FIFTY-NINTH QUARTO VOLUME

From July 1, 1915, to December 31, 1915

Railway Age Gazette

(Established in April, 1856)

SIXTIETH YEAR

139520
20/9/16.

NEW YORK

CHICAGO

CLEVELAND

LONDON

1915

SECOND HALF

INDEX

Fifty-ninth Quarto Volume—July 1, 1915, to December 31, 1915.

[Space forbids making the index of the *Railway Age Gazette* so detailed as to show every reference in the entire half year to every detail of every subject. General headings, therefore, are used which are intended to be inclusive, and if the reader fails to find a particular subject under the specific heading with which he connects it in his mind, if he will look under the general subject of which this is a branch he should find the article he is looking for. For instance, one of the articles published during this half year was entitled "Depreciation and Confiscation." This article dealt with the general subject of the Interstate Commerce Commission's accounting rules and in particular with their rules for charging for depreciation on equipment. The article is indexed, therefore, under Accounting—Depreciation and Confiscation. There is also, it might incidentally be mentioned, a cross reference Depreciation—see Accounting.]

AUTHORS

- Acworth, W. M., 725, 1203
Adams, E. E., 1083
Alfred, Frank H., 1184
Allen, P. C., 267
Anderson, C. B., 1005

GENERAL INDEX

[Illustrated articles are indicated thus *; Editorials thus †; Letters to Editor thus ‡.]

A

- Accident (See Automobile; also Safety First):
 Baltimore & Ohio at Belmont, Ohio, 70
 Baltimore & Ohio South Western at Orient, Ohio, 947
 British Statistics for 1914, 131
 Caledonian Ry. at Quintinshill, 653, 703
 Central of Georgia near Columbus, 1020
 Chicago, Milwaukee & St. Paul at Oakwood, Wis., 48
 Chicago, Rock Island & Pacific at Agawam, Okla., 767
 Erie at Otisville, N. Y., 1163
 Explosion at Ardmore, Oklahoma, 614, 703, 935, 973
 French Railways in War Time, 1015
 Highway Crossings, Safety at, 1119†
 I. C. C. Bulletin No. 55, 549†, 560
 I. C. C. Monthly Reports, 272, 695*, 824
 London & Northwestern near Weedon, 1103
 Monthly Summaries: June, 229; July, 328; August, 480†, 503; September, 732; October, 1086; November, 1201, 1256
 North Eastern at Chaloner Whin., 41†, 53
 Philadelphia & Reading at Phoenixville, Pa., 665
 Steamships and Railways, 264†
 Street Railroads of New York City, 1065
 Trespassing:
 Legislation, 453†, 460
 N. Y., N. H. & H. Campaign, 696*
 Southern Railway, Report of, 871
 Statistics, 549†, 560
 Texas Railways, Campaign of, 540
 Union Pacific at Randolph, Kan., 767
 Western Maryland near Thurmont, Md., 327, 373†
 With Railroads It's Different, 726
 Accounting (See also Association of Transportation and Car Accounting Officers; also Valuation):
 Bureau for Clearing Car Repair Accounts, 161*
 Cost Accounting by "Experts," 145†
 Cost of Additions and Betterments: I. C. C. Ruling, 357
 Depreciation and Confiscation, 44†, 311†
 Fiscal Year, Change in, 413†, 949†, 1101, 1234*
 Labor Accounts Distributed, 336†
 Adjuster, Manual Slack, 943*
 Advertising:
 Erie Suburban Cars, 33
 Tourist Transportation, 5†
 Agriculture:
 Live Stock Quarantine, 172, 616, 709
 Railway Development Association's Meeting, 909, 938
 Stock Claims, 280
 Air Brake (See Brake)
 Air Brake Hose (See Hose)
 Alaska: Government Railway, 71, 230*, 703
 Allegheny Construction Company: Tunnel at East Brady, 456*
 American Association of Passenger Traffic Officers: Meeting at French Lick, Ind., 844†, 854, 881†
 American Association of Railroad Superintendents:
 Annual Convention, 379, 451†
 Railroad and the Hoibo., 453†, 460
 American Bankers' Association: Railroads and the People, 1009
 American Bridge Company:
 A. T. & S. Fe at Sibley, Mo., 13*
 C. B. & O. at Kansas City, 263†, 284*
 New York Connecting R. R., 421*, 663, 865*
 American Car & Foundry Company:
 Annual Report, 80
 Truck Frames, Rolled Steel, 331*
 American International Corporation, 1101
 American Locomotive Company:
 Annual Report, 546
 Foreign Orders, 1011*
 Mountain Type for Seaboard Air Line, 87*
 Pacific Type; D., L. & W., 1185*
 American Railway Association:
 Car Service Rules, 209
 Committee on the Prevention of Accidents at Grade Crossings, 1065, 1119†
 Empty Car Movement, Committee on, 210
 Freight Car Surpluses and Shortages, 136, 295, 490†, 709, 928†
 Loss and Damage Payments, 993†, 1013
 Meeting, 947
 Plan for Remedying Freight Congestion, 1078†, 1102
 Tribute to Memory of W. F. Allen, 1020
 American Railway Bridge & Building Association:
 Annual Convention, 741†, 753*, 955*, 960
 Committee Appointments, 1144
 Efficiency in the Bridge and Building Department, 1160
 American Railway Engineering Association:
 Influence on Rails of the Method of Blooming, 1187
 Ingot, Ladle Test, 1196
 Rail Failure Statistics for 1914, 1007*
 Special Steels for Track Work, 741†, 747
 American Railway Master Mechanics' Association: Result of the Letter Ballot, 894
 American Railway Perishable Freight Association: Meeting, Semi-Annual, 513
 American Railway Tool Foremen's Association: Annual Convention, 170, 193
 American Smoke Washing Plant: Locomotive Smoke-washing Plant; N. Y. C., 558*
 American Society for Testing Materials:
 Annual Convention, 31, 41†, 61*
 Rail Specifications, 17
 Test Department; Pennsylvania R. R., 6*
 American Society of Mechanical Engineers:
 Electric Locomotives, 247
 Trucks, Four-Wheel Passenger Car, 1055*, 1133
 American Wood Preservers' Association: Annual Convention, 1152
 Amur (Siberian) Ry.: Construction Work, 971*
 Annual Reports (See names of companies)
 Apprentice (See Education)
 Arch (See Bridges and Buildings)
 Associated Railroads of Pennsylvania and New Jersey: Department of Public Policy and Relations, 210, 376
 Association of American Railway Accounting Officers:
 Changing the Fiscal Year, 413†, 949†, 1101
 Importance of Work, 787†
 Association of Manufacturers of Chilled Iron Wheels: Address of G. W. Lyndon, 690
 Association of Railway Electrical Engineers:
 Annual Convention, 770, 802
 Association of Railway Telegraph Superintendents: Annual Convention, 19
 Association of Transportation and Car Accounting Officers: Summer Meeting, 25
 Association of Western Railways: Reorganization, 703
 Atchison, Topeka & Santa Fe:
 Annual Report, 680†*, 716
 Ballast Dresser Results with, 529*
 Bridge at Sibley, Mo., 13*
 Engineman Injured After Ignoring Signals, 1077†, 1107
 Explosion at Ardmore, Okla., 614, 703, 935, 973
 Harmony Work, 198
 Loss and Damage Payments, 822
 Ripley, E. P., Dinner to, 844†, 849*
 Ripley, E. P., Ode to, 798
 Suggestions from Stockholders, 539
 Australia: Annual Report of the New South Wales Government Rvs., 1182†
 Automatic Stop (See Signaling)
 Automobile:
 Accidents in New York, 818
 Accidents in St. Louis, 871
 Railway and the Automobile, 804, 1180†
 Safety at Grade Crossings (See Safety First)
 Signal, Distant, S. P., 497*
 B
 Baggage:
 Charge for Checking, 881†
 Declaration of Value, 74, 364, 481, 824, 1024
 Baldwin Locomotive Works:
 Pacific Type; C. B. & O., 275*
 Pacific Type, R. F. & P., 1129*
 Ballast:
 Cost and Efficiency of Materials, 123*
 Dresser, Results with; A. T. & S. Fe, 529*
 Gravel Pit, Operation of, 107†, 117
 Gravel Screening and Washing Plant, 345*
 Ballou Safety Rail Joint Co.: Bolt Nut, 751*
 Baltimore & Ohio:
 Accident at Belmont, Ohio, 70
 Annual Report, 930†*, 988
 Bond Sale, 1117†
 Chaperones Appointed, 1208
 Credit Marks for Train Men, 267†
 Employees' Relief Department, 767
 First Aid Without Alcohol, 973
 Mail Room, 703
 Staff Meeting, 30
 Tie Preservation, 515†, 537
 Willard, Daniel, LL.D., 30
 Baltimore & Ohio Southwestern: Davis, J. M., on Regulation, 472
 Barco Brass & Joint Company: Smokebox Blower Fitting, 1019*
 Belt Railway of Chicago: Strike, 1163, 1180†, 1205
 Benners, Edwin H.: Frame, Truck, 1090*
 Bessemer & Lake Erie: Car Dumper at Conneaut Harbor, 390*
 Bill of Lading (See Freight)
 Blaw Company: Lining Diana Tunnel; L. & N., 966*
 Blower (See Locomotive)
 Bond (See Finance)
 Bonus (See Wages)
 Boston & Maine:
 Annual Report, 679†*
 Milk Rates, 581, 710
 Strike of Freight Handlers, 818, 865
 Brake:
 Car, Lever Hand, 398*
 Electro-Pneumatic, 511
 Safety Hanger for Brake Beams, 291*
 Shoe, Streeter Safety, 168*
 Brazil:
 Lease of Railways to J. G. White Co., 1101
 Bridges and Buildings (See also Construction, New; also American Railway Bridge & Building Association):
 Atchison, Topeka & Santa Fe Bridge at Sibley, Mo., 13*
 Caisson, Concrete: C. B. & O., 383*
 Canadian Pacific Draw Span, 239*
 Chattanooga Creek Bridge; N. C. & St. L., 343*
 Chicago, Burlington & Quincy Bridge at Kansas City, 263†, 284*
 Concrete Bridges, Reinforced, 761
 Concrete, Corrugated Sheet Asbestos, 537*
 Concrete Structures, Records of, 949†
 Construction in 1915, 1224†
 Contest on Bridge Construction Methods, 347*
 Delaware & Hudson Office Building at Albany, N. Y., 58*
 Delaware, Lackawanna & Western Bridge at Buffalo, 465*
 Efficiency in Department of, 1160
 Floors, Concrete, 965
 Floors, Crossed Wood Block, 1140†, 1145*
 French Bridge at Rouen, 564*
 Galveston Causeway Failure, 490†
 Harahan Bridge at Memphis Damaged by High Water, 1256
 Hell Gate Arch, 423*, 663, 865*
 Lag Screws in Trestle Construction, 107†, 125*
 Maintaining Bridges in Cities, 333†
 Paducah & Illinois Bridge at Metropolis, 160*
 Quebec Bridge, Progress on, 1189*
 Renewing Ties on Susquehanna River Bridge; L. V., 526*
 Safety First in Bridge Inspection, 356*
 Sand Blasting Plant, 104*, 397*
 Smoke-washing Plant; N. Y. C., 558*
 Tanks for Locomotive Supply, 955*
 Tanks, Stability of Unanchored, 954
 Treatment of Bridge Stringers, 752
 Trestles, Concrete; I. C., 279*
 Trestles, Pile and Timber, 754
 Tunkhannock Viaduct; D., L. & W., 809*, 913
 Waterproofing of Bridges, 1140†
 British Board of Trade:
 Accident at Chaloner Whin., 41†, 53
 Accident near Weedon, 1103

 State Commission Rulings:
 Alabama: Rate Increases Denied, 138, 916
 California: Excess Charge with Cash Fares, 34
 Louisiana:
 Accident Reports, 34
 Stopping of Interstate Trains at Certain Stations, 1025
 Maryland: Application of Chesapeake & Curtis Bay R., 665
 Missouri:
 Freight Rates and Passenger Fares Increased, 929†, 942, 1024, 1025, 1039†, 1069, 1257*
 Grain Rates Increased, 365
 Locomotive Headlights, 616
 Montana:
 Lumber Rates Reduced, 616
 Coal, Slack, Rates Reduced, 665
 New York:
 Bargain Value, 481, 824
 Charge for "Spotting" Cars, 296
 I. R. T. Signal Installation, 1167
 Passenger Fare Increase Denied; Ulster & Delaware, 76
 Passenger Fare Increases Suspended, 1179†
 Passenger Service on Mahopac Falls R. R., 665
 Salamanca Grade Crossing Case, 34
 Switching Service of New York Central and International Ry., 16
 South Dakota: Accident Reports, 824

State Commission Rulings (Continued).
 Texas:
 Concentration of Cotton, 253
 Rate Increase on Sash, etc., 1216†
 West Virginia:
 B. & O. Mileage Coupons from Other States, 76
 Express Rates Increased, 405
 State Regulation (See State Commissions)
 Station (See also Yards and Terminals):
 Agents, Index-Record of, 702
 Agents Inefficient, 84†
 Coaling Stations, 759
 Lehigh Valley Passenger, at Buffalo, 158*
 Painting of, 969
 Pennsylvania Freight, at Pittsburgh, 245*
 Statistics:
 Accidents, Steamship and Railway, 264†
 Block Signal Mileage to January 1, 1916, 1219†, 1252
 British Railway Returns for 1914, 675†, 690
 Cars and Locomotives Ordered and Built in 1915, 1219†, 1221†, 1240
 Comparison of the World's Railways, 787†, 805
 Construction in 1915, 1224†, 1247*
 Development in 1915, 1220†
 Earnings in 1915, 1237*
 Freight Loss and Damage Payments in 1914, 90, 146†, 903†, 1013
 Government and Privately Owned Lines, Mileage of, 3†
 Operation Control Through Statistics, 206, 553†
 Rail Failures in 1914, 1097*
 Receiverships and Foreclosure Sales in 1915, 1222†
 Records, Making, 206
 Records of Reinforced Concrete Structures, 949†
 Tables Omitted in Newspaper Quotations, 1039†
 Train Tonnage Increased in 1915, 1041†
 Trend of Affairs in Two Eight-Year Periods, 85†
 Steel (See Iron and Steel)
 Stop, Automatic Train (See Signaling)
 Stores (See Supplies)
 Strike (See Employee)
 Sturtevant, B. F., Company: Ventilation of Stampede Tunnel, 234*
 Subways (See also Construction, New):
 Pennsylvania Railroad, 654*
 Superheater (See Locomotive)
 Supplies, Railway:
 American Locomotive Builders and Foreign Trade, 643, 1011*
 Equipment Orders Exceed Records, 843†, 881†, 992†
 Exhibits at Panama-Pacific Exposition, 500*
 Hints for the Ordering of Lumber, 1150
 Manufacture of Equipment, 222†
 Material, Control of Stock of, 237
 Selling to European Countries, 901*
 Store Department's Success, 1200
 Surpluses and Shortages (See Car Service)
 Sweden: Rate Advances, 1205
 Switch:
 Light, Williams' Disappearing, 1199*
 Slip Installation, 120
 Syria: Railway System, 199*

T

Tanks (See Water Service)
 Tariff: Commission Advocated, 1118†
 Telegraph (See also Association of Railway Telegraph Superintendents):
 Pennsylvania: R. R. Employees Win Prizes, 843†, 871
 Typewriter: Seaboard Air Line, 400
 Telephone:
 Automatic Exchange; N. Y. C., 357
 Courtesy Rules, 74, 867
 Temple (See Rail)
 Tennessee Coal, Iron & Railroad Co.: Tests on Rails of Blooming Methods, 1187
 Terminal Railroad Association of St. Louis:
 Improvement Efforts Blocked, 147†
 Switchmen Demand Eight Hour Day, 1020
 Texas & Pacific: Wage Increase for Telegraphers, 1204
 Ticket:
 Agent's Best Asset, The, 357
 Extra Charge for Cash Fares, 34, 74, 130, 774, 978
 Ties and Timber:
 Cost of Ties, Annual, 352*
 Cost of Ties; B. & O., 515†, 537
 Creosoted Wood Block Floors, 1140†, 1145*
 Distributing Ties, 1139†, 1150
 Lumber, Ordering, 1150
 Norfolk & Western Dry Kiln, 431*
 Peeler, Pneumatic, 342*
 Preservation of Ties, B. & O., 515†, 537
 Preservative Treatment on Bridge Stringers, 752
 Renewing Ties; L. V., 526*
 Screws Lag for Guard Rails, 107†, 125*
 Tie Plate, Thomas, 752*
 Tie Purchases in Canada During 1914, 970
 Tie, Steel, 530*
 Turning Ties Over, 940†, 951†
 Timber Preservation (See Ties and Timber)
 Toledo Terminal Railroad: Letter on a Noisy Yard Engine, 812
 Tonnage (See Train Loading)

GENERAL INDEX—Continued

[Illustrated articles are indicated thus *; Editorials thus †; Letters to Editor thus ‡.]

- Tools:**
 Equipment for Maintenance of Way Forces, 334†, 337*
 Punch, Spike Slot, 351*
 Repair of, for Track Maintenance, 952*
 Training Laborers in Use of, 109†
- Track** (See also Maintenance of Way; also Construction, New; also Switch; also Rail):
 Ballast Dresser; A., T. & S. Fe., 529*
 Construction at Water Cranes, 336†
 Construction in 1915, 1224†, 1247*
 Crossing, Continuous Rail, 528*
 Crossing, Manganese, Repaired by Electric Welding, 119*
 Curves, Elevating, 951†
 Curves, Spiraling, 765*
 Development of Special Steels, 741†, 747
 Ditches, Digging, 355*
 English Construction Standards, 130*
 Improvement of a Section, 963
 Indicator, Vaughan, 970*
 Inspection, Annual; Pennsylvania, 764, 951
 Manganese Steel Work, 334†, 341
 Motion Study in Training Laborers, 109†
 Repairing Frogs and Switches, M., K. & T., 970
 Scale, Plate Fulcrum; Penna., 1156*
 Scales, Adjusting, 958*
 Slip Switch Installation, 120
 Smoke Removal, 1098*
 Stresses, Experimental Determination of, 121*
 String-Lining Curves by a Graphical Method, 130
 Tools, Repair of, 952*
 Track Depression: C., M. & St. P. at Minneapolis, 1059*
 Track Elevation (See also Grade Crossings):
 Pennsylvania R. R. Through Wilkesburg, Pa., 654*
- Traffic:**
 Classes at La Salle Extension University, 541
 Field Men, Efficient, 1246
 Freight Train Tonnage in 1915, 1041†
 German Achievements During War, 428, 725†
 Lining Tunnel Under Traffic; L. & N., 966*
 Live Stock Quarantine, 172, 616, 709
 Mobilization (See War)
 Moving Mexican Troops by Railroad, 904
 New Haven Foothall Traffic, 979
 New York Export Traffic, 1024
 Panama Canal and Transcontinental Rates, 480, 597, 788†
 Panama Canal Traffic, 1105
 Railway and the Automobile, 804
 Results of Terminal Improvements at Detroit; Mich. Cent., 739
 Snowstorm on North Atlantic Coast, 1164, 1179†
 Statistics of the World's Railways, 787†, 805
 Train Dispatchers' Association of America: Annual Convention, 16
 Train Despatching:
 Despatcher as a Revenue Solicitor, 322
 Despatcher, The, and Protective Organization, 318, 416†, 451†
 Despatcher, Work of the, 318, 1183†
 Orders, Uniform, 20
 "Safety First" in Excess, 1225†
 Train Indicators: Engine Numbers, 472
 Train Loading:
 Increase in 1915, 1041†, 1101
 Tonnage, Handling, on Local Freight Trains, 373†, 394
 Tonnage Rating Determined by Road Trials, 1095
 Tonnage Studies, Early, 972
 Train, Local Freight, 373†, 394
 Train Robberies:
 Freight Car Pilfering, 86†, 888†
 Miscellaneous, 131, 573, 703, 767, 818, 1256
 Train Rules:
 Uniform Orders, 20
 Train Runs:
 Havre-Paris Express of France, 798†
 Trains and Passing Points, Relation Between, 197*, 1197*
 Transcontinental Freight Rate Reductions, 480, 597, 788†
 Trap Car Decision, 213, 222†
 Traveling Engineers' Association: Annual Convention, 473, 477, 505*, 632†
 Trespassing (See Accident)
 Trestle (See Bridges and Buildings)
- Trucks:**
 Coupler, Automatic, 467*
 Four-Wheel, for Passenger Equipment, 1055*, 1133
 Frame, Benners Side; Pennsylvania, 1099*
 Frames, Rolled Steel, 331*
 Industrial; Pennsylvania, 737*, 818
- Tunnel:**
 Economic Value of Detroit River Tunnel; Mich. Cent., 739
 Lining Diana Tunnel; L. & N., 966*
 Lining Repaired with Concrete Atomizer; C. G. W. at Winston, Ill., 1158*
 Lining Sandy Ridge with Concrete, 533*
 Mount Royal into Montreal, C. N., 857*
 Pennsylvania at East Brady, 456*
 Rogers Pass, C. P., 400
 Signals at Miraflores, 327*
 Southern Pacific on Fire near Tehachapi, Cal., 115*
 Ventilation of Stampede; N. P., 234*

At a meeting held last week the executive committee of the Chicago Association of Commerce adopted the following resolutions expressing the appreciation of the association of the notable service rendered by the steam roads during the strike of the employees of the Chicago traction lines on June 14, 15 and 16:

An Appreciation of an Unusual Service

Whereas, In the recent emergency created by the withdrawal from service of all the facilities of the street railway and elevated railway lines of the city, the general public was greatly assisted by the immediate action of the steam railroads affording suburban service, the railroads making extraordinary efforts to provide for the tremendous increase in their patronage, not only by using to the fullest extent all equipment at hand, but by bringing in all available equipment within a radius of several hundred miles;

Resolved, That The Chicago Association of Commerce, through its Executive committee, hereby expresses its appreciation of the notable service

rendered by the steam railroads, whose efforts contributed in a most efficient manner to the means by which the city was enabled to meet a situation that otherwise could only have resulted in the serious curtailment, if not cessation, of many commercial, industrial and social activities.

The remarkable accomplishment of the Chicago roads, which suddenly found themselves the sole means of transportation for the bulk of the population of the city and were required, with only a few hours' notice, to accommodate over 625,000 people a day in their suburban service, or five times their normal suburban traffic, was described in last week's issue. "Extraordinary efforts" well describes the exertions made by some of the roads that were called upon practically to improvise a suburban service over night or by the roads that on account of their location were called upon to handle the majority of the crowds. The railroads performed a great public service on this occasion, and the Chicago Association of Commerce committee has done a handsome thing in thus making public acknowledgment of its appreciation.

L. F. Loree, president of the Delaware & Hudson, has received in answer to inquiries sent to all railroads above 100 miles in length replies indicating that at about the first of the present year there were approximately \$2,576,000,000 of American railroad securities held abroad. The total as shown by this investigation is only about

Two and a Half Billion of Foreign Holdings

half of what was estimated by some bankers at the beginning of the European war which probably shows that the early estimates were entirely too high. A classified summary of the replies is published elsewhere in this issue. When James J. Hill, some years ago estimated the needs of American railroads for new capital at over a billion a year his estimate was criticized by Congressmen and others, with no knowledge of the facts, as absurdly high. Time has proved that this estimate was not far from the mark, but must be remembered that European investors have during the past years helped to absorb a part of these securities. If, however, the present capacity of American investors is \$1,000,000,000 a year for railroad securities, it would take 2½ years for this market to take back from Europe the European holdings, even if no new capital was provided for railroad purposes for the entire 2½ years. The importance of the fact cannot be over-estimated. Squarely facing the fact, is not depreciating the value of American railroad securities as an investment for a moment. Money invested in these securities will be employed in the production of wealth, whereas money invested in war loans of the European governments is employed in the destruction of wealth. Since money, however, is going to seek investment that will give it the highest interest return commensurate with a certain degree of safety, the possible aggregate of securities which may come onto this market, as shown by the European holdings of American railroad securities is impressive.

While again declaring that the ownership of stock in a coal sales company by a railroad or by a railroad company's stockholders does not constitute an interest direct or indirect of the railroad company in the coal which the sales company offers to it for transportation, the United States Supreme Court, in the

The Commodities Clause Again

Delaware, Lackawanna & Western case handed down recently, decides that the contract between the sales company and the railroad company cannot legally make the sales company a mere agent for the railroad company. The court has, therefore, ordered the district court to enjoin the Lackawanna from carrying coal sold by the railroad company to the sales company under the contract now in force. When the commodities clause was enacted the Lackawanna formed a coal sales company with which it made a contract, and it is the terms of this contract which so bind and restrict the sales company as to make it a mere agent of the railroad company, that the Supreme Court

now finds to be illegal. The railroad company kept possession of its coal mines and continued to mine coal after the formation of the coal sales company. The contract with the coal sales company provided that the railroad company should receive 65 per cent of the market price of coal at New York, and was also to receive, of course, the legal rate for transporting the coal to New York. The railroad company could sell as much or as little coal to the sales company as it wanted to, and, on the other hand, the sales company could buy coal from no one else, and had to take all the coal which the railroad company wanted to sell it at the market price. The Supreme Court holds that this contract violates both the Sherman law and the commodities clause. It is very careful to point out that there is no intention on the part of the court of objecting to the contract simply because it protected the property interests of the railroad company, but the court finds it illegal because in the attempt to protect these interests the contract made by the sales company went so far as to obviously violate the intention of the commodities clause. It would appear plain from the decision that any one of the anthracite carriers may or may not now have such relations with its affiliated coal sales company as to violate the commodities clause, but, on the other hand, the decision describes clearly the kind of relation which it will not tolerate, and it should be possible for any company to act accordingly.

The decision of the Supreme Court annulling the Wisconsin law of 1911, requiring sleeping-car companies to give the occupant

**Wisconsin
Upper Berth
Law**

of a lower berth the free use of a part of the space allotted to the upper berth, until the upper is sold, fills six pages and cites 19 decisions; but the statute was so utterly childish that it is not worth while to discuss it. The gist of the basis of the decision is in the paragraph quoted in the abstract of the report printed elsewhere. The wonder is that there are two justices who dissent from the majority's opinion. The dissenting opinions were not put in writing. The Supreme Court of Wisconsin, which reversed the trial court (and is now itself reversed) sustained the statute on the ground that the rule which it prescribed "contributed to the comfort and convenience of the traveling public"; but it could so contribute, even theoretically, only by facilitating the circulation of air, and the evidence showed that this theory was too vague to be worthy of notice. The statute appears to have been one of the worst examples of meddling, pure and simple. An earlier statute (1907) gave the man in the lower berth the option of ordering or not ordering the upper berth to be kept up, or closed; but this was declared unconstitutional, and the 1911 statute was made mandatory: "the upper berth shall not be let down." What is next to be expected is hard to guess. Probably a law requiring the employment as porters of prestidigitateurs who can put a passenger into an upper berth at 1 a. m. without disturbing the sleeping passenger in the lower; with perhaps a paragraph declaring that for a passenger to seek privacy is against public policy. The short cut would be to order upper berths abolished and the price of sections reduced to \$1.50; but from the agitator's point of view that is too simple.

In an editorial in our issue of May 21, we referred to the fact that the National Transcontinental Railway of Canada, as built

**The Cost of
The National
Transcontinental**

by the government, has cost almost three times as much as the original estimate. In another place in the same editorial there appeared the statement "If, as has proved to be the case in Canada, a government will spend three times as much to build a railway as would be spent by a private company," etc. A valued correspondent writes to call attention to the fact that it does not follow, because the government so far exceeded its own estimate, that it spent three times as much as a private company would have. That is manifestly true. In making the statement questioned we had in mind what the government has spent, and what the

private railways of Canada are capitalized for. The private railways of Canada, old lines and new, equipped and in operation, are capitalized, according to the official reports, for \$53,619 a mile. On the other hand, the latest figure for the cost of the National Transcontinental which we have seen is \$98,898 a mile. Furthermore, the National Transcontinental is not finished, in the sense that the private railways are. It is not equipped, and its terminals are not completed. At the rate expenditures have been made on it in the past, how much will it have cost when it is finished? Perhaps it is putting it a little strong to say it has cost three times as much as a private company would have spent; but the government investigating commission said in its report, "the competing roads are only capitalized at from one-third to one-half as much per mile as the National Transcontinental."

STOCK WITHOUT A PAR VALUE

THE committee on railroad bonds and equipment trusts of the Investment Bankers' Association of America is sending out to members of the association a list of ten questions for consideration and discussion. The second of these questions is of particular interest because of the coincidence that it comes at the time of Clifford Thorne's final argument in the rate advance case of the Western roads at Washington. Investment bankers are asked whether the amount of bonds which should be issued to cover new property should be 100 per cent of cost or less. Clifford Thorne argues that the proposed rate advances are for the purpose of making additions and betterments to property from earnings, and that whereas the public is willing to pay rates sufficient to yield a return on the cost of new property, the public is not willing and should not be made to pay the principal.

A strong railroad company can, under present conditions, issue bonds up to 100 per cent of the cost of a comparatively small new line which holds out a fair chance of earning a return on the investment; but this is true only because the equity back of these bonds consists of the seasoned earning power and the credit of the railroad company. It is hardly conceivable that any banking house would finance a new company building a new line up to 100 per cent of the cost through the issue of bonds without any bonus or margin of safety of stock. The tendency to raise new capital through the issue of mortgage bonds up to the neighborhood of 100 per cent of the cost of additions and betterments is generally recognized as one of the dangers of the present railroad situation. Past experience and business practice in other lines both indicate beyond a reasonable question that all of the new railroad capital required for additions and betterments and extensions from year to year should not be raised through the issue of mortgage bonds up to 100 per cent of the cost of the improvements.

If, however, a part of the cost of improvements is to be provided for either from current funds, which means surplus earnings, or through the sale of stock, the railroad company has either got to have surplus earnings or has got to find a market for stock. The Chicago, Milwaukee & St. Paul could finance the greater part of the cost of the Pacific coast extension through the sale of the stock to its own stockholders only because it had been paying 7 per cent for years and earning a surplus above dividend requirements. Stockholders, even of this company, however, have had to accept a reduction to 5 per cent, and this was not earned by the new extension for some years after it was opened and may not yet be earned by the new extension.

The laws of many states do not permit the issue of stock below par; but where is the investor to be found who will pay par for stock issued to pay for 30 per cent of the cost of an extension or betterment work when the other 70 per cent of the cost is paid through the issue of 4½ or 5 per cent bonds, which can be sold only at the face value or less, and whose claims as to earnings and assets must be satisfied in full before the stockholder has any equity whatsoever?

A possible solution of this problem and of the problem that is facing the reorganization committees of many of the roads now in the hands of receivers might be furnished through the issue of stock without a par value. Of course, the manner in which any particular railroad company could readjust its finances to permit of the issue of stock without par value would be a specific problem and one which would have to be treated differently, probably, in each different case. The investor, it would seem, might be willing to put new capital into a railroad project if he knew that a part of the cost had been raised through borrowed money—the sale of mortgage bonds—and by taking stock without a par value he was to become an owner of the property and participate pro rata with other owners in profits commensurate with his risk. An analogous argument would apply in the case of reorganizations such as that of the Chicago, Rock Island & Pacific and the Missouri Pacific.

THE EXTENT OF GOVERNMENT OWNERSHIP

ARCHIV FÜR EISENBAHNWESEN, the official publication of the Royal Prussian Ministry of Public Works, has recently issued its annual compilation of the railway statistics of the world, showing the mileage, capitalization and the proportion of government-owned and privately-owned lines in each country for the year 1913, with comparisons with previous years. It is stated that, although most of the figures are derived from official sources, it has been necessary to depend in part on unofficial reports. Railways owned by governments are listed as state railways, whether they are actually operated by the government or by private companies. The mileage figures for 1913 are as follows:

EUROPE

Totals	690,133	14,206	228,712	9,644	464,421	5,487

*Loss.

Of the total mileage of the world for 1913—690,133 miles—private companies owned 464,421 miles, or 67 per cent, and governments owned 228,712 miles, or 33 per cent. In 1912 the private railways owned 68 per cent. The government railways gained one per cent by increasing their mileage by 9,644 miles, while the mileage of private companies increased only 5,487 miles.

However, an analysis of the statistics given for the various countries shows that this gain by the state railways represented the absorption of existing lines rather than greater activity in railway construction. For example, 4,478 miles of line were added to the government total in Mexico, and 1,002 in Argentina, without any increase in the total mileage of the country. In Australasia there was also a gain of 1,448 miles for the government lines by the absorption of private lines, although the total mileage of the country increased only 385 miles. The privately-owned lines, therefore, actually increased their mileage by construction 12,000 miles, of which about 6,500 miles was offset by the acquisition of lines by the governments.

It will be noted that, in respect of length of lines, outside of North and South America, government ownership greatly predominates, but that the privately-owned mileage in the United States, 256,823, greatly exceeds the mileage of all the government-owned roads in the world. It is somewhat surprising, however, to find that the greatest increase in government mileage is in North and South America, due to the absorption of private lines in Mexico and Argentina. Even outside of the United States, however, private ownership is greatly predominant in America. Excluding our 256,823 miles, there are in this hemisphere 71,261 miles of private railways, against 28,223 miles of government railways. In only two countries in this hemisphere, Mexico and Peru, is government ownership the predominating policy, and in Peru the roads are operated by companies.

In a majority of the countries of the world, also, private ownership of railways continues to prevail. Of 75 nations and colonies for which statistics are given in this compilation, 42 have more private than government mileage, while 33 have more government mileage. While in 26 countries the entire railway mileage is privately owned, in only 7 are all of the railways owned by the state. These are Serbia, Bulgaria, Natal and four

German colonies in Africa. In Europe state ownership predominates in only 10 out of 21 countries.

All the railways of the United States, Great Britain, Spain, China and Rhodesia are in the hands of private companies, and most of those in Canada; in France four-fifths of the mileage is privately owned, in Sweden nearly two-thirds and in Brazil and Argentina company mileage is greatly predominant. In Germany, Austria-Hungary, Russia, Italy and Japan government ownership is the dominant policy.

Of the total railway mileage of the world for 1913, over 37 per cent was in the United States. The total increase for the year was about 15,000 miles, of which 5,019, or about one-third, was reported for the United States, although this figure for this country is undoubtedly too high. The increase for the world was less than the gain reported in 1912 or 1908.

The total railway capitalization of the world as reported by this publication was \$60,222,036,784. In this is included, however, over \$19,000,000,000 as the capital of the railways of the United States, which erroneously includes all the duplications due to inter-corporate ownership. The Interstate Commerce Commission's figure for 1913 is \$15,330,131,446. With this correction the world's total in 1913 stood at \$56,350,804,230, an increase over the preceding year of \$1,848,250,566. The average capitalization per mile for the world was \$82,313, as against \$65,861 for the United States. The average for Europe was \$70,656, and 18 countries are reported as having a greater railway capitalization per mile than the United States. It will be noted that while this country has 37 per cent of the world's mileage, only 27 per cent of the total capitalization is chargeable against the railways of the United States.

JAMES J. HILL PROFESSORSHIP OF TRANSPORTATION

PRESIDENT LOWELL announced at the commencement exercises of Harvard University that a gift of \$125,000 had been received to endow the "James J. Hill Professorship of Transportation" in the Harvard Graduate School of Business Administration. A list of the donors and some other information regarding the establishment of this new chair are given elsewhere in this issue.

The endowment of this professorship is a tribute to Mr. Hill; and surely no tribute ever was more deserved. Take him all in all, he is probably the greatest genius who ever devoted his energies to railway transportation. He has been equally pre-eminent as a railway builder, as an operating executive, as a traffic manager and developer and as a financier. The various lines now constituting the Great Northern Railway were laid out and constructed so successfully under his immediate direction. He is the father of the "tonnage system"—the system of the largest practicable train loads, which has done more to promote economy in railway operation than any other practice ever introduced into it. He established a system of rate making on the Great Northern which has contributed enormously both to the development of the Northwest and to the upbuilding of a profitable traffic for the railways in that section. He has caused the railways which he has controlled to be so skillfully financed, as well as to be so efficiently developed and operated, that, considered as a whole, the great system which he dominates is one of the most prosperous in the world. Probably America has produced no other man who has combined in more pre-eminent degree the greatest qualities of both the business man and the statesman. We say "America" because, although he came to the United States when young, Mr. Hill was born in Canada.

Not only is the tribute paid to Mr. Hill so well deserved, but the establishment of the professorship itself is highly gratifying. Never was there in any country such need of a thorough and impartial study and exposition of transportation problems as there is in the United States at the present time. The railways of this country have 37 per cent of the total mileage of the globe. Whether viewed from this standpoint,

or that of the traffic they handle, the investment they represent, the number of men they employ, or their relative position in industry, our railways are very much the most important system in the world. For many years we have been confronted with the "railway problem"—the problem of how to regulate the railways, or as to whether the government should acquire and manage them. Never, apparently, was this problem farther from solution than now. It is a problem in the solution of which it would seem that the schools could help very materially. But although the United States has many universities in which some attention is given to transportation, it is a regrettable fact that most of them have contributed little, and many of them less than nothing, to the solution of this problem. Here and there are professors of economics and of transportation who realize that no man can safely draw definite conclusions regarding this problem's many important phases without having first spent some years in familiarizing himself with the history of railways and with the multifarious, complex and widely varying facts regarding their operation, rate-making, financing, etc. But thus far the good work of these men has been more than offset by that of the much larger number who have been willing to reach their conclusions first and find facts to fit them afterward, if indeed they ever find them at all. If many of the professors betray as much ignorance and bias in their class rooms as they do in their writings on railway subjects, it is easy to understand why so many of our young men graduate with their heads stuffed with misinformation and foolish hypotheses concerning railway matters.

The main function of a chair of transportation should not be the industrious formulation and elaboration of baseless hypotheses regarding the nature of the railway business, but the ascertainment and teaching of facts regarding it. If there be suggested some conclusions based on the facts ascertained, this is also a useful service. The Harvard School of Business Administration already has achieved a high reputation for the excellence of the research work and teaching done by its professors. It is reasonable to assume that in filling the James J. Hill Professorship the university authorities will show a high regard for the proprieties by apportioning to it a man whose knowledge of both the theory and the practice of transportation are such as will enable him to impart to students real knowledge. A wider diffusion of real knowledge of the subject is one of the greatest needs of the country, and Harvard can render no greater service than to set the example of imparting such knowledge to the nation's studious and ambitious young men.

Perhaps a word will not be out of place in this connection regarding those who have done most to secure the establishment of the James J. Hill Professorship. Probably those who have been most active in bringing it about are Howard Elliott, chairman and president of the New York, New Haven & Hartford, and Thomas W. Lamont, of J. P. Morgan & Co. Both of these gentlemen are graduates of Harvard, and in furthering the creation of this professorship they have rendered a service not only to their alma mater, but also to the public.

NEW BOOKS

Statistics of Railways in the United States; Twenty-sixth Annual Report. 751 pages, 9 in. by 12 in. Cloth. Prepared by the Interstate Commerce Commission, Division of Statistics. Issued by Superintendent of Documents, Government Printing Office, Washington, D. C. Price \$1.

The present volume is for the fiscal year ending June 30, 1913. The principal totals for the whole country, as given in this report were printed in the *Railway Age Gazette*, July 17, 1914, from a preliminary abstract sent out by the Interstate Commerce Commission. The first 62 pages of this report, giving the tabular summaries, came out last December and was noticed in the *Railway Age Gazette*, December 11, page 1074. At that time the commission expected the complete volume to be out in one month.

Letters to the Editor

DOES LABOR CREATE ALL WEALTH?

NEW YORK.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Warren S. Stone, grand chief of the Brotherhood of Locomotive Engineers, in the wage arbitration at Chicago repeatedly took the ground that labor produces all the wealth that exists, and, therefore, should come into the possession of all of it.

This seems to be a revival of an archaic notion. From pages 402, 403 and 406 of Webb's "Industrial Democracy" (a strongly favorable presentation of Trade Unionism), I quote the following:

"The operative bootmaker has inherited a rooted belief that the legitimate reward of labor is the entire commodity produced, or its price in the market. This idea was the economic backbone of Owenite Socialism, with its projects of Associations of Producers and Labor Exchanges. In the first number of the "Poor Man's Guardian," a widely-read journal of 1831, it was expressed in the following verse:

"Wages should form the price of goods;
Yes, wages should be all,
Then we who work to make the goods,
Should justly have them all;

"The same idea inspired the proposals of Lasalle, and most of the inferences drawn from Karl Marx's 'Theory of Value,' whilst it still lingers in the declarations and programmes of German Socialism and its derivatives. . . .

"Though the Owenite assumption here referred to was formerly accepted by large masses of English workmen, and though it still lies at the root of the desire for Co-operative Associations of Producers, it cannot be said to characterize the Trade Unionism of the present day, and it will accordingly not be discussed in our chapter on 'The Assumptions of Trade Unionism.' . . .

"If the operatives desire to maintain the modern Trade Union principle of the Standard Rate, they must abandon, once for all, the diametrically opposite assumption that 'wages shall be the price of goods.' . . ."

F.

RAILROAD ADVERTISING

NEW YORK.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I am aware that a layman has little business to butt into your columns. And yet sometimes the man outside the business can get a perspective that the railroader himself fails to vision. It is for this reason I make bold to address sundry observations to the *Gazette*.

These remarks were brought to a head by the admirable article on railway advertising by Edward Hungerford, published in one of your recent issues. Mr. Hungerford's article, excellent in everything touched on, failed to treat of certain details which have been somewhat painfully brought to my attention.

As manager of the Travel and Resort department of a leading magazine, I have an unquenchable thirst for information regarding passenger and more especially tourist traffic.

It has been my observation that in the Broadway ticket offices are many clerks who are grossly ignorant of the lines which they represent. I have frequently encountered clerks who did not know certain essential facts relative to passenger service which were familiar to me, an entire outsider. One illustration will suffice. In the mountains of a neighboring state is located a mountain resort fairly well known. It lies on a branch line just off one of our great systems. The writer phoned to the chief branch ticket office of this line and asked the clerk to give the nearest station on his line to this resort. After considerable delay and evident consultation this individual replied:

"About this here—(naming the resort). There ain't no such place on our line." And yet the place in question is listed in the system's summer book as among its particular attractions!

My advice to the G. P. A.'s is to conduct a course of instruction in railroad geography. Also in the dull season to round up all the ticket counter staff and take them out to see where and how the road actually goes. Such an excursion would result in more tickets being sold. It requires imagination to talk intelligently and compellingly of places you have never actually seen with your own eyes. Imagination is not a conspicuous quality in the ticket clerk. He sells transportation in most cases automatically. If he had a quarter of the courteous suggestion and clear intelligence found in the salesman of our high grade retail stores the road he represents would sell more transportation. If Mr. Ticket Buyer who has decided to take a trip to what we may call Mount Lookout is politely told he should not miss the scenic glories of the Sapphire Lakes, which are only 150 miles beyond on the same system and can be included in an attractive excursion rate for just a little more, nine times out of ten he will welcome the suggestion and purchase more transportation than he had intended.

Another criticism arises every spring. It is prompted by efforts to obtain the summer transportation literature in good season. There are always many laggards who are late with their summer booklets. They have all winter, presumably, to get this literature off the press. Yet in the first week in June I always receive circular post cards somewhat similar in their wording to the following from one of the leading summer tourist roads:

"Your request for our 1915 Summer Book is received today, and will be complied with immediately upon receipt of books from printer. The large amount of work entailed has slightly delayed the issuance of these books, but it is expected that they will be ready for distribution by June 5. Regretting the unavoidable delay, and thanking you for your interest, we are—"

The road that sends out this card has been advertising its resorts extensively. Every advertisement mentions the summer booklet. Readers who answer the ads get the above replies. Imagine such methods applied to retail trade, and yet the sale of tourist transportation is precisely the same in theory and should be the same in practice as the sale of watches.

There is also a deplorable lack of system in maintaining mailing lists of persons who should receive folders, etc. The writer maintains a complete file of folders, revised twice a year, and yet not a dozen roads mail him their literature unless written to semi-annually. My address should be always retained on a well arranged mailing list. Yet I am obliged to send a circular request out to several hundred G. P. A.'s twice each year.

If the same general methods of circularizing used by any big, first-class business were followed by the railroads' passenger departments there would be a heap more tickets sold.

Very beautiful, complete, and well written are the summer booklets this year, but in their intelligent distribution there is woeful lack of system or enterprise.

OUTSIDER.

PORTUGUESE RAILWAY RATES INCREASED.—The Portuguese railway companies have notified the public that, in view of the enhanced cost of fuel and other materials in consequence of the war, a general increase has been decided upon in all rates and fares, amounting to about 10 per cent. This action on the part of their neighbors will possibly surprise the people in Spain who have been agitating recently for a reduction in railway rates on the same grounds. Imported coal is now costing, in the peninsula, almost double the July prices, and Spanish coal has increased almost as much, the local mine owners having taken advantage of the situation to raise their prices. To counteract this the government has suspended the protective customs duties temporarily. An attempt is also being made to introduce Pocahontas coal from this country. Welsh steam coal is being quoted at 60s. (\$15), and Pocahontas at 53s. (\$13.25), c. i. f. Mediterranean ports.

The Test Department of the Pennsylvania Railroad*

Brief History and Outline of Its Present Scope; Description of the New Physical and Chemical Laboratory

By C. D. YOUNG

Engineer of Tests, Pennsylvania Railroad, Altoona, Pa.

Endeavoring to promote the safety of passengers and employees on its lines by minimizing or eliminating, if possible, all accidents traceable to defective or unsuitable material, the Pennsylvania Railroad has found that the quality of the material purchased for use in rails, bridges, cars and locomotives must be carefully scrutinized. Control over the quality of supplies is secured by the aid of specifications, which are based upon careful consideration of the materials available for the various uses of the railway, and by research work tending toward the development of new materials and devices, or improving those which are in general use. Neither the reputation of the manufacturer nor a superficial inspection of the materials offered has been found to be a sufficient safeguard in the

road companies for making tests of all its supplies and conducting investigations with a view of obtaining the best materials which can be commercially furnished.

The Department of Tests of the Pennsylvania Railroad—the first of an American railroad—has grown in the following way:

In 1874 there was established at Altoona a department of physical tests, the organization of which was placed under the direction of Theodore N. Ely, then superintendent of motive power. The first testing machine was purchased during the early part of the year. It was of 50,000 lb. capacity and was furnished by Fairbanks and Ewing. The first test was made on April 2, 1874.

In the beginning, the testing work was conducted by the mas-

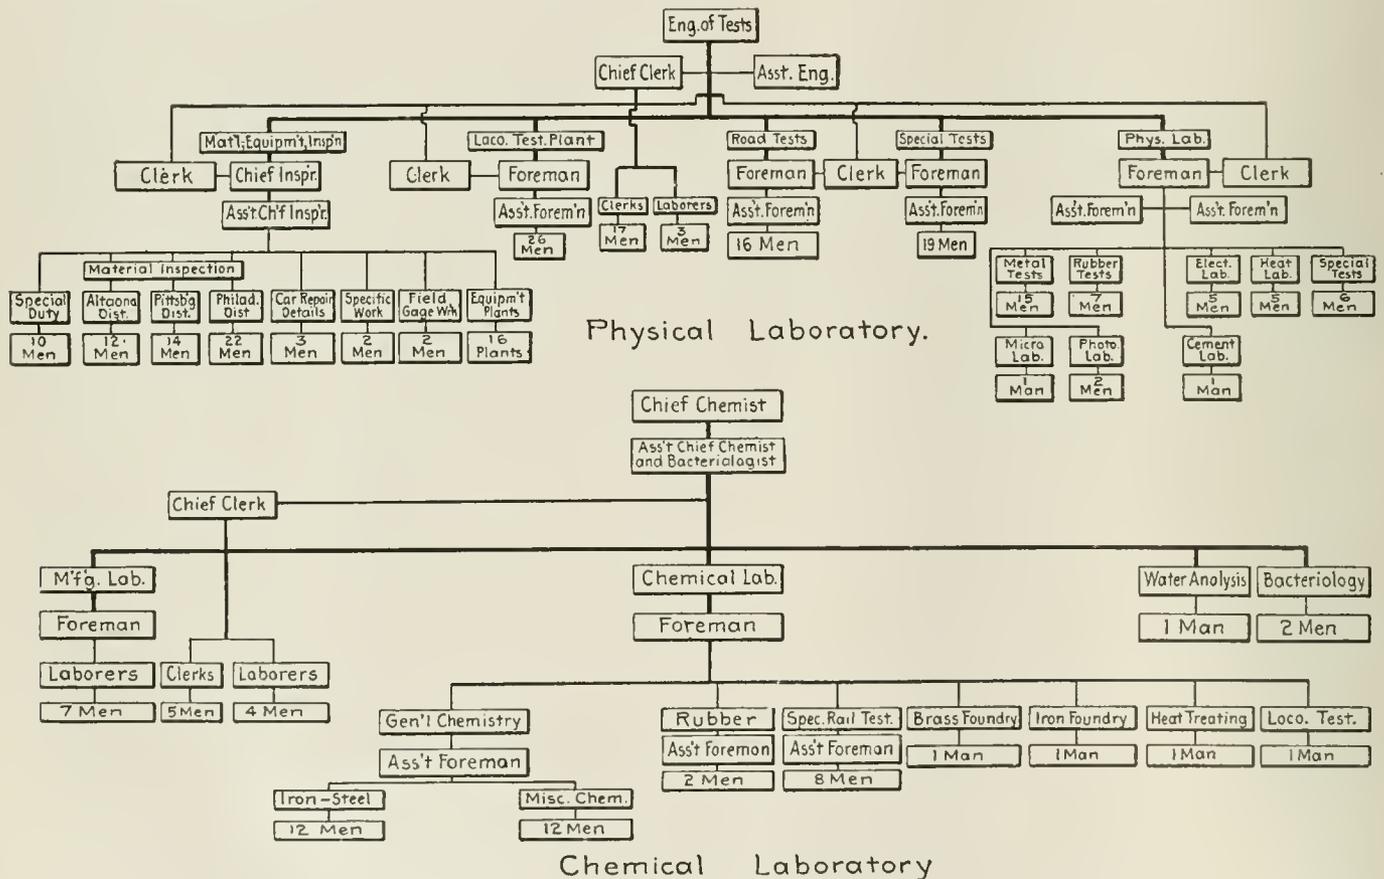

Chart Showing the Organization of the Department of Inspection and Tests

purchase of supplies, since frequently the manufacturer himself has no positive knowledge of the strength or other physical properties of the iron, steel or other metals, nor the purity of many of the articles offered for sale.

An organization with laboratories at a central point is an essential in promoting the work of thorough inspection, the importance of which is unquestioned. With this inspection, accidents to the traveling public and the employee have been reduced, and efforts in the future will be towards their further reduction. It is desirable, therefore, that the public be fully informed as to the facilities provided by one of the largest rail-

road companies for making tests of all its supplies and conducting investigations with a view of obtaining the best materials which can be commercially furnished. The department of physical tests was placed in charge of John W. Cloud, who became the first engineer of tests. A chemical laboratory, under the direction of the late Dr. Charles B. Dudley, was added in the autumn of 1875. Research work for the improvement of rails was begun, and the investigations and accumulation of experience, which later made possible the preparation of a series of "Standard Specifications," had their start.

It was not until 1879, or five years after the beginning of the testing of materials, that the physical and chemical departments were provided with a separate building. This building was a one-story frame structure, 25 ft. by 45 ft. These quarters were soon abandoned, however, and until 1914 space was made

*From a paper read at the annual meeting of the American Society for Testing Materials, Atlantic City, N. J., June 22-26, 1915.

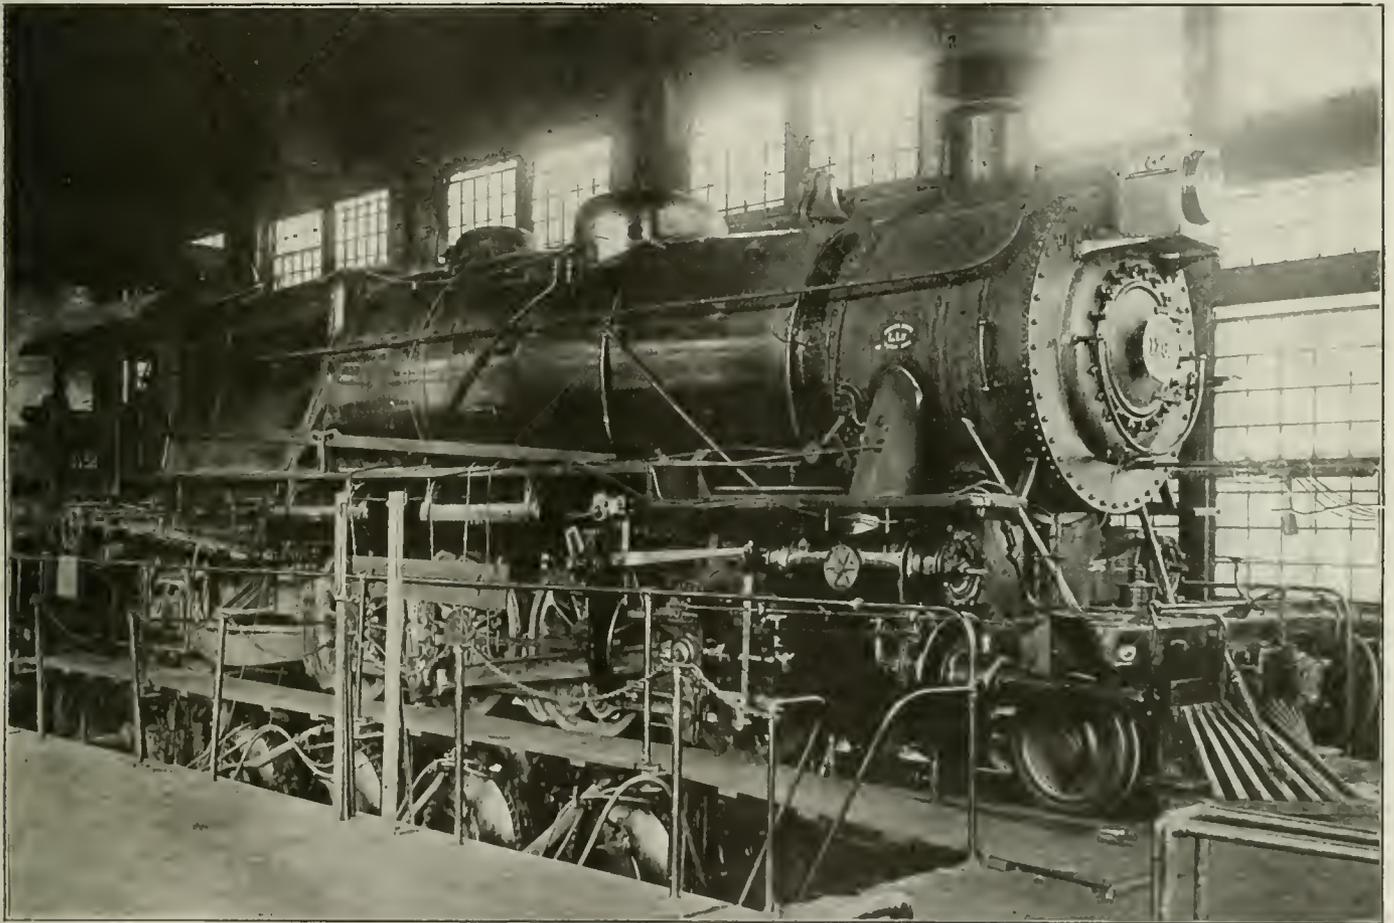

available in a part of the shop office and storehouse building, where the departments finally occupied 15,476 sq. ft. of floor area on four floors. That the growth of the departments has been rapid is also evidenced by the diagram, which shows the number of employees, the number of routine physical tests, and the number of standard specifications in force for each year from 1874 to 1914. The quarters having become congested in the past few years, a new building with a floor area of 41,000 sq. ft. was begun in 1913 and completed in 1914. Thus, in 35 years the requirements of the departments, as shown alone by the floor space occupied, have increased more than 35 times; or, there has been an average increase of over 100 per cent for each year since the work began. The growth of the test department and laboratory has been very much more rapid than the increase in

the main floor. There is a machine room in the basement and in this all of the metal test specimens are prepared. On this floor there are two large fireproof vaults for the storage of letter files and the like, and a room for chemical stores.

The first or street floor is devoted to physical tests. It contains a physical laboratory with five universal tension and compression testing machines, the largest of which has a capacity of 1,000,000 lb., and all are served by the traveling crane. On this floor are separate sections for oil, cement and lagging, hose, rail, miscellaneons and heat-treatment tests.

The second floor is used for office, locker and toilet rooms, the south end being occupied by the office force of the engineer of tests and the north end by that of the chief chemist.

The third floor is divided into laboratory rooms for bacterio-

The Locomotive Testing Plant, with a Mikado Type Locomotive in Position for Testing

tonnage hauled, or the extension of the general business of the railroad. The reason for this is that there was almost as wide a field for the application of specifications, and the inspection and testing of materials, in the beginning as at the present time.

THE NEW BUILDING

The new building at Altoona which has just been occupied is constructed of reinforced concrete, the reinforcement being of twisted bars. Structural steel cores are used in the concrete columns. The whole exterior is finished in red brick and red terra-cotta. It is arranged with a central service portion consisting of the middle bay which contains a stairway and an electric elevator, giving access to all parts. On the basement floor of the service section there is a receiving room for materials. This room communicates with the elevator for the distribution of small samples to the different sections of the building, while large pieces may be lifted to the physical-test section by means of a ten-ton traveling crane with a hatchway in

logy, rubber, water and gas analyses, photometry and lamp tests, and the calibration of electric instruments.

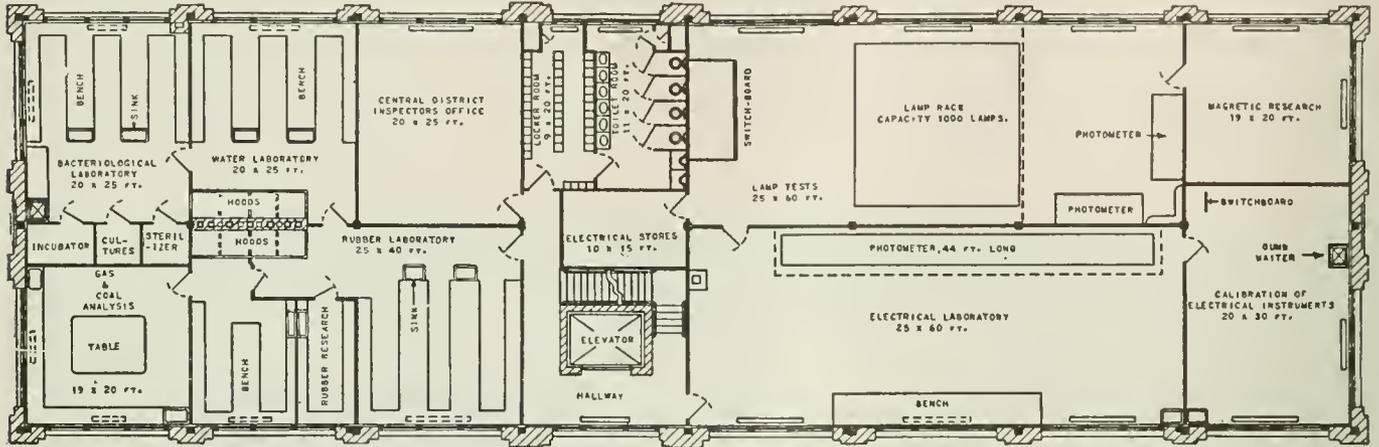

The whole fourth floor is used as a general chemical laboratory with a separate chemical balance room. The central bay is extended up to form a fifth floor, which comprises a photographic studio and dark room, while the roof of the remaining portion of the building is used for experimental work and tests where exposure to the atmosphere is required.

Direct lighting with tungsten lamps is the system of illumination. "Abolite" metal reflectors are used in the basement and on the first floor, with "Pyro" glass reflectors on the second or office floor. In the chemical laboratory, where metal would be injuriously acted upon by gases, "Holophane" glass reflectors are in use. All of the lighting and power conduits were placed in the floors before pouring the concrete. Telephone, dictaphone and buzzer systems are installed in the floor conduits, and in addition great flexibility is possible in the location of these fixtures by the use of a chair rail around the walls

of each room, the chair rail having three separate grooves for wires.

The building is heated by direct steam radiators with a single pipe system, and the radiators are placed under the windows. A hot water service, with a heating and circulating tank in the basement is provided. The gas, steam, air, water and hydraulic lines are of open work, and all pipe risers are in a common

- One vibratory endurance spring testing machine of 75,000-lb. capacity;
- One 43-ft. drop-testing machine;
- Two vibrating staybolt testing machines;
- One Brinell hardness testing machine;
- One 2,000-lb. cement testing machine;
- One horizontal microscope, with camera for metalographic work;
- One grinding, buffing and etching outfit for the preparation of samples for microscopic work.

Plan of the Third Floor, Giving an Idea of the Floor Layout in the New Building

conduit which is located in the central service bay of the building. The interior of the building is finished in natural chestnut throughout, with the exception of the office rooms, which are finished in imitation mahogany. All interior doors and partitions are glazed. The floors, with the exception of the basement where

In the machine room, where the sample test specimens are prepared, the following tools are used:

- Two 14-in. engine lathes;
- One 12-in. drilling lathe;
- One 24-in. shaper;
- One 24-in. radial drill;
- Two milling machines for specimens;
- One 30-in. cold saw;
- Two motor hack saws;
- Two tool grinders.

For the work in testing air brake, signal and tank hose and other miscellaneous tests including steam and hydraulic gages, there are:

- Six rubber stretching machines;
- One friction test rack for rubber;
- One hose mounting machine;

The General Laboratory in the Laboratory Car

the floor is of concrete and the physical laboratory where it is of wood on concrete, are of magnesium-cement composition.

It is noteworthy that the building was constructed and equipped complete within the original estimates and appropriation. The building itself cost about \$150,000. An estimate of the value of the contents is, for the physical laboratory, \$100,000; and for the chemical laboratory, \$25,000. With equipment complete, the investment for the laboratories is about \$275,000.

PHYSICAL LABORATORY

Among the machines and apparatus that compose the equipment of the physical laboratory, there are the following:

- Five universal tension and compression testing machines, one of 1,000,000, two of 300,000, two of 100,000 lb. capacity;

Metallographic Laboratory

- One vibrating test rack for hose;
- One continuous test rack for rubber;
- Four tension testing machines for rubber;
- One stretching machine for rubber insulation;
- One spring micrometer machine;
- One vacuum gage testing machine;
- One arbor press specimen cutter;
- One hydraulic gage testing machine, capacity 25,000 lb. per sq. in.;

- One dead-weight gage testing machine, capacity six gages;
- One wiggling testing machine for hose;
- One bumping testing machine for gages;
- One whipping testing machine for gages;
- One hydraulic machine for testing gage glasses.

The materials for test, including samples which have been obtained by the inspectors at outlying points and those sent to the department by the shops, are brought into the building through the receiving room. They are distributed throughout the building from that point, the metal specimens going to the machine room in the basement for preparation, then to the phys-

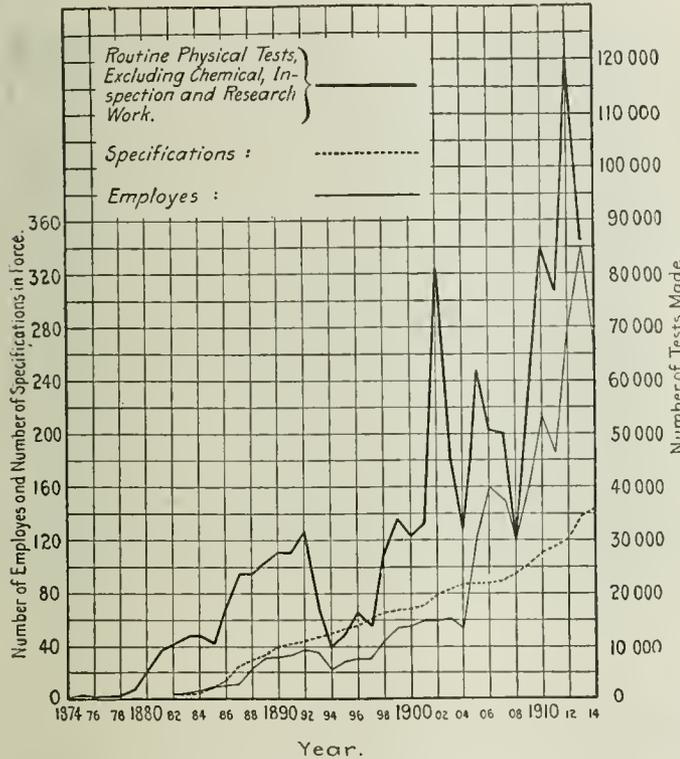

Diagram Showing the Growth of the Department of Inspection and Tests of the Pennsylvania Railroad

ical laboratory for tension, compression, vibratory or other tests, and to the chemical laboratory for analysis.

Rubber, Air Brake Hose and Miscellaneous Laboratory.—The extent of the work of this department is indicated by the fact that the needs of the railroad are about 635,000 pieces of air brake hose per year. There are now being installed machines for air brake, signal and tank hose, and other miscellaneous tests, including steam and hydraulic gages, and gage glasses for boilers and lubricators.

Heat-Treatment Laboratory.—This department, on the first floor, is for the development of standards in the heat-treatment of metals during the process of their manufacture for use in railway equipment. Investigations are carried out to study the effect of various heat treatments on a large variety of carbon and alloy steels. They are also made to determine the properties of non-ferrous alloys, including the co-efficient of expansion. Shop-manufactured locomotive and car springs, involving as they do a form of heat-treatment, are sampled and tested regularly to determine their acceptability for service.

Large castings of various kinds have been heat treated by this department with the aid of outside facilities with a gratifying degree of success. The effect of chemistry and heat-treatment upon the endurance of materials to repeated stresses is tested out by revolution and vibration tests, including vibration tests on complete springs. Rails, splice bars and tie plates are heat-treated to study the increased service it is possible to secure. The effects of heat-treatment are noted and a wide range of working conditions are applied on a variety of the high

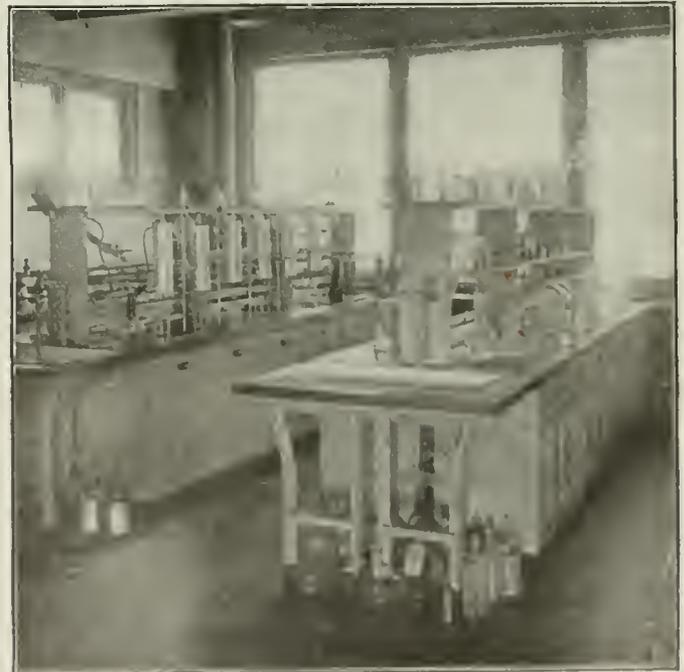

speed tool steels to ascertain the best chemical characteristics.

Investigations are made on various types of fireproof material for the purpose of maintaining a high standard. The testing of felt and insulating papers used for lining refrigerator cars has been made necessary by the large variety of materials of this kind on the market, the keen competition among manufacturers, and the ease with which the highest grade and best material can be closely imitated by cheap and inferior products. This laboratory is equipped with an insulated room and electrical heating arrangements for this work, the tests being designed to represent as nearly as possible the service conditions to which these materials would be subjected. Temperature measurements are made of various types of refrigerator-car construction by means of resistance thermometers. Aside from the measurements of high temperatures in the laboratory, periodic calibrations are made of the various pyrometers. The heat-treatment department in general carries on a large variety of special work, and there is but little that falls without its range of possibilities even to the extent of heat treating glassware.

ELECTRICAL LABORATORY

Lamp Tests.—On the third floor the equipment for lamp tests consists of three photometers, a lamp test rack of 1,000 lamps capacity, with switchboard, transformers and potential regulator equipment. This work was taken up in 1902, with a view of obtaining data for the preparation of specifications to secure uniformity in the ordering of incandescent lamps, and the maintaining of sufficiently high standards. It consists mainly of life tests of lamps at abnormal voltages and tests for the efficiency of illumination, as well as the investigation of new developments in the general field of illumination as applied to railway work.

Standardization of Instruments.—A division of the electrical laboratory is employed in investigations and development work along electrical lines, and the standardization of electrical in-

The Water Testing Laboratory

struments. Part of this work is done at the laboratory, and part of it, when necessary, at other points, by laboratory men. The character of the work may be judged from the following examples upon which comprehensive reports have been made:

- An investigation of electrolysis in systems of underground electric structures.
- Tests and investigations of the construction of various makes of transformers.
- Tests of various makes of primary and secondary battery cells.

Oscillographic tests for linear and angular velocity, wave forms, etc.;
Investigations of special cases of electrical troubles;
The development of an electrical method of measuring the hardness
and homogeneity of steel.

Matters such as these are reported on and recommendations made. Electrical instruments are sent in from all points on the Pennsylvania system to this department for calibration and repair, and men from the laboratory are sent out to inspect and check electrical instruments on switchboards at the various power plants, and at other points.

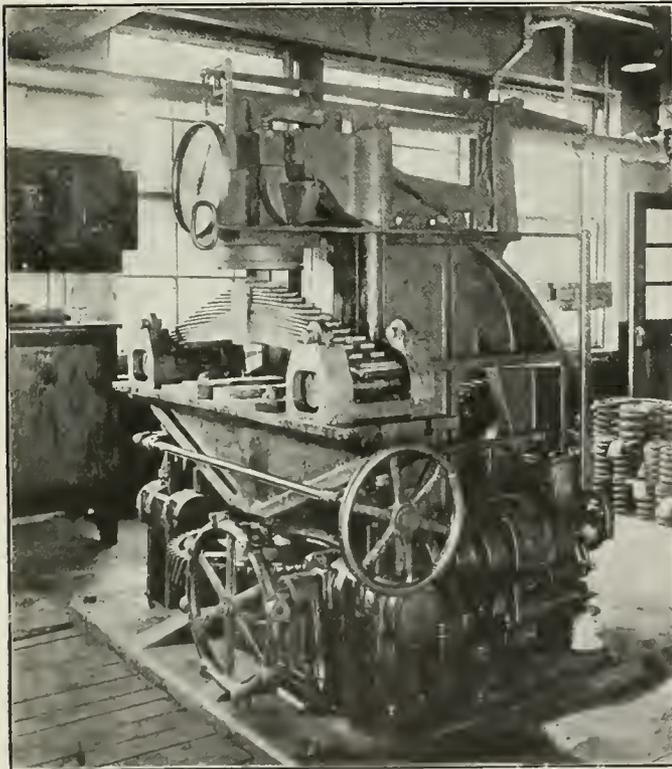

LABORATORY AND ROAD ASSISTANTS

The large room on the second floor is provided for the force of laboratory and road assistants coming under the direction of the foreman of road tests and special tests. The duties of these men are varied, and include tests of locomotives on the road or tests of equipment with special devices; the tonnage rating of trains and the following up of all experimental appliances which are put into service for test purposes.

The fifth floor has been arranged for photographic work, consisting largely in making prints of metal sections, photomicrographs of steel rails forming a large part of these. Photographs of parts which have failed in service are also made for convenient preservation and study. The photographic work requires the services of two men and about 25,000 prints per year are made.

CHEMICAL LABORATORY

Metallurgical Work.—The main chemical laboratory on the fourth floor is divided by the central balance room, into two

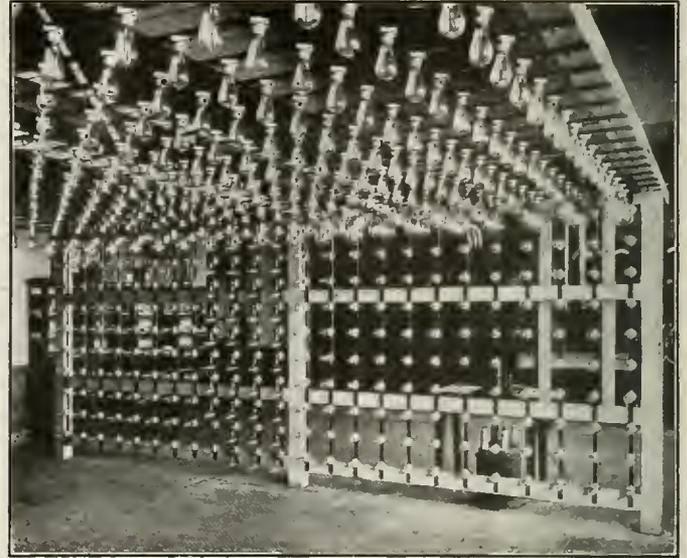

Vibratory Endurance Testing Machine for Springs

departments, the larger one of these being devoted exclusively to metallurgical chemistry. In this department methods are developed for the determination of the elements in plain-carbon steels, alloy steels, and non-ferrous alloys used for bearing backs and linings, packing-ring metal for different purposes, etc. Data are obtained leading to the development of specifications for this class of products, and samples of shipments are analyzed to determine whether they are acceptable under the specifications adopted. This steel laboratory has facilities for analyzing 100,000 samples per year.

Miscellaneous Work.—The smaller of these two laboratories is for work of a more general character, being used for the examination of fuels, the development of specifications for paint products, lubricating and burning oils, boiler compounds, lacquers, plush, car cleaners, cutting compounds, belt dressing, polishing compounds, hydraulic-jack liquids, fuses, track caps, fire-extinguishing preparations, the recovery of used or wasted products, etc.

In both of these laboratories much time has been spent in the examination of broken or "failed" parts of equipment, in an effort to determine the cause and with a view to the preven-

Lamp Test Rack with a Capacity for Making Efficiency and Life Tests of 1000 Lamps

tion of accidents which aside from the money losses, might result in injuries or loss of life.

Certain food products used in the dining car service are also examined here at times; many other miscellaneous investigations are made, as of conditions which may have led to loss from the damage of freight in transit, and to so establish methods for preventing such loss. During the past year a considerable amount of work has been devoted to the chemistry of tunnel air in connection with the installation of ventilating systems. The total list of activities touched upon would be too long for enumeration in an article of this character.

The chemical analysis of rubber compounds has been studied and much experimental work done in perfecting a method whereby material of this kind can be bought on specifications which define and limit its chemical properties. At present there is in force a specification for high-grade rubber insulation. Samples from all shipments are analyzed as well as some other rubber compounds. At the same time experimental work is being carried on to improve the method of analysis, and to devise others so that specifications may be drawn covering the chemical properties of other grades of rubber materials.

Manufacturing Laboratory.—A manufacturing laboratory, which might be called a small factory, is maintained in a separate building which is under the direct supervision of the chief chemist, and new products are manufactured in this until such time as it is found advisable to purchase them from "outside" manufacturers.

Laboratory Car.—In addition to the steel-rail work at Altoona a laboratory car has been built to be moved, as required, to that point where steel rails in process of manufacture are to be inspected. The object in equipping this car is to make chemical analyses of the finished rails at the mills by a force of chemists under the chief chemist. This, it is expected, will avoid delays which at times occur in the operation of the mills, and are im-

possible to avoid without the facility of a suitable force at hand at the time and when the rolling is taking place, in order to keep up with the chemistry requirements of the company's specifications. The car is equipped with furnaces for combustion and all other necessary apparatus for general chemical work in connection with the inspection of steel rails.

Bacteriological Laboratory.—When the department of chemistry was established, problems were frequently presented which applied chemistry could not solve satisfactorily. It was found, for example, that a chemical examination of water might show the presence of organic constituents, but it was impossible to tell the source of these. A water might contain a large amount of organic material of vegetable origin and yet not carry any infectious material which would likely give rise to disease, while other samples low in organic constituents were believed to carry infectious germs which might render their use very dangerous to employees or patrons of the road.

It was also found necessary to supervise certain sanitary matters and to disinfect cars, offices and waiting rooms under certain conditions, but it was not known what disinfectants were destructive to specific disease-producing bacteria. Manufacturing concerns were offering various disinfecting preparations, but the officers of the company had no means of determining which ones were efficient and the problem could not be solved by chemistry alone. These questions were considered so important that it was decided that a division of bacteriological chemistry was necessary, and on November 1, 1899, such a laboratory was established.

The work in bacteriology and water analysis has increased constantly, and at the present time four men are employed in the laboratory. The department co-operates with the surgeon general of the United States in the enforcement of the quarantine regulations of 1913, which require that railroad companies shall furnish wholesome drinking water and proper ice supply to passengers using their cars. Water which contains anything indicative of injurious contamination is not permitted to be introduced into the drinking containers of a Pennsylvania coach.

The department regulates the standardization of disinfectants and issues instructions concerning their application for the protection of passengers and employees, as well as the disinfection of stock cars. Special care is taken to prevent any infected employees from coming in contact with the public.

In 1914 bacteriological and chemical examinations were made of 609 samples of drinking water. There were 3,112 bacteriological examinations of pathological specimens, submitted by the relief association physicians. The total number of bacteriological examinations was 3,621, or an average of more than ten per day.

In addition, this department has under its care the examination of boiler feed waters and the formulation of methods for their treatment. In 1913, examinations of 287 boiler feed waters were made, while in 1914 the number was 282.

OTHER EQUIPMENT

As part of the equipment of the test department there is a dynamometer car which was built in 1906, and is the fifth of a series of such cars which have been in use on the Pennsylvania Railroad. There is also the locomotive testing plant which is located adjacent to the test department building. This plant was erected in 1905, after having been in use at the St. Louis Exposition in 1904, and is operated by a force of 26 men.

There is being installed in a separate building a brake shoe testing machine which will be the first of its kind, in that it will have two dynamometers of 4,000 lb. capacity, which will make it possible to obtain the co-efficient of friction of brake shoes when two shoes are applied to a single wheel (clasp brake conditions). The car wheel will run upon an idler wheel, representing the action of a rail upon the wheel.

EXTENT AND VARIETY OF MATERIALS TESTED

The scope of the work now embraced by these departments coming under the jurisdiction of J. T. Wallis, general superintendent of motive power, at Altoona, can be better appreciated

when it is understood that the cost of the materials covered by the inspection and tests, and entering into the construction of the railroad rolling stock and track, in 1913 amounted to \$82,119,480, while the cost of operating the test department and chemical laboratory for the same year was \$534,060. For an approximation and using these figures, it is interesting to observe that the total cost of operating the departments, including all additional work and inspection, is about 0.6 per cent of the cost.

The year 1913 was perhaps a record one for the test department and laboratory, and the extent and variety of the work of the departments can be shown by a few examples for that year. There were 61,148 separate reports of material tests issued by the test department. In the physical laboratory, while no record was kept of the number of samples examined, 138,886 tests were made. These tests represented quantities such as the following:

Of bar iron 149,863,693 lb. were tested and 6,246,611 lb. rejected; of staybolt iron, 15,385 tests representing 8,301,960 lb. were made; of cement, 29,231 tests were made, representing 587,900 bbl., of which 13,600 bbl. were rejected; of wheels, 310,381 were inspected, and 1,213 were rejected; of axles, 164,810 were tested and 8,035 were rejected; 290 samples, representing 56,322 yd. of plush, were tested; of air brake hose, samples representing 634,807 were tested and 84,826 rejected.

In the chemical laboratory, during 1913, a total of 57,309 samples were analyzed, involving about 286,545 determinations.

There are 85 items, ranging from asphaltum to zinc, which are now bought under specifications and which must be passed upon by the test department or the chemical laboratory.

During 1913 there were inspected, while building at manufacturers' works, 24,966 freight cars, 343 steel passenger cars, and 190 locomotives. The value of the materials rejected through the test department in 1913 was for the physical laboratory, \$776,928; and for the chemical laboratory, \$65,767.

ORGANIZATION OF DEPARTMENTS

As outlined in the diagram of the organization, the inspection at the manufacturers' works and the collection and forwarding of samples to Altoona is carried out under the direction of the chief inspector, with permanent resident inspectors and forces for the central district at Altoona, the western district at Pittsburgh and the eastern district at Philadelphia. In addition, when equipment is being built at outlying points, temporary inspection forces are maintained at these places during the progress of the work.

As previously stated, the work of the department began under the direction of John W. Cloud. In May, 1879, he was appointed the first engineer of tests and continued under that title until July, 1886, when he succeeded to the office of mechanical engineer, retaining control of the test department. Axel S. Vogt, the present mechanical engineer, succeeded Mr. Cloud in March, 1887. The work of the department under the mechanical engineer was in direct charge of W. O. Dunbar from July, 1886, to July, 1893. From the latter date to July, 1903, the assistant mechanical engineer had direct charge of all the work of the department. During this latter period the assistant mechanical engineers were A. W. Gibbs, from July, 1893, to August, 1902, and W. F. Kiesel, from the latter date until July, 1903. In August, 1903, E. D. Nelson was appointed engineer of tests, and in September, 1911, was succeeded by the writer.

Two men have been in charge of the chemical laboratory, Dr. Charles B. Dudley from November, 1875, until his death, December 10, 1909. Since December, 1909, Dr. F. N. Pease has held the position.

That the information collected and the developments which have been made in the chemical laboratory and the test department have been freely given to the public, is well exemplified by papers and addresses which have been presented by the late Doctor Dudley. In addition to the works of Doctor Dudley, there have been published by the test department, 27 printed bulletins covering field tests and the work of the locomotive testing plant.

TRIES TO USE RAILROADS AS SELLING AGENTS

An example of methods by which shippers may cause a great deal of trouble for railroads is illustrated by an experience which the Erie and other Chicago lines have been having with a small mail order house in Chicago, which apparently has been trying to coerce them into acting as selling agents for its products, and when some of the roads refused, has attempted to boycott them.

Ward & Company, located at 730 North Franklin street, Chicago, who deal in soap and toilet preparations and other articles, have been making a practice of shipping packages of their goods to prospective agents to be sold on a commission basis, the agent to keep half of the sale price and remit the other half to the company. The agents are required to pay the freight charges in both directions, but when they are unable to sell the goods they have often returned them to Ward & Company, without prepayment of the freight charges on the return movement. There have been other cases where the consignee has refused to accept the goods on arrival, leaving them in the hands of the carrier, without recourse of the latter to collect charges in either direction; in one instance at least, shipment was made to a young boy, who had answered the alluring advertisement of the concern.

This company sends to its prospective agents a blank contract form to fill out, in which the agent agrees to dispose of the goods within 30 days, and also to pay freight charges and take them promptly from the freight station. So many of the shipments were returned that the Chicago freight stations were congested with them, and when Ward & Company were notified they advised the railroad that they would accept no shipments on which the freight charges were not prepaid in full by the shipper, and requested the road to notify its agents to that effect. On January 27, 1913, the railroad did issue a circular to all its agents and connections advising them not to accept such shipments unless all freight charges were fully prepaid, but in the large number of circulars handled by the average station agent they were often overlooked and the shipments kept coming in. Also, in many cases the consignees declined to accept the shipments and they were sent to the unclaimed freight depots.

Ward & Company gave instructions to the railroad to sell the shipments for charges and to remit the balance. They usually claimed that the value of the shipments was \$10 and authorized the railroad to sell them for \$5, but the railroad could not dispose of them for anything above 75 cents. Authority was finally obtained to dispose of the packages at 75 cents each, which was not sufficient in all cases to cover the charges. Finally, notice was served on Ward & Company that commencing February 20, 1915, the railroad would require the prepayment of freight charges on the shipments on the ground that the goods were not worth the freight charges.

This action resulted in the issuance by Ward & Company of various notices not to ship goods over the Erie, which was some relief to the road, although giving it some unpleasant advertising, but the goods continued to be shipped to points which could be reached only by its lines. Red pasters were placed on all packages sent out by Ward & Company containing the notice in large type "Ship no goods to Ward & Company over the Erie Railroad," and postal cards were mailed to agents of the road containing the same notice, with a footnote "Account of Erie Restriction on Ward & Company's Outgoing Shipments." Similar notices were issued applying to the Baltimore & Ohio, Chesapeake & Ohio and Chicago & North Western. The railroad cannot collect the charges from the original consignees, the latter claiming that the goods are the property of Ward & Company, while the Ward company disclaims ownership but claims to have a lien on the property. Ward & Company, in a letter to the Erie, have stated that the matter will be taken up with the Illinois Public Utilities Commission and the Interstate Commerce Commission, and that, if possible, an injunction will be obtained restraining the road from refusing to accept their shipments with charges collect.

WISCONSIN BERTH LAW ANNULLED

The United States Supreme Court has declared unconstitutional the statute of Wisconsin prohibiting the making up of an upper berth in a sleeping car until the berth is engaged. The decision is by Justice Lamar who holds such a regulation unconstitutional as taking private property without compensation. Moreover, the practice interferes with interstate commerce in that it is an inconvenience for a passenger to have the upper berth made up after he has got into the lower one.

The statute was passed in 1911, being designed to take the place of one passed during the year 1907, and found to be unconstitutional. The suit was brought by James T. Hall, against the Chicago, Milwaukee & St. Paul, which runs its own sleeping cars.

On the trial the railroad company insisted that the statute was arbitrary and unreasonable; not designed to accomplish a legitimate public purpose and contrary to natural justice. It claimed that the statute denied to it the equal protection of the laws; took its property without due process of law in violation of the Fourteenth Amendment and attempted to regulate interstate commerce. There was a hearing before the trial court without a jury. Some of the averments in the railroad's answer were admitted to be true. In addition witnesses were sworn whose testimony—admitted over objection—was to the effect that—while the company had a pecuniary interest in having the upper berth kept down when the lower was occupied yet—such lowering was necessary to secure the comfort of the occupant of the lower berth and to prevent him or her from being wakened or disturbed if it became necessary to put down the upper berth and arrange it so that it could be occupied by a passenger who had purchased such upper space during the night. The evidence was to the effect that the opening of the curtains, the glare of the light, the noise of the lowering the berth, the work of arranging the bedding for the upper berth and securing the holding wires would necessarily inconvenience the man or woman occupying the lower berth; deprive him or her of the privacy to which they were entitled and interrupt the rest and sleep to secure which they had engaged the berth.

There was evidence, and contention based on common knowledge, that the letting down of the upper berth did not affect the health or convenience of the occupants of the car or of either berth. This was demonstrated by the absence of injurious effects and the fact that lower berths with the upper berths down had thus been constantly used by travelers since sleeping cars were invented. . . . And if it was harmful to let down the uppers it would be even more harmful to permit additional passengers to come into the car and occupy them.

The decision declares that the objection to the act of 1907, which was annulled by the Supreme Court of the state, has not been overcome by the language of the act of 1911. The state could not authorize the occupant of the lower berth to take salable space without pay, neither can it compel the company to give that occupant the free use of that space pending actual purchase by another passenger. The owner's right to property is protected even when it is not actually in use, and the company cannot be compelled to permit a third person to have the free use of such property pending the appearance of a buyer. The statute cannot be sustained as a health measure. The right of the state to regulate public carriers in the interest of the public is very great, but that great power does not warrant an unreasonable interference with the right of management.

Counsel for the state argued that the statute should be sustained as an exercise of the state's reserved power to alter the charter of the company; but this view is rejected; the right to amend a charter does not authorize the taking of the property without just compensation. The power of amendment is not without limit.

Justices McKenna and Holmes dissented; but delivered no written opinions.

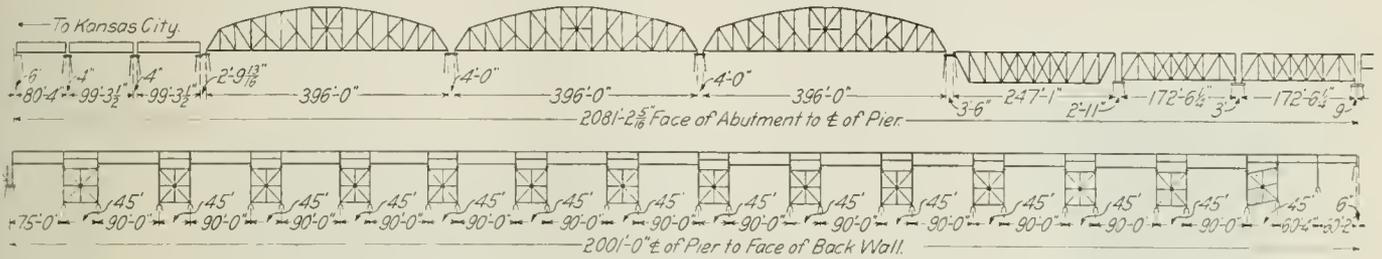

New Bridge Across the Missouri River at Sibley, Mo.

The Santa Fe is Completing the Renewal of a 4,100 ft. Structure With a Ballasted Deck Under Traffic

The Atchison, Topeka & Santa Fe is now completing a new bridge across the Missouri river at Sibley, Mo., on its main line about 25 miles east of Kansas City, which is of interest on account of its size, the advanced design adopted including the use of a creosoted ballasted deck, and the fact that the replacement of the old structure with the new was carried on without interference with a relatively heavy traffic. This problem was further complicated by the raising of the viaduct at the

construction imperative. For two years preceding its renewal large engines were not allowed to work steam when crossing the long spans and a pusher was attached on the approaches to the bridge.

The old crossing was at right angles to the stream and tangent for its entire length, with a 6-deg. curve on the bank at each end. The west approach required practically no embankment as the line is supported on the high bank which rises abruptly

Elevation of Santa Fe Bridge Across the Missouri River at Sibley, Mo.

east end a maximum of 7 ft. to reduce the approach grade from 0.8 per cent to 0.5 per cent. Approximately 9,600 tons of steel were required and the total expenditure was about \$1,300,000.

The old bridge was built in 1887 at the time the line was extended to Chicago. Beginning at the west end it consisted of one 80-ft. deck girder span, one 200-ft. deck truss span, three through-truss spans 396 ft. long, one 247-ft. deck truss span, two 172-ft. 6-in. deck truss spans and 2,000 ft. of steel viaduct

from the river. The east approach ascended from the adjoining low flood plain on a fill nearly two miles long and 60 ft. high at the bridge. When the renewal of this structure was first considered it was proposed to build the new bridge on another location closely approximating an extension of the east approach tangent. This would have eliminated the two 6-deg. curves and a small amount of distance, while it would have enabled the new bridge to be built without any conflict with traffic. It would

The New Santa Fe Bridge across the Missouri River at Sibley, Mo.

composed of 30-ft. tower and 60-ft. intermediate spans, making a total length of 4,082 ft. between parapets. This was a single-track bridge designed for a loading approximately equal to Cooper's E-24, and had become too light for the engines and trains operated over this line. Faulty details in the lateral system of the long spans, in the longitudinal bracing system in the viaduct towers and in the ends of the columns, made its re-

however, have resulted in the abandonment of the present sub-structure and have required a very considerable extension to the approach fill on the east end. It was therefore decided to re-build on the present alignment.

Approaching the old structure from the east was an 0.8 per cent grade, extending across the long approach fill and the viaduct to the truss spans. The grade was level across the seven

truss spans and then ascended on the west bank on a 0.3 per cent grade. When originally built, the ruling grade on the Missouri division was established at 0.8 per cent. Recent improvement and second-track work has gradually reduced this to 0.5 per cent, except at one or two points. In considering the reconstruction of this bridge it was therefore decided to reduce the grade on the east approach to the new standard, which necessitated a maximum change in elevation of the viaduct of 6.9 ft. at the east end and a maximum raise in grade on the approach fill of 22 ft. The river spans provide a clearance of 50 ft. above the high water elevation of 1903. The maximum variation between high and low water elevation at this point is 37 ft.

The new structure is being built for a gauntlet track. As this is the only stretch of single track between Chicago and Kansas City, the advisability of building a double-track structure received very careful consideration. However, it was finally

THE MAIN SPANS

While in general the old masonry was still in good condition, it was necessary to repair and remodel it in several places. The west abutment was enlarged and wing and parapet walls added. The west pier was raised to support the new girder spans. A new pier was also necessary to support the two 100-ft. girder spans which replaced the 200-ft. truss, while the change in grade at the east end of the viaduct and the increase in length also made necessary the reconstruction of the east abutment.

With the exception of the pier under the east end of the east deck truss span, which is supported on oak piles driven to rock, and that under the west end of the west truss span, which rests directly on a rock ledge a short distance below low water, all the piers under the truss spans are carried on pneumatic caissons founded on rock. The four piers under the main channel spans are faced with granite to the elevation at which the ice usually goes out. The remainder of the material is Strong City

Views Showing (left) The Bottom Lateral System and (right) The West Portal

decided that as there is double track up to both ends of the bridge, a gauntlet single-track structure would provide sufficient capacity for any increase in traffic which might be expected during the normal life of the new structure, and that when it again required renewal, the traffic might justify a double-track structure on the proposed new alignment. The construction of the gauntlet bridge on the existing alignment and including the reduction of the grade on the east approach showed a saving of over \$500,000 in comparison with a double-track structure on the new location.

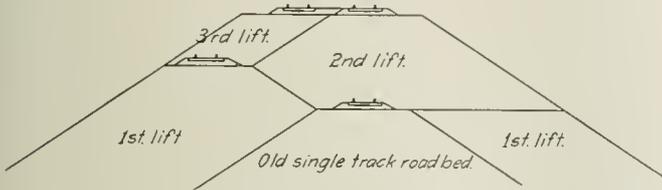

In the new bridge the 200-ft. deck truss span near the west end is replaced by two 100-ft. deck girder spans, resting on a new center pier. All other spans are replaced with others of the same length. The steel viaduct at the east end consists of 45-ft. tower and 90-ft. intermediate spans.

(Kan.) sandstone. While these piers were of ample dimensions for the new structure, the stone in the upper courses of four of them had become frost-broken, so that it was necessary to replace this with concrete for a distance of 12 to 20 ft. from the top. To accomplish this it was necessary to support the spans independently of the tops of the piers during their reconstruction. Two cofferdams were sunk onto the top of the pneumatic caisson on each side of each of these four piers. Concrete buttresses were then built in each of these cofferdams, supported on the caissons and extending up to average high water level. The buttresses on opposite sides of the pier were anchored together with 1½-in. rods extending through the pier. The concrete was placed by floating equipment. Steel hents were then erected on these buttresses and the load transferred from the masonry to these steel columns, after which the faulty

masonry was removed and the concrete placed. In the accompanying photographs of the reconstructed piers it will be noted that there is no projecting coping at the top, a standard practice on this road for concrete masonry.

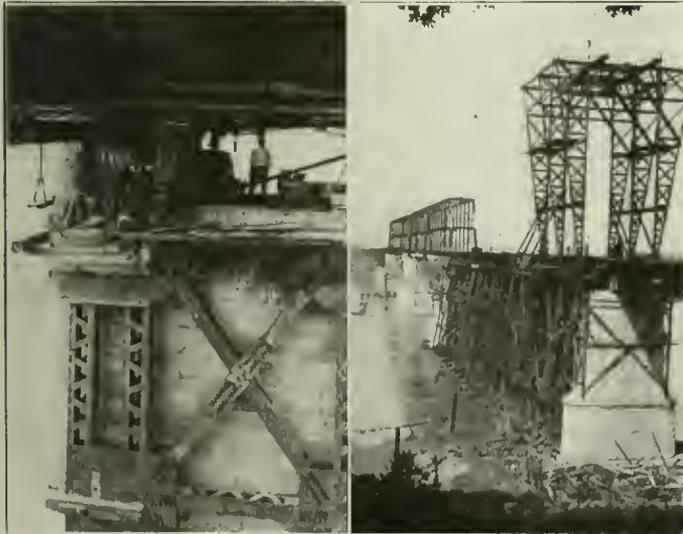

The remodeling of these piers and the placing of the concrete was done during the winter, much of it when the temperature was below zero. To prevent injury to the concrete in these exposed places the materials were heated before mixing and the green concrete was covered with tarpaulins, inside of which live steam was circulated.

This bridge is designed for Cooper's E-60 loading without modification. It follows the railway company's general stand-

Various Steps in the Construction of the East Approach Fill

ards of design except in a few instances. No adjustable members are placed in any of the large spans. To secure the desired strength and rigidity the various sections were designed liberally. To give an idea of the size of some of the more important members, the end post and top chord sections include three 40-in. web plates and 48-in. cover plates. In these sections no plates thicker than $\frac{3}{4}$ in. were used. The heavy design is especially noticeable in the bottom lateral system, which weighs 1,200 lb. per lin. ft. and in the top lateral system weighing 800 lb. per lin. ft. No curved members are employed, even at the portals, but care was taken in the design to use plain members

Transferring the Span from the Masonry to the Steel Post

Renewing the Floor on the First Long Span

throughout to secure a minimum cost of fabrication without sacrifice of serviceability or appearance.

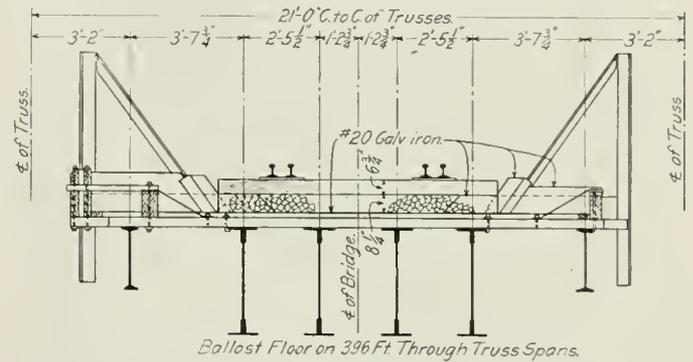

To provide a horizontal seat without vertical offsets at pier 6, the east end of the 247-ft. deck truss span is carried on a vertical steel bent on a rocker bearing. A similar arrangement is provided at pier 8, where the first girder span of the viaduct is also supported on steel posts.

In replacing the long spans, they were first transferred to falsework, one at a time, and dismantled by a traveler in the usual manner. The floors were then changed out and the new spans erected. Especially when changing out the floor, the necessity of avoiding interference with traffic was a serious problem.

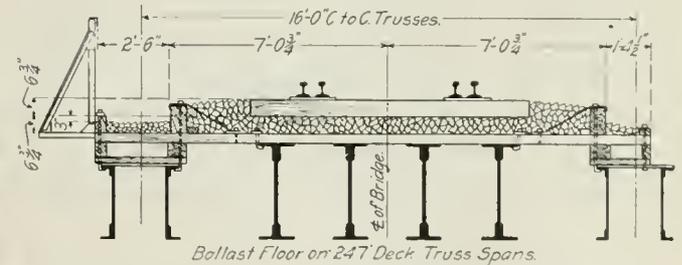

The government refused to permit the three long spans to be erected continuously across the stream, but required the west span to be erected first, the east long span next and then the middle span. This made it necessary to move the 150-ton traveler across the old center span. This was accomplished by laying stringers on the top chord of the span and placing rails on them. All movable equipment was removed from the traveler to lighten it, after which wheels were put under it and it was pulled across the center span by means of cables attached to a hoisting drum. While the removal and replacing of the equipment required considerable time, and this requirement of the government entailed an additional expense of \$1,500, the time actually consumed in moving the traveler across the span was less than 30 minutes.

THE VIADUCT

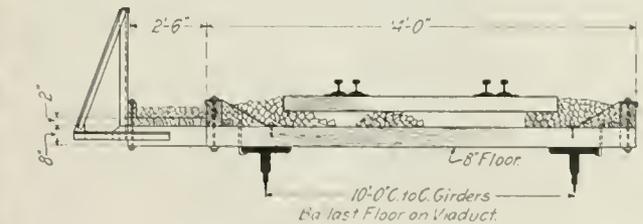

In designing the viaduct the principal problem arose from the necessity of adopting span lengths such that the new piers would

Ballast Floor on 396 Ft. Through Truss Spans.

Ballast Floor on 247 Deck Truss Spans.

Ballast Floor on Viaduct.

Typical Sections of Ballast Floor

miss the old ones in all cases, as the masonry in the old pedestals was faulty and could not be used. With a careful adjustment of span lengths it was possible to design the new viaduct so that no new pier came within 12 ft. of an old one, measured between centers. Because of the difference in depth, the 45-ft. tower girder spans are supported on shelf projections on the ends of the intermediate spans, and all loads are transferred to the steel posts through the longer girders. One end of each long span is carried on expansion bearings consisting of four 12-in. segmental rockers. The towers are built to a batter of 2 1/2 in. to 1 ft. and are heavily latticed.

The viaduct is supported on massive concrete pedestals carried on from 12 to 16 concrete piles each. They were cast at the site and were designed to carry 20 tons each. They were driven until 60 blows were required to sink them one inch. The pedestals are connected with a thin reinforced concrete wall extending from just below the ground line to the top of the piers, this wall being built monolithic with the pedestals. After

the erection of the steel towers the bottoms of the posts were filled with concrete to protect the connections from moisture.

As it was necessary to erect this viaduct under traffic the track had to be raised to the new grade before placing any of the new steel. This required raising the deck of the old structure vertically a distance ranging from nothing at the connection with the main spans at the west end to 6.9 ft. at the east end. This was accomplished by lifting the girders at one end of each span one foot at a time with a derrick and blocking under it on the top of the tower. This process was continued from span to span until the track over the entire viaduct was at the required grade when the new viaduct was erected and the load transferred to it.

OTHER FEATURES

One of the special features of this structure is the use of a creosoted ballasted floor throughout the entire length. While this form of construction has come into quite general use on short spans, its application to truss spans 396 ft. long is unusual. However, careful records of the cost of maintenance of other structures, equipped with this type of floor on the Santa Fe, showed that it was economical, even on these long spans, because of the decreased cost of track maintenance. It was on this consideration that it was adopted here. Four-inch by 8-in. creosoted timbers are laid solidly on 24-in. 85-lb. I-beam jack stringers between vertical curbs spaced 13 ft. 11 in. between faces and allowing 8¼ in. of ballast below the 6¼-in. by 9-in. by 9-ft. ties at the end of the spans and a minimum of 6 in. at the center with the span carrying the full dead load. No attempt is made to build this floor waterproof.

Although gravel ballast is shown in the accompanying photographs, this will be replaced with stone in the near future, as the hauling of dirt across the bridge for the east approach fill is now almost completed. New ties and 90-lb. rails will also be laid and the gauntlet track added at that time. The track will be laid with screw spikes and special tie plates and rail anchors. No. 20 frogs will be employed at the ends of the gauntlet. The creosoted floor provides for a sidewalk and hand rail across the entire structure. Telegraph brackets are attached on the downstream side, especially designed to afford ready access for the linemen.

The east approach fill is 10,000 ft. long and 65 ft. high at the highest point. In addition to being widened for double track it was raised a maximum distance of 22 ft. to conform to the new grade. This required placing 1,750,000 cu. yd. of material, all of which was secured from a cut about 3 miles west of the fill and across the bridge. This was loaded by two 95-ton Bucyrus shovels into 20-yd. Western air dump cars hauled by road locomotives. In spite of the necessity of avoiding interference with main line trains, as much as 5,400 cu. yd. of material was brought to the fill and unloaded in 9 hours. The accompanying sketch shows the manner in which the fill was widened and raised in three lifts.

The material was largely clay, which slid badly when saturated. After several slides had taken place about 80 large rock drains were built into the bank with outlets below the toe of slope in a quicksand bed. These drains were spaced as closely as 50 ft. apart in some instances where conditions were especially bad. After their completion a berm was built along the outer slope, since which there has been no further movement.

A new station with a 16-lever interlocking machine has been built at Sibley, near the west end of the bridge, to control the operation of the gauntlet tracks. Home and distant signals are provided at each end.

This work has all been handled without interference with the regular traffic, which amounted to an average of about 8 passenger and an equal number of freight trains during the 10-hour working day. When renewing the floor on the truss spans and when placing the 90-ft. girder spans on the viaduct, two passenger trains were detoured over another line to give a longer continuous working period. With this exception all trains were

handled over this bridge during the entire progress of the work. This added materially to the complexity of the problem as indicated by the fact that the gang placing the creosoted ballast floor was frequently only able to get in 3 hours actual work in a day.

This work was started in September, 1911. The premature moving of the ice took out the falsework under the west long span in February, 1912, without, however, damaging the structure. As soon as possible it was replaced and the erection of steel started in July, 1912. The three long spans were completed in January, 1913. Ice again took out the falsework under the west 175-ft. span in April, 1913. This was replaced and the deck truss spans were completed in June, 1913. Work on the viaduct was then postponed for some time until the east approach fill was raised sufficiently to enable the track on the viaduct to be raised to its permanent grade. Work was then carried on simultaneously on the fill and the viaduct until March 1914, when the steel work was completed. The construction of the fill is now practically completed, and it is expected that the final track construction will be installed by July.

This work has all been handled under the direction of C. F. W. Felt, chief engineer, and A. F. Robinson, bridge engineer system, with G. J. Bell, division engineer, and F. H. Frailey, assistant engineer, in charge on the ground. The steel was fabricated by the American Bridge Company at the Gary plant. The Missouri Valley Bridge & Iron Company, Leavenworth, Kan., erected all the steel except for the viaduct, and did all concrete work except building the east abutment. The viaduct was erected by company forces, who also built the east abutment and placed the ballast deck on the entire structure.

THE TRAIN DESPATCHERS' CONVENTION

The 28th annual convention of the Train Despatchers' Association of America was held at St. Paul, Minn., beginning Wednesday, June 15. President Charles A. O'Connor (B. & A.) in the chair. George T. Slade, vice-president of the Northern Pacific, welcomed the convention on behalf of the railways of the Twin Cities, and J. E. Scott, chairman of the train rules committee, responded. The president, in his annual address, reviewed the work of the year, congratulated the association on having reduced its deficit of last year by \$140, although the expenses of the official organ had exceeded its income by over \$500, and urged that some measure be taken to reduce this burden. He also recommended that the president's term be two years instead of one. There were thirty-seven applications for memberships and six for reinstatement, all favorably acted upon.

Charles F. Banks, former officer in charge of efficiency on the Northern Pacific, made an address on "Safety First," describing methods and their results on that road.

The report of the executive committee showed receipts for the year to be \$3,297. It was recommended that members be requested to pay for the "Bulletin" a club rate of 25 cents a year, and that the practice of issuing a free copy to each member be abandoned. This would make possible the publication of advertising matter, which, with some effort on the part of members to increase its circulation, would result in making the "Bulletin" self-sustaining. This plan was approved by the convention. The membership account showed that at the end of last fiscal year there were 1,151 members on the roll, to which were added during the year by election and reinstatement, less members deceased, withdrawn and lapsed 88, leaving the present membership at 1,239. Adding members elected at the convention, the membership of the association now stands at 1,282.

The train rules committee, which is joint with that of the American Association of Railway Superintendents, announced that the committee had no report to submit this year, the report of a year ago being incomplete and requiring still further revision. The committee had been in session for the two

previous days discussing certain questions as to which no satisfactory conclusions had been reached, and desired the views of the members of the convention thereupon. On these questions, relating to various phases of train rules, there was an informal discussion which continued until adjournment for the day.

On Wednesday, the second day, the members listened to the "Wonder-Phone," a loud speaking telephone, capable of delivering speech in a loud, clear, articulate manner to individuals or large audiences, and with a soft pedal which can reduce the sound to any extent. The convention was greatly interested in this.

Train rules were again discussed, nearly all day, being interrupted only by an address of half an hour by M. H. Clapp, superintendent of telegraph of the Northern Pacific, on the construction and maintenance of the telephone as a medium for train despatching. Mr. Clapp urged despatchers to more fully inform themselves as to details of telephone maintenance; many despatchers seem to take only a superficial interest. The train rules discussion covered the consideration of Rules 9, 20, 22, 37, 93, 202, 208, 210, 211, 218, 220, 221, 223, and Forms B, C, E, F, G, H and K of the Standard code. The discussion was concluded in the session of Thursday night. The convention affirmed by unanimous vote its opinion that Example 3 of Form G, or some similar example of Form C, giving right or "superiority" of one extra over another, was necessary to efficient single-track train despatching, and approved the Form C examples governing such movement framed by the train rules committee as being safe and effective; also approving the use of the middle order when practicable. There was some discussion as to the word "afterward" in the explanation to Example 4 of Form H, some roads having authorized the combination of this with Examples 1, 2 and 3, when the necessity for protection against certain extras already on the road was apparent at the time of issue of Example 1, while others required, under such circumstances, the issue of Example 4 separately, under a higher number, although delivered with the Example 1 order. The subject was referred back to the committee. There was also considerable discussion as to the practicability of relieving scheduled extras from the restrictions of Rule 93 in the numerous so-called yards where no yard engines are employed. The consensus of opinion was against such action.

The election of officers resulted in the choice of E. W. Weston, chief dispatcher, Northern Pacific, Livingston, Montana, as president; Frank I. Felter, chief dispatcher, Electric Division New York Central, as vice-president, and of John Colclough, dispatcher, Intercolonial, Riviere du Loup, Quebec, as member of the executive committee for four years. Toronto, Ontario, received the almost unanimous vote of the convention as the next place of meeting, and June 20, 1916, is the date.

The third day, Friday, was devoted to the reading and discussion of three papers. One on Checking Train Orders, by C. C. Barnard (St. Joseph & Grand Island); one on Team Work between train dispatchers, the yard, the engine house, the train crew and the operators in reducing over-time, by J. P. Finan (A. T. & S. F.), and one entitled The Curve Line of Horse Sense, by F. A. Parker (C. R. I. & P.).

Mr. Barnard presented a table for the year ending December, 1914, showing the number of errors found in each month by inspection of train orders and clearance cards. Out of 18,815 train orders issued in the twelve months the total number of errors found was 266 or 1.41 per cent of the number of orders. The number of errors in clearance cards was 163. The most numerous errors were the use of unauthorized abbreviations; the scratching out of words and the substitution of others; the use of misspelled words and illegible writing, the use of poor carious and the use of Ex for extra. The number of errors found in the month of January was 100; in February 78; in March 47, and so on down to the end of the year, when the total number was only 11. Notes concerning errors are entered in the personal records of the men making them, and the records

may at any time be useful as evidence that proper effort has been made to secure the best service.

The attendance at the convention was very good, there being 201 train dispatchers registered, besides ladies and visitors; and it was declared the best convention the association has held since 1892. The whole five days were filled with entertainments for the ladies, a part of the excursions being participated in also by the men.

RAIL SPECIFICATIONS*

BY A. W. GIBBS

Chief Mechanical Engineer, Pennsylvania Railroad

In this country we are using heavier concentrated loads than are carried elsewhere. Much has been written to show the relative increases of the weights of rail and of loads carried, and conclusions have been drawn that one or the other has unduly increased. The variables in the conditions of service are very great and very perplexing. The climatic conditions are directly reflected in the monthly record of failures of all kinds, and a spell of unusually severe winter weather is immediately marked by a sudden increase in the number of failures. On the other hand, a succession of mild winters may show such a comparative immunity from failures as to delude us into the belief that at last we are making definite progress. The number of rails which fail annually, as compared with the total number in service, is very small when reduced to percentages. In many materials it could be ignored as purely an economic loss, and not very large at that. It is because the rail is part of a chain that its occasional failure assumes such importance.

With the above points in mind, it must be said that the available data do not show that progress in performance which we have a right to expect. That the real answer to this great problem has not been reached is proved by the continued unrest in our specifications, and by the everlasting changes in sections.

What answer can we make? First, as users, we can and should lessen as far as possible unnecessary punishment of the rail by improvements in the mechanical design and maintenance of our equipment. We can be expected to improve our structure under the rail as our loads increase, and this change is in progress. It is but fair to say that bad conditions, both as to equipment and track structure, have contributed to rail failures. That the large number has attracted no more attention is because of the vigilance of the track inspection. In the very great majority of cases the rails are removed before any serious results ensue.

Against these unsatisfactory conditions we have several possible solutions: Better steel, in the sense of more uniform steel; better steel in connection with more rational sections; materially heavier sections; or retrogression in loads and speeds. To date, a combination of the first and second has been chosen. There has been a very general change to open-hearth steel, at an increased cost.

Neither the American Society for Testing Materials nor the American Railway Engineering Association specification really protects the buyer as to chemistry. Neither puts any limit on the amount of segregation permitted, and it is well known that this ranges over wider limits than would be permitted in the ladle analysis.

In investigating the causes of the failures of individual rails, many analyses have shown such startling discrepancies between the composition of the failed rail and the analysis purporting to represent the heat that it was difficult to believe that they could represent the same material. Either the ladle analysis is an unreliable index of the quality of the

*Abstract of the presidential address delivered before the American Society of Testing Materials, which met at Atlantic City, June 22-23. The complete report of the convention will be covered in these columns next week. The election of officers, etc., is mentioned in the General News Section of this issue.

material in the rail or there is a great need for chemical reform. We know by experience that when put to it the chemists of the producers and the consumers can tally within very reasonable limits. This is a serious matter for the consumer. How far the difference between chemists is due to difference in methods I do not know, but possibly the methods by which the chemistry is determined may have to be agreed upon and made a part of our specifications. Dr. C. B. Dudley, who did much work on standardizing methods of chemical analysis, would in his specifications not only state the composition required, but also the methods by which the determination was to be made.

From the physical standpoint both specifications are defective, as both contain the provision that if the test piece meets the requirements the material will be accepted; but in the event of the failure of the first test piece, two more tests are made, and if both pass, the material is accepted. We hold that this is a pernicious practice, in that the consumer has positive proof that some of the accepted material does not meet the requirements. The American Society for Testing Materials specification includes all the machinery for detecting physically unsound material by nicking and breaking, and then provides that the rails represented by these unsound test pieces shall be accepted as "Special" rails. Presumably they are to be used in some unimportant location. This is another very bad practice. It is not always possible to find unimportant places.

Summed up, the rail specification of the society does not put a proper premium on the selection of the better part of the ingot for one of the most exacting services for which steel is used. Where our specification differs from that of the American Railway Engineering Association it is not so good.

The rail committee is composed of able men. Among them are some of the ablest metallurgists in the country, and we should look to them for that constructive work which would make our specification beyond criticism. The purpose of the society is to make specifications and have them used. If year after year we retain provisions that lessen the incentive to improve the product, we cannot wonder if other specifications are preferred.

If we consider all the steps in our rail industry, we find very few improvements in methods other than those which lend themselves to increased output or reduced cost. There are some notable exceptions to this, three in particular; namely, the electric furnace, for producing steel; the sinkhead process for casting ingots, for producing better ingots; and the descaling process, for producing better rails, by mechanically removing some surface defects which would later develop into seams. All of these processes are represented by rails actually in track under observation, but it is yet too soon to justify an opinion as to their value, nor have any of these methods been generally adopted.

It is to be hoped that some of the large-scale experiments now in progress will show what is to be looked for from a more uniform product. One of these includes the requirement that the chemistry shall be from the rail, instead of from the ladle test ingot, and the segregation must be within reasonable limits. This experiment will, at least, give a quantity of fairly uniform material, so far as any practical method of representative testing will insure it.

Aside from these, and some experiments on too small a scale to deserve special notice, the rail situation remains very much as it was seven or eight years ago. Any deviation from the beaten path is immediately met by an increase in the price asked, the reasonableness of which the purchaser has no means of determining. In at least one case of which I have knowledge, the actual expense of every kind, so far as it could be ascertained, due to rail breakage on a certain system was less than one-fifth of the annual increase in the cost of rail due to the introduction of a proposed new specifi-

cation designed to secure the quality of rail desired. The year taken was not an abnormal one in any way. One serious wreck would, however, entirely have changed this showing. It requires a lot of courage and a strong sense of duty to justify such an expenditure when the direct return is problematical.

There are many who believe that we cannot hope for relief by the use of more uniform steel. They make the point that, if this is the solution, it can be obtained by a discard larger than the ordinary. They cite the records of the carriers to show that the failures, especially the breakages, are fairly well distributed throughout the ingot, so that no practicable discard would eliminate the trouble. They also call attention to the many examinations of broken rail which reveal no defect that we can recognize as such. From these conditions they argue that the only remedy is to use more steel—that is, heavier sections—without any change in the specifications as to quality. Possibly this is correct, but we would call attention to the fact that post mortems on rail sometimes give negative results, because we have not before us all the related evidence. The rail may have been damaged by unfair usage, of which there is no evidence. If due to defective support, the evidence is lost when the track is repaired. Damage from defective wheels, etc., leaves no permanent mark. There is a growing belief that the straightening press, by straining the material beyond the elastic limit, is responsible for many otherwise unexplainable failures, and it would also explain why rails from the lower part of the ingot figure so prominently in the breakage record.

As to the quality, we cannot ignore the fact of the difference between rails from different mills. There have been some notoriously bad rollings, as shown by the records of various roads, and these mills have subsequently turned out an excellent product. If all of the rail was as good as the best, we would have very little room for complaint.

The present line of progress includes a general increase in the weight of sections throughout the country. The 100-lb. mark, or that neighborhood, seems to be one of the halting spots, but some sections go considerably beyond this figure. A careful study has been made of the sections, and the new ones, especially of the heavier weights, are believed to be better adapted to secure good mill results, as well as better performance in the track.

Personally, I believe that the time has arrived for a considerable increase in the weight of sections, and I am not so certain that a change of quality is required at the same time. One reason that appeals is the presence within recent years of that class of failures known as "transverse fissures." So far there seems to be no satisfactory explanation. It seems surprising, if this class of breakage develops in the rail, that it should not also do so in the tire, which is subject to the same intensity of pressure. The tire, however, has an immensely greater section than the head of the rail. If the mere fact of the relatively large area of section of the tire contributes immunity from this class of failure, it is fair to assume that somewhat the same result could be looked for in the case of the rail head.

Certain practices, such as the present system of straightening, have long called for improvement. Nearly all rail passes through the gagging press. The rail specifications are possibly too exacting in requiring that all rails shall be "smooth, straight in line and surface, and without any twists, waves, or kinks." It is a question whether this is not asking too much for the good of the rail and whether it would not be well to make the greatest possible tolerance in the way of accepting rail with such variations from straightness as can be reasonably eliminated in laying.

In the search for a remedy for our troubles, some have proposed to improve the product by more or less radical changes in the mill practice. It must be remembered, however, that a modern steel mill, like the railroad, can only

exist by being operated on a large scale. It is designed in advance with a view to a certain sequence of operations, and if proper provision has been made for each, smooth operation follows. The mill, however, is only balanced when it performs these operations in the prearranged order, and to make a radical change—as, for instance, slow rolling, cold rolling, more passes, or one of the many other innovations suggested—may seriously unbalance the whole operation. It is not to be expected that a mill will be willing to make changes in its practice until after experimental work has demonstrated that the proposed practice is practicable and valuable. In conclusion, I must repeat that the rail situation, as we see it, is disappointing. To add to the complexity of the situation, the government, through some of its bureaus, is taking a hand and investigating every serious failure, apportioning blame and suggesting remedies. This will probably increase rather than diminish, and may some day be very awkward for the producer as well as for the user.

RAILWAY TELEGRAPH SUPERINTENDENTS

The 34th annual convention of the Association of Railway Telegraph Superintendents was held at Rochester, N. Y., June 22, 23 and 24. Acting President E. C. Keenan (N. Y. C.) in the chair. There was an attendance of about 200, including wives, daughters and friends. At the first session, largely social, Belvidere Brooks, vice-president of the Western Union Telegraph Company, made a short address. The Western Union takes much interest in these conventions. They promote the adjustment of relations between the telegraph company and the railroads. He reminded his hearers that Rochester was the birthplace of the Western Union Company.

Acting President Keenan stated that the past year had been a prosperous one for the association. Messrs. W. H. Potter and M. H. Clapp, chairmen of the Eastern and Western Divisions of the association, respectively, reported on the meetings of the two divisions during the year. The chairmen of the various committees also made their reports.

The first paper was on "Interference from Single-Phase High-Tension Power Lines on the New York, New Haven & Hartford," by N. E. Smith, of that road. He gave a history of the work of electrifying that road west of New Haven and the difficulties experienced with induction on telegraph and telephone lines. The methods experimented with to overcome these troubles were gone into in detail. The paper contains a fund of information on this difficult subject. In the discussion of the paper I. C. Forshie, of the Pennsylvania Railroad, described the work of electrifying the section of that road between Philadelphia and Paoli, 20 miles, including the sixteen tracks at the Broad Street terminal. All wires throughout the section are being put underground. The telephone and telegraph conductors are in two cables, one of which is called the trunk cable, carrying the through circuits. With the long distance telephone wires phantom circuits are operated and these are composited and duplexed. The Philadelphia-Pittsburgh phantom, 350 miles long, has four telegraph circuits which are operated duplex. He described experiments made during the electrification development to determine what effect would be produced by the different trolley currents. High insulation of the telephone and telegraph circuits and perfect balance both for resistance and capacity are necessary to insure satisfactory operation in the electrified district. The lead sheath of the cables, he said, has taken care of electrostatic induction, but it has no appreciable effect upon electromagnetic induction.

The next paper read was "Primary Battery for Transmission on Train Despatching and Other Telephone Lines" by G. W. Nelson and E. E. Hudson. This paper dealt principally with the use of low internal resistance, closed-circuit primary cells as a reliable and efficient source of energy for

telephone train despatching, arguing that the reliability insured by this source of current is more important than low cost of operation; though a substantial saving in maintenance was also claimed.

In the discussion W. E. Harkness pointed out the advantages and disadvantages of the caustic type of cell. While the caustic soda cell is superior to the dry cell for despatchers' transmitters, it is a question if it can show any advantage over storage cells in this service. For way-station transmitters the caustic soda battery, when properly maintained, has given satisfactory service. It would not, however, furnish a uniform or high grade of service when subjected to heavy or long periods of discharge. Under ordinary conditions storage cells cannot compete with either the caustic soda cell or the dry cell in way-station service. He favored the use of the caustic soda cell for booth and other outdoor telephones. The soda cell is superior to the dry cell, he said, as a common source of current. He thought caustic soda cells could be used with advantage for the operation of telegraph sounders.

R. F. Finley (N. Y. C.) read a report, giving results of tests of wet and dry batteries on that company's lines, with comparative costs.

At Wednesday's session the first paper was by M. H. Clapp (Northern Pacific). He reviewed the development and the growth of the use of the telephone in railroad service. The Northern Pacific has made extensive use of telegraph wires for telephones in a variety of combinations, and has extensive plans for further utilization of existing facilities for operating by the latest methods. When pole lines are rebuilt all wires are transposed, anticipating future needs. Railroads should establish more private telephone exchanges. The loud-speaking telephone is now an assured success.

G. A. Cellar (Pennsylvania Lines) and E. C. Keenan (N. Y. C.) and others told of high satisfaction with the telephone for despatching. The meeting brought out no dissenting voice. The telephone accomplishes great economy, but members who asked questions as to exact data received no answer. In most cases recent installations are less costly than earlier ones. The use of automatic telephone exchanges was looked upon favorably by several members.

R. E. Chetwood (Western Union) read a paper on "Screened Cable Conductors and their Application in Telegraph Service," which was briefly discussed. C. S. Rhoads (C. C. C. & St. L.) sent comments on this in writing. In closing the discussion Mr. Chetwood, answering questions, said that the screen only reduced interference from high speed circuits; that the cable is used largely for automatic circuits, and that other metals than copper had been considered for the screen, naming one cable with a brass screen. He said that very little was gained by loading screened cables.

There was a short discussion of the effect of aurora borealis on telephone and telegraph working, manifestations of this force having been observed in many places within the last two months.

Prof. C. A. Culver, of Beloit College, Beloit, Wis., gave a brief talk on radio (wireless) telegraphy and telephony. Great progress is being made in these fields. Recent inventions have simplified many processes, and next August an important patent expires. Professor Culver believes that high towers are no longer necessary for wireless sending. A relay for wireless communication is about perfected.

At Thursday's session, W. H. Hall (M. K. & T.) read a paper on "Censorship of Railway Messages," an abstract of which was printed in the *Railway Age Gazette* last week, page 1479. In the discussion of this paper J. F. Caskey (L. V.) told of the employment of a censor on his road for seven months, particularly for messages sent by Western Union lines under frank. All officers were instructed to send

copies of each such telegram to the superintendent of telegraph. Every message so sent was carefully edited and in many cases recast and unnecessary words cut out. He estimates the saving at \$2,000 yearly in excess of the salary of the censor. The railroad telegrams of the larger offices were also censored, with the result that in one department alone an estimated wastage of \$31 a day was reduced 85 per cent. The discussion on this subject showed that a number of roads have compiled comprehensive codes to be used in all departments. Mr. Caskey endorsed Mr. Hall's views in regard to the "mailgram." Such a system was being used on his road with success.

E. A. Chenery (Missouri Pacific) read from records showing the number of messages sent during the years 1913, 1914 and up to May this year from 12 important offices on his road. Since March, 1913, the total number of messages per day has been reduced from about 15,000 to 11,500 and the average monthly office expenses from about \$8,500 to \$7,300. This is the result of constant supervision and censorship. Mr. Chenery recalled the fact that Charles Selden, on the Baltimore & Ohio, did some effective censoring twenty years ago, by recording a charge for all railroad messages, the same as if they were to be paid for, and advising each department, monthly, of the totals for which that department was responsible.

H. D. Teed (St. L. & S. F.), in a written communication, told of the good results of censorship on his road. Formerly the officers sent letters very freely by wire. The "mailgram" system is very useful. These envelopes are a half hour quicker than ordinary train mail. In 1914 the number of railroad messages on Frisco wires was reduced very largely, as compared with 1913, and the total of the payrolls of the telegraph offices was reduced 18 per cent. In the relay offices the reduction was much larger than this.

The discussion of Mr. Hall's paper brought out considerable sentiment against the use of codes, based on the feeling that an excessive amount of time and work are required to code and decode messages. Simplicity is a cardinal principle in this matter and the use of ordinary language, properly condensed, may be the best way of adhering to this principle. Some departments have their own codes, for use between offices within their own control—the supply department and the auditor's department being mentioned—but that is not the telegraph department's concern. These short codes, prepared by departments, are probably a good thing; but a more comprehensive code is likely not to be appreciated. It was said that the American Railway Association's general code had never been adopted by anybody. One member remarked that the cost of railroad telegrams on his road, counting the wages of telegraph managers and messengers, was from 1½ cents to 2 cents a message. One large road had calculated that the total cost of railroad telegrams, including all expenses except maintenance of wires, averaged not over five cents a message; while the cost of coding, if done by a stenographer who is paid \$75 a month, may add considerably to the total expense.

David Sarnoff, contract manager of the Marconi Wireless Telegraph Company of America, gave an interesting talk on radio telegraphy, questioning some of the conclusions of Professor Culver, the previous speaker on this subject. He referred to the use of wireless amplifiers as repeaters on the transcontinental telephone line. The two great difficulties encountered in the development of the wireless telephone, he said, were, first, to get a transmitter that will be adequate for the current, and second, the proper regulation of voice currents; but he expects to see the success of the process.

Mr. Foley (D. L. & W.) said that recently five messages had been sent by telephone, with his wireless apparatus, from Scranton, Pa., to Binghamton, N. Y., about 60 miles.

E. C. Keenan and J. J. Ross (Mich. Cent.) told of the very satisfactory use on the Michigan Central of special signals at non-telegraph stations to instruct freight trains to enter sidings. These signals are controlled by the dispatcher by

means of the selector calling-apparatus the same as is used to call station operators, the selectors for the outlying sidings being on the same wire with the station selectors. The signals are enclosed disks formerly used as block signals. They are not interlocked with the switches and are arranged to give the indication to the train by oscillating; and the conductor, having cleared the main track, acknowledges the signal by telephoning to the dispatcher. Records for six months in 1914 showed the use of these signals 600 times, with 12 failures. These caused only slight delays except in one case. Answering questions, Mr. Ross emphasized the importance of care and accuracy in using this arrangement. If the dispatcher sets the "head-in" signal at the wrong station he can cause annoying delays. It is important too to have the automatic "answer-back." The necessary modifications of apparatus have been made by the General Railway Signal Company and the Western Electric Company. All of these signals are on double track lines equipped with automatic block signals. More of them are to be installed.

St. Paul, Minn., June 20, 21 and 22, were the place and dates chosen for the 1916 convention.

The following officers were elected: President, E. C. Keenan (general superintendent of telegraph, New York Central, Lines West of Buffalo), Chicago; first vice-president, L. S. Wells (L. I.); second vice-president, M. H. Clapp (N. P.); secretary and treasurer, P. W. Drew (M. St. P. & S. S. M.), Chicago. Messrs. W. H. Potter and F. T. Wilbur were elected chairmen of the Eastern and Western Divisions, respectively.

UNIFORM TRAIN ORDERS

By J. L. Coss

Why is it that on a large railway system it is frequently found that the forms of orders and the instructions as to their use differ on different divisions?

For instance; one division may use the right-of-track order while on another its use is not allowed. One division may use the straight meet order, as between passenger trains while another will use the time order. There will also be found different wordings of certain forms of orders. On some districts forms which are not prescribed by the book of rules, are used freely. Especially will this be found to be the case when changes have been made in the dispatchers, men from other lines using the forms they have been accustomed to until they are broken in; and sometimes they keep it up for a long time.

The general manager should have an experienced and competent dispatcher on his staff to inspect the different dispatchers' offices on the system; and this inspector should have the authority to require a uniform use of train orders. He should take the train order books and check back in them to see that the orders are used according to form; and should instruct all concerned in the manner of their use. He should also be qualified to render a decision on any order that may be in controversy. He should inspect the orders handled by operators at the large offices, as well as the small ones occasionally; and should see that block and clearance cards are made out correctly and handled properly. If a man is found who is not up to the standard in the handling of orders and other matters pertaining thereto, he should put him right, or recommend a remedy.

Train and enginemen, dispatchers and operators are transferred from one division to another every now and then, and a form of order which they are not accustomed to may cause a difference of opinion, and possibly may result in something more than that.

This inspector, while on his trips, could look up other things for the general officer and in that way be of great assistance to him. A man from the general office, making visits of this kind occasionally, will have more influence on the employees than will local officers, even though they visit every week, for the men will know that if an irregularity is discovered the facts concerning it will go direct to the top.

Automatic Signals on Norfolk & Western Electrified Line

Installation of Most Modern Signaling in the Mountains of West Virginia, with Costly Refinements of Detail

The electrification of the Norfolk & Western between Bluefield, W. Va., and West Vivian, recently completed, made necessary the change from d. c. to a. c. operation for the automatic signals in this territory. As the signals in service before the electrification were practically new, it was deemed advisable to make use of them on other parts of the road and to install new a. c. signals on the bridges supporting the overhead power line.

The electrified section, known as the Elkhorn grade, is on the main line through the Pocahontas coal fields, about 105 miles west of Roanoke. The line is double track throughout, except in the Elkhorn tunnel, 0.7 miles long, which is single track. Be-

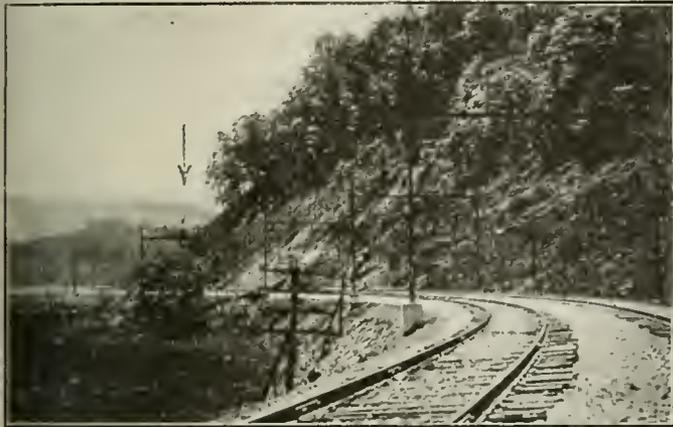

Fig. 1—Signal Near Graham, W. Va.

tween Bluestone Junction and Ruth there are two single-track lines, 2.9 miles and 1.9 miles long, respectively, which are normally operated as double track, both of which are signaled for traffic in both directions. The line has a large amount of curvature and heavy grades, varying from 1 per cent at the west end to 2.5 per cent just east of the Elkhorn tunnel.

Single-phase, 25-cycle power is used for traction and 60-cycle power for the signal system. All current is generated at the company's power house at Bluestone Junction, about 10 miles west of Bluefield, where plenty of good water is available and the coal supply is convenient. For the propulsion current, three 11,250-kv.a., 25-cycle, 11,000-volt, single-phase steam turbine engine sets are used, current from these being stepped up to 44,000 volts and distributed to substations at Bluefield, Maybeury, Northport and East Vivian, and also to substation transformers in the power house, where it is stepped down to 11,000 volts for the trolley wires.

The 44,000-volt feeders for the propulsion current are carried on bonnet posts on the south side of the bridges, and the signal transmission line, consisting of two No. 2, B. & S. hard-drawn, bare copper wires, carrying 4,400 volts, are supported on bonnet posts on the north side. All signal control, telegraph and telephone wires are carried on poles at the extreme northerly edge of the right of way. In order to provide against induction in these lines from the high-voltage propulsion current, the main transformer substations were located somewhat closer together than was required by considerations of voltage regulation and losses; and to provide for emergency conditions when one substation may be out of service, or for excessively high current, which occurs in cases of short circuits and grounds, it was decided to install so-called track transformers, or "boosters," in the trolley and track circuits at intervals of about one mile. The purpose of these transformers is to cause the return current, a considerable amount of which would ordinarily leak to earth, to

flow in the track rails and thus keep it at a fixed distance from the trolley wires and the telephone and telegraph lines. This required special consideration for the balancing of track circuits, and also for cross-bonding, to insure that there would be no lessening in the protection against broken rails otherwise provided.

Current for the signal system is generated in the power house by two 100-kv.a., 4,400-volt, 60-cycle steam turbine sets, connected directly to the signal transmission line. These are duplicate sets, one alone being of sufficient capacity to carry the entire signal load. The signal transmission line is carried on porcelain insulators and is broken at intervals of two miles on strain insulators. It is carried through a double-pole, single-throw oil switch at each of these points, so that it may be opened for testing or repairs.

A 1-kv.a., 4,400-110-volt transformer, having 5 per cent and 10 per cent taps for line-drop compensation, is used at each signal location, except at a few points where more current is required, 3.5-kv.a. capacity being provided in these cases. Each transformer is protected by 4,400-volt, graded shunt resistance multi-gap lightning arresters, and has 6,600-volt fused cutouts. The signal transformers, cut-out boxes and lightning arresters are mounted on the bonnet poles carrying the signal transmission wires. Screens are placed under these wires, so that persons on the bridges cannot come in contact with them. A hand-railing extends all the way around the platforms on the bridges, to which access is had by ladders at the north end. These platforms are not carried to the south end of the bridges, so that maintainers need not approach the 44,000-volt propulsion current feeders. The ladders on the north end of the bridges extend down only to a point 7 ft. above the ground, thus preventing unauthorized persons from climbing to the platform. The maintainers are provided with small ladders.

At each westbound signal location, the common wire is broken

Fig. 2—Signal Near Bluestone Junction

and small one-to-one transformers are placed in the control circuit in order to minimize the effects of induction and to localize the effect of grounds on any control wire. These transformers and the lightning arresters are mounted on a wooden box on the signal bridge. Switches are provided so that current may be cut off from the signal while the maintainer is working about it. The leads for the track transformer are taken from the

transformer side of this switch, so that the signal in the rear is not disturbed when one of these switches is open.

Double-rail track circuits are used throughout, the average block length being 4,500 ft., while some of the circuits in interlocking limits are as short as 300 ft. The U. S. & S. impedance bonds on the main line have a capacity of 200 amperes per rail continuously, or 400 amperes for two hours. At the turnouts to colliery sidings and other places where a large amount of propulsion current will not be used, bonds which have a capacity of 50 amperes per rail continuously and 100 amperes for two hours are used. The track circuits are supplied by small air-cooled transformers. In three cases where track circuits are very long and ballast conditions bad, 1-kv.a. transformers are used. The track transformers are supplied from the 110-volt taps of the signal transformers. Reactance coils having an adjustable air-gap in the magnetic circuit are used between the track transformers and the track to limit the amount of current when the circuit is shunted and to adjust the current and phase relation in the track coil of the track relay.

All insulated joints are six-hole, Keystone, having bakelized canvas insulation. These joints in most cases are staggered, but at booster transformer locations they are placed exactly opposite, also at crossovers between the main tracks, the joints are placed opposite, so that an electric locomotive using the crossover will not deliver return propulsion current to one rail of the track circuit, thereby unbalancing it and blowing the relay fuse. The track relays are of the U. S. & S. centrifugal, two-element type. The track transformer, track relay, reactance coil and line relays are housed in cast iron relay boxes on concrete foundations at the base of the bridge on which the signal is located. Track wires are carried from the relay boxes to the tracks in 1½-in. fiber conduit, and the wires are carried to the signal transformer, transmission line, etc., in galvanized steel conduit. No. 14, B. & S. solid copper Kerite wire is used on all control and signal circuits, and No. 9 B. & S. stranded Kerite is used for connections to the track. All line wires are No. 10, B. & S., copper-clad double braided, weatherproof. At the track, a cast-iron box, with a cover and a hooded opening for the entrance of the wires, is placed over the end of the conduit and concreted. The wire is soldered to a short piece of bond wire, both ends of which are bonded to the rail. At a standard signal location, an 8-in. by 12-in. by 12-in. cast-iron pull box is located on the bridge just underneath the signal platform, and from this a 2-in. conduit is run to the relay box, a 1½-in. to the lightning arrester box, a 1¼-in. to the signal and a ¾-in. to the transformer, to carry the necessary control wires. These conduits are fastened to the pull box, relay box, etc., by lock nuts over cup washers and lead washers, making a water-tight joint. Rubber-covered wire, run in galvanized cable rings and suspended from messenger wire, is used for the connection from the pole line to the signal bridges.

SIGNALS AND INDICATORS

The 70 automatic signals required on this section are the U. S. & S. Co.'s style S, upper-quadrant, operated by 110-volt, 60-cycle induction motors. The signals are mounted on the top of the structural bridges, special attention being paid in the design of these bridges to the elimination of obstructions to the view of the signals. The signals have enameled steel blades and Armspear spheroidal lens lamps. These lamps were found particularly desirable in this case on account of the large amount of curvature in the line, and also because in a number of cases on curves it would be difficult to provide an entirely satisfactory view of the signals if ordinary lenses were used, because of the obstruction caused by overhead structures.

The photographic illustrations, Fig. 1 and Fig. 2, show typical situations where, if the engineman of a passenger train had to depend on a lamp throwing rays only in lines parallel to the axis of the lens, he would have but a few seconds in which to get a good view of the light. (In Fig. 1 the location of the signal is indicated by the arrow.) As is well known, enginemen running under conditions of this kind are liable to get into the habit of ac-

cepting a very poor indication, finding this more convenient than to watch out with the care necessary to get a view of the signal at the exact moment when it can be seen at its best.

The spheroidal lens was described in the *Railway Age Gazette*, September 19, 1913, in connection with a report of its use on the Long Island Railroad. It is so shaped as to spread the light of an ordinary burner 90 deg.; that is to say 45 deg. on each side of the axis. And this is accomplished without impairing the visibility of the light on tangents. Tests have shown satisfactory results with green lights at a distance of two miles and red lights at over three miles.

At short distances the differences between the ordinary inverted lens and the spheroidal are not great; but at 900 ft. from the light and 15 deg. from the axis the stellar magnitude of the inverted lens measures 0.50, while the spheroidal measures 4.25. In a test made 1,890 ft. from the lamp and 15 deg. from the axis, the light from an inverted lens was entirely lost while the Armspear at that point measured 3.00.

The lamps on the Norfolk & Western are similar in appearance to the well-known design shown in the Armspear Manufacturing Company's bulletin, except that, being electric, there are no ventilating parts at the top. The lamps have the standard R. S. A. sockets and have relays, specially designed for these lights, to cut in the second lamp in case the first one fails; and have spherical silvered glass mirrors for reflectors. All metal parts are made of No. 18 gage steel plates. The signal lights are 10-watt, 110-volt tungsten, current being supplied from the signal transmission line to these lamps as well as to stations, towers and yards, also for operating the motor-driven air-compressor set at the Elkhorn tunnel, and for lighting the warning signs where the trolley wire is low.

Switch indicators are provided at all main-line crossovers where a train could clear the main track. These give an indication for the block in which they are located and for two blocks in the rear. They are of the vane type and operate on 110 volts. At the ends of passing sidings and other points where the protection is necessary, triple-lock switch machines are provided. These are controlled in the same manner as the switch indicators and the switch is held locked upon the approach of a train. Shunt boxes are used on all main-line switches and siding details.

INTERLOCKING PLANTS

The electro-mechanical interlocking plant at Graham has 14 working and 2 spare mechanical levers, and six electric levers. A similar plant at Bluestone Junction has 22 working and 2 spare mechanical levers, and 14 electric levers. All control circuits and indicators at these plants are d. c., operated by a battery of five 120-a. h. lead type cells, which are charged from a mercury-arc rectifier, taking current from the signal transmission line. The indication circuits for the levers in these plants are alternating current. Approach and route locking are provided for all through movements at all of the interlockings.

The electro-pneumatic interlocking plant at Elkhorn tunnel, which operates the switches on both sides of the tunnel, has a 17-lever machine with 13 working levers, which operate one three-arm, four two-arm, six one-arm and three dwarf signals, eight switches and five details. Air compressors, with a capacity of 50 cubic feet per minute, driven by 15-hp., single-phase, 60-cycle motors, are used to supply air for the plant at the tunnel, and instead of extending the air line through the full length of the plant, two 15-cu. ft. per minute air compressors were installed at a crossover located 5,500 ft. west of the tower, these compressors taking current from the signal transmission line.

This installation was made by company forces under the direction of D. W. Richards, signal engineer, to whom we are indebted for the above information.

WOMEN CLERKS ON THE BRIGHTON LINE OF ENGLAND.—Young girls are now being taught the duties of booking and parcel clerks and telegraphers in a special school at East Croydon, organized by the London, Brighton & South Coast.

New Railroad Legislation in Fifteen States

Regulation of Innumerable Details, Large and Small, Operating, Legal, Socialistic; North, South, East, West

Laws affecting railways which have been passed in 1915 by the legislatures of fifteen states are abstracted below:

PENNSYLVANIA

Only two bills affecting railroads were enacted into laws as a result of the recent session of the legislature of Pennsylvania and neither of them affects operation. The governor vetoed the bill to repeal the full crew act of 1911, withholding his announcement of disapproval until eighteen hours after the time limit, although he acted on the bill and officially certified his action within the specified period. Other bills affecting railroad operation and equipment were defeated or died in committee.

The new acts affecting railroads are as follows:

Permitting testimony to be taken by examiners to be named by the Public Service Commission anywhere within the state and allowing appeals direct to the superior court instead of through the Dauphin county court, which has jurisdiction in state cases. The act may have bearing on pending appeals, of which there are a dozen, and an official decision is to be asked.

Changing period for reports on capital stock and loans for state taxation to the calendar year. Provision is made so that arrangements can be made for filing, under certain conditions, at times required for federal reports. Heretofore reports were required for an official year materially different from a calendar year.

A bill providing for a new railroad map of the state was vetoed.

As the result of an appropriation being allowed for maintenance, the Pennsylvania State Bureau of Railways, a branch of the Internal Affairs department, has been revived. Freeman C. Gerberich is again chief. The bureau is a constitutional office and it was sought to make it ineffective by withholding appropriations in 1913, the contention being that the functions were performed by the Public Service Commission. The bureau receives and files certain reports.

INDIANA

The Indiana legislature at its recent session passed the following laws relating to railroads:

House bill 11 authorizes the public service commission to compel railroads to place a flagman or install an automatic gong at any public crossing where the view of approaching trains is obscured, if unable to remove the obstruction.

Senate bill 239 amends the grade separation law to permit the public service commission in ordering any separation of grades to relocate or consolidate highway crossings over railroads, street railroads, interurban lines or suburban roads, and to relocate or control highways leading to any such crossings.

Senate bill 318 amends the public utilities act to allow railroads to furnish free or reduced service or transportation to any bona fide employee or officer thereof, to carry free or at reduced rates agricultural experiment and demonstration cars or trains and lecturers, and to carry at free or reduced rates its furloughed, pensioned or superannuated employees, persons who have become disabled or infirm in its service, etc.

House bill 110 prohibits interference with railroad safety appliances, signal wires or telephone or telegraph apparatus.

MINNESOTA

Railroad laws passed by the Minnesota legislature this year include the following:

A bill requiring public service corporations to pay their employees at least semi-monthly the wages earned by them to within 15 days of the date of such payment.

A law providing for the sanitation, inspection and cleaning of stock cars.

An act enlarging the powers of railway companies, terminal companies, depot companies in respect of acquiring property by purchase or condemnation.

A law prescribing clearances.

A law regulating the furnishing of cars for the transportation of livestock.

A law authorizing the state railroad and warehouse commission to prescribe schedules of reasonable maximum rates.

OREGON

Railroad legislation passed at the recent session of the Oregon legislature includes a law to provide penalties for obstruction of railroad block signals, crossing bells, crossing gates, signal flags, torpedoes, etc. Another law requires reports of all industrial accidents to be made to the state industrial accident commission. Railroads will no longer be required to report to the labor commissioner, but are required to give immediate notice by telegraph, telephone or personally to the railroad commission of accidents attended by loss of life or limb or serious damage to property. Another law requires an annual accounting to be made to the commissioner of labor statistics by persons, firms or corporations withholding any portion of the wages of employees for the maintenance of any hospital or relief fund. The name of the Railroad Commission of Oregon is to be changed on July 1, 1915, to the Public Service Commission of Oregon.

NEBRASKA

The Nebraska legislature at its recent session passed the following laws affecting railroads:

Senate bill 26 provides that railroads shall furnish shippers of livestock with transportation of caretakers for shipments of one or more cars.

House bill 21 provides for cumulative voting and voting by proxy by stockholders of any company incorporated under the laws of Nebraska.

House bill 217 regulates the stringing of electric wires over railroad tracks.

House bill 304 requires express companies to properly house livestock entrusted to their care.

House bill 391 relates to destruction of weeds on railroad right of way and compensation therefor.

House bill 526 provides a penalty for injury or interference with telephone, telegraph or electric light wires and fixtures.

House bill 749 makes an appropriation for the use of the state railway commission to be used in the investigation of railroad rates.

NORTH DAKOTA

There were no railroad laws of any especial importance passed at the last session of the legislature of North Dakota. The following is a short summary of the laws that were passed:

House Bill 6 provides that railway cars shall be cleaned and disinfected before being used for transporting livestock into the state.

House Bill 154 provides that railroad companies shall build a hog-tight fence along their right of way when the owner of abutting property has enclosed the other three sides of his land with such a fence.

House Bill 159 provides that the state railroad commissioners may require railroads to build and maintain stock yards at stations.

House Bill 398 provides that a railroad corporation incorporated in one or more states increasing its capital stock shall pay to the state of North Dakota a fee on such proportion of the

increase as the mileage in the state of North Dakota bears to its total mileage.

Senate Bill 178 prohibits children from trespassing on railroad property.

Senate Bill 216 provides for the liability of railroad companies in case of employees suffering personal injuries. This law is substantially the same as the federal employers' liability act and applies to railroads engaged in intrastate business.

NEVADA

Laws passed by the Nevada legislature at its recent session include the following: An amendment to the state extra crew law, providing that the law shall not apply to railroad companies less than 95 miles in length, or on which but one train a day is operated in each direction.

An amendment to the electric headlight law, providing that any electric headlight "which will pick up and distinguish an object the size of a man dressed in dark clothes on a dark and clear night at 1,000 ft." will be deemed equivalent to a 1,500 c.p. headlight measured without a reflector. Section 2 of the act, which required such a headlight on the rear of engines when operated backwards at night, is repealed.

An amendment to the state railroad commission law prescribing regulations for the filing and posting of rates, and providing for the suspension of advanced rates by the railroad commission.

UTAH

The only legislation directly affecting railroads enacted at this year's session of the Utah legislature was the act prohibiting the transportation of intoxicating liquors into "dry" territory.

MISSOURI

The Missouri legislature, which recently adjourned, passed a law requiring railroads to maintain lights at night on main line switches and all lead switches in yards where cars are switched in making up or breaking up trains. The law does not apply to branch lines where trains are not run at night, or to independent lines of less than 50 miles in length, nor to trailing point switches on double track lines.

OKLAHOMA

The Oklahoma legislature at its recent session passed a law prohibiting railroads from maintaining or establishing a name for any railroad station other than the name of the town or city within which it is located, if the latter bears the name of the postoffice as given by the United States government.

ARIZONA

The only legislation affecting railroads enacted during this year's session of the Arizona legislature was Senate bill 36, providing that it shall be the duty of all railroad companies in the state to require section foremen or persons discharging like duties to keep at the section house a specified record of all stock killed or crippled upon their respective sections, which record shall be open and free for inspection by the public at all reasonable times. The law also provides that each engineer shall report to the railroad company on arrival at terminals all stock killed by his train, and that such report shall be posted on Monday of each week at the section or station nearest to the point where the accident occurred and shall be kept for 30 days.

FLORIDA

The 1915 session of the Florida legislature has just come to a close with less railroad legislation to its credit than any other in recent years. Only one bill was passed that might be called direct railroad legislation, and that was an act empowering the railroad commission to require the use of docks and terminals of a company operating the same under a franchise granted by the state or city, by any other such company. The Railroad Commission, after a hearing and investigation, is authorized to direct that track connection be made for transfer of freight, and the free use of the property by another such terminal company.

If the two terminal companies cannot agree upon terms of re-

muneration to be paid to the owning company, the railroad commission is to determine.

In the city of Pensacola, the Louisville & Nashville has large dock and terminal facilities. The city is contemplating the construction of a municipal belt line railroad and terminals, and the Louisville & Nashville would possibly object to this belt line railroad entering and using its facilities. However, this Act does not apply to municipalities that have elected Boards of Port Commissioners.

A large number of other bills were introduced during the session affecting railroad companies, but failed of passage. Among these were the "full crew bill," and one requiring running water to be provided in lavatories on passenger trains, with sanitary towels and soap.

SOUTH DAKOTA

The principal laws affecting railroads passed by the legislature of South Dakota at its recent session include the following:

Senate bill 55 amends the law with reference to taxation of railroad companies and other corporations, and provides for a tax on gross earnings and reports to be filed with the tax commission.

Senate bill 83 regulates the issue of warehouse receipts.

Senate bill 314 amends the law with reference to procedure before the state railroad commission and provides for the enforcement of commission orders by mandamus.

House bill 114 requires railroads whose rights of way divide farm lands to construct and maintain farm crossings when ordered by the railroad commissions.

House bill 271 prohibits railroads from increasing any intrastate rate or changing any classification rule or regulation without first obtaining the consent of the railroad commission.

House bill 272 authorizes the state railroad commission to reject and refuse to file any schedule or tariff of rates, rules or regulations unless handed to the commission not less than 30 days before the effective date.

House bill 175 gives the railroad commission authority upon petition to require railroads to construct track scales for the weighing of freight in carload lots from team tracks at any station at the expense of the shippers petitioning for such scales.

Senate bill 288 authorizes the railroad commission to prescribe rules for the weighing of carload lots and of livestock at track scales and of other commodities in ton lots. The commission may require all track scales to be sealed.

Senate bill 142 authorizes the railroad commission to require all railroads to erect at any station in the state proper and suitable stock yards and to equip them with feed troughs, racks and watering troughs and water supplies.

House bill 348 provides that on failure by a common carrier to appeal from any final order of the railroad commission or upon the affirming of any order from which an appeal has been taken, the railroad commission is authorized by mandamus to compel carriers to comply with such orders.

IDAHO

Laws affecting railroads enacted by the Idaho legislature at its recent session include the following:

Minor changes were made in provisions of the public utilities act including an amendment to the anti-pass provisions withdrawing the power of the utilities commission to designate the state officials to whom passes may be issued and enacting that passes may be issued to the members of the commission, or such of its officers and employees as the commission may designate, when traveling exclusively in the transaction of public business, or to such other state or county officials to whom the issuance of free transportation may be authorized by law. The amendment also enlarged the class of persons to whom passes may be legally issued to include veterans of the civil war. There was also enacted a uniform bill of lading act. Certain amendments were also adopted to the laws relating to the issue of bonds and notes by railroad corporations and the execution of mortgages to secure them.

WASHINGTON

Railroad laws passed at the recent session of the Washington legislature include the following:

Senate bill 144 regulates the issuance of bills of lading and the rights, obligations and liabilities thereunder.

Senate bill 258 authorizes the Public Service Commission of the state to suspend increases in rates for a period of 90 days with a possible extension for 60 days, pending a hearing and decision.

Senate bill 215 makes certain amendments to the laws regulating the purchase of railroad stocks, bonds and property by railroad companies. The law provides that the purchase, sale, consolidation or lease of another company shall be approved or ratified by persons holding 75 per cent of the capital stock of the company selling or disposing of its stock or bonds or leasing or otherwise disposing of its property. The law also provides that no railroad or transportation company shall consolidate its stock, property or franchise with that of any other railroad or transportation corporation owning a competing line, or purchase either directly or indirectly any stock or interest in a railroad or transportation company owning or operating a competing line. The law also requires the approval of the Public Service Commission for the consolidation of railroads and provides that the capital stock of the company formed by such consolidation shall not exceed the sum of the capital stock of the companies consolidated at the par value.

TRANSPORTATION AND CAR ACCOUNTING OFFICERS

The summer meeting of the Association of Transportation and Car Accounting Officers was held at Niagara Falls, Ontario, June 22 and 23, with 130 members in attendance, and J. M. O'Day (I. C.), president, in the chair. At the opening session there was an address by E. F. Kearney, president and receiver of the Wabash, who, while general superintendent of transportation of the Missouri Pacific, represented that company in this association. Mr. Kearney spoke at length on the causes leading up to the present agitation against railroads, calling attention to the fact that railway officers and employees were themselves largely to blame. He advocated the maintenance of high moral and business standards. He regarded patriotism as one of the greatest essentials in raising standards; if the ideals of patriotism are thoroughly instilled into the minds of the younger generation the old-time bad or questionable practices will not be repeated.

The report of the executive committee shows a membership operating 249,718 miles of road and having in service 2,557,365 cars. It was decided to continue the consolidation of the committees on conducting freight and passenger transportation and the committee on joint interchange and inspection bureaus for the succeeding six months, the combined committee to be known as the "Committee on Conducting Transportation."

The committee on car service reported the action of the Freight Claim Association at its Galveston meeting, wherein that association decided that demurrage or storage refunded under legal liability or when uncollectible owing to negligence in transportation shall be charged to the liable line or lines. The effect of this rule (which was approved) will be to make the lines which are liable for the freight charges on refused freight also liable for demurrage charges on such shipments; demurrage charges, when legally assessed, are a matter of filed tariff and cannot be voluntarily waived.

The association adopted for submission to the American Railway Association the proposed addition to the Switching Reclaim Rules of a definition to cover "intra-terminal switching," viz., "A car loaded within the switching limits for unloading within the same switching limits." It is provided that no reclaim shall be allowed for an intra-terminal switching movement.

The association concurred in the findings of the committee to the effect that at present there should be no change in Rule 8 to relieve the holder of the car from per diem where material for repairs has been shipped by the owner and lost in transit; but the committee requested that the subject be referred back. The findings of the committee were also concurred in, that, where the holding road orders material from the owner for repairs to a car and such material is not used because other material has been found, such a case does not come under Rule 8. In connection with the question of the advisability of establishing a reclaim for per diem on cars undergoing repairs or transfer because of the delivering line's responsibility, the committee on car service presented a recommendation to the effect that no reclaims should be presented or allowed under Car Service Rule 15; that at points where such reclaims had been in effect they had been eliminated by reason of the fact that experience demonstrated that the conditions were so thoroughly reciprocal that the amount involved in the reclaims did not pay the expense of the accounting incident thereto. The recommendation of the committee was adopted.

The association adopted for submission to the American Railway Association proposed form of per diem Rule 13, providing that reclaims under Rules 5 and 14, or on account of special conditions, must be presented within one year from the last day of the month in which the per diem is earned; this, however, will not prevent the continuance of any reclaim after the period named if it has been previously opened, even though the reclaim should eventually rest upon some road other than the one originally addressed, except that the privilege of continuance shall cease when the claimant fails to return reclaim or present it to another road within a period of six months from date such reclaim is last returned to claimant. The amended rule also provides that reclaims under this rule must be made by the designated transportation officer of the road which pays the per diem to the designated transportation officer of the road from which the allowance is claimed, unless specifically agreed by the interested roads to permit the presentation and acceptance of such reclaims by local representatives.

The proposed form of per diem Rule 14 as presented by the committee was also adopted for submission to the American Railway Association. The amendment to the rule provides that a connection intending to reclaim against a delinquent line for its failure to accept cars shall notify such delinquent line daily, prior to midnight, through the designated officer, or in such manner as may be agreed upon locally, of the cars held for it; also that when the hour at which the receiving road clears the interchange track is so late that the delivering road cannot deliver before midnight, the receiving road is to be responsible for the per diem on such cars for the following day, subject to local agreement as to time required to make delivery.

The committee on continuous home route cards reported that about 250 railroads are using the standard continuous home route card. The discussion on this report showed that those roads which have not adopted the card are deferring action principally for the reason that they do not wish to incur any obligation, under the rules, until, by the action of the American Railway Association, all roads are placed on a common basis. While much empty mileage can be saved by short-routing empty cars home, there must be a good deal of education of agents if they are to be allowed to do this on their own initiative. Thus far there has been much imperfect work, cards being filled out in a very slovenly manner.

The committee was requested to present a method for computing the saving in empty car mileage by the adoption of the standard continuous home route card.

The list of accepted assignments of reporting marks to cars of private ownership, presented by the committee on office methods and accounting, was adopted for submission

to the American Railway Association. The report of the committee indicates that approximately 385 owners of private cars have accepted assignments of reporting marks and are applying them to their cars. The marks are limited to four letters, except in certain instances where the short "&" is used to enable car owners to use reporting marks which correspond to the corporate initials of the owner. Up to the date of meeting 407 railroads have accepted the reporting mark assigned.

The committee is also engaged in assigning marks to cars of railroad ownership with a view to preventing duplicate marks. Assignments of marks have been made to every standard gage railroad in the United States, Canada and Mexico. The marks assigned to railroads are limited to three letters, except in certain instances where the short "&" is used to enable car owners to use reporting marks which correspond to the corporate initials of the owner. Up to the date of meeting 407 railroads have accepted the reporting mark assigned.

The committee has prepared forms for the collection of data relating to the subject of per diem, and these forms will be forwarded to members for the compilation of the data required by the committee for the period July, 1915, to December, 1915; and upon receipt of these statistics the committee will present the same to the American Railway Association as indicating the condition of per diem records of American railroads generally, such data affording a basis for future action affecting per diem discrepancy claims.

The association adopted for submission to the American Railway Association the proposed form of car tender report and the proposed form of summary of per diem reports as presented by the committee.

Acting in compliance with the request of the American Railway Association, the committee on office methods and accounting reported that, after a series of conferences held between representatives of the Freight Claim Association and representatives of the Transportation Association, by joint action of representatives of the two bodies a code of rules governing the application, inspection, recording and care of car seals was adopted, for presentation to the Freight Claim Association and the Association of Transportation and Car Accounting Officers for joint action by the respective associations. The Freight Claim Association at a meeting held June 16, adopted the rules presented. The Association of Transportation and Car Accounting Officers at this meeting also adopted the proposed rules for submission to the American Railway Association. These rules as adopted embody very full and elaborate instructions for the guidance of the seal inspector.

The association adopted for submission to the American Railway Association the recommendation of the committee on handling railroad business mail, that packages containing claim papers shall bear on the face thereof the fact that they relate to the business of the carriers handling the same.

The committee also recommended that roads receiving letter mail on which postage is due shall keep such envelopes, and where repeated instances from the same source are noticed the department at fault shall be advised of the inadequacy of postage. If the practice should not cease a corrective may be applied by rendering bill against the particular department of the carrier at fault, accompanying the same by a file of envelopes showing the postage due. The committee also recommended that all inquiries relative to the handling of railroad business mail be forwarded direct to the general secretary of the American Railway Association.

The association adopted the recommended form of yard check book as presented by the committee on conducting transportation. This form, in addition to providing space to show date and time of check and signature of man making the check, shows the following heads as necessary: Initials, Number, Condition (Loaded, Unloading, Empty, etc.), Location, Weather Record, Class of Car, Capacity of Car, Lading and Condition of Driveway at Team Tracks.

The association adopted for submission to the American Railway Association the recodification of car service rules as presented by the committee on conducting transportation.

The rules as presented provide for a separation of the car service rules relating to freight equipment cars from those relating to passenger equipment cars, the freight rules being numbered from 1 to 17, while the passenger rules are numbered from 101 to 113. In the recodification the committee presented a passenger car rule providing that "A foreign passenger equipment car must be promptly returned to its owner via the route and junction point received, unless the owner otherwise agrees. A road responsible for delay will be charged per diem rates in addition to mileage for the period of delay." The passenger car rules also provide that "Should a passenger equipment car, without consent of the owner, be delivered to a road other than connection from which received, the road responsible shall pay to the owner the per diem rate from the hour of appropriation until the hour car is returned to its owner or to the joint service and in addition thereto the established mileage rate shall be paid the owner by each road using the car."

The committee also reported that the committee on joint interchange and inspection bureaus at Toledo, Ohio, has completed its work and submitted its report and recommendations to the general managers, and that at Cincinnati a committee is at work with a view to installing a bureau in zones, contemplating eventually covering the entire terminal.

The election of officers resulted as follows: President, J. T. King (Atlantic Coast Line); first vice-president, F. E. Higbie (Central New Jersey); second vice-president, J. W. Nowers (A. T. & S. F.); secretary, G. P. Conard (75 Church street, New York); treasurer, F. M. Luce.

It was decided to hold the next meeting at St. Louis, December 14 and 15, 1915.

THE BATTLE OF THE MARNE

By WALTER S. HIATT*

Never in railroad history have men worked under operating conditions similar to those that existed in France during late August and early September last when the territory to the northeast of Paris became the scene of one of the most gigantic battles of the war.

The role the railroad men played in that battle is but vaguely understood even at this late date. In the frightful scramble that preceded the battle of the Marne, the railroad officers in Paris gave out the following notice to their employees: "Think of your helpless wives and children; work to get troops to the front." These men, thinking of what the Germans had done to women and children in Belgium, worked like demons, slept and ate at their posts for two weeks, and strained every nerve to get troops to the points required. The 17 railroads of the German government, all built with an eye for military purposes, may be admirable from the standpoint of construction and operation. They have certainly done great service in the war, but they have not to date been tried by the fire that assailed the French railways.

In a previous article I have sketched the general features of the mobilization in France, and showed how the railroads responded magnificently to the demands made upon them. I have also showed how 10,000 trains were kept going during the 20 days of the first period, transferring men from their homes to their regiments, thence to their army corps and to the front; and how the mad throngs of the civil population were cared for. This work was done without serious accident; the roads held up under a tremendous pressure, and they are today running as in times of peace.

But it is the work connected with the battle of the Marne that must forever form a monument to the French railroad men. It has already gained for them the gratitude of the French people, as has been indicated by the bestowal of the cross of the Legion

*The second article from our special European correspondent. The first appeared in the *Railway Age Gazette* of May 21, page 1047.

of Honor on dozens of station masters, enginemen, firemen, conductors and others. No soldier, or "hairy" man, as they call the unshaven heroes of the trenches, has given a better account of himself, or made more untiring sacrifices for his country than have the *cheminots*, the railway officers and employees.

"Then came Charleroi," is a phrase found in every soldier's account of the early campaign. The fall of Charleroi was the beginning of the battle of the Marne. In war time the French railways are under the control of the war department, the operation of each road being directly in charge of its own commission, consisting of a military commissioner and an operating director, who report to the war department's transportation officers. On August 17, the minister of war had issued a note of thanks to the various roads stating that, as the work of concentration was about finished, the government wished to acknowledge the efforts of the railroad employees and officers in preparing the way for victory.

This was the first brilliant period of the war when the nation was resounding with the glorious resistance of Liège and the rapid invasion of Alsace and Lorraine. The 58 German army corps forming the eight powerful armies thrown on France as the first big stroke of the Germans were still at the frontier and their terrific blow, so deliberately planned, had not been struck. The railroads of France had just finished concentrating her seven armies, and between August 12 and 20 the Northern, Western and Orleans railways had hauled the little English army of about 200,000 men from Boulogne, Nantes and Saint-Nazaire to Mons, handling 420 trains, many of them at six minute intervals, without disturbing the general concentration work of the French army.

The railroads were settling down to the more steady work of carrying food and ammunition to the front, and bringing back the wounded to Rheims and Châlons. Each of the six armies along the front from Maubeuge to Belfort, the seventh being at Paris, had its own central commissary, the vast stores of which were being renewed each day by the 42 trains set aside for that purpose. To be sure, there were a few changes of front to be made for certain army corps. The railroad men also had to take into account that the fifth German army under the Crown Prince had cut the line connecting the Northern and the Paris-Lyons-Mediterranean lines just south of Longwy, and that this meant new connections; but on the whole, the work was not too severe. On August 20, however, near Morhange, the army of Bavaria, the sixth German army, drove back the French to the river Meuse and united with the fifth. On August 22, at Charleroi, to which the Paris-Lyons-Mediterranean a week before had so proudly brought 60,000 troops across France from Africa, the battle began which lasted until the 26th and ended in a French defeat.

COVERING THE RETREAT

While the battle raged—the generals having orders to hold their positions as long as possible—the railroads were told to make ready to save as many as possible of the troops who otherwise might have been lost, for in a retreat foot stragglers are an easy prey. General Joffre insisted that the trains wait until the last. He wanted the men for the big coup which he seemed already to have decided upon.

But meanwhile, before the fall of Charleroi, the railroads were also busy doing what they could to save the civil population fleeing out of Belgium and the invaded French provinces all but submerged by the Teutonic flood. Some of the Belgians went to Holland; others went by boat to England. Several hundred thousand were placed in cars and transported to Calais and Havre, or directly to Paris with the French refugees. Further, no less than 2,700 Belgian locomotives were run upon French rails towards Paris and saved.

