should be surveyed by a special commission, he did not intend to shut the door to measures proposed in the interests of safety. At least, this is what Mr. Wilson is reported to have told H. E. Wills, P. J. McNamara, Wm. H. Clark and Val Fitzpatrick, railroad brotherhood agents, who waited on him last week.

The brotherhoods have as yet proposed no bill to the present Congress, but they evidently intend again to ask for a law prescribing clearance limits for cars and engines. It was this proposition, in the La Follette bill, as may be remembered, that President Taft referred to in a message to Congress, declaring that its enactment would impose a burden of more than \$400,000,000 on the railroads, and recommending that the same result should be sought by other, presumably non-legislative, means.

Representatives of the brotherhoods here now propose to have the suggested clearance figures apply only to new cars and engines with the view of dealing with existing equipment later. In drafting such legislation it would be the aim to try to disarm the opposition of the railroads, and the less radical the proposals the better chance of being passed by Congress.

It is believed that this plan was outlined to the President at last week's conference.

In this connection it is worth recording that the brotherhoods are announcing that they will work for the passage of an amendment to the sixteen-hour law fixing a minimum penalty of \$100 for violations as recommended by the Interstate Commerce Commission in its annual report a week ago.

The brotherhoods apparently do not intend at this session to press the proposed amendment to the Federal employers' liability law nor the bill to limit the length of trains; while the question of semi-monthly or weekly payment of wages, regula-

tion of loan sharks, and a law allowing men who are away from home to vote by mail have been put aside from the national field as properly belonging to the province of the states.

The joint resolution for a joint committee of the House and Senate to look into railroad matters was ordered printed in the Record the other day. It bears the authorship of Senator Newlands, of Nevada, and has a long preamble to the effect that numerous bills on this subject are now pending, that numerous recommendations of the Interstate Commerce Commission call for attention, that the experience of the past 28 years ought to be reviewed, that the commission is overworked, and that well-managed transportation facilities are a prime necessity of business prosperity and a common interest of all the people. The resolution calls for a joint sub-committee to consist of five senators and five representatives from the respective interstate commerce committees of the two houses; the sub-committee to have power to do whatever is necessary for a full and comprehensive study, and to report in December, 1916.

A few bills relating to transportation have already been introduced in the new Congress. In both houses there is a proposition to amend the Cummins' amendment so that shippers of baggage and express need not in all cases declare the value of goods offered for transportation. Senator Pomerene, of Ohio, has introduced a bill to define straight and order bills of lading and to codify the conditions on bills of lading. Senator Clapp, of Minnesota, has introduced a bill on the same subject.

In the house there is a bill to increase the period of time within which claims for damage to freight may be presented to carriers and another forbidding the granting of credit on freight bills for longer than ninety days. Representative Adamson, of Georgia, has introduced in the house a bill to increase the number of interstate commerce commissioners from seven to nine and to increase the salary of the secretary of the commission from \$5,000 to \$7,500. Mr. Rayburn, of Texas, has introduced a bill to give the interstate commerce commission control over the issuance of securities by carriers.

The American Federation of Labor announces a long program of legislation which it will ask for, among which are a proposal to limit the working hours of railroad telegraphers to eight per day; a compensation act for railroad employees engaged in interstate commerce; and a law to prohibit the interstate transportation of goods in the manufacture of which the labor of children under a certain age have been employed.

SEGREGATION AND SPONGINESS IN LADLE TEST INGOTS*

By ROBERT W. HUNT & Co.

A recent order for the inspection of open-hearth steel rails was of such a character as to demand a check of the manufacturer's chemical analysis of each heat represented, and the results of our analysis differed so widely from those reported by the mill that it was finally deemed advisable to make some investigation of matters pertaining to ladle test ingots, and principally to the possibilities of their segregation and soundness. What has been known to exist for a long time became apparent at the outset of our investigation, that ladle test ingots were subject to unsoundness and segregation exactly as are all large ingots, the only difference being one of degree. Obviously as long as this condition exists, it is manifestly impossible to expect analyses of the same test ingot by different chemists to agree within the limits of possible chemical error unless drillings for the samples are taken with special care and mixed and divided so as to insure both chemists working on identical lots. But of much greater importance is the fact that when the ladle test ingot is segregated and unsound, the drillings taken from it may not be representative of the steel or heat as a whole, and the reported results are therefore misleading and inaccurate. Thus a heat of steel can be reported as 0.60 per cent for carbon, while as a matter of fact, it was

* Abstracted from Bulletin 179 of the American Railway Engineering Association.

actually 0.75 per cent, and vice versa. These figures are not exaggerations but are the differences reported by two chemists on drillings from the same test ingot.

At the mill at which we were engaged the ladle test ingot mold was about 2½ in. sq. at the top, 2 in. sq. at the bottom and 5 in. high. Depending on the amount of steel poured into it and the extent of its boiling, or raising up of the top, the resulting ingots varied in height from 3 to 6 in., and when they were drilled, in order to obtain the sample for analysis, many cavities were encountered. In some instances it became necessary to take drillings from two different locations on the same ingot and in such cases the chemical results varied by as much as 0.15 per cent carbon (by combustion).

Samples of ladle test ingots were taken from the same heat of open-hearth rail steel and split open to show the interior structure. The metal near the outside of the ingots differed from that near the inside and the location of the drillings with respect to the height particularly, also gave different results. The degree of porosity is apparently somewhat greater in the ingot from the first part of the heat than that from the last part of the heat, and further, that the addition of the deoxidizing agent, ferro-silicon, experimentally in one case, made that ingot absolutely sound for most of its height.

Soundness, viz.: freedom from blow holes, etc., is a very important feature for ladle test ingots to possess. In the first place, the more unsound one is the more it is inclined to be segregated, and secondly, in drilling steel that is full of blow holes, minute particles break off from the sides of the holes and render the chemical determination for carbon by combustion methods more difficult of accuracy than when thin flake-like drillings are furnished. It is quite evident that the soundness of the test ingot is not predicated by its shape. At the same time it is logical to regard a thin slab-like shape as preferable, because of its tendency to chill quickly and thus solidify with a minimum degree of segregation. The disadvantage of this shape of test ingot lies principally in the difficulty of obtaining sufficient drillings to provide for the requisite number of analyses.

The addition of a deoxidizing agent to insure a sound setting steel and a ladle test ingot free from blow holes is more or less common practice at some mills, and commercially pure aluminum in the form of pellets is admirably adapted for this purpose.

Based on the experience of the past, we feel constrained to recommend such additions to rail specifications as will provide:

First—A standard shape and size for ladle test ingots with directions as to the size of drill and location of the borings on which the analysis is made.

Second—The addition of aluminum, preferably in the dipper, when necessary to insure a sound setting steel in the ladle test ingot with freedom from blow holes.

In conclusion, we submit that the location of the test ingot in the heat with respect to the regular ingots cast, is also deserving of consideration, as is also the precise method of making the analysis for the various chemical elements.

TURKISH RAILWAY CONCESSIONS. In November, 1914, within a week of Turkey's declaration of war, the Ottoman government not only took over the working of the railways, which it had a perfect right to do under the terms of their concessions, but also interfered with their administration and finances. The French manager of one railway was thus bluntly asked to resign in favor of the manager of the Hedjaz Railway, a German, and the government also determined to seize \$200,000, which the French manager had on his departure deposited with the Ottoman Bank at Beirut. In order to overcome the legal difficulties in the way, a special law was passed empowering the seizure of funds deposited with banks by companies carrying on their business under concessions, and this \$200,000 was then used by the Ottoman government for the construction of military lines.

LOCATION OF PASSING SIDINGS ON SINGLE TRACK*

By F. L. DODGSON

Consulting Engineer, General Railway Signal Company, Rochester, N. Y.

In considering the effect of passing-siding locations on the capacity of a single-track railroad, it would seem to be the most logical thing to first determine, if possible, what rule or rules, if any, must be followed in order to so locate the sidings that the maximum capacity of the road will be obtained.

With this view, let us first assume a piece of level railroad 40 miles long over which we are to operate one class of trains only, these trains traveling at a uniform speed of 20 miles an hour. Fig. 1 is a train diagram of such a road with the distance the vertical lines and the time the horizontal lines. If there were no sidings on this road, two trains could be run (one in each direction) each four hours during the day. These two trains are shown on the diagram by the two heavy lines aW and aE. If, now, we assume that there is one passing siding on the road, it is quite evident that the maximum capacity would be reached with this siding located exactly in the center of the road. With this arrangement two additional trains could be run each four hours and they are shown on the diagram by the lines bE and bW. If we represent the time required for the westbound train to run from E to C (C being the siding location) by W1 and the time required for the same train to run from C to A by W2; likewise the time required by the eastbound train to run from A to C by E2, and the time required to run from C to E by E1; and represent by S the spacing in time between trains running in the same direction; we shall find by inspecting the diagram that:

$$(1) S = W2 + E2$$

and

$$(2) S = W1 + E1.$$

Therefore:

$$(3) W2 + E2 = W1 + E1.$$

Or, if we state this last equation in words, it means that the sums of the running times of an eastbound and a westbound train between sidings are equal.

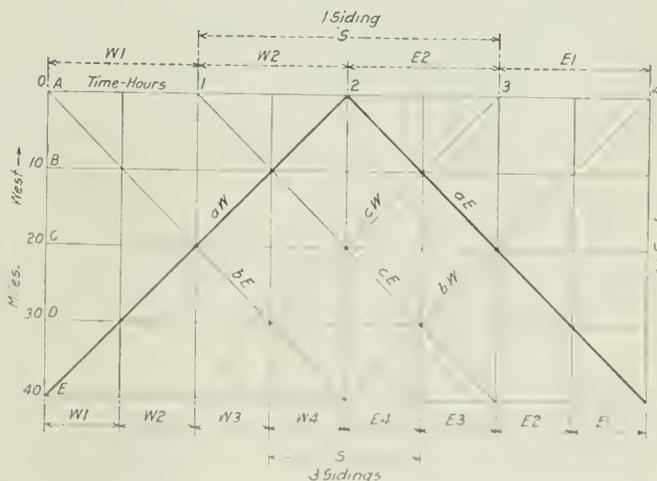

Fig. 1

Now let us continue and add two more passing sidings to our railroad. Again it is quite obvious that the maximum capacity will be obtained if these two additional sidings are located exactly midway between A and C, and C and E. If, as before, we represent the running time of the westbound train from E to D by W1, D to C by W2, C to B by W3, and B to A by W4 (B and D being the locations of the two new sidings); and also the running time of the eastbound train from A to B by E1, B to C by E2, C to D by E3, and D to E by E4; and

* A paper presented to the Railway Signal Association at its annual meeting, Salt Lake City, September 14.—Abridged.

as before make S the time spacing between trains in the same direction; we shall find from the diagram that:

$$(4) S = W1 + E1$$

and

$$(5) S = W2 + E2$$

and

$$(6) S = W3 + E3$$

and

$$(7) S = W4 + E4.$$

Therefore:

$$W1 + E1 = W2 + E2 = W3 + E3 = W4 + E4.$$

Again this last equation stated in words means that the sums of the running times of trains in opposite directions between passing sidings are all equal.

From this simple diagram, Fig. 1, it will appear, therefore, that the maximum capacity of the railroad, with a given number of passing sidings, would be reached when the sums of the running times of the east and westbound trains between passing sidings were all equal.

We can determine the value of S quite readily as follows: by adding equations 1 and 2 we have:

$$(8) 2S = W1 + W2 + E1 + E2$$

or, representing $W1 + W2$ by W , the total running time of the westbound train, and, similarly, $E1 + E2$ by E ,

$$(9) S = \frac{W + E}{2}$$

which is the value of S when there is only one passing siding.

Again, if we add equations 4, 5, 6 and 7, we have:

$$(10) 4S = W1 + W2 + W3 + W4 + E1 + E2 + E3 + E4$$

or

$$(11) S = \frac{W + E}{4}$$

If we let N equal the number of passing sidings, then, in equation 9, $2 = N + 1$, and, in equation 11, $4 = N + 1$. Therefore, by substituting in equations 9 and 11, N for the number of sidings, we obtain the formula:

$$S = \frac{W + E}{N + 1}$$

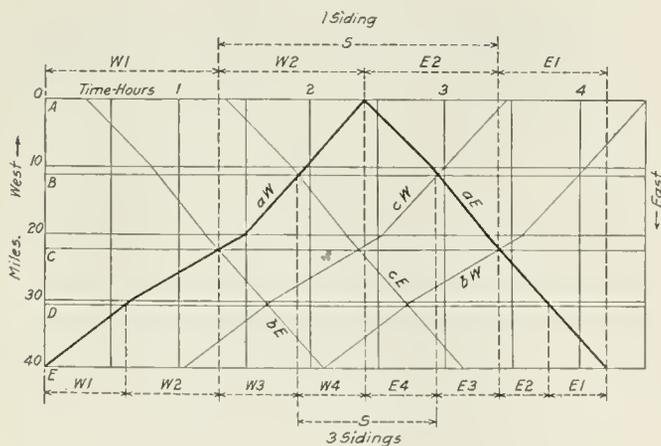

Fig. 2

To construct a diagram for varying and unequal speeds, the lines representing trains in the same direction may be plotted at intervals determined by the formula, $S = \frac{W + E}{N + 1}$, for a given number of passing sidings, as in Fig. 2. The intersections of the lines representing opposing trains will then fix the locations of those sidings for maximum capacity.

It will be apparent here, as before, that the sum of the running times between A and B is equal to the sum of the running times between B and C, etc. The rule, therefore, which we first laid down seems to hold true when the running times are unequal and speeds not uniform.

It is quite obvious that the number of trains per day, which we will represent by T , will be $T = \frac{1,440 \times 2}{S}$ (1,440 being minutes in a day and S being expressed in minutes).

In Fig. 3 allowance is made for the time lost at the siding,

represented by a ($\frac{1}{2} a$ entering and $\frac{1}{2} a$ leaving), and by a stop for water at mile-post 15. Then

$$S = W1 + E1 + \frac{a}{2} + \frac{a}{2};$$

also

$$S = W2 + E2 + \frac{a}{2} + \frac{a}{2};$$

or

$$2S = W1 + W2 + E1 + E2 + a + a$$

or

$$S = \frac{W + E + 2a}{2}$$

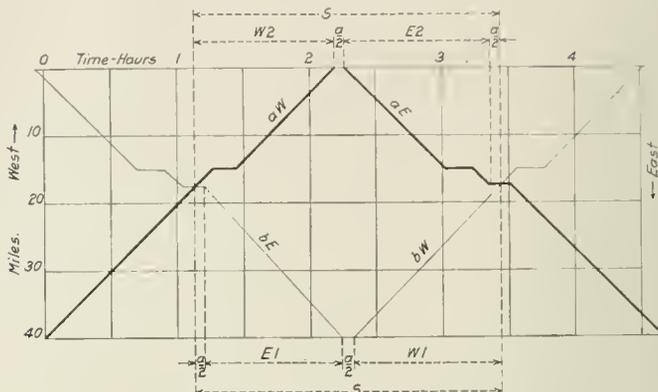

Fig. 3

If N equals the number of passing sidings, then substituting in the last equation $N + 1$ for 2 we have:

$$S = \frac{W + E + (N + 1) a}{N + 1}$$

Substituting this value of S in

$$T = \frac{1440 \times 2}{S}$$

we have

$$T = \frac{2880 (N + 1)}{W + E + (N + 1) a}$$

In other words the maximum number of trains of one class that can be run in 24 hours over a piece of railroad equals 2,880 times the number of passing sidings plus 1, divided by the sum of the running times of an east and a west bound train over the road, plus the number of sidings plus 1 multiplied by the delay caused by a train taking the passing siding.

If trains were run in one direction in two sections and in one section in the opposite direction, the train diagram would look like the following:

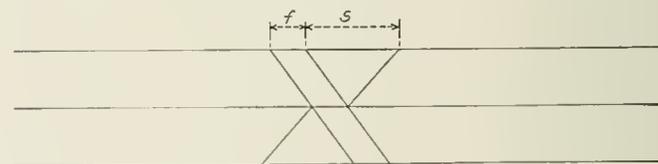

Fig. 3a

If we let f represent the time spacing between following trains, then the number of trains in 24 hours would be:

$$T = \frac{1440 \times 3}{S + f}$$

Substituting in this equation the value of S for maximum capacity we have

$$T = \frac{4320 (N + 1)}{W + E + (N + 1) a + (N + 1) f}$$

If passing tracks were of sufficient capacity, both the east and west bound trains could be run in two sections, in which event we should have:

$$T = \frac{1440 \times 4}{2 + 2f}$$

or, substituting the value of S ,

$$T = \frac{5760 (N + 1)}{W + E + (N + 1) a + (N + 1) 2f}$$

Let us now consider for a moment the effect the number of passing sidings has on the capacity. Going back to Fig. 1, it will be seen that with one passing siding there are four trains

in a certain time, that time being the sum of the total running times of the two trains. Further, with three passing sidings, there are eight trains in the same time, and if we continue adding passing sidings we shall find that, with seven passing sidings, there will be 16 trains and with 15 passing sidings, 32 trains, and so on. In other words, if we neglect for the moment the delay caused by one train meeting another, we can say that, in a time that is equal to the sum of the running times of the two trains over a certain territory, there will always be two more trains than twice the number of passing sidings. But while the capacity increases rapidly as the number of passing sidings is increased, the time required to cover the territory is rapidly increased. To arrive at this increase in running time, if we let R represent the average running time of the two trains, we can readily construct the following formula:

$$R = \frac{W + E + (N + 1) a}{2}$$

in which (N + 1) a is the total time required for the meeting of trains when there are N passing sidings.

This formula is also based on a schedule in which a train in one direction meets a train in the other direction at every passing siding. If trains are run in two sections in one direction, our formula then becomes:

$$R = \frac{W + E + (N + 1) a + Nf}{2}$$

and likewise, if trains are run in two sections in both directions, then our formula becomes:

$$R = \frac{W + E + (N + 1) a + N2f}{2}$$

In order to show a practical example of the application of the formulas which we have set forth in the foregoing, we have chosen an actual piece of railroad about 34 miles long on which there are six passing sidings at B, C, D, E, F and G, A and H being the two terminals. The running time for full-tonnage trains without stops is shown in the second and third columns of Table I, these being given between passing sidings. On this road the westbound trains take the siding and there is one water stop, this water stop being located at siding C. Siding C is a lap siding and the water crane is at the lap, so that an eastbound and a westbound train can both be taking water at the same time.

1 Sta.	Running time without stops			Original Siding Location Full schedule running time				Siding G Moved Full schedule running time			
	2 W.B.	3 E.B.	4 Sum	5 W.B.	6 E.B.	7 Sum	8 D. ¹	9 W.B.	10 E.B.	11 Sum	12 D. ²

H	88 97			65							21

¹ Column 8—Differences between the sums of the running times and the maximum, 53.

² Column 12—Differences between the sums of the running times and the maximum, 42.

W—Time including water stop.

Columns 5 and 6 of the table show, westbound and eastbound, what we have called a full schedule running time, full schedule meaning that in this case we are operating trains of only this one class and that every train is meeting a train in the opposite direction at every passing siding; and we have, further, made the assumption that the time lost by a train taking the siding to meet another train would be nine minutes and the time required for a train to take water, 12 minutes. Under these assumptions, therefore, the westbound running time between A and B would be 16 + 9 or 25 minutes; between B and C would be 10 + 9 or 19 minutes. Now between C and D, as a westbound train can be taking water while on the siding and as 12 minutes only is required for the water stop, the

additional time required for this train would be 13 + 12 or 25 minutes. The running time of the westbound train between D and E, E and F, F and G, and G and H, would in each case be nine minutes greater than the running time without stops as shown in the second column of Table I.

The running time of the eastbound train would be from H to C the same as shown in the third column, because this train does not take passing sidings. At the east end of siding C the eastbound train takes water. Therefore, its time between C and B would be increased by 12 minutes, the time required for the water stop. The seventh column of the table shows the sums of the running times of the two trains between the sidings plus the siding stops. It will be noticed that the maximum of these times is between F and G, and it is 53 minutes. The capacity of the road, therefore, for trains of this one class would be two trains in each 53 minutes or 54 trains per day.

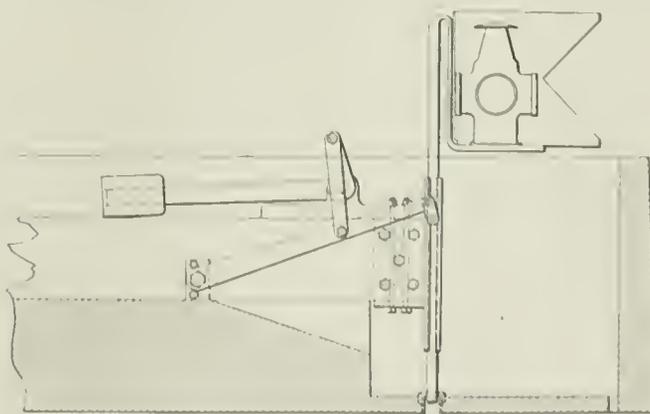

There would be a delay to each westbound train at each passing siding equal to the difference between 53 minutes and the sum of the two running times. For example, between B and C the sum of the two running times is 42 minutes and 53 minutes is allowed for these running times, so that there would be a delay to the westbound train of 11 minutes at siding C, and likewise a delay of 17 minutes at siding D. If the schedule were properly arranged, there would be no delay at siding B, because, while the sum of the running times is only 37 minutes, the westbound train would not leave A until just in time to meet an eastbound train at B. Likewise, there would be no delay at H because the westbound train would have reached its terminal. The total delay to the westbound train is, therefore, 65 minutes.

It is quite evident that, if the spacing between sidings F and G were decreased, the capacity of the road would be increased; and if siding G is the only one to be moved, it is quite obvious that it would do no good to move this siding east a greater distance than will be required to make the sum of the running times between F and G equal to 42 minutes, because the sum of the running times between B and C is 42 minutes.

When this is done the result is as shown in the last four columns of the table, and we have a maximum spacing of 42 minutes, which means two trains every 42 minutes or 68 trains per day, an increase of 14 trains from what the capacity was with siding G in its original location, or approximately an increase of capacity of 26 per cent. The delay to the westbound trains under this new arrangement totals 21 minutes, a saving in the running time of the westbound trains under full schedule of 44 minutes per train.

WILLIAMS' DISAPPEARING SWITCH LIGHT

This is a switch light fixed to the end of the tie at a switch and arranged to drop into a small pit when the track is set for

Disappearing Switch Light

the main line, so that it will be visible only when the switch is set for the side track. When set to show, the light appears just above the level of the tie as indicated in the illustration. It

is moved up and down by levers, the arrangement being similar to that of the ordinary ground switch lever. The target, of sheet metal, is cut out and the lamp is set into it. The pit is arranged with a steel cover, to be locked when the switch is set straight. This keeps out rain and prevents the lamp from being tampered with.

This lamp has been in use at the Bakersfield (Cal.) terminal of the Southern Pacific for something over a year, and is well spoken of by those who have had experience with it.

The proprietor is E. F. Hartzell, East Bakersfield, Cal. He says that he has two more under construction. Making them on a small scale, he finds the cost of the whole outfit about \$25 each.

A HISTORY OF THE LITTLE KANAWHA SYNDICATE

The Interstate Commerce Commission has made its report in the investigation of the ownership, management and control of the Little Kanawha Railroad in accordance with the resolution of the United States Senate calling upon the commission to make such an investigation. The commission's findings bring out the fact that the Little Kanawha was to have been used by the Goulds and Joseph P. Ramsey to form a part of the connection between the Wabash-Pittsburg Terminal and the Western Maryland. Very much condensed and in substance the findings of the commission are as follows:

The Little Kanawha Railroad is now being operated between Parkersburg, W. Va., and Owensport by the Baltimore & Ohio as agent for the stockholders. Of the 5,095 shares of stock of the Little Kanawha, 4,781 are jointly owned by a combination of the Pittsburgh & Lake Erie, the Pennsylvania Company and the Baltimore & Ohio. The Pittsburgh & Lake Erie owns half of this joint stock and the Pennsylvania Company and the Baltimore & Ohio one-quarter each. The purchase of the Little Kanawha Railroad Company's stock was made in order to obtain coal properties in Gilmer, Braxton and Lewis counties, W. Va., and the railroad has been operated at a loss since 1906 and is not being held to tie up and prevent the development of the Little Kanawha Valley. The road is now for sale. In 1901 George J. Gould, Joseph Ramsey, Jr., and William E. Guy organized the Little Kanawha syndicate after having bought the Little Kanawha Railroad. The former stockholders of the railroad received about \$8.09 per share for their stock. A total of \$6,310,104 was subscribed by the syndicate for the extension of the Little Kanawha, purchase of other railroads and purchase of coal lands. Construction work on the extension of the Little Kanawha was actually begun and contracts had been entered into with McArthur Brothers for the work. When the Gould scheme for a transcontinental system extending from Baltimore to San Francisco fell through, construction on the extension of the Little Kanawha was stopped and McArthur Brothers were given similar work on the Zanesville, Marietta & Parkersburg. About \$429,000 had been spent on the extension.

In 1905 relations between Joseph Ramsey, Jr., who had been president of the Wabash, and George J. Gould were severed and Mr. Ramsey was left with control of the Little Kanawha. He entered into negotiations with W. H. Newman, then president of the New York Central Lines, and J. M. Schoonmaker, vice-president of the Pittsburgh & Lake Erie (a New York Central Line), and the Pittsburgh & Lake Erie finally bought the properties which Mr. Ramsey offered it in order to obtain the Kincheloe, Fulton and Arnold coal properties, aggregating about 30,810 acres. To do this they had to buy also the majority stock of the Little Kanawha and also other railroad franchises. It is estimated that the price paid was about what the coal properties would have cost and that the majority stock of the Little Kanawha was acquired practically without cost. In February, 1906, the Pittsburgh & Lake Erie sold one-quarter of this majority stock of the Little Kanawha to the Pennsylvania Company and one-quarter to the Baltimore & Ohio. The transfer of one-half of the interest in these properties was made by the

Pittsburgh & Lake Erie on the basis of actual cost primarily for the purpose of sharing the burden of its investment in such properties and franchises with the Baltimore & Ohio and the Pennsylvania. The sale was in harmony with the spirit and general terms of a so-called gentlemen's agreement entered into between John Newell, when he was president of the Pittsburgh & Lake Erie, and George B. Roberts, when he was president of the Pennsylvania Railroad in the decade ended 1889.

Immediately after the purchase Mr. Schoonmaker made an inspection of the Little Kanawha and found it in a very poor condition, and found that to place it in proper condition and extend it would involve the expenditure of a large amount of money. No effort was therefore made to extend the road and efforts have been and are being made by the owners to sell their stock in the company and their coal properties.

RAILROADING FROM A GENERAL STORE-KEEPER'S POINT OF VIEW*

By J. G. STUART

General Storekeeper, Chicago, Burlington & Quincy

It was a common mistake some years ago to think because a man or a department used the material they would be the best fitted to care for it. This idea has died out to a great extent. It is certain that no superintendent or master mechanic fully alive to the interest of his own department has the necessary time to look after material he is using, and if his department is in charge of material it is certain he will not look after it individually, but will assign these duties to some one of his force. The best plan would seem to be to make the store department responsible for all material and let all departments look to it for supplies.

Like all other departments the store department is expected to pay dividends, or, in other words, to make a showing. A good showing for the store department consists among other things in the following: Service; reduced investment and economics in handling. While a small investment is very desirable, nevertheless, if the investment is reduced so that the service is curtailed, it is in many cases more expensive than to maintain a greater investment. By service I mean the ability to supply the generally used or standard items of material within a reasonable time after the order for them is received. To maintain a supply of standard material is a difficult matter, as the use of standard material is not and cannot be regular.

In practically all storehouses a stock book is kept, which, though different on the various roads, is yet similar in its general principle. Although the stock book is not by any means perfect, it is a great advance over the old "hit and miss" way of ordering which was in effect some years ago. In the minds of many the figures showing past consumption in the stock book are supposed to dictate what material is to be ordered for the future. This is an entirely wrong impression, as the figures are only used as a basis on which to order for the future. Good storekeeping begins with these figures, and the knowledge a storekeeper has of future conditions as compared with past conditions enables him to place his order for what in his judgment will be needed and not to follow arbitrarily any figures showing past usage.

Reduced Investment.—Reduced investment is placed second to service. Some time ago one of our large railroads figured it cost about 12 per cent per annum to carry material, that is, for every dollar's worth of material carried for one year it cost the railroad practically 12 cents to cover the interest on the investment, insurance, taxes, loss and damage through breakage, leakage or becoming defective or obsolete and by extra handling. These figures may not be absolutely correct, but they are not very far out of the way. To prevent this loss it is important that material be kept moving and not allowed to remain in

* Abstract of paper presented at the October meeting of the Western Railway Club.

stock longer than is absolutely necessary. Assuming 12 per cent to be correct, then a railroad reducing its investment in material by one million dollars would be able to make saving of \$120,000 a year or enough to take care of the entire monthly pay roll for some of the largest shops on the line. These figures, of course, are large, and large figures are generally too far away to be of much help.

Suppose a superintendent started over his division the first of the month and saw a section man sitting reading a paper and when he returned at night the same man was still sitting there doing nothing. There is no question but what something would happen. Yet the same superintendent will, perhaps, without giving the matter more than a passing thought, permit crossing plank, switch ties, frogs or switches amounting to \$300 to lie around for an entire year. The investment charges on this would amount to \$36 for the year or enough to pay the section man for an entire month. It should be fully understood that material lying idle is just as expensive to the railroad as laborers sitting idle and that it is immaterial to the railroad company whether the money is paid out as investment charges or wages.

The investment in material can also be reduced by the prompt return of all unapplied material, whether new or second-hand, to the store. It is perhaps a great temptation when a superintendent gets some special tools, such as ditching spades, for a job in his territory to hold them after the particular job is finished, because he may need them again and then he may not be able to get them. Consequently they are tied up as idle capital for an indefinite time while the superintendent on the next division may need some of these same spades and for whom it would be necessary to purchase them in order to supply his needs.

Every store department acts in the nature of a clearing house and material not needed at one point is shifted to another point where it is needed.

It should be borne in mind the store department is organized in order to furnish material and it will always furnish material that is needed when the order is properly approved. The habit of holding on to material of all sorts instead of returning it to the storehouse promptly is one that is costing every railroad a considerable amount of money. In using material men are prone to overlook its value and special efforts should be made to have men approving requisitions for material fully informed as to its cost.

The concentrating of material in the storehouses enables the store department to handle a large volume of business in one place and permits the use of labor-saving handling devices which cannot be profitably used if each department handles its own material and consequently does a smaller volume of business. Establishment of lumber yards permits the use of locomotive cranes, concentration of scrap yards permits the use of overhead or gantry cranes as well as locomotive cranes.

A successful store department cannot be entirely selfish in its aims, as it is impossible for a store department to make a good showing without helping the other departments at the same time. The master mechanic or superintendent should look on the store as his store, not because he is responsible for it, but because it is the store that is supplying him with his material, in this way making it possible for him to make his own work a success or else retarding him in his work. More earnest co-operation of these departments with the store would be beneficial all around.

A more lively interest in the store on the part of master mechanics or superintendents and an occasional visit to the store would undoubtedly be a great help to the storekeeper in making a showing for the store department, which after all is merely the giving of good and efficient service to his two best customers, the master mechanic and superintendent. It would result also in a reduction in the investment, which means a reduction in the operating cost to the railroad, the thing for which all railroad officers are striving.

TRAIN ACCIDENTS IN NOVEMBER¹

The following is a list of the most notable train accidents that occurred on railways of the United States in the month of November, 1915:

COLLISIONS						
Date	Road	Place	Kind of Accident	Kind of Train	Killed	Injured
2.	Balt. & Ohio.....	Keswick	rc	F. & F.	3	0
†22.	Cent. Georgia.....	Columbus	bc	P. & F.	5	45
†23.	Southern	Salisbury	rc	P. & P.	2	20
23.	Bessemer & L. E. ...	Grove City	rc	F. & F.	1	0

DERAILMENTS						
Date	Road	Place	Cause of Derailment	Kind of Train	Killed	Injured
8.	Baltimore & O.....	Cairo, W. Va.	b. truck	F.	1	2
11.	Atlantic C. L.....	Thomasville	malice	F.	1	1
13.	Denver & R. G.....	Salida	b rail	P.	0	20
14.	Trinity & B. V.....	Kirven	unx	P.	0	15
17.	Chicago, B. & Q.....	Quincy	neg	P.	2	0
29.	St. Louis, I. M. & S.	Garber	slide	F.	4	6

The trains in collision at Keswick, Va., on the night of the 2nd, about ten o'clock, were an eastbound freight, which at the time was standing at the station, and a following train, consisting of two locomotives moving backward. The two locomotives were running at excessive speed and crashed into the standing train with sufficient force to seriously damage three cars of cattle. Three trainmen were killed. The second train—the two locomotives—had been admitted to the block section on a caution card.

The trains in collision near Columbus, Ga., on the 22nd, were an eastbound passenger train and a westbound extra train of 28 cars carrying a "carnival" company. Both engines and nine flat cars of the carnival train were wrecked. The cars of the passenger train, of steel, did not leave the rails and the baggage car only was slightly damaged. The wreck took fire from combustible matter loaded on one of the flat cars and nine cars, containing carnival equipment, were burned. Five members of the carnival company were killed, and about forty others, passengers on passenger train and members of the carnival company, were more or less injured, none seriously. Five trainmen, one mail clerk and one express messenger were injured, none seriously. The cause of the collision was overlooking and misunderstanding of orders by the men in charge of the passenger train.

The trains in collision at Salisbury, N. C., on the evening of the 24th were northbound passenger No. 32, second section, and No. 38. No. 32 was an excursion, standing at the station. No. 38 disregarded a rule on the time table which required that from signal No. 370, south of Salisbury, to the station, speed should be reduced so as to be under control. The flagman of the standing train, however, is held primarily responsible. A coroner's jury blamed the flagman and the engineman and also held the fireman negligent for failure to observe the signal on the hind end of the standing train. Two passengers were killed and twenty were injured, all in the rear car of the standing train.

The trains in collision at Grove City, Pa., on the 23rd were southbound freights. The caboose of the leading train was wrecked. The flagman was fatally injured.

The train derailed at Cairo, W. Va., on the eighth was eastbound freight No. 40, and 11 cars were badly damaged. The car which first ran off the track crashed into the station of the Cairo & Kanawha Railway. The agent of that road was killed and two other persons were injured. The derailment was caused by a broken truck.

The train derailed at Thomasville, Ga., on the evening of the eleventh was a pay car train moving slowly over a Wye track. The locomotive was overturned and the engineman and fireman

¹ Abbreviations and marks used in Accident List: rc, Rear collision—bc, Butting collision—xc, Other collisions—b, Broken—d, Defective—unf, Unforeseen obstruction—unx, Unexplained—derail, Open derailing switch—ms, Misplaced switch—acc, Abst, Accidental obstruction—malice, Malicious obstruction of track, etc.—boiler, Explosion of locomotive on track—fire, Cars burned while running—P, or Pass, Passenger train—F, or Ft, Freight train (including empty engines, work trains, etc.)—Asterisk, Wreck wholly or partly destroyed by fire—Dagger, One or more passengers killed.

injured, the engineman fatally. The derailment was due to a spike which had been placed on the rail by a negro boy, seven years old.

The train derailed near Salida, Colo., on the 13th, was east-bound passenger No. 4, and 14 passengers and six employees of the dining car were slightly injured. The derailment was caused by the breaking of a rail.

The train derailed near Kirven, Tex., on the 14th was north-bound passenger No. 2. The tender was the first vehicle to leave the track, and after running about 100 ft. it came upon a trestle bridge where the bridge floor was broken up and the baggage car fell through to the creek below, about 30 ft. The second-class passenger car was overturned. Thirteen passengers and two employees were injured, none seriously. The cause of the derailment was not determined.

The train derailed near Quincy, Ill., on the evening of the 17th was a westbound passenger. The train was run past distant and home signals at the drawbridge over the Mississippi river and the engine plunged into the stream, the draw being open. The coupling at the rear of the engine was broken and the tender was left hanging over the end of the track on the fixed span. The engineman and fireman were killed.

The train derailed near Garber, Mo., on the 29th was a north-bound freight, and the engine and two cars fell down a bank. Three trainmen and one trespasser were killed and six trespassers were injured. The cause of the derailment was a landslide which occurred on a sharp curve. A rock fell from the bluff just as the train was passing, overturning the engine.

RAILROAD BONDS

The following is an abstract of the report of the committee on railroad bonds and equipment trusts, L. B. Franklin, chairman, at the fourth annual convention of the Investment Bankers Association of America.

During the period of the great prosperity of our railroad systems, their securities commanded a ready market both in this country and abroad, and throughout this time the competition on the part of investment bankers for new issues of railroad bonds was keen. This condition offered an opportunity to the issuing companies to decide upon the terms of their mortgages without much regard for the wishes of the banker and the protection of the investor, and this opportunity was in too many cases availed of. The investment banker, in order to participate in the business, was forced to accept the mortgages as drawn by the counsel for the railroad company, and in every way the advantage was with the seller and against the buyer. In justice to the banker, it must be conceded that since that period conditions unfavorable to the railroad companies have arisen which could not have been reasonably foreseen.

Conditions are now reversed. The advantage is with the buyer and a wonderful opportunity is offered for constructive banking. The buyer now can demand and obtain carefully drawn trust indentures protecting the investor at every point and avoiding those dangers which have in the past few years been pointed out in the most emphatic way.

Railroad property is no more immune from depreciation and obsolescence than is other property. Considerable mileage of road is dependent upon special sources of traffic which are not in their nature permanent and bonds secured on railroad property of this kind most certainly need and should have the benefit of a sinking fund. But this is not all. Trackage, which today is of the utmost importance and worth more than the bonds upon it, may in the near future, by reason of a change in conditions, become almost worthless. Replacement value or cost is not an infallible measure of real value. Property, to have value, must have earning capacity and earning capacity is subject to change. A sinking fund is the strongest protection which can be provided against a change in value due to a change in earning capacity. It is amazing what a small amount appropriated annually will provide in fifty years an ample fund. For exam-

ple, a cumulative sinking fund of $\frac{1}{4}$ of 1 per cent upon a 5 per cent fifty-year bond, callable at par, will retire more than 52 per cent of the issue by maturity, while a cumulative sinking fund of $\frac{1}{2}$ of 1 per cent on a similar bond will retire the entire issue prior to maturity.

The objection of the railroads to sinking funds is that their revenues are already restricted while the Interstate Commerce Commission, which controls railroad rates, does not appreciate the need for any repayment of debt out of earnings. Here is a fertile field for work.

The committee recommends that this association place itself on record as being in favor of the repayment of railroad debt in full or in part out of earnings and make an urgent plea before the Interstate Commerce Commission for the recognition of the principle.

The committee has discussed with railroad operators the question of providing in indentures for a specified sum to be spent on the maintenance of property covered by the mortgage and is of the opinion that such a provision is not practical.

Most of the states prohibit the sale of stock by a corporation at less than its par value and therefore comparatively few of our railroad corporations are today in a position to finance any part of their requirements for betterments, improvements or extensions other than by increase of their debt. This means a continual weakening of the margin of safety over the junior securities and unless offset in some way is sure to lead to trouble in the future as it has in the past.

What is a share of stock but an evidence of part ownership in the enterprise, and why should it have a nominal value which may in no way be related to its real or even its market value?

The railroad commission of the state of California has recognized the necessity on the part of public service corporations of maintaining the equity in their property over and above their bonded debt by allowing the sale of stock, both common and preferred, at prices below par, but approved by the commission. Such practice works no hardship on the buyer of the stock or the old stockholder, but maintains for the bondholder his pro rata lien on the property. It is admitted that such sale of stock without par value must not be permitted except under proper supervision, either state or national.

Contrast the credit position today of those roads which have been able to finance to a large extent by sale of stock with those which have had to sell bonds to meet all expenditures and then consider how much better would be the position of those weaker roads, had they been allowed to sell their stocks at fair prices. This is a subject where more education is needed.

Long-term bonds should not be issued to cover the purchase of equipment or to retire maturing equipment trust installments unless such bonds are protected by a strong sinking fund or strict provisions requiring the maintenance of the equipment pledged at a value equal to the bonds issued therefor. Provisions should be made for annual examination of the equipment records by the trustee at the expense of the railroad and adequate methods provided for enforcement by the trustee of the terms of the indenture.

It is recommended that general mortgage or refunding issues be drawn without fixed limits as to maturity, amount or rate of interest, thereby providing a flexible security which can be issued from time to time under provisions in accord with conditions then existing.

THE MERSEY RAILWAY.—The Mersey tunnel, under the river Mersey, connecting Liverpool with Birkenhead, was first proposed in 1860. The necessary authority was secured from Parliament in 1866, and additional powers in 1871, but it was not opened for traffic until February, 1886, when it was put in operation as a one and one-quarter mile two-tracked steam railway. Because of the difficulties of operation on the one hand and the lack of revenue resulting from the poor ventilation on the other, the Mersey Railway was not a paying venture. It was electrified in 1903, however, and since that time has actually had a new lease of life.

AN ENGLISH VIEW OF AMERICAN REGULATION

By W. M. ACWORTH

[The following discussion of some characteristics of American regulation of railways is an extract from Mr. Acworth's review, in the *Economical Journal*, of Prof. William Z. Ripley's book, "Railroads, Finance and Organization." The *Economic Journal* is the publication of the Royal Economic Society of Great Britain.]

Professor Ripley desires to maximize public interference. One would think that a supporter of interference by public authority would necessarily postulate two things: that the authority should be intelligent, and that the authority should be honest. Professor Ripley does not assert—as indeed in view of the history he could not—that either of these prerequisites exists in the United States. As for intelligence, let us take a crucial instance. If intelligent regulation is to be found anywhere, it is surely in that highly expert and respected body, the Interstate Commerce Commission. Yet in July, 1914, after an inquiry extending over more than 12 months, the majority of that commission solemnly reaffirmed their refusal of three years earlier to permit the trunk lines to raise their rates. Under the compulsion of gross and palpable fact they reversed that decision some 6 months later. But it is safe to say that for every dollar Jim Fisk stole from the Erie—and he stole a good many—the inhabitants of the United States lost a million in the months succeeding July, owing to financial depression and trade dislocation consequent primarily on the unintelligent appreciation of the situation by the Interstate Commerce Commission.

What about honesty? In the midst of a scathing indictment of the quite recent mismanagement of the New Haven Railroad Professor Ripley enumerates among its crimes "wholesale bribery, veiled in various ways, of members of the legislature." And this is not in the far west two generations ago, but in Massachusetts yesterday. Not a word is said in reprobation of those who were bribed. Does Professor Ripley take it as a matter of course that members of the legislature will be accessible to wholesale bribery? As for honesty in other than money matters, take this instance. The Interstate Commerce Commission is at this moment engaged in hearing at Chicago the application of the railroads in the territory west of that city to be permitted to raise their rates, with which, of course, the intrastate rates are inextricably entangled. Mr. Clifford Thorne is chairman of the Iowa State Railroad Commission, and he is appearing before the Interstate Commerce Commission as counsel for (a) a number of western state railway commissions, including his own, and (b) for a private trading association which dislikes the prospect of having to pay increased rates. The American public appear to see no objection. The Interstate Commerce Commission is evidently powerless, and the simple English expedient of disbarring Mr. Clifford Thorne is presumably not available. An Englishman, considering the propriety of further private regulation of railways, takes for granted the probity of parliament and the board of trade and the railway commission. But what would he think if legislators were accused of wholesale bribery, and if commissioners were as impartial as Mr. Clifford Thorne?

Take another instance, not from a western state, but from the federal government itself. For years the railroads have claimed that the payment to them for carrying the mails, which is practically in the uncontrolled discretion of the postmaster general, is inadequate. Some three years ago they succeeded in obtaining the appointment of a joint committee of the two houses of Congress to investigate. That committee severely censured the post office department and substantially supported the railroad contention that the method of payment was bad, that the arbitrary powers of the department were unjust, and that the amount of payment was insufficient. While the committee was sitting, the postmaster general introduced and carried a bill establishing a parcel post. The original limit of weight was reasonable. It has subsequently been extended to 50 lb. No provision was made in the bill for payment to the railroads for the extra work

thrown on them beyond the authorization of the postmaster general to pay to certain railroads a temporary increase not exceeding five per cent of the amount they were then receiving. How the extended parcel post is working as a business undertaking may be judged from scores of reports in the American press: of, for instance, a warehouse at Welis, Nevada, "where 80 tons of grain are held for shipment, sack by sack, through the parcel post;" of "a fast mail train delayed by the loading of two tons of wheat as parcel post;" or of "a car load of potatoes from Deeth to Halleck." From the moral point of view it is sufficiently criticised in the published words of ex-President Taft: "When we establish a parcel post—a good measure in itself—and make the railroads carry all the business we can get without adequate compensation, we are stealing from the railroads. That is what we are doing."

But this is not all the story. When the report of the joint committee above mentioned, based on two years' study of the question, was complete, and its tenor became known, but before it had been officially presented, the chairman of the House of representatives' committee on post offices, at the instance of the postmaster general, suddenly introduced a bill, the effect of which was further to reduce the payment which the joint committee had found to be inadequate, and to make the postmaster general absolute judge, without appeal, of his own cause. The bill was forced through the House of representatives, the railroads being refused even a hearing, and sent up to the Senate. The Senate refused to pass it, whereupon a second attempt was made to jam it through in the rush of business before the adjournment by "tacking" it on to an appropriation bill. Thereupon the Senate threw out the appropriation bill of the postmaster general, who, he it observed, is a cabinet minister, has since publicly accused the railroads of attempting to "loot the post office revenues." I have told these stories (which are not derived from Professor Ripley's pages) at some length because it would seem that English readers, in forming an opinion as to the desirability of more or less regulation, should have regard to the public record, not only of the regulatees, but of the regulators.

Another point may be noted in this connection. The railroads in the United States are regulated by 48 separate states and the federal government—"50 stripes save one," as a railroad president puts it—and in each of the 49 the authority to regulate is shared between the legislative, executive and judicial branches of the government—branches whose respective functions are strictly delimited by written constitutions. Professor Ripley recognizes the existence of a hopeless welter of confusion. He speaks of "the well-nigh intolerable conflict of authority of the many public services, commissions and state courts now at work. . . . No fewer than six different state commissions are said to be taking a hand in the reorganization of the Wabash. The approval of each is necessary for validation of the plans. And it is impossible to obey so many masters. It is daily becoming more clear that the conflict of state and federal authority can only be averted. . . . by the assumption of unified control by the United States. Rates, service, and finance are so completely interlocked that satisfactory regulation in each field cannot be exercised except by the assumption of full authority over all three domains alike." That exclusive federal authority will be established in the near future is most unlikely. For, as has been shrewdly pointed out, any member of Congress who voted to deprive his state of control of its railways would sign his own political death warrant. And such documents politicians do not sign with alacrity. But Professor Ripley is so whole-hearted an advocate of public regulation that even the "well-nigh intolerable conflict of authority" does not deter him from desiring to increase both in scope and minuteness the present mass of public regulation.

Perhaps the most useful contribution to the railway question in the United States at the present moment would be an equally well-informed, intelligent, and honest history and criticism of the faults, both of dishonesty and stupidity, of the public authorities of the United States in dealing with their railways. Let us hope that Professor Ripley will find time to write it.

General News Department

The eastbound through passenger train of the National Transcontinental was derailed, on December 16, near Armstrong, the first important derailment on the new line. The damage to cars is said to have been considerable, but there were no serious injuries to persons.

W. F. M. Goss, chief engineer of the Chicago Association of Commerce Committee on Smoke Abatement and the Electrification of the Railway Terminals of Chicago, spoke before the Western Society of Engineers, Chicago, on Monday evening, December 20, on the work of the commission and its report.

The Texas & Pacific has reached an agreement with the Order of Railway Telegraphers, providing for an increase in wages which will cost the road about \$14,000 a year. The compromise agreement provides for a minimum wage of \$70 a month and some changes in working conditions. The operators had asked for a 20 per cent increase in all parts of the system.

The Minnesota Railroad and Warehouse Commission has filed with the Interstate Commerce Commission a brief in reply to the brief presented by the Presidents' Conference Committee on September 1, 1915, and discussed orally before the commission on September 30. This brief presents the views of the Minnesota commission on the points discussed by the railroads.

The Baltimore & Ohio is now engaged in the elevation of its tracks and the elimination of the grade crossing at Liberty avenue, Pittsburgh. The tracks are being elevated for a distance of about a mile, being carried on a fill between concrete retaining walls for about two-thirds of the distance and on a steel viaduct for 200 ft. The improvement is estimated to cost \$750,000 and will be completed late in 1916.

At a meeting of the board of managers of the Chicago Great Western Station Agents' Association held on December 11, the following officers were elected for the ensuing year: President, G. H. Hunt, freight claim agent; vice-president, J. F. Coykendall, secretary and treasurer; secretary, W. J. Cunningham, auditor of freight receipts. It was decided to hold the annual meeting of the association at Des Moines, Iowa, on January 25, 1916.

As announced in a recent issue a sub-committee of the Committee on Relations Between Railroads of the American Railway Association conferred with the Interstate Commerce Commission on December 9 regarding a plan for changes in the demurrage rules. The next step is to discuss the plan with representatives of the National Industrial Traffic League, as is customary in connection with matters pertaining to the general demurrage rules. The commission offered no encouragement to a plan for filing tariffs on short notice.

The Chesapeake & Ohio Employees' Magazine for some time has made a practice of publishing each month a special merit roll, calling attention to examples of especially meritorious service on the part of employees in preventing accidents. Since the establishment of this department about a year ago 376 employees have received favorable mention in this way, ranging from 14 in one division to 91 in another division. One of the division superintendents of the company writes to the magazine that the system of commending employees in this way has been very successful, as far as his division is concerned, and that "it makes all the employees more observing and careful to see that nothing that is liable to cause an accident gets by their observation."

The arbitrators who rendered a decision early in the year on the demands of the western enginemen and firemen, have been called together for a meeting in Chicago on January 4, to pass on 70 questions which have been submitted by the railroads and by the labor organizations regarding differences of opinion as to the interpretations of certain provisions of the award. The board has already been reconvened once (August 30), and at its meeting at that time issued rulings on 194 questions of disagreement that had been submitted. Four members of the board, including the two railroad representatives and the two brotherhood representatives, held a meeting two or three weeks ago in the

effort to reach an agreement on the 70 additional questions. As they were only able to agree on a portion of them, it was found necessary to call a meeting of the entire board.

More Relief for the Railroads

"Clifford Thorne, leader in the fight against increases in rates, yesterday declined to make any statement whatever in regard to the commission's finding."—*From the Des Moines Register and Leader.*

The Complaint Box—Turned Around

The Southern Railway prints on the bills of fare in its dining car the following:

"The management expects its employees to distinguish their service to the public by courtesy, and requests the traveling public to report examples of successful service so that the employees may be encouraged by appreciation of their efforts."

Railway Business Association Dinner

It is announced that the annual meeting of the Railway Business Association will be held at the Waldorf-Astoria Hotel, New York, on January 27, 1916. The sessions will be as follows: A business meeting at 11 a. m.; election of officers, 1:30 p. m., and dinner at 7 p. m. promptly. The speaking program will be announced later.

Research Fellowships in Engineering at the University of Illinois

The University of Illinois has maintained 10 research fellowships of \$500 each for graduate work in the Engineering Experiment Station since 1907. Last spring four additional research fellowships were created, making 14 in all. There will be five vacancies in these fellowships at the close of the current academic year and nominations for the places will be made from applications received by the director before February 1. Appointments are open to graduates of approved American and foreign universities and technical schools. If accepted, the student must remain two consecutive college years.

American Electric Railway Association

The seventh annual mid-year meeting of the American Electric Railway Association will be held at the Congress Hotel and Annex, in Chicago, on February 4, 1916. The joint dinner with the American Electric Railway Manufacturers' Association will be held on the evening of the same day. Although the program for the two events has not as yet been definitely decided upon, it is probable that the meeting will be given over to the discussion of two subjects—Valuation and Rate of Return. The committee on subjects is making arrangements for the presentation of papers by three men of national prominence. An unusually large attendance at both meeting and dinner is anticipated.

Association of American Portland Cement Manufacturers

At the annual meeting of the Association of American Portland Cement Manufacturers held in New York on December 15, the following officers were elected for the coming year: President, B. F. Affleck, president, Universal Portland Cement Company; first vice-president, F. W. Kelley, president of the Halderberg Cement Company; assistant secretary, L. R. Ferguson, connected with the association for some time as assistant secretary; treasurer, G. S. Brown, president of the Alpha Portland Cement Company, and assistant treasurer, John J. Matthes, treasurer of the Alpha Portland Cement Company. J. P. Beck was elected general manager of the association.

Plans for Eight-Hour Day Campaign

The executive committees representing the Brotherhood of Locomotive Engineers, the Brotherhood of Locomotive Firemen

and Enginemen, the Brotherhood of Railway Trainmen and the Order of Railway Conductors at a meeting in Chicago on December 15, 16, 17, 18, 19 and 20, formulated demands to be presented to all the railroads in the country, providing for an eight-hour day or 12½ miles an hour speed basis in freight and yard service and time and one-half for overtime, with no change in the present schedules as to passenger service. The form of the proposed changes in the present agreements with the railroads expiring about April 30, 1916, are to be submitted to a referendum vote of the membership of the organizations.

The New Haven Trial

The government attorneys in the trial of the former New Haven directors in the Federal District Court in New York rested their case Friday last after having spent 43 days and calling 27 witnesses. The documents identified numbered 1,981, and most of these were introduced as evidence. The testimony fills 6,500 pages, this meaning possibly one and one-half million words. Beginning Monday the attorneys for the defense presented their side of the case.

Pan-American Scientific Congress

The program of the transportation, commerce, finance and taxation section of the second Pan-American Scientific Congress, to be held at Washington, D. C., from December 27 to January 8, as announced, includes the following papers on railroad subjects: "The Relation of Central to Local Control in the Regulation of Public Utilities," by C. A. Prouty, director, division of valuation, Interstate Commerce Commission; "Problems of Government Regulation of Railway Rates," by Prof. Emory R. Johnson, University of Pennsylvania, Philadelphia, Pa.; "The Safety First Movement on American Railways," by R. C. Richards, general claim agent, Chicago & North Western, and "Lines of Future Railway Development," by Fred Lavis, consulting engineer, New York City.

James S. Harlan, of the Interstate Commerce Commission, is chairman of the sub-committee on transportation for the congress, and the other members are B. H. Meyer, of the Interstate Commerce Commission, and Prof. E. R. Johnson, of the University of Pennsylvania.

Chicago Strike Settled

A strike of the enginemen, trainmen and switchmen employed on the Belt Railway of Chicago, which was mentioned in last week's issue, was called on the morning of December 14, and was settled late in the evening on December 16, by a compromise agreement effected by G. W. W. Hanger, assistant United States commissioner of mediation and conciliation. Under this agreement the railway will run special service trains in the morning and evening to carry the employees to their work at the Clearing yard until January 1, 1917, by which time the men are expected to make arrangements to move their homes to the vicinity of the new Clearing yard.

A large number of the employees of the Belt live in the vicinity of the yards at Eighty-third street. When the new Clearing yard was opened last May, rather than move to the new location about six miles west, the employees demanded that the company run hourly trains to transport them to and from their work. The company objected to running passenger trains over the Belt Railway, which is used only for freight service, but agreed to run a train for the accommodation of the employees up to June 1, 1916, to give them time to adjust themselves to the new circumstances. The employees' organizations insisted on the train service up to October 1, 1916, and longer if there should still be a lack of "proper housing conditions" near the new yard. When the company refused to agree to this the strike was called by officers of the Brotherhood of Locomotive Engineers, Brotherhood of Locomotive Firemen and Enginemen, and the Brotherhood of Railway Trainmen. At the company's request Mr. Hanger went to Chicago and spent two days in conference with the officers of the brotherhoods and of the railroads in the effort to bring about a settlement. Meanwhile the company made no effort to operate its freight trains, which interfered rather seriously with the interchange of traffic between the railroads and resulted in a large accumulation of loaded cars at the Clearing yard.

The terms of settlement provide that four service trains

shall be run each way between Seventy-fifth and Halsted streets and the Clearing yard between 5 and 9 a. m., and between 5 and 8 p. m.

Forestalling Anxiety About Delays

(Circular of the Long Island Railroad Company, J. B. Austin, Jr., Superintendent)

In event of any delay to trains or interruption of traffic which may be important enough to affect the comfort and convenience of passengers, conductors will make every possible effort to find out the cause of the delay and its probable extent and will furthermore see that a suitable announcement is made to the passengers and others interested.

Conductors and trainmen are instructed to freely and courteously answer all questions addressed to them upon this subject and give any and all information which may be necessary for passengers to make suitable arrangements. It may not always be possible for conductors and trainmen to find out exactly the cause of the trouble or the extent of the delay. In such instances they will only be expected to do the best they can.

The chief train dispatcher at Jamaica will get in touch with the situation and will aid the efforts of conductors by giving them proper information, which in turn should be given to passengers. Station agents will endeavor to find out why trains are late and see that the passengers waiting at the stations are properly advised. The train dispatchers will keep in touch with the agents and assist them in ascertaining cause and extent of trouble.

This company feels that its patrons should be informed of any interruption of traffic or extraordinary delays to trains upon which they may be traveling or about to travel. In many instances information of this character is of great value to our patrons and frequently will enable them to change their arrangements and lessen the inconvenience to which they would otherwise be subjected. Nothing will produce so good an effect and contribute as much to the popularity of the Long Island Railroad as the announcement of information of this character.

Swedish State Railroads Advance Rates

Advances not only in passenger and freight rates, but in sleeping car and baggage charges as well, have been made by the government railways of Sweden to offset higher operating costs due to the war, according to the Bureau of Railway News and Statistics. Sweden follows the example of the state railways of Italy, Switzerland, Norway and Russia. Government railways elsewhere in the world also have made heavy increases in fares and rates since the war. In some instances these advances follow increases already made within the last few years to offset the abnormal rise in wages and cost of material which has been felt generally throughout the world. The Bureau says in its bulletin:

"For third class sleeping car accommodations the Swedish charge has been raised from 67 to 80.4 cents per night, or 20 per cent. First class sleeping car rates remain at \$2.87 per night (which it will be noted is about 43 per cent higher than the standard rates prevailing in the United States), while second class remains at \$1.43 per night (likewise 43 per cent above the \$1 rate of our tourist sleepers).

"All privileges of carrying baggage free, whatever the weight, have been withdrawn. Heretofore Swedish railways, like others in Europe, have allowed a free weight of 25 kilograms, or 55 pounds, about one-third the free allowance on American railways. A charge of 5.36 cents, regardless of weight, will be made hereafter, which, it is stated, will fall hardest upon the poorer third-class travellers and therefore has been opposed strongly by the Swedish press.

"Passenger fares have been advanced by fixed amounts instead of sums increasing with the distance, so that the ratio of increase falls heaviest upon the cheaper short journeys. Expressed in American cents, the advances are:

	1st Class.	2nd Class.	3rd Class.
1 to 30 miles.....	5.36	2.68	1.34
Over 30 miles.....	13.40	8.04	5.36

"Monthly tickets are increased 40 cents second class and 13.4 cents third, while party tickets for 20 rides are raised 21.4 cents second class and 8 cents third.

"On fast freight the rates are advanced 1.07 cents for every 22 pounds l. c. l. and 8.04 cents for every 220 pounds carload. Ordinary freight l. c. l. is advanced by from 5.36 cents to 3.22

cents for every 220 pounds. On carloads the advance measures from 3.22 to 1.07 cents for every 220 pounds."

Traveling Third Class in Russia

An entertaining description of how the average Russian travels is contained in a new book which has recently been published. The author (Julius West, in "Soldiers of the Tsar and Other Sketches") preferred to mix with the man in the street rather than confine himself to interviewing notabilities. It appears that on long-distance journeys the third-class cars are apt to be crowded, even if they do not contain their full complement of passengers, since, "besides the normal impedimenta, the Russian takes food enough with him to tide him over the most interminable delays, and, if the journey is to be a long one, he will always have a pillow and blankets tied up in a manner which suggests a suffocated baby." Lovers of fresh air will hardly like such long journeys in winter, since air is excluded from the coaches by double glass windows, screwed down to prevent their being opened, and by threefold doors. The third-class sleeping accommodation is of the most primitive nature, being furnished by wooden shelves placed one above the other. As the various compartments communicate with each other, the atmosphere after a journey of some two days and nights, which is by no means a long one in Russia, can more easily be imagined than described. Compensation of a kind exists, however, in the shape of the buffet, where tea may be had, "in a compartment decorated at the expense of the Government with a sixpenny ikon (sacred picture) and a bunch of artificial flowers." Moreover, third-class travel is cheap. The journey from Moscow to Warsaw, a distance of 807 miles, only costs about \$4.75.

Signal Companies Investigated

A committee of the New York legislature investigating the conduct of Robert C. Wood, a member of the Public Service Commission of the state for the First district (New York City), had before it last week Sidney G. Johnson, Col. Henry G. Prout, A. H. Renshaw, W. C. Banks and some of the directors of the Union Switch & Signal Company, and in the course of its examination of these and other witnesses brought out a few facts of general interest.

It was charged that Commissioner Wood, in 1914, had asked Johnson for money in consideration of his vote in the commission in favor of granting to the Union Switch & Signal Company, of which Johnson was vice-president, the contract for installing block and interlocking signals in the Center street subway (which contract finally was awarded to the Federal Signal Company, and Johnson, corroborating this, named the sum as \$5,000. Johnson reported to Prout, president of the company, and he laid the matter before the directors. W. D. Uptegraff, now president of the company, then holding a lower position, testified that Prout's proposition was in substance a request for \$5,000 to be used as a bribe, and that a majority of the directors at once voted to ask both Prout and Johnson to resign. They did resign at once. Johnson soon became vice-president of the General Railway Signal Company and Prout subsequently became president of the Hall Switch & Signal Company. Colonel Prout told the investigators that the demand for his resignation was based, in fact, not on his alleged desire to bribe a public officer, but to dissatisfaction because he pursued too conservative a course in the management of the company.

Commissioner Wood, some weeks before he took office as commissioner, had received \$1,500 from the Union Switch & Signal Company for arranging a \$70,000 contract with the Kansas City, Clay County & St. Joseph Railroad. Johnson testified that Wood, after receiving this money, at once paid back to him (Johnson) \$500 of it and that it was by him turned into the treasury of the Union company.

A. H. Renshaw, president of the Federal Signal Company, testified that John T. Cade, vice-president of that company, had received from W. C. Banks, of the North Western Equipment Company, New York City, an offer, for a consideration, to influence Wood's vote in favor of giving a certain contract to the Federal company, Banks being well acquainted with Wood. Renshaw at once told this to E. E. McCall, chairman of the Public Service Commission, who advised Renshaw to lay the facts before the governor of the state.

The investigation is still going on, and most or all of those

who have given useful testimony have been called before the grand jury.

Valuation Circulars

Thomas W. Hulme, general secretary of the Presidents' Conference Committee for the Federal Valuation of Railways, has issued a circular to the chairmen of valuation committees on the individual railroads calling attention to the manner of determining depreciation. The valuation act directs that depreciation be considered. A difference of opinion exists between the carriers and the government as to what constitutes this depreciation. In certain instances the government has used the "straight line" method and life tables in determining what it terms the "condition per cent" of the property. On the other hand, Director Prouty stated recently that it was his view that the useful service life of composite property like locomotives, cars, etc., was not ascertainable and that no attempt would be made to fix the same, but that the remaining service life of the elements of such properties would be ascertained and that an effort would be made to agree with the carriers upon this. The position of the carriers on this subject was set forth in the brief filed with the Interstate Commerce Commission on September 1, in which they maintained that there was no depreciation in the composite property when the deterioration in its physical parts is taken care of by proper replacements as due. The use of the "straight line" method and of life tables was condemned.

The government and the carriers agree that any depreciation existing must be deducted, but they disagree as to what constitutes depreciation. At a recent meeting of the engineering and equipment committees of the roads the following instructions to pilots relating to "condition per cent" were agreed upon:

(a) Instruct pilots to endeavor to agree when requested in regard to facts such as "age," probable date of renewal of parts of each individual unit as result of inspection of each unit or its parts and the estimated cost of same; "general description of the physical conditions of the whole or parts."

(b) Instruct pilots not to agree to life tables, to the life of the whole unit of property, nor to condition per cent.

(c) Instruct pilots to furnish all information possible in regard to facts, from the records or other reliable information, in regard to operating conditions and the standards of maintenance and to co-operate as far as possible with representatives of the Division of Valuation.

(d) Pilot should make a daily report accompanied by his notes.

These instructions apply to equipment, buildings, tie and rail systems in tracks, bridges and all other railway structures.

It is the duty of the carriers to co-operate with the government in the ascertainment of facts in so far as they are invited or permitted to do so. The railway pilots, however, should not, either by the acceptance of copies of the notes or by their signature thereon, enter into any agreement as to the use of the results of life tables or other methods whereby a condition per cent of the composite property may be fixed.

The President's Conference Committee has also issued a circular calling the attention of the carriers to the importance of including in their inventories all property owned or used by them in accordance with the valuation act. The committee suggests that the carriers prepare special lists showing property which is not owned but which is used "for its purposes as a common carrier," including industrial side tracks, warehouses, docks, elevators and other property forming part of the terminal facilities, equipment of private car lines, etc. Also, all property owned and used jointly with other carriers or owned by non-carriers but used by the common carriers should be included in the inventory with a full statement of the condition. The committee suggests that if the federal field forces do not include this information, appropriate exception be taken by the carriers' representatives.

NO BOOKING OF RAILWAY SEATS IN ENGLAND.—The executive committee now in charge of the English railways has decided not to book seats on any of the railway systems, with the exception of whole compartments and sleeping berths. The booking of seats necessitates a large amount of telephonic and postal correspondence, and by dispensing with the bookings the staff which deals with this department will be released for more important war service.

REVENUES AND EXPENSES OF RAILWAYS

FOR THE MONTH OF SEPTEMBER, 1915

Table with columns: Name of Road, Average mileage operated during period, Freight, Passenger, Total revenues, Maintenance of way and structures, Equipment, Traffic, Transportation, Miscellaneous, General, Total, Net from railway operation, Railway tax accruals, Operating income (or loss), Increase (or decrease) comp. with last year.

MONTH OF OCTOBER, 1915

THREE MONTHS OF FISCAL YEAR ENDING JUNE 30, 1916

FOUR MONTHS OF FISCAL YEAR ENDING JUNE 30, 1916

Continuation of the main table, showing data for October 1915, and three and four months of fiscal year ending June 30, 1916.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, date of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontious, 455 Grand Central Station, Chicago. Next meeting, January, 1916, Atlanta, Ga.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, Supt. Timber Preservation, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 18-20, 1916, Chicago.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.
- NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.
- NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
- RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.
- RAILROAD MEN'S IMPROVEMENT SOCIETY.—J. B. Curran, Erie R. R., 50 Church St., New York. Meetings, alternate Thursdays, October to May, Assembly Rooms of Trunk Line Association, 143 Liberty St., New York.
- RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York. Annual meeting, January 27, 1916, Waldorf-Astoria Hotel, New York.
- RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.
- RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.
- ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
- SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.
- TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.
- TRAFFIC CLUB OF NEWARK.—Roy S. Bushy, Firemen's Bldg., Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, 559 Broad St., Newark.
- TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.
- TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Agt., Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings, bi-monthly, Pittsburgh.
- TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings, October to May.
- TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.
- UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.
- WESTERN CANADA RAILWAY CLUB.—L. Kou, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.
- WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Building, Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.
- WESTERN SOCIETY OF ENGINEERS.—E. N. Layfield, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

Traffic News

The Western Maryland has finished its new grain elevator at Baltimore and the structure is now in use. Its capacity is 1,000,000 bushels.

Shipments of anthracite coal during the month of November amounted to 6,297,215 tons as compared with 5,928,286 in November of the preceding year.

The railroads running east of Chicago have issued embargoes against export freight except perishable freight destined to the Atlantic seaboard ports, on account of the embargoes issued by the eastern roads because of the congestion at the ports.

The Twentieth Century Limited train of the New York Central Lines during the 12 months ending October 31, 1915, covered the total distance of 700,800 miles in both directions between New York and Chicago in 876,549 minutes. As the schedule called for 873,600 minutes, this is a record of 99.66 per cent on time.

The Panama Canal was cleared of obstructions sufficiently on Monday of this week to allow the passage of some small vessels, drawing not more than 20 ft. of water, which had been waiting for several months; but it was immediately thereafter ordered closed and it was announced that it would not be permanently reopened until there was no longer any danger of interruption by landslides.

Traffic officers of the Missouri railroads at a meeting in St. Louis last week decided tentatively to ask a rehearing of the case before the Missouri Public Service Commission in which the commission allowed increases in single ticket passenger fares on condition that the railroads issue 500-mile books good for bearer. A meeting was to be held this week to decide what action to take with reference to the increases in freight rates.

The Anti-Saloon League of New York has sent to the presidents of the railroads of that state a letter suggesting that the sale of liquor be abolished on all trains; the fact being pointed out that since the last election the number of towns in New York which have voted to prohibit the sale of alcoholic liquor in every form is 485. A considerable number of towns, in addition to this, have voted to permit its sale only by druggists.

The majority of the railway companies in Argentina on October 1 put into effect a 10 per cent increase in their freight and passenger rates after conferences with the officers of the national government, to offset increases in the prices of coal and railway materials, as well as increases in taxes. The increase does not apply to suburban first and second class tickets, second class long distance tickets, stone and maize, or to demurrage or telegraph charges. The companies had the power to raise rates without intervention by the government, because they are still earning less than the percentage of profit which under the law would enable the government to intervene in the regulation of their rates.

The Baltimore & Ohio has appointed two traveling chaperones, Mrs. C. H. White and Mrs. Samuel Watkins, who will have charge of special parties of students and other young women traveling. On account of the frequent trips made by students at girls' schools during the holidays, at vacation time and on other occasions, requiring the services of experienced travelers, it is believed that the chaperones will be of valuable assistance in imparting information as to points of interest, arranging for tickets, hotel accommodations, baggage transfers and other details. Everything will be done through the co-operation and approval of school authorities or others interested in such tours. The chaperones are the wives of agents of the road and have had wide experience in such matters. Mrs. White is the wife of the agent at Rockville, Md., and Mrs. Watkins the wife of the agent at Sykesville, Md. They will accompany a party of students of National Park Seminary, a girls' school at Forest Glen, Md., on a special train from Washington to Chicago.

The Chamber of Commerce of Boston has presented an elaborate protest to the Interstate Commerce Commission against the advanced freight rates which have been filed by the railways

to take effect January 1, on shipments from New England, New York and other Eastern territory to the Southeastern states. The special complaint of Massachusetts is that by the new tariff the rates from Boston are to be higher than from New York, whereas hitherto the two cities, on all important commodities, have had exactly the same rates. By the new tariff the first-class freight rate from Boston is five cents higher than from New York; second and third classes are four cents higher, fourth and fifth classes three cents, and sixth is two cents. Arguments were presented at the hearings in Washington by protestants from Nashville, Atlanta, St. Louis and a dozen other Southern cities. On the higher classes the increase in many cases is about 10 per cent; and on numerous commodities it is larger than this. The hearings, begun last week, extended to Wednesday of this week.

The Traffic Club of New York

The regular monthly meeting of the Traffic Club of New York, to be held at the Waldorf-Astoria, on December 28, will be addressed by P. H. W. Ross, president of the Marine League of the United States. His subject will be: "What If Ninety Per Cent of Our Land Transportation Were Also Under the Control of Foreigners?"

Decrease in Immigration to the United States

Immigration to the United States during the fiscal year 1915 was less than it has been for 17 years, according to the report of the Bureau of Immigration of the United States Department of Labor, amounting to only 326,700 in 1915, as compared with 1,218,480 in 1914; 1,197,892 in 1913, and 838,172 in 1912. The last year for which the immigration was less than in 1915 was in 1899, when the total number of immigrant arrivals in the United States was 311,715. For the fiscal year 1914, 204,074 aliens departed from this country, as compared with 303,338 the year before.

For 10 months of 1915, including October, the total number of alien and citizen steerage arrivals at the port of New York was 83,606, as compared with 427,346 in 10 months of 1914, a decrease of 343,740, or 80.44 per cent. Of the total for 1915, 76,527 were aliens and 7,079 were citizens.

Freight Traffic to and from Mexico

Since the resumption of freight traffic to and from Mexico through Eagle Pass and Laredo large numbers of loaded freight cars have passed over the river every day. Corn, wheat, clothing and machinery have been shipped in large quantities from Northern and Western states. American commercial travelers are now numerous in Mexico, but it is said that, in a good many cases, especially shipments of grain for remote interior points, payment for the goods is demanded at the border.

This week it is reported that shipments through the Laredo gateway are again badly hampered by the action of the International & Great Northern in cancelling its agreement with the National Railways of Mexico to permit its own cars and those of connecting American lines to enter the southern republic. It is said that the International & Great Northern was willing to let the agreement stand, but that other lines objected to allowing their cars to enter Mexico unless the Mexican roads would give a bond of \$1,000 for each car, insuring its safe return to this side of the border. This bonding feature is now in effect to a limited degree. Most shippers do not care to undergo the trouble and expense of guaranteeing the safety of a car and the old slow method of transferring freight from one car to another at the boundary is in effect. This embargo diverts much traffic destined to Mexico to the Eagle Pass gateway, where the Southern Pacific has a through-car working agreement with the National Railways of Mexico. The freight movement between the two countries is increasing rapidly. Considerable zinc ore is passing through Laredo and Eagle Pass on its way from Mexican mines to smelters in Oklahoma and Kansas.

RAILWAY IMPROVEMENTS IN INDIA. About 20 miles outside the Bombay terminus of the Great Indian Peninsula Railway, the main line to Kalyan, is being re-aligned between Thana and Paksi stations. Included in the engineering work is a double track, broad gage tunnel 4,762 ft. long which has just been completed.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Commissioner Hall and Examiner Thurtell, of the Interstate Commerce Commission, began a supplemental hearing in the Shreveport rate case at Houston, Tex., on December 17.

Coal from Illinois Points

Opinion by Commissioner Daniels:

Following the decision in the 1915 Western Rate Advance case (35 I. C. C., 497, 603-611) proposed increased rates on bituminous coal from Illinois mines to west bank Mississippi river crossings and other points are found justified (36 I. C. C., 549.)

Reparation Awarded

C. L. Gray Lumber Company v. Alabama, Tennessee & Northern et al. Opinion by Commissioner Clark:

The commission finds that a rate of 20½ cents a 100 lb. on lumber in carloads from Ward, Ala., to Memphis, Tenn., is unreasonable to the extent that it exceeds 14½ cents. (36 I. C. C., 376.)

Imported Nitrate of Soda

King Powder Company, et al. v. Pennsylvania Railroad et al. Opinion by the commission:

The commission refuses to permit increased import rates on nitrate of soda in carloads from Baltimore, Md., and Philadelphia, Pa., to Carrel street station, Cincinnati, and Kings Mills and Morrow, Ohio. (36 I. C. C., 653.)

Des Moines Commodity Rates

Greater Des Moines Committee v. Minneapolis & St. Louis et al. Opinion by Commissioner Harlan:

Proposed commodity rates to Des Moines, Iowa, from Chicago, based on the rates from Chicago to the Mississippi river, plus a mileage prorate of the rates from the Mississippi river to the Missouri river, found to be reasonable for the future. (36 I. C. C., 538.)

Classification of Empty Acetylene Gas Cylinders

Prest-O-Lite Company, Inc., v. Boston & Albany, et al. Opinion by Commissioner Harlan:

The official classification rate of third class on empty coppered or nickeled acetylene gas cylinders in less-than-carload quantities is found to be unreasonable and discriminatory, and a rating of fourth class is prescribed for the future. (36 I. C. C., 545.)

Rates on Glucose from Chicago

Opinion by Commissioner Daniels:

The commission finds that the carriers have justified proposed increases in the rates on glucose from Chicago to points in Pennsylvania and trunk line territory and for export through Atlantic ports. The present domestic rate to New York, for example, is 21 cents, the proposed rate is 25 cents. The export rate to New York is raised from 18.9 to 20 cents. (36 I. C. C., 379.)

Lettuce from Texas Points

Opinion by Commissioner Meyer:

The commission finds that the carriers have not justified items in a tariff of F. A. Leland, agent, which have the effect of increasing the arbitraries on lettuce in straight carloads, or in mixed carloads with other vegetables, from East St. Louis to various destinations in Central Freight Association territory, on traffic originating in Texas. As illustrative of the increased arbitraries, the arbitrary from East St. Louis to Cleveland would be increased from 24.7 cents to 28.2 cents; from East St. Louis to Cincinnati from 18.4 cents to 21.4 cents, and from East St. Louis to Pittsburgh from 27.8 cents to 31.5 cents. Most of this lettuce is des-

tined to more important markets in Central Freight Association territory, such as those named. (36 I. C. C., 511.)

Rates on Lumber from Points on the Oregon-Washington

Eastern Oregon Lumber Producers' Association v. Oregon-Washington Railroad & Navigation Company et al. Opinion by Commissioner Holl:

Combination rates on lumber and forest products taking the same rate from Oregon producing points on the line of Oregon-Washington Railroad & Navigation Company to points on the Chicago, Burlington & Quincy south and east of Hemingford, Neb., Guernsey and Cheyenne, Wyo., and Brush, Colo., to and including Missouri river points, are found unreasonable and discriminatory. Reasonable and non-discriminatory joint rates are prescribed for the future. (36 I. C. C., 526.)

Pig Iron from Virginia Furnaces

Opinion by Commissioner Daniels:

The tariffs in issue propose increased rates on pig iron in carloads from points on the Chesapeake & Ohio and the Norfolk & Western to certain points in Maryland, West Virginia, Pennsylvania, New York and by rail and water to Boston. The case is similar to *Low Moor Iron Co. v. C. & O.* (30 I. C. C., 615 and 36 I. C. C., 222), in which the commission prescribed maximum all rail rates on pig iron from Virginia furnaces to Baltimore, Philadelphia, New York and Boston. The commission finds that the carriers have not justified the increased rates to points in Pennsylvania, New York and Maryland and the increased rail and water rate to Boston. Increased rates to Pittsburgh rate points and to West Virginia points are found justified. (36 I. C. C., 552.)