On August 23 the little line from Sedan to Lerouville was still open. While the troops disputed every foot of ground, burning or blowing up fine steel bridges as they retreated, hundreds of trains were being used to save the cannon, the munitions, and

other valuable material. Even the food was gathered from the storehouses so that nothing would be left for the Germans. All these trains were directed to the points along the Marne indicated for each army corps. On some of these days 120 trains, and on others as many as 170 were used in this vast retreat.

Von Kluck's army, the German right wing, was meanwhile advancing toward Paris. To check it a little, other hundreds of Eastern, Western and Northern trains were rushed to pick up all the troops that could be spared from before the left wing in the Argonne region and to swing them around to form a new army behind Lille and Arras.

The biggest thing of all, however, was to transport an army from along the Meuse, north to Verdun, to within 18 miles of Paris, to block the passages to the coveted city. This army, composed of the fourth, sixth and eighth army corps was supposed to be defending the Meuse to the south of Longwy. When that place capitulated on August 27, these three army corps, leaving but a skeleton behind, were put aboard 180 waiting trains and hurried through Verdun, Sainte-Menehould, Châlons, Bar-le-Duc, Chaumont, Troyes, to Raincy, whereby within a week the army made an entire change of front. Owing to the marvelous efforts of the railroad men, this army of about 100,000 men later played the chief role in the battle of the Marne. It was the lost army which the Germans located too late. Near Raincy it was joined by the little English army, rushed in the nick of time to Crècy-en-Brie, and by the army of Paris which was thrown out at the last minute on railroads, in automobiles and almost on foot, helter-skelter.

The army of General Manoury which the railroads assembled behind Rheims, and the two armies assembled at Nancy, where Generals Castelnau and Sarrail took the offensive against the Crown Prince, then fell upon the Germans from three sides, caught them as in a sack, and there followed the bloodiest and most decisive battle of the war. The Germans as a result of it were pushed back to a position behind the river Aisne, which they were able to hold only because the French grew short of ammunition and had to rely on blank cartridges, rob the German dead of their rifles and cartridges or make bayonet charges when these means failed.

The sleepless railroad men behind meanwhile were practically scouring France for more troops and bringing up others to take the places of the fallen.

GOLD TRAINS AND PALACE CARS

Panic reigned everywhere but among the *cheminots*. The French government, on its part, as a matter of sound prudence, determined to move to Bordeaux. Three special trains were made ready for this purpose before midnight of September 2, and arrived without accident or incident at Bordeaux the next day. The first train, composed of six sleeping and parlor cars, carried President and Madame Poincaré, and arrived at 12:05. The second train, carrying Monsieur Viviani and other ministers, arrived at 12:25 and the third train, with more ministers and their secretaries, arrived twenty minutes later at 12:45. Later in the day arrived other trains concerning which but little has been said, arrived carrying the \$800,000,000 gold deposits of the Bank of France, the valuable state papers of France, and all the documents necessary to keep the government going on an official footing. After the removal of the government, other trains were forthcoming to carry away the precious paintings and statuary and other treasures of the Louvre, in the Luxembourg gallery and other places.

The cool-headed though bodily wrought railroad men had yet more to do. The officers of the government left openly, announcing that their removal was a measure of prudence and not of cowardice. After they had gone, the people in Paris came upon some frightful hours. The city was apparently calm, but it realized at last what was happening, and even the bravest and the most carefree determined that it was time to move to places of greater safety. At the American embassy, notices were printed to be tacked on houses belonging to or inhabited by American citizens,

warning the German soldiery to respect the rights of neutrals. These notices were never circulated. So it came about that in these frightful hours when Paris thought it was lost, while the railroads were desperately hurrying men and munitions forward, they also began to carry refugees from Paris by the hundred thousand. All the north of France was bent on flight. The terminals in Paris, in fact, became so crowded that the alarmed people hurried out on the roads, pushing their carts loaded with valises, trunks and household treasures before them.

Large numbers slept at the stations. The line at the Saint-Lazare station was 200 yd. long and that at the Orleans station 300 yd. long. Mothers with babes in their arms waited for 24 hours on the sidewalks, and they and others, when the chance came, thronged upon flat cars and into box and cattle cars. All sorts of cars took away 50,000 people daily. It took three days to make a trip that today takes three hours, for the military train had to pass at all hazards and had the right of way. They passed and passed eternally, it seemed, a few minutes apart, night and day.

The railroad men continuing at their posts of duty, were conscious that on them depended the safety of the women and children, as well as that of the troops. Their patience was tried beyond belief, but they remained at their posts. Never in this world, surely, have railroad men given such proof of their readiness and courage.

In all France was there but a single example of a *cheminot* who failed in his duty, and that example is widely known because of its singleness. A station master at Rheims, it is said, was discovered just before the Germans began arriving there in telephone conversation with a German officer somewhere out in the country. Fate would have it that the man's own boy led the French officers who were looking for him to give him orders, to the telephone booth. Of course the station master was executed as a spy.

Each day brought new difficulties. On the Northern and Eastern railroads, half of whose trackage was within the German lines, there were no more machine shops or roundhouses available. New ones had to be improvised. Right behind each locomotive was hauled a sort of wrecking car, wherein the train crews ate and slept, and wherein were carried relief crews and repair materials.

WORK, ALWAYS MORE WORK

With the German flood dammed and flung back upon itself, the task of these overworked railroad men nevertheless continued. They had to bring up re-inforcements to the River Aisne where the Germans halted in their retreat from the Marne. Fresh troops, more food, more ammunition had to be carried forward. The returning trains carried back more refugees, took German prisoners to the east and south, and hurried the thousands of wounded to the hospitals.

While the cannon were thundering along the Aisne, the spare railroad men about the shops of Paris and Lyons and Orleans were put to work manufacturing wagon, caisson and cannon wheels, shells and even cannon parts. These they loaded on cars. They helped hurry the heavy cannon from Creusot and Saint-Chamond to the Aisne to answer those the Germans had brought up, and emptied arsenals of their 50-year old mortars, now once more of use in the siege warfare of the trenches.

Trains carrying troops, ammunition, cannons, food and other supplies were run ceaselessly. In five weeks one of the six rail-

way companies ran no less than 1,600 provision trains, part of the run being made over lines new to the crews. At one time no less than 1,300 locomotives and 4,000 men were thus detoured.

DETAILS OF THE RAILROAD BATTLE

Amid this seemingly hurly-burly one astonishing transportation feat was accomplished right after the battle of the Marne by one railroad when 52 ships arrived at Marseilles in the south of France with 70,000 Indian troops and their immense amounts of baggage. In *three* days these troops were discharged at their camping ground of Cercottes near Orleans, where they remained 20 days before proceeding to support the English at Nieuport-Dixmude.

The people remaining in the regions covered by the German invasion had to be fed and provided with the necessaries of life. From September 21 to November 14, 43 different trains were made up in different parts of France for this purpose.

A mail service, beginning on a large scale from the end of September, demanded a mail car a day attached to every train to carry the millions of letters and packages sent to or by the soldiers. Gradually the railways also put themselves in position to take care of regular demands of commerce. Schedules were arranged on a stationary basis by October. The civil life of the country now goes on as usual.

One apparent explanation of the success of the railroad men in this ordeal is to be found in the network of roads that spreads over France, fan-like, with Paris as the center. When one route is interrupted there almost is always a possible detour.

Another thing which has contributed so largely to the success of French arms has been the unfailing good will, and the easy going spirit with which the railroad men are blessed. Often irritable in small things, the French railroad man, trained in a hard school, is never seriously annoyed for any long period by any kind of a job. When all seems lost, he begins to look for daylight. War, anyway, is an energizer, and it has found a fertile field in the French in the midst of their greatest trial.

RAILROAD SECURITIES HELD ABROAD

The following is the gist of the statement given out by L. F. Loebe, president of the Delaware & Hudson, in regard to the investigation which he made of the amount of American railroad securities held abroad:

Requests were sent to 145 railroad corporations, being all the railroads in the United States above 100 miles in length. Replies were received from 136 companies, 100 companies furnishing statements of securities held abroad, while 37 replied that none of their securities was so owned. Eight companies have not yet replied, and of them seven are of minor and one of medium importance, the combined mileage being 3,725 miles. They cannot materially affect the result.

The stocks were identified by entries in the transfer books of the issuing companies. To the extent that they may be carried in the names of domestic bankers, brokers, or institutions, for foreign holders, the amount would be understated. Inquiries indicate that such holdings will not exceed \$150,000,000 par value.

The bonds were in the main identified by the "slips" filed by the payee under the requirements of the federal income tax law. Where interest is in default there would be no income

RAILROAD SECURITIES HELD ABROAD

Security	On or before January, 1919	Jan. 1, 1920, to Dec. 31, 1924	Jan. 1, 1925, to Dec. 31, 1929	Jan. 1, 1930, to Dec. 31, 1939	On and after Jan. 1, 1940	Grand Total
First preferred stock						\$161,280,900.00
Second preferred stock						99,900.00
Common stock						633,802,162.00
Notes	\$54,921,000.00	\$6,438,640.16	\$16,000.00			61,375,640.16
Receivers' certificates	998,000.00					998,000.00
Collateral trust bonds	5,606,000.00	71,060,567.00	10,082,000.00	\$8,408,000.00	\$132,453,848.26	227,610,415.26
Equipment bonds	1,332,000.00	1,129,700.00	14,902,589.00			17,364,289.00
Car trusts	792,000.00	16,000.00				808,000.00
Debenture bonds	33,210,000.00	928,000.00	85,941,500.00	82,693,160.00	1,232,650.00	204,005,310.00
Mortgage bonds	16,129,400.00	62,365,367.00	182,978,300.00	180,952,216.00	826,631,443.00	1,269,086,726.00
Total	\$112,988,400.00	\$141,938,274.16	\$293,920,389.00	\$272,053,376.00	\$960,317,941.26	\$2,576,401,342.42

tax certificates in respect of coupons not paid, and to that extent the amount would be understated.

The information was determined from data collected from October, 1914, to April, 1915, and during that period there have been large sales of these securities for foreign account in the American markets, and to that extent the amount would be overstated.

There are held in France several hundred million dollars' worth of American railroad securities that are not repayable except in francs and that cannot in any likely contingency come upon this market, unless as a result of action by the French government. Where such bodies are in default it may be that there will be issued in place thereof, when reorganization is carried through, bonds payable in dollars. The amount of such bonds in default is not great.

There are held in Great Britain many of these securities by life and fire insurance companies that are likely to be held against calamities. There are also large amounts held by trustees and people of large means in that and other countries likely to be retained as insuring an income against any possibility of disaster.

It is believed that this information is of such general importance as well as of such particular importance to the railroads as to warrant a continuance of this investigation, especially in view of the large amount of these securities that have since the beginning of the European war been returned to this market. Blanks will therefore be sent later in the year to the 100 companies as above, with the request that information be reported for the six months, July 1 to December 31, as to bonds and other evidences of indebtedness, and for July as to stocks.

CALCULATING CROSS SECTION AREAS ON RAILROAD VALUATION WORK

By F. T. MORSE

Assistant Engineer, Chicago, Rock Island & Pacific, Chicago

The cross section of the roadbed of a railroad taken by the government valuation field parties is so different from that taken on the original surface of the ground at the time of construction that the ordinary formulas or methods do not apply. The following method of calculating such areas quickly was developed in checking over the I. C. C. inventory notes now being taken on the Chicago, Rock Island & Pacific.

In the accompanying diagram are shown typical sections as taken by the I. C. C. field parties, Fig. 1 being in embankment on a branch line where the roadbed is surfaced with dirt only, Fig. 2 in embankment where there is ballast, the top of the section being the bottom of the ballast, Fig. 3 in cut, and Fig. 4, a side hill section with both cut and fill. In each case 0.0 is the top of tie.

As no vertical distance through the required area is given, one cannot conveniently draw triangles and figure the area in the usual way. However, by enclosing the section in a rectangle, triangles or trapezoids are obtained which may be easily figured and their area subtracted from that of the rectangle giving the required section area. The general method has been expressed in letters, then these terms expanded and many cancelled, leaving the result as indicated. The method in Fig. 1 is used when the area between the ends of the ties is in the form of triangles. In Figs. 2 and 3 this area is a rectangle or trapezoid. The same method is used to produce the formula as shown below Fig. 3, which is exactly the same as in Fig. 1, with the addition of the two terms -dd and -ee, which take care of the difference in area between the ends of ties in the two cases. In cut sections, as in Fig. 3, it is necessary before multiplying to add to each elevation reading an amount equal to the greatest minus reading, to bring the reference line A-B to the lowest point of the cross section so that we have the general type of section shown in Fig. 2.

The application of this method to a side hill section is shown in Fig. 4. Ordinarily the government engineers plot all irregular or peculiar sections and measure the area with a planimeter, but the same general method explained above can be applied to such cases also if desired.

With practice most of the multiplying may be done mentally or by the machine when necessary, and the results re-

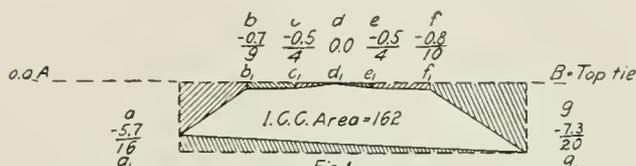

Fig. 1.
 $Area = g(a, +g) - \frac{1}{2}[(a+b)(a-b) + (b+c)(b-c) + (c+d)(c-d) + (d+e)(e-d) + (e+f)(f-e) + (f+g)(g-f) + (g-a)(g+a)]$
 Then, $2Area = +ab - a^2 + bc - b^2 + cd - c^2 + de - d^2 + ef - e^2 + fg - f^2 + ga - g^2 + a^2 + g^2$
 Since d and e are zero, all terms containing either become zero.

Applied to Notes $\frac{-5.7}{16} \frac{-1.0}{1} \frac{-0.7}{9} \frac{-0.5}{4} \frac{0.0}{16} \frac{-0.5}{4} \frac{-0.8}{10} \frac{-7.3}{20} \frac{9}{1}$ where $\frac{-}{-} = +$

5.7 x 9 =	+ 51.3	16 x 0.7 =	- 11.2
0.7 x 4 =	2.8	9 x 0.5 =	4.5
0.8 x 4 =	3.2	10 x 0.5 =	5.0
7.3 x 10 =	73.0	20 x 0.8 =	16.0
20 x 5.7 =	114.0		
16 x 7.3 =	116.0		
	361.1	Area =	$\frac{361.1 - 36.7}{2} = 162.$

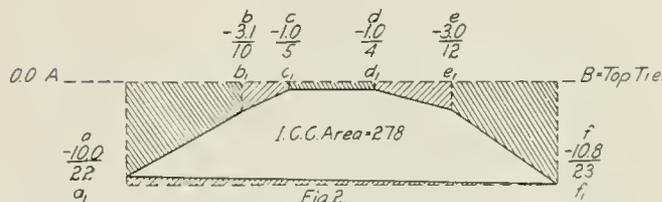

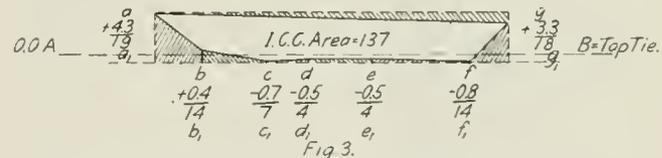

Fig. 2.
 $2Area = ab - a^2 + bc - b^2 + cd - c^2 + dd - dd + ee - ee + ef - ef + fg - fg + ga - g^2 + a^2 + g^2$

By adding 0.8 (f), to each reading to bring reference line through lowest point of cross section the formula becomes similar to Fig. 2.
 $2Area = ab - a^2 + bc - b^2 + cd - c^2 + dd - dd + ee - ee + ef - ef + fg - fg + ga - g^2 + a^2 + g^2$

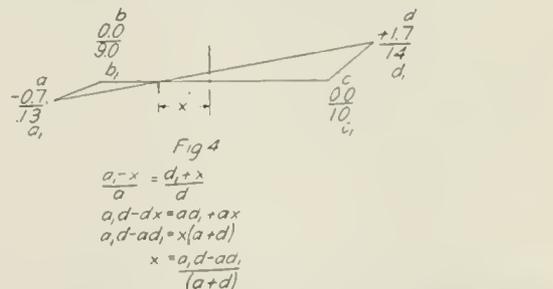

Fig. 4
 $\frac{a-x}{a} = \frac{d_1+x}{d}$
 $a, d - dx = ad_1 + ax$
 $a, d - ad_1 = x(a+d)$
 $x = \frac{a, d - ad_1}{(a+d)}$
 Area having largest reading = $(c_1 + x) \frac{d}{2}$
 $2A = dc_1 + dx$ Substituting the value of x and simplifying
 $A = \frac{(a_1 + c_1)d^2 - (d_1 - c_1)ad}{2(a+d)}$
 Area having smallest reading = $(b_1 - x) \frac{d}{2}$
 $2A = ab_1 - ax$ Substituting the value of x and simplifying
 $A = \frac{(b_1 + d_1)a^2 - (a_1 - b_1)ad}{2(a+d)}$

Diagram of Typical Cross Section Areas

corded at the same time, using an Ensign electric calculating machine or a comptometer, with the minus quantities in the right hand three columns and the plus quantities in the left hand three columns. When the last multiplication is completed the total plus and minus quantities can then be read on the machine, mentally subtracted and divided by two, giving the desired area.

General News Department

Among the bills aimed at the railroads which have been prepared for introduction in the Alabama legislature are a "full crew" bill, a maximum train bill, an anti-negro helper and fireman bill, and an employers' liability bill, all prepared by railway labor union interests.

H. U. Mudge has resigned as a member of the western group of the Presidents' Conference Committee for the Federal Valuation of the Railroads. H. C. Phillips, valuation engineer of the Atchison, Topeka & Santa Fe, has been elected assistant general secretary of this committee.

The railway department of the American Federation of Labor has issued a notice officially calling off the strike of the mechanical department unions which was declared on the Illinois Central, the Harriman Lines and the Pere Marquette in 1911. From the point of view of the railways the strike was terminated over three years ago.

The freight clerks of the New York, New Haven & Hartford, who have been threatening to strike finally agreed, on June 24, to submit their claims to arbitration, the leaders of the brotherhood and the officers of the railroad company having agreed to leave disputed questions to G. W. W. Hanger, assistant commissioner of mediation, at Washington.

The Pennsylvania Railroad announces that the operation of electric trains between Broad street, Philadelphia, and Paoli, will not begin until about the middle of August. Copper, needed for changes to be made in the overhead structure, cannot be had without considerable delay because of the pressing orders for munitions of war on which American shops are now engaged.

Reports from Ottawa say that the agreement between the government and the Grand Trunk Pacific for the operation by the government of the branch of this road extending to Fort William has been concluded, and that the rental to be paid is \$600,000, said to be equivalent to 4½ per cent on the cost of the line. Included in this property are the extensive terminal facilities at Fort William.

The Canadian Department of Labor has appointed a board under the Industrial Disputes Act to deal with a difference which has arisen between the Canadian Northern and two brotherhoods, those of the locomotive engineers and the firemen. The men have asked that the conditions under which they work in the East be raised to the level of conditions prevailing on the Western lines.

The Erie Railroad has sold four of its largest steamships which are in use on the Great Lakes, and the ownership of which the company has to divest itself in accordance with the recent decision of the Interstate Commerce Commission. It is understood that the boats will be cut in two and taken through the St. Lawrence river to the Atlantic ocean, there to be again put together and to be used by the purchasers in the coastwise trade.

The Interborough Rapid Transit Company, New York City, has reduced the working hours of all employees of the station department from twelve hours a day to ten hours, with no reduction in pay. This puts the station men and train men on the same basis as regards hours. The order affects 1,927 persons, about two-thirds of whom are on the elevated lines and one third in the subways. It will be necessary to employ about 20 per cent more employees in this department.

The Interstate Commerce Commission, Division of Valuation, is preparing to issue Orders Nos. 17, 18 and 19, requiring telegraph, telephone and railway companies, respectively, to furnish information regarding the purchase of materials and rates of compensation similar to that required of the railways under Valuation Order No. 14, issued some time ago. Only those carriers are expected to furnish this information upon whom these orders are served.

A party of officers of the Chicago Great Western left Chicago on Monday on a special train for a "safety first" inspection trip,

making short stops at various points for the purpose of inspecting conditions with respect to safety and to receive suggestions from the local committees. Short talks were made by J. A. Gordon, general manager; G. O. Perkins, superintendent of telegraph; G. E. Stoup, trainmaster; T. A. Sweeney, J. W. Mulhern, and C. A. Shoemaker, superintendents; G. A. Brown, superintendent of car service, and G. M. Crownover, superintendent of motive power.

The court at Buffalo, N. Y., has again postponed (to September 1) the date limiting the time during which the Buffalo & Susquehanna may be operated under the present temporary arrangement. It was September 1, 1914, when, in the receivership proceedings, the operation of the road was ordered discontinued, because of insufficient income; but negotiations for the sale of the property have been continued and now it is hoped soon to find a purchaser. It is reported that W. R. Page, of Olean, N. Y., chief owner of electric lines in that region is to take over the property and operate it in connection with the electric lines.

Daniel Willard, LL. D.

Daniel Willard, president of the Baltimore & Ohio, is now doctor of laws, that degree having been conferred on him last week by Dartmouth College, Hanover, New Hampshire. Professor Lord, in introducing Mr. Willard at the commencement exercises, alluded to his familiarity with railroad management, and his ability to set forth its principles with literary skill and convincing force; and to the fact that his wider interest in human and intellectual relations had led to his election as a trustee of Johns Hopkins University. In conferring the degree, President E. F. Nichols said:

"Daniel Willard, born among these hills, a man of rare sagacity, an acknowledged master mind, and gifted also with that higher, finer appreciation of human values, the college to which your youth aspired welcomes you in your maturity and honors your large achievements, though compassed without her aid."

Mr. Willard was born at North Hartland, Vt., in 1861. His career, with which our readers are already acquainted, may be summarized: Track laborer, fireman and engineman from 1879 to 1884; trainman, conductor, trainmaster and superintendent, 1884 to 1901; general manager, vice-president and president, 1901 to 1915.

Baltimore & Ohio Staff Meeting

At Deer Park, Md., last week, Friday and Saturday, officers of the Baltimore & Ohio, to the number of 300, led by Vice-president A. W. Thompson, held a general staff meeting, reviewing the work of the past 12 months and discussing plans for the future. The appropriations for maintenance of equipment for the fiscal year now closing will amount to \$12,000,000. About 4,000 cars will be dismantled during the coming year. During the year closing 1,690,000 new ties were put in the tracks at a cost of 75 cents each, or 50 per cent more than in 1905. Over 400,000 tons of stone ballast were put into the tracks last year. The efficiency of the track forces has been increased, and they are receiving higher wages.

Officers of the traffic department reported that a brighter outlook is dawning, judging by conditions in the industrial and agricultural communities in which they are engaged. A letter from President Daniel Willard was read at the opening session, reviewing the betterments which have been made to the property during the last five years at a cost of more than \$100,000,000, approximately half of which amount was spent for additional tracks and terminals, and the reduction of grades.

Mr. Thompson made an address designed to stimulate the pride of each man connected with the property. He urged loyalty at all times within the ranks, as well as a due sense of the railroad's duty to promote friendly public relations. A speaker from each department outlined his work for the enlightenment of his fellow workers in other departments. The Baltimore & Ohio glee club of forty-five voices gave a concert

at the opening of the night session, and an illustrated lecture on the Magnolia cut-off improvement was delivered by Vice-president Thompson.

J. J. Hill Professorship of Transportation at Harvard

President Lowell of Harvard University announced during the commencement exercises last week a gift of \$125,000 to the university to endow the James J. Hill professorship of transportation in the Harvard School of Business Administration, contributed by 12 present or former presidents of some of the most important railways of the country, over 20 prominent bankers, and other friends of Mr. Hill in all parts of the country, to the total of 74. The gift was arranged and the sum was collected by a committee consisting of Robert Bacon, G. F. Baker, Howard Elliott, Arthur Curtiss James, Thomas W. Lamont and Robert T. Lincoln. The list of donors is as follows:

RAILROAD PRESIDENTS

- William C. Brown, former president New York Central Lines, Clarinda, Ia.
- Frederic A. Delano, former president Wabash, Washington, D. C.
- Howard Elliott, president New York, New Haven & Hartford, Boston.
- S. M. Felton, president Chicago Great Western, Chicago.
- J. M. Hannaford, president Northern Pacific, St. Paul.
- Fairfax Harrison, president Southern, Washington.
- Hale Holden, president Chicago, Burlington & Quincy, Chicago.
- L. E. Johnson, president Norfolk & Western, Roanoke.
- L. F. Loree, president Delaware & Hudson Company, New York.
- Samuel Rea, president Pennsylvania, Philadelphia.
- F. D. Underwood, president Erie, New York.
- Daniel Willard, president Baltimore & Ohio, Baltimore.

- Pierce Butler, lawyer, St. Paul, Minn.
- Robert F. Carr, president Dearborn Chemical Company, Chicago.
- Hovey C. Clark, lumberman, Minneapolis.
- D. M. Clough, lumberman, former Governor of Minnesota, Everett, Wash.
- W. H. Cottingham, president Sherwin-Williams Paint Company, Cleveland.
- Otis H. Cutler, president Am. Brake Shoe & Foundry Company, New York.
- William B. Dean, hardware, St. Paul.
- Mrs. W. H. Dunwoody, Minneapolis
- Samuel Hill, Maryhill, Wash.
- A. N. Holter, hardware, Helena, Mont.
- P. L. Howe, director, Great Northern, Minneapolis, Minn.
- Arthur Curtiss James, vice-president El Paso & Southwestern System, New York.
- William V. Kelley, chairman American Steel Foundries Company, Chicago.
- A. H. Lindeke, dry goods, St. Paul.
- Robert T. Lincoln, chairman of board, Pullman Company, Chicago.
- W. J. McBride, president Haskell & Barker Car Company, Michigan City, Ind.
- J. T. McChesney, real estate, Everett, Wash.
- Mfred H. Mulliken, president Pettibone-Mulliken Company, Chicago.
- Edward A. More, St. Louis.
- B. F. Nelson, lumberman, Minneapolis.
- Northern Malleable Iron Company, St. Paul.
- A. R. Rogers, lumberman, Minneapolis.
- W. J. Rucker, lumberman, Everett, Wash.
- John D. Ryan, president Amalgamated Copper Company, New York.
- T. A. Schulze, boots and shoes, St. Paul.
- Thomas W. Slocum, New York.
- Howard C. Smith, bill broker, New York.
- William B. Thompson, New York.
- Samuel Thorne, director Great Northern, New York.
- Theodore N. Vail, president American Telephone & Telegraph Company, New York.
- F. A. Weyerhaeuser, lumberman, St. Paul.

The Western & Atlantic

Governor Slaton, of Georgia, in his message to the legislature, delivered last week, recommends legislation concerning what shall be done with the Western & Atlantic Railroad, owned by the state, the lease of which to the Nashville, Chattanooga & St. Louis will expire in 1919, or before the end of the next legislative term. Among the questions which have been under discussion in this connection have been proposals to lease a part of the property of the railroad in Atlanta and also some in Chattanooga, for outside purposes, not being needed in the operation of the railroad. The governor has appointed an agent, E. M. Durham, Jr., on behalf of the state, to participate with the officers of the Nashville, Chattanooga & St. Louis in the valuation of the Western & Atlantic in co-operation with the Interstate Commerce Commission. The North Georgia Mineral Railway is the name of a corporation, chartered last autumn, which proposes to build a railroad from Atlanta to a point in Bartow county, parallel to the Western & Atlantic. The governor raises the question of the effect which the construction of a new line would have on the value of the Western & Atlantic; and a bill has been introduced in the legislature designed to forestall any injurious competition in this field.

American Association of Railroad Superintendents

The twenty-eighth annual convention of the American Association of Railroad Superintendents is to be held at San Francisco on August 19 and 20. The convention will be opened with an address of welcome by Mayor James Rolph, Jr., of San Francisco, and there will be other addresses throughout the two days' sessions. Some of the speakers will be: William Sproule, president of the Southern Pacific; Hale Holden, president of the Chicago, Burlington & Quincy; W. R. Scott, vice-president of the Southern Pacific; A. G. Wells, general manager of the Atchison, Topeka & Santa Fe Coast Lines; W. E. Williams, general manager of the Missouri, Kansas & Texas, who will speak on "The Railroad, a Public Servant," and W. M. Jeffers, superintendent of the Nebraska division of the Union Pacific, who will speak on "Discipline." Reports will be presented by the executive and advisory committees and also by the committees on transportation, on interchange car inspection, and on arbitration. A complimentary train, including a composite car and five sleeping cars, will be run over the Atchison, Topeka & Santa Fe and the Southern Pacific for the accommodation of members and their families, leaving Chicago on August 14, and arriving at San Francisco on August 18. The membership of the association is about 500, and it is expected to have between 150 and 200 people, including members and their families, on this train. The convention headquarters will be at the Hotel Sutter. Saturday, August 21, has been set aside by the executive committee of the Panama-Pacific International Exposition as Railroad Superintendents' Day.

Convention of the American Society for Testing Materials

The eighteenth annual meeting of the American Society for Testing Materials was held at the Hotel Traymore, Atlantic City, June 22-26, President A. W. Gibbs, chief mechanical engineer of the Pennsylvania Railroad, presiding. The address of the president and a paper by C. D. Young describing the test department of the Pennsylvania Railroad are published elsewhere in this issue and a complete report of the convention will be published next week. The following officers were elected for the coming year: President, Mansfield Merriman; vice-president, W. H. Bixby; members of the executive committee, J. H. Gibboney, W. K. Hatt, J. A. Mathews and Edward Orton, Jr.

Joint Committee on Classification of Technical Literature

The Joint Committee on Classification of Technical Literature, W. P. Cutler, secretary, 29 West 39th street, New York, is desirous of obtaining assistance in making a collection of classifications of applied science which have been developed independently in the offices of manufacturing plants, engi-

neering firms, etc., especially those which exist in manuscript form, and have been used for filing or indexing data. The committee would especially like to have copies of any extensions of present systems to cover any special industry or branch of engineering not now fully covered by the published classifications.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

- AIR BRAKE ASSOCIATION.**—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 2-5, 1916, Atlanta, Ga.
- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.**—F. A. Pontious, 455 Grand Central Station, Chicago. Next meeting, July 21, 1915, Milwaukee, Wis.
- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.**—H. C. Boardman, D. L. & W., Hoboken, N. J. Next meeting, October 21-23, 1915, Boston, Mass.
- AMERICAN ASSOCIATION OF FREIGHT AGENTS.**—R. O. Wells, Illinois Central, East St. Louis, Ill.
- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.**—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.
- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.**—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next meeting, August 19-20, 1915, San Francisco, Cal.
- AMERICAN ELECTRIC RAILWAY ASSOCIATION.**—E. B. Puttitt, 8 W. 40th St., New York. Annual convention, October 4-8, 1915, San Francisco, Cal.
- AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.**—H. G. McConaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.
- AMERICAN RAILROAD MASTER TINNERS, COPPERSMITHS AND PIPEFITTERS' ASSOCIATION.**—W. E. Jones, C. & N. W., 3814 Fulton St., Chicago. Annual meeting, July 13-16, 1915, Hotel Sherman, Chicago.
- AMERICAN RAILWAY ASSOCIATION.**—W. F. Allen, 75 Church St., New York.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.**—C. A. Lichty, C. & N. W., Chicago. Next convention, October 19-21, 1915, Detroit, Mich.
- AMERICAN RAILWAY ENGINEERING ASSOCIATION.**—E. H. Frisch, 900 S. Michigan Ave., Chicago. Next convention, March 21-23, 1916, Chicago.
- AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.**—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June, 1916.
- AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.**—Owens D. Kinsey, Illinois Central, Chicago. Annual meeting, July 19-21, 1915, Hotel Sherman, Chicago.
- AMERICAN SOCIETY FOR TESTING MATERIALS.**—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.**—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.**—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 7-10, 1915, New York.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.**—F. J. Angier, Supt. Timber Preservation, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 18-20, 1916, Chicago.
- ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.**—E. R. Woodson, Rooms 1116-8, Woodward Bldg., Washington, D. C. Annual meeting, June 28, 1916, Detroit, Mich.
- ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.**—George W. Lyndon, 1214 McCormick Bldg., Chicago. Annual meeting, 2d Tuesday in October, 1915, New York.
- ASSOCIATION OF RAILWAY CLAIM AGENTS.**—C. W. Egan, B. & O., Baltimore, Md.
- ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.**—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Semi-annual meeting with Master Car Builders' and Master Mechanics' Associations. Annual meeting, October, 1915.
- ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.**—P. W. Drew, Soo Line, 112 West Adams St., Chicago.
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.**—G. P. Conard, 75 Church St., New York.
- BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.**—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.
- CANADIAN RAILWAY CLUB.**—James Powell, Grand Think, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.**—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.**—Aron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.**—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.**—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.
- FREIGHT CLAIM ASSOCIATION.**—Walter P. Taylor, Traffic Manager, R. E. & P., Richmond, Va.
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.**—A. M. Hubler, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.
- INTERNATIONAL RAILWAY FUEL ASSOCIATION.**—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago.
- INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.**—Wm. Hall, 1126 W. Broadway, Winona, Minn. Next convention, July 13-16, 1915, Sherman House, Chicago.
- INTERNATIONAL RAILROAD MASTER BLACKSMITH'S ASSOCIATION.**—A. L. Woodworth, C. H. & D., Lima, Ohio. Annual meeting, August 17, 1915, Philadelphia, Pa.
- MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.**—T. L. Goodwin, C. R. I. & P., Eldon, Mo. Next meeting, October 19-21, 1915, St. Louis, Mo.
- MASTER BOILER MAKERS' ASSOCIATION.**—Harry D. Vought, 95 Liberty St., New York.
- MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.**—A. P. Dane, B. & M., Reading, Mass. Next convention, September 14-16, 1915, Detroit, Mich.
- MASTER CAR BUILDERS' ASSOCIATION.**—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June, 1916.
- NATIONAL RAILWAY APPLIANCE ASSOCIATION.**—C. W. Kelly, 349 Peoples Gas Bldg., Chicago. Next convention, March, 1916, Chicago.
- NEW ENGLAND RAILROAD CLUB.**—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.
- NEW YORK RAILROAD CLUB.**—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.
- NIAGARA FRONTIER CAR MEN'S ASSOCIATION.**—E. N. Frankenberg, 623 Brisbane Bldg., Buffalo, N. Y. Meetings 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.**—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
- RAILROAD CLUB OF KANSAS CITY.**—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.
- RAILROAD MEN'S IMPROVEMENT SOCIETY.**—J. B. Curran, Eric R. R., 50 Church St., New York. Meetings, alternate Thursdays, October to May. Assembly Rooms of Trunk Line Association, 143 Liberty St., New York.
- RAILWAY BUSINESS ASSOCIATION.**—Frank W. Dixon, 30 Church St., New York. Annual meeting, December, 1915, Waldorf-Astoria Hotel, New York.
- RAILWAY CLUB OF PITTSBURGH.**—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.
- RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.**—J. Scribner, 1063 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.
- RAILWAY FIRE PROTECTION ASSOCIATION.**—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Next meeting, October 5-7, 1915, Chicago.
- RAILWAY SIGNAL ASSOCIATION.**—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Annual meeting, September 14-17, 1915, Salt Lake City, Utah.
- RAILWAY STOREKEEPERS' ASSOCIATION.**—J. P. Murphy, N. Y. C. R. R., Box C., Collingwood, Ohio.
- RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.**—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders and Master Mechanics' Associations.
- RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.**—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.
- RICHMOND RAILROAD CLUB.**—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.
- ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.**—L. C. Ryan, C. & N. W., Sterling, Ill. Annual meeting, September 14-16, 1915, Chicago.
- ST. LOUIS RAILWAY CLUB.**—E. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
- SALT LAKE TRANSPORTATION CLUB.**—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.
- SIGNAL APPLIANCE ASSOCIATION.**—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.
- SOCIETY OF RAILWAY FINANCIAL OFFICERS.**—Carl Nyquist, C. R. I. & P., 1134 La Salle St. Sta., Chicago. Annual meeting, September, 1915.
- SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.**—E. W. Sandwich, A. & W. P. R. R., Atlanta, Ga. Next meeting, July 15, 1915, Atlanta. Annual meeting, January, 1916.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.**—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.
- TOLEDO TRANSPORTATION CLUB.**—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boddy House, Toledo.
- TRACK SUPPLY ASSOCIATION.**—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.
- TRAFFIC CLUB OF CHICAGO.**—W. H. Wharton, La Salle, Hotel, Chicago.
- TRAFFIC CLUB OF NEWARK.**—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, 559 Broad St., Newark.
- TRAFFIC CLUB OF NEW YORK.**—C. A. Swope, 291 Broadway, New York. Regular meetings last Tuesday in month, except June, July and August, Hotel Astor, New York.
- TRAFFIC CLUB OF PITTSBURGH.**—D. L. Wells, Genl. Agt., Eric R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.
- TRAFFIC CLUB OF ST. LOUIS.**—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noontday meetings October to May.
- TRAIN DISPATCHERS' ASSOCIATION OF AMERICA.**—J. F. Mackie, 7122 Stewart Ave., Chicago.
- TRANSPORTATION CLUB OF DETROIT.**—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.
- TRAVELING ENGINEERS' ASSOCIATION.**—W. O. Thompson, N. Y. C. R. R., East Buffalo, N. Y. Annual meeting, September 7-10, 1915, Chicago.
- UTAH SOCIETY OF ENGINEERS.**—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.
- WESTERN CANADA RAILWAY CLUB.**—L. Kor, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.
- WESTERN RAILWAY CLUB.**—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.
- WESTERN SOCIETY OF ENGINEERS.**—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

Traffic News

The Southern Pacific has just finished at Galveston, Tex., a new 1,000,000-bu. concrete grain elevator, built at a cost of \$500,000.

In suburban passenger cars on a branch of the Erie road in New Jersey passengers now see advertisements like those which are common in elevated and subway city railways.

The Denver & Rio Grande and the Rio Grande Southern will place on sale July 1, a new mileage book containing 1,000 coupons for \$30, which will be good for passage of the buyer and the dependent members of his family.

The Chesapeake & Ohio announces that the sale of intoxicants has been discontinued on all of its dining and buffet cars. Prohibitory laws now prevail in a large part of the territory traversed by the lines of this company.

On July 1, the Chicago & Alton, the Chicago, Burlington & Quincy and the Nashville, Chattanooga & St. Louis established a new daily through package freight car from Chicago to Memphis, Tenn., making third morning delivery in Memphis.

Receipts for tolls on vessels passing through the Panama Canal during the month of April amounted to \$42,415, or \$84,112 more than the cost of operation and maintenance, not counting interest on capital investments. April was the first month in which the receipts exceeded the charges.

Pineapples from Cuba, by way of Key West, are being rushed north nowadays at the rate of 25 miles an hour. The Nashville, Chattanooga & St. Louis reports that the first 15 freight trains run for this traffic made the distance from Atlanta, Ga., to Martin, Tenn., 431 miles, in an average running time of 17 hours 16 minutes, which makes the average rate noted in the above.

The Pere Marquette has made a change in the route by which its passenger trains enter the city of Chicago. From Pine, Ind., into the city it now uses the tracks of the Baltimore & Ohio and the Baltimore & Ohio Chicago Terminal; and trains arrive in and depart from the Grand Central station. Heretofore the Pere Marquette used the tracks of the Pennsylvania for part of the distance.

Trains 39 and 54 of the Central division of the Pennsylvania now have a day-coach buffet car between Kane, Pa., and Erie, 94 miles. These are through trains which have no dining cars. The buffet occupies a space of about 8 ft. in length at one end of the car, and food is served on small tables placed between seats. Breakfast is served on train 39, westward in the morning, and supper on train 54, eastward in the evening.

Over 700 car loads of strawberries have been shipped from the East Tennessee section and points south of Chattanooga to Cincinnati and other western markets this year, according to figures of the Queen & Crescent Route, over which practically the entire crop moved. The great bulk of this freight comes from stations north of Chattanooga on the C. N. O. & T. P. The crop this year was much larger than last year, but good prices were realized, growers receiving an average of \$1.75 a crate, or about \$700 a car.

The Missouri Pacific has received a gold medal for its passenger traffic exhibit at the Panama Pacific Exposition, made on behalf of itself, the Denver & Rio Grande and the Western Pacific. The exhibit, heretofore described in these columns, is an immense globe, 52 feet in diameter, representing the world, the Missouri Pacific and affiliated lines being prominently shown, with miniature trains running to and fro. The interior of the globe is entered through massive arches guarded by statues, and is arranged to represent various scenic attractions along the companies' lines.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Arguments before the commission in the western advance rate case were completed on June 26. Chairman McChord has announced that the hearings relative to the rates on various commodities scheduled to be held in Chicago on July 19 and succeeding days (*Railway Age Gazette*, June 25, page 1491) will be cancelled, as the carriers have agreed to suspend the proposed advances until September. The increases mentioned were some proposed after the hearings in the original case were begun. They were made the subject of a separate case by the commission.

The Business Men's League of St. Louis has filed a complaint against the railroads, objecting to the alleged discrimination created by the five per cent advance in freight rates and advanced passenger rates permitted by the Interstate Commerce Commission in Official Classification territory, while no advance was made between points in the state of Illinois in the territory adjacent to St. Louis. The complaint states that prior to such advanced interstate rates becoming effective, passenger and freight rates between St. Louis and points in Illinois were, generally speaking, on the same general basis as the intrastate rates. The commission is asked to require the defendant carriers to make such a readjustment of the Illinois intrastate passenger, class and commodity rates as will remove the "unjust, unreasonable, discriminatory and unduly prejudicial rates."

Transportation of Potatoes in Refrigerator Cars

Opinion by Commissioner Harlan:

In *Rental Charges for Insulated Cars*, 31 I. C. C., 255, the commission found not to be unreasonable a proposed charge of \$5 per car per trip for the use of a refrigerator car in the movement of potatoes from points of origin in Minnesota and neighboring states and permitted to become effective tariffs naming rates on potatoes which contained the following provision:

Rental charge on insulated cars.—When shipper orders a refrigerator or other insulated car to be heated by him or to move without heat, a charge of \$5 per car per trip will be made for the use of the car and will accrue to the owner thereof.

It has now been proposed to eliminate from the above rule the words "and will accrue to the owner thereof." The commission finds that this change should be made, it being held that the charge to avoid discrimination should be uniform and collected from every shipper who has the use of a refrigerator car. There should be no discrimination between shippers using railroads, private car lines or privately owned refrigerator cars, and the proposed rule reduces to a minimum the possibility or probability of discrimination. (34 I. C. C., 255.)

Des Moines Commodity Rates

Opinion by Commissioner Harlan:

In accordance with previous decisions of the commission the carriers have graded the 80-cent scale of class rates from Chicago to the Missouri river, back across the state of Iowa to the 37½-cent and the 41.7-cent scales of class rates at the Mississippi river. Commodity rates, however, are still based largely on the scale of rates from Chicago or St. Louis to Minneapolis and St. Paul. The commission is of the opinion that the commodity rates would be more equitable if they, too, were scaled back across the state like the class rates.

These complaints, however, were filed in behalf of Des Moines only. Without knowing the consequences to other points in Iowa, the commission does not believe that it can enter any order dealing with Des Moines commodity rates that will require a wholesale readjustment of the rates to and from other points in Iowa. It is, nevertheless, shown that several of the commodity rates to Des Moines are in need of correction and the commission suggests that a conference between the parties in interest be held to see if these rates cannot be made the sub-

ject of an agreement between them. The commission will enter an order if the parties fail to agree before August 1, 1915.

Certain complaints involving class and commodity proportional rates between Des Moines and the Mississippi river on shipments originating at or destined to points east of the Illinois-Indiana state line are dismissed in view of the fact that the entire proportional rate structure has been readjusted in accordance with the decision in the *Interior Iowa Cities case*, 28 I. C. C., 64, and 29 I. C. C., 536.

The commission also takes into consideration a number of the commodity rates in question. The rates on cherry lumber and glove leather from Chicago to Des Moines are found unreasonable to the extent that they exceed the present fourth class and second class rates, respectively. (34 I. C. C., 281.)

Shipments Billed to Intermediate Points to Secure Lower Rates

Kanotex Refining Company v. Atchison, Topeka & Santa Fe. Opinion by Commissioner Harlan:

The Kanotex Refining Company ships regularly large quantities of petroleum from its refinery at Caney, Kan., to Woodward, Okla. In order to take advantage of the substantially lower Kansas intrastate rates on refined petroleum, the complainant devised the plan of billing its tank cars to one L. B. Hill of Kiowa, the latter point being the last in Kansas intermediate to Woodward. Hill was its agent for the sole purpose of acting as the consignee of the shipments and of rebilling them from Kiowa to Woodward, and he took no actual possession.

The carrier upon learning of this plan refused further to bill the shipments from Kiowa, except at the balance of the through interstate rate, and it also presented undercharge bills for the previous shipments.

The complainant frankly admitted that the cars were billed to Kiowa and then rebilled to Woodward for the sole purpose of securing lower rates; that Woodward was the intended destination of the shipments; and that the cars were expected to move to that point as a continuous shipment, subject only to the delay incident to the rebilling at the intermediate point.

The commission finds that the carrier acted entirely within its rights and that it exercised a plain duty under the law, when it refused to continue to rebill at Kiowa the shipments involved. The commission in so deciding adheres to the proposition that on any through carriage of traffic between interstate points the lawfully published interstate rate must be applied, and that where the through interstate rate is higher than the aggregate of the intermediate rates any plan of first billing to an intermediate point a shipment that is really intended to reach a destination beyond is simply a device for defeating the lawful through rate, and is unlawful. (34 I. C. C., 271.)

STATE COMMISSIONS

The Railroad Commission of Louisiana has ordered that, beginning with July, monthly reports of railroad accidents shall be made on forms identical with those prescribed by the Interstate Commerce Commission.

The Pennsylvania Public Service Commission has begun a series of hearings at points throughout the state, which indicates that the commissioners will not spend much time on vacations. The commission met in Scranton last week and is in Erie this week, considering grade crossing and switching cases. It will meet in Harrisburg in the week beginning July 6, in Pittsburgh the week of July 13, and in Harrisburg the remainder of the month, with hearings to be held in Philadelphia, Pottsville, Manheim and Williamsport.

It is probable that the superior court of Pennsylvania, at its session in Philadelphia on July 20, will be asked to pass upon the constitutionality of the act of 1915 providing for appeals from decisions of the Public Service Commission to the superior court instead of through the Dauphin county court. The primary object is to get a decision as to the effect of the act on the twenty appeals now pending in the Dauphin county court. These appeals include the anthracite rate case and a number of important railroad suits. The failure to provide in the new law for the disposition of pending appeals has caused the Dauphin county court to refuse to hear any appeals until the question is settled.

The California Railroad Commission, after an investigation, has issued an order holding that carriers have a legal right to collect an excess charge from passengers boarding trains at agency stations without tickets, provided the charge is published in their tariffs. The commission says that the manifold duties required of conductors in the operation of their trains do not permit of their spending any more than the shortest possible time in the collection of fares without more or less seriously jeopardizing the safety of the passengers; that the collection of cash fares demands considerably more additional time of the conductor than the collection of tickets, and to minimize such practice as much as possible an excess fare is just and reasonable; and that to give refund checks for the excess amount collected would only tend to considerably increase this practice. Carriers are authorized to collect an excess fare of 10 cents on amounts up to \$1.45, and approximately 10 per cent on amounts over that sum up to \$5; provided that no excess charge will be made where passengers have been unable to buy tickets; also, no excess fare shall be collected on electric or interurban lines.

The New York State Public Service Commission, Second district, in an opinion by Commissioner Hodson, has given a decision on the Salamanca grade crossing case, which has been before the commission for a long time and which involves a new interpretation of the grade crossing law. It is held that where, as in the present case, changes concededly needed in the railroad structure of an existing grade crossing are of such a nature as to relate back to the original plans for the elimination of the crossing they cannot be considered as maintenance and repair, for which the railroad [the Erie] alone would have to pay, but must be considered as changes in the said original plans, the cost of which, like the original work, must be divided among the municipality, the state and the railroad. This crossing presented structural difficulties in the first place due to the fact that the bridge carrying the tracks could not be raised much on account of the proximity of a large yard and the level of Main street could not be much depressed on account of difficulties of drainage. The engineers at that time sacrificed the ballast on the bridge and secured the rails to the bridge floor. But water leaked through the bridge and the old railroad commission ordered changes in the drainage to be made and assessed against all three parties to the elimination. The same trouble has again developed, and the commission will take up the case under the amended law.

PERSONNEL OF COMMISSIONS

William T. Gunnison has been appointed a member of the New Hampshire Public Service Commission in place of John E. Benton.

R. F. McLaren, secretary of the Montana Railroad Commission, has resigned. Mr. McLaren was formerly, for 17 years, in the employ of the Northern Pacific and subsequently was superintendent of the Montana, Wyoming & Southern.

COURT NEWS

The Supreme Court of Nebraska has denied the petition of the Missouri Pacific for a writ of mandamus to compel the state railway commission to issue an order increasing passenger fares within the state from 2 to 2½ cents a mile. The court was divided, four to three, the majority holding that the action of the legislature in fixing passenger rates in the state at two cents a mile is controlling, while the minority were of the opinion that when the legislature later passed a bill creating the railroad commission it gave power to the commission to change rates fixed by the legislature.

The Supreme Court of Missouri has this week sustained the demurrer of the Chicago & Alton in the suit of the attorney general of that state against the road to recover \$2,000,000 for alleged excess fares collected while suits were pending relative to the law limiting all fares to two cents a mile. This action of the Supreme Court sustains that of the court of Saline county in favor of the road. The attorney general had brought similar suits against other companies claiming altogether about \$24,000,000. When the Supreme Court of the United States sustained the law limiting fares to two cents, the railroads at once reduced their fares (from 2½

cents); but nothing was said about refunding the half cent a mile (above 2 cents) which had been collected while the law was in litigation.

Secret Rebates Judgment Affirmed

In an appeal from a judgment of the Pennsylvania Supreme Court (241 Pa. St. 536) awarding a shipper of coal damages for secret rebates to other shippers, the railroad company contended that part of the shipments—those to Greenwich, Pa., "included coal destined to points beyond the state," in respect of which no recovery could be had in this action. The United States Supreme Court affirmed the state court's judgment, holding that there was no evidence that any of the coal went out of the state or, if it did, that the circumstances were such that its carriage from the mines to Greenwich was in fact but part of an intended and connected transportation beyond the state. (*Pennsylvania v. Mitchell Coal & Coke Company*, June 14.)

Transverse Drains Law Upheld

In an action for the flooding of land in the Missouri river bottoms from the defendant's roadbed, which was not provided with transverse culverts, or openings of any kind, as required by the statute of 1907, it was argued by the defendant that the statute was invalid as an *ex post facto* law. This argument was based on a reading of the limiting clause "within three months after the completion of the same," which would make it apply to railroads already in existence. The United States Supreme Court holds that the express limit of three months applied only to railroads constructed after the passing of the act, and allowed railroads already in existence a reasonable time within which to make the openings. It also holds that the statute does not impair the obligation of the contract between the state and the railroad company, and is not repugnant to the "due process" and "equal protection" provisions of the Fourteenth Amendment. (*Chicago & Alton v. Traubarger*.)

Survival of Right to Damages for Pain and Suffering Before Death

In an action under the federal employees' liability act of 1908, as amended by the act of 1910, damages were awarded by the Arkansas Supreme Court of \$1,000 for the pecuniary loss (to the father) by reason of the death and \$5,000 for the conscious pain and suffering of the deceased before he died. It appeared that he survived his injuries more than half an hour, and that they were such as would naturally cause him extreme pain and suffering, if he remained conscious. This judgment is affirmed by the United States Supreme Court, which says that the original statute made no provision for a survival of the right of action for pain and suffering before death, and as that statute superseded the state statutes, many of which provided for such a survival, the act was apparently amended to make it as broad as the state statutes. While considering the award large, it involved only a question of fact and was not open to reconsideration by the Supreme Court. (*St. Louis, I. M. & S. v. Craft*.)

Coal Docks Not a Nuisance

A railroad, some time after the grant of a right of way from the United States in the city of Missoula, Mont., constructed thereon a coal dock. Residents in the neighborhood, who had received title to their property after such grant, sued the road for maintaining a nuisance, alleging that the dock caused coal dust to penetrate into their houses, etc. They did not allege that the dock was improperly equipped or operated. The Supreme Court of Montana held that the railroad was not liable, since the grant carried with it the right to maintain all kinds of property and do all sorts of acts necessary in constructing and operating the road, the term "railroad" fairly including all structures necessary to its operation. While cases involving coal docks are rare, the authorities are agreed that, when the grant of a right of way is made to a railroad without restrictions, it contemplates not merely the railroad as it is established in the first instance, but the road with its necessary appurtenances as it may from time to time come necessarily to be. (*Smith v. Northern Pacific (Mont.)*, 148 Pac., 393.)

Railway Officers

Executive, Financial, Legal and Accounting

H. C. Ausley, treasurer of the Southern Railway at Washington, D. C., has been elected treasurer also of the Danville & Western, succeeding C. L. Booth, resigned.

Bond Anderson, assistant auditor of the Blue Ridge Railway at Anderson, S. C., has been appointed auditor of that road, also of the Danville & Western, the Augusta Southern, the Tallulah Falls and the Hartwell Railway, with headquarters at Atlanta, Ga.

Operating

J. Lowell White has been appointed assistant to general superintendent of transportation of the Atlantic Coast Line.

S. Ennes, general superintendent of the Western Maryland at Hagerstown, Md., has been appointed general manager, with office at Hagerstown, and the position of general superintendent has been abolished.

Alexander Grant has been appointed general superintendent of mail transportation of the Southern Railway, the Virginia & Southern and the Northern Alabama, with headquarters at Washington, D. C.

S. E. Cotter, general superintendent of the Wabash at St. Louis, Mo., has been appointed general manager, with headquarters at St. Louis; J. W. Jones, superintendent of terminals at St. Louis, has been appointed superintendent of the Western division with headquarters at Moberly, and C. F. Ocheltree, assistant superintendent at Forrest, Ill., succeeds Mr. Jones.

E. T. Whiter, general superintendent of the Northwest system of the Pennsylvania Lines West of Pittsburgh, at Pittsburgh, Pa., has been appointed to the new position of assistant general manager of the Pennsylvania Lines West of Pittsburgh, with headquarters at Pittsburgh. W. C. Downing, general superintendent of the Central System at Toledo, Ohio, has been promoted to general superintendent of the Northwest system, with headquarters at Pittsburgh, succeeding Mr. Whiter, and I. W. Geer, superintendent of the Cleveland and Pittsburgh division at Cleveland, has been promoted to general superintendent of the Central system, with office at Toledo, succeeding Mr. Downing.

Franklin P. Brady, whose appointment as general superintendent of the National Transcontinental, in charge of the section between Quebec and Winnipeg, and of the Lake Superior branch of the Grand Trunk Pacific between Fort William and Superior Junction, with headquarters at Cochrane, Ont., has already been announced in these columns, was born on June 22, 1853, at Haverhill, N. H., and was educated at Newbury Seminary, Newbury, Vt. In May, 1869, he began railway work on the Connecticut & Passumpsic Rivers, now a part of the Boston & Maine, and in February, 1873, served consecutively as station baggage master and telegraph operator at Lyndonville, Vt. He was then train dispatcher on the Northern New Hampshire, now a part of the Boston & Maine at Concord, N. H., and from 1880, to November, 1887, was chief train dispatcher on the South-Eastern Railway, now a part of the Canadian Pacific at Farnham, Que. He subsequently became trainmaster on the same road, and from July, 1888, to May, 1896, was assistant superintendent of the Canadian Pacific. He was then in May, 1901, superintendent of the same road, with headquarters at Smith's Falls, Ont., and later served as superintendent at Toronto, Ont., and at Fort William until May, 1903, when he was appointed assistant general superintendent of the same road at Winnipeg, Man. In February, 1904, he was appointed general superintendent at North Bay, Ont., remaining in that position until September, 1908. The following May, he became a member of the Government Railways Managing Board and general superintendent of the Intercolonial and the Prince Edward Island Railways. In June, 1913, the Government Railways Managing Board was abolished, and since that time Mr. Brady served as general superintendent of the Canadian

Government Railways, until his recent appointment as general superintendent of the National Transcontinental as above noted.

Traffic

J. D. Kenworthy, assistant general freight agent of the Denver & Rio Grande, at Pueblo, Colo., has been transferred to Salt Lake City, Utah, in the same capacity, succeeding S. V. Derrah, deceased.

Thomas F. Hartnett, commercial agent of the Cleveland, Cincinnati, Chicago & St. Louis, at Toledo, Ohio, has been appointed to the newly created office of Pacific agent, with headquarters at San Francisco, Cal. W. F. Benning has been appointed to succeed Mr. Hartnett.

George H. Eaton, general freight agent of the Boston & Maine at Boston, Mass., has been appointed assistant freight traffic manager; William T. Lamoure, assistant general freight agent at Boston, has been appointed general freight agent, and Emery W. Abbott, division freight agent at Troy, N. Y., has been appointed assistant general freight agent.

R. M. Burr, traveling passenger agent of the Cincinnati, New Orleans & Texas Pacific at Cleveland, Ohio, has been promoted to district passenger agent, with headquarters at Cleveland, and the office of traveling passenger agent has been abolished. J. C. Volz, traveling passenger agent at Cincinnati, has been promoted to central passenger agent, with headquarters at Cincinnati, and the office of traveling passenger agent has been abolished. A. C. Mathias has been promoted to northern passenger agent, with headquarters at Chicago.

Engineering and Rolling Stock

J. S. Sheafe, master mechanic, Staten Island Lines of the Baltimore & Ohio at Clifton, Staten Island, N. Y., has been granted leave of absence for one year.

E. F. Vincent, assistant chief engineer of the Colorado & Southern, has been appointed chief engineer, with headquarters at Denver, Col., succeeding H. W. Cowan, deceased.

W. M. Bosworth, mechanical engineer of the Louisville & Nashville, at Louisville, Ky., has been appointed mechanical engineer of the Norfolk Southern, with office at Berkeley, Va.

Frank E. Wilmore has been appointed assistant road foreman of engines of the Pennsylvania Lines West of Pittsburgh, with headquarters at Fort Wayne, Ind., succeeding Robert J. Lyons, succeeded to other duties at his own request.

A. H. Mahan, locomotive foreman of the Grand Trunk Pacific at Prince George, B. C., has been appointed general locomotive foreman in charge of territory from Prince George to Edmonton, Alta., including intervening branch lines; J. F. Moffatt, road foreman at Wainwright, Alta., has been appointed general locomotive foreman in charge of the territory from Transcona, Man., to Fort William, Ont.; H. R. Simpson, road foreman at Jasper, Alta., has been appointed general locomotive foreman in charge of the territory from Watrous, Sask., to Winnipeg, Man., including intervening branch lines; W. G. McConachie, road foreman at Edmonton, Alta., has been appointed general locomotive foreman in charge of the territory from Edmonton to Watrous, including intervening branch lines, and A. Watt, general foreman at Prince Rupert, B. C., has been appointed general locomotive foreman in charge of the territory from Prince Rupert to Prince George. D. W. Hay has been appointed locomotive foreman, with office at Prince George, B. C., succeeding A. H. Mahan, and J. A. Miller has been appointed locomotive foreman at Endako, succeeding G. H. Laycock, transferred to Jasper, Alta.

OBITUARY

James J. Goodwin, a director of the Erie, died on June 23, at Hartford, Conn., at the age of 80.

William M. Hughes, formerly consulting engineer of the New York, Chicago & St. Louis, and at one time bridge engineer of the city of Chicago, died at his home in Chicago, on June 25.

Equipment and Supplies

LOCOMOTIVE BUILDING

THE INTERCOLONIAL RAILWAY OF CANADA has ordered 15 locomotives from the Canadian Locomotive Company.

THE ISTHMIAN CANAL COMMISSION, Major F. C. Boggs, general purchasing officer, will receive sealed proposals until August 16 for 12 electric towing locomotives for canal locks.

THE CAROLINA, GREENEVILLE & NORTHERN, an electric line, F. A. H. Kelley, chief engineer, Greenville, Tenn., is preparing specifications for motive power and rolling stock. See item under Railway Construction.

CAR BUILDING

CAROLINA, GREENEVILLE & NORTHERN. See item above under Locomotive Building.

THE GREAT NORTHERN has ordered 500 box cars from the Haskell & Barker Car Company.

THE NORTHERN PACIFIC has ordered 750 center constructions and 750 sets of draft sills from the Western Steel Car & Foundry Company.

THE BALTIMORE & OHIO is in the market for 35 coaches, 5 passenger and baggage cars, 2 combination baggage and mail cars, 4 baggage cars, 2 parlor-cafe cars and 2 cafe coaches.

THE CHICAGO, BURLINGTON & QUINCY is inquiring for 1,500 to 2,000 40-ton steel underframe box cars. This company is also reported to have asked bids on 55 coaches and 10 dining cars.

THE INTERCOLONIAL has ordered 650 80,000-lb. capacity box cars from the Canadian Car & Foundry Company, and 350 80,000-lb. capacity box cars from the National Steel Car Company.

THE CHICAGO, ST. PAUL, MINNEAPOLIS & OMAHA has ordered 750 box cars from the American Car & Foundry Company, and 750 from the Haskell & Barker Car Company. It is also inquiring for 100 refrigerator cars.

THE INTERNATIONAL & GREAT NORTHERN, which was reported in the *Railway Age Gazette* of June 11 as negotiating for 1,000 freight cars with the Mount Vernon Car Manufacturing Company, has ordered 500 box cars, 200 stock cars and 300 gondola cars from that company.

THE CHICAGO & NORTH WESTERN has ordered 10 coaches, 3 smoking cars and 10 60-ft. baggage cars from the American Car & Foundry Company, 3 70-ft. baggage cars, 10 70-ft. combination baggage and mail cars, 2 reclining chair cars, 5 combination baggage and passenger cars, 4 parlor cars and 2 dining cars from the Pullman Company, and will also place orders for 5 more passenger cars.

IRON AND STEEL

THE EL PASO & SOUTHWESTERN has ordered 8,000 tons of 90-lb. rail from the Colorado Fuel & Iron Company.

THE CHICAGO, MILWAUKEE & ST. PAUL has ordered 585 tons of steel from the Federal Bridge Company for five 105-ft. spans.

THE NEW YORK PUBLIC SERVICE COMMISSION, First district, will advertise for bids, to be opened July 16, for 40,200 tons of rail for equipping new rapid transit lines of the dual system.

THE SIAMESE ROYAL RAILWAY DEPARTMENT invites bids for three steel viaducts. Specifications and drawings may be obtained from the Siamese Legation at Gloucester, Mass., on payment of a fee of \$4 for each set.

THE UNION STATION COMPANY, Chicago, has ordered 1,150 tons of steel for its Monroe street bridge from the Chicago Bridge & Iron Company, and 155 tons for the machinery of this bridge from the Allis-Chalmers Company.

Supply Trade News

The Linde Air Products Company, New York, is completing plans for a one-story 80-ft. by 100-ft. plant to be erected at Milwaukee, Wis., at a cost of \$30,000.

H. F. Dow, for a number of years superintendent of the screw-machine department of the United Shoe Machinery Company, Beverly, Mass., and later a member of the firm of Babson-Dow Manufacturing Company, Boston, has recently been placed in charge of the automatic department of the American Steam Gage & Valve Company, Boston, Mass.

The Allegheny Steel Company, Pittsburgh, Pa., has completed plans to enlarge its plant at Brackeuridge, Pa., for the manufacture of pressed steel side frames for steel cars. Material for the new addition will be furnished by the 100-inch plate mill of the company. Several new buildings will be erected, including one 90 ft. by 126 ft., one 60 ft. by 120 ft., and two 30 ft. by 135 ft.

The Standard Steel Car Company intends to make some large additions to its New Castle, Pa., plant. A contract has already been given to the McClintic-Marshall Company for the steel for a new building to replace a structure destroyed last fall by fire. A large amount of new equipment will be installed, and it is planned to build steel cars complete. Hitherto only parts of the cars were made and assembled for finishing at Butler, Pa.

Edward M. Hagar, whose election as president of the Hagar Portland Cement Company, was announced in this column last week, was graduated from the Massachusetts Institute of Technology in 1893. In 1894

he received a master's degree from Cornell University for postgraduate work done at that school. He then came to Chicago and formed the corporation known as Edward M. Hagar & Co., which acted as agent for several machinery manufacturers. In 1899 he was appointed manager of the cement department of the Illinois Steel Company. The manufacture and sale of Universal Portland cement was carried on by the Illinois Steel Company until 1906 when the Universal Portland Cement Company was formed with Mr. Hagar as its president. Under his

management the manufacture of Universal increased from 32,000 barrels in 1900 to 12,000,000 barrels in 1914. Mr. Hagar resigned the presidency of the Universal Portland Cement Company in February of this year to form a new company for the purpose of acquiring a chain of Portland cement plants extending across the country.

The International Jury of Award of the Panama-Pacific International Exposition has awarded to the Western Electric Company the following medals for its exhibit in the Palace of Manufacturers: the Grand Prix for the exhibit as a whole; gold medals for telephone switchboards and equipment, for telephone train despatching and control apparatus and for insulated wires and cables and two bronze medals for mine rescue equipment and mine telephones.

Frank C. Rose, formerly purchasing agent of the Foundation Company, Ltd., Montreal, has been appointed general purchasing agent of W. S. Barstow & Co., Inc., engineers and managers, New York, operating the General Gas & Electric Company and the Eastern Power & Light Corpora-

tion. Previous to his connection with the Foundation Company, Ltd., Mr. Rose was assistant purchasing agent of J. S. White & Co. and prior to that general confidential assistant to the purchasing agent of the Delaware, Lackawanna & Western.

The United Railway Specialties Company, 30 Church street, New York, has been appointed representative of Mudge & Co., Chicago, in the New England, eastern and southern states. Representation will cover Mudge motor cars, Mudge-Peerless ventilators and the Mudge-Slater removable box front end for locomotives. The United Railway Specialties Co. is a comparatively new company. Its officers are: R. A. Patterson, president; H. M. Buck, treasurer, and John B. Given, vice-president. Mr. Patterson was for a number of years associated with Fairbanks-Morse & Co., Chicago, in charge of the railroad department of their New York office. Mr. Buck has been associated with the Railway Supply Company, Chicago, for many years as eastern representative. Mr. Given was at one time in the service of the Duplex Metals Company and is now also associated with the Galena-Signal-Oil Company. The United Railway Specialties Company, in addition to representing Mudge & Co., also represents the National Standard Company, Niles, Mich.; the W. E. Caldwell Company, Louisville, Ky.; the Continental Fibre Company, Newark, Del.; the William Robertson & Co., Chicago; the Railway & Traction Supply Company, Chicago, and a number of other companies.

Charles B. McElhany, general manager of sales of the Cambria Steel Company, has been elected also a vice-president of that company. Mr. McElhany has been in the steel business

for about 20 years, and in the service of the Cambria Steel Company for four years. His early years in the steel industry were spent in the employ of the Braddock Wire Company, the American Steel & Wire Company, the Union Steel Company and the Pittsburgh Steel Company. About nine years ago he entered the service of the Colorado Fuel & Iron Company, becoming assistant general manager of sales of that company. He then became assistant manager of sales of the Cambria Steel Company, in charge of the wire division. He was later appointed assistant general manager

of sales, and on March 1 succeeded J. L. Replogle as general manager of sales.

Two court decisions have recently been handed down relative to infringement of patents held by the Safety Car Heating & Lighting Company, New York. In the suit of the Safety Car Heating & Lighting Company v. the United States Light & Heating Company, the circuit court of appeals has affirmed the decision of Judge Hazel of the western district of New York, which held that the first eight claims of the Creveling patent No. 747,086, owned by the Safety Car Heating & Lighting Company, which were the only claims involved in the suit, were valid, that they were entitled to a broad interpretation, and that they were infringed by both the taper charge and stop charge systems of the defendant. The Safety Car Heating & Lighting Company believes that this patent as thus adjudicated covers not only the systems of the United States Light & Heating Company, but also practically all modern systems now in use on the railroads of this country. In the case of the Safety Car Heating & Lighting Company v. the Gould Coupler Company, in which the Safety Car Heating & Lighting Company sued for infringement of the patent to H. G. Thompson, No. 1,070,080 which it holds, patent claims 1, 9, 10, 11, 12 and 13 were alleged to be infringed by the Sneplex system of the Gould Coupler Company in

E. M. Hagar

C. B. McElhany

both the constant battery current and constant generator current forms. Judge Hazel of the United States court for the western district of New York at Buffalo, holds all the claims valid and all infringed by both the constant battery current system and the constant generator current system of the Gould coupler Company.

Harrison G. Thompson, whose appointment as general sales manager of the Edison Storage Battery Company, Orange, N. J., was announced in this column last week, has been in the service of that company since July, 1910, and a vice-president of it since July, 1913. Mr. Thompson was born at Weston, Mass., in 1875. In 1896 he entered the service of the Pullman Company and after having been with that company for two years was made foreman of electricians. In 1900 he resigned to become foreman of the battery department of the Riker Motor Vehicle Company, but left the latter at the time of its absorption by the General Vehicle Company, of Hartford, Conn., to become associated with W. L. Bliss, one of the pioneers in electric car lighting development. In 1905 he entered the service of the Pennsylvania Railroad and was placed in charge of electric car lighting with headquarters at Jersey City, N. J. About one year later he became electrical superintendent of the Safety Car Heating & Lighting Company, New York, and was in charge of that company's electrical laboratories during the development of its first electric car lighting system. In December, 1909, he was appointed manager of the railroad department of the Westinghouse Storage Battery Company and later for a short time was in the employ of the United States Light & Heating Company, New York. In July, 1910, he became manager of the railway department of the Edison Storage Battery Company.

H. G. Thompson

TRADE PUBLICATIONS

ELECTRICAL TESTING SERVICE.—The Electrical Testing Laboratories, Inc., New York, have recently issued an attractive loose-leaf booklet describing the equipment, organization and work of these laboratories.

PASSENGER CAR COUPLERS.—The McConway & Torley Company, Pittsburgh, Pa., has recently issued an eight-page booklet descriptive of the Pitt passenger coupler. In addition to an illustration of the coupler, the booklet also contains three drawings showing the coupler's great flexibility of curvature. Figure 1 shows the limits of such flexible movement; figure 2, the extreme positions to which the couplers will adjust themselves in passing over a curve and tangent, and figure 3, the relative positions on a reverse curve.

CONNECTING DEVICES FOR WIRING.—The Fargo Manufacturing Company, Inc., Poughkeepsie, N. Y., has issued three very full and complete catalogs of its connecting devices for wiring of all kinds. These devices are designed to be the very best of their class, both for strength and for quality of workmanship. Catalog No. 700 showing types A and B illustrates the straight connection, type A 3; the steel cable grip type A 4; steel guy grip; a cable lug; cable grip type A, and straight connection, type B. Bulletin No. 402 shows an insulated case for a straight connection, a bus bar connection grounding devices and tee and ell connections. Catalog No. 800 shows these and other devices with large illustrations and additional details of the uses to which they may be put. Ground and terminal connections are shown in great variety.

Railway Construction

ALAMANCE, DURHAM & ORANGE RAILWAY & ELECTRIC COMPANY.—Plans have been made to build an electric line from Altamahaw and Ossipee, twin manufacturing villages in the northwestern section of Alamance county, N. C., in a southeasterly direction through the manufacturing villages of Hub Mills, Glencoe, Carolina and Hopedale, thence via Burlington, Graham, Swepsonville, Saxapahaw and Chapel Hill to Durham, about 50 miles. Contracts for building the line will probably be let in November. J. H. Harden, president, Burlington, and H. G. Palmer & Co., Yorkville, Ill., and office at Burlington, N. C., are the engineers.

AMERICUS, FLINT RIVER & GAINS.—The city council of Americus, Ga., has given a franchise to the Georgia Lumber Company to operate a railroad into Americus. The company has the right of way secured, it is said, for a line to be about 25 miles long, and construction work is to be started before September. The projected route is from Byronville, Ga., west across the Flint river, thence to Americus, and the plans call for putting up a steel bridge over the Flint river. It is proposed later to extend the line which will probably be built under the name of the Americus, Flint River & Gains. The headquarters of the company are at Americus, and it is said that the plans call for establishing shops at that place.

CALHOUN COUNTY RAILWAY.—This company proposes to build a railroad from Pearl, Ill., to run south through Bee Creek, Cliffdale, Kampsville, Hamburg, Batchtown and Brussels to Golden Eagle. Grading in the district of Hardin, Ill., is in progress, and it is expected track laying will begin about August 15. The general contracts have been awarded to the Western Illinois Development Company. John E. Melick, Kampsville, Ill., is president and chief engineer of the railroad.

CAROLINA, GREENEVILLE & NORTHERN (Electric).—A contract has been given to A. H. Jacoby, Greenville, Tenn., for some of the work on this line. The company plans to build from Bristol, Tenn., west to Kingsport, thence southwest via Newport and Sevierville to Knoxville, about 140 miles. The maximum grade will be 1.5 per cent, and the maximum curvature 10 deg. There will be three steel bridges aggregating 1,500 ft. on the line. The company expects to develop a traffic in lumber, iron ore and coal. H. S. Reed, president, Los Angeles, Cal.; F. A. H. Kelley, chief engineer, Greenville, Tenn. (June 11, p. 1265.)

CHARLESTON SOUTHERN.—Under this name a line is projected from the Carolina, Atlantic & Western at Charleston, S. C., southwest to Savannah, Ga., 86 miles. The company has not yet been incorporated. G. E. Dargan and B. Williamson, Darlington, S. C., also J. E. Evans, Florence, S. C., are interested.

CHESAPEAKE & CURTIS BAY.—Incorporated in Maryland with \$50,000 capital, it is said, to build a line at Curtis Bay and at East Brooklyn suburbs of Baltimore to connect with the Baltimore & Ohio. The incorporators include R. D. Upham, New York; J. C. Boyd, Baltimore; J. H. Zink and R. B. Pue.

FLORENCE & HUNTSVILLE INTERURBAN.—According to press reports from Florence, Ala., the Lauderdale Power Company is promoting the construction of this line. The plans call for building from Florence east via Athens to Huntsville, about 75 miles, and about 12 miles of spur lines. (September 25, p. 587.)

KEOKUK, ROCK ISLAND & CHICAGO.—This company proposes to build a railroad from a point on the Chicago, Burlington & Quincy near Keithsburg, Ill., to a point opposite Muscatine, Iowa, and thence to Chillicothe, Ill., a distance of about 130 miles. Several bridges will be required. M. J. Healy, Joy, Ill., president and chief engineer, would like to hear from contractors.

MONTREAL & SOUTHERN COUNTIES (Electric).—An officer writes that work was resumed on June 1, on the extension from St. Cesaire, Que., to Granby, 15 miles. This work was first started in May, 1914, and was shut down in August of the same year. Track has already been laid on three miles. Grant, Campbell & Company, St. Cesaire, are the contractors. There

will be five short wooden pile trestles on the line, also car-barns and substation at Granby, and a station at Abbotsford. (January 15, p. 116.)

NEW YORK CONNECTING.—This company has given contracts to the Wilson & English Construction Company, New York, for the construction of Section 1, and to P. McManus, Incorporated, Philadelphia, Pa., for the construction of Section 2. This work is for the sections of the New York Connecting Railroad between Bowery Bay Road and the Long Island Railroad at Fresh Pond Junction, in the borough of Queens, New York. (May 28, p. 1139.)

NEW YORK SUBWAYS.—The New York Public Service Commission, First district, will open bids on July 20, for the construction of Section No. 1 of Route No. 49, a part of the Culver rapid transit railroad. Section No. 1 extends from a point in Thirty-seventh street 246 ft. southeast of Tenth avenue under private property and intersecting streets to Gravesend avenue and over Gravesend avenue to a point about 525 ft. south of Bay Parkway (Twenty-second avenue) produced.

NORFOLK, WASHINGTON & NEW YORK.—An officer writes that this company has secured most of the right of way on the section between Riverside, Va., and Sheperd's, D. C. The company plans to build from Newport News, Va., north via Washington, D. C. Channing M. Ward, president, Richmond, Va.

NORTH CAROLINA ROADS.—Plans are being made, it is said, to build a line from Rutherfordton, N. C., southwest to Columbus, about 15 miles. L. D. Miller, Rutherfordton, may be addressed.

NORTH GEORGIA MINERAL.—Surveys are reported under way on about 25 miles for a line from Atlanta, Ga., north to a point in Bartow county. Application was made by this company for a charter in Georgia last year with a capital of \$1,250,000, to build from Atlanta, northwest through the counties of Fulton, Cobb, Cherokee and Bartow, about 50 miles. W. J. Morrison, A. C. King, J. J. Spalding, Atlanta, are interested. (September 25, p. 587.)

OZARK SOUTHERN.—This company has projected a line from Harrison, Ark., it is said, south to Jasper and Parthenon, about 20 miles. The line may eventually be extended south of Parthenon. G. W. T. Shaw, Lee Center, Ill., is consulting engineer, and W. T. Allen, Jacksonville, Ala., and F. B. Moody are interested.

PENNSYLVANIA RAILROAD.—A short branch line is to be built at Steelton, Pa., to reach some industries without using main line track as at present.

SOUTHERN PACIFIC.—This company announces that the work between Eugene, Ore., and Marshfield is nearly completed. There remains some bridge work which is now in progress, after which there will be some trestle work, track laying and ballasting to complete.

STATESVILLE AIR LINE.—Financial arrangements are now being made, it is said, to carry out work on this line. The plans call for building from Statesville, N. C., north via Harmony to Houstonville, about 25 miles. Grading has been finished on about 20 miles, and track laying may be started soon. W. D. Turner, president; W. Wallace, vice-president; D. M. Ausley, treasurer and general manager.

TENNESSEE ROADS (Electric).—Plans are being made to build an electric line, it is said, from a connection with the Nashville, Chattanooga & St. Louis at Lebanon, Tenn., southeast to Smithville, about 35 miles. C. Edwards, representing White & Company, Chicago, Ill., is said to have made arrangements for building the line. J. T. Odum, Lebanon, may be addressed.

RAILWAY STRUCTURES

AUGUSTA, GA.—An officer of the Georgia & Florida is quoted as saying that the company will start work at once on a new passenger station at Twiggs and Calhoun streets in Augusta. The company was granted permission recently by the Railroad Commission of Georgia to discontinue use of the union station in Augusta, and to build a new station.

BROOKLYN, N. Y.—Contracts for the construction of eight elevated railroad stations in connection with the third-tracking of

the Broadway elevated railroad in the borough of Brooklyn have been approved by the New York Public Service Commission, First district.

CLAREMORE, OKLA.—The St. Louis, Iron Mountain & Southern contemplates building a new depot at this place. No definite decision has yet been reached as to the size of the building, or when it will be constructed.

COLEMAN, TEX.—The Gulf, Colorado & Santa Fe has awarded the contract for the construction of a brick and stucco depot at this point to H. D. McCoy, of Cleburne, Tex.

DALLAS, TEX.—The Dallas Union Terminal Company will construct a heat, light and power plant to supply the terminal now being built at that place. The estimated cost is \$60,000.

FROSTBURG, MD.—A contract has been given to the Luten Bridge Company, York, Pa., to build a 44-ft. concrete span bridge over the Cumberland & Pennsylvania tracks at Bowery street, Frostburg. The town of Frostburg and the Cumberland & Pennsylvania will jointly pay for the improvements, which are to cost \$5,340.

HERR'S ISLAND, PA.—A contract has been given by the Pennsylvania Railroad to the Bailey & Lush Company, Philadelphia, at \$150,000 for building a double-deck stock pen on Herr's Island.

HOPEWELL, VA.—An officer of the Norfolk & Western writes regarding the construction of a new freight warehouse at Hopewell, Va., that nothing definite has been decided as to the construction of this warehouse. It will probably be of frame construction and the work may be carried out by company forces.

KANSAS CITY, MO.—The Chicago, Burlington & Quincy has awarded the contract for the steel work of its Kansas City bridge to the American Bridge Company. The contract calls for 5,500 tons of steel.

MANSFIELD, OHIO.—Plans are being made by the Erie for building an addition, 40 ft. by 50 ft. to the freight house at Mansfield, at a cost of between \$8,000 and \$9,000.

PHOENIXVILLE, PA.—The Pennsylvania Railroad has given a contract to the James McGraw Co., Philadelphia, Pa., for building the concrete arch bridge at Campbell's Crossing, west of Frick's lock. The bridge is to consist of seven 84-ft. concrete arches for double track. (June 11, p. 1266.)

RIDGEWOOD, N. J.—The Erie has given a contract to the Corning Building Company, Corning, N. Y., for building a new station at Ridgewood. Another contract has been given to Arthur McMullen, New York, for constructing a pedestrian subway and the approaches to the new station, also for the paving, etc.

RAILWAY PROPERTY IN ASIA MINOR.—A telegram from Constantinople received in Amsterdam via Berlin states that it is reported in competent circles that the Porte has decided to abolish the Turco-French financial agreement drafted last year, the execution of which would have impeded the future development of the Hedjaz Railway. The government has decided to buy back all railway property in Syria and in the Lebanon district which is the property of alien enemies.

RAILWAY EXTENSION IN INDIA.—The Indian Railway Board has sanctioned the following new construction: the construction by the South Indian Railway, on behalf of the District Board of Tanjore, of a branch meter-gage line between Tiruturaipundi, a station on the South Indian Railway and Vedaraniam, a distance of about 23 miles; a survey by the agency of the Darjeeling-Himalayan Railway for a line between Thakurgunge and Sikti, a distance of about 44 miles; the construction by the Bengal Provincial Railway of a 2 ft. 6-in. gage line between Dasghara station on the Bengal Provincial Railway, and Jamal Purgunj, a distance of about 8 miles; a survey by the Assam-Bengal Railway administration for meter-gage lines between Karimganj into the Longai Valley and Hathikheri, with a branch into the Chargola Valley, length about 44 miles, and between Silchar and Dwarbund, with branch to Sonaimukh and Dhalai, a length of about 30 miles. On the Great Indian Peninsula Railway the four trading lines up to Kalyan have made good progress, but the completion of the work will be delayed, owing to the war.

Railway Financial News

ALABAMA & MISSISSIPPI.—This company has leased the Pascagoula, Moss Point & Northern. The Alabama & Mississippi runs from Vinerga Bend, Ala., to Leaksville, Miss., 17 miles, and the Pascagoula, Moss Point & Northern runs from Pascagoula, Miss., to Evanston.

BOSTON & MAINE.—President Hustis gave out the following statement after a meeting of the executive committee of the Boston & Maine, held on June 29:

"There is no friction between the directors of the Boston & Maine Railroad and the committee representing the leased line interests. This committee, of which Richard Olney is chairman, is fully alive to the importance of avoiding a receivership and is working to that end. They realize if receivership is to be avoided legislation must be secured in New Hampshire and that to secure legislation in New Hampshire the leased line interests must be practically a unit requesting it.

"The statement that because of a steady improvement in net earnings, reorganization is unnecessary, and that there will be no need of a receivership in case reorganization is not effected should not be regarded seriously. It is understood by all interests that no plan short of a permanent reorganization and one that will restore credit to the road will avail.

"It is true that net results of operation as compared with last year are continuing to show a favorable tendency. The report for the 11-months' period, published today in face of a loss in the operating revenue of \$1,335,000, shows a shortage of only \$773,000 in the amount required to pay fixed charges as against a shortage of \$2,186,000 for the same period of the previous year; but regardless of this favorable showing it is apparent that fixed charges will not be earned this fiscal year, although the result would have been more favorable had not track work been started earlier this year than last."

Chairman MacLeod, of the Massachusetts Public Service Commission, gave out on June 29 the following statement:

"The present corporate body of the Boston & Maine Railroad is a menace to any sound reorganization; the Public Service Commission does not favor any receivership if it can be avoided, but a reorganization on a sound basis. In conformity with the law as passed by the legislature, the stockholders may negotiate with the leased line interests, but any deal consummated must be within a capitalization fixed under the enabling act.

"Until the Boston & Maine gets rid of the fixed charges that it is now under there cannot, in my opinion, be any healthy reorganization effected. The road must be reorganized on such a basis that it will be able to weather any time of future stress."

CHICAGO, ROCK ISLAND & PACIFIC.—Judge Carpenter, in the United States district court, has authorized the receivers to issue \$2,500,000 5 per cent receivers' certificates, the proceeds to be used to pay interest due on July 1 on underlying bonds. The issue of certificates was opposed by Samuel Untermeyer, representing the Amster interests, but the objections were overruled by Judge Carpenter. The receivers' certificates were sold to the First National Bank of New York.

The following have formed a protective committee to represent the interests of the first and refunding mortgage bonds: Charles A. Peabody, president of the Mutual Life Insurance Company, chairman; Allen B. Forbes, of Harris, Forbes & Company, New York; W. A. Day, president of the Equitable Life Assurance Society; A. J. Hemphill, chairman of the board of directors of the Guaranty Trust Company, and Alfred W. Harris, president of the Harris Trust & Savings Bank, Chicago.

FLORIDA RAILWAY.—William B. Winslow, of New York, has been appointed receiver of the Florida Railway by United States District Judge Hand. The receivership suit was brought by Carl J. Sauer on the part of certain bondholders because it was alleged that the Union Trust Company of Florida, which was to have acted as trustee for the bonds, never qualified as trustee. The Florida Railway runs from Live Oak, Fla., to Jacksonville and Fernandina.

HOCKING VALLEY.—A dividend of 1 per cent has been declared, payable June 30. Six months ago 3 per cent was declared. This makes a total of 4 per cent for the year.

NEW ORLEANS, MOBILE & CHICAGO.—The United States district court has ordered the sale of the New Orleans, Mobile & Chicago under foreclosure within the next two months. A petition to intervene in the receivership proceedings made by L. S. Berg, formerly president of the company, and representatives of French bondholders was denied.

NEW YORK CENTRAL.—Residents of Yonkers have, after making an attempt to persuade the New York Central to electrify the Yonkers branch, made the railroad company tentative propositions looking to buying this branch and themselves electrifying it and operating it. The cost of electrification has been estimated at from \$450,000 to \$500,000.

PASCAGOULA, MOSS POINT & NORTHERN.—See Alabama & Mississippi.

PENNSYLVANIA RAILROAD.—This company now has over 93,000 stockholders, of whom 44,848, or 48.22 per cent, are women. This is an increase in the total number of stockholders of 3,158 as compared with June, 1914. The women stockholders, while aggregating in number 48.22 per cent of the total stockholders, hold 28.09 per cent of the stock, the average holdings per woman stockholder being 63 shares.

ST. LOUIS & SAN FRANCISCO.—The bondholders' protective committee representing the first and refunding 4 per cent bonds, has made arrangements to advance the interest due on July 1 on these bonds to holders who have deposited their bonds with the committee.

SOUTHERN PACIFIC.—The Supreme Court of the United States on Monday handed down a decision holding that the 2,300,000 acres of land located in Oregon and granted to the Oregon & California Railroad Company, a subsidiary of the Southern Pacific, is not forfeited to the government and that the Southern Pacific is entitled to hold this land, but an injunction is issued preventing the railroad company from selling it for a period of six months pending further action by Congress.

The Southern Pacific will operate beginning with July 1 as part of its Pacific system the properties of the Corvallis & Eastern; Portland, Eugene & Eastern; Coos Bay, Roseburg & Eastern; Pacific Railway & Navigation, and Salem, Falls City & Western.

WABASH.—The sale of this property, which had been set for June 23, has been postponed upon the application of the Equitable Trust Company, New York, to July 8.

WABASH-PITTSBURG TERMINAL.—The reorganization committee, of which James N. Wallace, of the Central Trust Company of New York, is chairman, has submitted to securityholders a plan of reorganization. This plan provides for a reduction in the par value of securities and outstanding indebtedness from \$91,000,000 to \$44,000,000. Of the former capitalization \$81,000,000 was bonds. This would be reduced to \$5,000,000, reducing fixed charges from \$2,783,000 to \$261,000 annually. The new securities to be issued will consist of \$9,100,000 6 per cent preferred stock, cumulative after January 1, 1921, and \$30,500,000 common stock, and the \$5,000,000 underlying bonds will remain undisturbed.

DUBLIN RAILWAY STRIKES.—Some 200 men left their work at Broadstone Railway Station on Monday, June 14, without notice. Many of them are members of the Irish Transport Union. Some 50 men failed to resume work on Monday morning at the locomotive and car shops of the Dublin & South-Eastern at Upper Grand Canal street, following an application for an advance of 6s. (\$1.50) per week in wages. The men belong to the Transport Union, which sought to secure the advance. The directors of the Midland Great Western decided on June 15 to grant a war bonus to their employees, i. e., 1s. (25 cents) a week to those earning 12s. (\$3) a week or less; to members of the clerical and wages staff (1) receiving more than 12s. and not exceeding 30s. (\$7.50), 1s. 6d. (38 cents) a week, (2) receiving more than 30s. and not exceeding 39s. (\$9.75), 1s. a week.

*Illustrated.

Chaloner Whin is the latest train accident reported on by the British Board of Trade; and it is another case in which the inspector points out the need of a cab signal or its equivalent; but the recommendation is couched in the inspectors' customary mild language. Chaloner Whin is two miles south of York, on the North Eastern,

The Cab Signal Propaganda in England

which road has a considerable equipment of cab signals. The report is abstracted on another page. Incidentally it shows also the comparative uselessness of an apparatus to enable a signalman to put torpedoes on the rail opposite his cabin. In this case the engineman ran past distant and home signals set against him and was thrown off the track, just beyond the cabin,

at a movable frog, which was open because the signal man tried to move it when it was clogged with snow. The rule prohibits signalmen from thus introducing an obstruction—moving the frog was an obstruction—when a train is known to be approaching; it requires him first to stop the train at home signal. The inspector calls for enforcement of the rule; the company says that at busy junctions it would cause congestion; and the inspector ends the discussion by declaring that, at least in the case of a passenger train, the moving of a frog (or switch) should be prohibited. This general rule, which means that a distant and a home signal cannot be depended on to stop a train, has for many years been a prominent feature of the English signaling creed; and for an equal number of years has been ignored by individual railways, in many situations, on the plea that it was an unreasonable restriction. Logically, this difference of view, as between the Board of Trade inspectors and the men who have the responsibility of actual railway operation, can be settled only by early and general adoption of cab signals, or their equivalent; but whether or not the inspectors are prepared to take such a positive stand does not year appear.

The annual meeting of the American Society for Testing Materials, held in Atlantic City, June 22-26, was successful both in the quality of the material presented and the number of members present. The work of the committee was painstaking in the extreme and their findings were accepted with little or no question by the society. There were two reports of committees on standard specifications and tests for cement and concrete that went through with little or no discussion, and it seemed as though the whole subject would be passed over in this way, but when the first paper, which was on the microstructure of concrete, was presented all such ideas were dissipated. The new method of examining concrete for the purpose of analyzing the reasons for failure was so simple in its procedure and seemed to appeal so strongly to the sense of what was fit that the meeting took on a tone of vigor that was quite unexpected. Then came three more individual papers, each dealing with a method of research that was important, which were discussed with interest and appreciation, the net result being a symposium along a single line of work that was valuable and suggestive. One of the most important papers, though there was no criticism or discussion on it, was that of C. D. Young, engineer of tests of the Pennsylvania Railroad, descriptive of the Altoona laboratory. This was printed in the *Railway Age Gazette* of July 2, 1915. In the first place, very few outsiders realize the extent of the activities of the test department of the Pennsylvania Railroad; then to those who are more or less familiar with its early, and one might almost say struggling, beginnings, its present magnitude, as indicated by this paper, comes as a startling contrast. The use of the proposed tentative specifications has worked out in a manner that is very gratifying. By this means the specifications are placed for one year in such a position that any necessary changes will be made before they are adopted as standard. This avoids the frequent disrupting of the standards.

American Society for Testing Materials

The last two decades have been marked by an ever-increasing demand on the part of the public for the elimination of crossings of railways with highways at grade. This movement has become especially active within the last five years, particularly in the smaller cities and the rural communities, where it is largely a result of the "good roads" agitation promoted chiefly by the owners of automobiles. In consequence, the railroads are constantly called upon to face new demands for work of this kind. Early efforts to secure elimination of grade crossing were characterized by unreasonable requirements, in some instances amounting to virtual confiscation, due largely to a lack of comprehension on

The Public and Grade Separation

the part of the public authorities of the true considerations involved and also to a certain extent to a limited point of view. Railroads usually receive the most consideration in cities where the municipal authorities and the public have a proper understanding of the principles involved, resulting from past experience. For this reason, the paper presented by C. N. Bainbridge before the Western Society of Engineers and abstracted in this issue, is of interest at this time as a clear, concise statement of the problem encountered. It draws attention to the necessity for careful independent consideration of each individual project. Each problem is just as surely one for independent and special solution as the location of a new railroad. It is not only necessary to consider the natural physical situation, but as well the arrangement of the improvements to which the community and the railroads have already been committed, largely as the result of the location originally selected for the railway. It is only in extraordinary cases that the slate may be washed clean to get a fresh start. It is also necessary to realize at the outset that there are several parties to the contract, each of whom is entitled to fair consideration and that the object to be attained is the elimination of the grade crossings in question at the least expense and with the minimum inconvenience to all. It is well to remember that the public eventually pays for these expenditures, though the immediate distribution of the expense usually is an equitable one, and that a city has no right to demand an extravagant, inefficient plan for track elevation or track depression, the cost of which will be borne by the public at large.

GOVERNMENT RAILWAY BUILDING IN CANADA

A WESTERN Canadian editor writes: "We want more railways. Optimism will never return to the west until the Dominion government builds some." To which the Montreal Gazette replies in an editorial: "It will be time enough to build new railways when they are needed." It adds:

"The three prairie provinces and British Columbia have incurred a gigantic indirect liability in guaranteeing railway bonds, while the Dominion government has just been obliged to take over the Transcontinental, which, including the Lake Superior branch, is 2,000 miles long and has cost well on to \$200,000,000. It is likewise engaged in constructing the Hudson Bay Railway, which can pay for axle grease only by diverting traffic from the Transcontinental and other Canadian routes; and some of these days may have to furnish additional aid to the Canadian Northern or perhaps to assume the ownership and operation of that large system. Facts such as these impress the eastern man, but the western optimist is never so much at ease as when advocating the throwing of good money after bad, provided of course it is someone else's money."

Especially pertinent is the reference to the National Transcontinental, which the government "has been obliged" to take over, because it was built by a government commission through an unproductive territory on such an extravagant scale of expenditure that the government could not get a private company—the Grand Trunk Pacific—to operate it rent-free for seven years and thereafter pay for 43 years a rental of three per cent on a cost which a government investigating commission found to include a waste of \$40,000,000. With these facts in mind the Montreal Gazette points out that just now it would be difficult for the government to borrow for new railways, even if it were disposed to do so, for the following reason:

"Our experience of them (government railways) has not been encouraging. The usual plea in their behalf, that a government can raise money on better terms than a company, may be true; but it is equally true that a company is less extravagant and far more business-like. The Transcontinental is a monument more lasting than brass to the wasteful and bungling methods of government construction; and we may be sure that no matter how careful Mr. Cochrane and Mr. Gutelius may be supervising its operations the results will scarcely equal those of private management."

As the government has often failed to earn operating expenses on the Intercolonial, to say nothing of interest on the investment, there is foundation for this prediction. With reference to government railway management in another part of the world the Montreal Gazette adds:

"In Australia the government roads are suffering from poor crops and the depression, but instead of practicing economy the ministers in charge have been forced to spend freely for useless extensions in order to provide work for the unemployed in other walks of life."

In recent years Canada has been building railways at a very rapid rate. It not only has practically three transcontinental lines, but shorter lines and feeders are numerous. Last year Canada built 1,978 miles of new railway, or more than the United States, and in 1913 railway construction in Canada was only 60 miles less than in the United States. But for some time not only the government railways but even the better-located and better-operated private railways have been suffering from a scarcity of traffic.

Perhaps the Montreal Gazette might appropriately have said: "It will be time enough for the Canadian government to build more railways when some of the railways already built are needed."

LET YOUR LIGHT SHINE

FOR a long time the Pennsylvania Railroad has made a practice of publishing leaflets containing information for employees and the public concerning the service of the railroad and its many activities in various directions. These are sent to newspapers and employees and placed on its trains where they may be available to the public. One of its latest bulletins is entitled "He Serves the Railroad Most Who Serves Its Patrons Best," and is devoted to a number of instances in the everyday routine of the railroad where individual employees have won commendation for themselves and for the company by acts of special courtesy, kindness or thoughtfulness toward patrons. In most cases these incidents were brought to the attention of the company by letters from patrons written without the knowledge of the employees concerned.

For example, one of the letters was written by a passenger who happened to observe the unusual kindness of a station master to a foreign woman traveling with three children, who was compelled to wait over night at his station before resuming her journey on a morning train. The station master, noticing that the woman appeared ill, found that she and the children were hungry and provided lunch for them and lodging for the night. Another letter was from a man who was taken ill while on a train and wished to call the attention of the company to the courtesy of the conductor and trainmen in looking after his welfare. Another told of the courtesy of a station agent who loaned money to buy a ticket to a man who had inadvertently left his purse at home. Several of the letters expressed appreciation for unusual efforts or promptness on the part of employees in tracing and returning lost articles. In one case a roll of bills containing \$390 was dropped on a station platform by a passenger, found by a station porter and returned to the owner the following morning. Another story referred to the award of a Carnegie medal to a crossing watchman for heroism in rescuing a little girl who had run in front of a moving engine.

Giving publicity to incidents of this kind is of benefit in two ways. It not only shows the employees that the company appreciates courtesy on their part, but it is the best kind of advertising for the railroad. It shows the public that it is the intention of the railroad not only to furnish safe and prompt transportation but to go further and treat the passenger as a guest. The employees are made to realize that their efforts to give good service are not always unnoticed and the public is given an opportunity to recognize that an occasional lack of courtesy on the part of an employee does not represent the policy of the company.

The Pennsylvania's information bulletins of this kind represent an admirable method of obtaining publicity for and setting the example of good service, which has also been adopted to some extent by other roads. The New York, New Haven & Hartford has recently begun the issuance of a similar leaflet and many other roads accomplish the same result in various ways. As far as the employees are concerned the various employees' magazines afford an excellent medium for disseminating information regarding examples of special service or faithfulness, but the importance of bringing such matters to the attention of the public should not be overlooked.

A RIGHT OF THE STATES

A VERY notable discussion of regulation of commerce is the address by Alfred P. Thom entitled "A Right of the States," which was delivered at the recent meeting of the State Bar Association of Tennessee. An abstract of this address is published elsewhere in this issue. The principle of "state's rights" is often advanced as an argument against the increase of federal regulation of commerce. Mr. Thom by broad implication points out that this overlooks one of the most vitally important rights of the states—their right to be protected by the federal government from unfair and burdensome regulation of their commerce by one another.

He recalls the historic fact that the need for regulation by some central authority to stop legislation by the individual states which burdened the commerce of all was one of the main reasons for the creation of the federal government. The states, by their jealous, selfish and parochial measures, were mutually ruining each other; and it was to forever end this internecine warfare that the federal constitution was made to provide that Congress should have power "to regulate commerce with foreign nations and among the several states." It was recognized from the start that this was one of the most important provisions of the constitution, and that one of the most important rights of the states was to have Congress exercise the authority conferred by it. Therefore, to contend, as some do, that it is an invasion of the constitutional rights of the states for Congress to take appropriate action to protect them in the enjoyment of their express constitutional right to be free from measures adopted by individual states which burden the commerce of all is highly irrational.

Turning from the legal to the practical aspect of the matter, there never was, as Mr. Thom clearly shows, more need than now for the federal government to put into effect measures adapted to protect the states and the nation from action by individual states having the intention and result of burdening commerce in general. A very much larger proportion of the country's commerce is "among the states," and a very much smaller proportion of it intrastate, than was the case at the time of the adoption of the constitution. The tendency of the individual states, as strikingly illustrated by their regulation of railways, to strive to promote their apparent interests at the expense of the interests of the other states and of the nation as a whole is, however, as strong now as it was then. The result of this relatively enormous increase of commerce "among the states," without any diminution of the tendency of the individual states to try to secure unfair advantages over the other states, is that the right of each and all of the states to have their commerce move freely and be handled economically, efficiently and profitably, is being flagrantly violated to the injury and loss of the people of every state and of the nation.

The unfair and injurious regulation of commerce by the individual states, as applied to railways, takes multifarious forms. Texas first, and then other states following its example, have tried to so regulate state rates as to make them lower than the corresponding interstate rates and than the intrastate rates of other states, and as to secure a monopoly of their own markets for their own producers and jobbers. This practice has been condemned by the Interstate Commerce Commission and the Supreme Court of the United States in the Shreveport case, but is still widely persisted in. Many states have passed laws making requirements as to the construction, equipment and operation of railways which are much more drastic and expensive than those which have been imposed by their sister states or by the federal government. The effect of such regulation cannot be confined within the boundaries of the states imposing it. It increases the cost both of transportation in other states and of interstate transportation. In many cases it requires the railways, in rendering their services in other states and their interstate service, to do things which the other states and the federal government do not want them to do.

Numerous states have passed laws for the regulation of the issuance of securities by railway companies chartered by these particular states. There is hardly a railway in the country which does not operate in more than one state, and most of them operate in several states. In consequence, when one state regulates the issuance of securities it determines how and to what extent a railway company may finance its development in from one to 14 or 15 other states. Such regulation is not state regulation. It is the regulation of "commerce among the states," and if not in violation of the letter is certainly in violation of the spirit and intent of the constitutional provision giving Congress alone power to regulate commerce "among the states."

Not only do the states pass much regulatory legislation by which they harm each other and the nation, but in many cases where uniform action by them is needed it is impossible to secure it. For example, last winter and spring legislation was needed and sought in various New England states to permit the reorganization of the Boston & Maine system. Some of the states passed it and others refused to. There being no uniformity, either those that acted were wrong or those that refused to act were wrong.

Moreover, while state regulation very generally harasses and burdens the commerce of the several states and of the nation, it also often leaves loopholes through which railway companies may escape from needed control. There has been much denunciation of the financial mismanagement of the New York, New Haven & Hartford under the Mellen regime. But this could never have occurred but for the looseness of the laws of one state—Connecticut. The New Haven had one charter from Massachusetts and another from Connecticut. As the Massachusetts Public Service Commission said, in a report rendered by it last February, under the laws of Massachusetts railway companies "have been given no broad, unsupervised power to acquire even the stock of other railroad companies. The general policy of Massachusetts is expressed in an act which provides that a railroad corporation shall not without express authorization by the proper officials, directly or indirectly subscribe for, take or hold the stock or bonds of or guarantee the bonds or dividends of any other corporation. "The policy of Connecticut," as the Massachusetts commission said, "has been very different. The New York, New Haven & Hartford Railroad Company, under Connecticut law, has for many years had unlimited power to acquire the stock or securities of any other corporation at any time and at any price and no matter what kind of a corporation it might be . . . In respect to the issuing of stock and securities, the inconsistency between the laws of Massachusetts and Connecticut is equally marked. . . . The contrast between the provisions of the Connecticut and Massachusetts statutes in the foregoing and in other respects is very great. They cannot be harmonized nor reconciled. To sum the situation up briefly, and yet with reasonable accuracy, Massachusetts has tried to make the New Haven a supervised railroad corporation; Connecticut has made it largely a non-supervised holding company. For years the New Haven company disregarded the laws of this commonwealth and relied upon the broad powers and privileges granted by Connecticut."

Practically every transaction under the Mellen regime which has been condemned by public sentiment was carried through under the Connecticut laws which the Public Service Commission of Massachusetts denounces. So it has been with respect to the abuse of the holding company. Under the common law one corporation could not own stock in another corporation. The legislatures of New Jersey and several other states abrogated this common law principle and turned loose all kinds of holding companies to prey upon the people of the United States in order that the states creating them might profit by receiving fees for chartering them.

We might go on and fill column after column with other specific examples of the way in which the individual states, by foolish and vicious legislation, have denied to the several states and to the

nation the right to which Mr. Thom refers to have their commerce left free from injurious restrictions and burdens. Experience has demonstrated only too conclusively that this "right of the states" will never be properly and adequately safeguarded and upheld until the federal government fully asserts its paramount authority over interstate commerce. Such action is essential for the protection and furtherance of the rights of the people of the very states which resort to such foolish and harmful legislation.

The first step in this direction should be the passage of an act for the federal incorporation of all corporations doing an interstate business. The next should be the passage of a law either abolishing all state regulation of railways which affects interstate commerce, or making all state regulation of railways subject to review and control by the Interstate Commerce Commission. There is no more sense in the kind of state regulation of railways which we have now than there was in the sort of state regulation of commerce which contributed so largely to forcing upon the attention of the people originally the need for the adoption of the federal constitution.

THE L. C. L. FREIGHT PROBLEM

NO subject has received more attention from railway men during the last three or four years than the reduction of loss and damage claims. Any money paid out on this account is a direct economic waste, as it depletes the funds of the railway without adding to the property of the claimant. The largest single source of such claims is l. c. l. traffic. One road with annual gross freight earnings of over \$75,000,000 finds that over 30 per cent of all payments for claims go for l. c. l. shipments in spite of the fact that this traffic forms considerably less than 10 per cent of the total business handled. These heavy losses arise primarily from rough handling of fragile materials and from errors in forwarding. In another column there is described a method to reduce losses from the latter cause employed at the Chicago freight house of the "Soo" for a year, which is both inexpensive and simple. This is only one of numerous methods which are being tried at various points. The test of the practicability of any of these plans is whether the claims are reduced by an amount sufficient to offset the increased expenditure.

While given a large amount of attention, the reduction of claims is only one phase of the l. c. l. problem. This class of traffic is very expensive to handle at best. Facilities must be provided in industrial centers where property values are high and where fixed charges are in proportion. It is therefore necessary to design and to operate these facilities to the best advantage in order to reduce the unit overhead cost to the minimum. The nature of the traffic also makes necessary a heavy expense for handling. To reduce the amount of labor necessary, motor trucks, elevators and other forms of mechanical appliances have been perfected and are being used while a number of methods are also being employed to increase the efficiency of the labor itself, such as the bonus system and piece-work.

The handling of l. c. l. freight has many ramifications, the study of any one of which may lead to important economies. To secure a full discussion of these various developments we have announced a contest on The Handling of L. C. L. Freight to include all phases of this problem from the time the freight is received at the freight house until it is delivered to the consignee at destination. We desire to secure general discussions of this subject with particular reference to improved designs and methods of operation. Data regarding such improvements should be given in detail. Prizes of \$50 and \$35 will be paid for the two best papers received, the award being based upon the completeness of the discussion and the practicability of the ideas presented. All other contributions accepted and published will be paid for at our regular space rates. All contributions should be sent to the Editor of the *Railway Age Gazette*, 608 South Dearborn street, Chicago, and must be received before August 1, to be considered by the judges.

Letters to the Editor

DEPRECIATION AND "CONFISCATION"

NEW YORK.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

In his article on "A Billion Dollar Confiscation," Morrell Walker Gaines exhibits some confusion regarding the subject of depreciation reserves and retirement accounting which should be explained, especially since the points were not developed in your editorial comment.

The requirement that plant retired be credited to fixed capital and charged to a depreciation reserve is a book transaction, designed to keep the fixed capital accounts in conformity with actual fact. If the reserves are inadequate and a part of the charge must be divided between income and surplus, investors are not being mulcted in any way. In fact, their interests are being conserved by the required accounting. The depreciation reserve is created for the protection of the capital investment: income is charged to build up a reserve which will restore the capital that has been consumed in the plant retired. If it so happens that reserves for this purpose have not been created, the charge to income or surplus for any deficit is prima facie evidence of neglect in insuring the perpetuity of the capital investment and of effective, though perhaps rigorous, steps being taken to remedy past neglect.

Another advantage of the required accounting is that it provides for the replacement of original capital investment, not of items of plant. From which it follows that any increased costs of new plant are automatically capitalized, as they legitimately should be. Mr. Gaines also speaks of the hardship to the roads in requiring them to charge expense with the annual depreciation quota at the same time they are bearing the deficit of their reserves in income. Undoubtedly this charge to expense will diminish distributable earnings, but the investors are benefited and the credit of the road improved by the process.

In the first place the creation of a depreciation reserve by charging expense results in a diversion of income from surplus to the reserve. The road loses nothing by the transaction, but really gains from an investing point of view. This is seen to be true when it is recalled that a depreciation reserve is pledged to the protection of the capital investment, with consequent greater security to stockholders and increased stability to bondholders. The practice of issuing long term bonds on the security of the stock investment in plant, whereby the term of the bonds exceeds the life in service of the plant, requires depreciation reserves to insure the replacement of the bondholders' equity. Therefore, if reserves are created, the bondholders are protected and they will accept lower interest rates in consequence.

The stockholders also have their proprietor shares enhanced, since the depreciation reserves are invested in the plant and are unalienable, while surplus may be invested in outside securities of doubtful value and subject to market fluctuations.

From the point of view of sound accounting, depreciation reserves are absolutely necessary in a continuing public utility. And they are based on good economic theory. Both the public and the investors are protected by the reserves and the carrier's best interests as a public utility are conserved. If testimony were needed in support of these assertions, the practice of telephone, telegraph, light and power, water companies and others would be sufficient. It should also be recalled that recognition of depreciation charges in the expense accounts for the replacement of capital places the roads in a much better position in rate cases, since it removes one more point of dispute regarding the legitimate requirements of the road for revenue.

LAWRENCE K. FRANK.

A Study of Grade Crossing Elimination in Cities*

A Discussion of the More Important Elements Which Must Be Considered in the Solution of This Problem

By C. N. BAINBRIDGE

Office Engineer, Chicago, Milwaukee & St. Paul, Chicago

The question of the separation of grade crossings in municipalities is vital and its importance cannot be denied. No single question affecting the relations of railroads to cities has received more consideration during the last decade. Various cities, utilities commissions and legislatures are requiring the railways to separate the grades of their tracks from those of the streets, and in practically all instances where such orders are issued, they specifically designate the manner in which the separation of grades shall be made.

The railroads recognize the right of a city to interfere with the grade of the railway tracks only as is imposed by its duty to preserve, as far as possible, the safety of public travel upon and along the streets and avenues intersected by such tracks, but do not concede that a city has authority to determine whether grade separation should be accomplished by elevation or depression of the tracks. The railways claim that they, and not the city, are entitled to the choice between two methods that are equally safe.

Numerous articles have been published covering track elevation. Little, however, has been written concerning the depression of tracks partially or completely and carrying the streets over the tracks on bridges or viaducts. It can not be said conclusively which method is the more satisfactory. Although track depression has found favor in several cities, few projects of this nature have been carried to completion, and it remains for time to determine whether track depression will be as satisfactory as track elevation is.

It is the purpose of the writer to set forth some of the general features which must be considered by the engineer, in studying a problem of grade crossing elimination. Probably the biggest factor is the cost, this being the most vital to the railroads, who generally bear the greater burden of the expense. The geological character and topography of the country and the effect on the grade of the railroad are also big factors in selecting a plan. In a flat low district like that around Chicago, there is little choice. Track depression would be out of the question on account of difficulties due to water and interference with the sewer system. This leaves the alternative of elevation, or partial elevation. Chicago, however, is only one city in many where grade separation is being carried on, and at other places where the tracks are at the summits of ascending grades, the natural selection would be depression, unless this proved to be too expensive. There are still other places where the ground is high above water and the present tracks nearly level, where either track elevation or track depression could be adopted without excessive gradients.

Numerous elements are involved in the study of a project of this nature and for convenience they will be considered in the following order: Excavation or embankment; clearances; bridges; right of way and retaining walls; changes in streets; apportioning of expenses; advantages and disadvantages, and conclusions.

EXCAVATION OR FILL

To carry the tracks over the streets requires a vertical separation of grades of from 15 ft. 6 in. to 17 ft. 6 in., allowing from 3 ft. 6 in. to 4 ft. for floor depth and 12 ft. to 13 ft. 6 in. for headroom. To carry the streets over the tracks requires a vertical separation of grades of from 21 ft. 6 in. to 26 ft. 6 in., al-

lowing from 18 to 22 ft. for clearance and from 3 ft. 6 in. to 4 ft. 6 in. for floor depth. The difference of from 5 to 11 ft. in the amount of vertical separation of grade, required for complete elevation and complete depression, together with the increased width of roadbed required for track depression over that required for track elevation, in order to provide for drainage, makes the amount of excavation, in the case of track depression considerably more than the amount of fill required for track elevation. This is illustrated by the accompanying figure.

Other things being equal, material can be excavated as cheaply in a cut for track depression as in the borrow pit for track elevation; but usually the cost of dumping material for fill will exceed the cost of wasting material from the cut, due to the fact that material for fill is usually dumped from a trestle, and the cost of the trestle is chargeable to the fill. The additional cost of a trestle will go a long way toward balancing the cost of additional yardage required in the project of track depression.

It is sometimes the case that a project of grade crossing elimination is carried on to advantage in conjunction with some other project, such as the construction of freight yards, where considerable grading is necessary and material may be borrowed or wasted to good advantage and at small expense. Other items,

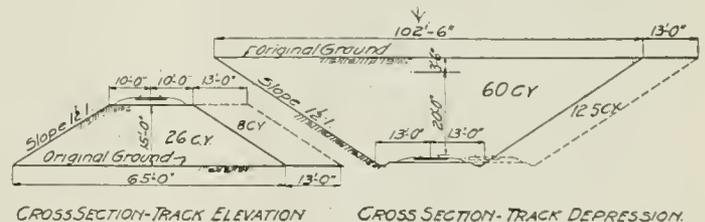

Fig. 1 Typical Sections for Track Elevation and Depression

such as the difference in the cost of bridges and walls, the number of tracks, and the cost of maintaining traffic, changes to sewers, the nature of the material to be excavated, the depth of depression and the amount of elevation may throw the balance either one way or another.

CLEARANCES

In recent years numerous state legislatures have passed various laws regarding vertical and side clearances.† In some cases the requirements of these laws are more rigid than the present standards. In most cases, however, there is a provision in such laws which allows this clearance to be reduced in special cases, if approved by the city or railroad commission. For track depression projects the overhead clearance generally adopted is between 18 ft. and 22 ft., but in some instances where passenger traffic alone is handled on the lines this is reduced to 16 ft., although this latter figure is somewhat scant if electrification is contemplated at some future date.

Where the tracks are elevated, the clearances of the bridges over the streets varies in different localities, the usual clearances being 12 ft. to 13 ft. for streets without street cars, and 13 ft. 6 in. to 14 ft. 6 in. for those with street cars. For proposed work there is little variation from the above clearances for bridges over streets, but there is a strong tendency, as indicated by recent legislation, to specify clearances under bridges over the

*Abstracted from a paper presented before the Western Society of Engineers, Chicago, June 4, 1913.

†For a discussion of clearance legislation see *Railway Age Gazette*, August 28, 1914.

tracks of 21 or 22 ft. wherever possible, although much smaller clearances have been used in the past.

BRIDGES†

Bridges for track elevation or track depression projects are in practically all instances of a permanent nature and are constructed either of structural steel or reinforced concrete; or a combination of both. A few of the roads are adopting concrete, wherever possible, to the exclusion of steel in structures of this class, as the first cost is the same or less than steel, the maintenance is less, and it can be treated aesthetically to better advantage where such treatment is warranted.

Bridges for track elevation can be divided into four types:

- Type A. Structures spanning the full width of the street with single spans.
- Type B. Structures spanning the full width of the street with two spans, supports being placed in the center of the street.
- Type C. Structures spanning the full width of the street with three spans, supports being placed at the curb lines.
- Type D. Structures spanning the full width of the street with four spans, supports being placed at the curb lines and at the center of roadway.

In practically all types it is desirable to: Keep the floor of the bridge as thin as possible; to avoid any projections above the top of rail, which might be a menace to safety, and to select a type of bridge which can be altered readily to provide for additional tracks.

Except in cases of narrow streets where comparatively short spans can be employed, bridges of types A, B and C have no alternative, except the use of steel girders, although they have been used to some extent by resorting to a combination of structural steel and reinforced concrete, but not to the exclusion of the deep side girders. These types, however, have the first qualification of thin floors, but cannot in all cases meet the second qualification of no projections above the top of rail, nor do they meet the third provision for taking care of additional tracks without considerable alteration and expense.

Bridges of types B and D have the objection that the roadway is obstructed by the supports in the center of the street, but, with the possible exception of structures spanning boulevards, there is no serious disadvantage in this, provided the roadway on each side of the center supports is of sufficient width to allow one vehicle to pass another going in the same direction. This objection would be even less for structures spanning streets with double street car tracks, although it requires the spreading of the car tracks. The car tracks themselves form a natural barrier in the center of the street, there being little occasion for traffic from one car track to the other, especially in the short distance occupied by the bridges.

Bridges of type D meet the three requirements of thin floors; no projections above the top of the rail and ease of alteration to provide for additional tracks. Due to the comparatively short spans, this type is well adapted to be constructed either of steel or concrete.

It has been recognized by practically all parties interested that tight floors are a necessity in bridges crossing city streets, not only to prevent grease, dirt and water from dropping through, but also to deaden the noise of trains passing at high speed across the bridges. There are numerous types which might be adopted, the various roads using the one with which they have had the greatest success, but in all probability floors as used in concrete bridges of type D will remain the cheapest.

Bridges for track depression projects may be divided in two main types:

- Type E. Bridges spanning the tracks with clear spans.
- Type F. Bridges spanning the tracks with two or more spans with intermediate supports.

In bridges for track depression it is also desirable to keep the floor of the bridges as thin as possible; avoid any obstructions between tracks, and to select a type of bridge which can be altered readily to provide for additional tracks.

Bridges of type E meet the first of these requirements, but in

most cases not as well as structures of type F. For streets with narrow roadways and short spans, not exceeding three tracks, the deck type structure of either concrete or steel can be adopted. For longer spans and wide roadways, however, the deck type must give way to the through type with girders projecting above the roadway, and reinforced concrete cannot be used to advantage; but a combination of structural steel and concrete may be used. For narrow roadways but two lines of girders need project above the roadway, one on either side at the curbs; but for wide roadways center girders are required. Structures of type E do not lend themselves well to the third requirement, that of additional tracks. Either additional tracks must be provided for when the structure is built, or considerable expense must be incurred to lengthen the bridge to provide for them later.

Bridges of type F meet the first requirement of thin floors and the third requirement of providing for additional tracks, but do not meet the second requirement of no obstructions between tracks. They are well adapted to the use of concrete.

RIGHT OF WAY AND RETAINING WALLS

In general, for the same number of tracks in each case, track depression will require a greater width of right of way than track elevation, even where the tracks occupy the full width of right of way and where retaining walls are resorted to. It has been shown that the amount of additional right of way required for track depression over that required for track elevation, if no retaining walls are used, depends on the amount of elevation and depression of the tracks.

In cases where the entire right of way is occupied by tracks retaining walls would be required for both track elevation and

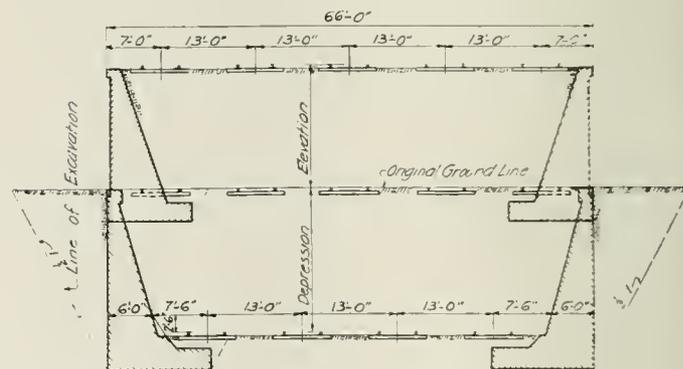

Fig. 2—Relative Track Capacities for Track Elevation and Depression

track depression. In such cases it is seen from the figure that it is necessary to acquire additional right of way to accommodate the same number of tracks in depression as in elevation, or else eliminate one track to allow room for the retaining walls, which must be built on railroad property. The loss due to the elimination of one track to the railroad company is impossible to determine. An order of any city or commission calling for track depression under such circumstances, in the face of the railroad's opposition, amounts to confiscation of railroad property without compensation and without due process of law, and it is doubtful if it would be upheld in the courts.

Both of these conditions are serious handicaps for track depression, for in the majority of cases the districts where grade separation is required are such as to make the acquisition of additional right of way almost out of the question on account of the value of adjacent property, so that the building of retaining walls is the only alternative.

There may, however, be instances where the tracks run through a strictly residence district, where land values would not be excessive, but this condition is the exception rather than the rule.

Any one of numerous types of retaining walls may be adopted on any project, economy being the prime factor in the selection. Much literature has been published regarding the economy of

†For an article on track elevation subways see *Railway Age Gazette*, March 6, 1914, page 459.

various types of walls, and this phase of the subject will not be discussed further than to state that for walls of the height required for track elevation and track depression a gravity wall will, under ordinary conditions, be cheaper than the reinforced concrete types

CHANGE IN GRADE OF STREETS

So far only complete elevation and complete depression of the tracks have been considered, which require very little change in the grades of the streets. The question immediately arises as to whether or not a partial elevation of the tracks with a partial depression of the street, or a partial depression of the tracks with a partial elevation of the streets, would not be the plan to adopt. It might be said here that on practically all projects for complete track elevation or depression the plans usually provide for at least a slight change in grade of the street, varying from 1 ft. to 3 ft., which change can readily be made without incurring excessive expense or property damage. It may also be said that to change the grade of the street entirely without changing the railroad track is unusual, except in the case of isolated crossings or in country districts.

To change the street grade any appreciable amount brings up questions of allowable grades on streets, economy, drainage and interference with sewers, gas and water mains, and property damages. Chicago has fixed by ordinance a maximum grade of 3 per cent. To adopt this grade, however, in all cities would be unquestionably in error, especially so in a hilly city, where existing street grades of from 6 to 8 per cent are not uncommon.

Although most cities try to limit the allowable grades to 3 per cent or 4 per cent, the following table gives some of the grades which have been used on work of this nature in various cities:

Location	Maximum Grade
Chicago	3½ per cent, usual 3 per cent
Buffalo	4 per cent
Joliet, Ill.	3½ per cent
Evanston	3½ per cent or 3 per cent
Milwaukee	4 per cent
Minneapolis	5 per cent, 4 per cent, usual 3 per cent
Cleveland	6 per cent, usual 4 per cent
Detroit	4 per cent, usual 3 per cent
Philadelphia	5½ per cent, usual 3 per cent
Indianapolis	4½ per cent, usual 3 per cent
Washington	9 per cent, 8 per cent, 6 per cent, usual 3 per cent, 4 per cent
Newton, Mass.	9 per cent, 8½ per cent, 7½ per cent, 6 per cent, usual 3 per cent and 5 per cent
Lynn, Mass.	3 per cent, 4 per cent, and 5 per cent
Brockton	9 per cent, 5 per cent

Where the street is to be carried over the tracks, the sidewalk and roadway must be elevated the same amount, but where the street is carried under the tracks the roadway is sometimes depressed 4 or 5 ft. further than the sidewalk at the deepest part. This has the disadvantage of high curbs, but where wagons would back up to property adjacent to right of way for loading or unloading it would be an advantage. It also has the additional advantage of producing a smaller actual damage to property, as very often the sidewalks can be left at the original level, though the streets may be depressed 4 or 5 ft.

At first glance it would be natural to say in most projects that the less the grade of the tracks is changed the less the project will cost. Streets, however, may occur with such frequency that the cost of excavating or filling streets, the cost of repaving streets and sidewalks, alterations to sewers and water pipes, and property damaged, will be equal to or greater than the cost of excavation or embankment for track elevation or depression.

Wherever streets are depressed adequate provision should be made for drainage. Catch basins with proper connections to sewers should be placed some distance outside the portals of the bridge so that in winter or spring time, when the thaw starts, they will not be in the shadow of the bridge and remain frozen. Similar provision and precaution to provide for drainage should be exercised in the cut in the case of track depression.

In cases where the streets or tracks are depressed to such an extent as to interfere with sewers, the problem is much more complicated. Either new sewers must be constructed at a lower level or else the sewage will have to be siphoned. Both of these

schemes entail considerable expense and are serious handicaps to track depression.

Interference with the water and gas mains is a less serious objection, the question of gradients there being a secondary consideration. Although it adds quite an item to construction cost, provision can be made to carry them across the bridge floor, or depress them under the cut.

The question of property damage is one for which it is impossible to lay down any set rule. In making allowance for this phase of the question, each problem will have to be handled separately, the damages estimated and an amount allowed which would be sufficient to put the property back into as good a condition or perhaps better condition than previously existed. It will be found, in many cases where damages are settled out of court, that considerable saving can be effected by buying the property damaged and selling it again after the work is completed.

APPORTIONMENT OF EXPENSE

The question of apportioning the expense incident to the separation of grades is of great importance, and with the exception of a few states, where legislation divides the expense on a percentage basis, the question is far from settled. There are a few cities where the railroads are required to pay the entire cost of grade separation. The unfairness of such order, however, needs little comment. There have been cases also where the expense has been borne by the municipality, the steam railroad, the street railway, and the various other public utilities, each doing the work and bearing the expense incurred by the changes to the property which it controls. Where this plan is followed there is controversy between the parties interested relative to procedure of the work, etc. It has in consequence not proved entirely satisfactory and is giving way to the more reasonable and logical method of considering the work as a unit and dividing the total cost of the project among the parties interested on a percentage basis agreed upon by the interested parties before work is started.

An examination of the different state laws and city ordinances enforcing grade separation shows that the apportionment of cost on a percentage basis has been followed in the majority of cases.‡

ADVANTAGES AND DISADVANTAGES

Some of the benefits or advantages and disadvantages applying especially to either track elevation or track depression may be summarized as follows:

1. For track elevation, the work of construction can be carried on with little or no interference to traffic, either in the streets or on the railroad. It is, however, exceedingly difficult to depress the tracks without stopping traffic on both streets and railroads, or building a detour around the entire project. The question of time on construction is also an important factor. A track elevation project can be completed in considerable less time than it would take to depress the same number of tracks, because it is possible to carry on the work at many different points simultaneously.

2. A distinct advantage of track elevation is the ease with which the industrial situation can be handled. Industries having side track facilities can adapt themselves to take trackage from the elevated level by slight alterations to their buildings and doing their receiving and shipping from the second floor. For coal yards, trestles can be readily provided and are particularly advantageous. Also during construction elevation has the advantage that shipping facilities are disturbed very little, causing practically no interruption to business. Where tracks are depressed, there is usually not sufficient distance between bridges, nor between right of way lines to allow inclined tracks to bring the cars from the depressed tracks to the former ground level to serve the industries, and it is therefore necessary for the in-

‡For an account of grade separation laws and ordinances see *Railway Age Gazette*, December 17, 1913, page 1118.

dustries to adjust themselves to take trackage from the lowered track level by altering buildings. Even if there were sufficient distance between bridges to allow inclined tracks, such an arrangement is objectionable, as it requires the right of way to be encumbered with massive walls which tend to restrict the development of the right of way and the industries. Much inconvenience and interruption to business must be contended with, while the tracks are being lowered and changes to buildings are being made.

The expense for making such changes, either in the case of elevation or depression, represents a considerable sum. The industries have claimed that the railways should bear the expense of changes to industries and industry tracks made necessary by the change in grade of the railway company's tracks. The railway companies do not concur in this and the practice has been for the industries to bear the expense, as the railway companies contend that the grade of the tracks are changed not on their initiative, or for their benefit, but by orders of the cities, or utilities commissions.

3. The annoyance from noise, smoke and gases will be less from track elevation than track depression. Little need be said to convince all that the smoke and gas nuisance will be less to those on the streets from tracks on a high level than from tracks on the lower level. The question of noise, however, is one on which there can be some difference of opinion.

From the foregoing considerations it may be said in a general way that track elevation is more satisfactory than track depression, both to the railroads and to the industries, and at the same time possesses many advantages to the city. With the possible exception of cases where the tracks pass through a high class residence district where the aesthetic is of such importance as to outweigh the other factors, track elevation would appear to be the best solution of the problem.

ACCIDENT CAUSED BY DEFECTIVE WHEELS

H. W. Belnap, chief of the division of safety of the Interstate Commerce Commission, has made a report on the Chicago, Milwaukee & St. Paul derailment which took place at Oakwood, Wis., on February 9, 1915, an abstract of which follows:

The accident to the freight train resulted in the derailment of 29 cars, 11 of which, together with the station building, were destroyed by fire. The train involved in the accident was a west-bound freight train consisting of 75 cars and a caboose, and was derailed at the frog of the house-track switch near the station at Oakwood, while moving at a speed estimated to have been about 25 miles an hour.

Examination of the track showed that the first indication of anything wrong was at a point about one mile east of Oakwood, where an oil box, brass, packing waste, etc., were found on the east side of the track. About 370 ft. west of this point the rear truck under Missouri, Kansas & Texas box car 60628, the tenth car in the train, left the rails and ran along on the ties until the frog at the house track was reached, where the other 28 cars were derailed. The oil box, etc., were found to have come from the rear truck of the box car, the partial destruction of the truck at this point evidently having been due to the defective condition of the wheels under the truck. Three of the four wheels were defective, the left forward wheel being the only one intact. The others had flat spots, broken flanges, etc.

Investigation developed that this car was received from the Belt Railway at Chicago in a transfer train at 5:35 p. m. on February 8. Before the train was broken up and switched around all the cars in the train were inspected and, although wheel defects were found in other cars, none was found under car 60628. Although this car was again inspected by two car inspectors, one safety-appliance man, and two oilers before being sent out, no defects were discovered.

Engineman Christoph stated that as his train was approaching Oakwood he looked back and noticed fire flying from under the train, and at once made an application of the air brakes, at about

which time the derailment occurred. Previous to this he did not notice anything wrong. At Wadsworth, a station 30 miles east of Oakwood, the train was inspected by the brakemen, but nothing wrong was discovered at that time.

This accident was caused by the defective condition of wheels in the rear truck of M. K. & T. box car 60628. This defective condition resulted in the partial destruction of the truck and its subsequent derailment.

The examination to determine the reason for the failure of the wheels under the car was conducted by James E. Howard, engineer physicist, tests being made in conjunction with representatives of the Chicago, Milwaukee & St. Paul at the shops of that company in Milwaukee, Wis.

SUMMARY

The examination of the wheels in the truck which was under M. K. & T. box car 60628 clearly fixed the immediate responsibility for this derailment on the worn treads of two of the wheels. These flat spots were not "slid flat" places, but were grooves 11 in. long each, worn in the treads, and having depths of three-eighths and five-sixteenths of an inch, respectively. The grooves were wider than the head of a 100-lb. rail. The axles drifted to the right, in the direction of these wheels, which showed worn flanges, approaching vertical faces.

The examination also revealed the fact that these wheels had less depth of chill than customary in wheels of this type, and at the worn spots the chilled metal was entirely absent.

The lack of rotundity of the wheels was such that excessive wobbling of the journals occurred at every rotation, bringing undue strains on the truck frame. At usual speeds these oscillations took place several times a second, and they are believed to have been the cause of the injury to the truck and the immediate forerunner of the derailment.

Furthermore, the mated wheels were of different sizes. Those on the right-hand ends of the axles were three and four "tape sizes" smaller, respectively, than the left-hand wheels. These differences would tend to cause the truck to run in an oblique position, not square with the track, and also be the equivalent of a certain amount of braking power set against the train.

A conspicuous feature associated with conditions of these wheels is the fact that the inspections which had been made from time to time failed to detect the presence of the flat spots. These defects in the treads were undoubtedly of long standing, and the car must have passed quite a number of inspections since the wheels had become unserviceable. These defects were of such a nature that they should have been discovered by ordinary inspection.

In a previous report covering the investigation of a derailment of a passenger train, due to a broken wheel, attention was called to the alarming frequency of accidents due to broken wheels, and statistics covering a five-year period were published, showing that during that period the derailments attributable to defective wheels were approximately 31 per cent of the total number of derailments charged to defective equipment. In the commission's Accident Bulletin No. 52 there is published a summary of derailments due to defects of equipment on steam railways for 13 years ending June 30, 1914. This summary shows that of 37,456 derailments due to equipment defects 12,882, or more than 34 per cent of the whole, were caused by defective wheels. The property loss suffered by the railroads on account of these 37,456 derailments was \$30,138,241, of which sum \$12,506,766, or about 41.5 per cent of the whole, was attributed to derailments caused by defective wheels.

These figures indicate that defective wheels constitute one of the most prominent causes of derailments. In the interest of safety, as well as of economy, steps should be taken by the railroads to insure that sound wheels will be obtained from the manufacturers in the first instance; and methods of inspection should be adopted to prevent the placing in service of defective wheels and insure that wheels which have become defective through service shall be removed in ample time to provide for the safe operation of trains.

"A Right of the States" Which is Often Overlooked*

Constitutional Duty of Federal Government to Protect From Harmful Regulation of Commerce by Sister States

BY ALFRED P. THOM,

General Counsel of the Southern Railway

One hundred and twenty-six years ago the United States became a nation. On the 4th of March, 1789, they joined in putting into effect the Constitution which formed them into "a more perfect union" and organized them to take their place as a unit among the nations of the earth.

Only recently they had been separate and distinct colonies of Great Britain, legally foreign to each other, and were bound together by no ties except a sense, common to them all, of oppression and discontent and a common aspiration and purpose of liberty. They combined to declare and to fight for their independence, and to assert that, as free and individual states, they had "full power to levy war, conclude peace, contract alliances, establish commerce, and to do all other acts and things which independent states may of right do."

During the succeeding epoch-making struggle, they sought to bind themselves together by something more enduring than the sympathies and exigencies of the existing war, and, to this end, adopted as their bond of union the Articles of Confederation.

The Articles of Confederation were soon found to be utterly inadequate to a national existence. A government without a purse, and hence without power to provide for the common defense, or to insure domestic tranquillity, was a mere "rope of sand" and could not long endure.

But there was another cause for dissatisfaction, which was hardly of less importance than a provision for the common defense and for the preservation of the national existence. The needs of trade were becoming more and more apparent and its just regulation the subject of greater and more universal public concern.

When the war ended and independence was an accomplished fact, each state possessed a sovereignty which was practically unlimited over its foreign commerce and over its commerce with the other states. Between many of them there was a race of greed and selfishness for commercial advantage and supremacy.

It will be noted that each state possessed the power of imposing export taxes and could thus keep its products at home, excluding them from the use and enjoyment of the people of the other states; that each state possessed the power of imposing import duties and thus could exclude people of the other states from its markets; and that each state retained complete control over its own ports, and thus, by its commercial policy, could, through the competition of ports, regulate or break down the commercial policy of another state in regard to its own ports and in regard to its own commerce.

EARLY ABUSES OF REGULATION

Nor were these powers merely theoretical. They were brought into active and oppressive operation. They were made the means of commercial war by one state upon another.

For example:

Virginia, by her export duties and inspection laws, with the incidental tax, sought to keep her tobacco at home.

Maryland, by her inspection laws and taxes, sought to do the same with regard to her potash and pearlsh.

Massachusetts prohibited the exportation of grain or unmanufactured calfskins and imposed an onerous inspection tax on exports to other states of tobacco, butter, and other products, while North Carolina laid, for a limited time an embargo on the exportation to other states of corn, wheat flour, beef, bacon, and other necessities of life

Turning to imports:

New York, by imposing an import duty, sought to exclude from its markets the butter, milk, and other dairy products of New Jersey and the firewood of Connecticut.

Rhode Island imposed an ad valorem tax of five per cent on all articles imported into that state from the other states as well as from foreign countries, with a proviso for reciprocal relief. And so with other states.

In regard to the commercial rivalry and war of ports, it was customary for states having available ports to impose an unlimited tax on all goods reaching this continent through their ports, and thus subjecting, for the benefit of themselves, the people of the other states to a substantial burden of taxation.

For example, the ports of Boston and New York were at one time far behind Newport in the value of their imports, and Rhode Island, according to the Supreme Court of the United States, paid all the expenses of her government by duties on goods landed at her principal ports.

The condition at that time of commercial selfishness and greed between the states is thus described by Fiske in his work on the "Critical Period of American History, 1783-1789," at page 144:

"Meanwhile, the different states, with their different tariff and tonnage acts, began to make commercial war upon one another. No sooner had the other three New England states virtually closed their ports to British shipping than Connecticut threw hers wide open, an act which she followed by laying duties upon imports from Massachusetts.

"Pennsylvania discriminated against Delaware; and New Jersey, pillaged at once by both her greater neighbors, was compared to a cask tapped at both ends. The conduct of New York became especially selfish and blame-worthy. . . . The feeling of local patriotism waxed strong, and in no one was it more completely manifested than in George Clinton, the revolutionary general, whom the people elected governor for nine successive terms. . . . It was his first article of faith that New York must be the greatest state in the union. But his conceptions of statesmanship were extremely narrow. In his mind, the welfare of New York meant the pulling down and thrusting aside of all her neighbors and rivals. . . . Under his guidance, the history of New York, during the five years following the peace of 1783, was a shameful story of greedy monopoly and sectional hate. Of all the thirteen states none behaved worse except Rhode Island.

"A single instance, which occurred early in 1787, may serve as an illustration. The city of New York, with its population of thirty thousand souls, had long been supplied with firewood from Connecticut, and with butter and cheese, chickens and garden vegetables from the thirty farms of New Jersey. This trade, it was observed, carried thousands of dollars out of the city and into the pockets of detested Yankees and despised Jerseymen. It was ruinous to domestic industry, said the men of New York. It must be stopped by those effective remedies of the Sangrado school of economic doctors, a navigation act and a protective tariff.

"Acts were accordingly passed obliging every Yankee sloop which came down through Hell Gate, and every Jersey market boat which was rowed across from Mulus Hook to Cortlandt street, to pay entrance fees and obtain clearances at the custom house, just as was done by ships from London or Hamburg; and not a cartload of Connecticut firewood could be delivered at the back door of a country house in Beckman street until it should have paid a heavy duty. Great and just was the wrath of the farmers and lumbermen. The New Jersey legislature made up its mind to retaliate. . . . Connecticut was equally prompt. At a great meeting of business men, held at New London, it was unanimously agreed to suspend all commercial intercourse with New York. Every merchant signed an agreement, under penalty of two hundred and fifty dollars for the first offense, not to send any goods whatever into the hated state for a period of twelve months. By such retaliatory measures, it was hoped that New York might be compelled to resemble her odious enactment. But such meetings and such resolves bore an ominous likeness to the meetings and resolves which in the years before 1775 had heralded a state of war, and but for the good work done by the Federal convention another two years would scarcely have elapsed before shots would have been fired and seeds of perennial hatred sown on the shores that looked toward Manhattan Island."

But these discriminations and exactions of one state as against

*Abstract of an address delivered before the State Bar Association of Tennessee at Chattanooga on June 25.

the trade of another, this fierce commercial rivalry, this internecine warfare which threatened the commercial destruction of some states and the undue elevation, prosperity and dominance of others, were not the only reasons for the insistent demand, which preceded and finally controlled the Constitutional Convention of 1787, in regard to the establishment of a system of just and equitable regulation of commerce between the states by an authority fairly representing them all.

The question of commercial regulation, in addition to its commercial relation to the trade between the existing states, possessed also a most important and commanding political aspect. The development of the great west was then going on and had been stimulated by the emigration thither from the older states incident to the readjustments after the war, and the settlement of the whole western region was proceeding with great rapidity. The west was spoken of by George Washington as a "rising world," and signified particularly, in the minds of the statesmen of that day, the territory now constituting the states of Tennessee and Kentucky and the states afterwards carved out of the territory northwest of the Ohio and east of the Mississippi rivers. The question of the future political affiliations of this large and important territory was a question of prime and of vast importance to the then existing states.

Great Britain or Spain, close neighbors on the north and south, could easily outbid such a policy of narrowness and greed as the people of the west saw already in operation in many of the most important eastern states, and it was apparent that, whether or not such a policy should be adopted, could not be safely left to the individual states.

George Washington, in speaking of the future political affiliations of these pioneer western people, said:

"If we cannot bind these people to us by interest, and it is not otherwise to be effected but by a commercial knot, we shall be no more to them after a while than Great Britain or Spain, and they may be as closely linked with one of those powers as we wish them to be with us, and, in that event, they may be a severe thorn in our side."

It thus became politically, as well as economically, necessary to find a way of fairly regulating commerce in the interest of all, free from the narrowness, the greed and the selfishness of particular states.

FEDERAL GOVERNMENT ESTABLISHED LARGELY TO STOP SUCH ABUSES

The only way of remedying these commercial evils, which were flagrant and were universally recognized, and of meeting the political exigencies of the situation, was, according to the practically universal belief of the day, to exclude the states from the power to regulate commerce among the states and with foreign nations, and to confer that power upon a central authority which should fairly and equitably represent them all.

The public consciousness on this subject was, prior to the convention, indicated in a great variety of ways and from a great variety of sources.

Alexander Hamilton declared for a central government with "complete sovereignty over all that relates to war, peace, trade, and finance."

James Monroe, as chairman of a committee of Congress, in 1785 submitted a report declaring that:

"The United States in Congress assembled shall have the sole and exclusive right and power of determining on peace and war, except in the cases mentioned in the sixth article, . . . and of regulating the trade of the states, as well with foreign nations as with each other."

James Madison moved in the General Assembly of Virginia a resolution for a convention of delegates of all the states "to take into consideration the trade of the United States; to examine the relative situation and trade of the said states; to consider how far a uniform system in their commercial regulations be necessary to their common interest and permanent harmony," etc.

There were similar expressions of view in the legislatures of Rhode Island, of Connecticut, of New Jersey, in resolutions of town meetings and in reports of committees of Congress.

The Madison resolution resulted in the assembling of the Annapolis Convention in 1786 and in a recommendation, by the

delegates there assembled to consider the regulation of commerce, that Congress should call a general convention of all the states to meet in Philadelphia on the second Monday in May, 1787, "to devise such further provisions as shall appear to be necessary to render the constitution of the federal government adequate to the exigencies of the union."

This was the convention which framed the Constitution, and the declaration of the Supreme Court of the United States in the case of *Cook vs. Pennsylvania*, 97 United States, 574, is amply justified, to the effect that:

"A careful reader of the history of the times which immediately preceded the assembling of the convention which framed the American constitution cannot fail to discover that the need of some equitable and just regulation of commerce was among the most influential causes which led to its meeting."

The result of its deliberations on the four large subjects of national concern enumerated by Alexander Hamilton—which are the four fundamental essentials of national existence and efficiency—and as to which Hamilton declared that the federal government should possess complete sovereignty, namely, the purse, war, peace, and commerce, is exhibited in the following clauses of the Constitution:

"The Congress shall have power:

"To lay and collect taxes, duties, imports and excises, to pay debts and provide for the common defense and general welfare. . . .

"To borrow money on the credit of the United States.

"To regulate commerce with foreign nations and among the several states, and with the Indian tribes.

"To declare war. . . .

"To raise and support armies.

"To provide and maintain a navy."

The fullness, the competency and the completeness of no one of these powers has ever been questioned, except of the power to regulate commerce. It is universally recognized that it is a right of each state that the federal government shall provide for the common defense; that the federal government shall determine as between peace and war; that it shall raise and support armies and shall equip and maintain a navy.

But there are other rights of the states not less important and not less sacred. These include the right to avail themselves, separately and individually, of the protection guaranteed to them and to their people by the Federal Constitution against the selfishness in trade of their sister states.

In adopting the commerce clause of the Constitution they intended to secure protection against this very thing. In the light of the history of its adoption, is it not, since the Constitution, a right of New Jersey that New York shall not regulate the trade between them as it did when it excluded the products of New Jersey industry from the New York markets; is it not a right of the state of Connecticut, since the Constitution, that its products shall not be excluded from the markets of New York and Boston by state action, and is it not since the Constitution, a right of each of the states that Virginia and North Carolina and Tennessee and the great food-producing states of the west shall not be able, as Virginia and North Carolina once did, to put an embargo upon the shipments of their products beyond their respective borders, and shall not be able to exclude the people of the other states from the riches of their farms, of their forests, of their mines, and of their factories? Is it not a right of each state that Congress alone, which represents all, shall be the exclusive arbiter of what is right and just in interstate and foreign trade, and that no state shall be permitted to advance itself at the expense, and to the disadvantage of the others, perchance by its narrowness, its greed, and its selfishness in trade?

INTELLIGENT INTERSTATE REGULATION NOW OF SUPREME IMPORTANCE

The existence of this exclusive power in Congress to regulate interstate and foreign commerce is of no less importance—is in fact of far larger importance—as a state's right now, than it was when the Constitution was adopted.

Commerce itself in these one hundred and twenty-six years has assumed a far greater consequence in the affairs and destinies of men and of nations, than it had in those early days. Steam

and electricity have come with their mighty revolutionizing influence and have brought all the states and all the nations into close and intimate commercial relationships. Men no longer deal in trade most largely with their immediate neighbors, but find it essential to their success to have free and unimpeded and adequate access to the markets of the world.

The interests of the producing states—particularly the states of the south and west where there are no markets of the first importance—imperatively require easy and quick transportation to the world's great market cities, such as New York, Philadelphia, Boston, and Chicago in this country, and Liverpool, London, Paris, and Berlin abroad.

It may be safely stated that at least eighty-five per cent of the trade of Tennessee, and of the United States generally, moves in interstate and foreign commerce.

To meet these economic conditions—to satisfy the essential needs and to accommodate the movement of this great traffic—it has become necessary to create long and continuous lines of railroad in the place of the short and disconnected lines which were once adequate to the requirements of trade. These large systems of railroad, which have come in obedience to the economic law which demands continuous, rapid, and unbroken transportation, necessarily extend across, and are, under existing law, in many respects subject to the varying policies of many states.

The problem of greatest magnitude which concerns the country in regard to them, is how their continuity of service shall be preserved unimpeded and what shall be the quality of adequacy and efficiency which their transportation facilities shall possess.

A broad and wise policy in dealing with the instrumentalities of commerce is, therefore, a matter of supreme interest to all the states. A narrow, or niggardly, or selfish policy, if adopted by any one of the states through which a railroad passes, may seriously cripple and depress the commerce of every other state which the railroad serves.

No adequate conception of the railroad problem, as it affects the development of the country and the growth of its commerce, can ignore the necessity that transportation facilities must be all the time growing and improving to keep pace with the growth and expansion of commerce—otherwise there will be no growth or expansion of commerce.

Such an increase in railroad facilities involves the constant input of new capital, for no railroad is ever finished except in a dead country. It is a mere platitude to say that new capital can only be attracted by credit. While no one state through which a railroad passes can alone establish its credit, a single state can impair or destroy it.

If a railroad runs through and serves eleven states, ten of them may be guided by broad and liberal views and may be controlled by the policy of encouraging the establishment and maintenance of adequate transportation facilities. The eleventh may, however, have no adequate commercial outlook or may be temporarily under the domination of small and time-serving politicians. It may reduce rates on state traffic so as to barely escape the line of confiscation. It may be unwilling that its state traffic shall contribute anything to the liberal program, favored by the other ten, which would build for the future and insure the present and continuing adequacy of the transportation facilities on which all are equally dependent.

In such a case, what shall be done? Shall the ten states bow to the will or caprice of the one and allow it to control?

If, on the other hand, the standard of facilities is not brought down to this low level and is to be made adequate to the needs of all, then the commerce of the other ten states, or interstate commerce, or both, must bear the burden, which the dissenting state has refused to share, of building up adequate transportation facilities.

HARMFUL FEATURES OF STATE REGULATION

In either case, the dissenting state, in a very effective way, regulates the commerce and the business opportunities of all.

Moreover, in the Shreveport case, recently decided by the

Supreme Court of the United States, and in another state which I shall not more particularly identify, state rates have been greatly reduced for the avowed purpose of preserving state markets for state trade, and thus excluding and discriminating against the trade of other states.

Is it not a right of each of these states, thus oppressed by the narrow and selfish policy of one, to have its commerce freed from these state restrictions and regulated by Congress, representing all the states, in accordance with the compact of the Constitution?

I have referred to the great importance to the welfare of all the states of transportation facilities. In this connection, and as exerting an important influence on the financial capacity of the carriers, it is appropriate to consider their capacity to issue and to dispose of their securities.

It is manifest that, if such issue is to be regulated by the individual states, every state is at the mercy of the others. A bond, to be available in the market, must, as a rule—especially now when most bonds are necessarily junior liens—be secured upon the whole railroad line; and this crosses many states. One of the states, therefore, if it possesses the power to regulate the issue of securities of an interstate carrier, may disappoint and defeat a financial plan approved by all the other states and necessary to the carrier's transportation efficiency.

Even if the state does not press its authority to the extent of absolutely declining to sanction the issue, it may selfishly and as a political expedient, attach a condition that a designated portion of the proceeds shall be spent within its borders where it may not in fact be needed, when the needs of interstate commerce and the commerce of other states fairly require that the whole shall be expended elsewhere.

The power of the state to consent, or to withhold its consent, is equivalent to a power to control the character and the location of additional transportation facilities against the views and the interests of all the other states.

But even if the necessity for the new capital is universally recognized, and the approval of the states is not ultimately withheld, the time necessary to permit the investigation and to secure the approval of so many would, or might, constitute a fatal obstacle in the way of a successful financial operation. Promptness—ability to avail without unreasonable delay of a favorable market—is essential to success in placing large financial offerings.

From whatever standpoint, therefore, it be considered, the destructive effect of a power in the several states to determine and limit the financial capacity of the carriers, through a regulation of the issue of their securities, is apparent. It is manifest that the financial capacity of a carrier which serves many states is a matter of transcendent importance to them all. No one of them should be allowed to control or to injuriously affect it. It is a right of each of the states that a matter so important, and in which all of them have so vital an interest, shall not be controlled by one which may have a selfish interest or an illiberal policy.

It is a right of the states, in respect of this matter of common and supreme concern, that an authority, which is the authority of all, whose power is delegated by all, which represents all and which acts for all, shall alone be the arbiter of what may be conflicting views and interests, and shall alone regulate and control.

And yet sixteen states have enacted statutes, each asserting for itself the individual right to control the issue of stocks and bonds of interstate carriers. And the end is not yet, for many other states are considering legislation which will give to them a power which they see is already being exercised by others.

Another striking illustration of the exercise by one state of a power to discriminate against and to injure the commerce of other states and interstate commerce is found in the state laws which impose heavy penalties for failure to furnish cars or other instrumentalities of commerce within a limited time.

One of the states now imposes a fine of \$5 for each day of delay; an adjoining state fixes the fine at \$1 per day; and the

interstate commerce law fixes no per diem penalty at all. A case may well be imagined where a carrier is reasonably supplied with equipment, but a large portion of it has moved in the regular channels of commerce to a point on or off its line and distant from the place where the demand for it is made. If, under these circumstances, there is a demand for a car by a shipper of intrastate traffic in the state which imposes a heavy fine for delay, and is also made by a shipper in the state which imposes a light fine and is also made by a shipper in interstate commerce as to which no fine at all is imposed, and there is at the moment, by reason of special circumstances, only one car available to meet all three of these demands, it, of course, results that the carrier in self-protection must deliver the one available car to the shipper in the state which imposes the largest fine, and the other must go without. In other words, the greediest, the most selfish and the most unreasonable state thus secures by its own laws a preference for its own commerce over the commerce of its sister states and over interstate commerce itself.

It is not a right of the other states to have the question of a fair distribution of available car supply determined, not by one of the interested states, but by the authority which represents them all and can see that a rule of equity and fairness shall prevail?

In addition to what has been said, a long and formidable list of state statutes, already in effect, might be given, which, without the consent of the other states, impose serious burdens of expense upon their commerce, and thus upon their people. All discriminate or have the effect of discriminating, against their commerce, both state and interstate.

Thus, three states have passed laws making it illegal for a carrier having repair shops in the state to send any of its equipment, which it is possible to repair there, out of the state for repairs in another state; fifteen states have attempted to secure preferred treatment of their state traffic, either by heavy penalties for delays or by prescribing a minimum movement of freight cars, some of them requiring a minimum movement of 50 miles per day, whereas the average movement for the United States is not over 26 miles per day—one of these states imposing a fine of \$10 per hour for the forbidden delay; 20 states have hours-of-service laws, varying from 10 to 16 hours; 20 states have full-crew laws; 28 states have headlight laws, with varying requirements as to the character of the lights, and 14 states have safety-appliance acts.

Let me take an illustration from a single class of these statutes. I will select the full-crew laws of New Jersey and Pennsylvania.

These laws impose upon the railroads operating within their respective limits an expense for unnecessary employes amounting to more than \$1,700,000 a year. There is nothing in these state laws putting the burden of this expense on their own traffic alone. That burden extends to all the traffic these railroads carry, and thus the traffic of Virginia and Tennessee and Mississippi and of all the American states whose traffic enters New Jersey or Pennsylvania is laid under tribute by these state enactments.

Or, the proposition may be stated another way. The expense put upon the railroads by the full-crew statutes of these two states would pay the interest at 5 per cent upon a capital fund of more than \$34,000,000. By requiring an amount equivalent to the interest on this capital to be expended on useless employes—at least on employes as to which the other states were not consulted—instead of being used to obtain new capital, these two states have by their own independent action reduced the borrowing capacity of the railroads to the extent of \$34,000,000. That amount of capital would have bought 1,360 locomotives, or 3,400 steel passenger cars, or 34,000 freight cars, or 1,133,000 tons of steel rails, or would have block-signalized 13,600 miles of road.

Thus, facilities immensely valuable to the traffic of the other states have been made impossible—not by their own action, but by the independent action of New Jersey and Pennsylvania.

STATE REGULATION WHICH VIOLATES "A RIGHT OF THE STATES"

It is apparent that these and similar statutes which impose burdens and create discriminations violate the principle of just

and equal treatment as against the states which have a more liberal policy, and constitute serious invasions of the field of regulation by the states which adopt them to the substantial prejudice of those which have not sought to obtain special or preferential treatment.

Again, it may be asked, is it not a right of the states that no one state shall possess the power of imposing a burden which the people of other states must help to bear, or of securing a preference for its own traffic over the traffic of the others?

In order to secure equality of burden and of privilege and the benefit of an adequate and efficient transportation system, the power to regulate commerce among the states and with foreign nations was, by their own action, withdrawn from the individual states and conferred upon Congress, which represents them all.

In fact, it may be truly said that the Constitution itself was the offspring of the insistent demand of the states for protection in trade against the other states. It is, therefore, peculiarly a right of the states to have this purpose fully and fairly carried into effect.

It seems not unprofitable to turn from the problem of commercial regulation, considered only as a problem of peace, to the lessons we must learn in regard to it from the great events now occurring on the continent of Europe.

We had fondly dreamed that the possibility of great wars had disappeared in the purer light of civilization, and that the barbaric and savage instinct of nations had been obliterated by the advance of moral and intellectual principles among mankind.

This dream has been rudely dissipated and the world has been made to realize that, when it comes to war, there has been no advance in humanity or morality since the Goths and Huns and Vandals fought and slew and pillaged fourteen centuries ago. The only difference is a difference in slaying power and in efficiency. The world has marveled to see a nation, with comparatively small territorial possessions, rise in arms against the strongest nations of the earth and defy them all with its organized energy and power.

Whatever may be the ultimate result of this titanic struggle, the lesson of national efficiency has been taught and will never be forgotten. We have had it borne in upon us that the most militant and most efficient nation of Europe has outgrown its territorial limits and is looking for other lands to colonize, into which it will introduce its own national ideals, its own national efficiency and its own militant and aggressive spirit.

If it should happen that her policies embrace the acquisition and colonization of certain parts of South America, our Monroe Doctrine would stand in the path of her ambition. Whatever course we may then pursue—whether we limit the application of this doctrine to North America or undertake to enforce it as to the entire Western Hemisphere—we shall be confronted by greatly increased international complications and will need both national power and national efficiency to deal with the conditions which will be certain to arise.

THE SUPREME NEED OF EFFICIENCY

Steam and Electricity and Science have done their work and have made great nations essential to meet these mighty forces.

Wisdom requires us to recognize the change which these mighty forces and these mighty events have wrought. We cannot step backward and disintegrate ourselves into separate states. We must be efficient as a nation if we are to deal successfully with our national emergencies.

We must realize that the agitation must cease for a divided sovereignty in respect of functions which are in essence national. We must appreciate that efficient transportation is an essential condition of national efficiency, and if we are to halt or weaken our transportation systems at state lines, by permitting the imposition of burdens or the exercise of hurtful, inharmonious or unwise regulation, we will make national efficiency impossible.

Is it wise for us to subject a matter of such universal concern and of such national importance to the uncertain policies and partial and inadequate outlook of a single state? The Constitution confides it to Congress, which represents the general

welfare and common interests of all the states. The evolution of forces, the progress of events, and the growth of nations emphasize the wisdom and necessity of reposing the power of commercial regulation, which so essentially involves the national interest and the national efficiency, in the hands of the authority which is alone responsible to all the people for the performance of national duties and the preservation of our national liberty.

If it was to the interest of the individual states to have a single and impartial regulation of interstate commerce and its instrumentalities when the question was the free introduction into New York of the firewood of Connecticut and the dairy products of New Jersey, it is far more so now in view of the influential relationship which transportation has come to bear to our national efficiency and to the liberties and destinies of our people.

It must also be realized that the regulation of interstate commerce and its instrumentalities is no violation of the rights of the states, is no invasion of their prerogatives, is in no sense in derogation of their reserved sovereignty, but in reality is merely the specific performance of the contract which each state bargained for when it subscribed to the Constitution. It is their covenanted right, and the covenanted right of each of them, as well as their highest interest, that the commerce in which one in common with another state is interested shall be regulated by the fair and impartial judgment of the authority which alone springs from and is responsible to them all.

DERAILMENT ON THE NORTH EASTERN

The British Board of Trade has issued a report, by Lieut. Col. P. G. von Donop, on a derailment at Chaloner Whin, on the North Eastern Railway, two miles south of York, on the night of March 18, about 10 o'clock. No person was killed or injured, but the inspector reports the case in great detail because of the general interest in its causes. The signalman, in disregard of a clearing-house rule, gave authority for the train to leave the last station north of him before he had set up the route over which it was to pass; and when he came to set the switches, including a movable-point frog, he was unable to do so, because of snow. He at once sent two trackmen to clear out the snow; and while he was watching these men at the work the train came on, at high speed, having passed a distant and a home signal set against it. The engineman and fireman say that the distant signal was off, but the inspector finds that this testimony cannot be accepted.

To the claim of the company that the rule forbidding switches to be moved after a train has left the last preceding block station cannot be enforced regularly, the inspector replies that, perhaps, with freight trains this is to be admitted; but with passenger trains, at all events, such difficulties should not arise; the rule should be enforced.

This signal cabin has a torpedo placer, provided for emergencies; but in this case the signalman, watching the men at work on the tracks, did not see the train until it was close to his cabin, and it was then too late to make use of the torpedoes. Moreover the obstruction was only a few yards beyond the cabin.

Continuing, Colonel von Donop says:

"This case is another instance of an accident mainly due to the fact of a driver not noticing that his distant signal was at danger. This is a matter to which the North Eastern Railway Company has, for some years past, been devoting attention; trials have been made by them of different devices for giving the driver an indication on the engine as to the position of the distant signal when he passes it, and over certain portions of the system devices are fixed which are in operation with North Eastern engines. None of them were, however, installed at Chaloner Whin, and even had one of them been installed there it would not have acted in this instance, as the engine, which belonged to the Midland Railway, would not have been equipped with the necessary apparatus. No such device has, however, as yet been decided on for general adoption on the company's system, and they inform me that at the present time the matter is practically at a standstill,

as far as their system is concerned; the reason of this is that they consider that it is essential that whatever system is decided on should be universally adopted by all railway companies, and they are therefore waiting until railway companies can agree upon a method suitable for universal adoption. It is understood that a committee has been appointed by the railway companies to consider this matter, and it is hoped that a decision may before long be arrived at."

Engines of six different roads run past Chaloner Whin every day, namely, the North Eastern, the Great Northern, the London & North Western, the Midland, the Great Eastern and the Great Central. These companies own in the aggregate about 14,000 locomotives. There are numerous union stations and junctions, both in England and in Scotland, where conditions much like this prevail.

A SIMPLE METHOD OF CHECKING L. C. L. FREIGHT

A very complete and simple system of securing two independent checks of outbound l. c. l. freight is in force at the new local freight terminal of the Minneapolis, St. Paul & Sault Ste. Marie at Chicago (described in the *Railway Age Gazette* of August 22, 1913). This system was installed when the terminal was opened about a year ago and has been in continuous use since that time with very satisfactory results.

As soon as the general plans for the new terminal were decided upon the local agent and his staff began the study of the methods under which it should be operated. The locations of the cars set at the house were first fixed, placing them so that trains might be made up in station order by doubling from one track to another and eliminating all switching. It is interesting to note a recent performance in this connection whereby without any attempt to make a record one of the regular merchandise trains was made up and passed the Soo Line outer yard, 19 miles out of the terminal 2 hr. and 5 min. after the house was

closed. In fixing the location of the cars, those normally loaded heavy were placed next to the house, and cars loaded more lightly on tracks further removed, the refrigerator cars being placed on the outside tracks. In this way trucking through the cars was reduced to the minimum. Permanent numbers were assigned to these locations, eight numbers being allotted to each door or run, as for instance, S1 to S8.

Having determined on the car locations a complete list of all stations for which freight can be received at this terminal was very carefully prepared from the tariffs. This list was made alphabetically and was grouped by states and provinces a con-

siderable amount of freight being received here for points in western Canada. Where alternate routes exist, as for instance to Alouez in Fig. 1, these are given separately. Opposite each station is placed the road over which freight should be forwarded and the number of the location of the car at the house in which it should be loaded with a symbol indicating the days on which refrigerator cars are loaded for those points.

A copy of this complete list is given to the receiving clerk at each receiving door. As freight is received the caller calls the destination to the receiving clerk, who secures the car location from the book and marks the number of the run on the

shipping bill while the caller marks it in chalk on the box. Freight for destinations not shown in the book is refused by the receiving clerk. The truckers then take the freight to the runs and cars indicated by the chalk marks.

Another list is prepared for the use of the stowers, showing all points for which freight may be loaded in each car, the stations being shown in alphabetical order for "gateway" and in station order for way cars. A separate sheet is prepared for each car. These lists for each run are bound separately into books for the use of the stowers in charge of those runs and show only the stations for which he can load. When freight is brought to a run by a trucker the stower disregards entirely the previous chalk marks. Noting the destination on the box he refers to his book to satisfy himself that this freight belongs

in his run and determines the car in which it belongs as well as the position in the car, if a way car. If he cannot find the station in his book, he refuses to accept the freight and fills out all but the fourth line in the slip shown in Fig. 3, sending it with the freight to the foreman, who investigates and designates where it should go.

In this way there are two entirely independent checks on the loading of each piece of freight. While it is possible for both the receiving clerk and the stower to make errors with the same box, this is not usual and the stowers catch from 8 to 10 errors

daily, all of which have passed the receiving clerks and would otherwise be loaded in the wrong car. While all of the stowers are foreigners with only a very meager knowledge of English, it is surprising to see the care with which they detect errors. All mistakes caught by them are investigated by the foreman. If the number chalked on the box is incorrect, while the shipping bill shows the correct run, the error arose from the caller writing it down incorrectly, while if the run number on both the bill and the freight is wrong, the fault evidently lies with the receiving clerk who called it. Likewise, all "overs" found on the line caused by wrong loading are reported by car number and the responsibility placed with the stower at fault.

Since each of these 8 or 10 errors caught daily by the stowers would have gone wrong otherwise, the payments for claims on freight shipped from Chicago have shown a material decrease, although no definite comparison has been made. Aside from this, each receiving clerk has at hand for ready reference, a complete list of the stations for which freight can be accepted and he has no excuse for accepting freight which cannot be handled by this line. He also has no excuse for guessing at the car in which irregular shipments should go and it is not necessary for him to consult the foreman in such instances. Likewise, the foreman is relieved from work of this nature and can devote his entire time to supervision. While these lists necessarily had to be compiled with great care to include all stations correctly, after once being prepared it has enabled a double check to be secured on all shipments with no increased labor or delay.

This system was devised and put into operation by J. Corrigan, local agent of the "Soo" Line, Chicago, Ill.

ELECTRIC LOCOMOTIVE WITH STEAM LOCOMOTIVE CHARACTERISTICS

BY Q. W. HERSHEY

In the usual operation with steam locomotives where long, heavy trains are being handled, with one or more locomotives on the head-end and one or more locomotives doing pusher service, concurrent starting of the head-end and pusher locomotives is secured by signaling with the whistle. Little or no difficulty in starting heavy trains in this manner is experienced owing to the well known characteristic of the steam locomotive to take up slack and stand against the load.

In connection with the electrification of the Elkhorn grade of the Norfolk & Western* the practical necessity that the locomotives be able to take up slack to their full tractive effort and stand stationary against the load until the action of the locomotives on both ends of the train becomes concurrent, was taken into consideration in the design of the electric locomotives. The traffic on the Elkhorn grade consists almost wholly of long heavy tonnage trains which are operated under such conditions that there is difficulty in securing simultaneous action in the starting and stopping of the locomotives at opposite ends of the trains.

The use of three-phase current at the motors has made possible the application of polyphase induction motors designed and constructed without commutators or commutating devices of any kind. They are therefore not subject to sparking, burning, pitting or brush troubles which would be found with ordinary direct current or series type motors. The peculiar "hang-on" feature of the alternating current locomotive is available entirely on account of the inherent characteristics of the induction motor; and the Norfolk & Western locomotives have been designed to approximate very closely steam locomotive characteristics which are necessary to make practicable the use of heavy electric locomotives for long train, heavy tonnage service, such as is found on the Norfolk & Western.

*For a description of the Elkhorn grade electrification, including a description of the locomotives, see the *Railway Age Gazette* issue of June 4, page 1153.

Hearing on Advances in Western Passenger Fares

Roads Present Testimony to Interstate Commerce Commission Why Passenger Revenues Should Be Increased

Examiner Thurtell of the Interstate Commerce Commission began a hearing at the Hotel La Salle, Chicago, on Tuesday, July 6, on advances in passenger fares in the territory west and southwest of Chicago to the Rocky mountains, sought by 46 roads. The tariffs were filed by the roads early in the year and were suspended by the commission under Investigation and Suspension Docket 600. It is expected that it will take about two weeks in all to hear both sides, the carriers presenting their testimony first.

The railways' case is being handled by two committees of attorneys, one for the roads in the Northwest, and the other for the Southwest. The committee for the Northwest consists of C. C. Wright, general solicitor of the Chicago & Northwestern, chairman; O. W. Dynes, commerce counsel, Chicago, Milwaukee & St. Paul; E. C. Lindley, general solicitor, Great Northern; R. B. Scott, interstate commerce attorney, Chicago, Burlington & Quincy; H. A. Scandrett, interstate commerce attorney, Union Pacific; and Charles Donnelly, assistant general counsel, Northern Pacific.

The Southwestern committee consists of S. T. Bledsoe, chairman, assistant general counsel, Atchison, Topeka & Santa Fe; H. G. Herbel, general attorney, Missouri Pacific; W. T. Hughes, assistant general attorney, Chicago, Rock Island & Pacific; E. T. Miller, general attorney, St. Louis & San Francisco; and C. S. Burg, interstate commerce attorney, Missouri, Kansas & Texas.

The railroads are opposed by a committee of State Commissioners, headed by P. W. Dougherty, of the South Dakota Railroad Commission, who was delegated by the protesting State Commissions to conduct the case, assisted by A. E. Helm of the Kansas Public Utilities Commission.

Mr. Wright made an opening statement on behalf of the roads in part as follows:

OPENING STATEMENT OF C. C. WRIGHT

"The proposed advance in passenger fares, covers the territory from Chicago west and southwest to the Rocky mountains, including Wisconsin, the northern peninsula of Michigan, Minnesota, Iowa, Missouri, Arkansas, Louisiana, Texas, Oklahoma, Kansas, Nebraska, North and South Dakota. It also includes the interstate rates from Illinois west.

"Of that territory, Wisconsin, Michigan, Illinois, Iowa, Missouri, Minnesota, Nebraska, Kansas and Oklahoma now have rates adjusted on a basis of 2 cents per passenger mile. North and South Dakota are upon the basis of 2½ cents per passenger mile. Arkansas, Louisiana and Texas are upon the basis of 3 cents. The territory west of the states described, viz, Montana, Wyoming, Colorado and New Mexico, has rates practically on a basis of 3 cents per mile. The advance in the passenger rates in the states named necessarily includes an advance in rates from and to that territory from districts in which no advance is proposed.

"The lines operating in Trunk Line and Central Passenger Association territory, that is, from Chicago and St. Louis east to the Atlantic Coast, have generally advanced their rates to the basis of 2½ cents per passenger mile, with mileage books at the rate of 2¼ cents per mile. In the territory involved in the present proceeding, which lies east of the Missouri river and west of the Missouri river on and north of the Union Pacific in Kansas, the rates under suspension are upon the same basis, with mileage books at 2¼ cents per mile. In the territory south of the Union Pacific in Kansas and west of the Missouri river, the proposed rates are upon the basis of 3 cents, with mileage books at 2½ cents. The passenger rates have been advanced by the carriers under the conviction that the earnings from the passenger business are not sufficient to provide the necessary passenger service and yield a fair return upon the property devoted

to that service. It is believed the evidence will demonstrate, that the passenger service is not paying a fair share of the expenses of the maintenance of the roads, and that the evidence will show that the ratio of profit and the net rate of return from the passenger business, are materially less than the return from the freight business.

"The carriers will follow substantially the same lines as in the recent freight advance case. It was stipulated that the testimony taken in that case in relation to the general financial needs of the carriers, may be treated as part of the evidence in this case. The carriers have taken the same roads which were involved in the composite showing and added thereto the Union Pacific, Great Northern, Northern Pacific, Duluth, South Shore & Atlantic, Toledo, Peoria & Western and Texas Midland, and eliminated the Chicago & Eastern Illinois, whose interstate rates were already advanced by permission of the commission.

"The operated line covered includes a little over 120,000 miles. Not all of the mileage included lies within the territory where the advance is sought. Lines like the Union Pacific, Santa Fe, Great Northern, Northern Pacific and some others, now maintain a 2½-cent or 3-cent basis on the larger portion of their mileage. Different groups of roads have been considered together and the composite results of operation shown, as was done in the freight case, for the purpose of eliminating the effect of rates on portions of the lines which lie outside the territory involved.

"The results of passenger operation for the last 14 years will be presented to the commission, divided into two periods of 7 years each, giving the results for each year, both as to the entire systems interested in the proceeding and as to the group which will be presented.

"It will be shown that the passenger revenue on these roads in 1914 was approximately \$271,000,000. Not all of this is affected by the advance. It is impossible to determine exactly what may be the effect upon the revenue in the territory involved, owing to the fact that under the proposed rates mileage books will be sold at less than the regular rate. It is believed that the advance will not amount to more than 8 or 9 per cent of the revenue in the territory in question, or in round figures, from \$20,000,000 to \$25,000,000.

"The carriers expect to show that the net operating income of those involved, during the last 7 years, has been materially less per mile of road than for the 7 years prior. It will be shown, that this is true, notwithstanding an increase in the volume of business and in property investment. This, of course, results in a materially higher operating ratio and a less net rate of return than has been maintained heretofore.

"Comparisons will also be made to present the conditions at the present time with those in 1910. It will be shown that this increase in expenses is largely due to the increase in cost of labor and rate of taxation, and that the economies which have been effected and the increased volume of business have not been sufficient to meet the increasing costs of operation.

"Taking the lines together, it will be shown that under any of the bases of division of expenses, as between passenger and freight, the return upon property devoted to passenger service does not amount to 3 per cent upon the value of the property devoted to such service.

"In the present case the carriers will treat the passenger rates as a whole, without an attempt to make definite separation of expenses as between state and interstate business. Information will be furnished, however, as to the proportion of the business which is state and interstate, the length of haul on each class of business and other matters of that kind affecting the passenger traffic. It is believed by the carriers that it is impracti-

cable to maintain state and interstate passenger rates upon any substantially different basis. This belief is based on the thought that to maintain any substantially different basis of passenger rates on interstate business would not only be discriminatory, but would be impractical from an operating standpoint."

The first witness for the railroads was L. E. Wettling, who has had charge of the compilation of the fundamental statistical exhibits.

STATISTICAL EXHIBITS

Mr. Wettling filed and gave testimony in explanation of a statistical exhibit of 217 pages, giving the results of operation, traffic statistics, etc., for the 46 roads or systems involved in the case for each year from 1901 to 1914, inclusive, with comparisons of the periods 1901-1907 and 1908-1914. The figures were given for the individual roads, for all the roads combined, and for the roads combined into 7 groups. A large number of the exhibits were like those presented by Mr. Wettling in the freight advance case, which were described in the *Railway Age Gazette* of March 12, except that only 41 roads were included in that case.

The 46 roads operated 120,790 miles of line in 1914. Their net cost of road and equipment was \$6,433,968,625 and the net operating income for the year was 4.24 per cent on that amount, or equivalent to 7 per cent on a value of \$3,898,830,406 or \$32,278 per mile. For the period 1901-1907 the net operating income was \$2,509 per mile. For the period 1908-1914 it was only \$2,394 per mile. For the first period this was 5.43 per cent of the cost of road and equipment. For the second period the return was 4.74 per cent. In 1914 the net cost of road and equipment had increased 64.04 per cent, as compared with 1901. In the same time operating revenue had increased 105.85 per cent and the ratio of operating revenue to cost of road and equipment had increased from 14.21 per cent to 17.84 per cent. Operating expenses meanwhile had increased 137.96 per cent and the operating ratio from 65.94 to 76.22, while the net operating income had increased only 43.71 per cent. The cost of road and equipment per mile of line owned increased from \$48,878 in the first period to 54,907 in the second period.

The total increase in capitalization, 1914 over 1901, was \$2,858,553,071. In 1901, 46.42 per cent of the total was represented by stock and 53.58 per cent by bonds. In 1914 the proportion was 40.71 per cent of stock and 59.29 per cent bonds. From July 1, 1907, to June 30, 1914, the 46 roads expended \$936,818,405 for additions and betterments, of which \$390,435,682 was for equipment.

For the first period gross operating revenues per mile averaged \$7,713, of which \$3,003 was paid for labor, \$240 for taxes and \$1,958 for material and other items, leaving a balance of \$2,509 per mile available for interest, dividends and surplus. For the second period, while gross operating revenues had increased to \$9,160 per mile \$3,849 was paid for labor, \$379 for taxes and \$2,536 for material and other items, leaving a balance of \$2,394 available for interest, dividends and surplus.

One exhibit showed that the requirements in the next seven years for refunding or refinancing maturing obligations now outstanding would amount to \$538,591,699 for 33 operating systems of which \$100,764,614 will mature in 1915.

A large number of exhibits were devoted to maintenance expenses. For the first period total maintenance averaged 25.59 per cent of operating revenue and 4.6 per cent of the cost of road and equipment. For the second period the average was 27.76 per cent of operating revenue and 5.3 per cent of cost of road and equipment. For maintenance of way and structures the averages were 13.86 per cent of operating revenue and 2.49 per cent of road and equipment for the first period and 13.54 and 2.59 per cent respectively, for the second period. Maintenance of equipment had taken 11.73 and 2.11 per cent, respectively, for the first period and 14.22 and 2.71 per cent for the second period. While the

proportion of maintenance of way and structures charged to passenger service had decreased from .577 cent per passenger mile in the first period to .5084 cent in the second period, the cost of maintenance of equipment in passenger service increased from .2983 cent per passenger mile for the first period to .324 cent for the second period.

Several exhibits were devoted to the increases in taxes and in expenditures for labor. In 1914 the 46 roads paid \$28,025,956 more for taxes than they would have paid at the 1901 rate, and \$101,806,957 more for labor than they would have paid at the 1900 rates.

From 1900 to 1914 the average daily compensation, including general officers, increased steadily from \$2.00 to \$2.52, and excluding, general officers, from \$1.96 to \$2.48. In 1901, 37.77 cents out of each dollar of revenue was paid for labor; in 1914, 42.98 cents. In 1901, out of each dollar 3.17 cents was paid in taxes; in 1914, 4.97 cents. Labor costs per train mile showed a steady increase, with the exception of only one year, from 66.14 cents in 1901 to 103.98 cents in 1914. Total labor costs per car mile showed an increase from 4.05 cents in 1901 to 5.48 cents in 1914.

For the period 1901-1907 locomotive repairs, renewals, depreciation and charges to profit and loss per locomotive mile averaged 7.215 cents. For the period 1908-1914 the average was 10.689 cents. Repairs and renewals per locomotive mile were 6.983 cents in the first period and 9.399 cents in the second period, while charges to depreciation and profit and loss per locomotive mile were .232 cent in the first period and 1.290 cents in the second period.

One of the exhibits was a chart showing graphically the disposition of each dollar of revenue paid to the 46 roads by the public. In 1901 operating expenses, including taxes, took 65.94 cents, leaving a balance of 34.06 cents available for interest, dividends and surplus. Labor consumed 37.77 cents, taxes 3.17 cents and material and other items 25 cents. In 1914 operating expenses and taxes took 76.22 cents of each dollar, leaving 23.78 cents for interest, dividends and surplus. Labor consumed 42.98 cents, taxes 4.97 cents and material and other items 28.27 cents. Operating expenses were divided between freight and passenger service on six different bases. Basis 6, an average of the results obtained by the other bases, assigned 57.93 per cent of the maintenance of way and structure expenses to freight and 42.07 per cent to passenger, and 67.22 per cent of total operating expenses to freight and 32.78 per cent to passenger.

The average revenue per passenger mile for the period 1901-1907 was 2.13 cents and for the period 1908-1914 was 2.07 cents. In 1901 it was 2.18 cents and in 1914 it was 2.09. Several exhibits were devoted to passenger traffic statistics for 30 states and two Canadian provinces for 40 roads for 1914. The average passenger mileage per mile of line was 107,322, of which 53,294 was intrastate and 54,028 was interstate. The total passenger revenue was \$246,432,097, of which \$123,611,446 was intrastate and \$122,820,650 was interstate. The average haul was 44.8 miles, but the average haul intrastate was only 28.67 miles as against 100.63 miles interstate. Because of the shorter average haul in intrastate business, out of a total of 263,327,957 revenue passengers, 204,312,678 were intrastate and 59,015,279 interstate. The number of passengers carried one mile was 11,796,186,229, made up of 5,857,738,762 intrastate and 5,938,447,467 interstate. The average revenue per passenger mile was 2.089 cents, on intrastate traffic 2.110 cents, and on interstate traffic 2.068 cents. The revenue per passenger mile ranged from 1.569 cents in Illinois to 7.606 in Nevada for intrastate traffic and from 1.872 cents in Wisconsin to 2.708 in British Columbia for interstate traffic. The average revenue per train mile was \$1.0770, ranging from 5.71 cents in Nevada to \$1.4893 in Tennessee, and the average revenue per car mile was 26.74 cents, ranging from 5.71 cents in Nevada to 35.75 cents in Oregon. The total passenger train mileage was 228,803,538,

including mixed train mileage, and the total car miles of cars carrying passengers was 921,682,764.

Total failure of predictions made in 1907, when passenger fares in many states were reduced to 2 cents per mile, that the lower fares would be more than offset by the stimulus to travel, was also described in figures by Mr. Wettling. He presented statistics showing that the return on property devoted to passenger service is only 2.37 per cent, while many roads operate at an actual deficit.

"The reductions to 2 cents per mile in passenger fares," said Mr. Wettling, "brought no stimulus to travel such as was anticipated. The mileage traveled by passengers for each mile of road in 1901 was 62,757. This had grown by 1914 to 107,255, a gain of 70.91 per cent. In the seven years ending with 1907, when the rates were reduced, the increase in travel was from 62,757 passenger miles per mile of road in 1901 to 95,235 in 1907, a gain of 51.75 per cent. In the seven years after the rates were reduced the gain was from 99,040 passenger miles per mile of line in 1908 to 107,255 in 1914, a gain of only a little over 8 per cent, compared with the 51.75 per cent gain in the seven years before the rates were forced down.

"On top of this failure of the growth in travel to hold its pace, there was, resulting from the rate reductions, a gradual decline in the average revenue, both for hauling the ton one mile and for carrying the passenger one mile. The average revenue per ton mile in the first seven years from 1901 to 1907 was 8.63 mills, which declined in the second seven years to an average of 8.58 mills and amounted in 1914 to only 8.42 mills. The average revenue per passenger mile in the first seven years was 2.13 cents and in the second 2.07 cents.

"Efforts at efficiency, to offset the adverse factors of rising costs and falling rates, although they have brought conspicuous results have not been adequate. With larger power and equipment and denser traffic, the tons carried per train on these railroads rose from 241 in 1901 to 387 in 1914, but the tons per car, in spite of the larger and heavier equipment, rose only from 10.10 tons to 12.27 in the same time. The number of passengers per train rose from 37.22 in 1901 to 51.82 in 1914 and the passengers per car rose in the same time from 7.56 to 9.31. All of this represents greater efficiency in handling traffic, in spite of which the earning power has declined.

"In providing the service demanded by the public, there has been a steady gain in number, size and value of equipment. On June 30, 1906, there was a total of 11,959 passenger cars owned or leased by 42 of these railroads, of which 11,899 were wooden cars, 60 were steel underframe and none were all-steel. The average value of all was \$5,740 and the average weight 71,307 pounds. On June 30, 1914, there were in service 16,958 cars, of which 13,030 were wooden, 1,636 were steel underframe and 2,292 were all-steel. The average value had risen to \$7,409 and the average weight to 85,291 pounds. The average value of the all-steel cars was \$12,343 and their average weight 121,170 pounds. On June 30, 1914, there were 167 passenger train cars, including Pullmans, owned or leased for every 1,000 miles of road, against 139 in 1906. There were in service June 30, 1914, 21,331 locomotives against 15,691, June 30, 1906. Of these there were in the passenger service in 1914, 5,108 locomotives with an average weight of 116.85 tons against only 3,978 in 1906 with an average weight of only 87.42 tons.

"As the result of decreased rates and higher expenses, the profit from passenger service is excessively small and on some of the roads, especially in the Southwest, the passenger service is operated at a deficit. This has been determined by a separation of operating costs between freight and passenger service. In 1914, 67.22 per cent of all operating expenses were due to freight service and 32.78 per cent to passenger. The average ratio of expenses to revenue in both

services was 76.22 per cent. The ratio in the freight service was 72.51 per cent, while in the passenger service the ratio of expense to revenue was 85.16 per cent.

"Both services combined earned a net return equaling 4.24 per cent on the value of the property. In the freight service alone the return was 5.15 per cent while the passenger service earned only 2.37 per cent on the value of the property devoted to passenger traffic on all of these 46 railroads as a whole."

The replies of the various roads to the series of 18 questions bearing on the reasonableness of existing passenger fares which were submitted by the commission some time ago, were filed at the opening of the hearing.

Mr. Wettling was to be followed on the witness stand by E. E. MacLeod, chairman of the Western Passenger Association, E. L. Bevington, secretary of the Transcontinental Passenger Association, W. J. Cannon, assistant general passenger agent of the Chicago, Milwaukee & St. Paul, and H. H. Butler, assistant general passenger agent of the Missouri Pacific.

CAFÉ DAY COACH

The Pennsylvania Railroad has equipped, and put in service, an all-steel cafe day coach, provided with a broiler buffet from which meals will be served. This car will be tried out as an experiment, and if it is found to meet a sufficient demand on the part of the traveling public, others of like character may be

The Kitchen of the Cafe Coach

placed in operation. It will not be used, however, to supplant dining cars.

The new car is intended for use on trains where a dining car is not warranted. The buffet occupies eight feet of space at one end of the car and is similar to those installed in broiler-buffet Pullman cars, but is of an improved type, alcohol broilers being

used instead of coal fires. Meals will be served on tables placed between the seats, with the outer ends resting on the arms. Both single and double tables are provided, the latter being used where two seats are turned to face each other. With a double table, a party of four can eat together. No extra fare will be charged for riding in the car, as it will be in the regular service as an ordinary day coach.

The car has a seating capacity of 70, and except for the buffet it is exactly like the steel day coaches used by the Pennsylvania. A supplementary use for this car will be to serve breakfasts in

Interior of the Pennsylvania Railroad Cafe Coach

sleeping cars on trains where no buffets or dining cars are provided. The new car has been placed in service between Kane, Pa., and Erie, Pa., on trains Nos. 39 and 54, which are through trains between Philadelphia and Erie.

NEW DELAWARE & HUDSON TERMINAL AT ALBANY, N. Y.

The Delaware & Hudson has recently completed and moved into a new office building and freight house in Albany, N. Y., which is of unusually fine appearance for a structure of this kind and is situated in a very convenient location. The entire project is an example of co-operation between the municipality and the railroad to their mutual advantage.

The building occupies a portion of the site of Beverwycke, the original Dutch settlement which covered an area of about 8 acres between Broadway and the river at the foot of Main street. Resisting the trend of modern advancement, this district retained its century-old characteristics, with ancient buildings, many falling into decay, on narrow and crooked streets, and had long been an eyesore to the citizens of Albany. The matter was finally taken up by the local Chamber of Commerce, which prevailed upon the city administration to extend the scheme of river front improvement which had already been undertaken, to include the creation of a civic center in what was the most unsightly section of the city. The Delaware & Hudson, whose main tracks occupied a narrow strip of right of way adjacent to the river had already begun the purchase of some property in this district. The company had a freight house at Livingston avenue, five blocks north, and another at Church street, ten blocks south, both of which

had become inadequate. They were also located too far from the business center for convenience. The plan finally determined on by the road provided for a new freight terminal of adequate size in the heart of the business center. It was also desired to raise the main passenger tracks to the level of those of the Union station located two blocks north and to connect them to the present station tracks. At the present time the Delaware & Hudson trains depart from tracks adjacent to but considerably below the main station tracks. This change in grade will also avoid trouble with occasional high water in the Hudson river. While the office building and freight house are now completed, the station tracks have not yet been raised.

Because of the common interest involved it was necessary for the city to co-operate with the railway company in the exchange of property and it was finally agreed that the railway would be granted permission to elevate its tracks and extend its terminal facilities by the construction of a new freight house and yard on condition that the office building be of such a character as to harmonize with the plans outlined by the city for the remainder of the district.

The plan agreed upon is shown in the accompanying general

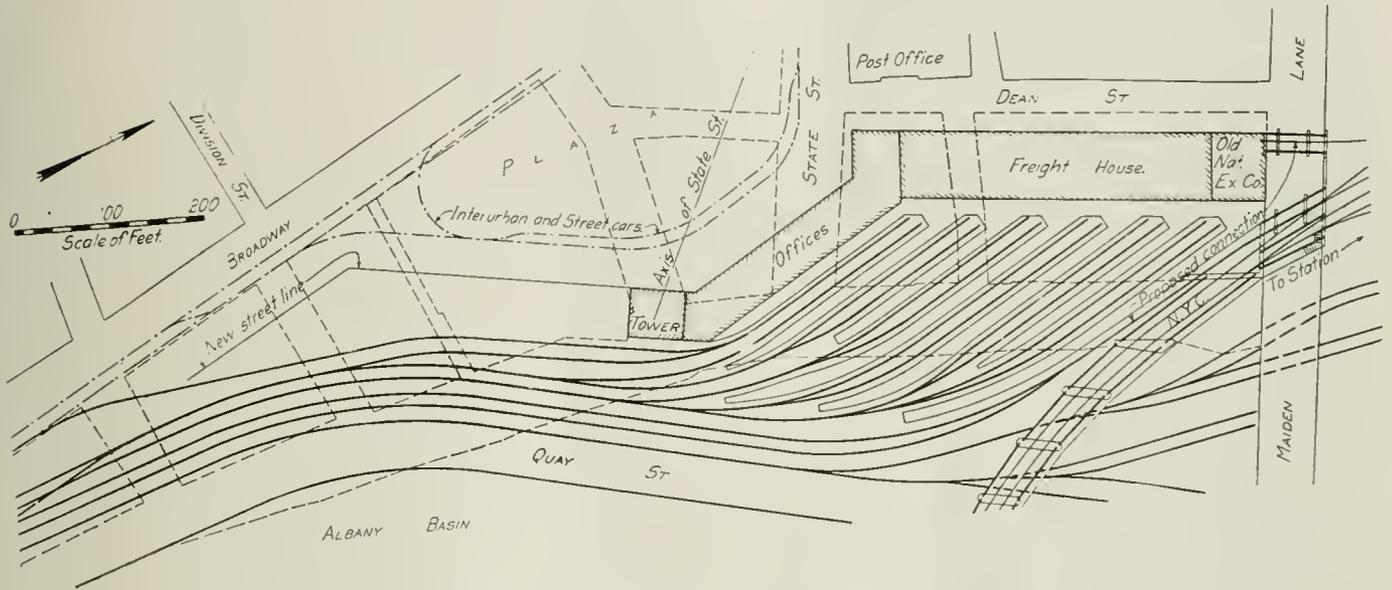

New D. & H. Office Building from the City Side

layout. The building occupies an irregular area between the tracks and the plaza, an open space roughly triangular in shape, bounded on the west by Broadway, with its axis approximately on the center line of State street, an avenue 100 ft. wide, which connects the plaza with the state capitol grounds four blocks west. Just south of the building is a pedestrian subway leading from the plaza east underneath the tracks to Quay street, abutting on Albany basin, an artificial body of water 200 ft. wide, separated from the Hudson river by the municipal recreation pier.

The building, which was designed by Marcus T. Reynolds, architect, Albany, consists of a tower 52 ft. by 62 ft., 13 stories in height, joined on the north by a four-story wing 260 ft. long by 50 ft. wide. To the north of this, and facing on Dean street, is the freight house. Flemish Gothic in design, the building is of imposing appearance and has an unusually fine setting, with the axis of the tower on the center line of State street facing the State capitol. It is also conspicuous from the river side, being the first building of importance to meet the eyes of travelers approaching the city on river steamers, or by trains crossing the river bridge just north of the building. The exterior walls are of Plymouth seam-faced granite, laid in random ashlar and

trimmed with Gothic details of synthetic stone. This synthetic or artificial stone for the trim was made by a special patented process using sand molds and has an excellent finish. The material is well adapted to the use of elaborate details. The roof is covered with heavy slate of variegated colors, the lower course being 1 in. thick and graded to the customary size at

total area of 128,000 sq. ft. An open arcade facing west on the first story permits passage under cover throughout the length of the building, and facing on this arcade and the plaza beyond are seven shops which may be rented out for various purposes, one being occupied by the city ticket office of the Delaware & Hudson. A well in the center of the tower, isolated by fireproof

General Layout of Delaware & Hudson Terminal at Albany

the ridge. The tower is crowned with a copper covered spire 70 ft. in height, bearing a weather vane representing Hendrick Hudson's ship "De Halve Maen."

With the exception of the first floor, the tower and its wings are used entirely for the general offices of the road, having a

walls and doors, contains two elevators and a stairway. Another stairway and elevator are located midway in the length of the wing. One unusual feature of the tower, combining utility and architectural enhancement is a turret-shaped pilaster located in the northwest corner, which contains a winding stair-

Office Building and Freight House from the River Side

way. Being protected by fireproof doors and small fireproof windows, it will afford an unusually efficient fire escape.

The entire building is supported on Raymond concrete piles. The tower is of fireproof steel-skeleton construction, while the wing and the freight house are of reinforced concrete flat slab construction. There is no basement except under the north end of the wing, which is occupied by the heating plant, consisting of three Mills sectional safety boilers. A Custodis radial brick chimney of 42 in. inside diameter, extending only a short distance above the roof, is enclosed above the basement in a fireproof ventilating flue.

The freight house consists of a new three-story portion 317 ft. by 70 ft., designed to take one additional floor in the future, and an old 4-story brick building 73 ft. by 63 ft. on the north, facing on Maiden Lane, formerly owned and occupied by the National Express Company, and now remodeled for use in conjunction with the new building. The first floor is used as an ordinary freight house, the second for storage and the third for offices for the freight clerks, while the upper floors of the old express building will be used for division offices. The new portion consists of 14 bays, 23 ft. 2 in. center to center of columns, with one double rolling door 11 ft. 6 in. wide to each bay, on both the street and the track sides. There are four stairways, one to every third bay, isolated by fire walls and fire-resisting doors. Adjacent to two of these stairways there are freight elevators with 8 ft. by 9 ft. platforms, while next to each of the other two are 8 ft. by 9 ft. platform scales equipped with Springfield automatic weighers of 10,000 lb. capacity. All three floors of the freight house are equipped with automatic sprinklers. Openings leading into adjoining portions of the building are protected by automatic fire doors. The floors throughout the office building and the new freight house are of concrete. The first and second floors of the freight house are illuminated by ceiling outlets, one in the center of each panel, equipped with 100-watt incandescent lamps and reflectors, while over each freight door is a 100-watt lamp, set with the axis of lamp and reflector horizontal.

The layout of the tracks and platform is shown in the accompanying drawing. Twelve house tracks with a total capacity of 100 cars, are located in pairs 12 ft. center to center, on a skew with the face of the building. Platforms between each pair of tracks are 12 ft. wide and connect to a head platform 17 ft. wide along the face of the house. In order to work out with a future arrangement of the main tracks at a higher grade, the house tracks are on a 1½ per cent grade descending toward the house, which is protected against runaway cars by heavy concrete bumping posts. The platforms are entirely of timber construction supported on small concrete pedestals, because it was thought undesirable to use permanent construction at this time on the filled ground which they occupy. It is proposed to replace them by permanent structures when renewal becomes necessary.

In addition to the new freight house facilities a new team yard has been provided some distance south of the station along Church street, from Pruyn street to Ferry street, a distance of about 1,300 ft., which will give eventually a capacity of about 150 cars. Plans are also under way for an express building on Maiden Lane for the United Traction Company, which operates the street cars in Albany, and serves also as a terminal transfer between the Delaware & Hudson and two interurban lines—the Albany Southern and the Schenectady Railway.

All work on the entire building was under contract to J. Henry Miller, Inc., Baltimore, Md., the contract price being \$610,000. The total cost of the terminal work to date, exclusive of real estate, is about \$750,000. The work on the building was prosecuted with unusual speed. Preliminary work was commenced in April, 1914, and the entire office building was ready for occupancy in April, 1915. All work is under the direction of James McMartin, chief engineer of the Delaware & Hudson, with Otis F. Rowland, assistant engineer in immediate charge.

PRESENT WELFARE WORK OF FRENCH RAILROADS

By WALTER S. HATT

Despite the enormous financial losses sustained by French railroads because of the war and the consequent reduction in commercial tonnage and passenger traffic, these railroads have continued their usual welfare work in the interest of their employees and have, indeed, increased it surprisingly in certain directions.

This fact is indicated in a recently issued report of the Paris-Lyons-Mediterranean Railway. In view of the facts that the railroad is under the control of the war department and that it has suffered tremendous war losses on every hand, some of these expenses might have been cut down by the board of directors. The railroad, however, seems to have shouldered all it could and to have helped freely in the united effort of the French people to keep going in war time. Even new homes for employees in conformance with plans made before the war, have been completed. The report does not call any particular attention to the work, but barely outlines the facts. The board of directors voted the usual sum to provide pensions for its 80,000 employees—a little over \$5,000,000 this year. The sum set aside for various kinds of welfare work totaled over \$6,500,000.

During the first few months of the war more than \$280,000 of the total was spent to aid the 12,000 younger employees who went to the front as soldiers, these men having served less than six months on the railroad and being subject to enrollment as soldiers and not as railroad employees engaged in military transportation. These soldiers were paid one-half their salaries and, when they had families to support, the railroad continued half of their salaries, and when possible gave the women employment as ticket sellers or clerks. In addition, such employees received their usual end of the year bonus, and their time as soldiers was counted as company service time towards promotions and participation in pensions.

The welfare work for the year 1914 is subdivided as follows:

Allowances to large families.....	\$450,000
Allowances to co-operative societies.....	30,000
Gifts to the treasury of pensions.....	4,450,000
Special pensions.....	593,000
To schools, orphans, apprentice shops, sanitariums.....	88,000
Salaries and half salaries to the sick.....	471,000
Medical supplies and care of sick.....	175,000
Hot drinks and mineral waters to employees.....	15,000
Interest on free loans.....	1,500

Among the interesting details of the general welfare work of the road, which is typical of all the French railroads, is its care of orphans of employees. In addition to the above sums, the company found homes for 188 of its own orphans and made a contribution to the national organization which cares for the 870 orphans of the railroads of France, this number having been grievously increased, because of the many deaths of soldiers at the front during the past few months. The company also provided for the schooling of 444 boys and girls of employees.

Further, this company provided homes to the number of 1,388 in the districts on its lines where rent is high or else in the country where modern houses are not available.

Note is also made of the satisfactory results of the system of loans without interest to employees, begun in 1899. During the past year \$86,000 was loaned to 2,887 employees who found themselves in urgent need of ready money, and in 1913 \$100,000 was loaned to 3,294 employees. Since 1899 the company has loaned \$1,100,000 to 32,959 employees, and during that period of 15 years has lost but \$1,300 through failures to refund.

A final paragraph of the report states that the company gave employment to some of the Belgian railroad men driven out of their own country. It also started an employment agency for the refugees from the invaded regions of northern France and found work on its own lines for 1,200 persons. At the same time it granted reduced fares to those moving to new homes.

*Our special European correspondent.

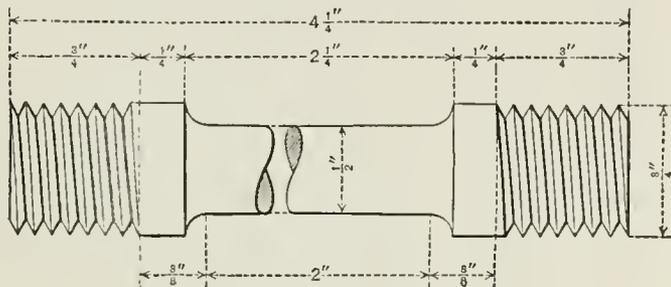

be $\frac{1}{2}$ in. square in section, or rectangular in section with two parallel faces as rolled, with corners rounded to a radius not over $\frac{1}{16}$ in.

9. If preferred by the manufacturer and approved by the purchaser, the following bend test may be substituted for that described in Section 7: A piece of the finished bar shall bend cold through 45 deg. around a pin the diameter of which is equal to three times the greatest thickness of the section, without cracking on the outside of the bent portion.

10. (a) One tension and one bend test shall be made from each melt.

(b) If any test specimen shows defective machining or develops flaws, it may be discarded and another specimen substituted.

(c) If the percentage of elongation of any tension test specimen is less than that specified in Section 6 and any part of the

Tension Test Specimen

fracture is more than $\frac{3}{4}$ in. from the center of the gage length, as indicated by scribe scratches marked on the specimen before testing, a retest shall be allowed.

11. If the results of the physical tests of any test lot do not conform to the requirements specified, the manufacturer may re-treat such lot one or more times and retests shall be made as specified in Section 10.

12. The splice bars shall be smoothly rolled, true to templet, and shall accurately fit the rails for which they are intended. The bars shall be sheared to length, and the punching and notching shall conform to the dimensions specified by the purchaser. A variation of $\frac{1}{32}$ in. from the specified size of holes, of $\frac{1}{16}$ in. from the specified location of holes, and of $\frac{1}{8}$ in. from the specified length of splice bar, will be permitted. Any variation from a straight line in a vertical plane shall be such as will make the bars high in the center. The maximum camber in either plane shall not exceed $\frac{1}{16}$ in. in 24 in.

13. The finished splice bars shall be free from injurious defects and shall have a workmanlike finish.

14. The name or brand of the manufacturer and the year of manufacture shall be rolled in raised letters and figures on the side of the rolled bars, and a portion of this marking shall appear on each finished splice bar.

15. The inspector representing the purchaser shall have free entry, at all times while work on the contract of the purchaser is being performed, to all parts of the manufacturer's works which concern the manufacture of the splice bars ordered. The manufacturer shall afford the inspector, free of cost, all reasonable facilities to satisfy him that the splice bars are being furnished in accordance with these specifications. All tests (except check analyses) and inspection shall be made at the place of manufacture prior to shipment, unless otherwise specified, and shall be so conducted as not to interfere unnecessarily with the operation of the works.

16. (a) Unless otherwise specified, any rejection based on tests made in accordance with Section 5 shall be reported within five working days from the receipt of samples.

(b) Splice bars which show injurious defects subsequent to their acceptance at the manufacturer's works will be rejected, and the manufacturer shall be notified.

17. Samples tested in accordance with Section 5, which rep-

resent rejected splice bars, shall be preserved for two weeks from the date of the test report. In case of dissatisfaction with the results of the tests, the manufacturer may make claim for a rehearing within that time.

The report was referred to letter ballot.

PROPOSED STANDARD SPECIFICATION FOR QUENCHED CARBON STEEL
TRACK BOLTS

1. (a) The steel for the bolts shall be made by the open-hearth process.

(b) The steel for the nuts shall be made by the Bessemer or open-hearth process.

2. The bolts shall enter the quenching medium at a temperature not less than 70 deg. C. The threads may be rolled either hot or cold.

3. The steel for the bolts shall conform to the following requirements as to chemical composition:

Carbon	not under 0.30 per cent
Phosphorus	not over 0.04 " "

4. An analysis to determine the percentages of carbon, manganese, phosphorus and sulphur shall be made by the manufacturer from a test ingot taken during the pouring of each melt, a copy of which shall be given to the purchaser or his representative. This analysis shall conform to the requirements specified in Section 3. Drillings for analysis shall be taken not less than $\frac{1}{8}$ in. beneath the surface of the test ingot.

5. Analyses may be made by the purchaser from finished bolts representing each melt, in which case an excess of 25 per cent above the requirement as to phosphorus specified in Section 3 shall be allowed.

6. (a) The bolts shall conform to the following minimum requirements as to tensile properties:

Tensile strength, lb. per sq. in.	100,000
Yield point,	70,000
Elongation in 2 in., per cent.	12

(b) Nuts shall be capable of developing the strength of the finished bolt up to its yield point.

7. Full-size bolts shall bend cold through 45 deg. around a pin the diameter of which is equal to the diameter of the bolt, without cracking on the outside of the bent portion.

8. Tension test specimens shall be taken from the finished bolts and shall be of the form and dimensions shown in Fig. 1 (for carbon steel splice bars).

9. (a) One tension and one bend test shall be made from each lot of 50 kegs or fraction thereof.

(b) If any test specimen shows defective machining or develops flaws, it may be discarded and another specimen substituted.

(c) If the percentage of elongation of any tension test specimen is less than that specified in Section 6 (a) and any part of the fracture is more than $\frac{3}{4}$ in. from the center of the gage length, as indicated by scribe scratches marked on the specimen before testing, or if the bend test specimen breaks in the threaded portion, a retest shall be allowed.

10. If the results of the physical tests of any test lot do not conform to the requirements specified, two additional tension and two additional bend tests shall be made from such lot, all of which shall conform to the requirements specified.

11. The bolts and nuts shall conform to the dimensions specified by the purchaser. The bolts shall be neatly formed, free from fins or nickings. The head shall be concentric with, and firmly joined to, the bottom of the bolt, with the under side of the head at right angles to the body of the bolt. The threads shall be sharp and true to gage and of the pattern specified by the purchaser. The nuts shall fit the bolts tightly so as to require a wrench not more than 10 in. in length to turn them down without distorting the threads or twisting the bolts. The nuts shall be screwed on before shipping, a sufficient number of turns to hold them on to destination. A variation of $\frac{1}{32}$ in. under and $\frac{1}{64}$ in. over the specified diameter of the body of the bolt will be permitted. The diameter of the rolled thread shall not exceed the diameter of the body of the bolt more than $\frac{1}{16}$ in. for $\frac{7}{8}$ -in. bolts and $\frac{3}{32}$ in. for 1-in. bolts. A variation in the

dimensions of the elliptical shoulders under the head of the bolt of 1/32 in. from the specified size will be permitted. A taper of the shoulder of 1/32 in. will be permitted.

12. The finished bolts and nuts shall be free from injurious defects and shall have a workmanlike finish.

13. A letter or brand indicating the manufacturer shall be pressed on the head of the bolt when it is formed.

14. The inspector representing the purchaser shall have free entry, at all times while work on the contract of the purchaser is being performed, to all parts of the manufacturer's works which concern the manufacture of the bolts and nuts ordered. The manufacturer shall afford the inspector, free of cost, all reasonable facilities to satisfy him that the bolts and nuts are being furnished in accordance with these specifications. All tests (except check analyses) and inspection shall be made at the place of manufacture prior to shipment, unless otherwise specified, and shall be so conducted as to not interfere unnecessarily with the operation of the works.

15. (a) Unless otherwise specified, any rejection based on tests made in accordance with Section 5 shall be reported within five working days from the receipt of samples.

(b) Bolts and nuts which show injurious defects subsequent to their acceptance at the manufacturer's works will be rejected, and the manufacturer shall be notified.

16. Samples tested in accordance with Section 5, which represent rejected bolts and nuts, shall be preserved for two weeks from the date of the test report. In case of dissatisfaction with the results of the tests, the manufacturer may make claim for a rehearing within that time.

This report was referred to letter ballot.

PROPOSED STANDARD SPECIFICATIONS FOR QUENCHED ALLOY-STEEL TRACK BOLTS

1. (a) The steel for the bolts shall be made by the open-hearth or electric process.

(b) The steel for the nuts shall be made by the Bessemer or open-hearth process.

2. The bolts shall enter the quenching medium at a temperature of not less than 790 deg. C. The threads may be rolled either hot or cold.

3. The steel for the bolts shall conform to the following requirement as to chemical composition:

Phosphorus.....not over 0.035 per cent

4. An analysis to determine the percentages of carbon, manganese, phosphorus and sulphur and any other elements used to obtain the physical properties specified in Sections 6 and 7 shall be made by the manufacturer from a test ingot taken during the pouring of each melt, a copy of which shall be given to the purchaser or his representative. This analysis shall conform to the requirement specified in Section 3. Drillings for analysis shall be taken not less than 1/8 in. beneath the surface of the test ingot.

5. Analyses may be made by the purchaser from finished bolts representing each melt, in which case an excess of 25 per cent above the requirement as to phosphorus specified in Section 3 shall be allowed.

6. (a) The bolts shall conform to the following minimum requirements as to tensile properties:

Tensile strength, lb. per sq. in.....	110,000
Yield point, lb. per sq. in.....	85,000
Elongation in 2 in., per cent.....	17

The rest of the five specifications are the same as for Heat-Treated Carbon Steel Track Bolts.

SPECIFICATIONS FOR SPRINGS, ALLOY STEEL FORGINGS AND AXLES

The Committee on Steel submitted proposed tentative specifications for silico-manganese steel bars for automobile and railway springs, for chrome-vanadium steel bars for automobile and railway springs, for helical and elliptical railway springs, for alloy steel forgings and for quenched-and-tempered alloy steel axles and other car and locomotive forgings. The latter are as follows:

1. (a) These specifications cover the various classes of alloy

steel forgings now commonly used in locomotive and car construction.

(b) The purposes for which these classes are frequently used are as follows:

Class K, for forgings for main and side rods, straps, piston rods, and all other forgings which are to be machined with milling cutters or complicated forming tools;

Class L, for forgings for driving and trailing-truck axles, crank pins, and other parts not requiring the use of milling cutters or complicated forming tools.

2. The steel may be made by the open-hearth or any other process approved by the purchaser.

3. A sufficient discard shall be made from each ingot to secure freedom from injurious piping and undue segregation.

4. For test purposes, a prolongation shall be left on each forging, unless otherwise specified by the purchaser.

5. (a) Unless otherwise specified by the purchaser, all forgings over 7 in. in diameter shall be hored, and all axles, shafts and similar forgings shall be rough-turned all over. The boring and rough-turning shall be done before quenching.

(b) If boring is specified, the diameter of the hole shall be at least 20 per cent of the maximum outside diameter or thickness of the forging, exclusive of collars and flanges.

6. For quenching and tempering, the forgings shall be allowed to become cold after forging. They shall then be uniformly reheated to the proper temperature to refine the grain (a group thus reheated being known as a "quenching charge"), and quenched in some medium under substantially uniform conditions for each quenching charge. Finally, they shall be uniformly reheated to the proper temperature for tempering or "drawing back" (a group thus reheated being known as a "tempering charge"), and allowed to cool uniformly.

7. The steel shall conform to the following requirements as to chemical composition:

	Acid.	Basic.
Phosphorus	not over 0.05	not over 0.04 per cent
Sulphur	not over 0.05	not over 0.05 per cent

The composition of alloy steel, other than phosphorus and sulphur, shall be agreed upon by the manufacturer and the purchaser.

8. An analysis to determine the percentages of carbon and the elements specified in Section 7 shall be made by the manufacturer from a test ingot taken during the pouring of each melt, a copy of which shall be given to the purchaser or his representative. This analysis shall conform to the requirements specified in Section 7.

9. Analyses may be made by the purchaser from a forging representing each melt, which shall conform to the requirements specified in Section 7. Drillings for analysis may be taken from the forging or from a full-size prolongation of the same, at any point midway between the center and surface of solid forgings, and at any point midway between the inner and outer surfaces of the wall of bored forgings; or turnings may be taken from a test specimen

In addition to the complete analysis, a phosphorus determination may be made by the purchaser from each broken tension test specimen, and this determination shall conform to the requirement for phosphorus specified in Section 7.

10 (a) The forgings shall conform to the requirements as to tensile properties specified in Table 1.

(b) The classification by size of the forging shall be determined by the specified diameter or thickness which governs the size of the prolongation from which the test specimen is taken

(c) The elastic limit shall be determined by means of an extensometer.

(d) Tests of forgings shall be made only after final treatment

11 If specified by the purchaser, bend tests shall be made as follows

(a) For the first and second classes by size, the test specimen shall bend cold through 180 deg around a 1 in. flat man

drel having a rounded edge of $\frac{1}{2}$ -in. radius, without cracking on the outside of the bent portion.

(b) For the third and fourth classes by size, the test specimen shall bend cold through 180 deg. around a $1\frac{1}{2}$ -in. flat mandrel having a rounded edge of $\frac{3}{4}$ -in. radius, without cracking on the outside of the bent portion.

12. Unless otherwise specified by the purchaser, all forgings shall be subjected to an impact proof test. The details of this test shall be agreed upon by the manufacturer and the purchaser.

13. (a) Tension and bend test specimens shall be taken from a full-size prolongation of any forging. For forgings with large ends or collars the prolongation may be of the same cross-section as that of the forging back of the large end or collar. Specimens may be taken from the forging itself with a hollow drill, if approved by the purchaser.

(b) The axis of the specimen shall be located at any point midway between the center and surface of solid forgings, and at any point midway between the inner and outer surfaces of the wall of bored forgings, and shall be parallel to the axis of

fied by the purchaser. Axles, shafts and similar forgings, unless otherwise specified, shall be rough-turned all over with an allowance of $\frac{1}{8}$ in. on the surface for finishing. In centering, 60-deg. centers with clearance drilled for points shall be used.

17. The forgings shall be free from injurious defects and shall have a workmanlike finish.

18. Identification marks shall be legibly stamped on each forging and on each test specimen. The purchaser shall indicate the location of such identification marks.

19. (a) The inspector representing the purchaser shall have free entry, at all times while work on the contract of the purchaser is being performed, to all parts of the manufacturer's works which concern the manufacture of the forgings ordered. The manufacturer shall afford the inspector, free of cost, all reasonable facilities to satisfy him that the forgings are being furnished in accordance with these specifications. Tests and inspection at the place of manufacture shall be made prior to shipment.

(b) The purchaser may make the tests to govern the acceptance or rejection of the forgings in his own laboratory or

TABLE I—TENSILE PROPERTIES (CLASSES K AND L)

For Forgings whose Maximum Outside Diameter or Thickness is not over 10 in. when Solid, and not over 20 in. when Bored

Class	Size	Tensile Strength, lb. per sq. in.	Elastic Limit, min., lb. per sq. in.	Elongation in 2 in., min., per cent	Reduction of Area, min., per cent
K Alloy Steel, Quenched and Tempered	Up to 2 in. in outside diameter or thickness, 1-in. max. wall.....	95,000—115,000	70,000	20	50
	Over 2 to 4 in. in outside diameter or thickness, 2-in. max. wall.....	90,000—110,000	65,000	20	50

	Over 4 to 7 in. in outside diameter or thickness, $3\frac{1}{2}$ -in. max. wall.....	100,000—120,000	75,000	20	50
	Over 7 to 10 in. in outside diameter or thickness, 5-in. max. wall.....	100,000—120,000	75,000	18	45
	Outside diameter or thickness not over 20 in., 5 to 8-in. wall.....	95,000—115,000	70,000	18	45

the forging in the direction in which the metal is most drawn out.

(c) Tension test specimens shall be of the form and dimensions shown in the illustration.

(d) Bend test specimens shall be $\frac{1}{2}$ in. square in section with corners rounded to a radius not over $\frac{1}{16}$ in., and need not exceed 6 in. in length.

14. (a) One tension and, if specified by the purchaser, one bend test shall be made from each tempering charge. If more than one quenching charge is represented in a tempering charge, one tension and, if specified, one bend test shall be made from each quenching charge. If more than one melt is represented in a quenching charge, one tension and, if specified, one bend test shall be made from each melt.

(b) If more than one class of forgings by size is represented in any lot, one tension and, if specified, one bend test from a forging of each class by size shall be made as specified in Sections 10, 11 and 13.

(c) If any test specimen shows defective machining or develops flaws, it may be discarded and another specimen substituted.

(d) If the percentage of elongation of any tension test specimen is less than that specified in Section 10 (a) and any part of the fracture is more than $\frac{3}{4}$ in. from the center of the gage length, as indicated by scribe scratches marked on the specimen before testing, a retest shall be allowed.

15. (a) If the results of the physical tests of any test lot do not conform to the requirements specified, the manufacturer may retemper or requench and temper such lot, but not more than three additional times unless authorized by the purchaser, and retests shall be made as specified in Section 14.

(b) If the fracture of any tension test specimen shows over 15 per cent crystalline, a second test shall be made. If the fracture of the second specimen shows over 15 per cent crystalline, the forgings represented by such specimen shall be retempered or requenched and tempered.

16. The forgings shall conform to the sizes and shapes speci-

elsewhere. Such tests, however, shall be made at the expense of the purchaser.

(c) Tests and inspection shall be so conducted as not to interfere unnecessarily with the operation of the works.

20. (a) Unless otherwise specified, any rejection based on tests made in accordance with Section 19 (b) shall be reported within five working days from the receipt of samples.

(b) Forgings which show injurious defects while being finished by the purchaser will be rejected, and the manufacturer shall be notified.

21. Samples tested in accordance with Section 19 (b), which represent rejected forgings, shall be preserved for two weeks from the date of the test report. In case of dissatisfaction with the results of the tests, the manufacturer may make claim for a rehearing within that time.

FINISHING TEMPERATURES OF RAILS

In a recent paper by G. K. Burgess, J. J. Crowe, H. S. Rawdon and R. G. Waltenburg, which was issued by the Bureau of Standards under the title "Observations on Finishing Temperatures and Properties of Rails" (*Railway Age Gazette*, June 26, 1914) the standard specifications for steel rails adopted by the American Society for Testing Materials are criticized, in a general condemnation of the use of shrinkage allowance as the basis of temperature determination.

2. In that the shrinkage permitted is too great.

The committee took these criticisms under consideration, and presents a report.

Shrinkage Allowance vs. Pyrometer Control

Theoretically the determination of the finishing temperature of a bar of steel, because of the sensitiveness of the measuring apparatus, should be much more exact than measuring the variation in the change of length of a bar in cooling. There are, however, two reasons why the cruder means is preferable.

1. It is much easier to enforce. The mill must set the saws at such a distance apart in the case of gang saws, or at such distance from the stop in the case of a single saw, that when rails

are cold they will be within the close tolerances for length prescribed by the specifications. The penalty for not observing this is the milling of every rail to length, and the penalty is so severe in a modern rail mill that there is no question that the proper adjustment of the hot length will be provided. The measurement of temperatures of rails by pyrometer is a much more complicated proposition. Carrying the identity of each hot rail as to its observed temperature through the mill and out to the finishing shed where it can be rejected where necessary, would be a difficult and expensive procedure.

2. The pyrometer measures the temperature at the particular portion of the bar that is under observation. For a simple section this does not vary greatly, but in a complex section, like a T rail, there is a wide variation in the temperature of the various parts.

The Amount of Shrinkage

The authors of the paper have taken the maximum shrinkage allowed in the specifications of the society, and by dividing by the coefficient of shrinkage established by their experiments, have arrived at a temperature which they claim could be used in rolling rails, and yet keep within the requirements of the specifications. Such a method of arriving at rolling temperatures is not admissible in the case of unbalanced sections. The shrinkage allowance necessary for rails is a function, not only of the average temperature, but also of the section. The flanges of a thin-base section cool much more rapidly than the other parts of the section, and in cooling first, they become more rigid than the remainder of the section. When cut by the saws the cooler base and hotter head are of the same length, but as the head has a greater range to cool through, its shrinkage would be greater and cold length less than the base. This is corrected by the cambering rolls, which stretch the head to such length as will compensate for its greater shrinkage.

The shrinkage allowance necessary for any rail is not the shrinkage allowance based on the average temperature of the rail, nor the temperature of the head or base, such as observed in the Bureau of Standards' experiments; but the shrinkage allowance in sawing, which is necessary for any rail, is the amount of shrinkage of the portion which cools and becomes rigid first.

In view of the importance of the subject, it seems very desirable to secure some data as to the effect of the variation in the finishing temperature on the quality of the rail. While there is a large amount of literature bearing on the subject, actual dependable data regarding the quality of the rails are very scarce. M. H. Wickhorst reported on a series of tests made on Bessemer rails, the finishing temperatures of which measured on the heads varied from 940 to 1,030 deg. C., and more recently he reported on a similar series of tests made on open-hearth rails. The rails were subjected to drop tests, bend tests, tension tests, transverse tests of base, and the structure was examined under the microscope.

As a result of the tests on Bessemer steel rails, Mr. Wickhorst reported "that the ductility and deflection in the drop test were influenced little, if any, by the temperature. The number of blows that it took to break the rails in the drop test was uninfluenced by the temperature of rolling. The yield point and tensile strength in the tension tests were influenced little, if any. The elongation in the tension test decreased some as the temperature increased. The influence of temperature showed most prominently in the tension test, in the reduction of area, which decreased as the temperature of rolling increased. The size of the grain, as shown by the microscope, increased as the temperature increased."

His conclusions on the open-hearth series, which were rolled at temperatures between 695 and 850 deg. C., were as follows:

"It may be said that the results in the drop tests, slow bending tests and transverse tests of the base, were about the same for the different finishing temperatures, varied by holding the rail bar between rolls before final finishing. In the tensile tests the results were also about the same, except that the lower

finishing temperatures showed a little greater elongation and reduction of area. The lower finishing temperatures also showed a somewhat finer grain structure."

In all of the information as to actual tests which the committee was able to obtain, there is lacking anything which points to such decided differences in the quality of rails rolled at varying temperatures, as theoretical considerations have led some to expect. The differences are so slight that it seems hardly justifiable to go to any great expense in determining finishing temperatures any more accurately than is possible with the shrinkage clause, which on account of its easy application is by far the most convenient means of checking the finishing temperature.

CHANGES IN DUES

At the opening of the fifth session the secretary presented a report from the joint executive committee composed of the incoming and outgoing officers, recommending that the dues of members be increased from \$10 to \$15 per year; those of juniors from \$5 to \$7.50 and those of members in perpetuity from \$200 to \$300. It was voted to accept the report and refer the suggestion to letter ballot.

MICROGRAPHIC DETERMINATION OF DECARBURIZATION OF HEAT-TREATED STEELS

The report called attention to the possibility of detecting the amount and depth of decarburization of the surface and stated, in conclusion, that surface decarburization frequently exists in heat-treated steel parts, due either to the mill practice or to the heat treatment itself. From whatever cause, it should be investigated by the metallurgist and its extent ascertained. The microscope is undoubtedly the most efficient means of accomplishing this purpose in hypo-eutectoid steels. When the exact cause and extent have been determined, means may be provided for correcting it—at least to a certain extent. In the grinding operation, however, there sometimes lies the opportunity of entirely removing its deleterious effects by a judicious determination of the grinding limits, and in this the metallurgist should play a more conspicuous part than he has in the past.

RELATIONS BETWEEN MAXIMUM STRENGTH AND HARDNESS

This paper showed that there is a close relationship between the hardness of a steel and the maximum strength; and that this relationship exists whether the same maximum strength be obtained from different steels by a difference in the heat-treatment to which they are subjected or whether the hardness is different because of difference in the steels themselves. In this it appears that there is no relationship between the chemical composition and the hardness, but only between the hardness and the maximum strength.

Discussion.—In the brief discussion that followed attention was called to the desirability that there should be found to be some relationship between the hardness and the limit of elasticity as this is really the quality with which the designer is most concerned. It is exceedingly desirable that some quick method should be found for determining the elastic limit of materials and that, without mutilation. It was shown that this might be done for any specific steel treated in a definite manner, where the limit of elasticity was known from other means and that the hardness test might thus be made to indicate the elastic limit of another piece similarly treated.

SOME NEGLECTED PHENOMENA IN THE HEAT-TREATMENT OF STEEL

The two points to which attention was particularly called in this paper were that, in the heating of a piece of steel to a point above its temperature of saturation, there was a pause in the rate of heating as the temperature of the piece was passing through the saturation temperature, and further that with constant furnace temperatures, the higher temperatures were reached by the pieces in a shorter time than the lower ones. For example, a temperature of 1,200 deg. F. was reached in a shorter time than one of 1,000 deg. and one of 1,000 deg. in a shorter time still, while to reach 1,100 deg. took the longest of all. The

explanation of this is that the absorption of heat varies as the difference between the fourth powers of the temperatures of the furnace and the piece being heated and that this difference increases as the furnace temperature increases, so that the absorption of heat is correspondingly more rapid. The seeming exception in the case of the rise to 1,400 deg. is explained on the ground of the phenomenon of lag in passing through the temperature of saturation, which is at about 1,350 deg., and therefore close to 1,400, where the difference of the fourth power is small, resulting in a slow increase of temperature at that point.

Discussion.—The discussion called attention to the practice of specifications calling for a slow heating and a rapid cooling as though the two practices were in opposition to each other, but it was explained that, in heating a piece, it was put under tension and that if the work were to be done rapidly, cracks would be developed, while in the case of cooling the surfaces were put in compression and there was not the same danger.

INTERNAL STRESSES DEVELOPED BY DIFFERENT QUENCHING MEDIUMS, AND THEIR EFFECTS

It was shown that the quenching power of a liquid depends largely on the latent heat of vaporization, and refutes the views commonly held that it depends upon the initial temperature or the heat conductivity of the medium. The addition of salt to increase the quenching power of water is also proved fallacious, and the experiments of Le Chatelier that the conductivity for heat is no measure of the cooling power of a liquid are confirmed.

Mercury has a heat conductivity of over ten times that of water, but both of these able physicists demonstrate that it is decidedly weaker as a cooling medium. Le Chatelier considers that the specific heat of the cooling medium governs the cooling speed—and this is confirmed by Benedicts—providing the temperature of the body is low, but the latent heat of vaporization is the controlling factor when the temperature of the body is high. This theory is tenable considering the large amount of heat which can be carried off by a relatively small weight of vapor, and accounts for the efficiency of water as a quenching medium.

Water is the oldest known cooling medium for quenching steel. Subsequently, various animal and vegetable oils were employed, and many of the artisans using them are still under the belief that carbon is added to the steel by these liquids and the properties thereby improved. In this country mineral oil, because of its low cost, has almost entirely displaced the animal and vegetable oils, and for many years was used almost exclusively for quenching spring plates and large objects. Water, however, possesses manifest advantages of cheapness, cleanliness, freedom from odor, freedom from fire hazard, and above all, efficiency. It is true that a higher elastic limit, tensile strength and elastic ratio for a corresponding elongation and reduction of area, or a higher reduction of area and elongation for a corresponding elastic limit, can be obtained on a water-quenched steel than can be secured by the methods of oil quenching generally practiced. Opposing these manifest advantages is the danger from fractures as the result of the lag in the temperature of the steel.

The results of these experiments are as follows:

1. That the tensile properties of water-quenched steel are superior to those obtained by quenching in any other of the usual quenching mediums.
2. The internal stresses induced in a water-quenched object are of much greater magnitude than those developed by quenching in any other of the usual quenching mediums.
3. They confirm the laboratory experiments of Doctor Benedicts, that the efficiency of the quenching mediums is not dependent to a marked extent on the initial temperature of the cooling mediums.
4. With but few exceptions, which can no doubt be explained by some inequality in the steel, the induced internal stresses are affected by the initial temperature, except in the case of water.
5. Internal stresses induced by quenching in water are independent of the initial temperature.

6. The small difference between the temperature of the cooling mediums, before and after quenching, confirms Doctor Benedicts' explanation that large quantities of heat are carried off by the latent heat of vaporization.

7. Light oils have a greater quenching speed than heavy oils but not markedly so. A good tempering oil, however, should be free from tar and should not become thick from the precipitation of the burnt tar.

THE EFFECT OF FINER GRINDING UPON THE PHYSICAL PROPERTIES OF PORTLAND CEMENT

The following is from a paper on this subject by P. H. Bates. The question of the finer grinding and the addition of more SO_3 to Portland cement is frequently discussed, and the consensus of opinion seems to be that further investigation is needed. Ten commercial cements either had more SO_3 added to them, were ground finer, or were both ground finer and had more SO_3 added. From the four groups of ten cements each, the customary physical tests and small specimens were made. In addition cylinders of 1:1½:4½ concrete were made, and expansion bars of neat and 1:3 standard sand mortars. Some of the neat tension briquettes were also examined microscopically for relative amounts of hydration.

The results show that the time of set is affected somewhat by each of the above treatments, finer grinding tending to produce a quicker set, and the addition of more SO_3 a quicker initial but slower final set. The addition of SO_3 to the coarser-ground cements does not materially affect the strength; finer grinding produces considerable increase; while the addition of SO_3 to the finer-ground cements tends to produce results very slightly less than those obtained when they contain the normal amount. Expansion measurements show that the addition of SO_3 to the coarse cements produces a large increase in length of neat cements; to finer-ground cements the increase is not so great. Finer grinding alone does not materially affect the expansion due to hydration; the expansion of the mortar bars is not materially affected by the use of the different cements.

All conclusions made in this paper are deduced from results obtained from specimens tested at the end of 90 days. Specimens have been made to be tested at the end of six months, one year, and two later periods, and consequently the present conclusions may have to be materially modified.

STANDARD TESTS FOR LUBRICANTS

The committee has very carefully reconsidered its report of last year, which was referred back to it by the Society.

For the determination of viscosity, the committee reaffirms its recommendation of last year to the Society that the Saybolt Standard Universal Viscosimeter be the standard. The very careful investigation of Dr. C. W. Waidner of the Bureau of Standards, showing that the Saybolt instrument possesses as great accuracy as any other viscosimeter used for the determination of the viscosity of lubricants, confirms the previous opinion of the committee. The Saybolt viscosimeter is the instrument in practically universal use in the United States for the determination of the viscosity of lubricants, and possesses many other advantages covered by the committee's report of last year.

On the question of an alternate instrument for viscosity, the committee after very careful consideration has concluded that the adoption of an alternate instrument would entirely destroy the value of a standard instrument. The committee realizes, however, that there are many who for years past have used other instruments than the Saybolt and will probably continue to do so, and in order not to work undue hardship in these cases, the committee is now submitting, and will submit from time to time, conversion tables for converting readings on various viscosimeters into readings on the Saybolt Standard Universal Viscosimeter.

The committee recommends that the proposed Standard Tests for Lubricants covering viscosity, specific gravity, free acid, and cloud and pour tests, be referred to letter ballot of the society.

PAINTS USED IN HAVRE DE GRACE BRIDGE TESTS

The special sub-committee, to which was referred the motion made at the last annual meeting of the society charging it to renew its efforts to obtain such additional information as would enable the committee to describe the composition of the several paints of the Havre de Grace bridge tests more satisfactorily to the engineering profession, than could be interpreted from the committee's published analyses, and also to compile a brief résumé of the methods and conditions of the test, reports as follows:

Under date of November 20, 1914, a circular letter was sent to each of the manufacturers who furnished paints for the Havre de Grace bridge tests. This letter referred to the continued demand for fuller information as to the composition of the paints, and for an identification of the manufacturers' names with the paints tested. Two inquiries were made of each manufacturer, namely: (1) "Would you object to the committee reporting to the Society that panels and section Nos. — were painted with paint furnished by you?"; and (2) "It is our plan to publish a brief description of your paint, such description to be based either upon the analysis which we have made, or upon information received from you. Would the following description of your paint be satisfactory?"

The letter also requested "that if the enclosed description is not satisfactory, please send one that is," adding that information of value to engineers was desired. Furthermore, there was enclosed to each manufacturer a blue-print "log," giving the record of the particular paint as applied, with a statement that copy of this had been sent originally upon completion of the painting of the bridge, and that such record was to be published by the committee.

The receipt of this letter was acknowledged by all but two of the contributing manufacturers. Of those who acknowledged the receipt of the letter, the manufacturers of nine paints were willing to have their names published in connection with the paints. The manufacturers of six paints were unwilling, and the manufacturers of two paints did not reply to this specific inquiry. The manufacturers of seven paints accepted the sub-committee's description without suggesting modifications. Ten suggested modifications.

The objections of the manufacturers of six paints to the publication of their names in connection with the paints makes it impossible for the sub-committee in good faith to publish any information relating thereto.

Satisfactory replies to the original circular letter asking for contributions to defray the expenses of the test having been received from a sufficient number of manufacturers to warrant the inauguration of the test, costs were figured on an area basis and a second circular letter sent to those who had agreed to enter the competition, the most important point involved being the following questions propounded, covering the composition and proportioning of the materials of each paint:

- Pigment; .
- Volatile thinner;
- Vehicle or liquid non-volatile matter, particular information being desired as to the following:
 1. Saponifiable oils, that is, linseed, etc.;
 2. Resinous matter, that is, resins and gums;
 3. Bituminous matter, that is, asphaltum, pitch, etc.
- Mineral matter such as lead, manganese, lime, etc., other than that present as pigment.

Unfortunately these questions were regarded as too searching by many paint manufacturers on the ground that if answered they would disclose trade secrets and methods of manufacture, since the committee had stated that in formulating the above list of questions the information sought was not intended to include trade secrets or particular methods of treatment or manufacture of the constituents of the paints.

In view of the attitude of the manufacturers, and to avoid the complete jeopardizing of the proposed tests, the above questions were specifically withdrawn and only such information as the manufacturers were willing to submit was asked for. This, coupled with that to be derived from the duplicate analyses

of each paint by the committee, comprised all the data accumulated whereon to base descriptions of the paints such as are desired by the large engineering membership of the society.

It must be understood that the committee fully recognized, as soon as the manufacturers refused the fullest information regarding their paint products, that a considerable part of the anticipated value of these tests would not be realized. Appreciating as time went on during the annual inspections, that the action of certain paints might be more intelligently interpreted with fuller detailed information not in the possession of the committee and not to be derived from a study of the most complete analyses but probably within the knowledge of the manufacturers, the unsatisfactory conditions imposed through the manufacturers' refusal to answer the original questions became so apparent that informal attempts were made from time to time to sound the manufacturers regarding the possibility of their meeting the committee's wishes. But with the development of the tests, it became more and more apparent that such information as desired by the committee could only have been obtained as originally proposed at the time of inauguration of the tests.

The test logs of the several paints give detailed information regarding the conduct of the tests which, as originally stated, was aimed to be "eminently fair to each competitor and to the paints themselves." The annual inspections were carefully carried out, all ratings being with the same scale, and detailed examination of yearly reports will demonstrate the surprising concordance of these with conditions likely to exist.

No attempt has been made in the reports on the Havre de Grace bridge tests to give full information as to the prices of the paints used, although it is recognized that engineers must consider price in figuring the cost of protection against rust.

SPECIFICATIONS FOR YELLOW-PINE BRIDGE AND TRESTLE TIMBERS

[These proposed revised standard specifications are to be applied to solid members and not to composite members.]

General Requirements:

1. Except as noted, all timber shall be cut from sound trees and sawed standard size; close-grained and solid; free from defects such as injurious ring shakes and crooked grain; unsound knots; knots in groups; decay; large pitch pockets, or other defects that will materially impair its strength.

2. (a) Dense southern yellow pine shall show on either end an average of at least six annual rings per inch and at least one-third summer wood, or else the greater number of the rings shall show at least one-third summer wood, all as measured over the third, fourth, and fifth inches on a radial line from the pith. Wide-ringed material excluded by this rule will be acceptable, provided that the amount of summer wood as above measured shall be at least one-half.

(b) The contrast in color between summer wood and spring wood shall be sharp and the summer wood shall be dark in color, except in pieces having considerably above the minimum requirement for summer wood.

(c) In cases where timbers do not contain the pith, and it is impossible to locate it with any degree of accuracy, the same inspection shall be made over 3 in. on an approximate radial line beginning at the edge nearest the pith in timbers over 3 in. in thickness and on the second inch (on the piece) nearest to the pith in timbers 3 in. or less in thickness.

(d) In dimension material containing the pith but not a 5-in. radial line, which is less than 2 in. by 8 in. in section or less than 8 in. in width, that does not show over 16 sq. in. on the cross-section, the inspection shall apply to the second inch from the pith. In larger material that does not show a 5-in. radial line the inspection shall apply to the 3 in. farthest from the pith.

(e) The radial line chosen shall be representative. In case of disagreement between purchaser and seller the average summer wood and number of rings shall be the average of the two radial lines chosen.

3. Sound southern yellow pine shall include pieces of southern pine without any ring or summer wood requirement.

4. Rough timbers sawed to standard size shall mean that they shall not be over $\frac{1}{4}$ in. scant from actual size specified. For in

stance, a 12-in. by 12-in. timber shall measure not less than 11¾ in. by 11¾ in.

5. Standard dressing means that not more than ¼ in. shall be allowed for dressing each surface. For instance, a 12-in. by 12-in. timber shall, after dressing four sides, not measure less than 11½ in. by 11½ in.

II. Stringers

6. (a) Dense southern yellow pine shall show not less than 80 per cent of heart on each of the four sides, measured across the sides anywhere in the length of the piece; loose knots, or knots greater than 1½ in. in diameter, will not be permitted at points within 4 in. of the edges of the piece.

(b) Sound southern yellow pine shall be square-edged, except it may have 1 in. wane on one corner. Knots shall not exceed in their largest diameter one-fourth the width of the face of the stick in which they occur. Ring shakes extending not over one-eighth of the length of the piece are admissible.

III. Caps and Sills

7. (a) Dense southern yellow pine shall show 85 per cent of heart on each of the four sides, measured across the sides anywhere in the length of the piece, and shall be free from knots over 2½ in. in diameter. Knots shall not be in groups.

(b) Sound southern yellow pine shall be square-edged, except that it may have 1 in. wane on one corner, or ½ in. wane on two corners. Knots shall not exceed in their largest diameter one-fourth the width of the face of the stick in which they occur. Ring shakes extending not over one-eighth the length of the piece.

IV. Posts

8. (a) Dense southern yellow pine shall show not less than 75 per cent of heart, measured across the face anywhere on the length of the piece, and shall be free from knots over 2½ in. in diameter. Knots shall not be in groups.

(b) Sound southern yellow pine shall be square-edged, except it may have 1 in. wane on one corner, or ½ in. wane on two corners. Knots shall not exceed in their largest diameter one-fourth the width of the face of the stick in which they occur. Ring shakes shall not extend over one-eighth of the length of the piece.

V. Longitudinal Struts or Girts

9. (a) Dense southern yellow pine shall show one face all heart; the other face and two sides shall show not less than 85 per cent of heart, measured across the face or side anywhere in the piece, and shall be free from knots 1½ in. or over in diameter.

(b) Sound southern yellow pine shall be square-edged and sound, and shall be free from knots 1½ in. or over in diameter.

VI. Longitudinal X-Braces, Sash Braces and Sway Braces.

10. (a) Dense southern yellow pine shall show not less than 80 per cent of heart on two faces and four square edges, and shall be free from knots over 1½ in. in diameter.

(b) Sound southern yellow pine shall be square-edged and sound, and shall be free from knots 2½ in. or over in diameter.

PROPOSED TENTATIVE SPECIFICATIONS FOR SOUTHERN YELLOW-PINE PILES AND POLES TO BE CREOSOTED

1. The specifications as to strength shall agree with the requirements that will be finally adopted by the Society under the Standard Classification of Structural Timber stipulating the number of rings per inch or some substitute therefor. (Included in this section will also be a list of the allowable defects, etc.)

2. All piles or telegraph poles shall show 40 per cent sapwood in cross-section, or there shall be a ring of sapwood not less than 1 in. in thickness all around the heartwood.

3. (a) Piles and poles shall be cut from sound live trees, of straight grain and regular taper; without crooks exceeding one-fourth the diameter of the stick at the middle of the crook when peeled. They shall be free from rot, red heart, holes or rotten knots, shakes and felling checks.

(b) All piles and poles shall have the bark and inner skin carefully removed when the tree is felled; all limbs and knots trimmed flush and butts cut square.

4. The minimum diameter of piles after peeling shall be as follows:

Length	Butts, In.	Tops, In.
36 ft. and under	14	10
38 ft. and under 50 ft.	14	9
50 ft. and over	15	9

No pile with butt diameter over 18 in., nor top diameter over 13½ in., will be accepted. The length of each pile is to be legibly marked on the butt with white or black paint.

PROPOSED TENTATIVE SPECIFICATIONS FOR SOUTHERN YELLOW-PINE TIMBER TO BE CREOSOTED

1. The specifications as to strength shall agree with the requirements that will be finally adopted by the society under the Standard Classification of Structural Timber, covering the number of rings per inch or some substitute therefor. (Included in this section will also be a list of the allowable defects, etc.)

2. All pieces shall show at least 30 per cent sapwood in cross-section. This is based on a minimum treatment of 12 lb. of creosote per cubic foot of timber.

3. In bridge stringers knots greater than 1½ in. in diameter shall be at least 4 in. from the edges of the stick. There shall be no knots more than 4 in. in greatest diameter in any part of the stick.

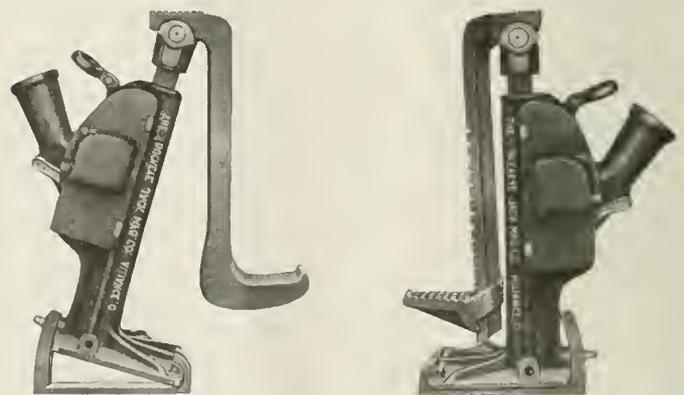

4. Caps, sills, posts and sawed poles must be free from knots more than 2½ in. in diameter.

5. Longitudinal bracing, cross-arms and similar pieces having small cross-section shall have no knots more than 1 in. in diameter.

6. Track ties shall show at least 20 per cent sapwood in cross-section. This is based on a minimum full-cell treatment of 8 lb. creosote per cubic foot of timber.

EMERGENCY JACKS

The jacks shown in the illustration include several features which are especially valuable in equipment designed for emergency use. These are the swivel top, to which is pivoted an auxiliary hook for low lifting operations and an auxiliary heel plate which enables the operator to use the jack at an angle without blocking up. An adjustable auxiliary lift is shown on one of the jacks, which may be quickly adjusted to the load without sacrificing a portion of the lifting range of the jack. The foot of the jack is so designed that the auxiliary heel plate may be applied in two positions at right angles to

Jacks with Adjustable Heel Plates and Low Lifting Hooks

each other, thus permitting the operation of the jack tilted either sideways or forward. The heel plate provides a substantial footing for the tool in any position without the necessity of special blocking. When so desired it may be removed and the jack operated upon its own base.

These jacks have recently been added to the line of the Buckeye Jack Manufacturing Company, Alliance, Ohio. In designing them special attention was given to the elimination of unnecessary parts in order that the number of repair parts required may be kept at a minimum. The parts are easily assembled, and repairs may be made by the ordinary shop labor.

General News Department

The Chicago & Alton has increased the working time at its shops at Bloomington, Ill., from eight to nine hours a day.

In the Federal Court at Charleston, W. Va., July 2, the government filed suit against the Chesapeake & Ohio for 21 violations of the hours-of-service law, the charges relating to the operation of freight trains on the Coal River branch.

The Carolina, Clinchfield & Ohio is now open for regular passenger and freight business to Elkhorn City, Ky., 35 miles north of the former northern terminus at Dante, Va. Through passenger trains began running on the first of July.

The Interstate Commerce Commission, Department of Valuation, has modified its valuation order No. 9, fixing the compensation of the railways for the movement of outfit cars used by the federal valuation parties so as to provide a minimum charge of \$2 per movement.

During the month of June the Norfolk & Western dumped 853,845 tons of coal over its coal piers at Lambert's Point, Norfolk, establishing a new high record. The record for the previous month was 716,002 tons, which was the previous high record, exceeding that of 694,000 tons established in September, 1914.

The Southern Pacific announces that the Panama-Pacific Exposition has awarded to it the grand prize, which will consist of a medal and a diploma covering track, equipment and shop products, and the company's safety first exhibition in the Transportation building; and also the traffic promotion exhibit in the company's own building.

In the state court at Columbia, S. C., July 2, the Southern Railway and other carriers secured a temporary injunction restraining the state tax commissioners, and other state officers, from collecting the three-mill annual license tax imposed on the railroads, insofar as the assessment is based on income from interstate commerce. The court will give a hearing on July 15.

Patrick W. Mulligan, crossing watchman of the Pennsylvania at Norristown, Pa., who received from President Wilson a medal, awarded in accordance with the Act of Congress, in recognition of his heroism in saving a little child who was in danger of being run over by a locomotive, has received a second medal, one from the Carnegie Hero Fund.

The Pennsylvania Public Service Commission has prepared a report showing that there are 151 tunnels in operation in that state. These tunnels aggregate 31 miles in length, the longest being at Greentree on the Wabash-Pittsburgh, which is 4,716 ft. long. Others are at Gallitzin, on the Pennsylvania, 4,716 ft.; Mahanoy, Philadelphia & Reading, 3,406 ft., and Big Savage, Western Maryland, 3,296 ft. The Gallitzin and Mahanoy tunnels have electric ventilating apparatus.

J. A. McCrea, general manager of the Long Island, says that it is only by the rarest chance that there was not a series of disastrous accidents to automobiles at grade crossings on that road during the week ending June 28. Every day he receives reports to the effect that the crossing gates at this or that place have been broken by drivers who thought more of speed than of safety. In that one week there were a dozen or more such cases. Mr. McCrea has issued a list of these "near accidents."

The San Pedro, Los Angeles & Salt Lake has issued to its employees a special bulletin on trespassing, urging them to begin a campaign of agitation in their individual circles of influence to arouse the public to a realization of the dangers of trespassing. The bulletin says: "The Salt Lake route is a safe road to ride upon. In the last eight years no passengers have been killed in train accidents. It is a very unsafe road to walk upon. During the same period 101 trespassers have been killed."

Upon the recent retirement of William McNab, principal assistant engineer, Grand Trunk, from the board of direction

of the American Railway Engineering Association after a continuous service of 11 years, he was elected an honorary member of the governing board and appropriate resolutions were passed in appreciation of his long service in various important positions, including that of president. These resolutions have been incorporated in an elaborate book which has been prepared for presentation to Mr. McNab.

In the United States District Court at New York City, July 7, Judge Grubb and a jury decided in favor of the New York, New Haven & Hartford Railroad in the suit for \$25,000 damages brought by Florence Clarke, a widow of George L. Clarke, engineer of the Boston Express, who was killed in the Westport derailment, October 3, 1912. Mrs. Clarke contended that the wreck was due to the bad condition of the track. Counsel for the New Haven convinced the jury that it was Engineer Clarke's failure to obey the stop signals set against the train that resulted in the wreck. All the other suits for loss of life have been settled by the road. It has also paid \$450,000 to claimants for personal injuries.

A remarkable record has just been made by the maintenance of way department of the Lehigh Valley in the loading of rails. Two work trains, equipped with every sort of a loading device from a locomotive crane to a ditching machine, in one day loaded from alongside the tracks 171,988 feet of 90-lb. relaying rail, with joints complete. This amount of work equals 2,303.41 tons or 16 track miles, believed to be the greatest amount of rail ever loaded on one division in one day. The cost of this work amounted to 15.7 cents a ton. A few days later on the Seneca division of the same road one work train loaded 149,466 feet of 90-lb. rail with joints complete, an even greater record. This equals 14.15 track miles or 2,001.78 tons of rail; cost per ton 15.6 cents.

President Fairfax Harrison, of the Southern Railway, has signalized the close of the company's fiscal year by sending to all officers and employees the following message: "We are closing today a fiscal year which has been full of anxiety and difficulty, but through team work and loyal self-sacrifices and effort by the entire organization, we have come out of it sound and full of courage for the future. This result has not been due to any one man or to any group of men, but to the co-operation of every man who has recognized the problem and given us in our common duty the best that was in him. I send my personal thanks then to everyone of you. The fight is not yet over, but the spirit of the past ten months is bound to see us through. Meanwhile, I want you to know my pride in you and in what has been done already."

J. E. Sexton, general manager of the Eureka & Palisade, the narrow gage railroad running trains three times a week between Palisade, Nev., and Eureka, 84 miles, who has complained, without avail, to the postoffice department because the government hires the mails carried by a mule team—taking 33 hours to traverse the 84 miles, when his train runs through in ten hours—has written an open letter to the presidents of the Southern Pacific and the Atchison, Topeka & Santa Fe to enlist their assistance. In this letter he begins by protesting, as a stockholder, against the granting of free transportation by these roads to the employees of the California State Railroad Commission, which free transportation he says, is contrary to the provisions of the constitution of that state. The commission has 200 employees and they travel all over the state on many errands, having nothing to do with railroad business, their investigations having to do with water companies, light companies and other kinds of public utilities. From this general protest against the over-reaching practices of government, Mr. Sexton goes on to restate his grievance against the postoffice department. With this our readers have already been made acquainted. The gist of the complaint is that the government is working against its own interest when, following the technicalities of the law, it employs a slow mule team to carry mail which could be carried much more quickly

by the steam locomotive. Referring to the postmaster general and his action under the constitution, Mr. Sexton says: "If the constitution was formed to establish justice, insure domestic tranquillity and guarantee to every person the equal protection of the law, the postmaster general is yet ignorant of the fact, but I will venture the opinion that if the inhibition complained of militated against a man because he was a member of a labor organization, there would be no tranquillity around his official roost at Washington until some action was taken."

Summary of Revenues and Expenses of Large Steam Roads

The following figures were compiled by the Interstate Commerce Commission from monthly reports of operating revenues and expenses of large steam roads for April, 1915. No reports

Accident Record—Correction

An officer of the Baltimore and Ohio writes that the number of trespassers killed in the derailment at Belmont, Ohio, May 14, reported in the Railway Age Gazette, June 18, page 1414, was two, not eight.

Efficiency on the New Haven

The efficiency bureau of the New York, New Haven & Hartford, since June 1, 1914, has made improvements in the view for wayfarers on the highway at 250 grade crossings; and a large number of crossings had been improved before that date.

At about 40 stations on the road, some near New York and some near Boston, red or white stripes have been painted on the platforms, on the side adjacent to the track to warn pas-

*Because of changes in accounting classifications, consolidations of companies, etc., comparative averages are approximate only

are included for roads whose operating revenues for the year ended June 30, 1914, did not reach \$1,000,000. The figures are compiled as rendered and should not be considered final, inasmuch as scrutiny of the reports may lead to their modification before acceptance.

sengers to keep back. The stripe is 3 in. wide and about 30 in. from the edge of the platform.

The standard clearance diagram of the company, designed to prevent the erection of any structure or the placing of any material too near the tracks has been the subject of investigation

throughout the company's territory and a strict enforcement of the regulations has been provided for. In this connection the proper care of baggage trucks and other things at stations has been attended to, and new rules have been prescribed for the safe operation of hand cars, velocipedes and motor cars.

The division efficiency committees meet every month and by means of interlocking committees useful ideas brought out on any division are made available throughout the company's lines. The yards and the larger stations are to be supplied with first-aid cabinets.

The Mutual Magazine

This is the title of a new monthly periodical which has been started by "The Mutual Beneficial Association of Pennsylvania Railroad Employees," an organization which has been organized for the purposes indicated in the title, and which has an insurance department. It has a large membership already. Its insurance feature seems to be popular notwithstanding the existence of the well-known relief association maintained by the railroad company and the promise of pensions to all employees who are honorably retired at the age of 70. At Philadelphia and at Harrisburg the members of the association secure discounts at stores by co-operative buying. The editor of the magazine is N. F. Dougherty, 1841 Filbert street, Philadelphia, and the president of the association is George W. Brown.

The Alaskan Government Railway

Secretary Lane has received a report saying that construction work has begun on the government railway in Alaska, and that a headquarters has been established at Ship Creek, Cook's Inlet. About 2,000 men are engaged in making wagon roads, which will be necessary to facilitate railway construction.

President Wilson has ordered the reservation of a tract 200 miles long and five to ten miles wide, along the proposed railroad line, to provide a supply of timber for use in the construction of the track, this land, however, being open to settlement, nevertheless.

The General Land office at Seward announces that there will be an auction sale of town sites along the route of the railway on July 9.

A Resume of the Mail Pay Question

The Committee on Railway Mail Pay, Ralph Peters, New York, chairman, has issued a booklet entitled "What the Railway Mail Pay Problem Means to the Railroads," summarizing the facts relating to this controversy, and copies of it have been sent to all members of Congress, state and federal regulative commissions, and many other persons in public life. The Moon bill, as here analyzed, is shown to amount to an almost complete delegation of the rate-making power, as far as the transportation of the mails is concerned, to the postmaster general, who would be vested, under its terms, with authority to make the rates anything he might choose, "not exceeding" certain specified sums. He could reduce the rates without restriction and could also dictate, in almost every respect, the character and extent of service the railroads would be required to render. The railroads would be compelled to perform such service as the postmaster general might demand, at such rates as he might choose to pay, under penalty of \$5,000 a day for each refusal.

The committee restates its position as follows:

1. The mails should be weighed, and the pay be readjusted, at least once a year instead of once in four years.
2. The railroads should be paid for the use and operation of apartment post office cars— for which the present law allows no pay.
3. The railroads should be paid for, or relieved from, the duty of carrying the mails between railroad stations and post offices.

The railroad presidents at their recent meeting in New York City approved the suggestion of the committee that the ultimate solution of the problem would lie in reference of the matter to the Interstate Commerce Commission, with full power.

Boston Terminal Commission

The Massachusetts legislature has provided for the appointment of a commission, to serve without pay, to investigate the subject of terminal facilities and the improvement of facilities for the transportation of freight in the Metropolitan district (Boston). The members are chosen partly by the legislature and partly by the governor of the state and the mayor of Boston. They are Charles M. Spofford, consulting engineer and head of the department of civil and sanitary engineering of the Massachusetts Institute of Technology; Luke D. Mullen; Senators James F. Cavanagh and Martin Hays; Representatives H. A. Wilson, F. P. Greenwood and Robert Robinson, and F. H. Prince and W. H. Coolidge appointed by the mayor. One specific feature in the committee's work will be to determine what proportion of the cost of improvements or developments should be borne by the state, what the city of Boston and what by public service corporations.

MEETINGS AND CONVENTIONS

The following list gives the names of secretaries, dates of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontious, 455 Grand Central Station, Chicago. Next meeting, July 21, 1915, Milwaukee, Wis.
- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Hartman, Room 101, Union Station, St. Louis, Mo. Next meeting, August 19-20, 1915, San Francisco, Cal.
- AMERICAN RAILROAD MASTER TINNERS, COPPERSMITHS AND PIPEFITTERS' ASSOCIATION.—W. E. Jones, C. & N. W., 3814 Fulton St., Chicago. Annual meeting, July 13-16, 1915, Hotel Sherman, Chicago.
- AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—Owen D. Kinsey, Illinois Central, Chicago. Annual meeting, July 19-21, 1915, Hotel Sherman, Chicago.
- AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa. Annual meeting, June 22-26, 1915, Hotel Traymore, Atlantic City, N. J.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Semi-annual meeting with Master Car Builders' and Master Mechanics' Association. Annual meeting, October, 1915.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday of each month, Pittsburgh.
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.
- INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1126 W. Broadway, Winona, Minn. Next convention, July 13-16, 1915, Sherman House, Chicago.
- INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, C. H. & D., Lima, Ohio. Annual meeting, August 17, 1915, Philadelphia, Pa.
- NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
- RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.
- RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.
- SALT LAKE TRANSPORTATION CLUB.—R. F. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.
- SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. R. R., Atlanta, Ga. Next meeting, July 15, 1915, Atlanta. Annual meeting, January, 1916.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.
- TOLEDO TRANSPORTATION CLUB.—HARRY S. FOX, Toledo, Ohio. Regular meetings, 1st Saturday in month, Bood's House, Toledo.
- TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.
- TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Genl. Agt., Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh. Annual meeting, 2d Monday in June.
- TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, N. V. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

Traffic News

At Jackson, Miss., June 30, the state court denied the right of the railroads to charge ten cents additional fare to passengers who fail to buy tickets before entering the train.

The Chesapeake & Ohio recently issued what is believed to be the most valuable railroad ticket ever sold. It was for the "Richmond Blues," covering their journey to the Pacific coast, one ticket providing for the movement of 185 men, and the value being \$17,800.

The western roads are not requiring passengers to declare the value of their baggage, as had been planned, and have postponed consideration of the Cummins law and the question of what action should be taken under it in connection with baggage. Meanwhile the carriers are assuming unlimited liabilities on all passengers' baggage.

The "Sandy Hook route" of the Central of New Jersey, from New York City to Long Branch and other New Jersey seacoast towns consists in part of a steamboat route, 20 miles long, the northern terminus of which is in Manhattan and the southern at Atlantic Highlands on the southern shore of New York Bay. This week a rival company has put on a ferryboat, bought from the City of New York, to run three times a day between these termini and to carry passengers at ten cents each, or one-sixth the fare charged on the railroad company's boats. The new line offers to make a specialty of automobiles, which will be carried at 25 cents for each foot of wheel base.

The United States Geological Survey has just issued a guide book (Bulletin 612) describing the Overland route from the Missouri river to the Pacific coast. This is the first of a series of four such books designed to afford the transcontinental traveler an intimate acquaintance with the country through which he passes. The next volume to be issued will describe the Northern Pacific route and will be published in a few days. The books describing the Santa Fe route and the Shasta and coast routes will follow soon. In these books the route is followed from station to station and the country along the way described and explained from many points of view, historical, geological, agricultural and mining. In the preparation of the book on the Overland route much information already in the possession of the Geological Survey has been utilized, but to supplement this material three geologists last year made a field examination of the entire route, while special topographic surveys for the accompanying maps were made by engineers. The route is covered by a series of 29 maps, and the book is also illustrated with half tone plates of some of the most striking views and objects to be seen on the journey. It includes 244 pages and may be obtained from the superintendent of documents at Washington.

Courtesy Over the Telephone

Don't fail to answer the 'phone just as soon as called. You cannot accomplish much work in another line while knowing that someone is calling you on the 'phone.

Don't fail to give the name of your office when answering the 'phone, as it saves the time of the party at other end.

Don't fail to give exchange the number you want very plainly.

Don't fail to have the number that you want, on the tip of your tongue when calling the exchange, as to delay her means that she is delayed in answering someone else. Possibly this someone else will sometimes be you.

Don't fail to have a pad or a memo paper nearby when taking car number, etc., over the 'phone. To jot these down takes no more time and sometimes saves a "call back," or guess work.

Don't fail to be courteous in answering the 'phone. Even though you might be a "Prince of a fellow" the party at the other end—may be a stranger—will not understand that your gruffness is a "habit" and not an intention. Courtesy costs nothing and pays big dividends.

Don't get angry when you get the wrong number. If you think the average operator has much time to loaf or that it is impossible for her to make a mistake just go to one of the telephone exchanges. One look will convince you that you are wrong.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Transcontinental Rates to Willamette Valley Points

H. S. Gile & Company et al. v. Southern Pacific et al. Opinion by the commission:

The commission finds that the through transcontinental carload and less-than-carload commodity rates to the Willamette Valley and points south of Portland, Ore., made by adding to the rates to Portland the local class rates from Portland to destination, are not preferential to points between Portland and Tacoma, but that they are unreasonable to the extent that they exceed the class rates fixed in *Railroad Commission of Oregon v. Southern Pacific* (24 I. C. C., 273), and an order is entered to that effect. (34 I. C. C., 319.)

Proportional Class Rates to Iowa Points

Opinion by the commission:

The commission grants authority to establish the same scale of proportional class rates as authorized by fourth section order No. 3,743, issued as a supplemental report to the *Interior Iowa Cities case* (29 I. C. C., 536), to apply west of the Mississippi river on traffic moving between certain additional interior Iowa cities on the Chicago, Rock Island & Pacific, and the Muscatine North and South, between Burlington and Muscatine, Iowa, and points east of the Indiana-Illinois state line. (34 I. C. C., 278.)

Rates on Lumber from South Pittsburgh, Tenn.

Haskell Lumber Company v. Nashville, Chattanooga & St. Louis et al. Opinion by Commissioner McChord:

The commission finds that the rates on lumber from South Pittsburgh, Tenn., to Ohio river crossings, of 17 cents a hundred pounds, and to Mississippi river crossings, of 22 cents, are not shown to be unreasonable or discriminatory against South Pittsburgh in favor of Chattanooga, Tenn. The tariff under which the shipments in question moved, however, named a rate of 13 cents. As the intention of the framers is not controlling with respect to the meaning of a tariff, and as the tariff is to be construed according to its language, it is found that the complainant was overcharged on shipments which were assessed charges in excess of 13 cents. (34 I. C. C., 333.)

East Bound Transcontinental Cotton Rates

Opinion by Commissioner Clements:

The commission finds that the carriers have not justified a proposed withdrawal of compression in transit arrangements on cotton from southern California and Arizona producing points to St. Louis, New Orleans, Galveston, Tex., and intermediate territory east of El Paso. Certain proposed increases in rates are held to be justified in part. (34 I. C. C., 248.)

Decision Under the Panama Canal Act

Opinion by Commissioner McChord:

The commission in this case grants the joint application of the Duluth, South Shore & Atlantic, the Grand Rapids & Indiana and the Michigan Central to continue their joint interest in and operation of the Mackinac Transportation Company, owning ferryboats plying between St. Ignace, Mich., and Mackinaw City, Mich. (34 I. C. C., 229.)

Storage in Transit on Apples at Indianapolis

Indianapolis Chamber of Commerce v. Cleveland, Cincinnati, Chicago & St. Louis et al. Opinion by Commissioner Harlan:

The refusal of the lines serving Indianapolis to permit at that point storage in transit on apples is not found to result in undue preference in favor of Chicago, St. Louis, and other western points, at which points storage in transit is permitted by the western lines. (34 I. C. C., 267.)

Transit Rates on Logs and Staves at Alexandria, La.

Opinion by Commissioner Clark:

The commission finds that Morgan's Louisiana & Texas and the Louisiana Western have not justified a proposed withdrawal of their net transit rates on logs, rough staves and stave bolts when manufactured at points in Louisiana and reshipped via respondents' lines beyond the state. The carriers did not show that the present rates were unremunerative or that the resulting increased rates would be reasonable. (34 I. C. C., 169.)

Rates on Plaster from Grand Rapids

Grand Rapids Plaster Company v. Lake Shore & Michigan Southern et al. Opinion by Commissioner Hall:

The present carload rates and minimum carload weights on plaster and other gypsum products from Grand Rapids, Mich., to points in northern Illinois and southern Wisconsin are held to be discriminatory as compared with the rates and minimum weights on those commodities from Fort Dodge, Ia., and defendants are required to remove the discrimination. It is also held, however, that there is no discrimination against Grand Rapids and in favor of Fort Dodge in that defendants make deliveries of plaster and other gypsum products from both points to team and industrial tracks in the Chicago switching district. (34 I. C. C., 202.)

Rates on Flour from Inman, Kan.

Enns Milling Company v. Chicago, Rock Island & Pacific et al. Opinion by Commissioner Hurlan:

The commission finds that the rates on flour, bran and shorts from Inman, Kan., to various destinations in southwestern Missouri are unreasonable, in that the difference between them and the rates prevailing under "higher Kansas City rate basis" is too great, this basis meaning in effect that the rates from Kansas grain fields to points in southwestern Missouri will be determined by the rates applicable to Kansas City, either from the Kansas grain fields or the southwestern Missouri destinations, whichever rates are higher. It is ordered that the rates be not in excess of 14½ cents on flour and 13 cents on bran and shorts, these rates being 1½ cents a 100 lb. higher than the rates prevailing under the "higher Kansas City rate basis." This case originally related also to a fourth section application, but the lower rates from Hutchinson and McPherson, Kan., having since been withdrawn, the Fourth Section application is denied. (34 I. C. C., 197.)

Imported Wood Pulp Rates from Boston, Mass.

Moore & Thompson Paper Company et al. v. Boston & Maine. Opinion by the commission:

The commission finds that the rates on imported wood pulp from Boston, Mass., to various New England points are not unreasonable or discriminatory. The allegation of discrimination was based on the fact that the rates on domestic pulp are less than the rates on the imported pulp. It was shown, however, that the rates on the domestic pulp from Boston to these points of destination were but paper rates. It was also shown that the imported pulp had a higher value per car because of a larger percentage of water contained in domestic pulp; that the expense of loading imported pulp is borne by the carrier, whereas domestic pulp is loaded by the shipper, and that the carriers have an inbound haul of the pulp wood used to manufacture domestic pulp which they do not have in the case of imported pulp. (34 I. C. C., 323.)

Furniture Rates from Grand Rapids

Furniture Manufacturers' Association of Grand Rapids v. Ann Arbor et al. Opinion by Commissioner Hurlan:

The commission finds that the rates of \$2.52 per 100 lb. on mixed carloads of furniture shipped from Grand Rapids, Mich., and of \$2.45 from Rockford, Ill., to Pacific coast terminals are not unreasonable or discriminatory. The industry at Grand Rapids has become specialized; and no manufacturer undertakes to produce a complete line of furniture. To take care of this trade condition a practice has grown up of shipping mixed carloads of furniture from a number of factories intended for one consignee. The car may be loaded and shipped by a manufacturer at Grand Rapids, to whose warehouse the goods of other manufacturers are brought for that purpose, or the goods

of several manufacturers may be sent for loading to the carloading department of the furniture and manufacturers' association. This association, which maintains assembling and loading facilities, is operated without profit and for the benefit of the furniture manufacturers of Grand Rapids and their customers. Goods are handled also for some of the factories located outside of Grand Rapids, such as Holland and Zeeland, and to these manufacturers a charge for the service of 10 cents per 100 lb. is made. In addition to mixed carloads, which, although billed to one consignee, may embrace goods for several consignees, many so-called pool cars, containing goods from several dealers intended for several consignees, are consigned to transfer companies, warehouses and distributing agencies on the coast. (34 I. C. C., 262.)

Charges for Disposal of Slag

In re charges for transportation and disposal of waste materials at Pittsburgh and other cities. Opinion by Commissioner Daniels:

Eleven carriers operating in Ohio, Pennsylvania and West Virginia have filed with the commission a tariff establishing a charge of 20 cents per net ton for the disposal of slag, flue dust, clean ashes or refuse molding sand, and a charge of 35 cents a net ton on ashes (mixed with other refuse), brickbats, dirt and other refuse material. The carriers have for a long time taken free all the slag which the mills gave them, for the reason that it furnished a useful material for the making of fills and for ballasting and sub-ballasting tracks. They still use large quantities of slag, but their construction work has so decreased, and the supply of slag given to them for disposal so increased, that the slag has become a burden to them, and they have even had to buy land on which to dump it.

The commission sees no reason why this disposal service should be performed gratuitously by the carriers. It appears, however, that the tariffs under consideration do not meet the requirements of section 6 of the act in that they do not designate the specific points at which disposal is made of the slag in question. The tariff should indicate that—

the carriers will receive carloads of refuse on any industrial or private side track connected therewith, or on any main track, and will haul this refuse to some convenient point on its line or the line of a connecting carrier for wasting at a charge of . . . cents per net ton

The tariffs might also indicate whether or not a definite consignment and bill of lading should be made; in whom title of the slag vests; and when and where transfer of such title, if any, is effected. The tariffs as they stand at present do not conform with section 6 of the act and must be ordered cancelled.

Commissioner Hall dissents, noting that the carriage of the slag and other refuse lacks many of the attributes of transportation by a common carrier. (34 I. C. C., 337.)

New Mexico Class and Commodity Rates

State Corporation Commission of New Mexico v. Atchison, Topeka & Santa Fe et al. Opinion by Commissioner Clements:

Complaint is made against the reasonableness of the class and commodity rates into New Mexico from Kansas City, and all points on and east of the Missouri river, including St. Louis, Chicago and the great lakes region, to, but not including, eastern seaboard territory. The paramount issue arises under the fourth section, the principal violation being that rates from Kansas City, St. Louis and Chicago are lower to El Paso than to New Mexico points directly intermediate.

The contention that the El Paso rates are depressed by the action of the carriers in equalizing the rates to El Paso to the basis applied to Laredo and Eagle Pass in order that all these Rio Grande crossings may be placed on a parity in their competition with each other for traffic into Mexico, and the contention that low rates are demanded by the competition of the water and rail routes from the eastern seaboard and from Europe to consuming markets in Mexico via Tampico and Vera Cruz are not held by the commission to constitute sufficient grounds for fourth section relief at El Paso. It is held, however, that the competition of the water and rail routes from the markets of production on the eastern seaboard to El Paso via Galveston and other gulf ports does constitute a sufficient basis for relief as to commodity rates from Kansas City, St. Louis and Chicago in those cases in which the El Paso rates are thereby actually affected and de-

pressed below a reasonable basis. In Commodity Rates to Pacific Coast Terminals (32 I. C. C. 611) the carriers operating west from the Missouri river, in those cases in which they were compelled by the competition of the water lines from the eastern seaboard, were allowed to maintain a rate to the Pacific coast of not less than 75 cents a 100 lb., and to continue higher rates to intermediate points, provided the intermediate rate in no case exceeded 75 cents. It is held in this case that the maximum rate, below which relief should be granted, and which will in cases in which relief is granted be the maximum rate from Kansas City and St. Louis to intermediate points, should be 65 cents.

On those commodities on which the lowest rates from the Atlantic seaboard to El Paso are 65 cents or more no relief will be granted to the carriers operating from Kansas City and St. Louis to El Paso. As to those commodities on which the lowest rates from the eastern seaboard are less than 65 cents the carriers from Kansas City and St. Louis may meet those rates provided the intermediate rates do not exceed 65 cents. In those instances in which the lowest rates from the eastern seaboard to El Paso are less than 65 cents and the petitioners desire to maintain even lower rates from Kansas City and St. Louis to El Paso than apply from the eastern seaboard they may do so provided the intermediate rates do not exceed the rates to El Paso by more than the difference between the rates from New York to El Paso and 65 cents; the net result of this last being that by whatever amount the carriers voluntarily reduce the El Paso rates below what is required by the water-and-rail competition they must likewise reduce the intermediate rates below 65 cents. In all cases where relief is denied under the fourth section the carriers may correct the discrimination existing against intermediate points by increasing the rate to the more distant point; by decreasing the rates to the intermediate points; or by simultaneous increases and reductions.

The case also relates to the reasonableness of rates to intermediate points. It is found that the present class rates from Kansas City are in many cases unreasonable and a scale of maximum rates is prescribed, the first class rate being set at \$1.55 to Tucumcari and Clovis; \$1.70 to Roswell, Carlsbad, Vaughn, Pastura, Alamogordo, Las Vegas, Albuquerque, Santa Fe, Belen and Rincon; \$2.00 to Deming; \$2.10 to Silver City, and \$2.25 to Gallup and Lordsburg, and other classes in proportion. The class rates to Raton are not found unreasonable. Maximum differentials ranging from 30 cents on first class to 8 cents on class E are prescribed over these Kansas City rates for shipments from St. Louis, and differentials ranging from 50 cents on first class and 13 cents on class E for shipments from Chicago.

Findings are made also relative to the commodity rates on the principal commodities moving into New Mexico. The rates on these commodities to Raton are not found unreasonable. Maximum rates are prescribed from Kansas City to Albuquerque as follows: Agricultural implements, 80 cents; beer, 65 cents; canned goods, 65 cents; emigrant movables, 55 cents; furniture, n. o. s., \$1.19; packing-house products, 80 cents; building and roofing paper, 70 cents; cast-iron and wrought-iron pipe, 65 cents; stoves, 85 cents; sugar and sirup, 60 cents; wire and nails, 70 cents. It is held that the rates to Las Vegas, Santa Fe, Belen, Rincon, Roswell, Carlsbad, Pastura and Alamogordo should not exceed these rates. To Deming, Silver City, Gallup, Lordsburg and other points to which class rates are prescribed the commodity rates established shall bear the same relation to the commodity rates prescribed to Albuquerque as the class rates to those points bear to the class rates to Albuquerque. The commodity rates from St. Louis and Chicago to all New Mexico points must not exceed those from Kansas City by more than 10 cents and 20 cents a 100 lb. respectively. The commission does not attempt to deal with other commodity rates which may be established in the future nor does it attempt to prescribe reasonable commodity rates to points other than those to which rates are herein prescribed. The fourth section requirements will set the maximum rates to main-line points directly intermediate to those to which rates are herein fixed. To branch-line points the carriers will be expected to line up their rates in reasonable relation to the class and commodity rates.

The rate on hay from the Pecos Valley to Fort Worth and other points to which at present a 30-cent rate is effective must not exceed 28 cents in the future.

The present rates on lumber to Pecos Valley points are found unreasonable to the extent that they exceed 30 cents from Santa Fe mills in Texas and Louisiana, 33 cents from mills on

connecting lines in Texas and 35 cents from mills on connecting lines in Louisiana and Arkansas.

The commission does not believe that the rates on traffic from the Pacific coast regions, including those on lumber and sugar, should be reduced. (34 I. C. C. 292.)

STATE COMMISSIONS

The West Virginia Public Service Commission, on application of the Baltimore & Ohio, has granted the road permission to accept coupons from mileage books which have been bought in other states on a basis of $2\frac{1}{4}$ cents a mile, provided the passenger proffers it in lieu of a ticket and is satisfied to pay the extra quarter cent. Persons living in other states coming into West Virginia frequently have tendered their mileage coupons instead of tickets, expressing the preference to pay the extra quarter cent rather than take the trouble to get a ticket at the West Virginia stations.

The New York State Public Service Commission, Second district, holds that it has not the power to permit a raise in passenger rates above a maximum set by the legislature. The decision is in the case of the Ulster & Delaware, which desired to increase its mileage book rate from two to three cents a mile. Chairman Vansantvoord wrote the opinion, which was concurred in by Commissioners Hodson and Irvine. In an extended review of all the statutory sections involved the opinion fails to find that the commission, either expressly or impliedly, has been granted such power. Commissioners Emmet and Carr dissented. Mr. Emmet held that, as the power to lower rates irrespective of legislative enactment is expressly granted by the Public Service Commission law, the power to raise rates is implied beyond reasonable doubt. The decision will probably be carried to the court of last resort.

COURT NEWS

Interstate Commerce in Intoxicating Liquors

In *Rossi v. Pennsylvania*, a case which arose before the passing of the Webb-Kenyon act of 1913, the United States Supreme Court holds that the Wilson act does not authorize the punishment of a liquor dealer in Ohio for soliciting orders for liquor in Lawrence County, Pennsylvania, where he had no liquor license, and delivering the goods there, since the Wilson act does not subject liquors transported in interstate commerce to state regulation until after their arrival at destination and delivery to consignee or purchaser.

Kansas Mutual Demurrage Law Held Void

The United States Supreme Court has declared invalid the Kansas "reciprocal" or "mutual" demurrage statute, providing that a railroad failing to furnish cars upon proper application shall pay to the party applying \$5 a day damages, and all actual damages, with reasonable attorney fees, and that a shipper shall pay \$5 a day for failure to load cars within 48 hours, for the reason that the act allows attorney's fees in favor of one class of litigants but not of the other, thus denying the latter the equal protection of the laws guaranteed by the Fourteenth Amendment. (*Atchison, Topeka & Santa Fe v. Vosburg*.)

State Statute Requiring Cars to Be Furnished Upheld

The United States Supreme Court affirms a decision of the Illinois Supreme Court (257 Ill., 80) awarding damages for the failure of the Illinois Central to furnish coal cars at the Mulberry Hill Coal Company's mine, located on the defendant's line, pursuant to the plaintiff's requirements and demands, as required by the Illinois act of 1874. The court approved the construction of the statute given by the state court, which was as follows: "The only requirement of the statute, as applied in this case or any other case, is, that the railroad corporation shall furnish cars, within a reasonable time after they are required, to transport the property offered for transportation, and what would be a reasonable time in any case would depend upon all the circumstances and conditions existing, including the requirements of the interstate commerce carried on by the corporation." It holds that the statute is not, as contended, a direct burden upon interstate commerce, and therefore repugnant

to the commerce clause, irrespective of congressional action. Decided June 14.

Reduction of Coal Rate to Nashville—Discrimination in Switching

In an action against the L. & N., the Nashville, Chattanooga & St. Louis, the Tennessee Central, the Illinois Central and the Nashville Terminal, the United States Supreme Court has reduced the \$1 rate on coal from Kentucky mines to Nashville to 80 cents. It based its finding on a comparison of the coal rates from the Kentucky mines to Nashville, Memphis and St. Louis, and of the Nashville coal earnings with those on all other traffic over the other roads entering that city. It also took into consideration that the carrying capacity of the cars had been much increased, resulting in a doubling of the earning capacity of fully loaded trains.

It also held that the practice of the companies to charge \$3 a car for switching *non-competitive* business between industries within the terminal limits and in conjunction with the Tennessee Central was discriminatory. The plaintiff contended that the practice was designed to prevent the switching of coal between the Tennessee Central and private industries, located on sidings and reached through the terminals. Its effect was to furnish switching service to each other on *all* business, and to the Tennessee Central on all except coal and competitive business. The order of the commission requiring the companies to cease the discrimination and to maintain "a practice which will permit the interswitching of such shipments from and to the lines of each and every defendant" (including Tennessee Central) was sustained. What would be a proper practice and the charge therefor were matters not decided.

Government Loses Suit Against the Reading

In the United States court at Philadelphia, July 3, a decision by Judge McPherson was handed down to the effect that the Reading group of corporations, the Central Railroad of New Jersey, the Lehigh Coal & Navigation and subsidiary and allied companies, are not leagued together in an unlawful combination and therefore do not unduly restrain commerce in the production, sale or transportation of anthracite coal. The court, however, suggests that the Lehigh & Wilkes-Barre Coal Company be divorced from the Central of New Jersey. The Reading ownership of the Central is not disturbed. The court called attention to certain other objections of a minor nature, which, however, did not affect the general decision.

The decision holds that there was no violation by the Reading companies of the commodities clause of the Interstate Commerce law.

The decision refused to declare that the Reading company, the Philadelphia & Reading Railway and the Philadelphia & Reading Coal and Iron Company were, either separately or individually, a combination in violation of the anti-trust law.

The court expressed regret at the delay in the decision of the case, giving as a reason the necessity of awaiting the decision of the Supreme Court in the government's suit against the Lackawanna. The decision was concurred in by Judges Buffington and Hunt.

The court finds that the evidence does not support the charge that the transportation of anthracite at the rates now and for a long time past in force has been enormously profitable.

As to the commodities clause, the court finds that under the facts presented in the Reading case the question is not decided by the recent decision in the Lackawanna case, which rests entirely on the construction of a certain agreement that was there attacked. After reviewing the evidence upon this subject the court decides that the commodities clause has not been violated by the Reading companies.

It is expected that the government will appeal the case.

Approval of Leases by Public Utility Commission

In refusing a writ of mandamus to the West Jersey & Seashore to compel the New Jersey board of public utility commissioners to approve a lease proposed to be made by the company of its railroad and franchises to the Pennsylvania, the New Jersey Court of Errors and Appeals, affirming the decision of the

Supreme Court, 85 N. J., Law 468, holds that the primary purpose of the requirement in the public utilities act, in regard to proposed leases is to provide a method for preventing the making of leases embracing provisions inimical to the interests of the state or omitting provisions which are requisite for the protection of those interests. The power of approval or refusal to approve conferred upon the board is discretionary in its character; and, this being so, the Supreme Court cannot substitute its own judgment for that of the board and compel it by mandamus to grant or withhold its approval. *West Jersey & Seashore v. Board* (N. J.), 94 Atl., 57.

Injuries to Animals on Track

In an action for the killing of a mule struck by a train, it is held by the Mississippi Supreme Court that the failure of the company to equip the locomotive with an electric headlight, as required by law, did not make the company liable, it not being shown that the presence of such a headlight would have prevented the mule from running in front of the fast moving train 30 or 40 ft. ahead of the engine, as appeared to have been the case. *Illinois Central v. Calhoun* (Miss.), 68 So., 442.

Damages for Blocking View by Embankment Not Recoverable

Damages were sought, under the Massachusetts statute providing that all damages caused by laying out, making and maintaining a railroad, or by taking land or materials therefor, may be recovered, for injury resulting from the cutting off of the plaintiff's view from his property by the location of a railroad embankment in front of it. The embankment was beyond a public way and intervening property of other owners, about 150 ft. away, and about the same height as the plaintiff's door, and did not in any way interfere with his light or air or access to the highway. It was held that the interference with the view from the plaintiff's house and estate, which was the sole ground on which damages were sought, related to matters too remote and speculative, and was not sufficiently special and peculiar to the plaintiff to warrant a recovery. No decision, so far as the court was aware, has ever gone so far as to hold that damages might be recovered for invasion of purely aesthetic elements of value. *Howell v. New Haven* (Mass.), 108 N. E., 934.

Adequate Return—Intrastate Commerce—"Unreasonable" and "Confiscatory" Rates

In deciding that a rate on slack, nut, and pea coal from Pittsburg, Kan., to Concordia, Kan., composed by adding the Kansas local distance rate of 20 cents a ton from Abilene to Concordia to the carrier's voluntary rate of \$1 from Pittsburg to Abilene, and involving only intrastate commerce, is not unreasonable, unjust, or oppressive, the Kansas Supreme Court cited the three recent cases of *Northern Pacific v. North Dakota and Minneapolis, St. P. & S. S. M. v. North Dakota*, 236 U. S. 585; and *Norfolk & Western v. West Virginia*, 236 U. S. 605, all decided March 8, 1915, on the subject of adequate rates. In the first of these, Mr. Justice Hughes says: "Frequently, attacks upon state rates have raised the question as to the profitability of the entire intrastate business under the state's business requirements. But the decisions in this class of cases furnish no ground for saying that the state may set apart a commodity or a special class of traffic and impose upon it any rate it pleases, provided only that the return from the entire intrastate business is adequate." The Kansas court says that it is too soon to say how far-reaching these decisions may be, but that the new doctrine is no doubt controlling; and whatever has been said in decisions and textbooks to the effect that a state or a state commission could establish a rate not in itself compensatory, provided the mass of state rates was profitable, may as well be discarded.

The court also sustained the railroads' contention that the word "unreasonable" in the statute is not synonymous with "confiscatory." A rate may not be confiscatory, and yet be inequitable in that it does not yield a fair compensation, which would include cost of moving the traffic, wear and tear of tracks and equipment, and a fair profit for the service rendered. This is also the view of the Texas courts on a statute much like the Kansas one, *Union Pacific v. Public Utilities Commission* (Kan.), 148 Pac. 667.

Railway Officers

Executive, Financial, Legal and Accounting

A. C. Hamilton, vice-president and general counsel of the Texas-Mexican at Laredo, Tex., has resigned.

F. S. Wynn, secretary of the Southern Railway at New York has been elected secretary also of the Mobile & Ohio, succeeding A. W. Mackintosh, resigned.

S. S. Russell, special agent of the auditing department of the Central Vermont at St. Albans, Vt., has been appointed claim agent, with office at St. Albans, and the office of special agent has been abolished.

F. W. Kirtland, freight traffic manager of the Florida East Coast at St. Augustine, Fla., has been appointed assistant to vice-president, with headquarters at St. Augustine, and the position of freight traffic manager has been abolished.

The following officers of the Morris & Essex were elected recently: Adrian H. Larkin, chairman of the board; J. O. H. Pitney, of Newark, N. J., president; E. E. Loomis, vice-president; Henry V. Poor, secretary; E. C. Stanley, Jr., assistant secretary; R. B. Schofield, treasurer, and W. D. Dunley, assistant treasurer.

The officers of the Monongahela Railway recently formed by the consolidation of the Monogahela Railroad and the Buckhannon & Northern are as follows: J. M. Schoonmaker, president, Pittsburgh, Pa.; J. J. Turner, vice-president, Pittsburgh; Lewis Neilson, secretary, Philadelphia; T. H. B. McKnight, treasurer, Pittsburgh; C. K. Elder, auditor, Brownsville; G. B. Obey, general superintendent, Brownsville; D. K. Orr, chief engineer, Brownsville, and J. C. Grooms, real estate agent, Pittsburgh.

Operating

F. N. Hibbits, superintendent of motive power of the Lehigh Valley at South Bethlehem, Pa., has resigned to go to the Baldwin Locomotive Works.

J. H. Owen, transportation clerk of the Florida East Coast at St. Augustine, Fla., has been appointed superintendent of transportation, with headquarters at St. Augustine.

G. B. Obey, superintendent of the Monongahela Railroad has been appointed general superintendent of the Monongahela Railway which was formed recently by the consolidation of the Monongahela Railroad and the Buckhannon & Northern. Mr. Obey entered the service of the Pittsburgh & Lake Erie as a train dispatcher in 1889, and in 1899 was promoted to chief train dispatcher. Two years later he was appointed superintendent of the Youghiogheny and Monongahela divisions of the same road, with headquarters at Pittsburgh, Pa. In 1905, he left the service of the Pittsburgh & Lake Erie to become superintendent of the Monongahela Railroad, with office at Brownsville, Pa., which position he held at the time of his recent appointment as general superintendent of the Monongahela Railway, with headquarters at Brownsville, as above noted.

G. B. Obey

D. S. Farley, superintendent of the Kansas City division of the Atchison, Topeka & Santa Fe at Kansas City, Mo., has been transferred to Amarillo, Tex. C. L. Mason, trainmaster of the eastern division at Emporia, Kan., has been appointed superintendent at Kansas City, Mo., succeeding Mr. Farley. H. R. Lake has been appointed trainmaster at Emporia, Kan., succeeding Mr. Mason.

Edward T. Whiter, whose appointment as assistant general manager of the Pennsylvania Lines West of Pittsburgh, with headquarters at Pittsburgh, Pa., has already been announced in these columns, was born at Stenbenville, Ohio, on March 26, 1864. He was educated in the public schools of that place and entered railway service on March 1, 1881, with the Pennsylvania, as telegraph operator, and served consecutively as train dispatcher, assistant trainmaster and trainmaster until January 1, 1903, on which date he was appointed superintendent of the Eastern division. On January 1, 1913, he was appointed general superintendent of the Northwest system, from which position he is now promoted to assistant general manager of the Pennsylvania Lines West of Pittsburgh. Mr. Whiter's entire career has been with the Pennsylvania.

E. T. Whiter

Isaac Wheeler Geer, whose appointment as general superintendent of the Central system of the Pennsylvania Lines West of Pittsburgh, with headquarters at Toledo, Ohio, has been announced, was born at Plainfield, Conn., on February 1, 1873. He was graduated from Yale university in June, 1895, and entered railway service as rodman with the Pennsylvania in September of the same year. In November, 1897, he was transferred to the maintenance of way department of the Erie and Ashtabula division as assistant on the engineer corps. In February, 1898, he was promoted to assistant engineer, and in March, 1900, was made engineer of maintenance of way on the same division. He was then transferred to the Pittsburgh division in the same capacity in December, 1902, in which position he remained until January, 1904, when he was appointed superintendent of the Terre Haute & Logansport and the Logansport & Toledo railways, which were at that time affiliated with the Pennsylvania Lines. In November, 1906, he was transferred to the Logansport division, and in January, 1913, he was transferred to the Cleveland & Pittsburgh division from which position he is now promoted.

I. W. Geer

Samuel B. Robertson, superintendent of the Erie and Ashtabula division of the Pennsylvania Lines West of Pittsburgh, at Newcastle, Pa., has been transferred in the same capacity to the Cleveland and Pittsburgh division, with headquarters at Cleve-

land, Ohio, succeeding I. W. Geer, promoted. W. M. Wardrop, superintendent of the Western division, at Ft. Wayne, Ind., succeeds Mr. Robertson. Otto Schroll, superintendent of the Toledo division, with headquarters at Toledo, Ohio, succeeds Mr. Wardrop. Paul Jones, superintendent of the Zanesville division, with headquarters at Zanesville, Ohio, succeeds Mr. Schroll. F. J. Stimson, division engineer of the Grand Rapids & Indiana, has been appointed superintendent at Zanesville, Ohio, succeeding Mr. Jones.

Traffic

Thomas E. Bond has been appointed chief of the tariff bureau of the Elgin, Joliet & Eatsern, with headquarters at Chicago.

Charles E. Brown has been appointed commercial agent of the Cleveland, Cincinnati, Chicago & St. Louis, at Los Angeles, Cal., and J. X. Kimberger has been appointed commercial agent at Seattle, Wash.

F. B. Humston, district passenger agent of the Chicago, Indianapolis & Louisville, at Indianapolis, Ind., has been appointed division freight agent, with headquarters at Indianapolis. Frank V. Martin, city passenger agent at Indianapolis, succeeds Mr. Humston. A. J. O'Reilly, general agent at Indianapolis has retired from active service because of ill health, but will be retained by the company in an advisory capacity.

R. A. Ebe, assistant general livestock agent of the Baltimore & Ohio at Pittsburgh, Pa., has been appointed general livestock agent, succeeding the late Ben Wilson, and the position of assistant general livestock agent has been abolished. W. J. O'Toole, secretary to the general livestock agent has been appointed assistant to general livestock agent; F. Fowler, division freight agent at Parkersburg, W. Va., has been appointed assistant to general freight agent, both with headquarters at Baltimore, Md., and H. H. Marsh, commercial freight agent at Wheeling, W. Va., has been appointed division freight agent, with office at Parkersburg.

Engineering and Rolling Stock

W. H. Oliver, division engineer of the Atchison, Topeka & Santa Fe, at Needles, Cal., has been transferred in the same capacity to San Bernardino, Cal.

C. E. Brooks, acting superintendent of motive power of the Grand Trunk Pacific at Trancona, Man., advises that J. F. Moffatt has not been appointed locomotive foreman as had been announced in circular No. 50, which was noticed in this column on July 2.

OBITUARY

Frank H. Chamberlain, claims adjuster for the Atchison, Topeka & Santa Fe, with headquarters at Guthrie, Okla., died at Battle Creek, Mich., on June 21.

Samuel Thorne, a director of the Great Northern, the Colorado & Southern and other Hill roads, died on July 5, of heart disease, on board the yacht of James J. Hill of the Great Northern, on the St. John's river, Quebec, Canada.

Charles L. Haydock, assistant engineer of the Missouri Pacific, at St. Louis, Mo., was drowned recently at Leavenworth Junction, Kan., while superintending the making of willow mattresses to prevent the river from undermining the tracks. He was 31 years old.

GERMAN RAILWAYMEN JOIN THE COLORS.—A report from Holland says that 400,000 German railwaymen will shortly be called to the colors. In order to replace the men a great number of women are now being instructed in railway work.

RAILWAY EXTENSION IN CHILE.—The directors of the government railways have decided to build a branch connecting the Longitudinal Railway with the port of Iquique; the estimated expenditure is \$110,000. It will be necessary for this money to be secured from the profits of one of the railways or included in the budget for the coming year. The only railway actually producing net earnings at the present time is the Arica La Paz. The government railways are preparing plans for the repair of roads that lead to the railway stations along the Central Railway at an estimated expenditure of \$282,000.

Equipment and Supplies

LOCOMOTIVE BUILDING

THE MISSOURI, OKLAHOMA & GULF is figuring on 6 Mikado type locomotives.

THE EUREKA NEVADA has ordered one Prairie type locomotive from the H. K. Porter Company.

RUSSIAN GOVERNMENT.—The H. K. Porter Co. is said to be working on 22 72-ton and 11 67-ton locomotives for the Russian government. This item has not been confirmed.

THE TEXAS & PACIFIC, reported in the *Railway Age Gazette* of May 28 as being in the market for 10 switching and 6 freight locomotives, is also reported to be in the market for 6 passenger locomotives.

THE RICHMOND, FREDERICKSBURG & POTOMAC has issued inquiries for 6 superheater Pacific type locomotives, to have 26 by 28 in. cylinders, a tractive effort of 47,000 lb. and a total weight of 285,000 lb.

THE DETROIT, TOLEDO & IRONTON has ordered 2 Consolidation type locomotives from the American Locomotive Company. These locomotives will have 21 by 28 in. cylinders, 56-in. driving wheels and a total weight of 106,000 lb.

THE MONTOUR RAILROAD has ordered 3 superheater Mikado type locomotives from the American Locomotive Company. These locomotives will have 27 by 32 in. cylinders, 57-in. driving wheels, and a total weight of 325,000 lb.

CAR BUILDING

THE LEHIGH VALLEY has ordered 20 milk cars from the Standard Steel Car Company.

THE CHICAGO GREAT WESTERN is reported to be in the market for 1,500 steel underframes.

THE DETROIT, TOLEDO & IRONTON has ordered 200 box cars from the American Car & Foundry Company.

THE BALTIMORE & OHIO is reported to be in the market for 2,000 hopper cars. This item has not been confirmed.

THE TEXAS & PACIFIC, which was reported in an unconfirmed item in the *Railway Age Gazette*, June 4, as inquiring for 500 coal cars, is in the market for 400 50-ton gondola cars.

THE HAWAII CENTRAL, which was reported in the *Railway Age Gazette* of May 28, as inquiring for 600 freight cars, is reported to have ordered these cars from the Standard Steel Car Company. This item has not been confirmed.

THE BRITISH GOVERNMENT was reported in the *Railway Age Gazette* of June 25 as having given the Canadian Car & Foundry Company a large order for box cars. It is now said that this order includes 1,200 Belgian type steel frame box cars, 24 ft. in length and of 26 ton capacity.

THE RUSSIAN GOVERNMENT was reported in the *Railway Age Gazette* of May 21 as having placed orders for 22,000 cars as follows: Pressed Steel Car Company, 7,000; Seattle Car & Foundry Company, 7,000; Eastern Car Company, New Glasgow, N. S., 2,000; Nova Scotia Car Company, Halifax, N. S., 2,000; American Car & Foundry Company, 2,000, and Canadian Car & Foundry Company, 2,000. On some of these orders the car builders and the Russian government were at first unable to agree as to the terms of payment. Contracts have now been definitely closed, however, for the following orders: Pressed Steel Car Company, 4,800 50-ton coal cars (the Russian government having the option of increasing this to 5,000 if desired) and 2,000 40-ton box cars; Eastern Car Company, 2,000 40-ton box cars, and the American Car & Foundry Company, 4,100 box cars, a total with these three

companies of 12,900 cars. The Seattle Car & Foundry Company has an order, or is negotiating for 8,500 four-wheel freight cars. Orders for 2,000 cars remain to be placed, the Nova Scotia Car Company having rejected its order.

IRON AND STEEL

THE GREAT NORTHERN has ordered 125 tons of steel for seven track scales from the American Bridge Company.

THE SAN PEDRO, LOS ANGELES & SALT LAKE has ordered 8,000 tons of rails from the Colorado Fuel & Iron Company.

THE ATCHISON, TOPEKA & SANTA FE has ordered 375 tons of steel from the American Bridge Company for an elevator at Argentine, Kan.

THE AMERICAN CAR & FOUNDRY COMPANY has ordered 322 tons of steel from the American Bridge Company for a yard crane runway and a car shop addition at Chicago.

THE CHICAGO, ROCK ISLAND & PACIFIC has ordered 17,000 tons of rails from the Illinois Steel Company, and 3,000 tons from the Algoma Steel Corporation. The rails will all be 100 lb.

THE NEW YORK PUBLIC SERVICE COMMISSION, First district, has awarded a general contract to the Newman & Carey Company, for 6,400 tons of steel for Section No. 1 of the Nostrand avenue subway, Brooklyn.

MACHINERY AND TOOLS

THE YAZOO SOUTHWESTERN, Walter C. Murphy, president, Yazoo City, Miss., is reported in the market for repair and machine shop equipment.

SIGNALING

The Public Utilities Commission of Ohio has ordered the installation of interlocking signals in Lima, at the crossing of the Pennsylvania Lines, the Cincinnati, Hamilton & Dayton and the Lake Erie & Western. The work is to be done by the Pennsylvania and shares of the cost charged to the other companies in proportion to the functions installed on the tracks of each company. The commission orders that the cost of operation shall be allotted, fifty per cent to the Pennsylvania and fifty to the other two roads; but when the two roads last named shall have separated their interests then each of the three roads is to pay one-third of the whole. The installation must be finished by October 1.

GERMAN SOUTH-WEST AFRICA RAILWAYS.—The damaged railway lines in German South-West Africa occupied by the Union forces are so far restored that through communications has been established between Lüderitzbucht and Karibib. An extension of the Upington line to Kalkfontein, north of Warmbad, is expected at an early date, thus linking up the German lines with the Union system.

RAILWAY IN YUNNAN PROVINCE OF CHINA.—Renewed activity is reported in regard to a railway from Mengtze, Yunnan Province, China, to the Ko-chiu tin mines. The Chinese capitalists concerned in the tin mines and in the railway undertaking have recently employed two French engineers in connection with the enterprise. The original plans and the actual location of the line were made by American engineers, who resigned several months ago because of the prospect at that time that nothing definite was likely to be accomplished because of unrest and uncertainty in China and later because of war conditions in Europe. The plans call for 60-centimeter (23.6 in.) gage track, and the rolling stock needed is estimated at 8 locomotives, 100 freight cars and 15 passenger cars. French interests are said to have an immense advantage in obtaining this business, not only because of the dominance of French interests in the district and the influence of French engineers, but also because of the discriminating duties on goods coming into China from Indo-China and into the latter from France and because of favors extended French interests by the railway from Indo-China to Yunnan fu.

Supply Trade News

The Schroeder Headlight Company, Evansville, Ind., is reported to have an order from the Russian government for 400 headlights.

The Scullin-Gallagher Iron & Steel Company, St. Louis, Mo., by a vote of its stockholders has changed its name to the Scullin Steel Company.

The American Brake Shoe & Foundry Company has secured an order for 52,000 brake shoes for the cars which the Pressed Steel Car Company is now building for the Russian government.

The American Steel Export Company was incorporated in Delaware on June 29, with a capital of \$200,000, to promote the sale abroad of products of the Cambria Steel Company.

Thomas R. Cook, formerly assistant engineer of motive power of the Pennsylvania Lines West, has been appointed chief engineer of the Willard Storage Battery Company, Cleveland, Ohio.

D. P. Lamoreux has been appointed to take charge of the railway and car material department of the Johnson Lumber Company, Milwaukee, Wis., with headquarters in the McCormick building, Chicago.

W. L. Jefferies, Jr., has been appointed representative of the Union Spring & Manufacturing Company, New Kensington, Pa., with office in the Mutual building, Richmond, Va., succeeding W. F. La Bonta, deceased.

The Condit Electrical Manufacturing Company, Boston, Mass., and the Luminous Unit Company, St. Louis, Mo., will hereafter, by arrangement with the Thomas G. Grier Co., Chicago, be represented exclusively by the Electrical Sales Engineers, Inc., Chicago. This is a new company with the following officers: Paul W. Koch, president and general manager; Fred B. Duncan, vice-president, and Alfred O. Dicker, secretary and treasurer. Mr. Koch was formerly manager of the Thomas G. Grier Co.; Mr. Duncan, formerly sales engineer of the George Cutter Co., South Bend, Ind., and Mr. Dicker was formerly illuminating engineer of the Commonwealth Edison Company, Chicago.

Fairbanks, Morse & Company, New York, have acquired the business of the Neil Machinery Company, and will take over the following agencies heretofore controlled by the latter: Lees Bradner Company, Cleveland, Ohio; Kern Machine Tool Company, Hamilton, Ohio; Springfield Machine Tool Company, Springfield, Ohio; Colburn Machine Tool Company, Franklin, Pa., and Bridgeford Machine Tool Company, Rochester, N. Y. George E. Neil, formerly manager of the Neil Machinery Company, has been appointed manager of the machine tool department of the New York office of Fairbanks, Morse & Company, and W. V. Gould, for many years with the Jones & Lamson Machine Company, Springfield, Vt., has also become associated with that department.

The Westinghouse Electric & Manufacturing Company plan has been declared operative. Stockholders of record July 17 will have the privilege of subscribing for new convertible 5 per cent bonds at 105 in a ratio of 45 per cent of the holdings of stock. The first payment on the new bonds will be \$250 for \$1,000 bond on August 13, the other payment being \$820.83 on December 1. The second payment includes an adjustment of interest. The new issue of bonds will be convertible into common stock at par up to December 31, 1916. If all the new issue of bonds is subscribed for by stockholders, the proceeds will be used to retire the existing issue of bonds at 105. If only a portion of the bonds are subscribed for by stockholders, the old issue will be paid off to the extent of the new money received and the new convertibles exchanged for the balance. If none of the new bonds are subscribed for, they will be exchanged for the old issue recently deposited with the Guaranty Trust Company.

The American Car & Foundry Company

The earnings of the American Car & Foundry Company in the fiscal year ending April 30, 1915, were \$3,615,054. From this there was deducted \$1,284,118 for renewals, replacements, re-

pairs, new patterns, etc., leaving net earnings of \$2,330,936. Dividends of \$2,100,000 (7 per cent) were paid on preferred stock, and of \$600,000 (2 per cent) on common stock, making a total of \$2,700,000. The total surplus on April 30 was \$25,694,076. The general balance sheet of the company on April 30 was as follows:

ASSETS.	
Property and plant account:	
Cost to April 30, 1914.....	\$66,108,223
Additions to plants during year.....	57,424
Reservation for steel car plants.....	616,886
Materials on hand.....	4,974,004
Current assets:	
Accounts and notes receivable.....	11,587,622
Stocks and bonds of other companies.....	847,711
Bank certificates of deposit.....	3,500,000
Cash.....	3,659,855
	\$91,351,725
LIABILITIES.	
Preferred stock.....	\$30,000,000
Common stock.....	30,000,000
Current liabilities:	
Audited vouchers and payrolls.....	2,569,948
Dividends (payable July 1).....	675,000
Reserve accounts.....	2,412,701
Surplus.....	25,694,076
	\$91,351,725

TRADE PUBLICATIONS

WELLS, FARGO & COMPANY.—This company has issued a booklet of 44 pages, giving a large amount of information as to how to reach the various points of interest in San Francisco in connection with the Panama-Pacific Exposition.

HEADLIGHTS.—The Esterline Company, Indianapolis, Ind., has recently issued catalog 364, descriptive of Golden Glow incandescent headlights. These headlights are very largely used on street car and interurban railway lines, and in steam and electric locomotive service.

STEEL POLES.—The Carbo Steel Post Company, Chicago, has issued a 20-page booklet describing Carbo steel poles for telephone, telegraph and signal lines. The booklet is illustrated with several typical designs of these poles, and contains considerable data regarding their construction and capacity.

COAL STORAGE SYSTEM.—Bulletin No. 221 recently issued by the Link-Belt Company, Chicago, is a four-page leaflet descriptive of the Link-Belt patented circular storage system. The leaflet describes the system in detail, names its several advantages and contains illustrations of typical installations.

WOOD BLOCK FLOORS.—The Ayer & Lord Tie Company, Chicago, has recently issued a booklet on that company's interior creosoted wood block floors. The booklet discusses the several advantages of this type of flooring material and contains several illustrations of wood block floors laid in different kinds of shops.

GAS ENGINES.—Bulletin No. 34-X, issued by the Chicago Pneumatic Tool Company, Chicago, is devoted to the Class A-G "Giant" gas and gasoline engines made by that company. Bulletin No. 34-U contains instructions for installing and operating "Chicago Pneumatic" Class N-SO fuel oil driven compressors.

AIR COMPRESSORS.—Form No. 3,031, recently issued by the Ingersoll-Rand Company, New York, is devoted to the Ingersoll-Rogler Class FR-1 steam driven single stage straight line air compressors sold by that company. The company has also recently issued Form No. 4,034, relative to the Leyner-Ingersoll water drill.

OXYGEN.—In a pamphlet entitled "Production of Pure Oxygen and Hydrogen," the International Oxygen Company, Newark, N. J., gives a description of its system of producing oxygen by water electrolysis. Several installations of this system are illustrated. The purity of the gases produced by this method is shown to be especially high.

SPECIFICATIONS FOR TELEGRAPH POLES.—The W. F. Goltra Tie Company, Cleveland, has issued a booklet containing general information and specifications for chestnut and cedar poles for telegraph, telephone and electric light lines. This book also contains a considerable amount of information regarding the weights, original costs and costs of setting poles of various timbers and lengths.

Railway Construction

ALABAMA GREAT SOUTHERN.—New second main track between York, Ala., and Cuba, 6.5 miles, was placed in service July 1, on the Alabama Great Southern, providing with the exception of a single track gauntlet between Toomsaba and Russell, Miss., of seven miles, continuous double track from York to Meridian, Miss., all of recent construction. This track is used jointly by trains of the Alabama Great Southern and the Southern Railway.

BUFFALO, LOCKPORT & ROCHESTER.—See Rochester Connecting.

CHERRY RIVER & SOUTHERN.—An officer writes that this company already has considerable of the right-of-way bought, and in about 90 days expects to secure through condemnation proceedings the right-of-way through the Gauley Coal Land Company on about 23.5 miles. The projected route is from a point on the Baltimore & Ohio at the mouth of Cherry river, where it flows into Gauley river at Curtin, Nicholas county, W. Va., thence down the south side of Gauley river, via Brooks Bridge to the mouth of Hominy creek, thence up Hominy creek to the mouth of Mouse creek, and up Mouse creek to its head waters, passing through Shawver's Gap to Eleven Mile branch of Angling creek and down Eleven Mile branch and Angling creek to Meadow river, thence up the east or north side of Meadow river to the Nicholas, Greenbrier and Fayette county lines, about 42.5 miles. Construction work will be started as soon as the right-of-way is secured. The maximum grades will be 3 per cent compensated down to 1½ per cent, and the maximum curvature will be 30 deg. There will be three steel bridges on the line; two of 400 ft. each, and one of 125 ft. The company expects to develop a traffic in lumber, timber products, coal and other general commodities. H. L. Kirtley, president; E. H. Venable, chief engineer, Charleston, W. Va.

EAST GEORGIA (Electric).—A charter has been granted this company in Georgia with \$212,000 capital and headquarters at Savannah. The plans call for building an interurban electric or steam railway from Glenville, Ga., north via Hagan to Adabelle, about 30 miles, with a short branch from Hagan to Claxton. H. P. Talmage, G. J. Baldwin and E. Leffler are incorporators. (April 1, p. 811.)

LINVILLE RIVER.—A contract has been given to W. S. Whiting, Elizabethton, Tenn., to build a branch from Montezuma, N. C., northeast to Pascoe, 12 miles. The company now operates a line from Pincola northwest via Montezuma to Cranberry, 14 miles.

RADFORD-WILLIS SOUTHERN.—A contract is reported let to the Williams Brothers Construction Company, Roanoke, Va., for building from Radford, Va., southeast along Little river and Indian creek to Willis, about 25 miles. J. L. Vaughan, president; W. L. Castle, secretary and assistant treasurer. (February 26, p. 390.)

ROCHESTER CONNECTING.—Application has been made to the New York Public Service Commission, Second district, for a certificate of public convenience and necessity to build 2.5 miles of line in the outskirts of Rochester, N. Y. The Rochester Connecting recites in its petition its connection with the Buffalo, Lockport & Rochester, which now operates an electric line, and is also interested in the proposal to build a new international bridge across the Niagara river and to connect it with the B. L. & R. by a new line from Niagara Falls to Lockport. The eastern end of the B. L. & R., through the proposed Rochester Connecting is to be connected with the Pennsylvania and Erie systems at Rochester. The project is backed by electrical traction men of western New York, including E. G. Connette, president of the International Railway, Buffalo.

TENNESSEE RAILWAY.—A contract is reported let to J. C. Rodes & Company, Franklin, Tenn., for work on an extension of 11 miles towards Petros. On the completion of this contract there will remain about five miles yet to be built to complete the line from Oneida to Petros.

Railway Financial News

BUCKHANNON & NORTHERN.—See Monongahela Railway.

CHICAGO, ROCK ISLAND & PACIFIC.—N. L. Amster has filed a supplementary or amended petition for intervention covering all of Federal Judge Carpenter's recent orders in the Chicago, Rock Island Pacific receivership.

DELAWARE, LACKAWANNA & WESTERN.—An independent board of directors has been elected by the stockholders of the Morris & Essex, which is leased to the Delaware, Lackawanna & Western and which heretofore had a board of directors composed of officers or directors of the Lackawanna. J. O. H. Pitney, of Newark, has been made president; Adrian H. Larkin, chairman of the board; E. E. Loomis remains vice-president, and Henry V. Poor has been made secretary. The executive committee consists of Mr. Larkin, John R. Hardin, George C. Van Tuyl, Jr., Dunlevey Milbank and J. O. H. Pitney.

The following announcement has been made in regard to the steps that have been taken to comply with the Supreme Court's decision in the commodities clause case, commented on editorially in the *Railway Age Gazette* last week.

"Steps were taken to comply promptly with the recent rulings of the United States Supreme Court.

"The board authorized the officers of the company to execute a new contract which should conform to all matters questioned by the Supreme Court as either illegal or objectionable.

"The only directors of the coal company who are directors of the railroad, namely: W. H. Truesdale and George F. Baker, Jr., resigned from the board, and C. D. Norton and T. J. Mumford were elected in their places.

"E. E. Loomis, president of the coal company, tendered to the board his resignation to be accepted as soon as his successor can be selected, and arrangements were made to procure separate office accommodations without delay."

An extra dividend of 50 per cent has been declared by the Delaware, Lackawanna & Western Coal Company.

EL PASO & SOUTHWESTERN.—The Arizona Corporation Commission has approved the issue of \$16,000,000 bonds, the proceeds to be used to buy new equipment and make additions and betterments and to provide for refunding. All the lines belonging to the company in Arizona, some of which now are not operated directly, will be merged and brought under one operating organization.

KANSAS CITY, MEXICO & ORIENT.—The three receivers who were appointed in 1912 have been formally discharged. The operation of the property was taken over about a year ago by a new company.

MISSOURI PACIFIC.—The plan of readjustment without receivership which three committees, representing the 5 per cent first and refunding mortgage bonds, the 40-year 4 per cent gold loan bonds and the Missouri Pacific stock respectively, have been working on, was announced on Wednesday afternoon. Kuhn, Loeb & Co., New York, are made readjustment managers. The plan calls for the raising of \$41,419,792 cash through the subscription by stockholders of \$50 cash for each share of Missouri Pacific stock held. This \$41,419,792 cash is to be used to pay the \$24,845,000 notes which were due June 1 and were extended for one year, to pay \$3,861,000 maturing equipment trust obligations of the Missouri Pacific and of the St. Louis, Iron Mountain & Southern, and to pay floating indebtedness, interest, some immediately needed improvements, and to provide working capital. Common stockholders are to receive in exchange for each \$50 cash and the share of stock given up \$50 in new general mortgage 4 per cent bonds and \$100 in new common stock. Underlying mortgages with bonds outstanding aggregating \$128,460,620 are to remain undisturbed. There are to be issued the \$82,839,585 new common stock—just sufficient to make the payment to old stockholders mentioned above; \$46,923,150 new first and refunding mortgage 5 per cent bonds; \$44,399,292 new general mortgage 4 per cent bonds, of which, as mentioned above, \$41,419,792 will go

to stockholders in exchange for the cash and the remainder will be used, as noted below, in exchange for outstanding bonds; \$76,751,635 new convertible 5 per cent preferred stock, cumulative after June 30, 1918, and convertible into common stock at par. The holders of the \$14,904,000 consolidated first mortgage 6 per cent bonds will be asked to accept in exchange \$16,394,400 (110 per cent) new first and refunding mortgage 5 per cent bonds; holders of the \$14,375,000 collateral trust 5 per cent bonds, due 1917, will be asked to accept \$14,375,000 new first and refunding 5's in exchange, and holders of the outstanding \$9,636,000 collateral trust 5 per cent bonds, due 1920, will be asked to accept \$9,636,000 new first and refunding mortgage 5 per cent bonds in exchange. Holders of the \$37,255,000 gold loan 4 per cent bonds will be asked to accept a like amount of new 5 per cent preferred stock, as will also the holders of \$29,806,000 first and refunding 5's and \$650,000 outstanding Lexington division 5's in exchange. Holders of the \$3,459,000 Central branch 4 per cent bonds and of the \$2,500,000 Central branch Union Pacific 4 per cent bonds will be asked to accept half of the face value of their bonds in new general mortgage 4 per cent bonds and the other half in new 5 per cent preferred stock. Holders of the \$520,000 Leroy & Caney Valley first 5's, of the \$1,024,000 Kansas City Northwestern 5's and of the \$500,000 Boonville, St. Louis & Southern 5 per cent bonds are asked to take a like amount of new preferred stock in exchange. Holders of the St. Louis, Iron Mountain & Southern \$4,175,000 first and refunding mortgage 6 per cent bonds are asked to take \$4,383,750 (105 per cent) in new first and refunding mortgage 5 per cent bonds, and the holders of \$393,000 Little Rock Junction first consolidated 6's guaranteed by the Iron Mountain, and of the \$1,741,000 Texas & Pacific notes endorsed by the Iron Mountain, are asked to take a like amount of new first and refunding 5's. Holders of the few thousand dollars (\$45,135) outstanding St. Louis, Iron Mountain & Southern stock are asked to take a like amount of new preferred. This plan reduces the interest bearing securities outstanding by \$60,552,558, or from \$39,996 per mile to \$31,357. On the basis of the earnings and expenses for the fiscal year ended June 30, 1915 (last two months estimated) there should be a balance of \$2,373,514. After the payment of all fixed charges this would amount to 3 per cent on the new preferred stock.

MONONGAHELA RAILROAD.—See Monongahela Railway.

MONONGAHELA RAILWAY.—The Monongahela Railroad and the Buckhannon & Northern have been consolidated and taken over by a new company, the Monongahela Railway. Both roads were previously controlled by the New York Central and the Pennsylvania, and the new company is likewise controlled jointly by these companies.

MORRIS & ESSEX.—See Delaware, Lackawanna & Western.

NASHVILLE, CHATTANOOGA & ST. LOUIS.—Brown Brothers & Co., New York, are offering \$1,500,000 Nashville, Chattanooga & St. Louis first consolidated 5 per cent bonds at 105, yielding about 4½ per cent on the investment. These bonds are part of a total authorized issue of \$20,000,000 bonds of 1888-1928. Out of this authorized issue there is outstanding, including the present issue, \$9,108,000. The mortgage securing these bonds is a first lien on the main line from Chattanooga, Tenn., to Hickman, Ky., 322 miles, and on 276 miles of branch lines and is a second mortgage on 142 miles additional main line.

BRITISH WOMEN RAILWAY EMPLOYEES.—Press despatches from London report that the women now being employed in fairly large numbers on the various railroads of England will henceforth be eligible to membership in the National Union of Railwaymen.

CAMPAIGN NOTES FROM GERMAN SOUTH WEST AFRICA.—On the entry of the British forces at Windhoek, the capital of German South West Africa, great quantities of railway material were found to have been buried and this was subsequently recovered. The troops found 10 engines with their essential parts removed. The Provost-Marshal issued a notice calling on the inhabitants to restore any government property in their possession, and as a consequence civilians are now returning large quantities of railway stores, which they allege were sold or given to them.

In the hearing regarding advances in western passenger fares at Chicago this week, those opposing the advances raised a question as to whether the railways are not wasting money by furnishing a much-duplicated and too luxurious passenger service. The implication was that if this is the case the roads should increase

Costly Service and Passenger Rates

their net earnings by eliminating the wastes rather than by advancing their rates. This is a good theory, but it is not an appropriate one to emanate, as it did, from persons connected with the various regulating commissions. The main reason why the service is so much duplicated is that there is too much competition between railways; and the reason for this, as has been pointed out hundreds of times, is that the laws prohibit the roads from making agreements or arrangements to limit competition. If the regulators want competition reduced let them direct their lectures toward those who make fool laws to compel fool competition, not to the victims of these forms of folly. As to the lavish expenditures on passenger terminals—and some of them are lavish—can the wise men who are now deprecating them suggest any means of getting public opinion and city councils to quit demanding them? The worst example of such lavish expenditure in the United States today is the new union terminal at Kansas City. The railways spent so much on it principally because the people and city council of Kansas City held them up in every way that they could. The passenger service of the railways of the United States is too luxurious and expensive; but if the railways of the west should make a concerted effort to reduce its luxury and costliness, the outcry that would be promptly raised against them would be led by the same stentorian friends of the people and members of the state railroad commissions who are now opposing advances in passenger rates.

Professor Moulton, of the University of Chicago, estimates in an article in the Journal of Political Economy, an abstract of which is published elsewhere in this issue, that when completed the Erie barge canal and connected waterways will have cost the state of New York for the through route from Buffalo to New York City \$340,000 a mile. The purpose of the public in developing this waterway was to "reduce the cost of transportation" The original appropriation for the improvements now under way was \$101,000,000. The state engineer estimates that to complete them \$27,000,000 more will be required. "All things considered," says Professor Moulton, "if the history of this and other projects may serve as a guide, we need not be at all surprised if the total cost actually reaches \$135,000,000." This, however, makes no allowance for "the indispensable terminal facilities, such as docks, wharves, freight depots and transshipping machinery," the provision of which will add enormously to the cost. The four railways directly competing with the Erie canal are the Erie, the New York Central, the Lehigh Valley and the Lackawanna. Their outstanding capitalizations per operated mile are as follows: Erie, \$208,843; New York Central, \$164,222; Lehigh Valley, \$108,363; Lackawanna, \$44,424. The Erie is one of the highest capitalized roads in the United States; and, according to Professor Moulton's estimate, the cost of developing this waterway from Buffalo to New York City will be 63 per cent greater than the average capitalization per mile of the Erie. This is one way to "reduce the cost of transportation." If the part of the bill which the public pays as well as the part which the shippers pay, be included the cost of transportation on the Erie canal will be very much greater than on any of the competing railways. The expenditure of money on waterway development with such results is not economical or business. It is simply an indefensible waste of the public's money for the benefit of the politicians who pass the legislation and the shippers who are expected to use the waterways.

SECOND-QUALITY STATION AGENTS

ON a certain prominent railway a circular recently mailed to all station agents brought the following results:

Number sent out	345
Blanks returned properly filled out.....	168
Blanks returned improperly filled out.....	65
Blanks returned with station name lacking.....	71
Stations failing to reply.....	41
	345

The officer who issued the circular says that as a rule ten to twenty per cent of replies to such circulars fail to show the name of the station, and in many cases the agent's name is also omitted; and he asks what would happen if there were a similar percentage of inefficiency in the train service, the track maintenance work or in the motive power and car department. "Why," says the officer, "should the station service be lacking in the essential element of correctness?"

As to why the service "should" be so lacking the answer is quite simple, though it is not often put in words. It is that this service is made secondary and subordinate to the other three departments mentioned. Judging by acts and facts, not by theories or book-regulations, it is a fair conclusion that railway managers are tolerably well satisfied that this is a reasonable situation: train operation, track maintenance, etc., first class; station work, especially at small stations, second class. The situation is looked upon as reasonable, on the ground that nothing better can be afforded. Those other matters affect safety and cannot be neglected; station work is less important than safety and cannot be allotted so much money or so much care. The public does not want to have its money spent that way. Other elements, including competition, come in. The passenger conductor should be a better man than the agent at the small station, because he has to deal with many more people. The small waiting room can be neglected, when the passenger cars cannot, because passengers spend much more time in the cars.

If our friend were to change his question and make it "Why is the station agent slipshod in his habits," he could get a ready answer from his nearest division superintendent; who, very likely, would say, "Because we do not make him cultivate better habits. With every dollar needed in several different directions it is not deemed wise to allot any larger proportion to the station service."

But the lesson of this circular is a serious one, nevertheless. A lack in "the essential element of correctness" indicates, not a mere detail, but a fundamental fault. Three far-reaching difficulties trouble the superintendent on the majority of roads, and their most troublesome manifestation is in the station service: (1) the man is too remote from his boss; (2) the better class of men are promoted (or resign) too frequently; (3) the pay (except for members of labor unions) is too low. These three reasons for weakness, more fully stated, include (1) the need of more thorough supervision and instruction (often a better quality of supervision); (2) men are too frequently changed, not only because the best ones are needed elsewhere, but because so many of poor quality have to be dismissed—this because of lack of care in selecting and the failure to provide under-studies; (3) with under-pay must be included overwork.

The foregoing outline of what, to the superintendent, should be an important subject is not presented in this place with a view of entering upon its general discussion. To most of the readers of the *Railway Age Gazette* who have duties in this direction, a discussion would, no doubt, seem superfluous. They know the situation very well, already. It not only should be, but is, an important subject. They have studied it many times. Still, the paragraph with which we began, as well as the criticisms of the service by public, serve as a reminder that the problem is unsettled.

A word may be permitted concerning the last one of the three points. Better pay would, as a rule, be a good lever with which to raise the quality of station service. But increasing the pay does not always improve the man. A horizontal advance is depended on sometimes for an improvement which does not materialize. The true and rational procedure is to have station super-

visors who will elevate the standards of service and requirements. Where the pay is too low a firm, intelligent and continued policy in this direction will force the salaries upward. Many station supervisors should be much bigger men than they are—or more courageous.

THE CAR "SPOTTING" DECISION

IF we understand correctly, the decision of this week in the car "spotting" case, the Interstate Commerce Commission has reversed itself regarding this matter and, incidentally, extinguished the main theory advanced by its special counsel, Louis D. Brandeis, in the Five Per Cent case.

While the application of the eastern lines for a general advance in freight rates was pending last year the commission, in an opinion rendered by Commissioner Harlan in the Industrial Railways case, said: "Under the common law . . . the delivery of carload freight to a shipper having a private siding is made by shunting the car upon the switch clear of the main tracks. All services upon the siding beyond that point, in placing a car for loading or unloading at a particular spot convenient to the shipper, are what may be called volunteered services in the sense that they are in addition to the main line haul, and in excess of any obligation of service by the carrier at common law." The implication that the carrier ought to make a special charge when in addition to shunting a car upon a switch, it placed it for loading or unloading, seemed clear. Mr. Brandeis so understood the commission, and based his argument against a general advance in rates largely on the ground that the carriers could and ought to derive large additional revenues from the general imposition of charges for "spotting" cars.

The references to this subject by the commission and its counsel, led the press and public to believe that the railways were dissipating their revenues, and drew down upon them a large amount of denunciation. In its original decision last July in the Five Per Cent case, the commission referred to its opinion in the industrial railways case in such a way as to give the impression that it still regarded a general charge for the "spotting" of cars as a means by which the carriers could secure a large part of the additional revenues they needed.

In conformity to what they understood to be the commission's views and wishes, the railways filed tariffs fixing charges for the "spotting" of cars. They were not especially enthusiastic about these tariffs. They doubted the fairness or expediency of making a special charge for placing a car at a convenient place on a shipper's siding when no extra charge was made for putting a car on a team track. They were unwilling, however, to incur the odium of apparently refusing to carry out a policy which they understood to be favored by the commission.

Now, after all the denunciation of the railways for profuse dissipation of their revenues, and after the intimation by the commission that "all services upon the siding beyond . . . placing the car for loading or unloading" are . . . in excess of any obligation of services by the carrier," the commission rules that the placing of cars on industry sidings *for loading or unloading* is part of the line haul, and that no extra charge can be made for it. In consequence, the "spotting" tariffs are set aside. Of course, the commission holds that the railways should make an extra charge for switching cars within a shipper's plant. There never was any real difference of opinion on that subject.

That the commission has been inconsistent is clear. But this is not entirely to its discredit. It went too far in its expressions regarding car "spotting" in the industrial railways case, and Mr. Brandeis subsequently went further still. Having found that it went too far, it shows good sense and courage in now backing up.

However, the incident holds a lesson which should not be lost upon those, whether on the commission or off it, who set out to reform the transportation industry. This lesson is that it is not safe to formulate and promulgate a theory regarding what

is being or ought to be done, with the expectation of subsequently finding facts which will support the theory. This is what was done concerning the matter in question. In practical affairs it is far safer to get your facts first, and formulate your theory afterward. If this were done more frequently in connection with the regulation of railways, many things that are now left undone would be done, and many things that are now done would be left undone.

THE TREND OF RAILWAY AFFAIRS IN TWO EIGHT-YEAR PERIODS

THE *Railway Age Gazette* in recent issues (June 4 and June 11) has called attention to the fact that there are now in the hands of receivers in this country about 30,500 miles of railways, having a total capitalization of approximately \$1,816,000,000. Many persons, conceding that the carriers are not as prosperous as could be wished, attribute their unsatisfactory condition largely to the effects of the war in Europe, and argue that they should not be given special consideration and relief because, as is argued, they are merely suffering along with other business concerns.

In our issue for November 27, 1914, we published an editorial entitled "What Is the Matter with the Railways and Regulation?" showing that the troubles of the railways originated long before the war began, and were in the main due to fundamental economic tendencies. In the editorial referred to, statistics for the two seven-year periods, 1899-1906 and 1906-1913, were presented, which demonstrated that the entire trend of affairs in the transportation business was different in the latter

increased 58 per cent, freight traffic per mile 59 per cent, and gross operating revenue per mile almost 55 per cent. The average annual wage per employee increased less than 8 per cent. Operating expenses per mile increased 56 per cent, and net operating revenue per mile almost 53 per cent. Taxes per mile increased less than 42 per cent, and in consequence net operating income per mile increased almost 54 per cent. The investment in road and equipment per mile increased only 3.88 per cent, and the percentage of net operating income on property investment advanced from 3.64 per cent to 5.39 per cent. The increase in the *percentage* of operating income on property investment was 48 per cent.

All these figures contrast very sharply with the corresponding figures for the period, 1906-1914. In this second period passenger traffic per mile increased less than 26 per cent. Freight traffic per mile increased less than 19 per cent. There were declines in both the average passenger and the average freight rates, and the increase in operating revenues per mile was only 21 per cent. The average annual wage per employee advanced almost 33 per cent, and in consequence the increase in operating expenses per mile was almost 33½ per cent, being far greater in proportion than the increase in either the passenger or the freight traffic handled. Net operating revenue per mile actually decreased three per cent, while taxes per mile increased 69 per cent. The increase in investment in road and equipment per mile was 20 per cent, while there was a decrease of over 10½ per cent in net operating income per mile of road. In consequence there was a decrease of almost 26 per cent in the *percentage* of operating income on property investment, the decline being from 5.39 in 1906 to 3.99 in 1914.

TREND OF RAILWAY AFFAIRS IN THE LAST TWO EIGHT-YEAR PERIODS

Item	Amount			Amount of increase		Per cent of increase	
	1898	1906	1914	1906 over 1898	1914 over 1906	1906 over 1898	1914 over 1906
Passenger-miles per mile of line.....	72,462	114,529	144,278	42,067	29,749	58.05	25.98

a Based on compensation adjusted to include the returns of the Southern Pacific Company, whose records were destroyed by fire. d Decrease.

period from what it was in the former. Both were periods of increasing gross earnings, but in the former the various influences at work caused total earnings to increase much faster than expenses and fixed charges, while in the latter the influences operating combined to make expenses and fixed charges increase much faster than earnings. The resultant was that in the period 1899-1906 the net return on investment substantially increased, while in the period 1906-1913, in spite of the fact that in 1913 the gross earnings were the largest in history, there was a decline in net return on investment.

The Bureau of Railway Economics at our request recently has compiled for us exactly similar statistics for the eight-year periods, 1898-1906 and 1906-1914. These statistics, while no more significant than those for the two last seven-year periods, are much more striking. In the fiscal year ended on June 30, 1914, contrary to the experience in the fiscal year 1913, there was a substantial decline in railway earnings and traffic. Therefore, while the figures for 1913 show how under present conditions the railways fare when their business is increasing, those for 1914 show how, under present conditions, they fare when it falls off. The fiscal year 1914 ended a month before the war in Europe began. Therefore, the results in that year, striking as are the figures for them, were not affected by the war.

The statistics for the two eight-year periods are presented in the accompanying table, and the attention of every thoughtful and public spirited student and business man is invited to them. It will be seen that in 1898-1906 passenger traffic per mile in-

To sum up, there was an increase in investment per mile in the first eight-year period of less than 4 per cent, and an increase of almost 54 per cent in net operating income with which to pay a return on it. In the second eight-year period there was an increase in investment per mile of 20 per cent, and a decrease in net operating income per mile with which to pay a return on it of 10½ per cent. Perhaps the figures regarding the actual increase and decrease in net operating income per mile in the two periods will convey the idea even more forcibly than the percentages of increase and decrease. The actual increase in net operating income per mile between 1898 and 1906 was \$1,124, while the actual decrease in net operating income per mile between 1906 and 1914 was \$339.

There is no difficulty in locating the principal causes of the decline in net operating income in the second period. They were the increase in the average annual wage per employee of almost 33 per cent, and in taxes per mile of 69 per cent. These advances in wages and taxes, together with the decrease of over one per cent in the average passenger rate, and of over two per cent in the average freight rate, were quite sufficient to have caused the railway companies much trouble. When, in addition to suffering such a loss in net operating income, it was necessary for the roads, in order to provide the improved service which the public demanded to make an increase in property investment per mile of 20 per cent, or five times as great as the investment per mile made in the preceding eight years, their embarrassment was bound to be great. The most

efficient management conceivable could not save any class of business concerns from being embarrassed by the operation of such a combination of adverse influences.

The Interstate Commerce Commission already has frankly recognized the unfavorable situation to which this conspiracy of causes, all operating to the same end, has reduced the eastern railways. It is only reasonable to expect that it will do likewise as respects the middle western railways in their rate cases. But the roads need more than relatively small increases in rates. They also need help in stopping the increases of expenses, and especially those which are entirely unnecessary.

A great many unnecessary increases of expenses have been forced on them by regulating bodies. If the legislative committees of the labor unions had got their way there would have been much more of this sort of thing at the recent sessions of the state legislatures. There will be a continuance of efforts by short-sighted people to put additional burdens on the carriers. The only way the success of these can be prevented is to create a strong and lasting public sentiment against them. The managements of the railways should go on doing all they can to create such a public sentiment, but in this work they need and should have the vigorous co-operation of business interests of all kinds. They should also have the co-operation of all classes of workmen, for in the long run whatever unnecessarily increases railway expenses will be felt adversely by every class in the community.

NEW BOOKS

Experiences in Efficiency. By Benjamin A. Franklin. Size 5 in. by 7½ in.; 167 pages. Bound in cloth. Published by the Engineering Magazine Company, New York. Price \$1.

It is stated in the introduction to this book that it "is offered in answer to a many-voiced inquiry for specific examples of efficiency methods." Most of the chapters originally appeared in the *Engineering Magazine*, but they have been adapted and rearranged in a logical sequence. "Experiences in Efficiency" is not a book on scientific management, for it treats of the introduction of individual efficiency methods in various plants rather than of the introduction of an entire efficiency system in one plant. In each case considered the underlying conditions are briefly described and the success of the efficiency method carefully discussed. Naturally several of the chapters treat of the labor problem, very careful attention being given to the necessity for fair play to the employees, for careful inspection and for a proper incentive. Chapters also deal with clerical labor, proper routing methods and an efficient system of cost accounting.

Human Nature and the Railroads. By Ivy L. Lee. E. S. Nash & Co., Philadelphia. 129 pages. Price \$1.

Under this title Ivy Lee, who up to a few months ago was special assistant to the president of the Pennsylvania Railroad in charge of publicity, has brought together ten lectures delivered before various associations, chambers of commerce, etc. All of the lectures deal with the relations between the public and the railroads, and all deal with this question in a frank, clear, "human" way. Mr. Lee has had unusual opportunities to get an inside view of how one of the greatest railroad corporations in the United States is run, and also, through his relations with the press, an opportunity to hear the other side of the story. In some ways he was able to view broad questions in a broader way even than could the executive officers of a railroad who might be, of course, engaged in the attempt to solve one particular phase of these questions. The titles of the various lectures give a good idea of the scope of the book: *Human Nature and the Railroads*, *The Railroad Man's Burden*, *Training the Railroad Man*, *Telling the Railroad Story*, *Why Should We Make the Railroads Safe*, *Publicity—A Cure for Railroad Evils*, *Regulation Hampering Good Manners*, *Do We Want Government Ownership*, *The Need for Faith in Men*, *The People's Part in Solving the Railroad Problem*.

Letters to the Editor

REDUCING LOSSES DUE TO PILFERING

HAILEYVILLE, Okla.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

If a man has made up his mind to break into a car of merchandise or flour he will first ascertain the location of the car and then the best time to enter it to avoid being caught. Observing the cards and chalk marks on the outside of the cars will show him the exact commodities they contain in almost every case, and their destination as well. After securing this information he only waits an opportune time to do the job; he may get on the train that takes out the car he is after and do his pilfering on the way, or he may telephone his confederates at other places that certain cars will go out in certain trains and they will be on the lookout for them.

Merchandise, as well as other cars, are generally carded and chalk-marked thus—"Merchandise (or whatever the load may be) for 1071 Train 103" and so on. What better guide for his work does the thief want than this advertisement? Why is it necessary to mark cars in this manner? They can be just as well handled by the conductors, yardmasters, foremen and yard clerks by the switch lists and way bills and the public will not know what the cars contain. Of course, where cars contain explosives they will have to be so marked.

Again, the seals now being used are of very little protection, none at all if a man wants to pilfer a car. By the use of a pocket knife some seals can be pulled apart and replaced and the average man will not know that they have been disturbed. To protect the merchandise and other commodities which are being daily stolen it would seem that substantial locks could be used for the through cars, the combination of the locks to be only given by wire to the agents at destination; or, locks of different design could be used, and the keys shipped by express to the agents at destination. The local cars could be handled under locks, the keys of which would be kept by the conductor. When cars are set out, the agent would have locks to protect them while standing loaded at his station. The method to be adopted in case of an accident would be the same as now—chop the car open if the occasion demands; if it has to be repaired by access to the inside have the key sent to the repair point by express, or if a combination lock, wire the agent at destination for the combination. The delay would not amount to much. It would require a large number of locks, and the first cost would be something. However, the seals now employed are only used once and thrown away. The locks could be used until they were lost or worn out. Thousands of dollars worth of property is stolen on the railroads every week, and it appears that some practicable method of protecting the freight in transit could be put in effect. If the practice of advertising the contents of the cars were discontinued this would reduce pilfering.

J. L. COSS.

Dispatcher, Chicago, Rock Island & Pacific.

RAILWAY EXTENSION IN CHINA.—The Chinese government proposes to construct railway lines outside the Great Wall. The termini of the proposed lines are the several places which will be opened as trade ports, such as Chifeng, Taonanfu, Dolonor, etc. The first line is from Peking to Jehol, a distance of 140 miles, with a line from Jehol to Chifeng of 130 miles, and another one of 170 miles from Chingchow to Chifeng. The other lines are from Kalgan to Dolonor of 150 miles, and from Dolonor to Chifeng of 200 miles. These lines will be connected with the Peking-Mukden and the Peking-Kalgan railways. The scheme is under the consideration of the Ministry of Communications.