Cottonseed Oil Refining in Transit

Swift & Co. v. Southern Railway. Opinion by Commissioner Clark:

It is held that the tariffs naming joint through rates on cottonseed oil did not, at times the shipments involved in this case moved, provide that shipments originating at points on the Central of Georgia and destined to points in northern states might be refined in transit at points on other lines, or in this case at Charlotte, N. C., and that, therefore, the aggregates of intermediate rates were legally applicable to shipments so treated. The commission finds, however, that the aggregates of the intermediate rates, as applied to through shipments, were unreasonable to the extent that they exceeded the joint through rates contemporaneously in effect and subsequently made applicable in connection with refining in transit at Charlotte, N. C. (36 I. C. C., 386.)

Complaints Dismissed

Elmore-Benjamin Coal Company et al. v. Chesapeake & Ohio et al. Opinion by Commissioner Harlan:

Through rates on coal in carloads from the Kanawha and New River, W. Va., fields on the lines of the Chesapeake & Ohio to Milwaukee, Wis., are not found unreasonable, and a request for joint rates is denied. (36 I. C. C., 528.)

Alexandria Paper Company v. Atchison, Topeka & Santa Fe, et al. Opinion by Commissioner Harlan:

Complaints against the carload rates on news print paper from Alexandria, Ind., to various points west of the Mississippi river are dismissed. (36 I. C. C., 532.)

Fall River Bleachery v. Atlantic Coast Line, et al. Opinion by the commission:

Rail-and-water rates on cotton piece goods from Carolina territory to Fall River, Mass., are not found unreasonable or discriminatory. (36 I. C. C., 535.)

Lehigh Valley Lake Lines

The commission in an opinion by Commissioner McChord has denied the petition of the Lehigh Valley for a rehearing relative to the commission's decision refusing to allow the railway to continue an interest in the Lehigh Valley Transportation Company. The original decision was made in *Lake Line Applications under the Panama Canal Act* (33 I. C. C., 700). The

petition did not request a rehearing on the evidence, but merely a reconsideration of the question whether a competitive relationship exists between the railway and the steamship company. The commission holds that no reason appears tending to show that the previous finding that the Lehigh Valley does or may compete with the Lehigh Valley Transportation Company within the meaning of section 5 as amended was in error (37 I. C. C., 77).

New York-Jersey City Ferry Rates

The commission in an opinion by Commissioner Clark holds that the Erie has not justified proposed increased rates for the ferriage of vehicles and animals between the railroad's terminus in Jersey City, N. J., and its ferry stations in New York City on the opposite side of the North River at Twenty-third and Chambers streets (37 I. C. C., 103).

STATE COMMISSIONS

The Texas Railroad Commission has authorized the railroads of the state to make increases in their rates on sash, doors, blinds and similar articles, effective on January 31.

The Quincy, Omaha & Kansas City has filed a petition with the Missouri Public Service Commission asking that it be eliminated entirely from the general rate advance case. This was one of the roads exempted by the United States Supreme Court in the decision sustaining the state maximum rate laws, and the road believes itself entitled to a different consideration from that accorded to all the roads in the state in the recent decision of the Missouri commission.

PERSONNEL OF COMMISSIONS

Charles D. McKelvey, engineer of the Public Utilities Commission of New Jersey, died December 17, at his home in Paterson, N. J., at the age of 67. Mr. McKelvey was born in Orange county, N. Y., and began railroad service in 1865 as a telegrapher on the Erie. He served as operator, trainman and dispatcher on a number of roads, and in May, 1884, was appointed superintendent of the New York, Susquehanna & Western. In 1889 he left that road and for a short time was manager of the Grand Central Terminal, New York City; but he soon returned to the Susquehanna and remained with that company until 1899, when he retired as general superintendent. He was appointed an inspector of the New Jersey Commission in 1910. For several years he was a member of the Board of Public Works of the City of Paterson.

COURT NEWS

The United States District Court at Portland, Oregon, has returned a decree in execution of the United States Supreme Court decision in the Oregon & California land grant case. The court holds that an equity of \$2.50 an acre in the 2,300,000 acres of land constituting the Oregon & California land grant is the sole right and interest of the Southern Pacific Company therein. Under the decree the Southern Pacific is temporarily enjoined from selling any of the land at any price, and permanently enjoined from selling at a greater price than \$2.50 an acre, or to persons other than bona fide settlers. It is also enjoined from removing or disposing of timber or mineral now on or in the land until Congress shall have had a reasonable opportunity to enact legislation for disposal of the land. The costs of the suit are assessed against the Southern Pacific.

Alternating Current Signal Apparatus Free of Royalty

In the United States District Court at Portland, Me., December 17, Judge Hale, a decision was rendered for the defendants in the suit of the Union Switch & Signal Company against the Hall Switch & Signal Company for infringement of the Struble patent, owned by the Union company, on alternating current apparatus used in automatic block signaling. The Hall company had used alternating current track circuit apparatus on the new subway in Brooklyn at Myrtle avenue. The Federal Signal Company jointly defended the suit with the Hall company. The court finds that if Struble's claims as to selective signaling by the use of alternating current are to be broadly construed they were anticipated by the patent of H. W. Spang, issued more than 40 years ago.

Liability for Conductor's Error

A passenger delivered his ticket to the conductor on a sleeping car and the conductor failed to return it, but gave it to some other passenger, resulting in the owner's ejection. The Alabama Court of Appeals held the railroad responsible for the act of the conductor, and therefore liable in at least nominal damages.—*L. & N. v. Laney* (Ala.), 69 So. 993.

Furnishing Cars—Local Agents' Authority

The Illinois Appellate Court holds that the promise of the local agent of a railroad company and its train dispatcher to supply cars to a shipper on the tracks of another railroad is not binding on the former company; and the fact that it had previously ratified similar conduct does not make it liable for failure to supply such cars.—*Bullard-Johnson S. & L. Co. v. O. S. L.*, 192 Ill. App. 387

Fires—Contributory Negligence of Owner

The owner of a barn adjacent to a right of way left a window therein (which faced the railroad) open. The interior was littered with loose straw and a spark from an engine fired the straw and destroyed the barn. The Texas Supreme Court held that the owner's contributory negligence in leaving the window open debarred any recovery by him against the road. *St. Louis Southwestern v. Arey* (Tex.) 179 S. W. 860.

Fires—Other Engines Emitting Sparks

In an action for the burning of a factory it was claimed that the fire was caused by sparks from engine No. 123. The North Carolina Supreme Court held that it was not competent to prove that an engine, not identified as No. 123, threw live sparks which fell where the burned building had stood, in the absence of proof of similar conditions of the engines, if it was another, as well as similarity of conditions and manner of operation.—*Kerner v. Southern Ry.* (N. C.), 86 S. E. 998.

Interstate Carriers Not Insurers of Goods

By the Carmack amendment carriers of interstate shipments are not liable as insurers and the liability imposed is limited to loss caused by the carrier where some default is plainly implied. So the Oklahoma Supreme Court holds, in an action for injury to an interstate shipment, that a charge to the jury that the railroad was liable as an insurer was reversible error. It had the right to have the question of its negligence submitted to the jury.—*Missouri, O. & G. v. French* (Okla.), 152 Pac. 591.

Excursion Tickets—Time Limit

The purchaser of an excursion ticket limited on its face to a certain day and hour who uses it on a train scheduled to reach that place after the expiration of that time must pay additional fare from the point reached by the train at the expiration of the time limit. The representation of the agent at the starting point that the ticket could be used on that particular train would not waive the stipulation, it not appearing that the agent had authority to alter the original contract.—*Shoenig v. A. C. L.* (Ga.), 86 S. E. 940.

Government Tables of Shrinkage of Stock as Evidence

In an action for damages for negligent transportation of animals, the Texas Court of Civil Appeals held it proper to exclude tables of the Department of Agriculture and of the Texas Cattle Raisers' Association as to tests of shrinkage of stock in transportation where there was nothing to show that they were accurate or authentic. The court held that a document purporting to have been issued by the government has no more weight as evidence than documents issued by any other authority.—*Missouri, K. & T. v. Dale Bros. Co.* (Tex.), 179 S. W. 935.

Lien for Construction Material

In an action by a lumber company for the purchase price of ties used in the construction of a railroad the principal question was whether the plaintiff had a lien against the road for

the value of the ties. Statutes giving liens for labor and material furnished in the construction of railroads are quite common. Kansas formerly had one passed in 1865, but the revision of 1868 resulted in its repeal. The Kansas Supreme Court holds that without such statute no lien arises from the mere fact that material sold for that purpose is used in the construction of the road.—*Chatten Lumber Co. v. Scott City Northern* (Kan.), 152 Pac. 665.

Household Furniture

In an action for damages to an interstate shipment of household goods, total weight 2,200 pounds, it appeared that the plaintiff signed a bill of lading containing the provision, "Owner's risk, value \$10.00 a hundredweight." A piano included in the shipment was damaged, and the Kansas Supreme Court held that it was error to follow the theory of market, instead of actual value. The piano could be repaired and used by the plaintiff, although after the injury it had practically no market value. A rug worth \$21 weighed less than 100 lb. Two rates were in force, of which the shipper is presumed to be aware, and he was bound by that named in the bill of lading, and could recover only for the weight of the rug at \$10 a hundred pounds.—*Collins v. Union Pacific* (Kan.), 152 Pac. 649.

Explosion in Stored Car—Injuries to Fireman

A railroad company stored a car containing combustible material in its yard. Some of this exploded, causing a fire, resulting in other explosions. The fire department was called and a fireman was injured by an explosion. In an action against the railroad the Texas Supreme Court held that, inasmuch as the company's negligence was the proximate cause of the explosion setting the fire, as well as the subsequent one by which the plaintiff was injured, the company's negligence was a continuing cause and the plaintiff's situation, as well as the duty of the company, was the same as if he had reached the premises before the first explosion occurred and it had caused his injuries.—*Houston Belt & Terminal v. Johansen* (Tex.), 179 S. U. 853.

Attorney's Fee; Compromise by Client

The Arkansas Supreme Court holds that an attorney, after the compromise or settlement in good faith by his client of a claim upon which suit has been brought, is bound by the terms of his contract as to the amount of his fee, and is only entitled to that per cent of the amount realized from the settlement or judgment which was fixed by his contract. By contract with their client, a law firm was to receive 50 per cent of any amount derived from recovery or compromise of an action against a railroad. The client settled the claim for \$25, as he had a right to do, either without their consent or over their objection. It was held the railroad was only bound to them for \$12.50, the half of the sum paid in settlement of the claim.—*St. Louis, I. M. & S.* (Ark.), 179 S. W. 648.

Fires Caused by Acts Outside Scope of Employment

In Kansas the rule that an employer is not liable for the consequences of negligent acts of his employee committed outside the scope of his employment has been applied by the Supreme Court in an action for damages resulting from a fire maintained by laborers for their own domestic purposes on the right of way. The court cited the leading case of *Morier v. St. Paul, M. & M.*, 31 Minn. 351. There sectionmen in charge of a foreman engaged in repairing track built a fire on the right of way to warm their coffee for dinner. After dinner they resumed work without extinguishing the fire, which spread to adjoining premises and burned the plaintiff's hay. It was held that the railroad was not liable. *Ireton v. Atchison, T. & S. F.* (Kan.), 152 Pac. 625.

Damages to Fireman for Permanent Injuries

A fireman, 32 years of age, who earned \$100 a month and was in the best of health, capable of undergoing the most strenuous exertion, was badly injured in a collision. His right leg from the knee down was caught between the tank on the tender and the boiler head in the cab and so roasted by the boiler that it had to be amputated, and the wound was not healed a

year after the accident; and he was unable to do any work. The Virginia Supreme Court of Appeals, finding the collision due to the company's negligence in giving wrong signals, held that an award of \$25,000 against the railroad was not so plainly excessive as to justify the court's disturbing it, although if it could have usurped the functions of the jury, it might have said that it should have been less.—*Chesapeake & O. v. Carnahan* (Va.), 86 S. E. 863.

Reasonable Notice of Demand for Cars

The West Virginia Supreme Court of Appeals holds that an application to a station agent for cars for a shipper's use on a particular day, made in the ordinary way, by one who has not been accustomed to make special contracts to furnish cars for particular dates, and without notice of intention or purpose to bind the company absolutely to furnish the cars on the day named, and the promise of the agent, in response to such application, that he would get the cars, do not prove a contract on the part of the railroad, binding it absolutely to furnish them on the day named. It was held that three days' notice of a demand for cars for live stock, in a period of great activity in such shipments, was not reasonable or sufficient. The court found that every effort was made to get the cars and the time required was just one week.—*McNeer & Co. v. C. & O.* (W. Va.), 86 S. E. 887.

Employers' Liability Act

A lineman of an electric railroad, engaged in interstate as well as intrastate commerce, killed while putting additional cross-arms on its poles for transfer thereto of the single wire used in its "hand" signal system and the stringing of additional wires to change the system to an "automatic" one, was held by the Iowa Supreme Court to be employed in interstate commerce, so that the cause of action for his death was under the federal employers' liability act, this work being "repair" or "maintenance" and not "construction."—*Rose v. Sheldon* (Iowa), 154 N. W. 499.

The South Carolina Supreme Court holds that an injury received by a car repairer, while raising a fallen drawhead to standard height during the temporary stoppage of the car for that purpose, while in interstate transit, falls within the federal employers' liability act.—*Lorick v. S. A. L.* (S. Car.), 86 S. E. 675.

Prescriptive Title to Railroad Land

A hotel was built partly on land belonging to a railroad, and the successive owners of the hotel knew it stood on the railroad land, and claimed no right therein, keeping possession under the mistaken belief that merely by going upon land they knew was owned by another and being suffered to remain in possession for 10 years they would acquire title by prescription under the Wyoming statute. In an action by the railroad to recover possession of the land, the Wyoming Supreme Court held that the defendants' possession for 10 years did not ripen into title by prescription. To have that effect the possession must not only be open, notorious, exclusive and continuous for the full 10-year period of the statute, but must also be taken and held either under color of title or claim of right. To acquire title by occupation and possession a man, in a case like this, must have a belief in his own mind that he possesses a right as owner.—*Bolin v. Colorado & S.* (Wyo.), 152 Pac. 486.

"Lookout Ahead" and Speed on a Curve

In an action for the death of a person struck by a train while he was standing on a sharp curve, it was the railroad's theory, sustained by proof, that a southbound train was so interposed between the deceased and the engine that struck him that he and his companion could not be seen from the engine. The Tennessee Supreme Court holds that, under Shannon's Code, section 1574, providing that every railroad company shall keep the engineer, fireman or some other person upon the locomotive always on the "Lookout ahead," enginemen are not required, when on a curve, to look across the intervening space to the further end of the curve, thereby withdrawing the lookout from the track immediately ahead of the engine.

It also holds that, as a precaution against injury to persons walking on the track, but not seen, there is no duty to slacken the speed of a train approaching a curve in the open country,

although the curve be in whole or in part in a cut or the track be hidden from view by a train going in the opposite direction on the concave side of the curve.—*Cincinnati, N. O. & T. P. v. Wright* (Tenn.), 179 S. W. 641.

Excessive Rates on Milk

In an action to recover excessive freight charges neither party attempted to show the reasonableness or unreasonableness of the rate of itself. The South Dakota Supreme Court held that in such a case under the state law which places the burden of proof on the carrier to show the reasonableness of the rates when they are attacked in a proceeding before the railroad commissioners, and making evidence of the lowest prevailing rate for similar service elsewhere prima facie evidence of a reasonable rate, the parties may adduce comparative evidence of other rates on the question of reasonableness. Evidence that express rates on milk between certain points were higher than the railroad's rates between the same points was held not to establish the reasonableness of the railroad's rates, where it did not appear that the service rendered was the same. The express company maintained a free "pick-up" service and a free delivery service, which the railroad did not do, and the tariff recited that while on the platform the milk cans were at the owner's risk. A through rate for the carriage of milk between certain points which exceeded the total of local rates over the same line and distance was held to be an unreasonable rate.—*Turner Creamery Co. v. Chicago, M. & St. P.* (S. Dak.), 154 N. W. 819.

Overexertion in Lifting Heavy Articles

A section gang was engaged in cutting weeds on a track. They used a hand car, which was moved off the track on the approach of a train; the section foreman keeping a watch for trains. A workman suffered an inguinal hernia while assisting in removing the car, and sued for damages, recovering a verdict. On appeal, the Minnesota Supreme Court directed judgment for the railroad notwithstanding the verdict. It is the general rule that a master is not liable for an injury to his servant caused by overexertion in lifting heavy articles, as the servant is the best judge of his own lifting capacity, and the burden is on him not to overtax it. *Stenvog v. Minnesota Transfer*, 108 Minn. 190. The plaintiff recognized this rule, but contended that the foreman did not discover the approaching train until it was so near that great haste was necessary to avoid a collision; that in the exercise of proper care the foreman ought to have discovered the train in time to permit the removal of the hand car without such haste; and that the negligence of the foreman in this respect brought about the situation which caused the plaintiff to overexert himself. A careful examination of the evidence was held to show no such negligence.—*Creamus v. Great Northern* (Minn.) 154 N. W. 616.

Libel in Letter Charging Station Agent with Intoxication

In our issue of November 12 last appeared an abstract of a decision in which a letter from a passenger to a railroad general agent charging a conductor with intoxication and rudeness was held to be a libel, being malicious. A very similar case has recently been handed down by the Pennsylvania District Court, the parties being the general superintendent of a large shipper of the line and a station agent, between whom had existed for a long time a deep-seated ill-feeling. The alleged libel was contained in a letter to the president of the railroad, which stated that the station agent had, the day before, been "so drunk he hardly knew his name." It was held that such a letter is not a privileged communication if written and mailed maliciously. The jury were instructed, however, and it was held, properly, that if they found as a fact that the plaintiff was intoxicated on the day mentioned in the letter, their verdict must be for the defendant; and if they found that he was not intoxicated on that day, even then their verdict should be for the defendant if the charges were lodged in good faith, for the purpose of bettering the situation at the station, and without malice. The jury found that the letter was sent maliciously, and returned a verdict of \$1,000 damages. As no special damages had been alleged or proved, this was reduced to \$700 on appeal.—*Peterman v. Dewey*, 24 Pa. Dist. 920.

Receivers—Allowance of Claims for Supplies

The Circuit Court of Appeals, Eighth circuit, in a suit against the Kansas City, Mexico & Orient and others, holds that the claim of a creditor for payment out of the corpus of railroad property for necessary supplies (in this case tanks and culverts) furnished to a railroad company and used in the operation of the road, is inferior in equity to the claims of bondholders under a prior mortgage, and is not entitled to preference in payment over them, there being no diversion to the payment of unpreferred claims of current income from the payment of current expenses for wages, materials, supplies, and such necessities of operation. The expectation of the seller of supplies that its claim would be paid out of the current earnings of the company is not sufficient to take it from the class of general claims and place it in the class of preferential claims. If it were sufficient for the purpose, liens of prior mortgages on railroads would be idle, for nearly all general creditors undoubtedly expect payment out of the current incomes of the companies. Even loans of money to pay current expenses, or to keep a railroad company a going concern, in reliance on and in expectation of payment out of the current earnings of the company, are ineffectual to transfer claims for their payment, otherwise without equitable preference, to the class of preferential claims.—*Martin Metal Mfg. Co. v. U. S. & M. Trust Co., C. C. A., 225 Fed. 961.*

Undercharge Recovery—Plainness of Tariff

In an action to recover an undercharge it appeared that the defendant shipped 27 car loads of cattle from Groom, Tex., to Meade, Kan., over the lines of the plaintiff and connecting carriers. The rate charged was \$35 per car load. The lawful rate was \$47.50. The defendant claimed as a set-off damages on another shipment of cattle. But the other shipment was made under a contract prescribing that no recovery should be had unless an action was brought within 6 months; and this condition precedent was disregarded. The Kansas Supreme Court therefore held that no set-off could be allowed.

It was claimed that the tariff did not conform to section 2 of the Interstate Commerce Act requiring plainness of statement and printing. Some 25 railroads participated in the tariff, which was approved by the commission. The contention was not sustained. The court said: "The statutory provision requiring simplicity in railroad tariffs is satisfied when it is made as plain as a subject inherently complex will permit. Tariffs and their arrangement with reference to simplicity follow the outlines prescribed by the Interstate Commerce Commission, and must meet the approval of that tribunal. Ordinarily the courts make no mistake in deferring to its expert judgment touching the best methods of complying with the statutory mandate as to plainness and lucidity."—*Chicago, R. I. & P. v. Theis (Kan.), 152 Pac. 619.*

Keeping Trespasser Off Train—Duty of Conductor

A trespasser on a train had been repeatedly put off, the train being stopped for the purpose. On the final occasion he ran after the train, overtook it and attempted to board it at the rear steps in spite of the resistance of the conductor. It was claimed in an action for his death that he was pushed off by the conductor, and fell on the track. The train, which was passing around a curve, was not stopped. Next day the mangled body of the deceased was found on the track near the spot. It was held by the Iowa Supreme Court that a verdict and judgment for the plaintiff were not supported by the evidence. Clearly it was the duty of the conductor to prevent the deceased from boarding his train. To that end he was required to exercise all the reasonable means within his power, and this implied the use of a reasonable degree of force. The attempt of the deceased to board the train at the very point where the conductor was standing guard to prevent him was wanton and reckless in the extreme. His act was not only a violation of the statute forbidding the boarding of trains in motion, but it amounted to an assault upon the conductor, and created a position of manifest peril to the conductor. That his attempt should fail was a natural and probable result. Whether the conductor ought afterwards to have stopped his train would depend upon the question of whether he knew or ought to have known that the deceased was rendered too helpless to remove himself from the track. It was possible that this did happen, and that he was thereby

run over by a later train, but it was by no means proved.—*Hawthorne v. Delano (Iowa) 154 N. W. 590.*

Taxation of Express Companies in South Dakota

The suits by Wells, Fargo & Company and the American Express Company to enjoin the state of South Dakota from assessing certain taxes levied against the companies for the year 1910 have been decided in favor of the companies by the United States Supreme Court. Under the state law, Wells, Fargo & Company made a statement showing gross earnings within the state for the year ending April 30, 1910, of \$131,096, and value of office furniture, fixtures and real estate, \$18,474. The State Board of Assessment and Equalization assessed the value of the company's property at \$289,877, and imposed a tax of twenty-eight mills on the dollar, making a total tax of \$8,116. Similarly, the board assessed the value of the American Express Company at \$193,260, and levied a tax of \$5,411. The companies' bill averred a tender of taxes upon the returns, and charged that the assessments were a violation of the state constitution, and, if enforced, would have the effect of taking the property of the companies without due process of law, in violation of the federal constitution.

The state constitution, as in force at the time of the assessments (in this respect it is still practically the same), provided that the levy of taxes on corporate property should be made as nearly as possible in the same way as on individual property, and that all taxes should be levied in proportion to the value of the property. It appeared that the express companies doing business in the state in 1909 and 1910 were under contracts with the railroads to pay to the latter from 45 per cent to 55 per cent of their gross earnings from the transportation of express business over their lines, and that this payment, if not the only basis of the assessments made by the board, was the principal factor in fixing the value of the express companies within the state. The South Dakota statutes, other than those relating to railroads, telephone, telegraph, express and sleeping car companies, do not authorize a valuation which considers gross income, and individuals and other corporations are taxed according to the value of their property, without reference to the income derived therefrom. In other words, property owned by other corporations and individuals is assessed for what it is fairly worth, and a valuation for taxation is not fixed by a method which gives controlling effect to the amount of the gross income derived therefrom. The Supreme Court concurred with the opinion of the Circuit Court of Appeals that such procedure is in violation of the provision of the South Dakota constitution, above referred to, and affirmed that court's judgment in favor of the express companies.—(Decided November 29, 1915.)

Demurrage in Bad Weather—Commission Cannot Order Refund

The New York State Supreme Court, appellate division, holds that the Public Service Commission is without power to direct a common carrier to refund freight payments found by the commission to be excessive, provided the sum which has been collected is correct according to the published tariff. The court, with Justice Laughlin dissenting, held that the commission may determine the just and reasonable regulations to be observed by the carrier, but that its power is confined solely to violations of such determinations in the future, and that the commission has not the power, after a determination, to direct the repayment of charges already collected. The prevailing opinion was written by Justice Scott.

In his dissenting opinion, Justice Laughlin holds that not only has the Public Service Commission the right to determine as to the reasonableness of charges, but it has power to "order the defendant to make reparation by refunding the amount exacted in excess of the amount found to be just and reasonable."

The decision was handed down in a suit brought by Edward D. Murphy and William P. Murphy, in the hay and grain shipping business, against the New York Central. The railroad charged and collected from them between November 1, 1907, and May 20, 1910, \$178 for "track storage" on consignments of freight at Melrose Junction. The Murphys contended these charges were excessive and took their complaints to the Public Service Commission of the Second District, which ruled that the track storage charges, so far as they related to days which, owing to bad weather, made it impossible to unload the freight, were unreasonable.

Railway Officers

Executive, Financial, Legal and Accounting

Edgar J. Rich, general solicitor of the Boston & Maine at Boston, Mass., has resigned.

Edgar M. Williams, second vice-president of the Southern Express Company, at Chattanooga, Tenn., has been elected vice-president, succeeding Charles L. Loop, deceased.

Arthur E. Sweet, general manager of the Second district of the Chicago, Rock Island & Pacific, with office at Topeka, Kan., has been elected vice-president of the Denver & Rio Grande, succeeding E. L. Brown.

Operating

L. M. Dooley has been appointed inspector of transportation for the Texas & Pacific, at Dallas, Tex., instead of superintendent of transportation, as announced in these columns recently.

The office of G. W. Clark, general superintendent of the Central New England, has been transferred from Hartford, Conn., to Poughkeepsie, N. Y. At the same time 34 members of the office forces move from Hartford to Poughkeepsie.

Charles H. Smith, trainmaster of the Green Bay & Western, with office at Green Bay, Wis., has been appointed superintendent of the Green Bay & Western, the Kewaunee, Green Bay & Western and the Ahnapee & Western, effective January 1.

L. L. McIntyre, whose appointment as superintendent of the Carolina, Clinchfield & Ohio, at Erwin, Tenn., has already been announced in these columns, was born on October 4, 1874, at McColl, S. C., and was educated in the common schools. He began railway work on June 1, 1892, with the Cape Fear & Yadkin Valley, now a part of the Atlantic Coast Line, as a clerk and relief agent. In July, 1893, he went to the Norfolk & Western as clerk and operator at Welch, W. Va., remaining in that position until the following September. He was then engaged in yard and coal and coke weighing and billing service at various points on the Pocahontas division of the same road until January, 1898, when he was appointed train dispatcher at Bluefield, W. Va. On May 1, 1902, he was appointed night chief dispatcher; then from November, 1904, to July, 1906, was chief dispatcher. From July, 1906, to March, 1909, he was car distributor of the same road. On March 15, 1909, he went to the Carolina, Clinchfield & Ohio as car service agent at Erwin, Tenn. In April, 1911, he was appointed trainmaster at the same place, which position he held at the time of his recent appointment as superintendent of the same road as above noted.

Traffic

John Dunphy has been appointed assistant general passenger agent of the Pere Marquette, with headquarters at Detroit, Mich.

H. B. Hatch, contracting freight agent of the Illinois Central at San Francisco, Cal., has been appointed freight and passenger agent, with office at Fresno, Cal.

S. F. Hilton, agent of the freight department of the Union Pacific at Fresno, Cal., has been appointed district freight agent at the same place, effective January 1.

William P. Behen, contracting freight agent of the Cincinnati, Hamilton & Dayton, has been appointed commercial agent of the Cincinnati, Indianapolis & Western, with headquarters at Chicago.

Robert C. Haase, northwestern passenger agent of the Baltimore & Ohio, with headquarters at St. Paul, Minn., and Minneapolis, has been appointed district passenger agent at Philadelphia, Pa., succeeding Bernard N. Ashby, resigned. H. C. Strohn, traveling passenger agent at Omaha, Neb., has been promoted to northwestern passenger agent.

O. S. Lewis, whose appointment as assistant general freight agent of the Baltimore & Ohio, Southwestern and the Cincinnati, Hamilton & Dayton has been announced, began his railroad career as an employee in the accounting department of the Baltimore & Ohio. Later he was stationed at Lawrenceburg, Ind., as agent,

and subsequently was promoted to chief clerk in the office of the division freight agent at Vincennes, Ind. He served in the general office of the road for seven years and in 1912 was sent to Dayton, Ohio, as division freight agent.

Engineering and Rolling Stock

Joseph Gilkison has been appointed roadmaster of the Chicago, Terre Haute & Southeastern, vice William Padden, deceased.

K. B. Duncan has been appointed valuation engineer of the Atchison, Topcka & Santa Fe, eastern lines, in connection with the Kansas rate case.

Frederick A. Bonz, assistant engineer of the Buffalo, Rochester & Pittsburgh, has been promoted to division engineer, Divisions 1, 2 and Eric division, with office at Rochester, N. Y.

George J. Adamson, formerly special engineer of construction for the Union Pacific, with office at Omaha, Neb., has been appointed division engineer of the Wyoming division, with headquarters at Cheyenne, Wyo. George F. Maitland has been appointed division engineer of the Kansas division, with office at Kansas City, Mo.

Purchasing

Harvey DeCamp has been appointed purchasing agent of the Gulf & Ship Island, with office at Gulfport, Miss.

Special Officers

F. A. Greene, chief inspector of the insurance department of the Pennsylvania Railroad, has been appointed assistant superintendent of the insurance department of the Pennsylvania system, effective January 1.

OBITUARY

R. H. Montgomery, superintendent of the New York Central shops at Collinwood, Ohio, died at his home in Cleveland, on December 14.

Joseph B. Redfield, for 60 years in the service of the Chicago & North Western, and most of that time as auditor and assistant secretary, died at his home in Chicago, Ill., on December 20. About five years ago Mr. Redfield retired from his duties as auditor and engaged in the compilation of historical matter connected with the railway. He was a graduate of Union College, Schenectady, N. Y., and was born on September 25, 1825.

John Kirby, formerly from October, 1870, to October, 1892, general master car builder of the Lake Shore & Michigan Southern, died on December 8, at Adrian, Mich. Mr. Kirby was born in October, 1823, in Oxfordshire, England, and was educated in the common schools. He began railway work in May, 1848, and until 1854 was engaged in repairing cars on the Syracuse & Utica, which is now a part of the New York Central. He was then to September, 1856, engaged in repairing and building cars on the Michigan Southern at Adrian, Mich. From September, 1856, to September, 1858, he was foreman of shops on the same road at Adrian; then to October, 1870, was master car builder of the Michigan Southern & Northern Indiana, which subsequently became a part of the Lake Shore & Michigan Southern, which is now a part of the New York Central. In October, 1870, he was appointed general master car builder of the Lake Shore & Michigan Southern, remaining in that position until October, 1892. Mr. Kirby was president in 1891 and 1892 of the Master Car Builders' Association, and from 1900 to 1909 was treasurer of the same association.

J. Kirby

Equipment and Supplies

LOCOMOTIVES

THE INTERCOLONIAL will install superheaters on 100 locomotives.

THE LEHIGH VALLEY has issued inquiries for 15 switching locomotives.

THE EDMONTON, DUNVEGAN & BRITISH COLUMBIA is inquiring for two superheater locomotives.

THE GRAND TRUNK PACIFIC will install superheaters on 47 Consolidation and Mikado locomotives.

THE UNION RAILROAD has ordered five Consolidation locomotives from the Baldwin Locomotive Works.

THE TAVARES & GULF has ordered one Prairie type locomotive from the Baldwin Locomotive Works.

THE NORFOLK SOUTHERN has ordered four Consolidation locomotives from the Baldwin Locomotive Works.

THE PRESCOTT & NORTHWESTERN has ordered one Mikado locomotive from the Baldwin Locomotive Works.

THE NORFOLK & PORTSMOUTH BELT LINE has ordered one six-wheel switching locomotive from the Baldwin Locomotive Works.

THE OZAN GRAYSONIA LUMBER COMPANY, Prescott, Ariz., has ordered two Mikado locomotives from the Baldwin Locomotive Works.

THE DELAWARE, LACKAWANNA & WESTERN, reported in last week's issue as contemplating the purchase of locomotives, will buy 10 Mikado and seven Pacific type locomotives.

THE CHICAGO GREAT WESTERN, which was reported in last week's issue as having ordered five Mikado locomotives from the Baldwin Locomotive Works, has increased this order to 10 locomotives.

THE NEW YORK CENTRAL has ordered one Mountain type locomotive from the American Locomotive Company. It is also further reported to be contemplating the purchase of other locomotives.

FREIGHT CARS

THE CENTRAL VERMONT is in the market for 1,000 box cars.

THE UNION PACIFIC is in the market for a number of box and stock cars.

THE EAST BROAD TOP RAILROAD is in the market for five narrow gage hopper cars.

THE NEW YORK, PHILADELPHIA & NORFOLK is in the market for from five to 10 cabin cars.

THE CHANUTE REFINING COMPANY is inquiring for prices on 50 8,000-gal. capacity tank cars.

THE DULUTH & IRON RANGE has ordered 100 flat cars from the American Car & Foundry Company.

THE SOUTHERN EXTRACT COMPANY has ordered 10 tank cars from the American Car & Foundry Company.

THE BETHLEHEM CHILE IRON MINES COMPANY has issued inquiries for 25 100,000-lb. capacity steel ore cars.

THE STANDARD OIL COMPANY, Whiting, Ind., has ordered three steel coke cars from the American Car & Foundry Company.

THE LONG ISLAND, reported in the issue of November 19 as being in the market for 100 gondola cars, has ordered 100 long gondola cars from the Pressed Steel Car Company.

THE NEW YORK, PHILADELPHIA & NORFOLK, reported in last week's issue as being in the market for 45 to 60 steel under-frame box cars, has ordered these cars from the American Car & Foundry Company.

THE MICHIGAN CENTRAL, reported in the *Railway Age Gazette*

of November 5 as having ordered 150 40-ton box cars from the Canadian Car & Foundry Company, ordered only underframes for 150 50-ton flat cars from that company.

THE IMPERIAL OIL COMPANY, LTD., Sarnia, Ont., has ordered 100 40-ton tank car bodies and trucks from the Canadian Car & Foundry Company for part of the 235 cars mentioned in an item in the *Railway Age Gazette* of December 10.

THE NEW YORK, NEW HAVEN & HARTFORD, reported in last week's issue as contemplating the purchase of 500 coal cars, has ordered these cars from the Standard Steel Car Company. It will also buy 20 milk and 50 refrigerator cars, not 500 refrigerator cars as reported in last week's issue.

PASSENGER CARS

THE WABASH is inquiring for prices on 6 postal cars.

THE LONG ISLAND, reported in the *Railway Age Gazette* of November 26 as being in the market for six parlor cars, 10 baggage cars and 25 trailer coaches, has ordered the 25 trailer cars from the Standard Steel Car Company.

THE NEW YORK MUNICIPAL, reported in the *Railway Age Gazette* of December 10 as inquiring for prices on 100 subway cars, has ordered these cars from the American Car & Foundry Company. These cars are for the Sea Beach Line, and constitute the fourth 100 ordered for this service from the same company.

THE NEW YORK, NEW HAVEN & HARTFORD.—The item in the issue of December 3, giving the division of the order for 100 passenger cars, placed with the Osgood-Bradley Car Company, was incorrect. The Osgood-Bradley Car Company has been authorized to proceed with the construction of 100 all-steel passenger train cars, as noted, but these will include 65 coaches and 35 baggage cars.

THE NEW YORK CENTRAL, reported in the *Railway Age Gazette* of December 10 as having issued inquiries for 30 to 60 70-ft. coaches, has placed orders for 105 cars as follows: Barney & Smith Car Company, 15 coaches for the Cleveland, Cincinnati, Chicago & St. Louis; Osgood-Bradley Car Company, 25 for the Boston & Albany; American Car & Foundry Company, 45 for the New York Central itself, and the Standard Steel Car Company, 20.

TRACK SPECIALTIES

THE GREAT NORTHERN has ordered 175,000 tie plates, 7,000 kegs of track spikes, 8,000 kegs of bolts and 90,000 angle bars from the Lackawanna Steel Company.

IRON AND STEEL

THE BALTIMORE & OHIO has ordered 300 tons of bridge steel from the Mount Vernon Bridge Company.

THE FRENCH GOVERNMENT has given the Maryland Steel Company an order for 90,000 tons of rails and fittings.

THE SOUTHERN RAILWAY has ordered 1,300 tons of bridge steel from the Virginia Bridge & Iron Company.

THE PENNSYLVANIA has ordered 435 tons of steel from the Pennsylvania Steel Company for an ore handling bridge on the Pennsylvania dock at Erie, Pa.

THE TOLEDO, ST. LOUIS & WESTERN has divided an order for 10,000 tons of 85-lb. rails between the Illinois Steel Company and the Carnegie Steel Company.

THE GREAT NORTHERN has divided an order for 8,000 tons of rails among the Illinois Steel Company, the Cambria Steel Company, the Lackawanna Steel Company and the Colorado Fuel & Iron Company.

SIGNALING

THE PHILADELPHIA & READING has given to the Federal Signal Company the contract for installing automatic signals on its line, double track, between Newberry Junction, Pa., and Lewisburg, 36 miles.

A mechanical interlocking plant is to be installed at Dun Loup, W. Va., at the crossing of the Chesapeake & Ohio and the Kanawha, Glen Jean & Eastern. The Federal Signal Company has the contract.

THE GREAT NORTHERN plans to install during the coming year automatic block signals on 200 miles of its line. The plans for the year include also the installation of a 22-lever interlocking plant at Aberdeen, S. D., where the line crosses the Chicago, Milwaukee & St. Paul; and a nine-lever interlocking at Calumet, Minn., where the line crosses the Duluth, Missaba & Northern.

THE ALABAMA GREAT SOUTHERN plans during the coming year to install automatic block signals on five miles of line. This number of miles is exactly the difference between the mileage reported as now operated under automatic block signals and the total mileage of road on which the passenger trains are run, indicating that at the end of the year the whole of the line will be signaled.

THE ILLINOIS CENTRAL plans to install automatic block signals during the coming year on 180 miles of its lines as follows: Gilman, Ill., to Mattoon, 90 miles double track; Dugan, Ky., to Cecilia, 8 miles; East View to Leitchfield, Ky., 14 miles; Horse Branch, Ky., to Beaver Dam, 12 miles; Rockport, Ky., to Mercer, 12 miles, and Eddyville, Ky., to Paducah, 35 miles, all single track; Woodstock, Tenn., towards Memphis, 8 miles single track, and Branch Junction, Ill., to Centralia, 2 miles, double track.

THE ERIE will install automatic block signals in 1916, in place of the manual block system, on 84 miles of road, namely: Solon, Ohio, to Cleveland, 16 miles double track; Kent, Ohio, to Leavittsburg, 27 miles double track; Buchanan Junction, Pa., to Pymatuning, 26 miles single track and 6 miles double track; Columbus, Pa., to Niobe Junction, 9 miles. Also on the controlled line, the New York, Susquehanna & Western, automatic block signals will be installed on 14 miles, double track, to take the place of the manual block system.

THE INDO-CYLON RAILWAY.—It has been proposed to make the Indo-Ceylon Railway into a railway throughout by constructing a line along Adam's Bridge. At the meeting of the South Indian Railway on November 17, it was stated that the existing railway and ferry steamer service—which was only opened less than two years ago—was causing a great deal of trouble and was being operated at a very considerable loss. It was instituted at the special instance of the merchants, planters, people and government of Ceylon, and unless some satisfactory understanding could be come to with the Ceylon Government Railway it might become necessary either to close the route altogether or to run the service periodically, and then only for passengers.