Seaboard Air Line Mountain Type Locomotives

Replace Pacific Type in Through Passenger Service on Heavy Grades; Comparison with Others of Same Type

The Seaboard Air Line has recently received 10 Mountain type locomotives from the American Locomotive Company. They are in service between Richmond, Va., and Columbia, S. C., replacing an equal number of Pacific type superheater locomotives having 23-in. by 28-in. cylinders, 72-in. drivers, 195-lb. boiler pressure, a total engine weight of 223,000 lb., and exerting 34,200 lb. tractive effort.

The Mountain type locomotives have a total weight, including the tender, of 499,000 lb., and develop a tractive effort of 47,800 lb.; the Pacific type engines have a total weight, engine and tender, of 397,300 lb. With an increase in weight of 25.8 per cent, an increase of 39.8 per cent in tractive effort was obtained, combined with a higher boiler capacity. According to the American Locomotive Company's method of determining boiler capacity, the engines of the Pacific type have 86 per cent boilers, while those of the Mountain type have 98 per cent boilers.

Through passenger trains consisting of from 10 to 13 steel

the Mountain type engines. The new locomotives have also given a very satisfactory performance in starting trains at stations where the grades are heavy. At certain stations, with the Pacific type engines it was necessary with 10 or more cars to take the slack a number of times, and occasionally to back the train off the hard pull. With the Mountain type the latter expedient has never been resorted to, and it is exceptional to have to take the slack in starting.

This locomotive design was developed as a part of the program of the Seaboard Air Line in reducing operating costs. The successful operation of the engines is of special interest because of the fact that it adds another road to those which are using this type of locomotive for heavy passenger service.

The accompanying table shows the principal data for a number of Mountain type locomotives in comparison with the Seaboard engines.

In working out the design there were included a 34-unit super-

COMPARISON OF FIVE MOUNTAIN TYPE LOCOMOTIVES

Missouri Pacific ...	50,400	296,000	208,000	63	28 by 28	170	75 ³ / ₄	3,165	285	3,450	761	4,592	56.5

cars, are being hauled by the new locomotives, the regular trains being made up of 10 cars. The engines are assigned to runs from Richmond to Raleigh, 160 miles, on which there are several grades of 1.2 per cent, 2½ miles long; and from Raleigh to Columbia, 207 miles, on which there are grades of 1.25 per cent, 3½ miles long. The introduction of the Mountain type engines was because of the inability of the locomotives of the Pacific type to maintain a sufficient speed up the grades with 10 or more steel cars to avoid the necessity of exceeding the maximum

heater, a 44³/₄-in. combustion chamber, Security firebrick arch, long main driving box, Cole outside bearing trailing truck, Woodard engine truck, and radial buffer. The table which follows gives the principal dimensions and data:

General Data

Gage	4 ft. 8½ in.
Service	Passenger
Fuel	Bit, coal
Tractive effort	47,800 lb.
Weight in working order	316,000 lb.
Weight on drivers	210,500 lb.

Mountain Type Locomotive Used in Heavy Passenger Service on the Seaboard Air Line

speed limit of 50 miles per hour on other parts of the run. The Pacific type locomotives, when hauling 11 cars, would drop back to speeds as low as 18 or 20 miles an hour before reaching the top of the heaviest grades, while those of the Mountain type will maintain a much higher speed with the same train. On some occasions they have hauled 12 cars, maintaining a speed of 35 miles an hour up the grades.

Records of the fuel consumption of the Mountain and Pacific type locomotives, with the same weight of train, show for the Mountain type, 12 lb. per car mile, and for the Pacific type, 13.5 lb. per car mile. This is a saving of 11 per cent in favor of

Weight on leading truck	53,000 lb.

arrangement is maintained, trouble from this source will be eliminated. Conditions may arise that will disarrange this schedule, but by reaching the complainer before he gets to you, the complaint can possibly be forestalled and delay and expense to him saved.

The irregular patron and team track man should be treated with utmost courtesy and with liberal information and due consideration, as one may secure a regular customer for his road. Irregular runs and special service should be discouraged as the practice is expensive and may disturb other patrons, but if necessary to save a patron from loss or damage the service should be performed.

Economical operation can only be attained by having an efficient organization. Learn to handle men and make them work for you. Win their confidence, encourage suggestions and make them feel that they are a part of the machinery and not merely tools. The most humble employee is worthy of your consideration and many differences can be adjusted by showing your interest in the case. Each employee should be encouraged to learn every detail in his own department and then, if occasion demands he may fill in, where needed.

The system of interchange in all large terminals is similar, the main object of all is to get rid of the cars, and to save per them and responsibility for delay and claims. To create a free interchange, the important question is keeping the transfer tracks open. Switch engines, being the most expensive item, must not be delayed waiting for cars. Bills or proper data for handling should in all cases accompany the cars. The mechanical inspection and seal records should be made promptly and meanwhile the bills should be checked up, tags made out and cars carded without delay. If a car is found without proper data, the delivering road should be immediately called and disposition requested, thereby saving delay and rehandling.

The most important function in terminal yard operation is for the man in charge to know exactly what is going on daily. In our terminal a complete yard check is made each morning, showing the number and initial of every car, loaded or empty, good or bad order and destination; if any cars are found without disposition, immediate action is taken to secure the data for moving them.

The universal interchange bureau in vogue here, eliminates the delay in mailing and makes complete up-to-date records possible. The bureau consists of an interchange clerk representing each road who assemble daily at one of the freight offices, check up each other's interchange, make proper corrections and complete each day's work.

The common practice in furnishing cars for shippers is to call on the routing road for empties, which often consumes several days. Delay to shippers and unnecessary rehandling of cars to and from connections can frequently be avoided by picking up a car and having it inspected for purpose required and applied on the order.

Some terminals are distributing points for grain, lumber and fruit, and have facilities such as storage and inspection yards for this purpose. Terminals that have no separate storage yards should have assigned tracks for the storage of hold grain, and this information conveyed to the grain exchange inspectors. The inspectors are then in a position to make prompt inspections, which means quick release of cars. Certain tracks should be assigned for the fruit distributors and located where they will be convenient for vehicles and ice men, in case cars have to be iced on track. A fixed hour should be maintained for receiving diversions or disposition and the track pulled regularly after this hour to facilitate the movement of the cars, to connecting lines or destination.

Co-operation with the other fellow will help any situation and a movement in this direction has been accomplished here by the formation of an organization known as the General Yardmasters' Terminal Association. The association meets once each month to discuss the problems of handling terminal traffic and cultivate good fellowship and much good has resulted therefrom. The

CO-OPERATION IN YARD OPERATION

By H. H. LARSON

Yardmaster, Union Pacific, Council Bluffs Transfer, Ia.

The successful operation of a terminal yard depends on the yardmaster, and to get results he must fit himself to conditions that are peculiar to the problems that surround him. He must first learn to enjoy his work, get into the real game of it and subordinate everything to it. Co-operation with all departments is the essential feature, and if the yardmaster is in perfect harmony with all the different department heads, his work will be less arduous.

The yardmaster is comparable to the merchant and should treat all whom he serves as his customers, dealing with them honestly and faithfully. To have and to hold the respect of his co-workers and patrons he must be a man of his word. The freight house is usually the biggest customer and should be served promptly and regularly, as a few moments' delay in switching will run up into hours and dollars to a large force of men. Where the drop truck system is used, the loss in time to the platform force can be reduced to a minimum if the switching is handled promptly. Dilatory switching service performed for the car department will result in delay to cars, but the prompt handling of material will save delay to equipment and dollars in labor. To get full value from each crew, the motive power must be in good shape and out in time; and to expect such service the round house, in return, must have its coal promptly and supplies handled quickly. By keeping in close touch with this department, many serious delays can be averted.

The industrial feature of terminal operation is frequently a trying proposition. The public expects prompt service. Some patrons are unreasonable and the ready excuse for presenting claims requires no little diplomacy to forestall. The man in charge should make himself personally acquainted with as many of his patrons as possible, interesting himself in their welfare, and finding out what they expect and want.

A regular and set schedule can, no doubt, be arranged with patrons which will be satisfactory to all concerned and if the

policy outlined has resulted in reducing delay to a minimum, saving in per diem and satisfied patrons.

A daily comparison of business handled, fair and impartial treatment toward co-workers and employees has enabled us to increase the cars handled per engine, 65 per cent in seven years.

CLASSIFICATION OF FREIGHT LOSS AND DAMAGE PAYMENTS

The very great increase in the amounts paid by the railroads of America for freight losses during the past ten years, has now become familiar knowledge. The report of the committees of the American Railway Association, recommending measures for improving the efficiency of the work of the transportation department in this respect was noticed in the *Railway Age Gazette* May 21, page 1088, and again May 28, page 1127, in connection with the proceedings of the spring meeting of the association, where mention was made of the fact that during the fiscal year ending June 30, 1914, the total payments on this account were

ending December 31, 1914. The total here shown is \$32,375,618. The figures do not include the payments of roads having annual revenues of less than \$1,000,000. In the reprint here given the table is divided into two parts, ten of the sixteen classes being in the upper part and the other six in the lower. The seventeenth column (letter q), as shown, represents a sum to be deducted from the aggregate of the preceding columns.

This statement presents the aggregate of the losses and damages on 180 roads operating 227,884 miles of road; the total represents 1.117 per cent of the total operating revenues of these roads; 1.551 per cent of the total operating expenses, and 1.625 per cent of the total freight revenues.

The committee in its report presents an analysis of the statistics which appear in the table, giving therewith reasons for the different recommendations embodied in the resolutions offered for the approval of the association (printed May 28). Some 18 per cent of the total loss is of entire packages. Unlocated losses amount to nearly 24 per cent of the whole. Rough handling of cars, representing carelessness outdoors, accounts

\$36,380,285, which sum is equal to 1.597 per cent of the freight revenue. This sum represents all of the reports made to the association, which include some Canadian roads. For the United States alone the total was \$33,671,219. The total in 1904 was \$17,002,602; in 1905, \$19,782,692; in 1910, \$21,941,232; in 1912, \$25,005,705; in 1913, \$30,885,454.

In connection with this report the committee presented a statement, reproduced herewith, giving, in considerable detail, as shown by the records of the Interstate Commerce Commission, payments made by class 1 roads during the twelve months

for over 13 per cent; and improper handling, etc., neglect or recklessness, mostly indoors, amounted to 4 per cent. In short, every one of the sixteen items, against each one of the 24 classes of commodities, has a very definite interest for some particular class of employees; and many of them, of course, for two or more classes.

Besides the matters dealt with in the resolutions printed last week, the committee on packing, marking and handling of freight has a number of other recommendations in hand and probably will take measures to have them put into effect at an early date.

It is proposed that where fibre board boxes do not come up to the standard of strength and security, the freight rate shall be made 50 per cent higher than the regular tariff. It will be proposed that liquids in glass or earthenware be not received, except in very small containers, say those of one quart capacity. Some articles ought not to be received in fibre containers, and a list of these will be presented to the classification committee. Boxes containing wine, liquor, shoes, hats and clothing ought to be completely strapped with wood or iron or wire and a recommendation to this effect is likely to be adopted.

This committee has under consideration regulations for the proper loading of cement, plaster, sewer pipe, newsprint paper in rolls, and drain tile; also rules for the removal and disposition of refuse; for fixing a closing hour for the receipt of freight; and for loading and handling carload freight.

THE COST OF THE ERIE BARGE CANAL*

By H. G. MOULTON

Assistant Professor of Political Economy, University of Chicago

The latest report of the state engineer and surveyor of New York¹ contains an account of the progress that has been made on the New York barge-canal system to date, and some revised estimates of the probable eventual cost of the undertaking. Canals have notoriously cost far more in the building than the original hopeful estimates. Such has been the almost universal experience, except in Germany, where faulty preliminary estimates have been comparatively rare. The experience in New York has followed the general rule. By act of the legislature and a referendum vote in 1903 the State of New York appropriated \$101,000,000 for the rehabilitation of the state canal system. The law provided that the new Erie canal should be 12 instead of 7 feet deep and that the locks should be 28 feet wide and 328 feet long.

According to this [state engineer's] estimate the canal construction work involved would cost approximately \$84,000,000. The balance of the appropriation was designed to cover damages, engineering, incidental expenses, and contingencies. It was also estimated that \$2,000,000 would be realized by the sale of abandoned canal lands, . . . where the line of the present canal was deviated from in the course of the new construction. This amount it was estimated would be turned back into the canal fund for the general uses of the appropriation, thus making the estimated total cost of the canal \$103,000,000, of which \$2,000,000 would be recovered.²

Let us see how these expectations have been fulfilled.

A series of wholly unexpected events have occurred which have rendered the foregoing estimates quite inadequate. The first of these came in 1906 when the legislature amended the original law so as to increase the width of the locks from 28 feet to 45 feet. This has added \$2,500,000 to the cost of construction without increasing the appropriation. Several smaller amendments passed by the legislature have added \$250,000 to this amount.

A second unanticipated expense has been due to delays in settlement with railroads whose lines have been crossed by new canal lines. This has required changes in railroad grades and alignments and the construction of new bridges. The advent of the Democratic state administration in 1911 resulted in throwing the question of the legality of the already consummated agreements with the railroads into the courts. "After three years of litigation the court of appeals has upheld the settlements made prior to 1911. This litigation, however, made it necessary to cancel several of the existing contracts for the reason that it was not possible to provide the contractors with the entire site of their contracts." Other contracts, also, became involved; and, to make a long story short, the state engineer now believes that the litigation damage claims and added expenses due to "re-surveying, readvertising, and the movement of heavy machinery" have increased the total outlays on this account by \$5,000,000.

A third cause of additional expense has been two unexpected

breaks in the line of the canal east of Rochester, one in 1911 and one in 1912. On these \$400,000 has already been expended, and the engineer estimates that permanent repairs will entail an additional outlay of \$250,000.

Fourthly, the rebuilding of public highways destroyed by construction operations on the canal has cost the state to date over \$1,250,000.

Fifthly, services rendered by the state departments of controller and claims and by the appraiser have added \$710,000 to the total. The original estimate made no allowance for these items.

Sixthly, "no provision was made in the 1903 estimate which at all adequately provided for the enormous damage claims" filed by private property holders. There have been filed up to the present time land damage claims to the amount of \$19,000,000; water-power damage claims to the amount of \$38,000,000; railroad-crossing claims to the amount of \$8,700,000; and damage claims by contractors to the amount of \$7,000,000; making a total in round numbers of \$72,700,000. The state engineer adds, however, that "many of these claims are very excessive and it is reasonable to assume that no just awards will reach much over one-third of the total sum claimed." This is a grudging admission of at least \$25,000,000 for claims thus far presented. The court awards, delayed as they have been, have already amounted to over \$10,000,000.

Finally, the incidental expense were grossly underestimated. "The necessity of maintaining navigation on the old canal while building the enlarged channel on the same site, as is the case in many sections, presented a number of unexpected and expensive difficulties. Injunctions on the part of property-owners which delayed work or made necessary the readjustment of plans have also added to the expense." The total charge for engineering, including the charges for consulting engineers, has amounted to \$9,100,000—much in excess of the anticipations. The straight construction costs have also been substantially increased, owing to "the increased cost of materials, particularly with reference to concrete, the eight-hour labor law, and the workmen's compensation law, both pieces of legislation passed subsequently to the making of the estimate in 1903."

The net result is that with only 85 per cent of the construction work on the canal completed, the appropriation of \$101,000,000 is overdrawn. "The state is at this moment obligated to an expenditure of \$1,500,000 more than is available in the appropriation." Unless an additional appropriation is made no section of the canal will be available for through traffic by large barges as the work remaining to be done is so located that the completed sections could be utilized for local traffic only.

The state engineer now estimates that to complete the project an additional sum of \$27,000,000 will be required. Perhaps this estimate is proportionately as wide of the ultimate mark as the previous ones. In particular the damage claims may much exceed the estimate of the engineer. All things considered, if the history of this and other projects may serve as a guide we need not be at all surprised if the total cost eventually reaches \$135,000,000.

Parenthetically, it is worth noting that engineers originally hoped that the project would be completed and ready for use with the opening of navigation in the spring of 1915. It is now the hope of the department that, if the additional appropriation required is granted at once, two sections of the canal, from Troy to Whitehall and from Waterford to Otsego—roughly half the distance—will be ready for local traffic by the opening of navigation in 1916. It would appear, therefore, that it will be at least three years yet before the undertaking as a whole is completed.

To return to the question of cost, it will be of interest to reduce the foregoing figures to a mileage basis. The project in New York is a system of canals rather than a single line, and is composed of the Erie, Champlain, Oswego, and Cayuga and Seneca branches. The appropriation of \$101,000,000 was for the first three branches; while a separate appropriation of \$7,000,000 was made in 1909 for the Cayuga and Seneca branch, which is 27.5

*Abstract of an article published in the Journal of Political Economy, May, 1915. Reprinted by permission.

¹Barge Canal Bulletin, January, 1915 (published monthly at Albany, N. Y.).

²Ibid., p. 3.

miles in length. The lengths of the Erie, Champlain, and Oswego branches are 323, 61.5, and 22.8 miles, respectively, giving a total of 407.3 miles for the main system. The average cost per mile has therefore been approximately \$330,000 (\$135,000,000÷407.3). Since the canal connects with the Hudson river, however, it makes possible a continuous water route from Buffalo to New York City. Spreading the same cost over this longer distance reduces the average to approximately \$260,000 per mile. This is exclusive of the cost of necessary improvements on the Hudson, particularly the construction of a large dam and locks near Troy.

All of the foregoing costs, it should be observed, are merely for the acquisition of canal sites, and for the construction of the channel, locks, etc. They make no allowance for the indispensable terminal facilities, such as docks, wharves, freight depots, and trans-shipping machinery. This failure to provide (originally) for these terminal facilities affords an excellent illustration of the utterly haphazard fashion in which public works are undertaken in this country. Campaign orators, chambers of commerce, specially interested shipping associations, waterway conventions, and state and national commissions had for many years portrayed the wonderful possibilities of water transportation and fanned the enthusiasm of the public to a white heat, before there was even so much as a reference to the terminal question. Indeed, it was not until 1909 that it made its belated appearance, in a government report, six years after the decision to rehabilitate the old Erie Canal.

The United States Bureau of Corporations was delegated to make an exhaustive report on the subject and in 1909 the state of New York appointed a Barge Canal Terminal Commission for the purpose of investigating the terminal situation in New York with a view to making an appropriation. After an extensive investigation costing \$10,000, the commission came to the important, though obvious, conclusion that "it is just as necessary that there shall be frequent, convenient, well-established, thoroughly equipped, and wisely managed depots all along the canals and waterways, where canal-borne freight may be received, cared for, and shipped away, as it is necessary that the railroads shall have their freight depots. It was found that a good waterway terminal has four prime factors: adequate wharves; warehouse space; transshipping machinery; and belt-line railway connections between the water routes and adjacent railways and local industries. Henceforth, the development of these necessary terminal facilities had to be included in estimating the total cost of the undertaking.

In 1911 the legislature, acting upon the commission's report, appropriated \$19,800,000 for the purpose of constructing terminals for the barge-canal system. This was approved by a referendum vote of the people in November of that year. Provision was made in this appropriation for New York and Buffalo at the terminal of the route, and for about fifty intermediate towns. Whether the sum appropriated is the usual underestimate remains to be seen, of course, but there is little reason for believing that the amount is at all adequate. Study of the report inclines one to believe that while the provision of the necessary docks and wharves has received pretty careful consideration, the matter of transshipping machinery, storage depots, and belt-railway connections has been slighted not a little. Even in the case of the docks and wharves these preliminary cost estimates may well prove far from adequate. There will doubtless be the "unanticipated" claims-department charges, appraiser's expenses, controller's fees, "incidental outlays" of many kinds, and, particularly, the customary heavy damage claims with the litigation expenses connected therewith.

Indeed, it is a certainty that further appropriations will be required for terminals, since the 1911 appropriation did not take into consideration or definitely provide for terminals along the Hudson river between Albany and New York. The state engineer has already called attention to the early need of an additional appropriation for this section of the route.

Finally, the appropriation that has already been made for terminals in New York City is clearly inadequate for the needs

there. The city itself in 1911 outlined a project, independent of the state, which calls for an initial expenditure of \$12,000,000 on terminal facilities. Whether this plan has been given up the writer is unable to ascertain; but at any rate it is a clear indication of the probable needs in the metropolis.

It would obviously be a mere guess on the part of the writer to state the probable ultimate cost of providing the terminal facilities that will be required. Not being averse to prophecy, however, I may hazard an estimate of \$40,000,000 on this account. Something like a grand total of \$175,000,000 may, therefore, prove to be the ultimate expenditure of New York in rehabilitating her canal system.³ This estimate would raise the figures of average cost per mile that were given above from \$260,000 to more than \$340,000, for the through distance from Buffalo to New York City. For purposes of comparison it may be added that the capitalization of the railroads of the United States averages approximately \$60,000 per mile.⁴

It has been seen that the question of terminals did not appear until several years after the barge-canal system in New York was approved. In a similar way the state has gone ahead building the canal without knowing what depth of channel is either desirable or necessary. It now appears that quite as serviceable a canal might have been provided at perhaps only a fraction of the present cost.

The depth of the new Erie canal at the locks is to be 12 feet. No good reason has ever been given for this particular depth. Perhaps the most common statement has been that the failure of the old canal to retain its former tonnage was due to the inadequate depth of the 7-foot channel. Another and perhaps more important argument has been that if the canal were made of ample depth boats could pass through the canal to and from the various lake ports without breaking bulk. But in this connection there was no investigation as to the practicability of lake and canal transportation by the same boats. As usual, investigation could be left until afterward.

At last, in 1911, the Barge Canal Terminal Commission recommended that it was important that a study be made of the best type of boat for use on the canal, but the advice passed unheeded. Just recently, again, the state engineer has urged that "one of the matters that should receive the early attention of the state is that relating to the size of boats for navigation upon the opening of the barge canal." It is apparent, therefore, that even yet there is no definite knowledge as to what is the most feasible boat for the canal or what its draft should be.

A great depth of channel is not required for economical barge transportation. For instance, the fleets of coal barges on the Ohio and lower Mississippi rivers, of which so much has been written, have to be content with a depth of 6 feet and even less for the greater part of each year. On the Rhine in Germany, barges of 2,000 tons capacity regularly ascend the river as far as Mannheim, where the low mean channel depth is only 6.52 feet. Between Mannheim and Strasburg, the head of navigation on the Rhine, the low mean depth is but 3.91 feet, but barges of 800 tons burden reach the latter port. In fact, the greater part of the vast canal traffic of Europe is carried on canals with a depth of less than 7 feet.

Evidently, the failure of the old Erie canal was not primarily due to its inadequate depth. Evidently, also (even assuming canal transportation is economical), a great part of the present outlays in New York is but a needless sinking of state funds. While the greater width may have been required, the extra depth appears to have been almost, if not quite, superfluous. It will be interesting to see, however, if other localities do not cheerfully go and do likewise.

³There is to be added to this estimate the \$7,000,000 appropriated for the Cayuga and Seneca branches.

⁴It has elsewhere been shown by the writer that the low transportation rates on the barge canal that are promised will be possible only because the state will charge no tolls on its waterways. The entire interest on the bonded indebtedness and even the cost of maintenance and upkeep of the canal are to be paid out of annual taxes. The canal rates, therefore, will merely cover direct haulage charges. But this shifting of a great part of the expense to the taxpayers does not lessen the cost as a whole. And if the inclusive cost is considered, it is easily shown that the entire undertaking will prove an enormous economic loss to the state. (See *Waterways versus Railways*.)

Hearing on Advances in Western Passenger Fares

Railway Officers Show Reduction of State Passenger Fares Has Not Brought Compensating Increase in Travel

Testimony on behalf of the western railroads at the hearing before Examiner H. E. Thurtell, of the Interstate Commerce Commission, at Chicago, in support of their application for advances in interstate passenger fares in the territory between Chicago and the Rocky mountains was concluded on Monday, July 12, and the hearing during the rest of this week has been devoted to testimony on behalf of the protesting state railway commissions. It was expected that the hearing would be completed by the end of the week.

L. E. Wettling, who presented most of the statistical testimony for the carriers, completed his direct testimony on July 8. Clifford Thorne, chairman of the Iowa Railroad Commission, asked a number of questions in an effort to get the witness to admit that the standard of maintenance had been higher during the period 1908-1914 than during the period 1901-1907, and that during the second period permanent improvements had been charged to operating expenses, as allowed in some cases by the accounting rules of the Interstate Commerce Commission, to such an extent that the net operating income was considerably less than it would have been without such expenditures. Mr. Thorne asserted that if the same standard of maintenance had been continued during the last seven years, as during the preceding seven years the roads would have shown a net operating income \$300,000,000 greater. Mr. Wettling said that some of the expenditures of this character represented deferred maintenance. Mr. Thorne also insisted that the commission give a ruling on his request for a statement of the amount of increased revenue which each of the roads involved would receive from the advance if allowed. The carriers had presented a rough estimate of the total advance, and C. C. Wright, chairman of the lawyers' committee representing the roads, said they would rest on that estimate, that it would be impossible to get an exact statement for each road.

A. E. Helm, counsel for the Kansas Public Utilities Commission, started a controversy by insisting that the carriers submit a division of their expenses between state and interstate business. Attorneys for the railroads attempted to put Mr. Helm on record as to whether he claimed that the state business cost more or less than the interstate business, but he declined to commit himself, saying the roads had usually contended in state cases that the cost of intrastate business was higher. Mr. Wright said that while in certain cases the roads had presented evidence to overcome the presumption that the cost of state and interstate business is the same, in this case they would rest on that presumption. Mr. Helm insisted that his request be submitted to the commission for a ruling. He then cross-examined Mr. Wettling on his exhibits to show that for all of the roads in the case, and for a number of the groups of roads, the increase in taxes in the second period over the first period was greater than the decrease in net operating income, and said that, therefore, the roads ought to "get after" the tax commissions rather than ask for an advance in rates.

SOUTHWESTERN ROADS

H. H. Butler, assistant general passenger agent of the Missouri Pacific, testified on behalf of the railways in the southwest, that have filed tariffs publishing interstate rates on the basis of 3 cents a mile in the territory west of the Missouri river and south of the Union Pacific line in Kansas. His testimony was largely devoted to showing the losses caused by the reductions of passenger fares to 2 cents a mile in 1907, and the failure of anything like a compensating growth in traffic to result.

"Comparing 1907, the last year under 3 cent fares, with 1914, the last under the 2 cent fares," he said, "the Missouri Pacific suffered a decrease in passenger revenue of 28 per cent. In

the same time the number of passengers increased 9.1 per cent. The average increase in revenues to the railways, in other words, has not kept up, although expenses due to wage increases, etc., have more than kept up with the growth of business. The argument for reduction was that travel would be increased, but this was not well founded. Comparing the Missouri Pacific figures from 1901 to 1907, seven years under 3-cent fares, its passenger revenue increased 57.7 per cent. Comparing 1908 with 1914, seven years under 2-cent fares in Kansas and Nebraska, and part of the time in Missouri, the increase in passenger revenue was only 10.9 per cent. Comparing 1907, the last 3-cent year, with 1908, the first 2-cent year, there was a loss in passengers carried one mile of 1.6 per cent, but a drop in passenger revenue of 10.4 per cent.

"This appears to prove," he said, "that a general reduction in base rates per mile in passenger fares in any territory will not cause a corresponding increase in the number of passengers handled and the revenue received. It has been the experience in this territory that people travel only when they have good reasons to travel, and this is substantiated by the fact that the public, after 2-cent fares were established, was as insistent that excursion rates be granted at reductions from 2-cent fares, as they had been previously that special reductions be granted from the 3-cent fare. Since these 2-cent fares were enforced, repeated efforts have been made by the southwestern lines to secure relief, in most instances thus far without avail. Before 1907, fares in Arkansas, Missouri, Kansas and Oklahoma were 3 cents per mile, but during 1907 the rates were changed to 2 cents by state action. The roads in Missouri, Arkansas and Oklahoma appealed to the United States courts on the basis of confiscation; injunctions were granted and the fares were restored to the old basis. The cases of Arkansas and Missouri went to the United States Supreme Court, and by a decision in 1913 were dismissed. The Oklahoma case was postponed awaiting decision in the other two cases. The intrastate fares in all three states were restored to 2 cents in 1913.

"When the 2-cent fares were restored, the interstate fares remained at 3 cents. Complaint was entered with the Interstate Commerce Commission against this by the Missouri, Oklahoma and Arkansas Commissions, but after a hearing the Interstate Commission decided that 3 cents through these states was not unreasonable.

"Since the Supreme Court decision dismissing the Arkansas and Missouri cases the roads have sought to increase the state fares. In Arkansas they have succeeded. After refusal of relief by the legislature in 1914, two roads secured perpetual injunctions against the Arkansas 2-cent fare from the United States courts, and the other three have secured a temporary injunction. In Missouri and Kansas all lines are now before the railroad commissions asking restoration of 3 cents. In Oklahoma the lines are now in the United States court asking an injunction against the Oklahoma 2-cent law.

"How little western roads can expect from 2-cent fares may be seen by comparison with the New York, New Haven & Hartford, one of the lines of heaviest passenger traffic in the country. The New Haven, operating in densely settled New England, earns \$15,957 per mile in passenger revenue and \$1.91 per train mile. Western roads earn only \$2,941 per mile passenger revenue and only \$1.31 per train mile. Yet, in the recent eastern rate case, the Interstate Commerce Commission found that passenger earnings of the New Haven did not contribute to taxes and interest, but that expenses of the passenger service consumed approximately 100 per cent of the passenger train revenue.

"It is proposed to advance the rates to 2 1/2 cents interstate east

of the Missouri river and west of the Missouri on, and north of the Union Pacific in Kansas. South of that line the proposed rate is 3 cents per mile.

"Comparisons of traffic conditions justify the higher rate in the southwest. Taking the 1910 census, the population north of this line was 40.8 per square mile against 28.2 south of the line. Population density south, therefore, was only 69 per cent of that north. Taking the revenues of four representative roads north against four south of the line, the southern roads earn only 78.6 per cent as much per mile of road as those north and handled only 74.4 per cent of the number of revenue passengers per mile of road. Furthermore, it should not be overlooked that the railroads in Arkansas, Oklahoma and Missouri, south of the line mentioned, have successfully defended their 3-cent fares for interstate purposes before the Interstate Commerce Commission."

F. A. Jones, chairman of the Corporation Commission of Arizona, cross-examined Mr. Butler at length on what he considered the discrimination against Arizona and New Mexico, to which points rates are advanced by the amount of the increase up to El Paso, whereas no advances are made in the rates to California nor to points in the intermountain states, with a few exceptions. Mr. Butler said that the California rates were not advanced because they had not been reduced at the time other rates were reduced which are now being restored to their former basis. The purpose of the present tariffs is to restore rates which were reduced on account of the effect of the reductions of intrastate fares in a number of states to 2 cents a mile. Mr. Jones also asked a number of questions to show what he considered the discrimination in lower rates from Kansas City to Utah than from Kansas City to points in New Mexico and Arizona, where the mileages were about the same. For example, he said the suspended tariffs provide a rate of \$44.40 from Kansas City to Williams, Ariz., 1,268 miles, or 3½ cents a mile, and at the same time carry a rate from Kansas City to Salt Lake City, 1,268 miles, of \$31.95, or 2½ cents a mile. He thought that the roads ought to make lower rates through Arizona and New Mexico than through the mountains, because of the more favorable transportation conditions. Mr. Butler pointed out that the density of traffic was greater to Salt Lake City, but said that the real reason for the difference was that the lowest factor west of El Paso would be the local rate of four cents a mile in Arizona and New Mexico. Mr. Jones thought that this was penalizing the states that have not made low intrastate rates. Mr. Butler also explained that it was the intention to advance rates to Montana, Utah and Idaho points, but that the tariffs had not been completed when the suspension order was issued, and so their preparation had been postponed.

Mr. Helm made a point of the fact that in many instances the tariffs provide for a discontinuance of the practice of meeting the short line rates in the rates via longer routes. Mr. Butler said that to some extent the roads were going out of the business of meeting short line rates at points where it has been discovered that the longer lines could not get the business even by meeting the rates by the shorter line, but not where there is any chance to get business by meeting the lower rates. Examiner W. V. King, who sat with Examiner Thurtell, said he noticed that all of the roads reported a loss in the dining car service, and asked whether it is proposed to make up for the loss in the passenger fares. Mr. Butler said dining car service is a necessary part of the passenger service.

WESTERN AND NORTHWESTERN ROADS

Mr. Butler was followed by W. J. Cannon, assistant general passenger agent of the Chicago, Milwaukee & St. Paul, who testified on behalf of the lines east of the Missouri river and north of the Union Pacific line in Kansas, that are proposing an advance from 2 to 2½ cents a mile. Mr. Cannon gave comparisons between western railways and eastern railways, which have already been allowed an advance to 2½ cents a mile, to show the disadvantages under which the western lines operate, saying that although the west taken as a whole, with the high fares of the states beyond the Rockies, shows a slightly higher

revenue for carrying a passenger one mile, the states covered by the present application for advances have the lowest maximum fares in the country.

He presented the following figures comparing the territory west of Chicago with New England; the trunk line territory, between Buffalo, Pittsburgh and the Atlantic; and the central territory, between Chicago, St. Louis, Buffalo and Pittsburgh.

	New England	Trunk Line	Central	Western
Population per square mile.....	105.7	136.7	89.8	24.9
Population per mile of railroad....	827	750	444	244
Average passenger train revenue per mile of line	\$8,913	\$7,676	\$4,110	\$2,849
Average number passenger miles per mile of line	431,387	357,779	169,743	112,782
Average receipts per passenger mile	1.777c	1.755c	1.917c	2.037c
Average receipts per passenger train mile	\$1.71160	\$1.46420	\$1.32070	\$1.39034

"Western railroads thus enjoy only from about one-half to one-quarter the population per mile of railroad enjoyed by eastern roads," he said. "Their average receipts per passenger mile are higher than in the other territories, it is true, but this is because the western territory includes roads having mileage in Montana, Idaho, Colorado, Wyoming, Washington, Oregon, British Columbia and Manitoba, all on the basis of 3 cents per mile where the traffic is exceedingly sparse and in North and South Dakota, where it is 2½ cents per mile. If we take New England as 100 per cent, the ratios in other territories are as follows:

	New England	Trunk Line	Central	Western
Passenger train revenue per mile....	100	86	46	32
Average number passenger miles per mile of line	100	83	39	26

"In spite of this more favorable situation for eastern roads, interstate fares in central territory are on a 2½ cent per mile basis. Fares in the trunk line territory vary from 2 to 3 cents per mile, and in New England from 2½ to 4½ cents, while in Illinois, Wisconsin, Minnesota, Iowa, Nebraska, Missouri and Kansas maximum fares are 2 cents per mile, both state and interstate.

"Experience has proved that the institution of reductions for tourist fares, etc., has generally stimulated travel and, as a large percentage of the traffic is carried in regular trains, the railways can afford to make such reductions. Tourist fares of all kinds are open to the public and necessarily reduce the average rate per passenger mile. Homeseekers' fares which apply to round trip tickets have been made for many years. Experience shows that the 'bargain principle' of granting such concessions on certain days is a factor of consequence in accomplishing the desired result.

"Mileage tickets with 2,000 coupons, each good for a mile, are sold for \$40. The proportion of travel upon these mileage tickets, mostly used by commercial travelers, is much smaller than is usually supposed. The proportion that such mileage honored bears to the total passenger traffic ranges, in fact, only from 1½ to 3½ per cent, showing that this form of transportation is a very small proportion of the total."

Reduction in passenger train schedules and the elimination of some of the luxuries of travel, which railway officials at the hearing claimed were universally demanded by the American public, were suggested by Examiner King in questioning Mr. Cannon. Mr. King produced a mass of newspaper articles and excerpts from the technical press, which described the present elaborateness of American passenger travel in schedules and equipment.

"Do you know the cost of hauling an observation car?" asked Mr. King.

"I do not," replied Mr. Cannon, "as that is an operating question, but the figure would be such a minute fraction of a cent per passenger mile that you would have to run your finger a long way to find the decimal point."

"Do you know the cost of hauling club cars?"

Mr. Cannon said he did not know.

The examiner then went through a long list of the special features in cars and accommodations afforded travelers, em-

phasizing the cost and seeking to draw an admission from the witness that the unprofitableness of passenger service was due to this.

"How many railroads operate between Chicago and St. Paul," asked the examiner.

"Seven," replied Mr. Cannon. The witness stated that these roads probably had an average of two through trains a day each between these points.

"Could not half of these trains be taken off?" asked the examiner.

"These trains do not only serve the terminals," said Mr. Cannon; "there are many prosperous towns local to each road and intermediate to the terminals which must have the passenger service. These trains also serve territory beyond the terminals, both to the West all the way to the coast, and east of Chicago. We have tried to reduce the passenger service, and when we did, it was not very popular with the public."

"These articles," said the examiner, "also call attention to the gilded stairs and marble hallways of the new passenger stations. Is not this wasteful?"

"Well, we might allow the old Union station to stand in Chicago," interjected one of the railway attorneys.

"Do you think," the examiner asked the witness, "that the commission should allow an increase in passenger fares while this costly service is being maintained?"

Mr. Cannon stated that question was impossible to answer categorically, but that he considered the passenger service was only what was demanded by the public.

STATES IN WHICH ADVANCE IS PROPOSED MOST PROSPEROUS

Eben E. MacLeod, chairman of the Western Passenger Association, testified that there are but 11 states in the United States that have as low a maximum passenger rate as 2 cents per mile and nine of these are the states covered by the advances now being considered, Illinois, the northern peninsula of Michigan, Wisconsin, Minnesota, Iowa, Nebraska, Missouri, Oklahoma and Kansas. Arkansas and West Virginia have just gone up from a 2-cent fare.

"It must be conceded," he said, "that population per railroad mile, gross passenger earnings per railroad mile and comparative expense per mile are the leading comparative factors, the first two representing traffic density and the other the concrete results. Comparison of these factors will show the railroads in these 9 states have less advantages, less opportunities and a lower maximum fare per mile than in any other equal section of the United States. Comparing them with eight eastern states shows they have a density of population per railroad mile only one-third as great and much less than one-third the passenger earnings per mile, yet the property investment is more nearly equal per mile and the maximum rate per mile averages fully 25 per cent greater in the more densely settled eastern states. All other states in the United States have a population density per mile of 280. The nine states in this territory have 323, but the eight eastern states have 1,036, yet these other states have an average maximum fare per mile of from 2½ cents to 6 cents per mile.

"These nine states are, comparatively, the most prosperous subdivision of agricultural territory in the United States, according to government reports. Yet they enforce lower passenger fares than prevail anywhere else in the union, except in Ohio and Indiana, which also have 2-cent fare laws. In March, 1906, the Ohio legislature enacted its maximum 2 cent per mile law. At the first following sessions of their legislatures, these nine states adopted similar rates, in some by commission orders, but in nearly all cases carrying such heavy penalties as to make it almost mandatory to comply with the enactments and orders. In no state was such compliance voluntary.

The argument by advocates of reduced fares, aside from political reasons, was that reduced fares would stimulate travel and that the practical effect would be not to reduce but to increase gross and net passenger revenue. The result is a disappointment after an honest and fair trial. It has been proved

conclusively that the increase in travel has been only the natural growth increase; that it has been less than the increase in passenger expenses; that the passenger fare per mile is less than the progressive value of the service; that the present service is not in excess of present public requirements and that the net result of the fare reduction is less revenue for more service.

"It is common knowledge that the reduction in passenger fares resulted from the allegations that the cut would not reduce net revenue, that it was good politics to enact anti-railroad legislation, and that other states had passed such laws. The reduced rates have had a fair and enforced trial since 1907, and considering all conditions the conclusion is necessary that it tends to produce a burden on other traffic."

Mr. Helm objected to the exhibits bearing on the prosperity of the territory, but Examiner Thurtell said the commission had usually admitted such evidence. Mr. Helm said it was necessary for each road to justify its own rates. Mr. Thorne also objected that the figures did not show that the farmers were actually making money and said that the advances in many instances would be paid by the people in other states.

E. L. Bevington, secretary of the Transcontinental Passenger Association, presented figures showing that even if the advance asked is granted, 2½ cents per mile in the West and 3 cents in the Southwest, the actual average earnings per passenger mile would be less, because of the necessity of roads with longer mileage meeting the rate of the shortest line.

"Between Chicago and Kansas City," said Mr. Bevington, "the short line is 451 miles, but the average mileage of all lines competing for traffic between those cities is 508 miles, making the average rate per mile 2.46 cents on the proposed fare, \$12.50. Thus, while the short line, whose mileage is used in the construction of the fare, receives approximately 2½ cents per mile, all other more or less indirect lines receive materially less than 2½ cents for their service between the same points. Between Chicago and St. Paul the average earnings under the proposed fares would be only 2.23 cents per mile; between Chicago and Denver, 2.39 cents, and between St. Paul and Council Bluffs 2.10 cents.

"Roads in the western district carried 39.6 per cent of all passengers carried one mile in the country in 1913 against 47.4 per cent in the eastern district, but the miles of track operated in the West exceeded those in the East by 17 per cent, showing the greater sparseness of travel per mile. Under 3-cent fares travel in this western district increased between 1903 and 1907 about 40 per cent, while between 1908 and 1913, under 2-cent fares, the increase was only 9 per cent, proving the total failure of predictions that lower rates would mean stimulated travel."

Mr. Bevington also presented statistics showing the great increase in expenses brought about by increases in wages and by state legislation, and the large investment in block signals for the purpose of increasing the safety of travel.

OPENING STATEMENT BY CLIFFORD THORNE

At the hearing on Monday morning Mr. Wetling was recalled for further cross-examination, after which Clifford Thorne, chairman of the Iowa Railroad Commission, made an opening statement on behalf of the protesting state railway commissions. He said that the net operating income during the past seven-year period of the northwestern group of railroads amounted to \$1,000,000,000 in round numbers, or \$170,000,000 greater than during any other seven-year period in their history, and that these roads during the past five years have increased their property by over \$750,000,000, a sum which exceeds that of any preceding five-year period by more than \$300,000,000. In the southwestern group the net operating income during the past seven-year period aggregated \$550,000,000, which was more than \$100,000,000 greater than during any other preceding seven-year period in their history. Mr. Thorne also criticized the use by the railroads of the property investment account as a basis for calculating the net returns, saying the commission has unanimously repudiated

it. He also criticized the inclusion in this account of the value of improvements built out of surplus earnings since 1907, saying the commission has unanimously held that railroads cannot rely upon betterments and improvements built out of surplus earnings as a justification for an advance in freight rates. "If it is seriously proposed at this time," he said, "that our federal commission shall reverse itself on this principle, then the carriers must content themselves without a surplus for the purpose of building such improvements in the future. For, so long as private ownership continues, the public will not long consent to be forced by any public tribunal to build railroads for private companies, and then pay those companies a return on what they build." Mr. Thorne also criticized as unsound the comparison of net earnings over a period of years, without allowances for substantial changes in the basic methods of accounting, or substantial changes in the policies of the carriers during the same period. "The most important changes in the rules of accounting prescribed by the Interstate Commerce Commission that have been made during the past 25 years became effective on June 30, 1907," he said. "The said changes affect both the operating expense account and the property investment account. These companies, having the burden of proof, have made no attempt whatever to show the effect of the changes, they have made no attempt to place the two periods compared upon the same basis. We have undertaken to perform that task with some of our exhibits after making proper allowances for any changes in practices and cost of material."

The first witness for the protestants was C. W. Hillman, president of the Mutual Audit Company, who had also been employed as statistician for the western commissioners in the freight rate case. For the purpose of separating freight and passenger expenses, Mr. Hillman presented an analysis of the accounts of the Chicago & North Western, the Chicago, Milwaukee & St. Paul, the Chicago, Rock Island & Pacific, the Atchison, Topeka & Santa Fe and the Missouri, Kansas & Texas, which, he said, "cover both the strong and weak lines and may be considered typical of the results of operation in the territory affected by the proposed advance." He had set up the expenses assignable to passenger business upon six different methods, only one of which, the gross weight basis, did he advocate as being the proper method for the division of the track maintenance accounts as between freight and passenger service. The other methods, he said, were introduced for comparative purposes or by direction of the committee representing the western states. On the gross weight basis, passengers, baggage, express and mail were reduced to a ton-mile basis, and his exhibit showed an operating ratio on passenger business of 68 per cent. The other bases used were the locomotive ton mile basis, the locomotive tractive power basis, the passenger car mile basis, the gross weight and car mile basis, the gross weight and net ton mile basis. Most of the differences between the various methods occur in the maintenance of equipment account, he said.

AMERICAN SHIPBUILDING FOR THE YEAR.—During the fiscal year ended June 30, 1915, there were built in the United States and officially numbered 1,226 vessels, of 215,711 gross tons, compared with 1,291 vessels of 311,578 gross tons, for the same period of 1914. The principal vessels are two colliers built for Panama canal trade, the Achilles and the Ulysses, of 11,081 and 10,910 gross tons, respectively. Other vessels over 5,000 gross tons, are the John D. Rockefeller, a tanker of 8,374 gross tons; the Great Northern and the Northern Pacific of 8,255 gross tons each, built for passenger service on the Pacific coast. The J. A. Moffett, 6,395 gross tons and the Lyman Stewart, 6,054 gross tons, both tankers, were built on the Pacific coast. Only one large sailing vessel was built during the year, the Georgia, a schooner of 1,318 gross tons. In all, 23 vessels of over 1,000 tons each were built, aggregating 123,242 tons.

THE RAILROADS AS A FACTOR IN OUR NATIONAL LIFE*

By HOWARD ELLIOTT

Chairman of the New York, New Haven & Hartford

An interesting and important statement of how the railroads of the country enter into the lives of millions of our citizens is made by computations just completed by the Bureau of Railway Economics. The momentous fact is brought out in these computations that from June 30, 1905, to June 30, 1914, inclusive, \$11,218,686,516 were paid for wages to an average of 1,611,105 men employed during each year of the ten years as follows:

Year	Number of employees	Wages	Gross revenue	Per cent of wages to gross revenue
1914.....	1,695,483	\$1,373,422,472	\$3,047,019,908	45.07
1913.....	1,815,239	1,373,830,589	3,125,135,798	43.96
1912.....	1,716,380	1,352,347,697	2,842,695,382	44.05
1911.....	1,669,809	1,208,466,470	2,789,761,669	43.32
1910.....	1,699,420	1,143,725,306	2,752,634,153	41.55
1909.....	1,502,823	988,323,694	2,419,299,638	40.85
1908.....	1,436,275	1,035,437,528	2,394,780,410	43.24
1907.....	1,672,074	1,073,386,427	2,589,105,578	41.42
1906.....	1,521,355	930,801,653	2,325,765,167	40.02
1905.....	1,382,196	839,944,680	2,082,482,406	40.33

The large proportion of gross earnings paid directly to these millions of our citizens is worthy of special attention.

Those who man the railroads received 40.33 per cent out of every dollar of gross earnings in 1905 and 45.07 in 1914. They perform arduous and responsible duties and should be well paid, but with increases in pay to the men and improved facilities to the public, should come increased pay to the railroads, and this has not been the case until the last year, when some increases in rates have been permitted.

There are possibly 1,500,000 individuals holding the securities, in one form or another, of the American railroads. They and the employees and their families represent at least 12,000,000 people whose daily bread and butter is involved in the success or failure of this great American transportation machine, or about one-eighth of the population. The par of the outstanding capital is \$20,247,301,257 or between one-ninth and one-tenth of the estimated national wealth. In New England the owners and employees of its transportation lines with their families represent at least 700,000 people, or more than one-tenth of the total population. These people are your neighbors and friends and their rights, comforts and feelings must be carefully considered in any discussion as to the best method of solving the New England transportation problem.

A very grave question today is whether under present conditions the railroads can be ready to serve the people when the next great uplift in business comes. It is not only a material question but a social and moral one. Speaking recently of the railroad problem of today, Professor Seligman, of Columbia University, said: "To combine the maintenance of reasonable private profits with the legitimate demands of social progress is the railway problem of today."

Today from one cause or another more than 30,000 miles of railroads with securities of \$1,815,900,000 are in the hands of receivers and several other great railroads are on the ragged edge. In 1896, when times were so very bad, there were about the same number of miles and the same amount of capitalization in the hands of receivers. This, it is needless to say, is not a healthy condition for the country.

Notwithstanding all the complaints made against our railroads the fact remains that they pay the highest wages and sell their transportation at the lowest prices and furnish more per dollar invested than any railroads of any country in the world. We should compliment the railroads for this and be proud of them. Instead, of late years, we have attacked them and have criticised this wonderful transportation machinery while those in other lands have realized that the work of the American railroad builder, owner and employee

*From a recent address at Peterboro, New Hampshire.

has been marvelous; and this in spite of the mistakes incident to the great task of building and rebuilding 250,000 miles of railroad since the Civil War.

The Comptroller of the Currency said in his recent annual report that there were 11,000,000 depositors in savings banks with \$5,000,000,000 to their credit. Much of this large sum is invested by these banks in railroad securities so that those 11,000,000 people have a very vital interest in having the railroad industry sound and profitable. The conservation of this industry is vital to the country, and owners and managers should be helped rather than hindered in their honest efforts to make it more useful and efficient.

Why is it that this piece of machinery which all admit is so necessary to the welfare of the country—which impartial critics think is such a wonderful work—which represents so large a part of the wealth and population of the country and is so closely interwoven with all of our activities, has been looked upon with suspicion and disfavor? Whenever a new railroad has been projected the people have welcomed the promoters and offered all kinds of inducements—but when the road is built they forget that it must be nourished in order to live.

One reason for this suspicion and disfavor, perhaps, is a lack of understanding on the part of the public as to the magnitude of the enterprise and the difficulties of successful administration. Much has been written and said by many to try and explain it. In the last ten years I have sent out over 1,000,000 pamphlets pointing out the facts and others have done similar work.

Another reason for the suspicion and disfavor is that in the struggle to build railroads and to make fortunes in the process, a few men—and only a very few of the thousands of high minded men in the business did things that are not now considered right and proper—and were not right and proper then—but were in accord with the accepted spirit of the times. Similar practices were in vogue in other fields of human endeavor. Railroad men are not more perfect than other business men. They are drawn from all ranks of society and are influenced by the trend of public opinion. In spite of all, however, a great work was done and the railroads, as a whole, are worth today to themselves and to the public, all their capitalization. I believe a fair valuation of the properties, following the principles laid down in various decisions of the Supreme Court of the United States, will show this to be the case. This wonderful machine that serves the country should not be condemned, crippled and rendered unable to prepare for the future because of a limited amount of unwise financing and unsuccessful management in the past.

Let me quote from a writer of the present day. He says:

Let's get down to common sense. The railways have done more toward making America than any other one thing. It is time they had their due and instead of bating them and talking foolish talk about taking them away from their owners the Government should grant them any request within reason.

Another of our problems is that of the proper treatment of capital organizations, or corporations. The great railroads that are such efficient servants of the nation could not have been constructed without them. In 1800 the total number of corporations in this country was 225, and today there are 350,000. They are necessary to carry on the great business of the United States. Because they were a new and untried method of doing the business of the country some errors were made. Men obtained great power, and in their intense desire to be successful some of the owners and managers demanded efficiency without enough consideration of the human unit and profits regardless of the public weal.

This policy created trouble, but owners and managers are awake to the situation today and realize that they must pay close attention to their duty to the public.

Large and strong corporations, wisely managed, are absolutely necessary, and bad ones are gradually being eliminated.

A few strong and ambitious men used the great powers of corporations unwisely, and as a result the country was aroused against them and all sorts of laws were passed in an effort to correct evils, and, as is often the case, some of the remedies were worse than the disease.

There are signs now that we are approaching the time when the country will obtain the full benefit of the corporate form of doing business, without the evils.

Another present-day problem is that of legislation. Because of some mistakes by railroad owners and managers, and by those engaged in other forms of corporate business, the suspicion and disfavor, of which I have spoken, developed, and a class of critics has grown up in this country who have made a living by agitation and by advocating unnecessary legislation.

Probably a large number of the alleged evils would have gradually corrected themselves and the country would be far better off with less instead of more laws. For example, in 1913, 1,395 bills were introduced into the legislatures of the various states and 230 became laws, all relating to the details of practical railroad operation, most of which would be better left to the men trained in the business.

There are about 4,000 legislators, national and state, and during the last sessions of the national and state legislatures 43,403 pages of laws were enacted, covering 20,510 chapters and 151,083 heads or sub-heads.

During this same period there were 28,000 decisions by courts of appeal, and these decisions have the force of statutory law.

With this deluge of legislation affecting all kinds of business it is not surprising that the country staggers and cannot go ahead with constructive work.

A well-known Western lawyer, in a recent address at Peoria, Ill., spoke on this subject, and said:

We need less investigations. Let law.

Everything and everybody is being investigated. This espionage creates great unrest and business disturbance and disorder. It produces equal dissatisfaction among the masses. Every industry is on the grill. These conditions have not lowered the price of commodities nor benefited the people, but they have hurt commerce and industry.

All this is a great waste—waste of time, waste of energy—and what is worse, destruction of confidence: The confidence of the masses is easily shattered, and it is difficult to be restored.

Another great problem before the country is that of the labor organizations. They are a part of our complex social machinery, but they have not yet found their place. In the struggle to create the great railroads and the great corporations the relation of labor to them was not, at times, carefully enough considered. As a result, laboring men united, and little by little the great labor organizations were developed and they now have very large powers. But just as the people took notice of the errors of the capital organizations, or so-called trusts, when they believed that they were ignoring the public welfare and passed the various regulatory measures in an effort to eliminate the bad and retain the good, so will the country in time consider the problem of the labor organizations and correct any errors in them.

The great leaders of capital, as I say, obtained tremendous power which has been curtailed and regulated by law. The time will come when the great unregulated powers now exercised by the leaders of the great labor organizations will be regulated in the same way. I believe the majority of our people feel that when a man earns his living by working for a public service corporation, he enters into a moral contract to do that work upon which the whole people depend until he is mustered out of his place in some orderly manner; that he owes that duty to society just as much as a soldier owes a duty to remain in the army until he is released in a lawful manner. I further believe that sooner or later some plan will be evolved by public opinion that will bring about a satisfactory adjustment of this great and complicated labor problem.

FREIGHT CLAIM ASSOCIATION

The twenty-fourth annual meeting of the Freight Claim Association was held at Hotel La Salle, Chicago, June 16, 17 and 18, President J. W. Newell (C. B. & Q.) in the chair and nearly 200 members present.

The president, in his opening address, reviewed the history of the association from its small beginnings in 1892. Looking to the future he said: "Is it possible for this association, covering the territory that it does and made up of members whose actions are in so many cases controlled by different laws of liability, to undertake to make rules for the settlement of claims between claimants and carriers, unless the association itself undertakes and does make those settlements? The transportation business of this country has so grown that it is no uncommon thing, with long distance shipments, for the laws governing the liability of carriers at point of origin and destination to be diametrically opposite to each other. . . . This association must either confine itself to the apportionment of joint liabilities, and its members must trust each other to make proper adjustments with claimants or must undertake to make all adjustments as between claimants and carriers, as well as apportion between carriers the amounts paid. It is generally recognized that society must protect its weaker members, and I believe that this association should do no less. An apportionment rule based upon the law of averages is not always a fair one. We have in our membership small roads and switching carriers, whose problems must be carefully considered and who must be made to assume their burdens the same as the larger lines; but neither must be persecuted because of its size or geographical location.

"A year ago this association undertook to point out the causes of freight claims and prescribe a course of treatment that would cure the ills. Whether that plan is to be effective depends entirely upon the individual members of this association, though we are attempting to correct conditions largely under control of others. . . . The whole general scheme of receiving, transporting and delivering of freight must be changed. The amount that can be saved must be carefully considered in connection with the amount expended. . . . The association must itself set a good example of efficient and economical operation; and must arrange so that the membership can attend to the association work with a minimum of time and expense. . . ."

The report of the secretary showed an enrollment on May 31 of 450 assessable members, representing over 263,000 miles of rail carriers, in addition to the steamer lines and other transportation companies. Over 40 new members were received. During the year 969 claims were passed to the three arbitration committees and 229 notices of appeal were filed. Majority awards were not reached on 10 claims, which were, accordingly, passed to the appeal committee for decision, and 11 notices of appeal were withdrawn.

The conference committee during the year has done much work of importance. Investigation of claims for concealed loss of and damage to freight, was gone into most minutely and it is hoped that by the next annual meeting new rules may be presented. Special Report Series Circular No. 17 and other matters have been the subject of conferences with representatives of the Interstate Commerce Commission. Statistics gathered show that a large majority of claims are settled very promptly, indicating that the complaints from certain quarters of delays in the settlement of freight claims were evidently based on isolated cases. Understandings have been reached concerning United States postoffice department claims; retention of claim papers when claims are declined; duplicating lost claims and presentation of claims to intermediate carrier.

An amendment to the constitution was adopted, providing that, instead of the nominating committee reporting the names of exactly the number of members necessary to fill the membership of the committees, double the necessary number should be named, the privilege heretofore enjoyed of additional nominations from the floor to still be operative. The committee on methods and

topics and the committee on accounts were abolished and a new committee created to be known as "the committee on methods, accounts and forms." The membership of the committee on cause and prevention was increased from five to nine members.

The rules were amended so as to provide that when a claim is in the course of preparation for arbitration, and additional investigation has been made which would affect the liability of carriers whose arbitration statements have already been submitted each carrier shall have the right of further investigation and one rebuttal brief only; and the right to see all rebuttal statements before the claim is submitted to the secretary.

The provision of the constitution relating to charging out under decisions of the arbitration committee was modified so that the paying carrier may relieve its account under a decision of the arbitration committee by charging arbitrarily only where Rule 255 applies; and from those who do not operate that rule authority must be obtained within thirty days.

A new sub-section was added to Section 20, Article VII, to provide for the relief of accounts of carriers outstanding, after decisions by the appeal committee, in the same manner as relief is provided after decision by an arbitration committee, except that authorities must be issued within ten (instead of thirty) days after receipt of papers.

Additional paragraphs were added to Sections 14 and 20, Article VII, providing that, when papers are lost after a decision has been rendered by the arbitration or appeal committee, carrier or carriers decided against may be debited with their proportion without duplication of papers other than a copy of the award; except that when an interested carrier desires to appeal from the decision of the arbitration committee a duplicate set of papers must be furnished by the carrier losing the originals.

The committee on cause and prevention made its first report. On recommendation of the committee, there was referred to the American Railway Association the subject of establishment of joint inspection bureaus at junction points, it being the expressed view of the association that the principle of joint inspection bureaus and joint records meets with its approval.

In connection with the subject of prevention of loss and damage to perishable freight, the secretary was instructed to ask the traffic associations to consider the advisability of providing in their tariffs more nearly uniform rules under which shippers of fruits and other perishable freight are required to give definite instructions as to icing, ventilating, etc.

In the matter of the alleged growing tendency on the part of some carriers to deliver astray freight without adequate proof of ownership, the association concurred in the opinion of the committee that the present rules of the carriers fully cover and that it is simply a question of enforcing them.

The association took action concurring in the resolution of the A. R. A. committee on packing, marking and handling freight that over and short reports at all common points should be checked at least twice a month.

The following officers were elected for the ensuing eleven months:

President, E. Arnold (Grand Trunk); first vice-president, W. O. Bunker (C. R. I. & P.); second vice-president, F. E. Winburg (A. & W. P.); secretary and treasurer, Warren P. Taylor (R. F. & P.), Richmond, Va.

The chairmen of the arbitration committees are: Committee "A"—H. R. Grochan (C. St. P. M. & O.). Committee "B"—G. C. Arnold (L. V.). Committee "C"—E. A. Jack (Terminal R. R. Ass'n of St. Louis). The chairman of the appeal committee is J. J. Hooper (Southern).

The next annual meeting is to be held at Washington, D. C., May 17, 1916.

LIGHT RAILWAYS IN FRANCE FOR THE WOUNDED.—To facilitate the transport of English wounded in France handy light railways have been laid down in certain districts, along which improvised trolleys can be quickly run to and fro with a minimum of shaking.

Two Important Commerce Commission Decisions

One Relates to Dealings with Industrial Railways. The Other Orders Proposed Spotting Charges Cancelled

The Interstate Commerce Commission on July 12 gave out its findings in the so-called Second Industrial Railways and the Car Spotting Charges cases. The former deals with allowances to and joint arrangements with short lines of railway owned by industries and in the latter the carriers are ordered to cancel the tariffs proposing car spotting charges which were filed in accordance with a suggestion made in the original Industrial Railways case. The opinions in both cases were written by Commissioner Meyer.

THE SECOND INDUSTRIAL RAILWAYS CASE

The following is an abstract of the decision in the so-called *Second Industrial Railways Case* (34 I. C. C., 596). The opinion establishes a set of findings relative to the dealings of the trunk lines with small lines of railway owned or controlled by industries.

Following the original report in the *Industrial Railways Case* (29 I. C. C., 212), the trunk line carriers in official classification territory withdraw from joint rate arrangements formerly in existence with substantially all the industrially owned lines in the territory. The tariffs were to become effective April 1, 1914. Complaints made against these tariffs were entered under the commission's docket 4181, which was the number given to the original *Industrial Railways case*. That proceeding was later consolidated with investigation and suspension docket 414 in which proceeding there were suspended tariffs proposing to cancel allowances to 22 of the industrial lines not involved in the original case. The effective dates of the tariffs under suspension have been extended by the carriers to July 15, 1915.

The commission has now made a careful investigation of the points in issue and by means of a series of questions is in possession of full details as to each of the 47 roads involved.

Because of the varying nature of the operations of the industrial lines, the commission wishes to point out the principles which must guide those desiring to enter into joint rate arrangements. There must be determined with respect to each of the lines, first, whether the instrumentality performing the service is a bona fide common carrier; second, whether the service which it performs between the point of interchange with the trunk line and point of placement on the line of the industrial road is plant service or public transportation; third, whether a charge should be made for such service in addition to the line-haul rate applicable to or from points on the rails of the trunk line at the junction. There is also to be considered the larger economic problem whether part of the money paid to the trunk line carriers for public transportation service is to be used to defray the expense of particular shippers in conveying their traffic to and from the terminals of the trunk line carriers. *The Industrial Railways case* rests largely upon the principle of placing the cost of service where it properly belongs.

In *A. T. & S. F. v. Kansas City Stock Yards Company* (33 I. C. C., 92) it was held that:

The principal test of common carriage is whether there is a bona fide holding out coupled with the ability to carry for hire.

Many of the lines own no cars and in some instances no locomotives, and maintain no stations other than loading and unloading docks within the plant. Their tracks lie wholly on the land of the industry which they serve, and access to them may be obtained only through the permission of the controlling industry. In such circumstances the holding out is not genuine.

If the service in any instance is a plant service the trunk line carriers can not lawfully compensate the shipper itself, or indirectly through its incorporated plant railroad, for the use of its plant tracks or for switching the shipper's cars over them

with its own motive power. *General Electric Company v. N. Y. C. & H. R.* (14 I. C. C., 237), *Solvay Process Company v. D. L. & W.* (14 I. C. C., 246), etc.

If the question here presented were new, if the power were given the commission under the act to fix the rates in the first instance, or if it had the power to compel carriers to extend their rails to the plants and industries of shippers, the problem would be stripped of many of its present difficulties; but the commission has before it a rate structure made by the carriers under which they have extended their rates to the plants of some shippers and not to others. It is the contention of the industrial line shippers that the rate structure as made for many years has extended the line-haul rates to points of placement on spur tracks and that those rates include the operation over such spurs. They say that the carriers have by custom changed the rule of the common law and have accepted the burden of making deliveries off their rights of way. Unquestionably if a new rate structure were being formed, the logical way would be to make a line-haul rate and to fix a separate terminal charge based upon the amount of service performed for each shipper. Even in the present state of the rate structure there must be a point beyond which an additional charge over the line-haul rate can be justified if additional service is in fact rendered.

An investigation made in 1910 by the commission shows that there were at that time 742 industries in official classification territory which performed their own switching, either with power owned by the industry or through an incorporated railroad owned or controlled by the industry. Of this number 594 performed the service without any compensation therefor, while only 148 were paid allowances or divisions by the trunk line. During the intervening years nearly all of such allowances and divisions have been canceled. There remain some industrial lines with which joint rates are continued, while to others they are denied under similar circumstances.

The trunk lines in attempting to apply the principles laid down in the *Industrial Railways case*, have not done so accurately nor altogether consistently. The decision of the Supreme Court in the *Tap Line cases*, and the supplemental report in the *Industrial Railways case* (32 I. C. C., 129) throw additional light upon the situation. In the supplemental report in the *Industrial Railways case*, the findings of the original report were modified so as to permit the trunk lines to arrange, by agreement with such of the industrial lines as are common carriers under the test applied by the Supreme Court in the *Tap Line cases*, for a reasonable compensation for such service in the form of switching charges or divisions of joint rates.

The commission will follow the same course in this case and will require that each line which becomes a party to such an arrangement file a full statement of the arrangement entered into, showing specifically the basis of rates to be applied from points on the industrial lines and the basis of the allowances or divisions thereof granted under the agreement. Such arrangements are not to be made indiscriminately. They are to be arranged in conformity with the suggestions of this report.

While each of the operations is to be treated in accordance with the particular facts relating to it, the lines fall into more or less well-defined groups.

The first group has a very general merchandise and commodity traffic aside from the traffic of the controlling industries. They are of the trunk line type and are as follows:

	Mileage
Algoma Central & Hudson Bay	380
Essex Terminal	15
Chicago & Illinois Western	14
Norwood & St. Lawrence	19
Illinois Terminal	42
Lowville & Beaver River	14

Ludington & Northern.....	15
Kane & Elk.....	15
Toledo, Angola & Western.....	11
Wharton & Northern.....	22
Susquehanna & New York.....	103

It will not be necessary to discuss in detail the characteristics of these lines. In some instances the joint rates are made by adding the local rate of the industrially owned line to the rate applicable from the trunk line junction. In other cases the junction point rate is extended back to points on the line, but when the junction rate is applied from points on the industrial line the rate structure in the general territory is based on a blanket system or, at least, a number of points of origin or destination are grouped together. As to these lines, there is no question involved which is within the purview of the commission's jurisdiction. The divisions of the joint rates are a matter of bargaining between the interested carriers. It may be that some of these lines are operating in violation of the commodities clause of section 1 of the act, but proceedings under that clause of the law are under the jurisdiction of the Department of Justice.

In the second group of lines are those extending from lumber mills. The control of these lines is vested in the lumber companies which they serve, and in all respects they fall within the principles laid down in the *Tap Line cases*, except that in that case the tap lines were all located within the producing territory from which the carriers applied a blanket rate to all important markets; whereas it appears here that no large blanket exists and rates on lumber are graded with some regard to distance. On short-haul traffic to many markets in this territory some recognition is given to the two-line hauls involved from points on the tap lines. These principles of rate making should be fully considered by the trunk lines when re-establishing joint rates with the lines here. The principles followed in settling the divisions under the second supplemental report in the *Tap Line case* (31 I. C. C., 490) should be considered in fixing the divisions with these lines.

The third group of lines includes those the physical operations of which are in all respects similar to those recited in such cases as the *General Electric Company v. N. Y. C. & H. R. R. Co.*

The only essential difference is that the lines here included have been incorporated and hold themselves to be common carriers. In most instances the incorporated industrial line was first constructed as a system of plant tracks, and in many instances the tracks are still owned by the industry and leased to the incorporated railroad. Usually the plant is located contiguous to the rails of a trunk line. In all of these instances there should be considered very carefully the test applied by the Supreme Court in the *Tap Line cases*, regarding the bona fide character of the common carrier:

It is the right of the public to use the road's facilities and to demand service of it rather than the extent of its business, which is the real criterion determinative of its character.

If a railroad within this group is a common carrier and access to its rails may be had by the public, there is also to be considered whether such a line should be sustained by the shippers it serves or whether the expense of maintenance, operation, and interest on the money invested are to be paid by that part of the public which receives no public service or public use from it. In other words, it may well be that there should be a charge in addition to the line-haul rate for the service upon the tracks of some of the industrial lines within this group.

The fourth group of lines resembles closely the lumber tap lines with the important exception that they haul commodities other than lumber, and thus in some instances fall under the direct inhibition of the commodities clause. As appeared in the *Tap Line case*, so also here, the history of these lines shows instances in which a system of plant tracks was constructed to serve an industry located immediately contiguous to trunk line rails; because of various considerations, including a desire for an adequate car supply and a development of competition which could be used as a weapon to obtain divisions of the joint rate for the industrial line, the plant tracks were incorporated and connected with another trunk line located at a distance from the plant. The

industrial line having thus developed a line haul and the trunk line not contiguous to the plant being desirous of getting the traffic of the plant, it afforded divisions of the locality rate to the industrial line, and thus extended its facilities to the plant. Under such conditions the trunk line which had formerly served the plant lost the traffic or in order to retain it afforded the same division as did the line at a distance from the plant. The remuneration paid by the distant trunk line may not have been excessive for the service performed by the industrial line, but as applied to the short distance movement of cars to and from the contiguous trunk line the same measure of remuneration gave to the industrial line earnings which amounted to substantial returns on the investment not only in the tracks and facilities outside of the plant, but also in the purely plant tracks and sometimes paid for a substantial part of the purely industrial operations. Surely in such instances it can not be said that the rate structure had previously included the service on the plant tracks. It would seem that the proper method to pursue in making the rates to such plants would be to add to the junction point rate for the service extended to the plant from the more distant line and cancel joint arrangements with the contiguous line. The industrial road should not receive from the more distant trunk line connection any compensation as division or allowance which exceeds the amount added to the junction point rate. Thus would be preserved the earlier rate adjustment, the relation between the rates applicable over the competing trunk lines would be equalized, the revenues of the trunk lines would be conserved, and the general rate-paying public would not be burdened with allowances and special services for particular shippers.

In a fifth group the following conditions are shown: An industry has plant tracks which could under no conceivable conditions be considered as having any common-carrier characteristics. In order to give to them such a status, a railroad is incorporated, the tracks of the plant are leased to it, and the trunk line grants trackage rights and even leases its rails to the industrially owned railroad corporation. Thereupon the industrial railroad publishes tariffs, files them with this commission, makes reports, and as a matter of form assumes the appearance of a common carrier subject to the act, and the trunk line affords it divisions out of the rate applicable to the locality for the same service which the industry has previously performed without compensation. The shipper through its incorporated railroad is thus afforded advantages which are denied to other shippers having a smaller volume of traffic. For a trunk line carrier to offer its facilities by lease or trackage rights, to give an undue advantage to a single shipper, is unquestionably such a device as is condemned by the act.

The sixth group is composed of industrial plant tracks which are neither owned nor operated by common carriers and are not dedicated to public use, the ownership and right of use being in the controlling industries which operate them. They ask that allowances be paid them out of the locality basis of rates under section 15 of the act, upon the theory that they are performing a service of transportation which the trunk line is obligated to perform under the rate structure. These cases illustrate the passing of the necessity for that provision of section 15 under which shippers may be compensated by the trunk lines for their facilities used in the handling of their own shipments. This legislative measure was enacted to give this commission a means of eliminating certain unjust discriminations. The gradual elimination of discriminatory practices by other processes leaves this provision of the law to be used as a cloak for various payments which but for it would be looked upon as rebates.

The commission will look to the trunk lines to reform their tariffs and file with this commission whatever arrangements they may make with the industrial lines here in question in the light of this report. An order will be entered directing the cancellation of the tariffs suspended in investigation and suspension docket 414, and the proceedings in docket 4181 will be dismissed without prejudice.

Commissioner Harlan dissents from the conclusions of the com-

mission in this proceeding, and will later file a separate report. (34 I. C. C.)

CAR SPOTTING CHARGES

The commission in the decision under this head (34 I. C. C., 609) refuses to allow the railroads in central freight association and trunk line territories, including also the New Haven, to put in effect tariffs proposing spotting charges in connection with placing cars on private sidings or tracks of industrial plants. These tariffs were filed in compliance with a suggestion in the *Industrial Railways case* (29 I. C. C., 212). They were to have become effective on different dates from April 20 to July 15, 1914, but were suspended. An abstract of the decision follows:

The proposed spotting charge is 5½ cents per ton, minimum \$2 per car, and the service for which the charge is proposed is defined in the suspended tariffs as follows:

"Spotting" service is the service beyond a reasonably convenient point of interchange between road haul or connecting carrier and industrial plant tracks, and includes:

(a) One placement of a loaded car which the road haul or connecting carrier has transported, or

(b) The taking out of a loaded car from a particular location in the plant for transportation by road haul or connecting carrier.

(c) The handling of the empty car in the reverse direction.

The industries to which the charge applies were divided into three lists. The basis of selection varied with different carriers, but in general the industries seem to have been arbitrarily selected.

It does not appear that the terminal facilities of the respondents, exclusive of industry spurs, private sidings, and tracks of industrial plants, are adequate for all the carload freight which they have been accustomed to receive and deliver upon such tracks, and respondents do not show that they could provide such terminal facilities, but some of the protestants testified that if such terminal facilities were provided by the carriers they would not use them.

It is admitted by the carriers that the proposed charge and also the lists of industries are tentative, and that if the tariffs should take effect as filed discrimination would result in that there are many industries not named in the tariffs for which the respondents perform without an additional charge the same spotting service. But while these respondents concede that the proposed tariffs can not be justified, they ask the commission to indicate how far they may go in imposing spotting charges.

It has long been the custom of carriers to receive and deliver carload freight upon spur tracks leading to private industries at convenient points for loading and unloading without imposing any charge for that service in addition to the line-haul rate, and in the *Los Angeles case* (18 I. C. C., 310), the commission held that where this service is merely a substitute for team-track receipt and delivery of carload freight the line-haul rate covers the service for the reason that rates generally in this country have been constructed upon that basis. The order in that case was upheld by the Supreme Court. *Los Angeles case* (234 U. S., 293). The mere size or complexity of the industry is not controlling in determining whether or not the line-haul rate covers the receipt or delivery of freight at the door of the plant.

As existing rates must be deemed to have been constructed to cover the customary placement of cars at factory doors, whether upon an industry spur or private siding, or upon the tracks of an industrial plant, and the outward movement of cars from such tracks, without regard to the size or nature of the plant, to add a charge now to the line-haul rate for that service would be revolutionary.

While the commission has from time to time called the attention of the carriers to the possibility of increased revenues from certain sources, and has suggested that it might be that the carriers ought to make a charge in addition to the line-haul rate for some services in connection with the movement of cars within industrial plants, for which no such additional charge is now made, it has never intended to suggest that an additional charge would be proper for services which by long continued

general custom and usage have been treated as covered by the line-haul rate.

In *General Electric Company v. N. Y. C. & H. R.* (14 I. C. C., 237), it was said that common carriers could not be called upon as a part of their contract of transportation to make deliveries through a network of interior switching tracks constructed as plant facilities to meet the necessities of the industry, but the case did not require a decision of that question. The point actually decided was that the complainant was not entitled to an allowance from the carrier for a service which the carrier was ready and willing to perform, and which the complainant performed because it was not convenient for it to permit the carrier to perform the service.

In the *Industrial Railways case*, the commission also expressed the opinion that the line-haul rate does not cover the movement of cars incident to the receipt and delivery of carload freight at large industrial plants where the movement is through a network of interior tracks, but in that case also the question presented was one of allowances, and the commission did not undertake to determine the number of tracks over which the cars must move prior to their receipt or delivery by the carrier in order to deprive the owner of the property transported of the right to an allowance for the service. It did, however, recognize the fact that the line-haul rate may cover the service of spotting a car at the factory door on a private siding:

Under the common law as construed in the practically unanimous decisions of the courts, a delivery of carload freight to a shipper having a private siding is made by shunting the car upon the switch, clear of the main tracks. All services upon the siding beyond that point, in placing the car for loading or unloading at a particular spot convenient to the shipper, are what may be called volunteered services in the sense that they are in addition to the main-line haul and in excess of any obligation of service by the carrier at common law. Nevertheless, the custom of making deliveries at the warehouse or factory door on private sidings is one of long standing in this country, and under certain language in the act it is possible that the carriers may be required, upon reasonable compensation, to do this spotting, as it is called. We find no authority, however, English or American, that holds or intimates that the line carrier, in connection with the main-line haul, is under any obligation to spot a car at the factory door on a private siding except upon reasonable compensation included in the rate itself or set up in the form of a special charge.

There may be cases in which the spots at which cars are placed for loading and unloading in complex industries are so located that the request for the receipt and delivery of carload freight at such spots could not, in view of general usage, be regarded as reasonable, and where a charge for the spotting service in addition to the line-haul rate might therefore be justified, but the mere fact that an industry is complex, or that it requires an interplant service in addition to the receipt and delivery of carload freight, is not sufficient to justify an additional charge for the placing of cars at the door of the industrial plant for the receipt or delivery of carload freight. The line-haul rate, however, covers only one placement of the car for loading or unloading, and an additional charge should be made for each additional placement of the car for that purpose.

The mere fact that many individual plants are operated together as a single industry does not deprive the industry of the right to such a service in the receipt and delivery of carload freight at each of the several plants as that plant would be entitled to have if it were operated separately, unless the collective operation so far removes the necessity for such a service as to make it unreasonable for the industry to demand the service.

To permit the carriers to add to the line-haul rate a charge for the movement of cars incident to the receipt and delivery of carload freight at industries selected because of their size or complexity, or upon some other basis equally uncertain, while treating a like service at all other industries as covered by the line-haul rate, would result in discrimination of a flagrant character.

Especially ought the tracks of the industrial plant to the extent that they are used by the carrier for a public service

treated as a part of its terminal facilities where the carrier does not show that it would be possible for it to provide the necessary terminal facilities in any other way.

The public interest is served in many ways by permitting the carriers to use the tracks of industrial plants as a part of their terminal facilities. The exclusively owned terminals of the carriers are thereby relieved of a heavy burden under which they would either break down completely or be so congested as to inconvenience shippers who are compelled to receive and deliver their freight in those terminals. The distribution of terminals also tends to prevent the undue concentration of industries and consequent concentration of population, thus aiding the solution of one of our social problems.

With the growth of terminal areas and the consequent increase of terminal expenses, there may be a growing need for a separation of the charges for line hauls from the charges for terminal services, and a graduation of charges for terminal services so that each industry within the terminal area will pay in proportion to the service it receives in addition to the line haul, if such a system should in the future be deemed to be preferable to what now obtains; but before that could be done there would have to be a separation of the cost of the line haul from the cost of the terminal service, and a complete reconstruction of rates.

The respondents have not justified the suspended tariffs, and an order will be entered requiring those tariffs to be canceled. The respondents may, however, file new tariffs providing for spotting charges in those instances in which the terminal services performed exceed the services which under established custom are, or should be, performed for the line-haul rate, in accordance with the views expressed in this report.

Commissioner Harlan dissents from the conclusions of the commission in this proceeding and will later file a separate report.

GENERAL FOREMEN'S CONVENTION

The eleventh annual convention of the International Railway General Foremen's Association was held in the Hotel Sherman, Chicago, July 13-16. The convention was opened with prayer and the association was welcomed to the city by the mayor of Chicago, William Hale Thompson. President Scott presented an interesting address, speaking in favor of closer co-operation between the various mechanical associations as mentioned in President Gaines' address at the Master Mechanics' convention. The secretary reported a membership of 255 and a cash balance of \$70 67.

VALVES AND VALVE GEARING

The size and weight of locomotives have been increased to the apparent limit, and it is now the consensus of opinion, that greater increase in capacity and speed must come from other sources. The possibility of further improvements in steam distribution have been recognized, and at the present time no part of the modern locomotive is the subject of so much study, discussion, and experiment as the valve motion.

It is true that large engines do not develop a drawbar pull at high speed at all proportional to their size, when compared with the smaller engines. This is probably due to the fact that the present valve gears do not take care of the large cylinder volumes now being used, and the cylinder passages are not suitably designed to allow the locomotive to run at high speed at fairly long cut-off. In the last few years, however, important improvements in exhaust nozzles, and exhaust passages, in the saddles have been developed, and this together with the increased capacity derived from superheated steam, has covered up the defects in steam distribution to a certain extent.

All of the present valve gears give a very limited opening for steam admission when working at short cut-off; and the openings for exhaust are equally disadvantageous, for although the opening is large, it is at its maximum very early in the

stroke and gradually decreases until at half stroke, where the piston speed is at its maximum, it is rarely over $\frac{3}{4}$ in. This narrowing of the exhaust port opening accounts for the high back pressure produced. Of course this abnormal back pressure can be overcome to a certain extent by giving the valves exhaust clearance, but this is done at a slight sacrifice in economy when engine is running at slow speed.

The tendency at the present time is to use large cylinders with the assumption that the engine is to be worked at a comparatively short cut-off. This necessitates large steam and exhaust ports, and a valve gear that gives a large port opening for both admission and exhaust. It is a well known fact that the quicker valves move over the ports the more power derived from the steam—possibly due to the loss in power which results from steam condensation when valves move relatively slow over the ports. Hence in the late valve gears an effort has been made to produce a motion which will give quick admission and release of steam. This condition can be brought about, to a certain extent, by a long valve travel.

The most important problem that confronts the motive power department at the present time is to bring about economy in locomotive operation. The valve motion is next in importance to the boiler in determining the efficiency of the locomotive as a whole; hence the vital importance of a proper design, construction, and maintenance of this feature, so that some degree of economy will be attained. Poor steam distribution results in loss of power in the engine, excessive fuel consumption, and an increased cost of repairs. One of the most important items of expense in locomotive operation is the cost of fuel, and the question of steam distribution is a dominant factor in this.

In order that the steam distribution in the cylinder may be as efficient as possible great care must be exercised in the selection of the type and design of the valve to be used. The piston valve possesses some advantage over the flat valve for high duty service in that it is fully balanced, though the slide valve can be quite satisfactorily designed in this respect. In short, it is a matter of choice and convenience of construction and maintenance as to which shall be used, though the tendency of modern practice is toward the general use of piston valves.

There is some doubt as to whether the piston valve is really more economical in steam consumption than the slide valve, and a number of tests have been made, some showing better for one, some showing more economy for the other. In 1904 tests were made by the Master Mechanics' Association to determine the relative leakage of slide and piston valves. The conclusions derived from these tests do not seem to favor either type of valve. The best piston valve showed a leakage of 268.56 lb. per hour, and the best slide valve 348 lb. per hour. The worst case of leakage with piston valves was 2,880 lb. per hour; and of slide valves 2,610 lb. per hour. Without doubt, the question of valve leakage with both slide and piston valves, depends largely upon the condition in which they are allowed to run. If the piston valve was given as much attention in the roundhouse as the slide valve, the former would probably show the least leakage.

Slide Valves.—With large cylinder dimensions and high steam pressures the slide valve becomes unduly large for a proper length of port, and even when well balanced creates an excessive amount of friction when moved on its seat. A slide valve when used on a very long cylinder gives undue cylinder clearance due to the increased length of ports, and the large steam chests necessary cause more or less steam condensation. This probably accounts for the high water rate of engines with very large valves, and steam chests. In pooled service, cut valves and seats are very common on slide valve engines. In fact, it is uncommon for engines to run more than 25,000 miles before the valves need facing.

The chief advantage of the slide valve lies in the fact that it can relieve itself of excess compression by lifting from its seat. Hence it is not necessary to provide means for relieving excess pressure in the cylinders.

In the design of the slide valves the balance is of as much im-

portance as an efficient distribution of steam in the cylinders. If the valves are not properly balanced an enormous stress is imposed upon the valve gear and transmitting rods in the work they are called upon to do. In calculating the dimensions of stems and rods the designer is obliged to consider the work that would have to be performed in case of an accident to the balancing strips and lubricating apparatus.

Piston Valves.—The advantages of the piston valve are as follows:

Increased port area for both admission and exhaust.

Ports in cylinder made very straight and direct.

A simpler, lighter, and cheaper cylinder casting; and a wearing face separate from the cylinder casting that can be cheaply renewed.

Its adaptability to any design of valve gear, since it can be placed above the cylinder, between the frame rails, or in any other position with equal facility.

With inside admission valves the steam passages are better protected from the cold and radiation, and the steam chest heads and packings relieved from all pressure except that of the exhaust steam, which is but a few pounds above that of the atmosphere and so puts, really, very little stress upon these parts.

Accessibility of parts. Peep hole plugs make it possible to get port marks without removing valve chamber heads.

Better balance which makes it easier to handle, and decreases the wear and tear on the motion work.

The relative frictional resistance of the piston valve is much less than the slide valve. (This was proven by tests made on the C. B. & Q.).

The greatest disadvantage under which the piston valve labors is its inability to relieve excess pressure in the cylinder port by lifting, after the manner of the slide valve. Many of the weak features of the piston valve have been eliminated in the recent designs, and where proper care is taken in the maintenance and operation of piston valves they give splendid service.

Piston valve cylinders have considerable advantage over slide valve cylinders. The walls lend themselves more readily to curved lines than do those of the slide valve. (The avoidance of flat walls exposed to steam pressure is one of the most important things to be considered in cylinder work). As piston valves can be made of any desired length the steam ports can be made very short and direct. For this reason also the steam chest should be placed as close to the bore as will allow the barrel flange to be turned for the head casing. The piston valve cylinder and all its appurtenances weigh somewhat less than a first class slide valve and its appurtenances of equal capacities. Piston valves give flexibility to the design because they can be located in almost any position with regard to the cylinders.

As regards the size of piston valve that should be used for large power there is considerable difference of opinion. Exhaustive tests made on the Pennsylvania Railroad showed that the piston valve could be largely standardized, and that a 12-in. diameter of valve was large enough for cylinders up to 27 in. in diameter, when used with superheated steam. The standard 12-in. diameter of valve was then developed, and with only one change in the overall length, it now fits locomotives of 14 different classes on that road.

Valve Gears.—At the present time four general designs of valve gears are used in this country. They are: The Stephenson link motion; the Walschaert valve gear; the Baker valve gear, and the Southern valve gear.

For many years the Stephenson link motion was used almost exclusively in this country, but with the introduction of the very heavy power, for structural reasons, some form of outside valve gear became imperative. The principal advantages of outside valve gears are: Accessibility for lubrication, inspection and repairs; opportunity for heavy cross bracing between the frames; motion can be made more direct, and with fewer wearing parts, and ability to hold their adjustment for a longer length of time.

The disadvantages of the outside valve gears are: Liability of damage from side swipes; rod work, changing of tires, etc.

made more difficult due to the location of outside valve gears, and slight distortion of the valve events due to up and down movement of the main wheel, and with it the eccentric crank, and back end of the eccentric rod.

Aside from the matter of good steam distribution, there are a number of items that must be considered in the selection of a valve gear for different classes of service. They are as follows: First cost; cost of maintenance and repairs; efficiency and reliability of service; ability to hold adjustment, and ease of handling in the cab.

Three of the most important features to be considered, in the design and construction of an outside valve gear are: Necessity for providing as rigid a support as possible; in the provision for reducing wear to a minimum, and in providing sufficient lubrication at every point.

The advantages to be derived from the high class materials for valve gear parts have been recognized, and at the present time the tendency is to use steel for these parts. The recent Pennsylvania engines have all motion work parts of heat-treated steel. Soft steel is used extensively for transmitting and other valve gear rods, and the jaws are usually case-hardened to give good wearing qualities. Cast steel is only adapted for certain parts, and where used should be annealed. The American Locomotive Company follows the practice of using drop forged motion work parts wherever it is possible to do so. Drop forged motion work parts have the advantage of requiring very little finish, and are strong and durable.

The outside valve gears produce a more uniform steam distribution with a lower percentage of preadmission than the Stephenson link motion. They hold their adjustment, and consequently give a better steam distribution for a longer length of time. Constant lead is the characteristic of all well known outside valve gears. While there is no reliable data available as to the cost of maintenance of the outside valve gears, in comparison with the Stephenson link motion, it is generally considered that the cost of maintenance of the outside gears is from 60 to 75 per cent less than for the Stephenson gear.

The Stephenson gear possesses the peculiarity of being exceedingly sensitive to a close adjustment of all its parts in order that a correct action and proper distribution of the steam may be obtained. It is the most flexible of any in use and can be most readily adapted to irregularities in the running and operation of the engine. At the same time it will get out of adjustment very easily, and requires the utmost care in its design in order that it may work properly. With the link motion in actual service there are three sources of error which cause a variation of the same events for the two ends of the cylinder, and which must be compromised for in some manner. They are: The location of the eccentric rod pins back of the link arc; the angular vibration of the eccentric rods, and the angular vibration of the connecting rod. To a certain extent the latter two compensate the first, but not entirely, and to complete the compensation the hanger stud is set back of the link arc.

In certain class of service the variable lead given by the Stephenson link motion permits the locomotive to accelerate more rapidly and to better adjust itself to different operating conditions than is possible with the valve gears giving a constant lead. Variable lead and flexibility are the characteristics of the gear. An added advantage of the Stephenson motion is that everything is inside where it is well protected from damage by a side swipe. For this reason several roads are still specifying the Stephenson gear for moderate sized switch engines. Switch engines are especially apt to be side swiped in congested yards.

On the other hand, because of the weight and power of modern locomotives, it is almost impossible to get a satisfactory design of the Stephenson link motion between the frames.

[This report also included a very clear description of the

action of the valve, descriptions of the various special valves and valve gears, together with the methods for setting them, descriptions of the various valve and cylinder attachments and the various power reverse gears now in service.—Editor.]

The report is signed by: Walter Smith, chairman (C. & N. W.); C. A. Barnes (C. & W. I.); G. W. Keller (N. & W.); T. M. Dewar (C. & O.); B. F. Harris (So. Pac.); J. Miller (Ill. Cent.); N. J. Shasberger (N. Y. C. West); C. D. Rafferty (K. & M.), and F. Anderson (C. St. P. M. & O.).

PLANT FOR SAND BLASTING STEEL CARS

It has been a difficult problem in connection with the use of steel cars to clean the exterior in a satisfactory manner before painting. The use of acids for this purpose is not entirely satisfactory and this method is also dangerous for the workmen. Where sand blasting has been adopted, however, it seems to have been productive of remarkably good results.

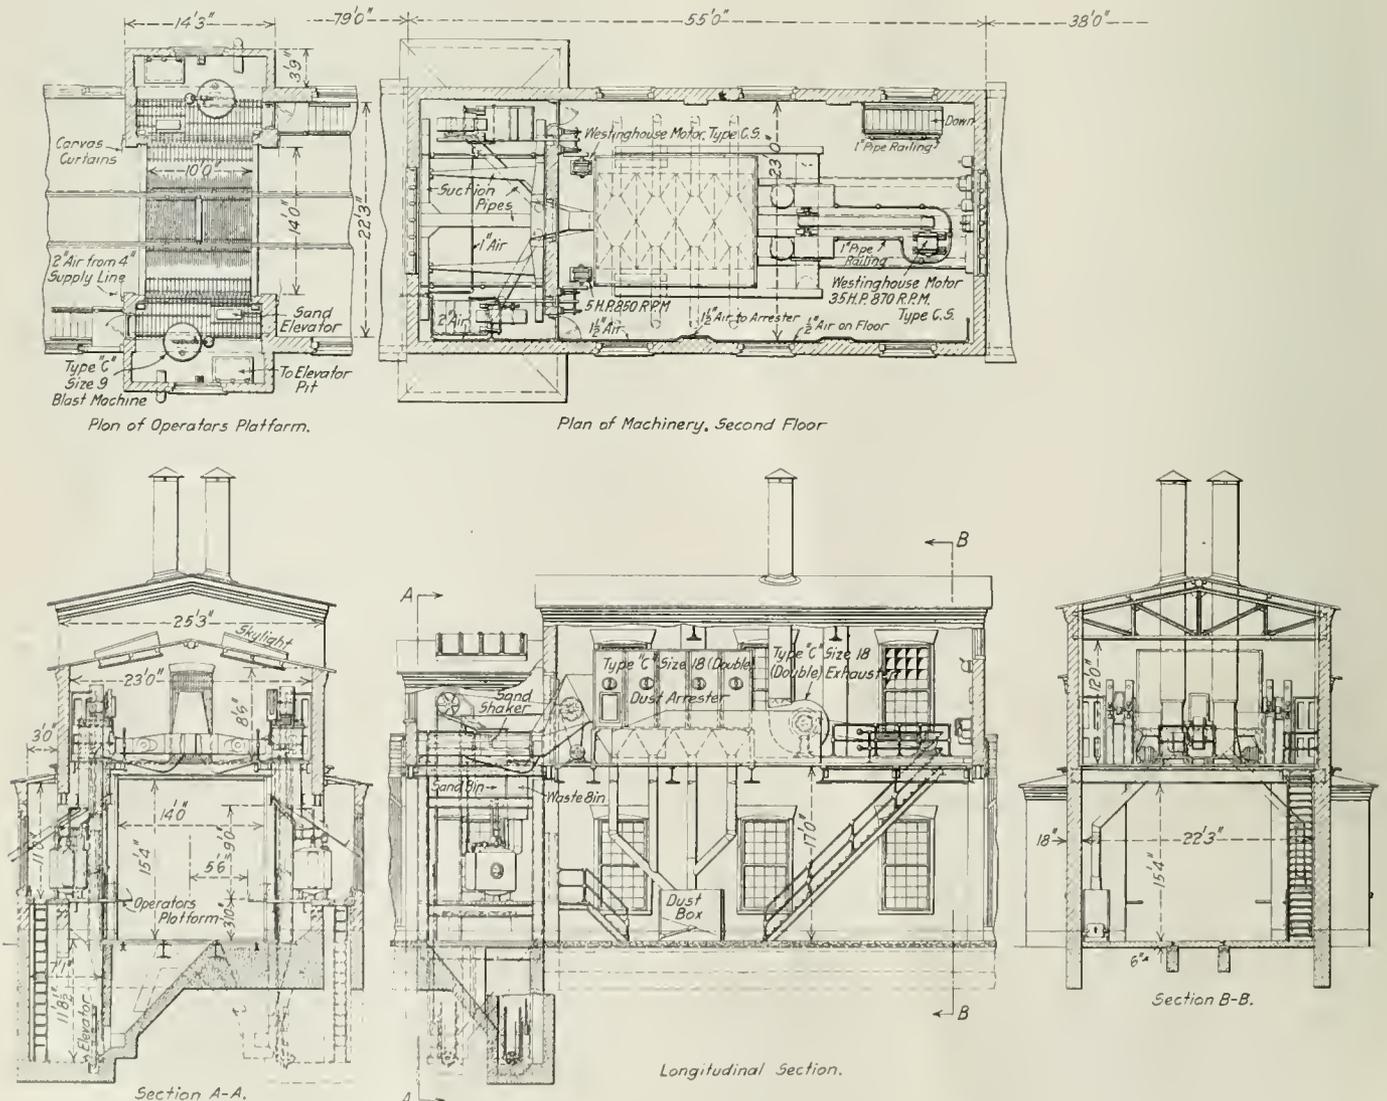

The engravings show side elevation and sectional views of a sand blast installation which is in successful operation on a large system operating a great many steel cars in both passenger and freight service. The installation was designed by the Pangborn Corporation, Hagerstown, Md., who also manufactured and supervised the erecting of the equipment which is known as their model "P" car cleaning installation.

As shown in one of the illustrations the building is 172 ft. long, the main part being 55 ft. long and of brick construction,

while the extensions are of wood and covered with corrugated steel sheathing. All the equipment is contained in the main part of the building; the sand blasting is done in a compartment 12 ft. by 17 ft. by 21 ft., and the dust is confined to this space. The end extensions keep the entire car indoors at all times. Cars are hauled in and out of the building by an electric winch, built by the American Engineering Company, Philadelphia, Pa., and having a capacity of 6,000 lb. at a speed of 50 ft. per minute.

Pits are provided, as shown in one of the sections, beneath the track on which the car stands and are covered with a grating 10 ft. wide. When new sand is necessary it is dumped on this grating and passes down the sloped sides of the pits to the elevators, which are of the bucket type and which carry the new sand as well as that which falls from the sides of the car during the blasting operations, to the sand separators. These sand separators remove any refuse from the sand, the good sand passing into the sand bins and the refuse into the waste bins. From the sand bins the sand goes to the blasting machines which are operated by compressed air, the sand passing from the machine to a hose and nozzle in the hands of the operator who stands on the platform shown. Canvas curtains, as indicated on the drawings are arranged so that the section of the car standing over the grating is entirely enclosed.

The engravings also clearly show the arrangement of the exhaust piping which is designed to remove the dust rapidly from the enclosure when blasting is going on. The exhaust fan is double and is driven by a 35-hp. motor running at 870 r. p. m.

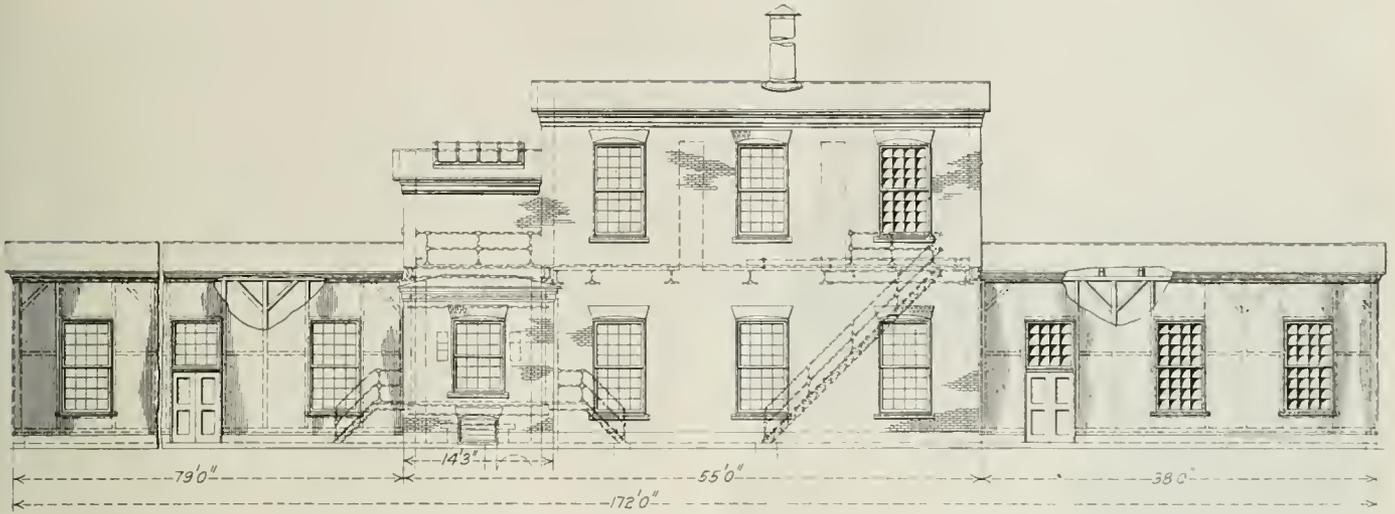

Sectional Views Showing the Arrangement of Machinery for Cleaning Steel Cars by Sand Blasting

The dust-laden air is exhausted into a dry process screen type dust arrester where the dust is completely separated. The dust is then delivered to the dust boxes located on the first floor.

The elevating, separating and blasting machinery is in two

the short end of the gate is loaded with a counterweight of 1,000 lb.

The gate is raised by a push, with little effort, and is lowered by pulling on a rope attached to the light end. When down it is

Side Elevation of the Building for Sand Blasting Steel Cars

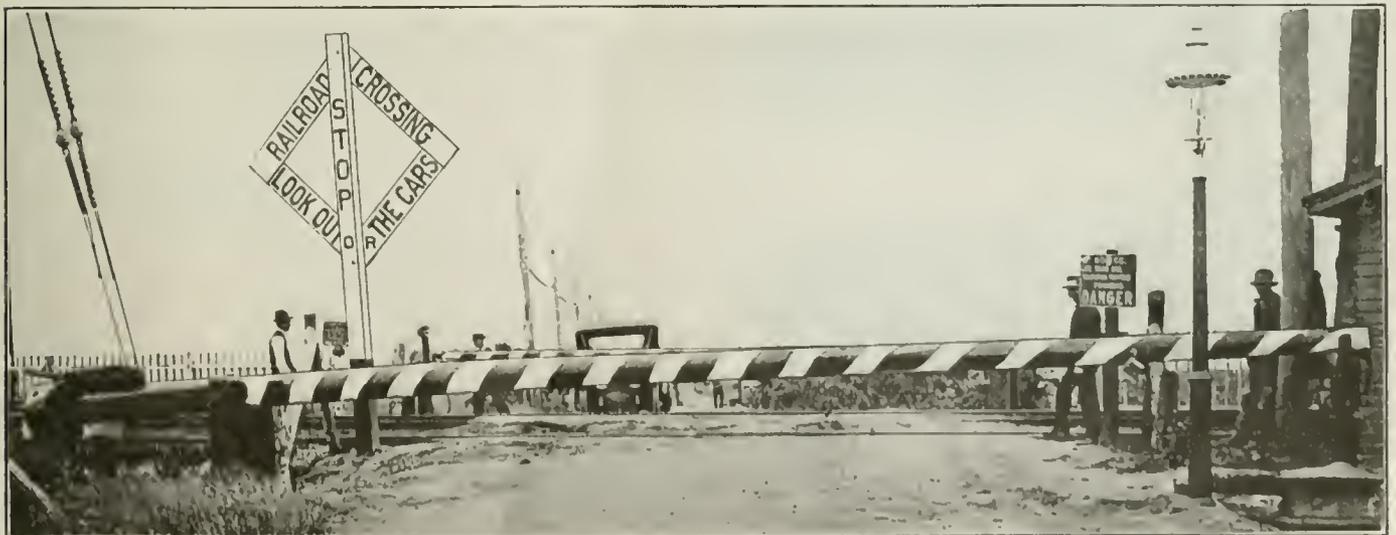

units, one on either side of the car so that both sides can be cleaned at once. The sand separators and the elevators are driven by 5-hp. electric motors running at 850 r. p. m.

A SUBSTANTIAL CROSSING BARRIER

The Long Island Railroad, which has tried all sorts of exhortations to curb the spirits of automobilists who approach the railway tracks at reckless speed, has concluded to employ something stronger than words—a gate which cannot be broken down with impunity. At a crossing on the highway leading to Long Beach the company has installed gates, one on each side of the railroad, made of heavy spruce piles or spars 40 ft. long and

fastened by a hook. To lower the gate on the side of the railway farthest from the cabin the attendant must walk across the tracks. When the gate is lowered it is 3 ft. 6 in. above the roadway.

As showing the necessity of adopting such extraordinary means to stop automobile drivers at grade crossings when trains are approaching, the company calls attention to the extraordinary frequency of disasters at its crossings, a fact which has been noted in these columns. In the two weeks ending July 10 there were a dozen cases where drivers ran through crossing gates let down to warn them of approaching trains. With gates of this kind, however, there will be a radical change in conditions; and, in the language of a New York newspaper, motorists going to Long

Highway Crossing Gate Long Island Railroad

about 10 in. in diameter (12 at the butt, 8 at the tip). These gates, shown in the accompanying engraving, are painted with spiral bands of black and white, so that they will attract attention a considerable distance off. The one in the foreground is supported at the left between two stout posts by a 1-in. iron bolt, surrounded by a pipe bushing.

To make the work of raising and lowering as easy as possible,

Beach will no longer be able to get themselves run over by Long Island trains.

BAGDAD RAILWAY—A tunnel over three miles long, near Bagdja, through the Amanus mountains, has been completed, thus connecting the Bagdad Railway on Kiliki plain with Aleppo in North Syria.

THE SELBY SIGNAL FLAG

A compact, complete flagging outfit for the use of train flagmen has been devised by the Selby Signal Flag Company, St. Louis, Mo., and has been used recently on several roads, including the Mobile & Ohio, the Frisco, the Missouri Pacific, the Santa Fe, the Kansas City Southern, the Wabash and the Missouri, Kansas & Texas. It consists of a heavy galvanized sheet steel case divided into three compartments longitudinally. One compartment consists of a circular case containing an all-

Method of Operation with Flag, Fusee or Torpedo

wool flag attached to a wooden staff with ordinary tacks. The base of this staff is fitted with wool packer for holding the staff, either extended when in use or telescoped into the protecting tube when not in use.

The lower portion of the signal handle is divided transversely into two compartments by a wooden partition. One compartment contains three standard 5 and 10 minute fusees and the other 6 standard torpedoes. Each compartment is fitted with a hinged lid which allows only one fusee or torpedo to issue at a time.

Flag Ready for Use. Lower View Shows Extra Supply Case Attached

These two compartments and that for the flag form the handle for the flag when in use. This case is painted a bright target red with flagging instructions printed in target yellow. It bears the standard trade-mark or monogram of the road, and is consecutively numbered for the purpose of identification and charging out. It is provided with a strap, enabling the flagman to carry it over his shoulder, leaving both hands free. The entire case is 3 1/2 in. in diameter, 22 in. in length and weighs 3 1/2 lb.

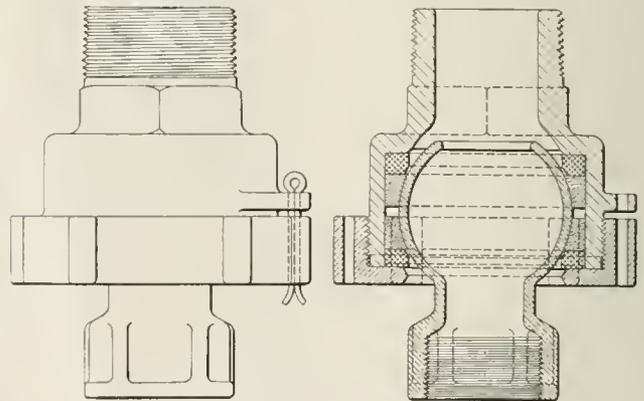

A detachable extra supply case has also been designed to

carry 6 additional fusees and 12 additional torpedoes. This case is attached to the flag handle by folding hooks. When not in use it may be hung on the rear platform of a train. It is intended for use where signals are used frequently and where the flagman does not have an opportunity to go to the baggage car or train box to replenish his supplies.

Among the advantages claimed for this device are, first, that it provides all the signals a flagman may need in a light portable waterproof case which he may carry with him readily to the point of display. There is no opportunity for him to forget to take all the necessary signals in case he starts out under excitement or in a hurry. Second, instead of the fusees being carried only at night, this flag provides them at all times so that they are at hand whenever a flag signal becomes indistinct during unexpected fogs, snow storms, etc. Third, this flag is inseparable from the signal handle, precluding the possibility of the signals being left behind. Fourth, instead of the torpedo straps being broken off by being tied to lanterns and flags and being broken and damaged otherwise, they are protected for effective use when needed, eliminating waste and insuring that the signals are in proper condition when needed.

MAIN RESERVOIR PIPE CONNECTION

The ball joint illustrated herewith was brought out by the Franklin Railway Supply Company, 30 Church street, New York, especially for making pipe connections to the main reservoir. Many engine failures are caused by the breaking of main reservoir pipe connections due to vibration of the pipes, the effect of which is concentrated at the rigid connection in the reservoir. The body of the ball joint is threaded and screwed di-

Main Reservoir Ball Joint Connection

rectly into the reservoir and the end of the pipe is screwed into the ball member, thus relieving the threaded connections of vibration stresses.

The construction of the joint is shown in the engraving. The body is made in the form of a cylindrical casing in which are placed two rubber packing rings and two hard babbitt retaining rings. The packing rings form the joint with the spherical surface of the ball member and are held in position by a gland nut on the casing.

INDIAN FUEL SUPPLIES.—An experiment is being made of carrying coal from the Bengal collieries by rail direct instead of as heretofore by sea via Calcutta for the railways in western India. The idea is to release shipping for jute and other classes of export business which have no alternative means of despatching their goods. One of the results of this policy has been an enormous increase in coal traffic in the western sections of the East Indian Railway; in one week over a quarter of a million tons of coal have been carried, of which just under half was for up-country, this being a record for the line.

Maintenance of Way Section

One large eastern railroad has created the position of supervisor of terminal operation and appointed a man whose duty it is to standardize the operation of the different yards on the road by inaugurating at each of the terminals the good methods of all as far as practicable.

Standardizing Methods of Work

Without such a plan, economies worked out at one point are in danger of being overlooked at others, and other yards will not benefit from them. The same idea is equally applicable to other departments. A comparison of the unit costs of renewing ties, or bridge stringers, for instance, on different divisions of the same system, will frequently show wide variations not due to local conditions. The explanation is that the methods used are not equally efficient, and it is evident that the practices of foremen and supervisors with the better records can be adopted on the divisions with higher unit costs with resultant economy. On some roads the organizations are such that improved methods are quickly introduced all over the lines. On most roads this supervision extends only to the larger problems, and there is no one whose special duty it is to study and compare the minor details of the work, which details are nevertheless highly important in the aggregate. The need for such supervision and ready exchange of methods is constantly becoming greater as larger numbers of less experienced men are being employed.

Railway men are only now beginning to realize the wide variety of uses to which a locomotive crane may be put with economy.

The Field for Locomotive Cranes

It is only within the last four or five years that this type of equipment has come into general use and on only a very few roads are locomotive cranes employed to full advantage today. Many labor saving devices have been designed for certain definite uses and their economy is dependent only on the amount of work of that character to be done. It is the versatility of the locomotive crane that gives it such wide use. This is especially emphasized in the maintenance of way field where this class of equipment has been most widely used. Where, for instance, the picking up of roadway scrap along the line may not alone justify the use of a locomotive crane, the fact that it can be employed at other times in handling excavations, driving piles, loading ties or lumber, handling concrete materials, loading ballast, etc., will frequently justify its purchase for the combined purposes. Also, because of this wide variety of uses, the locomotive crane is no longer regarded on many roads as a special type of equipment to be moved from one division to another for special work, but as many as 40 are employed on individual roads, most of which are assigned to particular divisions. In many cases one or more locomotive cranes are kept busy at single terminals. The adaptability of equipment of this kind to a wide variety of work is limited very largely by the ingenuity of the men in charge. There is so much handling of material and other work of a similar nature to be done at all times, and the economy of mechanical means as compared with manual labor is so generally recognized, that the proper utilization of equipment of this type is largely one of proper management. Thus, a crane employed in loading ballast in the summer can be diverted to the handling of storage coal in the winter. A definite example of their value is afforded on a western road which is contemplating the rearrangement of certain track facilities in an important terminal within the next few years at a point where new coal handling facilities

must be provided at once. To avoid the construction of a permanent coaling station where this proposed rearrangement of tracks may require its early removal, it is proposed to install a locomotive crane feeding a small frame coal storage pocket. When the track changes are finally decided upon and permanent coal handling facilities provided, the locomotive crane can be transferred to other work and the only investment lost will be that for the temporary coal pocket. Some of the most important uses of a locomotive crane are described in an article elsewhere in this issue, the purpose of this article being not only to call attention to the field existing for locomotive cranes, but also to aid in securing the greatest efficiency from those already in service.

The dapping of timber guard rails to fit over ties on wooden trestles and on open floor steel bridges to hold the ties in place and to prevent their bunching in case of derailment, seems to be a relic of the old days when it was considered necessary to fashion intricate joints in timber frames involving the cutting and

Dapping Timber Guard Rails

the material reduction of the strength of the various members. Modern tendencies are against this practice. In mill and wooden car construction the dovetail has been superseded almost entirely by metal yokes, hangers and bolts. It is strange, therefore, that only a few railroads have adopted substitutes for the dapped guard rail in spite of the fact that several have been developed. In a number of cases the substitute has taken the form of wood or cast iron spacing blocks between the ties, and in other instances lag screws have been used. The dapped guard rail is a strong device for the purpose intended. Theoretically it is much stronger than the largest lag screw which it would be practicable to use, but its very shape makes it particularly liable to checking and splitting and offers every opportunity for decay, not only of the guard rail itself but of the ties as well. With the increased use of treated lumber the dapped guard rail, which would have to be framed before treatment, is especially undesirable when we consider that no other member of a timber trestle deck requires cutting in advance. It would seem that this detail of a wooden bridge ought to receive more consideration than has been given to it in the past, in view of the fact that some of the substitute devices that have been suggested are cheaper and seem to serve the purpose equally well, if not better.

The operation of the average gravel ballast pit involves a daily expenditure of from \$100 to \$200. As the output is secured only when the steam shovel is working, it is highly important that all avoidable delays to the shovel be eliminated, thereby increasing the amount of material loaded and decreasing the unit cost of loading it.

Track Construction in Gravel Pits

Aside from an efficient pit organization no factor is more important than proper track construction and maintenance. It is usually not difficult to secure authority for sufficient track facilities. The importance of using heavy rail, long turnouts and a relatively high standard of track construction throughout is not so generally realized. Too frequently these tracks are considered in the class of temporary side tracks used only occasionally or for the storing of empty cars, while as a matter of fact, the average pit track is subjected to frequent service under large road engines and heavily loaded cars, and

does not receive the attention given to main tracks. A derailment on such a track ties up the shovel and the pit forces and in turn breaks up the schedules of the trains on the road. The use of heavy rails and fastenings on good ties and the employment of a sufficient force to maintain the tracks properly, will do much to eliminate such derailments and consequent delays and will therefore pay for themselves quickly. The high record output secured without any overtime in the operation of the Chicago, Milwaukee & St. Paul pit at South Beloit, Ill., described in another column, is obtained not only because of an efficient pit organization but also because of the fact that 75-lb. and 85-lb. rails, No. 10 turnouts and other correspondingly high standards of track construction have been used throughout. Money spent by the railroads in such a way will yield large returns in a season.

RAIL SECTIONS AND WHEEL LOADS

It is an open question whether in some respects the construction of track is not failing to keep pace with the loads placed on it. All predictions to the contrary, wheel loads continue to increase. A couple of years ago much attention was attracted to the new Atlantic type locomotives built by the Pennsylvania with a 66,500 lb. load on each driving axle. The Philadelphia & Reading is now building four Atlantic type locomotives for use in fast passenger service with 73,100 lb. on each driving axle, or nearly 10 per cent more than the Pennsylvania locomotives. A comparison of 18 recent designs of Mikado locomotives shows an average load per driving axle of 57,300 lb. All of these locomotives are or soon will be in regular service, and while they represent today the heaviest locomotives of these types, the history of past developments has shown that the heaviest locomotives of one year may not be many years in advance of the average.

In his presidential address before the American Society for Testing Materials last month, A. W. Gibbs, chief mechanical engineer of the Pennsylvania, and chairman of the committee on that road engaged in the preparation of new specifications and in the design of the 125-lb. rail section, made the statement that he believed the time had arrived for a considerable increase in the weight of rail sections. In this he is in agreement with many railway men. At present the 100-lb. rail may be said to be the heaviest standard section on any road, the 101-lb. rails of the Lehigh Valley and the Lackawanna, and the 105-lb. rail of the New York Central being modifications of the original 100-lb. sections. The Central Railroad of New Jersey has laid some 135-lb. rails during the past three or four years on curves subjected to heavy wear, but this action was prompted by a desire to secure a longer life from this rail rather than increased strength. The first radical departure from the 100-lb. rail section may be said to be the 125-lb. section of the Pennsylvania now being rolled for the first time in any considerable quantity. The American Railway Engineering Association at its last convention, also adopted standard sections for weights up to 140 lb., indicating the belief of the Rail Committee that sections heavier than the 100 lb were desirable.

Some engineers object to the use of heavier rails on the ground that the mechanical department at once takes advantage of this increased strength to design heavier locomotives, losing sight of the fact that the function of the two departments is to co-ordinate their work so that their railroad may operate most economically. If heavier locomotives than those now being employed will reduce the cost of operation and if clearances and other conditions make their use practicable, it is the duty of the engineering department to provide rail and track construction which will carry these loads if this can be done at reasonable expense. It is this pressure from the operating and mechanical departments, evidenced in the form of increased engine or car wheel loads, which is creating the demand for heavier rail sections.

Letters to the Editor

A COMPARISON OF PUMPING COSTS

NEW YORK.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

In the issue of June 18 there appeared a description of the Missouri Pacific pumping station at Nevada, Mo., which consisted of a brick pump house 42 ft. by 48 ft., a three room frame dwelling for the pumper, 18,000 ft. of 8-in. discharge pipe, and 150 ft. of 10-in. suction pipe and a steel standpipe 24 ft. in diameter by 45 ft. high, for all of which the railroad paid \$31,500. The article described the economy in operation of the fuel oil engine over the steam operated plant. The writer does not question that the fuel oil engine is cheaper, but he does wish to call attention to the fact that the operating cost given for pumping 1,000 gal. of water as 1.73 cents for the fuel oil engine and 3.09 cents for the steam operated plant, is somewhat misleading and apt to give one a wrong impression.

For instance, suppose we assume that the question came up as to the advisability of buying water at a cost of 7 cents a 1,000 gal., or installing one's own pumping plant. If an engineer were to use a report such as shown in this article as a basis to show that it would be cheaper to pump its own water than to purchase it, his deductions would be in error, and the railroad would be making a mistake in installing its own pumping plant on these figures.

In the first place, let us figure what the total cost of each kind of plant would be. The facilities as outlined above cost \$31,500. In addition the first cost of the fuel oil engine plant was given as follows:

40 hp. fuel oil engine.....	\$2,000.00
Two 400-gal. pumps.....	600.00
Foundations.....	100.00
Pipe and connections.....	200.00
Labor.....	125.00
	<hr/>
	\$3,025.00
	<hr/>
	31,500.00

Adding the first cost of the plant.....
Total first cost of fuel oil plant.....\$34,525.00

For the steam operated plant, the additional cost was given as:

45 hp. vertical boiler in place.....	\$1,200.00
Two 400-gal. pumps.....	600.00
Foundations.....	200.00
Pipe and fittings.....	200.00
Labor.....	200.00
Boiler feed.....	150.00
Heater.....	200.00
	<hr/>
	\$2,750.00

Adding the first cost of the plant.....
Total first cost of the steam plant.....\$34,250.00

The total operating yearly charge for each plant is as follows:

For the fuel oil engine,

Fixed charges:	
Interest at 5 per cent of \$34,525.00.....	\$1,726.00
Depreciation at 5 per cent of \$34,525.00.....	1,726.00
Taxes and insurance at 1 per cent.....	345.00
	<hr/>
	\$3,797.00

Operation (same as in article):	
3,250 gal. of fuel oil at 3 cents.....	\$97.50
114 gal. of lubricating oil at 17 cents.....	24.48
110 gal. of coal oil at 3.518 cents.....	3.98
Labor of maintenance.....	51.00
Minor repair parts.....	20.00
Salary of pumper.....	300.00
	<hr/>
	\$496.96

Operating cost for 6 months..... \$496.96
As the operating cost for six months equals \$496.96 the total operating cost for a year equals \$993.92.

Fixed charges.....	\$3,797.00
Operation.....	993.92
	<hr/>
	\$4,790.92

Total operating charge..... \$4,790.92 for fuel oil plant.
For the steam operated plant:

Fixed charges:	
Interest at 5 per cent of \$34,250.....	\$1,712.00
Depreciation at 5 per cent of \$34,250.....	1,712.00
Taxes and insurance, 1 per cent.....	342.00
	<hr/>
	\$3,766.00

Operation (Same as in article):	
152 tons of coal at \$2 per ton.....	\$304.00
Hauling coal 5 miles at \$1 per ton.....	152.00
Supplies	50.00
Repairs	100.00
Salary of pumper.....	300.00
<hr/>	
Operating cost for 6 months.....	\$906.00
Fixed charges	3,766.00
Operation	1,812.00
<hr/>	
Total yearly operating charge.....	\$5,578.00

Thus the total operating charge for a fuel oil plant is \$4,790 and for the steam operated plant is \$5,578, or a difference of \$787.08 per year in favor of the fuel oil engine.

As the capacity of the plant was 5,000,000 gal. per month, or 60,000,000 gal. per year, the cost of pumping 1,000 gal. with the fuel oil engine is \$.0798, or nearly 8 cents per 1,000 gal., instead of 1.73 cents as given in the article, and for the steam plant the cost is \$.093, or 9 cents per 1,000 gal., instead of 3.09 cents as given before.

However, in comparing the cost of pumping the water, or buying it at 7 cents per 1,000 gal., we must not lose sight of the fact that the road would have to furnish the piping and standpipe in any event, so we deduct from the total first cost of the facilities \$31,500, the approximate cost of the piping and standpipe, which we will assume cost \$4,500, leaving a balance of \$27,500. But if we install the pumping plant we still will have to lay the pipe and furnish the standpipe, so our first cost is still \$31,500.

The charges on the expenditure of \$4,500 for the piping and standpipe in connection with purchasing the water are as follows:

Interest at 5 per cent on \$4,500.....	\$225.00
Depreciation at 5 per cent. on \$4,500.....	225.00
<hr/>	
Yearly charge	\$450.00

This yearly charge gives an additional cost per 1,000 gal. equal to $\frac{3}{4}$ of a cent, to be added to the cost of the water purchased, making the total cost $7\frac{3}{4}$ cents per 1,000 gal.

In conclusion, the result plainly shows that (assuming it is possible to purchase water from some company) it is better and cheaper to let the water company furnish the plant and for the road to buy the water, even at a cost of 7 cents per 1,000 gal., plus the additional charge of $\frac{3}{4}$ cent, then it would be for it to install its own plant and pump its own water; for the engineer must not let the idea run away with him that because he sees a creek of good water running near the right of way, and apparently serving no purpose, that it will cost practically nothing to get this water into the tenders or shops as the case may be.

C. F. HERINGTON.

[NOTE.—The above is on the assumption that it is possible to purchase water in adequate quantity and of the proper quality. In all such cases a road should compare the cost of purchasing it with the cost of pumping it itself. In many cases, however, a road has no alternative but to provide its own pumping plant.—EDITOR.]

CANTING RAILS

Rochester, N. Y.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

On page 855 of the issue of April 16, there appeared a short article on the effect of canting the low rail on curves. With the conditions stated in that article, I believe that the effect on the rail, as shown from the photographs, is due more to excessive elevation than to the canting of the rail. The elevation shown for the degree of curvature given is equilibrium elevation for a speed of $30\frac{1}{2}$ miles per hour. While the article stated that many trains stop here and that the speed is slow, a speed of 15 miles per hour would only call for an equilibrium elevation of $\frac{1}{2}$ in.; 20 miles per hour would call for 1 in., and 30 miles per hour, $2\frac{1}{8}$ in. I have seen the same result on rail as is shown here, caused by excessive elevation. It is also possible that the gage shown has some effect on this flowing of the metal. I do not see any reason for having gage $\frac{5}{8}$ in. wide on a 3 deg 30 min. curve.

It is possible, of course, to overdo the canting of the rail but the rail should be canting at least enough to permit the wheels

to cover the entire surface of the head. It is just as objectionable to run only on the inside of the head as only on the outside. In this case the metal would flow with the rail insufficiently covered or properly covered. DIVISION ENGINEER.

CLASSIFYING SCRAP RAIL

MONTREAL, Que.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I have read with much interest the article by Charles E. Parks on the subject of Accounting for Rail and Ties in the issue of March 12, page 470. Having had considerable experience in the track department of this company, I endorse the statements he makes pertaining to the intricacies of rail and tie accounting, and particularly the suggestion of taking a reliable and accurate inventory of the rail on hand on the different sections at the beginning of each fiscal year.

One source from which a great many discrepancies arise is that the foremen or supervisors frequently report on hand partly worn and relaying rail as scrap, there not being sufficient discrimination between these three qualities. At a later date when called upon to construct an industrial track, either for the company or an industry, it is discovered that a sufficient amount of partly worn or relaying rail is not on hand to do this work. The result is that the supervisor goes over his supply of scrap rail and picks out a sufficient number of good rails from this stock to lay the required siding. In his report of this work he classifies the rail laid as either partly worn by relaying. The consequence is that the amount of scrap rail on hand has to be reduced, requiring an arbitrary adjustment.

In order to avoid this practice more care should be exercised by the supervisor in classifying the rail on his territory. In reporting the different qualities of rail on hand, closer attention should be given to the material classed as scrap. It often happens that many rails are turned over to the scrap heap, which only require the battered ends to be sawed off to make them suitable for relaying purposes.

L. C. FONTAINE,
Office of General Superintendent, Grand Trunk Railway.

TRAINING SECTION LABORERS

HAILEYVILLE Okla.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The article on motion study in track work in the *Railway Age Gazette* of June 18, is worthy of further consideration by our railway managers. The training of section men is just as important as of any other class of employees and a great deal more so in many instances. If the section man is not taught how to handle his tools he will not be able to give a good day's work and he as well as his fellow laborers are liable to personal injury therefrom. If he does not know how to hold the spike and how to strike it with the maul he may mash his hand or injure another employee by a flying spike. Drilling for such efficiency among the section men as well as with other maintenance laborers is one that has not had the attention which it deserves.

But, on the other hand, would it be profitable? What incentive is there for the men to remain with a road when farmers or others offer them more money for a day's work. If the position could be made attractive and remunerative enough to cause the men to stay with the job we would say that it would be a profitable investment to put good men in the field to instruct them in the manner of handling their tools and doing their work.

It is not reasonable to suppose that a gang of men will turn out as much work and as good work where they have had no training as where they had been schooled along lines in connection with their every day work. A carpenter is taught during his apprenticeship just how to hold a tool and the position to place himself in when doing a certain kind of work with a certain kind of tool. If the foreman wants to take out a rail or put in one and has to take the time to place each man in a certain position to secure the full benefit of his power, how much time has been lost in so doing? The same applies to any other duty on the section.

J. L. COSS,
Dispatcher, C. R. & P.

Uses of the Locomotive Crane in Railway Service

This Machine is Solving Many Problems in the Engineering, Maintenance, Stores and Operating Departments

One of the first extensive uses of a locomotive crane by a railway was on the Erie about 1899, the machine handling coal with a grab bucket from cars to storage piles and from storage to cars for reshipment. From this beginning, its use has spread to practically all of the roads in the country, although the eastern lines were much quicker to adopt it and with the exception of some of the larger roads in the West, as the Chicago, Burlington & Quincy, the Illinois Central and the Southern Pacific, the largest numbers of these cranes in railway service are still in the East. The extent to which they are used at present is indicated by the fact that the Erie owns about 40 machines, the Illinois Central, 31, and the Southern Pacific, 34. A wide variety of

the boiler, engine, boom and all hoisting drums, clutches, brakes, etc., used in propelling the car, slewing the upper structure and operating the various lifting and control lines. The distinguishing features as compared with other types of cranes are the high power, speed of operation and the full circle swing.

Locomotive cranes are ordinarily mounted on standard gage trucks of either four or eight wheels, but for some classes of special service, gantry or portal mountings are provided in order to place the crane directly over the cars in which the material is being loaded or unloaded. While the four-wheel cars were very generally favored a few years ago, the tendency to use cranes frequently for switching cars and to haul them more often in high speed trains has led to the more general adoption of the eight-wheel type. The car body is generally made of steel, and a length of at least 24 ft. is favored to make the car ride easy in trains. The boiler end of the upper structure should not extend beyond the end of the car.

Some roads require a freight car air brake schedule on eight-wheel cranes and in some cases both locomotive and freight car schedules are provided. Steam brakes are more common, how-

A 15-Ton Locomotive Crane Showing Typical Arrangement of Boiler, Engine, Hoisting Drums, Operating Levers and Boom Attachment. The Mounting in This Case Is Special to Allow the Machine to Rotate Over Platforms Close to the Track

uses has been developed for the locomotive crane in addition to the original one of handling coal, one of its important advantages being that it is capable of such ready transformation from one service to another. Recent developments in the attachments for cranes have considerably widened the scope of the crane's usefulness so that ordinarily there is little difficulty in finding sufficient work to keep a locomotive crane busy continuously, the condition under which the greatest economy can naturally be secured.

CONSTRUCTION OF CRANE AND ATTACHMENTS

A locomotive crane is a self-contained machine operated by steam, electricity or an internal combustion engine, although in steam railway service it is almost universally equipped for steam. The car body carries a turntable rack on which are mounted

A 15-Ton Lehigh Valley Crane Mounted on an 8-Wheel Car Equipped with a Bent Boom and a 43-Inch Magnet

ever, and can be applied much cheaper than air. A crane used exclusively in yard work of course has little use for air brakes and if such a crane is hauled occasionally in fast trains it can be moved under the I. C. C. ruling, permitting 15 per cent of the cars in the train to be operated without air brakes. This rule requires, however, that cars not so equipped have brakes applied to the wheels which can be operated from the car. This provision can be met by the application of hand brakes to the four wheels of one truck. The crane may also be shipped as a "long commodity" requiring two cars, in which case if it is chained to a flat or gondola car on which the boom rests it can be handled without brakes.

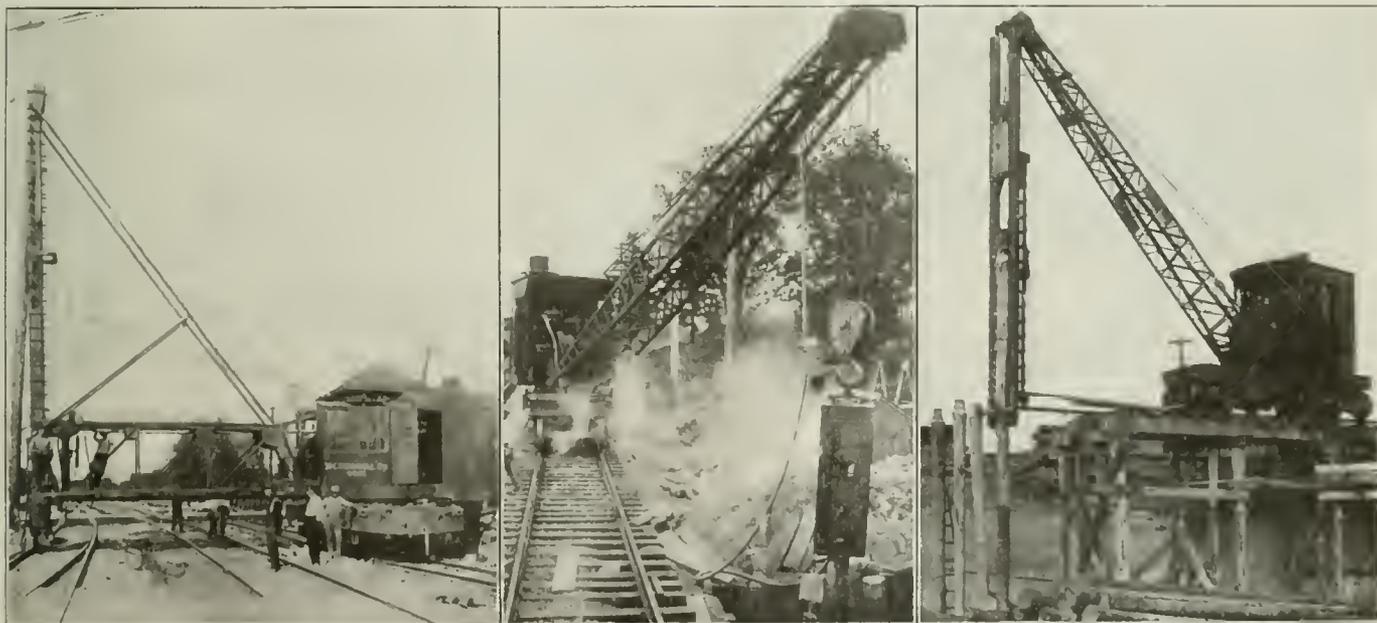

The standard sizes of locomotive cranes vary ordinarily from 3 to 60 tons. A definite rating, however, should include the radius of operation at which the crane will safely handle the specified load. The reason for this is evident since the same crane might handle 15 tons at 14 ft., 18 tons at 12 ft. and 20 tons at 10 ft., the radius of operation being the horizontal distance between the center of the hoisting hook and the crane center pin. The capacity of a crane is limited for operation at right angles to the track by the gage width. The use of jack beams or outriggers which are provided on some cranes increases the capacity greatly, being estimated in some cases as high as

100 per cent, but "hold down" devices for attaching to the rails are not ordinarily considered of great advantage. One of the manufacturers lists four-wheel cranes without jack beams in 5, 10, 15 and 20-ton sizes, eight-wheel cranes without jack beams in 15, 20, 25, 30, 40 and 60-ton sizes and eight-wheel cranes with jack beams in 20, 25, 30, 40 and 60-ton sizes, all of these ratings being figured for a 12-ft. radius. These cranes have a traveling speed of 4 to 8 miles per hour, can be turned at the rate of 3 to 6 revolutions per minute and have a hoisting capacity of 100 to 250 ft. per minute, with a single line, and 50 to 100 ft. per minute with a heavy load.

Locomotive cranes are ordinarily equipped with vertical boilers, although the horizontal locomotive type is sometimes used in heavy machines. It is desirable that they be of ample size to provide for continuous operation under severe conditions, and also in many cases to provide steam for turbine-generator sets supplying current to magnets or for operating steam hammers in driving piles. Typical sizes of the vertical boilers range between 42 in. and 62 in. in diameter. They are commonly lagged with asbestos or block magnesia and grates can be provided for burning either coal or oil. The manufacturers use various designs of engines, which are required to be high speed and quick

over the end of a high gondola car on the same track. The curved booms have a greater weight, however, and if head room permits, the straight booms are desirable. Special horizontal booms of the cantilever type have been provided in some instances equipped with a trolley for handling material across tracks where the overhead clearance prevents the use of a standard boom.

In handling material of various kinds a bottom block, bucket, or magnet may be used with the same boom. The use of a bottom block or line is ordinarily restricted to the handling of miscellaneous non-metallic material, some form of bucket being employed for bulk material and a magnet for practically any iron or steel product. There are several types of buckets in use, the most common being the clam shell. This is a simple substantial appliance adapted to handling bulk material, such as coal, sand and gravel, and with teeth can be used for light excavating. Scraper buckets are better adapted to handling heavy ore, stone, etc., and when equipped with teeth, for excavating clay, hardpan or other material. The orange peel bucket is essentially an excavator, being particularly adapted for sticky material or for dredging. Skips and tubs are commonly used for handling small amounts of excavated material or for handling

Methods of Driving Piles with a Locomotive Crane

Truss Attachment Supporting Leaders A Steam Hammer Suspended Without Leaders Leaders Supported from Upper End of Boom

acting. Reversible engines are favored, as they allow heavy loads to be lowered slowly. A typical design of double engine is supplied in sizes ranging from 7 in. by 10 in., to 12 in. by 12 in.

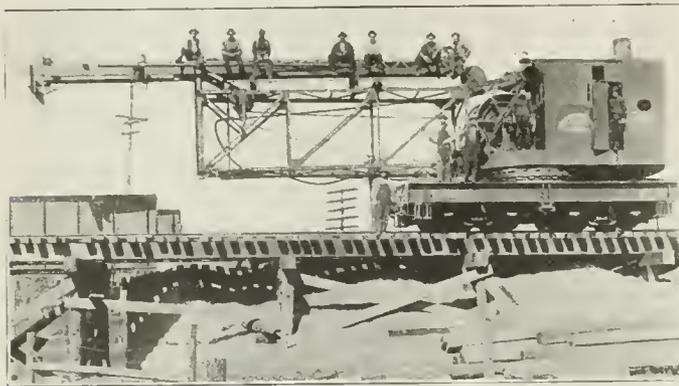

The boom, supported at the lower end on the turntable and at the upper end by lines from the hoisting drums, is ordinarily 25 to 60 ft. in length, although 75 ft. and 85 ft. booms are not uncommon on erecting cranes, and at least one manufacturer has built a boom as long as 115 ft. The shortest boom adapted to the work for which the crane is intended is preferable, since it insures faster speed and less strain on the machinery. The unusually long boom cannot handle the maximum load for which the crane is designed, and if both reach and maximum power are desired, the boom is built with a detachable section. One manufacturer has built a 75-ft. boom in three 25-ft. adjustable lengths in order to give a greater range of power and reach. In general, straight booms are preferable, although a slight curve at the top or a gooseneck extension is frequently used to increase the horizontal reach for high work, this being of particular advantage where it is desirable to handle material onto high piles. Booms curved at the bottom are also of advantage in reaching

concrete into forms. When equipped with a special boom a standard steam shovel bucket can also be used with a locomotive crane.

The lifting magnet was first utilized to any extent in the railway field about 1905. It is designed to be supported by a hook on a line from the end of the boom, allowing it to be attached or removed easily and quickly. The cable supplying the magnet with electric power may be attached to any convenient plug on an adjacent power line if little moving of the crane during the operation of the magnet is required. In many cases, however, a turbine-generator set is installed in the cab of the crane which supplies current both for the magnet and for lighting.

One of the attachments for use with the locomotive crane that has been developed more recently is a supporting truss for pile driver leads. These trusses are pin connected in the same manner as the boom and can readily be exchanged with the boom. Either a drop or steam hammer may be operated in the pendulum leads supported by these trusses and a machine so equipped has the advantage of greater reach and full circle swing as compared with standard pile driving machines. While this

arrangement is very satisfactory, especially where a considerable number of piles are to be driven, in some cases it is somewhat cheaper to attach the leads directly to the upper end of the boom and steady them by a strut to the turntable. This strut may be made telescoping in order to vary the distance of the leaders from the center of the crane, making this arrangement somewhat more flexible and easier to attach than the trusses. The objection to its use, however, is that it cannot be operated where restricted clearances exist as can the truss attachment with which the leaders are arranged to fold down on the truss within the necessary clearance. In some cases steel leaders have been suspended from the end of the boom by lines in order to secure an increased range of action. By this method, piles have been driven as much as 30 ft. below the track on which the crane stood with the boom at a radius of 30 ft. This method of course requires the use of a steam hammer. For

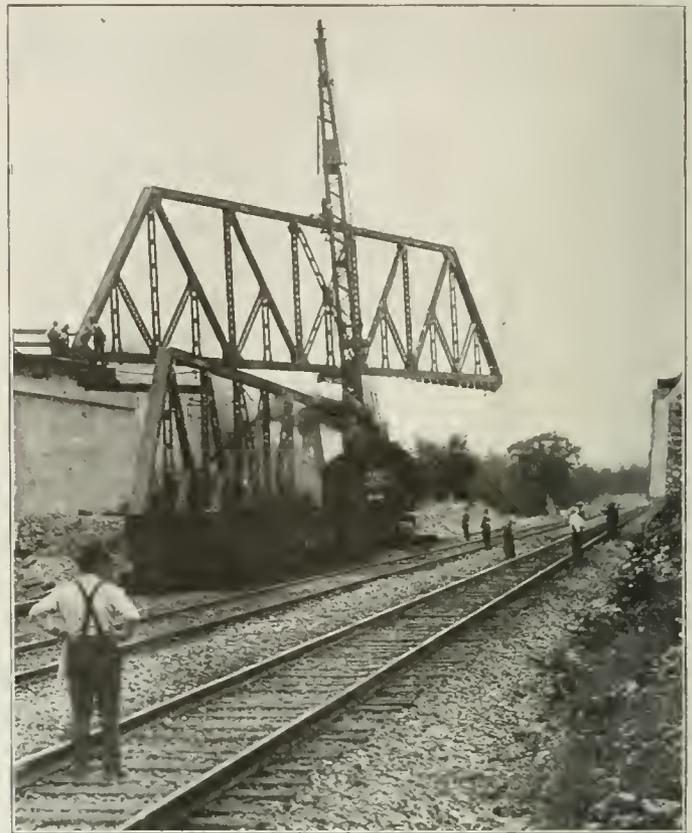

Two of the Uses to Which a Crane Is Being Put by the E. J. & E. At the Top Equipped with Supporting Truss for Pile Driving and at the Bottom, Lifting a Load of I-Beams with Outriggers in Place

simple work a steam hammer can be suspended from the boom without leaders, in which case it may or may not be necessary to brace the piles during driving.

Experience has shown that a reasonably good operator can average one trip a minute with a locomotive crane handling a bucket or magnet. In some cases this average can be raised as high as five trips per minute. The daily cost of operating an eight-wheel machine varies from \$8 to \$9 per 10 hours, including depreciation, 6 per cent interest on the investment and all operating costs. This estimate is figured on 300 working days per year. The cranes are ordinarily operated by one man who also fires the boiler, the number of men on the ground depending of course on the class of work handled. Investigation on the Illinois Central indicates that the average cost of maintenance is about \$600 per crane per year.

SERVICE SECURED FROM CRANES

In general the various standard sizes of cranes can all be used for any work, but in some classes of service there is a preference for certain sizes. One manufacturer finds, for example, that the principal use of the 60-ton crane is for erection

A 60-Ton Erection Crane with a 75-ft. Boom Handling a 132-ft. Highway Truss Weighing 28 Tons

work, a special long boom being provided for that purpose. The 40, 30 and 25-ton machines are also used for erection work as well as with buckets and magnets where large amounts of material are to be handled. The 20 to 40-ton sizes are usually

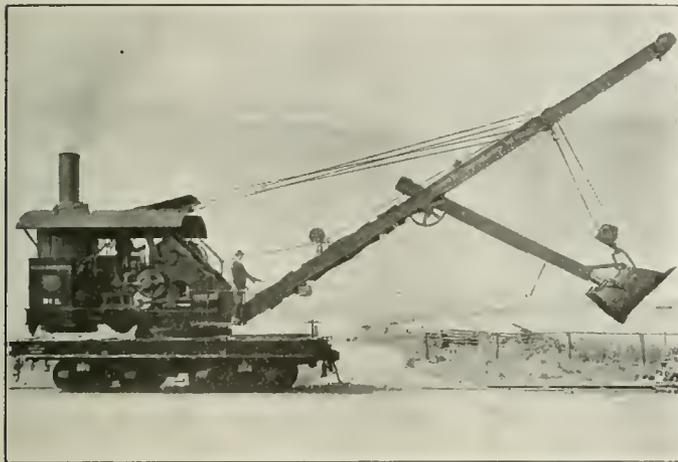

N. Y. C. & St. L. Crane on Cleveland Track Elevation Work Handling Excavated Material in a Skip

preferred for pile driving and drag line scraper work as a crane of good capacity is required in the first case to hold the weight of the leaders, pile and hammer at the full radius of driving and in the second to withstand the severe strain. The sizes under

20 tons are used for miscellaneous lifting and handling of material where the quantity is not so great. When equipped with a bucket they are well adapted to handle coal, ore, ashes and gravel, with a magnet they move scrap, rails, etc., and with chains and hooks they load or pile ties and timber and handle light construction work. With a steam shovel arm they can be readily used for excavating.

While locomotive cranes are made with standard gage, narrow gage, wide gage and portal mountings, the following discussion of their uses has been limited almost exclusively to standard gage machines, since the special types are limited to certain uses, such as the handling of coal and ore on docks, the han-

A 25-Ton Crane with Special Boom in Use as a Steam Shovel

dling of miscellaneous freight in yards and on piers, and in connection with heavy drag line construction work.

Standard gage cranes on many lines are finding an increased number of applications in construction and bridge work. They are frequently used for the erection of small steel bridges and buildings with resultant economy. In many cases the use of a crane allows a small truss to be riveted up on the ground and set in place at one operation, eliminating the use of falsework, decreasing the time required for the work, and possibly as in the case of track elevation work, greatly reducing or eliminating the interference to traffic. The New York, Chicago & St. Louis has used a number of cranes in its grade separation work at Cleveland, particularly for driving falsework trestles over streets. It is estimated that the cranes have handled this work in one-fourth the time that would have been required for a standard driver, because the crane is lighter and can move more quickly. In addition, it could also be used in placing the caps and stringers, in removing excavation from the street in skips and in placing concrete in the abutments and piers. The Nashville, Chattanooga & St. Louis has used suspended steel leads and a steam hammer, driving about 3,000 piles on one job in this manner. In this case a decided advantage was secured by passing the supporting lines between the ties of an old structure, allowing the driving to be carried on directly under the old track. The Chicago & Western Indiana has found that with its locomotive crane equipped with a truss attachment and leaders, 145 to 150 piles can be driven in 10 hours in a construction trestle, and equally satisfactory results have been secured for permanent work. A steam hammer used in pile driving may be supplied with steam direct from the crane or from an outside source.

A typical instance of the service of a crane in handling earthwork is furnished by a western lumber company which used one of these machines in the construction of a logging road, first for pulling the stumps and clearing the right of way, and then with a steam shovel attachment for making a 13-ft cut through earth, rock and roots, at a cost of about one-fourth that by previous methods. Seven cranes were used in handling the material removed from the excavation for the Grand Central

Terminal, New York City. In this case the solid rock was broken up by blasting into large blocks which in many cases were too large to have been handled in a steam shovel dipper, but were loaded on cars very satisfactorily by the crane. These machines were in service at this place for 8 or 9 years handling an average of 500 tons of rock daily. The Stone & Webster Corporation has used locomotive cranes for pulling 12-in., 35-lb. steel sheet piling after it had been started with a breast derrick using two five-sheave blocks.

In the construction of the approach fill to the hump in the Clearing yard of the Chicago & Western Indiana near Chicago, a sand fill was made by dumping and spreading the material from a construction track which was then pulled up on the new dump by a crane. In this service it was found that a crane with an engineer, a foreman and three men could throw more track in a day than a gang of 50 men in the ordinary way. The track could be thrown either away from or toward the track on which the crane was operating by attaching the line at the top or the bottom of the boom, respectively. The Bessemer & Lake Erie has handled slag from cars to a fill by a clam shell bucket operated by a 35-ton crane with a 50-ft. boom.

In one gravel pit where the operated face extends 15 ft. be-

A 35-Ton Crane with a 70-ft. Boom Equipped with a 1 1/2 Yd. Drag Scraper Bucket

low the water in a pond and 35 ft. above it, a 10 ton crane has loaded an average of 10 cars per day, including switching and running 1/4 mile to set out each two cars loaded. The best record is 20 cars per day, only three men being required at the pit for loading. At another pit, a crane with a 35 ft boom and 1 1/4-yd clam shell bucket handled 11,750 yd of gravel in one month at a cost of 2-4 cents per yd, also eliminating a switch engine.

The handling of coal by a locomotive crane is very extensively practiced both for filling locomotive tenders direct from cars or from storage and for unloading coal into storage piles and re-loading it into cars. Incidentally, the cranes employed at coal-
ing stations ordinarily handle ashes from the ash pits into cars,

unload sand for drying and handle miscellaneous material. A typical instance of cranes used in this service is furnished by the Central New England which operates several of these machines. The first one purchased has handled an average of 200 tons of coal per day to locomotives, loaded two earloads of cinders, and in addition averaged unloading about six earloads of sand per month and handling about one ton of rough, heavy material daily without approaching the capacity of the machine. In this case the cost of handling coal is about \$0.02 per ton, the machine using about 1/3 ton of fuel per day. In one instance a St. Louis

kind have been equipped with cranes mounted on a gantry frame under which the coal cars pass, saving considerable space in the layout. At these stations the bulk of the coal is stored on the ground adjacent to the bins, the latter holding a supply for one or two days at the smaller station. In this way one operator can handle two stations if they are not located too far apart, effecting a saving in the operating cost. A committee report of the International Railway Fuel Association recommends the locomotive crane very highly for temporary or emergency coaling plants, and particularly for small stations, but does not consider it a competitor with the modern coaling plant for large and important points. In this committee report one road

A 25-Ton Crane in the Clearing Yard of the Chicago & Western Indiana Throwing Construction Track on New Sand Fill

& San Francisco crane handling 5,000 to 8,000 tons of coal per month to locomotive tenders in addition to stationary engine coal and ashes, required new flues in its boiler. Rather than take the crane out of service, a steam pipe was coupled into the engine from a switching locomotive and the crane was operated continuously while repairs were being made.

For the conditions existing at many coaling stations the cheap-

Handling 3,175 Lb. of No. 2 Wrought Iron Scrap by Hand and with a Magnet

is quoted as stating the cost of handling an average of 247 tons per day during the month of July as \$0.0484 per ton and 356 tons per day in December as \$0.0343 per ton.

On the Illinois Central during 1914, 21 cranes were engaged in handling coal for locomotives and in loading cinders. In the year, 706,604 tons, or an average of 33,648 tons of coal per crane were handled, and the unit cost of labor and supplies for this service amounted to \$0.085 per ton. A much better showing would have been made except for the fact that some of the cranes were out

Two Methods of Coaling Locomotives with Cranes. At the Left, Direct from Cars to Tender. At the Right, Filling Small Storage Bins

est and most flexible arrangement is to handle the coal direct from cars or small storage piles into the tenders. A crane with a 1 1/2-yd. clam shell bucket should be able to load 10 tons into a tender in 7 to 10 min. The advocates of locomotive cranes for this service maintain that there is less breakage when the coal is handled by a crane than when it is chuted from a coaling station of the ordinary type, as it is handled less and does not fall as far. To insure against delays, some roads use cranes to load coal into small bins from which it is spouted directly into the tenders. On the Boston & Maine several stations of this

of service at times for repairs, and the above price includes the cost of handling coal by hand during such times.

The Central of Georgia in unloading coal from cars to ground storage piles and then handling it either to locomotive tenders or to cars for reshipment, has found the total cost of handling to be about \$0.045 per ton. In a paper presented before the International Railway Fuel Association in May, 1914, C. G. Hall of the C. & E. I., stated the cost of storing and reclaiming coal by locomotive cranes as \$0.10 a ton, including the cost of track, interest on the cost of the crane and all operating expenses. In

unloading coal from cars one man should be provided for cleaning up the corners, guiding the bucket, etc., for every 40 to 50 tons of coal per hour handled. Most good buckets will handle more than their rated capacity in slack coal, but few if any can handle the rated capacity in large mine run with little slack or in lump coal. Allowing for the cleaning up, full capacity can be assumed in slack coal and 70 per cent in mine run and large lump. With a 1½-yd. bucket, a reasonably good operator should be able to unload and clean up from 50 to 75 tons per hour, and when handling coal from a stock pile this figure may be increased to as high as 100 tons per hour since less time is required to spot the bucket and a better load is secured.

The cost of handling new and scrap material has been considerably reduced on many roads by the use of locomotive cranes. Probably the most extensive experience in this line is in the handling of scrap. One crane with a magnet on the Chicago & North Western has handled 41 tons of old locomotive grates in 40 min., 56 tons of old track spikes in 33 min., and 44 tons of miscellaneous scrap in 35 min. At one of the Chicago, Rock Island & Pacific scrap docks, a locomotive crane and magnet has handled this material for less than \$0.02 a ton as compared with the former price of \$0.25 to \$0.35 by hand. The Atchison, Topeka & Santa Fe uses four locomotive cranes in its Corwith yard, three being equipped with magnets and one with a clam-shell bucket. The cost for handling scrap with these cranes is \$0.05 a ton. At one scrap yard on the Pennsylvania a crane is handling 400 tons of scrap per day. The cost of this work on the Buffalo, Rochester & Pittsburgh in one specific instance was as follows:

Kind of scrap—	Crane cost	Hand cost
No. 1 wrought iron	\$0.04	\$0.22
Busheling, No. 2 wrought iron, and malleable.	0.02	0.10
Cast iron and mixed steel	0.02	0.09
Sheet steel	0.20	0.30

On the Elgin, Joliet & Eastern a crane and magnet is used to unload from cars, the old rails and other maintenance scrap picked up along the line, the labor cost being 90 per cent less than for doing the same work by hand. The machine is able to pick up as high as 10 to 12 rails. In this connection the need for a locomotive crane in a work train to pick up scrap along the line has been felt on some of the heavy tonnage roads. Where traffic is very dense it is difficult for the section forces to bring in heavy scrap to their tool houses, and in addition this work involves serious danger to the men. If the scrap is collected and put in small piles along the track a crane with a magnet operated over the line in a work train can pick it up rapidly.

At the Burnside shops of the Illinois Central a 15-ton crane is used to handle scrap, including boilers, bridge steel, rails, locomotive cylinders, etc. A small direct connected steam generator furnishes current for an electro-magnet. This crane is considered to do the work of 18 laborers.

Under some conditions, ties and timber can be very advantageously handled by a crane. The Buffalo, Rochester & Pittsburgh has developed a special tie handling device for use with a crane which reduced the cost of handling ties at its treating plant 40 per cent below the piece-work rates. At one commercial treating plant where 300,000 ties are handled each year and each tie requires four handlings two cranes are used which only work about eight months of the year and are idle at least one-third of that time. A lumber company on the Pacific coast handles an average of 100,000 ft. of lumber daily with a 10-ton crane, loading lighters with 250,000 ft. in less than eight hours with only three men. An incidental advantage of the crane for handling lumber and similar material is that storage piles can be carried much higher, thereby increasing the value of storage space. One company for example, piles ties 24 ft. high with a crane, and another stacks pig iron 18 ft. high. Other miscellaneous uses of cranes include the handling of car wheels at shops and the unloading of bad order cars and the handling of miscellaneous freight in yards and on piers.

A TUNNEL DESTROYED BY FIRE ON THE SOUTHERN PACIFIC

On May 14, a fire in tunnel No. 15 on the Southern Pacific near Tehachapi, Cal., resulted in several rock falls closing the tunnel and interrupting traffic until June 9, when a shoo-fly line was completed around the shoulder of the mountain through which the tunnel passed. This involved the construction of 1,200 ft. of track, 450 ft. of high trestle and a 36,000 cu. yd. cut. The construction was carried on entirely by the railroad company's forces and is an example of efficient and rapid construction under stress of an emergency.

The tunnel passes through a buttress of the mountain con-

Drillers at Work in Advance of the Shovels. Trestle Started

sisting largely of shattered granite and having a maximum height of 130 ft. over the tracks at the middle point. It is 360 ft. long, and was timbered throughout with red wood arches of the segmental type. The cause of the fire is not definitely known. A gang of men were working in the tunnel at the time but had gone outside to allow a train to pass up the 2 per cent grade and upon re-entering at 10:30 a. m., within 10 minutes after the train had passed, the fire was discovered at a place in the lagging of the tunnel near the springing line where the tun-

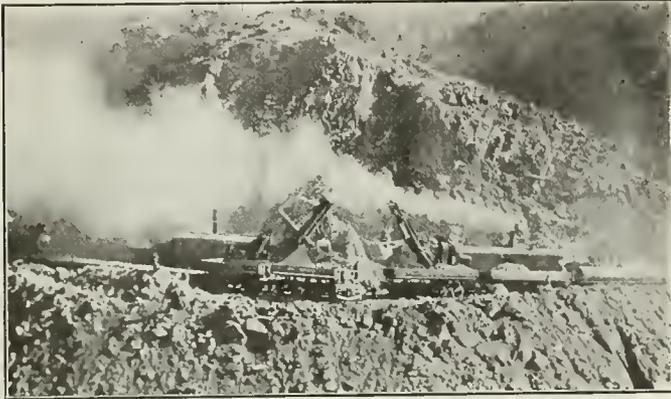

The Trestle Nearing Completion

nel had been opened by the workmen for the purpose of enlarging the section for future concreting. This work had opened up an old backfilling of timbers and lagging that had been packed in a small cave evidently developed during the construction of the tunnel. Every effort was made to quench the fire, but owing to an excessive draft caused by a very heavy wind and inability to reach the seat of the fire back of the lagging, it was reported beyond control at 12:05 p. m. As soon as the timber burned out in the central portion of the tunnel a fall took place, evidenced by a depression of the surface of the ground above the tunnel

Shortly thereafter both portals burned out, causing slides which effectively shut off the bore at each end and smothered the fire.

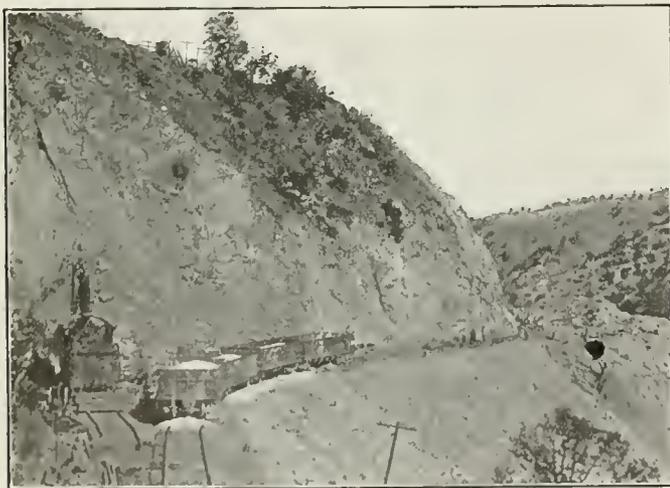

Steam shovels were sent to each end of the tunnel to open up the portals, and disclosed the fact that 100 ft. of the center of the tunnel was completely filled in. On the north end about 166 ft. of the timber was still intact, though badly charred, while at the south end 94 ft. of the tunnel had not caved in, although the lining had been completely burned out. In order to prevent further fire the timbering at the north end was thoroughly drenched, water being thrown as far back into the lining as

Shovels Meeting in the Cut

possible, but this proved ineffective and the fire soon started again. The south end showed further evidence of caving, which made it necessary to withdraw the men from the interior and subsequently further cave-ins took place, closing the entrance for a second time.

Because so large a part of the tunnel had caved in and in view of the fact that the fire could not be controlled, it was evident that the tunnel could not be opened for traffic in less than six weeks. Furthermore, there was no assurance that the fire would not break out again in the old lagged-up cave in which would burn out any new timber that would be put in

Shoo-Fly Completed and the Shovel Standing on the Old Line at the Mouth of Caved Tunnel

during the rush reconstruction. On the other hand it was estimated that a shoo-fly could be constructed around the shoulder of the mountain at a cost of \$40,000 which could be completed within three weeks. Owing to the importance of this line the shoo-fly construction was decided upon.

The actual construction was started at 12 o'clock noon, May 19, on a 450 ft. trestle 90 ft. high at its highest point crossing a canyon and a side hill excavation 64 ft. deep at the center line

and 105 ft. on the uphill slope. Ordinarily a through-cut would have been made at this point, but it was considered possible to handle the material quicker on a bench or "daylight" cut and this type was therefore decided upon. About 125 drillers and powder men were continually employed working day and night shifts. Two 5-cu. yd. Bucyrus steam shovels were used. One started at the south end and worked as rapidly as drillers could get the mountain shot up ahead of them. The steam shovel on the north end could not be used until work on the trestle was finished.

Of the 450 ft. of trestle, 225 ft. was driven with 6-pile construction because it was on a sharp curve and on a side hill embankment. The remaining 225 ft. was frame trestle four stories in height. In all 200,000 ft. B.M. of lumber was used. It was completed in 9 days and 9 hours from the time the material was ordered by telegraph from Oakland, 350 miles from the seat of operations. Eight gangs of carpenters of from 20 to 25 men each were used on the work in two 12-hour shifts.

The completion of the trestle made it possible to bring the second steam shovel in to the south end on Saturday, May 29, and by working with all possible haste with day and night shifts, traffic was restored at 2:10 a. m. June 9, completing the shoo-fly in 19½ days instead of 21 days, as originally estimated. The alignment involves 15 deg. curves with 90-ft. spirals. The track is of 90-lb. rail with full length guard rails, giving a 3-in. flange-way with 4 to 6 tie bars for each 33-ft. rail on the curves to prevent spreading.

Remarkably good time was made when it is considered that steam shovels had to be brought a distance of 400 miles, gangs of carpenters and other laborers organized, compressors installed to run the air drills, power requisitioned and delivered and the trestle material hauled long distances. In order to forestall delays due to possible breakdowns, extra steam shovels and pile drivers were kept ready on the job and all available extra parts for the repair of this equipment were brought to the scene.

We are indebted to W. R. Scott, vice-president and general manager of the Southern Pacific for the details of this performance.

DECREASE IN PRODUCTION AND SHIPMENTS OF PORTLAND CEMENT, 1914

The total production of Portland cement in the United States in 1914, according to the United States Geological Survey, was 88,230,170 barrels, valued at \$81,789,368; the production for 1913 was 92,097,131 barrels, valued at \$92,557,617. The output for 1914 represents a decrease in quantity of 3,866,961 barrels and a decrease in value of \$10,768,249. The value assigned to the production is computed on the basis of 92.7 cents a barrel, the average value of the Portland cement shipped in 1914.

The shipments of Portland cement from the mills in the United States in 1914 amounted to 86,437,956 barrels, valued at \$80,118,475, compared with 88,689,377 barrels, valued at \$89,106,975, shipped in 1913. This represents a decrease in quantity of 2,251,421 barrels, and in value of \$8,988,500. The average factory price per barrel in bulk for the whole country in 1914 was 92.7 cents, compared with \$1.005 in 1913, a decrease of 7.8 cents a barrel.

Among the states, Pennsylvania and Indiana held first and second places respectively in quantities of cement produced, but both suffered an appreciable reduction of output. The greatest decrease in production was in the Pacific coast district and equaled 16.54 per cent, while the greatest reduction in shipment, 12.9 per cent was in the Tennessee, Alabama, Georgia districts. A notable change was the increase in storage. The stock for the entire country at the end of 1914 was 12,893,863 bbl. as against 11,220,328 bbl. for 1913, an increase of 14.92 per cent. The greatest proportional increase in storage was in New York state, 74.66 per cent.

The Economical Operation of a Gravel Ballast Pit

Some of the Provisions Which Must Be Made to Secure the Largest Output at the Lowest Unit Cost

At this season of the year when ballasting work is at its height, the operation of ballast pits is of general interest. Probably the most generally used material for ballast in this country is gravel. We give below two discussions of measures necessary in the operation of gravel pits to secure the lowest unit cost of the ballast loaded on cars.

GOOD TRACK CONDITIONS ESSENTIAL FOR THE ECONOMICAL OPERATION OF A GRAVEL PIT

BY E. KEOUGH

Assistant Engineer, Maintenance of Way, Canadian Pacific, Montreal

It is often the practice in building gravel pit tracks to use the lightest pattern rail for the tracks in the pit. The idea being that these tracks are sidings and subject to the same conditions as are most tracks which are used a few times a day. No greater saving can be made than to see that a heavy pattern rail is used in practically every track in the pit, and if possible, there should be but one pattern used in order to permit repairs to be made promptly. By the more general use of this heavier rail a reduction may be made in the maintenance cost, which is necessarily too high where the lighter rail is used.

With good rail more cars can be handled and they can be moved at a higher rate of speed than if an engineer moves according to the condition of the track. It is too often found that trainmen will take a chance on the lighter tracks with the hope of hauling one or two more cars up a heavy grade in a pit by increasing their speed and the result is a bad delay due to spread track or a broken rail.

Where a pit has a heavy grade leaving for the main line this running track should be made especially good. All curves should be tie plated and if wet gravel is being loaded every third tie on straight track should be plated to insure against the rail spreading. Where the running tracks has curves above two degrees care should be used to see that all curve-worn narrow-ball rails are placed on the inside of the curve to reduce the friction wear. Where derailments occur on sharp curves, it is frequently advisable to close the engine sander on the inside of the curve to decrease the friction as much as possible and to allow the trucks to change their direction readily in moving around it.

By making use of this heavier pattern rail it is possible to lay the loading track by full spiking only every third or fourth tie. It will be found that this track can be moved easily when it is time to throw it to its new position. Since in lining track it is found that it is the ties which bother the most and since movement over this loading track in many places is necessarily slow time can be saved by this construction. Since the friction between the base of the rail and the tie is the greatest holding force there is no danger of the rail spreading as the sand and gravel always provide plenty of friction.

Where there is a good face for the shovel, care should be taken to see that no time is lost in changing trains and it is generally found that two engines can work to better advantage if each engine handles its own cars from the shovel to the storage track, instead of using one engine for spotting and another for hauling.

Where the bank is shallow and much time is consumed in moving the shovel ahead it may be found that a smaller engine can be used to spot the cars by dropping the loads and making its moves at the same time the shovel is ready to move up, or even by leaving one car spotted for the last three or four dippers. It then has the time it takes the shovel crew to load these three or four dippers, and to move up and load

three or four more to do most or all of its switching without delay to the shovel.

The man in charge of a gravel pit should remember above everything else that to get the maximum output from a shovel he must arrange his layout so that the actual delays to the shovel are practically eliminated and to do this track facilities and conditions must be as good as, if not better than in a first class yard since road engines are generally used and are harder to keep on the track than switch engines. In fact all conditions must be such that the only delays obtained are those necessitated by the shovel movements.

To reduce the number of derailments of empty cars, and of trailer or tank wheels to the minimum, all curves should be maintained without superelevation. While this same rule applies to yard tracks or to slow speed curves it is especially important on temporary tracks which are apt to be given a minimum amount of attention. Unless superelevation is properly maintained, derailments will follow because of the irregular surface over which unevenly loaded, swaying cars are hauled.

THE EFFICIENT OPERATION OF A GRAVEL PIT AT SOUTH BELOIT, ILL.

BY G. R. MORRISON

Division Superintendent, Chicago, Milwaukee & St. Paul, Savanna, Ill.

The Beloit gravel pit of the Chicago, Milwaukee & St. Paul is supplying ballast for a large part of the lines of that road, long hauls being justified by the high quality of the gravel and the economical operation of the pit, due to efficient methods which the layout of the pit has made possible. The pit is located at South Beloit, Ill., directly adjacent to the Wisconsin state line and one-half mile south of the main line of the Racine & Southwestern division. It occupies a little more than 50 acres of land and is covered by an average of 3 ft. of sandy clay. As this material can be handled in wet or dry weather, the price per yard for stripping is much below the average.

In order to open the pit the first track was laid in an excavated incline on a 4 per cent grade. When this had reached a point 8 ft. below the ground surface, a steam shovel was put in to dig a trench 20 ft. wide and 8 ft. deep, the full length of the pit, 3,700 ft. A track was laid behind the steam shovel as it advanced so that when the latter had reached the end of the pit it was able to back out immediately and start another cut. Each successive cut of the shovel is made 8 ft. deeper than the preceding one until the pit now has an average face of 35 ft. throughout. The practice of building a track behind the shovel is followed each time. In consequence the shovel can start a new cut within 30 min. after it has finished the old one and the track in the cut just finished is ready for use at once as a loading track. As soon as the track is no longer used for loading it is taken up so that the material may be re-used behind the shovel.

The track layout of the pit includes a loading track and two storage tracks in the pit, a makeup track, an engine track and a repair track. Including the head room at the south end of the pit, the loading track is 4,500 ft. long. Adjacent thereto are two storage tracks each 3,500 ft. long in the pit proper. The makeup, engine and repair tracks are located at the north end near the entrance to the main line. The track on which the trains are made up is 1,650 ft. long. The pit is laid with 75- and 85-lb. rail, using No. 10 turnouts. The tracks are maintained at a high standard, a policy which has been justified by the fact that there have been no accidents of any nature during the entire season of last year and so far this year

For water service an elevated tank has been located where the engines can take water on arriving or departing from the pit. A water tank tub has also been located in the pit to supply water to the shovel. By supplying the steam shovel with an additional tank it is only necessary to take water from the tub at the noon hour so that there is no delay due to taking water or coal for the steam shovel in the 24-hour period. The supply of water in the tanks is maintained entirely by a day pumper.

A 2½ yd. Bucyrus shovel is used, operating day and night. Each shift consists of a steam shovel engineer, a craneman, a fireman, and six laborers. In addition there are three men who assist the car men, looking after car aprons, and closing side and drop bottom doors. The pit gang consists of 40 laborers laying and repairing track, one car foreman, two car laborers days, two car laborers nights, and a pumper. Each shift is under the direction of a conductor who acts as pit foreman. This conductor is assisted by two brakemen who do the spotting and switching. The conductor is given absolute charge of all trains and road crews, while the same brakemen are kept in service as spotters for the entire season. Two large spotting engines are used, one for the day shift and one for the night shift. The pit is laid out in such a way that a spotting engine readily handles full trains of 30 cars at a time.

In the regular operation of the pit the road engines back into the pit with the empty trains, leaving the cars on the storage tracks from which they are taken, 30 cars at a time by the spotting engine for loading. After the cars are loaded they are pulled out of the loading track and pushed onto the makeup track. The road engine assigned to the next trip then backs them out onto the main line. The engine track is so arranged relative to the makeup track that the engines first in are always first out. The roundhouse force looks after the engines while they stand on the engine track.

During the season of 1914, 500,000 cu. yd. of gravel was taken from the pit and it is expected that the output will be increased to 700,000 cu. yd. during the present season. This estimate is based on the fact that an average of 176 cars have been loaded per day since April 1. The road engines used in this service handle 2,000 tons on the division in both directions over 1 per cent grades. The cars are of 100,000 lb. capacity, and there are 485 cars in the hauling service.

The output so far has been delivered to the new double track in Iowa. The road crews run from Beloit to Savanna over the Racine & Southwestern and Chicago & Council Bluffs (Ill.) divisions for delivery of the material to the Iowa division. Notwithstanding the necessary delay in switching empties and loads from the shovel and loaded trains backing out onto the main line and empty trains backing into the pit, during the working hours the loading average is 12 cars per hour. In all 15,000 cars have been handled this season without overtime.

THE METHOD OF OPERATION OF THE BUFORD, WYO., BALLAST PIT OF THE UNION PACIFIC

The ballast pit from which the Union Pacific secures its main supply of gravel is located at Buford, Wyo., 27 miles west of Cheyenne, on the Omaha-Ogden main line. It is at an elevation of about 7,850 ft. above sea level, and five miles east of the summit of the Black Hills range of mountains, which this road crosses at an elevation of about 8,000 ft. at Sherman, Wyo. The present ballast pit was opened in 1901. Prior to that time Sherman gravel was loaded from two pits, one located a short distance east, and the other west of Sherman station on the old line and only a few miles from the present pit. The main line in this vicinity was changed to a new location in 1900-1901, at which time the old pits were abandoned and the present pit opened up just south of the main line at Buford.

Sherman gravel is a disintegrated granite rock, occurring in very extensive beds over an area of many square miles in this vicinity. In color it varies from a light gray tinged with pink to a deep pink or red. The economically workable deposits are not so extensive on account of the occurrence of granite out-

croppings or ledges, which are detrimental to the successful operation of a ballast pit. In choosing a location for a pit it is very important that an area be selected where there are few or no granite ledges. These ledges occur in vertical planes, varying in width and in some cases are not apparent or visible on the surface. In locating the present pit investigation was made and test pits put down at intervals over the area desired for the pit, to determine so far as practicable the presence of granite ledges, and developments so far show that the company was very fortunate in deciding on this location.

In general, the present pit is about 1½ miles in length and has a working face of about 4,500 ft. The depth of the working face varies from 20 to 30 ft., the average being about 25 ft. So far in the present pit the ballast loaded has been from the first lift, although a second lift of about 25 ft. in depth was worked successfully for one or two seasons. There seems to be no limit to the depth of the gravel, but, in the vicinity of the present pit it is not practicable to work to a greater depth than reached by the second lift on account of water. There is a light deposit of soil over this gravel deposit varying in depth from 3 to 10 in., but no stripping is necessary, as the amount of soil is not noticeable or injurious.

Following is an outline of the organization employed at this pit for an operating season which usually begins in April or May and ends in September or October, depending on weather conditions, traffic and the total amount of ballast desired for the season:

- 1 Ballast pit foreman,
- 1 Assistant foreman—in charge of track work.
- 1 Powderman—in charge of drilling and blasting
- 1 Blacksmith.
- 1 Timekeeper.
- 3 Machine drill runners.
- 3 Machine drill helpers.
- 1 Steam shovel engineer.
- 1 Steam shovel craneman.
- 1 Steam shovel fireman.
- 6 Steam shovel pitmen.
- 20 Laborers—handling pit trackage.
- 2 Car repair men.
- 4 Car bucklers.
- 1 Work train crew (consisting of conductor, engineer, fireman and two brakemen).

All of the above employees are under the immediate supervision of the ballast pit foreman who is held responsible for the operation and output of the pit, and who is under the general supervision of the division maintenance of way officers.

Before the gravel can be loaded in cars it is necessary to drill and blast it. Holes are drilled to an average depth of 26 ft., three Ingersoll-Rand machine drills being used for this purpose and supplied with steam from a portable boiler moved to convenient locations as the drilling progresses along the working face of the pit. The holes are generally spaced about 20 ft. apart in the direction of the pit and about the same distance back from the edge of the pit bank. Ordinarily, heavy blasting is not required, as it is only necessary to shake or lift the mass slightly, which results in its breaking up in angular pieces in sizes varying from fine material to 1½ in. in size, the average being about ¾ in. in its greatest dimension. Records indicate that it requires about 400 lb. of FFF black blasting powder and 50 lb. of 40 per cent dynamite to break up or loosen 1,000 cu. yd. of gravel.

After blasting the gravel is ready for loading in ballast cars for which purpose a 95-ton Bucyrus steam shovel with a 5-yd. dipper is used, the cars being spotted for loading at the shovel by the work train locomotive and crew. From 20 to 25 empty cars are taken at a time, the engine holding to all of them until they are loaded and placed in the loaded storage yard. This shovel has loaded as high as 140 cars, approximately 4,900 cu. yd. in a 10-hr. working day. The average daily loading for a season is about 100 cars. Sufficient trackage is provided in the pit for the storage and handling of about 300 empty ballast cars and 150 loads besides the necessary working trackage in the vicinity of the shovel and along the pit face. This latter trackage is rearranged as the operation of the pit requires, and is taken care of by the assistant foreman and 20 track laborers. Two tracks are laid the entire length of working face, one of which

is used as a loading track, while the other is being laid immediately behind the shovel as it moves through the pit.

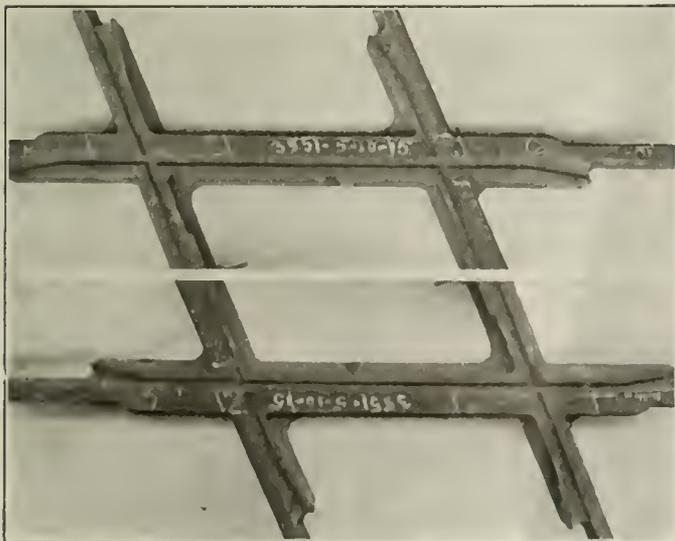

The ballast is billed to destination by the regular agent at Buford in accordance with instructions received from the division engineer's office, and is hauled from the pit in ballast trains and regular revenue freight trains, depending on whether extensive ballasting is being done the ballast is handled in full trains to the point where it is to be used, and is there distributed by assigned work trains, the empties being returned promptly to the pit.

All cars are inspected at the pit by the car men, the necessary minor repairs are made, worn brake shoes are replaced, the air equipment is inspected, dump chains are repaired or replaced and the cars are put in good shape for loading. Whatever heavy repairs are necessary are made at some terminal through which the cars pass on their way back to the pit. Detailed daily reports of the pit operation are made and all concerned are furnished a copy.

Since the opening of the pit in its present location in 1901 about 5,000,000 cu. yd. of gravel have been removed and used on the main lines from Omaha to Creston, the top of the Continental divide, a distance of 720 miles, of which 675 miles is double track; and on the line from Denver to Cheyenne, the Julesburg cut-off and other portions of the main lines in Colorado and Kansas. In all approximately 7,500,000 cu. yd. of Sherman gravel has been excavated and used on the Union Pacific for ballast. In addition several thousand cubic yards have been used by towns and cities in this vicinity for paving streets.

REPAIRING MANGANESE CROSSING FROGS BY ELECTRIC WELDING

The use of manganese steel for frogs, crossings and other special track work has reduced the cost of maintenance and renewals materially, but under heavy traffic local wear eventually takes place, particularly at the points, reducing the efficiency long before any appreciable wear has taken place elsewhere. In an effort to increase the life of manganese crossing frogs an experiment was made recently by the Chicago Great Western at its Oelwein shops

A Solid Manganese Crossing Repaired by Electric Welding

in building up the worn points of a frog by the electric welding process. The result is shown in the accompanying photograph, in which the frog appears to be as good as new. The total cost of the repairs was \$49.27, or approximately, 10 per cent of the cost of a new crossing, while with accumulated experience, the work will probably be done for considerably less. The crossing has not been in use a sufficient time since being repaired to de-

termine the wearing qualities of the welded metal, but even if it should not prove equal to that in a new frog, the saving over a complete renewal would still be considerable.

A SOUTH AFRICAN RECORD IN RAILWAY CONSTRUCTION

The railway from Prieska to Upington—a distance of 142 miles—which was authorized by the Union of South Africa Parliament last September, was completed on November 18. In view of the circumstances under which the work was conducted, it will probably equal anything that has been accomplished elsewhere in rapid railway construction at a comparatively small expenditure. The line was built by the railway administration. It is laid with second-hand 60-lb. rails and wooden ties (1,760 to the mile), and the maximum grade, compensated for curvature, is 1.5 per cent. There is one fully equipped station on the line, at Draghoender, and also 12 sidings. The estimated cost was \$11,000 per mile, and it is hoped to come out within the estimate.

The speedy construction of a railway line from Prieska to Upington was considered necessary to facilitate the movement of troops towards the German southwest border and to admit of assistance being rendered in the field with the greater promptitude which rail communication would afford. On August 15 the railway administration received the first intimation that the line had to be constructed and with great expedition. To minimize expense it was decided to utilize second-hand material. The collection of approximately 155 miles of permanent-way material for a work which had not been foreseen or provided for was a large order. Material had to be collected; sidings which had fallen into disuse were repaired, and arrangements made to relay portions of the main lines in need of strengthening, in order to release material for the Upington branch. The material was assembled at De Aar, where it was unloaded, sorted, and reloaded and despatched daily to the end of the track. In view of the many different types of material which were collected, all of which required different fastenings and accessories, the sorting alone was anything but a simple task.

The route of the line had not previously been surveyed, though an engineering inspection had been made by the late Cape government for a distance of 53 1/4 miles. Survey parties were at once formed, and as the survey proceeded the necessary plans were prepared. The survey was commenced on August 24, nine days after instructions were received from the government to construct the line, and the grading was started seven days later. Tracklaying began on September 9 and the terminus on the south bank of the Orange river at Upington was reached on the evening of November 18. This gives an average of two miles per day from the date of commencement of tracklaying, but if the time during which work was at a complete standstill owing to military operations and water difficulties be deducted, the average rate of progress was 2 1/4 miles per day. The maximum mileage completed in any one day was 3 1/4 miles. After the work was properly set going it was carried on day and night.

The disabilities under which the construction staff labored were numerous and formidable. Water between Prieska and Draghoender—53 miles—is scarce, and between Draghoender and Upington practically unobtainable, and such water as was most readily available was generally unsuitable for locomotive purposes. Water for the construction gangs had to be carted long distances, and the supplies for the engines had to be carried in water tanks attached to the trains. To add to the difficulties the water supplies on the De Aar-Prieska line, at De Aar, and at certain watering stations in the vicinity, suddenly and unexpectedly failed, and caused grave concern and some delay to construction material. Water tanks had to be collected in considerable numbers and additional tanks constructed, and water in large quantities had to be conveyed by rail from the Orange

river 70 miles north of De Aar. The position was serious and the water so bad that engine failures were of frequent occurrence. On one or two occasions there were as many as six and seven "dead" engines on the new line, due to failures through bad water. When it was decided to construct the line, the aid of the irrigation department was requisitioned, and great assistance was rendered by that department in putting down boreholes. The exceptional traffic naturally resulted in a much heavier drain on the available water than is ever likely to be experienced under normal conditions.

Shortly after construction work started heavy military traffic had to be handled on the new line, and the number of military and material trains which have been run over this line would have taxed any old-established single-track line to its utmost capacity. About 600 tons of permanent-way material had to be carried over the line daily, the total quantity of track material conveyed approximating 36,000 tons. A further source of difficulty, although not so acute, was the fact that heavy engines could not be utilized on account of the axle loads having to conform to the strength of the bridges on the adjoining section of the old line, and that only a limited number of engines of the class suitable for that line was available.

POINTS FOR SLIP SWITCH INSTALLATION

By W. F. RENCH

Supervisor, Pennsylvania Railroad, Perryville, Md.

As the various parts composing a slip switch are made to the exact dimensions prescribed by a standard plan, the utmost care is necessary in the installation of the parts to attain accuracy in every detail. The linear measurements, particularly for the longer slips, must always be made with a steel tape, and indeed for the nicest work the tape should be one that has been tested for its accuracy. It is not too great a refinement to adjust the measurements for temperature variations. Steel tapes are not infrequently as much as $\frac{1}{2}$ in. in error, and extremes of temperature may balance this error or introduce a further error which in a No. 20 slip nearly 200 ft. long might cause a total error of 4 in., which would of course be inadmissible.

All linear dimensions should be measured along the axis of the slip, a line connecting the theoretical points of the end frogs. It is very useful to sketch this axial line accurately upon the ties for the triple purpose of laying off the detailed linear dimensions, for spacing the switch ties and for lining the ends of the timbers, which for a double slip crossing will be symmetrical about this line. By multiplying twice the gage by the frog number the distance between theoretical points of the frogs measured along the main track will be obtained, and from this the desired points can be located by carefully squaring across the gage, the main track having been tested for correct alinement and the gage at the two frogs being made exact.

The middle point of the axial line should be marked to fix the middle point of the slip, from which all measurements in both directions will be made to locate the ties and the points of the slip switches. It should be noted that the middle point is the theoretical point of the two movable point frog rails.

The distances between centers of ties are given consecutively, but to attempt to lay off these by successive measurements would introduce cumulative error which at the ends of the slip might amount to several inches, which would be out of the question. The distances from the center of the slip to each tie should be calculated and the location made by continuous measurement along the line previously laid down for the axis of the slip.

As the ties vary in length only between the limits of 11 ft., which is the nominal length of the tie at the middle of the slip, and 13 ft., while the number of ties within these limits for each half varies from 17 for a No. 6 to 55 for a No. 20, the

increments will be nearly uniform and the ends on both sides will be practically in a straight line, and thus no difficulty whatever need be experienced in applying the necessary timber for any slip set. It should be noted that the last short tie has the same relative location with reference to the end frog in the slip that it has in a plain cross-over.

The importance of obtaining a correct alinement for the main tracks in the installation of any switch connection is well known, but the absolute necessity for this precaution in the placing of slip switch work cannot be too strongly stated. While a perfect alinement of the slip ladder is desirable and will follow if the installation is correct in all its details, the essential feature is to preserve the integrity of the main track alinement and the line, if tangent, should be established with the transit and be faithfully followed. To facilitate the attainment of the best possible detailed line the track should be brought to perfect grade and surface immediately upon the completion of the switch tie installation, and before any of the slip members are applied. If the slip is on a curve the method of ordinates should be used in lining first with a 100-ft. string to correct the general line, and then with a 50-ft. string to obtain a fine detail line. This will be a final determination, for, since the timbers having been placed in their exact permanent locations, no shifting or other work causing distortion will be necessary.

As mechanical work cannot in the nature of things be perfect, some detail adjustments may be necessary even after the most faithful adherence to the standard plan in the application of the material. This correction should not be attempted until a final surfacing has been given, as frequently defects that appear as line are really caused by imperfect surface.

But fine work in the installation is unavailing without the means of maintaining the adjustment of the slip members, and to this end heel blocks should be supplied through which the main and turnout rails are bolted together, anti-creeping straps should be applied to the heels of the slip switches and the movable points, anchoring them against movement in either direction, and all tracks leading to the slips should be plentifully equipped with rail anti-creepers.

A better method has been found for securing the adjustable rail braces to the bridle plates. The lag screws which formerly engaged the wooden tie were inclined to work loose. It is now the practice to engage these screws direct with the bridle plates where one inch greater thickness of metal is provided and the braces now remain tight. The seats should be neatly dapped into the ties to exclude moisture as far as possible.

A very distinct error in switch economics, and one which as a rule is not fully appreciated is the placing of an extended layout upon a broken grade. This is particularly disadvantageous when the layout is at the marked depression made by two sharply changing gradients and the effect is most adverse in the case of a slip ladder by reason of its greater length. The ideal location of an interlocking is with a single grade continuous throughout its limits. The saving in maintenance, both to the signal and track forces, through the ideal arrangement is quite measurable. The aesthetic feature is likewise greatly enhanced by such provision.

THE ORLEANS RAILWAY OF FRANCE AT THE BEGINNING OF THE WAR.—From the first day of the war the Orleans railway system passed entirely into the hands of the military authorities, and between August 2 and 5 nearly 1,500 trains carried men to centers of mobilization. From then until August 19 trains took these troops from the centers towards the frontiers, and at the same time transported soldiers from Algiers and Morocco. In this period 57,000 passenger and freight cars were used for the conveyance of 600,000 officers and men, 144,000 horses, 40,000 guns and gun-carriages, etc., and 64,000 cases of supplies of various kinds. This enormous service was carried out with remarkable precision and order and without the smallest accident to military trains.

The Experimental Determination of Stresses in Track

A Description of the Methods Adopted to Secure Measurements Under Actual Traffic and the Results Secured

By C. C. WILLIAMS

Professor of Railway Engineering, University of Kansas

The intensity and distribution of the stresses that occur in a railroad track under actual operation cannot be calculated reliably from theoretical considerations and recourse must be had to experimental tests for such information. Dr. P. H. Dudley, G. Cuénot and others have done much valuable work in this connection and it was with a view to extending their observations somewhat that an investigation of the subject was undertaken in the Railway Engineering department of the University of Kansas, a brief summary of which follows:

The apparatus used consisted of Berry strain gages for ascertaining the stresses in the rails and a device for measuring the deflections specially designed and built for this purpose, which will require a word of description. It consisted essentially of a stylus carrying a 4-H lead attached to the

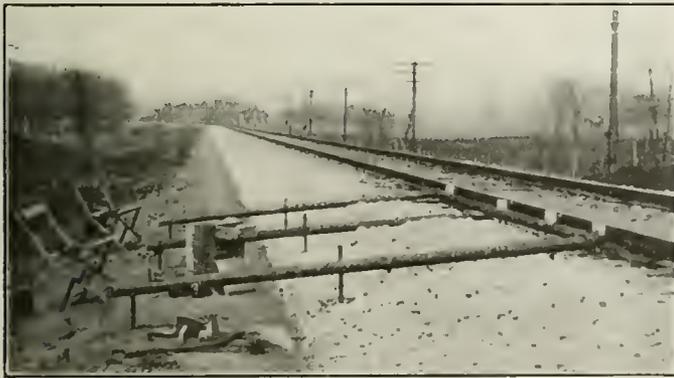

Fig. 1.—A General View of the Apparatus

rail or tie being studied, and a revolving drum carrying a sheet of paper on which the deflection diagram was traced by the stylus. A small electro-magnet was placed immediately below this stylus and so arranged that when the former was energized, it actuated another stylus which made a dot on the sheet of paper below the main deflection diagram. One of the wires to the electro-magnet was bonded to the web of the rail and the other was laid on, but not across the top of the rail, so that when a train wheel passed it pressed the wire against the head of the rail causing the stylus of the electro-magnet to indicate the position of the wheel relative to the deflection diagram. The revolving cylinder, which was turned by means of a cord wound around its base, was supported on a 2½-in. pipe frame that was anchored and held rigid by being clamped to long iron posts driven in the roadbed outside of the ballast. Fig. 1 shows the general arrangement of the apparatus and Fig. 2, the details of the same. The section of pipe parallel to the rail was somewhat more than half the length of the rail so that a recording gage could be placed at the middle, one at the joint and two about equally spaced between. By thus supporting the apparatus entirely outside the ballast, the normal condition of the track was not disturbed and freedom from movement of the support due to passing trains was attained. With the gages in this position, they covered the first half of the rail length for west bound trains and the second half for eastbound trains. For observing the deflection of the ties, the pipe supporting the deflection gages was placed between two ties at right angles to the track, as shown in Fig. 3. One gage was placed at the middle of the tie, one at the end and two between these two.

The Berry strain gage was attached under the rail between two ties by means of a special clamp and was read while

the trains were passing by the aid of powerful field glasses.

The track where most of the observations were made was on a tangent in the main line of the Atchison, Topeka & Santa Fe. The roadbed is on a 10-ft. embankment and is Class A track, with 22 in. of crushed rock balast under the bottom of the ties, 22 ties to the 33-ft., 85-lb. rail. The width of the top of the embankment was 24 ft., allowing a berm of 4 ft. outside the ballast. The ballast was half above and half below the base of the roadbed. Other observations were made at the middle of a 3-deg. curve with similar roadbed and on a tangent yard track on cinder ballast near the depot. Other observations were also made on branch lines with inferior roadbed, but they are not included in this discussion.

The traffic over the above stretch of track consists of 7 passenger and 2 freight trains each way per day. The passenger engines were either of the Atlantic type with 56,000 lb. per axle on the drivers (1,400 Class) or the Pacific type with 55,000 lb. per axle on the drivers and trailer (3,500 Class), the latter being a balanced compound locomotive used in fast passenger service. West bound trains passed the point of observation at speeds varying from 40 to 50 miles per hour, while east bound trains varied from 30 to 40 miles per hour.

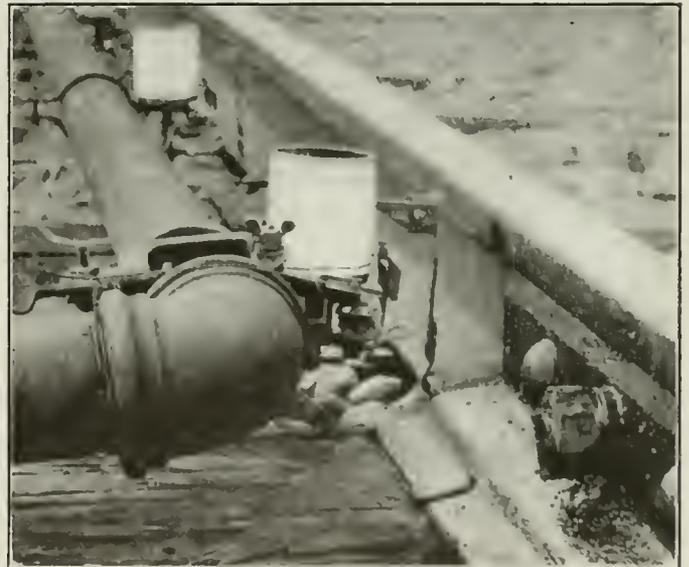

Fig. 2.—A Closer View of the Deflection Recording Apparatus

Without going into detail, a summary of the results of the observations can be briefly stated:

1. Fig. 4 is a record of the deflections under a passenger train drawn by an Atlantic type engine and shows the character of the charts made by the recording apparatus. A is the deformation of the track from the initial straight line and at B may be seen the dots that indicate the position of the wheels, the interpretation of which was sketched in at D afterward.

2. The compression in the head of the rail is greatest under the trailer wheels, owing doubtless to the distance between them and the driving wheels in front and the tender wheels behind.

3. The maximum tension occurred in the head of the rail due to upward moment about 6 to 10 ft. ahead of the truck of the locomotive and between the two trucks of a Pullman car.

4. The compression in the head of the rail is increased and

the tension diminished by the impact of succeeding wheels against the end of the rail at the joint.

5. The 1,400 Class Atlantic type engine produced greater stresses in the rail in a somewhat greater proportion apparently than the ratio of wheel concentrations.

6. The stresses in the end of the rail were from 12 to 25 per cent greater than at the middle. When a careful profile of the rails was made, they were found to be permanently deflected downward 0.1 to 0.25 in. at the ends. This would indicate that an effort should be made to afford more rigid support at the joints.

7. The end of a rail at the joint is subject to intense and violent vibrations resembling those of a tuning fork, so great in the present experiments that it was with great difficulty that any record of deflections could be obtained. It was utterly impossible to attach the strain gage securely enough to obtain the stress. When a record of the deflection was finally secured, it revealed rapid vibrations, four to six occurring between the passage of each successive pair of wheels. This vibration probably accounts to some extent at

Fig. 3.—The Apparatus Attached to a Tie

least for the cracking of angle bars. The writer has frequently observed that cracked angle bars are not bent but are straight, indicating that the failure is due to fatigue of the material rather than to flexure. This vibration of the end of the rail offers a possible explanation of this phenomenon.

8. Freight cars caused fully as high if not higher stresses than did passenger coaches, although the weight of the latter was about 30 per cent greater than that of the former. This was apparently because of the unevenness of the wheels and the generally inferior construction and condition of the rolling stock.

9. Flat wheels caused the stresses to be increased from 50 to 100 per cent in the cases observed.

10. The stress in the outer rail on the 3-deg. curve was about 10 per cent greater and in the inner rail about 10 per cent less than on straight track.

11. So far as these tests gave any indication, the speed of the train had no noticeable effect on the stresses.

12. The stress in the 6 in. by 8 in. by 8 ft. 2 in. ties varied from 1,500 to 3,000 lb. per sq. in., although the record in the case of the ties did not seem to be perfectly reliable.

13. The stresses in the head of the rail at the middle of its length averaged about as follows:

Atlantic type of locomotive—	
Tension	6,000 to 7,600 lb. per sq. in.
Compression	8,000 to 9,000 lb. per sq. in.
Pacific type of locomotive—	
Tension	7,000 to 10,000 lb. per sq. in.
Compression	7,000 to 8,000 lb. per sq. in.

14. The maximum deflection of the track on stone ballast was about 0.3 in.

The tests described above were carried on under the direc-

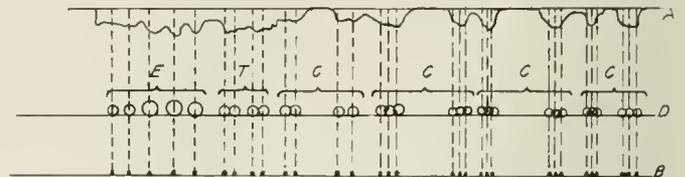

Fig. 4—A Record of the Deflection from an Atlantic Type Locomotive

tion of the writer by W. A. Kingman and N. J. Pierce, senior students in the department of Railway Engineering at the University of Kansas. By furnishing information concerning the weight of equipment, by detailing track men to help in placing the apparatus and by making suggestions, R. A. Rutledge, chief engineer of Eastern Lines; C. T. McLellan, division superintendent, and C. M. Buck, division engineer, of the A. T. & S. F., contributed materially toward the work.

ABSTRACT OF ENGINEERING ARTICLES

The following articles of special interest to engineers and maintenance of way men to which readers of this section may wish to refer have appeared in the *Railway Age Gazette* since June 18, 1915:

Some Important Considerations in Right of Way Valuation.—A discussion of this important problem in accordance with the decision of Justice Hughes in the Minnesota rate case, was presented by Halbert P. Gillette, in the issue of June 25, page 1483.

The Test Department of the Pennsylvania Railroad.—The Pennsylvania Railroad has probably the most elaborate and thoroughly organized test department of any American railway. A detailed description of the new laboratory building and of the method of organization, prepared by C. D. Young, engineer of tests, Pennsylvania Railroad, was published in the issue of July 2, page 6.

New Bridge Across the Missouri River at Sibley, Mo.—The Santa Fe is now completing a new gauntleted structure over 4,000 ft. long crossing the Missouri river 25 miles east of Kansas City. An interesting feature of this structure is the construction of a ballasted deck floor for its entire length, including three 396-ft. through truss spans. This bridge was described in an illustrated article in the issue of July 2, page 13.

Rail Specifications.—In his presidential address, delivered before the American Society for Testing Materials at the recent convention at Atlantic City, A. W. Gibbs discussed the present status of rail specifications, pointing out some present defects and describing the progress which has been made. An abstract of this appeared in the issue of July 2, page 17.

Calculating Cross Section Areas on Railroad Valuation Work.—Checking the cross section notes taken by the federal parties in the field involves a great deal of detail work. A method to reduce this was described by F. T. Morse, assistant engineer, C. R. I. & P., in the issue of July 2, page 29.

A Study of Grade Crossing Elimination in Cities.—The relative advantages of track elevation and depression in the separation of grade crossings was discussed by C. N. Bainbridge, office engineer, Chicago, Milwaukee & St. Paul, in an extended illustrated article in the issue of July 9, page 45. In the same issue was published an editorial note commenting on some of the points brought out in this paper.

New Delaware & Hudson Terminal at Albany, N. Y.—The Delaware & Hudson has recently completed a new general office building at Albany which is of unusually attractive appearance architecturally for a railway building. This building was described in the issue of July 9, page 58.

The American Society for Testing Materials.—A detailed report of those portions of the reports and papers presented at the recent annual meeting of the American Society for Testing Materials, of interest to railway men, was included in the issue of July 9, page 61. Among the specifications presented were those for quenched high carbon steel splice bars, quenched carbon steel track bolts and quenched alloy steel track bolts.

The Relative Efficiency of Various Ballast Materials

A Discussion of the Different Elements of Cost Which Enter into the Ultimate Expense to a Railroad

By G. W. VAUGHAN

Engineer of Maintenance of Way, New York Central, New York

A definition of efficiency reduced to track terms and applied to ballast might be as follows: "The ratio of continuous smooth track secured to the cost per lineal foot of track in securing it." In this definition the "cost" means the cost of the ballast, cost of transporting, cost of installation, cost of renewals, and the labor cost of surfacing to keep continuous smooth track.

Let "a" = cost of stone ballast per lineal foot of track, which is assumed at \$0.38.

"A" = cost of gravel ballast per lineal foot of track, which is assumed at \$0.22.

"b" = cost of 2 in. stone ballast renewed after three years, per lineal foot of track, figuring that 20 per cent is renewed at that time, which is assumed to cost \$0.076.

"B" = cost per lineal foot of track of gravel ballast renewed after three years, figuring that 33 1/3 per cent is renewed at that time, which is assumed to cost \$0.0733.

"c" = cost of keeping continuous smooth track on stone per lineal foot of track for three years, assuming it has to be surfaced three times per year, and that in 10 hours one man can surface 45 lineal feet of track, which is assumed to cost \$0.339.

"C" = cost of keeping continuous smooth surface on gravel per lineal foot of track for three years, assuming it has to be resurfaced eight times per year, and that in 10 hours one man can surface 60 lineal feet of track, which is assumed to cost \$0.072.

Then "x" = continuous smooth track.

"E" = efficiency of gravel ballast.

100 = efficiency of stone ballast.

$$\text{By definition given above, efficiency} = \frac{\text{continuous smooth track}}{\text{cost per lin. ft. of track}}$$

In the case of 2 in. stone ballast:

$$100 = \frac{x}{a + b + c} = \frac{x}{.380 + .076 + .339} = \frac{x}{.795}$$

In the case of medium gravel:

$$E = \frac{x}{A + B + C} = \frac{x}{.220 + .073 + .079} = \frac{x}{.372}$$

Comparing the two

$$100 \cdot \frac{x}{.795} = E \cdot \frac{x}{.372} = \frac{100x}{.795} = \frac{Ex}{.372} = \frac{100}{.972} = \frac{E}{.795} = 79.5 : .972 E$$

$$E = \frac{79.5}{.972} = 82$$

Therefore, if efficiency of stone ballast is 100, efficiency of medium gravel is 82.

Therefore

Stone ballast efficient	100 per cent
3/4-in. stone ballast	75 per cent
Coarse gravel	80 per cent
Medium gravel	75 per cent
Fine gravel	60 per cent

From experience we find that the least depth of ballast that should be placed under the ties is as follows:

Stone	12 in.
3/4-in. stone	12 in.
Coarse gravel	12 in.
Medium gravel	14 in.
Fine gravel	14 in.
Clean coarse sand and under	16 in.

Any less depth of ballast than above will not hold track in good surface or line under heavy traffic without continual surfacing.

SUB-BALLAST

Where tracks are being ballasted with stone, it is sometimes necessary on account of the condition of the sub-grade, to place

what is known as sub-ballast. When ballasting old tracks with stone where ballast has been used for many years, this sub-ballast is not necessary, but where the sub-grade is wet and is composed of loam or clay, sub-ballast should always be placed previous to ballasting track with stone or gravel. Gravel, sand, cinders, granulated slag or other porous material can be used for this purpose, and the following depths are generally used.

Crushed slag	12 in.
Cinders	12 in.
Sand	12 in.

The lasting qualities of ballast and the percentage required for renewals depends upon the traffic. The following table gives the per cent of renewal at the expiration of a certain number of years.

Stone	3 years.	Percent of renewal	20
3/4-in. stone	2 years.	Percent of renewal	20
Coarse gravel	3 years.	Percent of renewal	33 1/3
Medium gravel	3 years.	Percent of renewal	33 1/3
Fine gravel	3 years.	Percent of renewal	33 1/3

The relative cost of raising track on ballast is:

Stone	100 per cent
3/4-in. stone	75 per cent
Coarse gravel	75 per cent
Medium gravel	66 per cent
Fine gravel	50 per cent

The relative cost of surfacing track is:

Stone	100 per cent
3/4-in. stone	75 per cent
Coarse gravel	75 per cent
Medium gravel	66 per cent
Fine gravel	50 per cent

The relative cost of maintaining surface on various kinds of ballast is:

Stone	100 per cent
3/4-in. stone	150 per cent
Coarse gravel	200 per cent
Medium gravel	200 per cent
Fine gravel	200 per cent

Track on gravel ballast can be surfaced at a cost of 25 per cent less than stone but to keep continuous smooth track, winter and summer, it has to be surfaced or shimmed nearly three times as often. The 200 per cent for gravel in comparison with 100 per cent for stone, is obtained as follows:

"a" = cost of surfacing one lineal foot track stone ballast, assumed at \$0.032.

"A" = cost of surfacing one lineal foot track gravel ballast, assumed at \$0.024

"b" = number of surfacings stone ballast track required per year = 3.

"B" = number of surfacings gravel ballast track required per year = 8 (taking into consideration that gravel has to be surfaced after heavy rains and has to be shimmed in winter).

Then

$$100 = \frac{\text{stone}}{\text{gravel}}$$

$$a \times b : A \times B = 100 : X$$

$$0.32 \times 3 : 0.24 \times 8 = 100 : X$$

$$.096 : .192 = 100 : X$$

$$0.92 X = 19.2$$

$$X = 200$$

GENERAL METHOD OF RAISING OR BALLASTING TRACK

A gang should be large enough that six racks can be used, three on each side, spaced one-half rail length apart. Ballast stakes should be set so that the desired grade can be obtained with the least amount of lumps and sags. A sighting board and blocks should be used to obtain uniform grade between ballast stakes. A track level should be used so that the proper cross level can be obtained. The table on the following page shows

the number and different classes of men composing the ballast gang and the manner of placing them.

Adjust the sighting board at a grade stake, where the grade changes, or if that is too far ahead, at a grade stake where the line on the sighting board can be clearly seen from the point where the track is to be first lifted. Tap down all loose spikes so that all the ties will be up close to the bottom of the rail. Place the six jacks, three on a side, at the joint, center and joint, and on the sighting side of the track, place on the rail three sighting blocks at the joint, center and joint. The foreman with another sighting block should then go back three or four rail lengths, depending upon his eye-sight, and place his sighting block on the rail. Jacks are then to be worked until the tops of the three sighting blocks on the rail that is being lifted are

be lightly pick-tamped on both sides. In surfacing track with gravel ballast, pick-tamping or bar-tamping should be used, following the same general principles, if the lift is not too great. On greater lifts, shovel tamping is the best unless the gravel is very coarse.

For ballasting and surfacing track, we find the following to be the best tools to use for this purpose.

	First lift	Surfacing
2-in. stone	Spade	Tamping picks and mechanical percussion tampers.
3/4-in. stone	Spade	Tamping picks and mechanical percussion tampers.
Coarse gravel	Spade	Tamping picks and mechanical percussion tampers.
Medium gravel	Spade	Tamping picks and mechanical percussion tampers.
Fine gravel	Spade	Spade

By using the mechanical percussion tampers, greater efficiency and more permanent track can be obtained at 50 per cent of the expense of track tramped by hand.

LOADING AND HAULING BALLAST

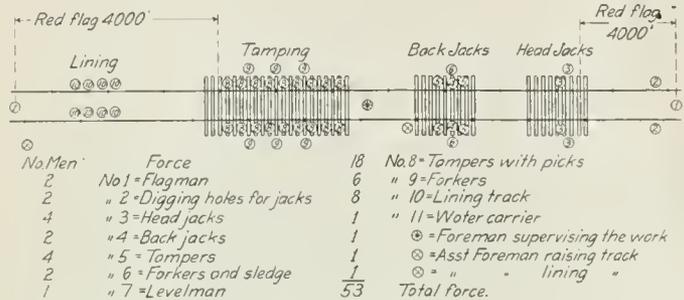

To obtain efficiency, the loading of ballast should be done by mechanical means or gravity. Gravel, sand, etc., should be loaded by steam shovels and crushed stone should be loaded from bins by gravity. All ballast should be hauled and unloaded by special trains, preferably in center dump cars of the Rodger or Hart types, as this puts the ballast where it is wanted. When track is raised, a large proportion of the ballast slides under it by gravity, thereby saving that much hand labor. However, for surfacing track, where there is a very heavy fast passenger traffic it is preferable that ballast be unloaded outside of the rails to avoid discomfort to the passengers caused by the fast trains picking up the stones and dirt from the center of the track.

Track should be lined promptly after it is ballasted, and before filling in. It should also be filled in promptly after lining in order to hold the line. In stone ballast particularly, if the track is not lined promptly after the stone is put under, it becomes set in and no matter how much one lines it the first train or two over it will line it back to its old position, in which event the only remedy is to spike-line the rail. When track is filled in, it should be dressed up to the standard cross-section. In dressing up stone ballast on the shoulder, it is not necessary to place any of this ballast by hand. The men should line the track, and throw the ballast from outside of the ties up on to the ends of the ties. They should then place an ordinary board the proper distance from and below the base of the rail and rake the ballast down to the board with forks or shovels.

Hard stone, that breaks with an angular fracture when crushed and passes through a 2 3/4 in. round hole in a revolving screen and will lay on a 1 1/4 in. screen, is considered to be the best ballast for high speed and heavy traffic lines. Coarse gravel ranging from sand to 2 in. pebbles is considered good enough for medium traffic, while sand, fine gravel or cinders is considered ample for lines of ordinary traffic.

I consider a light raise to be much preferable to heavy raises on fast express lines or lines with heavy freight traffic, owing to the settlement of the track during the winter months, due to the frost heaving the ground, heavy rains, snow, etc. With light raises, track can be kept in better condition with less expense than can be done by putting a large amount of ballast under the track. When a large amount of ballast is placed under the track, the track naturally settles down into the ballast to a greater or less extent and it requires more labor for tamping the track than by making lighter lifts and making them oftener. By making light raises in the track we are able to keep the track from getting centerbound and to keep it in the same riding condition continuously year to year which cannot be done in any other manner.

In regard to classes of labor best suited for work in ballast gangs; any man of good physique, who can understand the language and is willing to obey the orders of the foreman will be the most suitable, regardless of nationality.

Average performance-raising track 4500 per day.
Average " -back-filling 1200 Cu.yds. per day

Distribution of Men in a Ballast Gang

on a line with the top of the foreman's sighting block and the sighting line on the sighting board. At the same time the sighting side is being raised, the opposite rail is to be raised level with the sighting side by the use of three uniform track levels placed at the joint, center and joint. If on a curve, use the low rail for the sighting side and put the desired elevation in the track levels. Some tracks lift different from others and a foreman may find it necessary frequently to use a jack in the quarter in addition to the ones at the joints and centers.

It is proper, if the foreman is experienced, to raise the joints slightly high, tamp the middle tie of the joint, drop the jack and then strike the tie tamped down to the proper level with a large wooden hammer. This means a solid joint tie. It means also that the tie referred to is the only one that should be treated in this manner, for if other ties are treated in this manner, loose ties will result from the practice. The main thing in tamping is to do it evenly and uniformly, both outside of the rail and for 18 in. inside. The center of the tie should not be tamped. The ballast should be simply pushed in so as to fill in to avoid and prevent a pocket for water. The action of traffic will tamp the center of the tie sufficiently and many times more than is necessary.

The method of raising track on a light lift is practically the same as when ballasting track. If the raise is not very great, or if it is being done by a section gang, less jacks are required.

SURFACING TRACK

In surfacing track with the sighting board where the lift is from 1 to 2 in., the general method is the same as when raising track. The height the track is to be raised is determined by the foreman, and the sighting board is set accordingly. The distance that the foreman should be away from the raising block is usually about twice the distance customary when raising track for ballast. When surfacing track on stone ballast the tamping should be done with tamping picks, tamping bars or percussion tamping machines. The ends of the ties should be tamped quickly when the raise is made and then the gang should thoroughly pick or machine tamp for a distance of 3 ft., in from the ends of the ties, care being taken not to knock out the tamping previously done on the opposite side of the ties. The center of the tie should

FASTENING TIMBER GUARD RAILS WITH LAG SCREWS

At the last convention of the American Railway Engineering Association, the committee on Wooden Bridges and Trestles submitted considerable information concerning the use of lag screws for fastening timber guard rails to the ties on wooden and metal bridges. While the investigation of the committee showed that only a small percentage of the roads use this form of construction, nearly all of those who have tried it were in favor of it. The committee recommended that ties and guard timbers be sized one dimension at the mill and that the customary dapping be omitted, also, that alternate ties be fastened to the stringers and a lag screw be used to fasten the guard timber to each tie. Holes should be bored the full depth and the lags screwed into place.

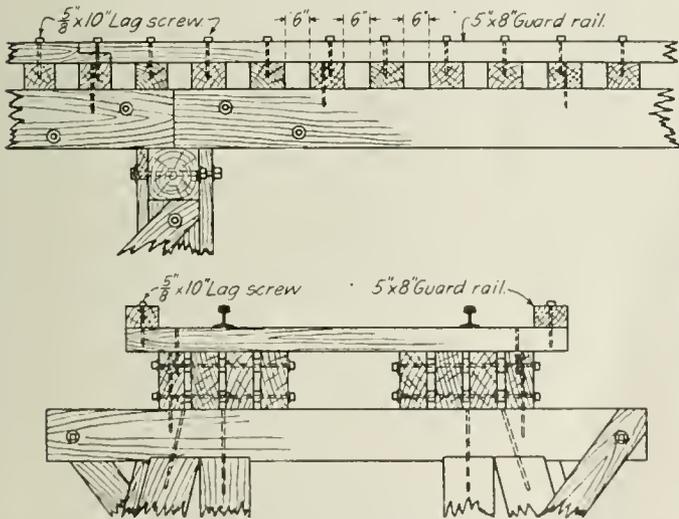

Because of the interest in this subject evidenced by the work of this committee, we show herewith the standard plan of the Seaboard Air Line, on which road the use of lag screws is standard. In a general way this form of construction has been used to a limited extent for many years. Fully 30 years ago it was the practice of the Queen & Crescent to fasten the guard timbers to the ties with ordinary bolts, but considerable trouble was experienced in preventing the nuts from working off the bolts and also in preventing the bolts themselves from

held the ties in place. A recent motor car trip over a portion of the lines in Florida on which there are a large number of trestles, failed to show a single instance of bunched ties.

THE BROWNHOIST-SHENABLE DRAG LINE BUCKET

The Brown Hoisting Machinery Company, Cleveland, has recently purchased the patents for and is now manufacturing a new type of drag line bucket originally designed and built by E. R. Shnable, of Shnable & Quinn, contractors, for use on the Calumet-Sag channel of the Chicago Drainage System. This bucket has been used on this work for the past five years in materials consisting of a thin soil covering a glacial conglomerate of sand, gravel and boulders, cemented with clay and very tightly packed; below this is what is termed "marl" hard-pan of the color of bluish clay, full of pieces and ledges of limestone; and at the bottom is solid limestone rock which has to be blasted. This bucket has dug this material successfully, and has stood up under this hard work.

This is a back-dumping bucket, consisting of a shell, a pulling

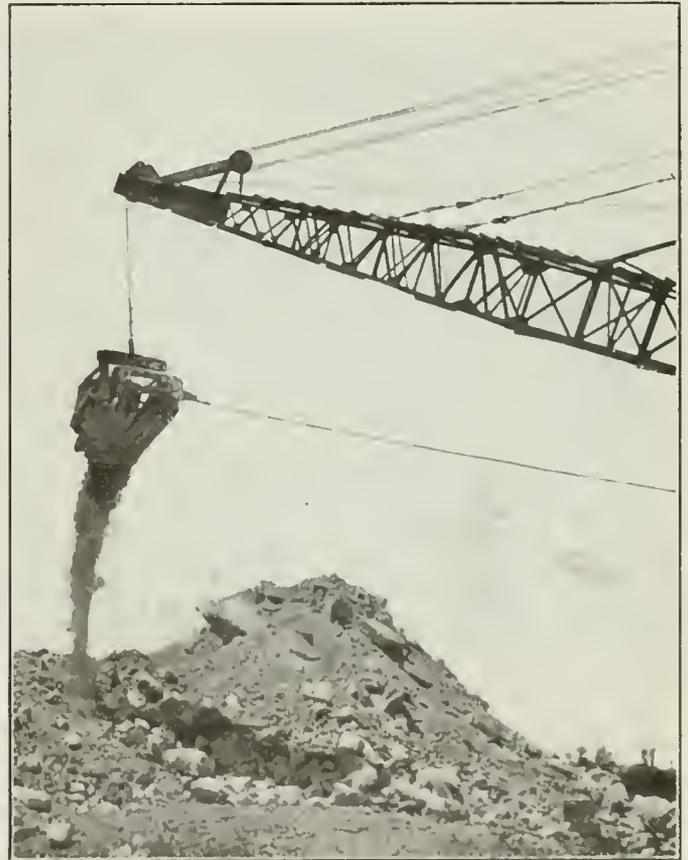

Use of Lag Screws in Trestle Construction on the Seaboard Air Line

coming out of the guard timbers. With this form of construction it is absolutely essential that every tie be securely fastened to the guard timbers to prevent bunching.

In 1907 it was the standard practice on the Seaboard Air Line to use 7 in. by 8 in. bridge ties with 6 in. by 8 in. guard timbers dapped over the ties and fastened with lag screws. The practice was modified on that year to use a 6 in. by 8 in. by 9 ft. tie and a 5 in. by 8 in. by 18 ft. guard rail without dapping. Reducing the size of these timbers effected a saving of over 400,000 ft. B. M. of timber per year in addition to \$7 per 1,000 ft. B. M. to frame and place the dapped timber. All ties and guard timbers are required to be sized to a uniform thickness, insuring an even bearing. It has also been found that by turning the surfaced side up, decay is retarded to some extent. Every fourth tie is drift bolted to the stringer, enabling the track to be kept in line at a moderate expense.

The action of this form of construction under derailment has been particularly successful. At various times derailed cars have been moved over a trestle without bunching any ties. In one instance where the guard timber on one side was completely demolished very few ties were bunched, as the guard timber on the opposite side was in good condition and the lag screws still

Dumping Beyond the Normal Radius of the Machine

haul and a combination hoisting bail and back gate. In its digging position the pulling bail is connected to the shell at points located above the center of gravity of the shell. The pulling bail is also connected by means of links to the hoisting bail and back gate in such a way that tension on the drag line forces the gate to close and remain so. When the bucket is suspended on the hoisting bail and the tension on the drag line is released, the back of the shell tips down away from the back gate allowing the load to slide and drop out. The pulling bail is connected to the shell by means of bronze sliding blocks carried in slots in the shell. These slots give to the link connections, between the pulling bail and the back gate, the required motion to permit the bucket to dump when the tension on the drag line is released. Special attention is given to flexibility of the bucket and to the

prevention of binding in any of the parts by providing loose-fitting connections.

All standard buckets are equipped with teeth bolted to the digging edge at an angle to give the proper "suck." For extra heavy digging in rock, the bucket is furnished with rock teeth set at the proper angle for this service. The teeth are tipped with removable manganese steel points so that only the points need be replaced when worn.

The bucket is operated with two single-part lines, the drag line and the hoist line, and is placed in different positions by the manipulation of these two lines. The bucket may be made to dig at any desired slope by varying the tension on the hoist line while playing it out. When the bucket is filled it is raised to the dumping position at the end of the boom by pulling in on the hoist line and at the same time keeping a tension on the drag line. When the tension on the drag line is released, the bucket is dumped. After the load has been dumped, the shell automatically resumes its closed position and the bucket is again ready to dig.

As shown in the illustrations the bucket has been working in

The Brownhoist-Shnoble Bucket Preparatory to Loading

rock and handling very large pieces. With proper manipulation of the line the operator can pick up a rock larger than the bucket itself, by clamping the rock between the pulling bail and the digging edge, and this rock is then dumped frontwise.

The bucket is of simple construction. Repairs can be made in the field with the average contractors' tool or shop equipment. All bushings are made from bronze and steel tubing. Tubing may be kept on hand and when a new bushing is required, a piece can be cut to the proper length.

The front section of the bucket is removable so that it can be replaced without the necessity of replacing the entire shell. To this front section is attached a manganese steel cutting plate which is also removable for repairs. The teeth are bolted to the cutting plate and have removable points. Thus the part of the bucket subjected to the greatest wear is constructed of four separate removable parts, any of which can be quickly renewed, namely, the front section of the shell, the cutting plate, the teeth, and the tooth points.

This bucket has no locking or tripping device on the gate, as the necessity for this is eliminated by the patented construction whereby the gate is closed and kept closed by the pulling on the drag-line. Because the load is dropped at the back, it does not strike any part of the bucket or lines. The bucket can be worked

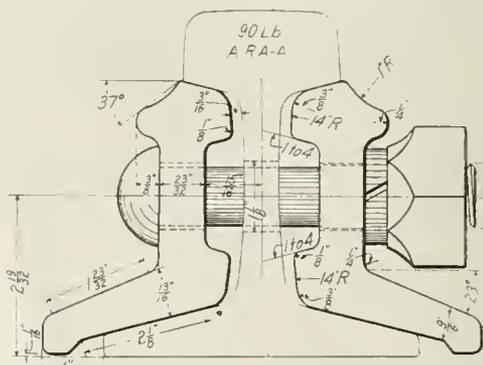

down a slope opposite the machine without changing the location of the connection of the pulling-bail to the shell. The relative location of the digging edge and the points at which the two bails are attached, give a resulting force by which it is possible to dig down a slope, though the drag-line is pulling up at an angle. This same feature makes it possible to take any depth cut desired.

The bucket can be placed on its bottom and the gate opened by slacking the drag-line and going ahead on the hoist line. This raises the bucket away from the load, depositing it as from a clam shell bucket, permitting the loading of cars without any damage to them, as it eliminates swinging of the bucket against the side of the car, and dropping the load into the car.

Being a back-dumping bucket, the load is always thrown away from the machine, and the centrifugal force acquired while the machine is rotating assists the bucket to dump its load and also throws it further out than the radius of the machine. Both bails are very short, permitting the bucket to dig up to the machine and also enabling it to be dumped close under the end of the boom, giving the operator the maximum radius of action and the maximum height of spoil bank.

NEW ILLINOIS CENTRAL STANDARD JOINT

Early last year the Illinois Central determined to discontinue the spacing of ties at the time of laying rail and to allow the track to run until it became necessary to overhaul it "out of face." Even then it was decided not to slot spike the joint, but to depend upon rail anchors to prevent the rail from creeping. Up to May 1, 1915, 124 track miles of 90-lb. A. R. A. rail had been laid in this manner on high speed, heavy traffic main line. While no conclusive results can be seen in this limited time, it is believed that this method is producing satisfactory results, that it will largely eliminate low joint troubles and that this practice can be followed wherever the track is in fair condition without any work being done on the spacing of the ties or in ballasting, except occasionally to give the track a light running surface. At the time this practice was adopted, a new joint was designed for this

Illinois Central Standard Joint for 90 lb.—A. R. A.—Type A Rail

service. Careful investigations and tests were made, as a result of which the joint shown in the accompanying drawing was determined upon. In eliminating the spacing of ties it is necessary that the joint be capable of carrying the load regardless of the position of the ties. These angle bars are therefore made of high carbon, heat-treated steel with bolts of the same character of material. The specifications call for a minimum tensile strength of 100,000 lb. per sq. in., and a minimum elasticity limit of 70,000 lb. per sq. in. Particular attention was also paid to the distribution of the metal to secure the greatest efficiency. To secure the greatest possible strength in that section of the angle bar farthest removed from the neutral axis, the outward projection at the top has been designed to come very close to the line of flange travel on badly worn wheels, but this is not expected to cause any difficulty. The joint is 24 in. long, with four bolts. One pair of angle bars for 90-lb. A. R. A. type-A rail weighs 64.71 lb. This joint has now been in use about a year and is giving excellent satisfaction.

Making a Physical Valuation of Large Terminals

Important and Practical Points Which Facilitate the Carrying on of This Work in the Field and Office

BY CLAUDE L. VAN AUKEN

Much railway valuation in the past has been from a theoretical, legal or office-record standpoint. The decision of the government to make a physical valuation of all roads has created a new interest among railways in the physical part of valuation work. Many men to whom the work is entirely new have suddenly been plunged into valuation work and, as little of value has been written in detail regarding methods to be followed, there are many costly and haphazard methods in use.

The writer has had several years of railway valuation experience, including both field and office work. Consequently many methods have come under his observation. However, the best that has come to his knowledge is one now used in whole or in part on two of the largest railways running west of Chicago.

ELEMENTARY DETAILS OF THE METHOD

If speed is desired, a field party engaged in yard valuation should consist of 8 men as follows: 1 assistant engineer, 1 instrumentman, 1 rodman, 2 chainmen, 1 building inspector and 2 material men. The general organization is as follows: The instrument man should, with the help of the yard map (blue print), determine on the number or name of each track, including its beginning and end, and should direct the chainmen in measuring the lengths of tracks. He should mark the name or number of each track, its beginning, end and length, for the information of the material men, and also place the same information with soft black pencil on the blue print of the yard. The material men follow, entering this information in the material book, together with all detailed information on ballast, rail, ties, angle bars, bolts, spikes, tie plates, rail braces, bridle rods, frogs, switches, switchstands, crossing plank cattle guards, etc. The rodman accompanies the building inspector taking detailed size, location and other information required for making a valuation of each separate building.

GRADING

On spurs and sidings from the main line it is usually desirable to keep the grading separate for each track, but in yard work this is unnecessary and it is usually combined, including that for the main line, unless those tracks are outside of the yard proper. On all miscellaneous tracks separated from the main yard, the grading should be kept separate for each track. If no records of grading for the yard are available, it will be necessary to take measurements of the earthwork, rip-rap, bank protection, etc. Notes on right of way fencing should be taken with the grading notes. If no records are available on clearing and grubbing, estimates should be made with the help of old employees with personal knowledge of original instruction, or of old inhabitants of the locality familiar with the original condition of the property before the construction of the line.

METHOD OF PROCEDURE

The first thing to be done upon the arrival of the party at a large yard is to chain the main line (or main through yard track to be used as a base line) and establish a system of stationing, preferably the profile stationing. These stations should be clearly marked in a specified manner so that they may be used later in taking grading data, locating buildings, crossovers, turnouts, etc., and also to save chaining in adjacent parallel tracks. All necessary "plusses" should be recorded on the map, on switchstands, etc., by the instrument man as the chaining progresses. The material men follow,

taking notes on main line track material, while the building inspector and helper take measurements and notes on yard buildings, etc.

After the stationing is completed the assistant engineer should inform the instrumentman of the system of numbering tracks that has been decided upon. This numbering should preferably correspond to the construction or map numbering if there is such. If not, the numbers and names used locally by the switchmen and yardmaster should be followed as closely as is consistent with good judgment. If neither of these methods of numbering has previously been established, the assistant engineer should adopt a clear and logical method, using numbers on parallel tracks and descriptive names for miscellaneous tracks. Each track having been assigned a name or number, the instrumentman should determine its limits and mark the turnout or turnouts which the track includes. To do this in the field, place an arrow on the switchpoint leading to the track under consideration, the arrow pointing along the rail in the direction which the turnout

Fig. 1—Method of Marking End of Track Measurements

leaves the track (see Fig. 1). Mark the number of the track immediately in front of the arrow as shown. Proceeding along the marked switch rail in the direction indicated by the arrow one is led directly along the proper track to which has been assigned the number marked immediately in front of the arrow. If the track is not a stub end track, the marking is repeated at the end, the arrow being reversed. The length, point of switch to point of switch is also indicated. Thus it will be seen that the material men, who follow later taking notes, cannot possibly confuse the numbering of tracks or their beginning and end, no matter whether or not they proceed in the same direction as did the chainmen. This method of marking also makes it unnecessary for the material men to closely follow the chainmen and instrumentman and does away with the necessity of the material men carrying a yard map.

At the same time that the instrumentman marks the yard tracks as outlined above, he should mark the yard map in a corresponding manner, using a heavy black pencil. The arrows not only indicate the ends of tracks but also serve to show with which track the turnout material is included; the "tail" of the arrow being extended well beyond the frog and within the lines indicating the rails of the track. This information is reproduced on the office copy of the yard map by putting in the arrows and lettering with a bright colored pigment ink, preferably yellow or white. This information, together with the track material notes, is an accurate and complete record of each track, even to the exact material in any turnout one may select on the map, the material men having designated the switch material as "east" and "west" or "north" and "south," as the occasion may be.

To such a record, changes, such as "additions and deductions," may be applied easily from year to year, without necessarily obliterating the original record. Extensions and changes of alignment may be shown by coloring new work with red pencil, while deductions and the old alignment may

be shown by dotted black ink lines colored between with green pencil. Map changes such as these should be accompanied by a short note (in yellow pigment ink) giving authority for the change and the file number of the record of change and field inspection.

MATERIAL NOTES

A fact which seems to be of primary consequence in taking material notes is to impress the material men with the importance of making notes which can be interpreted readily by persons other than themselves. If it is found convenient to use any unusual abbreviations or systems of recording a general explanatory note should be incorporated in the notes with the initial use of such abbreviations or systems of recording.

It is a good idea to adopt a regular sequence of items of material and place these in the same order in the notes for each track, thus accustoming one's self to obtaining and recording items in a systematized manner and thus lessening the chance for omission and error. Material men should acquaint themselves with the track standards and avoid such errors as reporting 75-lb. steel rail on a road that uses almost exclusively 72-lb. steel, etc. Most railways have adopted certain frogs as standard and material men should see that frogs which measure up to other dimensions than those included in the standards are actually railway property and that dimensions or the numbers are correct as reported. A clear and convenient form for material notes is shown in Fig. 2.

To the building inspector falls the task of obtaining notes on all bridge and building items, together with miscellaneous data regarding buildings and structures, such as piping, wells, paving, walks, sewers, drains, parking, fencing (except right of way fencing), tools, machinery, special equipment, etc. In connection with the miscellaneous items it is well to look up old employees connected with the bridge and building department, who have a personal knowledge or record of concealed items such as piping, sewers, etc. If this is not done many improvements and much railway property will fail to appear in the valuation.

The amount of information required for a building or struc-

ture and no plans or cost data are available, the notes and dimensions should be in such detail that it will be possible to compute and estimate all material required to reproduce the structure "in kind." In this connection the immense value of sketches should not be overlooked. These remarks are particularly applicable to structures owned jointly by two or more companies. When this condition exists, the proper percentage of ownership of each company should be obtained from the proper authority and clearly stated. The rigid adherence to a comprehensive set of bridge and building standards, greatly reduces the time and labor necessary and also decreases the chance of errors in arriving at the correct value.

Throughout the entire method as outlined above it will be noticed that the assistant engineer is not personally burdened with routine details, except inasmuch as he is concerned in

Fig. 3—Typical Card Record for Filing

them in supervising the work and "breaking men in." This leaves him free to attend to the miscellaneous matters which are either questionable or of a more or less intangible nature, such as underground piping, data on wells, deep foundations, property not classed as right of way, grading irregularities, joint ownerships, leased rail or trackage, abandoned right of way, connections with other roads, condition of property, etc. Old employees, such as local agents, repairmen and foremen, often prove a valuable and reliable source of information in regard to the above mentioned items.

OFFICE RECORDS

The proper handling of field notes in the office is as important as the field work and while it is best if possible to have the same men do the more important part of the work in both field and office, this is often inconvenient. The most important fact to bear in mind in the office is that the original field notes and data should never be destroyed and that they should be so filed as to be easily accessible at all times, more especially if the valuation is a permanent feature. In making annual reports in future years it will often be found necessary to refer to these notes many times.

The office records and the filing thereof will in each case depend upon the magnitude of the valuation and its importance. On a railway extending into several states, a good method to use is a card filing system, having a card for each structure, item, or group of items. These cards should be classified into the thirty to forty items or classifications usually used in valuation work, such as station buildings, water stations, fuel stations, sidings, etc., preferably coinciding, both in the classification and the number of the item assigned to it, with the Interstate Commerce Commission or state commission classification, if any. These cards should then be filed according to state, division, section of division, station, item classification and card number. Fig. 3 shows a sample card and also a method of recording information for a siding. The filing data shown at the top of the card is in accordance with the above, thus: State of Iowa, Omaha divi-

Fig. 2—Suggested Form for Recording Field Notes

ture depends entirely upon the records and standards available for the valuation office. If a building is of recent construction and information can be obtained in the field that plans and reliable cost data are to be had, then the field notes should consist only of the location, the descriptive name of the structure, the general dimensions and construction data, together with a note giving the date built and information regarding plans and cost records. If a structure is of standard construction of which there are detailed plans in the general offices, then the dimensions and location should be given with the additional note "standard." From the standard detailed plans of such structures, unit costs per square and cubic foot may be determined and these applied to all similar structures of standard construction.

When a structure of unusual type or construction is en-

sion, Section 3, Station 12 (Belden), Item 19 (Sidings), Card 5.

It will be noted that on the card for a siding the total length of the track, point of switch to end is shown, the rail is reported for the entire length and that the split switch and frog are also reported. This makes a double entry for rail in the space occupied by the switch and frog. This difference may be taken care of in the section summary by deducting the track equivalent in tons, occupied by a complete switch, from the total tonnage.

In making summaries such as this it is convenient to have at hand tables showing the amounts of material in various standard turnouts, etc. Computing tables such as these, together with information on track, bridge and building standards, are invaluable in a valuation office. Failure to prepare such data leads to hundreds of needless inaccuracies and to much useless repetition of recurring computations. Adequate and convenient files should also be furnished for yard and station maps and both the field map and the corrected office copy should be kept in the file. It may be argued that the filing systems herein outlined are too elaborate and unnecessary, but engineers who have been for years in railway valuation work concede that they are necessary and are using similar systems, thus proving that valuation work not only requires engineering ability, but skill in office work and accounting as well.

It will be noticed that the entire method outlined above lends itself readily to a system of annual reports of additions and deductions to bring the valuation to date. This important feature is overlooked many times and consequently much confusion results in trying to bring up to date a valuation which has been "lumped" or one without detail, by making the proper additions and deductions. For instance, in making a deduction properly, one must know what was previously reported both as to detail and cost, else a sum of money is liable to be deducted from the total for which nothing was ever included in former reports. After years of successful work a properly conducted valuation department becomes useful not only for its valuation reports and records, but also as a general source of information and statistics for the use of other departments, a value which has not as yet been fully realized by other than engineers or those closely connected with the work.

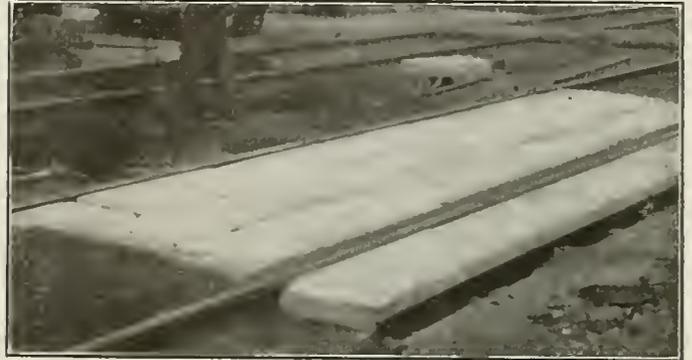

The portion of the instructions for the federal valuation parties (as outlined in the *Railway Age Gazette* of January 8, 1915), which pertains to yard valuation, may be easily applied to the method herein given, as the instructions are primarily to indicate the general data that is to be secured throughout the entire railway system, rather than to state specifically how the work shall be handled in a large terminal yard.

THE SWISS RAILWAYS.—According to the latest figures, the total length of the network of the Swiss Federal lines alone amounts to 1,700 miles—that is of standard gage lines only—to which must be added the narrow gage Brünig Railway, 36 miles in length. There are, besides, the standard lines owned by private companies, of which the chief are the Loetschberg, 65 miles; the Bodensee-Toggenburg line, 38 miles, which was in exceedingly poor financial condition even before the war; the Sædal line, 34 miles, electrified a few years ago, and several smaller lines. There are also the narrow-gage lines, 49 in all, chief of which is the Khaetian Railway system with a total length of 170 miles, with both steam and electric traction; the new Chur-Arosa line, with electric traction, 16 miles; the Montreux-Oberland line; the Bernese Oberland lines, and various others. The rack railways in Switzerland number 15, the most important being the Wengernalp line, 12 miles in length, with an 80 cm (31½ in.) gage. Of the cable railways, now 47 in number, in Switzerland, the longest is that from Sierre to Montana in the Valais, 3 miles, with a maximum grade of 48.4 per cent

AN EXPERIMENTAL CONCRETE SLAB GRADE CROSSING

BY MAC RAE D. CAMPBELL

At the point where the Chicago & North Western crosses Pearson street, Des Plaines, Ill., this street is paved with concrete and it was desirable, if possible, to preserve the same pavement surface in crossing the tracks. With this in view, the experimental concrete slab crossing shown in the accompanying illustration has been recently installed. This scheme was in part the idea of Peter Hoffman, coroner and

The Crossing Completed for One Track

chairman of the Cook County Safety First Commission, who interested the Chicago & North Western in the work. The concrete slabs are about 1 ft. 6 in. wide by 3 ft. long and 5 in. thick. They were manufactured at a local cement products plant at Des Plaines, and consist of a 1-2-3 concrete mixture, in which Wisconsin granite was used as coarse aggregate. Six of the blocks were reinforced (experimentally) at the center with No. 6 American Steel & Wire mesh, the heavy wires running the long way of the block. All blocks were

Preparing to Place the Concrete Crossing

cured by steam for the first 16 hr. and then removed from the steam curing room and stored in a warm room where they were kept thoroughly sprinkled. They were kept in a warm moist temperature until used in the crossing. Blocks were finished with a wood float and all edges rounded with an edging tool having a ¼ in. radius, except where plans called for different provisions, namely, a suitable flangeway along the rails. As shown in one of the photographs, blocks are

kept in alinement by steel angles spiked to the ties. Blocks are set upon a sand cushion and the joints filled with sand. The crossing is 18 ft. wide and extends across two tracks.

A GRAPHICAL METHOD OF STRING-LINING CURVES

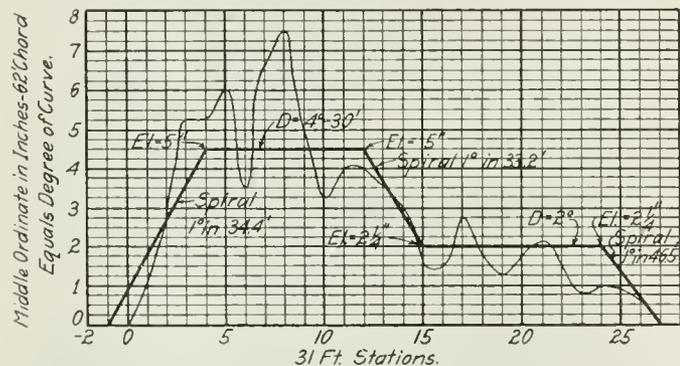

BY H. M. CHURCH.

Division Engineer, Baltimore & Ohio, Baltimore, Md.

Some discussion has appeared heretofore in these columns regarding the advantages and results to be obtained by the use of a string for lining track, and the extensive use of various methods which have been tried where curves have not been staked and spiraled previously by an engineering corps. The following method of string lining has been found to be specially practicable and adaptable to use on all curves, simple or compound.

One takes the usual preliminary notes with a 62-ft. chord, noting the middle ordinate which gives the degree of the curve at each station, observing the curvature and elevation at each station and recording this data in the usual engineers field book. On the opposite side of the book, usually ruled like cross section paper, the ordinates of the degrees of curve at each station can be plotted quickly so that the curve will show clearly the points of maximum and minimum variation.

If all the degrees of curvature in inches as originally taken are added, the sum for each particular curve will remain con-

An Example of the Graphical Determination of the Curve Offsets

stant. After reading from the diagram the proposed degree of curve for each station and again adding, the totals should equal the previous sum, and if not, adjustments can be made.

The diagram of the curve will locate quickly the points of the maximum and minimum variation and then an average line for the spiral and curve can be plotted. It has been found in plotting the "Talbot Spiral" in this manner that it becomes a straight line inclining in proportion to the rate of runoff in feet per degree of curve. A similar diagram for elevation using inches as ordinates at each station can be correspondingly figured out to fit the new curve and spiral. This will give data that will permit a track man to line the track for the spiral and curve throughout readily.

TABLE OF MEASUREMENTS

31-ft. station	Measurements taken on existing curve		Measurements for re-established curve

STANDARD TRACK CONSTRUCTION ON THE GREAT EASTERN RAILWAY OF ENGLAND

BY W. A. D. SHORT

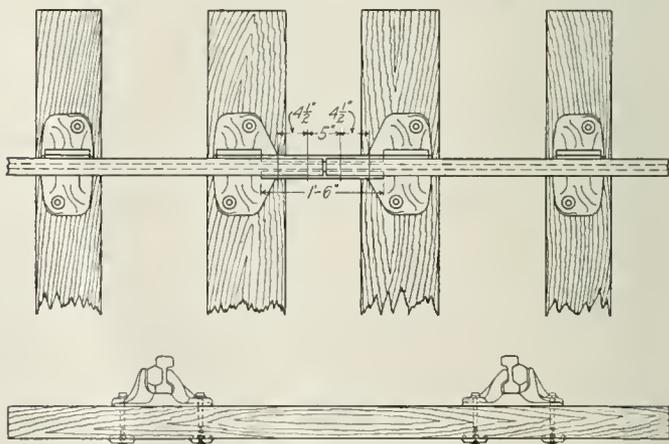

Most American railway men have only a general idea of the principal features of English railway track construction, such as the bull-head rail, the cast iron rail chair, etc., while tourists comment on its excellent riding qualities.

The track standards of the Great Eastern are similar to those of most English railways and will illustrate English practice in

Section Through Rail Joint and Through a Rail Chair for 95 lb. Bull Head Rail

track construction. The rail is of the bull-head type; a section weighing 95 lb. per yd. is used on principal main lines and one weighing 85 lb. on less important main lines and branches. The rails are either 30 or 45 ft. long and are carried in cast iron chairs weighing 54 lb. each, to which the rails are secured by oak keys 7 in. long driven home with sledges. The chairs are

Half Plan at Rail Joint and Cross Section

placed on ties to which they are secured, in the case of the 95 lb. rail, by long bolts passing entirely through the ties, and secured on the under side by special nuts having prongs which bed into the wood. Where the lighter rail is used the chairs are secured to ties by wooden trenails and iron spikes. There are 18 ties for each 45 ft. rail and 13 for each 30 ft. rail. The intermediate ties are 5 in. by 10 in. 9 ft. long, while joint ties are 5 in. by 12 in. in section. The joints are of the suspended type with 4-hole fish plates weighing 32 lb. per pair, the chairs on either side having bases extended towards the joint to give greater bearing area. The ballast, which is generally slag, has a depth of 6 in. under the ties and is carried up flush with their tops.

General News Department

The car shops of the Baltimore, Chesapeake & Atlantic, at Salisbury, Md., were destroyed by fire June 26; estimated loss \$15,000.

The Grand Trunk Railway freight sheds, on the St. Clair river front, at Port Huron, Mich., were destroyed by fire July 6; estimated loss \$300,000. The office of the Port Huron and Duluth Steamship Company adjoining also was burned. The property destroyed included several hundred tons of sugar, flour, feed, and other freight, and 22 freight cars.

Southbound passenger train No. 37 of the Louisville & Nashville was stopped by robbers near Greenville, Ala., on the morning of July 10 and the engine and three cars were cut off and run to a point some distance forward, where the valuables in the cars were taken. Before going on with the robbery the men detached the engine and sent it forward under full steam with no man aboard. Uncontrolled, the engine ran about 40 miles, and finally stopped for lack of steam. The conductor of the train is said to have died of apoplexy during the excitement. It was stated, but not confirmed, that the value of the goods taken from the express and mail cars amounted to from \$60,000 to \$100,000.

Correction

In the report of the proceedings of the recent convention of the Master Boiler Makers' Association, published in the June 4 issue of the *Railway Age Gazette*, the following paragraph appeared in the report on the Oxy-acetylene Process for Boiler Work:

"In this country there are two principal classes of generators; high pressure, by which is meant pressure over 1 lb. per sq. in., and low pressure or less than 1 lb. per sq. in. All things considered the pressure type is the better for railroad work." The sense of the last sentence was changed by the omission of a word. It should have read, "All things considered, the low pressure type is the better for railroad work."

British Railroad Accidents in 1914

The annual return issued by the Board of Trade shows that in the year ending December 31 last the number of passengers killed in train accidents on the railways of the United Kingdom was six; employees killed eight, other persons none. Injuries: passengers, 322; employees, 115; other persons, one. Including all causes connected with the movement of cars or engines the total number of persons killed during the year was 1,115 and of injured 7,850, as compared with 1,131 killed and 9,054 injured in the preceding year. By accidents not connected with the movement of vehicles 9 passengers, 52 employees and 19 other persons were killed and 638 passengers, 22,153 employees and 598 other persons were injured.

Valuation Work on the New Haven

On April 1, 1915, the government placed its first valuation party on the lines of the New York, New Haven & Hartford. A second party has recently been sent out and it is expected that a third party will be added in the near future. The government program calls for the completion of the field inventory for about 800 miles of road this year and for the entire 2,300 miles of line to be covered in two years.

Interest attaches to this work particularly because of the age of these properties, the records of some of the constituent roads going back to 1831. The preparation of the records is estimated to involve the examination of between 30,000 and 35,000 recorded papers exclusive of records of condemnation proceedings. In connection with this work a chart has been prepared showing the 175 distinct corporations forming the New Haven proper and the 27 forming the Central New England, making a total of 202 individual railroad companies composing the present system.

The force now employed by the railroad in its valuation department consists of 114 employes and the expense for the fiscal year just starting is estimated at \$145,000, while the total expense

to the railroad company is placed at \$500,000. In addition to the office force the railway is assigning a pilot and two computers to accompany each government party, pointing out all property of value and checking the computation of all quantities. As indicating the progress which has been made by these parties, the first which started work at Boston Switch, on the old Boston & Providence road on April 1, has averaged a little over a mile a day to date. Only roadway parties have been placed on this line by the government up to this time.

"Stop, Look and Listen"

This is the title of a circular addressed to the public which has been issued by Fairfax Harrison, president of the Southern Railway. Referring to the fact that the automobile has greatly increased the comfort and convenience of life and has contributed to the progress of civilization, he calls attention to the new social complications and new risks which it has introduced. At crossings on the Southern Railway during the year ended June 30 last, there were 69 automobile accidents, in which 12 persons were killed and 58 injured. Calling attention to the need of caution, and noting well authenticated cases of deliberate assumption of risk by drivers of automobiles from pure love of excitement and speed, Mr. Harrison says:

"It does not suffice the public in any moral sense that the fund made up of the revenues collected by the railroad is usually made to respond in damages for consequences of crossing accidents. Suicide to collect life insurance has never been deemed honorable, while no one would deliberately sell the life of a mother or wife, son or brother for money; on the other hand, the collection of damages out of railroad revenues, as a punishment for an avoidable accident, when there can be no real compensation, is an economic waste; it punishes the public more than it punishes the stockholders. . . . Given the progressive policy of the Southern to make improvements to the extent of its ability, it is of interest to note that, in the last year in which a dividend was paid, 3.80 cents of every dollar of revenue went in payment of damages; practically the same amount, 3.88 cents, went to the stockholders, while only thirteen hundredths of one cent could be applied on permanent improvements. Such other improvements as were made were necessarily charged to new capital, thereby increasing the demands on the fund in which the public has so vital an interest. . . ."

"In practically all cases these serious and distressing accidents can be readily and easily avoided by the automobile driver acting upon the familiar warning to stop, look and listen. Surely every one, when using a highway, can afford to sacrifice enough of his time and his pride of opinion to have a practical assurance of safety. The demands of commerce and of public transportation do not permit a railroad to stop all its trains at all highway crossings. . . . The company is, speaking generally, making progress more rapidly than most municipalities, which have an obligation in the premises; but by co-operation of municipalities and railroads many dangerous crossings have been eliminated throughout the South, and more will be every year. . . . The elimination of grade crossings must be a gradual development with the growth of population and wealth, but, meanwhile, good judgment on the part of all concerned can do much to anticipate the benefits of the admittedly desirable expenditure of large sums of money. The same sober sense of responsibility for life on the part of automobile drivers which actuates most locomotive engineers, and in addition the willingness of the automobile driver in such a high interest to subordinate his time and convenience to that of the greater number represented by a railroad train, can check the waste of life and limb.

"To this end I appeal confidently for the counsel of every responsible man and woman in the South, whether or not he or she drives an automobile. Words of caution and common sense around the family dinner table can have more influence and can save more lives at crossings than all the warning whistles ever blown by a locomotive engineer."

REVENUES AND EXPENSES OF RAILWAYS

ELEVEN MONTHS OF FISCAL YEAR ENDING JUNE 30, 1915

Table with columns: Name of road, Average mileage operated during period, Freight, Passenger, Inc. misc., Total, Maintenance of way and structures, Equipment, Traffic, Trans- portation, Miscel- laneous, (general), Total, Net operating revenue (or deficit), Railway tax accruals, Operating income (or loss), Increase (or decr.) last year.

REVENUES AND EXPENSES OF RAILWAYS

ELEVEN MONTHS OF FISCAL YEAR ENDING JUNE 30, 1915—CONTINUED

Table with columns: Name of road, Average mileage operated during period, Freight, Passenger, Total, Operating revenues, Way and structures, Maintenance of equipment, Traffic, Transportation, Miscel., General, Total, Net operating revenue, Railway tax accruals, Operating income, Increase (or decr.) comp. with last year.

* Figures shown here are for five months ending May 31, 1915

Revenues and Expenses of Steam Roads

The Bureau of Railway Economics' summary of revenues and expenses and comments thereon for April, 1915, are as follows:

Net operating income of the railways of the United States for April increased \$33 per mile, or 16.2 per cent, as compared with April, 1914. This increase was due not so much to an increase in gross earnings as to reductions in expenses, which have been effected in all parts of the country. In April, 1914, net operating income per mile was 3.5 per cent less than in April, 1913.

Total operating revenues amounted to \$230,997,430, a decrease from 1914 of \$4,363,087. Operating expenses were \$165,131,384, a decrease of \$12,124,214. Net operating revenue amounted to \$65,866,046, an increase of \$7,761,127. Taxes amounted to \$11,106,959, a decrease of \$341,684. This left \$54,709,207 for net operating income, available for rentals, interest on bonds, appropriations for improvements and new construction, and dividends. Operating revenues per mile of line averaged \$1,010, a decrease of 2.7 per cent; operating expenses averaged \$722, a decrease of 7.7 per cent; net operating revenue per mile averaged \$288, an increase of 12.3 per cent, while taxes per mile were \$49, a decrease of 3.9 per cent. Net operating income was \$239, an increase of 16.2 per cent. Railways operating 228,736 miles of line are covered by this summary, or about ninety per cent of the steam railway mileage in the United States.

Total operating revenues of the Eastern railways per mile of line shows an increase of 1 per cent as compared with April,

the East, decreased 16.7 per cent in the South, and decreased 3.5 per cent in the West.

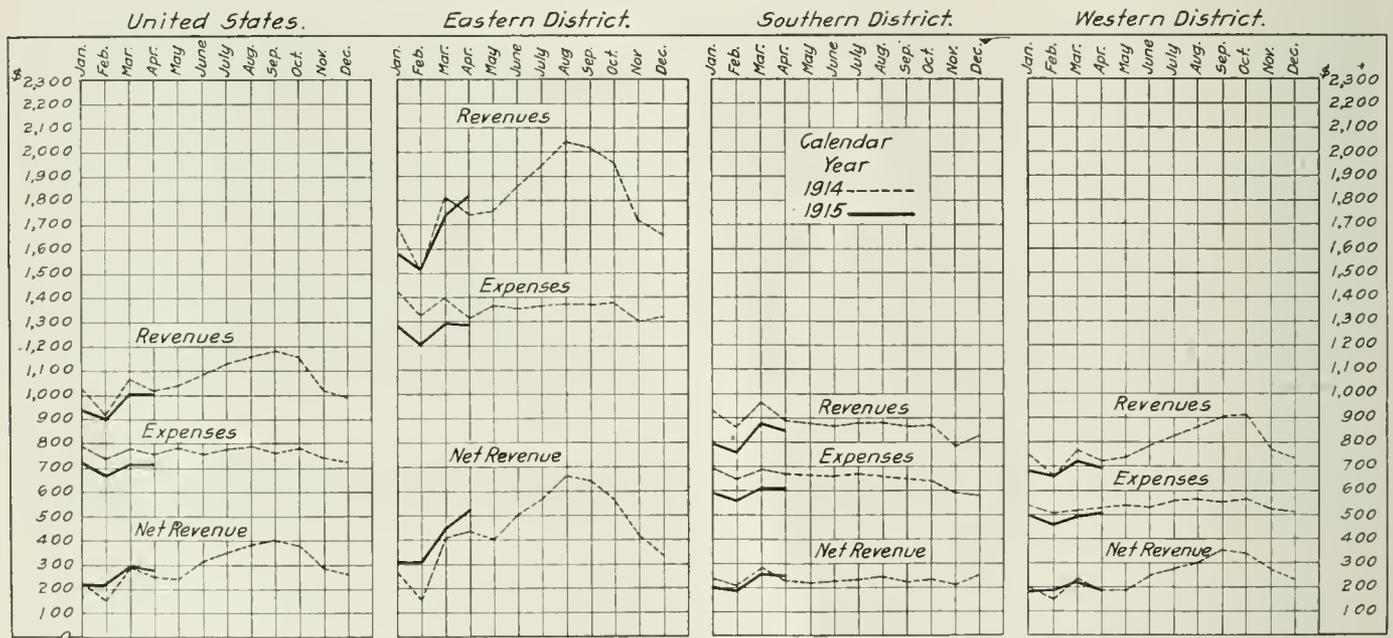

April net operating income per mile was 16.2 per cent greater in 1915 than in 1914, 11.7 per cent greater than in 1913, 12.8 per cent greater than in 1912, and 4 per cent less than in 1911.

The James J. Hill Professorship

The purpose and conditions of the gift to Harvard University of a sum to found the James J. Hill Professorship of Transportation, as mentioned in our issue of July 2, is explained in the following letter to the president and fellows of the University by the committee which arranged for the gift:

"The undersigned self-constituted committee, representing a wide circle of friends and admirers of James J. Hill, Esquire, and desiring to perpetuate many of Mr. Hill's ideas in a way so as to merit his cordial counsel and support, and at the same time give ample latitude in administration to the university, hereby present to the president and fellows of Harvard University the sum of \$125,000 to found the James J. Hill Professorship of Transportation.

"The income only of this fund shall be used to maintain a Professorship in the Graduate School of Business Administration of Harvard University. It is our desire that the recipient or recipients of this income shall give instruction or promote investigations in the subject of transportation, giving chief attention to railroad transportation. While it is our intention that this income shall ordinarily secure the service of a competent teacher, it is also our desire to promote research, and if for any reason

Monthly Revenues and Expenses per Mile of Line in 1914 and 1915

1914, operating expenses decreased 6.1 per cent, net operating revenue increased 23.9 per cent, taxes decreased 1.3 per cent, and operating income increased 29.8 per cent.

Total operating revenues of the Southern railways per mile of line shows a decrease of 6.1 per cent, operating expenses decreased 11.5 per cent, net operating revenue increased 10.3 per cent, taxes decreased 5.4 per cent, and operating income increased 13.5 per cent.

Total operating revenues of the Western railways per mile of line shows a decrease of 5.2 per cent, operating expenses decreased 7.5 per cent, net operating revenue increased 1.5 per cent, taxes decreased 5.5 per cent, and operating income increased 3.3 per cent.

The ten months of the current fiscal year show a decrease in total operating revenues per mile of line of 7.4 per cent as compared with the corresponding period of the preceding year, a decrease in operating expenses per mile of 9.6 per cent, a decrease in net operating revenue per mile of 1.6 per cent, a decrease in taxes per mile of 2.6 per cent, and a decrease in net operating income per mile of 1.4 per cent.

The net operating income per mile increased 8.2 per cent in

the professorship should be temporarily vacant, or in the discretion of the president and fellows it should be unnecessary to apply the entire income of this fund to maintain the professorship, they are authorized to use the income and accumulated income in contributing to the instruction and research in the university in the subjects named in such way as they see fit."

The letter was signed by the members of the committee: Robert Bacon, George F. Baker, Howard Elliott, Arthur Curtiss James, Thomas W. Lamont, Robert T. Lincoln and J. P. Morgan.

In announcing the gift to the alumni of the university President Lowell said:

"The largest single gift in money that the university has received during the year is dated June 21. It is that of \$125,000 to endow a professorship of transportation in the School of Business Administration, subscribed by friends of the school, and admirers of James J. Hill, in whose honor it is founded and named. The chair marks an epoch in the life of the school, and by its recognition of transportation as a permanent object of systematic instruction, in the life of the nation also. It is eminently fitting that such a professorship should bear the name of Mr. Hill, who has applied scientific principles to the construction and operation

of railroads to an extent, and with an accuracy, unknown before. He is, perhaps, best known to the public at large by having aroused the nation to the need of conserving its natural resources, but this was the fruit of a long active career in developing the vast country between the Great Lakes and Puget Sound, and enabling it to prosper. He had the imagination to conceive and the skill to execute a plan of transportation on a vast scale."

Exhibitors at the General Foremen's Convention

The following is a list of the exhibitors at the convention of the International Railway General Foremen's Association, held at Hotel Sherman, Chicago, July 13-16:

- Ashton Valve Company, Boston, Mass.—Pop safety and relief valves, pressure and vacuum gages. Represented by J. J. Gettrust.
- American Steel Foundries, Chicago.—Models, Vortic steel column posts, American adjustable pockets, Alliance couplers, Simplex couplers, Economy draft arm. Represented by Wm. C. Walsh and N. J. Melchert.
- Anchor Packing Company, Philadelphia, Pa.—Packing. Represented by E. C. Adams and J. O. Waterman.
- Barco Brass & Joint Company, Chicago.—Barco flexible joints. Represented by F. N. Bard and C. L. Miller.
- Baldwin Locomotive Works, Philadelphia, Pa.—Photographs of locomotives. Represented by A. S. Goble.
- Chicago Pneumatic Tool Company, Chicago.—Air and electric tools. Represented by J. L. Canby.
- Celfor Tool Company, Buchanan, Mich.—Drills and reamers. Represented by C. O. Montague.
- Cleveland Twist Drill Company, Cleveland, Ohio.—Twist drills, reamers and small tools. Represented by H. S. White.
- Duff Manufacturing Company, Pittsburgh, Pa.—Barrett jacks. Represented by C. N. Thulin.
- Dearborn Chemical Company, Chicago.—Catalogs. Represented by Geo. Carr, P. T. Payne and J. D. Purcell.
- Detroit Lubricator Company, Detroit, Mich.—Automatic flange lubricator, radiator valves, injectors, etc. Represented by A. D. Howard.
- Daniels Safety Device Company, Chicago.—Lock nuts. Represented by A. G. Wood and C. F. Ames.
- Edna Brass Manufacturing Company, Cincinnati, Ohio.—Injectors, lubricators, boiler checks, coal sprinklers, fire extinguishers, reflex water gages. Represented by E. O. Corey and H. A. Glenn.
- Grip Nut Company, Chicago.—Lock nuts. Represented by W. E. Sharp and B. C. Hooper.
- Garlock Packing Company, Palmyra, N. Y.—Packing. Represented by J. P. Landreth.
- Goldschmidt Thermit Company, New York—Examples of thermit welding. Represented by A. F. Beaulieu and H. S. Mann.
- Green, Tweed & Co., New York.—Palmetto packing, wrenches. Represented by V. B. Nickerson.
- Horne-Dale-Brown Company, Chicago.—Ratchet wrenches, Lincoln-Williams twist drills, Victor hack saws, Cleveland steel files. Represented by J. J. Dale, P. V. Bachelé and J. W. Horne.
- Hunt-Spiller Corporation, Boston, Mass.—Side rod bushings, driving boxes, shoes and wedges, cylinder bushings, cylinder packing, headers for superheaters, pistons, eccentrics and eccentric straps. Represented by V. W. Ellet, J. M. Monroe, E. J. Fuller and H. McB. Parker.
- Ingersoll-Rand Company, New York.—Pneumatic tools. Represented by R. C. Cole.
- Independent Pneumatic Tool Company, Chicago.—Pneumatic hammers, portable air and electric tools. Represented by H. F. Finney, F. J. Passino, G. C. Wilson and H. H. Henricks.
- Imperial Brass Manufacturing Company, Chicago.—Oxy-acetylene apparatus. Represented by J. G. Pettis.
- Jenkins Brothers, New York.—Valves and packing. Represented by B. J. Neely.
- Leslie Company, The, Lyndhurst, N. J.—Valves and coupling nuts. Represented by J. J. Cizek.
- Mudge & Co., Chicago—Mudge-Slater spark arrester. Represented by Burton W. Mudge and G. W. Bender.
- McCord & Co., Chicago.—Journal boxes, locomotive drifting valves. Represented by H. E. Creer.
- National Railway Devices Company, Chicago.—Shoemaker fire door, National and singlelink coupler release riggings. Represented by J. G. Robinson.
- National Boiler Washing Company, Chicago.—"Safety First" fire door. Represented by H. A. Varney.
- Niles-Bement-Pond Company, New York.—Catalogs of small tools and machinery. Represented by G. E. Mills, B. Sloan, D. Trees and F. K. Irwin.
- Ohio Injector Company, Chicago.—Lubricators and injectors. Represented by William Furry and A. C. Beckwith.
- O'Malley-Bears Valve Company, Chicago.—Valves. Represented by R. J. O'Malley.
- Paxton Mitchell Company, Omaha, Neb.—Piston packing rings. Represented by W. M. Leighton.
- Pilood Company, The, Swanton, Ohio.—Photographs of valve gears. Represented by F. S. Wilcoxon.
- Pyle-National Electric Headlight Company, Chicago.—Electric headlights. Represented by J. Will Johnson, W. Miller, L. H. Steger and C. E. Kinnaw.
- Summers-Boardman Publishing Company, New York—*Railway Age Gazette*, *Railway Age Gazette*, *Mechanical Edition*. Represented by R. V. Wright, R. E. Thayer, L. B. Sherman, C. R. Mills, F. H. Thompson and W. Ford.
- Street Company, R. K., Chicago.—Horton lathe and drill chucks, Billings and Spencer wrenches, Hyatt roller bearings, Yale & Towne triple blocks, Keystone pulleys. Represented by F. A. Taylor and C. J. Butterfuss.

- Rich Tool Company, Chicago.—Drills and reamers. Represented by L. Whiteside.
- Ryerson & Son, Jas. T., Chicago.—Catalogs of iron and steel and machinery. Represented by E. T. Hendee.
- United States Metallic Packing Company, Philadelphia, Pa.—Leach improved sander, King locomotive piston rod packing. Represented by M. B. Brewster and R. K. Wells.
- Whitman & Barnes Manufacturing Company, Akron, Ohio.—Drills, reamers and wrenches. Represented by M. E. Towner.

Awards at the Panama Pacific Exposition

The superior jury of the Panama-Pacific International Exposition at San Francisco has approved the following list of awards made by the group jury for exhibits in the railway division of the transportation department:

GRAND PRIZE

- Baldwin Locomotive Works, Philadelphia, Pa.
- Pennsylvania Railroad.
- Southern Pacific.
- United States Steel Corporation.
- United States Post Office Department.
- Westinghouse Air Brake Company, Pittsburgh, Pa.

MEDAL OF HONOR

- American Locomotive Company, New York.
- Cambria Steel Company, Philadelphia, Pa.
- Commonwealth Steel Company, St. Louis, Mo.
- Locomotive Superheater Company, New York.
- Ministry of Communications, Republic of China.
- National Malleable Castings Company, Cleveland, Ohio.
- New York Air Brake Company, New York.
- Pennsylvania Steel Company, Philadelphia, Pa.
- Rail Joint Company, New York.
- Westinghouse Traction Brake Company, Pittsburgh, Pa.
- Wells Fargo & Co.

GOLD MEDAL

- American Brake Shoe & Foundry Company, Mahwah, N. J.
- American Arch Company, New York.
- Chicago Car Heating Company, Chicago.
- Canadian Pacific.
- Denver & Rio Grande.
- Fairbanks, E. & T., & Co., St. Johnsbury, Vt.
- Flannery Bolt Company, Pittsburgh, Pa.
- Galena Signal Oil Company, Franklin, Pa.
- Gold Car Heating & Lighting Company, New York.
- Grand Trunk Railway.
- Great Northern.
- Griffin Wheel Company, Chicago.
- Hupp Automatic Mail Exchange Company, Chicago.
- Locomotive Stoker Company, Schenectady, N. Y.
- Manganese Steel Rail Company, New York.
- National Brake & Electric Company, Milwaukee, Wis.
- Railroad Supply Company, Chicago.
- Safety Car Heating & Lighting Company, New York.
- St. Louis Car Company, St. Louis, Mo.
- Standard Steel Works Company, Philadelphia, Pa.
- Taylor-Wharton Iron & Steel Company, High Bridge, N. J.
- Union Switch & Signal Company, Swissvale, Pa.
- Western Wheeled Scraper Company, Aurora, Ill.

SILVER MEDAL

- Adams & Westlake Company, Chicago.
- American Steel Foundries, Chicago.
- Ashcroft Manufacturing Company, New York.
- California Dispatch Line.
- Chicago Railway Equipment Company, Chicago.
- Franklin Railway Supply Company, New York.
- German-American Car Company.
- Han-Yet-Ping Iron & Steel Company, Han-Yong, China.
- Hale & Kilburne Company, Philadelphia, Pa.
- International Harvester Company, Chicago.
- McCloud River Railroad.
- Miner, W. H., Company, Chicago.
- Nathan Manufacturing Company, New York.
- Ohio Injector Company, Chicago.
- Orenstein-Arthur Koppel Company, Koppel, Pa.
- Pyle-National Electric Headlight Company, Chicago.
- Union Draft Gear Company, Chicago.

BRONZE MEDAL

- Ajax Metal Company, Philadelphia, Pa.
- Atkins, E. C., & Co., Inc., Indianapolis, Ind.
- Carcy, Philip, Company, Cincinnati, Ohio.
- Chambers Valve Company, New York.
- Copper River & Northwestern Railway.
- Detroit Lubricator Company, Detroit, Mich.
- General Brake Shoe & Supply Company, Chicago.
- Hewitt Rubber Company, Buffalo, N. Y.
- Hickey, W. J.
- Hwa Nan Kwai, China.
- Independent Pneumatic Tool Company, Chicago.
- Johns Manville, H. W., Company, New York.
- McLeod & Co., Chicago.
- Ohio Locomotive Crane Company, Bucyrus, Ohio.
- Parkesburg Iron Company, Parkesburg, Pa.
- Pennsylvania Steel Casting & Machine Company.
- Pittsburg Steel Foundry Company, Pittsburgh, Pa.
- St. Louis Steel Foundry Company, St. Louis, Mo.
- Swmington, J. H., Company, Rochester, N. Y.
- Taylor Portable Steel Derrick Company.
- United States Metallic Packing Company, Philadelphia, Pa.

HONORABLE MENTION

- Brill, J. G., Company, Philadelphia, Pa.
- Hobart Mather Company, Chicago.
- MacLeod Company, Cincinnati, Ohio.
- Sargent Company, Chicago.

MEETINGS AND CONVENTIONS

The following list gives the names of secretaries, dates of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontious, 455 Grand Central Station, Chicago. Next meeting, July 21, 1915, Milwaukee, Wis.
- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next meeting, August 19-20, 1915, San Francisco, Cal.
- AMERICAN RAILROAD MASTER TINNERS, COPPERSMITHS AND PIPEFITTERS' ASSOCIATION.—W. E. Jones, C. & N. W., 3814 Fulton St., Chicago. Annual meeting, July 13-16, 1915, Hotel Sherman, Chicago.
- AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—Owen D. Kinsey, Illinois Central, Chicago. Annual meeting, July 19-21, 1915, Hotel Sherman, Chicago.
- AMERICAN SOCIETY OF CIVIL ENGINEERS. Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday of each month, Pittsburgh.
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.
- INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, C. H. & D., Lima, Ohio. Annual meeting, August 17, 1915, Philadelphia, Pa.
- INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1126 W. Broadway, Winona, Minn. Next convention, July 13-16, 1915, Sherman House, Chicago.
- MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 14-16, 1915, Detroit, Mich.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.
- NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
- RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.
- RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Annual meeting, September 14-17, 1915, Salt Lake City, Utah.
- RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.
- RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.
- ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Annual meeting, September 14-16, 1915, Chicago.
- SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.
- SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.
- SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, C. R. I. & P., 1134 La Salle St. Sta., Chicago. Annual meeting, September, 1915.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.
- ST. LOUIS RAILWAY CLUB.—B. W. Fraebenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
- TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.
- TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.
- TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.
- TRAFFIC CLUB OF NEWARK. John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, 559 Broad St., Newark.
- TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Genl. Agt., Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh. Annual meeting, 2d Monday in June.
- TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings last Tuesday in month, except June, July and August, Hotel Astor, New York.
- TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.
- TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., East Buffalo, N. Y. Annual meeting, September 7-10, 1915, Chicago.
- UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.
- WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.
- WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.
- WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

Traffic News

J. F. Townsend, traffic manager of the National Tube Company, has been elected president of the Traffic Club of Pittsburgh.

Special trains carrying representatives of the government to give demonstrations in "better farming" are now touring the provinces of Saskatchewan and Alberta under the auspices of the Provincial Departments of Agriculture. The Canadian Pacific makes reductions in fare for passengers going to the cities and towns where demonstrations are made.

F. D. Underwood, president of the Erie, in an interview given to a Milwaukee paper last week, was quoted as advocating a passenger rate of 1 cent a mile and a 20 per cent advance in freight rates. Mr. Underwood said that if the Interstate Commerce Commission should make an experiment of this kind and it proved unsuccessful, the old condition could be restored on short notice.

The Official Classification Committee held a meeting in New York on Tuesday, July 13, for the consideration of subjects enumerated in docket No. 23, including recommendations of the committee on Uniform Classification respecting classification rules and descriptions of articles. A preliminary hearing was held in the rooms of the Central Freight Association in Chicago on Thursday, July 8.

The Canadian Government Railways expect during the next winter to maintain regular transportation service between the main land and Prince Edward Island regularly, in spite of ice, a new car ferryboat, designed to break thick ice, having just been received from Newcastle, England. The vessel has three sets of engines and in fair weather will make 15 knots an hour. There are two propellers at the stern and one forward. The deck has two tracks for cars, each 254 feet long.

Passenger trains are now running over the National Transcontinental between Cochrane, Ont., and Winnipeg; and, according to the announcement of the "Canadian Government Railways," which is the operating organization, trains will run through between Winnipeg and Toronto, 1,257 miles. The route from Toronto is by the Grand Trunk to North Bay, 227 miles, and the Temiskaming & Northern Ontario, operated by the Ontario government, from North Bay to Cochrane, 253 miles. Trains will leave Toronto on Tuesdays, Thursdays and Saturdays at 10:45 p. m., and are scheduled to run through to Winnipeg in 42 hours.

Car Surpluses and Shortages

The committee on relations between railroads of the American Railway Association, in presenting statistical statement No. 6 giving a summary of freight car surpluses and shortages for July 1, 1915, says:

The total surplus on July 1, 1915, was 275,896 cars; on June 1, 1915, 300,146 cars, and on July 1, 1914, 220,875 cars.

The surplus for June 1, 1915, shown above, includes figures reported since the issue of statistical statement No. 5, reported in the *Railway Age Gazette* of June 18, page 1452.

The decreases in surplus under June 1, 1915, are chiefly in groups 2, 3 and 6 (East and Central North) and group 8 (Central), except box cars. There is an increase in the surplus of box cars, chiefly in groups 2, 3 and 6 (East and Central North) and group 11 (Canada).

The total shortage on July 1, 1915, was 785 cars; on June 1, 1915, 218 cars, and on July 1, 1914, 1,333 cars.

The shortage for June 1, 1915, shown above includes figures reported since the issue of statistical statement No. 5.

The figures by classes of cars follow:

Classes.	Surplus.	Shortage.
Box	131,105	331
Flat	13,536	77
Coal and gondola.....	83,726	185
Other	47,529	192
	275,896	785

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Rates on Lumber to Las Cruces, N. Mex.

Bascom-French Company et al. v. Atchison, Topeka & Santa Fe et al. Opinion by the commission:

The commission finds that the rate of 34 cents a 100 lb. on lumber and articles taking the lumber rate in carloads from Texas and Louisiana producing territory to Las Cruces, N. Mex., is unreasonable to the extent that it exceeds 28 cents. Reparation denied. (34 I. C. C., 388.)

Complaint Dismissed

Louden Machinery Company v. Atchison, Topeka & Santa Fe et al. Opinion by the commission:

The commission finds that the western classification rating applicable to feed or litter carriers in less than carloads, the minimum weights applying to the same commodities in straight carloads, or mixed with stalls, stanchion frames, or stanchions, and the refusal of the carriers to permit the mixture of these commodities in carloads with agricultural implements is not unreasonable or otherwise in violation of the act. (34 I. C. C., 383.)

Western Newspaper Union v. Aberdeen & Rockfish et al. Opinion by Commissioner McChord:

The commission finds that the present classification of first class on new stereotype plates and third class on old stereotype plates in less than carload lots in official and southern classification territory is not unreasonable or discriminatory. (34 I. C. C., 326.)

Nebraska State Railway Commission v. Union Pacific et al. Opinion by Commissioner Hall:

The commission finds that the rates on wheat and on corn, and articles taking the same rates, from certain stations on the Union Pacific in Nebraska, Central City to Gothenburg, inclusive, to St. Joseph and Kansas City, Mo., and Leavenworth, Kan., are not unreasonable or discriminatory. (34 I. C. C., 381.)

Concentration of Cotton at Alexandria, La.

Opinion by Commissioner Clark:

The commission finds that the Chicago, Rock Island & Pacific has not justified a proposed cancellation of privileges relative to the concentration and compression of cotton and cotton linters at Alexandria, La., and reshipment therefrom, upon the basis of through rates. The carrier contended that the concentration and compression of cotton at this point involved unusual expense to it, as the compress is on the tracks of other companies, whereby the Rock Island is compelled to pay a switching charge of \$2.50 per car or a drayage charge of 10 cents a bale. (34 I. C. C., 163.)

Transit on Grain and Mixed Feed at Memphis

Memphis Grain & Hay Association et al. v. Illinois Central et al. Opinion by Commissioner Harlan:

In the original report in this case (24 I. C. C., 609) it was found that under the rate structure and transit rules then applying on grain and mixed feeds Memphis was unduly restricted in its source of supply when compared with the access of St. Louis to a materially more extensive producing territory through the maintenance of a system of reshipping rates. The result of this was to give St. Louis an undue advantage over Memphis in reaching points in the Mississippi valley that are geographically in Memphis territory. At that time through rates on grain to Mississippi valley points over the Illinois Central were applicable under a transit arrangement through Memphis only when the grain originated on the Illinois Central, the Burlington, the Wabash and the South Dakota Central, and then only when the line of the Illinois Central was used into and out of Memphis. The Illinois Central has since readjusted its tariffs as to meet the requirements of Memphis with respect to grain produced in Missouri, Nebraska, Iowa, South Dakota, Wisconsin, Minnesota, Illinois and Indiana, by establishing through rates to Mississippi

valley points with a liberal transit arrangement at Memphis, and it has extended this arrangement to traffic transported under combination rates where through rates were not established. The commission finds that the widening of the territory in the middle west from which Memphis may now draw grain has circumscribed the advantage heretofore existing in favor of St. Louis to a point where it is no longer undue. This has no application to grain from southwestern territory that reaches Memphis over western lines. It is the opinion of the commission that this territory should be made available to Memphis under a transit arrangement that will permit the participating carriers to retain the proportions they now receive in dividing the current through rates. The record will be left open for further action on the part of the carriers. (34 I. C. C., 315.)

Rates on Coal from the Sullivan-Linton Group

Monon Coal Company et al. v. Chicago & Eastern Illinois et al.

The commission finds that a rate of 87 cents a ton on coal to Chicago from mines in the Sullivan-Linton group of Indiana is not discriminatory as compared with the rate of 77 cents from mines in the Brazil-Clinton district of Indiana. The issue was one of alleged discrimination only, the reasonableness of the 87-cent rate not having been questioned. The commission believes that the situation in which the operators of the Sullivan-Linton group now find themselves is due not to a rate schedule that is unreasonable or discriminatory, but largely to a trade condition which has developed in a neighboring field, namely, the opening of new mines in the Brazil-Clinton field, particularly in the No. 4 vein. (34 I. C. C., 221.)

Rates from Iowa Points to Stations on the Santa Fe in Kansas

Iowa State Board of Railroad Commissioners v. Arizona Eastern et al. Opinion by Commissioner Daniels:

The original order in this case (28 I. C. C., 563) prescribed a mileage scale in conformity to which rates were to be established from points in interior Iowa to certain destinations in Kansas. It is alleged that the application of the scale has resulted in rates to Kansas points from Council Bluffs and other points in western Iowa lower than the present rates to the same points in Kansas from Omaha and other points similarly situated on the Missouri river. The commission, therefore, finds that the order should be modified so that the carriers may establish from the points in Iowa in question to points in Kansas on the main line of the Santa Fe to La Junta, Colo., and other points in Kansas north thereof, rates not less than those which were in effect on May 31, 1914—the day before the order became operative—from the Missouri river cities to the same destinations. (34 I. C. C., 379.)

The Goldfield Cases

Inquiry and investigation concerning the reasonableness of freight rates to points on certain railroads in Nevada. Opinion by Commissioner Meyer:

This is an investigation by the commission on its own motion concerning the reasonableness of the rates on freight from various points in the United States to points in Nevada on the Tonopah & Goldfield, the Las Vegas & Tonopah and the Bullfrog-Goldfield.

Tonopah and Goldfield are mining camps about 30 miles apart, in a wide region of western Nevada with practically no present agricultural possibilities. The former is served by the Tonopah & Goldfield, which extends from Goldfield through Tonopah to Mina, a distance of about 100 miles, where connection is made with the Southern Pacific and by the Bullfrog-Goldfield, which extends in a southerly direction from Goldfield to Beatty, Nev., a distance of 80 miles. At Beatty this road connects with the Tonopah & Tidewater, which extends in a southerly direction 168 miles from Beatty to Ludlow, where it connects with the Santa Fe. At Beatty connection is also made with the Las Vegas & Tonopah, extending in a southeasterly direction 118 miles to Las Vegas, Nev., where connection is made with the San Pedro, Los Angeles & Salt Lake.

The Tonopah Railroad was completed to Tonopah in 1904, and was built as a direct result of the discovery of silver at Tonopah in 1900. It was originally a narrow-gauge line, but when gold was discovered at Goldfield in the fall of 1903, it was

extended to that point, changed to standard-gage and renamed the Tonopah & Goldfield. For a while its business was very great, the tonnage and travel over the Tonopah Railroad during the 16 months of its operation as a narrow-gage line being so great as to tax its capacity to the utmost, and to give it a net income sufficient to pay for more than one-half its original cost. The population of Goldfield in 1905 and 1906 was about 20,000. Tonopah had a population of nearly 10,000, while the outlying mining districts that drew their supplies from these camps had a population of at least 10,000 more. The Bullfrog-Goldfield was built in 1905-6. The Tonopah & Tidewater was completed in December, 1907, and was constructed primarily to furnish a rail outlet for the borax deposits in Death Valley, Cal. The Las Vegas & Tonopah built to Beatty in October, 1906, and to Goldfield in October, 1907, was projected by those owning the Salt Lake Line.

It was shown that the only one of these four roads that has been able to pay dividends is the Tonopah & Goldfield, which has been able to pay $5\frac{2}{3}$ per cent during the years of its operation, and to retire approximately 60 per cent of the bonds outstanding at the time of its completion. All of these roads are almost entirely dependent on the operation and development of the mining industries, the total irrigated and cultivated area along their 500 miles of line not exceeding 500 acres. There is no timber and very little stock, the country not being adapted for the latter. The sparsity of traffic on the lines south of Goldfield is shown by the fact that the mixed train from Las Vegas to Beatty, which runs six times a week, averages from 8 to 11 passengers and from one to three carloads of freight and returns with a like number of passengers and almost no freight whatever. The trains on the Tonopah & Tidewater carry about a like amount. The total tonnage handled by the Las Vegas & Tonopah during October, 1914, was 2,891 tons, and by the Bullfrog-Goldfield, 2,888 tons.

Reductions in rates have been made by the California and the Nevada railroad commissions. The scale of wages paid to the employees of these roads is from 25 to 65 per cent higher than the average upon roads in the United States. The outlook for the future from the development of new business is quite gloomy. The lives of the silver or gold mining camps have been limited and Rhyolite and Beatty, which in 1907 had a population of probably 10,000 people, now have a combined population of about 300. Goldfield's present population is approximately 5,000 and Tonopah's population has been reduced to half of that in 1907. The lines operate over a mountainous and barren country with severe grades and difficult operating conditions.

For these reasons the commission refuses to find that the rates involved in this and the related cases are unreasonable. Complaints dismissed. (34 I. C. C., 360.)

Reshipping Rates on Grain at St. Louis

Merchants Exchange of St. Louis v. Baltimore & Ohio, et al. Opinion by Commissioner Meyer:

This case arises from the establishment by act of the Missouri legislature of lower intrastate rates on grain and flour from interior Missouri points to St. Louis than the proportion of interstate rates for the same movement on through shipments. The lower rates became effective June 12, 1913. On January 10, 1914, the carriers from St. Louis and East St. Louis to central freight association and trunk line territories refused to apply the reshipping rates from St. Louis to points in those territories except upon surrender of inbound expense bills showing that the grain had moved to St. Louis at the interstate rate or else upon payment of the difference between the intrastate and the interstate rate to St. Louis. The Merchants Exchange of St. Louis attacks this regulation as unreasonable.

As a general rule, the rates from St. Louis to southeastern Mississippi valley, and southwestern territories are not published as proportional or reshipping rates, but apply from St. Louis proper as well as on grain coming from beyond.

The Southwestern Missouri Millers' Club alleges that the millers at interior Missouri milling points are discriminated against in that the combination of the state rates to St. Louis and the rates to points in central freight association, trunk line, southeastern, Mississippi valley, and southwestern territories is lower than the rate for the through movement from interior Missouri points to the same destinations.

The case is further complicated because most of the grain which comes to St. Louis is not billed through to destinations beyond but to consignees at St. Louis, by whom it is sold on the grain exchange. It frequently changes hands several times.

The commission finds that in the absence of local or flat rates from St. Louis proper, shipments of grain and grain products are entitled to move out on reshipping rates "regardless of the point of origin of the grain and regardless of the rate paid on the inbound shipment" because "we must so construe the tariffs as to permit the traffic to move, if that be possible," thus reaffirming the decision in *Merchants Exchange of St. Louis v. Baltimore & Ohio* (30 I. C. C., 700.)

It is also held that while reshipping or proportional rates are applicable to part of a through but suspended movement from point of origin to ultimate destination, outbound local rates, although they may likewise apply to part of a through movement, can not be limited according to the point of origin of the shipment or the rates which were paid inbound. So long as there are intrastate rates published to St. Louis shippers can not be denied the right to avail themselves of these rates for movements which are clearly intrastate, and so long as there are flat rates published out of St. Louis shippers must be permitted, in proper cases, to ship outbound under these rates irrespective of the rates paid inbound. It is plain that the intrastate movement to St. Louis must be considered as a separate movement which can not be tied up to the outbound movement in such a manner as to constitute the two one through movement, provided the consignee has in good faith taken possession. Absorption of elevation charges is made upon the theory that the inbound and outbound movements comprise a through movement and that the grain has been elevated in transit. Whenever the absorption is made the grain can not lawfully move forward except at the balance of the through rate.

However, while St. Louis shippers can not be denied the benefit of the intrastate rates to St. Louis so long as they are in force, that does not preclude a finding that the intrastate rates effect an unjust discrimination against interstate traffic.

The record is not sufficient to justify a determination as to the reasonableness of the present interstate rates from interior Missouri points to St. Louis. Should the intrastate rates remain unchanged a widespread revision of rates from interior Missouri points through Memphis to the southeast and the Mississippi valley and of the direct rates to the southwest will have to be made. This revision may even spread to the rates from Kansas and Nebraska points to St. Louis and other markets.

The commission must come to the conclusion, nevertheless, that in the maintenance of interstate rates higher than the intrastate rates from interior Missouri points to St. Louis an unlawful prejudice and advantage is given to St. Louis and an unjust discrimination is effected against the interior Missouri and southern Illinois points and East St. Louis.

The carriers serving St. Louis from the west are, therefore, ordered to desist from this discrimination. (34 I. C. C., 342.)

STATE COMMISSIONS

The Arkansas Railroad Commission has given permission to the Arkansas Central to charge a 2-cent a mile passenger fare on its line from Ft. Smith, Ark., to Paris, 60 miles.

Investigation of rates and service of the Westmoreland Water Company and the Ohio Valley Water Company, which supply large districts and railroads in western Pennsylvania has been undertaken by the Pennsylvania Public Service Commission. Physical valuation may be ordered.

The Missouri railroads have filed their brief with the public service commission of the state, reviewing the evidence that has been taken in a series of hearings throughout the year on the application of the roads for general advances in freight and passenger rates throughout the state. Final arguments in the case were set for July 15.

The State Corporation Commission of Arizona has entered before the Interstate Commerce Commission a formal complaint that passenger rates between Arizona and California are unjust and discriminatory. Charges are made against the Southern Pacific, the El Paso & Southwestern, the Arizona & New Mexico, the Arizona Eastern and the Grand Canyon.

The Alabama State Railroad Commission has denied the pe-

tion of the Louisville & Nashville for authority to advance passenger rates on its branch lines from 2½ cents a mile to 3 cents. Two applications for authority to make advances in freight rates have also been denied; that of the Nashville, Chattanooga & St. Louis to advance certain rates on its Huntsville division, and that of the roads entering Mobile to make an advance in the rates on pig iron carried to that city. The rate from the principal mines to Mobile is now \$1.75 a ton; the roads desired to advance it to \$2.75 a ton. The petition of the Anniston Chamber of Commerce for an order reducing rates on steam coal to that city, over the Louisville & Nashville and the Southern, was denied; and all petitions for authority to increase rates on coal to Birmingham were denied.

The Arkansas Railroad Commission has announced that it will make no effort to restore a 2-cent passenger rate on the St. Louis & San Francisco and the Kansas City Southern, although it had previously refused to accept the railroad's 2-cent a mile tariffs, pending an appeal from the recent decision of Judge Trieber of the United States court at Little Rock, sustaining a 3-cent fare. Judge Trieber has rendered a decision declaring unreasonable the freight tariff filed by the St. Louis & San Francisco to take the place of the railroad commission's tariff which the court had earlier declared unreasonable. This placed into effect a court tariff which had been in effect for a time during the litigation. A hearing on the application of the roads for a perpetual injunction against the Arkansas Railroad Commission's freight tariff will be held in St. Louis in the circuit court of appeals in December.

COURT NEWS

The Wadley Southern, a company operating less than 100 miles of line, has paid into the treasury of the State of Georgia a fine of \$1,000, being the penalty imposed by the court, in Jefferson county, in 1911, for refusal to obey an order of the state railroad commission. The order of the commission had directed the Wadley Southern to cease giving preference to the Central of Georgia in through freight shipments, to the prejudice of the Macon, Dublin & Savannah. The Wadley Southern is owned by the Central of Georgia.

Showing Tickets Before Entering Cars

The Oklahoma⁺ Supreme Court sustains order No. 804 of the Corporation Commission directing railroads to desist from requiring passengers to show tickets before entering the cars and requiring them to collect from passengers who board cars without tickets an additional one cent a mile fare (except where tickets are not on sale). The court holds that the rule is not in conflict with Section 812, Rev. Laws 1910, authorizing a common carrier to demand passenger fare either at starting or at any subsequent time. *St. Louis & S. F. v. Travelers' Corporation* (Okla.), 148 Pac., 166.

Damages from Sparks—Plaintiff Must Indicate Engine

In an action for damages from fire alleged to have been caused by sparks from an engine, it was held by the Georgia Supreme Court that the petition, speaking of "defendant's engine" did not plainly and distinctly set forth the ground of complaint in such manner as to put the defendant on notice of what engine it was claimed emitted the sparks, so that it might be prepared to show, if it could, that any emission of sparks was not due to negligence in the equipment or operation of the engine. The petition should have alleged, as was claimed by the railroad, at what time of day the fire occurred. *Louisville & Nashville v. Moreland* (Ga.), 85 S. E., 341.

Reasonable Uses of Freight Yard—Sufficient Regulation as to Soft Coal

The following are the New York Court of Appeals' holdings in the case of *Hearst v. New York Central*, which has already been briefly noticed: (1) That the plaintiff was entitled to maintain the action, which was to enjoin certain uses by the company of its tracks west of Riverside Drive and between Seventy-second and Ninety-sixth streets, New York; (2) that the company had the right in the regular course of business to use switch engines in transferring cars to the different freight yards,

though this involved some noise, and that the kicking of cars from the main tracks on to stub tracks was not unreasonable; (3) that the habitual and indefinite storing of livestock outside the yard and near the plaintiff's residence should be enjoined; (4) that the use by the company of its through tracks for the purpose of separating and classifying cars intended for its other yards was not reasonably incident to the use of the yard at the point in question. Anthracite coal only was used on yard engines, and the company's rules required that outgoing road engines should be supplied with enough of such coal to carry them beyond the point in question, and that the fires of incoming engines should be banked above that point and no smoke or cinders emitted. It was held that the enforcement of these rules was sufficient for a reasonable regulation of the business of the road. The order of the Appellate Division was modified in accordance with these views.

Improper Remarks of Counsel Cause Reversal

In an action for injuries to a switchman the defenses were negligence of fellow servant, assumption of risk and contributory negligence. The question of contributory negligence was exceedingly close and depended entirely upon the credibility of the witnesses. In his closing argument to the jury the plaintiff's counsel, after giving a vivid description of the perils which constantly threaten a switchman, made the following statement: "I say to you the time will come in this country and in this civilization when the rule of fellow servants, and the rule of assumed risk and contributory negligence, will be relics of barbarism, and will no longer disgrace our law." This statement was objected to, and the trial court ruled that it was improper and should not be considered. Plaintiff's counsel then said that it was not the law now, but that he had a right to express his opinion of the law if he did not attempt to mislead the jury as to what was, in fact, the law, nor seek to induce them not to follow the law. On appeal from a judgment for the plaintiff, the Illinois Supreme Court held that, in view of the condition of the plaintiff, who was seriously and permanently injured, and whose condition was likely to awaken the jury's sympathy, the argument was of such a character as to be calculated to arouse the prejudice of the jury, and the defendant was entitled to a new trial. *N. V. Coy v. Chicago & Alton* (Ill.), 109, N. E. 1.

Fires—Limits of Liability—New York Rule

In an action for the value of two buildings and contents and some lumber and shingles set on fire by sparks or dropped coals, the trial court charged the jury that they must find, in order to make the railroad liable for the lumber and shingles, that the fire was communicated directly to them and not from the buildings. It was impossible to determine from the evidence where the fire started, or whether it was communicated from one building to the other or from the buildings to the lumber and shingles, or vice versa. The jury therefore returned a verdict for the company. All the property abutted on the track.

On appeal the New York Court of Appeals said that it is the settled law of the state of New York that the limit of liability for damages caused by a fire allowed to spread from one's premises to his neighbors is the damage to the abutting lands, and that damages to the lands of other proprietors not adjoining the premises of the one responsible for the origin of the fire are too remote. *Hoffman v. King*, 160 N. Y., 618, 55 N. E., 401, 46 L. R. A. 672; *Van Inwegen v. Port Jervis, M. & N. Y.*, 165 N. Y., 625, 58 N. E. 878; *Dougherty v. King*, 165 N. Y., 657, 59 N. E. 1121. The prior decisions of the New York Court of Appeals were reviewed in the *Hoffman* case, and a workable, if somewhat arbitrary, rule was adopted. The court thinks that this rule should be adhered to, but not extended. In the present case there was no intervening property between the plaintiff's lands and the track. A fire communicated to any part of the property destroyed was almost certain to spread to the rest. If the origin of the fire was attributable to the railroad's negligence, the entire destruction of property caused by it was a proximate result of that negligence. The mere fact that the fire may have spread from one building to the other, or from the buildings to the lumber, did not break the causal connection between the company's negligence and the entire damage done. Judgment for the defendant was reversed and a new trial ordered. *Davies v. D. & L.* (N. Y.), 109 N. E. 95.

Railway Officers

Executive, Financial, Legal and Accounting

W. C. Carr has been elected treasurer of the Toledo Terminal Railroad, with office at Toledo, Ohio, vice R. H. Scribner, resigned.

C. S. Burg, assistant general counsel of the Missouri, Kansas & Texas, has been appointed interstate commerce counsel, with headquarters at St. Louis, Mo.

G. H. Winsor, secretary, auditor and traffic manager of the San Benito & Rio Grande Valley at San Benito, Tex., has been appointed also general superintendent, vice E. E. McLellan, resigned.

John J. Ekin, general accountant of the Baltimore & Ohio, with headquarters at Baltimore, Md., has been appointed general auditor of the entire system. Mr. Ekin was born on June 8, 1873, at Whitestown, Pa., and began railway work in 1895, as a warehouse clerk on the Pittsburgh & Western, now a part of the Baltimore & Ohio. He then served in the yard and freight offices at Ellwood City, Pa., and later was transferred to the auditor's office, at Pittsburgh, Pa. On February 1, 1901, he was appointed general book-keeper, and was promoted to chief clerk to the auditor the following July. In March, 1902, he was appointed book-keeper and general clerk in the office of the auditor of subsidiary lines of the Baltimore & Ohio at Baltimore, Md., and in January, 1904, was promoted to chief clerk in the same department, remaining in that position for four years. He was subsequently auditor, superintendent of the relief department and secretary to the board of managers of the Washington Terminal Company, and at the time the government instituted the railroad valuation campaign, Mr. Ekin was appointed secretary of the valuation committee of the Baltimore & Ohio. On December 1, 1913, he was appointed general accountant, which position he held until the time of his recent appointment as general auditor of the same road, as above noted.

J. J. Ekin

Operating

C. B. Davidson has been appointed trainmaster of the Wabash for the sixth and seventh districts, with headquarters at Forrest, Ill.

Morris Donahue, roadmaster of the Chicago & Alton at Bloomington, Ill., has been appointed general roadmaster, with headquarters at Bloomington. F. B. McMillan, supervisor at Springfield, Ill., succeeds Mr. Donahue.

Frank E. Hatch has been appointed trainmaster of the Illinois Central at Centralia, Ill., succeeding A. M. Umshler, and James D. White has been appointed trainmaster of the Johnson City and Goleonda branches, and the Carbondale and Eldorado districts (except between Du Quoin and Pinckneyville), with headquarters at Carbondale, Ill., succeeding Mr. Hatch.

J. H. Stanfel, superintendent of the Southern Railway and the Northern Alabama at Birmingham, Ala., has been promoted to general superintendent of the Southern district of the Southern Railway, with headquarters at Birmingham, Ala., vice C. L. Harris, resigned. H. H. Vance, superintendent of

terminals of the Southern Railway at Birmingham, has been appointed superintendent of the Southern Railway and the Northern Alabama, with headquarters at Birmingham, vice Mr. Stanfel. B. Haggard, trainmaster of the Southern Railway at Birmingham, Ala., has been appointed superintendent of terminals, in charge of Birmingham terminals, with headquarters at Birmingham, vice Mr. Vance, and T. O. Crane has been appointed trainmaster, east end, Birmingham division, with headquarters at Birmingham, vice Mr. Haggard, promoted.

Clifford E. Ocheltree, whose appointment as superintendent of terminals of the Wabash at St. Louis, Mo., has been announced, was born at Homer, Ill., on January 20, 1874. He was educated in the public schools at Homer and attended the University of Illinois during the years of 1891 and 1892. He entered railway service on June 21, 1893, with the Wabash as telegraph operator and agent, and served in that capacity at various stations on the Decatur division until April, 1902, when he was made car distributor at Decatur, Ill. Later in 1902 he was promoted to despatcher at Decatur, and in November, 1904, was made night chief despatcher, becoming chief despatcher of the Springfield division in December, 1905. In November, 1906, he was made chief despatcher of the Decatur division, which position he held until November, 1910, when he was appointed trainmaster of the sixth, seventh and eighth districts of the same division. From October, 1912, until July, 1915, he was assistant superintendent of the Decatur division, from which position he is now promoted.

C. E. Ocheltree

William Chappell Downing, whose appointment as general superintendent of the Northwest system of the Pennsylvania Lines West of Pittsburgh, with headquarters at Pittsburgh, Pa., has been announced, was born at Richmond, Ind., on August 21, 1865. He was educated in the public schools and the Earlham college at Richmond, and entered railway service in April, 1885, with the Chicago, St. Louis & Pittsburgh as rodman on an engineering corps. On June 1, 1886, he was made acting assistant engineer, and on September 7, 1888, was appointed assistant engineer at Indianapolis, Ind. From May 1, 1891, to June 1, 1895, he was engineer of maintenance of way of the Richmond division of the same road, with headquarters at Richmond, Ind., when he was appointed in the same capacity on the Main Line division of the Terre Haute & Indianapolis (now the Vandalia). On June 10, 1901, he was appointed superintendent of the Peoria division of the Vandalia, and on April 5, 1902, he returned to the Maine Line division as superintendent, which position he held until November 1, 1912, when he was appointed superintendent of the Pittsburgh division of the Pittsburgh, Cincinnati, Chicago & St. Louis, with headquarters at Pittsburgh, Pa. On February

W. C. Downing

1. 1914, he was appointed general superintendent of the Central system of the Pennsylvania Lines West of Pittsburgh, with headquarters at Toledo, Ohio, from which position he is now promoted.

Charles L. Mason, whose appointment as superintendent of the Kansas City division of the Atchison, Topeka & Santa Fe, with headquarters at Kansas City, Mo., has been announced, was born at Portland, Ind., on December 24, 1868, and was educated in the public schools of that city. He entered railway service on June 10, 1887, and served as clerk at various stations on the Middle West and the Oklahoma divisions until May, 1893, when he came to Chicago and worked as clerk at the Grand Central passenger station. The following year he returned to the Atchison, Topeka & Santa Fe and served in clerical positions on the Illinois division until August, 1899, when he was made agent at Streator, Ill. In April, 1903, he was appointed superintendent and agent at St. Joseph, Mo., and on July 1, 1914, was appointed trainmaster of the eastern division, with headquarters at Emporia, Kan., from which position he is now promoted.

Traffic

C. M. Fish has been appointed traffic manager of the Texas-Mexican, with headquarters at Laredo, Tex.

J. D. Cornell has been appointed traffic manager of the Joplin & Pittsburg, with headquarters at Kansas City, Mo.

H. G. Leutert has been appointed traffic manager of the Kansas City, Mexico & Orient of Texas, with headquarters at San Angelo, Tex., succeeding J. P. O'Donnell, resigned.

C. L. Ewing, chief of tariff bureau (freight) of the Central of New Jersey at New York, has been appointed assistant general freight agent. He will continue in charge of the tariff bureau.

J. C. Murray, general freight agent of the Missouri & North Arkansas at Harrison, Ark., has been appointed general freight and passenger agent, with headquarters at Harrison, and the office of J. Kerr, general passenger agent, has been abolished.

George H. Lee, general passenger agent of the Third district of the Chicago, Rock Island & Pacific at St. Louis, Mo., has been appointed general passenger agent of the Lehigh Valley, with headquarters at New York, succeeding George W. Hay, resigned, effective August 1.

Lewis Snodgrass, commercial freight agent of the Delaware & Hudson at St. Louis, Mo., has been appointed special agent, freight department, with office at Albany, N. Y., and J. B. Stewart has been appointed general agent, freight department, with office at St. Louis, Mo., vice Mr. Snodgrass.

Engineering and Rolling Stock

George M. Rice has been appointed chief engineer of the Puget Sound & Willapa Harbor, with headquarters at Raymond, Wash., succeeding C. H. Byers, resigned.

G. E. Buckley, engineer maintenance of way of the Western district of the Southern Railway, at St. Louis, Mo., has been appointed engineer maintenance of way of the Northern district, with headquarters at Richmond, Va., vice W. T. Dobyms, resigned; and H. E. Tyrrell, supervising engineer, at Washington, D. C., has been appointed engineer maintenance of way of the Western district, with headquarters at St. Louis, vice Mr. Buckley.

Purchasing

The office of C. A. Gerrard, general storekeeper of the Missouri & North Arkansas at Harrison, Ark., has been abolished, and the duties of that office will in future be performed by Charles Manley, master mechanic at Harrison.

Special

G. S. Ward has been appointed chief special agent of the Wabash, with headquarters at St. Louis, Mo.

L. J. Ferritor, formerly superintendent of the Chicago & Alton, has been appointed personal representative of President E. F. Kearney of the Wabash, in charge of affairs in Canada, with headquarters at Buffalo, N. Y.

Equipment and Supplies

LOCOMOTIVE BUILDING

THE GOVERNMENT RAILWAYS OF THE UNION OF SOUTH AFRICA are reported to have ordered 6 narrow gage locomotives from the Baldwin Locomotive Works.

THE ST. PAUL BRIDGE & TERMINAL has ordered one Mogul type locomotive from the American Locomotive Company. This locomotive will have 20 by 26 in. cylinders and 51-in. driving wheels.

CAR BUILDING

THE QUANAH, ACME & PACIFIC has ordered 25 box cars from the Mount Vernon Car Manufacturing Company.

THE NORTHERN RAILWAY OF FRANCE is reported to have ordered 1,300 freight cars from the National Steel Car Company.

THE BUFFALO, ROCHESTER & PITTSBURGH is said to be contemplating the purchase of 900 underframes. This item has not been confirmed.

THE CHICAGO, BURLINGTON & QUINCY has ordered 1,000 box cars from the Bettendorf Company, and 1,000 from the American Car & Foundry Company.

G. HARRY PEACOCK, Selma, Ma., writes that he is in the market for 6 second hand 30-ft. box cars, and 15 second hand 3-ft. gage box car bodies for New York city delivery.

THE CHICAGO & NORTH WESTERN has ordered 2 observation-lounging cars and 3 observation-buffet-lounging cars from the Pullman Company, and is inquiring for 300 automobile cars.

IRON AND STEEL

THE LEHIGH & NEW ENGLAND has ordered 300 tons of bridge material from the Phoenix Bridge Company.

THE BALTIMORE & OHIO has ordered 300 tons of steel from the Fort Pitt Bridge Works for a bridge in Ohio.

THE CHICAGO, BURLINGTON & QUINCY has ordered 500 tons of steel for girder spans from the American Bridge Company.

THE PULLMAN COMPANY has ordered 180 tons of steel for a track system and overhead crane at Pullman, Ill., from the American Bridge Company.

THE SOUTHERN has ordered from the American Bridge Company 1,200 tons of structural steel shapes, to be used in a new building at Washington, D. C.

THE RUSSIAN GOVERNMENT is reported to have ordered 100,000 tons of 67-lb. rails from the Cambria Steel Company and 60,000 tons from the Lackawanna Steel Company.

THE PENNSYLVANIA RAILROAD has placed a large order for rail joints, frogs and switches for the Delaware River Terminal at Philadelphia, with the Pennsylvania Steel Company.

MACHINERY AND TOOLS

THE NEW YORK, ONTARIO & WESTERN is inquiring for one turret lathe.

THE SEABOARD AIR LINE has taken bids on about 75 machine tools for the shops at Portsmouth, Va.

SIGNALING

The Western Maryland is to install automatic block signals on its line, single track, between Highfield, Md., and Big Pool, Md., 35 miles. Highfield is 17 miles east of Hagerstown and Big Pool is 18 miles west of Hagerstown. Plans are being made also for the installation of automatic signals from Highfield east to Thurmont, 11 miles.

Supply Trade News

Andrew Allen, Sr., the founder of the firm of A. Allen & Son, New York, died July 6.

The Bourne-Fuller Company, Cleveland, Ohio, announces that on August 1, its selling arrangement with the A. M. Byers Co., Pittsburgh, Pa., will terminate.

J. F. McNamara has been appointed general manager of the Bayonne Steel Casting Company, Bayonne, N. J., succeeding W. E. Oakley, effective July 1.

The Eastern Railway Signal Company, Elkton, Md., has been incorporated with a capital stock of \$100,000. Clement M. Egner, Elkton, Pa., is one of the incorporators.

Flint & Chester, Inc., New York, dealers in railway, mill and contractors' supplies, have been appointed New York sales agents for the jacks made by A. O. Norton, Inc., Boston, Mass.

Paul B. Oatman, formerly manager of the Ideal Die & Tool Company, Beaver Falls, Pa., has been appointed manager of the small tools department of the Modern Tool Company, Erie, Pa.

H. A. F. Campbell has been appointed European representative of the Baldwin Locomotive Works, with headquarters in Paris. Mr. Campbell has been in the service of the company since 1900.

The Northern Railway Signal Company has been incorporated with a capital stock of \$15,000 at Pittsburgh, Pa. The incorporators are Joseph P. Taggart and E. A. Schooley, Pittsburgh, and Herbert L. Stitt, Edgeworth, Pa.

H. Gossen has been placed in charge of the New York office of the American Steel Export Company. This is the new company which has been incorporated to take over the foreign business of the Cambria Steel Company.

F. N. Hibbits, until July 1, superintendent of motive power of the Lehigh Valley at South Bethlehem, Pa., has been appointed assistant general superintendent of the Baldwin Locomotive Works, effective July 1.

The National Hose Coupling Company, which has recently been incorporated, with Mortimer J. Silverberg as president, will manufacture a coupling which is applicable to various railway uses. The works of this company are at Kankakee, Ill., and its general offices are in the Peoples Gas building, Chicago.

Joachim G. Giader, chief engineer of structural design and foundations for D. H. Burnham & Co., for the past seventeen years, has opened offices as a consulting engineer at 751 Railway Exchange building, Chicago. He will specialize in structural design, foundations and building engineering in general.

An item in the New York Times of July 15 says that it has been creditably reported but not confirmed that the Baldwin Locomotive Works has taken an order for \$80,000,000 worth of shells from the Allies. The report also says that a subsidiary company will be organized and that possibly a new plant will be built.

The Continental Piston Ring Company, Memphis, Tenn., has been incorporated with a paid in capital of \$100,000. It will manufacture piston rings for locomotives, engines, automobiles and pumps of various kinds. The officers are B. H. Mason, president; W. P. McCadden, vice-president; R. E. Brown, secretary and treasurer, and C. R. Bryant, chief engineer.

Thomas E. Carliss, manager of the works of the Buffalo Brake Beam Company at Buffalo, N. Y., and Hamilton, Ont., died suddenly in Buffalo on July 9. Mr. Carliss had been in the brake beam business for about 30 years. He was at one time associated with the Central Brake Beam Company, at Detroit, for many years, afterwards becoming associated with the Monarch Brake Beam Company, when that company was started by Detroit capital. He had been in the service of the Buffalo Brake Beam Company for about six years.

The Columbus Bolt Works Company, Columbus, Ohio, has been incorporated with a capital stock of \$660,000 to take over the business of the Columbus Bolt Works. J. R. Poste, formerly secretary and general manager of the Columbus Bolt Works, has been elected president, treasurer and general manager of the new company; J. H. Poste, vice-president; T. A. Fleming, assistant treasurer, and H. A. Mason, secretary. The incorporators include J. R. Poste, J. H. Poste, W. F. Burdell, Beale Poste and F. H. Barrett. Julius Blum & Co., 510 West Twenty-fourth street, New York, have been appointed eastern sales agents.

TRADE PUBLICATIONS

SUPERHEATERS.—The Locomotive Superheater Company, New York, has issued the fourth edition of its pamphlet entitled: The Use of Highly Superheated Steam in Locomotive Practice. This is devoted to a description of the Schmidt superheater, including data concerning its operation. A number of superheater accessories are also described.

SLOTING MACHINES.—Catalog No. 49, recently issued by the Newton Machine Tool Works, Inc., Philadelphia, Pa., contains illustrations and specifications of the company's complete line of standard and special slotting machines and a number of illustrations of different designs of milling, boring, drilling and cold saw cutting off machines.

TOOLS FOR CUTTING SCREW THREADS.—This is the title of a catalog recently issued by the J. M. Carpenter Tap & Die Company, Pawtucket, R. I. The booklet, which is quite similar to the usual tap and die catalog, contains illustrations of the several taps, dies, die-stocks, etc., made by the company, as well as tables of sizes and list prices.

BRONZE CASTINGS.—The Titanium Alloy Manufacturing Company, Niagara Falls, N. Y., has just issued a booklet describing the titanium, aluminum and other standard bronze castings produced by this company, with descriptions and approximate composition of these various standard alloys. This booklet is illustrated with photographs of etched sections.

CAR HEATING APPARATUS.—The Gold Car Heating & Lighting Company, New York, has recently issued circulars relative to that company's No. 804S positive lock coupler, its pressure regulator No. 1,014, and its up-to-date vapor system. The last of these three not only describes the vapor system, but also shows how Gold's thermostatic control may be used in connection with it.

DRIVING BOX LUBRICATOR.—A catalog just issued by the Franklin Railway Supply Company, New York, is devoted entirely to the Franklin automatic driving box lubricator. It is illustrated with a large number of sectional drawings, showing the construction of lubricators of various sizes and for different classes of service. The methods of removing packing and replacing the cellar is clearly explained with illustrations.

STEEL SASH.—The Trussed Concrete Steel Company, Youngstown, Ohio, has just issued an elaborate 128-page catalog describing the United steel sash and its application. This book is printed on the standard 8½ in. by 11 in. sheet adopted by the American Institute of Architects, and is well illustrated throughout. The first portion is devoted to a general discussion of the features of steel sash construction, followed by detailed descriptions of pivoted, vertical sliding and other types of sash. The latter part of the book contains many interesting structures on which these sashes have been used.

LOCOMOTIVES.—The H. K. Porter Co., Pittsburgh, Pa., has recently issued the eleventh edition of its catalog devoted to light and heavy steam locomotives. This is a book of over 150 pages, 8½ in. by 11 in., and is substantially bound in cloth. In addition to the usual catalog features dealing with a large variety of standard Porter locomotives it contains a section devoted entirely to engineering information, tables and formulas and another section containing tables and other useful information not usually found in print. The book is intended specially for engineers, superintendents and master mechanics of industrial plants, coal mines, logging roads, contractors, etc. Owing to the expense involved in the compilation of the data which the book contains, general distribution is being made at the price of \$1 per copy.

Railway Construction

AUGUSTA-AIKEN RAILWAY & ELECTRIC CORPORATION.—This company has increased its capital stock, it is said, from \$1,500,000 to \$2,500,000, and, it is understood, is planning to build an extension from Aiken, S. C., northeast to Columbia, about 50 miles.

CANADIAN NORTHERN.—On the Western division the following new lines have been opened for business: Strathcona subdivision, from Camrose Junction, Alta., west to Terminal Junction, 45.8 miles; St. Brieux subdivision, from Melfort, Sask., west to St. Brieux, 21.5 miles; Tollerton subdivision, from Edmonton Junction, Alta., west to Peace River Junction, 33.8 miles. On the Central division the Wakopa subdivision has been extended from Adelpha, Man., west to Deloraine, 28 miles.

CHARLESTON INTERURBAN.—A contract has been given to Board & Duffield, Charleston, W. Va., to build an extension of the Charleston Interurban from Charleston, W. Va., southeast via Malden, Marmet, Winifrede Junction, Cabin creek, and Coalburg to Montgomery, about 25 miles. Track has been laid on about one mile, and the company expects to finish 13.5 miles this year from Charleston to Cabin creek junction. The Charleston Interurban now operates a line from Charleston west via Spring Hill to St. Albans, and is leased to the Kanawha Valley Traction. (March 12, p. 493.)

CLINTON & OKLAHOMA WESTERN.—This road has been extended from Hammon Junction, Okla., to Hammon.

FLORIDA EAST COAST.—This company has under consideration the question of building an extension, it is said, of the Maytown-Okeechobee branch from Okeechobee, Fla., south around the eastern shore of Lake Okeechobee, thence east to West Palm Beach.

FLORIDA ROADS.—The Southern Investment Company is planning to build a railway, it is said, from Placida, Fla., on the Charlotte Harbor & Northern, northwest towards Venice on the Seaboard Air Line, about 22 miles. L. M. Williams, president; J. G. Earnest, secretary, Richmond, Va.

GRAND TRUNK PACIFIC.—The Prince Albert subdivision of the Prairie division has been extended from Hoey, Sask., to St. Louis, 3.8 miles.

INTERCOLONIAL.—An officer writes regarding the diversion to be constructed between the main line of the Intercolonial and the National Transcontinental that from Moncton west these two railways parallel each other for a distance of about 11 miles. It is proposed to construct a connection between the two roads at mileage 11. Both these railways are now being operated by the Canadian government, and the diversion, which is to be three-quarters of a mile long and will consist of one cut and one fill, is to be built to do away with the expense of maintaining one of the lines.

JOHNSTOWN & SOMERSET (Electric).—A contract has been given to J. A. Vandegrift & Co., Incorporated, Somerset, Pa., to build from Johnstown, Pa., south via Davidsville, Haas Mine, Jerome Mine, Boswell, Jenner, Belmont Mine, Harrison and Somerset to Rockwood, about 40 miles. Bids are wanted at once for the bridges, ties, rails, poles, wire and construction material. The maximum grades will be 3.5 per cent, and the maximum curvature will be 15 deg. There will be 14 steel girder bridges, each 15 ft. long, six steel girder bridges each 30 ft. long, and one viaduct 650 ft. long and 85 ft. high. The plans include constructing two car barns and four rotary stations. The power will be furnished by the Pennsylvania Electric Service Company, Johnstown. The company expects to develop a traffic in coal, farm and dairy products. J. A. Berkey, president; F. O. Keller, engineer, Somerset, Pa.

MICHIGAN RAILWAY.—A new section of this road has been opened for business from Grand Rapids, Mich., south to Kalamazoo, 50 miles.

MISSISSIPPI VALLEY RAILWAY & POWER COMPANY. Incorporated in Delaware with \$4,500,000 capital, it is said, to construct

railroads. The incorporators include C. B. Bishop, J. Jacobs and H. W. Davis, Wilmington, Del.

NEW YORK SUBWAYS.—Bids are wanted by the New York Public Service Commission, First district, on July 27, for the last section of the Broadway subway in the borough of Manhattan, extending under Broadway from Thirty-eighth to Forty-second street, and under Seventh avenue from Forty-second street to Fifty-first street. Bids are also wanted on July 27 for work on the Eastern Parkway subway in the borough of Brooklyn under Eastern Parkway from Nostrand avenue to Buffalo avenue, and bids are wanted on July 28 for the second section of the Nostrand avenue subway under Nostrand avenue from Church avenue to Flatbush avenue.

Ward & Tully, Incorporated, submitted the lowest bid at \$71,355 for the installation of tracks on the New Utrecht avenue elevated line from about Thirty-eighth street and Tenth avenue to a point near avenue Y, in the borough of Brooklyn.

OCILLA, PINEBLOOM & VALDOSTA.—This 11-mile line in Coffee county, Ga., which passes through Willacooche has been bought by the Henderson Lumber Company, of which J. A. Henderson, Ocilla, Ga., is president. It is understood that the line will be extended on the northern end from Lax northwest to Ocilla, 15 miles, and on the southern end from Pinebloom southeast to Homerville, about 28 miles.

OKLAHOMA & TEXAS SOUTHERN.—A contract is reported let to Ward & Lee, Floresville, Tex., for work on this line. The company plans to build from Denton, Tex., northwest to Buckburnette and later north of the Red river. W. R. Heagler, Potosi, Mo., chief engineer.

OREGON-WASHINGTON RAILROAD & NAVIGATION COMPANY.—This company will build a 30-mile extension from Riverside to Crane Creek Gap in Harney county, Oregon. Contracts for grading and bridges will be awarded soon. The track will be laid by company forces. The maximum grade is 1 per cent.

OZARK SOUTHERN.—This company proposes to build a line from Harrison, Ark., through Elmwood, Marble City and Jasper to Parthenon. The estimated cost is \$600,000. G. H. T. Shaw, Lee Center, Ill., is chief engineer.

PACIFIC GREAT EASTERN.—Announcement is made that through an arrangement with the Canadian and British Columbia governments this company has secured funds to continue construction work on the line between Vancouver, B. C., and Fort George. The line is now in operation out of North Vancouver towards Squamish, and from Squamish to Lillooet, 120 miles. Considerable work has been done between Lillooet and Fort George, and the company expects to have 100 miles additional completed during 1915. (April 9, p. 811.)

PETERSBURG & JAMES RIVER (Electric).—Construction work was started recently on this line, it is said, at City Point, Va. The company was organized to build an electric line from City Point, southwest to Petersburg 10 miles. J. W. Long, president; B. R. Walters, secretary and treasurer, 801 Real Estate Trust building, Washington, D. C.; J. H. Starkey, chief engineer, Rockville, Md. (May 14, p. 1033.)

PHILADELPHIA, PA., ROADS.—A. M. Taylor, director of city transit at Philadelphia, Pa., has been authorized to let contracts and start work at once on the Broad street subway and the Frankford elevated. Ordinances passed recently by councils allotted \$3,000,000 for each of these projects. Actual construction work is to be started on September 13. Bids are wanted until August 10, for some of the work on both projects.

PITTSBURG, SHAWMUT & NORTHERN.—This road has been extended from Kittanning, Pa., to Cadogan, 6 miles.

SOUTHERN TRACTION. See Texas Traction.

TEXAS TRACTION. It is announced that plans are under way to merge the properties of the Texas Traction and the Southern Traction. The pending transaction involves the interurban electric lines radiating out of Dallas, Tex., and other holdings of the two companies. Following the consummation of the plans, work on an extension of the Southern Traction is to be started, it is said, south from Waco via Austin to San Antonio.

VIRGINIA-CAROLINA. This road has been extended from West Jefferson, N. C., south to Elkland, 20 miles.

RAILWAY STRUCTURES

BAYONNE, N. J.—The Central of New Jersey has plans under way for the proposed rebuilding of the Newark bay bridge. Actual construction work will probably not be started for a year.

CHICAGO, ILL.—The Pennsylvania has awarded the contract for the structural steel of its new freight house at this place to McClintic Marshall Construction Company, Chicago.

The Baltimore & Ohio Chicago Terminal is building new engine and passenger terminal facilities at Fourteenth and Robey streets, Chicago, which will include a 33-stall roundhouse, a 300-car coach yard, a 2-story building 600 ft. long for coach yard supplies, a power plant, oil house, coaling station, sand house and office building. Contracts for the construction of these buildings have been awarded to James Stewart & Co., Chicago.

KANSAS CITY, MO.—The Union Pacific, the Chicago, Rock Island & Pacific and the Metropolitan Street Railway of Kansas City, will build a viaduct at Eighteenth street and Muncies boulevard over the tracks of the Union Pacific and the Chicago, Rock Island & Pacific. The city authorities awarded the contract for the fabrication and erection of the steel to the American Bridge Company. The viaduct will be 1,383 ft. long and will have 36 steel deck and through spans of various lengths up to 100 ft. It will have concrete piers and 224 lineal ft. of reinforced concrete retaining walls. Work has not yet been started.

MILTON, PA.—The Philadelphia & Reading has applied to the Pennsylvania Water Supply commission for permission to build a steel bridge over the Susquehanna river at Milton.

NEW YORK.—Bids are to be opened on August 3, by the New York Public Service Commission, First district; for station finish on the Corona elevated railroad and the extension of the Queensboro subway in the borough of Queens. Bids are wanted on August 4, for station finish on the Astoria line in the borough of Queens.

SIMCOE, ONT.—The Railway Commission of Ontario has approved the location of the Lake Erie & Northern's proposed yard and station in Simcoe township, Ont., provided the end of the freight siding be constructed north of Victoria street.

TRENTON, N. S.—The Intercolonial has let contracts for the following buildings: For a combined station and freight shed at Trenton, N. S.; to Rhodes, Curry & Company, Ltd., Amherst, N. S.; combined station and freight shed at Derby Junction, N. B.; and station at Humphreys, N. B., to McLaggan, McBean & Bell, and for a freight shed, 40 ft. by 400 ft., at Levis, Que., to G. B. Mitchell, Montreal, Que.

YARMOUTH, N. S.—Bids will be received up to July 17, it is said, for the construction of a passenger station for the Halifax & Southwestern at Yarmouth.

THE AUSTRALIAN TRANS-CONTINENTAL RAILWAY.—Notwithstanding the fact that Australia is just as much at war as any other part of the Empire today, and is doing everything possible to bring about a speedy and successful termination, the great public works of that country are not being held up, but, if anything, more energy is being thrown into those works which are regarded as of national importance, and among these is the line of railway which is to connect the systems of Eastern and Western Australia. This is being pushed on as quickly as possible. The latest reports indicate that if no greater difficulties are experienced than have been overcome, the line should be ready for through working in January or February of 1917. About 900 men are at work on the western section, and 1,700 on the eastern section. Expected difficulties in supply of material have been settled by the new order of 12,500 tons of rails from a British firm. Lack of water is now the main trouble, but the engineer is confident that the bores now being put down at various points ahead of the railheads will secure sufficient supplies. Of the eight bores so far completed five have produced salt water, one brackish water, and two good drinking water. Five other bores are being sunk near the West Australian border. Local traffic proceeds on each section for nearly 200 miles.—Engineering (London).

Railway Financial News

CHICAGO, ROCK ISLAND & PACIFIC.—It is understood that the 60 days' period of grace which the indenture securing the \$20,000,000 5 per cent debenture bonds provides for will be availed of before action is taken in regard to the payment of interest due July 15. Judge Carpenter, under whose jurisdiction the receivers are acting, is now on his vacation.

DENVER & RIO GRANDE.—E. T. Jeffery, chairman of the board of the Denver & Rio Grande, has announced that the \$853,000 necessary to meet the semi-annual interest on the first and refunding mortgage bonds, which interest is due August 1, has been deposited with the Bankers Trust Company, and with Blair & Co., both of New York.

NEW YORK CENTRAL.—Judge Mayer, in the United States district court, has denied a motion for the dismissal of the suit brought by J. W. Hunnewell on behalf of himself and other holders of stock of the Rutland against the New York Central for an accounting. The suit alleges that the New York Central has improperly used the Rutland's funds.

NEW YORK, NEW HAVEN & HARTFORD.—A suit brought by minority stockholders of the New York, New Haven & Hartford against William G. Rockefeller, Lewis Cass Ledyard, James S. Elton, Charles S. Mellen and other directors to recover \$102,000,000 alleged to have been improperly paid out by the New Haven, has been dismissed. The opinion dismissing the suit says, among other things, that "the allegations of the bill do not show reasonable application to the directors to institute proceedings to recover the losses referred to in the bill, nor facts showing that such application would have been useless." Permission has been given to amend the petition for a suit.

RUTLAND RAILROAD.—See New York Central.

UNION STATION COMPANY (CHICAGO).—Since three-quarters of the stock of the Union Station Company, of Chicago, which is to build a new union station, is held by the Pennsylvania and the Chicago, Milwaukee & St. Paul, it is supposed that Kuhn, Loeb & Co. and the National City Bank will underwrite the sale of the bonds, and it is said that this bond sale will amount to \$25,000,000 to \$30,000,000. The Chicago, Burlington & Quincy is the only other railroad owning stock in the new station, and the other companies which will use the station will pay a rental charge.

PETROZAVODSK-SOROKA BAY RAILWAY OF RUSSIA.—Owing to difficulties that have arisen in contracting out the Petrozavodsk-Soroka Bay line the Russian government has decided to take over the construction of the railway.

CHINESE PROPOSE A SHORT RAILWAY LINE AT CANTON.—A group of business men of Canton have conceived the idea of laying a short local line, about ten miles in length to bring a very populous district outside Canton in closer touch with the capital, and hence with Hongkong, by means of the Kowloon-Canton line. As far as the promoters can at present estimate the cost of the line, with rolling stock, will be about \$100,000 United States currency. The project provides for a narrow-gauge line, about 3½ ft. wide. The large villages through which the proposed line will pass are numerous and some of them important.

THE FOREIGN TRADE OF THE BRITISH EMPIRE.—The British Empire's total trade with foreign countries in 1913, according to the Statistical Abstract of the British Empire, was \$7,577,914,300, made up of \$4,114,504,100 imports and \$3,463,410,200 exports. The United Kingdom's trade with other parts of the British Empire was \$1,172,291,200 imports and \$1,126,915,900 exports, the inter-colonial trade imports being \$384,755,200, making a total of inter-imperial trade of \$2,683,962,300. The grand total of empire and inter-imperial trade was \$10,261,876,600, the percentages being: foreign trade, 73.8. and inter-imperial trade, 26.2 per cent.

GENERAL NEWS SECTION..... 169

*Illustrated.

The suggestion made by Mr. Basford in the address before the Burlington Association of Operating Officers, which is printed in another part of this issue, that the matter of selecting, training and promoting employees be placed in charge of an officer with full authority over these matters and reporting direct to the president of the railroad, appears to offer a simple and logical solution to a most troublesome problem. The methods outlined to be followed by such an officer are practical. Many railway officers are frank to admit that the proper selection and training of men is the most important problem now before the railroads. They are equally frank in admitting that something must be done immediately to improve the situation. Why not give the suggestions which are made a thorough trial?

In the recent hearings in the western freight rate advance case, three accounting "experts" employed by the shippers and state railway commissions, and one employed by the Interstate Commerce Commission, sought to segregate the cost of handling various commodities, and by the use of different methods arrived at very different results. In the western passenger fare hearing at Chicago last week the same state commissions put on the stand one of the same "experts," who proceeded to enlighten the commission as to the cost of passenger service. He arrived at the conclusion that it costs less to earn a dollar in the passenger service than in the freight service; and he vouchsafed the information that he was "surprised himself" at the result. Then, on cross-examination it was brought out that in his analysis of the expenses of the Chicago & North Western he had adopted a basis of division in the freight rate case which showed the ratio of passenger expenses to revenue as 77 per cent, while in the passenger rate case he had used a basis which produced a passenger expense ratio of 72 per cent! In other words, in the zeal of his efforts to show that advances in either freight or passenger rates would be unreasonable, he had used a different method of "cost accounting" in the one case from what he had used in the other. The methods used by the railroads in dividing freight and passenger expenses in these cases at least had the merit of consistency because they used the same methods both times. If they redounded to the carriers' advantage in the freight case, by showing freight costs too high, then they worked to their disadvantage in the passenger case by showing the passenger proportion of the expenses as too low. Many hope that some method will eventually be worked out for correctly distributing the various expenses between the freight and passenger traffic. The state commissions and their "experts" are not helping the matter along by the use of such extraordinary means.

The question of the legality of the series of arbitrary measures which the postoffice department has adopted in recent years to compel the railways to handle increased quantities of mail without an increased, and even for a decreased, compensation, is to be finally settled, in the only way such a question can be settled—by a lawsuit. The New Haven, the Boston & Maine and some other New England roads have joined in a proceeding against the government in the Court of Claims for the recovery of an aggregate of \$10,880,865. They allege this amount is due them mainly on the ground that under the system of quadrennial weighing they are not paid at all for handling the annual increment in the mails, and that they have been forced to handle the parcel post traffic without adequate compensation. It is gratifying that a group of railways finally has decided to appeal to the courts to ascertain what are the respective rights of the carriers and the postoffice department. For almost ten years successive postmaster-generals and Congress itself have dealt with the compensation of the railways for carrying the mails with an insolent and tyrannical arbitrariness which would have done credit to the bureaucracy of Russia. It is high time that it should be ascertained whether the Constitution and laws of the United States afford no protection to railway property against the attacks of government officials bent, for political purposes, on making a showing in the postoffice department at the expense of other people. Meantime, the question arises as to why railways should have to sue the government to determine their rights regarding compensation for carrying the mail, when the rates they may receive for carrying freight and passengers are determined by the Interstate Commerce Commission? Why should not the government submit the question of what rates it shall pay for transportation to the same body to which it requires the traveler and shipper to submit the question of what rates they shall pay?

Regarding
Mail Pay**

Of the \$32,375,000 paid by the Class I roads (those having annual revenues of more than \$1,000,000) of this country for loss and damage to freight for the 12 months ended December 31, 1914, as reported in the *Railway Age Gazette* of July 16, 1915, page 90, over 13 per cent, or \$4,343,481, was directly traceable to rough handling of cars.

Damage Due to Rough Handling of Cars

In other words, \$2.18 of each \$1,000 of total freight revenue was used to pay for damage caused in this way. If we consider the damage which may have been caused to the equipment at the same time, and also the fact that a large proportion of the damage to freight by rough handling could not be directly traced to that cause, the figure will be much larger. Is there no way in which it can be reduced? One railway officer who has given the subject much attention says emphatically that there is. He believes that a large part of this damage caused by the rough handling of cars is due to the fact that the tendency to economize in the number of switch engines has been carried to the extreme, thus causing the crews to work so fast that they cannot use proper precautions to protect the lading in the cars. In his opinion the addition of a comparatively small number of switch engines in yards or terminals where this is being done will greatly decrease the amount of the payments for damage to freight. It may be difficult to demonstrate this, but considering the rate at which such damage is increasing, would it not be worth the trial? Suppose that the cost of the additional service would only equal the reduction in damage to freight, or even be somewhat greater than it. Over and above this we would have the decreased cost of maintenance of equipment and the good will of the consignors and consignees who would not be disappointed and hampered by delay and damage to the shipments.

THE WABASH-PITTSBURG TERMINAL REORGANIZATION PLAN

THE story of the Wabash-Pittsburg Terminal bristles with superlatives. The building of the road into Pittsburgh, with the break between the Goulds and the Pennsylvania Railroad interests and the subsequent bankruptcy of the Terminal company, followed by the collapse of the great scheme for a transcontinental railroad under Gould control, was one of the most dramatic incidents in contemporary railroad history. The reorganization plan recently announced is one of the most drastic ever proposed for an American railroad. The possibilities held out at the time of the sale of the Wabash-Pittsburg Terminal Company's first mortgage bonds of that company's getting a share of the Pennsylvania Railroad's Pittsburgh traffic was one of the romances of American railroading and the failure is within these ends one of the most complete imaginable.

The Wabash-Pittsburg Terminal owns a single track road running from Pittsburgh Junction, in Ohio, where it connects with the Wheeling & Lake Erie, to the corner of Ferry street and Liberty avenue, within the city of Pittsburgh, a distance of 60 miles. On this 60 miles of road there are 77 bridges and 17 tunnels. The road was put in operation in July, 1904. The entrance into Pittsburgh was obtained by building a tunnel under the rock bound ridge on the west side of the Monongahela river and bridging that river with a bridge 1,504 ft. long and by using an old street railway franchise for the necessary permit to lay tracks to the Ferry street property which had previously been secretly acquired. The Pennsylvania Railroad considered this an invasion of its territory, and the feeling between the Goulds and that company was extremely bitter. It will be recalled that the Gould transcontinental system was to have consisted of the Western Pacific, running from San Francisco to Salt Lake City, Utah; the Denver & Rio Grande, running from Salt Lake City to Denver and Pueblo, Col.; the Missouri Pacific, running from Pueblo to St. Louis; the Wabash, running from St. Louis in Toledo; the Wheeling & Lake Erie, from Toledo to Pittsburgh Junction; the Wabash-Pittsburg Terminal, from Pittsburgh Junction to Pittsburgh, and the

Western Maryland, running from a point in West Virginia, only about 40 miles from a branch of the Wheeling & Lake Erie, to Baltimore. The final completion of this system called for the building of the Wabash-Pittsburg Terminal and the 40-mile line to connect the Wheeling & Lake Erie with the Western Maryland. This latter link was never built.

In addition to the 60 miles of main line, the Terminal company owns a branch line $3\frac{1}{2}$ miles long and owns a majority of the stock of the Wheeling & Lake Erie, all of the consolidated mortgage bonds and all of the stock of the Pittsburgh Terminal Railroad & Coal Company, the only other securities of the Coal company outstanding being \$3,922,000 first mortgage 5 per cent bonds. All of the stocks and bonds mentioned above which the Terminal company owns had been pledged as security for loans. The Coal company mentioned above owns at present about 12,880 acres of unmined coal estimated to contain from 90,000,000 to 100,000,000 tons of coal, and also owns the stock and bonds of the West Side Belt Railway, which has a single track railroad running from a point in the west end of Pittsburgh south paralleling the Monongahela river and some few miles to the west of it to Clairton, in Allegheny county, Pa., 21 miles.

Summed up, the Wabash-Pittsburg Terminal now owns about 63 $\frac{1}{2}$ miles of single-track railroad and can obtain coal property having 100,000 tons of unmined coal on it and a 21-mile single-track railroad by paying \$3,818,152. After this payment, of course, the coal property will still have a mortgage on it of \$3,922,000. The total par value of securities and loans and other indebtedness, including receiver's certificates of the Terminal company, is now \$91,260,345, and adding to this the \$3,818,152 necessary to get out of pawn its title to the coal properties and the 21 miles of belt railroad, the gross capitalization is \$95,078,497. The total interest charges would call for \$2,783,252 yearly. The total amount which the properties, including the Coal company, earned in 1914, a moderately prosperous year, available for interest charges was \$513,172, and in the year ended June 30, 1915, a very unprosperous year, \$95,156.

The public owns \$30,236,000 first mortgage bonds of the Terminal company and \$20,000,000 second mortgage bonds, and there is in default on these two issues of bonds \$13,459,343 of back interest. The reorganization plan calls on the holders of the first mortgage bonds to give up their bonds and in addition to pay \$300 in cash with each \$1,000 bond given up and receive in exchange stock in the new company of par value of \$300 preferred and \$1,000 common. The second mortgage bondholders can only come into the reorganization plan if some of the first mortgage bondholders refuse to pay their \$300 per bond and take their new securities.

If this plan works out successfully the first mortgage bondholders, or the first and second mortgage bondholders together, will put into the new company \$9,070,800 cash. This cash will be used to pay the \$2,395,880 Wabash-Pittsburg Terminal receiver's certificates and \$714,286 West Side Belt Receiver's certificates and the \$3,818,152 necessary to get the consolidated mortgage bonds and stock of the Coal company out of pawn and the remainder for paying certain judgments and forming working capital. Under this plan there will be but \$5,100,868 bonds all told outstanding, of which \$3,922,000 will be the first mortgage bonds of the Coal company which it was previously mentioned are held by the public; \$383,000 first mortgage bonds of the West Side Belt which are held by the public, and \$795,868 mortgages on real estate. The interest charges will therefore be cut from the \$2,783,252, which they stood at before, and only a fractional part of which, of course, were ever earned before, to \$261,103. It will be recalled that in 1914 the earnings applicable to interest charges amounted to \$513,172.

If the present plan goes through the new company will issue \$39,600,000 stock, of which a quarter will be preferred and three-quarters common. This will make a total capitalization, including the bonds mentioned above, of \$44,700,868, as against a present capitalization of \$91,260,345, plus the \$3,818,152 required to get the Coal company stock and bonds.