RAILWAY DEVELOPMENT IN EASTERN MANCHURIA.—Some interesting details regarding Japanese railway development in Eastern Manchuria have recently been published in the Far East. Although the entire line from Antung to Mukden, 170 miles in length and costing \$10,000,000 to reconstruct, is devoid of any cities of importance, except Penchilin, which, about 40 miles southeast of Mukden, is in the center of a coal-mining district, the Japanese are busily engaged in opening up the mineral wealth of the country and constructing branch and light lines. Near Penchilin two modern smelting plants have been installed and iron ore is obtained at the Miao-Kou Iron Mine, some five miles from Nan Fan Station and connected with it by a light railway. Near the station of Nui-hsin-tai is situated another colliery, known as the Ho Lien Kuo, and from this a light line is to be built by the Japanese to Chien Chang, 53 miles to the north, for the purpose of carting timber from the forests. A new line is also to be built between Kaiyuan and Hailungsen, as there is plenty of coal from the Sha Ting Kang mines to work them. On the other hand, a group of Chinese merchants have formed a syndicate to build a light railway from Fushun, at the end of the Mukden extension, to Shing Ching, where there is a good supply of timber, which is greatly needed for the Fushun collieries. It is a sign of the times that it is reported that the Fengtien Branch of the Bank of China has agreed to finance the scheme, which needs \$500,000. The Japanese have recently laid a Decauville railway through the city of Liaoyang itself.—*Railway Gazette, London.*

Supply Trade News

Wilfred R. Dean, vice-president of the Dean Brothers Pump Works, Indianapolis, Ind., died recently, after a prolonged illness.

S. K. Smith, treasurer of the Harlan & Hollingsworth Corporation, has also been elected vice-president, succeeding Persifer Frazer. Henderson Weir, secretary, has been elected a director.

A. L. Murphey, purchasing agent, and J. P. Coonahan, assistant purchasing agent of the Midvale Steel Company, have been appointed to similar positions with the Midvale Steel & Ordnance Company.

Frank Howard Bailie, assistant manager of sales of the H. K. Porter Company, Pittsburgh, Pa., died after a brief illness from pneumonia on Tuesday, December 14. Mr. Bailie had been associated with the company for 27 years.

Richard Henry Lee, superintendent of the Lebanon blast furnaces of the Pennsylvania Steel Company and consulting engineer of the American Manganese Manufacturing Company, died suddenly, December 8, of heart failure.

Charles E. Duncan, formerly with the Carnegie Steel Company, and at one time superintendent of the plant of the Algoma Steel Corporation, Ltd., Sault Ste. Marie, Canada, has been appointed general manager of the newly incorporated Donner Steel Company, Ltd., Buffalo, N. Y.

The Garland ventilator, which is in general use on railroad sleeping and parlor cars, has now been successfully applied to automobile trucks and pleasure cars, removing the heated air from the motor compartment and reducing losses in power, oil, burned out bearings, scored cylinders and damage to the radiator.

Henry C. Kloos, of the electrical staff of the Pullman Company, has accepted a position with the Franklin Railway Supply Company, New York. This company is now engaging in the manufacture and sale of car lighting equipment, and is placing upon the American market the "Stone" system of car lighting, hitherto manufactured in England and extensively employed abroad.

Announcement is made that the receivership of the Barney & Smith Car Company, Dayton, Ohio, came to an end December 15, following the negotiation of a loan of \$600,000. There will be no change in the status of the stock and bondholders of the company. The officers of the company are as follows: President, H. M. Estabrook; vice-president and general manager, A. J. Stevens, and treasurer, A. F. Kiehofer. The board of directors will include these and Lawrence Maxwell, E. J. Barney, J. L. Oneil, E. N. Patten and C. L. Harrison.

The Boston Elevated Railway will build a creosoting plant of its own in Boston for the purpose of treating ties and other material. G. B. Shipley, consulting engineer, Pittsburgh, Pa., has been engaged to design the plant and superintend its construction. It will be a modern pressure creosoting plant, designed for any standard process, and will be fully equipped to meet all of the Boston Elevated requirements. This decision to use creosoting material comes after long experiments with various methods of wood preservation. The plant will be the first modern creosoting plant to be built in New England.

The American Steel Railway Cross Tie Company, Pittsburgh, Pa., has purchased the Maxey patents formerly owned by the United States Steel Railway Tie Company. The present management of the American Steel Railway Cross Tie Company is as follows: President, J. A. Langfitt, a Pennsylvania state senator for two terms; vice-president, W. S. Maxey, attorney-at-law and a prominent business man of Pittsburgh (this Mr. Maxey is not related to the Mr. Maxey who sold the patents to the company); treasurer, Oscar A. Adrian, of the Peoples Homewood Bank and treasurer of the Charles C. Wesley Real Estate Company, and secretary, Charles C. Wesley, president of the Charles C. Wesley Real Estate Company.

A new company with a capital of \$150,000 is about to be organized under the leadership of Joseph C. Reed, until re-

cently in charge of the railway and government business of the Shapleigh Hardware Company, St. Louis, to take over the Southern Railway Supply Company of that city. W. D. Achuff, vice-president, and Ephron Catlin, Jr., secretary and treasurer of the Southern Company, will hold similar positions with the new company, the name of which has not yet been definitely decided. The new company, in addition to carrying in stock a full line of miscellaneous supplies for railroads, mines, mills and industrial corporations, will specialize and represent exclusively in the southwestern territory the Buda Company, the E. F. Houghton Company, the Verona Tool Works and other companies. It will also have the exclusive sales agency in the United States for the Saunders corrugated car-stopper.

The following is quoted from the New York Times, of December 23: A syndicate headed by Potter, Choate & Prentice and F. B. Keech & Co. has bought the Haskell & Barker Car Company at Michigan City, Ind., and will take steps to extend the business after new capital has been raised. An offering of 220,000 shares of stock without stated par value is expected in a few days. It is understood that the shares are being placed with the syndicate at \$50 a share. Among the directors of the re-organized company are F. A. Vanderlip, president of the National City Bank; Ambrose Monnell, president of the International Nickel Company; William E. Corey, head of the Midvale Steel & Ordnance Company, and Arthur O. Choate, of the firm of Potter, Choate & Prentice. A large interest in the Haskell & Barker Car Company was held by Miss Catherine Barker, who was recently married to Howard Spaulding, Jr., secretary and general manager of the company. Control of the property has been in the hands of James B. Forgan, president of the First National Bank of Chicago; E. K. Boisot and T. J. McBride (president of the company) as trustees since the death of John Barker in 1910.

TRADE PUBLICATIONS

SAND BLASTS.—Bulletin No. 531, recently issued by the Pangborn Corporation, Hagerstown, Md., is a leaflet illustrating and describing the company's type "L. A." rotary table sand blast.

A RAILWAY CRANE.—The Bucyrus Company, South Milwaukee, Wis., has issued an eight-page pamphlet describing its Class 150-17 crane for wrecking and other railway purposes. This pamphlet gives the details of its construction and operation and is illustrated with numerous photographs.

PLANING MACHINES.—The Newton Machine Tool Works, Inc., Philadelphia, Pa., has recently issued Catalog No. 50, illustrating and describing the company's line of rotary planing machines. The catalog contains illustrations showing the various machines made by the company and gives specifications and general dimensions.

ACETYLENE.—The Searchlight Company, Chicago, has issued a pamphlet entitled "The Searchlight Treatise on Acetylene." It contains 12 pages, briefly describing the development of the use of the oxy-acetylene process for welding and cutting and discusses at some length the commercializing of the gases, in which the method of preparing, purifying and handling acetylene in cylinders is considered. There is also a brief discussion regarding the use of acetylene generated by small generators at the plant vs. the cylinder acetylene.

BOILERS.—The Harrison Safety Boiler Works, Philadelphia, Pa., has recently issued a 68-page catalog entitled "Finding and Stopping of Waste in Modern Boiler Rooms." The book treats of the value of feed water and condensate meters as aids in the management of power plants and it is shown how with a feed water meter one can ascertain the results of various factors, such as grade of fuel, grates, methods of firing, air leaks, control of draft, condition of gas passages, scale and soot on boiler tubes, radiation, etc. The point is made that the use of records which may be obtained with the meters arouses the ambition and spirit of emulation of the men, and makes it possible to reward special skill or attention to duty, as by bonuses or promotions. A section of the book also treats of the Cochrane metering heater (combined open feed water heater and hot water heater) with its several modifications. The Cochrane flow record for use in connection with V-notch weirs and a new type of meter working on the volumetric principle are also described. The book is well illustrated and attractively gotten up.

Railway Construction

ALASKA VALLEY.—Incorporated in North Carolina with \$150,000 capital to build from Bryson City, N. C., on the Southern Railway to the falls of Alaska creek, 12 miles. The headquarters of the company are at Bryson City. Arthur Brooks is said to be interested.

CALIFORNIA SOUTHERN.—Construction work is now under way on the section from Red Hill Station, Cal., to Blythe, 27 miles. The Blythe Construction Company, of Blythe Junction and Los Angeles, Cal., also G. W. Grayson, of Blythe Junction, are the contractors. (May 7, p. 993.)

CHICAGO, WEATHERFORD & GULF.—A charter has been filed in Texas to build a railroad from Gainesville, Tex., south via Weatherford and Granbury, to Waco, about 200 miles. The company has a capital of \$250,000, and the principal office is at Weatherford. W. D. Stratton, president; D. L. Decker, vice-president and general manager, both of Middleton, N. Y.; H. L. Moseley, vice-president; G. A. Holland, treasurer; T. R. Erwin, secretary, Weatherford.

CURTIS BAY RAILROAD.—Application to build and operate a railroad at Curtis Bay in Anne Arundel county, Md., has been made to the Public Service Commission of Maryland. The company was incorporated in March of this year with \$10,000 capital, and plans to build a railway from the plant of the Davison Chemical Company to Hawkins Point. The company also asks permission to construct wharves, piers, etc. In the application filed it is pointed out that the road will not conflict with any existing road, and that the conditions in that section demand the construction of a line of this kind, not only for commercial reasons, but to meet the passenger traffic needs of hundreds of workmen employed in the vicinity. C. Wilbur Miller, president of the Davison Chemical Company; J. Luntz, P. J. Peters, J. F. Gillespie and E. Miller are incorporators.

ELKIN & ALLEGHENY.—Construction work is now under way between Doughton, N. C., and Sparta. The company is carrying out the work with its own forces. Four miles have been graded, but track laying has not yet been started. The company now operates a 15-mile line from Elkin, N. C., northwest via Doughton to Veneer.

GRAND TRUNK PACIFIC.—Grading work on the Grand Trunk Pacific Branch Lines Company's Prince Albert branch has been completed into Prince Albert, Sask., but track has only been laid to St. Louis, on the north shore of the Saskatchewan river, which is 25 miles from Prince Albert. Grading work has also been finished on the Harte-Brandon branch, 26 miles, but track laying has not yet been started.

GULF, SABINE & RED RIVER.—The construction of a 35-mile extension has been decided upon, it is said, by Litcher & Moore, lumber manufacturers of Orange, Texas, the owners of this line. The proposed route is from Starks, La., north to Merryville. The extension will traverse a rich territory of the Sabine River valley, and will open up timberland. The company now operates a line from Niblett's Bluff, a few miles north of Orange, Tex., to Starks, La., where connection is made with the Kansas City Southern.

JACKSON & EASTERN.—Construction work is now under way from Union, Miss., west to Sebastopol, 14 miles. The work is being carried out by company forces. H. W. Harris, Meridian, Miss., may be addressed.

KANSAS SOUTHERN TRACTION.—Incorporated in Kansas with \$100,000 capital and headquarters at Oswego. The plans call for building an electric line from Parsons, Kan., southwest to Coffeyville, also a line from Parsons southeast to Columbus, in all about 70 miles. The incorporators include: P. Stack, Parsons, Kan.; T. Ritzo and D. Conti, Kansas City, Mo.; J. W. Everett and J. M. Page, Topeka, Kan.

MONTREAL & SOUTHERN COUNTIES (ELECTRIC).—This company has finished work on the extension from St. Cesaire, Que., to Granby, 15 miles. One mile of the extension was built in 1914, and 14 miles in 1915. (July 2, p. 38.)

NEW YORK, PHILADELPHIA & NORFOLK.—This company now has under construction 7.54 miles of second track from Hallwood, Va., to Parksley.

PACIFIC & IDAHO NORTHERN.—This company, which now operates a line from New Meadows, Idaho, to Weiser, 89.7 miles, some years ago made surveys and reconnaissances from New Meadows north towards Grangeville or Lewiston, following generally the route of the Little Salmon and Big Salmon rivers. Governor Moses Alexander has been agitating the question of completing the gap between New Meadows and one of the points named above to provide rail connection between the northern and southern sections of Idaho. A commission was appointed by the governor, which has already made a favorable preliminary report. It is understood that capital can be secured to build the line; the construction work will be expensive. The Pacific & Idaho Northern has not yet done any work north of New Meadows except to make surveys. The company has filed its right of way through government land as far north as Riggins, at the junction of the Little and Big Salmon rivers, 35 miles north of New Meadows, at which point the P. & I. N. surveys intersect the Gilmore & Pittsburgh surveys from the present western terminus of that road at Salmon City, down the Big Salmon river and Snake river to Lewiston.

PALATINE, LAKE ZURICH & WAUCONDA.—This company, which operates a line from Palatine, Ill., northwest to Wauconda, 15 miles, has surveys made for an extension from Wauconda to Fox Lake, 10.5 miles. During 1915 work was finished on one-half mile of side tracks.

PHILADELPHIA ROADS.—The lowest bid for the steel superstructure of the Frankford elevated line extension from Unity street to Dyre street, Philadelphia, Pa., was submitted by the American Bridge Company. This company offered to carry out the work for \$249,000. (December 10, p. 1113.)

RICHMOND, RAPPAHANNOCK & NORTHERN.—Conditional contracts have been let by this company for the construction of the new line from West Point, Va., northeast to Urbanna, 17 miles. The contract, it is understood, was let to Winston & Co., Richmond, Va. The promoters must make a first payment of \$100,000 to the contractors before actual construction work will be started. The cost of construction and equipment of the line is estimated at \$300,000. The project has the endorsement of the Richmond Chamber of Commerce and Retail Merchants' Association, who are co-operating in raising the necessary funds. (August 20, 1915, p. 369.)

ROANOKE RIVER.—This company, which now operates a 12-mile line from Townsville, N. C., east to Manson, contemplates building an extension from Townsville west to a connection with the Southern Railway, about 9 miles.

SOUTHERN TRACTION.—An officer is quoted as saying that definite action for building from Waco, Tex., south to Austin, thence to San Antonio, about 180 miles, will be taken within the next few months. The company owns and operates interurban lines between Dallas and Waco and between Dallas and Corsicana.

SOUTH DAKOTA SHORT LINE.—This company, which was recently incorporated in South Dakota with \$2,000,000 capital, plans to build a line either from Sioux Falls, S. D., northwest to Pierre, 200 miles, or from Mitchell to Pierre, 120 miles. G. W. Adams, president, Council Bluffs, Iowa. (October 1, p. 622.)

VALLEY & SILETZ.—Work is now under way building an extension between Spalding Dam, Ore., and Siletz Basin, eight miles. The work is being carried out by company forces. (March 26, p. 721.)

VIRGINIA-BLUE RIDGE.—This company is building an extension from Lowesville, Va., to Massies Mill, 9 miles. The Wuch Construction Company, Roanoke, Va., has the contract. Surveys are now being made for an extension from Massies Mill to Tyro, 3 miles. (August 13, p. 301.)

RAILWAY STRUCTURES

TWO HARBORS, MINN.—The Duluth & Iron Range will build a one-story car repair shop at Two Harbors. The building will have a steel frame and brick walls; it will be 275 ft. by 310 ft. and will cost \$175,000. The date for opening bids for the work has not been set.

Railway Financial News

BUFFALO & SUSQUEHANNA.—See Wellsville & Buffalo.

CHICAGO, BURLINGTON & QUINCY.—See Paducah & Illinois.

CHICAGO, MILWAUKEE & ST. PAUL.—Kuhn, Loeb & Co. and the National City Bank, both of New York, have bought from the Chicago, Milwaukee & St. Paul \$2,856,000 general mortgage 4½ per cent bonds, the proceeds to be used to refund a like amount of Dakota & Great Southern first mortgage 5 per cent bonds maturing January 1, 1916.

The Wisconsin Railroad Commission has authorized the company to issue \$48,176,650 4 per cent bonds to retire a like amount of 4 per cent 15-year European loan bonds of 1910. These European loan bonds were printed in French and largely held in France. They have been surrendered by the owners to the French government and sent to this country to raise money for the government.

CHICAGO, ROCK ISLAND & PACIFIC.—The receiver is to ask the court for authority to pay the interest coupons maturing January 1 on underlying bonds and to renew short term loans and receiver's certificates.

ELKIN & ALLEGHENY.—C. B. Penney, general manager, and M. W. Thompson have been appointed receivers.

GULF, MOBILE & NORTHERN.—The state of Mississippi has issued a charter for this company, which is the new company taking over the New Orleans, Mobile & Chicago.

LEHIGH VALLEY.—Samuel T. Bodine has been elected a member of the board of directors, succeeding Abram Nesbitt, resigned.

MISSOURI PACIFIC.—Federal Judge Elmer B. Adams has, at his own request, been relieved of the receivership affairs of the Missouri Pacific and Judge Sanborne, of the United States Circuit Court of Appeals, has assigned Judge William C. Hooke, of Leavenworth, Kan., to take over the Missouri Pacific receivership.

NASHVILLE, CHATTANOOGA & ST. LOUIS.—See Paducah & Illinois.

NEW ORLEANS, MOBILE & CHICAGO.—See Gulf, Mobile & Northern.

PADUCAH & ILLINOIS.—Kean, Taylor & Co., the Union Trust Company, the Merchants Loan & Trust Company, all of Chicago; the Second Ward Savings Bank, the First National Bank, both of Milwaukee; the Northwestern Trust Company, the St. Paul Commerce Trust Company, both of Kansas City; the Mercantile Trust Company, St. Louis, Mo., and James C. Wilson & Co., Louisville, Ky., have bought from the Paducah & Illinois \$3,500,000 first mortgage 4½ per cent 40-year bonds. These bonds are guaranteed principal, interest and sinking fund by the Chicago, Burlington & Quincy and the Nashville, Chattanooga & St. Louis. The Paducah & Illinois is a subsidiary of these two companies and is building a double-track steel bridge over the Ohio river near Metropolis, Ill. The bridge is about 5,700 ft. long and will form the only direct connection between the Nashville, Chattanooga & St. Louis and the Chicago, Burlington & Quincy.

PERE MARQUETTE.—Judge Tuttle, of the United States district court, has fixed April 5, 1916, as the date of sale with an upset price of \$14,000,000 subject to underlying bonds.

RICHMOND, FREDERICKSBURG & POTOMAC.—The directors, in accordance with the expressed desires of stockholders, have voted to issue a scrip dividend of 50 per cent. The state of Virginia owns about 18 per cent of the stock, which has been paying regular dividends of 9 per cent.

WELLSVILLE & BUFFALO.—This is the name of the new company which has applied to the New York Public Service Commission for a certificate of public convenience and necessity to operate the Buffalo & Susquehanna Railway, which it has taken over after reorganization.

WHEELING & LAKE ERIE.—For the third time the Wheeling & Lake Erie has been offered for sale. No bid was made.

* Illustrated.

The salient fact in the annual statistical review of the block-signal situation on American railways, published in this issue, is the continued testimony to the superiority of the automatic to the manual block system, as shown in the large investments being made to substitute the one for the other. And the items of proposed new work for 1916 indicate that this tendency grows stronger, year by year. The direct financial results of these changes are, usually, not immediately apparent, but everybody agrees that there is increased safety, and the increase in capacity of road by the shortening of block sections (which always accompanies the introduction of automatics) is surely valuable as soon as that increased capacity is used. The increase in manual block signal mileage is

also significant. Well-informed railroad officers have long known that the space interval system is the only adequate preventive of collisions; more and more this belief is shown by actual adoption of the practice. Including Canada, North America now has over 100,000 miles of railway on which the space interval is in use; and the thirty-odd thousand miles of this which covers automatic signals includes a good deal of four-track railway, so that the total miles of track automatically signalled is over fifty thousand.

A second very careful estimate has been made by L. F. Loree, president of the Delaware & Hudson, of the volume of railroad securities held abroad. The first estimate which Mr. Loree made was as of March 31, 1915; the second estimate as of July 31, 1915. Between these two dates the par value of railroad securities held abroad decreased by \$480,892,135. The total par value as of July 31 was \$2,223,510,229. There was apparently returned to this country between the first of February and the last of July securities with a par value almost as great as the amount which France and England borrowed under the terms of the joint loan which was negotiated in this country and floated by the syndicate of bankers with J. P. Morgan & Co. at its head. There is this difference, however, that whereas all of the proceeds of the \$500,000,000 loan was to be spent in this country, the proceeds of the sale of railroad securities may or may not have been spent in this country. The total market value of the \$2,223,510,229 railroad securities held abroad as of July 31 was \$1,751,437,913. It is rather interesting to note the taste of European investors for various classes of railroad securities. Whereas there was \$438,415,606 par value of railroad common stock held abroad, its market value was \$263,996,929; there was \$25,253,201 equipment trust bonds, with a market value, however, of \$24,480,411; there was a total of \$1,150,339,130 par value of mortgage bonds, with a market value of \$962,081,613. In addition to the common stock mentioned above there was \$236,151,600 par value preferred stock and \$5,608,850 of second preferred stock. The total of all classes of stock held abroad is about 30 per cent of the total par value of railroad securities. The total par value of all stock issued by American railroads reporting to the Interstate Commerce Commission is about 43.50 per cent of the total par value of all securities held by these railroads.

The large increase in the number of freight cars ordered in 1915 as compared with 1914 is clearly shown by the car construction statistics on another page. Although the total number is still considerably behind that for 1913, the full significance of the increase as an indication of present business conditions may be realized from the fact that orders for about one-half of all the freight cars ordered during the year were placed after October 1. A year ago attention was drawn to the increase in the number of all-steel box cars ordered. While steel box cars have again shown a large increase, both in the number ordered and in their proportion of the total number of box cars ordered, they cannot yet be said to be coming into general use, since about 95 per cent of the cars of this type were ordered by two systems—the Pennsylvania Lines and the New York Central Lines. The type of construction which has received the widest application during the year is the steel underframe car with steel body framing members. There has been a material increase this year in the average box car capacity. This is accounted for by the increased number of 100,000-lb. capacity cars ordered and the decrease in the orders for 60,000-lb. capacity cars. The number of cars of 80,000-lb. capacity has remained practically unchanged, for the two years, and the orders are widely distributed, making it evident that this is the accepted capacity for general service box

Securities Repurchased from Abroad

cars. There is no apparent change in the draft gear situation, friction gears having been specified on about five-eighths of all the freight cars ordered. However, attention should be directed to the fact that while the spring gear has been applied to a large number of cars with capacities as high as 100,000 lb. and 110,000 lb., these cars were practically all ordered by the New York Central Lines, and the tendency toward the adoption of the friction gear is much more general than the figures indicate. Practically the entire number of passenger carrying cars ordered are of all-steel construction. Of a total of about 3,000 cars for all classes of passenger train service approximately 90 per cent are all-steel. The others are of steel or composite underframe construction and are nearly all for express refrigerator or milk service. As compared with over 200 cars of wood construction reported a year ago it is interesting to note that, out of a considerably larger total, practically no orders for passenger cars of wood construction have been reported this year.

A NEW LOW RECORD IN RAILWAY EXPANSION AND ITS MEANING

THE statistics regarding developments in the railway field in the year 1915 which have been compiled by the *Railway Age Gazette*, and are published in this issue, disclose a most remarkable and significant fact. This is, that the new mileage of railways built in this country this year is less than in any other year for over 50 years, or since 1864. Furthermore, there have been only three years since 1848 when the increase in mileage was so small.

Neither the statistics which have been compiled by the *Railway Age Gazette* since 1893, nor those which have been compiled by the Interstate Commerce Commission since 1887 extend far enough back to afford a precedent for the conditions which have prevailed in 1915. The statistics of Poor's Manual of Railroads, which go back to 1833, cover for calendar years, not the new mileage built, but the increase in operated mileage. The two things are not the same; for a railway line built in one year may not be put into operation until the next. However, bearing this fact in mind, Poor's statistics may be used for comparison. They show that the only years since 1848 when the increase in operated mileage was less than 1,000 miles were 1861, 1862 and 1864; and the new mileage built in 1915 was less than this amount. In other words, the only period within the last 66 years which is comparable with 1915 in respect to new mileage built, is that during which the nation was devoting its energy and resources, not to its economic and industrial development, but to the prosecution of the greatest war in history until the present one in Europe.

The showing made by these figures is rendered more impressive if they be considered in connection with the fact that in October, 1915, there was the greatest mileage of railways in the hands of receivers in the United States ever recorded. This is not the case at the end of the year, only because since then the receivership of one large road, the Wabash, has been terminated. The number of cars and locomotives bought in 1915 was greater than in 1914; but it was smaller than in any other years except 1908 and 1914 since we began compiling statistics on this subject.

The question at once arises as to why the development of the railways sank to such a low ebb in 1915. Why did railway construction become less than in any year of the profound depression following the panic of 1873? Why was it more nearly halted than in any of the years of business prostration following the panic of 1893? Why did it require the ravages of civil war to create a condition comparable to that existing in 1915? The extreme situation which has existed is not attributable to general business depression, for the general depression has not been as profound as it was in the 70's or the 90's. It is not attributable to the war in Europe, for the decline in railway building began long before the war.

It is evident that the condition in the railway field in the

year now closing has been largely due to causes which did not operate in the past, or which have operated recently with unprecedented force. Furthermore, what those causes are must be clear to every person who has studied railway affairs and the railway situation with a real desire to understand them. The outgo of the roads has been increased enormously by advances in wages and taxes, and by regulation by the state and national governments; and their total earnings have been restricted by regulation of their rates by the state and national governments. Ground between these upper and nether millstones the income available for interest and dividends has tended downward for over nine years. It has not become relatively as small as in some earlier periods; but in those periods the roads were not subjected, as they are now, to regulation, one of the main avowed purposes of which is to restrict their net return. In consequence, in those earlier periods capitalists and railway managers were encouraged to continue to make investments in permanent improvements and in new lines by the hope and expectation that after the depressions had passed they would be able to make large profits which would more than offset the losses incurred in bad times. The present system of regulation has effectually discouraged such hopes and expectations. This, unquestionably, is the correct explanation of the condition in the railway field disclosed by our statistics for 1915.

There are many gentlemen of the railway-baiting type, such as Senator La Follette, Senator Cummins and Clifford Thorne, who in reply to such statements as the foregoing pile up long rows of figures to show that under regulation the railways have been, and are, eminently prosperous, and that therefore regulation is not responsible for the interruption of railway development, and consequently should not be made less drastic. It is usually easy to demolish their statistics and the conclusions they draw from them, but the situation which actually exists is the best answer to them. It demonstrates beyond question that capitalists are not disposed to invest in railways. They must, therefore, believe that such investment would be unprofitable. Those who have shown that they know how to make money by making it must be better judges of the relative profitableness of investment in the various fields than even the most eminent statesmen of the class mentioned. Anyway, their opinion, and not that of the railway-busting politicians, is controlling it, for they have the capital and will invest it where they please; and the facts show that at present they do not please to invest it in railways.

It may be said that the reason why the construction of new mileage has been so greatly reduced is that the country now has all the railways it needs. Possibly it does not need many more trunk lines, but it certainly is not true that it does not need a much larger mileage. There are vast areas susceptible of being rendered highly populous and productive scattered throughout the country, but mainly in the south, the southwest and the southeast, which can never be adequately developed without the construction of a large additional mileage of railways. In New Jersey, Massachusetts, Pennsylvania, Ohio, Illinois, Indiana and Connecticut, and in the District of Columbia, the mileage of railway line per 100 square miles exceeds 20 miles, and rises to 31 miles in New Jersey and to over 60 miles in the District of Columbia. But the average number of miles of railway per 100 square miles of territory in the entire United States is only 8½ miles. In Wyoming, Utah, New Mexico, Nevada and Arizona it is less than 3 miles; in Idaho, Montana and Oregon, only a little more than 3 miles; in Texas only 6 miles; and in California, Colorado and South Dakota less than 6. In Nebraska it is only 8 miles and in Washington and North Dakota it is less than 8. In Tennessee, Oklahoma, Kentucky and Florida it is less than 10 miles. In 20 states the mileage of railway per 100 square miles of area is less than 10 miles, and in 6 others it is less than 12 miles. Are the people of these states prepared to say that they do not want any more branch lines built? Do the people of Texas, with only 6 miles of railway per 100 square miles, want no more lines? In all the great territory west of the western boundary of Minnesota, Iowa,

Missouri, Arkansas and Louisiana, there are only four states whose mileage of railway per 100 square miles equals the average for the entire United States, $8\frac{1}{2}$ miles, and there are only two west of the Mississippi river which have more than 11 miles per 100 square miles. And yet it is in this relatively undeveloped section that regulation has waxed most furious.

The condition in the railway field is not good for capital, because capital is not getting a fair return. It is not good for labor, because, while labor is getting high wages, the interruption of railway expansion is preventing a normal increase in the number of men employed in transportation services. It is not good for the public, because it is interfering with the development of the country in every way.

Is the present condition as respects railway development going to continue? While the statistics for 1915 do not show it, the situation undoubtedly is changing for the better. We do not refer to the large increases in gross and net earnings which occurred during the last six months of the year. Large, important, and helpful as these were, they would have little significance if there were reason to believe that the same influences which have been affecting the railways were going to continue to affect them with the same force as in the past. Increases in expenses and taxes unaccompanied by advance in rates have converted large increases in gross earnings to decreases in net earnings in the past, and could and would do so in future. The true and sufficient reason for optimism is that the press, the public and influential public men, including members of the Interstate Commerce Commission and the President of the United States, are beginning to realize the condition existing in the railway field, and to adopt means for dealing with it. The press is discussing it with a fairness and intelligence never shown before. The Interstate Commerce Commission, while refusing many advances in rates which the railroads have sought, has granted many which, combined, will amount to a good many millions of dollars a year. It is also advocating its own reorganization along lines which it believes would increase its efficiency, and is apparently disposed to curb some of the pernicious activities of the state regulating authorities. The attitude of some of the state regulating bodies themselves is improving. Finally, and perhaps most important of all, President Wilson has recommended the creation of a commission to investigate the entire subject of the regulation of railways and to recommend such changes in the present system and policy as the welfare of the nation demands. That a commission composed of able economists, business men and statesmen would find reason for recommending great and important changes in the present system and policy there can be no serious question.

The country has been experimenting with effective regulation for almost 10 years. Experience has shown that effectiveness is not the only thing or the most important thing needed. The main things needed are consistency, expertness, fairness, public spirit, and wisdom both in drafting and in administering the regulatory laws. The whole system and policy of regulation ought to be overhauled and made more simple and constructive. The inconsistencies and conflicts between state and federal regulation should be abolished. The principle should be adopted of not only restricting the freedom of action of the management of railways in respects in which restriction will promote the welfare of the public, but of also helping them in those respects in which helping them will be of public benefit. If the labor brotherhoods, as well as the railway managements, need curbing, then both, and not merely one, should be curbed. If railway profits are to be regulated, they should be regulated, not merely to prevent them from becoming too large, but also to prevent them from becoming too small.

There are many indications that the press, the business interests and leading public men are being brought by the compulsion of the irrefutable logic of events to a recognition of the soundness of these principles, and that they will join and join soon in a movement to give them effect in our policy of railway regulation.

LOCOMOTIVE PROGRESS IN 1915

THERE were ordered during the calendar year 1915, 1,573 locomotives, an increase of 308 over the figures for 1914. Of these, practically 50 per cent were ordered since October 1 and the outlook for a continuation of this rate of ordering in 1916 is promising. Of those ordered the greater number were Mikados, there being 562 of this type, a considerable increase over 1914. The number of Mallets ordered has also increased, there being 59 in 1914 as against 120 ordered in 1915. The 75 locomotives of the Santa Fe type ordered constitute an increase of 12 over those for 1914, and it is worthy of note that this type has come into popularity during the past two years, none having been ordered in 1911, 1912 and 1913. There was a slight falling off in the number of Mountain type locomotives, but the number ordered in any year indicates that this type is still favored for special service only. There were 10 more electric locomotives ordered in 1915 than in 1914.

Of the total locomotives ordered, 1,174 are equipped with superheaters and 919 with brick arches. The percentage in both these cases show no falling off but rather a tendency toward an increase. There has been no tendency toward the revival of compounding, practically the only type in which it is employed being the Mallet.

Last year we called attention to the probability of large numbers of existing locomotives being equipped with economy and capacity increasing devices. It is interesting to note that during the past year there were practically two locomotives modernized in this way for every new locomotive built. Attention was also called at that time to the experimental use on one locomotive of pulverized fuel. The experimental work in this connection proved successful and the work of development along these lines has continued throughout the year, there now being three locomotives so equipped. The results from those now in service give indications of the more extended use of this fuel in the immediate future.

The continued increase in locomotive capacity is well shown by the marked increase in the number of stoker-fired locomotives. There are now about 1,300 locomotives in the United States on which the mechanical stoker is in daily use and the greater portion of these are of such a maximum capacity as to be beyond the limits of hand firing. The records of stoker-fired locomotives show marked increases in the tonnage rating as compared with the same or similar locomotives hand-fired. Of superheating it may be said that while there have been no radical changes during the past year there has been, and in all probability will continue to be, a tendency toward the use of a greater number of units, giving an increase in the amount of superheat obtained. The only radical move made in connection with the fire-brick arch is the extension of its use, supported on arch-tubes, to oil-burning locomotives. It now has a fair start in this field and promises excellent results.

A year ago the use of special steels and refined designing in order to obtain the lightest possible reciprocating and running parts was confined to but a few roads. There has been a great deal more attention given to this during the past year, resulting in a considerable number of locomotives having been built with what might be considered a minimum weight in the parts comprising the driving gear and a corresponding increase in the dimensions of the boiler to provide additional steaming capacity.

There has been, as previously noted, a considerable increase in the popularity of the ten-coupled locomotive and there are now in service several locomotives of this type having all the driving wheels flanged and working successfully on curves of 20 degrees because of the application of a floating front axle and ball joints in the side rods. Locomotives with this construction now in service on the New York, Ontario & Western have 28-in. by 32-in. cylinders, 57-in. driving wheels and a maximum tractive effort of 71,200 lb., the driving wheel base being 20 ft., while similar locomotives for the Erie Railroad have 31-in. by 32-in. cylinders, 63-in. driving wheels and develop 83,000 lb. tractive effort on a driving wheel base of 22 ft. 6 in. It has been pre-

dicted that the use of this principle on a twelve-coupled locomotive with floating driving axles front and back can readily provide a tractive effort of 100,000 lb. with the use of a single pair of cylinders, the limit of wheel loads now used on a number of locomotives not being exceeded.

The largest and most powerful locomotives of the Pacific type built during 1915 of which we have record are those of the Delaware, Lackawanna & Western, which develop a tractive effort of 47,500 lb., and have a total weight of 305,500 lb., cylinders 27 in. by 28 in., and driving wheels 73 in. in diameter. They were built by the American Locomotive Company. Locomotives of this type built by the Baldwin Locomotive Works for the Richmond, Fredericksburg & Potomac develop practically the same tractive effort, but have driving wheels 68 in. in diameter. The cylinders of these locomotives are 26 in. by 28 in. and the total weight 293,000 lb. The most powerful locomotive of the Mallet type ordered during the year of which we have record develops 91,400 lb. maximum tractive effort, but more powerful Mallets have been built in previous years. A Mikado type locomotive built for the Montour Railroad develops 64,500 lb. tractive effort. The most powerful locomotive of the 2-10-2 type is that the Erie Railroad, referred to above.

The Erie Railroad has under construction at the Baldwin Locomotive Works two Triplex locomotives similar to the one which was built in 1914. In general the construction is the same as that of the original locomotive, although, as might be expected, certain changes were made in details based on the performance of the experimental locomotive. Everything considered, while the building of large locomotives continues, there is not the tendency that there was a few years ago to build large engines without due consideration being given to economical features as well as maximum capacity. On the contrary the immediate future will probably see continued progress along these lines.

RECEIVERSHIPS AND FORECLOSURE SALES

At one time during the past year there was approximately 42,000 miles of railroad being operated by receivers. Since that time the Wabash, operating 2,514 miles, has been sold and taken over by a new company. There have been various other adjustments and changes, so that the mileage being operated by receivers on December 31 was 38,661. The total face value of securities of the old companies of the roads in receivers' hands was \$2,354,900,301. The accompanying table shows also the amount of receivers' certificates and the aggregate of interest in default wherever this information could be obtained. On December 27 an application was made in Texas for the appointment of a receiver for the Texas & Pacific. The hearing on this application

*The amount of outstanding securities of this road is not ascertainable.
†This road was sold under foreclosure and later the operation of it was discontinued.

was set for December 31. The road is, of course, not included in our table. As will be seen from the accompanying table, there were 12 roads for which receivers were appointed during the calendar year 1915. The total mileage for these 12 roads was 20,143, and the total face value of the securities \$1,070,808,628.

The most important roads that went into bankruptcy in 1915 were the Chicago, Rock Island & Pacific, the Missouri Pacific, the Missouri, Kansas & Texas and the Western Pacific. The Rock Island holding company device has been described at length

in these columns. The whole scheme hung on the ability of the railway company to pay dividends. This it could not do in 1914 and the holding companies were wiped out, but the railway company's credit had been so impaired that it could not make ar-

secured by Kuhn, Loeb & Co., of New York. This strong banking house proposed a reorganization plan under which all classes of security holders would have accepted certain readjustments and the holders of junior bonds and the bonds on what were considered unimportant lines would have accepted a

nominal scaling down of the face value of their securities and accepted a preferred stock in place of a bond. Common stockholders were asked to subscribe sufficient money to rehabilitate the property. It was soon found, however, that it was quite impossible to reconcile the various conflicting interests of security

holders and that the only way to effect a reorganization would be through receivership. The road, therefore, was put into the hands of receivers.

The Missouri, Kansas & Texas was being particularly well operated. Crop failures and flood damage had been very costly

¹On September 15, 1915, this road was sold under foreclosure, but it was under lease to the Arkansas, Louisiana & Gulf Railroad to December 1, 1915. As soon after that date as is practicable the new purchaser is to take over the road. The mileage is not included in the totals, nor are the securities.

²This road, 31 miles long, has been in the hands of receivers for a number of years. Operations have now been discontinued and the mileage and securities are not, therefore, included in the totals.

³No recent figures for the securities of the old company are available. The figures used here are those given in Poor's Manual or other unofficial sources.

⁴This is one of the former subsidiaries of the St. Louis & San Francisco but is now being operated by a separate receiver. Its mileage and operations however, were formerly included in the annual reports of the old St. Louis & San Francisco company.

⁵This road was sold under foreclosure in October, 1915, but the receiver was instructed to continue the operation of the road until the delivery of the deed, the purchaser for the bondholders not having taken delivery up to the latest advices received pending negotiations for the disposition of the property to other parties.

⁶The amount of interest in default is not ascertainable because of the periods of grace for various bonds on which interest was not paid when due, but has not become as yet legally in default.

⁷No interest has ever been paid on the outstanding bonds.

⁸The portion of this road in Florida was sold to the Atlantic Coast Line and that portion in Georgia has now been abandoned and the rails taken up and sold as scrap. No mileage or securities, therefore, are included in the totals.

⁹The \$8,774,000 bonds and the stock and receivers' certificates do not include securities of the railroad company or the Texas company. The railroad company's bonds are shown separately.

¹⁰The securities of these two companies are furnished separately. There is, therefore, presumably some duplication in the amount shown as outstanding.

¹¹This is the amount given as the cost of road.

¹²The Tennessee Central figures include securities and mileage of the Nashville & Knoxville.

¹³Including West Side Belt.

¹⁴Information refused.

in the previous year, but had there been a normal condition in the railway security market the company ought easily to have pulled through its difficulties. It had \$11,000,000 notes falling due shortly before the sinking of the Lusitania. An agreement with the holders of these notes was reached by which all but a very small minority of the notes were extended. After the sinking of the Lusitania, however, bankers were more than ever disinclined to make any new ventures, and further flood damage necessitated considerable immediate expenditures of cash on the Missouri, Kansas & Texas. This situation was made worse by attempts on the part of the holders of the notes that were not extended to compel payment in cash, and it was decided that the best way to preserve the interests of everybody was to place the roads in the hands of a receiver.

The Western Pacific was the extension of the Gould system to the Pacific coast, which had previously ended at the western extremity of the Denver & Rio Grande at Salt Lake City, Utah. The road had no local traffic to speak of and was carried for a while by the Denver & Rio Grande, but receivership had been inevitable for some time.

BRIDGE CONSTRUCTION IN 1915

THE unprecedented stagnation in railroad development during the past year is reflected in the field of bridge building. The tonnage of structural steel bridges erected during the year has been unusually small and except for the sudden and unusual demand late in the year for structural steel as an indirect result of the war orders, the bridge shops would have fared badly. The general reduction in railroad construction and retrenchment in the replacement of existing structures has naturally resulted in a marked reduction in the construction of railroad bridges of moderate size. There has been an unusual number of large bridges under construction during the year, but this is readily explained by the fact that work had been commenced on most of these structures before the present depression became general. The year 1915 saw work in progress on bridges over the Ohio river at Metropolis, Ill., Sciotoville, Ohio, and Pittsburgh, Pa., and over the Mississippi river at St. Paul, Keokuk and Memphis, while the citizens of St. Louis are finally building the \$2,000,000 approach to their free bridge. A new project of importance started during 1915 is a bridge over the Missouri river at Kansas City for the Chicago, Burlington & Quincy.

The crowning achievement of the year was the closing of the Hell Gate arch, but the year was marked also by another important event in the completion of the Lackawanna's Tunkhannock viaduct, a triumph for concrete construction. Satisfactory progress is being made on the Quebec bridge, but the honor of witnessing its completion belongs to another year.

Still other structures deserve notice as marking progress in bridge engineering. The bridge which is being built jointly by the Burlington and the Nashville, Chattanooga & St. Louis at Metropolis, Ill., provides for a pin-connected, simple truss span of 725 ft., the longest of its kind in the world. The new bridge of the Pennsylvania Lines at Pittsburgh contains a riveted truss simple span of 525 ft., also the longest of its type in the world. At Sciotoville the piers for the Chesapeake & Ohio Northern bridge are now ready for the erection of the longest riveted trusses in America. In railroad plate girder construction, records have been set by the Nickel Plate on track elevation work in Chicago, where girders have been used for a 130-ft. 6½-in. simple span, and again by the Canadian Pacific at Montreal for a double track draw span involving deck girders 239 ft. long and 13½ ft. deep.

One trend of bridge construction is noted in the increased use of special steels, no less than five of the structures mentioned above involving the use of high strength steel in some parts. However, the tonnage of this material represents so small a proportion of the total tonnage of bridge shops that its fabrication is still considered of a highly special nature. Further developments have been noted in the design of movable bridges,

particularly of the vertical lift type. Similarly in erection there has been a continued display of ingenuity and skill on the part of those responsible. In this field of engineering no single incident deserves more notice than the work on the Hell Gate arch.

CONSTRUCTION ACTIVITIES IN 1915

NO statistics show in a more striking manner the depression through which the railways have been passing during the past year than those of the mileage of new lines completed. Following four years of steadily declining activity in this field and particularly last year, when the amount of new line placed in service was only half of that built in the previous year, a further reduction of 35 per cent this year is most unusual and significant. Records compiled in these columns for the past 23 years show no equal for this condition. It is necessary to go back to 1864 during the midst of the Civil War to find a year in which less miles of new railway were built than in 1915, or a year in which less than 1,000 miles of line was placed in service. Instead of a normal increase in the mileage of about 1½ per cent, the increase this year was only about 0.35 per cent, or less than that for any year since railway development really began in this country. It must also be remembered that some of the mileage placed in service this year and reported in the statistics for 1915 was placed under construction three or four years ago. This was the case of the Lackawanna cut-off north of Scranton, Pa., which was started in 1912. Even less mileage was placed under construction during 1915 than these figures indicate.

The distribution of this mileage through the country is also interesting. A total of 172 miles was built in the area east of the Mississippi and north of the Ohio rivers. Eliminating the 98 miles built in Pennsylvania and the 29 miles built in Wisconsin, only 45 miles was built in the remaining 14 states. The south shows continued although decreased activity, 253 miles being built in 11 states. Likewise, in the west, a total of 473 miles was built. While there is the greatest demand for increased railway facilities in the south and west, it is interesting to note that the state in which the largest mileage of new line was built during 1915 was Pennsylvania. While few if any long lines will be built in the more highly developed eastern states which are now well served with railway facilities, increased development will require the construction of additional mileage of short lines continuously for many years.

In studying statistics of railway construction and particularly such unusual data as are compiled this year, it is interesting to observe the extent to which construction activity was curtailed in those southwestern states which have been most active in anti-railroad legislation, including particularly Iowa, Missouri, Kansas, Arkansas, Oklahoma and Texas. In one of these states, Iowa, no mileage was built during 1915, while only 0.16 miles was built in Missouri. In Texas, the state which has led in attacks on the railways and which probably needs additional railway facilities more than any other state in the Union, only 4.40 miles was built in 1915, as compared with 50 miles in 1914 and 356 miles in 1913. Only 35 miles of line was built in Oklahoma, while 59 miles was built in Kansas, this latter mileage consisting principally of three short independent lines.

The mileage of second and other multiple main tracks built last year is also correspondingly small, reflecting not only the unsatisfactory conditions under which the railways have been operating, but particularly the decreased demands upon the railways for additional facilities. Following the congestion of business in 1906 and 1907, the railways spent large sums for enlarged terminals and multiple main tracks, with the result that in general, they are to-day in a position to handle economically and promptly considerably more business than was offered to them during 1915.

The situation in Canada is also interesting. As was to be expected, the beginning of the European war brought about an almost complete cessation of construction activities of every kind

in the Dominion. Consequently, although 718 miles of line was completed, nearly all of this was mileage on which work was far advanced and which it was advisable to push to completion. Among the more important projects of this nature was the Pacific Coast extension of the Canadian Northern, which was placed in service a few weeks ago. The Canadian Pacific Western Lines, which reported a total of 574 miles built in 1914, report only 23 miles opened this year. A further condition leading to this decreased mileage is the fact that the mileage of railways built in western Canada has expanded far more rapidly than the settlement of the country and as a result the railways can well afford to decrease their construction activities in this territory until the country develops more fully.

The causes for the unusual conditions in the United States are fully discussed in another column. It requires no argument to demonstrate that any conditions which have led to the almost complete cessation of railway construction activities in a country of the magnitude of the United States are wrong. Recent events indicate that this fact is being realized by the public and railway commissions alike and that the worst has been passed from this standpoint.

It is difficult to predict what 1916 will produce. A deeper realization of the needs of the railways on the part of the state and national commissions and of the public and a more favorable attitude on their part are reflected in recent rate decisions. The recent stimulus to railway traffic resulting from the movement of the heavy crops and war materials has created a more optimistic feeling among railway men and even at this early season plans are being prepared for a relatively large amount of railway improvement work involving large expenditures for next year. With the general revival of business the railways will find it necessary to make large expenditures for increased facilities, and, if conditions permit, many of the roads are planning to prepare for this condition as soon as possible. The year 1916 can be no worse and the indications are that it will be far better than the year just closed.

NEW BOOKS

Proceedings of the International Railway General Foremen's Association: Compiled and published by William Hall, Secretary of the Association, Winona, Minn. Size, 6 in. by 9 in., 265 pages. Bound in paper or leather.

At the eleventh annual convention of the International Railway General Foremen's Association, which was held at the Hotel Sherman, Chicago, Ill., July 13-16, 1915, a number of subjects were discussed which are of vital interest to those having to do with the maintenance of locomotives. An extensive report was made on piston valves, which covered not only the construction and operating features of the various types of valves, but also dealt with the maintenance of valves, valve packing, rings and bushings. A comprehensive report on valve gears was also presented. This contains considerable information relative to valve setting and maintenance of all types of all gears now in use on locomotives. Other subjects discussed are rods, tires, wheels, etc., shop efficiency, and oxy-acetylene welding. The report on the latter subject contains considerable information relative to generators and equipment installations, as well as the use of torches in locomotive repair work. The book is illustrated with a large number of line drawings and photographs.

Proceedings of the Twenty-third Annual Convention of the International Railway Master Blacksmiths' Association: Size, 6 in. by 8½ in., 226 pages. Bound in cloth. Published by the Association, A. L. Woodworth, Secretary, Lima, Ohio.

This volume contains a complete account of the proceedings of the last annual convention of the International Railway Master Blacksmiths' Association, which was held at the Hotel Walton, Philadelphia, Pa., August 17-19, 1915. Among the subjects discussed were flue welding, frog switch and crossing work, carbon and high-speed steel for tools, tools and formers, reclaiming scrap, and shop kinks. The volume contains a fund of information on these subjects which will be found of value to many blacksmith foremen.

Letters to the Editor

"SAFETY FIRST" IN EXCESS

REOSTACK, Ark.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

"Safety First," like every other great movement, loses its effectiveness in direct proportion to the extent that it is overdone.

I have in mind a railroad which I once served, where, when it rained, which was quite often, it was necessary for the train dispatcher to issue an order to all trains on the division that a severe storm was in progress between certain points and that within storm limits they should run carefully, with extreme caution; take no chances, sacrifice speed to safety, not endeavor to make schedule time where conditions were unfavorable, approach all stations at reduced speed and keep a sharp lookout for soft track, washouts and slides where they were liable to occur.

In winter an order fully as long, but somewhat differently worded, was at once issued on the appearance of more than half a dozen snowflakes in the atmosphere. This form contained, along with other valuable information, the news that a snowstorm was imminent, and unusual care should be displayed in attending to switches, etc. Being near the seacoast, where fogs were frequent, we were also provided with a stereotyped "fog" order, which it was necessary to put out upon the slightest indication of a superabundance of vapor hovering over the landscape.

Wary of all this agony, the dispatchers viewed approaching summer with relief, hoping that the weather bulletins would disappear with the inclement weather. But it was not to be. The first day that the sunshine was in evidence enough to bring out B. V. D.'s the assistant superintendent ordained that an order be issued to all enginemen to run carefully and look out for sun kinks!

Unless it is arbitrarily assumed that all trainmen and enginemen are deaf, dumb, blind and foolish and cannot recognize bad weather unless they have a meet order with the same, there should be no necessity for such methods. The mere fact that a man is considered worthy to command a train or drive a locomotive should guarantee his judgment in such matters. If certain men are naturally reckless and prone to flirt with danger they will do it regardless of a bushel of such orders; and yet we go on issuing them to the prudent and imprudent alike. The cases of careless men should be handled individually, and if they cannot be educated to a proper appreciation of their responsibilities they should not be retained in the service.

It should not be necessary for a train dispatcher to sit with one eye and one ear trained on the weather, and at the first appearance of a disturbance among the elements put out a long-winded train order directing train and enginemen to do exactly what they are taught and expected to do in their routine duties without any special instructions in individual cases. It burdens the dispatcher with unnecessary work and burdens the men on the line with useless train orders and diverts their minds from the proper interpretation and execution of more important orders. There are very few of them that do not regard these "rain," "fog" and other such orders as jokes.

The practice of issuing such orders seems to be becoming prevalent on many railroads, although the practice is a direct violation of the standard rule that train orders shall not contain information nor instructions not essential to the movement of trains.

Too much cooking spoils many a cake and in "Safety First" as well as in everything else a little judgment should be used. Zeal should be tempered with a little consideration of the exigencies of the case.

PRESENT RELATIONS OF RAILWAYS AND THE PUBLIC

By J. KRUTTSCHNITT

Chairman, Southern Pacific Company

Anyone who studies the present relations of the public and the railroads must conclude, however regretfully, that the public still lacks confidence in the honest intentions of the carriers, and that a lack of confidence exists on the part of the carriers in the fairness of the public. This absence of complete harmony and co-operation has behind it many years of history, which it would hardly be profitable now to review.

Suffice it to say that at the beginning the conception of a railway as a public servant was little understood by railway stockholders, directors and other officers, and that the exaggeration of the private personal point of view at the expense of the public point of view led to many abuses. This attitude, while now almost entirely abandoned, still is occasionally evidenced, particularly in reckless financial operations that jeopardize operating efficiency and arouse hostile sentiments in the minds of all classes of the public.

Possibly because railroads are so vital to their existence, the people have too freely generalized from conspicuous cases of inefficient and dishonest management, and have manifested their condemnation in severely restrictive statutes that have, while restraining the guilty, at the same time hampered the innocent. The public has not been as fair in discriminating between good and bad railroads as between good and bad banks, for instance, which are also under federal and state control. In the case of banks, which are under close regulation, the public satisfies its sense of justice by jailing the dishonest officers, not by a sweeping statute restricting the natural and reasonable activity of banks in general.

The mass of ill-considered, conflicting and oppressive legislation which hampers in so many instances that activity on the part of railway management that is essential to good service—which interferes with minute details of railway management under the guise of regulation, and at the same time evades all responsibility for results—has aroused distrust and suspicion in the minds of railway owners.

In such an infected atmosphere, nothing of enduring value in the way of regulation can be achieved. Harmony and co-operation between regulators and regulated must be established. It should be plain to the thinking public that its interest in good service—which is the fundamental consideration—demands an attitude of compromise at least, but, better yet, of cordial co-operation in achieving the result desired.

It is a simple thing to restore harmony and confidence, if both parties display a willing spirit. The railways appreciate the paramount necessity of public backing. Their shareholders and their officers and employees, themselves constituting a large

part of the public, are eager and ready to meet their fellows more than half way. If, therefore, investors in railroad securities, shareholders, directors, officers and employees labor with the public, in season and out of season, in a spirit of trust and co-operation, they cannot fail to inspire a reciprocal spirit, and out of the new *relations* will be achieved that degree of progress in railway service that the public is rightfully demanding.

J. KRUTTSCHNITT
Chairman, Southern Pacific Company

RAILWAY SECURITIES REGULATION

By FRANK TRUMBULL

Chairman, Chesapeake & Ohio

I think there is no objection, and on many accounts it is desirable, that the issuance of railway securities in the future be supervised by the federal government, if the onerous and conflicting regulation as well as supervision by the various states of bond and stock issues can be done away with. This question is largely a banking function and is too delicate to admit of delays, either at Washington or at the state capitals. In saying this, I refer particularly to the question of prices investors may be willing to pay and which, as we all know, are subject to fluctuations, some of which are violent in character. Any company

might fall into bankruptcy by not acting promptly at a favorable moment, and even when that is obviated delays frequently add to the cost of financing, a burden which ought to be saved to the public. This has been demonstrated many times. On the other hand, it would be entirely proper for the federal government to determine in behalf of all the states the purposes for which new capital issues may be made, and to require a strict accounting of the disposition of the proceeds realized by carriers engaged in interstate commerce, which, as we all know, embrace all the roads of the country.

Concerning the President's recommendation about railways matters in his address* to Congress on the 7th of December: I feel quite sure that the railroads do not object, but will welcome, a comprehensive inquiry by Congress into the methods of railway administration and regulation. If it is accompanied by a broad and tolerant spirit and an honest desire to get all the facts, I believe it will prove very helpful to all interests.

I am confident that there is a very much improved public attitude toward the railroads, and that, of course, provides a very helpful foundation for a fine piece of constructive work for the railroads by the federal government, similar to that already

accomplished for the banks.

FRANK TRUMBULL
Chairman, Chesapeake & Ohio

* The president said in part:

"In the meantime may I make this suggestion? The transportation problem is an exceedingly serious one in this country. There has from time to time of late been reason to fear that our railroads would not much longer be able to cope with it successfully, as at present equipped and coordinated. I suggest that it would be wise to provide for a commission of inquiry to ascertain by a thorough canvass of the whole question whether our laws as at present framed and administered are as serviceable as they might be in the solution of this problem."

PUBLIC CONTROL OF RAILWAY CAPITALIZATION

By JUDSON C. CLEMENTS

Member Interstate Commerce Commission

Before stating reasons which in my view call for some degree of public control over the issuance of stocks and obligations by railway companies, I desire to be clearly understood as not in favor of unnecessary legislation of any kind; for that which is not well considered, directed to the protection of rights by the prevention, suppression, or reparation of wrongs or the furtherance of the general welfare, and effected by means consistent with justice to all, is sure to produce harmful results in some direction. This is especially true in respect of legislation for the regulation of business methods of persons, whether natural or corporate. It is, therefore, only because I am convinced of grave wrongs, effected through improper capitalization, that could in large measure be prevented by reasonable limitations or restraints upon such issues, particularly as to bonds and other fixed obligations which when due demand their "pound of flesh," that I believe the time has fully arrived for the exercise of suitable public authority in prevention of abuses of this kind.

But the question is asked: How is the issuance of stocks, bonds, or notes by a corporation a matter of lawful concern to any member of the general public other than the corporation and the investors in its securities? An all-sufficient answer, it seems to me, is plainly apparent in the rate contests before the commissions and the courts, where questions of confiscation are raised in connection with the reasonableness of existing or proposed increased rates. In approaching these questions it is the almost universal method of the carriers in recent years, in cases involving rates on traffic of large volume, to show the gross earnings, the operating cost, the extent to which earnings have been diminished by fixed charges, including taxes and interest on obligations, and finally the balance available for dividends or a margin of surplus. Then when there results from this process no such balance as will afford a fair return upon the property of the shareholders, the need of increased revenue through increased rates is urged.

It would, therefore, seem obvious that if there is to be no recognized relationship or connection between the capitalization of the companies and their rates, it must follow that their financial condition and the need of revenue with which to meet obligations imposed by such capitalization is immaterial and irrelevant to the question of the reasonableness of their rates, existing or proposed.

Whatever may be said of the relative insignificance of stock issues, especially in former times when the considerations pertinent to the determination of questions of reasonableness and confiscation in rate-making did not arise as they do now in the more advanced stages of public regulation and judicial interpretation, their importance cannot longer be questioned. This, I repeat, is especially true as to such specific obligations as bonds and notes.

While not conceding that the demonstrated need of increased revenue is of itself conclusive justification for increased rates, it is impressive to take note, from the viewpoint of the carriers, of the inseparable links in the short chain connecting capital obligations with the outgo of capital funds to meet them for whatever purpose, proper or improper, they have been issued, and the net financial results which are constantly pressed as pertinent and forceful in the determination of the reasonableness of the rates to be borne by the public.

Although for many obvious reasons the financial condition of a carrier or its need of additional revenue cannot be the exclusive or controlling test of the reasonableness of its rates,

there seems to be no doubt of the relevancy of these considerations, along with others proper and pertinent, in arriving at just conclusions upon this subject. Otherwise, in its search for the reasonable maximum rates to be prescribed, how is the commission to avoid fixing them on a scale that might be confiscatory? How can the question of confiscation in rate-making be dealt with if we are to leave wholly out of view the financial results of operation as related to investment, or value and capital obligations? If, therefore, included in the capitalization of a company there be obligations, calling for interest from time to time, or dividends, as well as final payment of the principal, the issuance of which was not justifiable or representative of actual investment for the legitimate purposes of the carrier, then the financial results which we are called upon to consider in rate-making rest upon a basis that is unsound because it has been affected by an outgo of corporate funds used to meet the demands of securities which, but for the rights of innocent purchasers, in justice have little if any better standing than spurious issues.

Many millions of dollars in securities of the railways go into the vaults of the insurance companies, savings banks, trust companies and other fiduciary institutions, and in a propaganda on behalf of the carriers for increased revenue through increased rates or fares in order to strengthen their credit, it is but to be expected in the natural assertion of self-interest that these institutions line up in favor of the increases.

A restatement here of the facts disclosed in the investigations of the Chicago & Alton; the purchase of the stock of the Louisville & Nashville by the Atlantic Coast Line, in connection with which securities of the latter company, in bonds and preferred stock, were issued to the extent of fifty millions of dollars; the New York, New Haven & Hartford; the St. Louis & San Francisco; and the Chicago, Rock Island & Pacific, which show beyond question that directly, as well as through holding companies and otherwise, unjustifiable action of the sort to which I have referred has been taken on large scale, would outlaw this paper by reason of its length.

Briefly, some of the important facts disclosed by the investigation of the Chicago & Alton a few years ago are as follows: The books of this company, on December 31, 1898, showed that the value of the property was \$39,935,887, and that the stock and funded debt and other liabilities amounted to \$33,951,407. About this time the Harriman syndicate purchased the Chicago & Alton at \$200 for the preferred stock and \$175 for the common, or at a total cost of \$39,042,200. Thence on until June 30, 1906, the capital indebtedness of the Chicago & Alton expanded from \$33,951,407 to \$114,610,937, an increase of about \$80,000,000. Of this only \$18,000,000 was actually expended in improvements, etc., leaving \$62,660,000 increase of stock and liabilities without one dollar of consideration. This was done by placing a \$40,000,000 three per cent mortgage on the property to take up \$8,500,000 of first mortgage bonds and to make improvements, additions and for "other corporate purposes." These bonds were sold to stockholders at about 60 cents on the dollar, the syndicate obtaining nearly all, owning at that time 218,138 shares of stock out of 222,306 outstanding. But only \$32,000,000 of the \$40,000,000 issue was sold, the syndicate disposing of what it had obtained at a profit of about \$8,000,000. Of the remaining \$8,000,000 issue \$7,000,000 was pledged as security for a \$5,000,000 loan and the remaining million was retained in the treasury. Out of about 60 cents on the dollar realized by the railroad the principal stockholders voted themselves a dividend of 30 per cent, amounting to \$6,669,180, which was never reported to the Interstate Commerce Commission. What the stockholders obtained for all of them was not shown, but it did appear that

JUDSON C. CLEMENTS
Member Interstate Commerce Commission

ten millions of them went into one of the great New York life insurance companies at about 96 cents on the dollar.

How many more such object lessons are necessary to demonstrate that the time has arrived to prevent for the future these indefensible practices, detrimental alike to the general public and hurtful to the good name and credit of American railways, both at home and abroad; to *bona fide* investors; and to the stockholders of the carriers other than those who invent, execute and profit by the schemes whereby these wrongs are consummated?

In answer to questions propounded to Mr. Cravath, attorney for Kuhn, Loeb & Co., the New York banking house that figured in the Chicago & Alton matter, he said:

I think any fair-minded man must recognize that under existing conditions there is a call for a closer regulation of the issue of securities by semi-public corporations than has heretofore been the case. And yet we must not forget conditions that existed when these securities were issued.

I quite agree that there is ample basis for the view that the time will come when attention should be paid to seeing that the par value of securities outstanding bears a definite relation to the value of the property against which they are issued. I think there is no doubt about that.

But I quite agree that where securities do not bear some definite relation to the intrinsic value of the property, it becomes difficult in many cases to ascertain what the fair earning capacity is, and I shall not differ with you at all in advocating, under existing conditions, some regulation by law as to the amount of securities which should hereafter be issued against property and against earning capacity.

Publicity and exposure "after the fact," as we have seen in the list of disclosures above referred to, occurring since the Chicago & Alton matter, is wholly insufficient to prevent the repetition of these things. There should, I believe, be required such previous notice of proposals to increase capitalization as would insure publicity beforehand; at least, to some public federal authority; and in addition to this there should be vested in some public tribunal authority to veto or prevent a proposed issue, if after investigation and upon the exercise of a sound discretion, directed and controlled by law, such proposed issue is found not justified. Such limited authority might prove sufficient. It is worth trying before resorting to an elaborate system which may prove to be so rigid as to seriously impair the consummation of necessary and limited financial transactions in respect to which there is no apparent or probable cause for suspecting impropriety, after due publicity has been given.

It must be apparent that state authority, for want of that uniformity of action which is most desirable and of territorial breadth of authority, will never be adequate, especially as to large systems of railways traversing many states wherein the regulating bodies are vested with varying degrees of authority.

It seems improbable that the outstanding capitalization of railways can ever be purged of that for which there was either no proper reason for its issuance or a misapplication of the funds thereby derived, because to do so would, even if lawful, work gross injustice to *bona fide* investors who were not parties to their flotation. It must also be clear that wrongs once effected by improper and over-capitalization cannot be righted as to all victims. Prevention is the only adequate means of protection from the evil.

THE RELATION BETWEEN NATIONAL AND STATE RAILWAY REGULATION

By ROBERT R. PRENTIS

President, National Association of Railway Commissioners, and Chairman, Virginia State Corporation Commission

This is my response to your request to me as president of the National Association of Railway Commissioners for a short article on the relation between national and state railway regulation. It must be distinctly understood, however, that I am not speaking in my official capacity, but only expressing some personal views, and that I am alone responsible for what is here said.

The question has been discussed for many years, and with renewed interest since the decision of the Supreme Court of the United States in the case of *Houston East & West Texas Railway Company, etc., v. United States, etc.*, 234 U. S. 342, commonly designated as the Shreveport case. This case decides that the prohibition against unjust discriminations as between persons, places, commodities, or particular descriptions of traffic, which are forbidden by section 3 of the act to regulate commerce, authorizes the Interstate Commerce Commission to require a common carrier to remove the resulting unjust discrimination against interstate commerce arising out of the relation between intrastate and interstate rates where the interstate rates are in themselves reasonable, and this notwithstanding the proviso in section 1 of the act that its provisions shall not apply to intrastate traffic.

In view of that proviso which reads:

That the provisions of this act shall not apply to the transportation of passengers or property, or to the receiving, delivering, storage, or handling of property, wholly within one state and not shipped to or from a foreign country, from or to any state or territory, as aforesaid.

the decision came as a distinct surprise to the state commissions.

There has been much intemperate discussion on both sides of the controversy, and much darkening of counsel "by words without knowledge."

The other recent case which should be considered in this connection is *Simpson v. Sheppard*, 230 U. S. 352, which is the great Minnesota rate case. Mr. Justice Hughes, in the Minnesota case, discusses most elaborately the well-established doctrine that the states have the right to control intrastate rates, and with unanswerable logic and emphasis reaffirms the doctrine, subject only to the admitted qualification that the action of the state must not impose a direct burden upon interstate commerce, and must not be in conflict with the lawful provisions of the act to regulate commerce. In that case the point afterwards decided in the Shreveport case is expressly reserved.

The opinions in these two cases doubtless contain the last authoritative word on the subject, and the law as expounded therein will be accepted by all unless and until the Congress shall enact further legislation. Under existing legislation the question may be regarded as closed, and the law as expounded by Mr. Justice Hughes will be applied to future controversies.

In order to consider the Shreveport case intelligently, however, the limitations plainly expressed must be remembered. For instance, Mr. Justice Hughes, referring to the lower Texas intrastate rates, says:

It is undisputed that the difference was substantial and injuriously affected the commerce of Shreveport.

And in another place:

Here the commission (Interstate Commerce Commission) expressly found that unjust discrimination existed under substantially similar conditions of transportation, and the inquiry is whether the commission had power to correct it.

The whole result of this decision is made to depend upon the undisputed fact, which had been formally ascertained by the Interstate Commerce Commission, that the discrimination created by the application of the Texas rates to commerce moving between points in Texas substantially and injuriously affected and unjustly discriminated against interstate commerce. Having ascertained this fact the court determined that the carrier could be required to remove this discrimination against the interstate rates from Shreveport, Louisiana, to Texas points, which interstate rates had been already determined to be reasonable.

The opinion makes it apparent that the court is merely determining the precise question which it reserved in the Minnesota case for future decision, and that it was not intended in any way to limit the authority of the Minnesota case. This

is indicated in many ways. At one point it is thus expressed:

This is not to say that Congress possesses the authority to regulate the internal commerce of a state, as such, but that it does possess the power to foster and protect interstate commerce, and to take all measures necessary or appropriate to that end, although intrastate transactions of interstate carriers may thereby be controlled.

So that the insistence that the decision in the Shreveport case practically eradicates state lines as to all railway rates is either the thoughtless expression of those who being interested in maintaining the authority of the states unimpaired take counsel only of their fears; or of those representing and advocating the railway interests in whom the "wish is father to the thought."

The decision then is carefully limited to the proposition that, if there is unjust discrimination in favor of the intrastate rates and against interstate rates which have been ascertained to be reasonable, then the Interstate Commerce Commission has the authority under the act to regulate commerce to require the railroads to remove such discrimination.

Whatever criticism may be made of the decision itself all well-balanced and just men desire to avoid unjust discrimination in rates, whether in favor of interstate or intrastate commerce. It is, however, believed that as wise men have either settled, or successfully temporized with, the great controversies arising out of our dual state and federal sovereignty in the same territory, so the true relations between national and state regulation will ultimately be well and wisely settled, and there is little danger that radical action will be attempted, either by state or federal authorities.

There are many things in connection with public regulation which the state authorities can do very much better than the federal authorities, such as the regulation of local rates, and the supervision of local officials, tracks, station buildings, and many of the instrumentalities used by the carriers in commerce. They can do many things far better than a central commission located in Washington, already greatly overworked, or the subordinates of such a commission, can possibly do. At the same time it is true that the federal commission can do many things that the state commissions cannot do, such as the regulation of interstate rates, and matters of a character which directly relate to and promote commerce between the states.

The National Association of Railway Commissioners, composed as it is of the members of the Interstate Commerce Commission and certain of its officials, of the various state commissions and the Canadian commission and certain of their officials as active members, together with representatives from the Association of American Railway Accounting Officers and the American Electric Railway Accounting Association and others, as honorary members, was organized 26 years ago, and is maintained for the express purpose of avoiding and correcting the evils which were anticipated and have been developed by reason of the conflicts which sometimes, but not frequently, arise between federal and state regulations.

In its efforts for the last quarter of a century to bring about such uniformity as is desirable the association has not labored in vain.

Much of the criticism of the federal and state commissions, to which many seem to be so ready to give support, is inspired by those interested in obstructing and defeating all effective public regulation, and those criticisms which are most severe and extreme are generally based upon gross ignorance of the facts. The questions with which all of the commissions have to deal are frequently complicated and difficult and it is still true that sometimes commissioners, railroad men, and even editors "rush in where angels fear to tread," and with a word dispose of the most difficult problems which wise men confess

themselves unable to solve. If those engaged in such thoughtless criticism would credit the public authorities with those things which have been accomplished, which all admit are for the general good, much better progress could be made. For instance, under public regulation rate wars have ceased; the evils of rebates and the abuses of the pass system are practically unknown; publicity in accounting has greatly enlarged the knowledge of railway men themselves as to the condition and progress of their business, and has promoted economy in transportation expenses and otherwise. Within the past three years the whole system of stating express rates has been simplified and improved. There is a disposition everywhere to make state legislation conform with federal legislation, although as to many reforms which are deemed wise by those who have given most attention to the subject the states have more frequently led than the Congress.

If those who are most interested in railway development will devote as much time to co-operating with the federal and state commissions as they do in their efforts to produce public distrust progress toward better things for them and for the public would be more rapid. However desirable it might be in the interest of simplicity and uniformity to have all the powers of regulation lodged in a federal commission, it cannot be demonstrated that such a radical change in our system would be either wise or produce any greater efficiency. It needs all the power of the federal government combined with all the power of all of the states to deal with these questions efficiently.

There are many strong men who are members of the National Association of Railway Commissioners. Many of them have rendered distinguished public service in other high official positions both federal and state. In ability and character they will compare favorably with any other body of picked men in the country, and it is believed that at no time in the history of the association has its membership been more earnest and patriotic or more determined to render valuable and efficient service to the country.

The dual system of regulation is here; it has come to stay, for the states will not surrender their authority. The state commissions desire, however, heartily to co-operate with the federal commission, with each other and with the public service corporations for the accomplishment of the best results. This co-operation between federal and state commissions has already to some extent been accomplished through the National Association of Railway Commissioners. When the railway authorities more cordially sustain and support such of their efforts as are wise many of the evils most complained of will disappear.

Co-operation then is the remedy for any conflicts, inconsistencies and discriminations which exist because of national and state railway regulation.

REQUIREMENTS OF OUR RAILWAYS IN A SYSTEM OF NATIONAL DEFENSE

By CHARLES H. MARKHAM
President, Illinois Central Railroad

The efficiency of a country's railways as a part of a system of national defense will depend, first, upon the completeness with which they connect centers of population and production with outlying points upon the coasts or frontiers; second, upon the centralization, unanimity and efficiency of the operating control for military purposes; third, upon the physical condition of all the facilities of transportation and their capability of withstanding a sudden overload.

Our railway system would require less of extension than of unification to fit it for military purposes. An amplification of

ROBERT R. PRENTIS
President, National Association of Railway
Commissioners

the plan which appears to work successfully in Great Britain seems to promise satisfactory results here. So long ago as in 1871 the British government adopted the plan under which its railway system is now operating. There, as here, the railways are owned by numerous private companies. The resolution of 1871 provided that in case of war all the lines should at once come under the control of the government. The working out of the plan provides that actual operation of each road shall remain in the hands of its own officers and employees. On August 4, 1914, when war became imminent, an order in council put in effect the resolution. A railway executive committee was immediately organized, of which the president of the Board of Trade, a cabinet minister, became ex-officio chairman and the general manager of the London & South Western Railway acting chairman. Other members of the committee are the general managers of ten of the leading railways. Provision was made by act of Parliament for a net return to the railways during the period of government operation equal to the rate earned by them in the period immediately preceding.

Although the burden thrust upon the roads has been far in excess of what was anticipated and the expected duration of the arrangement has been greatly prolonged, its working appears to have been satisfactory to the government and to the managements. As a result of the scheme, Great Britain has in its hands a flexible means of transporting whole armies from one place to another with a celerity never before approached outside of a country whose railways have been constructed primarily for military purposes.

While the system adopted by England is adaptable to American conditions, the nature and magnitude of the problems presented in the two cases are quite different. The railway board of Great Britain directs operations in a territory comparable in extent to New England, New York and New Jersey. The area of this part of the United States is a little greater than that of the United Kingdom, and the railway line mileage involved is somewhat less. The density of population of England is, of course, very much greater than that of this country.

There is an obvious relation between the territorial extent of a country and the importance of the service its railway system may be able to perform as a part of a system of national defense. The United States has a very large area. This means long boundary lines and frontier points far distant from the centers of population and production. Its boundaries consist largely of coast lines far apart. The completeness and efficiency of its means of internal communication are therefore matters of vital importance in the consideration of measures of preparation for possible war. It is conceivable that in a densely-populated country of small extent secondary means of transportation may serve with some approach to adequacy, but where distances are represented in thousands of miles, there are no secondary means of military transportation. If the primary means, the railway system, fails, the cause is lost.

The first step toward constituting our railways a satisfactory part of a system of preparedness should be a conference between representatives of the government and of the railways to decide upon the form of central organization which should have active control in case of war and to inquire into the measures that should be adopted to unify and improve the physical facilities. Such other measures as might be found necessary to provide for the efficiency of the operation of the unified system would also naturally follow under the guidance of the central organization.

Military authorities fully recognize the importance of such co-operative consideration. General Leonard Wood, formerly chief of staff and now in command of the United States Army

in the Department of the East, in a recent discussion before the New York Railroad Club, said:

"The vast area of our country, our long coast lines, all make it most important that our use of the railroads should be upon carefully thought out plans. This includes many a little line which runs to some unimportant place commercially, but important nevertheless from a military standpoint. . . .

"Normally, our rail routes are potent agents in our national development and material betterment. This machinery of peace, which contributes so much to the tide of our prosperity, should be readily adaptable to defensive service if the occasion arise. But this would not be possible with us unless some scheme of general co-operation were agreed upon in advance, not only among the roads themselves, but as between the roads so united in purpose and the general government; in short, organization in the fullest sense of the word.

"The railroads and our military experts must be brought together and from their joint labors must spring a plan of reciprocal action, a scheme of interdependence that will evolve unity of working and instant readiness on the part of every railroad in the country."

Brigadier-General Tasker H. Bliss has recently contributed an article to the Journal of the Military Service Institution in which transportation facilities are considered at some length. He says, concluding a reference to the present inadequate condition of the railways from a military viewpoint:

"We often speak of the throwing—that's our favorite word for it—throwing great masses of men on this or that frontier threatened with sudden danger. We can stop the pulsation of the blood for only an instant without destroying the life of the organism; and the railroads are the veins and arteries of national life. They are none of them military; that is, none of them has been constructed with a secondary view to commerce and a primary one to military requirements. . . . The railway systems of the United States are an essential part of our military resources and must be first available in time of war. They become as much a part of the military organization as are the ammunition and supply trains of an army. There is no greater problem before us than the working out of a scheme for the orderly handling by railways of both military and civil business—a scheme for mobilizing the railroads, for making them able to move with the greatest effectiveness in war, without which schemes for the mobilization of armies will be of little avail."

Second in order, though perhaps not in importance, to the establishment of a controlling and operating organization, would be the adoption of measures toward putting the railway system in proper physical condition. These should take into account not only the main lines of communication, but all lines forming connection between the principal centers and isolated localities. Lines now seemingly insignificant might have an important service to perform as connecting links.

General Wood has answered the question, "What are some of the essentials toward putting the railroads of this country in position to meet the requirements of a system of national defense?" by in substance emphasizing the importance of bringing the railroads into a proper condition for efficiency in time of peace.

Under the general head of needed improvement in physical condition falls one item which requires special mention. The experience of European nations, and particularly Great Britain, in the present war, impresses the importance of extensive terminal facilities.

Handling rapidly a large volume of traffic, troops and supplies suddenly concentrated at a single point, is of the very essence

C. H. MARKHAM
President, Illinois Central

of successful military transportation. Present terminal facilities of American railways constitute one of their weaker points. Proof of this is afforded by the present condition at the ports. A heavy movement of freight of all kinds following closely upon a long-continued depression in traffic, has congested some of the principal ports to an alarming extent. It is commonly supposed that most of this congestion is due to the accumulation of munitions of war for export. This is not so. The growth of our export business is, of course, affected by war conditions in Europe. But the greater part of this freight is for the supplying of demands hitherto supplied by countries now at war. Statistics of the Department of Commerce show that for the month of October, 1915, the proportion of the whole export business of this country that could accurately and properly be classed as war material amounted to a little less than 11 per cent.

In time of war somewhat similar conditions might arise at any important terminal, whether on the coast or in the interior. There is also at the present time a heavy strain upon the facilities of railways far in the interior and which are only moderately affected by the increase in volume of export traffic.