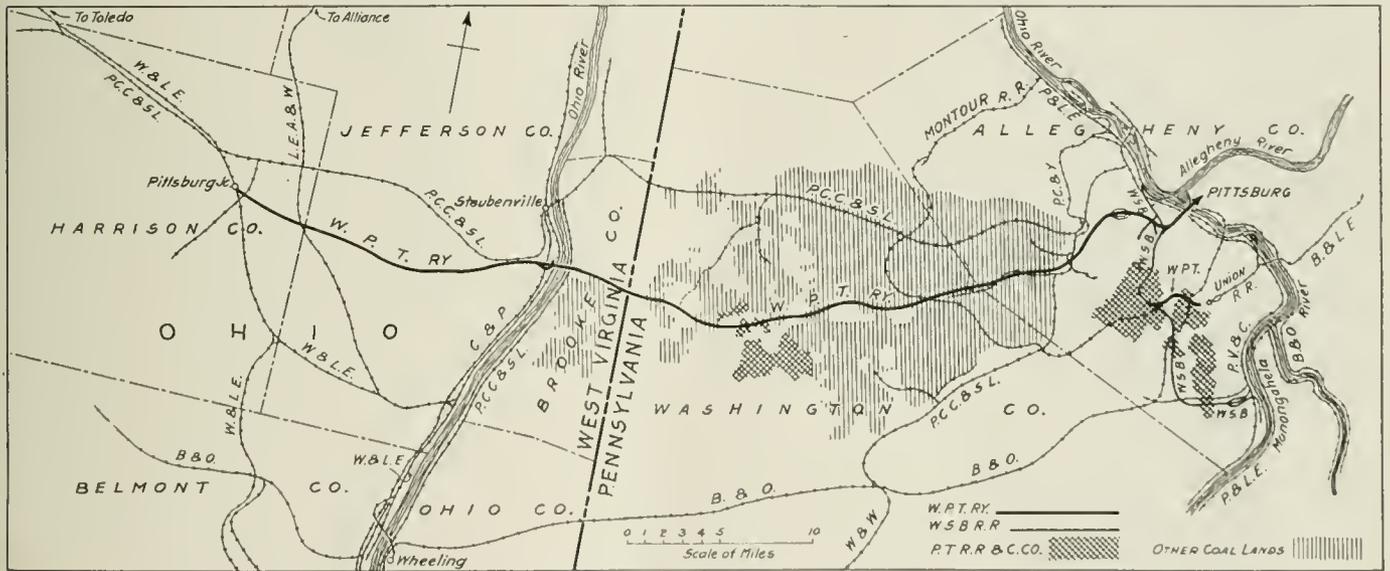

The Wabash-Pittsburg Terminal owns the majority stock of the Wheeling & Lake Erie, which is of doubtful value, however, The reorganization plan of the Wheeling & Lake Erie, which has been in the hands of receivers, calls for an assessment on this stock. The Terminal reorganization plan, therefore, quite properly provides that each of its own bondholders should receive his pro rata share of the Wheeling & Lake Erie stock, and thus be in a position to decide for himself whether he wants to pay the assessment or not.

It would simply be a retelling of a stale scandal to recount in detail the history of the Wabash-Pittsburg Terminal; but there are certain facts in this history which are brought out in so lurid a way that they may well form an object lesson to investors. In 1905 the Wabash-Pittsburg Terminal first mortgage 5 per cent bonds were selling at above 90. The purchaser of a \$1,000 bond paid for it \$900 or more. He received his interest only up to June 30, 1908. Since then he has received nothing, and under the reorganization plan he will have to put up \$300 more in cash, give up his bond, and get for the total investment of \$1,200 \$300 preferred stock in a new company and \$1,000 common stock, with no present prospect of any return on the common stock and no certainty of return on the \$300 preferred stock. The lesson is obvious. The building of the Wabash-

Whether or not a holder of these bonds should pay the assessment of \$300 per bond would seem to depend entirely on whether his individual circumstances are such as to permit him to put the required amount of money in as a speculation with the hope and fair prospect of recouping himself for losses, or whether he is in a position where he cannot afford to risk any more money and therefore should take the losses which he has now sustained.

ST. LOUIS, "INADEQUATE TERMINAL FACILITIES"

THE people of St. Louis are in a position to realize the truth of the old saying, "Curses, like chickens, come home to roost." The Interstate Commerce Commission, in an opinion rendered last week in a case brought by the Business Men's League of that city, said that the "rail terminal facilities of St. Louis have not grown proportionately with the growth and trade of the community." The terminal facilities are afforded almost solely by the Terminal Railroad Association, which is owned by 15 of the trunk lines. Persons not familiar with the facts might naturally assume that the failure to develop them adequately was chargeable to the managements of the Terminal Railroad Association and of the companies which own it. This assumption would be incorrect. The managements of the Ter-

The Wabash-Pittsburgh Terminal and Pittsburgh Terminal Railroad and Coal Company's Coal Lands

Pittsburg Terminal was a speculation pure and simple. Bonds issued at the rate of more than three-quarters of a million dollars a mile on a road whose earning power was a pure matter of guesswork should never have been offered to investors by any reputable banking house. No investor who made any investigation of the situation for himself should have ever bought these bonds, and the moral of that is that an investor should make some investigation for himself of the nature of the assets which are held out as security on which he is asked to loan money.

On the other hand, the present plan of reorganization appears to be a conscientious, thorough-going and common sense attempt to make the best of a very bad bargain. The new securities are speculative, of course. They are not proper investments for the conservative man or woman who is not already entangled in the Wabash-Pittsburg situation. On the other hand, to the holder of the old 5 per cent first mortgage bonds of the Terminal company they hold out the only opportunity to get back in the future something of the losses already sustained. If, as the reorganization committee appears to think, traffic can be developed, which development has never taken place so far, the road has good potential earning power.

terminal Association and of the controlling railways have put forth great efforts adequately to develop its facilities. They have failed because for years they have been blocked by persons seeking to profit by bottling up the Terminal.

The Terminal Railroad Association was organized originally to furnish to the St. Louis district a unified terminal system which could render the best service at the least cost. For about 14 years, or since 1901, almost every attempt which it has made to enlarge its accommodations has been opposed by shippers seeking thereby to obtain advantages in rates, by real estate men seeking thereby to gain by speculation in land, and by politicians seeking thereby to win public favor. Back in 1901, 1902 and 1903, just preceding the Louisiana Purchase Exposition, an ordinance was presented authorizing the construction of elevated tracks, connecting the Eads bridge with the elevated railroad on the river front. This would have enabled the passenger tracks using the bridge to be handled without passing through the tunnel operated in connection with the bridge. The ordinance was defeated. Subsequently, as an agency for solving the entire terminal problem, a Municipal Bridge and Terminal Commission, composed of public officials and prominent local business men, was created by the city council. After a series of conferences

with this commission, the officers of the railways agreed to absorb the terminal charges at St. Louis, except on traffic originating within 100 miles. This being satisfactory to the Bridge and Terminals Commission it recommended that the roads should now proceed to improve and enlarge their physical facilities. The Terminal Association, therefore, bought a large tract of land, known as the Rankin tract, and ordinances were introduced looking to the development of this property at an outlay of about \$2,000,000.

The Terminal Association was now met with attacks of two kinds. It was denounced as a monopoly, and suit was brought in the federal court to dissolve it. The ordinances for the development of the Rankin tract were defeated in an effort to compel the railways to absorb the terminal charges on traffic originating within the 100-mile zone. The people of St. Louis repeatedly were warned that the main effects would be to prevent adequate development of their railway facilities. It was pointed out that it was to their interest that the question of the absorption of the "arbitrary" should be taken before the Interstate Commerce Commission, and that meantime the roads should be allowed to go ahead with their development plans. President McChesney of the Terminal Association gave figures showing that while the freight traffic of the city had more than doubled its terminal facilities had remained practically at a standstill, notwithstanding the efforts to enlarge them. These arguments were of no avail.

The proceeding for the dissolution of the Terminal Association finally went to the Supreme Court of the United States. It held that the Terminal was an illegal monopoly, but that it could bring itself within the law by admitting to its facilities at a reasonable compensation any line that wished to use them. This decision has as yet had no practical effect, for no railway has since applied for admission. The court also indicated that the question whether the railways should absorb all the terminal charges was one for the Interstate Commerce Commission. The matter was then taken before the commission, which held last February that the so-called "arbitrary" within the 100-mile zone was reasonable and legal. In other words, all the efforts to "hold up" the Terminal proved futile.

Since the decision of the commission approving the "arbitrary" the city, through its public service commission, has manifested a willingness to co-operate with the railways. It seems, therefore, to be only a matter of time until the conditions at St. Louis will be greatly improved. But it would have been better for St. Louis if it had heeded the dictates of reason and fairness, as expressed by its Municipal Bridge and Terminal Commission some eight years ago. And other communities can best avoid causing similar delay in the expansion of their railway facilities by pursuing a policy the opposite of that which St. Louis pursued for so long.

NEW BOOKS

Purchasing, Its Economic Aspects and Proper Methods. By H. B. Twyford. Size, 6 in. by 9 in.; 230 pages, 112 diagrams and forms. Bound in cloth. Published by D. Van Nostrand Company, New York. Price \$3.

The author of this book speaks with the authority of experience gained in the purchasing departments of the Otis Elevator Company (with which company he is at present connected), J. G. White & Co., and the Underground Electric Railways of London. The book contains 15 chapters, these being arranged under the following heads: purchasing, the purchasing organization; the operation of the purchasing department, and purchasing as practised. The first section relates primarily to the importance of the purchasing function. The chapters in the second division consider the position of the purchasing agent and treat in brief of the work to be done by him and his assistants. This work is classified under the following heads: the obtaining and recording of information; the actual purchasing; the recording and checking of invoices; and in the case of the purchasing depart-

ments of some companies, there may also be included the functions of traffic, inspection, and the receiving and storage of materials. These elements and their sequence are shown also in graphic form. The third section, dealing with the operation of the purchasing department, enlarges upon this and treats in detail of the methods followed in the well organized purchasing department. The fourth division, which supplements it, relates, in particular, to the methods used in the purchasing departments of the Otis Elevator Company, J. G. White & Co., and the Underground Electric Railways, the chapters in both divisions being well illustrated with about 100 specimen requisition, order and other forms. The book apparently does not aim so much to train the purchasing agent as it does to show wherein the work of that officer can be simplified and applied in the most effective manner.

Railroad Accounting. By Wm. E. Hooper. D. Appleton & Co., New York and London. 641 pages. Price, \$2.*

According to its title, this is a book which deals with nothing but railroad accounting; and railroad accounting in the United States at that. According to its form, it is little more than a reprint with running commentary of all the instructions issued by the Interstate Commerce Commission for the compilation of the statutory reports which they require from every railway company. For all that, it may be heartily commended not only to railway accountants but to every railwayman in this country who wants to master his own profession.

The author does not specify his own qualifications on the title-page, so it may be as well to say that he is an "associate editor" of the *Railway Age Gazette*, and that not much happens on American railways without being known in the office of that journal; and that—as he tells us in the preface—he has been helped by Mr. Cunningham, who has the unique position of being at once a professor and an active railwayman; by Mr. Mahl of the Southern Pacific, the *doyen* of all railway accountants; and by Mr. Trumbull, who has risen from being accountant of the Colorado & Southern, to being chairman of the board of two great railway companies. So we may be sure that the book is worth very serious attention. For Mr. Hooper and those who have helped him are all much more than accountants in the narrow sense. They are all men trained in the use of figures, who know that figures are indispensable for "disciplining the property." And they can be trusted to make figures their servants, and not their masters; to remember, according to the old phrase, that, though figures cannot lie, liars can figure; to assume, in Mr. Hooper's own excellent phrase, "an attitude of sceptical good fellowship with the figures that are used."

It is, of course, impossible within the limits of a review, to attempt detailed comment on a book of this kind. English railwaymen who criticized our new form of accounts on the ground that it was too voluminous, may perhaps be surprised to find that the corresponding American form consists of nearly 800 "primary accounts," and that the instructions drawn up by the Interstate Commerce Commission as to what items are to be included under each heading constitute in themselves a considerable volume. And in the near future the commission proposes to elaborate these accounts still further by including the costs of freight and passenger services respectively, figures which are already published by some railways and prepared by most for their own information. Mr. Hooper discusses at considerable length the question of how far cost accounting is carried and can be carried; and the extent to which such figures, if and when worked out, are useful to the manager and the public control authority respectively. And by the way it may be mentioned that he appreciates one point in which our English accounts are superior to the American, namely, that on certain large items of expense the wages costs and the material costs are entered separately.

One of the most interesting points in the book is the discussion of the eternal and insoluble question of the proper treatment of

*This review is reprinted from *The Railway Gazette of London*

additions, betterments, obsolescence, and the "costs of progress." In this country till very recently all additions and betterments were, speaking broadly, charged to capital. In America, however far the practice on poorer or less honestly managed railroads may have fallen short of the theory, the ideal was that net revenue should yield a dollar for dividend and a dollar for betterments; and the betterments dollar was ploughed into the road through the maintenance accounts, and no trace of its presence appeared in the balance sheet. Nowadays the practice is very different. The Interstate Commerce Commission requires—and, through its right of inspecting the accounts, can enforce its requirements—that nothing shall be charged to maintenance beyond actual replacement. If an engine costing \$10,000 is scrapped, and a new engine costing \$18,000 is substituted for it, only \$10,000 must be debited against operating expenses. And so, if a bridge of steel or stone replaces a wooden trestle, the cost of a new trestle alone is a working expense. The additional cost must be shown as "additional investment." Whether the company issues new capital to pay for it, or charges it against income, is still left to the directors to decide; but the main point on which the commission insists is that the accounts shall show clearly what the net revenue of the company is after charging against current income everything that can be included as maintenance proper, but nothing more.

It is evident that the whole of the net revenue so obtained is available for dividend if the company thinks fit so to apply it. Such application is no doubt unwise. No company can devote its revenue wholly to dividend without having cause to regret its action sooner or later. But here in England no one has yet doubted that undivided profits put back into the business belong to the shareholders just as much as the property purchased with the capital originally subscribed. In America, on the other hand, this position is very seriously challenged. The attitude of the public authority is this: railway companies are an agency of the nation; they are employed by the nation to execute a public function on condition that they may charge reasonable rates and earn, if at these rates they can do so, a reasonable return on their money. If they earn, say, 7 per cent dividend, that is reasonable. But if they earn 14 per cent and can afford, after taking 7 per cent for themselves, to pay another 7 per cent into betterments, that implies an unreasonable return obtained by charging unreasonably high rates. The extra 7 per cent, therefore, cannot in equity belong to the shareholders. They might later on issue capital against it, and pay 7 per cent dividends on this new capital also. To all time it must, however, belong to the public, who are entitled to claim that the railroad company should hold it in trust for them as a fund out of which the railroad can be improved for the public benefit without further cost to the public in the shape of dividends on new capital. The position is curious. *Prima facie* the contention of the public authorities seems not without force. On the other hand, there is nothing either in law or in equity to prevent the company dividing the full 14 per cent. It is clearly more in the public interest that they should divide only 7 per cent. And the claim of the public authority seems in effect to amount to penalizing the railway company for acting in the public interest.

The latter part of the book gives a very full account of the auditing and accounting organization of the American railways, the details of which will naturally appeal to specialists. But scattered all through the chapters are to be found many shrewd remarks showing what may be done by treating figures with "sceptical good fellowship." On the whole it is quite safe to say that no railwayman, whatever be his department, can fail to find this book interesting, or fail to profit by reading it. Scientific scepticism is an admirable attitude of mind, and we all need to be shaken up and made to think what is behind and what has gone to the compilation of the summary figures which we are apt to take for granted as simple and positive facts.

W. M. ACWORTH.

Letters to the Editor

SAFETY FIRST SUGGESTIONS

NEW YORK.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

As railroad inspectors are primarily employed to insure safety, would it not be well to designate them as Safety Inspectors; for example: Car Safety Inspector, instead of simply Car Inspector; Track Safety Inspector, in place of Track Walker; Signal Safety Inspector, instead of Signal Inspector? I would also suggest furnishing these inspectors with badges or shields with their respective titles inscribed on them. It is believed that by following a plan of this kind, whereby inspectors would be placed in a special "Safety" class, it would not only have a good moral effect on the individual inspectors but on the other employees with whom they came in daily contact. As car inspectors mingle with the traveling public at terminals, it is also believed that the "Safety" badge would attract attention and tend to insure confidence in the management of the road. Quite often inspectors are called before public investigation committees, etc., and if it were brought out that they were safety inspectors, employed solely for the purpose of safety, it might have some weight in favor of the railroad company.

RAILROAD MORTGAGES

NEW YORK.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

In regard to an article in your issue of June 8, 1915, headed "A Recent Development in Railroad Finance," by George A. Clark, I take the liberty of differing with Mr. Clark, as to the statement he makes in the table headed "Comparison of salient provisions in latest type of railroad 'blanket mortgage' bonds."

Opposite the title "Authorized Issue" under the N. Y. C. & H. R., C. M. & St. P., and N. P., he uses this language: "Limited to three times outstanding capital stock." I think that if he will refer to the mortgages of the New York Central & Hudson River and the Northern Pacific, he will find that the language contained in those mortgages is not the language he has used. The mortgage of the Chicago, Milwaukee & St. Paul, in conjunction with the supplemental mortgage, also does not contain the limitation named. The New York Central & Hudson River mortgage, under article I, has the following language:

The authorized issue of bonds under this indenture is limited so that the amount thereof at any one time outstanding, together with all outstanding prior debts of the railroad company, after deducting therefrom the amount of all bonds reserved under the provisions of this indenture to retire prior debts at or before maturity, shall never exceed three times the outstanding capital stock of the railroad company.

As I interpret that language, under certain circumstances, the limit could be three times the outstanding capital stock, but under other circumstances it could not equal three times the outstanding capital stock, for if the prior debts to be added are greater than the prior debts reserved for under the mortgage, then the authorized issue under that language would be less than three times the capital stock, and I think that the language used in the other mortgages is of a similar nature.

The language used in these mortgages cited was evidently intended to comply with the savings bank law of New York, and if the law is examined, it will be found that the language used is practically the same as that used in the law. The savings bank act does not say that the authorized issue is limited to three times the outstanding capital stock but states that

The mortgage shall not authorize a total issue of bonds which together with all outstanding prior debts of said company, after deducting therefrom the bonds reserved under the provisions of the mortgage to retire prior debts at maturity, shall exceed three times the outstanding capital stock of said company.

White & Keable.

Training of Young Men With Reference to Promotion*

A Powerful Directive Influence in Selecting, in Training, and in Promoting Men Is Absolutely Necessary

By GEORGE M. BASFORD

Chief Engineer Railroad Department, J. T. Ryerson & Son, New York.

A railroad president recently made this observation and asked this question: "What troubles me most is the question of promotion of men to subordinate executive positions. I don't know who should be promoted and my department heads don't have proper confidence in their own recommendations. Can you suggest a way to promote men intelligently?"

American railroad officials have attained their positions either because of or in spite of the conditions under which they came to the front. These paragraphs are based upon the opinion that they have come to the front in spite of unfavorable conditions. They are also based upon the belief that railroad problems of the immediate future will create demands for ability beyond the possibility of present methods to supply. They are further based upon the conviction that the selection, training and promotion of their personnel is the problem of supreme importance before railroads today. The object of your speaker is to reveal this problem and show how it may be solved by inspired leaders of a railroad organization.

The time-honored method of waiting for executive force and leadership to reveal itself in the ranks has produced magnificent men, but this method will not meet the great need now coming upon us. It is inadequate. It will result in a famine of leadership. It belongs to the past days of relatively small things. You must make men. You can not afford to wait for them to make themselves.

On the other hand, the plan adopted by some railroads a generation ago and now coming to new life—that of training young men, usually college men—announcing that they are being trained for official positions—is unquestionably wrong in principle and is doomed to failure. With some notable exceptions, it has failed generally, and for a very definite reason it is sure to continue to fail. West Point and Annapolis plans are ideal for the army and navy, because enlistments in the rank and file are for limited periods and the majority of recruits leave the service in early manhood. It is, therefore, necessary to train many young men specifically as officers of the army and navy. Success of railroads, however, largely depends upon the permanent enlistment of its rank and file. This changes the entire problem. It is from the ranks of enlisted men in railroad service that most of you have come. It is from the same source that nearly all of the great railroad leaders of the time have come. It is from the rank and file that the very greatest leaders of the world have come. Railroads will fly in the face of history of achievement if they forget this fact. It is safe to predict that the same source will supply the even greater leaders that the future will require. When you announce that young college men are being trained for official positions, you slam the gates to advancement in the face of the man in the ranks. This plan has brought exactly this result on one of our great railroads. It is not fair to the college men. It is not fair to the rank and file.

Great works require great leaders. Great leaders require perfection of training in the ranks. Perfection of training in the ranks in turn produces and develops great leaders. Therefore, it appears that the men in high authority today will leave the legacy of greatest value to the future if they properly attend to the training of the recruits coming into the ranks.

For success, all large business organizations must depend upon ability, fitness, training and loyalty of men in the ranks

and of subordinate executive officials. Because its organization is scattered over thousands of miles, this is particularly true of a big railroad. Picture your own position as a railroad officer if you could depend upon the individual shopman, trackman, yardman, brakeman, conductor, fireman, engineer, despatcher, agent or clerk to do the right thing at the right time and intelligently to devote the hours of his day to that part of your problem for which he is responsible! You would have time to think and time to plan. Your mind would be free for the larger tasks and larger opportunities before you. Your desk would not be piled high with the useless official literature of today, the burden of which is, "Please explain." Today we are looking for the genius and are overlooking the production of good workmen. We are depending upon officers. We need to depend upon men. Trained, properly educated and encouraged workmen will provide good officers later.

Whereas greatest care, deliberation, study, specification, test or guarantee are applied in the purchase of property, rails, equipment, machinery or material and the highest officials interest themselves in the purchase, the prevailing custom is to leave selection of new employees to mere chance. It may happen that the future chairman of the board will in his first entrance into the service be hired by a clerk, or that one capable of development to such an office may be rejected by a clerk. High-priced officials buy your locomotives and your rails. Who buys your men of the future?

Solution of this problem begins with the selection of men in the ranks. Systematic methods of selecting human material for the organization are imperative. The boys in offices, in shops, and all along the road should be most carefully and intelligently selected. Some one well qualified must be given this responsibility. Then these recruits must be tried out, and those "making good" must be trained. This word "trained" represents a new meaning as applied in this connection. It means thorough education of hand and brain and conscience. Selection is important in all organizations, regardless of size. The larger the organization, however, the more important is the matter of training. Training through apprenticeship is imperative. It may not safely be deferred. You will not be able to hold your own in railroad progress without it. For example, how will you keep up with requirements in locomotive-boiler construction and maintenance without apprentices in your boiler shops? You need workmen who are better informed than the foremen used to be. This is true of many trades and many positions in railroad service.

It is believed to be perfectly practicable to provide thorough training for boys and young men in every department of the railroad. Each should be trained and encouraged to develop and advance as far as he can go. For shop recruits the way is clear, through apprenticeship and apprentice schools. This has already been worked out on several railroads. The Santa Fe today has 877 shop apprentices in nine separate trades at forty-one shops. They are under instruction by shop instructors, through whom they are learning their trades. In company schools in working hours these boys receive mental training and development in lines corresponding with their work. The school instructors are company employees who have developed an educational plan so satisfactory as to merit the attention of the professional educators of highest standing. The shop and school instructors are selected and trained most carefully. They are expected to, and they do, exert a powerful moral in-

*An address recently made before a meeting of the Burlington Association of Operating Officers.

fluence over the boys. After eight years of continual growth, the Santa Fe will this year graduate 175 of these boys into the ranks of competent, educated workmen, and this is only a beginning. Ask yourselves whether or not your official load would be lightened if you had 175 trade trained and educated workmen launched into your organization each year. In eight years the road referred to has graduated 651 of these competent reliable young men. Seventy-one per cent of these youths are now in the service. If only half of these remain in the service a promising start has been made.

With a suitable plan of promotion a large proportion will remain in service, and that curse of railroads—the floater—will be displaced by the steady, reliable workman you all want. At a shop on another road where apprenticeship has been established eight years, and where 1,500 men are employed, but 57 men of mechanical trades have left the service in a year.

Because the boys are supervised and trained in groups, training in mechanical trades is relatively easy, but boys in every department may be trained if an officer high in authority issues the order that every one on the road must see to it that the employee immediately below him in rank is trained and prepared for promotion. This applies to offices, stations, yards, and everywhere else. All employees will some day be told that they must not expect promotion until they have properly trained and educated their own successors. You will all agree with this, but are you doing it? Every shop and large office building will some day have its school and every road will some day provide educational schemes for outlying points by correspondence. Every road will also some day provide an officer whose duty is to scour the cities and the rural districts along the line for boys of the right sort.

Clerks are a neglected crowd of competent and incompetent men—usually in blind-alley jobs with no training and no outlook. You can not afford to have any blind alleys on a railroad. Many of these clerks would make good station men if they had a friend and a chance, just as many good shop boys would make excellent firemen and roundhouse men. Don't forget that many of the best high officials of our railroads have been clerks. They did not rise because they were clerks, but in spite of that fact. The development of this idea has no limit, but two factors are absolutely necessary to successful accomplishment. One of these is an adequate, complete and systematic scheme of promotion. The other is an inspired officer, very close to the president of the road, as organizer and administrator of the training and promotion of men. Let us speak of this officer first.

There can be no better foundation for an organization than the principle that the ranks, if carefully recruited, will necessarily contain the men of the future. The men are there. We must turn on the light in order to find them. The men of the future must be discovered and promoted. Because of the size of a railroad organization it is necessary to provide easy and automatic methods of discovering ability. It is desirable that promotion should be proposed by co-operative action by subordinate officials and controlled by a very high official whose authority is complete in this case. Suppose the president of a railroad could find a man qualified for the duty of directing the training and promotion of men. The difficulty in finding such a man emphasize the importance of the duty. This man should be given a dignified, powerful position, with such a title as "assistant to the president." He should be responsible for methods of recruiting, methods and means of training men, and for a scheme whereby he will personally know that every promotion is based upon merit, with favoritism and politics banned. He should be responsible for and personally approve every promotion in the entire organization. To do this with intelligence, periodical individual surveys of the organization should be made, say, every six months. This was done with success by L. G. Parish for his department when superintendent of motive power, and the scheme is adaptable to all departments with practically no limits.

The cards used by Mr. Parish have been mentioned and described publicly before and are worthy of your earnest attention. This is the personal record card and these are the definitions of terms accompanying it:

NAME.....		AGE.....			
EMPLOYED AT					
AS					
		Very Good	Good	Medium	Poor
EDUCATION					
SPECIAL KNOWLEDGE.....					
EXPERIENCE					
HONESTY

DEFINITIONS

- EDUCATION: Mental and moral training.
- SPECIAL KNOWLEDGE: Knowledge acquired by actual trial and observation.
- EXPERIENCE: Knowledge acquired by actual trial and observation.
- HONESTY: Upright disposition or conduct.
- MORALITY: Accord with the rules of right conduct.
- TEMPERANCE: Moderation.
- TACT: Ability to do or say what is best for the intended effect.
- RESOURCE: Good at devising expedients.
- RELIANCE: Sure dependence.
- FORESIGHT: The act or power of foreseeing.
- APPEARANCE: Outward look or aspect
- MEMORY: Mental hold on the past
- ENERGY: Active, Effective.
- INITIATIVE: The ability or disposition to take the lead.
- PERSISTENCE: Steady or firm adherence to, or continuance in, a state, course of action, or pursuit that has been entered upon.
- ASSERTIVENESS: Affirming confidently; positive.
- DISCIPLINE: To teach rules and practice and accustom to order and subordination.
- PROMPTNESS: Quickness of decision or action.
- ACCURACY: Correctness.
- SYSTEM: Regular method or order.
- ORGANIZATION: A systematized and regulated whole.
- EXECUTIVE ABILITY: Ability to carry into effect in a practical manner.

Mr. Parish issued exactly enough of these cards for all employees in the department except laborers. These were filled out by foremen, for the men under them; by general foremen, for the foremen; by master mechanics, for general foremen; by roundhouse foremen, for their men; by road foremen of engines, for firemen; by chief clerks, for clerks, and by every under official for those immediately reporting to him. This extended all along the line up to his own position. He personally kept the cards and compared the reports from time to time. No official was allowed to keep records of his opinions of his subordinates, and it was soon clear that the officials were undergoing a course of training in observation of their men. The manner of making out the cards reveals the difficulty in getting people carefully and systematically to estimate the value of the

work of their subordinates. Some time is required to train officers properly to make out these cards. This fact emphasizes the value of the cards.

It is hard to tell about a man whom you do not really know. For example, when one of these cards is filled out by a foreman, suffering on that particular day with rheumatism, everything takes on a somber hue and under such conditions the foreman's opinion of a subordinate is not normal and not fair. In other words, the estimate of the good and poor qualities of the subordinate is likely to be colored by the condition of mind of the one who makes the estimate, at the time he makes it. An officer, until he has made a very careful study of a subordinate, is quite likely to mark up some of these personal characteristics differently at different times, according to his own moods. When these cards are examined and compared with those previously issued for the same individual, it may be found that the officer has recorded on one card that the subordinate is "very good" as to tact. On the next card six months later he may mark the same individual "poor" as to tact. This means that the officers making the records need training in studying their own men. Let me suggest that you fill out these cards for your own first assistant. Lay the cards aside and repeat the operation three months later. One of the best results to be obtained by the cards is to compel, and check up, this intimate study of individuals. It is perfectly clear that today promotions are made without any such study. The difficulty indicates the great importance of improvement of methods of promotion.

A part of the scheme was the general announcement that the standing of an officer was affected by the records of his men, by the improvement of those records, and by the number of men under him that were promising for promotion. All promotions were made from these records which in a large measure revealed the capacity of men for the particular promotion recommended. This scheme was carried out for a length of time sufficient to prove its value before Mr. Parish left the service. It is unnecessary to elaborate the method of application of this principle to other departments. It is sufficient to state that upon one occasion this scheme prevented the promotion of a worthless youth simply upon the ground that the official recommending the promotion wished to marry the lad's mother.

Do not misunderstand this card. It is not a blacklist of any kind, but a record of virtues with intent to use them for promotion. It will reveal weakness, but with intent to overcome it. A very broad man must dictate the policy of handling the cards. He must not be one to look for trouble, but to look for light. Then the cards must be kept as if sacred by the heads of departments. Note that this plan requires no bureau, not even an additional clerk, and no red tape. In the form shown it is not final, but may be varied to suit any conditions of employment.

Our assistant to the president need not personally watch all these cards. He should, however, by frequent checks know positively that every department head is watching them, and he should personally keep the records of all important officials. He should also require record cards for a long period to accompany a recommendation for promotion. For example, a vacancy as assistant superintendent is to be filled. The assistant to the president would call on all interested departments for recommendations and the office would be filled after an intelligent and complete investigation of all eligible men, including the mechanical and track as well as the operating department. The plan should cover every department. If you are to have the mechanical officials you need for future problems you must consider them for promotion into operating positions. Railroads are already paying dearly for neglect of their mechanical men. Of course, the jobs to which promotion is to be made should also be analyzed as well as the men who are to be promoted and misfits thereby may be avoided.

How about the college man in railroad service? College men are needed on railroads, but they will be most valuable if they come from the ranks or through the ranks. If you establish

trade apprenticeship wherever your boys may be grouped, as in the shops, and other methods of training boys who can not be grouped; if you require these boys to attend schools, either day schools on company premises and on company time or night schools directed or controlled by you, you will soon have a lot of earnest youths honestly endeavoring to improve themselves. If you select the best of these as candidates for courses in colleges or technical schools, you will certainly have at hand the best possible raw material from which to make college men. Moreover, they will be of and from your organization. You will know them and they will have already established themselves as a part of your organization. Send a few such youths to college and they will return splendidly equipped for your service.

Your speaker believes that railroads should offer scholarships in technical schools as rewards to youths in the service. It would cost \$1,200 per year for a scholarship each year as a reward for the best personal record among the apprentice or other boys on your road. Three hundred dollars a year, with a little money earned during vacation, will see a boy through college. Send one of your own boys each year, require him to work for the railroad during vacations and require him to return to the service for two years after graduation. You will have four boys at college all the time and one graduate each year. These graduates will be college men of great value to you. You may not retain all of them in service, but this plan will enable you to offer college courses as a stimulant for ambition to the recruits in your service. This may be worked out in the form of prizes for young men in all departments of the service. As an investment, it would pay to send several boys each year.

For twelve years Joseph T. Ryerson & Son scholarships have been available for boys from the ranks in railroad service. Three fine young men have enjoyed the advantages of a four-year course in mechanical engineering. The more young men of this sort you have in your service, the better for you. The American Railway Master Mechanics' Association provides several scholarships. Why don't you send boys from your ranks to college?

Training of men will cost something. It has, however, been demonstrated beyond question that it pays from the very start. It will pay in every department. The instructor in shop trades pays for himself from the very first day in the damage saved in machines and materials. At the Montreal works of the American Locomotive Company apprentice boys became efficient as workmen at the end of the first year. Wherever apprenticeship with real training and apprentice schools have been accorded a fair trial, the results have fulfilled most sanguine expectations as definite examples would prove if time permitted of their presentation.

These words, from a report of a Massachusetts commission on industrial training, represent the need in all departments of a railroad as well as they apply to the manufacturers of this country.

"In many industries the processes of manufacture and construction are made more difficult and more expensive by a lack of skilled workmen. This lack is not chiefly a want of manual dexterity, though such a want is common, but a want of what may be called industrial intelligence. By this is meant mental power to see beyond the task which occupies the hands for the moment, to the operations which have preceded and to those which follow it—power to take in the whole process, knowledge of materials, ideas of cost, ideas of organization, business sense, and a conscience which recognizes obligations."

Train your men in every department. This can not be made too emphatic. You will fail in your mission in life if you don't. You will leave a priceless legacy in the form of an organization replete with human efficiency and, therefore, human happiness, if you do. Train your rank and file and this great railroad organization will be a pyramid resting upon its base. A pyramid is typical of the structure of an ideal organization built to endure. It has a broad, firm base as a foundation. In the human

organization this foundation is the men in the ranks. If the men in the ranks are what they ought to be, the top will take care of itself. If only the top is right, the structure is unsafe. When you raise the rank and file you lift yourself also. You can't be a master of efficiency unless the men you trust to carry out your orders are efficient. The organization is strong as the ranks are strong in the old-fashioned virtues—skill, industry, economy and integrity.

To the man in the ranks the future looks hopeless with increasing intensity as organizations grow larger. Do something for him. Recognize the individual whom you as officers seldom or never see. Save the souls of men of the kind the world needs by simple encouragement, by recognition of merit, by looking for it, by recording it, and by rewarding it. Employers are responsible for many lost souls and ruined lives just because of neglect of the subject of this talk.

The path has already been blazed. The pioneer work has already been done, but thus far the complete plan here suggested has never been carried out. Remember that while this plan is really simple in principle, its inauguration and operation can be intrusted only to an inspired and powerful official, and one capable of handling it is not easily found. This fact indicates the tremendous importance of the question of training and promotion. It is a great undertaking as measured by the certain results, but the plan itself is simple and the expense is negligible.

There is no greater work in the world than to help those who desire to help themselves. There is no nobler task than the training of young minds. But experience has shown that training alone is not sufficient. A powerful directive influence in selecting, in training and in providing the organization for men who are trained is absolutely necessary. To show the necessity for and the possibility of providing this influence is my object.

HEARING ON ADVANCES IN WESTERN PASSENGER FARES

The hearing at Chicago before Examiner Thurtell of the Interstate Commerce Commission on proposed advances in western passenger fares which was begun on July 6, was concluded on Saturday, July 17. Reports of the testimony presented during the first week of the hearing were published in the last two issues of the *Railway Age Gazette*. The second week of the hearing was mainly devoted to the introduction of exhibits by representatives of the protesting state railway commissions and cross-examination by the attorneys for the roads.

C. W. Hillman, president of the Mutual Audit Company, who, as reported in last week's issue, testified on behalf of the protesting state railway commissions, making a separation of the freight and passenger expenses of seven of the roads in the case, was subjected to a vigorous cross-examination by Charles Donnelly, assistant general counsel of the Northern Pacific. Mr. Hillman's figures had shown the operating ratio in the passenger service of these roads as only 68. He said he had been surprised himself to find that the ratio of expenses to revenues in the passenger service was less than in the freight service. Mr. Donnelly brought out the fact that although he had made a separation of expenses between various classes of service in several other cases against railroads he had used different formulas in almost every case. While he had used six different bases of separation between freight and passenger expenses in his exhibits, he said that he had a strong personal preference for the gross weight basis, which he had used for the separation of most of the accounts.

"Upon your gross weight basis of dividing freight and passenger expenses," said Mr. Donnelly, "if we had a 3,000-ton freight train moving at 15 miles per hour and a 500-ton passenger train moving at 40 miles per hour, you would charge the passenger train with only one sixth as much expense as you would the freight train." Mr. Hillman replied in the affirmative, saying he had made no allowance for the element of speed, because there were some compensating factors on the other side and he had made no investigation as to the effect of speed.

Mr. Hillman had divided all of the maintenance of way and structures expenses between wear and weather, attributing 17½ per cent of the expense of renewing ties, 10 per cent of the rail expenses, 15 per cent of bridge expense, and 25 per cent of the account for cattle guards, fences and signs, to wear. He said that portion of the expense attributable to wear should be divided between freight and passenger on the basis of the use, but that the portion attributable to the weather could not be divided on the basis of any operating factor. He preferred the revenue basis, but said that that had been largely discredited. Therefore, he had used the net ton mile basis for dividing the expenses due to weather. He had attributed 52 per cent of the total maintenance expenses to weather, and this method resulted in assigning to the passenger service only 2 per cent of the cost due to weather and to the freight service 98 per cent. He said he had taken his percentages for wear and weather from figures used by the Wisconsin Railroad Commission, with some modifications of his own. Mr. Hillman said that the railroads had used antiquated methods in dividing their freight and passenger expenses, whereas he had endeavored to keep up with the latest developments on the subject. Mr. Donnelly asked if any railroad man had ever used a method more crude than that of assigning a fixed percentage of the ballast, or tie, or bridge expense to weather, regardless of different conditions on different railroads. Mr. Hillman said that the basis was not absolutely dependable, but that he had taken it as an average. Mr. Donnelly brought out the fact that the figures presented by the railroads in the passenger case as to the comparative cost of passenger service are the same as were presented in the freight case. Therefore, if they redound to the benefit of the roads in this case, showing passenger costs too high, then they would have been to the disadvantage of the roads in the freight case. He also contended that the witness had reversed methods he had used in the recent western freight rate case, and had made numerous deviations in his oral testimony describing his methods from those outlined in his written statement of his methods and percentages. "In the freight case," said Mr. Donnelly, "you found the passenger expenses 31.02 per cent of the total for November, 1914, for the Chicago & North Western. If you had used the same basis in this case the passenger expense for the North Western would be \$1,058,647 higher than you showed in the passenger case exhibit. If you had used the same basis in this case as in the freight case the North Western ratio of passenger expense to revenue would be 77 per cent, instead of 72 per cent." Mr. Hillman admitted that the difference in his methods would make a difference of about 5 per cent. Mr. Donnelly also showed that the witness had charged freight with all non-revenue freight, but charged passenger with no non-revenue passenger business, thus reducing its cost. He had also used a different basis for dividing the maintenance of way expenses than he had used for dividing the maintenance of equipment expenses, with the result that in each instance less was charged to the passenger service. It was also shown that the witness had charged all special train miles to freight and all officers' cars to freight, showing none of their expense in the cost of operating passenger service.

U. G. Powell, rate expert and accountant for the Nebraska Railroad Commission, presented an elaborate exhibit to show the comparative cost of operation of through and local trains, but his figures were limited to the direct train costs, in which he included only fuel and wages of train crews. His figures showed that it cost more to handle local passengers than through passengers, but he contended that this was offset by the more expensive character of equipment in the through traffic. His figures were based on an analysis of the accounts of the Chicago & North Western for 14 days, and of the Chicago, Rock Island & Pacific for seven days in 1915, and showed that for the two roads combined the average train cost per passenger mile was 59 mills for local trains and 483 mills for through trains. For the North Western the combined cost of through and local trains was 4.97 mills and for the Rock Island 54 mills. For the Rock Island the average cost of through passengers per mile was 5.33

mills, and for local passengers 5.69 mills. These figures excluded suburban passengers and passengers in mixed trains.

W. E. Reed, attorney general of Nebraska, asked the witness his opinion as to whether the railways are earning a fair return on their property. "In my opinion," replied Mr. Powell, "the roads are making a fair return on the value of all their property which represents a sacrifice on the part of the investor, but if the courts finally hold that they are entitled to a return on all of their property, regardless of the source, I would have to change my opinion." This remark caused a commotion among the representatives of the states. Mr. Reed said he thought the witness misunderstood his question. Mr. Powell said he would limit his statement to the six roads of which he had made a study, including the Missouri, Kansas & Texas; Chicago, Milwaukee & St. Paul; Chicago & North Western; Chicago, Burlington & Quincy; the Atchison, Topeka & Santa Fe, and Chicago, Rock Island & Pacific. Mr. Thorne then fired a volley of questions at him in an effort to impeach his qualifications to speak at all on the question of return on value, while representatives of other states interrupted with additional questions. "Is this cross-examination or impeachment of your witness?" asked Attorney H. A. Scandrett of the Union Pacific.

Mr. Powell said, that in his opinion the higher cost of hauling passengers a short distance did not justify a different fare on that short haul business, but that a road should be considered as a whole. Mr. Scandrett brought out that his exhibit showed that on passenger traffic for hauls of less than 50 miles the cost was very much higher than for the longer hauls. His question as to whether this justified a higher charge on the short hauls aroused a protest by representatives of the state commissions, but after a ruling by the examiner Mr. Powell stated that there should be no difference, at least until the courts are commissioned to determine the exact difference in cost. Mr. Scandrett also contended that the wage and fuel items included by Mr. Powell in his direct train costs amounted to only about one-fourth of the total expenses.

The next witness was W. M. Sangster, an accountant for the Arizona Corporation Commission, who presented a number of statistical exhibits for 21 western roads for the period 1904-1914. On cross-examination it was found that his figures showed in almost every case a reduction in the number of passengers per mile of line, in passenger revenue per mile of road and in revenue per train mile, although there was a total increase of passenger miles. S. T. Bledsoe, assistant general solicitor of the Atchison, Topeka & Santa Fe, brought out the fact that the exhibit showed that the number of passengers per mile of road on the Santa Fe in 1911, was 143,000, and in 1914 only 137,000. The passenger service train revenue per mile of road was \$3,796, in 1911, but only \$3,671 in 1914. The passenger service train revenue per train mile was \$1.54 in 1911 and \$1.46 in 1914. Mr. Sangster contended that this condition was explained in part by operating conditions. For example, he said, the Santa Fe had constructed a large mileage of line, especially for the freight service, on which few passengers were carried, and that, therefore, the passenger figures per mile of road would be correspondingly reduced. Mr. Sangster also filed an exhibit to show alleged discriminations in the fares to Arizona points.

Other witnesses for the state commissions were M. A. Chambers, an accountant for the Kansas Public Utilities Commission, who presented a number of statistical exhibits to show the amount of improvements charged to operating expenses, and Wayne Ellis, an accountant for the Iowa commission, who presented figures showing what the returns of the railroads would have been if their capitalization had been one-third stock and two-thirds bonds, based on valuations made by D. F. Jurgenson, engineer for the Minnesota Railroad Commission.

Clifford Thorne requested that a large number of the exhibits on behalf of the protestants in the western freight advance case be included as a part of the record in this case, and he made a long statement explaining the bearing of each exhibit on this case, based on his theory that the railroads have decreased their

net operating income in recent years by including in operating expenses a large amount of additions and betterments, and by increasing the rate of renewals, etc., thus raising the standard of the property, and endeavoring to show that the railroads were earning as high a net return as other lines of business.

Mr. Thorne also demanded that the railroad men who had compiled the replies to the commission's list of 18 interrogatories be produced as witnesses for cross-examination. This request was denied by the examiner.

The testimony on behalf of the state railway commissions was completed on Saturday morning, after which E. K. Clink, chairman of the committee representing the International Federation of Commercial Travelers, filed a long statement with the commission, entering a protest against the proposed advances as "unnecessary, inconsistent, arbitrary and an imposition on the traveling public, and a particular hardship on the commercial travelers." The statement was said to be on behalf of a membership of 400,000 commercial travelers, and figures were presented to show that 500,000 commercial travelers, making an average of 50 miles a day for 10 months of the year, would spend in railroad fares an average of \$15,000,000 a month, or \$150,000,000 a year. The statement also declared that 75 per cent of the commercial travelers are on a commission basis and pay their own expenses.

The railroads then put on the stand a number of witnesses in rebuttal. The first rebuttal witness was T. A. Hamilton, supervisor of efficiency of the St. Louis & San Francisco, who criticized the gross ton mile basis of division between freight and passenger expenses used by Mr. Hillman, explaining the engine ton-mile basis used by the railroads, and also the equivalent ton-mile basis recommended by the committee on Economics of Railway Location of the American Railway Engineering Association in a bulletin issued in 1913. These bases, he said, take into consideration the speed of a train, and also the fact that from one-half to three-quarters of the damage to the track is done by the locomotive. He ridiculed Mr. Hillman's division of the expenses between wear and weather, saying that the best engineer ever born, entirely familiar with the conditions on his own railroad, could not apply the same figures to another railroad with any degree of accuracy. He said that the Supreme Court had held that expenses must be divided according to the use, and that the use is measured by weight, distance and speed, which are taken into consideration in the formulas used by the railroads. Mr. Hillman had not taken the effect of speed into consideration in any of his formulas. Mr. Hamilton said that on the engine ton-mile basis, after the principle is once accepted no figures need be estimated, but absolute records can be used. "We do not have to assume as Mr. Hillman did," he said, "an arbitrary average weight of carload or locomotive and then apply a theoretical division to this and get a result carried out to seeming refinement by the use of a large number of decimal places which look like a punctuated box car number." Mr. Hamilton said that the engine mile basis is defective because it makes no allowance for the different types of engines; the train mile basis does not allow for the fact that the engine does the most damage to the track, and that expenses cannot be divided on the revenue basis unless the rates are based on cost.

Frank Nay, controller of the Chicago, Rock Island & Pacific, testified that he checked over Mr. Hillman's figures pertaining to the Rock Island and found an under-statement of \$1,023,803 in the passenger expenses for the year covered, and that there was an over-statement of the net revenue. He also defended the locomotive ton-mile basis as the proper basis of division. Other rebuttal testimony was given by A. L. Conrad, assistant general auditor of the Atchison, Topeka & Santa Fe, and G. R. Martin, controller of the Great Northern.

SOUTH AFRICAN RAILWAYS LINKED UP.—The extension of the Upington railway line to Kalkfontein, north of Warmbad, has been completed, thus linking up the German lines with the Union system. This linking up constitutes a remarkable record, all material having been brought 400 miles.

International Railway General Foremen's Convention

Reports on Rods, Tires and Wheels, Shop Efficiency, Roundhouse Efficiency and Oxy-Acetylene Welding

The first session of the eleventh annual meeting of the International Railway General Foremen's Association was reported in the *Railway Age Gazette* of July 16, page 102, and the report of the committee on valves and valve gearing was given in abstract. The greater part of the first two sessions was devoted to the discussion of this report, which covered 65 pages in the advance sheets. One member strongly advocated the Stephenson valve gear for switch engines because of the variable lead which assists in starting. While the piston valve is accepted as the best all-around valve and is especially desirable on superheater locomotives, some roads have found that the slide valve could be made to work satisfactorily on these locomotives.

There is quite a difference of opinion regarding the use of superheater valve oil on superheater locomotives, some claiming that as good results could be obtained with Perfection oil, which gives less trouble in the gumming up of the air compressor ports. Some members reported favorable results with common gray iron piston valve bushings, while others believed that special metals give enough better service to warrant the additional expense. W. F. Lauer, of the Illinois Central, reported that on a test run with a superheater passenger locomotive fitted with Hunt-Spiller bushings and rings, 266,000 miles had been made using one pint of valve oil for every 65 miles. It was clearly shown that from the standpoint of economical operation it is very necessary to keep the valves in first-class condition, and with that end in view several roads require inspection every 30 days. The use of the piston valve accessories, such as vacuum valves, has been quite generally done away with. Good service records were reported for both the Baker and the Walschaert valve gears. Special stress was placed on the necessity for proper and careful design of valve gears. One of the most important claims made for the Baker gear is the standardization of parts for all locomotives.

RODS, TIRES, WHEELS, ETC.

Rods.—One member of the committee on this subject favored the rectangular rod as against the I-beam rod, from the standpoint of maintenance, saying that the rectangular section is much less subject to fracture and that it is about 20 per cent cheaper to make. The material in the rod should be of mild steel, without welds. The forked end rod was recommended by one member, as it is much less difficult to maintain. Regarding the crank pin bearings in the side rod, one member favored the split brass and straps on heavy engines, for the reason that they can be kept to a closer fit than the bushing, and are much easier to keep in proper repair. One road is experimenting on large freight engines with cast iron crank pin bushings with babbit blocks dovetailed in them.

One road has tried both brass and steel bushings for knuckle joints, and has found the steel to be more efficient. It was pretty generally conceded that all rods should be annealed at least every year or two. Among the many causes of broken rods and poor service are the rods being out of tram, the engine being out of tram, rod collars binding on the rod brasses, pins worn out of round, flaws in the straps or rods, engine out of quarter and engine not properly counterbalanced.

One road is using the electric welding process to build up worn places in the knuckle end of the rod and for welding small cracks in the jaws and rods to prevent them from getting larger. Another road finds it expedient to shim the side rod bushings and rebores them, stating that as much as 35,000 miles have thus been obtained on freight engines with but one set of bushings. It was recommended that cotter keys be placed in all main rod keys in conjunction with the two set screws, as too much care cannot be given to the back end main rod keys to prevent them from working out

Tires.—It is recommended by one road that a lip be placed on all tires to facilitate the setting, and also to prevent the tires from creeping in when they become loose. The rim of the driving wheel centers should be 5 in. wide to give a proper bearing surface on the tire. One road recommends that the wear of the tire in the center should not exceed $\frac{1}{4}$ in., and that flat spots should be limited to $\frac{1}{16}$ in. in passenger service and $\frac{1}{8}$ in. in freight. The minimum thickness to which a tire may be worn will vary in the different services and on different roads. When the tires become thin the brakes should be watched to see that they do not drag. Retaining rings were recommended for passenger engines; the use of shims on new tires was believed to be bad practice. Cut flanges are caused by the driving wheels being out of square with the engine, the wheels out of tram, the side motion not properly distributed, the engine trucks leading to one side and the engine not being level on the frame.

The report is signed by A. A. Masters, chairman (D. & H.); W. G. Reyer (N. C. & St. L.); M. J. Hayes (C. H. & D.); A. D. Clark (C. G. W.); A. B. Corbett (M. K. & T.); W. T. Gale (C. & N. W.); W. F. Lauer (I. C.), and A. F. Taylor (M. St. P. & S. S. M.).

Discussion.—Several roads reported that they were discarding channel rods and applying the rectangular or slab rods on account of the channel rods breaking. On heavy engines a number of the members recommended strap ends for the middle connection, as it is much easier to keep them in proper conditions between general shopping periods, the bushing rods requiring too much labor to renew. Special metal, such as gun metal, has been used instead of brass for rod bushings, with very good success, if it is properly lubricated. Some roads have even used gray iron. Several members spoke strongly in favor of the automatic flange oiler, but it was pointed out that the engineman should be carefully instructed to handle it properly, or that its manipulation be placed in the hands of the engine inspector at the terminal.

Several methods were reported for heating the tires, the cheapest being that where wood was used as a fuel, the wood, of course, being scrap material. The Soo Line reported that tires could be applied at a cost of 16 cents apiece where wood was used for the heating medium. Several roads reported that they were using cast iron for hub liners, while some used no hub liners until the wheels become sufficiently worn, when bronze is used. Some roads place a definite age limit on driving axles and crank pins, believing that after a short time the metal is liable to fail. This, of course, depends on the quality of steel used on the locomotive.

SHOP EFFICIENCY

The greatest factor in effecting and maintaining shop efficiency is competent supervision. Competent supervision, insuring competent workmen, makes it possible for an old shop, with less modern tools and facilities, to not only equal but exceed the output of the modern shop with the latest improved facilities, but poorly supervised. The foreman or the gang foreman who is in direct touch with the individual workman is the man who is largely responsible for efficiency, and his qualifications necessarily must be many. A combination of executive and mechanical ability is to be desired, and if he lacks in either, it is better that his executive ability be the greater.

Close supervision is conceded to be profitable, and no foreman should have under him more men than he can keep in touch with intelligently. He should be able not only to know what each man is doing, but how he is doing it.

Shop Schedules.—No shop can be efficient unless there is a fixed time set for the completion of repairs to the engines. There is no real need of an elaborate schedule which covers the time each separate part of an engine must be finished, but there

is an absolute need of a schedule which allows a certain number of hours for each class of repairs handled, consistent with the facilities. If, by reason of financial depression it is necessary to operate, say a 20-pit shop, with only enough men to properly handle 10 engines, put but 10 engines in the shop and get them out as quickly as possible, as even with the closest kind of supervision and checking of labor and material charges, the cost of repairs on 20 engines handled with a 10-engine force will be way above the usual cost of repairs, when engines are repaired in their usual time. There are a number of logical reasons for this, but I will mention only two: The first and principal reason in a shop which has been working full force under a satisfactory schedule is, of course, the changes which must unquestionably be made in the schedule time, thus disorganizing systems, and making for confusion and its attendant delay.

The second reason is the noticeable relaxation of efforts of the working forces which, under a short schedule, were keyed to a much higher pitch and the need of haste to get work completed on time kept men energetic and active; lengthening of the schedule has seemingly indicated to them that the need of haste has been obviated and that they now have lots of time, and it is a difficult matter to keep them from taking it. Schedule time as short as consistent with conditions makes for efficiency.

Facilities.—Modern facilities make for efficiency and where an improved tool or appliance will show a consistent increased output sufficient to pay a good rate of interest on the investment, it should be bought and installed.

Too often a shop's efficiency is retarded by reason of the initial cost of tools or appliances being considered rather than the ultimate profit that would be made with them. Then again, tools or appliances are purchased because of their price rather than their worth, and because they do not duplicate the output or come up to the standard of some similar tool or appliance, higher priced and of higher efficiency, men in charge are criticized and oftentimes termed incompetent.

Tool Room.—In a large shop where mechanics get their own tools on checks from the tool room, the delay of a minute multiplied by the number of times they occur in a day and by the number of men affected runs into hours, which in turn mean dollars. Therefore, energetic, quick moving and thinking men who know the condition of all tools in their charge, and who do not leave a defective tool where it may get in service are necessary.

Apprentices.—An apprentice makes for efficiency in proportion to the amount of interest he shows and the amount of interest that is taken in him. Select boys with as good an education as possible and who have a real desire to master the trade they wish to follow. Give the boy every opportunity to thoroughly learn his trade. Apprentice schools increase the efficiency in some shops—why not schools in all shops?

Shop Demonstrator.—A thoroughly competent demonstrator in a shop of any size is an absolute necessity. It is through his efforts largely that maximum capacity of machine output is obtained. He is invaluable because of his intimate knowledge of machines, enabling him to break in a new machine or a new operator on any machine which is at all complex. His work is not confined to machines, but to any proposition which needs close checking to insure results.

Store Department.—The store department can increase the efficiency by keeping a stock consistent with the mechanical department's needs and the prompt shipment of necessary material to the unfortunately located foreman of shops at an outside point where only stock common to ordinary requirements is carried. When it is considered that, as stated by G. S. Goodwin, in a paper read before the Western Railway Club of Chicago last February, the average value of a locomotive's services through the United States was \$44 a day, it is problematical whether the cause of efficiency is best served by the store department keeping material so low that at any time it makes for an engine delay. The problem should be given the most careful analysis.

Shop Appearance.—Shops should be roomy and well ventilated, windows so designed and lighting systems so planned that there are no dark spaces and glare of sun or lights so modified that the eyes of employees are not subjected to any undue strain; lockers and toilet rooms sufficient for the convenience of all employees should be installed and maintained in an absolutely sanitary condition.

The report is signed by Geo. H. Logan (C. & N. W.), chairman; J. M. Kerwin (C. R. I. & P.); J. C. Newmarch (N. Y. C. West); C. M. Newman (A. C. L.); J. Miller (I. C.); E. E. Griest (Penn. Lines); F. A. Byers (S. L. & S. F.); Wm. Smith (P. L. & E.), and W. T. Abbington (C. & N. W.).

Discussion.—Most men find that the scheduling of the locomotive parts through the shop is desirable, some roads going into more detail than others. On the St. Louis & San Francisco at Springfield, Mo., a man is assigned to the routing of the material through the shop, and is sort of an assistant to the general foreman. Another man devotes his whole time to checking up material, making shortage reports every day, and keeping after the store department for the material needed. The routing man also makes a daily report and red marks the work that is behind. On the Santa Fe a material man works in conjunction with the shop and store department.

On the Delaware, Lackawanna & Western a special committee inspects and passes on new devices or inventions presented by the employees, and if these devices are accepted for use the employees are paid for them. Other roads obtain the patent rights for the men with the understanding that the devices can be on the roads without the payment of royalty.

ROUNDHOUSE EFFICIENCY

The roundhouse is the connecting link between the mechanical and transportation departments. A well-equipped roundhouse will do much towards strengthening this link, and it is time that more attention be paid to its construction and equipment, so that it may be brought up to the highest state of efficiency. Too much of the details of the construction of roundhouses is in the hands of the engineering department, and too little in the hands of the man who is on the ground, who has to furnish the power for moving trains, and who knows more than anyone what is required for the highest state of efficiency. To the roundhouse foreman belongs the responsibility for engine delays, engine failures, engine mileage, cost of despatching, etc., and therefore his ideas and recommendations should receive the first consideration. Good light, heat and ventilation are important for facilitating roundhouse repairs, for in order to get good results from the employees' conditions should be equal to those of the repair shop. Lockers and adequate toilet facilities should also be provided.

Equipment.—Drop pits for driving wheels, engine and tender wheels should be in all roundhouses where running repairs are required to any extent. An engine may be kept out of the repair shop indefinitely by dropping the driving wheels for repairs to driving boxes, turning tires, etc. Overhead cranes or trolleys should be arranged for removing dome caps, front end doors, bumper beams, etc. Washing out systems effect a great saving as well as protecting the boiler against leaking flues, and all roundhouses should have hot water and plenty of it for washing and filling boilers. Storage tanks, or sumps, should be made large enough to take care of all the water that is blown from the boilers; it should then be used for washing out, reclaiming all of the water by filtration.

There are instances of roundhouses equipped entirely with old tools discarded by the repair shop. This is a short sighted policy. The tools for the roundhouse should be the very best, especially where it is isolated from the repair shop, and it would seem that the repair shop should take the old tools rather than the roundhouse, because the repair shop is in a better position to make repairs to them than the roundhouse.

Roundhouse piping is a subject for consideration. It would seem that the only proper and safe way to install the piping is in

conduits of sufficient size to hold all the pipes and provide easy access should repairs be necessary. No sewer pipe leading from the roundhouse should be less than ten inches in diameter and preferably 12 in. Engine house pits, especially drop pits, not properly drained, dispel an odor causing dissatisfaction among the employees, and are also unhealthy.

There should be two inbound tracks with an emergency run-around track and two outbound tracks. The inbound tracks should be of sufficient length to admit of a water crane a reasonable distance from the entrance so that engines coming in from the road leaking and having low water in the tender can be given water. Otherwise with engines ahead, they will die before getting into the house, causing delay. There should be about 350 ft. between the water crane and the coal chute so that after taking water the engines may move ahead to wait their turn for coaling. There should be at least 600 ft. between the coal chute and turntable to allow for engines standing after taking coal.

To prevent damage to cars by fire from hot cinders pits containing several feet of water are being constructed so that the cinders can be dumped from the engine into the water. The Chicago & Western Indiana load cinders with clam shells, the cinder pits containing water to the depth of 7 ft. The cinders are loaded into cars at a cost of about twelve cents per car. These cinders are sold to the track elevation department for \$3 per car, for which the roundhouse is credited. Water cranes should be located, one at the entrance of the inbound tracks, one on the inbound tracks between the cinder pit and turntable and one on the outbound tracks.

The office and store house should be combined into one building conveniently close to a track for loading and unloading purposes and should be made fire proof.

Cleaning engines, on a number of roads, is being discontinued on account of the expense. This would not appear to be a good policy for the reason that the defects are liable to be covered up and may not be detected by the engine inspectors. There are several mechanical devices for cleaning engines, which bring the cost down so much lower than the hand cleaning, that it does not seem that a railroad can afford to entirely dispense with cleaning.

The report is signed by: N. B. Whitsel (C. & W. I.), chairman; H. W. Ensign (C. G. W.); Chas. Snyder (A. T. & S. F.); E. J. Buckbee (C. C. C. & St. L.); W. S. Whitford (C. & N. W.); S. J. Harper (Y. & M. V.); W. B. Middleton (A. C. L.); and E. R. Butler (C. & O.).

Discussion.—Those roads that are equipped with electric cranes in the roundhouse are very strongly in favor of them, and believe that they are indispensable. Some roads use jib cranes at the posts between the pits. A number of roads also find the use of portable lathes valuable. One road has a satisfactory arrangement of drainage providing settling boxes in the sewer line to catch the waste and sediment. These boxes are cleaned every week at a small cost. Roads cleaning engines by washing with a mixture of oil and water under pressure find that the work is done very satisfactorily. On the Delaware, Lackawanna & Western a large Mikado engine can be cleaned in about 15 minutes, by this process at a cost of not more than 30 cents. A mixture of 75 gal. of water to 1 gal. of oil is used with a pressure of 90 lb., the pressure being taken from the air line in the yards. This method of cleaning not only gives the locomotive a very neat appearance and does the work economically, but it keeps all the parts clean and free from grease, which makes more perfect inspection possible.

OSY-ACETYLENE WELDING

The oxy-acetylene process of welding and cutting metals has during the past few years been adopted by many of the principal railroads. It is doubtful, however, whether any of the present installations are of as great capacity as will eventually prove necessary to handle the volume of work which can be most efficiently performed by this process. As far as is known, the lar-

est single oxy-acetylene installation is that at the Springfield shop of the St. Louis & San Francisco. This plant, in addition to the ten others on the Frisco System, was furnished and installed by the Oxyweld Railroad Service Company. The oxygen generators are of the duplex type and 1,000 cu. ft. capacity. The oxygen used is purchased from the Linde Air Products Company, being delivered to the road in 100 and 250 cu. ft. cylinders. These are connected to a duplex manifold which makes it possible to remove and replace cylinders without cutting off the gas supply to the shop. In all of the Frisco plants* the oxygen and acetylene gases are piped throughout the shop, stations being placed at convenient intervals to serve the various departments.

The only trouble which has ever been experienced with oxy-acetylene welds has been due to the inefficiency or inexperience of the operators. On the Frisco welders are selected from among the best journeymen of the various trades. No handy-men or apprentices are used on any class of work whatever. The mechanics who are selected are given a four months' course of training under an expert. By this system a corps of more than seventy expert welders has been trained on the Frisco System, and the work which is being turned out of the shops today is of first quality.

The Frisco with first-class boilermakers as burner operators is handling all classes of boiler work with unvarying success. It is the present practice to weld in all part sheets, whole sheets and seams of complete boxes. This method is more economical than riveting as to initial cost, and also represents a great saving in subsequent repairs required at roundhouses.

During the past two years all broken frames have been welded by the oxy-acetylene process, which has proved itself not only cheaper, but more satisfactory than any method previously used. The percentage of failures on frame welds when competent operators, usually blacksmiths, were used has been zero. This process has no limitations as to classes of metal; brass, cast, malleable and wrought iron or steel being welded with equal facility.

The New York Central at the Collinwood shops use both the electric and oxy-acetylene welding process. The latter is used principally for boiler work in welding and cutting. The electric process has been found of special advantage in welding flues in fine sheets, very good results having been obtained from this practice.

The Chicago, Rock Island & Pacific at Silvis, Ill., operate both systems but still adhere to the use of Thermit for all frame welds.

The report is signed by: F. A. Byers (St. L. & S. F.), chairman; J. M. Kerwin (C. R. I. & P.), and I. C. Newmarch (N. Y. C. West).

Discussion.—A large number of interesting jobs were mentioned as being done by both the electric and oxy-acetylene processes, showing that as the operation of these systems becomes better known the opportunities increase. It was shown that in order to be used successfully the operators must be expert and have a thorough understanding of the art of welding, the varying successes on different roads on the same class of work making this clearly evident.

CLOSING EXERCISES

During the Thursday session an address on the Selection of Men and Their Promotion was made by Roy V. Wright, managing editor of the *Railway Age Gazette*. The necessity of having the officers and foremen study their men more critically was emphasized.

The following officers were elected for the ensuing year: President, L. A. North, superintendent of shops, Illinois Central, Chicago, Ill.; first vice president, Walter Smith, general foreman, Chicago & North Western, Deadwood, S. D.; second vice president, W. T. Gale, foreman, Chicago & North Western.

*For a complete description of these plants and the work done see the *Railway Age Gazette* of September 11, 1914.

Chicago, Ill.; third vice-president, W. G. Reyer, general foreman, Nashville, Chattanooga & St. Louis, Nashville, Tenn.; fourth vice-president, C. L. Dickert, assistant master mechanic, Central of Georgia, Macon, Ga.; secretary-treasurer, William Hall, foreman, Chicago & North Western, Winona, Minn.

NEW LEHIGH VALLEY PASSENGER AND FREIGHT TERMINALS AT BUFFALO

The Lehigh Valley has recently started the construction of complete new passenger and local freight terminals at Buffalo to replace the present facilities which have become inadequate for the traffic. The passenger station, located between Main, Quay, Washington and Scott streets will be a four story structure of gray Indiana limestone with a granite base and terra cotta trimmings. The building will be set back 50 ft. from the east line of Main street to provide for a driveway and approach to the main entrance. It will have a frontage of 164 ft. on Main street and will extend back 102 ft. on Scott street. The area-way between the north side of the building and Quay street will be paved, providing standing room for cabs and another driveway to the building. On the Washington street side an open

rooms, etc. A hospital room will also be provided in the station.

Offices will be provided on the Main street side of the building on the second, third and fourth floors for the use of the Lehigh Valley and tenant companies. These offices will be provided with double elevator service and with independent stairways.

A ramp will lead from the waiting room to a tunnel under Washington street, providing access to trains. At the opposite end of the tunnel there will be another ramp bringing passengers to the street level, the headhouse and the train shed.

The headhouse will be a two-story steel-encased building set back 20 ft. from the building line on the east side of Washington street. It will have a frontage on this street of 181 ft., and a depth of 100 ft. on Scott street. In outward appearance the building will be of gray brick with granite base and terra cotta trimmings in harmony with the station proper.

On the first floor of the headhouse a baggage room will be provided with an area of 4,300 sq. ft., 3 independent express rooms with a total area of 4,600 sq. ft., and a mail room of 1,200 sq. ft. A concourse 181 ft. long will extend across the full length of the building with a total area of 5,600 sq. ft., and will be open to the roof. At one end there will be another cabstand. Exits will be provided on Scott street and on the areaway on

Architect's Drawing of the Main Street Side of the Proposed Passenger Station

area 50 ft. wide will be given over to a grass plot. Coming through the main entrance on Main street or from Quay street, one enters immediately into the main waiting room 82 ft. by 102 ft. in area and the full height of the building. Three large arched windows will be provided on the Main street side and smaller windows on the other sides in addition to large skylights in the roof. Marble will be used for the floors and wainscoting of this room. A lunch room and restaurant will be located on the Quay street side of the waiting room, while on the Scott street side there will be a smoking room, a women's room and retiring rooms for both men and women. Adequate space will be provided for the telephone, telegraph, news-stands, parcel

the north side. The ramp from the tunnel under Washington street will lead directly to this concourse. Seats will be provided here as well as in the main waiting room.

Provisions will be made for immigrant travelers on the second floor of the headhouse where separate rooms will be provided for men and women, for the exclusive use of this class of travel. There will also be lounging rooms and lockers for enginemen, firemen, conductors, trainmen and Pullman and station employees on this floor.

The train shed will be 195 ft. wide and 842 ft. long and will provide for 10 tracks. The Bush type of concrete and steel shed with Keppler skylights has been adopted, requiring more than

50,000 sq. ft. of glass. The platforms will be of concrete, built at an elevation 8 in. above the top of rail.

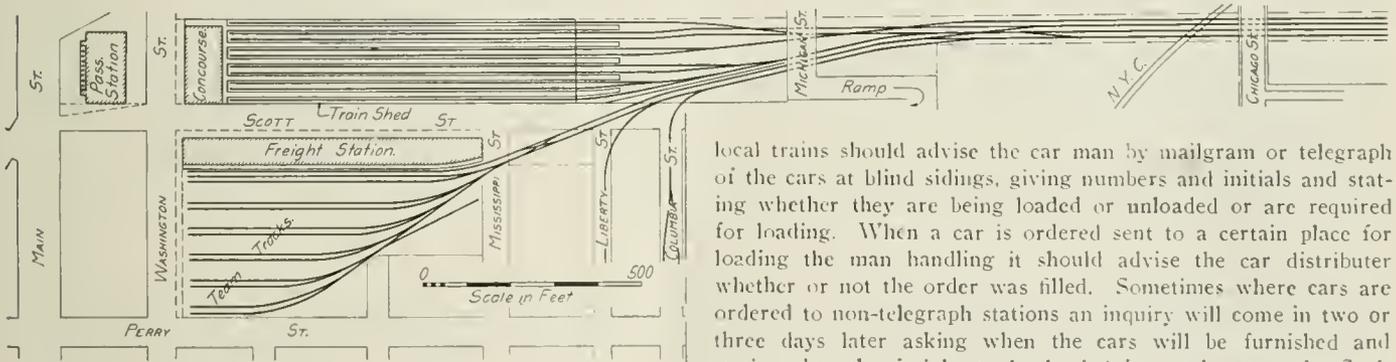

The freight terminal will be located between Washington, Scott, Quay, Perry and Mississippi streets. A two-story office building of steel encased construction with a granite base and terra cotta trimming, in harmony with the passenger buildings, will be located 15 ft. from the east line of Washington street and 18 ft. from the south side of Scott street, having a 60 ft. frontage on Washington street and being 111 ft. deep. Connected directly with this building will be the freight house proper, a steel and concrete structure divided into three separate sections by fire walls. The building itself is 600 ft. in length, while each section is 191 ft. long and 60 ft. wide. Natural illumination will be provided by a continuous line of sashes around the entire house just above the doors and daylight will enter from all four sides. The floors of the freight house and the platforms on either side will be of concrete. The platforms will be 10 ft. wide, while there will be a ramp on the track side leading to the ground at either end. A line of steel curtain doors will be provided on both sides with steel canopies above. The area between Scott street and the freight house will be paved with Belgian blocks, while the two tracks on the opposite side will provide room for 32 cars.

Beyond the two freight house tracks there will be 11 team tracks spaced 45 ft. between pairs. The driveways will be paved with Belgian blocks, while an electric crane will be provided to handle heavy materials. A concrete wall 8 ft. high will sur-

round the entire block occupied by the freight terminal with the exception of that portion occupied by the office building and freight house proper. An all-electric interlocking plant housed in a brick and steel tower will govern the entrance to the terminal.

of the geography of the surrounding country, the different railroad connections, etc. He should have the different series of cars in use on his system committed to memory and should acquaint himself as far as possible with those in use on direct connecting lines so that when a car number comes before him he will not have to refer to the Equipment Register to ascertain whether it is a box, stock, flat or passenger car. He should also be familiar with the M. C. B. rules in order to be in a position to act when a defective car is to be interchanged and he cannot communicate with higher officers on the subject. An idea as to the construction of a car will help out many times when a car is "bad-ordered" on the road and disposition is desired.

The agents and yardmasters should be so drilled that their car reports, both by wire and mail, will be promptly transmitted at the appointed time and not an hour later; if any fail in this the superintendent should apply a remedy at once to prevent a repetition because the car distributor cannot do his work efficiently without knowing what cars are on the line and the requirements at the different stations. When these reports are received he should make a thorough check in order to fill the orders for the next day and at the same time rid the division of any foreign cars not needed for immediate loading. It will also be necessary to haul some empty cars for loading and he should figure on the short haul for them. He should place his orders for empties with the yardmasters far enough in advance to insure their being put in the trains and not make it necessary for trains to be reduced to put them on. At the end of their runs conductors of

Track Layout at New Lehigh Valley Terminal at Buffalo

local trains should advise the car man by mailgram or telegraph of the cars at blind sidings, giving numbers and initials and stating whether they are being loaded or unloaded or are required for loading. When a car is ordered sent to a certain place for loading the man handling it should advise the car distributor whether or not the order was filled. Sometimes where cars are ordered to non-telegraph stations an inquiry will come in two or three days later asking when the cars will be furnished and stating that the freight to be loaded is on the ground. Such service results in law suits for delays and damages.

The car distributor should be furnished with a copy of each conductor's report and have access to the index book at the yard office where he is located. In tracing cars and handling diversion orders the telegraph service is severely abused because many car distributors will not avail themselves of the information at hand; for instance, they can check the conductor's wheel reports, index books and agents' and yardmasters' car reports and secure a great deal of information which will be of value in tracing cars, and filling orders for empty cars. It has been noticed that some large yards do not make a daily car report showing the record of individual cars into and out of the yard, on hand, etc., claiming insufficient force. The time consumed by operators sending telegrams concerning cars would more than offset the salary of a clerk to make such a report in the yard office.

All inquiries concerning cars should be referred to the car distributor and handled by him and not by other employees in the division office. Then he is familiar with what is going on and there is no chance for a duplication of messages, mailgrams and letters; this will also insure against agents and yardmasters having to answer two or three inquiries concerning a certain car, a practice which has a tendency to cause them to become negligent in making replies.

The car distributor should also be qualified as a telegrapher for the reason that he can communicate direct with the different agents' and yardmasters' offices, by the use of the instrument, secure information that will assist him in making a quick disposition of cars, and secure tracing and diversion records, when if he has to wait until telegrams take the regular course he may

THE CAR DISTRIBUTER

By J. L. Coss,

Assistant Chief Dispatcher, Chicago, Rock Island & Pacific, Haileyville, Okla.

On heavy divisions a car distributor is usually employed to distribute cars, as the chief dispatcher cannot do this in addition to his other duties. This man fills a position which is of more importance than the average person appreciates. The quick handling of cars is essential; therefore, it requires a man who can place them promptly for loading and at the same time do it with the least expense. The position should be made attractive enough to secure the right kind of a man—one who will stay with the job and who has an ambition for something better; for the service required will not be obtained when frequent changes are made. Where business is heavy and especially where there are several industries to serve, the position should pay at least \$125 per month. There should also be another incentive. When there are vacancies in the general office of the car accountant, transfer to which would be a promotion to the car men on the road, they should be given a chance at them.

A first-class car distributor should have a thorough knowledge

be delayed and in the end have to cause more telegraphing by sending wire tracers for answers to messages he has filed previously.

THE METROPOLIS BRIDGE OVER THE OHIO RIVER

Work has recently been started on the construction of a new double-track bridge over a mile long across the Ohio river at Metropolis, Ill., including a span 722 ft. 11 in. center to center of piers, over 50 ft. longer than any other simple truss span in the world. The bridge, together with a railroad 15 miles long connecting Paducah, Ky., and Metropolis, Ill., is being built by the Paducah & Illinois Railroad, which is owned jointly by the Chicago, Burlington & Quincy and the Nashville, Chattanooga & St. Louis, and will serve as a connection between these two roads.

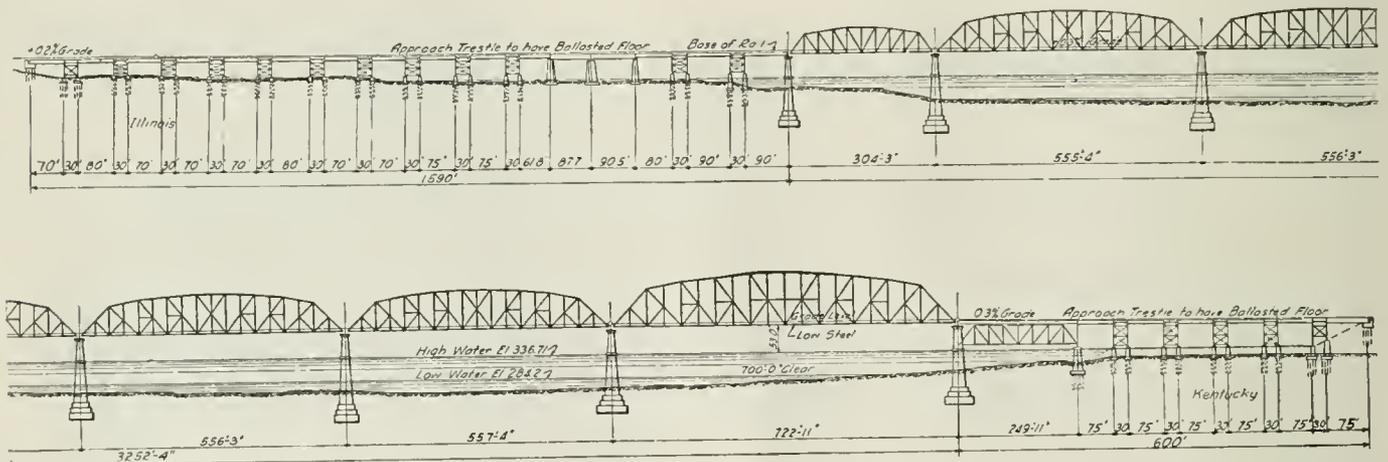

The bridge will consist of a channel span 723 ft. long on the south side of the river, four spans each about 555 ft. long and a 304 ft. span on the north side, all pin-connected trusses of the Petit type. South of the long channel span there will be a deck truss 250 ft. long. The bridge provides for two tracks spaced 13 ft. center to center, while the through truss spans will provide a side clearance of 8 ft. and a vertical clearance of 22 ft. above top of rail. There will be a viaduct approach on each end, made up of 30 ft. tower spans with clear spans varying from 65 to 90 ft. in length. At one point in the north approach there will be four girder spans in succession with high masonry piers

track and a uniform load of 7,500 lb. per foot of track for the far track, except on floors, hangers and sub-diagonals where the load will be two E-90 engines on each track. The impact per cent to be added to live load stresses is 10 per cent in all members except hangers and sub-diagonals, and the web members of the 246 ft. and the 300 ft. spans. On the latter 20 per cent is added, while on the floor, hangers and the sub-diagonals 50 per cent of the live load for one track is added. The designing stress for tension and bending under full live load, impact load, and dead load is 20,000 lb. per square inch for medium steel, 30,000 lb. per sq. in. on silicon steel, and 35,000 lb. per square inch for nickel steel eyebars.

The contract for the structural steel and the erection has been let to the American Bridge Company, and it will be, for the most part, fabricated at the Gary plant. The Union Bridge & Construction Company of Kansas City has the contract for all piers requiring pneumatic foundations, and is now at work on the caisson for Pier No. 1. All other masonry work will be done by company forces.

The approach embankment at the south end of the structure is 70 ft. high for a distance of 1,800 ft., continuing as a much lower embankment for an additional distance of 6,000 ft., and contains in all 855,900 cu. yd. The heavy portion of this embankment is being built by steam shovels. The fill at the north end of the bridge is 6,000 ft. long, averaging 15 ft. in height and contains 140,600 cu. yd.

The line between Paducah and Metropolis, including the ap-

Elevation of the Metropolis Bridge

for intermediate supports, one of them on a skew, to provide for railroad tracks under the structure. The south approach is 600 ft. long, while that on the north is 1,500 ft. long. Both approaches will end in pocket abutments, resting on piles driven into the end of the embankments, the one on the south end being 75 ft. high, and that on the north 40 ft. high.

The total length of the bridge is 5,442 ft. The track on the channel span will be on a level grade 113 ft. above low water. The rest of the structure will be on 0.3 per cent approach grades descending each way from the channel span. There will be 53 ft. of clear head room above high water, which is 52.7 ft. above low water. The seven river piers will require pneumatic foundations carried to a thick stratum of sharp white quartz sand about 75 ft. below low water, which sand extends to bed rock, about 230 ft. below low water. The viaduct approaches will be on concrete pile and spread foundations, the latter being on a compacted gravel

The design of this bridge involved a departure from usual practice in the use of a much higher live loading than that actually existing at the present time, in conjunction with high unit stresses, in order to insure greater uniformity of stress in all parts of the structure when the high live loading is ultimately realized. The live load on the trusses consists of two Cooper's E-90 engines, followed by 7,500 lb. per foot of track for the near

approaches to the Metropolis bridge, is being built with embankments and cuts for single track and with all structures providing for double track. It is expected that the line will be completed about August 1. The estimated time for the completion of the bridge is from 2½ to 3 years, but in order not to delay the use of the rest of the property until that time, inclines are being provided at each side of the river to permit the transfer of trains across the river by car ferry.

The bridge was designed by and is being constructed under the direction of C. H. Carlidge, chief engineer of the Paducah & Illinois Railroad, and bridge engineer of the Chicago, Burlington & Quincy, all plans and specifications being approved by Ralph Modjeski, consulting engineer, Chicago.

SWISS RAILWAYS AND THE WAR. — Perhaps in no country in Europe has railway construction and railway engineering work in general been more affected by the war than in Switzerland. It is true that work is proceeding upon the great enterprises on which it had already been begun when war broke out, such as the second Simplon tunnel, the Hauenstein Base tunnel, the Muenster-Grenchenberg tunnel, and the Frasn-Vallorbe line; but it is certain that there will not be for a long time to come any new developments of new mountain railways, for several of which concessions had already been obtained.

Proposed Bureau for Clearing Car Repair Accounts*

Organization to Be Supervised by the American Railway Association or the Master Car Builders' Association

By C. F. STRAUB

The idea of traveling M. C. B. inspectors in the employ and under the supervision of the American Railway Association or the Master Car Builders' Association, as recently suggested by a car department officer in one of the railroad journals, is undoubtedly a good one. It would obviate a great deal of discussion regarding improper charges on M. C. B. repair cards. It would in time eliminate the suspicion that strict honesty is not always adhered to by those handling M. C. B. charges, due, it is said, to overzealousness in attempting to make good showings in departmental expenses, which is too often thought to be condoned by higher officers.

The writer has been engaged for a number of years in the detail work of M. C. B. billing, accounting and correspondence, including the direction and instruction of car shop clerks and car inspectors in the issuing of repair cards and entering the charges thereon, and has felt the need for such inspectors; he would, however, propose going a step further, in the establish-

ment of a clearing house for the settlement of car repair accounts. The bureau would then make up credit bills in favor of each company, without showing car numbers or details. This would mean that, instead of a large company making up several hundred bills, some having 300 or more pages, containing 12,000 or more car numbers and showing charges in detail, there would be but one bill to debit the bureau. The repair cards would then be appropriately stamped by the bureau (mechanically, somewhat as letters are stamped in large postoffices) showing that credit had been allowed the issuing company, and the charges then entered in the balance sheet in the credit column of the issuing company opposite the names of the various debtor companies. By referring to the proposed form of balance sheet shown in the illustration it will be seen that when the credit entries of all the member companies have been properly made both the total credits and the total debits of each company are directly obtainable. In the form illustrated no detail entries are given but totals are shown, the number of dollars in each case being equivalent to the number of cars owned according to the 1911 Proceedings of the Master Car Builders' Association

Each company would forward to the bureau, either monthly or semi-monthly, properly assorted, all of its billing repair

Suggested Form of Clearing House Balance Sheet

ment of a clearing house for the settlement of car repair accounts.

By creating a bureau to handle these accounts, either under the jurisdiction of American Railway Association or Master Car Builders' Association, the matter of M. C. B. billing could be placed on an economical and efficient basis and benefits would accrue which no doubt have been and now are, apparent to every railroad officer and employee who is familiar with the amount of work involved in the present method of handling. So far as is known, no one has yet presented a sufficiently definite plan to warrant the consideration of either association and year after year the needless waste goes on.

The proposed bureau should be organized somewhat as follows. After a sufficient number of companies who are members of the M. C. B. Association, have subscribed to the new plan the bureau could be established by the appointment of a manager and a number of assistants. The manager should have had a number of years' experience in M. C. B. general office

cards. The bureau would then make up credit bills in favor of each company, without showing car numbers or details. This would mean that, instead of a large company making up several hundred bills, some having 300 or more pages, containing 12,000 or more car numbers and showing charges in detail, there would be but one bill to debit the bureau. The repair cards would then be appropriately stamped by the bureau (mechanically, somewhat as letters are stamped in large postoffices) showing that credit had been allowed the issuing company, and the charges then entered in the balance sheet in the credit column of the issuing company opposite the names of the various debtor companies. By referring to the proposed form of balance sheet shown in the illustration it will be seen that when the credit entries of all the member companies have been properly made both the total credits and the total debits of each company are directly obtainable. In the form illustrated no detail entries are given but totals are shown, the number of dollars in each case being equivalent to the number of cars owned according to the 1911 Proceedings of the Master Car Builders' Association

*Copyright, 1915, by C. F. Straub.

The use of these figures is based upon the fact that on some roads the amounts of monthly credits and debits account of interchange car repairs have each been found to average approximately one dollar per car owned; they may be considered as representative of the amounts which would be involved in the clearing house transactions.

The bureau staff handling the credits and charges would be interested only in the proper charges on repair cards, and being experienced in M. C. B. billing, would be qualified and authorized to make such changes and corrections as to make the cards eligible for billing, or return them to the issuing company for correction. This would eliminate all checking of bills by the railroads except as to the location of cars by the car record office, which could readily be done from the repair cards. The cards for such cars as did not check with the car accountant's records could be returned to the bureau and proper credit allowed. The bureau could then return the cards to the issuing company for correction and deduct the amount of the charges from the next credit bill in favor of the issuing company, permitting the return of the cards to the bureau for rebilling only after they had been endorsed by that company's car record office showing the interchange record. Under the bureau plan repair cards would not be given the close supervision in the offices of department heads which they now receive and such supervision should be given at the shops and inspection points as to insure the least possible amount of correspondence with the bureau. Each company should endeavor to send its repair cards to the bureau as nearly correct as possible.

It has been the writer's purpose to go into detail far enough so that it may be readily understood that the plan is feasible. No doubt objections may be raised, perhaps the greatest one of which is the vast number of private car lines. However, if the railroads once put the bureau plan into operation there will certainly be enough such owners who will at once recognize its benefits to start a movement in favor of a bureau of their own if they do not care to become members of the railroad bureau. A separate bureau would probably be found to be the best plan, and it is believed would receive the endorsement of the greater number of private owners. All matters pertaining to repairs to privately owned cars would then be settled between the two bureaus.

It is obvious that considerable expense, on some roads thousands of dollars each year, would be saved by handling but one credit and one debit bill each month, instead of several hundred as at present. Also in the operation of the bureau, mechanical devices could be extensively employed, the use of which is entirely impracticable under the present unit system of billing. On railroad systems having an average monthly credit and debit for interchange car repairs of from \$40,000 to \$45,000, it is safe to say that a net saving can be effected of from \$8,000 to \$10,000 per annum, including stationery, postage, clerk hire, etc., in the motive power and accounting departments.

The cost of operating the bureau should be apportioned among the members monthly on the basis of the amount of both credit and debit repair accounts. The bills rendered on this account should be separate from those rendered on account of car repairs.

The advantages of the bureau system may be briefly summed up as follows:

1. Elimination of the suspicion of dishonesty and unfair practices.
2. Elimination of a vast amount of correspondence, due to exceptions to charges, wrong car numbers, etc.
3. Several hundred accounts of bills payable consolidated into one account and *closed* as soon as received.
4. Several hundred accounts of bills receivable consolidated into one account and *closed* as soon as received.
5. Postage saved by elimination of multiplicity of bills and correspondence in connection therewith.
6. Of the gross amount saved by each company, possibly not

more than 20 per cent would be required to meet its share of the cost of maintaining the bureau.

It is the hope of the writer that he may some day see such a plan tried out and its feasibility proven. It seems as though the time were ripe for action to that end by either the American Railway Association, the Master Car Builders' Association or the Accounting Officers' Association.

HUNTING STRAY FREIGHT ON THE PENNSYLVANIA

The Over and Short Bureau of the Car Record office of the Pennsylvania Railroad, at Philadelphia, under the charge of T. S. Bell, receives about 2,500 over and short reports daily, reports being made to this office by all stations on the Pennsylvania and its controlled lines east of Pittsburgh and Erie; and an ingeniously devised index has been put in use for the purpose of matching the overs with the shorts; that is, for satisfying, as far as possible, all reports of freight short by discovering the missing goods at some other station. This is accomplished by carefully searching the records of all the over reports which are received within the next 10 or 15 days after the date on which the freight reported short began or should have begun its journey; searches are begun, usually, about the tenth day. For a large proportion of the shipments or packages which go astray the clerk, with little trouble, finds an over report and a short report which match each other; and, indeed, many cases are, of course, settled by the station agents without troubling the head office at all; but the system here referred to deals with those cases which cannot be cleared up without some little study; perhaps two or three hundred daily. Of these a considerable portion can be settled readily by correspondence. Many others require more particular treatment, and the office employs twenty-four men who are on the road, most of the time, searching for lost goods and making other investigations incident to the proper treatment of freight claims of all kinds. Classes of shortage which cannot be readily settled are those where the corresponding "over" is on another road and is not reported; or where thieves have stolen the goods. A record of this kind should be looked upon as an essential feature of the service, even if costly; but there have been gratifying results from a financial standpoint. In a typical week the number of lost shipments located was 50, involving claims amounting to \$2,056; and in the same time 93 shipments, for which claims had not been presented.

The essential feature of this over and short record is the combination of four indexes in one. The clerk has before him four sheets; and each item is entered on all four. In the first one the shipment in hand is indexed alphabetically by the name of the originating point; in the second it is indexed, on a line bearing the same number, under the name of the station to which it is billed; in the third by the name of the consignee, and in the fourth by the name of the commodity.

The illustration shows a set of index blanks as arranged for use, the engraving being reduced about two-thirds in width and height. These four indexes, consisting each of 24 sheets, fastened one above another, are arranged on a board 21 in. wide and 14 in. high, the sheets being held at the top by strong clips. In the photograph diameters are reduced as stated, and to further save space, about *one-half* of each sheet has been cut out, viz., lines 4 to 24 inclusive and lines 41 to 56 inclusive. Sheet B has one more line than Sheet A; C has one more than B and so on, this arrangement having been found the best to facilitate the quick uncovering of any given sheet.

In the illustration the letters A, B, C, D, E, F, G, H represent each the lower end of a separate sheet; and a complete view would show separate sheets for the whole alphabet, A to Z.

The method of making the record may be illustrated by referring to line 28. Reading this line the interpretation is as follows: The shipment was billed from Ashland, N. J., on May 2; and the name of the place billed to, is indicated in the right hand

margin. This is to be found in the next index under A; referring to the next index, line 28, we find in the first column a letter A referring back to the word Ashland. (The date shown here is not the date on which the waybill arrived at destination or on which the short report was made; it is the date of the waybill. Throughout the records this earliest date is kept constantly prominent.) The letter A in the last column at the right indicates that the consignee's name is to be found in the index under that letter. Following the same rule we find in the third index that the commodity is to be found under A, and that leads us to the fourth index.

Going back now to the first index we find that in the item entered on line 31 the letter at the right is H. This indicates that the name of the station billed to will be found on sheet H, of the second index. The H sheet begins at line 40. The clerk always reads up. With his pencil, he turns up the lower left-hand corner of the sheet marked G, which discloses sheet H; and there, on line 31, he finds that this item was billed to Harrisburg. In the right-hand column of this index he finds the letter M; and by referring to sheet M in the third index, which ends at line 45 he reads on line 31 the name of the consignee, A. Morris. The whole of the index is made up in this way. If the sheet for a given letter is filled up while yet there is much room on the others, an additional sheet is inserted. A bunch of sheets lasts two or three days.

A similar set of indexes, with the heading slightly modified, is

stations was similar freight loaded?" "Have you received an over report from any other point covering this shipment?"

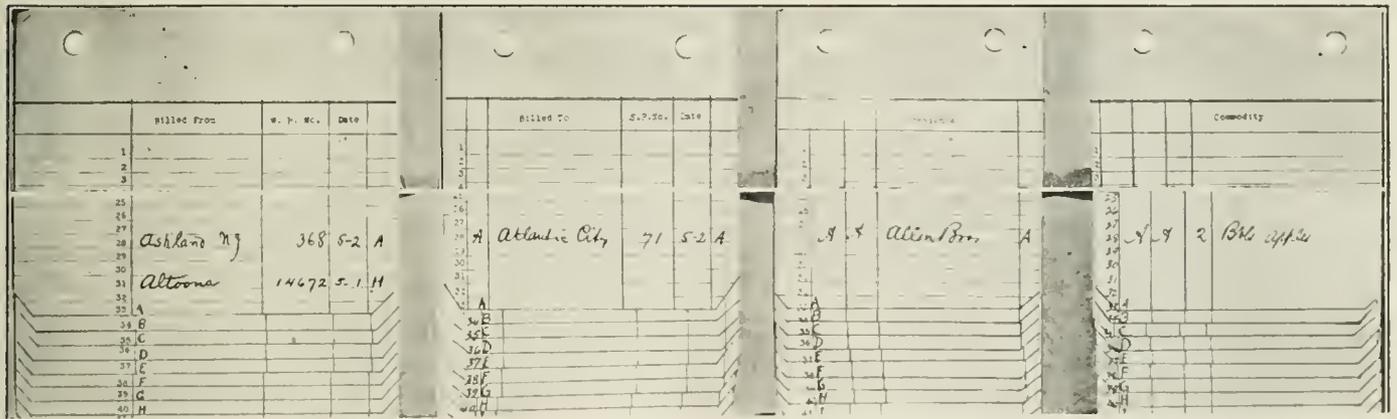

The instructions require this report to be made within two days after receipt of waybill, if all or a part of any shipment is short. Three copies are made, one for the agent at the point of shipment, one to go to the last transfer station at which shipment checked "O. K." and one to be retained. If the shortage has not been accounted for in seven days then a report is to be sent to the over and short bureau, including replies received, should there be any.

In making reports of overs property must be described as fully as possible. Castings and parts of machinery must be described in detail, so as to show, if possible, to what they belong. Packages must be described as old or new. An over report should bear notations of any articles reported short from the same car.

Freight known to belong at some other station is immediately forwarded, of course; but the report is made just the same.

An agent who receives freight which is known to belong at his station, but for which he has no waybill must make an over report within two days. He can of course, deliver the goods on presentation of original bill of lading or other proof of ownership, and payment of freight charges from point of shipment. Freight found over, which, because of absence of marks or other reasons, cannot be disposed of, must within ten days be sent to the unclaimed freight station, which is at Downingtown, Pa.

Mistakes in marking, or the sending of packages with no marks,

Forms for Indexes to Freight Shortage Reports—Pennsylvania Railroad

kept for the over reports received. The first of the four indexes is to show the point of origin, so far as this can be ascertained, whether there is or is not a waybill to give light on this point. The second index shows the station with which the over report is connected, without regard to whether there is or is not any waybill reference. For a package without marks, or with marks which are not understood, the entry in the third index, instead of showing name of consignee, would be registered as "no marks."

The reports both for shorts and overs are made on very large blanks (8½ in. by 14 in.) with a view to having spaces large enough for writing in each item of information, so that as a rule the same kind of information can always be found in the same part of the sheet. On the short report, for example, there are ample spaces not only for facts obviously needed, but also for copies of all transfers, time stamps or other marks on the waybill; seals on all four doors, and answers to such questions as:

1. "Was car left at your station, or taken forward in same train?"
2. "How long was car at your station unsealed before shipment in question was checked?"
3. "Value of freight short."
4. "Has claim been entered." Give particulars.

The report fills one-half the sheet, and the other half contains spaces for the answers to be made by the agent at the forwarding station. Among the questions which must be answered by him are: "For what other stations was freight loaded?" "For what

or illegible marks, are the most numerous causes of freight going astray; and the searching of the records in most cases begins with the commodity index. For example Eminton, Pa., reports short one barrel of flour for McGinnis. A search of the flour items on the over reports discloses a barrel, the record of which agrees in all particulars with the short report except the name of the consignee. The name of the shipper, the point of shipment and the date agree to such an extent that it appears to be an error of the shipper; and it is found that he marked one too many barrels for Krugg, Rahway, N. J., and one too few barrels for McGinnis. Frequently it will be found that two items will match in the name of consignee but not in destination, the shipper having made a mistake in marking the package. A mistake of this kind often passes undetected by freight-house men, though there is a plain discrepancy between the shipping receipt and the mark on the goods. Errors of this kind are quickly disclosed.

The original reports are filed under the name of the destination, or assumed destination of the goods, all for one name being put in a box together. For example, the Philadelphia box contains records not only of goods wanted at Philadelphia, Pa., but also any similar information concerning Philadelphia, N. Y., on the New York Central, or Philadelphia, Miss., on the New Orleans, Mobile & Ohio. Likewise—

"Springfield, O., and Springfield, Mo.,

And Springfields, Mass., and Ill."

are all in the same box.

NEW ENGLAND ROADS FILE CLAIMS FOR MAIL PAY LOSSES

Alleging that they have lost large sums through carrying the mails under the present system of weights and that their compensation at the present rate fixed per mile is unreasonable and confiscatory, seven New England roads, filed petitions, July 17, in the Court of Claims in Washington in an effort to obtain from the government the money which they contend they have lost in the last six years by reason of the postmaster general's alleged arbitrary mandates and the operation of the present system.

The roads filing these petitions and the sums they claim from the government are as follows:

New York, New Haven & Hartford.....	\$4,524,714
Boston & Maine	3,676,824
Maine Central	1,839,740
Bangor & Aroostook.....	490,194
New York, Ontario & Western.....	305,000
Sandy River & Rangeley Lakes.....	30,968
Bridgeton & Saco River.....	13,425
Total	\$10,880,865

This is an average annual loss of \$1,813,478 for the last six years.

The petitions filed by these New England railroads claim:

First.—That the annual increase of mail has not been paid for at all.

Second.—The carrying of the parcel post has been without adequate compensation.

Third.—That the deficiency created by loss of mail compensation must be made up from the freight, passenger and express receipts.

Two causes of action are set up in the petitions filed, one with respect to the system of quadrennial weighing, declared to be illegal, and the other with respect to the rate of pay per mile and the increasingly expensive demands made from time to time by the postmaster general upon the railroads for facilities, for which no adequate compensation has been made.

With respect to the weighing of the mails every four years as a basis for the mail payments to them, the railroads assert that such weighing has been done exclusively by the postoffice department and that they have been prohibited from fully inspecting and verifying such weighing. This weighing of the mails for a certain period every four years as the basis for stating the average weight of the mail carried for the four years beginning a number of months after such weighing had been made, it is contended is not in accordance with the law.

The railroads charge that the postmaster general deliberately resorted to this system for the reason that the railroads would be compelled to carry the increasing amount of mail during the subsequent four-year period without any compensation. This is held to be illegal inasmuch as the annual compensation was by law fixed according to "the amount of mail carried per annum." The railroads assert that they repeatedly requested of the postmaster general that the mails be weighed annually or that the weights be taken at the beginning and end of the four-year period and averaged, but that such demands were ignored.

With regard to the effect of the parcel post the railroads point out that the increased mail resulting since the law went into effect on January 1, 1913, has not been included in any weights ascertained by the department and no compensation has been paid them for it upon any basis of weight. Furthermore, the raising of the weight limit of packages by the postmaster general on July 25 and December 18, 1913, has enormously increased the amount of this mail. The railroads ask in each case for the difference between the extra compensation granted them by the act of March 4, 1913 for this parcel post business and a sum which they fix as the reasonable compensation for the transportation of such mail.

Since the law was passed in 1873, fixing the rate of pay per mile, there have been several reductions, the last occurring in 1907. It is alleged, however, that even prior to these reductions the total compensation paid was insufficient to pay the cost of transportation furnished, the reductions merely increasing the deficiency.

At the same time, according to the petitions, the cost of labor, materials, depreciation charges, betterments, maintenance, taxes and operation have largely increased, notwithstanding which the demands of the postoffice department have from time to time been made more exacting, making necessary increased expenditures, and a far more costly service in the transportation of mails.

Regarding the acts of the postmaster general by which they allege that their burdens have been increased, the railroads say that not only has he made more exorbitant demands for a more extensive use of terminal facilities and switching conveniences, but "he has pretended to exercise an arbitrary, discriminating and unfounded discretion constantly against the legal rights and contract interests of the carriers; he has from time to time during the existence of outstanding quadrennial contracts made large additions thereto and increased requirements therein; he has refused to pay the statutory rates for carrying the mails during contract periods stated by him; he has at various times ordered apartment and railway postoffice cars of special construction, design and equipment, and entered into contracts for their use for definite periods, and then refused to pay the rates stated in the contracts, but offered lower and different rates which were unremunerative and confiscatory; he has made greater and more expensive demands as to rooms in stations for handling the mails; he has made many and extensive demands in the handling and the disposition of the mails at the several stations along the lines of railroad, and in the transportation of the mails between the stations and the postoffices not more than 80 rods therefrom; he has required the hauling of vast amounts of gold coin as mail of the fourth class in violation of law and without compensation to the carriers; he has required the carrying of mail on limited trains, and has burdened the service with onerous fines, forfeitures and increasing exactions."

Another charge made against the postmaster general is that "without any warrant or authority in law" he raised the weight limit of the parcel post packages by his executive orders of July 23, 1913, and December 18, 1913, the latter order bringing it up to 50 lb. in the first and second zones, "and thereby invited and permitted the shipping of vast quantities of merchandise, farm, mine and factory products, and materials of all kinds which theretofore had been shipped by freight or express, all without any adequate compensation therefor."

SUEZ CANAL TRAFFIC IN 1914.—The net tonnage of vessels passing through the Suez canal in 1913 showed a decrease of 241,236 tons as compared with 1912. The reduction of the transit dues to 6.25 francs, or \$1,206 per ton from January 1, 1913, together with the slight reduction of tonnage, had the effect of reducing the transit receipts to \$24,443,630 in 1913, as compared with \$26,329,800 in 1912. In the early months of 1914 traffic improved showing an increase of 254,497 net tons for the first six months as compared with 1913, while the transit receipts increased \$409,000. Traffic through the canal after the war began decreased considerably.

RAILWAY CONSTRUCTION IN CHILE.—The president has been authorized to proceed with unfinished public works begun in 1914 and to use the income of the Arica-La Paz Railway up to \$82,000. Among other expenditures will be the surveys for the Alamo-Molina Railway, Curico-Los Queñes Railway, and the branch railway from Arica to Zapiga. The president has also been authorized to contract at public tender for the construction of the railway that will unite Traiguén with the Central Railways, at a maximum cost of \$600,000 United States currency, and to expend in the present year \$150,000, which will be taken from the earnings of the Arica-La Paz Railway.

The Pennsylvania's 1915 Rail Specifications

The Specifications for 100 and 125-lb. Rail Are Based on Previous Experiments and Experimental Rollings

For the past two years the Pennsylvania Railroad has been engaged in the preparation of specifications for carbon steel rails and in the design of a new 125-lb. section. Various changes in these specifications have been tested as to their practicability by the rolling of small lots in several different mills. Based on previous experience and on the results of these experimental rollings the specifications given below have been prepared for 100-lb. rail. The specifications for the 125-lb. rail ordered this year differ from those for the 100-lb. rail in that they do not require the chemistry to be taken from the finished rail, omitting sections 6c, 6d and 6e. They differ from the specifications for the 125-lb. rail first prepared last year in that the carbon limits are established at 0.68 to 0.82 or 10 points below those previously set.

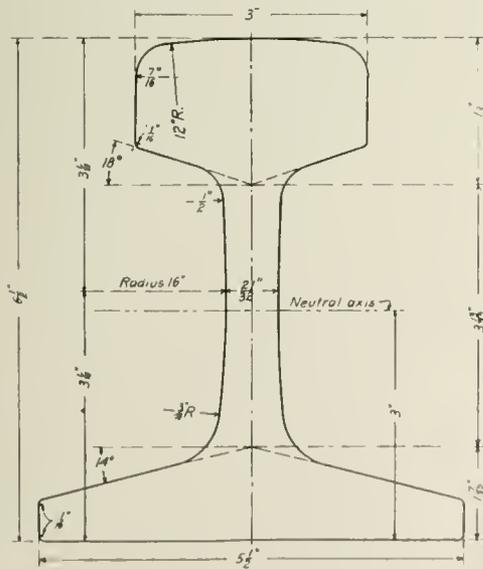

The 125-lb. section illustrated herewith is 6½ in. high with a 5½-in. base. The head is 3 in. wide with a top radius of 12 in. and vertical sides. Complete dimensions are shown in the sketch.

SPECIFICATIONS FOR 100-LB. CARBON STEEL RAILS

INSPECTION

1. *Access to Works.*—Inspectors representing the purchaser shall have free entry to the works of the manufacturer at all times while the contract is being executed, and shall have all reasonable facilities afforded them by the manufacturer to satisfy them that the rails have been made and loaded in accordance with the terms of the specifications.

2. *Place for Tests.*—All tests and inspections shall be made at

Area = 12.15 sq in
Weight = 123.8 lbs per yard
Moment of Inertia, 68.7
Sec. Modulus head, 19.6

Sec. Modulus base, 22.9
Area head, 4.73 sq in = 38.9%
" web, 2.47 " = 20.3%
" base 4.95 " = 38.3%

The New Pennsylvania 125-lb. Rail Section

the place of manufacture prior to shipment, and shall be so conducted as not to interfere unnecessarily with the operation of the mill.

MATERIAL

3. *Material.*—The material shall be steel made by the Bessemer or open-hearth process, as provided by the contract.

CHEMICAL REQUIREMENTS

4. *Chemical Composition.*—The chemical composition of the rails rolled from each melt of steel, determined as described in

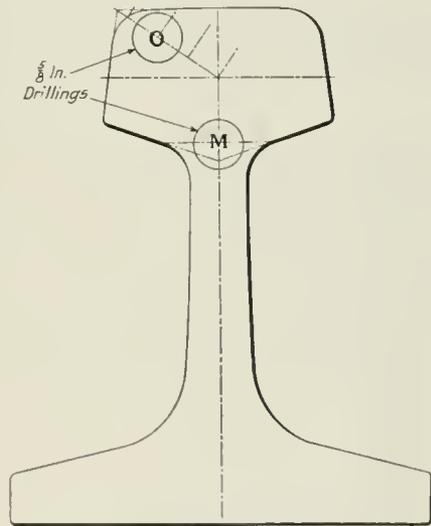

Section 6, shall be within the limits shown in the following table:

Elements	Bessemer process Per cent	Open-hearth process Per cent
Carbon	0.45 to 0.10	0.60 to 0.75
Phosphorus	Not to exceed 0.55	Not to exceed 0.04
Manganese	0.80 to 1.10	0.60 to 0.90
Silicon	0.05 to 0.20	0.10 to 0.50

In the event of nickel and chromium being present to the extent of 1.0 per cent and 0.35 per cent, respectively, these elements will be considered as the equivalent of 0.07 per cent of carbon in the above requirements. When the analyses for carbon by the mill chemists and by the railroad chemists do not agree, a tolerance of two points below the minimum or two points above the maximum will be allowed to cover such variation before condemnation.

5. *Average Carbon.*—It is desired that the percentage of carbon in an entire order of rails shall average as high as the mean percentage between the upper and lower limits specified.

6. *Analyses.*—In order to ascertain whether the chemical com-

Section Showing Location of Borings

position is in accordance with the requirements, analyses shall be furnished as follows:

(a) For the Bessemer process, the manufacturer shall furnish to the inspector daily, the carbon determination for each melt before the rails are shipped, and two chemical analyses every 24 hr., representing the average of the elements, carbon, manganese, silicon, phosphorus and sulphur, contained in the steel, one for each day and night turn, respectively. The analyses shall be made on drillings taken from the ladle test ingot not less than 1/8 in. beneath the surface.

(b) For the open-hearth process, the makers shall furnish the inspectors with a chemical analysis of the elements, carbon, manganese, silicon, phosphorus and sulphur, for each melt.

(c) For the open-hearth process, a check analysis will be made by the purchaser of a piece of rail representing a melt, after the rails from that melt have passed the physical requirements. On request of the inspector, and in his presence, the manufacturer shall furnish from one of the drop-test pieces (See 10) representing the melt, drillings satisfactory to the inspector, taken with a 5/8-in. flat drill, parallel to the axis of the rail, at a point one-third of the distance from the upper corner to the center of the head, as shown at location "O" in the accompanying section. The analysis from these drillings shall conform to the chemical requirements specified in Section 4, and failure to meet these re-

quirements shall be sufficient cause for the rejection of the entire melt.

(d) For the open-hearth process, after the rail has passed the physical requirements, additional drillings will be taken from the same rail, and in the same manner as specified in Section 6 (c), at the junction of the head and web, as shown in location "M," in the figure. The carbon determination from these drillings (Note 2, Sec. 4) shall be within 12 per cent of the amount found at location "O." If the test from the top rail fails to meet this requirement, all the top rails from the melt shall be rejected, and a similar determination shall be made from location "M" of a second rail (Note, Sec. 10). If this test fails all the second rails from the melt shall be rejected, and a similar determination shall be made from location "M" of a third rail. If this test fails, all the remaining rails from the melt shall be rejected.

(e) If, however, the segregation found at location "M" in any rail in a rolling exceeds 25 per cent, when determined as provided for in Section 6 (d), the progressive testing of the second and third rails will not be permitted on any subsequent melts; but on such melts the failure of the top rail to pass the requirements provided for in 6 (d) will cause the rejection of the entire heat.

PHYSICAL REQUIREMENTS

7. *Physical Qualities.*—Tests shall be made to determine:

- (a) Ductility or toughness as opposed to brittleness.
- (b) Soundness.

8. *Method of Testing.*—The physical qualities shall be determined by the drop test.

9. *Drop Testing Machine.*—The drop testing machine used shall be the standard of the American Railway Engineering Association.

(a) The tup shall weigh 2,000 lb., and have a striking face with a radius of 5 in.

(b) The anvil block shall weigh 20,000 lb., and be supported on springs.

(c) The supports for the test pieces shall be spaced 3 ft. between centers, and shall be a part of, and firmly secured to, the anvil. The bearing surfaces of the supports shall have a radius of 5 in.

10. *Pieces for Drop Test.*—Drop tests shall be made on pieces of rail not less than 4 ft. and not more than 6 ft. long. These test pieces shall be cut from the top end of the drop rail of the ingot, and marked on the base with gage marks 1 in. apart for 3 in. each side of the center of the test piece, for measuring the ductility of the metal.

NOTE.—Where it is necessary to test rails lower than the first rail, the bottom of the first rail, in lieu of the top of the second rail; and the bottom of the second rail, in lieu of the top of the third rail, will be accepted, if preferred by the manufacturer.

11. *Temperature of Test Pieces.*—The temperature of the test pieces shall be between 60 and 120 deg. F.

12. *Height of Drop.*—The test piece shall be placed head upwards on the supports, and be subjected to impact of the tup falling free from a height of 18 ft.

13. *Elongation or Ductility.*—(a) Under this impact the rail under one or more blows shall show at least 6 per cent elongation for 1 in. or 5 per cent each for two consecutive inches of the 6-in. scale, marked as described in Section 10.

(b) A sufficient number of blows shall be given to determine the complete elongation of the test piece of at least every fifth melt of Bessemer steel, and of one out of every three test pieces of a melt of open-hearth steel.

14. *Permanent Set.*—The permanent set for No. 1 classification rails, measured by the middle ordinate in inches in a length of 3 ft., after one blow under the drop test, shall not exceed that in the following table:

Section	Rail		Permanent set in inches	
	Weight per yard	Moment of inertia	Bessemer process	Open-hearth process
P. S.	100	41.9	2.00	2.00

under the first or subsequent blows shall be nicked and broken, to determine whether the interior metal is sound.

(The words "interior defect" in the following sections shall be interpreted to mean seams, laminations, cavities or interposed foreign matter made visible by the destruction test, the saws, or the drills.)

16. *Bessemer Process Drop Tests.*—One piece shall be tested from each melt of Bessemer steel.

(a) If the test piece does not break at the first blow and gives the required elongation (Sec. 13), all of the rails of the melt shall be accepted as No. 1 or No. 2 classification, according as the permanent set is less or more, respectively, than the prescribed limit, provided that the test piece, when broken, does not show interior defect.

(b) If the test piece breaks at the first blow, or does not give the required elongation (Sec. 13), or if the test piece does not break and gives the required elongation, but, when broken, shows interior defect, all of the top rails from that melt shall be rejected.

(c) A second test shall then be made of a test piece selected by the inspector from the top end of any second rail of the same melt, preferably of the same ingot (Note, Sec. 10). If the test piece does not break at the first blow and gives the required elongation (Sec. 13), all of the remainder of the rails of the melt shall be accepted as No. 1 or No. 2 classification, according as the permanent set is less or more, respectively, than the prescribed limit, provided that the test piece, when broken, does not show interior defect.

(d) If the test piece breaks at the first blow, or does not give the required elongation (Sec. 13), or if the test piece does not break and gives the required elongation, but, when broken, shows interior defect, all of the second rails from that melt shall be rejected.

(e) A third test shall then be made of a test piece selected by the inspector from the top end of any third rail of the same melt, preferably of the same ingot. If the test piece does not break at the first blow and gives the required elongation (Sec. 13), all of the remainder of the rails of the melt shall be accepted as No. 1 or No. 2 classification, according as the permanent set is less or more, respectively, than the prescribed limit, provided that the test piece, when broken, does not show interior defect.

(f) If the test piece breaks at the first blow, or does not give the required elongation (Sec. 13), or if the test piece does not break and gives the required elongation, but, when broken, shows interior defect, all of the remainder of the rails from that melt shall be rejected.

17. *Open-Hearth Process Drop Tests.*—Test pieces shall be selected from the second, middle and last full ingot of each open-hearth melt, and all three pieces shall undergo the complete set of physical tests.

(a) If none of the test pieces break at the first blow and give the required elongation (Sec. 13), all of the rails of the melt shall be accepted as No. 1 or No. 2 classification, according as the permanent set is less or more, respectively, than the prescribed limit, provided that the test pieces, when broken, do not show interior defect.

(b) If any of the test pieces break at the first blow, or do not give the required elongation (Sec. 13), or if none of the test pieces break and give the required elongation, but, when broken, show interior defect, all of the top rails from that melt shall be rejected.

(c) Second tests shall then be made from three test pieces selected by the inspector from the top ends of any second rails of the same melt, preferably the same ingots (Note, Sec. 10). If none of the test pieces break at the first blow and give the required elongation (Sec. 13), all of the remainder of the rails of the melt shall be accepted as No. 1 or No. 2 classification, according as the permanent set is less or more, respectively, than the prescribed limit, provided that the test pieces, when broken, do not show interior defect.

(d) If any of the test pieces break at the first blow, or do not give the required elongation (Sec. 13), or if none of the test

15. *Test to Destruction.*—The test pieces which do not break

pieces break and give the required elongation, but, when broken, show interior defect, all of the second rails of the melt shall be rejected.

(e) Third tests shall then be made from three test pieces selected by the inspector from the top ends of any third rails of the same melt, preferably of the same ingots (Note, Sec. 10). If none of the test pieces break at the first blow and give the required elongation (Sec. 13), all of the remainder of the rails of the melt shall be accepted as No. 1 or No. 2 classification, according as the permanent set is less or more, respectively, than the prescribed limit, provided that the test pieces, when broken, do not show interior defect.

(f) If any of the test pieces break at the first blow, or do not give the required elongation (Sec. 13), or if none of the test pieces break and give the required elongation, but, when broken, show interior defect, all of the remainder of the rails from that melt shall be rejected.

18. *No. 1 Rails.*—No. 1 classification rails shall be free from injurious defects and flaws of all kinds.

19. *No. 2 Rails.*—(a) Rails which, by reason of surface imperfections, or for causes mentioned in Sections 16, 17 and 29, are not classed as No. 1 rails, will be accepted as No. 2 rails, but No. 2 rails which contain imperfections in such number or of such character as will, in the judgment of the inspector, render them unfit for recognized No. 2 uses, will not be accepted for shipment.

(b) No. 2 rails to the extent of 5 per cent of the whole order will be received. All rails accepted as No. 2 rails shall have the ends painted white and shall have two prick punch marks on the side of the web near the heat number near the end of the rail, so placed as not to be covered by the splice bars.

DETAILS OF MANUFACTURE

20. *Quality of Manufacture.*—The entire process of manufacture shall be in accordance with the best current state of the art. Ingots shall be kept in a vertical position until ready to be rolled, or until the metal in the interior has had time to solidify.

21. *Bled Ingots.*—Bled ingots shall not be used.

22. *Discard.*—There shall be sheared from the end of the bloom formed from the top of the ingot sufficient metal to secure sound rails.

23. *Lengths.*—The standard length of rails shall be 33 ft., at a temperature of 60 deg. F. Ten per cent of the entire order will be accepted in shorter lengths varying by 1 ft. from 32 to 25 ft. A variation of 1/4 in. from the specified lengths will be allowed, except that for 15 per cent of the order this variation may be 3/8 in. No. 1 rails less than 33 ft. long shall be painted green on both ends.

24. *Shrinkage.*—The number of passes and speed of train shall be so regulated that on leaving the rolls at the final pass the temperature of the rail will not exceed that which requires a shrinkage allowance at the hot saws, for a rail 33 ft. in length, of 6 3/4 in.

25. *Cooling.*—The bars shall not be held for the purpose of reducing their temperature, nor shall any artificial means of cooling them be used after they leave the finishing pass. Rails, while on the cooling beds, shall be protected from snow and water.

26. *Section.*—The section of rails shall conform as accurately as possible to the template furnished by the railroad company. A variation in height of 1/64 in. less or 1/32 in. greater than the specified height, and 1/16 in. in width of flange, will be permitted; but no variation shall be allowed in the dimensions affecting the fit of the splice bars.

27. *Weight.*—The weight of the rails specified in the order shall be maintained as nearly as possible, after complying with the preceding section. A variation of 1/2 of 1 per cent from the calculated weight of section, as applied to an entire order, will be allowed.

28. *Payment.*—Rails accepted will be paid for according to actual weights.

29. *Straightening.*—(a) The hot straightening shall be carefully done, so that gaging under the cold presses will be reduced to a minimum. Any rail coming to the straightening presses show-

ing sharp kinks or greater camber than that indicated by a middle ordinate of 4 in. in 33 ft., will be at once classed as No. 2 rail. The distance between the supports of rails in the straightening presses shall not be less than 42 in. The supports shall have flat surfaces and be out of wind.

(b) Rails heard to snap while being straightened shall be at once rejected.

30. *Drilling.*—Circular holes for joint bolts shall be drilled to conform accurately in every respect to the drawing and dimensions furnished by the railroad company.

31. *Finishing.*—(a) All rails shall be smooth on the heads, straight in line and surface, and without any twists, waves or kinks. They shall be sawed square at the ends, a variation of not more than 1/32 in. being allowed, and burrs shall be carefully removed.

(b) Rails improperly drilled or straightened, or from which the burrs have not been removed, shall be rejected, but may be accepted after being properly finished.

(c) When any finished rail shows interior defects at either end or in a drilled hole the entire rail shall be rejected.

32. *Branding.*—Rails shall be branded for identification in the following manner:

(a) The name of the manufacturer, the month and year of manufacture, and the weight and types or section of rail shall be rolled in raised letters and figures on the side of the web. The type shall be marked by letters which signify the name by which it is known as for example:

Sections of Pennsylvania Railroad System.....	P. S.
Sections of American Society of Civil Engineers....	A. S. C. E.
Sections of American Railway Association.....	A. R. A.—A.
Sections of American Railway Engineering Association...	A. R. E.—B.

(b) The number of the heat and letter indicating the portion of the ingot from which the rail was made shall be plainly stamped on the web of each rail where it will not be covered by the joint bars. The top rails shall be lettered "A" and the succeeding ones "B," "C," "D," etc., consecutively; but in case of a top discard of from 20 to 35 per cent the letter "A" will be omitted, the top rail becoming "B." If the top discard be greater than 35 per cent the letter "B" shall be omitted, the top rail becoming "C."

(c) Open-hearth rails shall be branded or stamped "O.-H." in addition to the other marks.

(d) All markings of rails shall be done so effectively that the marks may be read as long as the rails are in service.

33. *Separate Classes.*—All classes of rails shall be kept separate from each other.

34. *Loading.*—Rails shall be carefully handled and loaded in such a manner as not to injure them.

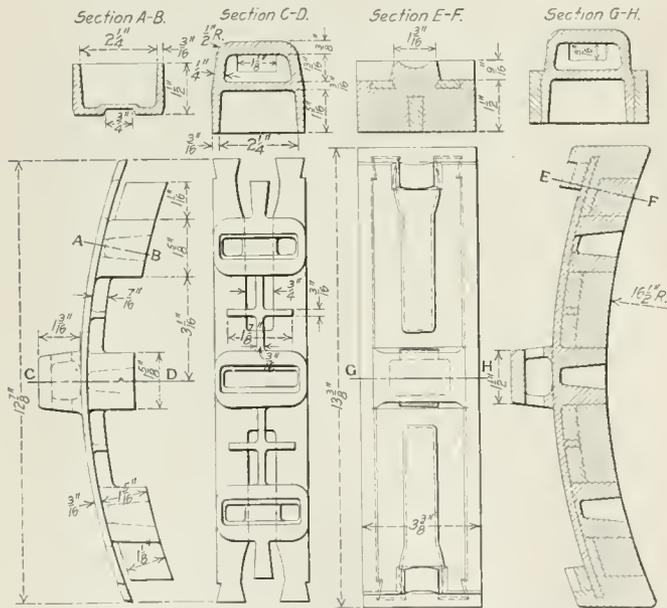

LONDON TUBE SERVICE EXTENSIONS.—The utility of the new Queen's Park extension of the Bakerloo tube will soon be increased further by the running of through trains to the new London & North Western station at Willesden Junction. Work is also proceeding on the Central London extension which will link up that railway with the Great Western main line at Ealing Broadway. The tube railway, as originally conceived, was to have been a self-contained undertaking, with no connection with other lines. The tubes were deep-level lines and tunnels of too small diameter to admit modern main-line rolling stock with the exception of the Great Northern & City, which has never been used for such rolling stock. The new era of through bookings and other facilities for encouraging interchange traffic has since caused the old policy of isolation to be abandoned and there now is through running on surface lines. This innovation is of value to all concerned, but it raises the question whether the tunnels would have been built to their narrow diameter if future developments could have been foreseen. Standard main line rolling stock cannot be used for these new through services, and it is possible that that may militate against other extensions of through service. The difficulties can be overcome by changing at suitable junction points, but experience gained during the past few years has shown plainly the cash value of through facilities.

BRAKE SHOE WITH MALLEABLE IRON INSERTS

A recently developed car wheel brake shoe which is claimed to have given excellent results both in service and laboratory tests is shown herewith. It is of the insert type and details of its construction will be readily understood by referring to the drawing.

The body of the shoe is a special cast iron mixture poured around three inserts of malleable iron which form an integral part of the back and lug of the shoe. The inserts are rectangular in section and in the center of each is a dust pocket, the opening of which in the face of the shoe is $\frac{3}{4}$ in. wide by $2\frac{1}{4}$ in. long. The back of the shoe, which is reinforced with stiffening ribs, is so formed that it is well secured in the cast iron body.

A laboratory test of one of these shoes was recently made at Purdue University. When tested on a cast iron wheel at a pressure of 2,808 lb., it developed a coefficient of friction of 28.01 per cent. When the pressure was increased to 6,840 lb., the coefficient was 20.37 per cent. The coefficient at these pressures required by the Master Car Builders' specifications are respectively 22 per cent and 16 per cent. A similar test on a steel wheel developed coefficients of 15.92 per cent at a brake shoe pressure of 6,840 lb., and 11.96 per cent at 12,000 lb., the minimum Master Car Builders' coefficients for these conditions being 12.5 per cent and 11 per cent respectively. On the steel wheel the loss in weight for each 100,000,000 ft.-lb. of work done was 1.04 lb., the specifications permitting a maximum of

Details of Brake Shoe with Dust Pockets in the Inserts

four pounds under these conditions. The average distance of stop from 65 miles an hour on the steel wheel was 890 ft. under 12,000 lb. brake shoe pressure; under 6,840 lb. pressure the average stop was made in 1,348 ft. On the cast iron wheel the average distance of stop in the low pressure test was 881 ft., while in the high pressure test it was only 440 ft.

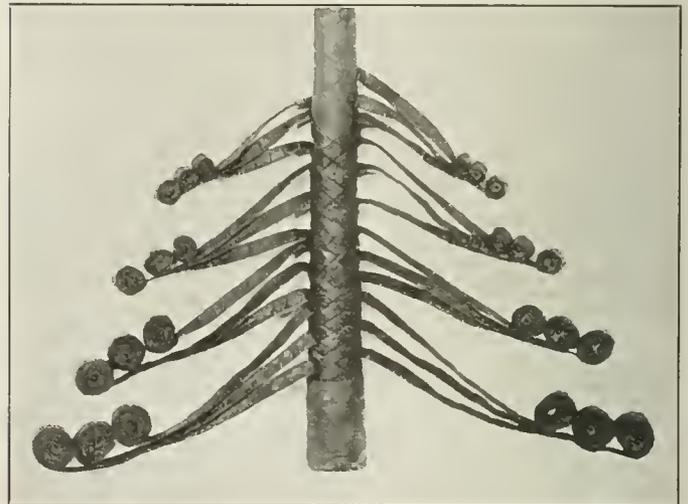

This shoe is known as the Streeter safety brake shoe and the special features of its construction have been patented. Its further development is in the hands of A. Mitchell, Bedford building, Chicago.

RUSSIAN RAILWAY TO THE ARCTIC OCEAN.—The Council of Ministers at Petrograd has sanctioned an expenditure of \$8,500,000 for the construction of a railway line from Kandalakscha, in the Government of Archangel, to Kola, in the same government, which will run across the Kola peninsula and connect the Arctic ocean with the Russian railway system.

AIR BRAKE HOSE

A method of rubber hose construction has been developed by the Goodyear Tire & Rubber Company, Akron, Ohio, which permits the manufacture of a hose of uniform thickness throughout in which the tendency to twist or contract under pressure has been entirely eliminated. It is known as the Subers process, and is now being used in the manufacture of standard M. C. B. air brake hose.

In the making of what is termed wrapped hose, the fabric is cut on the bias, overlapped and wrapped directly over the tube. The lap of the fabric in hose of this type varies the thickness often as much as $\frac{1}{32}$ in., and when cut through, a section of the material clearly shows that the fabric is not thoroughly impregnated with the rubber. The wrapping material under the Subers process consists of parallel strands or cords combined into strips, each strip consisting of about 288 strands and being approximately $\frac{1}{16}$ in. thick by $\frac{1}{2}$ in. wide. Every strand is separately coated with rubber compound which binds the strands in each strip firmly together, the impregnation of

Method of Wrapping the Tube or Lining in the Subers Process

the fabric being thus very complete. The strips are wound spirally about the tube or lining of the hose, there being two complete layers in each direction. The strips in each layer are separated by a space equal to their own width and there is no overlapping. The manner in which the strips are applied may be clearly understood by referring to the accompanying illustration.

Hose of this construction shows a specially high bursting pressure and the distorting effect of the pressure is minimized. The elongation per foot per 1,000 lb. pressure will average about $\frac{1}{8}$ in., with an expansion of about $\frac{1}{16}$ in. on the diameter, there being no twisting or contracting. Until a pressure of 1,300 lb. has been reached, however, but little change takes place.

At the present time the manufacturers are confining their production of this type of hose to the standard air brake hose in lengths of 22 in., but later expect to adapt the process to the manufacture of car heating steam hose, pneumatic tool hose, etc. The air brake hose now being manufactured conform to the Master Car Builders' specifications presented at the last convention of the association. They are being used at the present time by several railroads.

REGISTRATION OF TRADE-MARKS IN LATIN AMERICA.—The Bureau of Foreign and Domestic Commerce of the Department of Commerce has recently issued a preliminary report on this subject giving data relative to the offices for registration of trade-marks; duration; fees, and formalities of registration in the countries of South and Central America.

General News Department

The safety first and the freight claim preventive committees on the St. Louis & San Francisco were consolidated, effective July 1.

The city council of Cleveland has appointed a committee to investigate the subject of electrification of steam railroads. The committee will have before it for consideration a report on the subject presented in 1913 by E. T. Roberts, then city smoke inspector.

The special recess committee appointed to study the development of terminal facilities in Boston, Mass., has elected Edward J. Dunn secretary, and has set July 29 for the first public hearing, to which Boston civic organizations, street railway officers and steam railroad officers are invited.

The Colorado Eastern Railroad, which has been operating one train a day between Colorado and Scranton, Col., a distance of about 20 miles, in order to hold a franchise, has suspended operation in consequence of a decision of the Colorado supreme court, declaring that the franchise to use the city streets was invalid.

United States civil service examinations will be held on August 17 and 18 respectively for senior land appraisers and junior land appraisers for men desiring to qualify for these positions on the Interstate Commerce Commission's valuation corps. The senior land appraiser positions pay from \$1,800 to \$3,600, and the junior from \$900 to \$1,500.

The Georgia state senate, by a vote of 38 to 2, passed a bill to amend the constitution so as to prohibit any privately owned railroad from paralleling the tracks of the Western & Atlantic so long as it remains the property of the state. The bill now goes to the House. The Western & Atlantic is now leased by the state to the Nashville, Chattanooga & St. Louis, and this lease expires in December, 1919.

Bulletin No. 8 of the Pennsylvania Lines is a warning against trespassing. These bulletins are issued from time to time by the Pennsylvania "to inform its patrons as to facts and problems of importance to the railroad and the public." No. 8 is headed with red letters an inch high, "The Most Needless Waste of Human Life in America," and winds up with red letters half an inch deep, "Don't you trespass." The circular points out that it is a fact that more people are killed every year trespassing on railroad tracks in the United States than the total number who lost their lives in the Johnstown flood, San Francisco earthquake and fire, the Salem, Baltimore and Jacksonville fires, and the sinking of the Titanic and Lusitania.

Operating Revenues and Expenses of Express Companies for March, 1915

The following statement, which is subject to revision, has been compiled by the Interstate Commerce Commission from the monthly reports of operating revenues and expenses of the principal express companies for March, 1915.

A—FOR THE MONTH OF MARCH											
Item	Adams Express Co.		American Express Co.		Canadian Express Co.		Globe Express Co.		Great Northern Express Co.

*Includes previous year's returns of United States Express Co.

Southern Railway's Accident Record

More than 16,500 passengers were carried on the Southern Railway in the year ended June 30 with not a single passenger killed in a train accident and only one fatal injury to a passenger while on a train. This injury occurred to the passenger while standing on a car platform. In making this announcement the company calls attention to the fact that during this year 12 persons were killed at public highway crossings on the Southern in automobile accidents, every one of which could have been prevented by the exercise of caution on the part of the driver of the automobile.

Tool Foremen's Convention

The seventh annual convention of the American Railway Tool Foremen's Association was held at the Hotel Sherman, Chicago, July 19 to 21, Henry Otto, tool foreman, Atchison, Topeka & Santa Fe, presiding. The opening address was presented by R. W. Bell, general superintendent of motive power, Illinois Central, and a paper was read on "Getting the Most Out of Tools," by B. W. Benedict, director of shop laboratories, University of Illinois. A report of the convention will be included in next week's issue of the *Railway Age Gazette*.

The following is the list of exhibitors:

Abrasive Material Company, Chicago.—New electric abrasive—"boro-carbone." Represented by J. C. Dillenbeck.

Armstrong Brothers Tool Company, Chicago.—Lathe and planer tool holders, drop forged wrenches, lathe dogs, drills and clamps. Represented by Geo. E. Armstrong and Paul Armstrong.

Besly, Chas. H., & Co., Chicago.—Helmet temper taps. Represented by C. A. Mills.

Brown Instrument Company, Philadelphia, Pa.—Pyrometers. Represented by J. W. Lazear and F. C. Mahoney.

Brown, Tom, & Co., Chicago.—Flue expanders; beading tools and journal jacks. Represented by Tom Brown.

Browne & Sharpe Manufacturing Company, Providence, R. I.—Machinists' tools and cutters. Represented by H. M. Geis and R. E. Doras.

Carborundum Company, Niagara Falls, N. Y.—Carborundum crystals and wheels. Represented by C. C. Schumaker, E. P. Ritzma and H. P. Frost.

Celfor Tool Company, Buchanan, Mich.—Twist drills, reamers, countersinks and miscellaneous tools. Represented by W. Nochmanson and C. O. Montague.

Chicago Pneumatic Tool Company, Chicago.—Pneumatic tools.

Cleveland Pneumatic Tool Company, Cleveland, Ohio.—Riveters, clippers, drills and hose couplings. Represented by C. J. Albert.

Cleveland Twist Drill Company, Cleveland, Ohio.—Drills and reamers. Represented by A. L. Beardsley and H. S. White.

Colonial Steel Company, Pittsburgh, Pa.—Specimens of tool steel. Represented by Mallory P. Spencer.

Desmond-Stephen Manufacturing Company, Urbana, Ohio.—Grinding wheel dressers. Represented by H. H. Dovell.

Detroit Twist Drill Company, Detroit, Mich.—Twist drills, reamers and cutters. Represented by M. F. Crawler.

Duff Manufacturing Company, Pittsburgh, Pa.—Genuine Barrett jacks, Duff ball bearing and high speed screw and journal jacks. Represented by C. N. Thulin.

Edgar-Allen & Co., Chicago.—Specimens of steel.

Faessler, J., Manufacturing Company, Moberly, Mo.—Flue expanders, cutters, etc. Represented by G. R. Maupin.

Greenfield Tap & Die Corporation, Greenfield, Mass.—Taps, Wells self-opening dies, gages and reamers. Represented by J. K. Simons and Martin Sweder.

Hardy, F. A., & Co., Chicago.—Safety welding and grinding glasses; new Hardy noviweld glass. Represented by C. S. Wells.

Horne, Dale Brown Company, Chicago.—Sateco safety drill holders and ratchets; Cleveland crucible steel files; L. W. drills and reamers; Victor hack saw blades. Represented by J. J. Dale, J. W. Horne and P. V. Bachellet.

Hyland, R. H., & Co., Chicago.—Norton self-lowering ball bearing jacks, journal jacks, Mulcomby flexible metallic air and steam twin acetylene hose. Represented by R. H. Hyland.

Independent Pneumatic Tool Company, Chicago.—Pneumatic and electric tools; pneumatic roller bearing drills and new chipping hammers. Represented by H. E. Finney, H. H. Henricks, V. W. Robinson, G. C. Wilson and F. J. Passino.

Ingersoll-Rand Company, New York.—Pneumatic tools.

Norton Company, Worcester, Mass.—Norton grinding wheels, India oil-stones and grinding machinery. Represented by George W. Thomson, W. N. Jore and Wm. H. Warner.

Nye Tool & Machine Works, Chicago.—Nye cutter wheel, dies, combination stocks, post vise and reeding stock. Represented by H. G. Nye and Chas. Wildridge.

Racine Tool & Machine Company, Racine, Wis.—High speed hack saw. Represented by J. M. Jones and Edward Genten.

Rich Tool Company, Chicago.—High speed tools, reamers, rivet sets and tungsten valves. Represented by O. F. Schubert.

Ryerson, Jos. T., & Son, Chicago.—Exhibiting booklets on special machinery and special nikrome and tool steels. Represented by A. H. Ackerman and John Pomie.

Street R. R., & Co., Chicago.—Billings & Spencer tools; Horton chucks; Yale chain blocks; Jackson drill press vise; Hyatt roller bearings; and Keystone steel pulleys. Represented by A. H. Taylor, Chas. Butterfuss and Lane Schofield.

Whitman & Barnes Manufacturing Company, Akron, Ohio.—Exhibiting drills, reamers and wrenches. Represented by M. E. Townner and A. O. Wange.

Wilson, T. A., & Co., Reading, Pa.—Safety glasses and grinders' glasses. Represented by B. T. Roberts.

MEETINGS AND CONVENTIONS

The following list gives the names of secretaries, dates of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the *Railway Age Gazette* for each month.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontious, 455 Grand Central Station, Chicago. Next meeting, July 21, 1915, Milwaukee, Wis.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next meeting, August 19-20, 1915, San Francisco, Cal.

AMERICAN RAILROAD MASTER TINNERS, COPPERSMITHS AND PIPEFITTERS' ASSOCIATION.—W. E. Jones, C. & N. W., 3814 Fulton St., Chicago. Annual meeting, July 13-16, 1915, Hotel Sherman, Chicago.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—Owen D. Kinsey, Illinois Central, Chicago. Annual meeting, July 19-21, 1915, Hotel Sherman, Chicago.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Laylor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday of each month, Pittsburgh.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, C. H. & D., Lima, Ohio. Annual meeting, August 17, 1915, Philadelphia, Pa.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1126 W. Broadway, Winona, Minn. Next convention, July 13-16, 1915, Sherman House, Chicago.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 14-16, 1915, Detroit, Mich.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month. Jefferson Hotel, Peoria.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Annual meeting, September 14-17, 1915, Salt Lake City, Utah.

RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Annual meeting, September 14-16, 1915, Chicago.

SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

SIGNAL AFFLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, C. R. I. & P., 1134 La Salle St. Sta., Chicago. Annual meeting, September, 1915.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEWARK.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, 559 Broad St., Newark.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Genl. Agt., Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh. Annual meeting, 2d Monday in June.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings last Tuesday in month, except June, July and August, Hotel Astor, New York.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., East Buffalo, N. Y. Annual meeting, September 7-10, 1915, Chicago.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.

WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

*Operations began July 6, 1914. No figures shown for eleven months.

Traffic News

Through train service on the National Transcontinental between Toronto and Winnipeg was begun on July 14. The through train is to be known as the National, and makes the run in 42 hours.

The Union Pacific has announced that effective at an early date, to be announced later, only one coupon will be required on tickets reading to points on or reached by any one or more of the Union Pacific System lines, instead of a separate coupon as heretofore for each of the system units.

The Atlantic Coast Line has made arrangements for the exhibiting of products of the south at a number of fairs to be held in the fall in New York, Pennsylvania, West Virginia and Maryland. Co-operation of the farmers in Virginia, North Carolina, South Carolina, Georgia, Florida and Alabama is asked and arrangements have been made for an express car to carry the exhibit, leaving Wilmington, N. C., about August 15.

The number of ocean-going vessels which passed through the Panama canal during the month of May was 141. This is more than used the canal during any preceding month. The previous highest number was 136 for March. The cargo passing through the canal in May amounted to 578,708 tons. The cargo traffic during March amounted to 635,057 tons. During May 75 vessels passed through the canal eastbound and 66 westbound. Thirteen of the vessels were in ballast. The average loading of the 128 vessels which carried cargo was 4,961 tons.

Railroads serving New York harbor have agreed to furnish importers of South American beef with one car to a float at a cost of \$4 to \$6 a car. Heretofore six cars were furnished to a float and a charge made of \$9 for each car not used. The Argentine beef importers have claimed that adequate facilities are not furnished them by the trunk lines and have filed briefs with the Interstate Commerce Commission. The action of the railroads is in answer to one of the complaints of the importers, and the other complaint that the railroads do not or cannot furnish refrigerator cars will be answered before the Interstate Commerce Commission.

James McCrea, general manager of the Long Island, has given out a statement showing the passengers handled and delays to trains over the Fourth of July holidays in 1915, together with comparisons for the previous six years. The total number of passengers carried on trains in five days was 917,917 in 1915, comparing with 893,667 in 1914, and 588,500 in 1909. The number of passenger-train movements to handle this business was 5,015 in 1915, comparing with 5,441 in 1914 and 4,178 in 1909. During this time in 1915 there were 780 carloads of express and baggage movement, comparing with 894 in 1914 and 381 in 1909. The average delay to all trains in 1915 was 2 min. and 45 sec., comparing with 3 min. and 3 sec. in 1914 and 2 min. and 22 sec. in 1909. Of the total 4,097 scheduled trains 2,636 were on time and the average delay to each train that was late was 7 min. and 42 sec.

Some States Freed from Quarantine

The Department of Agriculture announced on July 19 that the last remaining quarantine for foot and mouth disease in Rhode Island and Ohio had been raised, parts of these states having been under quarantine since last fall. Three counties in Illinois have been entirely freed, and the only "exposed area" is now the union stock yards in Cook county. Eight counties in Pennsylvania have been freed, leaving only Allegheny, Chester, Jefferson, Lebanon and Philadelphia under quarantine. In Massachusetts quarantine has been raised from Plymouth and Worcester counties, leaving only the Brighton stock yards and abattoir under quarantine in the states. In West Virginia the whole of Jefferson county has been freed, leaving a part of Berkeley county the only territory still under quarantine in the state. In New Jersey, Bergen, Essex and Union counties have been freed from quarantine, leaving Hudson the only territory in the state under quarantine.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission has given out a decision written by Commissioner Clements, in which it is held that the carriers have not justified proposed charges for trap or ferry car service in trunk line, Central Freight Association western trunk line, trans-Missouri, and southwestern territories and Chicago. The schedules naming the proposed charges are required to be cancelled. A more complete abstract of the report will be given in this column next week.

Examiner Dow held a hearing in Chicago last week and the first part of this week on tariffs filed by the eastern railways advancing the rates on livestock, meats and packinghouse products from Chicago and St. Louis to the East, and on livestock in Central Freight Association territory, which have been suspended by the Interstate Commerce Commission. The tariffs provide for rates from Chicago to New York on dressed beef, 47½ cents; on cattle, 33 cents; hogs, 33 cents; packinghouse products, 33 cents and bulk meats, 38 cents per hundred pounds. Witnesses who testified for the railroads were L. E. Oliphant, chief of tariff bureau of the Lake Erie & Western; W. C. Maxwell, general traffic manager of the Wabash, and William Hodgdon, freight traffic manager of the Pennsylvania Lines.

Rates on Stone and Marble to St. Paul, Minn.

In re rates on stone and marble in carloads not polished, lettered, or figured, from Chicago and Peoria, Ill., to St. Paul, Minn. Opinion by the commission:

The commission finds that the carriers have justified proposed increased rates on stone and marble, not polished, lettered, or figured, from Chicago and Peoria, Ill., to St. Paul, Minn., in the case of stone and marble, sawed or dressed, but not in the case of rough stone and marble. (34 I. C. C., 350.)

Complaint Dismissed

George M. Spiegle & Co. et al. v. Southern Railway. Opinion by Commissioner Hall:

Defendant's rules and regulations applying to lumber hauled in transit at Newport, Tenn., are not found to be unreasonable or discriminatory. It is also found that the charges on lumber bought by complainants at points between Newport, Tenn., and Asheville, N. C., shipped to Newport, and reshipped from the latter point under transit rates through Asheville to Virginia cities and east, are not unreasonable. Reparation denied. (34 I. C. C., 448.)

Rates to Montrose & Delta Counties, Colo.

Montrose & Delta Counties Freight Rate Association v. Denver & Rio Grande et al. Opinion by Commissioner Hall:

The commission finds in this case that the rates on classes and certain commodities from Missouri river points and points east thereof to Montrose, Olathe, Delta, Hotchkiss and Paonia, Colo., are not unreasonable or discriminatory. Montrose is typical of these points. The Denver & Rio Grande maintains two routes from Salida, Colo., to Montrose. Originally shipments from the east moved through Pueblo to Salida and were there transferred to the narrow gage line running through Marshall Pass to Montrose. Later when a standard gage line was opened through Tennessee Pass and Grand Junction with a branch to Montrose, shipments were sent over the standard-gage line throughout. The latter is much longer, but the freight does not have to be transferred, the grades are easier and the supply of equipment greater. Because of the decision in *Grand Junction Chamber of Commerce v. D. & R. G.*, 23 I. C. C., 115, the carrier was led to accord to Grand Junction rates not in excess of those to Salt Lake City, but this basis of rates was not extended to points not directly intermediate. Early in 1915, following the decision in *Class and Commodity Rates to Salt Lake City*, 32 I. C. C., 551, increases in rates were made to Salt Lake City,

Grand Junction, Montrose and other points. The commission finds that the former reduction in rates to Grand Junction because of competition or an order of the commission is no justification for a similar reduction in rates to a branch line point not intermediate to Grand Junction, such as Montrose. (34 I. C. C., 393.)

Montrose & Delta Counties Freight Rate Association v. Denver & Rio Grande et al. Opinion by Commissioner Hall:

The commission finds that the rates on apples, deciduous fruit, potatoes, onions and other vegetables from points in Montrose and Delta counties, Colo., to destinations in the east are not unreasonable or discriminatory. Upon the record in this case the commission is not prepared to require the establishment of rates on low-grade apples in bulk from Montrose and Delta counties to various destinations in the east lower than the rates on apples in packages contemporaneously in effect between the same points. The question is held to be of sufficient importance, however, to merit further consideration by the defendants. It is also found that the charges for the refrigeration of shipments noted above are not unreasonable. (34 I. C. C., 400.)

Montrose & Delta Counties Freight Rate Association v. Denver & Rio Grande et al. Opinion by Commissioner Hall:

The commission finds that the rates on classes and certain commodities from Los Angeles and San Francisco, Cal., and related points, to Delta, Olathe, Montrose, Hotchkiss and Paonia, Colo., are not unreasonable or discriminatory. Complaint dismissed. (34 I. C. C., 409.)

Weighing of Livestock at Kansas City

Kansas City Live Stock Exchange v. Atchison, Topeka & Santa Fe et al. Opinion by Commissioner Hall:

Complaint is made against the following tariff provisions; first, those providing that when cars are not track scaled the hoof-selling weights, less certain fill allowances, shall be the basis for freight charges, and second, those forbidding track-scale weights, if taken, to be set aside in favor of hoof-selling weights unless the difference between these weights amounts to 1,000 lb. a car, under some tariffs, or 500 lb. a car under others.

The commission finds that the assessment of freight charges upon hoof selling weights, less the fill allowances, is not unlawful, but the requirement that the variation between weights taken on track scales and hoof-selling weights shall amount to 1,000 lb. a car as a condition to setting aside the one in favor of the other is found unreasonable. According to the findings in the case *In re Weighing of Freight by Carriers*, 28 I. C. C., 7, it is held that a sufficient variation would be 500 lb. (34 I. C. C., 423.)

Western Trunk Line Rules

In the matter of western trunk line rules, regulations and exceptions to classifications. Opinion by Commissioner Meyer:

Western trunk lines circular I-K, I. C. C., No. A-513, containing special rules and regulations and exceptions to classifications, filed to become effective October 1, 1914, was suspended by the commission until January 21, 1915, and further suspended until July 29, 1915. The commission makes the following findings relative to this circular:

The rule providing in effect for a carload rating on miscellaneous freight in mail sacks is disapproved. The elimination of rules for mixtures of salt and different kinds of pitch and tar in carloads with cement, lime, stucco and plaster is approved. The cancellation of the rule providing for the shipment of cigarette papers with smoking tobacco at the tobacco rating is approved. Corn starch is held to be an uncooked cereal food product and ordered continued in the list of uncooked grain or cereal food products manufactured from corn subject to corn rates. The class B rating on iron and steel pipe applied as a proportional basis is ordered continued. The cancellation of the rule providing for a rate on plastering hair or fiber with carload shipments of lime or plaster 25 per cent above the carload rate on lime or plaster at actual weight is approved. The elimination of the provision for fifth class rating on straight or mixed carload shipments of stove-pipe iron, stove-pipe, stove pipe elbows, and coal hods, and for mixed carloads of the foregoing articles and sheet-iron dripping pans and stove elbows is authorized. An

increase to 50,000 lb. of minimum carload weight on scrap iron into concentrating points is approved. Numerous other rules are discussed and changes authorized for publication in a revised circular.

Attention is directed also to the views of the commission in *Investigation and Suspension Docket 76*, respecting publicity of proposed changes and method of classification procedure, and the opinion is expressed that if the classification committee had given these changes greater publicity the present proceeding would probably not have been necessary. Where provisions are eliminated from one tariff in anticipation of publishing them in another the two tariffs should be amended simultaneously.

Rates on Bituminous Slack Coal to Martins Creek, Pa.

Alpha Portland Cement Company v. Baltimore & Ohio et al. Opinion by Commissioner Clements:

The commission finds that a rate of \$2 a gross ton on bituminous slack coal in carloads to Martins Creek, Pa., from mines in the Fairmont region of West Virginia and in the Westmoreland region of Pennsylvania are not unreasonable or discriminatory. It also holds that the requirement of a differential between slack and other sizes of bituminous coal would not be justified.

The complainants asked for a rate of \$1.45 on slack and \$1.65 on other grades of bituminous coal and produced figures showing that the cost of carrying this traffic was about \$1.42 a gross ton. The commission notes:

"In determining the reasonableness of rates, cost of service is one of several factors to be considered, and, while carriers are not entitled to receive more than a reasonable rate on any traffic, in cases where it appears that the rate challenged is in harmony with a general adjustment between a large number of producing regions and an extensive consuming territory consideration must be given not only to the accuracy of cost estimates, but to the probable effect of a substantial reduction on the main body of rates. Complainant's estimates of observed cost may be reasonably accurate, but its total operating cost estimates are, after all, approximations based on general averages of the various carriers which may or may not be correct on the particular traffic in question and they do not, of course, take into consideration the comparative values of the lines traversed and equipment used and of all lines and equipment of the carriers defendant. These estimates, which are elaborate and represent much labor, may be the most complete that can be furnished in advance of a complete valuation of the properties of the carriers, but we do not feel justified upon the showing made thereby in making a finding of unreasonableness in the rate challenged." (34 I. C. C., 414.)

Rates on Pulpwood from Points in Minnesota

Pulp & Paper Manufacturers' Traffic Association v. Chicago, Milwaukee & St. Paul, et al. Opinion by Commissioner Clark:

In the commission's original report in this case, 27 I. C. C., 83, it was found that the carload rates on pulp wood from points in Minnesota to gateways and junctions of connecting carriers in that state, applying on shipments to Wisconsin and Michigan were unreasonable, and reasonable maximum rates were prescribed, effective August 1, 1913. The Duluth & Northern Minnesota was one of the defendants, but it did not file an answer to the complaint, or offer any testimony. It did, however, comply with the order by filing proper tariffs. In December, 1914, it sought to enjoin the enforcement of the order. The court granted a preliminary injunction, but in February, 1915, dissolved the latter and dismissed the bill. In March, 1915, the carrier filed a petition for a rehearing.

The stock of this railroad is held by Alger, Smith & Company, or by stockholders of that company and the owning interest supplies 50 per cent of the road's tonnage. The carrier produced cost figures showing a deficit from operation in 1914, but the commission refuses to hold this year a representative one, as there have been surpluses in previous years. It also appeared that the carrier's principal interest in the rehearing was to have the commission find that the rates prescribed were unreasonably low, so as to enable it to use such finding as a shield when certain outstanding reparation claims were represented. The commission, therefore, is unable to release the petitioner from the requirements of the order. (34 I. C. C., 500.)

Shipper's Load and Count

Louisiana State Rice Milling Company v. Morgan's Louisiana & Texas et al. Opinion by Commissioner Clements:

The complainant protests against practice provided for under rule No. 23 of western classification No. 51 reading:

Freight loaded by shipper and not checked by carrier must be receipted for "shipper's load and count."

The commission holds that this rule is not contrary to the Carmack amendment, and that it is not a limitation upon carriers' liability as is contemplated by the prohibitions of the Cummins amendment. "It does not appear that the rule operates to limit the liability of the carrier for the full value of the property shipped but, in its application to a claim for loss because of alleged failure to deliver the whole amount transported, has the effect of placing the burden upon the shipper who loads on his private track to prove that the amount specified was loaded and that a less amount was taken out of the car by the consignee; whereas in the case of a receipt not so qualified the burden is upon the carrier to prove that the amount specified in the bill of lading was either not in fact loaded, or was delivered, or otherwise to settle for the full value thereof."

The commission finds that the rule is not unreasonable and dismisses the complaint. (34 I. C. C., 511.)

The Shreveport Case

J. J. Meredith, Shelby Taylor, and Henry B. Schreiber, constituting the Railroad Commission of Louisiana v. St. Louis Southwestern et al. Opinion by Commissioner Hall:

The commission's first order in this case was made March 11, 1912, in 23 I. C. C. 31. That order was upheld by the Commerce Court April 25, 1913, in 205 Fed. 380 and by the Supreme Court June 8, 1914, in 234 U. S. 342.

The order, save in so far as it required the establishment of new rules to govern the concentration of cotton ran only against three of the defendants, the Texas & Pacific, the Houston, East & West Texas, and the Houston & Shreveport. It required the establishment by them of specified class rates on shipments by their lines from Shreveport, La., to specified destinations in Texas, which rates were established July 1, 1912. It further required that these three defendants "abstain from exacting any higher rates for the transportation of any article" from Shreveport to Dallas, Tex., and points intermediate via the line of the Texas & Pacific, and from Shreveport to Houston, Tex., and points intermediate via the lines of the Houston, East & West Texas and the Houston & Shreveport, "than are contemporaneously exacted for the transportation of such article from Dallas or Houston for an equal distance toward said Shreveport."

The case is now brought up again by a petition of the Louisiana authorities requesting (1) the establishment of reasonable class rates from Shreveport such as were previously prescribed over the lines of the three defendants to all points on the lines of all the defendants, and (2) the application of no higher rates upon all commodities from Shreveport to all points on the lines of all defendants than for like distances from any points on said lines eastbound to destinations in Texas. The petition alleges that the other defendants will not establish a uniform scale of rates except upon a supplemental order; and that as a result shippers over the three lines whose rates have been adjusted in conformity with the order of March 11, 1912, will have an undue advantage.

The commission now finds:

The evidence upon supplemental hearing shows no material change in transportation conditions over the lines of defendants, either from or toward Shreveport, since this proceeding was first before the commission.

Class rates are prescribed for transportation from Shreveport to points in eastern Texas, and also from points in eastern Texas, toward Shreveport, on the lines of all the defendants.

As the transportation conditions for the competitive hauls here involved are substantially similar, justice demands that the same classification shall apply to all, and consequently that the western classification shall govern on traffic via the lines of these defendants from points in eastern Texas toward Shreveport.

It is discrimination for defendants to charge higher rates upon any commodity from Shreveport into eastern Texas than on such commodity for an equal distance from points in eastern Texas toward Shreveport; and such commodity rates should not exceed, distance considered, the corresponding class rates named herein.

It constitutes discrimination against Shreveport for defendants

to charge higher inbound rates on uncompressed cotton from eastern Texas to Shreveport for concentration there than they charge, distance considered, on uncompressed cotton to concentration points in eastern Texas. (34 I. C. C., 472.)

The St. Louis Terminal Case

In the matter of terminal allowances and rates at St. Louis, Mo., and East St. Louis, Ill. Opinion by Commissioner Harlan:

In 1906 when St. Louis, East St. Louis and a number of other stations were made into a definite rate point in the 117 per cent zone, the eastern carriers, which hitherto had had terminals in East St. Louis only, were obliged to receive traffic for through movement to and from St. Louis itself under through bills of lading. For a while they undertook to do this by moving their freight across the river under an agreement with the Terminal Railroad Association of St. Louis which controls the four means of transportation across the river, namely, the Eads bridge, the Merchants bridge, the Wiggins ferry and the Interstate car transfer. It was found that the terminal association did not have sufficient facilities in St. Louis to enable it to handle all the additional traffic with promptness. The eastern carriers, in order to give the public a service that was sufficiently prompt, were compelled to make arrangements with certain transfer companies to move the freight by wagon between St. Louis and East St. Louis. As a part of the arrangement, the transfer companies undertook also to furnish and operate stations in St. Louis where they could receive and deliver freight for the carriers.

These freight stations in St. Louis, are often referred to as "off-track" stations because they are not reached by the rails of any carrier. Although the western lines have rail depots of their own in St. Louis, many, if not all, of them have made similar arrangements with the transfer companies. This arrangement was made by the carriers only with such transfer companies as had warehouses that could be used as freight stations. These are the St. Louis, the Columbia, the Fidelity and the Central Transfer companies. In most instances the first floor of the warehouse is considered the station of the carriers, the floors above being used by the transfer companies in their private business as warehousemen. Obviously the transfer companies that conduct a private warehouse business are enabled, under this arrangement, to save all cartage expense that other warehouse companies, not participating in this arrangement with the carriers, must pay, and it is on this ground that the allegation of discrimination rests. The off-track stations, however, are intended for the use of the general shipping public without restriction and it is shown that these freight stations have proved to be a substantial aid in the prompt handling of traffic into and out of St. Louis.

The carriers, finding the above arrangement so successful, also made arrangements with the same transfer companies, and also with others, for hauling the traffic by wagon between the East St. Louis rail stations and the store doors of shippers and consignees in St. Louis, without passing it through the off-track stations, but through what is referred to by the carriers as their "constructive" stations on the west bank of the river. These stations are simply an undefined point on the river bank and have no corporeal existence. By employing the transfer companies as their agents, the eastern lines perform a "constructive" station service, making at the undefined point on the west bank a purely nominal or constructive delivery of the inbound shipment and in the same manner an imaginary acceptance of outbound traffic, the freight not being moved from the wagon in either case. The rail rate takes the traffic to and from the constructive point, the cartage charges of the transfer companies being paid by the carriers. The shippers and consignees pay the cartage charges, however, between the incorporeal station and their store doors.

Besides operating the "off-track" stations, the transfer companies perform certain other services as agents of the carriers. They undertake to quote rates. They collect charges on shipments and remit the amounts to the carriers. They do not issue bills of lading; they issue dray tickets on outbound shipments, which may be surrendered to the carriers by the shipper for a bill of lading. In handling traffic to and from the constructive stations, however, nothing of this kind is done by the transfer companies.

The commission is of the opinion that the operation of the off-

track stations is not unlawful and that it does not result in discriminations that are undue.

It is found, however, that the constructive receipt and delivery of traffic at incorporeal stations at the undefined points on the west bank of the river is not available to all shippers and should be condemned unless that fault is corrected. It is agreed that the carriers' service begins and ends at the undefined point. The undefined point, if comparable with anything physical, must therefore be regarded as taking the place of a station for less-than-carload traffic and a team track for carload traffic. In either case the right to use this constructive service is limited to shippers who approach the constructive terminals through the agency of transfer companies designated by the carriers. They may not, with their own vehicles, go to the constructive stations to deliver or receive their traffic. In other words, the right of a shipper to have an east side line extend its service to and from these undefined points depends upon his willingness to employ the carrier's agent to haul his traffic between those points and his store door. If he employs a transfer company designated by the carrier he may have the service; if he uses his own vehicle the service is denied to him. The result is an unjust discrimination which must be corrected. (34 I. C. C., 453.)

Rates on Lumber from Southern Points

In re rates on lumber from southern points to the Ohio river crossings and other points. Opinion by Commissioner McChord:

The southern carriers have proposed to increase the rates on lumber and articles taking the same rates from the producing regions of the southwest, the Mississippi valley, and the southeast to St. Louis, East St. Louis, Thebes and Cairo, Memphis and the Ohio river crossings. The proposed increases average about one cent a 100 lb., except that the increases are greater than one cent in those instances where the present rates on hard wood are less than the rates on pine. The territory of production involved is as follows: (1) The southwestern territory, including part of Oklahoma, Missouri and northern Arkansas, and the territory embraced in the so-called southwestern yellow-pine blanket, bounded on the north by the Arkansas river, on the east by the Mississippi river, on the south by the Gulf of Mexico, and on the west by a line drawn through Kansas City and Houston, Tex.; (2) Mississippi valley territory, the region lying east of the Mississippi river and on the west of the line of the Mobile & Ohio; (3) southeastern territory, embracing Georgia and Florida, and parts of Alabama and Tennessee.

The methods of constructing through rates from the territories of origin to points in central freight association and trunk line territories are not uniform. From the southwest the local rates to the gateways are generally used also as proportional rates and are added to other local or proportional rates beyond the gateway to make the through rates. The present yellow-pine rate to Cairo, Ill., for example, is 16 cents, both local and proportional. The rate from Cairo to Chicago is 10 cents, making a through rate of 26 cents. From Mississippi valley territory to the consuming territory north of the Ohio through rates are made by combination upon the Ohio river crossings, except in a few cases, and they are in some cases published as joint through rates. From southeastern territory there is a dual system of rates, one set being the rates to the crossings proper and the other the proportional or basing rates. The same increases are proposed in both.

The principal reasons given by the southwestern lines for the increases are the following: (1) They need more revenue; (2) the rates are unusually low, having been made for the purpose of aiding an industry which was struggling to overcome the prejudices against it and market its product in competition with other woods; (3) the prejudice no longer exists and competition is almost a thing of the past; (4) water competition, which originally influenced the rail rates, is now negligible.

The southwestern lines taken collectively are not prosperous. A consolidated statement, filed on behalf of 26 of these lines, shows that from 1903 to 1914 their mileage increased from 24,897 miles to 34,012 miles, and that their total operating revenue increased during the same period from \$166,516,000 to \$287,116,000. In spite of this, the net operating income decreased during the same period from \$45,269,000 to \$41,175,000, the average net operating income for the whole period being only

\$48,937,000. The ratio of net operating income to property investment account of these roads in 1903 was 4.78 per cent, while in 1915 it was 2.84 per cent. The average ratio for the entire period was 3.78 per cent, while for 35 railway systems in official classification, which were interested in the *Five Per Cent case*, the ratio was 5.41 per cent. Even though the carriers may not be prosperous it does not follow, in the commission's opinion, that they should get additional revenue by means of an increase in the rates on lumber, for the latter may at present be contributing its fair share of revenue.

The respondents show that commendable efforts have been made by some of them to conserve their revenues, with gratifying results, and the St. Louis & San Francisco is chosen as typical. During the period beginning June 30, 1913, and ending November 30, 1914, that carrier, by increasing its trainloads, reducing the amounts paid for loss and damage, reclaiming scrap material, and in numerous other ways, effected a saving of \$931,526. The extent to which the other carriers in the southwest have been able to conserve their revenues is not shown in the record, but the evidence just detailed suggests that it is possible to better materially the financial condition of these lines without an increase in the rates on lumber.

The commission, therefore, finds that the proposed increased rates on yellow-pine lumber from the southwestern blanket to St. Louis, Mo., and East St. Louis, Thebes and Cairo, Ill., have not been shown to be reasonable. The evidence of record also does not show that the rates from Little Rock, Ark., and Pine Bluff, Ark., to Memphis, Tenn., should be increased to the blanket basis. The commission in *Northbound Rates on Hardwood*, 32 I. C. C., 521, held that was no good reason why the rates on hardwood lumber should not be as high as the rates on yellow pine. For that reason the commission will now allow increases in the rates on hardwood from the blanket to St. Louis, Cairo, etc., to the extent that they do not exceed the rates on yellow pine.

The carriers proposed also to make increases of one and two cents in the rates on all kinds of lumber to the gateways named from points north of the Arkansas river. These increases are not found reasonable. Because of its difficult operating conditions, however, the Chicago, Rock Island & Pacific will be allowed to increase a hasing rate to Thebes and Cairo from stations Hazen, Ark., to Galloway, inclusive, on its Memphis branch and to increase its rates to Memphis from certain other points on that branch. Increases to Thebes and Cairo are also allowed from certain stations on the Missouri & North Arkansas.

A proposed cancellation of a local rate to Cairo from points on the Texas & Pacific is found not to be justified. Proposed increased rates to Louisville and Cincinnati from stations on the Rock Island, Walker Spur, La., to Eunice; Fitch, Ark., to Apex; and Milams, La., to Meridian, La., are also found to be unreasonable.

The commission also refuses to allow the carriers to make increases averaging two cents in the rates on all kinds of lumber to New Orleans from a number of stations in the southwestern territory.

Concerning the increases proposed by a number of carriers from points east of the Mississippi river the commission holds that these carriers may increase their rates to north bank Ohio crossings by not more than one cent in those instances in which such increases are necessary to effect a spread of one cent between the rates to opposite crossings in accordance with the conclusions in the so-called *Ohio river cases*. In no case may the rates to north bank points be increased more than is necessary to make the rates to those points one cent higher than the rates to the opposite southbound points.

The commission will also allow proposed increased rates to Ohio river crossings from points on the Texas & Pacific, the Vicksburg, Shreveport & Pacific and Southern Pacific lines in Louisiana.

The record shows that cottonwood and gum are not entitled to lower rates than other kinds of hardwood, and the proposed rates on cottonwood and gum are permitted in all cases where they do not exceed the rates on other hardwoods. In no case may the rates on cottonwood or gum or other hardwoods exceed the rates on yellow pine.

Proposed increased rates from Cincinnati to western termini and points in trunk line territory are held not to be justified. (34 I. C. C., 652.)

STATE COMMISSIONS

In last week's issue, page 138, it was incorrectly stated that the Arkansas Railroad Commission had given permission to the Arkansas Central to charge two cents a mile passenger fare. The commission authorized a three-cent rate.

The New York Public Service Commission, Second district, which recently denied the Ulster & Delaware permission to raise its mileage rate above the two-cent maximum set by the legislature has formally denied an application for a rehearing.

William G. Busby, counsel for the Missouri Public Service Commission, has filed a brief with the commission in answer to the briefs of the railroads of the state, that are asking a general advance in freight, passenger and baggage rates throughout the state. The brief opposes the application of the railroads, saying they have failed to justify the proposed increases, and is largely devoted to a defense of the formula for dividing the expenses between freight and passenger service and between state and interstate business, prepared by the accountant for the commission, which was attacked by the railroads during a hearing.

PERSONNEL OF COMMISSIONS

H. A. Herndon, chief draftsman of the Fort Worth & Denver City at Childress, Tex., has been appointed junior mechanical engineer, division of valuation, of the Interstate Commerce Commission, with headquarters at Kansas City, Mo.

Ledyard P. Hale, counsel for the New York Public Service Commission, Second district, has been given a leave of absence until September 1, because of press of duties as chairman of the public utility committee of the constitutional convention. During his absence, Frank H. Mott, secretary will serve as counsel, and Francis X. Disney, assistant secretary, will succeed Mr. Mott.

M. Maltbie, formerly a member of the New York Public Service Commission, First district, and more recently chairman of the valuation committee of the National Association of Railway Commissioners, has been appointed a member of the advisory board of C. A. Prouty, director, valuation division, of the Interstate Commerce Commission, with headquarters at Washington, D. C.

COURT NEWS

Judge Sanborn of the United States Circuit Court of Appeals has rendered a decision reversing that of the United States district court of Nebraska, that the Union Pacific acted in violation of the Sherman anti-trust act in acquiring a majority of the stock of the St. Joseph & Grand Island. The opinion is concurred in by Judges Carland and Amidon. The court, however, ordered that a perpetual injunction be entered to prevent the St. Joseph & Grand Island while dominated by the Union Pacific from purchasing the line of the Hastings & Northwestern from Hastings, Neb., to Gibbons, 26 miles. The case was remanded to the lower court for a re-trial.

Limitation of Liability—Fire—Interstate Commerce

The Alabama Court of Appeals holds that section 20 of the Interstate Commerce Act, providing that a common carrier shall be liable for loss caused by it, or by any connecting carrier, does not prevent a carrier from exempting itself from liability for goods destroyed by a fire which is not attributable to the carrier's negligence. *Central of Georgia v. Patterson* (Ala.) 68 So., 513.