These occasional congestions in times of peace are significant as indicating what would be likely to occur in exaggerated form under conditions calling for strenuous measures of defense. The present congestion shows how easily trouble may arise under abnormal conditions caused mainly by a sudden great increase of traffic. It also suggests that certain measures needed to prepare our railways to serve as a part of a system of defense are also required to put them in satisfactory working shape in time of peace.

Several causes have united to contribute toward keeping many of our railways in poor physical condition and unfit for handling increases in traffic due to a general return of industrial activity. They would be still more incapable of making the extraordinary exertions incident to service as an adjunct to a military organization. Heavy increases in wages and taxes have not been accompanied by corresponding increases in rates. In some instances they have been accompanied by decreases. Reduction in net earnings and inability to raise capital for needed improvements have been reflected on many roads in imperfect maintenance. Unpractical and inconsiderate demands on the part of local regulating authorities have added greatly to expenses and impaired facility of operation. An essential to putting the railways in position to serve properly as part of a system of national defense is a less localized and less selfish and short-sighted policy of public control.

A policy of regulation which constantly imposes new burdens and restrictions on them, and limits their profits as narrowly as the federal constitution will permit, is not adapted to preparing them to serve the public well and adequately, either in peace or war.

THE RAILWAY SITUATION IN THE SOUTHWEST

By W. B. SCOTT

President, Sunset-Central Lines

The railway situation in the Southwest, particularly in Texas and Louisiana, in which states our lines operate, while somewhat improved, is yet far from satisfactory. I see but small prospect of any permanent improvement until such time as there develops a better recognition of the difficulties surrounding railway operation and a better understanding and support on the part of the public, who should realize by this time that their best advertisement and their most effective solicitation in the matter of immigration is in the prosperity of their transportation lines. I say here "best advertisement and solicitation" because both Texas and Louisiana are agricultural states with great promise, and an equally great need of high-class, intelligent and enterprising farm owners. These the states could not hope to secure, for success feeds upon success, and if the railway systems of any section are operated by receivers and struggling for existence,

the condition would seem to suggest an equally hazardous and precarious situation as affecting all other lines of commercial endeavor.

Of the 12 more important railway lines or systems operating in Texas, 5 are being operated by representatives of the courts because of their inability to meet their operating expenses and other obligations from their current income. I am satisfied that those which are still operated by their owners have escaped the fate of their neighbors only through rigid economies and through more favorable local conditions, rather than through any special or particular privilege or emoluments. The same conditions which have oppressed the lines now in the hands of receivers have applied with a like force, differing only in degree, to the lines which still retain their own autonomy and direction.

In considering the handicaps which have for the past several years deterred the progress of the Texas transportation lines, I am hardly prepared to suggest that, or those, which represented the greatest obstacle to success. Suggestion may have been presented, for with an example set prominently by our national government in the matter of restrictive and possibly unnecessary legislation, it is not particularly surprising to witness state legislatures going Congress one better, adding to the burdens of the railways and always failing to provide means or opportunity for recouping revenues in order to meet constant additions to their operating expenses.

I do not assert that legislative acts have been the main contributing factors, but rather than they have contributed their quota to a general situation. Neither do I suggest that commission regulation of railroads is altogether unnecessary. Possibly the cause as represented by some lines or group of lines may have made commissions a necessity, for no one with propriety may claim an exception to proper regulation, but "over-regulation" often follows when once the excuse is suggested. It is a sad commentary upon the equity of government, yet nevertheless true, that commissions sometimes fail to recognize that they set as judges of questions involving the rights of both the people and the corporations, and in some instances incline to the role of prosecutor for the people alone. The adjudication of differences demands that both sides of the shield be read. There is some fallacy in any reasoning which forbids an increase in rates when the expenses are greater than the revenues. This principle is exemplified and well illustrated by the action of tax boards, which by various direct and indirect methods replenish their depleted treasuries by an increased assessment of railway properties out of all proportion as compared with the increases assessed against other properties. In 10 years the taxes of Texas lines have increased 267 per cent, and of Louisiana lines, 156 per cent.

I am satisfied that the commissions are trying honestly to work out a basis whereon differences may be amicably adjusted, but the very nature of the business would seem to require the cool, dispassionate judgment of men thoroughly familiar with railroad details, including rates, to pass intelligently upon the mass of technical detail that environs the operation of a rail line. This cannot be absorbed in its entirety, and while not of any extreme difficulty, personal familiarity alone can make these details comprehensive in all of their many phases. Our commissioners, or most of them, are able and sincere, but if they cannot, as I suggested, give to the problems confronting them the benefit of a really expert personal knowledge, I fear they will have just as decided a difficulty in absorbing second hand information from individuals whose knowledge of the facts often is not thorough. Reasons for rates, direction and balance of traffic, physical complexities, grades, distribution of power, equipment and fuel, and a multitude of other important considerations must be apparent and understood before conclusions can be either fair or satisfactory.

There are other factors, however, which nature and topography in this section have made pertinent. Floods and storms of the past three years have created havoc, both in their immediate damage and as a cumulative result. Roadbeds have been

washed and rewashed, softened and kept soft, materially increasing the cost of current operation and requiring large sums for replacement and repairs. Bridges, structures and equipment have felt the burden; not once but many times, while expenses of train operation have coincidentally shown very pronounced advances, overtime and fuel not the least of these, with disordered schedules and an impatient and not always considerate public.

Texas is a state of considerable distances. Much of the transportation is through territory interminable in extent and unproductive as to local business, yet these sections of the line must be operated and maintained despite the lack of revenue from intermediate sources, the through haul being charged with the burden of upkeep. To this, and the situation practically applies to the north and south lines as well as the transcontinental railways, are added the unsatisfactory freight conditions represented by the long and expensive haul of empty equipment, due to the unequal movement of business, which is frequently 65 to 80 per cent one way, necessitating equalization of power, equipment and crews, which adds heavily to expenses with no attendant revenue.

Loss and damage claims in this territory make heavy inroads into the earnings of the carriers. This is partly due to the long hauls on perishable commodities and the opportunity for deterioration enroute. The return empty movement of special equipment, unsuited for other traffic moving in that direction, is also a considerable item of expense. Again, the carriers often suffer heavy loss through the shipment of live stock and market conditions, and also, perhaps, the natural disposition of some shippers and consignees to capitalize the disability or unavoidable delay on the part of the railway.

The viewpoint of the public as to moral obligations in relation to physical conditions must vary in the several states. This is evidenced by the attitude of certain Texas juries in determining personal injury verdicts and damage claims. Legitimate injury and damage claims are, as a rule, not difficult to adjust when negotiations are between the claimant and the railway, but claims of a doubtful character and those where no actual injury or damage exists, ordinarily termed "fake" claims, which are made the subject of a damage suit, are mainly responsible for the heavy tax upon our revenues, such payments having increased from \$165 per mile in 1906 to \$275 per mile in 1914. Perhaps a more striking comparison is in the payment to this account for the year 1900 the amount of \$1,018,637, while for the year 1914 the total payments had increased to \$2,905,327, an increase of 185 per cent, with an increase of only 60 per cent in train mileage. From this showing we would naturally conclude that railroading in Texas was more hazardous than elsewhere, but the contrary is the case, and it is safe to say that a very great portion of the amount mentioned was unwarranted by fact, but the drain continues to increase notwithstanding. Sentiment rather than responsibility is too frequently the governing factor, the law often being disregarded as well as the disposition or willingness of the railways to recognize even an implied liability in the settlement of such obligation as exists.

The situation today, and this is demonstrated by the receiverships recently inaugurated on a number of the smaller purely local lines, proves that no Texas railway can be profitably operated without a large quota of interstate traffic, and even then the results are questionable, as indicated by the receiverships on lines which do an interstate business.

Such of the transcontinental railways as have remained solvent have done so because of the volume of traffic which came to them from their interstate connections and which enabled them

to meet their expenses, when, if they had been dependent upon a purely local or intrastate business, they would more than likely have gone down in defeat.

One of the main sources of revenues of the Texas lines is in the carriage of cotton, yet few realize the great expense and risk attending this business, owing to loading and compress charges, insurance, light tonnage loading, handling into and out of compresses, all without extra charge and all trenching upon the efforts to make both ends meet and realize a margin of profit from their handling of freight—handicaps railways in other sections are not compelled to bear.

Generally speaking, conditions are not altogether normal and we may not be compelled again to take care of a loss of over a million dollars, speaking for our Sunset-Central Lines, caused by storm conditions, nor witness again the utter demoralization of business by war scares and impairment of the value of cotton and other southern commodities. The southern roads do not serve a manufacturing territory and few penetrate the great grain-producing belt; therefore they have participated but little in the prosperity that has come to other lines as one result of the European struggle. There will be an urgent necessity for positive economies with us for a long time to come yet. The \$13,000,000-dollar deficit of the Texas lines for the past three years cannot be made up by a few good months. The heralded wave of prosperity which the northern half of the country is experiencing has only touched us, but we have hopes that the real stringency is about over.

I am inclined to believe that popular and unreasoning prejudices against railroads are getting to be a thing of the past and that the rights of the carriers are being recognized more and more by the people and the government. At least I hope so.

SIGNALING PROGRESS IN 1915

By W. J. Eck

Signal and Electrical Engineer, Southern Railway*

Progress in railway signaling during the year 1915 was marked by a few notable developments rather than by the quantity of work installed. The signal departments have borne their proportion of the general retrenchment required and many economies in operation have been effected. The reduction of forces has resulted in considerable study being given to the subject of combined maintenance. The combining of track and signal forces is still used to some extent where originally installed, but has made practically no progress elsewhere. The consolidation of the signal, electrical and telegraph departments is more promising and has been effected on a number of roads. On account of the similarity of the duties of the three departments, all having to do with electrical affairs, the arrangement is a logical and economical one.

The most marked tendency of the year has been the very extensive use of alternating current for the operation of signals on steam railways. First employed on electrified lines from necessity, its advantages were so apparent that its use has rapidly extended to steam railroad lines, and the coming years will probably see it used with the majority of semaphore signals installed.

"Light" signals consisting of electric lights with various colored lenses have been used for a number of years on electric lines where cheap power was available and where speeds were moderate. Such signals are also in general use in snow sheds and tunnels on steam lines. An entirely new improvement of the light signal, known as the "position light," has been developed which is suitable for both day and night service in the open on high-speed railroads. An extensive installation of these signals was made during the year on the Pennsylvania Railroad

*Mr. Eck is now president of the Railway Signal Association.

W. B. SCOTT
President, Sunset Central Lines

and is now in successful operation. The possibilities for the future use of this signal are very great on account of its having no moving element and its peculiar adaptability to roads using alternating current for signal operation.

Single-track automatic signaling is receiving an increasing amount of attention and the mileage installed during the year greatly exceeds that on double track. It has been only a few years since railway officers believed that automatic signals on single track would hinder instead of facilitate movements. Particularly since the so-called "absolute permissive block" has been developed has this idea given way to a realization of the safety and aid that the system affords. In the A. P. B. system for single-track signaling the trains are given an absolute block from passing siding to passing siding for opposing trains and a permissive block for following trains. This system has been almost exclusively installed during the past year.

There has been a substantial decrease in the miles of track protected by manual block owing to the substitution of automatic block signals in its stead. This was also true in 1914 and can reasonably be expected for a number of years to come unless a law should be passed requiring the immediate installation of block signaling on all lines, in which case the manual system would be the only one that could be installed in a short time.

The use of electro-mechanical interlocking, that is, interlocking where the power for operating switches and derails is manual and for the signals, electric, shows continual growth due to the satisfactory operation of such plants. The use of switch and lock movements and the elimination of separate levers for facing point locks is a development of the year. Such plants reduce the size of machines necessary and with switch indication circuits, concrete foundations and heavier construction now used in signaling, no element of safety has been sacrificed.

On railways where white is used as a proceed signal there is always the possibility of a false proceed indication due to a broken lens or roundel in a stop signal. This possibility, though very rarely causing an accident, is always present and each year sees the gradual adoption of green as the color indication for proceed on some railroads. This year has been no exception, one prominent road in the south having completed the change from white to green in the past few weeks.

The Division of Safety of the Interstate Commerce Commission has secured the services of an experienced and well-known signal engineer during the year. His advice and counsel will, it is believed, do much to prevent hasty and unconsidered legislation affecting railway operation and, particularly, block signaling and automatic train control. The appointment of an experienced man to this position was of peculiar interest to the railways just at this time when Congress has before it a bill to expand the jurisdiction of the Interstate Commerce Commission to cover operating matters.

Valuation of the signal appliances on a number of railways has been started during the year in connection with the federal valuation. This work has required the services of many signalmen both by the government and the railroads. It is only because of the general depression in construction work that the railways have not been required to materially increase the signal engineers' forces to take care of this work on roads where it is now under way. This work is generally handled under the supervision of the signal engineer, his forces making the detailed inventory and obtaining the required records. The Presidents' Conference Committee on Valuation has appointed a subcommittee of signal engineers to prepare data and to handle such signal matters as are assigned to it. The committee has been quite active throughout the year.

An interesting development during 1915 has been the extensive introduction of American signal devices and American signalmen on Australian railways, a field which has heretofore been occupied exclusively by the products of Great Britain, and this, with the American signaling appliances that have been put in service on English railways, where signaling was born, says much for the state of the art in this country.

Except for a few small installations for experimental purposes there has been no installation of automatic stops or cab signals on steam roads. The Brooklyn Rapid Transit, an electric subway line, is installing an automatic stop and cab signal system with speed control features which is of interest on account of the control being continuous, the brakes being applied whenever the speed at any point exceeds a predetermined amount as obtained from a braking chart. A speed control of this character prevents much of the serious decrease in capacity which will result from a simple automatic stopping device.

The Railway Signal Association has continued its work of standardization during the year, so that a majority of the parts used in signaling and interlocking are now standard. The uniformity established by the association has resulted in material savings to the railways and it has had much influence for good in the advancement of the signaling art generally.

The coming year promises to be the most active in the volume of signaling installed ever experienced on American railways.

PROGRESS IN ELECTRIFICATION DURING 1915

BY GEORGE GIBBS*

Consulting Engineer, New York

During a year of great disturbance in all business conditions little has been done in the way of initiating new railway projects, but the period has witnessed the completion of two very important electric traction installations and the partial completion of a third on steam railways. All three represent departures in important details from previous installations and practical results will be watched with interest.

On the Norfolk & Western a freight haulage installation was undertaken to re-

lieve the congestion by an increase in train speed and also to produce operating savings on the main line heavy grade division over the Alleghany mountains; it is conducted under unprecedented conditions as to density of traffic and train weight.

The suburban passenger train electrification of the Pennsylvania at Philadelphia is an application under complicated terminal conditions of an electric system which is designed to be adapted for future extension over long distance main lines and to then handle all classes of service.

The Chicago, Milwaukee & St. Paul electrification in Montana and Idaho applies electric traction to heavy train units, both freight and passenger, on a line having heavy traffic and over the longest distance yet attempted; it is being carried out by an electric system quite different in detail from that employed on the two railways first mentioned.

These installations, added to others already in operation, furnish examples representing practically all conditions and kinds of railway service. Their purposes are various. Electric traction has been employed to make underground terminals in large cities practicable; to facilitate safe operation in long tunnels; to increase the capacity of lines or of passenger terminals; and to increase the operating capacity on heavy grades. In certain of these cases increased economy of operation is an important and perhaps a controlling consideration. The reasons, therefore,

* Mr. Gibbs is chief engineer of electric traction, Long Island Railroad, consulting engineer, Norfolk & Western, in charge of electrification over Elkhorn Summit, and consulting engineer, Pennsylvania Railroad, in charge of electrification work at Philadelphia. Mr. Gibbs is also chairman of the committee on electrical working of the American Railway Association.

W. J. ECK
President, Railway Signal Association

have been either compelling ones from an operating standpoint, or those connected with expected economies.

The success of this form of traction may be viewed from different standpoints, accordingly as the inquirer sets the problem for himself. Technically, it has been amply demonstrated that electricity can propel trains of any weight at any speed, not limited by other considerations, and that the apparatus required will function reliably; in fact, notwithstanding the complicated mechanism involved and the circumstance that an electric system is tied together from the power house to the trains, thus requiring that all links must operate to secure service, operation has been found remarkably reliable, and, in this respect, an advance on steam operation which it superseded.

Increased capacity has been obtained from electric operation, both as the result of its ability to concentrate almost unlimited power at the train, and thus increase speed and hauling capacity under adverse conditions, and because in certain kinds of service, such as suburban passenger, multiple unit motor car operation is substituted for head end locomotive operation, thus reducing shifting and idle movements in congested terminals.

As regards the aspect of economy, this is not yet as clearly defined as might be expected, considering the number and variety of installations already made. Some of these installations are as yet too new to furnish comparison, but a factor of more importance is that in nearly every case new conditions have been introduced with the new form of traction, and thus the same things cannot be compared. Another fact is that the actual cost of an existing steam service is frequently as much in doubt as the probable cost of electric operation which is to replace it. This peculiar condition exists because railway accounts are not thoroughly segregated for the cost of each part of the equipment or for each operating division as a whole, much less for a particular service on part of a division, as is often required.

Generally speaking, the most attractive fields for electric operation from the standpoint of increased direct net money return on the investment are: (1) where traffic is dense over an entire division and where the train loads, or speeds, or both, may be increased by electric operation, thus utilizing motive power more effectively than with steam; (2) for traffic having a high load factor, i. e., a fair degree of uniformity throughout the day, so that trains may be operated with reduced power and labor costs. Long lines with thin traffic and terminal station operations do not generally furnish an attractive field for electric traction from the standpoint of operating savings, although in some cases such installations may prove profitable where the cost of energy can be largely reduced by obtaining it from cheaper sources.

The indirect benefits of electric operation are, however, often controlling in any installation, and among these may be mentioned smoke elimination in tunnels and underground terminals, increased comfort, speed and attractiveness in passenger service, and the increased line capacity referred to above.

It is, therefore, to be expected that electric traction will continue to develop as regards methods of application, and will be used in the many cases where it is well suited to or is required by surrounding conditions. Electric traction apparently cannot supersede steam traction for all, or for even a very large part of the railway mileage of the country, unless some radically new type of apparatus should be developed, a contingency which, unfortunately, does not seem at present to be pending.

A word may be said regarding the technical developments which have occurred or have become realized during the past year. Electric traction has for several years been tending towards extension to long distance or, rather, to entire divisional operation; this is in many cases almost essential for proper railway operation, as intradivisional transfer of power or train is costly and inconvenient. Long distance and heavy train-unit traction has made a change desirable from the expensive method of distribution of low tension direct current power to the trains by third rail conductors, which requires large capacity of feeders and sub-station machinery. The three installations completed this year all illustrate the present tendency to use an overhead

trolley wire of small size, but large power capacity, by reason of the high potential of the current carried. The Norfolk & Western and Pennsylvania installations use an alternating current system throughout and distribute current at very high potential; the St. Paul's installation uses direct current in the trolley wire at a potential which is high compared with that used in a third rail, but low compared with the practice in alternating current systems. Standardization, therefore, of electric systems as a whole cannot be said to be complete, but progress has been made towards the use of overhead conductors as a standard, and, in the case of the alternating current systems, towards uniform characteristics of the current used in the working conductors.

We may, therefore, as regards further developments, properly await experience with the two overhead systems now on trial. The relative first cost of these two systems does not appear, from present information, to differ greatly and the further development of both will doubtless proceed for some time. It may well be that both will find a place in heavy railway work unless one of them is shown to be greatly superior as regards simplicity, reliability and cost of operation. It is especially important, therefore, that each new installation undertaken should be based upon a competent examination, not only of the railway operating features, but of the complex technical developments now taking place, in order to clarify the problem for the future.

ENDING THE FISCAL YEAR ON DECEMBER 31 INSTEAD OF JUNE 30

BY FRANK NAY

Controller, Chicago, Rock Island & Pacific

The Interstate Commerce Commission was created by an act of Congress in 1887. The act required annual reports from railroads to the Interstate Commerce Commission for the years ending on June 30,—that being date for closing the governmental fiscal year. Prior to that time the railroads closed their fiscal years on various dates, according to their own convenience. Later on, when the various states required annual reports from railroads similar to those to the Interstate Commerce Commission, they also adopted June 30 as the close of the report year.

Under these conditions a large majority of the railroads closed their books two times each year and rendered two separate annual reports covering different periods, one covering their own fiscal year to their stockholders and directors, and the other for the year ended June 30 to the Interstate Commerce Commission and to the various state commissions. This caused a duplication of work, and, owing to the fluctuations of traffic and operating conditions in different seasons of the year, the annual reports to the stockholders frequently appeared to be out of harmony with the annual reports to the Interstate Commerce Commission and the various state commissions. Consequently, nearly all the railroads in the United States changed their own fiscal years to agree with those of the Interstate Commerce Commission.

As the years went on, serious objections developed to June 30 as the date for closing the fiscal year, among which were the following :

1.—On the majority of the railways of the United States the programs of maintenance and improvement work conform naturally to the calendar year, and in reporting the details of such work, a year ending December 31 has decided advantages over a year ending June 30. The maintenance and improvement forces are at the maximum and the heavy work is in progress on June 30, while December 31 is the natural close of the year for maintenance and improvements.

2.—Annual reports, the compilation of which is so much work added to the daily routine, can be more easily prepared during the winter than during the summer season, on account of vacations in general offices, and the slowing up, as a rule, of accounting work.

3.—December 31, coming at the close of the season for main-

tenance work, is a better time than June 30 for taking the annual inventory.

4.—Many carriers are required to make extensive reports to state commissions and taxing bodies, covering a calendar year period, for purposes of taxation, thus duplicating much of the work included in the report for the fiscal year ended June 30. The two reports may present more or less apparent variance which would be overcome by having both cover the same period.

5.—The present plan of closing the fiscal year for railroads on June 30 prevents satisfactory comparisons with other great lines of industry, as nearly all the latter close their fiscal years on December 31.

These objections were presented from time to time to Henry C. Adams, in charge of statistics and accounts for the Interstate Commerce Commission, by the accounting officers of various railroads in their conferences with him concerning the uniform system of accounts formulated and promulgated by the Interstate Commerce Commission. He presented the matter to the Interstate Commerce Commission and the National Association of Railway Commissioners, which latter association appointed a committee of which Mr. Adams was chosen chairman, to canvass the situation and report the result. Under date of July 28, 1909, Mr. Adams issued an inquiry to all of the carriers in the United States reporting to the Interstate Commerce Commission, calling on them for an expression of opinion on this subject, by propounding to each one of these carriers the following questions:

- 1.—Would you approve such a change in date?
- 2.—What reasons occur to you as pertinent why such a change should be made?
- 3.—In case you oppose making a change, what reasons occur to you as pertinent for retaining June 30 as the date for closing the fiscal year?

Coincident with the inquiry among railroads, he also solicited opinions from the various state railway commissioners. Mr. Adams reported that the result of these inquiries did not indicate any great desire either on the part of the carriers or the state railway commissioners for a change in the date for closing the fiscal year for railroads; in fact, many of the state railway commissioners opposed the change for the reason that to make the change would require statutory enactment on the part of 22 states. However, in 1910 the act was amended so that the Interstate Commerce Commission may change the fiscal year from June 30 to December 31.

It is believed that when the first inquiry was sent out by Mr. Adams, the subject was not given careful consideration, and from time to time the matter was discussed by railway accounting officers. In March, 1914, at a special meeting of the Association of American Railway Accounting Officers, a special committee was appointed to bring this matter again to the attention of the railroads and a circular was sent to all railroad accounting officers in the United States, propounding the following queries:

- 1.—Do you approve of the suggestion to change the period covered by the annual report to the Interstate Commerce Commission from the 12 months ended June 30 to the 12 months ended December 31?
- 2.—Please state as fully as possible your views in favor of or against the proposition.
- 3.—Lines for which answer is made; total operated mileage of the same.

In response to that circular, replies were received from railroads representing 271,867 miles operated, of which roads representing 212,542 miles or 78.2 per cent of the total miles operated recorded their votes in favor of the change, and roads representing 13,939 miles, or 5.1 per cent of the total mileage operated,

were indifferent, leaving roads representing only 45,376 miles or 16.7 per cent of the total as recording themselves in opposition to the change. Subsequently, some of the latter roads changed their votes, and recorded themselves as favorable to the proposed change. Those who opposed the change offered the following reasons:

- 1.—Comparisons would be disturbed.
- 2.—It would be necessary to have stockholders change the fiscal year for most of the railroads in the United States.
- 3.—It would be necessary to have the statutes of 22 states changed.

As to these objections, it may be stated, in passing, that they are not at all serious, because: comparisons would be disturbed for one period only and one supplemental report relieves that situation; it would not be a serious hardship for the stockholders to change their fiscal years from June 30 to December 31; and since the Congress of the United States has already amended its law so as to permit the Interstate Commerce Commission to change the date for closing the fiscal year from June 30 to December 31, whenever it sees fit to issue an appropriate order, it should not be difficult to induce the 22 states referred to to enact similar amendments to their laws.

The report of the special committee was presented to the Association of American Railway Accounting Officers at its annual meeting in Atlanta, Ga., April 28, 29 and 30, 1915. The matter was referred to the executive committee of the association with power to deal with federal and state commissions relative thereto. Subsequently, the executive committee sent communications to all of the members of the association, inquiring if the executive officers of the railroad concurred in the vote of the accounting officers as registered in the replies to the circular sent out by the special committee. The replies to this latest inquiry indicate that the executives of railroads are now very much interested in this subject, and substantially all executives whose accounting officers had given replies favorable to the changes support their accounting officers. Some executives whose accounting officers voted against the change take a different view and favor the change. At the present time it may be safely stated that the desire for a change is nearly unanimous on the part of railroad companies.

R. A. White, president of the Association of American Railway Accounting Officers, delivered an able address before the National Association of Railway Commissioners at their annual convention in San Francisco, Cal., held in October, 1915, in which he presented in a very convincing way, the need for this change in the fiscal year. While Mr. White gave several reasons, he particularly emphasized two which should appeal strongly to all, viz.:

(a) The programs of maintenance and improvements conform naturally to the calendar year, as such programs are commenced during the early part of the calendar year and are completed during the latter part of the calendar year. At June 30 they are in their busiest stage. Erroneous impressions may be conveyed in the annual reports because in one year the climatic and business conditions are such that a majority of the maintenance and improvements programs may be completed prior to June 30, while in the succeeding year a majority of work covered by such programs may be deferred until after June 30, but these programs are always substantially near completion at December 31.

(b) Nearly all of the officers and as many as possible of the clerical force like their annual vacation at a time of the year when it really counts for something. Few men can really have a good time in winter; most of them want to get away during the summer for rest and recreation. No one would maintain that

FRANK NAY
Controller, Chicago, Rock Island & Pacific

a vacation should take preference over reports to the various commissions, but with the fiscal year closing on June 30, the heaviest work for the clerical forces of a railroad occurs, in July, August and September, during which time the weather conditions are most depressing and during the very time when these men would like to have vacations. During the period of the preparation of annual reports it is necessary for the clerks to work overtime more or less, and the officers who have to supervise the preparation of the reports must perform such supervision in addition to their regular duties during the heated season of the year. If the fiscal year closed at December 31 this pressure would come during January, February and March, —a time of the year when the weather conditions inspire vigor and activity.

The present year ending June 30 consists of six months of one year added to six months of another year, while the calendar year is the logical business year. Therefore, in the interest of producing more useful annual reports of railways covering a 12 months' period, closing at the end of the logical business year which will reflect more nearly than any other, on the whole, their true financial conditions, their true income accounts, and the true additions and betterments to their properties, it is most desirable to have the fiscal year end on December 31.

1915 FROM THE CONTRACTOR'S STANDPOINT

By W. A. ROGERS

President, Bates & Rogers Construction Company, Chicago, Ill.

The year just closing is unique from the standpoint of the railroad contractor. During the past year less miles of railroads have been built in the United States than in any year since 1864. In 1915 only 933 miles of main line was completed in the United States, and 718 miles in Canada.

In past years we have been in the habit of comparing periods of depression in railroad construction with the years immediately following 1893. We will now have to start with a new date. There was 495 miles less railroad completed in 1915 than in 1895, which was the year of least railroad construction in that period of depression. There have been only four years since 1848, and 1915 was one of these, when less than 1,000 miles of new line was completed. When we consider that the normal amount of railroad construction completed in a year runs from 3,500 to 4,000 miles, we can realize why 1915, with its 933 miles, has seemed such a quiet year. It is a significant fact that during this year not a railroad in the United States built 100 miles of line. In fact, the greatest mileage reported by any road is in Alabama, where one road reports 52 miles of main track constructed. Only one state in the Union has added to its mileage as much as 100 miles of railroad.

Many causes have contributed to the dearth of railroad construction. It would be a wise man, indeed, who would be able to give all of the reasons and to name them in the order of their importance. One of the principal reasons has been the attitude of our law makers and other public officials toward the railroads. The shortsighted policy which has resulted in the practical abandonment, during 1915, of expenditures for the construction and improvement of the railroads has had undoubtedly an immense reflex action on the prosperity of the country. The railroads have not had the money to spend, with the result that the thousands of men who would ordinarily have been employed in the various construction activities have been idle. There has also been a corresponding depression in the various lines of business involving materials of construction and other railroad supplies.

The result of this lack of railroad construction has been a very quiet year for railroad contractors. Only a very small number of contracts of any size have been let during the year, among the largest of which were those for the Norfolk & Western cut-off near Farmville, Va., and the Chesapeake & Ohio

extension in Ohio. The Lackawanna cut-off has been completed during the year, as well as the Canadian Northern's transcontinental line. There has been very little railroad work going on elsewhere in Canada, and practically no new work has been started there. Good progress is being made on the Rogers Pass tunnel of the Canadian Pacific, which was started in 1914, and there has been some terminal work in eastern Canada.

With this dearth of railroad work, the contractors who have followed this class of construction in the past have, in many instances, turned to other fields. They have taken up river and harbor work, reclamation service work, mine stripping, various forms of municipal and power development work, building construction and road making. By spreading out into different fields many of the railroad contractors have kept busy.

The labor conditions throughout most of the United States have been good during the greater part of the year, although during the latter part of the season the war order business in the East has caused some shortage. Prices for contract work during 1915 have been very low, and work has been figured on closer margins than in many years. Many contracts have been taken simply to keep the contractors' organization intact. As we draw to the close of 1915 I think that the railroads, the railway supply men and the railroad contractors are all glad to write "Finis" to a very quiet year and turn over the page.

Beginning about September, railroad earnings began to show an improvement, resulting, in considerable measure, from the handling of war order business, and later from the moving of the most bountiful crops in the history of this country. As the year is closing the railroad earnings are showing a remarkable improvement. I believe we can look forward with confidence to a good year in 1916. Over 1,200 miles of new line is now under construction, about 1,625 miles additional has been surveyed ready for construction, and projected lines amounting to over 2,060 miles are being seriously considered. In view of these facts and considering also the changed attitude of the public, the newspapers and the law makers toward the railroads, coincident with the increased earnings and the general increase of business throughout the country, a more optimistic feeling is apparent among those who are dependent upon the railroads for business.

Railroad construction work will cost more in 1916 than in 1915. Prices for materials have advanced and are advancing. If any large amount of construction work is undertaken the labor supply is almost certain to be very short. In addition, those contractors who have been willing to take work at cost, simply to keep an organization together, will undoubtedly be relieved of this necessity by the fact that there will be more construction work to bid on. One of the serious problems is going to be the labor supply. When we consider the number of men who have gone to Europe to join the armies of the various warring nations, with the sources of further supply practically closed, one can realize what we may have to contend with when construction work really starts. With this in view it would seem to be the part of wisdom of those who expect to undertake work the coming season to start as early as possible in order to get organized early in the season before the shortage develops.

As we look back over 1915 and forward to the coming year we cannot help feeling that we have now really come to the turning point, that a new era of prosperity for the railroads and allied interests is just starting, and that beginning with 1916 we will have a steadily increasing period of prosperity.

RAILWAY CONSTRUCTION IN SPAIN.—It is officially announced in Spain that projects will be received at the Dirección-General de Obras Públicas, Ministerio de Fomento, Madrid, up to May 21, 1916, for the construction of a secondary railway from Palencia to Aranda de Duero. The line will be of meter-gage. The average cost per kilometer must not exceed 100,000 pesetas (about \$20,000). The minimum weight per meter of the rails to be used will be 30 kg. (66 lb.)

The Trend of Railway Earnings in the Year 1915

Results as Shown by Net Earnings Compare Favorably with 1914, but Principally Through Savings in Expenses

By FRANK HAIGH DIXON

Professor of Economics, Dartmouth College, Chief Statistician, Bureau of Railway Economics.

At the close of the year 1914 the Commission had just granted to the Eastern carriers an increase in rates as a result of the rehearing in the five-per-cent case. Many had hoped that this would furnish the necessary stimulus to pull business in general, and the railway business in particular, out of its slough of despond. But in spite of a marked revival in industrial activity, almost wholly due, I regret to admit, to the demands occasioned by the war, the railways for another six months remained quiescent and closed the fiscal year, on June 30, 1915, with a discouraging looking income account.

Table I, based on the compilations of the Interstate Commerce Commission, shows the revenues and expenses in the aggregate and per mile for the fiscal years 1912 to 1915 of all railways having annual operating revenues of \$1,000,000 or over, and includes about 90 per cent of the mileage of the country. The inclusion of the remaining 10 per cent of mileage, which unfortunately is unavailable, would reduce somewhat the per-mile figure, but would not disturb to any important degree the impression gained from a comparison of the items year by year. Total operating revenues show a falling off from the previous year of \$165,000,000. While this decline on a per mile basis amounts only to 6.7 per cent as

compared with 1914, it should be noted that this follows a decline of over \$80,000,000 in gross earnings between 1913 and 1914. If the classification of railways by the commission made it possible to carry the per-mile figure for the "million dollar" roads back as far as 1910, it would be found that the per-mile figure of operating revenues for 1915 is smaller than in any year since 1909.

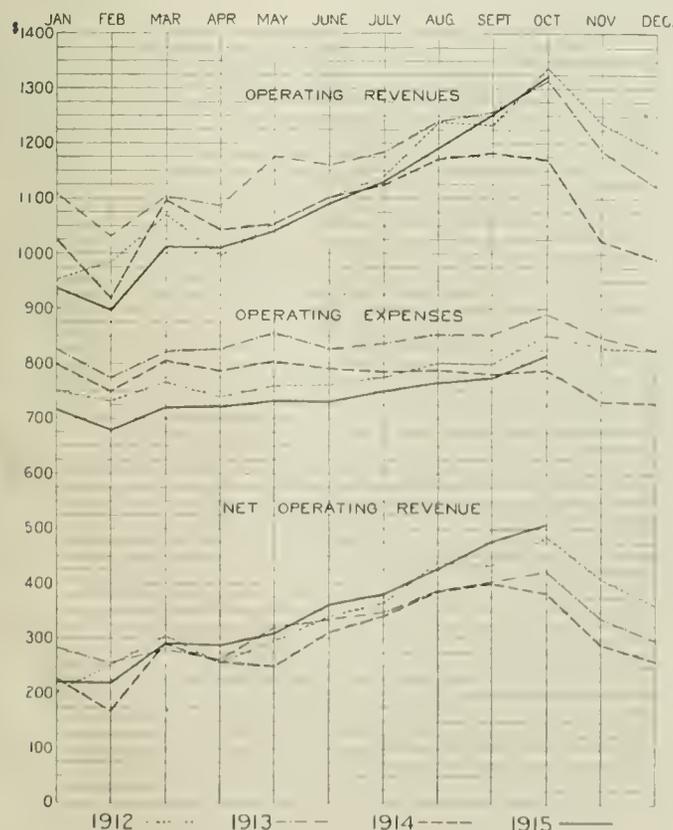

Upon a superficial examination, net earnings look better, but closer inspection shows that the slight increase in net, amounting per mile to 1.3 per cent over 1914, had no encouraging features about it. It was secured only by drastic cuts in the costs of operation, which have been practiced from the very beginning of this fiscal year, and which mean in large measure deferred expenditures that must be made good as soon as earnings permit. Taxes, for some unaccountable reason, did not increase during the year, but actually fell off 3.3 per cent per mile. The result is an increase of 2.1 per cent per mile in operating income, which, however, is 13.9 per

FRANK HAIGH DIXON
Professor of Economics, Dartmouth College

cent below the figure for 1913 and 6 per cent below that for 1912.

Table II presents the financial experience for these railways by months for the complete calendar years 1912, 1913 and 1914, and for the ten months of 1915 for which data are available. For any revival in the carrying industry we look at once to the figures of gross earnings. Here the first six months tell the same story as do the final figures for the fiscal year just discussed—a decline month by month as compared with the corresponding month of 1914; and this, it should be recalled, was on top of a shrinkage in gross earnings in the previous year. In not one single month of 1914 did the operating revenues equal those of 1913. However, during these six months of 1915, the monthly decreases were growing smaller until finally they disappeared altogether, and in July were replaced by an increase of one-half of one per cent. This was the turning point, as it proved, and increases in gross have been steady and rapid in the three months since, amounting to 13 per cent in the per-mile figure for October as compared with the same month of 1914. Drastic cuts in operating expenses, which had been a feature of every month of the year 1914, continued throughout the first nine months of 1915. The effect on net earnings has been remarkable. Whereas in every month but one in 1914 net earnings per mile showed decreases as compared with 1913, beginning with February, 1915, there are increases per mile in net earnings in every month, which run all the way from 10.6 per cent in August to 32.3 per cent in October. The policy of retrenchment was yielding its results at last. As has already been intimated, this policy of economy can be pursued only so long as gross earnings compel it. It was therefore to be expected that when earnings took a turn for the better expenses would increase. October shows the beginning of this policy with an increase in expenses per mile of 3.6 per cent. That the railways must enter upon a period of more generous maintenance is everywhere recognized—in fact, contracts on a large scale have already been signed. But for many months ahead, the severe economies practiced in the last eighteen months should show their effects in considerable increases in net revenue.

Comparative Chart of Earnings and Expenses

The comparative chart of monthly revenues and expenses per mile reveals in a very striking fashion this movement which I have endeavored to describe. The 1914 operating revenues curve for the months of September to December drops far below those of 1912 and 1913. The curve representing 1915 starts

1914. The purpose of this table is to analyze the material already presented, and to bring out any characteristic features peculiar to some one section of the country that might escape attention in aggregates for the United States as a whole. This analysis reveals the fact that recovery in gross revenues began much

TABLE I—REVENUES AND EXPENSES IN THE AGGREGATE AND PER MILE OF LINE OF STEAM ROADS HAVING ANNUAL OPERATING REVENUES OF \$1,000,000 OR OVER; FISCAL YEARS ENDED JUNE 30, 1915, 1914, 1913 AND 1912

d Decrease.

below those of the previous three years, crosses 1912 in April, only to fall back again in May. In July it passes 1914, in September, 1912, in October, 1913, and fails to reach the highest point attained in the four years only because of an abnormal jump in earnings in October, 1912. The 1915 line of operating

earlier in the East than in either of the other sections, due unquestionably to the stimulus given to manufacturing by the war orders of the allies. There has been an increase in gross revenues per mile in the Eastern district in every month since April, this increase growing steadily larger until it reached 17.1

d Decrease.

expenses remains below all the others until October, when it passes 1914. It has not yet reached the height attained by the curves of the other two years. The 1915 line of net revenue shows a steady gain over those of the three preceding years, being at a higher point than any of the others in April,

per cent in October. In the other two districts the increase did not begin until September. In the movement of operating expenses, experience was similar in all three districts, decreases occurring in every month except October. But the decreases in the South were much larger than in either of the other two

a Less than one-tenth of one per cent. d Decrease.

June, July, September and October, and destined, it is hoped, to remain in its present relative position for many months to come.

Table III presents the per-mile figures of gross and net earnings and expenses for the three districts into which the country is divided for statistical purposes by the commission. The table covers the ten months of the calendar year 1915, and gives the percentage relation of the figures to the corresponding data for

sections. In net revenue the East has made a striking showing. Every month has a substantial increase in its per-mile figure over the corresponding figure of 1914, October having a gain of 45.4 per cent. The February percentage of 81.8 per cent may be disregarded as abnormal. The month of February, 1914, yielded only \$174 per mile of net revenue, which was a decline of 55.6 per cent from 1913. While this showing of net earnings in the East cannot be equalled either in the size or the uni-

formity of the increase by the other districts, yet the latter have shown steady improvement since March. October yielded an increase per mile in the South of 46.7 per cent and in the West of 19.7 per cent.

One may safely prophesy that the year 1916 will show results far more agreeable to railway stockholders than have been realized in the past few years. The turning point seems to have been reached. However much we may deplore the occasion for our sudden awakening from our industrial lethargy, we must admit that it has enormously stimulated business and that its influence is being felt in industries and in sections remote from any connection with the European conflict. The commission has recognized the principle that the railways must have sufficient income to attract investors and to secure the capital necessary to maintain a standard of service demanded by the public. Such increases as the commission has granted will now do their part in increasing the fund of gross earnings. So far as reduction in expenses consists of deferred maintenance, it will mean only a temporary saving to the railways. But so far as the starvation period now passing away has developed more economical methods of operation and has reduced transportation expenses, it will represent a clear saving to the roads and a swelling of their net earnings. Their prosperity during the coming year depends in no small degree upon the manner in which expenses have been curtailed during the past two years.

DIVIDEND CHANGES

The accompanying table shows the changes in rates or in amounts declared of dividends of the railroads in the United States which made a change in 1915 as compared with 1914. The uncertainty of the first half of the calendar year and the increased business and brighter prospects of the second half of the year made the dividend changes very irregular.

Only such roads are included in the table where the total amount declared in 1915 was different than that in 1914. Thus,

	Declared in 1915	Declared in 1914	Present annual rate	Annual rate in 1914
Alabama & Vicksburg.....	5	7	5	7
Baltimore & Ohio, common.....	5	6	5	6
Bangor & Aroostook.....	3	3½	1	..
Chesapeake & Ohio.....	None	3
Chicago Great Western, first preferred..	1	None	4	..
Chicago, Milwaukee & St. Paul, common	4½	5	4	5
Detroit & Mackinac, common.....	None	5	5	5
Hocking Valley	1	7	..	7
Kanawha & Michigan.....	1½	5	..	5
Louisville & Nashville.....	5	7	5	7
Michigan Central ²	4	6	4	6
Nashville, Chatanooga & St. Louis.....	5	7	5	7
Pennsylvania Company	6	4	3	3
Pittsburgh, Cincinnati, Chicago & St. Louis ⁴	None	4½ ⁶	..	5
Southern Railway, preferred.....	None	4¾	..	6
Toronto, Hamilton & Buffalo.....	None	5	..	5
Vicksburg, Shreveport & Pacific.....	None	6	..	6
Wrightsville & Tennille.....	3	6	..	6

¹ Deferred.
² The company declares its dividend after the English methods out of earnings for certain periods, but in the table above the periods within which the dividends were declared are indicated, and the Michigan Central is made uniform with the other companies.
³ The annual rate is not determinable.
⁴ In December the directors declared 4 per cent on the preferred and 2 per cent on the common stock. The last previous dividend was 2½ per cent, declared in December, 1914, on the preferred, and ¾ per cent declared in March, 1915.
⁶ Of the 4½ per cent dividends declared in 1914, 2 per cent was paid in 5-year 4 per cent interest bearing scrip.

if a road deferred or omitted to pay a semi-annual dividend in the first half of the year 1915, but later declared the regular semi-annual dividend in the second half year and a dividend to correspond with the deferred or omitted dividend of the first half year, this road would not be included in the table.

ENLISTMENTS FROM THE NORTH-EASTERN RAILWAY OF ENGLAND.—The total number of employees of the North-Eastern Railway who had joined the colors up to November 22 was 9,179, or 16.85 per cent of the company's regular staff.

THE LABOR SITUATION

By W. L. STODDARD.

Washington, December 29.

The meager news which emanates from various quarters, chiefly from Chicago, concerning the great eight-hour day movement of the concerted railroad employees is causing considerable speculation here. The average congressman is, very likely, a resume of the salient ideas and theories which this correspondent of the situation, but Washington opinion is not wholly ignorant of the situation, but Washington opinion is not wholly made up of congressmen's views. The following paragraphs are dent, for one, has been able to gather from more than a single source. While it is forbidden to mention names, it may be said that the general theme of this letter follows closely the thought of a government officer who is peculiarly well placed to speculate wisely:—

The gravity of the situation cannot be overestimated, and as time goes on the movement which has been started after months of more or less circumstantial rumor, grows more and more formidable. Eventually it will mean either a strike, the worst railroad strike in the history of the United States, or mediation. In case a strike should be called, it is expected that the public would step in, and the case then go to arbitration. But the men will avoid arbitration as long as possible, preferring to place their demands in the hands of a committee for the purpose of conferring or mediating with a committee of railroad officers.

The railroad employees appear to be little inclined to use the strike as a bluff—as has been done in the past. Brotherhood officers who are averse to striking are finding it difficult to talk down the idea of a strike—to make the men see that the strike should be used as a threat rather than as an actual implement wherewith to secure their demands.

The fact that the rank and file of the railroad employees appear to be getting impatient of the usual long-drawn-out arbitration proceedings is an important factor. It means that there are only two ways in which they may press for their demands: mediation or strike. The men seem to be in the mood for bargaining with the roads, provided the bargain can be of the short, direct, non-technical kind instead of the elaborately documented court proceedings of the usual arbitration case. As the situation "sizes up" today, the last resort of the brotherhoods in their fight for an eight-hour day will be forced arbitration growing out of an actual strike of some days' duration.

The seriousness of this situation is still evidently unappreciated by the public and by many railroad men—both employees and employers. The organized and industrial unionized movement for an eight-hour day has been a long time coming, but apparently it is surely approaching a climax. The moral effect of this great movement, say my informants, is bound to be far-reaching irrespective of the immediate outcome. And, by the same token, the manner in which both the men and the roads handle themselves and the case will be of the utmost significance in future railroad wage controversies—for, boiled down to dollars and cents, the fundamental question is one of wages for overtime. It is partly a question of machinery, but to a large extent a question of attitude and temper. On the answer made to these questions depends the further question of whether there will be an actual strike or not.

ELECTRIFICATION IN BRITAIN.—At the end of 1913 there were 83 electric locomotives in use on British railways, of which 52 were on the City & South London, and 21 on the Metropolitan. There were at the same period 1,019 electric motor vehicles with a total seating capacity of 51,219, and 1,467 electric trailer cars with a seating capacity for 77,297. All the electric locomotives and the trailer cars, and also all the motor vehicles except 13 cars, seating 712 passengers, in Ireland, are in England. In addition to these there were 214 steam rail motors, seating 11,078 passengers. Four, seating 145, were in Scotland; six, seating 242, in Ireland, and the remainder in England and Wales.

Cars and Locomotives Ordered and Built in 1915

Year Signalized by Extension of All-steel Equipment,
Foreign Orders and Rush of Business in Last Quarter

The railways, the private car lines and other users of cars and locomotives in the United States, Canada and Mexico have during 1915 placed orders for or authorized the construction of 107,796 freight cars, 3,092 passenger cars and 1,573 locomotives.* The supply companies of this country and Canada have at the same time, however, received orders from foreign coun-

tabulations as complete as possible, but it will be found that the orders shown do not add up to as great amounts as the totals given in the several tables, there having been orders placed (as reported by the equipment builders) for 1,830 tank cars, 85 miscellaneous freight cars, and 88 small locomotives con-

TABLE I. CARS AND LOCOMOTIVES ORDERED DURING PAST 15 YEARS

				1915....	1,573	3,092	107,796

tries, notably Russia and France for at least 18,222 freight cars and 850 locomotives. The domestic orders this year show a substantial increase over those of 1914 when 80,264 freight cars, 2,002 passenger cars and 1,265 locomotives were ordered, but they are small compared with the figures for 1905 when 341,315 freight cars, 3,289 passenger cars and 6,265 locomotives were ordered.

During 1915 there have been built in the plants of the car and

paper since 1904, and that of locomotives the smallest since 1898.

On the following pages are shown detailed lists of the freight cars, passenger cars and locomotives ordered by the railways, private car lines and industrial companies of the United States, Canada and Mexico. Every effort has been made to make these

* It will be understood that these totals include only those orders for cars and locomotives which came to our attention up to the time of going to press, Wednesday evening, December 20. If other orders, placed before the end of the year, are reported later, the items will appear in the Equipment and Supplies column in the General News Section in next week's issue and revised totals will be given in that column.

The information given herewith is compiled from official sources. The *Railway Age Gazette* in answer to its inquiries received communications this year from all but two of the railways in the United States and Canada owning over 500 cars. It also heard from the greater part of the remaining roads and from most of the private car lines owning over 100 cars. In the case of foreign orders, and where no replies were received, from the railways here, the details were taken from the weekly records or from the reports of the builders.

The remarkable feature in this year's records has been the revolutionary change in business activity since October 1. Our records show that the first half of the year, as far as the equipment market was concerned, was exceedingly dull, and that scarcely more than one-third of the orders for the year were placed before July 1. The last four months have been exceptionally prosperous, and it is worthy of note that approximately half the year's orders have been placed since October 1. The year will also be remembered for the enormous increase of business with railways of foreign countries.

Of the 107,796 freight cars ordered this year only 725 are specified as being of wood, and only 1,708 as having composite underframes. There has been a very decided increase in cars of all-steel and steel frame construction, but the cars with steel underframes only are but little more than half those of last year. This is shown in the case of the box cars particularly, the number of all-steel box cars having increased over four times.

Concerning passenger cars, it is noticeable that by far the

from builders in both the United States and Canada, and, as usual, the output of railway shops is also included. Of the total of 74,112 freight cars built, 59,984 were on domestic, and 14,128 on foreign orders. In like manner, 39,783 were specified as being of all-steel construction, 27,887 as having steel underframes, and only 4,432 as being of wood. The construction of the remaining 2,010 was not specified. These figures for freight cars built do not show the great amount of repair work done, or the large number of steel underframes constructed for installation on old wooden cars. The economies forced upon the carriers by the late depression made this a big business this year, and a number of builders did no other work.

The total of 1,949 passenger cars built includes 1,935 for domestic uses, and only 14 for export. Nearly all the cars were of all-steel construction, 1,898 being so specified, 40 as having steel underframes, and 11 as being of wood. The total of 2,085 locomotives built includes 1,250 for domestic uses, and 835 for export abroad.

It is the consensus of opinion that the prosperity which the

TRANSPORTATION SALESMEN

By J. E. LIGHT

Traveling Freight and Passenger Agent, Southern Pacific Company

While the carriers are bending their efforts toward the creation of favorable public sentiment, it is possible they are overlooking the very department that could best secure this result.

I refer to the field men of the traffic department—transportation sellers. These representatives, more than any other class of railroad men, are in constant touch with the public. An efficient field man can accomplish much in creating a better understanding between the railroads and the public. By diplomacy and ability he can explain to the shipper and general public the reason for many actions of the carriers that—to them, because they do not understand—seem ridiculous and erroneous. To do this, however, such representatives must have a thorough working knowledge of railroad operation and traffic principles.

Commercial corporations feature this element of their business. They must do so or fail. There are many commercial salesmen selling groceries, coffee, produce, etc., and representing companies whose entire investment would not equal the outlay

in small station facilities, yet these men are carefully selected and paid much higher salaries than the salesmen for transcontinental carriers. Because of the nature of their business, commercial salesmen are able to show tangible results that warrant the investment. An efficient traffic representative, while unable to measure the result of his efforts in dollars and cents, could nevertheless produce returns that would justify greater consideration by his chief.

In the selection of these representatives care should be taken to appoint men who necessarily must possess enough diplomacy to heal many a breach between carrier and shipper; men with character and initiative to convince a shipper why his line should be used; men with dignity, personality and congeniality befitting a representative of a concern worth millions; men with the business ability and courage to handle a proposition with clever business men without calling on the busy general office for information on matters that they should know. It is my opinion that representatives with the above qualifications would be a profitable investment.

These men should be picked from the railroad ranks. Otherwise they would have no practical transportation knowledge. There are many men with this practical knowledge, obtained by actual experience, but this is the extent of their ability. Also many practical men superficially study the theoretical elements. These men are usually selected. In the majority of cases, however, the transportation knowledge found in these offices is sadly lacking. Most of them are chosen because of their purported good-fellowship and ability to "mix." When unable to secure a man with the above combined qualifications, the "good mixer" characteristic is deemed paramount.

The percentage of these representatives who are familiar with Emory Johnson, McPherson, Dunn, or even George B. McGinty, is indeed small. There is even a smaller percentage who could satisfactorily explain to a shipper why it is necessary and possible to haul a shipment across the continent for less than is charged to haul the same shipment 400 miles inland. Few, indeed, could expound the fallacies of the "zone" system or distance rates when applied to traffic generally.

There is perennial warfare between the various communities in an attempt to obtain for their respective territories an advantage in transportation costs. There are numerous transportation matters which, to the average shipper, are perplexing and confusing. The ability of a traffic field man to give a satisfactory explanation of these matters would create a much better feeling between the shipper and the railroads. Also it would most likely result in increased competitive takings for the line he represents.

I fully believe that the carriers will eventually recognize the importance of selecting efficient men for these positions. The result of such recognition would be a well-organized effort to select congenial young men with ability and train them for this particular work in the same manner employed by commercial concerns. Men of this character will always be a valuable asset to the railroads, even after competition is eliminated—should it ever be.

Public sentiment is largely responsible for the position of the carriers today. I cannot believe that the railroad chiefs realized the potent effect of adverse public sentiment until now. The public is learning something of the carriers' side, and I fully believe that the more they know the better it will be for the carriers' interests. Therefore they should use every means of disseminating information—and an efficient traffic field man would be an important factor in this work.

A BRITISH POOLING ARRANGEMENT.—The fish traffic from Aberdeen, hitherto sent daily by both the Caledonian and North British routes, is now, beginning December 1, being sent by only one route, each company taking all the traffic alternately for a period of two months. The Caledonian will take it for December and January, 1916, while the North British will take it for February and March.

New Railway Construction Statistics for 1915

Less Track Was Built in the United States Than for Any Year Since 1864. Canada Also Shows Decrease

During 1915, 933.24 miles of new first track was completed in the United States and 718.37 miles in Canada. In the same period 356.28 miles of second track was completed in the United States and 0.84 miles in Canada. There was also built during this period 64.70 miles of other multiple main tracks in the United States. Some activity is again noted in Mexico, where 36.50 miles of line was reported completed. The government railways of Alaska report 34 miles of line completed and 350 miles additional projected. These figures are based on reports made directly to us by the various railroads, supplemented by our own construction records and are as complete as it is possible to compile at this time.

As shown by the accompanying diagram and by the tabulation given below, the mileage of first track completed is much less

states and less than 10 miles for each of 16 states. Pennsylvania leads in mileage with 98.37 miles completed, while Oregon is second with 82.70 miles, Washington third with 70.88 miles and Kansas is fourth with 58.56 miles. Practically half the mileage reported was for the seven states of Pennsylvania, Oregon, Washington, Kansas, Alabama, Arizona and Kentucky.

The longest continuous line reported built during the year was that of the Gulf, Florida & Alabama from Broughton to Kimbrough, 52.40 miles. This is in marked contrast with extensions of 100 miles or more reported in previous years. The work was generally light in character, although there were one or two notable exceptions. The line involving the heaviest work was that of the Delaware, Lackawanna & Western from Clarks Summit, Pa., to Hallstead, 39.43 miles. This line, which has

New Mileage Curve from 1893 to 1915 Inclusive

than that for any of the 23 years during which we have collected such statistics. In fact, the mileage reported this year is only about 65 per cent of the smallest mileage reported for any previous year since 1893. The mileage of line completed this year is only 15 per cent of that completed in 1902, the record year since 1893, and only about 25 per cent of the mileage completed during an average year.

The figures of new construction by years beginning with 1893 are as follows:

1893	3,024	1905	4,388
1894	1,760	1906	5,623
1895	1,428	1907	5,212
1896	1,692	1908	3,211
1897	2,109	1909	3,748
1898	3,265	1910	4,122
1899	4,569	1911	3,066
1900	4,894	1912	2,997
1901	5,368	1913	3,071
1902	6,026	1914	1,532
1903	5,652	1915	933
1904	3,832		

New mileage was reported completed in 38 states and territories. There are 11 states in which no new mileage was reported, while less than 5 miles was reported for each of 11

been described previously in these columns, was built at an expenditure of over \$12,000,000.

Our reports show that 356.28 miles of second track was completed in the United States in 1915 as compared with 566 miles in 1914; 1,264 in 1913, and 1,073 miles in 1912. This work was distributed over 25 states, although less than 10 miles was built in each of 16 states and 20 miles or more was built in only six states. The greatest mileage built in any single state was 81.03 miles in Virginia, the next largest was 44.80 in Pennsylvania and the third largest was 39.90 miles in North Carolina, 37.90, of which was built by the Southern Railway between Pelham and Denim. This road also completed 28.10 miles of the second track built in Virginia. The 64.70 miles of other multiple tracks were divided between third track, 36.11 miles; fourth track, 22.96 miles; fifth track, 2.30 miles, and sixth track, 3.30 miles. The third and fourth track mileage consisted principally of that laid on the Clarks Summit line of the Lackawanna in Pennsylvania.

At the present time 1,207.18 miles of new line is reported under construction, 1,024.25 as definitely surveyed, and 2,001.81 miles as projected. Also, 289.11 miles of second track is under con-

struction, 10 miles reported surveyed and 9.40 miles projected. These mileages compare with 1,015 miles of new first track under construction, 1,229 miles surveyed and 2,031 projected one year ago, and 1,522 miles under construction, 1,511 miles surveyed and 1,296 miles projected two years ago.

In 1914, for the first time, the mileage of line completed in Canada exceeded that in the United States. The mileage built in the Dominion this year, however, shows an even greater decrease than that in the United States, falling to 718.37, or less than 37 per cent of that of last year. The European war has, of course, practically put a stop to all construction projects in Canada. Of the mileage built in 1915, 165.95 miles was reported completed by the Canadian Northern (Western Lines) and 14 miles by the Winnipeg & Northern, a subsidiary of this same road. The Edmonton, Dunvegan & British Columbia and

THE AGITATOR AND THE LAKE LINES

[From the Northwestern Miller.]

The Lehigh Valley Railroad Company has petitioned the Interstate Commerce Commission for a rehearing on its application to be allowed to continue its lake service, which, in common with that of other railways operating lines on the lakes, was ordered stopped because the commission held that such service violated the terms of the Panama Canal act.

This act, commonly supposed to apply specifically to lines operating through the Panama Canal, was given general application by the simple inclusion of two words "and elsewhere," thus bringing under its provisions the Great Lakes, according to the ruling of the Interstate Commerce Commission, a result no doubt never contemplated by the majority of those who voted for the measure in Congress, believing it to be intended only for regulating traffic through the canal.

Taking advantage of this opportunity, the Interstate Commerce Commission promulgated a ruling which is one of the most preposterously destructive acts ever perpetrated by this body, totally disrupting and destroying an established system of lake transportation, which has been of incalculable benefit to the Western shipper and receiver, in the hope of encouraging an imaginary system of so-called "independent" transportation, which, by a disjointed and disconnected service, is to accomplish what the commission considers "competition," but which actually would be a state of irresponsible chaos. Thereby it is the desire of the commission to turn backward the wheels of progress to a system of transportation which was out of date 25 years ago.

In its interpretation of the meaning of the act, the commission is doubtless sincere, believing that in some mysterious way an independent system will come into being which shall give shippers the benefit of a competition which they do not at present have, and cannot, under existing conditions, obtain.

The commission has been led into this belief by the persistent outcry of the paid agitators employed by certain associations and trade organizations. For some time actual shippers have been aware that, on the whole, the work of these agitators has been mischievous and even dangerous, but they were powerless to restrain them; the machinery for their employment having been put in operation, no way is provided either for directing them wisely or suppressing them altogether.

The civic organizations that support and keep in motion these "experts" rarely represent the real shippers either by their membership or their published sentiments. Mostly they are composed of real estate operators, local bankers, retailers and a vast conglomeration of clerks, salesmen and subordinates, who like to imagine themselves representative citizens. Shippers who have a large and comprehensive view of traffic matters have long since withdrawn their support.

Such influences as these, which really signify nothing but a distorted sense of local patriotism, are responsible for the hue and cry raised against the railway-controlled lake lines which are now threatened with extinction. To these the Interstate Commerce Commission has evidently listened—not wisely but too well. If its ruling is not reversed, the Western shipper and receiver, now so dependent upon lake transportation, will find themselves facing a situation nothing short of calamitous in the very near future. For this they may thank the walking delegates of their local trade-unions, whether or not they themselves are members in good standing.

Mileage of American Railroads Block Signaled

Space Interval in Use on Nearly One Hundred Thousand Miles. Another Thousand, Automatic, Planned for

The mileage of railroad in the United States operated under the block system on January 1, 1916, as shown in the large table printed herewith is 97,809 miles. The increase over the total given in our table printed one year ago is 9,677 miles. As is well known, however, the manual block system is used on a large mileage of single track lines for the protection only of passenger trains and the more significant total is that of automatic block signal mileage; of this we record now 31,160 miles of road as compared with 29,689 miles in the table for January 1, 1915. The increase in automatic mileage during the past 12 months is comparatively small, as might have been expected.

As in former years, a considerable portion of the new automatic mileage consists of signals installed on lines where the manual system had been in use, and the total length of road worked under the space interval system, automatic and non-automatic together, is not increased by such items; but in 1915 there has been a net increase of 8,206 miles in manual block signal mileage.

The detailed comparison of the totals of the *Railway Age Gazette* tables for the four years last past is as follows:

Miles of Road Worked by the Block System

	—Automatic—		—Manual—		—Total—	
	Jan. 1	Increase over prev. year	Jan. 1	Increase over prev. year	Jan. 1	Increase over prev. year
1916.....	31,160	1,471	66,649	8,206	97,809	9,677
1915.....	29,689	3,566	58,443	Decrease	88,132	943
1914.....	26,123	3,827	61,062	5,127	87,185	8,954
1913.....	22,296	1,961	55,935	Decrease	78,231	1,821

These figures are to be understood with the usual conditions, with which the reader is familiar. A number of roads exclude from their statement of total mileage operated all lines on which there is regularly in service only one locomotive, and also lines on which only freight trains are run. Among the roads thus reporting are the Baltimore & Ohio, the Chesapeake & Ohio, the Chicago, Burlington & Quincy, the Chicago, Milwaukee & St. Paul, the New York Central, the Pennsylvania and the Southern Pacific. A number of roads have long sections of road used exclusively for freight trains which are equipped with automatic block signals; notably the Pennsylvania, the Erie and the Lehigh Valley.

The Panama Railroad is operated throughout by the block system, nearly all automatic.

Canada.—The block system is operated in Canada on 8,787 miles of road, of which 611 miles is automatic, as shown in the small table. In the Canadian manual mileage there is included 75 miles worked by train staff.

Lines in Canada Worked by the Block System

	Automatic miles of road	Manual miles of road	Total miles of road

Toronto, Hamilton & Buffalo.....	62	62
	611	8,176	8,787

† No report received. Figures repeated from last year.

PLANS FOR 1916

Roads which have given information concerning proposed new work, including both block and interlocking signals, for next year, are not so numerous as one year ago, but it is to be noted that most of the large roads have given no information on this point; they say that their plans are not yet settled. One road intends, during 1916, to equip 400 miles of line with automatic block signals (in place of manual); but is not yet quite ready to have the figures appear in our list. The Long Island is the

only company which plans to install any considerable length of manually operated block signals. A comparison will show that, in some cases, the expectations for 1916 are but a repetition of those formulated a year ago for 1915; but, no doubt, everybody's expectations have at the present time a better basis of facts than they had one year ago.

The Alabama Great Southern plans during the coming year to install automatic block signals on 5.4 miles of line. This number of miles is exactly the difference between the mileage reported as now operated under automatic block signals and the total mileage of road on which passenger trains are run, indicating that at the end of the year the whole of the line will be signaled.

The Atchison, Topeka & Santa Fe plans during the coming year to install automatic block signals on seven miles of its line, double track, between Standish, Mo., and Carrollton; ten miles, double track, between Le Loup, Kan., and H. U. Tower and between Claremont, Cal., and Arcadia, 20 miles, single track. Of these three installations, the two last named have already been begun. During 1916, the company proposes to install electric interlocking, 36 levers, at Arcadia, Cal., jointly with the Southern Pacific and the Pacific Electric, and at Los Angeles, Cal., electric interlocking, 80 levers, jointly with the Salt Lake Route and the Southern Pacific.

The Atlantic Coast Line reports that the length of road equipped with automatic block signals, given in the table as 252 miles, will soon be increased to 320, signals having been nearly completed on 68 miles (double track), but not yet put in operation.

The Boston & Maine is to install an electro-mechanical interlocking at Newburyport, Mass.; 20 mechanical and 7 electric levers.

The Chesapeake & Ohio plans during the coming year to install automatic block signals on 8 miles of its line, double track, and 21 miles single track.

The Chicago & Northwestern plans during the coming year to put in an electric interlocking plant at Deering, Ill., of 44 levers. This is at the crossing of the Chicago river. Another electric interlocking of 100 working levers is to be put in at Washington street, Milwaukee, to take the place of two mechanical interlockings.

The Chicago, Indianapolis & Louisville is to install mechanical interlocking at the crossing of its line with the Grand Trunk at Haskells, Ind. The machine will have 25 levers and the distant signals will be power operated.

The Chicago, Milwaukee & St. Paul, on its electrified line between Butte, Mont., and Finlen, Mont., 16 miles, will install light signals, automatic, in place of manual block signals; and this work together with 39 miles, in the same vicinity, which has already been changed from automatic semaphore signals will make 55 miles of road equipped with light signals.

The plans of the Chicago, Rock Island & Pacific for the ensuing year include the installation of automatic block signals on five miles of road, double track.

The Cincinnati, Hamilton & Dayton plans to install automatic block signals on 21 miles of its line, double track, during 1916; and an additional length of 6 miles will be changed from single track to double track.

The Cleveland, Cincinnati, Chicago & St. Louis contemplates the installation of automatic block signals during the coming year on its line from Bellefontaine, Ohio, to Anderson, Ind., 106 miles, single track.

The Cumberland Valley proposes during the coming year to install automatic block signals on its line near Berkeley, six miles, single track.

The Erie will install automatic block signals in 1916, in place

† No report received; figures repeated from last year. Interboro Rapid Transit: Only the four-track line is included.

of the manual block system, on 84 miles of road, namely: Solon, Ohio, to Cleveland, 16 miles, double track; Kent, Ohio, to Leavittsburg, 27 miles, double track; Buchanan Junction, Pa., to Pymatuning, 26 miles single track and 6 miles double track; Columbus, Pa., to Niobe Junction, 9 miles. Also on the controlled line, the New York, Susquehanna & Western, automatic block signals will be installed on 14 miles, double track, to take the place of the manual block system.

The El Paso & Southwestern proposes to install automatic block signals this year on its line between Lee, Ariz., and Moores Spur, Ariz., 25 miles.

The Great Northern Railway plans to install during the coming year automatic block signals on 200 miles of its line. The plans for the year include also the installation of a 22-lever interlocking plant at Aberdeen, S. D., where the line crosses the Chicago, Milwaukee & St. Paul; and a nine-lever interlocking at Calumet, Minn., where the line crosses the Duluth, Missabe & Northern.

The Illinois Central plans to install automatic block signals during the coming year on 180 miles of its lines, as follows: Gilman, Ill., to Mattoon, 90 miles, double track; Dugan, Ky., to Cecilia, 8 miles; East View to Leitchfield, Ky., 14 miles; Horse Branch, Ky., to Beaver Dam, 12 miles; Rockport, Ky., to Mercer, 12 miles, and Eddyville, Ky., to Paducah, 35 miles, all single track; Woodstock, Tenn., toward Memphis, 8 miles, single track, and Branch Junction, Ill., to Centralia, 2 miles, double track.

The Interboro Rapid Transit Company, New York City, will install automatic block signals on 30 miles of track during 1916. This is the centre track, now being built, which will change the principal parts of the elevated lines in Manhattan from two-track to three-track road. These new tracks will be signaled for the movement of trains in both directions. The company also plans to install 17 electro-pneumatic interlocking plants, nine on the Manhattan Elevated lines and eight on the extensions to the subway line. One of these machines will have 107 levers, and others range from 55, 39, 31, down to 7 levers each.

The Long Island Road during 1916 plans to install the manual block system on 58.4 miles of line.

The Monongahela Railway proposes to install during the coming year automatic block signals on its line, single track, from South Brownsville, Pa., to the West Virginia line, 33 miles.

The plans of the New York, New Haven & Hartford for 1916 include extensive reconstruction on the New York division, four-track, between New Haven and South Mt. Vernon, as heretofore announced. From Stamford to South Mt. Vernon, 20 miles, the controlled manual system is to be abandoned and a complete system of automatic signals put in, to be worked by alternating-current apparatus, and the signal aspects to be in the upper left-hand quadrant. On the eastern part of the division, New Haven to Stamford, 40 miles, automatic signals are already in service, but these will be changed from two-arm, two-position, to one-arm, three-position; and the semaphores will work in the upper left-hand quadrant.

In connection with these changes in the block signaling, a number of new interlockings will be installed. At Stamford an electric interlocking, type F, with 53 levers, will be installed in the place of two large mechanical plants. New electro-mechanical plants will be installed at Cos Cob drawbridge, at Greenwich, and at Rye, each to have a 16-lever frame. Five manual block stations will be discontinued. New electro-mechanical interlockings, 16 levers each, will be put in at Greens Farms and at Westport drawbridge.

The New York, Ontario & Western plans to install a mechanical interlocking, 56 levers, at Campbell Hall, N. Y. This plant was included in the estimates for 1915, but it was not built.

The Norfolk & Western plans during the coming year to install automatic block signals on 62 miles of line, as follows: On the new line now under construction between Burkeville, Va., and Pamplin, 37 miles; and on lines now operated under the manual block system, 25 miles, as follows: Poe to Jack, Jack to Church Road, Pepper to Belspring and Pembroke to Ripplemead. The company proposes also to install four electric interlocking plants;

Burkeville, Va., 15 working levers, A. C.; Pamplin, Va., 33 working levers, A. C.; Jack, Va., 19 working levers, A. C.; and Low Grade Tunnel, Va., 26 working levers, D. C. At City Point, Va., an electro-mechanical plant is to be installed, 11 mechanical and 5 electric levers.

The San Pedro, Los Angeles & Salt Lake plans to install automatic block signals during the coming year on its line between Los Angeles and Riverside, 58 miles. A manual interlocking plant is being put in at Magnolia avenue, Riverside, where the line is crossed by the Pacific Electric Railway. This machine will have 12 levers.

The Southern Railway proposes during 1916 to install automatic block signals on 178 miles of its line. The plans for the coming year include also two large mechanical interlocking plants; one at Charlottesville, Va., 48 levers, and one at Danville, Va., 40 levers.

The Southern Pacific's plans for new work during the coming year include three interlocking machines, Saxby & Farmer, 8 levers each, at three drawbridges in Oregon.

The Sunset Central Lines propose during 1916 to install two mechanical interlocking plants; one at Bellaire Junction, crossing the San Antonio & Aransas Pass, 13 levers; and one at San Antonio at the crossing of the same road, 16 levers.

The Wabash Railway plans during the coming year to install automatic block signals on 43 miles of its road, single track.

The Western Maryland proposes during the coming year to install automatic block signals on 106 miles of its line.

FREIGHT EMBARGOES STILL IN EFFECT

The committee of railroad officers which is watching the freight situation at New York City reports this week that the embargoes have begun to produce some relief, but the congestion is still very great, and some new embargoes have been placed. The number of loaded cars awaiting delivery at and near New York, and on the way from the western termini of the Trunk Lines rose before Christmas to about 50,000, or 10,000 more than the number thus on hand and detained when the committee began its work; but there has since been some reduction. The Pennsylvania extended its embargo on eastbound freight to include shipments originating on its own lines; but made an exception of foodstuffs, livestock and perishable freight destined to New England. The congestion was aggravated by the blockade on the New Haven Road, due to the snow-storm. The effect of the congestion at the Atlantic seaboard is felt at Chicago and even farther west, and many shipments are held back by lack of box cars.

The Chesapeake & Ohio has removed its embargo on export oats at Newport News, but has now embargoed wheat. The Pennsylvania has been releasing 1,000 cars a day at Philadelphia and Baltimore, and it is hoped to remove the embargoes there early in January.

A heavy movement of grain at western primary markets continues, but scarcity of cars is a factor in reducing the deliveries.

On December 24 the New York Central extended its embargo to all export freight. This road now has about 350 barges and lighters in service in New York harbor, or nearly double its normal quota. Within the last 18 months it has chartered 180 extra barges. On December 26 the New York, New Haven & Hartford, largely on account of storms, embargoed everything except coal, food and perishable freight for all points in its Western district, except Hartford and the junctions of the Boston & Albany.

On Tuesday of this week, December 28, the Pennsylvania removed its embargo on domestic freight for New York and Brooklyn. In New York City, coal dealers begin to threaten an advance in prices owing to scarcity, and contractors using large quantities of cement and structural steel fear they will have to suspend work because of non receipt of supplies.

ENGLISH RAILWAY MEN AND THE WAR—The National Union of Railway Men has already lost over 1,020 members by death in the war.

General News Department

The Lehigh Valley has advanced the pay of car inspectors from 19 cents an hour to 22 cents.

Beginning with January the railroads of Texas, in accordance with a new law, will pay their employees twice a month.

The Interstate Commerce Commission announces a hearing at Washington, January 26, for further argument on questions relating to physical valuation of railroads.

The American Museum of Safety, New York City, has awarded to the Hudson & Manhattan Railroad (New York, Jersey City and Hoboken) the Travelers' Insurance Company medal for good results in prevention of accidents.

Southbound passenger train No. 1 of the Kansas City Southern was stopped by robbers on the morning of December 16 near Eagleton, Ark., and a safe in the express car was blown open, and the mail car robbed of the registered mail. The passengers were not molested.

At Middletown, Conn., December 22, Antonio Vernaie and Paul Karuba pleaded guilty to the charge of wrecking a passenger train on the New York, New Haven & Hartford at Maromas, Conn., in August, 1911, and were sentenced to imprisonment for from 5 to 15 years. The men are already serving prison sentences for other crimes.

The Pullman Company has announced that, effective on January 1, it will increase the pay of its conductors and porters and miscellaneous employees in its operating department by approximately 10 per cent. This will amount to an increase in payroll of about \$600,000 a year, and will affect about 9,000 conductors and porters.

The Chicago, Burlington & Quincy has completed work on the Wendover cut-off and has opened it for freight traffic. The cut-off is about 8½ miles long, extending from Guernsey, Wyo., to Wendover, and is one of the units in the Omaha-Montana short line which, when completed, will mean a "water grade" from the Rocky mountains to the Missouri river.

The College of Engineering of the University of Illinois has received a Mogul type locomotive from the Illinois Central. It has 19-in. by 26-in. cylinders, and weighs with its tender 206,000 lb. It was taken from service and put through general repairs before delivery to the university. The locomotive will be used under the general direction of Prof. E. C. Schmidt for instructional work in the locomotive laboratory.

The Interborough Rapid Transit Company has advanced the wages of conductors and guards 10 cents a day and has made considerable increases in the pay of different grades of motormen, those working their first year being advanced from \$3 a day to \$3.25. Advances have been made in the pay of train dispatchers and others. Advances in pay have been announced also by the New York Railways Company, operating surface street car lines in Manhattan; by the Third Avenue (street) Railway, and by the Brooklyn Rapid Transit Company.

Mr. Cox, of Indiana, has introduced in Congress a bill to amend the Interstate Commerce law by including in the term "railroad" all bridges used by wagons, automobiles, etc., in transportation from one state to another. Mr. Dyer, of Missouri, has introduced a bill to authorize the Interstate Commerce Commission to hold competitive examinations to get men for the positions of roadmaster, foremen and certain other railroad places. Carriers would be required to fill vacancies in these positions only with persons certified by the commission.

Frank Trumbull, chairman of the board of directors of the Chesapeake & Ohio, has been made chairman of the committee on immigration recently organized by the Chamber of Commerce of the United States. Mr. Trumbull's associates on the committee are: Julius Rosenwald, Sears-Roebuck Company, Chicago, Ill.; J. F. Denechaud, chairman, Louisiana Immigration Commission, New Orleans, La.; B. J. Rothwell, president, Bay State

Millington Company, Boston, Mass.; Malcolm McDowell, formerly vice-president Southern Development Company, Washington, D. C.; B. L. Winchell, traffic director, Union Pacific, Chicago, Ill.; Herbert Myrick, editor, New England Homestead, Springfield, Mass.; A. C. Weiss, publisher, Duluth Herald, Duluth, Minn. It is expected that in the near future other names will be added to the committee.

Keswick Collision

An officer of the Baltimore & Ohio calls our attention to an error in the *Railway Age Gazette* train accident record for November, printed December 24, page 1201, where a rear collision at Keswick, Va., on the Chesapeake & Ohio, November 2, is entered as occurring on the Baltimore & Ohio.

American Association of Railroad Superintendents

The executive and advisory committee of the American Association of Railroad Superintendents, at its meeting on Monday at St. Louis, decided to hold the 1916 annual meeting of the association at Memphis, Tenn., on August 16, 17 and 18. The membership of the association has more than doubled during the past year.

High Water Carries Out Falsework at the Memphis Bridge

On the night of December 23 high water carried out 418 ft. of falsework for the new Harahan bridge across the Mississippi river at Memphis, now being built by the Rock Island, the Missouri Pacific and the "Cotton Belt." This falsework was for the west or 418-ft. semi-suspended span between piers 3 and 4. Fortunately no part of the span had been erected, though the wrecking of the falsework carried with it the traveler, a mule derrick, four hoisting engines and stringers for the highway floor temporarily used as runways for the traveler. At the time of the accident the anchor arm on the east end and the 621-ft. center fixed span had been erected, although falsework is still in place under the latter. The bottom chord and the floor system for the 186-ft. cantilever arm to support the east end of the semi-suspended span were also in place on falsework and the traveler was just about to commence erection of the semi-suspended span. The falsework under the fixed span and cantilever arm did not go out. The accident is the result of unprecedented high water for this time of the year which rose from 13 ft. to 28½ ft. in a few days. The exact extent of the damage will not be known until a fall of water will permit an estimate of the salvage.