Mississippi Spur Track Statute Held Invalid

The Mississippi Supreme Court holds that Laws 1908, c. 88, providing that upon application the Railroad Commission may order railroad companies to construct and maintain tracks to connect with industrial plants, if the tracks can be built without undue hazard to the trains or other property of the railroad, is in conflict with the Fourteenth Amendment prohibiting the taking of property without due process; for it neither provides for compensation to the railroad nor makes the right contingent on the amount of freight offered by the applicant. *McInnis v. New Orleans & N. E.* (Miss.) 68 So. 481.

Scope of Federal Employers' Liability Act

In proceedings under the New Jersey workmen's compensation act for the death of an employee of the Pennsylvania, who fell off a barge on the Delaware & Raritan canal, in the course of his employment as a boatman, it was held by the New Jersey Supreme Court that, although the employer is a railroad and the canal is an interstate waterway, the federal employer's liability act did not apply so as to supersede the workmen's compensation act, because, as the deceased's employer, the railroad was operating a canal. *Hammill v. Pennsylvania* (N. J.), 94 Atl., 313.

Right to Fence Right of Way

A railroad built a fence along its right of way to prevent the use thereof as a passageway by the patrons of a neighboring restaurant. In an action by the proprietor of the restaurant for injunction, the Texas Court of Civil Appeals held that the company was within its rights, though there were no other means of ingress or egress to or from the restaurant, as the use of the right of way for such a purpose would largely increase the risk of accident and consequently the liability of the company, and was inconsistent with the use of the right of way for railroad purposes. A railroad may exclude trespassers from its right of way, and take reasonable steps necessary to do so, even though the title to the land it occupies is not vested in it. *Ft. Worth & D. C.* (Tex.), 176 S. W., 827.

Fares—Overcharges—Statutory Penalties

A railroad's ticket agent gave a passenger, by mistake, a ticket for a station in the opposite direction from his intended destination. The conductor on the train refused to accept the ticket, and demanded the fare in cash. In an action for the statutory penalty for taking or receiving any "greater compensation for the transportation of passengers than is allowed by law," the Arkansas Supreme Court held that, though the carrier was liable for damages for violating the contract of carriage, it was not liable for the statutory penalty, there being no intention to charge or receive more than the legal rate. Judgment for the defendant was affirmed. *Smith v. St. Louis, I. M. & S.* (Ark.), 176 S. W., 308.

Validity of Contract for Open Farm Crossing

Action was brought to require the Missouri Pacific to maintain an open farm crossing provided for under a contract whereby the railroad's predecessor obtained its right of way across the plaintiff's land. The Kansas Supreme Court holds that such a contract is not contrary to the public policy of Kansas, as indicated by its statutes, and that the contract might be specifically enforced by the land owner, although he had had considerable trouble about cattle getting killed at the crossing, and the railroad desired to erect gates to avoid killing the plaintiff's cattle and to protect the public. *Atkinson v. Mo. Pac.* (Kan.), 149 Pac., 430.

Stoppage of Trains at Small Stations—Necessity

A decree of the New York Appellate Division required the Boston & Maine to maintain a regular station at a sulphur spring on the outskirts of Saratoga Springs, "at which all its regular trains must stop." There was scarcely a resident in the vicinity whose convenience would be served by the stopping of trains, and the only substantial travel to the station, if any, would be during the summer months. On a motion for contempt against the company for failure to comply with the decree, the court held, on this showing, that all that was contemplated by the decree was the stoppage of regular trains only when necessary to take on or put off passengers who held tickets, or on signal. (*Franklin v. Boston & Maine*, 153 N. Y. Supp., 688.)

Presentation of Claims for Loss—Waiver of Condition

An interstate shipment contract in the state of New York provided for the re-icing of perishable fruit at points within the state, and also that the carrier should not be liable on claims for loss, damage, or delay unless they were presented in writing within four months. The company, by deviating from the agreed route, converted the shipment into an interstate shipment, and loss resulted from its failure to properly re-ice the fruit. No claim for the loss was made within four months. In an action

for the loss the Niagara County Court holds that by such deviation the railroad became an insurer, and could not avail itself of the exception in the contract, though the exception would have been valid as applied to an interstate shipment. (*Lynch v. New York Central*, 153 N. Y. Supp., 633.)

Fall of Article from Rack—Burden of Proof of Negligence

In an action for injuries in a passenger car caused by the fall of a suit case from a rack above the plaintiff, the plaintiff testified that it fell about an hour and a half after he got on the train, that he did not change his seat, did not fall asleep, and did not know whether the suit case was on the rack when he boarded the train. It was held by the Wisconsin Supreme Court that the burden was on the plaintiff to show that the suit case was in the rack long enough so that the defendant's employees, in the exercise of reasonable care, should have discovered and removed it, and that the plaintiff had not met this burden. It was a matter of pure speculation how long the suit case had been in the rack before it fell. The complaint was dismissed. *Colburn v. Chicago & N. W.* (Wis.), 152 N. W., 821.

Trespassing Animals—Duty of Road

The conductor and engineman of a train were warned that horses had got loose and were likely to be found on the track at a certain point. The animals were afterwards killed by the train. The Indiana Appellate Court holds that, though the animals were on the track without right, nevertheless the railroad's knowledge that they were there imposed a duty on it to take due care, by maintaining a reasonable lookout, and, upon discovery, exercising reasonable care to avoid injuring them; and for violation of this duty, resulting in injury to the stock, the railroad was liable. What constituted such reasonable lookout and care were questions for the jury, bearing in mind the railroad's correlative duty safely to carry its passengers, and its duty to itself to preserve its property. *Vandalia Co. v. Duling* (Ind.), 109, N. E. 70.

Validity of Contracts for Services by Shippers

In an action for freight charges the defendant set up a counterclaim under a contract made in 1894, by which the carrier agreed to pay to the defendant one cent for each 100 lb. of incoming and outgoing freight handled by the defendant, for spotting cars on the defendant's own track. The only question was whether this contract violated the Interstate Commerce Act. The New York Appellate Division held that the contract was one for the performance by the shipper of a duty, which the carriers owes, to place each car so that it can be unloaded, and, there being nothing to show that the service performed by the shipper was not worth the agreed price, the contract did not provide for the payment of a rebate, in violation of the act of 1887, but was within section 15 thereof inserted by the amendment of 1906, providing that, where the owner of property transported under the act directly or indirectly renders any service connected with the transportation, an allowance therefor shall be no more than is just and reasonable. (*New York Central v. General Electric Co.*, 153 N. Y. Supp., 478.)

Hours of Service—Application to Work Train Service

A fireman on a work train handling only company material between Hiawatha, Mo., and Seneca, Mo., went on duty at 4:30 a. m. and continued on duty until 7:30 p. m., when the train was placed on a siding at Seneca and the fireman remained as watch in charge of the engine until 12:40 a. m. Action was brought by the government in the district court for the first division of Kansas to recover penalties for the violation of the federal hours-of-service act. The defendants claimed that since the work train was handling only company material to be used wholly within the state, the crew was not in interstate service. The courts holds that since the line on which the fireman was working is part of the through main line over which interstate commerce passes, the fireman's service comes within the jurisdiction of the federal law. The opinion by Judge Pollock says in part: "Congress has the constitutional power to regulate commerce among the states. The power to regulate is inclusive of the right to make safe. The purpose of Congress in the passage of the act in question was not alone to conserve the safety of those employees of railways

actually engaged in interstate commerce at the time of the performance of the service, but to further the protection and safety of passengers or co-employees traveling or engaged in interstate commerce from the negligent acts of employees of the road connected with the movement of trains, whether engaged in interstate or intrastate commerce, whose minds, having become clouded and whose senses have become deadened by long-continued service and loss of rest and sleep, and who for such reason may through neglect bring disaster not to themselves or to the train on which they are working, but to other trains moving in interstate commerce, and such are the decisions."

Parol Gift of Right of Way—Continued Use of Spur Track

The owner of land, after a right of way for a spur track had been staked thereon, said to a representative of the railroad company that the land was theirs, to go ahead and take it. The company took possession and laid the track which it maintained with the consent of the owner for more than 20 years. In an action by a subsequent owner of the land to quiet title in the strip occupied by the track, the Iowa Supreme Court holds that there was a parol gift, or at least an irrevocable license for an easement in the right of way. Moreover, during the 20 years other industries were established along the track, which were dependent on the continued use of the spur track, and the railway company had, known to the owners of the land, expended about \$4,000 in improving the track. After acquiescing in the use of the track for the advantage of the other industries for so many years, the plaintiff's grantor and himself were estopped from setting up any claim inconsistent with the continued use of the right of way by the defendant. *Shimanck v. Chicago M. & St. P.* (Iowa), 152 N. W., 574.

Child Held Passenger, Though Paying No Fare

A mother, carrying a girl about nine months old, became a passenger and notified the trainman who collected the fare that she desired to get off at a certain station, and informed him she had never been there. The Alabama Court of Appeals holds that the child, though riding free, was a passenger, and the railroad owed her the same duty as if she had paid fare. In this instance the duty it owed was to give the mother notice that the train had stopped, or was about to stop at her destination, either by calling the station distinctly, or by personal notice, and to stop the train and afford the mother a safe place and reasonable time to alight. While ordinarily the railroad is under no duty to give the passenger personal notice that his particular station has been reached, exceptional circumstances, such as age, or physical infirmity, may impose this duty. Having failed in this duty, and carried the child and the mother beyond destination, and in returning to the destination the child becoming ill as a proximate consequence, it was held that the child could recover. *Southern v. Herbon* (Ala.), 68 So. 551.

Increase in Rates—Reasonableness

In affirming the judgment of the Appellate Division (159 App. Div. 546, 145 N. Y. Supp., 513), annulling an order of the New York Public Service Commission, Second district, directing a reduction of commutation fares to stations between New York and Peekskill and White Plains on the New York Central, the New York Court of Appeals makes the following rulings: That a lower rate has been in force for some years raises no presumption that an increase is unreasonable, in the absence of a showing that the lower rate was reasonable and compensatory. Because a rate was once compensatory, it will not be presumed that several years later it afforded a fair return, it being common knowledge that the price of materials and scale of wages had increased. In establishing a rate, a railroad is not bound to consider that branch alone for which the rate is applicable, but may take into consideration the cost of operation and rates prevailing over its entire system. In view of the regulations imposed upon railroads, and the public reports required of them, it is improper to assume that they have peculiar knowledge of their affairs, and so should have the burden of justifying an increase in rates, instead of those objecting having the burden of proving that the increase was unwarranted. The question of whether it is impolitic for the railroad to make the increase is immaterial, and the commission should not set aside the increase on that ground. *People ex rel. New York Central v. Public Service Commission* (N. Y.), 109 N. E., 252.

Termination of Liability for Interstate Freight—Oklahoma Statute

In an action against an initial carrier for damages for delay in transportation of fruit trees, the Oklahoma Supreme Court announced the rule under the statute of that state to be as follows: If intrastate freight, addressed to a place beyond the usual route of a common carrier who has received it, is lost or injured, or if the shipper is damaged by unnecessary or unreasonable delay in transportation, the carrier must, within a reasonable time after demand, give satisfactory proof to the consignor that the loss, injury, or damage did not occur while it was in its charge, or because of delay caused by it, or it will be liable therefor. The demand for such proof must be direct and specific, and a simple request or demand for payment of the loss or damage does not bring the shipper within the requirements of the statute. The shipper in the present case having made no such demand, but having merely demanded payment for the damages caused by the delay, it was held that he was not entitled to recover. *Missouri, K. & T. v. Foote* (Okla.), 149 Pac., 223.

Twenty-Eight-Hour Law—Additional Time for Rest

In an action for damages to cattle by negligent delay in transportation from Worth, Mo., to Chicago, the plaintiffs' theory was that, as experienced shippers, they knew that the cattle arrived at Galesburg at from 6 to 9 a. m., and obtain 11 hours' freedom from the cars, and present a good appearance on their arrival in Chicago next day; but owing to a delay in transit, they did not arrive in Galesburg until 10 or 11 a. m., and were unloaded in the heat of the day. It was admitted by the plaintiffs that the cattle were transported from Worth to Chicago in the usual time, and got over five hours rest at Galesburg. It was held by the Kansas City Court of Appeals that the railroad had done all that was required of it under the 28-hour law, and its failure to give the additional time for rest anticipated by the shippers did not render it liable, in the absence of a contract stipulation relative to such additional time. *Kent v. C. B. & Q.* (Mo.), 176 S. W., 1,104.

Interstate Shipments—Limitation of Liability—Change After Loss Is Discrimination

A contract for the shipment of horses recited that in consideration of the lower of two rates being paid, the railroad's liability should not exceed \$100 for each horse. The shipment being interstate was therefore governed by the federal law. One of the horses had a leg broken during transit, and was killed. The railroad agreed to settle the owner's claim by paying \$172, the stipulated value of the horse. In an action for the loss of the horse, the Kansas Supreme Court holds that the limitation in such a contract becomes a part of the rate, and the parties cannot, by any agreement after a loss has occurred, change the limitation and arrange for the payment of a greater amount than the value as fixed in the contract. To hold otherwise would be giving him an advantage over other shippers and constitute an unlawful discrimination. *Donohoo Horse & Mule Company v. Missouri, K. & T.* (Kan.), 149 Pac., 436.

Additional Taking of Land for New Location of Right of Way—Measure of Damages

A railroad had acquired a right of way across a farm by a deed which provided that the consideration named therein covered all damages to the adjoining lands incident to the construction and operation of the railroad. The right of way was 100 ft. wide, consisting of 2.91 acres, and the consideration was \$750. It afterwards began a new survey to swing the road east from a point in the farm, necessitating the taking of a small triangular piece of the land, amounting to .91 of an acre. In proceedings to condemn this land the Kentucky Court of Appeals holds that the measure of damages was the difference between the value of the farm with the railroad constructed and operated on the original right of way and its value with the railroad constructed on the new location, and it was error to admit evidence, instruct the jury, and permit argument by the owner's attorney on the theory that the damages caused by the construction of any railroad on the farm could be recovered. In view of the consideration of \$750 for the original 2.91 acres conveyed, a verdict for \$1,200 for the .91 taken for the new location was manifestly excessive. *L. & N. v. Wilson* (Ky.), 176 S. W., 980.

Railway Officers

Operating

C. Gavin has been appointed trainmaster of the Northern Alabama, with headquarters at Sheffield, Ala.

C. A. Hodgman has been appointed superintendent of car service of the Minneapolis & St. Louis, with headquarters at Minneapolis, Minn.

J. H. Elliott, superintendent of the New Orleans division of the Texas & Pacific, has been appointed general superintendent, with headquarters at Dallas, Tex., succeeding J. E. Taussig, resigned.

J. P. Falk, general yardmaster of the Chicago, Burlington & Quincy at Kansas City, Mo., has been appointed superintendent of terminals, with headquarters at Kansas City, succeeding O. C. Hill, resigned.

W. R. Cahill, formerly superintendent of the Nebraska division of the Union Pacific, has been appointed superintendent of the Texas division of the Missouri, Kansas & Texas, with headquarters at Wichita Falls, Tex.

O. C. Hill, formerly superintendent of terminals for the Chicago, Burlington & Quincy, has been appointed general superintendent of the Kansas City Terminal Railway, succeeding R. A. Barrett. Mr. Hill's headquarters are at Kansas City, Mo.

Fred J. Stimson, whose appointment as superintendent of the Zanesville division of the Central system of the Pennsylvania Lines West of Pittsburgh, with headquarters at Zanesville,

Ohio, has been announced, was born at Kalamazoo, Mich., on October 30, 1868. After graduating from the Kalamazoo high school in 1886, he entered the employ of an engineering company at Knoxville, Tenn. He entered railway service in November, 1888, with the Grand Rapids & Indiana as clerk in the office of the claim and timber agent. The following year he worked as rodman on survey and construction work. In June, 1890, he entered the employ of the Colorado Midland as assistant engineer on preliminary and location surveys, which position he held until December,

1892. He returned to the Grand Rapids & Indiana in March, 1893, as assistant roadmaster and on January 1, 1904, was appointed division engineer, from which position he is now promoted.

Traffic

Leon O. Dismuke, city passenger agent of the Houston & Texas Central at Dallas, Tex., has been appointed division passenger agent, with headquarters at Dallas.

Roy Hinckman, formerly agent of the Baltimore & Ohio at Athens, Ohio, has been appointed general passenger agent of the Cincinnati, Hamilton & Dayton, with headquarters at Dayton, Ohio.

C. B. Sloat, assistant general passenger agent of the Chicago, Rock Island & Pacific, Little Rock, Ark., has been appointed general passenger agent, with headquarters at St. Louis, Mo.,

succeeding George H. Lee, who has resigned to go to the Lehigh Valley.

John S. Talbot, recently general agent of the Chicago & North Western, has been appointed commissioner for the Association of Lake Lines, with headquarters at Cleveland, Ohio, succeeding F. E. Signer, who resigned last December to enter the service of the Lehigh Valley.

George H. Lee, whose appointment as general passenger agent of the Lehigh Valley, with headquarters at New York, has already been announced in these columns, was born at Mt. Morris,

N. Y., and was educated at Hamilton College, Clinton, N. Y. He began railway work in 1886, as a clerk in the auditor's office of the Arkansas Valley Route at Little Rock, Ark. He subsequently entered the traffic department, and for a time was in the service of the Choctaw, Oklahoma & Gulf, and other western lines until he went to the Chicago, Rock Island & Pacific. He held various positions on that road until his appointment as general passenger agent of the Third district, with headquarters at St. Louis, Mo., and on August 1, will leave that road to become general passenger agent of the Lehigh Valley, with headquarters at New York, as above noted.

G. H. Lee

Engineering and Rolling Stock

R. H. Pembroke, having resigned as chief engineer of the Coal & Coke, with headquarters at Gassaway, W. Va., that office has been abolished, and F. D. Cosner has been appointed engineer maintenance of way, assuming all duties heretofore assigned the chief engineer.

Purchasing

R. A. Lunsford has been appointed storekeeper of the Kansas City, Mexico & Orient of Texas, with headquarters at San Angelo, Tex., succeeding T. A. Pratt.

OBITUARY

Frank Roberts, president of the Valdosta, Moultrie & Western, died on July 15, at Valdosta, Ga.

Judge Henry L. Waldo, formerly solicitor for New Mexico for the Atchison, Topeka & Santa Fe, died recently in Kansas City, Mo.

E. E. Smythe, formerly general freight agent of the Kansas City Southern, died in Kansas City, Mo., of injuries received in an automobile accident on May 5.

G. Aldrich, supervisor of bridges and buildings of the New York, New Haven & Hartford, with headquarters at Boston, Mass., died on July 9, after an operation for cancer of the stomach.

Theophilus P. Brown, formerly, from 1883 to 1885, president of the Toledo & Indianapolis, and later president and general manager of its successor, the Toledo, Columbus & Southern, now a part of the Toledo & Ohio Central, died recently in Toledo, Ohio, at the age of 80.

Arthur Brown, who was division superintendent of the Maine Central previous to 1875, and from 1876 was superintendent of the Bangor & Piscataquis until that road was taken over by the Bangor & Aroostook in 1892, when he retired from railway work, died on July 19 at his home in Bangor, Maine, at the age of 95.

F. J. Stimson

Equipment and Supplies

LOCOMOTIVE BUILDING

THE MINNESOTA STEEL COMPANY has ordered 3 saddle tank locomotives from the H. K. Porter Co.

THE ALABAMA & TOMBIGBEE has ordered one Consolidation type locomotive from the Lima Locomotive Corporation.

THE CZARNIKOW-RIONDO COMPANY, 112 Wall street, New York, has ordered one Mogul type locomotive for the Gomez Mena Plantation Company from the American Locomotive Company. This locomotive will have 18 by 24-in. cylinders and 50-in. driving wheels.

CAR BUILDING

THE ILLINOIS STEEL COMPANY is in the market for 10 tank cars.

THE EL PASO & SOUTHWESTERN has ordered two dining cars from the Pullman Company.

THE NEVADA NORTHERN has ordered 50 Ingoldsby dump cars from the Pullman Company.

THE PHILADELPHIA & READING is said to be contemplating the purchase of a number of freight cars.

THE TEMISKAMING & NORTHERN ONTARIO has ordered four passenger cars from the Pullman Company.

THE COLD BLAST TRANSPORTATION COMPANY has postponed its inquiry for 300 refrigerator cars for the present.

THE CHICAGO & NORTH WESTERN has ordered 300 automobile cars from the American Car & Foundry Company.

THE NEW YORK CENTRAL is said to have issued inquiries for 1,500 box and 500 automobile cars for the Michigan Central.

THE FRENCH GOVERNMENT is reported to have ordered 200 armored cars from the Standard Steel Car Company. This item has not been confirmed.

THE RUSSIAN GOVERNMENT has exercised its option for 200 cars with the Pressed Steel Car Company, thereby increasing that company's order to 7,000 cars, and is also reported to have given it an additional order for 2,000 cars.

THE BALTIMORE & OHIO has divided an order for 2,000 hopper cars among the American Car & Foundry Company, the Pressed Steel Car Company and the Cambria Steel Company, and ordered 35 coaches, 5 combination passenger and baggage cars, 2 baggage and mail cars, 4 baggage cars, 2 café-parlor cars and 2 café coaches from the Pullman Company.

IRON AND STEEL

THE GULF, FLORIDA & ALABAMA has ordered 750 tons of steel from the American Bridge Company.

THE ITALIAN GOVERNMENT is reported to be negotiating with an American company for the purchase of 20,000 tons of rails.

THE MINERAL RANGE has ordered 289 tons of steel from the American Bridge Company for an approach to a bridge at Houghton, Mich.

THE NEW YORK PUBLIC SERVICE COMMISSION, FIRST DISTRICT, has ordered 35,500 tons of open hearth rails and 2,400 tons of open hearth guard rails from the Bethlehem Steel Products Company for use on the lines of the dual subway system of New York City. The Public Service Commission will open bids on August 18 for the supply of special work needed on the rapid transit lines in the Borough of Queens.

MACHINERY AND TOOLS

THE SOUTHERN PACIFIC is reported to be preparing specifications for a large number of machine tools. This item has not been confirmed.

Supply Trade News

The Allis-Chalmers Manufacturing Company, Milwaukee, Wis., has taken a small order for tractor trucks for Russia.

The Hail Switch & Signal Company, New York, is reported to have received an order for shells aggregating \$1,000,000 in value.

The Burd High Compression Ring Company, Rockford, Ill., is beginning the installation of machinery in an additional new factory building.

The U. S. Metal and Manufacturing Company, New York, has been appointed railroad sales agent for the injector sand blast apparatus manufactured by J. M. Betton.

Thomas J. McMaster has been appointed district sales manager in the western territory for the Diamond Power Specialty Company of Detroit, Mich., with headquarters at 809 Ashland block, Chicago.

L. S. Love, formerly head of the L. S. Love Machinery Company, has become associated with the Sherritt & Stoer Company, Inc., Philadelphia, Pa., dealers in machine tools and railway and machine shop equipment.

Louis F. Beckert, a salesman in the railway equipment division of the railway and lighting department of the Westinghouse Electric & Manufacturing Company, died suddenly of typhoid fever at his home in Pittsburgh on July 7.

Roy C. McKenna, of the McKenna Brothers Brass Company, Pittsburgh, Pa., has been elected president of the Vanadium-

Alloys Steel Company, also of Pittsburgh. He succeeds E. T. Edwards, who has resigned to accept the presidency of the Latrobe Electric Steel Company, Latrobe, Pa., but who will remain a member of the board of directors of the Vanadium-Alloys Steel Company. Mr. McKenna brings to his new position the experience gained in the years he has been the head of the mechanical department of the McKenna Brothers Brass Company. He graduated from the University of Pittsburgh in 1903 in electrical and mechanical engineering. His family has been identified with the high-

R. C. McKenna

speed steel trade ever since the year 1902.

It is reported that the Baldwin Locomotive Works, which has recently taken a contract for about \$80,000,000 worth of shells, will incorporate a new company to be known as the Eddystone Munitions Company, and spend about \$1,500,000 for another new plant at Eddystone.

W. Spencer Robertson, assistant to Leigh Best, vice-president of the American Locomotive Company, has been appointed secretary of the company, effective July 14, succeeding C. B. Denny, formerly treasurer and secretary, who has resigned. Mr. Robertson has been in the service of the American Locomotive Company since May 1, 1908. He was born in Brooklyn, January 10, 1885, and from November, 1900, until 1908 he was associated with the law office of Simpson, Thacher & Bartlett, New York.

The publicity department of the Pennsylvania Railroad has issued the following: It can be authoritatively stated that the Pennsylvania Railroad Company has not given an option on its

Cambria Steel Company's stock to Mr. Frick, nor is there any basis for the reported consolidation of the Cambria and Pennsylvania Steel Companies. When Mr. Donner became chairman of the board of the Pennsylvania Steel Company, he was given an option on a portion of the Pennsylvania Company's holdings, both in the Cambria and Pennsylvania Steel Companies.

Negotiations now are pending between the Canadian Car & Foundry Company and the allies for an additional contract for war supplies. It is understood the amount of new business, which it is believed will be closed shortly, is about \$6,000,000. First shipments to Europe of completed shells called for under the terms of the company's original \$83,000,000 contract are expected to be made from the Kingsland, N. J., plant early in August. That plant was erected as an assembling factory for the parts which are being turned out by about fifty manufacturers in the eastern section of this country.

The Locomotive Stoker Company, Schenectady, N. Y., has purchased the coal pusher business and taken exclusive licenses under all of the patents covering mechanical coal pushers for locomotive tenders owned by Ryan, Galloway & Co., Chicago, which, with the patents already controlled, will enable the Locomotive Stoker Company to add a complete line of mechanical coal pushers for all classes of locomotive tenders to its rapidly growing stoker business. Edward Ryan, of Ryan, Galloway & Co., has entered the employ of the Locomotive Stoker Company as mechanical expert.

TRADE PUBLICATIONS

CONDUIT.—The Sprague Electric Works, of the General Electric Company, New York, has issued a four-page folder, naming the good qualities of Spragueduct superior enameled conduit and giving price lists and other data.

GEARS, PINIONS AND TROLLEYS.—The R. D. Nuttall Co., Pittsburgh, Pa., has recently issued catalog No. 12 relative to gears, pinions and trolleys for mine and industrial locomotives, and catalog No. 13 relative to like equipment for electric railways. Each booklet contains illustrations and specifications of the apparatus described, there being included tables giving the sizes and list prices of the gears and pinions which may be obtained.

VERTICAL GAS ENGINE.—The National Transit Company, Oil City, Pa., has recently issued bulletin No. 401, in which is illustrated and briefly described a vertical four-cycle, air cooled gas engine. A unique feature in the design of this engine is the use of the exhaust to induce the circulation of air through the cooling flanges on the cylinder. Bulletins Nos. 104 and 105 also recently issued are devoted to a line of the Duplex direct acting type steam pumps, the former outside center packed and the latter of the packed piston type. These pumps are designed for service from 200 lb. to 1,000 lb. pressure per sq. in.

FLEXIBLE JOINTS.—Barco Flexible Joints is the title on the cover of a loose-leaf booklet recently issued by the Barco Brass & Joint Company, Chicago. In this booklet are contained catalog No. 10, relating to blow-off, terminal coach heating and wash-out nozzle connections; catalog No. 20 relating to round-house blower connections and specifications and the Barco automatic smokebox blower fitting; catalog No. 30, entitled "Barco Flexible Joints, Catalog and Descriptive Bulletin," and catalog No. 40 relating to engine tender connections for steam, air and oil and car connections for steam and air.

RAILWAY CONSTRUCTION IN ENGLAND.—According to the Railway News, the Gowdall-Braithwell Railway, 22 miles in length, intended to form an additional route from new South Yorkshire collieries to the Humber, is now approaching the final stages. The line was originally promoted by the Hull & Barnsley Railway, with the support of the Midland Railway, to which trackage rights were to be given, and which was to find part of the capital. Later the North-Eastern Railway also obtained trackage rights and other advantages, while opposition by the Great Central resulted in the new line being vested in the Hull & Barnsley and Great Central companies. The Act was obtained in 1909, contracts were let the following year, and the work of construction commenced in 1911. The rails have now been laid, and only a few finishing touches are required to complete the work.

Railway Construction

ARTESIAN BELT.—It is stated that work to complete the extension from Christine, Tex., south to Crowther, 16 miles, on which grading work is already finished, will be carried out soon. Plans have been made to extend the line southeast via Beeville to some point on the Gulf coast. The company now operates a 43-mile line from Macdona south to Christine.

CANADIAN NORTHERN.—Construction work is reported resumed on the line to St. Paul de Metis, Alta. About 14 miles of grading has already been finished; D. F. McArthur is the contractor. (October 22, p. 779.)

CANADIAN NORTHERN QUEBEC.—The new location of the projected extension of the old Montford & Gatineau Colonization Railway has been approved from Huberdeau, Que., to a point near St. Remi d'Amherst. The route is along the east bank of the Rouge river to the Argenteuil county line, thence crossing to the west side of the river joins the original approved route, about six miles from Huberdeau. (January 1, p. 39.)

CENTRAL CANADA.—A sub-contract is reported let to J. Timothy for grading the last 22 miles to Peace River Crossing, Alta. Track laying has already been completed, it is said, to mile 28 from McLennan, where connection is made with the Edmonton, Dunvegan & British Columbia. The grading work yet to be carried out will be heavy. It is expected that the grading work will be finished by October 1, and track laying completed and the line ready for operation this year.

CINCINNATI, NEW ORLEANS & TEXAS PACIFIC.—New double track from a point north of Huffman, Tenn., to north of Sunbright, 2.9 miles, was placed in service on July 15. The company now has a total of 129 miles of double track in service between Cincinnati, Ohio, and Chattanooga, Tenn.

CORPUS CHRISTI TRACTION.—Incorporated in Texas with \$100,000 capital to build and operate an interurban system of railways. The plans call for building lines north, west and south of Corpus Christi. The incorporators include J. H. Caswell, San Diego, Cal.; J. R. Hopkins, G. Boone, O. P. Metcalf, W. E. Pope, Corpus Christi, and A. McEvoy, New York.

INTERCOLONIAL.—A contract has been given to J. W. McManus & Co., Moncton, N. B., it is said, for building an industrial spur at Bathurst, N. B., 2.3 miles long.

LOUISIANA ROADS.—Surveys are being made by the Cady Lumber Company, McNary, La., it is said, for a line to be built to connect with the Texas & Pacific and the Chicago, Rock Island & Pacific at Lamourie.

MANITOBA ROADS (Electric).—H. W. Adecock, Winnipeg, Man., is said to be back of a project to build a line from Winnipeg, Man., east to Transcona, about 10 miles. Gasolene motor cars are to be used for the motive power. The line is to be finished by October of this year, and early in 1916 is to be extended to the south side of the town.

MERIDIAN & MEMPHIS.—A contract is reported let to C. G. Kershaw, Birmingham, Ala., for work on this line involving the handling of about 200,000 cu. yd. of earth. The company started work early this year on an extension from Union, Miss., west to Sebastopol, about 13 miles. This line will probably be extended to Carthage, about 30 miles from Union. (April 30, p. 955.)

NEW YORK STATE RAILWAYS (Electric).—The New York Public Service Commission, Second district, has approved the extension of the New York State Railway's lines from Rochester, N. Y., into the town of Greece, Monroe county, to connect the company's tracks, with a loop crossing Dewey avenue in Greece and crossing the Kodak branch of the New York Central's tracks.

NEW YORK SUBWAYS.—The New York Public Service Commission, First district, has approved plans and form of contract for the erection of steel, construction of tracks, etc., on the Broadway elevated railroad, in the borough of Brooklyn, between Myrtle avenue and Aberdeen street, in connection with the third tracking of that line. The commission also approved the

plans and form of contract for the supply of structural steel for widening and strengthening the Myrtle avenue elevated railroad from Willoughby avenue to Wyckoff avenue for the third-tracking of that line.

The contract for the installation of tracks on the New Utrecht avenue elevated railroad, in the borough of Brooklyn, has been awarded to Ward & Tully, Incorporated, the lowest bidders, who offered to do the work for \$71,355. (July 16, p. 143.)

Post & McCord, Incorporated, submitted the lowest bid at \$877,959 for the construction of Section 1 of Route No. 49 of the Culver rapid transit line in the borough of Brooklyn. Section 1 extends from Thirty-seventh street to the intersection of Gravesend avenue and Bay parkway (Twenty-second avenue). (July 2, p. 39.)

PHILADELPHIA, PA. ROADS.—Bids are wanted, until August 16, by A. M. Taylor, director, Department of City Transit, Philadelphia, Pa., for the construction of the city hall section station of the Broad street subway. This section will extend under city hall and the Market street subway, and will be about 700 ft. long. Bids are also wanted on the same date for the construction of concrete column foundations and piers for about 26,000 lineal ft. of elevated railway in Front street, Kensington avenue and Frankford avenue. (July 16, p. 143.)

ST. LOUIS RAILWAY & DOCK COMPANY.—Incorporated in Missouri with \$250,000 capital, to build a terminal railroad in St. Louis county and the city of St. Louis, Mo., about 25 miles long. The projected route is from a point north of the St. Louis city limits near the Columbia Bottom road in a general southerly direction to a point near Van Buren and Catalan streets. The incorporators include W. J. Holbrook, J. T. Moore, E. W. Bannister, D. A. Bowman, J. Hill and H. F. Bell, all of St. Louis, Mo.

TAMPA, CLEARWATER & ISLAND CITY.—Organized in Florida with \$100,000 capital to build a line from the eastern limits of Clearwater to Clearwater Key, about 2.75 miles. The work includes the construction of a bridge about two miles long to be of pile, timber and concrete construction. Bids for a 50-ft. steel draw are wanted, it is said, until August 7. E. W. Parker, president and general manager, Tampa; G. R. Smoyer, vice-president, Clearwater; E. T. Roux, secretary, Plant City, and H. W. Bivins, treasurer, Clearwater.

RAILWAY STRUCTURES

BAY CITY, TEX.—At a meeting of the officials of the Gulf, Colorado & Santa Fe, the Southern Pacific and the St. Louis & San Francisco, with the business men of Bay City, on July 8, a committee was appointed to select a site for the union station to be built by the three railroads entering the city.

CHICAGO, ILL.—The city council has passed a five-year ordinance permitting the Chicago & Western Indiana to build a temporary one-story addition to the Dearborn station on Polk street. It will be a brick structure about 40 ft. wide and 60 or 70 ft. deep.

GALESBURG, ILL.—The Chicago, Burlington & Quincy is rebuilding its blacksmith shop at this place, which was recently destroyed by fire. The work is being done by company forces.

MANITOU RAPIDS, MAN.—A contract for the substructure of the cantilever bridge to be built for the Hudson Bay Railway, over the Nelson river at Manitou Rapids, has been let, it is said, to Robert McDonald, Winnipeg, Man.

NEW YORK.—Bids for the construction of station finish on the new rapid transit lines in the borough of Queens are wanted by the New York Public Service Commission, First district, on August 3, for the junction section on the Queensboro bridge plaza, for the elevated railroad from that point to Corona, and for the extension of the Queensboro subway through Davis street and Ely avenue, and on August 4, for the elevated railroad from the Queensboro bridge to Astoria.

OAKLAND, CAL.—The Southern Pacific is considering the erection of a suburban station on its terminal property in Oakland. No plans have been prepared at present for such a building.

PILOT ROCK JUNCTION, ORE.—The Oregon-Washington Railroad & Navigation Company has awarded the contract for the grading on its new freight terminal at this place to Twohy Brothers Company, Portland, Ore. There will be about 100,000 cu. yd. of grading required.

Railway Financial News

EL PASO & SOUTHWESTERN.—The Corporation Commission of Arizona has approved the issuance of \$16,627,000 bonds by the El Paso & Southwestern. These bonds are to be used for refunding purposes.

HOUSTON & TEXAS CENTRAL.—See Missouri, Oklahoma & Gulf.

INTERNATIONAL & GREAT NORTHERN.—The receivers have filed injunction proceedings against the state tax board of Texas to restrain the board from certifying to tangible assets totaling \$10,000,000. This valuation the receivers claim is excessive.

MISSOURI, OKLAHOMA & GULF.—The Houston & Texas Central has given the Missouri, Oklahoma & Gulf trackage rights from Sherman, Tex., to Plano, and the St. Louis Southwestern has given the Missouri, Oklahoma & Gulf trackage rights from Plano to Ft. Worth and Dallas. It is said that through train service between Ft. Worth and Dallas and Joplin, Mo., will be begun in the near future.

PENNSYLVANIA RAILROAD.—See official statement in regard to Pennsylvania Steel Company and Cambria Steel Company stock in Supply Trade News.

ST. LOUIS SOUTHWESTERN.—See Missouri, Oklahoma & Gulf.

SOUTHERN RAILWAY.—The Tennessee railroad commission has approved the issue of \$3,500,000 Atlanta & Charlotte Air Line bonds, the proceeds of the sale of which are to be used to pay for the double-tracking of the line between Spartanburg, S. C., and Central, 56 miles, and between New Holland, Ga., and Cornelia, 21 miles.

WABASH.—The Wabash was sold under foreclosure at St. Louis on July 21. This, of course, is the preliminary step to the putting through of the reorganization plan, described in the issue of May 7, page 978. The price, which, of course, was subject to the liabilities of the company, was \$18,000,000, which covered the receivers' liabilities.

CONSTRUCTION WORK ON BENGUELA RAILWAY, ANGOLA.—The war has delayed construction work on the Benguela Railway, extending from Lobito Bay, Angola, into the interior. Plate-laying has been entirely suspended for the present, but the construction of earthworks is being steadily pushed forward, and the bed is now ready for rails to be laid to a distance of 40 miles from the present railhead. Only a relatively small amount of work remains to be done in order to complete the road as far as Belmonte, capital of the Bihe district, 390 miles from Lobito. It may, however, be many months before the rails and other material are received. The railway has been in operation as far as Chinguar, 322 miles from Lobito, since the end of 1913.

FROM HOLLAND TO BELGIUM.—The Railway Gazette (London) in a recent issue, quoting from an Antwerp paper, gives interesting particulars of the difficulties attending a railway journey between Holland and Belgium under existing conditions. A German passport office, served by German officials has been opened at the frontier town of Roosendal. The first step on the journey into Belgium is to obtain the passport, which costs a trifle over 45 fr. (\$9.00). The passenger then makes his way to the little station where all refreshments are sold at famine prices, and waits patiently for the train which rarely leaves at the appointed time. The traffic over this section of line would appear to be relatively heavy, since it is said that on the average from 600 to 700 persons leave daily for Antwerp, while about 400 to 500 journey in the reverse direction. The actual Belgian frontier station is at Esschen, where the line is patrolled by sentinels. Here each coach is inspected. The examination, although lasting two hours, is described as not being "very severe." After this formality passengers change into another train, which eventually brings them into Antwerp, the actual time of arriving being a matter on which it is impossible to speculate in advance. At Antwerp the male passengers are allowed to leave the station as soon as their papers are found to be in order, but the women are first searched, a process to which they also have to submit at the beginning of the journey.

*Illustrated.

All-steel gondola and hopper cars have now been in service on a number of roads for a sufficiently long time to give a fairly accurate idea as to their possible life. On

Life of Steel Freight Cars

one road 50-ton gondola cars used in coal and ore traffic are only now having the floor sheets replaced, although they have been in service about 12 years. The underframes are in first-class condition and the side sheets in fair shape. With the new floor sheets it is expected that the life of the car will be extended, without excessive maintenance costs, for another six or eight years. On hopper cars, or gondolas with hoppers, the side sheets opposite the hoppers usually go first because of pounding upon them to loosen the coal and

ore so that it will flow freely. As unloading machines have come into more general use, this trouble is decreasing and in some cases gondola cars are having the hoppers removed and replaced with a level floor. On one road the expanded metal top sides on coke cars are being replaced after eight years of service. The expanded metal has rusted out where it is fastened to the framing members, but is otherwise in good condition. The expense of replacing it is not large and is much less than would be the cost of maintenance of wooden racks or the cost of hauling about the greater weight of either steel or wooden sides. As facilities have been improved for handling repairs to steel freight cars, the trouble in maintaining them has grown less, until now they are giving no more and probably less trouble than the wooden cars which they replaced.

With the increase in the cost of car maintenance, due principally to the rougher treatment freight cars receive in the long trains of today and in hump yards, steel ends are coming to be considered an economical adjunct in car construction. In the words of one prominent mechanical officer, "the steel end is going to offer a very fortunate and economical solution after the years of trouble we have had with box car equipment due to the ends bulging and tearing out." The end is the most vulnerable part of the body of a car, with the possible exception of the door, and by the use of the steel end a structure of more uniform strength is obtained. On several roads the cost of these ends has been proved to be entirely justified on new equipment, as well as old equipment, with a probable life of six to ten years, that is receiving general repairs. The two-piece steel ends seem to be more popular, as they are easier to handle and ship, and in case of damage will be more economical to repair. In some cases, such as the Union Pacific cars described in the February 5 issue of the *Railway Age Gazette*, three pieces are used on account of the large size of the car. A canvass of five roads shows that no serious difficulty is experienced in the maintenance of these ends and in case of an accident it has been found cheaper to replace them than the wooden ends. Any deformation may be easily straightened, and cases have been known in which steel ends have been bulged out 6 or 8 in., due to a sudden shock, with no other injury to the car.

Steel Ends for Box Cars

To the average civil engineer in railway service construction seems to make a stronger appeal than maintenance of way work. There are a number of reasons for this. Popular fancy always connects the railway engineer with the location of new roads, the bridging of canyons and the tunneling of mountains. In other words, he is regarded as a pioneer and a wonder worker, and there can be but little doubt that it is these notions of him which prompt the high school graduate to select engineering as a profession. In the technical school this same feeling prevails. Almost all the training is directed toward design and construction. Lectures are given by engineers engaged in construction work and such inspection trips as are made usually cover new work or reconstruction. In actual practice there is also a certain fascination about the construction project, the satisfaction of seeing the work develop from day to day, an appeal which holds as long as it is in progress but which quickly wanes when the job is finished. On the other hand, maintenance of way is largely of a routine character, and is surrounded with no glamor. In fact, the public is largely ignorant of its character or very existence, and to the engineering graduate it seems uninteresting. Considered purely from the standpoint of material gain, however, maintenance possesses several advantages over construction. The permanence of employment neutralizes any possible advantage in the rate of pay in favor of the construction man.

The Engineer in Maintenance Work

There are a number of reasons for this. Popular fancy always connects the railway engineer with the location of new roads, the bridging of canyons and the tunneling of mountains. In other words, he is regarded as a pioneer and a wonder worker, and there can be but little doubt that it is these notions of him which prompt the high school graduate to select engineering as a profession. In the technical school this same feeling prevails. Almost all the training is directed toward design and construction. Lectures are given by engineers engaged in construction work and such inspection trips as are made usually cover new work or reconstruction. In actual practice there is also a certain fascination about the construction project, the satisfaction of seeing the work develop from day to day, an appeal which holds as long as it is in progress but which quickly wanes when the job is finished. On the other hand, maintenance of way is largely of a routine character, and is surrounded with no glamor. In fact, the public is largely ignorant of its character or very existence, and to the engineering graduate it seems uninteresting. Considered purely from the standpoint of material gain, however, maintenance possesses several advantages over construction. The permanence of employment neutralizes any possible advantage in the rate of pay in favor of the construction man.

It also makes it possible for those engaged in maintenance to establish permanent homes. But most important of all is the unlimited opportunity maintenance of way work affords for gaining intimate familiarity with railway operation, not to say of the entire science of transportation; for the railways and the engineers themselves are beginning to look to the operating positions as offering opportunities for the increased usefulness of the engineer. The relative permanence of employment is well illustrated at the present time. There have been few periods when so many competent and experienced construction engineers were out of work. In the maintenance of way department, on the other hand, the prevailing measures for retrenchment have not seriously affected the trained men. While great reductions have been made in the number of laborers it has not been practicable or advisable to reduce the supervision to any great extent. There is growing demand for trained men in the maintenance of way department. The increasing density of traffic, the diversity of the problems, and the labor situation are calling for the best talent available. The principal difficulty with the technically trained man has been a lack of proper appreciation on his part of the practical features of the work, due partly to a disinclination to serve the necessary apprenticeship and partly to a lack of training in the college; for most of the technical schools have made little effort to readjust their courses of study to meet the changes taking place in the railway business.

PREFERRED STOCK IN EXCHANGE FOR FIRST MORTGAGE BONDS

AN outline of the plan for the reorganization of the Missouri Pacific without receivership was published in the *Railway Age Gazette* of July 9, page 82. The proposal that holders of such a very large volume of securities should agree to a plan of reorganization in which they must make very considerable sacrifices of at least paper values shows a degree of faith in human nature on the part of the banking house making the proposal that is not usually credited to bankers as a class. Of the many interesting features of the plan none is of greater interest or throws more light on the complexities of railroad financing than the proposal that the holders of certain absolutely first mortgage bonds secured at a rate of less than \$12,000 a mile shall exchange these bonds for preferred stock. First lien divisional mortgage bonds at the rate of \$12,000 a mile one would think would be about as conservative an investment as could be secured, providing, of course, that the railroad ran through territory which would justify any railroad at all.

One of the divisional mortgage bond issues for which the holders are asked to make the exchange to preferred stock is the Lexington division first mortgage 5 per cent bonds. The Lexington division is 57 miles long and runs from Sedalia, Mo., to Lexington. It forms, therefore, one of the feeders of the Missouri Pacific system, and this 57-mile line would need to earn only \$600 per mile net, or a total of \$34,200 a year, to pay the interest on this issue. The conclusion to be drawn from the fact that holders of these bonds are asked to exchange them for preferred stock apparently is that, in the opinion of the bankers, this line could not be operated independently from the rest of the Missouri Pacific system and earn \$34,200 a year on the average over good and bad years. To the holder of these bonds the question pretty surely arises as to whether or not the bankers are asking for a larger sacrifice than is justified because of a belief that the holders of these bonds cannot get together or are not likely to get together and insist on a foreclosure sale and the independent operation of their little line. Of course this is a question of fact which could only be determined by a very careful study of traffic conditions on this line, and since the bankers have made such a careful study, the presumption is that this is not a bluff but an honest estimate of the facts. If it were not, presumably some one would buy up a large enough block of these bonds to get control of the situation and force a foreclosure sale.

The situation illustrates quite remarkably clearly the fact

which investors in railroad securities have been so slow to recognize, namely, that a first mortgage is no better than an unsecured debenture on a railroad property which does not have the *earning power* to meet its interest charges. Until within recent years about the last thing that an investor who was offered railroad bonds asked was where his railroad was or what the density of freight and passenger traffic on it was. This Missouri Pacific situation is also a good illustration of the apparent wisdom of railroad companies which are consolidating all of their mortgage debt and issuing a blanket mortgage covering the entire system, with liberal provisions for future financing and refunding. The investors can make some intelligent estimate of what he is getting in the bonds issued under a mortgage like this, and what the security back of his bonds is. The real security back of the bonds is the earning power of the road. Of the earning power of the system as a whole even the investor who knows very little about railroad affairs can get impartial information either from the figures published by the Interstate Commerce Commission or by the annual reports of the company itself which are compiled in accordance with the rules made by the Interstate Commerce Commission.

LOWER PASSENGER FARES AND HIGHER FREIGHT RATES

PRESIDENT UNDERWOOD of the Erie has started an interesting discussion by his recent interviews concerning the readjustment of railway rates in this country. He is quoted as having said that he is not in favor of increasing passenger rates. On the contrary, he favors reducing them to one cent a mile and then raising freight rates 20 per cent. His proposal has called forth considerable comment, some of which is quite astonishing. Seth Low, president of the National Civic Federation, writes to the *New York Times* to say that he has long recommended that our railways adopt the policy of making their passenger rates relatively low and their freight rates relatively high. This, as he points out, is the policy of the state railways of Europe, and is popular, because while almost everybody directly pays passenger fares, only comparatively few directly pay freight rates.

The most astounding expressions of all come from an entirely unexpected source. We have always regarded the *Christian Science Monitor* as an unusually fair and intelligent newspaper, but in its issue of July 15, it published an editorial entitled, "Lower Passenger Fares," which discloses either an ignorance or an unfairness, or a combination of the two that is surprising. "All things considered," according to the *Monitor*, "transportation is higher in the United States today than it has been at any time since the introduction of the railroad. . . . Tens of thousands of people in the United States who would gladly see America, if not first, at least sometime, are prevented from seeing it at all by the almost prohibitive cost of travel." Reduced fares, according to this new, but entirely cocksure, authority on transportation, would quadruple the passenger business of our railways and greatly increase their profits.

It would be somewhat surprising if it should be found that Seth Low and the *Christian Science Monitor* know more about what is good for the railways as well as the public than all of the experienced railway managers who are now seeking advances in passenger fares. It might be said that Mr. Underwood, at least knows what he is talking about. There is no question about that. But Mr. Underwood was very careful to say that he was not advocating merely a reduction in passenger fares. "My plan," he said, "is not only to reduce passengers to one cent a mile, but to increase freight rates 20 per cent on the average." The application of this reduction in passenger fares and this increase in freight rates to the Erie's business would, on the basis of the present traffic, reduce its passenger earnings about \$3,000,000 a year and increase its freight earnings about \$8,500,000 a year, thereby adding \$5,500,000 to its net earnings. You bet Mr. Underwood knew what he was talking about! He always does.

But he was not expecting, as the *Christian Science Monitor* seemed to think, to get an increase in profits from an increase in passenger business. On the contrary, he said that if one cent

a mile would not cover the cost of the passenger service, "whatever adverse balance there might be should be absorbed in the freight earnings where it would not be felt." The application of Mr. Underwood's plan to the railways of the United States as a whole would, if there were no change whatever in the amount of traffic, increase their net earnings over \$90,000,000 a year, simply because an increase of 20 per cent in their freight rates would increase their freight earnings that much more than the reduction of their passenger rate to one cent a mile would reduce their passenger earnings.

But what of the Christian Science Monitor's statement that transportation now costs more than ever before? It is simply not true. Both passenger fares and sleeping car fares are lower on the whole than ever before. And what of its contention that if passenger rates were reduced there would be such a large increase in passenger business that the profits of the railways from that source would be increased? In the first place, contrary to its assumption, passenger rates are reduced voluntarily for the express purpose of enabling people to "see America first." At the very time its editorial appeared there were special rates in effect between practically all points in the United States for vacation trips, trips to the fairs on the Pacific coast, etc., which averaged only 1¼ cents to 1½ cents a mile. It estimated the cost of a trip from Boston or New York to Chicago at from \$25 to \$45, when, as a matter of fact, the regular fare between New York and Chicago by all except two roads is \$19.10, and there was in effect a round trip summer tourist rate between Chicago and New York of \$28.65.

Now as to the wonderful effect that would be produced by a reduction in fares in increasing traffic: In 1907 many of the states passed two-cent fare laws on the theory that a reduction in the regular rate would increase business. In the seven years before these laws were passed the number of passengers carried by the railways of the United States increased 59 per cent, while in the seven years afterward it increased 21 per cent. A few years ago the Interstate Commerce Commission ordered a reduction of 20 per cent in the rates for upper berths in sleeping cars. It was expected that this would increase the demand for upper berths. As a matter of fact, the proportion of upper berths sold since that time has decreased a fraction of one per cent. The average passenger fare of the Erie railroad, which has a line between New York and Chicago, is 1.56 cents. The average rates by way of the New York Central and the Pennsylvania are substantially higher, excess fares being charged on many of their trains. But in spite of this difference in rates the density of passenger traffic of both the New York Central and the Pennsylvania is very much larger than that of the Erie. The average rate per passenger per mile of the railways of Germany is very much lower than that of the New York, New Haven & Hartford. The population per mile of railway in Germany is much larger than that in the states in which the New York, New Haven & Hartford operates. In spite of these facts, the New York, New Haven & Hartford has developed a greater passenger traffic per mile than the railways of Germany. Again, the average rate per passenger per mile in the United States is two cents; the average rate on the New York, New Haven & Hartford is 17 cents. This is not a very great difference in rates. Nevertheless, the New Haven has a passenger traffic density five and a half times as great as the average in the United States, and it has developed it without any such reduction in its fares as the Christian Science Monitor proposes.

What is the explanation of the foregoing facts? Why have not compulsory reductions in passenger fares and in the rates for upper berths stimulated business? Why does the large majority of the passenger business between New York and Chicago move by way of the railways which charge the highest rates? Why has the New Haven, with a higher rate and a smaller density of population, developed a denser passenger traffic than the railways of Germany? One reason is that service counts for as much and even more in developing passenger business than reductions in rates. Experience has shown that a reduction in the regular rate has no more tendency to increase pas-

senger traffic than it has to increase the amount of travel in upper berths. The things which stimulate passenger traffic on our railways are an increase in the service or a reduction from the regular rate, carrying with it a right to the best service. The second reason for some of the facts given above is a difference in the density of population. The New Haven has five and a half times as dense a passenger traffic as the average railway in this country, not because its average rate is somewhat lower, but chiefly because it operates in a territory with a dense population.

Even if a reduction of passenger fares did cause a great increase in passenger business, it would make it necessary to run many more passenger trains, which in turn would cause an increase in operating expenses that would more than consume the increase in earnings. The New Haven road has as large a passenger business as the Christian Science Monitor predicts other roads would have if fares were reduced and it gets a higher average rate than the Monitor thinks other roads should charge, and yet the chairman of the New Haven, who ought to know, has testified that even on its present rate the cost of operating its passenger trains is so great as to leave no net earnings with which to pay taxes or a return on investment. Such a reduction in passenger fares as Mr. Underwood proposes would make the passenger business of all railways unremunerative. It would bankrupt a road like the New Haven, which derives one-half of its revenue from its passenger business.

Another of its effects, as foreseen by Mr. Underwood, would be to make it necessary to pay a deficit in the passenger business from the earnings of the freight business. This is precisely what is done on those state railways of Europe on which, as Mr. Low has pointed out, passenger rates are made relatively low and freight rates relatively high. No expert who ever studied the figures has any doubt that the German railways suffer losses on their passenger business which are made good from their relatively high freight rates.

Is it fair to make those who directly or indirectly pay freight rates bear not only the cost of freight transportation, but also part of the cost of passenger transportation? We do not believe it is. Is such a policy legal? The Interstate Commerce Commission has indicated that the passenger business even on the present rates is unremunerative, and that advance in these rates are one source from which the railways should increase their net earnings. How, as a practical matter, can the railways hope to reduce their passenger rates and more than offset the effect by increases in their freight rates when the body which controls their rates tells them that they should increase their passenger rates and will not permit them to make any very large general advances in their freight rates? Again, the United States Supreme Court has held in the Norfolk & Western and in other cases that each branch of the service, passenger and freight, should earn enough to pay its own way. In other words, however attractive, theoretically Mr. Underwood's plan may be to some roads, its execution, it would appear, would be both impracticable and unconstitutional; and to railways handling a large passenger business the plan is decidedly unattractive.

From the point of view of the railways it makes no difference so long as their earnings are adequate, whether they receive exactly proportionate amounts of them from the passenger and freight services or a disproportionately small part of them from one branch of the service and a disproportionately large part of them from the other. But it does make a great deal of difference to them and to the public how such questions are discussed, because ignorant and misleading discussions of them, such as appeared in the Christian Science Monitor, have frequently led to ignorant and harmful legislation. One of the great misfortunes of this country is that there are so many people who have had no experience in railway affairs and never devoted a week to the study of them, who nevertheless, doubtless as the result of inspiration, know more about them than all the men who have devoted their lives to railway operation or to the study of transportation problems. This misfortune is much aggravated when gentlemen who have learned so much more by inspiration and

absorption than others have by years of experience and study break into the editorial sanctums of influential papers or into legislative and regulating bodies.

OWNERSHIP OF RAILWAY STOCK

OWNERSHIP of the stock of American railways at the close of the fiscal year ending June 30, 1914, was distributed among 622,284 stockholders with an average holding of only \$13,958 par value, according to a compilation just made by the Bureau of Railway Economics from the returns of the railways to the Interstate Commerce Commission. These figures, as shown in the accompanying table, are based on returns from 837 roads operating 254,387 miles of line, and 450 non-operating roads, making a total of 1,287 companies, with a total outstanding capital stock of \$8,685,764,125. This includes 171 Class I roads having annual operating revenues of \$1,000,000 or over, 271 Class II roads with revenues between \$100,000 and \$1,000,000, and 395 Class III roads with revenues of less than \$100,000.

The compilation thus covers practically all of the railways of the country, excepting only a few for which data were not available, and presents the number of stockholders as shown on the books of the companies and reported to the Interstate Com-

District and Class	Number of roads	Number of stockholders, June 30, 1914	Capital stock outstanding, par value	Average amount of capital stock per stockholder, par value	Miles of single track operated

merce Commission. For some reason, however, the Interstate Commerce Commission has never found these figures sufficiently interesting to publish them in its statistical reports.

For the Class I roads, operating 224,550 miles, the average holding per stockholder was \$13,006, for the Class II roads \$43,932, and for the Class III roads \$15,894, making an average for all operating roads of \$13,628. The average for the non-operating roads was \$16,109. For the roads in the eastern district the average holding per stockholder was \$11,460, for the southern district \$24,425, and for the western district \$14,925. Relatively large holdings per stockholder are shown for Class II roads and for non-operating roads in the western district, due to the fact that many small roads are owned in whole or in part by other railways or by mining or other industrial corporations.

The popular notion that the railways of the United States are owned by Wall Street has been pretty thoroughly exploded in recent years along with many other fallacies that have caused a great deal of trouble in their time. It is not so well understood that the ownership of the American transportation system really constitutes it one of our most democratic institutions. The Bureau of Railway Economics therefore has performed a useful

service in investigating this subject and showing authoritatively how the stock of our railways is held.

Never before was the ownership of American railways so widely distributed. In 1904, 1,182 companies reported 327,785 stockholders. In 1914 this total was exceeded by 20 of the leading railway companies, which had 376,897 stockholders on their books. The same roads in 1904 had 153,610, so that the increase in 10 years was 146.7 per cent. The Pennsylvania Railroad last year had over 90,000 stockholders of which 48 per cent were women. The Atchison, Topeka & Santa Fe was second in the list with 39,825 and five other roads, the New York Central, the New York, New Haven & Hartford and the Union Pacific, the Great Northern and the Southern Pacific, all had over 25,000.

Of the \$8,685,764,125 capital stock outstanding \$3,019,020,981, or 34.78 per cent received no dividend during the year, according to Interstate Commerce Commission reports. The dividends paid averaged 5.2 on all of the stock outstanding so that the average stockholder received an income of \$625.81 on his investment. Even this rate of dividend was not earned from the operations of the year and the total amount of dividends paid—\$451,262,197—includes \$196,931,595 of dividends declared out of surplus, a very large percentage of which represents duplication in the form of dividends paid out of the treasury of the company into that of another and used to make up the dividend paid by the latter to the public. The total for the year was also swelled considerably by the extra dividend of \$74,020,372 declared by the Union Pacific in distributing its holdings of Southern Pacific stock, which reduced the regular dividend on the Union Pacific from 10 to 8 per cent.

The bureau's compilation takes no account of the ownership of railway bonds, as there are no data from which this can be shown. The total funded indebtedness of the railways in 1914 was \$11,566,541,553, and although there is no record of the distribution of these securities we do know that at least indirectly it is much wider than that of railway stocks. Railway bonds are largely held by banks, insurance companies and educational and benevolent institutions and thus form the basis of the security and earning power of the savings and small investments of a very large proportion of the public. It has been estimated that the insurance companies alone, with over 34,000,000 life insurance policies, have over \$1,500,000,000 invested in railroad securities, while the savings banks, with nearly 11,000,000 depositors, in 1913, held \$821,552,244. State banks held \$65,501,389 and loan and trust companies \$297,234,766, so that there are at least 45,000,000 savings and insurance investments largely dependent on railroad securities.

NEW BOOKS

Poor's Manual of Public Utilities, 1915. Published by Poor's Manual Company, 80 Lafayette street, New York. 2,280 pages. Price \$7.50.

This is the third annual number of this standard manual of public utilities. It is the most comprehensive manual covering this class of companies that is published, and the fact that it is compiled under the direction of Poor's Manual Company guarantees a high standard of accuracy and authority. In many states public utility corporations are required to make reports to state commissions, but in the majority of instances the statistics which these state commissions compile are confusing rather than illuminating and are generally published so long after the expiration of the fiscal year as to be of comparatively small value. The investor, therefore, is largely dependent on information in the manuals. The inter-relation of public utility companies under the present trend of their development is particularly complicated. Poor's Manual of Industrials shows subsidiary, controlled and affiliated companies in conjunction with the parent company, and in most cases a lucid statement is given of the relation of one company to another. Poor's manuals consist of the Manual of Railroads, issued in January; of the Manual of Public Utilities, just issued, and the Manual of Industrials, which will be issued in a few weeks.

The Essential Qualities of Good Steel Rails*

A Discussion of the Defects in the Present Sections and in the Methods of Manufacture, with Remedies

BY GUSTAVE LINDENTHAL
Consulting Engineer, New York

In the beginning of the steel rail industry, 40 or 50 years ago, the details of fabrication were left almost wholly to the manufacturer, who could then claim with some reason to know more about the matter than the consumer. The time has arrived when the rail consumers themselves must now take the lead in determining certain details of manufacture, which will insure thoroughly sound steel, but they must also expect to pay, at least for a time, a higher price for better steel and for better rails.

Towards that first requisite of sound ingots should be directed all efforts at any reasonable cost. Not one of the present specifications for steel rails insures through its provisions thoroughly sound ingots. The external defects of flaws and seams, etc., are more readily discovered by inspection and tests than the insidious internal defects, caused by unsound metal which are in fact discovered only by chance, notwithstanding the closest inspection. The only way to prevent internal defects is to insist on methods of manufacture that will absolutely avoid them. It would not be unjust, that the rail manufacturers should share with the railroads responsibility and damages for such accidents as can be traced to defective rails. Now the railroads alone are responsible.

Modifications of methods must be metallurgically sound and reasonable in cost. Unbalanced rail sections, meaning those with thick heads and thin webs and flanges, should be given up. For these the railroads alone are responsible. Really good and tough rails cannot be made that way. Neither can good rails be made by rolling them in the fewest number of passes and finishing at a high heat. But this is the only way the present form of heavy rails with thin flanges which get cold in the rolling while the thick heads are still waxy, can be finished without breaking the rolls.

It is known that ordinarily the manufacturing difficulties are not in the melting furnace, but that the defects of fabrication as regards soundness of steel occur mostly after the metal is teemed into the ingot molds. Thereafter the defects in steel arise mainly from five causes: blow-holes, piping, segregation, enclosure of slag, oxides, and other foreign matter, and a coarse crystalline structure. The first four causes occur in the ingots, the fifth in the rolling.

It is generally recognized that small blow-holes are not harmful and are readily welded up in rolling and that larger blow-holes can be avoided by the addition of aluminum, put in the form of small shot into the bottom of the ladle before filling it. Ferro-titanium and ferro-silicon are used for the same purpose. All oxides, sulphides and other chemical impurities, also any particles of furnace lining that may be in the fluid steel, will, if given sufficient time, float up into the slag on top. This self-cleansing process, by holding the metal in the ladle before teeming, is held to be very important, and an interval of at least ten minutes, depending upon local conditions, should be allowed for that purpose.

In the present practice the metal is teemed as a rule from the ladle into the ingot forms as quickly as it can be conveyed after the addition of the ferro-manganese, and there is not allowed sufficient time for the cleansing of the steel bath from impurities before teeming. Thirty to forty minutes are consumed before the steel is all run out of the ladle into the ingot molds, but during that time the currents set up in the steel interfere

with and prevent the rising of the impurities into the slag, therefore the importance of keeping the metal still *before* pouring.

Metallurgists agree that the addition of aluminum reduces blow-holes, but increases piping; and piping facilitates segregation. In all rail specifications piping and segregation are treated as unavoidable evils imposed, as it were, by an inscrutable providence upon steel making. The only provision in rail specifications against their mischievous effect upon the soundness of steel is a requirement for discard from the upper part of the ingot.

As the extent of pipe varies with every ingot and may reach all the way from 15 to 80 per cent down into it, the amount of discard would need in fact to be determined for each individual ingot. That is not practicable in the press of the mill operations, and cannot be very well followed up by the inspectors. The amount of discard is therefore assumed at some convenient percentage, but practically is left to the working force of the manufacturer. If the extent of pipe and discard could be readily ascertained for each ingot, it would be an easy matter to compensate the railmaker for the remelting. But this not being practicable, the matter is really left to chance, and all precautions of the railmaker for sound steel and all the precautions of the rail buyer come to naught by this "hit or miss method" to which must be ascribed the largest share of blame for unsound steel rails. Even a discard of 30 per cent is proven by experience to be no real protection.

As pointed out many times by metallurgists, the fundamental requisite for obtaining solid ingots is the maintenance of a fluid top and sinkhead for filling up automatically and quickly any cavities formed in the ingot by shrinkage during cooling. Stated more correctly, cavities must not be allowed to form at all because immediately upon the formation of a cavity segregation takes place, which cannot be cured thereafter by filling the frozen cavity with fluid metal.

In all discussions on this subject, it is admitted that if the ingot were cast with the big end up, and the top of the steel kept fluid so that it shall be the last to solidify, no deep pipe would form and no segregation would occur in the interior of the ingot. There are a number of well-known methods to this end. Some of them are complicated and patented; others are simple and not patented. All of them, however, cause extra cost and labor, and will therefore not be used unless made specifically a part of the contract and paid for.

In the present practice, pipe and segregation, being at the smaller end of the ingot, pass into the rolls first, are closed up and squeezed into the metal and lengthened in the rolling to an unknown extent, forming interior seams and defects which cannot be discovered by inspection. This inferior method of rolling should be prohibited by the specifications. Cropping may or may not remove pipes. It is a mere chance and pretense. Only successive croppings and a microscopic examination of the cropped ends will lead to the discovery of the interior defects, and that it is impossible with the thousands of rails rolled in a mill in a day.

Sound ingots, free from blow-holes, pipes, segregation and internal impurities are, however, only the preliminaries for the rolling of good rails. Wearing quality, great resistance to abrasion, great strength and toughness to resist the violent reversional stresses are necessary, and those qualities depend

*Presented before the New York Railroad Club, May 21, 1915.

not only upon the chemical composition of steel but most importantly also upon the fineness of grain, which is developed in the process of rolling.

In practice the number of passes are made as few as possible so as to have for the rolling train the largest possible output in a given time. That does not put the kind of work upon the plastic steel that will break up the coarse crystals, which form during the higher heat in the ingots and blooms. There is also considerable doubt as to whether the so-called continuous process, that is, forming the rail in one continuous operation from the blast furnace or mixer to the finishing pass does not produce a sleazy metal unsuited to the formation of fine grained texture.

All existing specifications permit the rails to be finished at too high a heat which is evidenced by the high shrinkage allowance at the saws ($5\frac{1}{2}$ to $7\frac{3}{8}$ in. prescribed for 33-ft. rail when it should be about 4 in.). This contributes to but is not the sole cause of coarse crystalline structures in the thick part of the rail, that is, the head, just where a fine grain is most wanted to resist abrasion and peening from the heavy driving wheels.

For the high finishing heat the rail-makers have a good excuse in the thin webs and flanges of the heavy rail sections. The flanges would otherwise cool down too quickly and get dark in the rolling, while the head is still at a bright heat. It has been recognized, therefore, that reform must commence with the rail section. Web and flanges should be thicker, and the head if possible thinner, so that the metal may keep a more even heat during rolling and cool more uniformly after rolling, avoiding large internal stresses. In a well-balanced rail section it is easier to break up the coarse crystals of the higher heat, permitting the finer crystalline structure to be produced by the work of rolling at the lower heat, and finish the rail near the point of recalescence (675 deg. C.).

In respect to blooming, roughing and finishing and the number of passes the practice in rail mills is not uniform. The number of passes from the ingot to the finished rail without reheating varies in different mills from 15 to 30, and the time from the ingot to the finished rail from 3 to 6 minutes. More time should be given to the last five or six passes of the rail through the rolls. It is not indifferent, whether the rail passes through the rolls at 10 ft. per second as now, or at a much slower speed. At the higher speed the pressure from the rolls may be sufficient to penetrate through thin metal, as in the web or the base of the rail, but it does not seem to be sufficient for penetration through the $2\frac{1}{2}$ in. of metal in the head. It will produce in the head a fine grain, only near the surface if at all, leaving the interior of the head coarse grained and weak. The fact that thick rolled metal is weaker than thin metal is long established, and allowance is made for it in all specifications for structural material and boiler plates, but no specific allowance has yet been made for it in rail specifications.

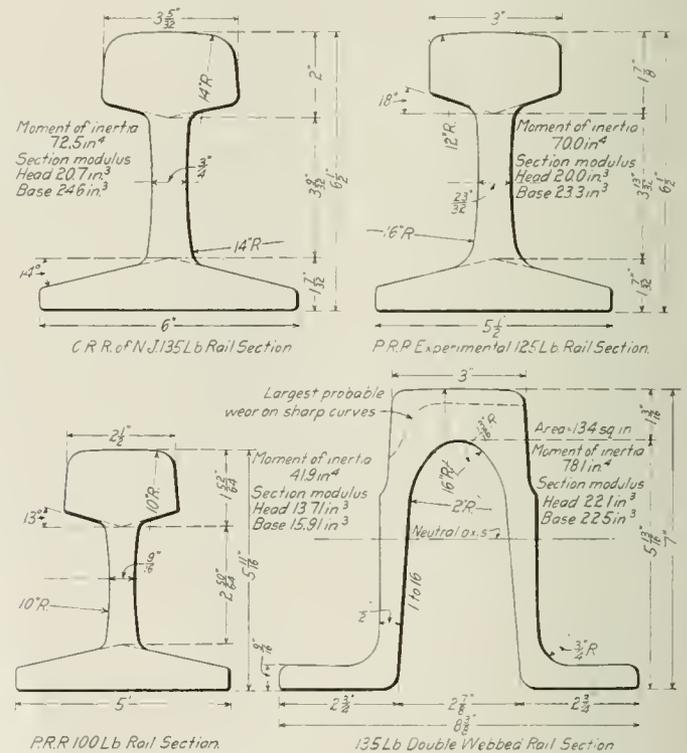

For the rolling of heavy rail sections the speed of the last five or six passes should be very much less than the speed permitted by present practice, which is about 600 ft. per minute. It should not exceed 4 ft. per second to commence with as an experiment. It is plain, that the cost will be greater, because the tonnage run per rolling train will be less. The railmakers will therefore not volunteer to change their practice. The merits of this method of rolling rails is disputed by some mill men for lack of sufficient experiments, but at least the great need of such experiments needs to be emphasized.

For the further control of quality of steel the minimum number of grains or pearlite cells per square inch of rail section should be guiding. It is fully as important as any tensional or bending test or as the drop test. The aim should be a minimum of 70,000 pearlite cells per square inch, nearly uniform over the whole section. It is objected that the measuring of cells in high carbon steels is not an easy matter, because of their undefined condition, but I am informed that steels finished at the proper heat, like tool steels, do not present that difficulty. Fine grain is the best evidence of properly worked steel, whether high carbon or alloy steel. Fineness of grain (70,000 per sq. in.) is

sometimes attained in present practice, in the smaller rail sections, say under 70 lb., but rather by accident than by design. As a rule the grain is finer in the base and web than in the head, for the reasons already stated.

The drop test, as ordinarily prescribed in rail specifications, is crude and not sufficient for judging the quality of the steel. Additional acceptance tests are necessary. From a practical point of view the inspection of rails should particularly concern itself with the following features:

1. At the furnace and ladle, seeing that the proper method and time (minimum 10 min.) is given for the self-cleansing of the steel.
 2. At the ingots, that the larger end be up and provided with a sinkhead.
 3. At the reheating furnace, that ingots are not exposed to an oxidizing flame and come out thoroughly heated at a uniform temperature.
 4. At the rolling train, seeing that the finishing temperature shall be below 700 deg. C., indicated by a dark red cherry color.
- The stiffness of a rail, that is, its capacity to distribute the

Comparison of Proposed Double Web Section with Other Recent Sections

wheel load upon the ties, is measured by the moment of inertia of its section, and the strength of a rail is measured by its section modulus. Each increases faster in proportion than the weight of the rail, so that a 100-lb. rail, although only 25 per cent heavier than an 80-lb. rail, is about 65 per cent stiffer and 50 per cent stronger in bending strength for the same steel. But this is not enough for the 125 per cent increase of wheel loads and for the increased speeds.

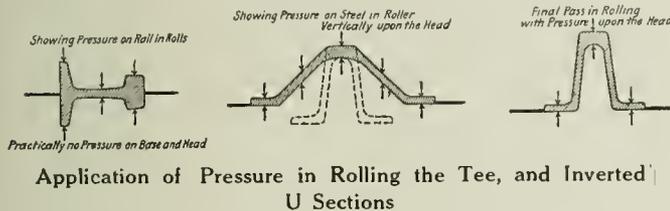

The 70- to 80-lb. rail (with section modulus 10) was found to be strong enough for a wheel load of 15,000 lb. 20 years ago. For the 100-lb. rail (with a section modulus of 15) the wheel loads should be limited to 22,500 lb. Then it would be relatively as strong (on the same tie spacing) as the 80-lb. rail for the 15,000-lb. wheel load, provided the steel were of equally good quality. But as the steel in the 100-lb. section is not of equal quality, the wheel load should not exceed 20,000 lb. For the wheel loads of 30,000 to 34,000 lb. of fast passenger engines now in use on the Pennsylvania and other trunk lines, the rail on the same tie spacing should have a section modulus of 20 to 22, which

would correspond to the 135-lb. rail now in use on the Central Railroad of New Jersey. But even with such heavier rail, the relative safety of the track would not be greater than that on the best European railroads with their lighter wheel loads. That 135-lb. rail is the heaviest in the United States. It is not a good-proportioned section.

The new 125-lb. section, now experimentally used on the Pennsylvania Railroad, has the same strength and stiffness as the 135-lb. section of the Jersey Central. The saving of 10 lb. per yard is the result of a better distribution of metal. The head is lighter, the base narrower and the metal more evenly distributed, insuring better rolling properties.

The carbon is 0.85 desired, against 0.70 desired in the 100-lb. rail with phosphorus below 0.04 in both rails, open hearth steel. The aim is to get for the heavier section a harder rail with longer wearing capacity sustaining a greater wheel tonnage. On some curves the 100-lb. rail does not last more than three months while the 125-lb. harder rail will from present indications, probably have a life of 9 to 12 months. We may conclude that on tangents the life of the harder rail will last probably under the exceptionally heavy wheel tonnage of that road, 10 years against 7 years for the 100-lb. rail. The greater stiffness of rail, indicated by its larger moment of inertia (70 against 42 in the 100-lb. rail) is expected to notably decrease expenses for surfacing and track repairs. About 15,000 tons of these experimental sections have been ordered and laid in the track.

Let us go a step further towards obtaining a fine grained durable rail of heavy section. There are reasons for doubt

whether any amount of care in the rolling of heavier Tee rails will produce in the head where it is most desired, a fine grain, toughness and high elastic limit uniformly throughout. The complaint is general as already stated, that the heavier Tee rail sections do not give as good wear and do not sustain the same wheel tonnage as the lighter rails. The greater strength of the heavier rail is necessary to better distribute the heavier wheel loads upon the ties, but its durability has been found to be less because apparently the resistance to abrasion of the coarse-grained metal is less.

Heavy rail sections are therefore rather wasteful unless the same fine grain is obtained in them as in the light John Brown rail; and, most important of all, in the head. The limit in the Tee rail for a fine-grained head seems to be the 70-lb. section.

Experienced rollers contend that the form of the Tee rail precludes good results on the large head of the heavier sections. It cannot get sufficient work. The rolling pressure upon the rail is sidewise, at right angles to the axis of the section and to the direction of the wheel pressure, whereas the heaviest pressure during rolling should be at right angles to the top to produce a fine grain in the thick head. The metal in the head is compressed in the most unfavorable direction, that is, crosswise to the strains it will have to bear. There is much difficulty in filling out in rolling the head and base of the rail. The metal has to be coaxed, as it were, into the grooves for the head and base, the web receiving the most work and the head and base the least. As one of the most experienced rail makers remarked to me, if as much work could be put upon the head as now on the side of the web in the rolling there would be very few complaints about rails.

All this leads me to think that a modified and enlarged form of the old inverted U shape or double-webbed section will answer better the purpose of a heavy rail than the Vignol or Tee shape. That section low in height of wrought iron was

used many years ago but could not be properly spliced, so it was abandoned for the Vignol type. In the double-webbed rail the steel receives pressure from the first pass to the last vertically upon the head, producing the desired dense fine grain throughout its thickness. The metal can be first rolled out flat, then bent back to a form as shown in the sketch, and in the last few passes the rail receives its final form. The very method of its rolling should insure the denseness and toughness of the steel.

On the point of economy of track we must consider that unless the heavier rails carry more wheel tonnage than the lighter rails the track expenses will be largely increased. It is important from an economic point of view to increase the wearing quality of the heavier rails. This can only be so if the steel is of finer grain and better quality than that heretofore obtained. I have no statistics on hand of the wearing quality of rails, but an average on tangents and curves of 100,000,000 tons is probably considered a good record for 100-lb. rails. A wheel tonnage of 375,000,000 is reported for exceptionally good 100-lb. rails, lasting 12 years with prevailing passenger traffic on the New York Central. It would seem reasonable to expect a wheel tonnage of 500,000,000 for the double-webbed rail, with the finer grain and greater resistance to abrasion, which surely can be obtained. There are tracks on the Pennsylvania on which the daily wheel tonnage from prevailing heavy freight is 300,000 or 150,000 per rail. The double-webbed rail should last there about ten years on tangents.

An experiment with a few miles of track laid with the double-webbed rail will show results in a year. There is no difficulty in making a splice as strong as for the Tee rail. For switches and frogs, etc., it need not be used. The Tee rail can readily be connected to the double-webbed rail by a special rail joint.

DISCUSSION BY DR. P. H. DUDLEY

I have been able in the last decade to replace Bessemer metal of 0.10 phosphorus and 0.50 carbon, with open hearth steel in which the failures are reduced to less than 1/15 of what they were in the same sections of Bessemer metal. The service tests show that progress is being made, at least in my own practice.

The rail can be loaded only through the wheel load contacts of the passing equipment, therefore, under each wheel specific deflections are produced in the rails in the equilibrium depression. The stremmatograph record of the strains shows that the wheel spacing governs the span of the bending rails instead of that of the flexible crosstie supports. This must be considered in any final mathematical analysis, for it has been established by physical measurements of precision.

The relations of the stresses to the supports constitute the engineering difference between the work of the metal of the rail and of a bridge girder, for the former is a constant section for the length occupied and supported by construction, while the latter is suspended for its full length between the pier supports, and the complexity and massiveness of the structure must increase with the length of the span.

There is, as would be expected, in the different types of locomotives a marked difference in the amount of unit fiber stresses produced per pound of static construction due to the number of wheels and the spacing of the driving and running wheels to subdivide and distribute the total load and the expended tractive effort. The stremmatograph tests prove that the law of mechanics for single deflections in simple beams applies to each and all of the specific deflections in the rail under each wheel contact on their flexible crosstie supports in the momentary equilibrium depression, though with more constraint than for the simple beam.

The unit strains in the rail increase under wheels as the wheel spacing is augmented, and the load on the trailing wheels is reduced to two-thirds or less of that upon the drivers owing to the double spacing between the driver and tender wheels. Even this loading usually produces the maximum strain for the wheels of the locomotive. In designing locomotives for light rails superintendents of motive power space the drivers close together and use smaller drivers close spaced for freight locomotives to reduce the strains in the rail. They do not concentrate great

loads on one or two driving wheels, but use moderate axle loads on three, four or even five pairs of drivers for the modern types of efficient locomotives. The practical effect of the subdivided load is, that as the truck wheels produce the transitory depression of the rail from the trackman's surface to its position in the equilibrium depression for the drivers, we obtain under them the partial results of the constrained beam by the efficient manner of loading the rail by the front four wheel truck, and followed by the trailer and tender wheels.

The New York Central distributed the weight and metal in the sections for girders of greater stiffness than the general practice, believing that it was essential for the highest standard of track that sections should have sufficient stiffness with moderate unit stresses to distribute one-fourth to one-third or more of the wheel effects to the wheel spacing, and relieve each cross-tie of the concentrated major portion of the wheel load as occurred upon the early steel rails, which not only cut under the rail seats but disturbed the ballast and road bed and required constant attention by the trackmen to maintain the tracks in fair operating condition. The New York Central has had an experience of more than two decades with the broad 6 in. 100-lb. rails, and has found them highly advantageous. In the design of its rails the Pennsylvania adhered to the narrow top and deep head, thin web and thin base recommended by the committee of the American Society of Civil Engineers in 1873. These represent the two distinctive types of rail sections.

I designed the stiffer sections to reduce the deflections in the track, but before rolling them I advised the railroad companies that it would be necessary to improve the physical properties of the steel for, as the deflections being less, the length of the area of contact on the wheel would be shortened, and we should broaden the head of the rail in relation to the wheel tread to retain the same relative area of contact. The observations of this favorable wear for nearly two decades demonstrated that it was possible to secure wear and a large bearing area over the entire head of the rail of the 6 in. 100-lb. section.

The safety from rail breakages today is in the combination of the ductility of the metal with the proper section for rolling. The basic open hearth rails for the New York Central Lines with a chemical composition from 0.62 to 0.75 carbon for 100 and 105-lb. rails are made under their elongation and exhausted ductility tests, by which nearly the full value of the ductility due to the chemical composition is obtained. The same section in Bessemer metal of 0.10 phosphorus and about 0.50 carbon and laid in the same place, does not have as great a duration strain factor as in the open hearth steel. The breakages of the Bessemer rails are about 22 times as great as occur in the basic open hearth rails of the same section and locality. Bessemer metal shows nearly as great tensile strength under a static test as open hearth, but for a rapidly applied stress, its duration strain factor is much less, particularly in cold weather.

The subject of the manufacture of rail is far more comprehensive than a discussion which only refers to sound ingots and rolling rails with less than the usual shrinkage allowance. It is not altogether the fine structure in the John Brown rails which gave them such decided resistance to the wheel abrasion as would be understood by the author's paper, but the fact that the mechanical properties of the sections as girders were so small that the metal had but little to do to carry the moving wheel loads. There was another factor in producing the excellent wearing quality of the metal in the John Brown, Barrow, Cammell, and the early American Bessemer rails. The ingots were all teemed in pits in front of the converters which limited the production per 24 hrs. The vessels were often waiting for the pit work and after the vessel was turned down and the metal recarburized it lay in the belly of the vessel for 5 or 6 min. before it was poured into the ladle for teeming ingots. This allowed the oxides and slag to escape from the bath and produced a better quality of steel with less slag inclusions than occurred after the pit teeming was replaced by ingots upon cars.

The question today with several railroads is not wholly in reference to the required composition and sound ingots, but it embraces the broader question of good steel in the furnace from the chemical composition which will produce the essential physical properties of strength, toughness and requisite ductility when in the finished rails as girders. The elongation and exhausted ductility tests of the New York Central Lines for basic open hearth steel show how perfectly the steel from the furnaces has been made, then it must be teemed in ingot molds with the proper relations of length in the mold to its base area, so the interior shrinkage tendency of the setting metal can be practically obviated by charging the ingots as soon as stripped into the reheating furnaces and blooming them from their equalized initial heat. The shrinkage of the hot to the cold metal has not taken place and sound ingots have been produced by the prevention of the interior or minor shrinkage occurring in the ingots by unnecessary reductions of the temperatures of the hot ingot metal before they are bloomed.

Mr. Lindenthal mentions rolling rails until the temperatures are as low as 700 deg. C. This would be lower than heavy sections have ever been rolled, and we know now from the past 4 or 5 years experience in rolling basic open hearth rails with shrinkage from $5\frac{1}{2}$ to $6\frac{3}{4}$ in., and carbon 0.62 to 0.75, that such rails may be cooled so rapidly or rolled so cold when the atmospheric temperatures are near zero and up to 45 deg. above, that some of the transformations from the hot molten metal to the finished product may be delayed in the center of the head and leave a central core of metal of less ductility than the exterior portions. Such rails laid in the tracks have developed interior transverse fissures causing a great many breakages of rails. The temperatures in rolling and cooling upon the hotbeds must be controlled, so that the transformations from the hot set metal to the finished rail are not delayed, to produce metal in the central core of less ductility than its surrounding envelope. To roll the sections of rails of 100 lb. or more to a shrinkage of 4 in. with the temperature down to 700 deg. C. would create greater possibility of delayed transformations in the center of the heads than even occurs at the present time. It is proper to state that the delayed transformations are less in the rails from reheated blooms than in those which are rolled direct from the ingot with their own equalized initial heat. Interior transverse fissures have developed in rails rolled from the reheated blooms, and railroad people are extremely cautious about changing methods of manufacture until they know what the effect of each step in the process will be in the finished manufactured rails.

The half moon and square breaks and the more recent interior transverse fissures in the basic open hearth steel rails which occur, are due to a combination of contributory causes which shows that the study of the entire manufacture of the rails must be considered to insure safety. Sound ingots, with too cold rolling, will not insure sound physical rails with an ample duration strain factor which will not fail in the track.

The present methods of straightening the heavy sections should be replaced by a method which distributes the compression of either the head or base, or lengthening either one uniformly per inch of rail, for the effect of the gags has been the cause of a majority of the broken rails in the track, and particularly the detailed fractures due to the half moon breaks from the base, and final fracture of the section.

The manufactured, finished rail is the product which must be considered, and not alone what might be produced from considering only sound ingots. It does not necessarily follow that sound rails will be made from sound ingots, but the first important step is to make good steel and then give attention to every step subsequent in the manufacture of the rail. There will be a revision of the construction of the mills for the highest quality of the manufactured rail of basic open hearth steel in every essential process or step of its fabrication. To do this it will involve co-operation and investigation by both consumer and manufacturer. Their interests are not antagonistic, but mutual.

EFFECT OF WATER LEVEL ON SUPERHEAT

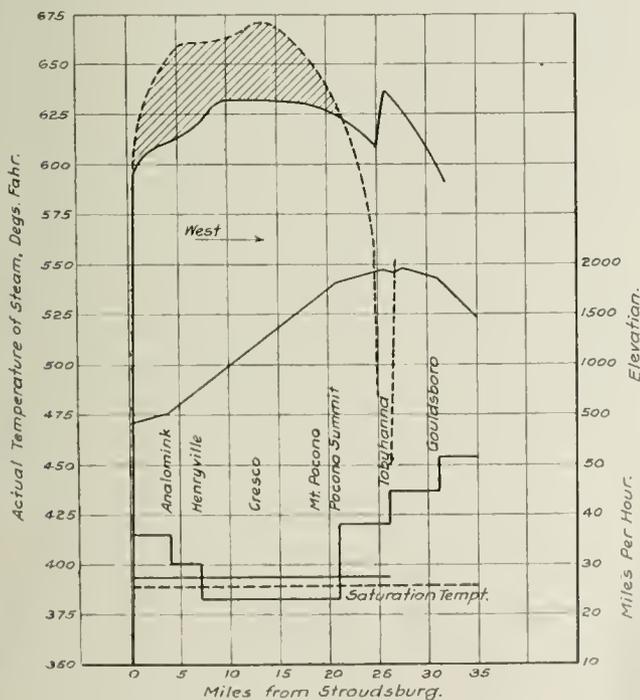

By M. C. M. HATCH

Superintendent Fuel Service, Delaware, Lackawanna & Western

Any one familiar with locomotive operation is acquainted with the deleterious effects of priming, or working water through the engine cylinders. It washes the lubricated surfaces, is destructive in its action on rod and valve stem packing, causes broken packing rings, cylinder heads, etc. With an engine using saturated steam, these ill effects are very apparent. Even when the priming is not sufficient to cause trouble in any of the above-mentioned ways, the presence of 3 or 4 per cent of moisture in the steam seriously affects cylinder efficiency and is, therefore, most undesirable.

The use of high degree superheat practically eliminates the possibility of priming in the cylinders. If too much water is carried, however, the percentage of moisture worked over into the superheater will be high and, while this will be evaporated before reaching the steam chest, the temperature of the steam as delivered by the superheater will be correspondingly reduced. In other words, the use of the superheater units as tubes of an auxiliary water tube boiler is an inefficient proceeding, resulting in lower cylinder economy, inasmuch as the economies resulting from the use of superheat depend directly upon the final temperature of the steam as delivered to the cylinders.

With this in mind, tests were run on the Lackawanna some

The Effect of a High Water Level on Superheat

time since to determine, if possible, just what the effect of high water is on superheat, and the chart shown was made up from these tests. The locomotive under observation was a heavy anthracite-burning Pacific type, hauling the westbound Lackawanna Limited, between Hoboken and Scranton, a train weighing about 450 tons, and operating on an exacting schedule. The curve shows only the results obtained while climbing the eastern slope of the Pocono mountains, as it is here that the engine is working hardest and the differences in superheat are most apparent. All conditions, with the exception of the water level, were kept as nearly constant as possible, and the results are believed to be consistent. The solid line is plotted from observations taken when three full gages of water were carried continuously, while the dotted curve was taken with 1½ gages, or about one-half a glass, in the boiler. The material increase in superheat under the latter method is very striking and amounts

to about 12 per cent, demonstrating beyond question that the practice of running a superheater locomotive with the water high in the boiler, is detrimental in its effect on the degree of superheat, and hence on the economy of the engine.

This curve has been used for some time in connection with instruction work on the Lackawanna, has created considerable comment and interest among the enginemen, and it is believed that substantial improvement has been effected by its use.

THAT TERMINAL PROPOSITION

By R. M. BAKER

Pennsylvania Railroad, Bellwood, Pa.

In order that we may approach this question in an entirely frank manner with nothing "up our sleeve," so to speak, suppose we first clean out our desk. How about that box of good cigars with the card tucked away in the corner? We cannot afford to buy that kind ourselves, but a box drops in every once in awhile, usually about Christmas time, and of course a fellow does not like to turn them down. At least that is the way we looked at it when it came, but since then, however, it seems to present a somewhat different aspect and the card in the corner looks bigger than it did. That box cost him about \$4.50; I am no relation, and I never gave them a box of cigars in my life. By accepting it I certainly placed myself under a definite obligation the discharge of which must sooner or later embarrass me. Now I want to look after my company's interests to the best of my ability and have no desire to be hampered by such unnecessary obligations. Lots of good men bigger than I am have fallen down over just such a cigar box. Having gotten rid of it, I am in position to say to my subordinates, "You must not accept gratuities of any kind from either shippers or consignee," and I have taken the first and most important step toward the successful operation of a terminal yard.

The terminal official recognizes three distinct duties: to the public, satisfactory service; to his company, efficient and economic operation; to the employees under him, justice. In pleasing the public there is only one answer to "How can all complaints be eliminated?" and that is, "It can't be done." A definite system of shifting local sidings which will provide for some regularity in the time at which such shifts may be expected and an honest effort to adhere to such a system will avoid many complaints. Shippers will in time arrange their work to conform to and respect such a schedule, and while exceptions may be necessary they should be exceptional and not regular.

In shifting industries the thing of first importance is not speed, but safety. This embraces not only care that workmen in or about the cars are not injured, but that proper care is exercised that the lading of cars partly loaded or unloaded is not damaged. Next in importance is courtesy to patrons, from yourself first, but also clear down to the extra brakeman. Never in the presence of one of your men, or at any other time for that matter, make a slighting remark about a patron or his peculiarities. Also, never tell a patron, even on the telephone, that you have other things to do beside shift his one-horse operation, because if you do it will make him mad and he may go straight to the superintendent, and then you will have to do what he wanted done and catch "thunder" beside. Make him feel that your railroad thinks a lot of him (it does if you don't) and is doing their best to please him; for, after all, the patrons are paying your salary, not the stockholders. Of course the courtesy may have to be all on your side, but if it is, it brings the best results and naturally is in the greatest demand. Make a friend of your patron. He is trying to run a business just as you are, and what benefits him in turn benefits you. Give him the best information you can when he asks for it. Were we ever asked this question, "Will I get any cars this afternoon?" How often did we answer, "I don't know," when we did know or could have found out with little effort. "Oh, well," we say, "I got into trouble once for telling a shipper that he would get cars and then

could not give him any, and since then I tell them all, "I don't know." That is not the way to look at it, is it? That shipper needs the information or he would not have asked for it and if you positively do not know and cannot find out at the time, make a memorandum of it and give him the information as soon as it can be gotten, even if the answer is, "No, sir." "No" is a better answer than "Don't know." I have often wondered how much business is influenced one way or another at a competitive point by the personality of the terminal people and their attitude toward the shipper and consignee.

In order to satisfy yourself that this practice of courtesy to patrons is being carried out by those under you, drop around when one of the crews is shifting a plant track and without being seen, observe how the work is being done. Maybe you will only need to listen to learn why complaints from that particular shipper are so frequent; perhaps he has not come across with the cigar box and there is a little uncivil war on between him and the shifting crew. Such things have happened.

When complaints do come give them the consideration they deserve, for the chances are there is some justice in them. For example, a shipper in open cars made this complaint: "I do not object to removing from a car an ordinary fall of snow, but I certainly do object to unloading almost a car load which has been shoveled in." By prompt action six other cars almost full of snow were found in the yard and possibly six similar complaints avoided.

Another way in which the interests of both the shipper and the company may be equally served is in encouraging him to be specific in his requests for cars and then endeavor to fill his order just as nearly as possible, and not with the first car the crew gets a hold of. Do not let them place an old leaky car for flour, and at the same time a new car for brick, because it is more convenient. The brick people will not object, but the claim department may have a flour claim to pay in a month or two. Again they asked for a 60,000 capacity and received a 50,000 or an 80,000 capacity car. Three railroad companies suffered when we placed that Great Northern for a shipment to Tampa, Fla., instead of getting the Atlantic Coast Line car back of it. The l. c. l. transfer is a great place to get cars started out of route. Of course it is inconvenient to change cars at a point of this kind, but a little anticipation may sometimes avoid some penalty per diem and foresight is what we are paid for. Sometimes a large car received under load is allowed to be reloaded with a smaller shipment to avoid a shift and the car started possibly on a long journey three-fourths full—false economy.

Nothing pays bigger interest on the money invested than a light claw bar suitable for removing protruding nails from the floor and sides of box cars before placing for loading. Actual counts of bent-over nails have shown an average of from 65 to 75 per car, and we heard of one car which had a total of 363 bent nails on its four door posts alone. These figures are not recent, but the subject is a live one and will continue to be so, for on every nail hangs the possibility of a damage claim.

From satisfactory service, his duty to the public, we come to the yardmaster's duty to his company, namely, efficient and economic operation of his yard. Why don't we tell the other fellow to run the job for a day or two and go out and see how orders similar to those we have been giving work out on the ground, and whether we are railroading on paper or not. Maybe we can find out at the same time which crews have too many brakemen and which have not enough. Drop out of sight and see whether the brakemen and enginemen are saving brake shoes and themselves by stopping against the bumping blocks.

Consider a draft collision, a run-through switch, a car dropped off the end of a track or a similar accident as a distinct reflection upon your management. Make it a rule thoroughly understood by all that a brakeman must carefully test his brake before a car is cut loose and he must remain on it until it stops. In one yard with a splendid record for careful handling of cars under adverse grade conditions trainmen themselves state that their good record is due in no little part to a vigorous enforcement of this rule

regarding the testing of brakes. See that a trainman occupies a conspicuous place on the front end of the draft, according to rule, when it is being pushed by an engine and that he knows what he is there for.

Call your conductor's attention to careless methods of doing work, although accidents do not result and insist upon the conductors doing the same with members of their crews, recommending for discipline any who refuse to profit by such warning. The man should be punished, not for the accident, but for the carelessness or violation of rule from which the accident results.

Encourage suggestions from your conductors as to methods of doing work. No one person ever knew it all. The ideal organization is the one in which there is an equal division or responsibility as well as work and an equal division of interest is the natural result.

This brings us to the yardmaster's third duty: justice to the employees under him even when justice means discipline. Railway employees in train service are practically all in the ranks of organized labor and have working agreements with their companies which must be respected and strictly adhered to whether they seem right in principle or not. Nothing is gained by attempting to evade what seems to us unjust. However, study those rules until you know just what they mean and how they apply to conditions in your own jurisdiction. Not every claim made by an employee under these rules is a just one, and if you are to adjudge it you must be quick to recognize a frameup from a legitimate complaint. If you are in the wrong be quick to rectify it. Nothing can be gained by arguing the point. However, if you believe yourself right stay with it until your judgment is either confirmed or over-ruled by someone higher up. Men usually know whether they are in the right or not, or else are willing to be shown. They are also quick to learn whether you know what you are talking about and always respect the man who cannot be hoodwinked. If the man is "from Missouri," show him, don't bluff him. Strictly adhered to, many of the rules become an aid rather than a hindrance to your work. Be friendly toward all but do not make companions or intimate associates of those under you, for, whether you wish it or not, your intimacy will look like favoritism to others, and favoritism breeds trouble.

Railroading is a science, yes several sciences combined. We should have room on our desk for at least one good railway magazine. It will broaden our horizon and give us a better insight into this, the greatest business in the world and the one upon which so much other business depends.

Higher officers should give communications from their yardmasters the prompt and careful attention which the importance of their work deserves. Do not issue instructions relative to yard work without first consulting the yardmasters affected thereby. Be careful that investigation papers which contain criticisms of the yardmaster's work are not referred to trainmen, as nothing will give the ordinary trainman more pleasure than to peruse such papers. Do not allow men under a yardmaster's jurisdiction to run to your office with matters of minor importance which have not been first taken up with him, and do not then decide such matters without taking the yardmaster into consultation. Remember that there is no carpet in the yardmaster's office to awe the trainman and his attitude toward the yardmaster is much more belligerent than toward you. If your yardmaster is to be successful he deserves whole hearted support, as his success is your success, and his failure your failure. Allow him to exercise to the fullest extent the executive ability by which his success is brought about and he then cannot complain when results are demanded.

BELGIAN RAILWAYS CLOSED.—It is reported that great unrest prevails among Belgian railway officials, who have attempted to hold meetings to express their grievances, but were prevented in time by the German authorities. Various lines are closed to ordinary traffic. There is a lively transport of troops and wounded, the latter being distributed all over Belgium. Some have been brought even from Alsace.

American Railway Tool Foremen's Convention

Safety First, Maintenance of Pneumatic Tools, Grinding and Distributing Tools and Standard Reamers Discussed

The seventh annual convention of the American Railway Tool Foremen's Association was held at the Hotel Sherman, Chicago, Ill., July 19 to 21, inclusive, Henry Otto, tool foreman, Atchison, Topeka & Santa Fe, Topeka, Kan., presiding. Prayer was offered by Rev. O. M. Caward. The address of welcome was made by Robert W. Bell, general superintendent of motive power, Illinois Central. President Otto in his address spoke of the opportunities the tool foremen have to increase the efficiency of the local shop by conscientious and careful work in the tool room.

R. W. Bell, among other things, said: "There can be no better plan for reducing shop costs than through efficient tool service, and it must be apparent to you that tool foremen have a direct influence on the efficiency of the many workmen employed in your shops who, if not supplied with good safe equipment to work with, are liable to waste much time, and in many cases work under hazardous conditions. The importance of good tools in railroad shops was never realized as it is today."

SAFETY FIRST

E. J. McKernan (A. T. & S. F.):—There has been a great amount of money spent in making safety improvements to prevent personal injuries to employees, but this cannot be accomplished unless the co-operation of each and every employee is obtained. While the men are showing more interest in the matter there is still need for greater co-operation. The shop should be maintained in a clean and sanitary condition, as an unhealthy man is more liable to be careless and thus injure himself or his fellow workman. Employees, other than those assigned to the work of applying or removing belts, should not be allowed to handle them, as serious accidents have occurred to those inexperienced in this work.

Too much care cannot be exercised in mounting and taking care of grinding wheels. There have been numerous accidents caused by improper inspection of wheels; wheels mounted on improper sized spindles; wheels mounted with only one flange; flanges having uneven bearings causing the wheels to crack; flanges used of different diameters; loose wheels; improper method of truing up the wheel; forcing wheels on taper arbors; wheels running at improper speed; wheels running out of true, and improper rests used for emery wheels permitting the work to pass down between the wheel and the rest. It has been found to be bad practice to allow any emery wheel to be immersed in water, especially where half of the wheel is immersed and the other half is not. It throws the wheel out of balance. It is also bad practice to grind on the side of an emery wheel. Where men are called on to do a large amount of grinding on emery wheels they should be equipped with goggles.

R. D. Fletcher (Belt Ry.):—From a study of accidents it has been found possible to eliminate only 50 per cent of the injuries by guarding the machinery. The other half is the direct result of carelessness by the men. A great deal can be accomplished by closely watching the actions of each new employee to see, if possible, whether or not he is inclined to be careless. Where such are found they should be carefully instructed and warned against the danger that may result. A large number of machine manufacturers have altered the construction of their machines to reduce to a minimum the possibilities of injury to operators. One very important factor in the elimination of injury to shop employees has been the adoption of the motor driven machinery. The special controlling features for machines have also added a great deal to their safety. The tool foreman is in a position to assist greatly in the Safety First campaign by being sure that unsafe tools are not permitted to be passed out to the workmen.

George Nutt (C. G. W.):—It is the duty of every employee,

not only for his own benefit but for the benefit of his fellow workmen to report a dangerous situation immediately to the safety committee or to the foreman in charge. Safeguards which will help to eliminate accidents are good lighting, and white-washed walls and ceilings, which serve a double purpose of being sanitary and giving plenty of light. The gangways should be kept clear and the floors, especially around machinery, should be kept in good condition. It is a good plan to post bulletins as accidents occur stating how they happened and making comment on them, showing how they could have been prevented.

Discussion.—W. G. Reyer, general foreman of the Nashville, Chattanooga & St. Louis, was called on to make a few remarks at the Tuesday morning session. Referring to safety first he spoke of the necessity of operators using the goggles where their work required it, and of the necessity of obtaining a glass that would not break readily. He called attention also to a sign that he had seen in a shop stating, "Safety First is all right, but a careful man is essential." This, he believed, was the key to the safety first proposition.

Other members speaking on goggles, stated that it had been found difficult to have the men wear them consistently. One member stated that employees found using the emery wheels without them were disciplined. Various methods are adopted to keep the goggles in an antiseptic condition. Some use a mixture of alcohol and water; others use a steam cylinder, while some use a mixture of one-half wood alcohol and one-half water for sterilizing, and then rinse the glasses in plain water. Several members criticized the non-use of goggles with eye glasses, stating that the shield does not extend far enough back to fully protect the eyes.

MAINTENANCE OF PNEUMATIC TOOLS

J. J. Sheehan (N. & W.):—When the delicate construction of the working parts of the pneumatic motor and hammer and the narrow margin between efficiency and inefficiency are considered, it will be found that there are no tools in the shop that receive harsher treatment. If satisfactory results are desired, facilities must be provided for the removal of water and dirt from the air before it enters the pneumatic machines. Water can be quite successfully removed by having a suitable sized settling tank with a drain valve close to the point of operation. The most effective strainer for keeping the dirt out of the tool is that made of a double thickness of muslin cloth placed in the air line back of the tool.

Drills and hammers should be standardized, as far as possible, both in styles and sizes, as they may be maintained easier and a smaller number of repair parts are required. It is important to know after a drill has been overhauled, what per cent of its rated energy it will exert. On the Norfolk & Western the repaired motors are compared with the power of a new motor, and if they are not 75 per cent efficient they are thoroughly overhauled. It is found in the pneumatic hammers that if the valve casing is worn .002 in. the hammer will be unfit for service. The valves are purchased .002 in. over size which allows a certain amount of reaming to put them in proper working condition.

E. V. Nabell (Southern Ry.):—In selecting pneumatic tools the economical operation and the low cost of maintenance should receive the first consideration, not the low first cost. As a means of securing better maintenance and higher efficiency from pneumatic tools the operators should be educated to use the tool that is best adapted to the work to be done, and to take the proper care of the tools. All pneumatic tools should be inspected and tested at regular intervals, cleaned and thoroughly lubricated with a good grade of lubricant. Where possible it is desirable

to confine the repair work on pneumatic tools to one mechanic who is thoroughly familiar with them.

A. F. Baker (C. N. O. & T. P.):—Every railroad should have a standard for its pneumatic tools just as it does for taps and reamers. This will reduce the cost of repairs and much delay caused by waiting for repair parts; less material will have to be carried in stock.

GRINDING AND DISTRIBUTION OF TOOLS

G. W. Smith (C. & O.):—On the Chesapeake & Ohio the tire turning tools after having first been ground to the standard gage, are maintained by the operators of the lathe, an emery wheel formed to the standard shape being used for this purpose. It has been found that the dry grinding, if care is exercised and too heavy a cut is not taken, is better than wet grinding. Each machine tool is provided with a cupboard in which a reasonable number of standard shaped tools are kept.

J. C. Beville (E. P. & S. W.):—There is no doubt but that better results could be obtained if all tools were ground by an expert, for it is a question as to whether the machine operators really know how their tools should be ground to produce the best results.

J. C. Hasty (A. T. & S. F.):—Grinding machines should be kept as far from other machinery as possible to avoid dust getting on the wearing parts of the machines. The open grain dry wheel gives the best results for redressing high speed steel. All the lathes, planers, boring mills, shapers, etc., should be equipped with a sufficient number of tools for the class of work performed on the machine. Each operator has a locker in which these tools are kept and locked when not in use. A man is appointed to take care of all tools for machines, chisels, and chisel bars. He collects the tools that require redressing, takes them to the smith shop, grinds them, and returns them to the workmen. When tools become short from redressing they are forged to smaller sizes for use in the tool holders down to $\frac{1}{2}$ in. by 1 in.

Discussion.—While it was generally believed that much better results can be obtained in the machine shop if the tools are maintained by the tool room force, the practice on most of the roads seems to be to allow the machine operators to grind all but the very special tools. However, on the Wabash none of the machine operators or machinists are allowed to grind the tools. The drill presses are equipped with tool boxes containing a set of tools which are charged to the operator; when they become worn they are exchanged at the tool room. On the Santa Fe all the machines are provided with charts showing the speed and feed to be used by each size of drill on the different kinds of material. This insures that the full benefit of a high speed steel drill will be obtained without spoiling the drill. Mr. Pike of the Rock Island, reported the successful welding of high speed tips on soft steel bodies.

STANDARD REAMERS

The committee [E. J. McKernan (A. T. & S. F.) and C. A. Shaffer (I. C.)] reporting on the standardization of reamers for locomotive repair shops recommended that all frame and rod taper reamers in sizes under 1 in., be the commercial standard. In sizes over 1 in., three over-all lengths were recommended, as follows: 18 in., 20 in., and 28 in. The square shank on $\frac{7}{8}$ in. up to and including 1 in. reamers, was recommended to be $\frac{7}{8}$ in.; on sizes up to and including $1\frac{1}{8}$ in., 1 in. square; on sizes over $1\frac{1}{8}$ in., $1\frac{1}{4}$ in. square. The length of the square was recommended to be $1\frac{1}{4}$ in.; the length of the collar $\frac{3}{4}$ in., and the clearance between the end of the flute and the collar $\frac{3}{4}$ in. The taper was recommended to be $1/16$ in. in 12 in. The left hand spiral was recommended because it will eliminate the danger of feeding of the reamer too fast, and will greatly reduce the number of breakages. On reamers under $1\frac{5}{8}$ in. two flutes less than the standard were recommended; on all sizes over $1\frac{5}{8}$ in. four flutes less than the standard were recommended. This will give a much stronger flute and the reamer will have a longer life.

OTHER BUSINESS

The Committee on Special Jigs and Devices in Locomotive Repair Shops, of which C. A. Shaffer (Ill. Cent.) was chairman, presented an interesting report in which a number of useful devices were illustrated and described.

An illustrated lecture on "Getting the Most Out of Tools," was presented by B. W. Benedict, director of shop laboratories, University of Illinois.

The secretary reported a cash balance of \$90.16. The following officers were elected for the ensuing year: President, J. J. Sheehan, Norfolk & Western; first vice-president, C. A. Shaffer, Illinois Central; second vice-president, J. C. Beville, El Paso & Southwestern; third vice-president, C. T. Brunson, Wabash; secretary-treasurer, Owen D. Kinsey, Illinois Central. It was voted to hold the next annual convention in the city of Chicago.

NOTES ON TRANSPORTATION IN EUROPE*

By A. STUCKE

The European passenger cars are all small and are divided into small compartments, each holding a limited number of passengers. Most of the French cars have running boards along each side and doors opening outward from the compartment. The German and Austrian cars usually have an aisle along one side of the car with a door leading from each compartment into it. The Swiss cars as a rule have center aisles, with partitions between each compartment built solid to the ceiling, and doors across the aisles.

In any case, each compartment is independent of the others, has its own lamp which can be set at bright or dim, a ventilator with open and closed positions, a steam heat lever to regulate the heat and curtains to be drawn at night. Each compartment is also marked "Smoker" or "No Smoking," some even are reserved for passengers with dogs. Each compartment often has a small stationary mirror and hinged arm rests, so that the seats can be used as a sofa if the number of occupants permits. On the face of it, there seems nothing lacking as to the comfort of the traveler.

Such a subdivision of the cars, however, also has disadvantages. It is almost impossible to fill the car to its seating capacity. There may be too many second-class passengers and very few of the first-class, or vice versa, so that seats will be left empty no matter how carefully the cars are selected. Then again there may be more smokers than expected, or just the reverse; but the greatest difficulty exists in filling all the seats without splitting up the parties into different compartments, and here, I find, lies the greatest difficulty. These points affect the earnings of the railroad companies.

The other disadvantages affect the traveler and his comfort. Just imagine a group of strangers in one closed compartment. One likes to look at the country, the other wishes the sun kept out; one prefers the door to the aisle open to get some air, while a lady may object to the fumes coming from the adjoining smoking compartment. One may insist on opening the ventilator, while the next one may feel chilly, even with it closed. Later in the evening some may want the light turned down to dim, so as to be able to sleep, while someone else wants to read. For the same reason one may want the curtains drawn, and the other may not, and in the morning the disputes may be renewed in reversed succession. During the winter season differences may come up as to the regulation of the steam heat, and no matter how many rules and regulations exist, the harmony and the comfort of the traveler are bound to suffer.

The fact that in most parts of Europe no baggage is checked free is no doubt responsible for making a store room of the compartment. Invariably I found the hat racks loaded with heavy baggage up to the ceiling (turtle back), and were it not for the good-natured porter, travel would be a curse. He takes

*From a paper read before the Railway Club at Pittsburgh

more interest in his "client" than all the other railroad employees together. He takes care of your baggage, and inquires as to the kind of compartment wanted. He opens the doors as soon as the train backs up to the station, hunts and covers the number of seats wanted, window seats if possible, and you get as a rule any information from him you require in the most pleasant way.

About 20 or 30 minutes are usually allowed to get a train ready to start, and it is my observation that all of that is needed, as each compartment has to be inspected and the number of the seats taken, registered. Besides that the closing of the doors all along the train also takes a good deal of time, not only at the terminal, but also at the way stations. The Swiss center-aisle cars have no doors opening outward, and hence are not subject to the last-mentioned objection. They are similar to our own cars in that respect.

Only the heaviest cars of comparatively recent build use trucks; by far the greater portion use stationary axles, two or three in number. In the last case the middle axle has lateral freedom to accommodate the passing of curves. The fact that the cars are light and that there are no springs in tandem results naturally in a very hard-riding car compared with our own. Lengthwise, however, the reverse is the case. The making up and rearrangement of trains does not require the everlasting bumping so pronounced in closing our heavy and ever-increasing automatic couplers.

The trains are still coupled with the hook, and the slack is taken up by an employee going between the cars and tightening the screws. I often wondered why in a land where the protection of employees in shops and private establishments is made compulsory, the trainmen in coupling are allowed or rather compelled to go between the cars.

I happened to see a hospital car, which was equipped to run in all the European states except Spain and Russia, because I understand they have a different gage. Here the arrangements at the end, not even speaking about the different brakes and signal apparatus, were so manifold that I at once appreciated doubly what the M. C. B. Association accomplished in bringing the many hundred private roads together and getting up common standards for the most important details, while the few state railroads cannot even agree as yet on a common automatic coupler.

The destination of each car in Europe is indicated by a large reversible signboard, fastened to the side of the car body. They are not ornamental, but they are a great comfort to the traveler, and I am sure that we should do the same thing. This would at least avoid the painful duty of classifying the passengers in entering a train of cars with different destinations. It would not be necessary to disfigure the appearance in any way, and signs could be applied similar to those now used on Pullman cars, or, better yet, on the subway cars of our large eastern cities.

SLEEPING CARS

With the exception of the cars owned by the International Sleeping Car Company, which run on some of the fastest express trains, the European sleeper is mainly built like their ordinary passenger car. The interior is like that of our compartment sleepers, namely, an aisle along one side of the car. The compartments of the second class have two berths, one above the other, and a small table, and a small toilet at the end of the car, while the first-class compartments contain single berths and private toilets. All sleeping cars are owned by private companies and the berth can be engaged ahead. Sleeping cars are not provided freely with night trains, as the conventional compartment in the day car is in itself considered a half-sleeping car.

DINING CARS

The dining cars in Europe are owned by private companies. The meals are invariably served table d'hote, the whole being served at the same time. This reduces the number of waiters,

but it deprives the traveler of individual attention and hurries him unduly, as the courses follow each other very rapidly, in order to get the next setting accommodated as quickly as possible. This in a sense increases the capacity of the dining cars and the earnings of the company. The meals are usually excellently cooked and cost about 75 cents nominally, \$1.50 actually. In our dining cars the capacity is often reduced by slow service.

FREIGHT

Owing to the lack of great masses of bulky freight and comparatively short hauls, the capacity of the European freight car is seldom over 15 tons. Two axles per vehicle are the rule. Often a third one is located in the center, arranged so that it can move laterally to avoid binding on curves.

What has been said about the lack of common standards among the comparatively few state railway systems on passenger equipment holds good to an even greater degree on freight cars.

RELATIVE COST OF TRANSPORTATION

Without going into great details let us consider the fare between Pittsburgh and Chicago (468 miles), taking conditions as a basis and then giving the parallel figures, using the rates of the Prussian state railways—baggage in both cases is supposed to be 75 lb.

A man holding a seat in a Pullman car pays \$2 for it and \$10.50 railroad fare, a total of \$12.50. The baggage is checked and carried free of charge. Our German cousin traveling first class would pay a railroad fare of \$15.68, and for baggage \$2, or a total of \$17.68.

A traveler in our day coaches of a less expensive train will pay \$9.50. In Germany the corresponding mode of traveling would be second class, the railroad ticket being \$8.92, and the baggage charges \$.50, a total of \$9.42.

By far the largest portion of the European traveling public ride in third class cars. The fare is \$5.55, and the baggage charges 50 cents, a total of \$6.05. We have no parallel to this class.

The freight tariffs in Europe are so specialized as to material, as to kind of train, locality and nature of the shipment (local, through or export) that a fair comparison in each particular case is well nigh impossible and it appears to be much fairer to compare the average figures. Comparing the above-mentioned railroad and our group II and the official average rate per 100 ton-miles of some years ago, the rate is \$1.23 abroad and \$.763 for the eastern states.

It must be borne in mind that the bulk of the business transacted is about the same in each case, but the haul is only half as long in Germany. This means that terminal expenses are much greater in proportion, especially since the average shipment is comparatively small, and since a large proportion of the bulky freight is shipped by water.

An additional burden to the German shipper is the charge made by the "spediteur." As said before, the tariff schedules are so exceedingly intricate that it pays invariably to employ an expert in this line to pick the route, to comply with the regulations and to follow the shipment. All this the American railroad does for its customer without charge.

In all questions of fares and tariffs, it must be remembered that the German railroad employee earns just about half as much as our people. In other words, the money value is ordinarily just twice as great, and in looking at it from that angle the figures above given show as follows:

	U. S.	Germany	
		Nominally	Actually
Passenger fare (Pittsburgh to Chicago)			
1st class	\$12.50	\$17.68	\$35.36
2nd class	9.50	9.42	18.84
3rd class		6.05	12.10
Freight, average rate per 100 ton miles	763	1.23	2.46

REASONS GIVEN IN EUROPE FOR GOVERNMENT OWNERSHIP

Since most of the railroads in Europe are now owned by the respective governments, it may not be out of the way to dwell

upon the reasons leading up to that fact. It has been argued by the governments that it is desirable for the industrial, agricultural and commercial development of a country to control and furnish proper means of transportation. This is undoubtedly true, but figures and facts show that our private roads offer the same transportation more promptly and for much less money.

The governments also claim that the revenue derived from the railroads will help to pay current expenses, thus lessening the taxes of the people. This is true on the face of it. None the less, the people now agree that the heavy toll exacted by the railroads comes from the masses just the same, as the cost of transportation is simply added to the price of foodstuffs, clothing, fuel or whatever it may be.

Undoubtedly the main reason for acquisition of the railroads by the respective governments is a military one. This is more or less apparent from the fact that railroads and aerial navigation are centralized, while elevated and street-car lines, subways and typical mountain railroads are left in the hands of private and municipal corporations as a rule. The experience in war-torn Europe for the last few months is possibly the best proof of what has just been stated. Immediately as mobilization began, the trains ceased running on their schedule time to accommodate the movements of the troops, the ammunition and the other war material, and on the morning of the third day the federal railroads of Switzerland, for instance, were bodily turned over to the military department.

I have often wondered whether the same results in emergency cases could not be obtained by special laws and licenses between the government and the private companies.

A very popular argument during the amalgamation period of the railroads in Switzerland was the claim that a great economy would result from doing away with unnecessary offices. This did not work out well; on the contrary, the number now is stated to be greater than before, since each district has a council of its own besides the federal council. For the same reason it has now been found that more direct and more effective business methods which were promised at that time did not realize. On the contrary, it is now a rather difficult matter to settle on any changes and improvements owing to the special interests each district council represents.

RESULTS OF CENTRALIZATION

Government ownership, generally speaking, has helped the weak roads and avoided critical periods which we here usually overcome by receivership and reorganization. At the same time it leaves the formerly prosperous private roads in a less prosperous condition.

It is also interesting to note how completely, down to the smallest detail, the instructions in any one of these complex railway systems are worked out. Each employee or officer is expected to carry out instructions to the letter. This is the ideal and the highest duty of every one, and if carried out, will insure employment for life. That way, every employee can feel that he has done his duty and does not need to care for anything further. This, however, will not produce improvements, reduce labor cost, bring forth fuel and labor-saving devices, not even safety.

I have, for instance, seen a passenger, who jumped on a car just as it started, grabbed by a station employee, and, as he couldn't manage him alone, another uniformed co-worker ran to his assistance. They finally succeeded in pulling off the "criminal." By this time the train was moving at a fair speed and I was very much afraid that an accident might happen as soon as the "trespasser" loosened his grip. This was a center-aisle car with a platform at the end.

As a contrast to such narrow conceptions of duty, let us read for instance the honor column of any one of our railroad employees' magazines and compare the spirit and the results.

One thing is sure, namely, that the government railroads of Europe do not keep pace with the evolution in other branches of

industry and science, and this is undoubtedly one reason why American railroads are often studied by Europe, a country much older than ours.

Another great drawback in Europe is the lack of competition. As soon as a government becomes the manager of the railroads, the rivalry between the different roads ceases, which again spells stagnation to a large extent, but what is possibly more objectionable to the customer is a cold and overbearing treatment, not so seldom noticed. You have no redress, you cannot ship over the other road. By this I do not want to say that, as a rule, their railroad employee is not polite, but real courtesy and whole souled spirit of co-operation is certainly not in evidence. Is it not natural after all? Why should the roads lay special stress on anything which does not bring them special returns?

A peculiar case came to my notice showing again how very little the government railroads are really doing for their patrons. A valise through no fault of the passenger was mis sent and the railroad office was asked by telephone to have it intercepted at the next station and returned. The phone call and the parcel post charges were both collected before the valise was surrendered, with the explanation that the government owns the telephone and parcel post systems and would object to the railroads' performing such service free, as this would minimize the receipts in the other two departments.

OBJECTIONS TO GOVERNMENT OWNERSHIP IN THE UNITED STATES

If all the railroads in the United States were combined into one tremendous system, it would be so unwieldy that it could not be managed in the true sense of the word, and whoever doubts this will please read the paper by A. W. Thompson, vice-president of the Baltimore & Ohio, presented recently before the Engineers' Society of Western Pennsylvania, wherein he shows the obstacles, financial and otherwise, which had to be overcome by constant struggle and almost superhuman efforts.

Such a system could, of course, be kept going by rules and regulations, but the performance of each road would surely suffer. In two excellent articles on "pooling" engines in the November number of the Buffalo, Rochester & Pittsburgh Employees' Magazine, it was brought out that a gain in engine working hours led up to this, but that as far as the performance of each engine, its physical condition and its upkeep were concerned, the results were far superior at the time when every engine had its own individual attention. Therefore "pooling" the railroads would surely have similar results in this respect. Such an immense net of government roads and a still more elaborate system of operating them would in a way lend stability to the undertaking, but this also means stagnation and inability to adapt itself to new conditions as fast as they arise.

In Europe, for instance, the passenger and freight rates and their application to certain territories are hardly ever changed and the industrial conditions are expected to adapt themselves to the railroads and their policies. We over here so far have always taken the opposite view. We believe in extending the industries in those localities where natural conditions will offer the greatest inducements, then we adjust the railroad service to the new requirements. This is undoubtedly one of the reasons why the Canadian government doesn't operate its roads, although it has built some, helped build others and heavily subsidized the rest.

Our political contests are, we all know, fought in a bitter way, simply because the existence of so many employees depends on the respective victory. Suppose we added another million or two of such employees, would not this fight for supremacy become alarming? All competition between the different roads, as to improvements for the comfort of passengers would be relaxed, also as to safety, economy in operation, economy in the shops and the upkeep of the equipment.

When the Hungarian state railways, undoubtedly for just such reasons, had large yearly deficits, they simply raised the rates, and when one of the flourishing Swiss roads, after it went

and passing points will be multiplied by four; if the number is tripled these points will be multiplied by nine, etc. At first glance this appears to be correct. Two trains in opposite directions will meet once; four trains may meet four times, etc. The error lies in the fact that in changing from one number of trains to another the operating conditions are not duplicated. If one should have a certain number of meeting and passing points under present conditions and should double the number of trains he might have four times as many meeting and passing points but the chances are that he would have considerably more. It makes a great deal of difference whether the trains are scattered at intervals throughout the 24 hours or are concentrated in a portion of that time.

To illustrate the point the accompanying diagrams have been made on the same principle as density diagrams; the vertical dimension being divided into spaces for each hour and the horizontal distance being the length of an engine district. Passenger train speeds are assumed as being 30 miles an hour and freight 15 miles.

The only general rule that can be formulated is that the slow trains should follow immediately after the fast and be scattered at nearly equal intervals through the day. It is also apparent that increasing the speed will decrease the number of meeting and passing points. To make the rule general, the interval of time occupied by a train passing over the district, divided by 24, should be as small as possible. Under the assumed condition, the following interesting results are found:

TABLE 1

Diagram Nos.	No. of round trip trains per day	Square of the number of trains	No. of meeting and passing points	
			Minimum	Maximum
.....	1	1	0	1
1 and 2	2	4	0	6
3 and 4	4	16	0	20
5 and 6	6	36	18	36
7 and 8	8	64	30	71

In counting the meeting points one half value has been given to points on the lines dividing engine districts and days. As the number of trains increases it is apparent that the tonnage of freight trains will decrease unless there is considerable excess power in the locomotives for the rating, say in Diagram 1. This feature is of considerable importance in making calculations for tonnage ratings in problems of the economics of railway location. According to the older method laid down by Wellington and others, a rating was assumed for one daily train and this was multiplied by ten or twelve as the case might be, but the time spent in meeting and passing will be increased very rapidly and the available running time decreased after a traffic of about eight trains per day is passed, as is shown in Diagram 9, which can be compared with Diagram 7, as both are for the most favorable circumstances. The graphical method of handling such problems is not new, but new applications can be found for it, as it has as many variations as the kaleidoscope.

The proper location of passing sidings on new work is not always an easy matter. By turning the horizontal distance into time and finding the fraction of the whole run between each passing point this may be arrived at. The next step would be to develop a table of accelerations and retardations and plot a time curve. The location of the train when 1/6 of its run (in time) has elapsed could then be fixed or any other fraction that might be caused by the ordinary operation of trains.

ENLISTMENTS FROM THE MIDLAND RAILWAY OF ENGLAND.—The chairman of the Midland Railway recently said that of the 80,000 railwaymen who had joined the colors, 10,200 had gone from the Midland. Among the latter 200 had been killed in action or had died of wounds or disease, 43 were missing, and 609 had been wounded or invalided home. Of the 1,996 members of the Midland Railway rifle clubs in Derby and other towns, 432 had joined the colors, and a larger number would have done so if they could have been spared.

THE SANTA FE'S HARMONY WORK

E. P. Ripley, president of the Atchison, Topeka & Santa Fe, five years ago called a conference of operating, traffic and other officials and expressed to them a new view about railroading.

"I have figured it out," Mr. Ripley said, at that time, "that the hostile public sentiment against transportation corporations is due largely to the fact that the people do not understand the railway situation, and that the men who manage the railroads are not familiar enough with the troubles confronting the people. I want your co-operation in the inauguration of a campaign for the purpose of bringing our officials and patrons into a closer relationship, with the view of changing this feeling of hostility to one of friendliness. I would like to have general managers, general freight and passenger agents, financial and accounting officers, attorneys and others visit the cities and rural communities along our lines, and get better acquainted with merchants, manufacturers, farmers, stockmen, bankers and every other class of people doing business with our company, and ascertain the cause of their discontent. We will tell our story to the people, and ask them to tell theirs to us."

The plan outlined was put into effect, and the work still is in progress, division by division. A Kansas newspaper called it "the Harmony special," and by that name it is known in Santa Fe territory.

"Harmony work has developed into a feature of our business," Mr. Ripley said recently. "The campaign was a success from the start, and now it is a part of every official's duty to perform a harmony stunt when occasion demands."

Here is the plan in detail of the Santa Fe's harmony campaign: One week in every month, half a dozen or more officials of the company are drafted for a trip over a division. The superintendent makes up a short train for the accommodation of the party, and a town-to-town tour is conducted, stops being made long enough at every place to enable the officials to meet the business men and farmers in a convenient room, usually the Commercial club, court house, or city hall. The meetings are informal—a sort of handshaking affair. Sometimes there is a bit of speechmaking, and occasionally a luncheon or banquet is given for the visitors to enable them to extend their acquaintanceship.

The railroad men make it plain to the people that they are on a get-acquainted trip; that they want to improve the relationship between the company and the community visited; that all they have to sell is service, and they want that commodity to be the best on the market; that if there is anything out of gear, they want to know it.

The meetings give the railroad officials opportunity to discuss first hand with their customers the general railroad situation—rates, train service, increased cost of operation and maintenance and similar topics, showing the difficulties with which the carriers have to contend.

Before leaving town the railway officials offer the company's co-operation in the development of the natural resources of the territory traversed by its lines.

For instance, the railway company offers gratis the service of its industrial department, to find new industries; of its colonization department to send desirable people into the community; of its agricultural department to carry on experiments along the line, giving the farmers the results obtained; of its engineering department to pass on plans for public work, especially for bridge construction, and improvements having to do with drainage.

As a result of this harmony movement, there has been a reduction in law suits against the Santa Fe; a decrease in the number of cases before commissions; fewer men in the legislature who want to tear up the track, and generally a more friendly feeling on the part of the people toward the corporation.

The harmony campaign is not a drain on any official's time, as the work is divided in such a way that the extra burden falls lightly on many shoulders. The plan calls for a tour of every division twice a year. There are twenty-four divisions.

The Railway Lines of Syria and Palestine

Resumé of Conditions Before the War; Well Managed Lines of Syria Compared with Run-down Hedjaz Railway

BY LEWIS R. FREEMAN

The well-built and ably managed 500 miles of railway of the Chemin de Fer Damas-Hama et Prolongments, a French company, before the war, was one of the best paying properties in the near East, and with the completion of the Bagdad Railway, of which it bade fair to become the main feeder, its property would have been greatly augmented. According to the plans there were to be two main approaches to the western end of the Bagdad Railway—the Ottoman Anatolian line from Constantinople, which would carry the fast mails, and the passenger and freight traffic of northern and central Europe; and the Beirut-Aleppo line of the Damas-Hama Railway, which would carry the traffic of southern Europe, Africa and the Mediterranean gen-

1906, the Ottoman government guaranteeing a net income of \$4,320 per mile on all of the line between Reyak and Aleppo, a distance of 200 miles. In 1910 the company received a concession to build a line from Homs, on the Reyak-Aleppo branch, to Tripoli, a port of some importance on the Mediterranean. This line, which was 65 miles long and carried no guarantee, was completed in 1911. This completed the Syrian railway system as it exists to-day, and as it will remain for some years, no important extension being under consideration at this time. The total mileage is about 427 of which only 207 miles—the least costly section of the system, that from Reyak to Aleppo—was built under a guarantee. The system throughout is of standard gauge.

The 6,000-ft. climb of the Damascus line over the summit of the Lebanon is one of the most picturesque pieces of railway in the world, and severe engineering difficulties were involved in its construction. Tunnels and viaducts are encountered almost as soon as the train is clear of Beirut station, and the line passes either through one or over the other most of the 40 miles until Reyak is reached in the valley beyond the Lebanon range. To take a railway over this unusually abrupt mountain wall without the use of the rack system, while not impossible, would have been prohibitively expensive. The locomotive begins to climb with the cogs while still in the vicinity of Beirut and of the 35 miles between that city and Mallaka, on the edge of the plain of Bekka, 20 miles are negotiated in this manner. An average grade of 7 per cent is surmounted by the rack in the ascent from Beirut, while the descent on the further side is 6 per cent. The steepest grade surmounted by adhesion is 2.5 per cent. Construction throughout is of the most substantial character, stone retaining walls and drains and other protective work being especially worthy of notice.

This section of the line runs through the independent state of Lebanon, which, in spite of its rough and mountainous character, is most thickly populated and intensively cultivated. Even the local traffic, therefore, has been heavy from the first.

The 50 miles from Reyak to Damascus is by a low and easy pass over the anti-Lebanon range. The spring-fed river which the railway follows down to the rich and ancient city at the desert's edge has a number of fine waterfalls and swift rapids, from which several thousand horse-power in electricity have already been developed to light Damascus and run its tramways. A more ambitious project plans to develop power to operate the railway for 50 miles on either side of Damascus, while other projects in the Lebanon mountains will develop sufficient power to make it possible ultimately to electrify the whole system.

Damascus, which is the focal point for the caravan routes for a thousand miles to the south and east, furnishes enough business alone to have warranted the construction of the railway; nor has the French line suffered at all from the competition of the branch of the Hedjaz Railway, which gives another outlet to the Mediterranean at the port of Haifa. The 60-mile extension of the line into the semi-desert region to the south, terminating at El-Mezzeirib, has proved a valuable feeder in spite of the fact that it is paralleled by the main line of the Turkish-owned Hedjaz Railway throughout its length. The freight, passenger and other receipts for the Beirut-Damascus-El-Mezzeirib branch of the line for the year 1900 were \$434,000, or about \$2,700 per mile. In 1911 receipts from the same sources had increased to approximately \$872,000, or nearly \$5,600 per mile.

The 250 miles of road which will tap the Bagdad Railway at

The Railways of Syria and Palestine

erally. The latter route, unless it was strongly discriminated against by the Bagdad Railway, was likely to do much the larger business of the two.

The Chemin de Fer Damas-Hama et Prolongments was formed in 1891 by the consolidation of two companies organized the previous year with the purpose of building a railway from Beirut to Damascus, a distance of 90 miles over the crest of the Lebanon mountains. This line was subsequently extended 65 miles farther south to El-Mezzeirib, the point of departure for the Mecca-bound caravans. In 1905 a concession was obtained from the Turkish government for a railway, starting from Reyak, on the Damascus line, to Aleppo, a distance of 207 miles. The portion of this line from Reyak to Hama had been built some years before. The Hama-Aleppo extension was completed in

Aleppo and give a quick outlet to the Mediterranean at Beirut is expected to prove of great importance when the latter line is opened. That part of the line between Reyak and Aleppo—207 miles—was built under an annual guarantee of \$4,350 per mile.

The construction was neither difficult nor expensive, while the populous and productive country along the route has given

Constantinople and across the Bosphorus. Aleppo is conceded to be the best and most probable seat of the Ottoman government. From the standpoint of the traveler the most interesting point on this line is Baalbek, the site of ancient Phoenician and Roman temples.

Unlike the Damascus-Beirut line which, from uprisings, political disturbances and other causes, has experienced considerable

Freight and Passenger Train in the Lebanon Mountains

an ample amount of traffic from the start. Aleppo itself, which occupies about the same commercial position in northern Syria as does Damascus in the south, has taken full advantage of the improved transportation facilities, and is rapidly becoming one of the most progressive cities of Asiatic Turkey. Indeed, in the by-no-means unlikely event of the Porte being forced out of

fluctuations in receipts, the Reyak-Aleppo branch has yielded steadily increasing returns from the first. These have increased from \$361,000 in 1907 to \$534,000 in 1911, or from \$1,739 to \$2,671 per mile. As the Ottoman government had to make up the difference between these sums and the guarantee of \$4,352 per mile, the gross receipts for each year since the opening of

Switch Back Station on the Climb up the Lebanon Mountains

the line have amounted to about \$900,000. It is more than likely that the next year or two will see the average receipts per mile pass those of the guarantee, putting an end thenceforth to the necessity of the fulfillment of that obligation by the overburdened Ottoman government.

First, second and third-class passengers are carried on all lines of the Syrian system. Fares vary somewhat according to the nature of the country traversed, those over the rack divisions of the Lebanon mountains being the highest. Roughly speaking, they are about the equivalent of $5\frac{1}{2}$ cents per mile, first class; $3\frac{3}{4}$ cents per mile, second class, and $1\frac{1}{2}$ cents per mile, third class. First class passengers are carried in roomy side-entrance compartment cars, which can be made very comfortable for sleeping on the night runs. The second class compartments are less spacious than the first, and generally more crowded, but are also considerably used by Europeans. The third-class passengers are packed closely into corridor cars provided with wooden benches and baggage racks, and, as on most other lines of the East, furnish the principal source of revenue.

The locomotives and rolling stock of the Syrian railways are

building in Turkey, a thoroughly up-to-date road was begun. There was trouble with his Moslem subordinates, trouble about finances and trouble with the nomad tribes along the route; but with the same energy and devotion to the task in hand that had characterized his work in opening up Asia Minor, the resolute German stuck to his task and ultimately completed the 800 miles of line between Damascus and Medina. He was ready to carry it on over the additional 250 miles to Mecca, but the opposition of the desert tribes—who saw in the railway an end of the tribute they had been accustomed to levy upon the pilgrim caravans—discouraged the Ottoman government, and the work was stopped. The construction of a branch running westerly from the main line to the sea of Galilee and the port of Haifa on the Mediterranean, completed the Hedjaz system as it exists to-day.

Five years or more ago Meissner Pasha turned over to the Turkish government a railway which—with the exception of two or three lines in India—was as well constructed as any in Asia. Thanks to the half decade of Ottoman management, the Hedjaz Railway now could not be more fittingly described than in the expression above quoted—"the worst run and the worst

A Portion of the Rack Section in the Lebanon Range

modern in design and well maintained. French, Swiss, German, Belgian and Austrian concerns have each furnished some of the locomotives, and this is also true of the other equipment, materials and supplies. The rails are of Belgian manufacture, that country proving America's most serious competitor at many points in Asia. Neither the United States nor England has supplied rolling stock, machinery or materials of any description.

* * *

In comparison with the finely maintained, up-to-date railway system of Syria, the two lines of Palestine make but a sorry showing. The more prominent of the latter is the much talked of Hedjaz or "pilgrim" line, which is commonly characterized as "the worst run and the worst run-down railway in the world." This line, which starts at Damascus, was begun with the idea of being extended all the way to Mecca and of transporting the great annual flocks of the faithful which had theretofore had to reach the Holy City by way of the Red Sea and Jeddah. The contract for construction was let to Germans, and under the distinguished Meissner Pasha, the general manager of the Baghdad railway, who had already spent a score of years in railway

run-down railway in the world." Within a year or two the Germans were entirely eliminated from the management of the line, and shortly afterwards from its technical departments. The inevitable result was that rolling stock and machinery were soon ready for the scrap heap while the roadbed was scarcely a respectable camel trail. In the matter of replacements, the oriental tendency to graft asserted itself, and not half of the money appropriated in Constantinople ever found its way into new equipment—which was probably just as well, for new machinery and locomotives promptly went the way of the old. The occasional employment of foreigners in the engineering department has effected sporadic improvement from time to time, but for the most part the line is in the condition of chaos to which it reverted after the German regime ended. That it is a dismal failure financially goes without saying.

It is just possible that if the Hedjaz railway had been carried on to Mecca it might have met with better success in catering to the pilgrim traffic. The route to Mecca by way of the Red Sea is circuitous and expensive, but the short caravan journey from Jeddah to Mecca is a good deal safer and less costly than

the one from Medina which must be taken if the railway is used. At any rate, statistics covering the last five years show that over 80 per cent of the pilgrims have clung to the old route. As the country through which the railway passes for nearly all of the 800 miles between Damascus and Medina is absolute desert, that ill-starred venture has found very little to contribute to its support beyond its entirely inadequate share of the pilgrim traffic.

Three trains a week leave Damascus for Medina throughout the year, with numerous specials when the pilgrim movement is at its height. The best part of three days is consumed on the

themselves to trains that are scheduled by Arabic time, which changes every day with the sun. At least the time-table is made out according to Arabic time, and if even that were adhered to it would not be so bad, as the difference may usually be roughly calculated and allowed for. As a matter of fact the schedule seems to depend upon nothing but the convenience of the train men, as the writer's own experience would indicate. On the first occasion of his departure from Damascus over this line, acting on the advice of the hotel proprietor, he went to the station an hour before train time—sunrise or 12 by Arabic time—only to

Typical Station on the Jaffa-Jerusalem Line

800 mile journey. A first class car is attached to the train, but rarely has over two or three occupants. The fare is \$35, or about $4\frac{1}{2}$ cents per mile. There is no second class, and the third class fare of about $2\frac{1}{4}$ cents per mile is the highest in Asia for that class of travel. No Christians use the line south of Palestine, for should one do so he would place himself under the suspicion of endeavoring to reach Mecca. Those who have to travel over the northern sections have the annoying experience of adapting

find that it had, for some reason, departed half an hour earlier. Endeavoring to profit by this experience, he allowed two hours leeway on another occasion, and had to wait four. A third time, as no engine could be found that was in condition to take a train out of the station, he had to go back to the hotel and remain another day. Still more annoying was the experience of an Englishman. His Hedjaz railway train had left Damascus on time, but had lost two hours on the twelve-hour run to Haifa.

Railroad and Highway Bridges Near Beirut

There was still time left to catch his steamer, however, until the belated "express"—it is really called that on the time table—pulled up at a wayside station on the outskirts of Haifa and remained there three hours to fill up a couple of flat cars with cabbages for next morning's market. As a result he missed his steamer and had to wait four days for another. This is Turkish railway management.

The 54-mile railway from the port of Jaffa to Jerusalem is somewhat better managed than the Hedjaz railway, but that is about all that one can say about it. It was built a couple of decades or more ago, and has had a checkered career under alternate Ottoman and French management. At the present time it is under French management and doing better than at any other stage in its history. Under normal conditions a railway between Jaffa and Jerusalem should pay handsomely, as much of the hinterland is rich and fertile, while the tourist and pilgrim travel to the Holy City is alone enough to support a properly managed railway. Complications due to various troublesome features of the concession of the Ottoman government, conspiring with the hopeless inadequacy of Jaffa as a port in any but the fairest weather, have been its undoing in the past and are not unlikely to result in its complete collapse in the near future. For days at a time in rough weather no passengers can be landed at Jaffa, and the ever-imminent possibility that the Ottoman government will run a branch of the Hedjaz railway up from Haifa to Jerusalem has thus far made it impossible to put through any kind of a project for harbor works. The railway,

Desert Water Tank on the Hedjaz Railway

which was not especially well aligned in the first place, has never felt justified in making the expenditure necessary to remedy this defect, nor has it even carried its tracks down to the waterfront. The trans-shipment of the Jerusalem freight is, therefore, labor and expensive, while the change is also a troublesome one for passengers. Everything considered, and especially on account of the great expense that would be involved in making even a passable harbor of Jaffa, a railway from Haifa to Jerusalem—even under Turkish management—would prove the best solution of the problem. If this line is ever built, and it doubtless will be before many years, the position of the present Jaffa-Jerusalem line will be similar to that of a bridge which is left spanning a half-emptied river bed after the main stream has changed its course.

Only two classes of passengers are carried between Jaffa and Jerusalem. The first class fare is equivalent to about 5½ cents a mile, and the second class 2 cents. As a large number of European tourists are booked through second class, this arrangement, which throws them in with the lowest classes of Jews, Arabs and Turks, involves considerable hardship.

Several American locomotives were once purchased by this line, but as this happened some years ago, the two or three that still survive are hardly in a condition to awaken any stirrings of patriotic pride in the breast of the American tourist who beholds their battered remains.

WHAT IS THE MATTER WITH THE RAILROADS?*

By E. STENGER

General Manager, St. Joseph & Grand Island

Some years ago the popular cry in the west was, "What is the matter with Kansas?" Now, the nation-wide cry is "What is the matter with the railroads?" There are several things the matter with us, the most important of which perhaps is that we are going broke. Brandeis says we are wasting a million dollars a day, but it was reported that when offered a job as trustee of a railroad to show us how to save the million he declined with thanks. I wonder what is the matter with Brandeis.

While railroad earnings are at their lowest ebb for many years, and while the country is full of unemployed clamoring for work and at a time when everyone is conserving his resources and struggling to overcome adverse conditions, the engineers are demanding an increase in pay and better working conditions, all at an increased expense to the railroads. I sometimes wonder what is the matter with the engineers.

The train men had a full crew bill passed by the last legislature in Missouri which increased the number of brakemen on a train by one and the people rejected it. Now these same train men are in Jefferson City trying to have a law passed cutting the trains in two and thereby doubling the number of train men required to handle the same business. I wonder what is the matter with the trainmen.

The politician goes up and down our land demanding more and more drastic regulation of railroads, lower rates for his favored shippers, higher wages and shorter hours for the men and better service for the traveling public. I wonder what is the matter with the politician since he quit traveling on passes.

There is more delay to traffic in St. Joseph at Fifth and Edmond or Sixth and Edmond streets than is caused by all the railroads crossing Sixth street and besides the city pays the traffic policemen kept on duty all hours of the day at those points while we pay for the watchmen on Sixth street; still it has been deemed the popular thing to clamor for viaducts and subways and "cuss" the railroads generally. I sometimes wonder what is the matter with our newspapers.

To be killed in Europe is now a matter of glory. To be killed in an automobile is a matter of course. To be drowned on a ship is a matter of accident, but to be killed on a railroad is a matter of criminal negligence and as a consequence the land is filled with lamentations and excoriations of railroad managers. I cannot see that the manner of killing makes much difference to the corpse who is the most interested party. I wonder what is the matter with the public.

The Nebraska commission reduced the rates in Nebraska so that Omaha cuts into territory previously served by St. Joseph so that we lose some traffic and earnings. If we should reduce our rates to meet the Nebraska reductions we would lose still more revenue, which leaves us between the devil and the deep sea through no fault of ours. I wonder what is the matter with state regulation.

When the eastern roads asked for a 5 per cent increase the Interstate Commerce Commission refused it but gave them a lot of good advice. They asked for bread and were given a stone. When they attempted to follow the advice both the commission and the courts stopped them and later, when the net revenues had fallen over 20 per cent the commission granted the 5 per cent increase. Sometimes when a gleam of light penetrates my daze I wonder what is the matter with the Interstate Commerce Commission.

The government has for some time compelled us to haul the mails at a loss and then to make the matter worse has added

*From an address before the St. Joseph Railroad Club on January 18, 1915.

the parcel post to increase the burden, and now, by means of the Moon bill, proposes to reduce our mail pay still further. The upshot of the whole matter is that the government is today robbing the railroads by underpayment for mail service and threatens to do still worse. I sometimes wonder what is the matter with the government.

What is the matter with the railroads? Nothing, except that their problems are not yet thoroughly understood.

What is the matter with railroad men? Nothing, except that they have been somewhat remiss in meeting changing conditions.

What is the matter with the people? Nothing, except that they are not yet awake.

PERSONALITY AND EXPERIENCE

BY RICHARD BROOKER

Yardmaster, Canadian Pacific, Portage La Prairie, Man.

The operation of a yard is affected by controllable and non-controllable circumstances. The former are included in the organization controlled and directed by the general yardmaster. The non-controllable include conditions such as the layout of the yard, track, and other local facilities, which, like the laws of the Medes and Persians, do not change.

The human element enters into the subject of yard operation more prominently than some might be prepared to admit. The successful yardmaster is the man with a personality, respected and revered by call boy and superintendent alike; providing, of course, that practical experience is added to his personality. Whether this experience was gained from an office stool in a yard office, or while riding the footboard of a switch engine makes little difference; the man is the predominating feature.

If there is one occupation more than another in which the little things count it is that of yardmaster; for in the operation of a yard, constant attention to detail is of paramount importance. "Take care of the pence and the pounds will take care of themselves," is a proverb, the truth of which is apparent even when its terms are translated into car numbers and consist lists; for a whole track full of through loads does not require the care in forwarding that one bad order will. The call boy getting a crew for a train is a mere detail; but if the call is omitted, and the omission is not detected until the train is ready to start, the magnitude of that detail is considerably enlarged. When compiling a list of cars for team tracks, with the directions for spotting it may seem a small thing if one car is omitted, but over on the team track a teamster may be waiting the promised spot-run for the yard engine, are both expensive.

To maintain discipline and secure good results from the staff requires an efficient method of handling the various grades of men needed to operate a yard. Their education is no small matter, particularly in the rush season when the office staff has to be augmented with green men. In large yards the general yardmaster could not be expected to attend personally to the educational end of it; both the education and discipline of the office staff should be assigned to the chief clerk, which person will, in my opinion, when the powers that be fully recognize his worth, form the chief recruiting field for the yardmasters of the future; his training and education in dealing with all the various problems, both inside and out, fitting him for the position far better than the man, who though he be the best of switchman, is uninitiated into the most elementary duties of the office.

No educational code of rules can be written that will so quickly and efficiently produce the desired result, as will a little time spent in oral explanation of the work under discussion. The juniors appreciate their senior's consideration and can question any statement not understood. These personal talks bring out many things which are of benefit to pupil and tutor alike. Many a man with good powers of observation, although young in the service, can offer valuable suggestions with reference to his particular work, which could often be adopted to the benefit of the organization of which he is a part. Another point of importance is that where certain clerical work is performed by one

particular man, the question of understudying that man should not be overlooked; otherwise, should sickness or resignation occur, chaos is the result.

The matter of discipline is a problem materially solved by organization. Firm, fair and considerate treatment invariably obviates friction and creates a feeling of loyalty among the staff and any employee not amenable to such treatment should not be tolerated.

The matter of giving satisfaction to shippers takes considerably more time to accomplish than it does to describe; for it can all be summed up in one sentence—give them good service. It would surprise the uninitiated how quickly the yard staff learns to anticipate the various shippers' requirements. Shippers comprise all sorts and conditions of men, but there are few who cannot be influenced by a courteous and obliging manner. Even the few who are dissatisfied should get the service, anyway. Their money is as good to the company as the others'. The spotting of cars at the freight house is another important feature of the day's work. Less than car lot freight is a great source of revenue and demands constant attention; and although this is more the freight agent's province, and depends largely for its success on the way he handles the merchants, still, if the yard does not co-operate by giving him good service, the merchants will soon be transferring their patronage to other roads. Courtesy often gets the business, but good service keeps it.

The regular movement of cars from the yard should be the aim of all concerned. This is not always the easiest way by any means, but it should be the hard and fast rule, nevertheless. When a string of old loads are pulled from a track, the remaining cars on that track should not be buried from the forwarding end, but should be pulled out onto the head end of the next oldest loads, leaving the track clear for fresh cars. Only about five per cent of the traffic handled, comprising bad orders for heavy repairs, loads to be transferred on account of bad order, cars for icing, errors in billing, etc., demand careful and minute attention. All of the foregoing need the co-operation of various departments, which must be of an expeditious character, if any showing is to be made.

In the making up of trains there is one point which is often overlooked. I refer to what may be called the "purpose" of the train, that is to say, whether the train is to turn at some intermediate yard or go through to the next terminal. It is an easy matter to throw sufficient cars behind an engine to make up the right tonnage, but if there are grades en route which necessitate a reduction, and the important loads are not marshalled, the work of reducing makes considerable switching inevitable on the part of the train crew, who may probably be blocking other crews in the process; whereas, if the important loads were on rear of train this time would not be lost. When a turn is being built for an intermediate yard, to be used in filling out other trains en route, the important loads should be on the head end, so that the first train filling out gets them.

An important factor for success or failure in the operation of a terminal is the relation existing between the despatcher's department and the yard staff. The yard may or may not be proverbially prompt with trains ordered; they may or may not furnish correct information respecting loads to move, or the despatcher may or may not give the yard a good line-up of incoming trains, including the consist of same; but it is precisely whether they do or not that forms the difference between bad and good working conditions. Failure to have trains ready when ordered gives much trouble to despatchers; and the absence of advice as to incoming trains may mean pulling the pin on work half done.

RAILWAYS IN "BRITISH" SOUTH-WEST AFRICA.—In addition to the restoration of the lines of communication in what may be called British South-West Africa and the rebuilding or repairing of station and other depots, there is a considerable length of narrow-gauge line to be converted to the 3 ft. 6 in. standard South African gage.—*The Engineer*.

OBSERVATIONS ON FILING CORRESPONDENCE

By C. T. ANDREWS

Secretary to Chairman, Southern Pacific Company

The following observations are offered to fellow railroad employees interested in their office files, especially those who are dissatisfied with the results obtained from their present system. They apply to the use of the Williams Classification, or decimal system of filing, the adoption of which by all railroads has been urged for some years by its authors.* They also embrace a few important features of filing under any system. I make these observations after having installed the decimal system in the chief operating office of the Union Pacific and Southern Pacific systems, and after having watched its operation for more than a year until the unmerging of those two systems. During that time, and with the Southern Pacific files since then, the system has proved very satisfactory. Unlike our past filing systems, the longer it is used the more efficient it becomes.

I do not undertake to describe the decimal system, or to dwell on its advantages, for to do this would take much space and would be to repeat what has already been published in these columns. I only offer my judgment of it, to wit, that it is a good, workable system, correct in principle, and of the greatest usefulness to an office having a large volume of correspondence on a great many subjects. I believe, furthermore, that this classification, or a selection from it of the subjects needed, and following its general plan, will prove satisfactory in a smaller office.

The efficiency of a filing department may be determined by one's answer, applied to his own office, to the following query: What should be the proportion of time spent in hunting things to that spent in filing them? Much time spent in hunting leaves correspondingly less time for filing, and hasty filing causes much time to be spent in hunting. Conversely, careful filing insures quick finding, and quick finding leaves the maximum time for careful filing. The proportion of time spent in hunting files or papers indicates the degree of mastery of the file room work. If one's file service is unsatisfactory, let him ascertain what this proportion is; then let him determine what it should be and give orders accordingly, and whatever is needed to accomplish the improvement will promptly develop, whether it be a better system, a better file clerk, clerical assistance, or something else.

If the adoption of the decimal system is contemplated, it should be well understood before its installation is undertaken. If possible, one experienced in its use and fairly familiar with the office business should be assigned to install it and get it running. If a change is made of filing systems, it is inadvisable to re-index all old files under the new system, however good that system. It is best to set a date, after which all correspondence will go under the new system, and prior to which it will be under the old system. Each active file should bear reference to the old number under which previous correspondence is filed, and to the new number under which subsequent correspondence will be found. Individual files or parts thereof can be brought up from the old system and placed under the new, from time to time, if desired.

In the Williams Classification, which is pre-designed to accommodate correspondence on any subject, it is sometimes difficult to decide in which of two or more places a communication should be filed. This is rarely the fault of the classification, when understood, each place having its use. At such perplexing points a file clerk will find it advantageous to record his decision, or ruling, for his future guidance and that of future file clerks. In an important office this is very desirable. A loose-leaf binder will make it possible to keep these rulings and other rulings on special files, in numerical order, and will prove a handy and invaluable auxiliary to the printed classification index book.

*W. H. Williams, vice-president, Delaware & Hudson, and John U. Hanna, chairman of committee on handling correspondence, Pennsylvania Railroad.

It is recommended that the alphabet be utilized to the fullest extent possible, in any filing system. More than half of the files of the average railroad office can be identified by proper name. The simplicity of alphabetically arranging these files commends itself; yet in many offices each of such files is assigned a serial number and laboriously indexed. The Williams Classification provides for the most advantageous utilization of the alphabet, which is one of its best features.

A large office that experiences much difficulty from letters being misplaced or lost, will find a remedy in recording important incoming communications. This helps to locate papers quickly, and to allocate responsibility. The time necessary to record a single communication is negligible, and when a communication is missing it is helpful and gratifying to have a record indicating whether it was received and where it ought to be. These statements are based on experience. A simple record sheet can be devised for this purpose, and the clerical work made very slight. These sheets preserved form a fair chronological record of all important incoming letters.

An important subject, or a subject having much correspondence, may profitably be kept in two sections, one for the papers having enduring or permanent value, such as standing instructions or rulings, the other for papers having a temporary value only. The former usually are in the minority, though their importance is greatest; the latter are the more numerous, or voluminous. The former may be termed the "standing file," the latter the "running file" of the same subject. Under the decimal system the latter are readily kept separate by adding the figures "dash nine" to the file number.

The rule that only a single subject should be included in a communication is generally recognized and adhered to, but the best-intentioned sometimes lapse from it. Again, unavoidably the correspondence will sometimes embrace two or more related phases of a subject for which the file clerk maintains separate files, or one subject will grow out of another. The file clerk must be alert to revert or divert the flow of correspondence into its proper channel (file), also to make necessary cross-references, extracts, or extra copies for other files.

In the preceding paragraph reference is made to separate files for related phases of a subject, and in this connection the observation may be made that as a general thing a unified file is more satisfactory than a minutely subdivided file. It is prudent, therefore, to maintain a unified file wherever practicable, subdividing only when the expediency thereof is developed by experience. And this leads to another observation, that some files kept separate for convenience while active may well be consolidated into a unified file when transferred to storage. The storage section, containing old matter unfamiliar to succeeding new file clerks, should be as uncomplicated as possible.

A word of caution may here be offered to file clerks, not to over-estimate system, nor to become over-dependent on it. There is a temptation to over-enthusiasm for system, which may cause one to *serve it*, more than employ it as a facility. Furthermore, long-continued working under specific and definite rules induces a dependence on such pre-designed specifications, a machine-like process of thinking and action, which becomes injurious because it displaces intuition and renders one less able to comprehend new situations and act therein promptly. All should beware of these pitfalls.

Finally, it is to be observed that for every employee there is a satisfaction, amounting nearly to pride, in having a smooth-running filing department. Confusion, impatience and friction are obviated, time is conserved, and work is facilitated and made pleasurable. What is perhaps not yet fully recognized, is that every *user* of the files *contributes* in some measure to the good or bad working of the filing system. To secure best results, *all users* of the files should get acquainted somewhat with their filing system, be interested in it, and co-operate with the file clerk in the little ways they can without inconvenience to themselves.

EFFICIENT CONTROL OF RAILROAD OPERATIONS

By F. L. HUTCHINS

Four functions are required to adequately control any undertaking: (1) Securing complete and accurate knowledge of facts. (2) An analysis of facts to develop the best plan of action. (3) The introduction and maintenance of a plan. (4) Supervision to assure the correct performance of all details of the plan.

Knowledge of facts must be adequate, not only at the inception of the enterprise, but continuously during its progress. Facts are derived from experience; it is upon the experience of the race from the very beginning of existence that many of the facts of the present day depend, but those facts must be supplemented by ever-new facts.

Perfect knowledge of facts can come only through perfect records of experiences; as the records of the past are true so is the knowledge derived from them true; only as present records are exact is the present knowledge exact. As past experiences have been truly recorded, preserved, and available to the present generation, so is its knowledge correct; as present records are made complete and true, so is present knowledge complete and true. Hence it is that the method of making records demands scientific determination; this requirement lies at the base of the science of statistics; in fact, that which often passes for statistics—the tabulation of many figures, the comparison of averages, the setting of aggregates side by side—is not statistics in any sense, for it is only when the original records have been derived through a scientific method that the results can be statistical truths.

To be efficient and successful the inception and conduct of any enterprise must be governed by accurate records; a beginning should never be made until all the facts affecting the enterprise are understood and the probable outcome anticipated. This must be supplemented by accurate records of daily performance if it is to be adequately controlled.

The science of statistics has evolved the laws through which accurate records may be obtained, the principal of which are:

(a) A rigidly exact definition of the facts to be recorded; (b) preparation of a blank upon which the record is to be made; (c) selection of unbiased and careful enumerators to make the record; (d) segregation of the function of sorting, tabulating and aggregating from that of making the records; (e) the use of experts for the analysis of aggregates and extraction of their meanings so that correct knowledge may be had.

In the matter of their records the railroads violate each and every one of these principal laws. A scientific statistical method requires that before the fundamental laws can be complied with there must be a comprehensive plan which includes all of them. In the case of railroads it demands the selection of an expert statistician to have charge, from the making of the original record up to the final analysis.

The method of a record bureau may be outlined as follows: In the first place there must be exact definitions made for each fact that is to be recorded so that the aggregate of any record will be the accumulated instances of the same identical fact, uncontaminated by the admixture of any element not contained within the basic definition; by this means the aggregate will be a single entity, which may be compared with other single entities to establish their relationship and evolve correct conceptions from which alone can come efficient control.

Following the fixing of definitions comes the preparation of the blank upon which the fact is to be recorded. This is no simple matter, as it is too often assumed to be when persons of no experience, or training, are allowed to create blank forms for reports. In form it should be a slip, or card, restricted to the single fact to be recorded; its spaces should be arranged to make for accuracy and ease; in many cases it is possible to so arrange the spaces upon the blank as to make any erroneous entry obvious upon inspection. The required entries should be as simple as is possible; that is, a name, figure, or symbol; it will be found ad-

vantageous in many cases to use a card carrying numbers and symbols which can be punched out to convey the information. The record as to any fact may be fully comprised within a list of questions as shown below, not that every fact requires all of them, for it may be that only one will yield the required information.

- | | | | |
|-------------|----------|------------|----------|
| 1. Where? | 2. When? | 3. Who? | 4. What? |
| 5. Number? | 6. Rate? | 7. Amount? | 8. Kind? |
| 9. Quality? | 10. Yes? | 11. No? | |

Assurance that a record is made of every occurrence of the fact may be had by so arranging the records as to have subordinate ones that must agree in aggregate with a principal one of which they form the parts.

It is obvious that the combined totals of the subordinate facts must agree with the total of the principal fact if the records are correct.

To obtain the most perfect results the record bureau must arrange to have the record pass out of the hands of the recorder, as soon as made, into the hands of persons specially selected by the bureau and subject to its supervision, to be sorted, summarized and tabulated. These persons should be taught the necessity of absolute accuracy in their work; to eliminate all prejudice, and to carefully scrutinize the original records for faults and errors.

The bureau should provide a tabulation sheet for each fact so arranged as to make the totals of the several columns self-improving; it should see to it that the tabulation be made as near the source of records as the situation will permit, but in no case beyond the limit of the division authority. Tabulations should be totaled daily and from these totals there should be daily statements placed before the division officials showing the percentage of efficiency attained, with all instances much above the average, which increase the efficiency percentage, and all those instances below the average, which decrease it.

Such knowledge liberates control from all estimates, biased information, fallacious personal observation and prejudice; it furnishes an accurate basis for adequate control; it points out the places which require study and remedial applications, by which wastes will be lessened and more efficient operation secured.

Duplicate copies of the tabulations going to the record bureau headquarters will be consolidated into aggregates for the whole system from which the higher officials may obtain exact knowledge of the situation, not at the end of a month or two, but from day to day as they may have the need.

Analysis and comparison of the various aggregates from each of the divisions will enable the supervisor of records to deduce the best method of operation, and with this information the executive may require such observance as will raise the efficiency of the system as a whole.

Finally from correlation, comparison and analysis the statistician will be able to point out the weak places, the possible prevention of wastes and improvements in methods; with such guidance the authorities can have experts study the operation on the ground and determine the best course of action in each case.

As a straight line is the shortest distance between two points, and as the scientific method makes the shortest path from the original record to its aggregate for the entire system, it makes for the smallest expense—an expense that will be very much less than that now entailed by the circuitous, duplicated, uncoordinated and misleading reports of the present day.

Having all the facts it is a comparatively simple matter to adequately control the details of operation, to eliminate the "rule of thumb" method, to obviate the necessity of that most fallacious method, personal observation, and to exercise that definite control, by the record, which is the function of the governing head.

Common sense is the wisest dictator, and common sense is but another name for that rarest of things, complete knowledge of facts and their relationships.

EXTENSIBLE TRAP DOOR FOR PASSENGER CARS

The Pennsylvania Railroad has built high station platforms at its New York terminal, at Manhattan Transfer, Rahway and North Philadelphia, and has similar platforms under construction at Wilkesburg and Johnstown on its Pittsburgh division. It is often impossible to build tangent platforms, owing to the physical conditions at stations and a difficulty has arisen in connection with the adoption of the high platform where it is built on a curve, owing to the gap between the end of the car and the platform.

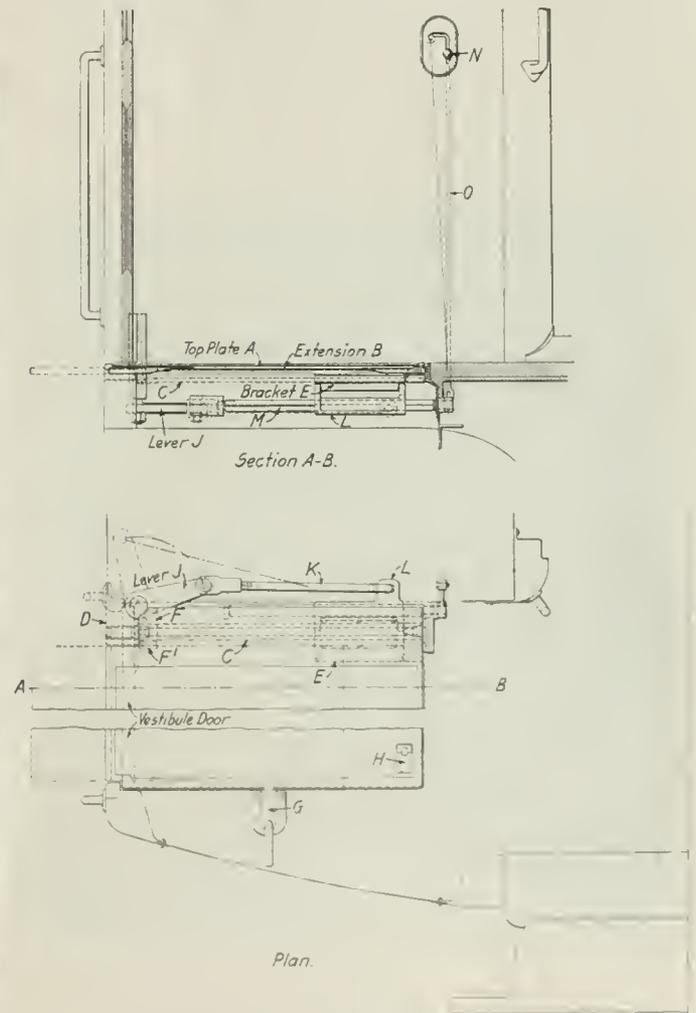

With a view to overcoming this difficulty the Pennsylvania has equipped for trial a steel vestibule car with an extensible trap door patented by Elwood H. Sickels, 213 Woodside avenue, Narberth, Pa., which is designed to bridge the gap between the car and the station platform. The operation of this device is practically automatic. When the trap is down the opening of the vestibule door causes the sliding portion to extend be-

attached to the top plate bracket *F*. When the trap is extended, owing to the fact that it is supported at one side on lug *F'*, and at the opposite side on the usual angle iron ledge, the extended portion is prevented from deflecting when a passenger steps on it. Spring catches *G* and *H* of the usual type are used to hold the trap door down when the door is closed and to hold it up against the vestibule door when it is raised for the use of the steps.

The operating device consists of a bell crank lever *J* attached to the bottom of the vestibule door, the connecting rod *K* and the cam *L* which slides on the square shaft *M*. The rod shown at *O* is attached to the end of a lever which turns the square shaft. The upper end of this rod extends through a slot in the end of the car and is provided with a knob by means of which it may be raised to the position shown by the dot and dash centerline, or returned from that position to its normal position as shown in the drawing. In the latter position the cam *L* on

Trap Extended at a High Platform

Details of Sickels Trap Door Extension

yond the side of the car; closing the door returns it to its normal position. When the trap is to be raised for the use of the step, or when the brakeman opens the door while the train is moving the trap should not be extended. To provide for this feature a small handle is set flush in the end of the car body, by means of which the connection between the door and the trap extension may be disengaged.

The extension trap in outward appearance is like the ordinary trap, and consists of a rubber covered top plate *A* and an extensible portion *B*, which is built in the familiar panel pattern and acts as a support for the top plate. The two parts are hinged on the rod *C* so that they act together when the trap is raised for the use of the step. The hinge rod is hollow and accommodates the flat springs which are adjusted at the bracket *B* to obtain the proper tension. The extensible portion of the trap is supported by bracket *E*, which slides on the hinge rod and lug *I*

the square shaft engages a taper lug on bracket *E*, through which the trap extension is moved by lever *J* and connecting rod *K* when the door is opened. When the knob *N* is in its upper position the cam is disengaged from the bracket on the extension and opening the door has no effect upon the trap. The cam is so designed, however, that when released its front finger is always in position to prevent the trap from being extended independently, thus making it impossible for the trap to be out when the door is closed. The trap is so arranged that it is impossible to raise it when extended, due to interference between the corner of the extension and the hinge bracket *D*. The trap is designed with a uniform extension to take care of the gap at platforms built on curves as sharp as 6 deg. On lighter curves the extension may slightly overlap the platform, the latter, of course, being kept a small step below the floor of the car. Owing

to the varying height of car floors above the top of the rail, due to differences in springs, etc., it has been found impossible to maintain the car floor level with the station platform.