Quite a List of Reasons

In the Supreme Court of New Jersey, last week, the Erie Railroad, appealing from an order of the Public Utility Commission requiring the abolition of 15 grade crossings in Paterson within eight years, at an estimated cost of \$3,000,000, argued:

That the act of 1913 is unconstitutional because it confers upon the board arbitrary power to make or refuse to make an order for the alteration of a grade crossing; provides for the taking of property for private use and for public use without just compensation; impairs the obligation of contract as existing between the railroad and the holders of its securities, between the state and the railroad and between the railroad and the Public Service Railway Company, also involved in the proceedings; constitutes an unreasonable exercise of the police power of the state; requires changes in the property of private corporations and municipalities; fails to give the Erie the alternative of eliminating the alleged danger to the public and impediment to travel by either decreasing the number of train movements or by abandoning the railroad; and impairs the powers of the equity and law courts of the state. Last, but not least, it was stated that the Erie has not the funds to carry out the provisions of the order and in all probability will not be in a position to obtain them.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, date of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.**—F. A. Pontious, 455 Grand Central Station, Chicago. Next meeting, January, 1916, Atlanta, Ga.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.**—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.**—F. J. Angier, Supt. Timber Preservation, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 18-20, 1916, Chicago.
- CANADIAN RAILWAY CLUB.**—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.**—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.**—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.**—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.**—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.**—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.
- NEW ENGLAND RAILROAD CLUB.**—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.
- NEW YORK RAILROAD CLUB.**—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.
- NIAGARA FRONTIER CAR MEN'S ASSOCIATION.**—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.**—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
- RAILROAD CLUB OF KANSAS CITY.**—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.
- RAILROAD MEN'S IMPROVEMENT SOCIETY.**—J. B. Curran, Erie R. R., 50 Church St., New York. Meetings, alternate Thursdays, October to May, Assembly Rooms of Trunk Line Association, 143 Liberty St., New York.
- RAILWAY BUSINESS ASSOCIATION.**—Frank W. Noxon, 30 Church St., New York. Annual meeting, January 27, 1916, Waldorf-Astoria Hotel, New York.
- RAILWAY CLUB OF PITTSBURGH.**—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.
- RICHMOND RAILROAD CLUB.**—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.
- ST. LOUIS RAILWAY CLUB.**—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
- SALT LAKE TRANSPORTATION CLUB.**—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.**—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.
- TOLEDO TRANSPORTATION CLUB.**—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.
- TRAFFIC CLUB OF NEWARK.**—Roy S. Rushy, Firemen's Bldg., Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, 559 Broad St., Newark.
- TRAFFIC CLUB OF NEW YORK.**—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.
- TRAFFIC CLUB OF PITTSBURGH.**—D. L. Wells, Gen'l Agt., Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings, bi-monthly, Pittsburgh.
- TRAFFIC CLUB OF ST. LOUIS.**—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings, October to May.
- TRANSPORTATION CLUB OF DETROIT.**—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.
- UTAH SOCIETY OF ENGINEERS.**—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.
- WESTERN CANADA RAILWAY CLUB.**—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.
- WESTERN RAILWAY CLUB.**—J. W. Taylor, 1112 Karpen Building, Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.
- WESTERN SOCIETY OF ENGINEERS.**—E. N. Layfield, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

Traffic News

In West Virginia, where a new prohibitory law is in operation, the principal railroads are trying to carry out an order of the court forbidding the acceptance of baggage of passengers whenever the trunk or bag offered baggage contains intoxicating liquor.

The Oregon Short Line has issued an announcement that after February 15, 1916, the Ogden gateway will be closed to through passenger traffic by way of the Denver & Rio Grande. This action is in accordance with a ruling of the Interstate Commerce Commission made last summer.

The Missouri roads have filed with the State Railroad Commission an application for a rehearing of the intrastate rate case. They complain that both freight and passenger rates are too low, and ask that they be raised to the basis of the rates recently authorized by the Interstate Commerce Commission, for interstate traffic in Missouri and adjacent territory.

The annual comparative statement of lake commerce passing through the canals at Sault Ste. Marie, Mich., and Ontario for the seasons of 1914 and 1915 shows a total of 71,290,304 tons in 1915, as compared with 55,369,934 in 1914—an increase of 29 per cent. Of the freight traffic in 1915 63,548,993 tons passed through the United States canal and 7,741,311 through the Canadian canal.

At the annual meeting of the Salt Lake City Passenger Association, held on December 18, the following officers were elected: President, C. L. McFaul, district freight and passenger agent, Southern Pacific; first vice-president, F. J. Bambach, traveling passenger agent, New York Central Lines; second vice-president, R. D. Staley, traveling passenger agent, Rock Island Lines; secretary and treasurer, J. S. Earley, city passenger agent, San Pedro, Los Angeles & Salt Lake.

The following have been elected members of the railroad subdivision of the Ways and Means Committee of the Chicago Association of Commerce: Chairman, J. C. Clair, industrial and immigration commissioner, Illinois Central; vice-chairman, James Webster, assistant freight traffic manager of the New York Central Lines; F. A. Spink, traffic manager of the Chicago & Western Indiana; C. H. Caswel, general agent of the Chicago, Rock Island & Pacific; and W. H. Wharton, commercial agent, Nashville, Chattanooga & St. Louis.

The baggage and milk department of the Baltimore & Ohio has been enlarged. John P. Dugan is general baggage and milk agent, and W. E. Shetrone, an experienced dairyman, is to be traveling milk agent. The company aims to assist farmers adjacent to its lines in bettering the economic methods of selecting dairy cattle and feeding their herds. Mr. Shetrone is a graduate of Pennsylvania State College, and since his graduation has been in charge for two years of the Bradford County Cow-Testing Association, at Le Royville, Pa. His headquarters will be at Baltimore.

Officers of the International Railways of Central America and the National Railways of Mexico are making preparations looking to the inauguration of through freight and passenger traffic between Mexico and Guatemala. They expect to run through sleeping cars between the capitals of the two countries. The Guatemala Central division of the International Railways of Central America was completed to a connection with the Pan-American division of the National Railways of Mexico at Ayutla several months ago, but on account of the bad condition of internal affairs of Mexico no interchange of cars was permitted.

In the United States District Court of Kansas City, Mo., December 21, a fine of \$40 was imposed on the Richards & Conover Hardware Company of Kansas City, for violation of the interstate commerce law in misbilling freight as hardware when the packages contained articles which should take a higher rate. This company, with two others, was indicted by the grand jury November 12, on information filed by the Interstate Commerce Commission.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

1915 Western Rate Advance Case—Part II

Rate increases in western classification territory. Opinion by Commissioner Daniels:

Many of the schedules here in issue propose increases in carload rates on various commodities, while others propose increases in less-than-carload rates on some commodities, and still others propose charges for special transportation services, such as switching incident to storage in transit, for which no charge is now made. The general region in which the increases and additional charges are proposed is the same as that involved in the *Western Rate Advance Case* (35 I. C. C., 497). While some of the increases are proposed as part of the general increases proposed in the *Western Rate Case*, others are proposed for the purpose of removing discrimination, or to correct mistakes in tariffs. Those increases here proposed, which were intended as a part of the general increase proposed in the *Western Rate Advance Case* and also the proposed charges for special transportation services, were placed in this docket for investigation rather than in the *Western Rate Advance Case*, for the reason that the effort was made to constitute that investigation "one of the propriety of increased rates which the carriers seek to impose upon a relatively small number of articles of heavy movement in the territory affected." The testimony heard in that proceeding relating to the financial needs of the carriers was made a part of the record in this case.

The commission finds that the carriers have justified increased carload rates on agricultural implements except to points in Louisiana and on canned goods and flue lining in western trunk line territory. They have not justified proposed increased carload rates on eggs from points in Kansas and other points to southwestern points, and on cider vinegar from interstate points to Kansas and Missouri. Proposed increased carload rates on bauxite ore to certain points only are found justified. The carriers may increase their carload rates on boots and shoes, leather, and boot and shoe findings between Missouri manufacturing points and interstate points, but not their less-than-carload rates between the same points or their carload minima on this traffic.

The carriers have also justified proposed increased rates on dried and evaporated fruits in portions of western trunk line territory; proposed increased carload rates on furniture from Kansas City and other points to Oklahoma, groups 6, 7 and 8; proposed charges for switching "run-by and setback" grain; proposed transit charges on fruits and vegetables in western trunk line and trans-Missouri territory and some of the proposed increases upon miscellaneous items. They have not justified a proposed readjustment of rates to Louisiana; proposed increases in carload rates on furniture from Kansas City and other points to Oklahoma, group point 9. Proposed increased less-than-carload rates to and from manufacturing points in Missouri on various commodities are found unlawful when made to vary with the quantity shipped.

COURT NEWS

The Supreme Court of Alabama by a vote of four to three has decided a case in the long-drawn-out litigation between the Louisville & Nashville and the Western Union Telegraph Company, against the telegraph company, holding that on certain divisions of the road, which figure in this case, there is no public necessity justifying the court in forcing the railroad to allow the telegraph company to continue the use of its right of way.

In the United States District Court at Buffalo, N. Y., December 17, the Northern Central Railway (Pennsylvania) was found guilty on 17 counts of paying illegal rebates on large quantities of coal shipped by the Mineral Railroad & Mining Company. In the same court, December 23, the Delaware, Lackawanna & Western Coal Company, indicted for illegal reduction in rates for transportation of coal by means of improper reduction of the rental charged the coal company by the railroad company, for the use of trestles at Buffalo, were acquitted by the jury.

Railway Officers

Executive, Financial, Legal and Accounting

Stewart C. Pratt has been appointed assistant general solicitor of the Lehigh Valley, with office at New York.

Woodward Hudson, counsel of the Boston & Albany, at Boston, Mass., has been appointed vice-president and general counsel of the Boston & Maine, with office at Boston, Mass. Effective January 1.

Walter D. Owens, chief clerk to the controller and secretary of the valuation committee of the Baltimore & Ohio, has been promoted to auditor of subsidiary lines of the Baltimore & Ohio, with headquarters at Baltimore, Md., succeeding J. L. Kirk, deceased.

G. N. Orcutt, assistant to president of the Erie at New York, has been elected a vice-president in charge of the purchasing, land and tax and federal valuation departments, with headquarters at New York. G. A. Richardson, vice-president at New York in charge of the financial and accounting departments, has resigned, effective January 1, 1916.

Operating

J. J. Prentice has been appointed assistant superintendent of the western division of the Chicago, St. Paul, Minneapolis & Omaha, with headquarters at St. James, Minn., vice Peter Cope land assigned to other duties. E. R. Gorman has been appointed trainmaster of the northern division, with headquarters at Spooner, Wis. Effective December 22.

John B. Dickson, general superintendent of the Erie at Cleveland, Ohio, has been appointed general manager of the lines west, with office at Cleveland. Franklin G. Robins, division superintendent at Buffalo, N. Y., has been appointed general superintendent of the lines west, with office at Youngstown, Ohio. Charles P. Eckels, division superintendent at Susquehanna, Pa., has been appointed superintendent of the Buffalo division at Buffalo, N. Y., and Joseph W. Foote, trainmaster at Susquehanna, Pa., has been appointed superintendent of the Delaware division, with office at Susquehanna, effective January 1, 1916.

The Chicago, Rock Island & Pacific has changed its operating organization and will have two instead of three districts, the second district being abolished. The new first and second districts will have their headquarters at Des Moines, Ia., and El Reno, Okla., respectively. The Nebraska and Colorado divisions are added to the first district, and the St. Louis, the Kansas City Terminal, the Kansas, and the El Paso divisions will be added to the new second district. A. E. Sweet, general manager of the second district, has resigned, to go to the Denver & Rio Grande, as reported last week. G. W. Rourke, assistant general manager of the second district, goes to El Reno to become assistant general manager of the new second district, succeeding A. B. Copley, deceased. C. W. Jones remains general manager of the first district as enlarged. T. H. Beacon, general manager of the old third, is general manager of the new second district. The other officers of the present first and second districts have their authority extended correspondingly. F. T. Beckett is engineer of maintenance of way of the new second district, and R. L. Stewart, mechanical superintendent.

Traffic

John T. Monroe has been appointed assistant general passenger agent of the Sunset-Central Lines, with office at Houston, Tex.

E. R. Whelen, general agent of the Cleveland, Cincinnati, Chicago & St. Louis at Cincinnati, Ohio, has been transferred to Chicago, Ill.

A. P. Johnson has been appointed division passenger agent of the St. Louis & San Francisco with office at Memphis, Tenn., effective January 1.

G. P. Ruickbie has been appointed district freight agent of the Canadian Pacific, Eastern division, at Ottawa, Ont., vice J. J. Kelly, acting district freight agent, transferred.

William L. Donaldson, assistant to general freight agent of the Lehigh Valley at New York, has been appointed assistant general freight agent, with headquarters at Buffalo, N. Y., succeeding Samuel A. Story, resigned to go into other business.

George A. Walton, general agent of the Canadian Pacific at Chicago, has been appointed general passenger agent with office at Winnipeg, Man., succeeding A. C. Shaw; T. J. Wall, general agent at Minneapolis, Minn., succeeds Mr. Walton as general agent at Chicago.

J. H. R. Parson, general passenger agent of Morgan's Louisiana & Texas Railroad & Steamship Company, with office at New Orleans, La., has been appointed general passenger agent of the Sunset-Central Lines of the Southern Pacific, with office at Houston, Tex.

C. E. Stone, general traffic manager of the Great Northern Pacific Steamship Company at San Francisco, Cal., has been appointed passenger traffic manager of the Great Northern. H. A. Noble, general passenger agent of the Great Northern, has been appointed general manager of the Glacier Park Hotel Company, effective January 1.

Engineering and Rolling Stock

Robert S. Parsons, general manager of the Erie, at Cleveland, Ohio, has been appointed chief engineer, with office at New York.

I. C. Newmarch, general foreman in the Collinwood, Ohio, locomotive shops, of the New York Central, has been appointed superintendent of shops, with headquarters at Collinwood locomotive shops, vice R. H. Montgomery, deceased.

O. S. Beyer, Jr., general foreman of the Horton, Kan., shops of the Chicago, Rock Island & Pacific, has been appointed first assistant in the engineering experiment station in the department of railway engineering of the University of Illinois.

H. C. May, superintendent of motive power of the Chicago, Indianapolis & Louisville, has been appointed to the same position on the Lehigh Valley, with office at South Bethlehem, Pa., succeeding F. N. Hibbits, resigned. Mr. May's first railroad service was with the Chesapeake & Ohio at Covington, Ky., where he served as machinist apprentice from 1892 to 1896. He was then machinist for three years at the same place. In 1899 he became a student in the Mechanical Engineering School of Purdue University at Lafayette, Ind., from which he graduated in 1902. He was then appointed master mechanic on the Cleveland, Cincinnati, Chicago & St. Louis at Louisville, Ky., remaining in that position until 1907. From 1907 to 1910 he served on the Louisville & Nashville as master mechanic at New Decatur, Ala., and at South Louisville, Ky., and since 1910 was superintendent of motive power of the Chicago, Indianapolis & Louisville.

OBITUARY

William C. Hayes, superintendent of locomotive operation of the Erie, at New York, died on December 25 at his home in New York.

Arthur A. Hurd, special counsel in Kansas of the Atchison, Topeka & Santa Fe, died at his home in Topeka on December 20, at the age of 66.

O. T. Maier, vice-president and general manager of the New Orleans, Southern & Grand Isle, committed suicide at New Orleans, La., on December 20.

George V. Sueden, engineer maintenance of way of the New York & Long Branch at Long Branch, N. J., died on December 24, at his home in Red Bank at the age of 60.

A. W. Swanitz, formerly chief engineer and manager of the Alaska Northern, with headquarters at Seward, Alaska, died at Alameda, Cal., on December 22. He participated in the construction of a number of railroads in various parts of the country.

Homer Eads, formerly division superintendent of the International & Great Northern at San Antonio, Tex., died in that city on December 19. He resigned his position with the railroad in September, 1911, and since that time has been engaged in private business enterprises.

Equipment and Supplies

LOCOMOTIVES

THE MINERAL RANGE is inquiring for 2 consolidation locomotives.

THE CAMBRIA STEEL COMPANY has ordered 2 six-wheel switching locomotives from the Baldwin Locomotive Works.

THE LEHIGH & NEW ENGLAND has ordered 4 switching and 1 consolidation locomotives from the Baldwin Locomotive Works.

THE RICHMOND, FREDERICKSBURG & POTOMAC has ordered 4 Pacific type locomotives from the Baldwin Locomotive Works.

THE EAST TENNESSEE & WESTERN NORTH CAROLINA has ordered one ten-wheel locomotive from the Baldwin Locomotive Works.

THE NORFOLK SOUTHERN, reported in last week's issue as having ordered 4 consolidation locomotives from the Baldwin Locomotive Works, has increased this order to 6 locomotives.

THE INTER-URBAN RAILWAY has ordered one 60-ton electric locomotive from the McGuire-Cummings Manufacturing Company. The electrical equipment will be supplied by the Westinghouse Electric & Manufacturing Company.

FREIGHT CARS

THE SOUTH DAKOTA CENTRAL is asking prices on 2 refrigerator cars.

THE ANACONDA COPPER COMPANY has issued inquiries for 100 hopper cars.

THE BESSEMER & LAKE ERIE is reported as contemplating the purchase of 2,000 ore cars.

THE VIRGINIAN has given the Standard Steel Car Company an order to repair 250 box cars.

THE DIAMOND ALKALI COMPANY has ordered one tank car from the Pressed Steel Car Company.

THE UNITED STATES NAVY has ordered 2 tank cars from the German-American Car Company.

THE MINERAL RANGE has ordered 100 rock cars from the American Car & Foundry Company.

THE ILLINOIS CENTRAL has withdrawn its inquiry for 1,500 center sills mentioned in the issue of December 17.

EAST BROAD TOP.—The item in last week's issue to the effect that this company is in the market for 5 narrow gage hopper cars has been denied.

THE TUCSON, CORNELIA & GILA BEND has ordered 2 6,000-gal. tank cars from the German-American Car Company and 4 50-ton flat and 2 50-ton box cars from the McGuire Cummings Manufacturing Company.

THE UNION PACIFIC, reported in last week's issue as being in the market for box and stock cars, has issued inquiries for 1,500 box and 500 stock cars, but it is understood that the company intends to make total purchases of 4,000 cars.

DELAWARE & HUDSON.—It is reported, but not confirmed, that this company, which was reported in the *Railway Age Gazette* of December 3, as being in the market for 1,000 underframes, has ordered these underframes from the American Car & Foundry Company.

PASSENGER CARS

THE SOUTH DAKOTA CENTRAL is inquiring for 2 coaches.

THE BOSTON & MAINE has issued inquiries for 2 combination baggage and mail cars.

THE EAST BROAD TOP RAILROAD is contemplating the purchase of 4 or 5 second hand narrow gage coaches.

THE NATIONAL RAILWAY OF MEXICO are reported to have ordered 30 sleeping and dining cars from the Pullman Company.

THE BOSTON & ALBANY will install steel underframes on 20 wooden coaches and 13 wooden baggage cars. See also New York Central.

THE CHESAPEAKE & OHIO, reported in the *Railway Age Gazette* of December 10 as being in the market for 12 express cars and 6 coaches, will also buy 2 chair cars.

THE MISSOURI, KANSAS & TEXAS has ordered 15 70-ft. steel baggage cars, 4 72½-ft. steel dining cars and 2 60-ft. steel postal cars from the American Car & Foundry Company.

THE CHICAGO, BURLINGTON & QUINCY has ordered 8 dining cars, 9 passenger and baggage cars, 15 coaches, 15 chair cars, 2 road and smoking cars and 5 postal cars from the American Car & Foundry Company. All these cars will be of all steel construction.

THE NEW YORK CENTRAL was reported in last week's issue as having placed orders for 105 coaches, as follows: Barney-Smith Car Company, 15 coaches for the Cleveland, Cincinnati, Chicago & St. Louis; Osgood Bradley Car Company, 25 for the Boston & Albany; American Car & Foundry Company, 45 for the New York Central itself, and the Standard Steel Car Company, 20. This report is slightly incomplete in that only 30 of the cars ordered from the American Car & Foundry Company are for the New York Central proper; the remaining 15 are for the Michigan Central. The 20 cars ordered from the Standard Steel Car Company will also be built by the Osgood-Bradley Car Company, and are for the New York Central itself.

IRON AND STEEL

THE LEHIGH VALLEY has placed an order for 2,500 tons of 136-lb. rails.

THE CHICAGO & EASTERN ILLINOIS has ordered 10,000 tons of rails from the Illinois Steel Company.

THE CHICAGO, BURLINGTON & QUINCY has ordered 5,000 tons of rails from the Lackawanna Steel Company.

THE INTERNATIONAL & GREAT NORTHERN has ordered 3,000 tons of rails from the Lackawanna Steel Company.

THE DULUTH, MISSABE & NORTHERN has ordered 469 tons of steel for the Lawrence Lake viaduct at Bovey, Minn., from the American Bridge Company.

MACHINERY AND TOOLS

THE PENNSYLVANIA EQUIPMENT COMPANY, Philadelphia, Pa., is in the market for a shear for cutting sheet bars or skelp, with a capacity of 12 in. in width and one inch thick. The shearing will be done cold. A 19-in. blade will be adequate.

THE NEW YORK CENTRAL has recently issued inquiries for a 42-in. car wheel boring machine, a double axle lathe, a 400-ton double end wheel press and a 6-in. forging machine for its shops at Air Line Junction, Ohio, and for a combination punch and shear for the shops at Englewood, Ill.

LIGHT RAILWAYS ON THE WESTERN FRONT.—From an article which recently appeared in one of the London papers it appears that the backbone of the German railway system in Champagne, the Bazancourt-Challerange line, is now within range of the French batteries, but this line has the advantage of being linked up with a comprehensive network of light railways. The German trains are run so near to the actual firing line "that their locomotives can at times be heard in the night." Tunnels have even been built in the danger zone for the handling of this traffic. Light railways of this nature are stated to have been laid throughout Belgium and the occupied districts of France with the object of relieving the pressure on the highways and of releasing cars for service in the Eastern theater of war, where the railway facilities are inferior. A uniform method of construction has been employed. The rails are light, but of high grade steel, laid on steel ties. They are built up in sections, which can thus be laid in a "ready-made" condition, so to speak. It is this feature which permits of track laying on level ground at the rate of some ten miles a day, which may be taken as equivalent to the average daily advance of an army. The lines are, of course, narrow gage, but the passenger cars can seat five people a side.

Supply Trade News

E. F. Carry, first vice-president and general manager of the American Car & Foundry Company has been elected president of the Haskell & Barker Car Company of Michigan City, succeeding Mr. W. T. McBride. Mr. Carry has been associated with the American Car & Foundry Company or its predecessors since 1888, and vice-president of the company since its formation in 1899.

The Economy Devices Corporation, New York, has opened a western office at room 1634, McCormick building, Chicago, under the management of Joseph Siukler.

Warren Moore Osborn has been appointed representative for the Track Specialties Company, New York in the Chicago district with headquarters in the McCormick building in that city.

Graham Fraser, from 1904 until a short while ago director of the works of the Dominion Iron & Steel Company, and a director of the company, died recently at New Glasgow, N. S.

The Roberts & Schaefer Company, Chicago, have recently been awarded a contract for a 300-ton capacity, two-track automatic counterbalanced bucket locomotive coaling plant by the Chesapeake & Ohio for installation at Paintsville, Ky.

John C. Neale has been appointed general manager of sales of the Midvale Steel Company and the Worth Brothers Company. As such he will have complete charge of all sales matters. His office will be in the Widener Building, Philadelphia.

The Pilliod Company, New York, has received orders during the past 10 days for Baker valve gear to replace the Stephenson gear on 59 old engines. Included are orders from the Santa Fe; the Erie; Norfolk & Western; Pittsburgh & Lake Erie; New York, Ontario & Western, the Illinois Central, and the New York Central.

The American Mason Safety Tread Company, Lowell, Mass., announces that, effective January 1, 1916, Joseph T. Ryerson & Son, of Chicago, will act as general western distributors for its various types of Mason safety treads. A large stock of both lead and carborundum filled tread will be carried in stock for immediate deliveries.

Because of changes in the organization of Pierson, Roeding & Co., San Francisco, Cal., who have acted as the sales agents of the Electric Storage Battery Company of Philadelphia on the Pacific coast since 1910, the Battery Company will hereafter conduct its business on the coast through George R. Murphy, soliciting agent. Mr. Murphy will have offices in the Rialto building, 118 Montgomery street, San Francisco.

The Poland-Miller is a new company which has been organized with offices in the Erie building, Cleveland, Ohio, to conduct a general engineering business and to specialize in the design and inspection of coal, coke and ore handling machinery, docks and industrial plants. The company consists of J. F. Poland, formerly associated with the Brown Hoisting Machinery Company, and recently with the J. W. Frazier Company, in each case in the capacity of civil and structural engineer, and R. E. Miller, recently mechanical and electrical engineer of the J. W. Frazier Company.

William Claflin Andrews, advertising manager of the Edison Storage Battery Company, Orange, N. J., died in New York City, December 21. Mr. Andrews was a graduate of Columbia University. He was for a time sales engineer of the Stanley Instrument Company, Great Barrington, Mass., and later became connected with the General Electric Company in Schenectady, N. Y. and Harrison, N. J. He was for two years secretary of the Rae Company, New York, leaving to join the Edison Storage Battery Company in April, 1913, where he was advertising manager until his death.

The directorate of the Haskell & Barker Car Company, which company was recently organized, as noted in last week's issue, by a syndicate headed by Potter, Choate & Prentice and F. B. Keech & Co., will include Ambrose Monell, president of the International Nickel Company; William E. Corey, president of the Midvale Steel & Ordnance Corporation; Frank A. Vanderlip,

president of the National City Bank of New York; Edwin S. Webster, member of the firm of Stone & Webster; John Movrin, president of the Atlas Portland Cement Company; J. W. Harriman, president of the Harriman National Bank, and Arthur O. Choate, member of the firm of Potter, Choate & Prentice. The remaining members have not yet been chosen.

W. L. Conwell, vice-president and treasurer of the Transportation Utilities Company, New York, has been appointed assistant to the president of the Safety Car Heating & Lighting Company, effective January 1. Mr. Conwell has been in the service of the Transportation Utilities Company since 1911. He was born at Covington, Ky., January 25, 1887. He received his education in the public schools of Philadelphia and at the University of Pennsylvania, from which he graduated in 1898 with the degree of electrical engineer. He then passed the examinations for first assistant engineer for the United States Navy, but received no appointment because of the cessation of hostilities. He was employed in contracting work as a time-keeper for the Tennis Construction Company, Philadelphia, becoming later chief engineer and secretary of the company. In 1901 he resigned to become city salesman of the Westinghouse Electric & Manufacturing Company in New York. He was later placed in charge of the isolated plant department of the company, and for five years, ending in 1911, was engaged in railway work. In that year he became vice-president of the Transportation Utilities Company.

W. L. Conwell

Paul M. Lincoln, for over 23 years connected with the operating and engineering activities of the Westinghouse companies, will on January 1 become associated with the sales department of the Westinghouse Electric & Manufacturing Company, with the title of commercial engineer. Mr. Lincoln, shortly after his graduation from Ohio State University in 1892, entered the employ of the Short Electric Company in Cleveland. He then went to the Westinghouse Electric & Manufacturing Company, and was engaged in the testing-room, and in general engineering work. When the plant of the Niagara Falls Power Company was opened he became its electrical superintendent, and as such had much to do with the first transmission line to Buffalo. In 1902 he returned to the Westinghouse Company, specializing on the general engineering of power stations and transmission lines. He was for several years in charge of the power engineering department, but was transferred to the engineering department when that was organized. Mr. Lincoln is well known in engineering circles through his active work in the American Institute of Electrical Engineers of which at one time he was president. He is a well-known writer on technical subjects and has also been identified with educational work for some time,

filling the chair of professor of electrical engineering at the University of Pittsburgh.

Kelly, Cooke & Co. have recently opened offices in the Drexel building, Philadelphia, to conduct a general engineering practice in the public utility and industrial fields. Their organization is equipped for the design and supervision of construction for railroads, light and power properties and industrial plants, engineering reports, appraisals and rate developments for public utilities. The firm also investigates industrial situations to develop ways and means for reducing manufacturing costs. William F. Kelly, senior member, received the degree of Mechanical Engineer from the University of Pennsylvania in 1893. For several years thereafter he was on the engineering staff of the Union Traction Company of Philadelphia and from 1901 to 1915 was a member of the staff of Ford, Bacon & Davis, acting as engineer in charge of several of their larger operations, including the construction and reconstruction of the Knoxville Railway & Light Company and the Birmingham Railway, Light & Power Company. Charles B. Cooke, Jr., was also graduated from the University of Pennsylvania and entered the shops of the Westinghouse Machine Company, East Pittsburgh, working up finally to the position of assistant commercial engineer of the company, which position he occupied for two years prior to joining the staff of Ford, Bacon & Davis. During his connection with the latter firm Mr. Cooke specialized on financial engineering reports and also had personal charge of a number of important rate developments and reports for public utility companies.

delphia, becoming later chief engineer and secretary of the company. In 1901 he resigned to become city salesman of the Westinghouse Electric & Manufacturing Company in New York. He was later placed in charge of the isolated plant department of the company, and for five years, ending in 1911, was engaged in railway work. In that year he became vice-president of the Transportation Utilities Company.

TRADE PUBLICATIONS

ELECTRICAL APPARATUS.—One of the recent publications of the railway and lighting department of the Westinghouse Electric & Manufacturing Company is an illustrated booklet containing a paper presented before the Railway Club of Pittsburgh by E. M. Herr, entitled "Notes on Electric Power Development."

BOILERS.—One of the recent booklets issued by the Harrison Safety Boiler Works, Philadelphia, Pa., is a reprint of an article by George H. Gibson on the subject, "Establishing and Maintaining Boiler Room Economy." The paper is taken from a recent issue of the Journal of the Ohio Society of Mechanical, Electrical and Steam Engineers.

ELECTRICAL APPARATUS.—The Esterline Company, Indianapolis, Ind., in its recently issued bulletin No. 365 describes the new line of Esterline graphic meters. These instruments are intended for checking up voltage and current on alternating current circuits and have been designed for use where the usual high price of graphic meters may possibly be prohibitive.

LOCOMOTIVES.—Bulletin No. 1, recently issued by the Lima Locomotive Corporation, contains illustrations and general descriptions of a number of locomotives which the company has built for representative railroads. Included are the Erie Pacific, Mikado and six-wheel switching locomotives, a Duluth & Iron Range Mikado locomotive, a Pennsylvania Lines West six-wheel switching locomotive, a Lackawanna eight-wheel switching locomotive, etc.

CORK INSULATION.—The Armstrong Cork & Insulation Company, Pittsburgh, Pa., has issued a 152-page book describing its Nonpareil corkboard insulation. This book, which is prepared in an attractive manner, describes briefly the preparation of cork and more in detail the merits of this material for different purposes and tests to which it has been subjected. Nearly one-half the book is devoted to specifications covering the methods of erecting Nonpareil corkboard for a wide variety of conditions. The book is well illustrated with photographs of typical installations of this material.

WELDING.—The Goldschmidt Thermit Company, 90 West street, New York, has recently issued three attractive bulletins relative to the Thermit process of welding. One is a folder, treating in a somewhat general way of the subject of locomotive repairs. The other two are much more elaborate and are entitled, respectively "Thermit Locomotive Repairs" and "Thermit Mill and Foundry Practice." These books contain instructions for the use of Thermit and are illustrated with drawings and other views showing the necessary steps to be taken. There are also a number of views showing the results which may be obtained.

P. M. Lincoln

returned to the Westinghouse Company, specializing on the general engineering of power stations and transmission lines. He was for several years in charge of the power engineering department, but was transferred to the engineering department when that was organized. Mr. Lincoln is well known in engineering circles through his active work in the American Institute of Electrical Engineers of which at one time he was president. He is a well-known writer on technical subjects and has also been identified with educational work for some time,

Railway Construction

ALABAMA ROADS.—Bids were received recently, it is said, by the Bell Lumber Company for grading about three miles of a seven-mile lumber line. The Alabama Engineering Corporation, C. M. Ayres, president, Tuscaloosa, Ala., will locate and supervise the construction of the line.

GRAHAM COUNTY RAILROAD.—According to press reports, a contract has been given to the Wright-Johnston Construction Company, Andrews, N. C., to grade 12 miles between Topton, N. C., and Robbinsville. The headquarters of the company are at Andrews. The Graham County Lumber Company is said to be interested in the project. (October 29, p. 828.)

GUTHRIE-EDMOND (ELECTRIC).—Incorporated in Oklahoma with \$500,000 capital, it is said, to build an extension of the Oklahoma Railway from Edmond, Okla., north to Guthrie, 15.5 miles. The incorporators include B. Shartel, G. B. Treat and E. J. Reichart, Oklahoma City.

LUTCHER & MOORE LUMBER COMPANY.—This company will extend its present logging railroad from its northern terminus in Louisiana 35 miles northeast to the vicinity of Stables, La. The road is now about 35 miles long and extends from Sabine river at Nibett's Bluff into the adjacent lumber country. The extension will cross the Gulf, Colorado & Santa Fe near Merryville, La. At present the southern terminus of the road, Nibett's Bluff, is 18 miles from the company's mills at Orange, Tex., and it is planned eventually to lay track over this distance also. The work has not yet passed the survey stage.

NEW BRUNSWICK ROADS.—Application has been made to the Legislature for a guarantee of \$20,000 a mile to build a railway from a point on the Canadian Pacific to connect with Beaver Harbor, N. B., Black's Harbor, LeTang and Eastport, Maine. L. Connors, president of Connors Brothers, Limited, Black's Harbor, N. B., is back of the project.

NEW YORK SUBWAYS.—The New York Public Service Commission, First district, will advertise for bids, to be opened January 14, for the construction of Section No. 2-A of Route No. 12, a part of the Broadway-Fourth Avenue Rapid Transit Railroad. Section 2-A extends from Prospect Park plaza at Flatbush avenue to a point at the intersection of Flatbush avenue, Ocean avenue and Malbone street in the borough of Brooklyn. It will be a two-track line and will connect with the Brighton Beach railroad at Malbone street. The commission also authorized the New York Municipal Railway Corporation to award the contract for the reconstruction of the Brighton Beach line, to connect with this section of the subway, to the Inter-Continental Construction Company, the lowest bidder. The work will cost over \$1,900,000, and is to be completed within 24 months.

NORFOLK & WESTERN. This company plans to carry out during 1916 second track work between Walton, Va., and Ripplemead, on 8.65 miles.

OKLAHOMA RAILWAY.—See Guthrie-Edmond.

SALEM & PENNSGROVE TRACTION.—The Board of Public Utility Commissioners of New Jersey has approved the general plan of this company for the construction of an electric line from Salem, N. J., north via Pennsville to Pennsgrove, about 12 miles. It is understood that construction work will be started at once from the Pennsgrove end. A. B. Smith, secretary and treasurer of the Smith Davis Lumber Company, Salem, N. J., is interested. (September 3, p. 419.)

SAVANNAH & NORTHWESTERN.—The Savannah & Atlantic has been incorporated with \$500,000 capital, it is said, to build the extension of the Savannah & Northwestern from St. Clair northwest about 35 miles. (October 8, p. 670.)

SOUTH BOSTON INDUSTRIAL TRACK.—Under this name work is now being carried out on a 2-mile railway from a point on the New York, New Haven & Hartford South Boston to the waterfront. Track has already been laid on one mile. The New York, New Haven & Hartford and F. T. Ley & Co., Inc., are carrying out the work.

STATEVILLE AIR LINE. Grading work is now under way from Stateville, N. C., to Mt. Airy, 62 miles. The work is being carried out from Stateville north, and has already been completed on a section of about 20 miles. D. M. Ausley, treasurer and general manager, Stateville, N. C. (July 2, p. 39.)

TEXAS ROADS (ELECTRIC).—The Pecos Valley Railroad Association, Buenavista, Tex., plans to build a gas-electric interurban line from a point on the Kansas City, Mexico & Orient in Texas, northwest up the Pecos Valley in Pecos county for 25 or 35 miles. Such a line would supply railway facilities for the Imperial, Zimmerman and Grand Falls irrigation systems. The line will probably be extended later up the valley to connect with other railroads. V. L. Sullivan, chairman, Buenavista, Tex. (See Texas Roads, Oct. 29, p. 829.)

TORONTO, HAMILTON & BUFFALO.—Surveys are now being made to build an extension of the Dunnville branch from Dunnville, Ont., to Port Maitland, 3.12 miles.

VANDALLA.—This railroad has begun the construction of additional tracks at Rose Lake Yard, Ill., which will increase the capacity of the yards for handling cars about 50 per cent, and will cost about \$80,000. The new tracks will measure 33,710 ft., and will be apportioned as follows: A westward running track between Rose Lake Yard and Willows, three repair yard tracks, extension of one repair yard track, four westward storage tracks, a caboose track, a wreck train track, five tracks in the eastward yard, a stock car cleaning track, necessary cross-overs and ladder tracks. The work is being done by a force of 100 men, and will be completed early in January. F. T. Hatch, chief engineer.

YELLVILLE-RUSH & MINERAL BELT.—Incorporated in Arkansas with \$140,000 capital, it is said, to build a 19-mile line through Yell county, Ark. It is understood that work will be started early in 1916 on the line. J. C. Shepard, president, Rush, Ark.

RAILWAY STRUCTURES

BUTTE, MONT.—The Chicago, Milwaukee & St. Paul is preparing plans for a new passenger station. The depot will be used also by the Butte, Anaconda & Pacific.

HOUSTON, TEX.—This city will soon begin the construction of railway yards near the turning basin of the Galveston-Houston ship canal on the south side of the bayou. As soon as the yards are completed a switch-engine will be purchased, and all cars over the municipal wharves, most of which are already constructed, will be handled by the city.

JERSEY CITY, N. J.—The Lehigh Valley is building, at its Jersey City terminal, a new open pile pier, 580 ft long by 67 ft. wide. This pier is to have five tracks. Freight can be loaded direct from the cars to lighters or small vessels. In addition, two other piers are being remodelled at the same location. The total cost of these improvements will be about \$100,000.

LOUISVILLE, KY.—The Pennsylvania Lues West contemplate reconstructing the bridge crossing the Ohio river here. The present structure is a mile in length and carries a single track; it consists of a draw span over the canal, a 370-ft. through span called the Kentucky Chute, a 400-ft. through span for the Indiana Chute, and a succession of deck truss spans with spans ranging from 149½ ft. to 245½ ft. The entire structure eventually will be rebuilt to carry two tracks, according to the plans of the company, but the work has been divided into five parts and the five spans at the Indiana end of the bridge, comprising a length of about 790 ft., will be reconstructed first.

PENROSE, COLO.—The Beaver, Penrose & Northern has completed a combination engine-house and pumping station. The building is of cement and timber construction, 60 ft. by 170 ft. Cost, \$4,000. G. E. Whitlock, engineer.

PERTH AMBOY, N. J.—The Lehigh Valley is rebuilding its old clay pier at Perth Amboy. When completed, this pier will be 825 ft. long by 69 ft. wide, and will cost \$105,000.

SAN ANTONIO, TEX.—Work on new yards and shops to be constructed for the International & Great Northern on an 80-acre tract purchased recently, will begin on January 1. Rails and material are expected to arrive this week. The plans call for an expenditure of \$250,000.