It is unnecessary to provide extra trainmen to attend to the operation of this trip, as with the small hand lever set in proper position, the opening of the vestibule door, whether accomplished by the trainman or passenger, will cause the trap to extend. Owing to the fact that the top plate does not slide, it is impossible for passengers to be thrown by the extension.

CAR LIGHTING GENERATOR WITH UNDER-FRAME SUSPENSION

An electric car lighting equipment has recently been brought out in which the generator is suspended from the underframe of the car instead of from the truck. The deep center sill generally used on all-steel and steel underframe equipment has limited the space available for applying the generator to such an extent that it is difficult to obtain the proper clearances for the generator and the driving belt with truck suspension.

The general appearance of the generator and its suspension and the method of attaching it to the underframe is shown in Fig. 1. The successful operation of this type of suspension de-

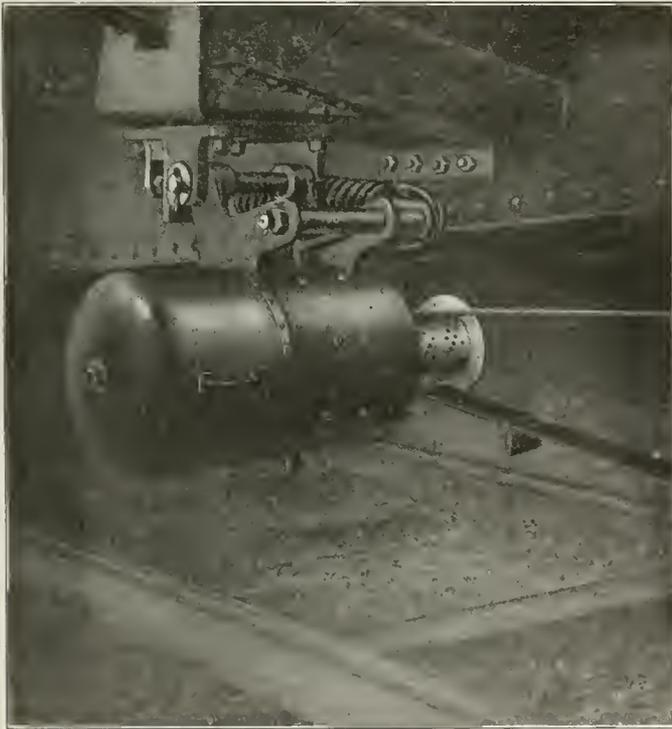

Fig. 1—Generator and Its Suspension Attached to Coach Underframe

pend on the ability to maintain a uniform belt tension through the comparatively wide range of adjustment necessary to take care of the curving of the truck. The method of securing uniform belt tension will be understood by referring to Figs. 2 and 3. Cast on the generator frame are two carrying lugs *A*, which are pivoted to supporting lugs *B* on the suspension casting by a bar, the end of which is shown at *C*. One end of the tension spring is secured to a bracket *E* on the suspension casting, while the other end engages with the lug *D* on the generator frame. The tension of the belt is the result of two varying factors, one of which is the horizontal component of the weight of the generator, and the other the tension of the spring. When the generator is hanging as shown in Fig. 2 with its center of gravity directly under the supporting bar *C*, the weight of the generator has no effect on the tension of the belt, but the tension of the spring has its greatest effect, since the lever arm *CX* is greatest. When the generator is swung

into the position shown in Fig. 3, the effect of its weight is a maximum, while the effect of the spring is decreased due to the shortening of the distance *CX*. The parts are so designed that the combined effect of these two factors is practically constant in all positions. Ample latitude is provided between the two extreme positions shown to take care of belt stretch and the varying location of the axle due to the curving of the truck. The spring is assembled on a carrier under tension.

A simple means of lining the generator with the car axle is provided. The hole for the supporting bar in the lug *B* is slot-

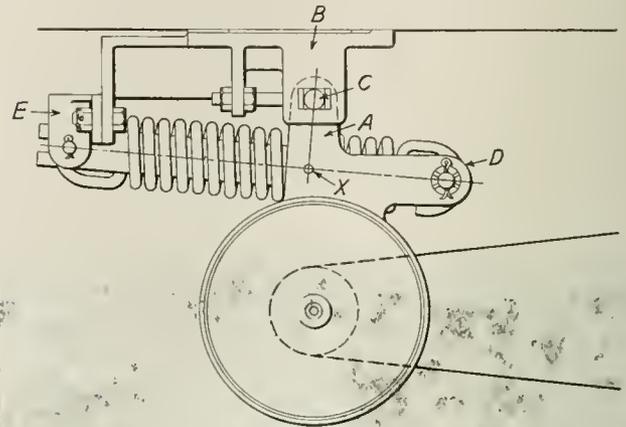

Fig. 2—Generator Position When Spring Effect Is a Maximum

the position of the bar in the slot being readily adjusted and locked by means of a bolt and lock nuts.

The increased belt clearances obtained with this equipment have made possible the use of a type of belt fastener which operates properly on small pulleys. A small armature pulley has therefore been used and a ratio higher than usual obtained between the axle pulley and the armature pulley. The increased speed of the generator thus produced has made possible the design of a generator of lighter weight. This saving together with the reduction of the weight of the suspension itself has resulted in a total reduction for this type of equipment of nearly 900 lb., and the truck has been entirely relieved of the unsprung and unbalanced weight usually suspended from one end of its frame.

The underframe suspension has made possible a considerable

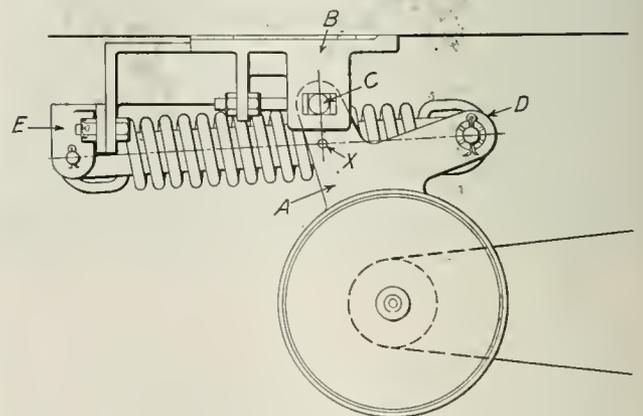

Fig. 3—Position of the Generator When Weight Effect Is a Maximum

increase in the clearance between the generator and the track, and the moving parts of the suspension are still further removed from the track by being placed above the generator. The effect of snow and ice in severe weather conditions is therefore considerably reduced. The suspension of the generator from the car body also produces more favorable conditions with regard to wear since the moving parts, both of the generator and the suspension, receive the full benefit of the truck springs. This equipment is manufactured by the Safety Car Heating & Lighting Company, 2 Rector street, New York.

General News Department

The Erie has announced that surplus strips of right of way adjacent to the tracks between Chicago and Marion, Ohio, are to be leased to farmers.

Governor Henderson of Alabama has vetoed the anti-tipping bill passed by the state legislature on the ground that he did not believe the law could be enforced and that its constitutionality was doubtful.

The Grand Trunk Pacific now uses oil-burning locomotives exclusively on passenger trains throughout the line from Jasper to Prince Rupert, 719 miles. This is the main line on the mountain section, and passes through some of the finest scenery in the Canadian Rockies.

A demonstration of the Gollos automatic train control system will be held on the Chicago, Burlington & Quincy between Sugar Grove and Big Rock, Ill., about 40 miles from Chicago, on August 3 and 4. The installation is to be given exhaustive tests, beginning this week, under the observation of inspectors of the division of safety of the Interstate Commerce Commission.

All of the fast westbound Lchigh Valley freight trains out of New York and Philadelphia during June arrived on time at terminals. Deliveries of this fast freight at Buffalo and Suspension Bridge, which are made to the Lake Shore, the Wabash, the New York, Chicago & St. Louis, the Michigan Central, the Grand Trunk, and the Pere Marquette were made on or before schedule time every day in June.

The demurrage bureaus at Chicago, Milwaukee, Peoria, Minneapolis, Duluth and Butte have been abolished, effective on July 31, and their work will be taken over by the individual roads. The bureaus at Kansas City, St. Louis and Denver are to be continued for a time, although some of the lines have withdrawn as members. The bureaus in the territory east of Chicago and north of the Ohio river were abolished in 1910.

In the news item headed "Southern Railway's Accident Record" in the *Railway Age Gazette* of July 23 it was said that the Southern Railway had carried "16,500" passengers in the year ended June 30 with no passenger killed in a train accident. This should have been, of course, 16,500,000, the point being that this company, operating over 7,000 miles of railroad, had not a single passenger killed in a train accident during the past year.

In connection with double track work in Virginia and North Carolina during the past fiscal year the Southern Railway has eliminated 54 out of 73 grade crossings. By the building of underpasses 20 were eliminated, by overhead bridges 19, and by changing the direction of public highways 15. The 19 which remain are so located as to make their elimination physically impossible or they involve prohibitive damages to abutting property.

The Liberty bell, which was sent from Philadelphia to the San Francisco exhibition, made the journey in a car specially designed and equipped for it by the Pennsylvania Railroad. The car was attached to a special train, carrying the escorting city and state officers, which was in charge of the Pennsylvania Railroad's representatives through the entire journey. The steel gondola car on which the bell rests was equipped with specially designed springs, and festooned with electric lights which brilliantly illuminated the bell at night.

Riley E. Phillips, runner of the bankers' express from New Haven to New York, has completed fifty years in the continuous service of the New York, New Haven & Hartford. As the ranking of engineers he was the recipient of congratulatory messages from officers and fellow employees. He was born in 1846 in Westport, Conn., and served in the 15th Connecticut Volunteers through the civil war. Mr. Phillips entered the employ of the New York & New Haven July 18, 1865, as fireman. At that time the road operated 73 miles and owned 31 engines.

The Pennsylvania Railroad announces that there was no truth in the report that the fast freight train that was derailed near

Metuchen, N. J., on July 25, was loaded with war munitions. Many of the New York daily papers published an account which said that the train contained explosives and that an officer or employer of the road had said that it was only a miracle that the Atlantic Coast Line express, consisting of 11 cars, had escaped destruction, since it had passed the freight train but a moment before the wreck. The company says that as a matter of fact there was no car loaded with explosives of any kind, or even with highly inflammable material, and that the car on which the broken axle occurred was loaded with flour.

The Cincinnati, Hamilton & Dayton is to pay pensions to employees. According to the regulations, announced by General Manager J. M. Davis, with the approval of the receivers, employees who have completed 50 years' service will be retired and will receive 1 per cent of their average salary or pay during the 10 years preceding retirement for each year of service; that is to say, 50 per cent of their average income during the last 10 years. Leave of absence, unattended by other employment, or dismissal followed by reinstatement within one year, will not be taken into consideration on the personal records, nor will furloughs on account of compulsory reduction of forces be counted as a break in the continuity of service for computing a pension record.

A prize of \$50 has been awarded by Major Robert U. Patterson, of the United States Army Medical Corps, payable from the William Howard Taft fund, to James Haley, a brakeman on the Buffalo, Rochester & Pittsburgh, for first aid work by railroad employees. The second prize—\$25—was awarded to Clarence J. Widner, a conductor on the Buffalo, Rochester & Pittsburgh. Brakeman Haley was on a train when he noticed some boys playing with a little express cart on a high bank, and as the train passed, the cart rolled down the bank and threw one of the boys under the train, crushing his leg. Haley made a tourniquet from a woman's apron string and a stone and so prevented the boy from bleeding to death. Conductor Widner applied first aid to a cook in a dining car, whose cheek had been cut through by a can exploding, and prevented the man from bleeding to death.

Car Service Rules Amended

Secretary W. F. Allen announces the adoption by the American Railway Association by large majorities of the amendments to the per diem and car service rules proposed at the meeting of the association last May. Per diem rule 14 is amended so that a road failing to receive empty cars promptly from a connecting line shall be responsible for double the per diem on such cars after the first day for which reclaim is made.

Car service rule 5 is amended so as to require the delivery, with every car, except cars of private ownership, of a continuous home route card or substitute. A car need not be considered as delivered by a connection unless accompanied by the card.

Five Years of Safety First on the North Western

R. C. Richards, chairman of the Central Safety Committee of the Chicago & North Western, has issued a bulletin giving figures showing the results of the safety first movement on this road during the past five years, since the organization of the safety committees. For the fiscal year ended June 30, 1910, the number of employees killed was 107, and the number injured was 8,629. In the five years ended with June 30, 1915, since the safety first committees were organized, the number of killed has been respectively, 90, 70, 69, 63 and 36, and the number of injured, 7,135, 5,907, 6,412, 5,912 and 5,203.

As compared with five years on the same basis as the year ending June 30, 1910, this represents a reduction of 207 in the number of employees killed, a decrease of 38.7 per cent; a reduction of 12,576 in the number of employees injured, a decrease of 29.1 per cent; a decrease of 3 in the number of passengers killed, or 5.4 per cent, of 1,091 in the number of passengers in-

jured, or 23½ per cent; of 216 in other persons killed, or 18.4 per cent, and 252 in other persons injured, or 8.3 per cent. There was an increase of 5 in the number of car repairers killed; of 769 in the number of car repairers injured, and of 6 in the number of unclassified employees injured. This represents a total decrease of 426 in the number of persons killed, or 24.1 per cent, and of 13,919 in the number of persons injured, or 27.4 per cent. All injuries to employees are counted where the injured person lost more than one day's time. No passenger was killed in a train accident on this road during the last two years, during which time approximately 66,000,000 passengers were transported. The mileage of road on June 30, 1910, was 7,953, and on June 30, 1915, was 8,423. Mr. Richards says in the bulletin: "If we could operate the railroad for two months in the last fiscal year as we did in April and June, without an employee being killed, why cannot we do it for six months this fiscal year?"

Department of Public Policy and Relations

The executive Committee of the Associated Railroads of Pennsylvania and New Jersey, which consists of R. L. O'Donnell, general superintendent of the Pennsylvania Railroad, chairman; J. B. Fisher, superintendent New York division of the Pennsylvania Railroad; C. H. Ewing, general superintendent of the Philadelphia & Reading; F. Hartenstein, assistant to general manager of the Lehigh Valley, and P. C. Allen, division superintendent of the Baltimore & Ohio, conducting the campaign against the full-crew laws, recommends a permanent "department of public policy and relations."

The committee's report contains the following:

"In the judgment of your executive committee, the results of this campaign prove conclusively that the railroads should take active measures to identify themselves, in a proper manner, with matters of public interest. They should not become active in political affairs, but they should organize to protect themselves against the enactment of vicious legislation and, at the same time, lend their aid and influence in the passage of proper laws. This will protect not only the railroads but the public as well, who suffer from the financial burdens imposed by ill-advised legislation.

"The foundation for a move of this kind has now been laid. The conviction is strong that our recent campaign went far towards establishing a firm and proper understanding between the railroads, their great body of employees and the public. The interests of all are closely inter-related. Their association is so intimate that there are no hard and fast dividing lines. The public has not always realized this, and possibly railroad officers have not appreciated it as they should. The opportunity for correcting this condition is now presented. The people have demonstrated that, when properly informed, they will support the railroads when their cause is just. They are awakening to the fact that vicious legislation enacted against railroads reacts on themselves.

"The railroads should press forward for what is right and proper. They should do this courageously and without apology, for none is necessary. They should be equally careful not to ask for assistance in obtaining anything to which they are not fairly entitled. They should proceed in the open and depend upon frank publicity as their greatest protection. Fair and honest propositions thrive through publicity—unfair and dishonest propositions are destroyed by publicity.

"In the opinion of your committee, there should be a permanent organization created, which could be known as the 'Department of Public Policy and Relations,' to represent the railroads in matters of public interest and in such other respects as may be deemed proper along the lines adopted by this committee in the recent campaign. The creation of this organization should be made known to the public at the start, and the purposes for which it was established specified.

"If the formation of a general organization of this kind is approved by the railroads interested, it will, of course be necessary to create a similar local organization on each railroad to assist in carrying on the work outlined by the officer in charge of the Department of Public Policy and Relations.

"Your committee strongly recommends that prompt action be taken looking towards the creation of this general organization

and similar supporting organizations on the railroads interested. The details will, of course, have to be worked out later.

"As an indication of the necessity for action along the lines suggested, your committee desires to call attention to the recent creation by the four brotherhood organizations, comprising employees in the train service, of a committee known as the Joint National Legislative Board, to represent the organizations in legislative matters; and similar local committees are being formed at many points. It is, therefore, not only fair, but essential, that the railroads should likewise organize, only on broader and more comprehensive lines.

"The railroads, in addition, should do everything consistent and proper to foster more friendly and intimate relations with business interests in the territory through which they operate by broadening their many business connections, and by giving greater attention to matters of local interest. They should also keep their local representatives and officers in more intimate touch with their security holders residing in local territory.

"In making the foregoing recommendations, your committee is not unmindful of the efforts made in the past to handle matters such as we suggest be handled in the future by the proposed Department of Public Policy and Relations."

Meeting on Plans to Minimize Empty Car Movement

The committee of twenty-five appointed by the president of the American Railway Association, consisting of 15 transportation officers and 10 mechanical officers, representing various sections of the country, in accordance with a resolution adopted at the meeting in New York on May 19, to meet with the Committee on Relations Between Railroads and the Executive Committee of the Master Car Builders' Association and "develop some workable plan to minimize the movement of empty cars in good and bad order," held its first meeting at Chicago on July 26. The committee received and discussed a large number of suggestions which have been made to accomplish the purpose for which the committee was appointed, including, it is understood, several of the plans which are now in effect on different roads and which have been described from time to time in the *Railway Age Gazette*; and adjourned to meet again at the call of the chair for further consideration of the subject.

The committee as appointed, includes the following 15 transportation officers: A. Hatton, general superintendent of car service, Canadian Pacific; Charles Ware, general manager, Union Pacific; W. B. Storey, vice-president, Atchison, Topeka & Santa Fe; H. E. Byram, vice-president, Chicago, Burlington & Quincy; A. C. Ridgway, chief operating officer, Chicago, Rock Island & Pacific; J. T. King, general superintendent of transportation, Atlantic Coast Line; A. J. Stone, vice-president, Erie; J. A. Middleton, vice-president, Lehigh Valley; W. C. Kendall, superintendent car service, Boston & Maine; J. A. Somerville, superintendent of transportation, Missouri Pacific; G. T. Slade, first vice-president, Northern Pacific; E. E. Betts, superintendent of transportation, Chicago & North Western; N. D. Maher, vice-president, Norfolk & Western; A. W. Thompson, third vice-president, Baltimore & Ohio; P. E. Crowley, assistant vice-president, New York Central; A. R. Whaley, vice-president, New York, New Haven & Hartford; and the following mechanical officers: H. M. Curry, mechanical superintendent, Northern Pacific; T. H. Goodnow, assistant superintendent car department, Chicago & North Western; W. H. Lewis, superintendent motive power, Norfolk & Western; F. H. Clark, general superintendent motive power, Baltimore & Ohio; G. W. Wildin, mechanical superintendent, New York, New Haven & Hartford; D. F. Crawford, general superintendent motive power, Pennsylvania Lines West; J. J. Hennessey, master car builder, Chicago, Milwaukee & St. Paul; James Coleman, superintendent car department, Grand Trunk; F. F. Gaines, superintendent motive power, Central of Georgia.

American Association of Demurrage Officers

The semi-annual meeting of the American Association of Demurrage Officers was held at Milwaukee, Wis., on July 21, with 16 members present. Most of the time of the meeting was spent in discussing a plan for a re-codification of the demurrage rules and of various explanations and interpretation of the rules

in the interest of simplification. It was believed that without changing any of the provisions such a re-codification would greatly simplify the rules and eliminate possibilities for misunderstandings. A tentative set of rules was formulated at the meeting and a copy furnished to each member to consider in preparation for an adjourned meeting on the same subject to be held possibly next month.

MEETINGS AND CONVENTIONS

The following list gives the names of secretaries, dates of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next meeting, August 19-20, 1915, San Francisco, Cal.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March. Hotel Statler, Buffalo, N. Y.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday of each month, Pittsburgh.
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.
- INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, C. H. & D., Lima, Ohio. Annual meeting, August 17, 1915, Philadelphia, Pa.
- MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 14-16, 1915, Detroit, Mich.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.
- NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
- RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.
- RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Annual meeting, September 14-17, 1915, Salt Lake City, Utah.
- RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.
- RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.
- ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Annual meeting, September 14-16, 1915, Chicago.
- SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.
- SIGNAL AFFILIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.
- SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, C. R. I. & P., 1134 La Salle St. Sta., Chicago. Annual meeting, September, 1915.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.
- ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
- TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.
- TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.
- TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.
- TRAFFIC CLUB OF NEWARK.—John J. Kantzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, 559 Broad St., Newark.
- TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Genl. Agt., Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh. Annual meeting, 2d Monday in June.
- TRAFFIC CLUB OF NEW YORK.—C. A. Swape, 291 Broadway, New York. Regular meetings, 1st Tuesday in month, except June, July and August, Hotel Astor, New York.
- TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.
- TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., East Buffalo, N. Y. Annual meeting, September 7-10, 1915, Chicago.
- UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1141 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.
- WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigrated Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 3d Monday, except June, July and August, Winnipeg.
- WESTERN RAILWAY CLUB.—L. W. Taylor, 1117 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.
- WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Menadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

Traffic News

The New York State Public Service Commission, Second district, reports that all of the principal roads have issued revised tariffs regulating the sale and use of party tickets and fixing the charges for special trains. The most important change is the reduction of the requirement as to the minimum number of fares to be paid when special baggage cars are used, from 40 full fares to 25 full fares. This change takes effect August 15.

The Baltimore & Ohio with a view to bringing growers in touch with profitable markets, has issued a booklet containing lists of apple and peach growers in Maryland, Virginia and West Virginia and of the larger dealers in the markets of New England, New York, Philadelphia, Baltimore, Pittsburgh, Cleveland, Chicago, Cincinnati, Louisville and St. Louis. In the case of growers, the post office address and variety of fruit grown are given; while in the list of dealers the street address is given.

The Chicago-St. Louis roads have served notice that they will withdraw the \$12 round-trip summer excursion rate between Chicago and St. Louis on August 25. The rate was originally published to apply from St. Louis to Chicago and return. The Business Men's League of St. Louis protested against the rate because it took people to Chicago, while correspondingly low rates were not made to St. Louis. After a conference between the passenger officers and representatives of the league the rate was made effective in both directions.

Having in mind particularly the needs of women who travel without male escorts, the Oregon-Washington Railroad & Navigation Company has appointed women assistants in its city ticket offices in Portland, Seattle, Spokane and Walla Walla. It is expected that this innovation will be so popular that the making of preliminary arrangements for journeys will become a pleasure, and that women who travel will no longer have any inclination to call on their male friends for assistance. This new arrangement went into effect June 20, and if it meets expectations it will be extended to other places on the Union Pacific System.

On Sunday, July 25, the Wabash established three new lines of sleeping cars to Hot Springs, Ark., Houston, Tex., and El Paso, Tex., in connection with the St. Louis, Iron Mountain & Southern, the Texas & Pacific and the International & Great Northern. The cars for Hot Springs and El Paso will be run on the "Banner Limited," leaving Chicago at 12:02 p. m., and the car for Houston will run on the train leaving Chicago at 11:55 p. m. A new train to be known as the Morning Banner Limited, was put in service on the same day from St. Louis to Chicago, leaving St. Louis at 9:01 a. m., daily, and arriving in Chicago at 4:53 p. m.

SWITZERLAND.—The main standard gage lines in Switzerland naturally depend mostly upon international traffic. For a while, although international passenger traffic fell off enormously after the beginning of the war, so that only a very much reduced timetable was in force, the heavy freight traffic between Italy and Germany to some extent compensated the Gothard, and also the Loetschberg-Simplon line for the loss of passenger traffic.

ECUADOR.—Notwithstanding the continued financial stringency from which Ecuador is suffering, a considerable amount of new railway and other construction is being carried out. The greater part of the work is in the hands of American firms. The Curaray railroad, which is being built from Ambato to the navigable waters of the Curaray river, a tributary of the Amazon, is making good progress, and may be completed before the end of the summer. In the meantime, so as to be in readiness for the traffic which is confidently expected to present itself, the contractors are building a large number of cars and putting together several locomotives in their own shops. Already a small private railroad adjoining the Curaray line at a place called Naranjito and which is destined to bring to it considerable traffic, is completed and fully equipped. Hitherto local transportation has been carried on by water; but the advent of the railroad will now cause all carrying to be conducted by road, and the whole district will benefit accordingly.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Complaint Dismissed

Alton Box Board & Paper Company v. Illinois Terminal et al. Opinion by the commission:

The rates on straw from points on the Missouri, Kansas & Texas to Alton, Ill., are not found unreasonable. (35 I. C. C., 1.)

Pect Brothers Manufacturing Company v. Illinois Central et al. Opinion by the commission:

An import rate of 33 cents a 100 lb. on coconut, copra, palm and palm-kernel oils in carloads from New Orleans to Kansas City, Mo., is not found unreasonable or discriminatory. (34 I. C. C., 624.)

W. J. Echols & Company et al. v. Ahnopee & Western et al. Opinion by Commissioner Harlan:

The commission finds that the carriers have not justified proposed increased rates on cheese from producing points in the Green Bay and Lake Winnebago sections of Wisconsin to points in Arkansas, including Fort Smith, Mena and Pine Bluff. It is found, also, that the rates now in effect between the points in question are not unreasonable. (34 I. C. C., 644.)

Cleveland Salt Company v. Pennsylvania Company et al. Opinion by the commission:

The commission finds that charges for the storage of a carload of salt at La Grange, Ga., were not shown to have been unreasonable or discriminatory. The carriers do not ordinarily impose storage charges for profit, but to prevent congestion of their terminals. On that account storage charges of public warehouses do not afford a fair test of the reasonableness of storage charges imposed by carriers. (34 I. C. C., 638.)

Chamber of Commerce of the City of Milwaukee v. Chicago, Milwaukee & St. Paul et al. Opinion by Commissioner Harlan:

The complainant alleges that the rates on grain and flaxseed from certain points in Iowa, Minnesota and South Dakota to Milwaukee, Wis., are unreasonable, and subject that place to a disadvantage, and compares these rates to the rates from the same points in Minneapolis. The commission notes, however, that this comparison leaves out of consideration the rates on these commodities from the territory of origin to other points to which rates are made with relation to the rates to Minneapolis and to Milwaukee. In *Chicago-Duluth Grain Rates*, 27 I. C. C., 216, and in earlier reports, the commission has passed upon the rates on grain and the relationships that should obtain between such rates to Minneapolis and to the ports on Lakes Superior and Michigan from the territory named, and nothing in this case is persuasive that the rates to Milwaukee or their relationships to the rates to other places should now be disturbed. (34 I. C. C., 581.)

Rates on Coal to Omaha, Neb.

In re coal rates from Illinois mines to Omaha, Neb., and other points. Opinion by the commission:

The commission finds that the carriers have justified a proposed increase from \$2.05 to \$2.25 a net ton, in the rate on bituminous coal from points on the Southern Railway in the Belleville district in Illinois to Omaha, Neb., and points grouped therewith (34 I. C. C., 623.)

North Bound Rates on Hardwood from the Southwest

Opinion by Commissioner Hall:

In *Northbound Rates on Hardwood*, 32 I. C. C., 521, the commission held that the carriers, with few exceptions, had justified certain increased rates on hardwood from southwestern points of production to northern destinations. Upon a reconsideration of the case, in the light of the reargument based thereon, and on the record in *Rates on Lumber from Southern Points*, 34 I. C. C., 652, it is now held that the conclusions expressed in the former proceeding should not be changed. (34 I. C. C., 708.)

Rates from Danville, Va.

City of Danville, Va., et al. v. Southern Railway et al. Opinion by Commissioner Clements:

The commission finds that the general adjustment of rates between Danville, Va., and points in the west, east and south is not unreasonable or discriminatory, but in view of readjustments in rates from the west to points in North Carolina and in South Carolina, and the establishment to such points of rates on grain and grain products and on flour lower than the class rates, the carriers will be expected to establish corresponding rates on those commodities to Danville. A rate of \$2.20 a net ton on bituminous coal to Danville from points in the Pocahontas fields of West Virginia is found unreasonable, and a rate of \$2.10 is prescribed for the future. (34 I. C. C., 430.)

Conference Ruling

The commission has issued the following conference ruling:

A company owns and leases cars to railroad companies on a mileage basis and ices and re-ices such cars at various points on the carriers' lines at the expense of the carriers. Inasmuch as the furnishing of cars and the icing of cars are duties imposed upon carriers under section 1 of the act, and following the principle laid down in conference ruling 208 (B), it is held that passes may lawfully be issued to the officers and employees of the car company when traveling solely for the purpose of furnishing or icing cars for shipments over carriers' own lines, but may not lawfully be issued to or used by the officer of the car company when not traveling in the performance of a bona fide service for the carrier.

Rates on Wheat from Hillsdale and Litchfield, Mich.

F. W. Stock & Sons v. Chicago, Milwaukee & St. Paul et al. Opinion by Commissioner Hall:

The through rate on wheat, all rail, from Minneapolis, Minn., via Chicago and Hillsdale and Litchfield, Mich., to New York, and to other points taking New York rates is one cent a 100 lb. higher than on flour. The aggregate rate on wheat shipped from Minneapolis, milled in transit at Hillsdale or Litchfield, and forwarded thence as flour to New York, is 1.7 cents higher than on flour. The commission holds that this aggregate rate is prejudicial to the complainant engaged in milling wheat into flour at Hillsdale and Litchfield, to the extent that it exceeds by more than the established transit charge, the rate in effect on flour from Minneapolis to New York and to other points taking the New York rates. The decision in *Federal Milling Company v. Minneapolis, St. Paul & Sault Ste. Marie*, 27 I. C. C., 696, is cited and followed. (34 I. C. C., 481.)

Grain Elevation Allowances at Kansas City

In re grain elevation allowances at Kansas City, Mo., and other points. Opinion by Commissioner Hall:

The commission finds that the defendants have justified proposed cancellations of tariff provisions for the payment of an allowance of one-fourth cent a bushel now made to elevator operators at St. Louis, Des Moines, Fort Worth, Kansas City, Omaha and other points, chiefly in the Missouri river territory, for elevation of grain and seeds destined to all points west and southwest of the Missouri river, and in Louisiana west of the Mississippi. Cancellations were not proposed on shipments to the Mississippi river crossings or points taking the same rates, or to points east thereof, or upon any shipments when for export. The carriers contended that the elevation in question is commercial rather than transportation elevation as defined in *In re Elevation Allowances to Elevators*, 10 I. C. C., 309, and that there is little occasion for transfer of grain at a terminal market. (34 I. C. C., 442.)

Rates on Fuel Oil to Points in Arizona

Pacific Creamery Company v. Southern Pacific et al. Opinion by Commissioner McChord:

In its original report in these cases, 29 I. C. C., 405, regarding the rates on fuel oil from California producing points to Creamery and Gilbert, Ariz., and the rates on fuel and refined oil from eastern and western producing points to all points in Arizona, the commission made certain readjustments in rates, but the

order in the case was later set aside, because it was felt that the matter had not been given sufficient consideration.

On a rehearing it is now found that the \$6 rate charged by the Southern Pacific on fuel oil from California oil-producing points to Creamery and Gilbert, Ariz., should not exceed \$5 a ton from Los Angeles and \$5.50 from Bakersfield.

Lower rates are also prescribed on refined oil and fuel oil from Bakersfield and Los Angeles to Hayden, Tucson, Douglas, Phoenix and other points in Arizona. The rate on distillate must not exceed 80 per cent of the rate on refined oil. (34 I. C. C., 586.)

Rates to Spartanburg, S. C.

Spartanburg Chamber of Commerce v. Southern Railway et al. Opinion by Commissioner Clark:

Upon complaint against the reasonableness of defendants' class and commodity rates to Spartanburg, S. C., from eastern points, both all rail and ocean and rail; from Buffalo-Pittsburgh territory; from Ohio and Mississippi river crossings and points in Central Freight Association territory; and from Virginia cities, the commission finds:

The ocean-and-rail rates from eastern points to Spartanburg via Charleston, S. C., are discriminatory in so far as they exceed the ocean-and-rail rates to Charlotte, N. C.

All-rail rates from the east to Spartanburg are discriminatory in so far as they exceed the all-rail rates to Charlotte by more than the rates to Spartanburg from the Virginia cities exceed the rates to Charlotte from the Virginia cities.

A fourth section application seeking authority to charge joint through rates from eastern points to Spartanburg higher than the combinations on Norfolk, Va., is denied.

Rates from Ohio and Mississippi river crossings and points in Central Freight Association territory to Spartanburg on traffic moving through Ohio river crossings and Asheville, N. C., are discriminatory in so far as they exceed the rates to Charlotte.

Rates from Buffalo-Pittsburgh territory and from the Virginia cities to Spartanburg are not shown to be unreasonable or discriminatory. (34 I. C. C., 484.)

Lighterage and Storage Regulations at New York

Opinion by Commissioner Meyer:

The railways operating lines which enter New York City from the west and from the north filed tariffs, to become effective January 1, 1915, which proposed changes in their regulations governing charges and service in connection with the delivery and receipt of freight at that terminal. The effect of practically all of these proposed changes would be to increase the charge for the service rendered, either by a direct increase in the rate or by the discontinuance or reduction of service rendered for the rate now in force. The operation of the proposed tariffs was suspended until May 1, 1915, and by a later order until November 1.

The commission finds that the carriers have justified: a proposed reduction of the period of free storage on the New Jersey shore from 10 to 5 days as to domestic inbound freight for delivery at New York; a proposed increased charge of one cent a 100 lb. for each 10 days or fraction thereof for storage on the New Jersey shore of freight for New York delivery after the reduced free storage period; proposed increased charges for handling and storing heavy iron and steel articles, cooperage stock, and sawed stone; a proposed charge of 3 cents a 100 lb. on less-than-carload lots of westbound freight lightered or floated with a carload or more of lighterage free freight, and proposed increased charge for staking, wiring, or cleating shipments of lumber, telegraph poles, etc.

They have not justified: a proposed reduction of the period of free storage on the New Jersey shore from 10 to 5 days of domestic inbound freight destined for coastwise transshipment; a proposed reduction of period of the free storage at railroad pier stations of domestic inbound freight from 3 to 2 days; a proposed reduction of the period of free storage of export less-than-carload freight at railroad pier stations from 10 to 2 days; a proposed charge for loading to or unloading from lighters at other than station piers or vessels of the carriers; a proposed discontinuance of the allowance to shippers or consignees for loading and unloading cars on floats; a proposed minimum charge of \$3 for each lot of westbound less than carload freight lightered or floated with a carload or more of freight which is carried

lighterage free; proposed increase charges for lightering heavy articles; a proposed increase of minimum weight from 10,000 to 20,000 lb. for free lighterage of dressed poultry, butter, cheese, and eggs, and proposed increased charges for towing freight to certain points outside of the free lighterage limits.

As to proposed increased rates in support of which no testimony was offered, it is held that the respondents have not sustained the burden of proof imposed upon them by law, and that such increased rates are not justified.

It is also held that where a terminal service has heretofore been treated by the carriers as a part of the transportation service covered by the freight rate and regularly performed by them, they may not now segregate the service and assign to it a separate charge without taking into consideration, in order to justify such charge, the entire through service of which it forms a part and the compensation heretofore received for such through service.

The tariffs in question are in some respects ambiguous, and also not sufficiently uniform. They will have to be cancelled. Reference is also made to the necessity for a thorough revision of the tariffs governing terminal charges and practices at New York, and it is suggested that a joint tariff, containing such rules as are common to all the carriers, would be greatly preferable to the present diversity. The commission believes that for the convenience of the public, as well as that of the carriers, such a tariff should be issued, or that the rules in tariffs separately issued by the carriers should be harmonized, and that in the preparation of such tariff or tariffs opportunity should be taken not only to harmonize the construction of rules and to clarify the meaning of such as are obscure, but also to eliminate all such features of unjust discrimination or other impropriety as are found to exist in either the present or the suspended rules. (35 I. C. C., 47.)

Trap or Ferry Car Service Charges

Opinion by Commissioner Clements:

These cases relate to certain proposed charges by the carriers for "trap-car" or "ferry-car" service in that part of the country west of New England, north of the Potomac and Ohio rivers, and east of the Mississippi river; and also that part west of the Mississippi river and east of the Rocky mountains, including southwestern territory. The term trap or ferry, strictly speaking, is applied to a car placed at an industry having a private siding, and there loaded by a shipper with less-than-carload shipments, and hauled by a carrier to its local freight or transfer station for handling and forwarding of contents; and also is applied to a car loaded with less-than-carload shipments which is hauled to and placed upon the private track of an industry by the carrier from a local freight or transfer station. Where such cars are loaded to a prescribed minimum, the carriers usually make no charge for the service.

In the east the name "ferry" is given to a car used as above described, and in the west the name "trap" is applied.

The proposed charges, in trunk line territory, except Buffalo, N. Y., and points taking Buffalo rates, and Pittsburgh, Pa., are 2 cents a 100 lb., minimum \$2 a car; in central freight association territory, including Buffalo and Pittsburgh, 4 cents a 100 lb., minimum \$4 a car, with a graduated scale of minimum charges for cars of less than 10,000 lb. loading, and in the territory west of the Mississippi river, including western trunk line, trans-Missouri, and southwestern territories, 4 cents a 100 lb., minimum \$4 a car. The charges proposed by the various carriers, however, are not absolutely uniform.

(The commission's report discusses in detail the elements of the trap-car service, and the charges proposed by the various carriers, etc., which were discussed at the hearing. It will not be necessary to consider these in this abstract because the matter was discussed in the columns of the *Railway Age Gazette* as follows: April 2, 1915, page 761; April 9, page 804; April 23, page 905; April 30, page 950.)

The commission finds that the carriers have not justified the proposed charges.

It maintains that the carriers did not give the matter due consideration and that the tariffs were prepared without proper investigation. It also declares that under the proposed schedules the trap-car service is not to be uniform, for the reason that one carrier proposes to furnish one kind of service and another carrier another and different kind of service, although both carriers

serve the same terminal. It is manifest that if the proposed tariffs are allowed to become effective, they will result in numerous gross discriminations; many of them contain unlawful provisions and ambiguous language open to various interpretations; the tariffs do not agree, even at the same terminal, with respect to the charges proposed; and many of them contain exceptions which eliminate from the proposed charges traffic of vast territories, states, cities, and individual shippers.

The carriers contended that the charges for trap-car service were proposed in response to suggestions of the commission in *The Five Per Cent case*. The commission notes that, while in that case it called attention to the large possibilities for increased net revenues that were afforded by special services which the carriers of the country had been rendering, whatever statements it may have made afford no justification for the hasty preparation and filing of tariffs without proper consideration to avoid ambiguities, conflicts, and unjust discriminations, with which these tariffs in the main appear to abound.

Trap-car service has come to be an organized and definite part of the railroad transportation system. Facilities have been located and operated with a view to the maintenance of the service. The service has measurably assisted industrial development generally. By co-operation carriers and shippers have made the trap car an efficient and important instrument for the expansion of both transportation and commercial business of the country. It is not desirable that anything should be done that will seriously impair its efficiency.

Carriers throughout the country have considered, and now consider, their terminals in cities as units for rate-making purposes. Rates applicable to less-than-carload shipments of freight that move outside of terminal districts, or originate outside and move inside, have included the delivery of cars containing them on industrial tracks. The same is true with respect to carload shipments. This rule is applicable without regard to the distance of the haul within the terminal. Rates on both carload and less-than-carload traffic have been maintained with respect to terminal conditions as they exist. Many of the sidetracks of industries are used by carriers as substitutes for adequate freight terminals. The tracks and loading facilities furnished by shippers relieve the carriers' freight stations, necessitating less outlay for expensive terminals in crowded cities, and in other ways aid in the expeditious and economical handling of traffic which the carriers' facilities are not adequate to handle. Carriers assert, and it is generally recognized, that higher charges are imposed for transportation of less-than-carload shipments than for carload shipments of the same commodities, because the former are loaded and unloaded by the carrier, and because the former entail more terminal and office expense upon the carrier. Should not some consideration be given a shipper who loads and unloads his less-than-carload shipments and furnishes a terminal to the carrier besides?

A carrier performs trap-car service within its terminal. It consists largely of switching cars to and from industry sidetracks from and to freight or transfer stations located within the terminal district. Charges for terminal switch movements are generally made upon a per car basis, and they are usually made with some reference to the amount of the service. There does not seem to be any good reason why trap cars should be excepted from the general rule. If charges are made on a per car basis, they may be graded in accordance with the amount of service required and rendered, and need not, therefore, be uniform at all points.

If a consignor orders a car placed on his private track, and he there loads it with less-than-carload shipments, and then orders the carrier to transport the car to its local freight or transfer station for rehandling and forwarding of contents, the consignor has used the facilities of the carrier to dray his shipments. The carrier has rendered a service which is special in character and for which it would seem to be entitled to fair compensation, with due regard to the service rendered. The same character of service is rendered when a car is held at a local freight or transfer station and inbound less-than-carload shipments are loaded into it and it is then transported to an industry sidetrack. If a car is loaded with less-than-carload shipments and is transported between the sidetrack and transfer point outside the terminal district, on or off the line of the industry carrier, or if the car moves between a gateway and destinations, the service at the terminal is not different from that rendered with respect to car-

load shipments moved from or to the same siding. The so-called trap or ferry car service involved is not a free service.

While conditions may properly warrant a reasonable difference in the charges dependent on the amount of the service rendered, there should be no difference with respect to what trap-car service to which charges are applicable shall consist of. If a trap car is defined so as to include every car moving from or to an industry sidetrack loaded with less-than-carload shipments in one schedule, and in another to include only cars that move between the industry and local freight or transfer stations, unjustifiable discriminations can but be the inevitable result. There is apparently no difficulty as a matter of tariff construction in clearly defining what is a trap car subject to the charge, and to apply the charge only when the service that warrants its imposition is rendered.

If the suspended tariffs were permitted to become effective the inequalities and discriminations pointed out in existing tariffs would be increased, and new discriminations of like character would be multiplied. Under such circumstances it is found that the respondents have failed to justify the charges proposed for trap-car service, or the rules proposed to govern that service, named in the schedules under investigation, and they will be ordered canceled.

It is assumed that respondents will promptly correct tariffs now in effect and remove therefrom the ambiguous and unlawful provisions.

Commissioner Harlan concurs in this decision, saying:

"Although the respondents are required by the report and order of the commission in this proceeding to withdraw the tariffs under suspension on the general ground that they are not in harmony with one another, and will result in many discriminations; and also because they propose charges which in some cases have not been shown by the record to be reasonable, the report nevertheless concedes the propriety of a charge for the so-called trap-car service in its most typical form." (34 F. C. C. 516.)

Express Companies Granted Higher Rate

In the matter of express rates, practices, accounts and revenues. Opinion by Commissioner Clark:

In its order dated July 24, 1913, the commission prescribed a uniform schedule of rates, classifications and rules for the express companies. This order went into effect February 1, 1914, and required substantial reductions in the rates then effective. On March 16 (as noted in the *Railway Age Gazette* of March 19, page 641) the Adams, American and Southern Express companies and Wells Fargo & Company, filed a petition for a rehearing and a modification of the order. They alleged that although they had complied in good faith with the order, their revenues were not sufficient to enable them to continue to furnish an adequate service, and that as a whole they were operating at a net loss. They asked that the order be modified so as to permit them to transpose two of the three factors composing the express rate basis: that is, the collection and delivery allowance of 20 cents a shipment and the rail terminal allowance of 25 cents a 100 lb. It was estimated that this change would afford them approximately 3.86 per cent increase in gross revenue.

It was shown that petitioners' revenues from transportation after payment of express privileges decreased from \$71,264,974, in 1914 to \$64,703,119 in 1915, a decrease of 9.21 per cent. Operating expenses during the same period decreased from \$70,011,535 to \$65,835,930, a decrease of 5.96 per cent. The net operating revenue decreased from \$1,253,438 in 1914 to a deficit of \$1,132,812 in 1915. Operating income decreased from \$68,969 in 1914 to a deficit of \$2,380,894 in 1915, a decrease of \$2,449,863.

The number of shipments handled increased from 191,644,891 in 1914 to 193,870,819 in 1915, an increase of 2,225,928, or 1.16 per cent. The average charge per shipment in 1914 was 75.59 cents, while in 1915 it was 67.66 cents, a decrease of 7.93 cents, or 10.49 per cent. Operating expenses decreased in 1915 \$4,111,991, or 5.78 per cent. Operating expenses and taxes per shipment in 1914 were 37.15 cents as compared with 34.60 cents in 1915, a decrease of 2.55 cents, or 6.86 per cent.

In 1915 petitioners handled 2,225,928 more shipments than in 1914, with a decrease in revenue of \$13,680,810 and a decrease in operating expenses of \$4,111,991.

While the financial condition of certain of the petitioners is more favorable than that of others, it clearly appears that as a whole they are operating at a loss. In the original order they were treated largely as one company and are entitled to similar treatment now. The commission therefore finds that the present revenues are not adequate.

The present express rates are composed of three factors: First, an allowance of 20 cents a shipment for collection and delivery service which does not vary with the weight or distance. Second, a rail terminal allowance of 25 cents a 100 lb., which varies with the weight but not with the distance. Third, the rail transportation a 100 lb., which varies with both the weight and the distance and also varies in the different zones. The petitioners ask a modification so as to permit of the transportation of the first and second factors.

This change would result in increases on first-class shipments approximately as follows: 1 to 5 lb., 5 cents each; 6 to 29 lb., 4 cents each; 30 to 49 lb., 3 cents each; 50 to 70 lb., 2 cents each; and 71 to 99 lb., 1 cent each.

By actual count of shipments on two typical days for each company in 1915, petitioners have estimated that they handled during that year in interstate movements and in the states in which the interstate scale has been adopted 119,544,043 first-class and 20,191,646 second-class shipments, each less than 100 lb. in weight; the first-class shipments being 61.66 per cent and the second-class 10.41 per cent of the total number of shipments. By a similar method they have estimated the average weight per first-class shipments of less than 100 lb. to have been 21.36 lb. and per second-class shipment of less than 100 lb. 52.17 lb. during the same period. Using these average weights for first and second-class shipments, the additional revenue per first-class shipment under the proposed plan will be 3.93 cents, and on second-class, 1.79 cents. At the additional revenue of 3.93 cents per first-class shipment of less than 100 lb., the 119,544,043 shipments handled in the year 1915 would have yielded an estimated additional revenue of \$4,700,471. At an increase of 1.79 cents per shipment the 20,191,646 second-class shipments of less than 100 lb. would have yielded an estimated additional revenue of \$362,162, or a total estimated additional revenue from both classes of \$5,062,634. Petitioners' gross transportation revenue for the year 1915 was \$131,173,669. The estimated increase of \$5,062,634 would be approximately 3.86 per cent increase in gross revenue.

While it is true that under the proposed plan the small shipments will bear the greater share of the increase, the commission does not think that any unjust discrimination will result therefrom, because it was on the small shipments that the greater reduction was made by the rates which it prescribed.

With respect to a suggested change in the base rate in zone 1, which is the territory east of the Mississippi and north of the Ohio rivers, where the companies now operating at a loss do the greater portion of their business, the commission notes that it appears that the present 100-lb. rates approximate the rates that were in effect prior to February 1, 1914, and cannot be increased to the extent of providing the necessary additional revenue without destroying the business. To provide for an increase of approximately \$5,000,000 it would be necessary to increase the 100-lb. rates substantially, many of which would then exceed those in effect prior to the effective date of our order, particularly the short haul rates.

No definite objection was made to the petitioners' prayer for relief.

A western state commission suggested, although not on the record, that the relationship of the rates in the west to those in zones farther east is not what it should be, and that if any change is to be made a revision of the whole scheme of rates should be made. The investigation which resulted in the original order was most exhaustive. The present plan has given very general satisfaction and has provoked but little complaint. Petitioners have co-operated earnestly and fairly in an effort to make the new plan a success and to secure uniformity of rates for state and interstate business. "If they are, in face of those efforts, operating at a loss under rates prescribed by us, and it clearly appears that they are, they are entitled to reasonable relief promptly, and without awaiting the result of another general investigation that would consume two or three years."

New scales of rates are ordered in conformance with the findings herein. (35 I. C. C., 3.)

STATE COMMISSIONS

The Illinois Public Utilities Commission has announced a series of hearings to be held beginning on August 2, on proposed advances in the rates for industrial switching from 10 cents a ton with a minimum of \$2 and a maximum of \$4 a car to 15 cents a ton with a minimum of \$6 a car on coal, and 20 cents a ton with a minimum of \$5 a car on other commodities.

COURT NEWS

The hearing before Judge Youmans of the United States district court at Oklahoma City on the application of the Missouri, Kansas & Texas, the Chicago, Rock Island & Pacific, the St. Louis & San Francisco and Atchison, Topeka & Santa Fe, for an injunction restraining the operation of the Oklahoma two-cent fare law, was resumed at Oklahoma City on July 19. The hearing was adjourned last March on account of the illness of the judge. The first witness for the railroads was A. Hermany, auditor of disbursements of the Chicago, Rock Island & Pacific, who presented and explained a number of exhibits showing the separation of the expenses of the road between state and interstate traffic, between passenger service and freight service, and between line haul and terminal expenses. These figures were based on a most exhaustive test of the traffic and operations of the road in order to directly allocate as many as possible of the expense items. Mr. Hermany said that out of every \$100 spent by the roads for operating expenses in Oklahoma \$67 could be directly allocated to state business. He was followed by E. W. Peabody, statistician for the Missouri, Kansas & Texas, and A. L. Conrad, assistant general auditor of the Atchison, Topeka & Santa Fe. W. E. Symons, consulting mechanical engineer of Chicago, also testified regarding the division of expenses.

Validity of Bond Issue on Consolidation

Certain stockholders of the New York Central sought to enjoin the company from issuing 4 per cent interest-bearing bonds to replace and retire outstanding 3½ per cent bonds as an incident of the proposed consolidation with the Lake Shore & Michigan Southern. The plaintiffs' contention was that the new issue would violate both section 141 of the New York Railroad Law and section 55 of the Public Service Commissions Law. The New York Appellate Division holds that the issue is not an issuance of bonds against, or as a lien on, a contract for consolidation or merger, contrary to Public Service Commissions Law, section 55; and that the prohibition in Railroad Law, section 141, against increase of capital and issuance of bonds in connection with a railroad consolidation, being in derogation of the general authority to consolidate, must be strictly construed, and limited to indebtedness already accrued; that is, to principal and past-due interest. (*Continental Securities Company v. New York Central*, 153 N. Y. Supp., 879.)

Stop, Look and Listen Rule

The Vermont supreme court holds it to be well settled in that state that it is the duty of a traveler approaching a grade crossing to look and listen for approaching trains, and, if necessary to enable him to listen effectively, to stop to listen. He must continue to look and listen as he approaches the track until the last moment when the discovery of the train would have availed for his protection. In an action for injuries to the driver of a wagon at a crossing, it appeared that when the plaintiff reached a point 78 feet from the crossing, where he had a clear view along a straight track for at least 1,000 feet, the approaching train must have been within his range of vision. Assuming that his rate of travel did not exceed 2½ miles an hour, or 3½ feet per second, which gave him the benefit of any doubt, and that the train maintained to the time of the accident a uniform speed of 20 miles per hour, or 29½ feet per second, though of necessity it must have been less, when he reached the point 78 feet from the crossing the train was 624 feet away and in full view. From that point on, as he approached the crossing, there was no time when he could not have seen the train, if he had looked, and no time when, in the circumstances, he could have failed to hear its approach, if he had listened attentively. Judgment for the

plaintiff was reversed, the plaintiff's contributory negligence being conclusively shown, and judgment was entered for the defendant.—*Harrington v. Rutland* (Vt.) 94 Atl. 431.

Overflowing Lands—Proof of Standard Methods of Construction of Bridges

In an action against a railroad for overflowing lands by the manner of construction of bridges across streams, whereby the bents were placed at right angles to the rails, the railroad company examined a number of expert engineers on the question of the proper construction of the bridges involved, and especially upon that feature of the construction complained of. It undertook to show that the bridges were properly constructed in that respect, and that such method of construction was necessary for the purpose of safety, and also that this method of construction was recognized as standard by construction engineers, and that it was in general use as such. This evidence was excluded by the trial court, principally on the ground that it was an effort to prove custom and practice. On appeal the Iowa supreme court holds that the testimony should have been admitted, because, while the fact that a particular neglect may be customary does not change its character, standard methods of construction, recognized as such by those experienced and learned therein, may be shown by appropriate expert testimony.—*Thompson v. Illinois Central* (Iowa) 153 N. W. 174.

Hepburn Act—"Knowingly" Giving Unlawful Concessions

The Erie appealed from a conviction of a violation of the Hepburn act. The specific charge was that it had applied to an interstate shipment an "import rate," when a "domestic rate" was the lawful one, and had thereby granted a concession—the import rate being the lower. The "import rate," according to the filed and published tariffs of the company, was applicable "only on property received direct from the ship's side or dock of steamer upon which imported or from customs bonded warehouses or appraisers' stores." The property had been landed at an entirely different dock, and later transported to the dock and warehouse from which the Erie took it. There appeared to have been negligence on the part of the company's agents in not making proper inquiries as to whether the property had been originally landed at the latter dock. But the New Jersey federal district court held that in a case like this negligence is not sufficient to charge knowledge. A company is not guilty of "knowingly" granting an unlawful concession in rates, contrary to the Hepburn act, where it is not shown that it knew, or wilfully remained in ignorance of, the facts which made the rates unlawful. A new trial was therefore granted.—*United States v. Erie*, 222 Fed. 444.

Operation of Sunday Trains

For several years the Great Northern operated on its line between Grand Forks, N. D., and Duluth, Minn., two trains, each way daily, including Sunday, one a day train and the other a night train. It discontinued the Sunday day train. The Minnesota Railroad and Warehouse Commission ordered it restored. The state district court found the order "unlawful and unreasonable and not justified by public necessity or convenience." The evidence showed that the Sunday day train passenger traffic was mostly a traffic of pleasure or convenience, with few instances of necessary travel, and that it rendered the incidental service of distribution of Sunday newspapers. The supreme court of Minnesota, on appeal, holds the order to be unreasonable and void under the facts of the case, on the ground that the compulsion of Sunday labor and of the operation of Sunday local passenger trains is contrary to the legislative policy of the state, although under some circumstances the operation of Sunday trains may be made compulsory. No such question appears to have ever before arisen, and no railroad commission appears ever before to have sought to compel the operation of ordinary local day passenger trains on Sunday. In one reported case in Missouri the state legislature by statute imposed such a duty and the statute was sustained by a divided court, *State v. C. B. & Q.*, 239 Mo. 196, 143 S. W. 785. Three out of the seven judges participating dissented, being of the opinion that the legislature had no constitutional power to compel such Sunday operation, and this although no specific provision is found in the Missouri constitution purporting to forbid it.—*State v. Great Northern* (Minn.) 153 N. W. 247.

Obstruction of Street Delaying Fire Department—Liability of Railroad for Loss by Fire

Action was brought against the Northern Pacific for damage to the plaintiff's building caused by fire. The fire was not started by the railroad. One of the trains, standing on the track five minutes, blocked Central avenue, in Wichita, and delayed the fire department three or four minutes in reaching the fire. By one city ordinance, trainmen were prohibited from blocking any street for more than five minutes, and by another they were prohibited from stopping trains, engines or cars on Central avenue. The train was stopped under the rule of "Safety First," to repair the brake rigging on the locomotive, which had fallen down and was dragging on the track, in which condition it might derail some part or all of the train. It was held by the Kansas supreme court that it was not necessary for the railroad to pull its train off Central avenue, and take the chances of wrecking the train, destroying its property, and of injuring its employees and others, provided it pulled the train off the streets as soon as it safely could.—*Walker v. Mo. Pac.* (Kan.) 149 Pac. 677.

Regulation of Rates—Special Classes—Commutation Rates

In a suit by the Pennsylvania to enjoin enforcement of an order of the Maryland Public Service Commission fixing the maximum charge for commutation tickets, the Maryland court of appeals held that the action of the state in establishing, through the commission, a single fare rate does not exhaust its power to regulate transportation charges, and it may thereafter make any reasonable regulation affecting mileage or commutation rates, leaving them so as to bring a proper return to the railroad for the specific service, independent of the return to it from other services. In determining the reasonableness of a commutation rate, the court held the entire net revenue of a railroad, from whatever source derived, is not to be looked to, though there are cases supporting the contrary view, as *Railway Co. v. Smith*, 60 Ark. 221, 29 S. W. 752; *P. & A. v. Florida*, 25 Fla. 310; *People v. St. L. T. & H.* 176 Ill. 512. It did not, however, consider these cases in accord with the general trend of decision. In *L. & N. v. Railroad Commissioners* (D. C.) 208 Fed. 35, certain passenger rates were complained of, and the evidence tended to show that the operation of the road as a whole was unprofitable, mainly because it was transporting iron and coal at or below cost, and it was there held that the intrastate passenger rate could not be attacked because the entire business of the road did not yield a fair return. In *Railroad Commissioners v. Illinois Central*, 20 I. C. C. 181, the question arose with regard to certain tolls of the Dunleith & Dubusque Bridge Company, of 25 cents per passenger, for local traffic, when the same charge was not made on through tickets, and it was there held that the fact that the net earnings of the carrier may be large does not of itself justify the commission in fixing a rate at less than is reasonable for the service, all other things being considered. In the commutation rate cases, 21 I. C. C. 428, the Interstate Commerce Commission had under consideration the commutation rates of eight railroad companies running into New York, most of them from points in New Jersey. Commissioner Harlan said that "the carriage of a commuter differs in many respects from other passenger traffic and is an independent, special service"; and, while the commutation rates of the Pennsylvania were then reduced, in so doing no account was taken of the passenger returns from the entire Pennsylvania system, nor of the net revenue from the combined receipts of freight, passenger and express business. The same principles underly the decisions in the *Minnesota Rate Cases*, 23 U. S. 352, 33 Sup. Ct. 729, *Interstate Com. Comm. v. Northern Pacific*, 222 U. S. 541, 32 Sup. Ct. 108, and *Interstate Com. Comm. v. L. & N.*, 227 U. S. 88, 33 Sup. Ct. 185. The same question was before the Maryland court of appeals in *Public Service Comm. v. U. C.*, 122 Md. 355, where Judge Thomas, on page 390, said: "We cannot adopt the view that common carriers may be required to perform services at rates less than the actual cost of such services, for that would amount to confiscation, and would ultimately defeat the very ends they are designed to accomplish, namely, to subserve the public good and public convenience."

The evidence being insufficient to show that the rate fixed by the commission was unreasonable and confiscatory, it was held that the rate be allowed to go into effect to determine its character by actual experience, subject to the right of the road at any future time to seek its abrogation by judicial action for cause shown.—*Pennsylvania v. Towers* (Md.) 94 Atl. 331.

Railway Officers

Executive, Financial, Legal and Accounting

Roberts Walker, general counsel for the receivers of the Chicago, Rock Island & Pacific, has resigned. He has offered to aid the receivers of the road at any time his knowledge of its legal affairs may be needed, and this offer has been accepted.

Operating

It was erroneously reported in last week's issue that J. P. Falk, general yardmaster of the Chicago, Burlington & Quincy, at Kansas City, Mo., had been appointed superintendent of terminals at Kansas City. Mr. Falk has been appointed assistant superintendent, with headquarters at Kansas City.

W. M. Whitenton, formerly general manager of the first district of the Chicago, Rock Island & Pacific, and later with the Chicago Electrification Committee, has been appointed operating assistant of the Texas & Pacific, reporting to the general superintendent and first vice-president, with headquarters at New Orleans.

John Edward Maun, whose appointment as superintendent of the Central Vermont, with headquarters at St. Albans, Vt., has already been announced in these columns, was born on June 28,

J. E. Maun

and was educated in the public schools of his native town and at Randolph Academy. He began railway work on May 1, 1876, with the Central Vermont, and served for two years as brakeman, and then for two years as freight conductor on the same road. He was then for one year yardmaster and later for four years passenger conductor on the Mexican National, now a part of the National Railways of Mexico. He subsequently served for 30 years as passenger conductor on the Central Vermont, until his appointment in January, 1915, as assistant superintendent of the

same road, and the following May was promoted to superintendent, with headquarters at St. Albans, as above noted. Mr. Maun represented the city of St. Albans in the Vermont legislature during 1910-1911, and is now mayor of St. Albans.

S. T. Cantrell, assistant superintendent of the Baltimore & Ohio at Cumberland, Md., has been appointed acting superintendent of the Cumberland division, with headquarters at the same place, succeeding C. Lee French, deceased. C. H. Lee has been appointed terminal trainmaster of the Cleveland terminal of the same road, with headquarters at Cleveland, Ohio. W. J. Head has been appointed road foreman of engines and trainmaster of the C. T. & V. district and the Cleveland branch; his jurisdiction as road foreman will extend over engine crews at the Cleveland terminal.

Traffic

C. J. Chisam, assistant general freight agent of the Chicago Great Western at Omaha, Neb., has resigned, effective August 1, to engage in other business.

Edwin F. Smallwood has been appointed division freight agent of the Boston & Maine, with office at Springfield, Mass., and the position of traveling freight agent at Springfield, Mass., has been abolished, and Josiah D. Greene has been appointed division freight agent, with office at Troy, N. Y., succeeding E. W. Abbott, promoted.

O. R. Bromley has been appointed division freight agent of the Michigan Central, with headquarters at Grand Rapids, Mich., vice E. A. Treadway, retired, and Thomas Evans has been appointed general agent, with office at London, Ontario.

Roy Hinchman, formerly agent of the Baltimore & Ohio at Athens, Ohio, was erroneously announced in last week's issue to have been appointed general passenger agent of the Cincinnati, Hamilton & Dayton, with headquarters at Dayton, Ohio. Mr. Hinchman was appointed traveling passenger agent only, but has since been transferred back to his former position.

J. A. Stewart, general passenger agent of the second district of the Chicago, Rock Island & Pacific at Topeka, Kan., has had his jurisdiction extended to include the St. Louis territory, and his headquarters have been moved to Kansas City, Mo. P. A. Auer, assistant general passenger agent at Chicago, has been transferred to the second district, with headquarters at St. Louis, Mo. It was erroneously stated in last week's issue that C. B. Sloat, assistant general passenger agent at Little Rock, Ark., had been appointed general passenger agent of the third district, with headquarters at St. Louis, Mo. His jurisdiction has been extended over the district formerly in charge of George H. Lee, who resigned to become general passenger agent of the Lehigh Valley at New York City.

OBITUARY

J. Frank Chapman, manager and purchasing agent of the Thousand Islands Railway and the Oshawa Railway, with headquarters at Gananoque, Ont., died at his home in that place July 19.

Dr. William H. Stennett, auditor of expenditures of the Chicago & North Western, died on July 22, at the home of his daughter in Oak Park, Ill. He had been connected with the North Western continuously for 43 years.

John Hasbrouck Scoville, a director of the Detroit, Toledo & Ironton, and a member of the stock exchange firm of Maxwell & Scoville, New York, died at his summer home at North Andover, Mass., on July 25, at the age of 72.

Chester Lee French, superintendent of the Cumberland division of the Baltimore & Ohio, with headquarters at Cumberland, Md., died July 17, at Atlantic City, N. J., at the age of 48. Mr. French's death followed an illness of several months' duration.

R. H. Shoemaker, formerly general freight agent of the Dayton & Michigan, now a part of the Cincinnati, Hamilton & Dayton, died at his home in Saratoga Springs, N. Y., on July 28. Mr. Shoemaker was at one time superintendent of the Dayton Short Line, now a part of the Cleveland, Cincinnati, Chicago & St. Louis, and later vice-president of the St. Louis Bridge & Transfer Company.

C. E. Spagnoletti, formerly and for 37 years superintendent of telegraph of the Great Western Railway of England, died on June 28 at the age of 83. Mr. Spagnoletti was inventor of numerous useful devices in telegraphy and railway signalling. He was consulting electrical engineer for the construction of the City & South London Railway, and was president of the Institution of Electrical Engineers (England) in 1885.

Sir Sanford Fleming, civil engineer, scientist and a former railway builder, died on July 22, at Halifax, N. S., at the age of 88. He was born in Scotland and went to Canada in 1848. Four years later he became an engineer on the Ontario, Simcoe & Huron, now a part of the Grand Trunk, and when the construction work on this line was finished he was appointed chief engineer, remaining in that position for 11 years. In 1863 he was appointed to make a survey of the line connecting the maritime with the upper provinces of Canada and later was in charge of the construction of this line which was opened in July, 1876, and was known as the Intercolonial. He advocated the construction of a line to the Pacific coast and from 1871 until 1880, was engineer in chief to carry out the surveys on lines which now form a part of the Canadian Pacific, and he also planned and built the railway across the Island of Newfoundland. He spent the latter years of his life in literary pursuits and scientific research, and was the author of a number of books on scientific subjects.

Equipment and Supplies

LOCOMOTIVE BUILDING

THE SHEVLIN HIXON COMPANY, Minneapolis, Minn., has ordered one 60-ton three truck Shay locomotive from the Lima Locomotive Corporation.

THE CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS will build five Pacific type locomotives at its Beach Grove, Ind., shops, to be completed before the end of the year.

CAR BUILDING

THE ATLANTIC COAST LINE is in the market for 800 box cars.

THE INTERNATIONAL AND GREAT NORTHERN is in the market for 2 coaches and 3 chair cars.

THE BALTIMORE & OHIO's order for 2,000 hopper cars, reported in the *Railway Age Gazette* of last week, was divided as follows: American Car & Foundry Company, 1,000; Cambria Steel Company, 500, and Pressed Steel Car Company, 500.

IRON AND STEEL

THE CHICAGO, INDIANAPOLIS & LOUISVILLE has ordered 6,000 tons of 90-lb. rails from the Illinois Steel Company.

THE BOSTON & ALBANY has ordered 600 tons of bridge steel from the Pennsylvania Steel Company.

THE PHILADELPHIA & READING has ordered a quantity of steel from the Pennsylvania Steel Company for a bridge at Milton, Pa.

THE MINNEAPOLIS & ST. LOUIS and the CHICAGO & NORTH WESTERN have ordered 764 tons of steel for a viaduct at Marshalltown, Iowa, from the Minneapolis Steel & Machinery Company.

THE SOUTHERN has ordered 4,500 tons of rails from Tennessee Coal, Iron & Railroad Company and 300 tons of steel for a bridge over the Rivanna river in Virginia from the Virginia Bridge & Iron Company.

SIGNALING

The Southern Railway has started work on the installation of electric automatic block signals on the line from Orange, Va., to Arrowhead, 36 miles; Elma, Va., to Amherst, 18.5 miles, and Whittle, Va., to Danville, 23 miles. All of this is double track nearing completion, except 9 miles of single track between Whittle and Dry Fork. This is on the main line between Washington, D. C., and Atlanta, Ga., and when completed will make a total of 415 miles protected by automatic block signals out of the 649 miles between Washington and Atlanta.

The Western Maryland has closed a contract with the Union Switch & Signal Company for the new automatic signals, noted in the *Railway Age Gazette* July 16, page 141. The installation extends from Big Pool, Md., to Williamsport, 13 miles, and from Hagerstown, Md., to Emory Grove, 67 miles. On this 80 miles of track there will be 169 signals, 27 highway crossing bells and 36 switch indicators. This, together with the 60 miles of signals put in last year between Cumberland, Md., and Big Pool, completes the automatic signaling of all the single track line between Baltimore and Cumberland.

The Southern Railway is to install a mechanical interlocking plant of 40 levers at Danville, Va., at the connection of the new main line of the Danville division with the Richmond division. In connection with the double tracking of the line, the company will install a 48-lever mechanical interlocking at Charlottesville, Va. This interlocking will include the crossing with the Chesapeake & Ohio, and will have the power-operated home and distant signals. At Embree, S. C., the company will put in a mechanical interlocking at the crossing of the Edisto River Lumber Company's road. Here the signals will stand normally clear for the trains of the Southern Railway.

Supply Trade News

The A. M. Byers Company, Pittsburgh, Pa., has increased its capital stock from \$1,500,000 to \$2,000,000.

The Sauvage-Ward Brake Company, Inc., New York, has recently changed its name to the Smith-Ward Brake Company, Inc.

The Brown Hoisting Machinery Company, Cleveland, Ohio, has taken an order for 38 locomotive cranes for the Russian government.

George F. Alderdice has resigned as assistant general manager of sales of the Republic Iron & Steel Company, to become assistant to the president of the Brier Hill Steel Company.

The Kilbourne & Jacobs Manufacturing Company, Columbus, Ohio, is reported to have received an order from Russia for 500 all-steel cars and to be negotiating for orders for industrial cars to be shipped to France.

The Westinghouse Electric & Manufacturing Company has received an order from the Russian government for \$35,000,000 of shells, and is reported to have also received an additional order for \$62,000,000 worth of rifles.

The Roberts & Schaefer Company, Chicago, has received a contract from the Canadian Northern for the building of two 200-ton capacity, modern automatic locomotive coaling plants for installation at Big Valley, Alta., and at Kindersley, Sask. The contract price is \$21,000.

The Macleod Company, Cincinnati, Ohio, which was announced in the issue of July 9 as having received honorable mention for its exhibit at the Panama-Pacific International Exposition at San Francisco, has more recently been awarded, instead, a silver medal. This has been given for its exhibit of locomotive tire heaters, rivet forges and portable oil burners.

The American Steel Export Company, which has been organized to handle the export trade of the Cambria Steel Company, has established general offices in the Morris building, Philadelphia, in connection with the general offices of the Cambria company. The officers of the company are William H. Donner, president; C. B. McElhany, first vice-president; W. S. Ottinger, second vice-president, and O. Kafka, general manager of sales.

The United States Light & Heat Corporation, Niagara Falls, N. Y., has been incorporated with a capital of \$7,000,000 to manufacture machinery, batteries and apparatus for the production of electric light and heat. It is a reorganization of the United States Light & Heat Company, and will take over and continue the operation of that company's plant at Niagara Falls. G. M. Walker, A. L. Fowle and A. S. Jones, 60 Broadway, New York, are the directors.

The strike of the molders and coremakers which has been in progress at the Depew plant of the Gould Coupler Company for the past 18 months, was called off last Monday evening by the union. The plant has been in continuous operation since a few days after the strike began, but the union maintained its pickets until a short time ago. It is understood that the company has made no concessions to the men, although it is stated that a number of men will be taken back as soon as feasible.

The Roberts & Schaefer Company, Chicago, has issued the following announcement: "We desire to announce that we have voluntarily released our control over the Holmen patents as relates to locomotive coaling plant equipment, and have canceled our agreement with Mr. Holmen. Two years ago we secured control of an improved design of elevating machinery which, while retaining all of the advantages of our previous equipment under the Holmen patents, entirely eliminates the bucket latches, closing springs, and trippers required by those patents. This change greatly improves the service and reliability. The results obtained after two years' operation of many representative plants, warrants us in making this form our standard, which we will hereafter employ in all locomotive coaling stations designed and built by this company."

John Havron, president of the Rogers Locomotive Works, Paterson, N. J., from 1901 to 1908, and more recently an officer of the Walker & Bennett Car Seat Company, died in Jersey City on Saturday, July 25, at the age of 56, from cancer of the stomach. Mr. Havron started his career as a clerk in the employ of the old Rogers Locomotive & Machine Works in Paterson, N. J., in 1881. He gradually worked his way up to the position of secretary of the company, but left in 1893 to go to Chicago as the western representative of the Latrobe Steel Company, Latrobe, Pa. In 1901 when the Halloran and Smith syndicate bought the Rogers Locomotive Works, he returned to that company as its president and held that position until October 1, 1908, leaving at that time to go with the Latrobe Steel & Coupler Company, with office at Chicago.

Henry S. Hawley, president of the Railroad Supply Company of Chicago, died on July 22, at his summer home in Saunders-town, R. I. He was born on August 12, 1851, at Bridgeport,

H. S. Hawley

Conn. From 1874 to 1883 he was actively engaged in bridge contracting and in promoting and constructing railroads, during which time he was identified with the Grank Trunk from Valparaiso, Ind., to Thornton, Ill., and also purchased at Master's sale the Chicago & Southern, now owned by the Grand Trunk. In 1883 he was the promoter of the Chicago & Wisconsin, which was leased to and completed by the Chicago, Wisconsin & Minnesota, and was president of the latter road during its construction from Chicago to Schlesingerville, Wis. This is now a part of the Minneapolis, St. Paul & Sault Ste. Marie. He was general agent and purchased a part of the right of way of the Chicago Great Western, and on its completion was appointed general agent in charge of traffic and leases. From 1890 to October, 1893, he was general agent in charge of traffic of the Chicago & Northern Pacific, and later was general agent and treasurer for the receivers of the same road. On July 1, 1897, he was made general agent and treasurer of the reorganized company, which was called the Chicago Terminal Transfer Company, and on February 1, 1899, he was appointed traffic manager, treasurer and assistant secretary of the same road. On June 1, 1902, he was elected president of the Railroad Supply Company, which position he held at the time of his death.

TRADE PUBLICATIONS

ALONG THE LACKAWANNA.—This is the title of an extremely attractive booklet which has recently been issued by the passenger traffic department of the Delaware, Lackawanna & Western to introduce the reader to the various points of interest along the line of the Lackawanna Railroad between New York and Buffalo and its connecting lines to Chicago. The booklet contains a few words about each of the stations or towns passed through on the route and a large number of illustrations of the things of interest which may be seen on the way, the two best of these illustrations showing the skylines of New York and Chicago, respectively.

RUSSIAN STEEL TRADE IN 1914.—Russia's pig iron production in 1914 is estimated at 4,270,000 metric tons against 4,555,000 tons in 1913. The falling off was entirely in the latter half. The furnaces in Poland were closed by the war while those in the Ural and Moscow districts suffered. In South Russia the pig iron output was 3,008,000 tons in 1914 and 3,050,000 tons in 1913; that of finished iron and steel, 2,314,000 tons in 1914 and 2,275,000 tons in 1913.

Railway Construction

DALLAS SOUTH WESTERN TRACTION.—This company will build a railroad to be operated with gasolene motor cars from Krum, Tex., through Dallas to Stephenville, Tex. No contracts have been let. There will be five bridges and several depots, shops and car sheds. E. P. Turner is president, and John T. Witt is chief engineer. F. R. Perkins, Dallas, Tex., is engineer in charge.

EDMONTON, DUNVEGAN & BRITISH COLUMBIA.—A contract is reported let to G. H. Webster, Calgary, Alta., for work on a section of 60 miles through the Grande Prairie district of Alberta. (June 4, p. 1181.)

FAIRMONT & HELEN'S RUN.—See Western Maryland.

NEW YORK SUBWAYS.—The New York City Board of Estimate on July 21 adopted the alternate tunnel plan proposed to carry the Fifty-ninth street subway traffic under the East river to the borough of Queens. The other plan was to remodel the Queensboro bridge. Although this action informs the Public Service Commission, First district, that the Board of Estimate believes the tunnel should be built and is prepared to supply the funds based on the \$4,500,000 bid promised by the Degnon Contracting Company, the final decision must be approved by both bodies.

The Holbrook, Cabot & Rollins Corporation has submitted the lowest bid of \$3,741,000 for that section of the Broadway subway beginning at Thirty-eighth street and running north to Forty-second street, crossing under the present subway and running north under Seventh avenue to Fifty-first street.

The Dock Contractor Company submitted the lowest bid of \$1,700,000 for the construction of that part of the Eastern Parkway subway in Brooklyn from a point near Church avenue under Nostrand avenue to Flatbush avenue.

OZARK RAILWAY.—This company has awarded the Blodgett Construction Company of Kansas City, Mo., a contract for the construction of its line from Mountain Home, Ark., to Rothville, a distance of about 15 miles.

PENNSYLVANIA RAILROAD.—The mayor of Philadelphia has signed an ordinance empowering the Pennsylvania to build an addition to its Overbrook yards at Philadelphia. It is said that from \$6,000,000 to \$7,000,000 will be spent on this work.

TEXAS ROADS.—The construction of a railroad is proposed from Beeville, Bee county, Tex., to Three Rivers, Live Oak county, a distance of about 25 miles. The railway will connect with the Southern Pacific and the San Antonio & Aransas Pass at Beeville, and may ultimately be extended west to a connection with the International & Great Northern. It will pass through a ranch country now being rapidly converted into farmland. C. O. Williams of Corpus Christi, Tex., is interested.

TIDEWATER SOUTHERN.—This company will extend its line from Modesto, Cal., through Ceres to Turlock, Cal., a distance of about 16 miles. There will be one bridge of two 150-ft. spans and a 2,000-ft. trestle requiring 350,000 ft. of timber. The grading contract has been awarded to A. G. Chatom of Turlock, Cal. The track laying and bridge work will be done by company forces. Byron A. Bearce, Stockton, Cal., is president and general manager.

WESTERN MARYLAND.—A charter has been granted in West Virginia to the Fairmont & Helen's Run Railway, of Baltimore, Md., with a capital of \$500,000, which was organized by Western Maryland interests. The plans call for building a 6-mile line to connect new mines which are being opened up by the Consolidation Coal Company in the Helen's Run fields of West Virginia with the Baltimore & Ohio near Fairmont. The incorporators are all officers of the Western Maryland.

WEST VIRGINIA ROADS.—The question of building a line from Summersville, W. Va., west to Charleston, about 50 miles, is now under consideration, it is said. G. W. Curtin and H. B. Curtin, of Curtin, W. Va., are said to be interested in the project.

YORK & RAPEHANNOCK RIVER.—Application will be made for a charter in Virginia, it is said, by this company with a capital

of \$400,000, to build a line from West Point, Va., northeast to Urbanna, about 15 miles. R. S. Bristow, president, Urbanna; F. H. Sprague, vice-president, West Point.

RAILWAY STRUCTURES

ATHENS, GA.—A contract has been given by the Georgia Railroad to Hinton & Stewart, Athens, Ga., to build a two story brick and steel warehouse at Athens. Work has already been started on the building, which is to be 72 ft. wide, and 130 ft. long, and will cost about \$20,000. A contract has also been given to Hinton & Stewart for grading work in connection with new freight terminals, to consist of a freight house, team tracks, warehouses, etc.

BALTIMORE, MD.—The Pennsylvania has let a contract to the Brann & Stuart Company, Inc., Philadelphia, for the reconstruction of the Charles street viaduct over the Pennsylvania tracks at the Union station.

BATTLE CREEK, MICH.—The Michigan Railway will build a 150-ft. by 50-ft. concrete, steel and brick freight house, including freight tracks, pavement, paving approaches, etc. The Michigan Railway Engineering Company, Kalamazoo, Mich., has been awarded the contract. Work will start about August 1.

CHICAGO, ILL.—J. J. Turner, first vice-president of the Pennsylvania Lines West of Pittsburgh, has been elected president of the Chicago Union Station Company. E. D. Sewall, vice-president of the Chicago, Milwaukee & St. Paul, has been elected vice-president, and W. G. White has been appointed secretary. An executive committee has been appointed to supervise the work of building the new terminal, consisting of A. M. Schoyer, vice-president of the Pennsylvania Lines; E. D. Sewall, vice-president of the Chicago, Milwaukee & St. Paul, and E. A. Howard, real estate agent of the Chicago, Burlington & Quincy.

DAYTON, OHIO.—The Pennsylvania Lines West of Pittsburgh will build a bridge over the Miami river at this place to replace the one washed out by the floods of March, 1913. No definite plans have been prepared at present for such a structure.

LYNCHBURG, VA.—The Norfolk & Western, the Southern Railway, and the Chesapeake & Ohio have made an agreement to construct a new bridge over the James river at Seventh and Commerce streets, Lynchburg. Plans for the proposed bridge have not yet been made.

MANAYUNK, PA.—Bids have been received by the Pennsylvania Railroad for putting up a concrete arch bridge over the Schuylkill river at Manayunk. Action has yet to be taken by the Public Service Commission of Pennsylvania on this proposition, before the contract will be let.

MILTON, PA.—An officer writes regarding the steel bridge which the Philadelphia & Reading will build over the Susquehanna river at Milton, that the bridge will have 14 through plate girder spans from 83 to 96 ft. in length. Contracts have already been let to the Robert Grace Construction Company, Pittsburgh, Pa., for the foundation, and to the Pennsylvania Steel Company for the steel work. Samuel T. Wagner, chief engineer. (July 16, p. 144.)

PHILADELPHIA, PA.—The Pennsylvania Railroad has let a contract to James Stewart & Co., Chicago, for the construction of a 1,000,000 bushel addition to the grain elevator at Girard Point. This addition will double the present capacity of the elevator which was completed about a year ago. (June 18, p. 146.)

PITTSBURGH, PA.—The Baltimore & Ohio has prepared plans for a complete remodeling of its passenger station at Smithfield and Water streets. Work will be started at once. The entire first floor of the present building is to be used as a general waiting room. The mezzanine floor, now used for the offices of the general superintendent and his force, telegraph office, yardmaster's office and conductor's room, will be removed. This will give a general waiting room 60 ft. wide by 76 ft. deep, with a ticket office facing the general waiting room and the concourse. The concourse will be 32 ft. deep and 60 ft. in width. The second floor of the station will be remodelled to take care of the general superintendent's force which will be moved from the mezzanine floor. The baggage, mail and express will be located in new quarters arranged for by renovating the present outbound freight house.

SCRANTON, PA.—The Delaware & Hudson, it is said, will spend about \$225,000 to abolish 16 grade crossings in this city.

Railway Financial News

CHICAGO, ROCK ISLAND & PACIFIC.—Roberts Walker has resigned as counsel for the receivers of the Chicago, Rockland & Pacific.

EL PASO & SOUTHWESTERN.—The Arizona company, which owns and operates the western end of the El Paso & Southwestern, running from El Paso, Tex., to Tucson, Ariz., has made a first and refunding mortgage to secure an issue of 5 per cent bonds, due 1965. The *Commercial & Financial Chronicle* says:

"It is proposed eventually to consolidate the El Paso & Southwestern system, owning approximately 1,030 miles of railroad in New Mexico, Texas, Arizona and Mexico, into one owning and operating corporation under the laws of New Mexico and Arizona; and ultimately to transfer to that corporation the title to all the property in the system which can suitably be connected with the railroad. The present issue of bonds, of which \$8,055,000 have been immediately authorized and will at once be a first lien on the 458 miles on the Western division, will eventually be a first lien on the entire system of over 1,000 miles, the issue of additional bonds after consolidation having been authorized by the corporation commission to retire the existing first mortgage bonds on the Eastern division.

"The present outstanding bonds of the system, including bonds in the treasury, are \$15,792,000. When the operation is completed the outstanding bonds will be \$16,627,000, including bonds in the treasury.

"No additional financing is contemplated at present, and the result of the consolidation will be to place both the title and the operation in a consolidated company, which will be called the El Paso & Southwestern Railroad Company. Thus the objection to having a railroad owned by a holding company will be eliminated, and the number of corporations comprising the system will be reduced from 13 to 4, or perhaps 3. The system will have one first mortgage bond in a substantial amount, instead of several scattered and disconnected bonds in a like total amount."

MISSOURI PACIFIC.—A notice has been sent to holders of the \$3,459,000 Central branch first mortgage 4 per cent bonds, due 1919, asking them to communicate with a committee consisting of Charles A. Peabody, president of the Mutual Life Insurance Company; L. Edmund Zacher, of the Travelers Insurance Company, Hartford, Conn., and Robert Struthers, Jr., of Wood, Struthers & Co.

See editorial comments elsewhere in this issue.

OAKLAND, ANTIOCH & EASTERN.—A financial plan has been adopted by the investigating committee and the approval of the California railroad commission has been asked to the putting through of this plan. The committee says: "If the amended plan is consummated and the bondholders forego the collection of the three years' coupons, and the stockholders make the loan [\$3 on each \$100 shares held], the entire net earnings during that period can then be used to pay for new debt. Should the earnings equal the estimates of Bion J. Arnold, sufficient money will be available during the period to reduce the floating debt to such an extent that the road will be able to continue."

PERE MARQUETTE.—A date for the sale of this road has once again been fixed, the date now being November 15, 1915, and the upset price being fixed at \$14,000, subject to underlying bonds, interest and receiver's certificates.

GUATEMALA RAILWAYS.—In his message to the National Legislative Assembly at its ordinary sittings opened on March 1, the president of Guatemala said in regard to railways that the section of the Pan-American Railway in Guatemala has been finally completed, though its advantages have not yet been felt, owing to the suspension of traffic caused by the civil war in Mexico. Work on the railway of the Altos was interrupted for a time in consequence of the necessity of all available laborers being required for agriculture, but this having passed the construction work has been renewed and is now actively proceeding. Tenders for constructing the Eastern Railway are being considered.

For railways to carry some of their own insurance is common practice and in many cases profitable. There is one risk, however, that has been let out almost entirely to the insurance companies, and that is the stationary boiler insurance. One road in the middle west, operating over 540 stationary boilers, has recently investigated this problem, being prompted by the fact that the rates on this class of insurance had materially increased since the time it was last placed. It was found that by far the greater proportion of the premiums paid to the insurance companies was spent for inspection, and that a very small percentage was held for the payment of claims, the theory being that with competent inspection there would be very few claims to pay.

Stationary Boiler Insurance

Believing that as competent inspectors of boilers could be obtained from the mechanical department of the road as could be provided by the insurance companies, this railroad has decided to assume the entire liability and carry its own boiler insurance. The expense incident to the inspections and the claims are to be carried by the insurance department and no opportunity is left for any charges to be shifted to other accounts. The insurance department will act as an individual outside concern, the profits going to the road itself. The plan is worth the consideration of other railways.

Railroad officers generally agree that one of the most troublesome problems confronting them to-day is that of the selection of men and their promotion. The article on this subject on another page supplements in a way the one by George M. Basford, which was published in the RAILWAY AGE GAZETTE of July 23, page 150. Closely allied with this subject of the selection and promotion of men is that of the education and training of employees; in fact in a big way it is practically impossible to consider them apart. Because of the importance of these things it would seem not only wise, but necessary, if anything really worth while is to be accomplished, to have them placed in the hands of some officer reporting direct to the chief executive and having full authority and responsibility in matters pertaining to the selection, training and promotion of all of the employees in all departments. That this step would be fully justified is indicated to a degree by the remarkable results which have followed the inauguration of rational apprenticeship systems in the motive power department or of special educational campaigns which have been carried on in other departments of various railroads in recent years. Unfortunately such movements have not been general and in most cases have touched only one or two departments on any one road. The time would seem to be opportune for developing and inaugurating movements of this kind on a larger scale, including every employee of all departments.

The Selection and Promotion of Men

Why can a railway be run more safely in April and June than in other months of the year? This question is suggested by Mr. Richards, chairman of the Chicago & North Western central safety committee, in a report which was noticed last week, page 209. The same suggestion may be found in the train-accident record for the month of April, printed in the *Railway Age Gazette* of May 21, page 1036. The general fact has been evident from a long series of accident records. There have been many notable train accidents in the United States during the past 20 years, but only three, of the first magnitude, occurred in the month of April. Good weather, a moderate volume of traffic and a minimum number of inexperienced trainmen are three elements in which April often, or usually, has an advantage over the other months of the year. But Mr. Richards appeals quite definitely to the individual officer and the individual employee. He aims to make the matter personal. You cannot control the weather; but can you not take more care to provide against injury to persons or property, when weather conditions are adverse? A moderate volume of traffic tends to make work easy, all around; but why not, in the easy times, train yourself to perform a larger share of your duties automatically, so that when the rush comes on you will not get "rattled"? Knowing the advantages of experience and the benefits from being able to perform all operations with tried men, why not take more pains to instruct new men, systematically? Mr. Richards has opened up a broad subject, one embracing a hundred questions for superintendents, trainmasters, trainmen, and all hands. He is not propounding new problems; but his report suggests the attacking of old ones from a new angle. At his best the engineman, the conductor, the track repairer does everything safely not only in April but in February.

Safety First All the Year Round

in spite of the cold. At his best he avoids errors and accidents in rush times as well as in slack. Mr. Richards challenges him (and every one) to be at his best all the time.

We publish on another page an article on "The Farmer and the Railroad," which was written by Philip Meinen, a farmer who formerly lived at Hanover, Kan., and who now resides at Stites, Idaho.

The Farmer and the Railroad

This article condenses as much common sense on the railroad problem as we have ever met in a similar space. There is so much common sense in it because Mr. Meinen looks at the railroad business just as he looks, and thinks others should look, at the farming business. He believes it is a poor rule that will not work both ways; and applying to the railway business the rule that he believes should be applied to the farming business, he is quite unable to see why those who plant their capital in railroads should not, like a farmer or any other business man, be allowed to reap where they sow and garner a harvest proportionable to the enterprise and skill with which they cultivate their chosen field. In imagination he puts himself in the railway investor's and the railway manager's places, and frankly recognizes how, if he were in their places, he would like to be treated; and having done this, he advocates, in substance, the application of the Golden Rule. The solution of all of our seemingly difficult economic and social problems would be greatly simplified and facilitated if all classes of the people would approach them in this direct, common sense and honest way. The managements of the railways could do much to get other people to treat the railways as they think the railways should be treated by setting the example of dealing always with other people as the railways wish to be dealt with.

THE TRAP CAR DECISION

The hope of the railroads of increasing their revenues by charging for spotting cars and by cancelling tunnel, lighterage and industrial road allowances, held out by Commissioner Harlan and Special Counsel Brandeis, seems to have gone glimmering, along with the charge that they were dissipating their revenues by "free services" and allowances. But the decision in the trap car case really seems to hold forth an opportunity which may be translated into money.

While the commission orders the cancellation of the tariffs filed by the railways as being hastily prepared, ambiguous and discriminatory, its language is such that Commissioner Harlan no longer dissents. He says the opinion "concedes the propriety of a charge for the so-called trap car service in its most typical form." The majority opinion by Commissioner Clements finds that the trap car has come to be an efficient and important instrument for the expansion of both the transportation and the commercial business of the country, and that it is not desirable that anything should be done that will seriously impair its efficiency. But it notes some important distinctions between various classes of trap car service.

"If a consignor orders a car placed on his private track, and there loads it with less than carload shipments and then orders the carrier to transport the car to its local freight or transfer station for rehandling and forwarding of contents," the commission says, "the consignor has used the facilities of the carrier to dray his shipments. The carrier has rendered a service which is special in character and for which it would seem to be entitled to fair compensation, with due regard to the service rendered." This is substantially the position taken by the *Railway Age Gazette*. The commission also says that the same character of service is rendered when a car is held at a local freight or transfer station, then loaded with inbound shipments and transported to an industry side track. But "if a car is loaded with less than carload shipments and is transported between the side track and a transfer point outside the terminal district, on or off the line of the industry carrier, or if the car moves between a gateway and destination, the service at the terminal is not

different from that rendered with respect to carload shipments moved from or to the same siding." This service, the commission holds, is not a free service.

These distinctions were not made by the railroads in preparing their tariffs, nor by the shippers in opposing any charge for trap car service, and on the record it is not surprising that the commission should have found it necessary to order the cancellation of the tariffs. Commissioner Harlan adheres to the view that any form of trap car service is a discrimination in favor of the owner of a private side track. The majority decision, however, shows that the railroads will be permitted, even expected, to make a charge where a special service is rendered, in which case the shippers will be guided in their decision between the trap car and the dray by the comparative costs of the two methods, while present practices which have been shown to result in advantage to both the railroad and the shipper will in no way be interfered with.

THE RAILWAYS AND THE MANUFACTURE OF EQUIPMENT

To what extent ought the railways to engage in the manufacture of equipment and supplies? On the ground of economy some of them have gone into this to a very considerable extent during the past few years. Has this been a wise movement? Primarily, the business of a railroad is to manufacture and sell transportation, and because of its semi-public character and the difficulties involved in handling more men than are actually required for the carrying on of its business, it would seem that it ought to confine itself as closely as possible to that business.

It stands to reason that ordinarily a manufacturing concern, specializing on a certain line of material or equipment and competing with other companies for the business, will do better work in turning out a uniform product and in cheapening the processes of manufacture than would the railroad which handles this work more or less as a side issue. The argument is often advanced that the selling cost is eliminated when the material is manufactured by the user. True, it is, and yet not a small part of the railroad passenger traffic revenue is contributed by the railroad supply interests. Then, too, it must be remembered that the railway supply companies have been extremely active and have in many cases done remarkable work in developing better materials and better designs, thus saving the railroads untold sums of money which would have been lost if it had been left to the already overburdened railroad officers to develop and perfect these materials and devices. It should also be remembered that the railroad salesman is in many cases a sales engineer rather than a salesman, as the term is usually understood. In most cases these men are technical experts and their duties are largely along missionary or educational lines. In not a few cases railroad supply companies are spending thousands and thousands of dollars each year in educating the railroads to improve their methods and practices in order that the devices which they sell may be given sufficient care and attention to make them most effective. These men are not only of great value to the railways in this way, but ordinarily their experience and training have been so extensive and so broad that they are continually asked for advice as to practices outside of the particular work in which they are specially interested. In the earlier days these sales engineers were used by one or two of the important supply interests only, but in the past few years a considerable number of companies have developed their sales forces along these lines.

Data would be interesting if it were available regarding the exact part which the designers employed by the locomotive and car builders have played in the development of more efficient and effective equipment. Comparatively few railroads maintain a sufficient corps of expert designers to handle this work in anything but a general way and the builders are largely responsible for many of the most important developments and improvements which have been introduced in both locomotive and car design.

On what basis do the railroads compare the cost of material

manufactured in their own plants with the cost of that purchased from the outside? In a manufacturing plant the overhead charge or burden is accurately calculated. On the railroad, with its multiplicity of interests, this factor is far more difficult to calculate and in most cases is arrived at by some rule based more or less on guesswork or rough estimates. Mechanical department officers were greatly disturbed a number of years ago on the publication of the results of an investigation into the burden or surcharge problem which was made on one of the most important western lines in connection with certain betterment work. This investigation showed that the surcharges in a modern railway repair shop averaged about 60 per cent. of the payroll in the locomotive department and 38 per cent. in the car department. It was found, moreover, that these charges, which covered wages paid for supervision, accounting, draftsman, stationary engineers, firemen, electricians, etc., and also taxes, interest on investment, depreciation of buildings, machinery, etc., varied in the different departments of one locomotive shop from 40 to 220 per cent. In comparing the cost of manufacturing material with the cost of buying similar material outside it is essential that the overhead charges for each department or material be calculated separately, as the use of an average figure will undoubtedly be misleading in many cases. If a correct charge is made for overhead, the wisdom of manufacturing material rather than buying it will in many cases be open to even more serious question.

There has been a tendency in some of the foreign countries to manufacture in the railroad shops practically all of the material used by the railroad. This has discouraged the manufacturer in the developing of his business and has stunted the growth of railway supply manufacturing concerns so that they have not been in a position, when called upon, to furnish material for export to other countries. If the railroads in this country should go to the extreme in manufacturing the materials used by them, would it not so affect the supply industries that they would not be in a position to go after and develop foreign business, thus in the end affecting the revenue of our own railroads because of the reduction in freight traffic? The freight revenue from the handling of the finished material is a comparatively small part of the total freight revenues from the raw products which must be supplied to the manufacturer.

Public opinion has been very much against the railroads and they have been harassed and hampered in every direction. The pendulum is now slowly swinging back in the other direction. One important factor in bringing this about and educating the public to a better appreciation of the railroads was the active interest which the railway supply manufacturers took in the educational campaign. Without their sympathy and good will the task would have been a far more difficult one and would have taken much longer to accomplish. From this standpoint is it not to the best interests of the railroads to continue to purchase as much of their finished supplies as possible from outside sources, thus retaining the good will and co-operation of the manufacturing interests?

Finally, and not by any means the least important factor, is that involved in the labor situation. Too much time is now required of the railroad executives in considering the handling and adjustment of labor difficulties. Why complicate this situation by going into the manufacturing business, thus increasing the number of men in the organization and multiplying in a proportion greater than the actual number of additional men required, the danger of friction and loss in the handling of labor? Is it not much better to divide this among the different manufacturers supplying railway materials and have each one handle his own special labor problems?

Doubtless there are other factors which might be considered in the effort to determine the extent to which a railway can profitably engage in the manufacture of its supplies and equipment. The foregoing are sufficiently important, however, to challenge any further tendency along these lines and should receive the most careful attention of railway officers who are considering or have gone into the manufacture of equipment and sup-

plies to any very great extent. The wisdom of so doing would appear to be extremely questionable.

THE COMMISSION AND THE EXPRESS COMPANIES

In granting the petition of the express companies for an increase in their rates, the Interstate Commerce Commission has recognized the truth of the sentiment so well expressed by Senator Oscar W. Underwood when he said: "The proper regulation of business requires that it must be sometimes helped and not always hindered, that we must occasionally say 'you may' and not always 'you shall not.'" Two years ago the commission prescribed a uniform schedule of rates, classifications and rules for the express companies, which went into effect on February 1, 1914. The order at that time was considered unusually drastic, but the commission indicated that in its opinion the reduction in rates would so stimulate traffic that the express companies would not suffer unduly. After a year's trial of the rates the express companies asked for a rehearing and modification of the order, showing that while the number of shipments handled had increased 1.16 per cent, their revenues from transportation after payment of the railways for handling express matter had decreased 9.21 per cent. Increased efficiency reduced the operating expenses 5.96 per cent, but the net operating revenue decreased from \$1,253,438 in 1914 to a deficit of \$1,132,812 in 1915, while operating income showed a deficit of \$2,380,894. The commission therefore found that the present revenues are not adequate and granted the changes in rates asked by the companies, which it was estimated would afford them approximately 3.86 per cent increase in gross revenues.

It is noteworthy that no definite opposition was made by shippers. The commission says that the express companies have co-operated earnestly and fairly in an effort to make its new plan of making and publishing rates a success, and that they are entitled to reasonable relief promptly. It has thus manifested a praiseworthy disposition to remedy its own errors, and the express companies, by their attitude during the past two years, have made it easy for the commission to treat them with some consideration. After having got the public into a frame of mind where it was almost willing to see them put out of business, and with reduced rates and the new competition of the parcel post to meet, the express companies took their medicine with as good grace as possible. By exerting every effort to improve their service and to develop new sources of traffic, and by using wisely planned methods of publicity, they have not only maintained themselves in the face of the most difficult conditions, but have even attained a considerable degree of popularity.

BROOKLYN RAPID TRANSIT

The progress of the huge joint undertaking being carried on by the Brooklyn Rapid Transit and the city of New York shows clearly some of the disadvantages that may result from such a partnership. On the other hand, the company's management of its 246 miles of surface lines and 61 miles of rapid transit lines, in which, while, of course, subject to the regulation of the New York Public Service Commission, the company has a fairly free field for initiative, shows progress being made that is marked and in some aspects of national interest.

In the fiscal year ended June 30, 1915, the Brooklyn Rapid Transit earned \$26,428,000, an increase of \$869,000 over the previous year. This increase in revenue, however, is entirely due to the fact that the earnings from the Coney Island & Brooklyn Railroad are included for the entire fiscal year 1915 and were only included for six months in the previous fiscal year. As a matter of fact, comparing like with like and excluding from both years the Coney Island & Brooklyn, there was a decrease in 1915 as compared with 1914 due, as Colonel Williams points out in his annual report to stockholders, to the fact that a general business depression such as was experienced in 1915, with the resulting large number of men out of work in the big cities, affects street railway companies' earnings materially. An-

other reason for the decrease in passenger revenues was the increase in the issuance of transfers as the result of an order of the Public Service Commission increasing the number of transfer points from 721 to 1,008. There was an increase in the number of transfer passengers carried of 10,552,000, with a decrease in the cash passengers of 2,142,000. The financial results of the operation of the company are shown in the table at the end of these remarks.

The rate of wages on street railways is tending steadily to increase partly in line with the higher cost of living, which is most felt in the cities, and partly with the general tendency of wages in all branches of transportation to increase as the labor unions make steady progress in their constant efforts to secure shorter hours or higher wages. The street railway company, therefore, like the steam railroad, must depend on its efforts to get more and more efficient work out of each employee to offset the increased rates of wages. The Brooklyn Rapid Transit's efforts to attain this end have been specially directed toward bettering the condition of its employees and making the jobs which it has to offer more attractive, thus appealing to a higher grade of men. The Employees' Benefit Association of the Brooklyn Rapid Transit, through which the employees' welfare work is largely conducted, now has a membership of 8,000, of which 6,500 are in the operating department.

Mention has been made previously in these columns of the system of compulsory medical inspection and free medical attendance for employees excused on account of illness. This system was established on January 1, 1913, for the men in the operating department, numbering about 10,000. Steady progress has been made in reducing the amount of time lost on account of sickness, and making full allowance for the milder weather of last winter, it is estimated that the reduction in lost time attributable to this system was 8.6 per cent. in 1915. In the first year of operation of the system there was a reduction of 24 per cent. in loss of time as compared with the previous year.

Instruction is being given in first aid work, and first aid equipment cases have been installed in 68 depots, terminals and shops of the company; first aid kits have also been supplied to emergency crews and work crews.

The company has been remarkably successful in arousing an interest in its employees in its safety first campaign. This work has been organized by departments and meetings of committees and of whole departments are held at which safety problems are freely discussed by the employees. The Brooklyn Rapid Transit is also, as has been previously mentioned, conducting a campaign of education in the public schools in Brooklyn and has organized Safety Patrols among the boys and careful clubs among the girls. During the year the company distributed 234,000 safety stories among the school children.

The amount paid for injuries to passengers and damage to property in 1914 was \$608,000, an increase of \$64,000 over the previous year; but this increase was probably largely due to payments for accidents occurring in previous years, there being actually 1,333 fewer accidents in 1915 than in 1914.

The figures for revenue and the facts in regard to treatment of employees, etc., are, of course, in respect to the Brooklyn Rapid Transit as the operating company for the now existing surface and elevated lines of Brooklyn. The building of the New York subways and elevated extensions which is being carried on in partnership with the city of New York is in the hands of a subsidiary company—the New York Municipal Railway Corporation. The agreement between the city and the Brooklyn Rapid Transit provides for an expenditure by the city of about \$100,000,000 and by the New York Municipal Railway Corporation of about \$65,000,000. The new system was to have been ready for operation on January 1, 1917. Two things have occurred to very much hamper this work. On the one hand, the work which is to be done by the company all has to be approved of by the New York Public Service Commission, and every plan and form of contract is subject to the commission's scrutiny and must be approved by the commission

in advance. Colonel Williams, the president, says that in some cases the commission has taken many months to consider contracts submitted to it which should have been passed on in a few days, or at the most a few weeks. This makes the extension of the company's own lines slower than it should be. The letting of contracts by the city for its share of the work has been very much delayed and contracts have been let in such a way as to promise to delay the opening of the most profitable of the new lines. The result is that the city's extension of credit which will come with the opening of the subway lines is delayed and financial hardship is also worked on the Brooklyn Rapid Transit. It is the old story of red tape and delay in municipal management, although in general the present New York City administration has a reputation for better work in this respect than most large city administrations.

The following table shows the principal figures for operation in 1915 as compared with 1914, but it must be remembered that the 1915 figures include a full year's operation of the Coney Island & Brooklyn, while the 1914 figures include only six months operation of this road:

	1915	1914
Transportation revenue	\$26,096,265	\$25,246,452
Miscellaneous revenue	331,421	311,797
Total operating revenue	26,427,687	25,558,250
Maint. of way and structures.....	2,391,815	2,021,647
Maintenance of equipment	2,401,841	2,315,990
Operation of power plant	1,553,178	1,463,284
Trainmen's wages	4,787,574	4,520,023
Other expen. of operation of cars.....	1,744,690	1,696,132
Total operating expenses*	14,960,381	13,994,553
Net revenue from operation	11,467,305	11,563,697
Other income	438,715	451,772
Taxes	1,700,035	1,752,880
Interest and rentals	4,693,424	4,946,884
Net available for dividends	5,512,561	5,315,705
Dividends	4,467,318	3,660,048
Surplus	1,045,243	1,655,657

*Included in this figure but not shown separately above are payments for damages, legal expenses, etc.

NEW BOOKS

Public Utilities, Their Present Value and Return; by Hammond V. Hayes, consulting engineer. 203 pages, size 6 in. by 9 in. Bound in cloth. Published by D. Van Nostrand Company, 25 Park Place, New York. Price \$2.

The author's first book on this subject, "Public Utilities, Their Cost New and Depreciation" (reviewed in the *Railway Age Gazette*, of February 13, 1914, page 305), was devoted largely to a consideration of the general principles underlying the ascertainment of the fair present value of a property and to the methods to be followed by engineers engaged in such work. The present book, which is a supplement to the other, deals rather with what is to be done to ascertain the fair present value after the appraisal has been made. The former book emphasized that the same valuation might not hold for purposes of sale, as for purposes of taxation, condemnation, or as a basis for reasonable rates. The present volume is confined to cases where questions of rates are involved and to public utilities subject to regulation by state or government authority. The book covers its subject under the following heads: The Present Controversy; Ascertainment of Fair Present Value; Fair Rate of Return; Replacement Cost; Actual Original Cost; Going Value, and Depreciation. The chapter on the ascertainment of fair present value is divided into discussions of the basis for fair charges for service for a new company, for a previously unregulated company, for non-competitive successful undertakings, for non-competitive unsuccessful undertakings, and there is also a division on the fair value of property of competitive undertakings. The chapter on replacement costs deals with cost of promotion, physical property and going value. In the discussion of going value it is brought out that the latter is not good will, but that it is the difference between the cost as a going concern and the capital cost, and should include such items as company organization, general expenses, legal expenses, taxes and interest during construction.

It is noted that: "Going value, consisting of costs made up as outlined in the present study, is as much a portion of the property of a company in a rate case as in a case of sale." Good will and franchise values are not to be so included.

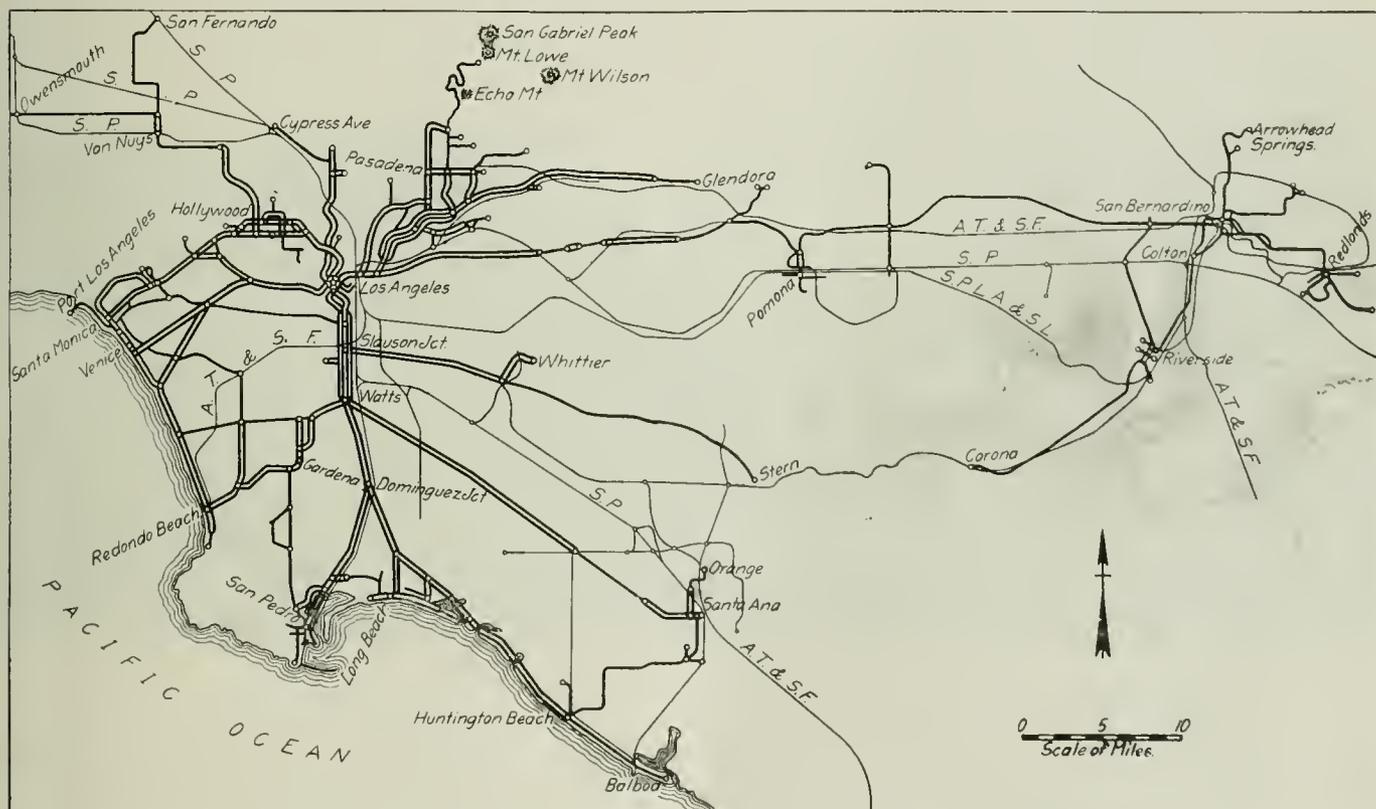

The Operation of the Pacific Electric Railway

A Study from the Standpoint of the Steam Road Man of the Largest Interurban System in the Country

The development of electric interurban railway lines as subsidiaries of and feeders to steam roads has been most pronounced along the Pacific Coast, where both the Hill and Harriman systems have built and acquired a considerable mileage of such roads. The largest electric railway system in the country is the Pacific Electric, now controlled by the Southern Pacific, radiating from Los Angeles and giving the parent steam system an intensive development in this highly productive traffic center. Built originally for passenger traffic only, it now competes actively for freight, and, in spite of the fact that it has not actively solicited such business until with the last four or five years,

separated. The interurban lines were reorganized and have continued under the name of the Pacific Electric Railway Company.

The further development of this system has continued steadily until today practically all of the lines laid out by Mr. Randolph have been built with the exception of a connection between the termini of the La Habra line at Stern and the Riverside line at Corona. The most recent extensions are those from Upland east to San Bernardino, a new line between San Bernardino and Riverside connecting the Riverside-San Bernardino groups of lines with the main system, and that from Harrison to

Map Showing the Single, Double, and Four Track Lines of the Pacific Electric System

its revenue from this traffic amounted to \$1,203,956 for the last fiscal year and is increasing rapidly.

The Pacific Electric Railway Company was originally organized in November, 1901, by H. E. Huntington and associates, to build about 1,000 miles of standard gage electric railways in Southern California, radiating from Los Angeles. Under the direction of Epes Randolph, as vice president and general manager, a comprehensive system of lines was planned into those territories capable of intensive development, and construction began at once. After building the major portion of these lines this system was consolidated on September 1, 1911, with the Los Angeles Pacific, extending from Los Angeles west to the beaches at Venice, Santa Monica and Redondo; the Los Angeles & Redondo, running from Los Angeles to Redondo Beach; the San Bernardino Valley Traction Company lines, serving San Bernardino, Redlands and Highland, and the Riverside & Arlington lines at Riverside. At the same time the interurban and the narrow gage street railway lines in Los Angeles were entirely

Corona, in the vicinity of Riverside, both completed last year. At the present time the Pacific Electric operates 600 miles of line extending from Los Angeles west and south along the beaches from Santa Monica to Newport Beach and Balboa; southeast into the sugar beet country at Santa Ana and into the La Habra oil fields and east through the citrus country about Covina, Glendora, Pomona, San Bernardino and Riverside. Nearly 12 miles of these lines have four tracks and 280 miles double track. The system includes 1,057 miles of operated track.

THE PHYSICAL PROPERTY

Except in the cities, the lines are built entirely on private right of way, and even within the corporate limits of cities and towns the tracks are removed from the streets in many instances. Thus, at Los Angeles the private right of way extends to within seven blocks of the main passenger terminal. The standard track construction consists of 75-lb. Harriman line common standard rail on untreated red wood ties principally in gravel and

crushed rock ballast. Where not so ballasted, the sand or dirt roadway is oiled heavily at regular intervals to compact it. This is especially necessary on those lines along the beaches where the sand drifts badly at times during the long dry season.

Because of the frequent stopping and the heavy braking of trains, and the use of multiple tracks in one direction only, the track creeps badly, having been observed to move as much as 36 ft. on one long trestle in six months. This requires the liberal use of rail anchors, especially on the tracks approaching heavy traffic stations where the pull is greatest. Manganese track construction is used almost exclusively for special work. This road has been a pioneer in the use of solid manganese and employs it almost exclusively for frog and switch work on the lines with heavy traffic. On the other lines built up manganese frogs and switches are installed.

Double tracks are built 15 ft. 6 in. between centers. On the four-track lines, the distance between the centers of the outside tracks is 13 ft. 6 in. The stations vary in size and design from the nine-story general office and passenger terminal building at Los Angeles to the frame or concrete passenger shelters at outlying passenger stops. Regular agents are maintained at

built. These are constructed on 50-ton steel flat cars, and are housed in and feed directly from the high tension power lines above mentioned. Each of these portable substations is equipped with a transformer and a 600-kw. motor-generator set. This equipment is of special value in handling heavy traffic such as the sugar beet rush in the fall, as it can be set out on any siding and cut in on the power line directly wherever the energy may be the most needed.

Power is delivered to the motor equipment by means of simple feed and trolley wires on all lines. For single and double tracks the construction is the same, as it has been assumed that any stretch of single track will eventually be double tracked. The trolley wire is supported on single poles with pipe arms on most of the single and double track sections and span pole construction on four track lines and on most curves, side tracks, station and yard tracks, etc. Catenary construction has been adopted on the lines built recently, with a view to gradually changing over to this form of overhead construction over the entire system. The extension from Upland to San Bernardino is operated at 1200 volts d.c. and the line from Upland into Los Angeles is being changed over to this from 600 volts. All other lines are now operating at 600 volts, but it has been the

The Station at Monrovia, Cal.

all stations of sufficient traffic to justify their employment, including some 40 points, who devote their entire time to the company's business. At most of these places standard stations are provided, equipped with ticket offices, parcel, freight and express rooms, waiting rooms, etc. No general design has been adopted, as in many cases it is desired to harmonize the construction of the station with that of the surrounding buildings in the communities, many of which are suburban towns.

While the road formerly generated its power at its own steam plants, the development of hydro-electric and other power by large power companies has made it more economical to purchase it from these large producers, and the company's steam plants are held in reserve. Power is delivered at convenient specified points on the railway company's lines at 15,000 volts and transmitted at this potential to the various substations, of which there are now 52, the power wires being carried over the greater portion of the system on the railway company's pole lines. These substations are spaced from 6 to 12 miles apart on busy lines and from 10 to 12 miles apart on those of lighter traffic. The equipment installed in the different substations varies with the traffic demands and also with the age of the substation.

The rapid development of the traffic on this system has made it exceedingly difficult to provide sufficient power at all times. To handle peak loads or to allow a substation to be taken out of service for repairs, four portable substations have been

intention to go to 1,200 volts as fast as the overhead construction is changed to the catenary type.

At the end of this year nearly all crossings with steam roads will be completely protected with all-electric interlocking plants, and within another year all other crossings and junction points will be similarly protected. Twelve interlocking plants are now in service, three others are under construction and five more are provided for. Those built recently are all-electric with track circuit approach locking. One of the most modern is that completed at Watts, 18 miles south of Los Angeles, where three busy double track lines converge into one four-track trunk line. This plant now has 76 working and 12 spare levers and is said to control more functions than any other plant west of the Rocky Mountains. Over 1,000 scheduled trains pass over it daily, requiring over 6,000 lever movements. During two hours in the morning and the same period in the evening a train passes over the crossing every 0.85 minute.

Automatic signals are being installed gradually on the busiest lines. Last year three-position light signals were installed on 9½ miles of the Venice Short Line and also on four miles of the Pasadena Short Line. The Venice line was signaled for 1 minute headway at a speedway of 30 miles per hour. Two miles of the Pasadena line was signaled for 45 seconds headway at 20 miles per hour, and two miles for 1 minute headway at 30 miles per hour. To give an idea of the density of the traffic, over 15,000

passengers are carried daily between Los Angeles and Pasadena alone. Between Los Angeles and Long Beach three-car trains are run in each direction at intervals of 20 minutes daily from 8:00 a. m. to 8:00 p. m., with double service on Sundays and holidays. This line also furnishes similar service to San Pedro, traveling over the same rails as far south as Dominguez Junction, in addition to freight traffic, the most of the freight traffic, however, being handled over all lines at night.

The company operates 675 passenger cars, all of which are provided with motors. It also operates 18 express cars which can be operated singly and which have power sufficient to haul as many as five to eight loaded freight cars. The company also operates sufficient freight equipment for its own traffic, although it requires foreign lines to provide equipment for through shipments from points on its lines to the more distant points on the steam roads. It operates 55 electric locomotives in freight service exclusively, 10 of which are in switching and the remainder in road service. These locomotives are operated in two shifts as the business demands, giving practically 24 hours' continuous operation. The newer locomotives weigh 62 tons and are provided with four 250-h.p. motors. They have a tractive effort of 21,000 lb. at 17.6 miles per hour and a maximum tractive effort of 30,000 lb. The freight equipment is fully up to steam road standards. Recent purchases include 90

passenger traffic. The state and the various counties in Southern California have spent large sums of money during the past few years in the construction and improvement of the public roads. This has greatly stimulated automobile traffic and has resulted in the appearance of large numbers of "jitney" busses competing for passengers and express business not only in Los Angeles and the immediate suburbs but to points as far distant as Venice. While it is difficult to see how this can prove profitable and therefore exist permanently, it is cutting into the passenger revenue of the Pacific Electric seriously at this time and is an exceedingly difficult competition to meet, as it is largely unregulated.

Over 3,200 scheduled passenger trains are operated daily in

A Four-Track Line Dividing into the Double-Track Lines at Watts

box cars with steel underframes, 225 steel flat cars and 250 steel dump and gondola cars, all of 100,000 lb. capacity.

New general shops have been planned to be built at Torrance, midway between Los Angeles and San Pedro, to replace older shops in Los Angeles. The company now builds none of its equipment but does all its own repair work, employing about 800 men for this purpose.

TRAFFIC

The revenues of the Pacific Electric for the fiscal year ending June 30, 1914, were \$9,467,483.15, divided as follows:

Passenger revenue	\$7,366,661.40
Baggage revenue	1,277.16
Hire of chartered cars.....	45,691.80
U. S. mail revenue.....	18,038.96
Express revenue	144,655.70
Milk revenue	34,503.99
Freight revenue	1,203,956.31
Switching revenue	30,753.04
Miscellaneous transportation revenue.....	173,600.26
Total transportation revenue.....	9,019,138.62
Revenue other than transportation.....	448,344.53
Total	\$9,467,483.15

Approximately one-half the passenger revenue is commuter traffic and the remainder is largely local, although through tickets are sold to all points from the more important agency stations. Wells, Fargo & Company and the Postal Telegraph Company operate over the entire system. United States mail is also carried on a number of the trains, mostly in closed pouches, although railway postal cars are operated over several of the lines.

An interesting situation has recently arisen with reference to

A Portable Sub-Station

addition to 62 way freights and 84 express trains. This excludes heavy drag freight trains which are not regularly scheduled but are run as the traffic demands. Over 185,000 passengers are carried daily.

It is the freight traffic in which the steam railway man is most interested. As stated above, these lines were designed and built originally for passenger traffic alone with no thought of developing a freight business. With the building up of new communities removed from other railway facilities, there soon arose a demand for the transportation of building and other materials. This condition combined with the acquiring of these lines by the Southern Pacific has resulted in special attention

One of the Newer Locomotives

being given to the solicitation of freight traffic within the past four or five years. The greatest stimulus was given to this business on December 1, 1913, when the Pacific Electric secured joint rates with the Southern Pacific and the San Pedro, Los Angeles & Salt Lake on citrus fruits, followed by similar rates on other commodities on January 1, 1914. This road also participates now with the Santa Fe in joint rates from certain points on the Pacific Electric lines to Arizona and California points on the Santa Fe. As a result, the Pacific Electric is now enabled

to solicit through as well as local business on an equality with the steam roads, which was essential to it if it was to compete successfully for the transportation of citrus fruits, sugar and similar products, practically all of which go to the East.

About 200,000 tons of freight is handled monthly, of which about 80 per cent. is local traffic, the remainder being delivered

A Regular Passenger Train

to and received from the steam lines at Los Angeles and other connecting points. This traffic is growing rapidly, having doubled within the past four years and is increasing even more rapidly now that the road is permitted to solicit traffic for and from points beyond its own lines. The rapid building up of communities along these lines is also adding to the traffic. As for instance, Torrance, an industrial town, less than three years

titles of sugar beets are raised in the vicinity of Santa Ana. About 500,000 tons are produced annually in the area tributary to the line between Santa Ana and Huntington Beach, 9 miles long, and three large sugar factories are located on this line. Over 3,000 cars of lumber and 1,000 cars of citrus fruit were also handled during the past year and it is estimated that about 3,000 cars will be handled during the present year. This latter business especially is increasing rapidly, resulting from the through billing arrangement and also from the extension to San Bernardino, passing through the well-developed citrus area.

Another important source of freight traffic on the Pacific Electric is the l. c. l. merchandise business. About 25 per cent of the freight handled consists of this traffic. About 45 cars are loaded daily at the Los Angeles station alone. Two l. c. l. freight trains are run on each line daily. All such freight received during the forenoon is delivered at the various stations over the system the afternoon of the same day. All freight received up to 5:30 p.m. is loaded during the early evening and taken out during the night. At the largest stations for which full cars are loaded, this freight is ready for delivery at 7:00 o'clock the following morning. At the smaller stations, where no regular agents are employed, and where freight left on the platforms during the night is liable to loss by theft or from the weather, it is delivered during the forenoon on the return trip. Additional service is given perishable products for the ocean resorts received up to the middle of the afternoon, for which deliveries are made the same evening.

As a result of the through rating, the tonnage turned over to connecting lines at Los Angeles has increased from 10,000

A Drag Freight Train

old, is now giving the road over 100 cars of revenue business monthly. The ability of an electric line to furnish frequent and rapid freight and passenger service results in such communities developing faster and the land being given over to more intensive cultivation than would be the case if they were on steam road lines only, with but one or two trains daily.

The car load business consists principally of oil, rock, sand and gravel, vegetables, citrus fruits, nuts, lumber, grain and hay. The largest individual source of traffic is oil from the La Habra fields which goes to Los Angeles for distribution. Two or three solid oil trains are operated daily, the total shipments for the last fiscal year amounting to 449,565 tons or 10,440 cars. Over 11,000 cars of rock, sand and gravel were hauled last year for building and highway construction.

The next largest source of traffic is vegetables, consisting principally of sugar beets, which furnished 4,224 cars. Large quan-

ties of sugar beets are raised in the vicinity of Santa Ana. About 500,000 tons are produced annually in the area tributary to the line between Santa Ana and Huntington Beach, 9 miles long, and three large sugar factories are located on this line. Over 3,000 cars of lumber and 1,000 cars of citrus fruit were also handled during the past year and it is estimated that about 3,000 cars will be handled during the present year. This latter business especially is increasing rapidly, resulting from the through billing arrangement and also from the extension to San Bernardino, passing through the well-developed citrus area.

OPERATION OF THE PROPERTY.

For operating purposes the Pacific Electric is divided into four divisions. The Northern division includes the lines from Los Angeles to Pasadena, San Gabriel, Glendale, Glendora, Pomona and Upland with 156 miles of main line. In addition to handling a very heavy passenger business, this division also secures considerable fruit traffic from the Glendora and Upland lines. The Western division includes the lines to the beaches

as far south as Redondo Beach and to Van Nuys, Owensmouth and San Fernando in the San Fernando Valley. It handles a very heavy passenger traffic with only local freight and comprises 142 miles of main line. The Southern division is the largest, with 209 miles of main lines, including those to San Pedro, Huntington Beach, Santa Ana and La Habra. While the first two lines handle a heavy passenger traffic, this is primarily a freight division on which originate the oil, sugar beets, various other vegetables, and a considerable fruit traffic. The Eastern division with 102 miles of main line, comprises the lines in the vicinity of San Bernardino, Redlands, Riverside and Corona, connecting with the Northern division at Upland. Previous to the completion of the connection between Upland and San Bernardino last July, this division handled local traffic only. It is now succeeding in developing a considerable fruit and other freight traffic as well.

The operating organization is similar to that existing on steam roads. The general manager is in charge of all departments, with a general superintendent in charge of transportation matters. Each division is in charge of a superintendent, with one or more assistant superintendents; the division organization being based more on the number of employees and the density of traffic than on the number of track miles. The maintenance and operating, engineering, mechanical and electrical departments are each in charge of an executive engineering officer reporting direct to the general manager.

The standard code of the American Railway Association is used in operation, modified where necessary for electric operation. All despatching is done by telephone. The dispatchers give their orders direct to the conductors, who copy them on standard train order forms, giving copies to the motormen. At all outlying points where there are no station buildings, telephone booths are provided under lock and key, cutting in directly onto the dispatcher's wire.

In addition to the passenger and l. c. l. freight trains referred to above, regular milk trains are operated daily with a minimum of 2 cars each. In addition, several points ship milk in car load quantities. These milk and l. c. l. trains are regularly scheduled.

All drag freight trains are run extra and are ordered as the traffic warrants. These trains are run almost entirely during the night to avoid interference with the passenger trains and to secure a more economical power factor. One interesting problem in their operation has been the difficulty in preventing the crews from overloading the locomotives. With steam operation the only effect of this is to stall the train, but an electric locomotive is subjected to severe damage when overloaded.

About 6,000 men are employed in all departments of the Pacific Electric, of which about 1,600 are in passenger train service and 150 in freight and switching service. All the men employed are non-union. While numerous attempts have been made to organize the employes in various departments, the attempts have always been unsuccessful. Train service employes are paid on a graduated scale increasing annually for 5 years. They work on a 10-hour per day average basis, 7 days per week. To train men for this service a school is maintained at Los Angeles, during attendance at which the students and new men are paid \$0.25 per hour for actual time put in and are guaranteed a minimum of \$45 a month.

RAILWAY DEVELOPMENTS IN BULGARIA.—A British consular report says that at the end of 1912 there were 1,388 miles of railway completed to Bulgaria, the number of passengers conveyed being 3,342,000. The weight of the merchandise transported annually averages 2,000,000 tons. The construction of the following lines may be taken in hand during the present year: Radomir-Dupnitsa-Gorna-Jumajia, with extension down the Struma valley to the Greek frontier, Plevna-Lovetch, Dupnitsa-Bobov-Dol, and Gabrovo-Sevlievo. Work is progressing on the survey and preparation of the Mikhailovo-Haskovo-Porto Lagos line.

TRAIN ACCIDENTS IN JUNE 1

The following is a list of the most notable train accidents that occurred on railways of the United States in the month of June, 1915:

Collisions.				Kind of Accident.	Kind of Train.	Kil'd.	Inj'd.
Date.	Road.	Place.					
†24.	Western Md.	Thurmont	bc	P. & P.	6	6	
27.	Chicago, R. I. & P.	Platte River.	bc	F. & F.	3	5	
29.	Mobile & Ohio	Lawley.	bc	P. & F.	1	9	
Derailments.				Cause of Derailment.	Kind of Train.	Kil'd.	Inj'd.
Date.	Road.	Place.					
3.	Chicago & Alton	Minier.	Exc. speed.	P.	0	22	
5.	Chi., St. Paul, M. & O.	Northline.	Landslide.	P.	1	2	
5.	Chi., Mil. & St. P.	Lake City.	Washout.	P.	3	10	
6.	Mo., Kan. & Tex.	Dallas.	d. track.	F.	0	3	
8.	St. Louis & S. F.	Carrier, Okla.	Exc. speed.	P.	0	52	
†9.	Seaboard A. L.	Birmingham.	Malice.	P.	3	15	
29.	Erie	Mahoning.	Acc. obst.	F.	2	0	

The trains in collision near Thurmont, Md., on the night of the 24th were westbound passenger No. 11, and eastbound passenger No. 10. The collision occurred on a high bridge and the baggage car of the westbound train fell to the ravine below. The engines were badly damaged, but remained on the bridge, as did all of the rest of both trains. In the baggage car which fell were two passengers, both of whom were killed; and the baggageman, one engineman, one fireman, and a traveling fireman were also killed. Several passengers were injured. The collision was due to a mistake of the train despatcher, who sent conflicting orders.

The trains in collision near Platte River, Mo., on the 27th, were both fast freight trains, and at the time of meeting were running about fifteen to eighteen miles an hour. Both engines and five cars were demolished. One engineman, one fireman and one brakeman were killed, and two other trainmen were injured. The westbound train, several hours late, and inferior to the eastbound, encroached on the other train's time without orders.

The trains in collision near Lawley, Ala., on the 29th, were southbound passenger No. 107 and a northbound locomotive running without cars. Both engines were badly wrecked and were overturned. One fireman was killed and both enginemen and seven passengers were injured. The empty engine was running on the time of the superior southbound train, without orders, the engineman having overlooked the schedule of No. 107.

The train derailed near Minier, Ill., on the third of June was eastbound passenger No. 70, and the tender, two baggage cars and one passenger car were overturned. Twenty passengers and two trainmen were slightly injured. The train was running at about 40 miles an hour, and the tender was the first vehicle to leave the rails, too high speed on soft track being apparently the cause.

The train derailed near Northline, Wis., on the 5th was a westbound passenger. The engine and three cars went off the track and the engine was overturned. The engineman was killed and two other employees were injured. The derailment was due to a landslide, caused by a cloudburst.

The train derailed near Lake City, Minn., on the night of the 5th, was a westbound passenger, and the engine and first two cars fell into the Mississippi River. No passengers were killed. Two trainmen and one other person were killed and eight passengers and two other persons were injured. The cause of the derailment was the weakening of a bridge abutment by a cloudburst.

The train derailed on the 6th, about 7 a. m., near Dallas, Tex., was a southbound freight and the engine and two cars were overturned. The engineman, fireman and one brakeman were injured. The cause of the derailment was soft roadbed.

The train derailed near Carrier, Okla., on the night of the 8th was a westbound passenger, running about 35 miles an hour. Two cars were overturned and 52 passengers were injured. The

†Abbreviations and marks used in Accident List: bc, Rear collision—bc, hitting collision—xc, Other collisions—b, Broken—d, Defective—unf, Unforeseen obstruction—ms, Unexplained derail, Open derailing switch—ms, Mispliced switch—acc obst, Accidental obstruction—malice, Malicious obstruction of track, etc—boiler, Explosion of locomotive on road—br, Cars burned while running—P, or Pass, Passenger train—F, or Fr, Freight train (including empty engines, work trains, etc)—Asterisk, Wreck wholly or partly destroyed by fire—Dagger, One or more passengers killed.

derailment is believed to have been due to excessive speed. The tender was the first vehicle to leave the rails.

The train derailed near Birmingham, Ala., on the night of the 9th, was westbound passenger No. 5, and the engine and four cars were ditched. The engineman, fireman and road foreman of engines were killed and nine passengers were slightly injured. The cause of the derailment was the malicious removal of a rail, one rail having been unbolted and taken up and laid across the track.

The train derailed on the 29th, at Mahoning, Ohio, was a south-bound milk train, and five cars were ditched. The engineman and fireman were killed. The derailment was caused by a piece of machinery, which was lying on the track, having just fallen from a train passing on the adjacent track.

THE ALASKAN GOVERNMENT RAILROAD

Plans have been outlined for the first season of actual construction on the United States Government Railroad in Alaska. As announced in the *Railway Age Gazette* of April 23, 1915, the route adopted extends from Seward on Resurrection bay across Kenai peninsula and the head of Cook inlet, ascending the valley of the Susitna river, crossing the Alaska mountains through Broad pass and then descending the Tanana river to Fairbanks, a total distance from Seward of 471 miles. From Seward to the head of the Turnagain Arm of Cook inlet the road follows the line of the Alaska Northern, which the Government purchased

of Knik, at the mouth of the Matanuska river, 77 miles from Kern creek at the head of Turnagain Arm. At Knik the line turns northwest across the valley of the Susitna river. The most difficult part of the work on this end of the line will be the rock cuts and tunnels along the north side of Turnagain Arm between Kern creek and Bird creek. Work may be started later in the season from the Kern creek end and will continue in the tunnels through the winter months.

The first portion of the new line to be built will be from Anchorage, known also as Ship creek, to the Matanuska coal fields; 34 miles of this is main line, while 38 miles will be on the Matanuska coal branch, leaving the main line at Matanuska Junction near Knik. Anchorage is located on navigable water at the mouth of Knik Arm, so that by building this line first, immediate access will be had to the rich coal fields of the Matanuska without waiting for the completion of the line to Seward. The sea connection at Anchorage will also save 117 miles of train haul from Anchorage to Seward. In some seasons ice forms in considerable quantities in the upper end of Cooks Inlet, making navigation rather difficult for three or four months. This detracts somewhat from the advantages of Anchorage as a harbor. The tidal range is from 35 to 40 ft. There is plenty of good available land in the vicinity of Anchorage for terminals.

The town of Knik, located at the head of Knik Arm, is the center of a considerable mining region, which gives promise of a great future. It cannot be used as a sea terminal, because the upper end of Knik Arm is not navigable at low tide. There is considerable good agricultural land in the vicinity of Knik. Seward, the south end of the Government line, will be the winter terminal for the entire line, and will serve the Kenai peninsula the year round. It is located on deep water, on Resurrection bay, and has long been an important port on the Alaskan peninsula. The old dock of the Alaska Northern will have to be largely rebuilt before it will be of service.

It is expected that parties put in the field this year will complete the final location for the entire line between Seward and Fairbanks. The information collected on the preliminary lines run last year is so complete that the work outlined for this season should be completed without difficulty.

The appropriation for carrying on the work this year is \$2,000,000. Because of climatic conditions and the difficulty of getting equipment in to the line, most of the work will be done by station men on small contracts. The experience gained by this method this year will aid in determining the method to be followed in building the remainder of the road later.

Construction work at Anchorage commenced in May, and is now progressing quite rapidly over a distance of twenty miles. So far the material encountered is mostly gravel which is quite easily worked. There are many excellent station men on the ground, anxious for the work at reasonable prices. Considerable clearing has to be done all along the line, as the country is covered with a growth of small hirsch and spruce. Rails are now being contracted for, and it is expected that about thirty miles of track will be laid before winter. During the winter some rock work can be carried on, but earth work cannot be done to advantage. During next season it is expected that the work will be pushed more vigorously.

The entire project is under the direction of the Alaskan Engineering Commission, of which W. C. Edes is chairman, and to whom we are indebted for the information given above.

DANISH STATE RAILWAYS.—The earnings of the State Railways in Denmark during the financial year 1914-15 represent a record figure, amounting to about \$3,105,000. Owing to the extraordinary conditions prevailing, ample sums have been written off and added to the different funds, the net profits thereby being fixed at \$2,295,000, the same amount as the previous year. Last year differed considerably from ordinary years, inasmuch as the war at the outset reduced the income to an unprecedented minimum, but later the traffic grew to such an extent as has never been witnessed before.

Location of the Proposed Government Railroad

for \$1,150,000. It was originally intended by the projectors of this road to follow substantially the same course which the Government has now adopted, but the line ran into financial difficulties very early in its career, and only 71 miles of the line were built. A sale was finally made to the bond holders, who ordered construction work stopped, and rather than pay the \$100 a mile tax, discontinued the operation of trains. During the past four years the road has been operated by a "citizens' committee," using gasoline cars, during the summer only.

The Government intends to use the Alaska Northern this year as far as mile 34. Owing to the poor physical condition of the road it will be necessary to make very extensive renewals and repairs before it will be in shape to use.

From the head of Turnagain Arm the line will be entirely on a new location, turning to the west along the north shore of the Arm to Ship creek, at the mouth of Knik Arm, then in a generally northerly direction along Knik Arm to the old town

How Do You Select and Promote Your Men*

Simple and Practical Suggestions Looking Toward the Solution of a Most Difficult and Troublesome Problem

BY ROY V. WRIGHT

Possibly no one problem is of greater importance to the railway executive or industrial manager than that of knowing how best to select men either to enter the organization at the bottom or for promotion to more important positions. We can analyze the properties of materials and predict their performance under given conditions with more or less accuracy. The human element, however, which controls the use of these materials and is by far the most important factor in determining the efficiency of operation of a manufacturing plant or a railway property is far more difficult to analyze and direct with a view to securing maximum efficiency. The necessity of giving greater attention to this element has become more and more evident in the intensive development toward greater efficiency which has been so marked during recent years. The selection of men is such a complicated problem, however, that many executives have gone on as best they could, feeling that science could contribute little toward its practical solution.

Vital as is this problem to a manufacturer or industrial plant, it is far more important to the railway with its forces scattered widely and with the higher executive officers, and many even of the minor ones, unable to keep in close or intimate touch with their subordinates.

In attempting to solve the problem of the selection of men some have looked to experimental psychology, such as is exemplified in Professor Hugo Munsterberg's work and particularly as outlined in his book on "Psychology and Industrial Efficiency." Others have looked into the theory of phrenology, feeling that possibly it might be used to determine the characteristics of different individuals with a view to seeing whether they were fit for promotion or whether by this means men could be selected with any degree of success for performing certain specific classes of work. Then we have had the theories of Dr. Katherine M. H. Blackford, which take into consideration certain physical characteristics, including color (blond or brunette), shape and profile of head, size, structure, texture (fineness or coarseness of fibre or grain as seen in the hair, skin, nails, features, hands, feet and general body build); consistency (hardness, softness or elasticity of bodily tissues), proportion, expression and condition of body, clothing, etc. Dr. Blackford it was who placed special emphasis on keeping three things in mind in selecting a man for a job: First, the type of job; second, the characteristics of the man himself, and third, and possibly equally important, the characteristics of his boss. Some of the claims which are made for this science of character analysis are defined in an advertisement in one of the recent numbers of a popular magazine in the following words:

In this course you learn to judge others quickly and accurately. You learn to know what a man's appearance means—his face, his head, his hands, his eyes, his expression, his walk, his handwriting—everything about him. You do not measure his head or ask him questions or let him know in any way what you are doing. There are no repetitions, no theories, but a clean-cut presentation of the principles underlying human character—with so many photographs, diagrams and charts that you can learn and apply the principles rapidly and easily, etc., etc.

Of how much value are all of these things? How much reliance may be placed upon them? If they are not satisfactory or reliable, is there any practical way of selecting a man for a job or for promotion with a fair degree of certainty as to his fitness for the position? The remainder of this brief talk will be devoted to answering these questions.

Most of you have undoubtedly heard of Dean Hermann

Schneider, of the University of Cincinnati, and possibly some of you are fortunate enough to have had the pleasure of meeting and becoming acquainted with him. He it was who first put into effect in a big way the idea of having practical and theoretical training go hand in hand in engineering education, by securing the co-operation of the machine tool builders and manufacturers of Cincinnati with the university, and in establishing the co-operative engineering courses. The wonderful results which followed this experiment make a long story and doubtless are familiar to many of you. Suffice to say here that the results were so eminently practical and so striking that in one form or another the methods are rapidly being extended far and wide, both in connection with engineering courses, in colleges and universities which are so located as to be able to secure the co-operation of industries, and also in many lines of industrial and vocational training throughout the country.

As a concrete example, let us consider what happened in one large department store. Those in charge felt that the sales force was not doing its best work because the employees were not properly trained, either in general education or as to their knowledge of the merits of the products which they sold, to deal to the best advantage with the leading people of the city who did their shopping in the store. Manifestly there are certain times during the day when it is not necessary to have all of the sales force on duty. Arrangements were made with the city school system to provide instruction during these periods, to those who could be spared, in English, civics and other studies which would develop the employees into bigger and broader men and women and make better citizens of them. Then, too, the employer, who provided and fitted up the schoolroom, saw to it that expert instruction was given in the methods of manufacture and as to the merits of the different products which were sold.

The latest development along this line is the general vocational training movement which is spreading throughout the country. New York City, for instance, has gone into the matter on a large scale and has retained Dean Schneider as one of its chief advisers. In the Woolworth Building, where our offices are located, the representatives of the city school system have made a canvass to find whether a sufficient number of employees can be spared at different times during the day to warrant the fitting up of a schoolroom and the providing of instruction in the building. At the shops of the Baltimore & Ohio on Staten Island, the city is co-operating by providing instruction to the apprentices, the railroad furnishing the schoolroom—an old passenger car—and the Board of Education of the City of New York paying the salary of the teachers, who in this particular case are employees of the railroad, and also for the material used.

I have outlined this development thus fully, not because it has any special bearing on the subject under discussion, but because I want you to have some idea of what Dean Schneider has done and of that for which he stands. He is a man with a hobby, but he is big enough to see over and around it. He has a keen and analytic mind and is capable of sizing a problem up from a broad and liberal viewpoint. He has a splendid supply of patience and is absolutely unselfish in his efforts to help others.

In connection with the work of the co-operative engineering courses at Cincinnati, which have been carried on for a number of years, Dean Schneider and his associates have come in contact with hundreds of young men whom they have had an opportunity of studying critically and whose progress along both practical and theoretical lines they have been able to observe and follow closely. Because of the nature of the work, the students spending alternate weeks in the manufacturing shop and in the

*An address given at a luncheon of railway officers at the Auditorium Hotel, Chicago, Tuesday, June 24, under the direction of the General Railroad Committee of the Chicago Y. M. C. A.

classrooms at the university, the instructors and shop co-ordinators can get closer to the students and know them more intimately than under the usual conditions. Moreover, they have been able to follow many of these men after they left the institution and to observe their progress.

As stated by Dean Schneider in a paper entitled "The Problem of Selecting the Right Job," which was recently presented before the third annual convention of the National Association of Corporation Schools, "one leg of the tripod upon which the co-operative system of education rests is the selection of men for the work for which they are to be trained." The university authorities, on the basis of their study and observation of the individual students, now guarantee to Cincinnati manufacturers for certain jobs men who have finished three years in the co-operative course.

In the effort to determine whether phrenology, physical characteristics or applied experimental psychology had any merit in such selection, a great number of experiments were made on mature students whose characteristics and qualities were well known, but not by those actually conducting the tests. The tests demonstrated conclusively that these systems were not at all reliable and that the only practical and successful way of selecting men is by testing them out on the actual job.

Concerning the tests as to physical characteristics Dean Schneider stated: "This seems to be a development of the old idea of phrenology. It is claimed in this system that physical characteristics indicate certain abilities. For example, a directive money-making executive will have a certain shaped head and hand. A number of money-making executives were picked at random and their physical characteristics charted. We do not find that they conform at all to any law. Also we found men who had the physical characteristics that ought to make them executives, but they were anything but executives. A number of tests of this kind gave negative results. We were forced to the conclusion that this system was not reliable."

As to applied experimental psychology the Dean had this to say: "The science of applied psychology seems to be at the point where chemistry was when it was alchemy; we may hope, however, that Illusion is the First Appearance of Truth."

It is not my intention, and I very much doubt if it was Dean Schneider's intention, to unqualifiedly and wholly condemn these things. It is quite possible that they may contain certain elements of truth. The trouble is that they are being carried to a ridiculous extreme. If on the other hand they are instrumental to some degree in awakening executives to the importance of the problem, they will have served a useful purpose.

Dean Schneider finally concludes, on the basis of the study and testing of about 1,000 mature students, both in theoretical and practical work, that: (1) A worker's failure is as significant as his success and should be analyzed to indicate a new and fitting job; (2) the characteristics developed by analysis of many successes and failures furnish a basis for placement which works better than any plan we know; (3) the method is crude and unscientific; it requires a period of time much greater than other methods proposed, but it insured a reliable verdict.

Knowing of the man and his work as we do, we are pretty safe in accepting his conclusions. Doubtless they agree fairly closely with those of many in the audience who, however, have not been in a position to prove their correctness, not having had the exceptional opportunities for observation possessed by Dean Schneider.

On these conclusions as a basis, how can we go ahead logically to induce the supervising officers to study more critically the characteristics and work of the men who enter the service, with a view to determining whether they are properly fitted for the tasks to which they are assigned? It would seem that in hiring men the initial selection should be made by members of the organization who have some special ability in sizing men up; then if they are closely watched and given a thorough trial on actual work, it should be possible to determine within a reasonable time whether they are the sort of men that will prove satisfactory

and along what lines it will be best to develop and train them.

The trouble under present methods is that a new man taken into the organization is in most cases not given any systematic attention. If he is very bad he is fired. If he is passably good he is allowed to remain, but no one knows with any degree of certainty whether he is the best man for the job, or whether he is capable of doing better work or not.

A simple method of checking the personality and performance of these new recruits will be described. It was not developed and used especially for that purpose, but is admirably adapted to it, as well as for checking men already in the service with a view to determine whether they are properly placed, along what lines they can best be developed and just which ones are best suited for promotion to more important positions. It has been tried out on a large scale with splendid results and is inexpensive to install and maintain. It cannot be successfully inaugurated or followed up, however, unless it has the enthusiastic backing and support of the higher executive officers.

Briefly, the scheme is as follows: Each foreman or supervising officer is provided with a sufficient number of special report cards to cover each one of his immediate subordinates, which he is required to fill in and return to his superior officer. He is not expected to keep any copy of these reports and is called upon at periods, of say six months, to make similar reports on each man. The comparison of the reports for any individual will show whether he has made progress in improving his weak points. If he has not, or has apparently fallen behind, his superior is asked for an explanation and is held responsible either for failure to properly train and develop the man or for lack of accuracy in sizing him up in making his reports.

In this way the foreman or officer is automatically compelled to study his men more closely, and the effect in improving and developing the executive ability of such officers is a most noteworthy feature.

The characteristics upon which a report is made are such as to indicate a man's fitness for holding a position in the organization and as to whether he is worthy of promotion. The items on a report card,* which was used by LeGrand Parish, with standard and concise definitions, are as follows:

EDUCATION: Mental and moral training.
 SPECIAL KNOWLEDGE.
 EXPERIENCE: Knowledge acquired by actual trial and observation.
 HONESTY: Upright disposition or conduct.
 MORALITY: Accord with the rules of right conduct.
 TEMPERANCE: Moderation.
 TACT: Ability to do or say what is best for the intended effect.
 RESOURCE: Good at devising expedients.
 RELIANCE: Sure dependence.
 FORESIGHT: The act or power of foreseeing.
 APPEARANCE: Outward look or aspect.
 MEMORY: Mental hold on the past.
 ENERGY: Active, effective.
 INITIATIVE: The ability or disposition to take the lead.
 PERSISTENCE: Steady or firm adherence to or continuance in a stated course of action or pursuit that has been entered upon.
 ASSERTIVENESS: Affirming confidently, positive.
 DISCIPLINE: To teach rules and practice and accustom to order and subordination.
 PROMPTNESS: Quickness of decision or action.
 ACCURACY: Correctness.
 SYSTEM: Regular method or order.
 ORGANIZATION: A systematic and regulated whole.
 EXECUTIVE ABILITY: Ability to carry into effect in a practical manner.

A man is graded, as very good, good, medium or poor in each of these characteristics.

This scheme eliminates the "hit and miss" method of selecting men for promotion and was instrumental in locating suitable men with considerable accuracy. Too often when it comes to promoting men a decision is based on the man's recent performance, when he may have done some spectacular piece of work which placed him in the limelight, but which may not give any indication of his fitness for holding an executive position. The men throughout the organization, understanding that these records were being kept, were encouraged to improve and better themselves. Men who were unsuited for the work to which they were assigned were discovered and transferred to tasks for which

*For more complete description of this card see *American Engineer and Railroad Journal*, December, 1908, and *Railway Age Gazette*, July 23, 1915, page 151.

they were better fitted, or if they were found hopeless, were eliminated from the organization.

These report cards were developed ten years or more ago and remained in use several years until Mr. Parish left railway service—long enough to demonstrate their value beyond question. In the light of experience it was Mr. Parish's idea to revise the characteristics, including some which are not shown in the list quoted and eliminating or changing others.

It so happens that Dean Schneider, in making his observations, employed record cards of a somewhat similar nature, but possibly of a broader scope and more closely approximating the ideal toward which Mr. Parish was working. The characteristics noted on Dean Schneider's records were as follows:

Physical strength, or physical weakness. In some occupations physical strength is essential; in others it is not.

Mental, or manual. This may be stated in another way and in rough terms as "head efficiency" as compared with "hand efficiency."

Settled, or roving. Some men work best under a steady routine; others like to move about and see or do new things.

Indoor, or outdoor. Some men thrive best under outdoor work; others prefer indoor work.

Directive, or dependent. Some men assume responsibilities; others evade them.

Original (creative), or imitative. Some men are fertile in making suggestions; others do not possess this quality, but are good at putting them into effect.

Small scope, or large scope. Some men like to fuss with intricate bits of mechanism; others want tasks of big dimensions.

Adaptable, or self-centered. The first might make a good salesman; the second a statistician.

Deliberate, or impulsive.

Manual accuracy or manual inaccuracy.

Mental accuracy (logic), or mental inaccuracy.

Concentration (mental focus), or diffusion.

Rapid mental co-ordination, or slow mental co-ordination.

Some men go to pieces in an emergency, whereas if they were given time to consider the situation they hold together and act wisely.

Dynamic, or static. One man may lack push or determination; others having the dynamic quality possess these characteristics.

Little has thus far been said as to the necessity for providing some adequate means of training the men in all of the departments. Its importance immediately becomes apparent in developing a system such as that outlined above. That it pays generous dividends is indicated on such roads as have installed modern apprenticeship systems for mechanical department employees, or have developed educational campaigns for improving conditions and securing greater efficiency or economy in other departments. It is unfortunate that more attention is not being given to this subject by railroads generally.

In this connection allow me to quote a few paragraphs from an address on "Training of Young Men with Special Reference to the Question of Promotion,"* which was given by George M. Basford before a recent meeting of the Burlington Association of Operating Officers.

"To-day we are looking for the genius and are overlooking the production of good workmen. We are depending upon officers. We need to depend upon men. Trained, properly educated and encouraged workmen will provide good officers later.

"Systematic methods of selecting human material for the organization are imperative. The boys in offices, in shops, and all along the road should be most carefully and intelligently selected. Someone well qualified must be given this responsibility. Then these recruits must be tried out, and those 'making good' must be trained. This word 'trained' represents a new meaning as applied in this connection. It means thorough education of hand and brain and conscience.

"Because of the size of a railroad organization it is necessary to provide easy and automatic methods of discovering ability. It is desirable that promotion should be proposed by co-operative action by subordinate officials and controlled by a very high

official whose authority is complete in this case. Suppose the president of a railroad could find a man qualified for the duty of directing the training and promotion of men. The difficulty in finding such a man emphasizes the importance of the duty. This man should be given a dignified, powerful position, with such a title as Assistant to the President. He should be responsible for methods of recruiting, methods and means of training men, and for a scheme whereby he will personally know that every promotion is based upon merit, with favoritism and politics banned. He should be responsible for and personally approve every promotion in the entire organization."

Mr. Basford then describes the report cards which were used by Mr. Parish and among other things concludes: "Our Assistant to the President need not personally watch all these cards. He should, however, by frequent checks know positively that every department head is watching them, and he should personally keep the records of all important officials. He should also require record cards for a long period to accompany a recommendation for promotion. For example, a vacancy as assistant superintendent is to be filled. The Assistant to the President would call on all interested departments for recommendations and the office would be filled after an intelligent and complete investigation of all eligible men, including the mechanical and track as well as the operating department. The plan should cover every department."

The scheme suggested by Mr. Basford, if put into effect, would do much to make positions on the railroad more attractive to ambitious young men and would undoubtedly develop means for locating such men in the territory served by the road and of getting them to enter its service.

In conclusion the point which I especially wish to make is that it is imperative from the standpoint of future efficiency and economy that each organization should formulate and adopt a policy, which will have the hearty support and backing of the executive officers, as to the selection of men for the different jobs; the proper training of these men in order to make their efforts as effective as possible, and a comprehensive method of selecting men for promotion. If this is done—and it is not a matter which can be accomplished in a week, a month or a year—it will not only increase the efficiency of each individual in the organization to a maximum, but it will encourage loyalty on the part of all the employees and develop an *esprit de corps* which will do much to eliminate friction and labor difficulties and will place any organization which possesses it in an enviable position as to efficiency and effectiveness.

GERMAN RAILWAYS AND THE WAR.—A writer in the London Times, commenting on the important part played by the German railways in war time, describes the ease and rapidity with which huge masses of troops are transported from one front to the other. He says: "Naturally the usual train service in Germany has been considerably reduced. The time-table itself shows a high percentage of trains withdrawn. But the reduced service is perfect, despite the decrease in the number of railway servants, who now include very few able-bodied young men. In the booking offices women are supreme. But trains leave and arrive to the minute, and provide the usual accommodation. There are sleeping and restaurant cars on the important expresses between the principal cities. All the German railways are now worked on one single system, which has been extended to the whole of Belgium under German occupation, as well as to the occupied portions of France and of Russian Poland. Direct express trains, with sleeping and restaurant cars, run from Berlin to Metz-Charleville-Mezières. Similar trains run to Brussels and Lille. With a special permit a civilian can travel there just as he can travel eastward to Lodz. The German time-tables tell him when he can reach places as far west as Noyon, Laon and Chauny. In fact, the organization is such that, notwithstanding the heavy military burden on the railways, one can travel almost as freely and quite as punctually as if there were no war. In certain towns and fortified areas your passport may be required, but that is all."

VENTILATING THE STAMPEDE TUNNEL OF THE NORTHERN PACIFIC

Late in March the Northern Pacific placed in operation a ventilating system at the Stampede tunnel, which required the solution of a number of unusual and interesting problems. This tunnel is located on the main line to the Pacific Coast, at the summit of the crossing of the Cascade Mountains, about 75 miles east of Seattle. The approach grade on the west is 2.2 per cent. for several miles, reducing to 0.7 per cent. at the west portal. On the east slope there is a 2.2 per cent. grade for five miles,

General View of the Ventilating Plant with the Power House in the Foreground and the Fan House in the Rear

changing to 0.2 per cent. at the east end. The summit of the grade is a short distance east of the center of the tunnel, which is 1.95 miles long.

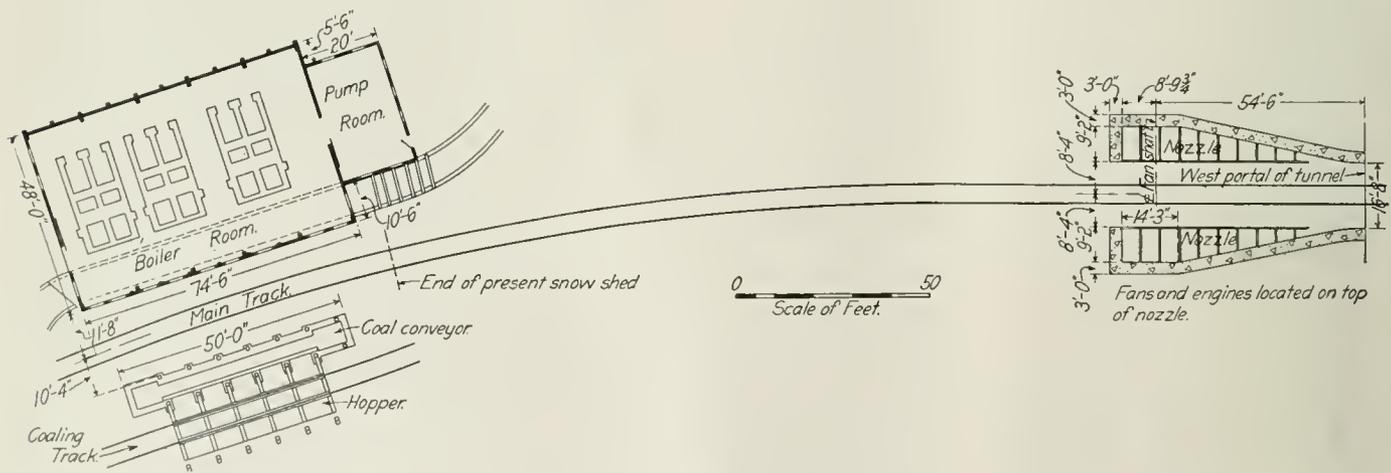

An average of 10 passenger and 10 freight trains pass through this tunnel daily. Most of the passenger and all of the freight trains require helper engines. The rating of freight trains is 2,850 tons westbound, and 2,400 tons eastbound. Such trains are hauled by large Mallet road engines, assisted by two smaller

to 150 deg. The substitution of oil-burning locomotives on freight trains two years ago relieved the smoke conditions somewhat, but did not lower the maximum temperature appreciably.

To relieve traffic conditions on these heavy grades over this mountain a second track has been constructed between Lester and Easton during the last two years, the only break in this being through the tunnel, which is still single track.

In considering the design of a ventilating system at this point, the most serious problem presented was the length of the tunnel. Previous installations have been made in tunnels varying from one-half mile to one mile in length. The Stampede tunnel is almost two miles long. This at once raised the question whether a sufficient nozzle velocity could be obtained to drive the air through the entire length of the tunnel with a train in it with a reasonable expenditure of power. After careful consideration it was decided that such a method required one of two alternatives, either operating the trains slowly to keep the smoke ahead of them by the expenditure of a reasonable amount of power, or if trains were run at their normal speed, the expenditure of a greatly increased amount of power. It was finally decided that the plant should be designed to clear the tunnel of smoke in approximately six minutes after a train had passed through. This insured that every train would enter a clear tunnel, and, also, if for any reason it was stalled in the tunnel the fans would have sufficient capacity to keep the smoke moving through the tunnel, supplying the crew with fresh air.

The presence of the summit of the grade, a short distance east of the center of the tunnel presented another problem. Theoretically, a set of fans would be required at each end, so that the smoke could be driven ahead of a train running up grade in either direction. As it was finally decided to clear the tunnel of smoke after the train passed through, the usual procedure was not followed and only one plant was constructed. As the prevailing natural direction of the wind was eastward it was located at the west portal. It was designed to furnish 540,000 cu. ft. of free air per min. at a velocity of 1,700 ft. per min. in the tunnel. The required impact pressure at the nozzle discharge was figured

Plan of the Power and Fan Houses

Mallet pusher engines, one of which cuts off at the portal of the tunnel and the other passes entirely through it. The helper engines in freight service drop back to the foot of the grade at each side after assisting trains over the summit, while the passenger helper engines go through from Easton, at the foot of the slope on the east, to Lester, at the bottom of the heavy grade on the west, and vice versa.

This frequent train and helper movement created smoke conditions which made relief necessary. The portal at each end is located in a ravine. This fact, combined with the presence of the summit of the grade midway in the tunnel, caused the smoke to remain in the tunnel for considerable periods of time, especially when the wind was in certain directions. Even more serious was the heat problem, the temperature frequently rising

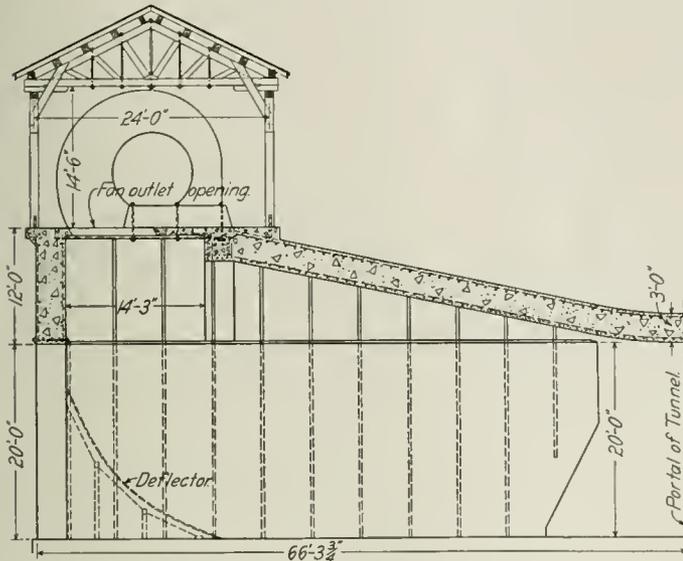

at 4.2 in. water gage. The general type of the nozzle adopted is that devised a number of years ago by Charles S. Churchill and C. C. Wentworth, of the Norfolk & Western.

As stated above, the west portal of the tunnel lies in a narrow ravine. For this reason, while the fan house is located directly over the portal it was necessary to locate the power house 250 ft. back along the track. On the side of the main track opposite the power house, is a short side track leading to a trestle and coal hopper. Coal for the power house is received here and unloaded into pockets. From the pockets it is carried up and over the tracks by a link-belt bucket conveyor and deposited in storage bins directly over the main tracks with a capacity of 450 tons.

The power house is located across the main track from the coal hopper. It contains five Babcock & Wilcox 150-h.p. boilers

equipped with Jones underfeed automatic stokers feeding directly from the storage bins. Auxiliary apparatus includes a No. 12 Sturtevant "Multivane" induced draft fan, driven by a 7-in. by 7-in. vertical engine, a Hoppes feed water heater, and three 12-in. by 8-in. by 12-in. Dean pumps, one of which is for the feed water heater, one for the boiler feed, and one as an auxiliary so connected that it can replace either of the other two.

Steam is conducted from the boiler room to the fan house through a 10-in. steam line. The ventilating equipment consists

Section Through Fan House and Nozzle

of two No. 22 Sturtevant "Multivane" fans, each fan being driven by two 16-in. by 16-in. Sturtevant horizontal center crank engines, direct connected. The fans are 16 ft. long by 14 ft. high and 7 ft. wide, and operate at 220 revolutions per minute. The fans and engines are mounted on a concrete platform carried on a concrete arch over the tunnel.

The fans force the air vertically down onto a deflector, from which it passes into the nozzle. The nozzle is 50 ft. long and 19½ ft. high inside at the rear, reducing to an 8-in. opening at the top and 14-in. on the bottom at the outlet, which gives a total outlet area of 52 sq. ft.

The outer wall of the nozzle is of concrete 3 ft. thick, while

View of the Fan House Over the Tunnel Portal

the inner wall is of 5-in. tongue and grooved timber anchored to the concrete by ½-in. by 3-in. flat steel bars spaced 6 ft. horizontally and 4 ft. vertically. A damper is placed below each fan so that it can be shut off completely when out of service.

This plant was built by force account during the winter of 1913-14. Over 1,000 cu. yds. of concrete were required in the construction of the nozzle and the engine base. Because of the very limited amount of room available and the necessity of preventing

all interference with main line trains, since a westbound train would have to stop in the tunnel and an eastbound train on the ruling grade, the concrete was mixed at the site of the coal dock. It was then hoisted by an Ensley system of spouts and dumped into small cars running on the top of the snow shed extending over the track between the boiler and fan houses. All of this concrete was put in in two weeks, as much as 130 yds. being placed in a single day. During this same time all concrete material had to be unloaded directly from the main line.

The fans were installed during last year. Recent tests showed that they are delivering 540,000 cu. ft. of air per min., with an impact pressure at the nozzle outlet of 4 in. Tests made with a freight train moving at a speed of seven miles per hour showed that the smoke was driven ahead of the train and the temperature did not exceed 100 degrees.

This installation was designed and built under the general direction of W. L. Darling, chief engineer, by S. J. Bratager, principal assistant engineer, in conjunction with F. Herlan, district manager, B. F. Sturtevant Company, Boston, which company furnished the equipment. T. Z. Krum was assistant engineer, and B. C. Rowell, resident engineer on the ground for the railroad company.

THE FARMER AND THE RAILROAD

By PHILIP MEINEN

Farmer, Stites, Idaho

One reads much nowadays in almost every newspaper in the country about farmers urging legislation to lower freight and passenger rates. Before going any farther I wish to say that I am not a railroad man, but am a farmer and believe in justice between man and man or man and company, regardless of wealth on either side.

Now, to begin with, the first thing a farmer will say is that the railroads are making too much money, basing his argument on something he has read somewhere or that someone has told him who doesn't know any more about fair rates and profits than he does, but who is urging lower rates only to be a good fellow and get subscriptions for his paper.

To be frank, we need both the farmer and the railroad company. I say company because many would say let the government handle the railroads. I don't think the government should go into the railroad business and you don't either if you have ever given it any observation and thought.

Let's not overlook the consumer, as he is the prime factor to both the farmer and railroad. Without him the farmer couldn't sell his products or the railroad do any transporting, and his sympathy is not altogether with us farmers, as he accuses us of getting too much for our hogs, cattle and grain and is employed by railroad companies or other city industries for his livelihood.

I have heard farmers remark that the cost of living is too high for the poor people in cities and should be reduced by cutting freight rates and cutting out the middleman's profit. Well, there might be something in that, but we don't do it when we have a chance. For example, at present I am living in the state of Idaho. In the village where I live the farmers have a co-operative creamery running the third year now. They were going to furnish cheaper butter by cutting out freight rates and also middlemen's profits. Before this creamery was there they used to ship their cream to Spokane, Wash., a distance of 195 miles, and ship the butter back. Now they have saved dray charges at both ends of the line, saved middlemen's commissions at both ends and also saved railroad charges both ways, and the result is that we pay the same price as usual, and at times a little more, so there is not much sincerity to the cheaper butter question.

A short time ago I noticed in some paper where a spokesman for the farmer came before a hearing on freight rates, stating that the railroads were getting from six to nine per cent on their investment. He claimed that this was too much

as compared with the farmer who was getting only from three to four per cent on his investment, and further, that the average farm investment in the state of Iowa was \$17,000, and that a man could only earn \$600 a year on that investment, declaring that a man capable of handling a \$17,000 investment was worth more than \$600 a year.

Now surely there is something wrong besides high freight rates. Let's investigate. In the first place, if any man who has \$17,000 invested in a quarter section of land can only make it pay him \$600 a year there is something wrong with the man or the land. If he is not a farmer and does not understand farming thoroughly, as many of us do not, it's the man's fault. On the other hand, if he has paid \$17,000 for a quarter section where the land is not worth more than \$10,000 a quarter section that makes a difference in figuring interest on an investment.

The fact of the matter is this: we have all been anxious to have a farm of our own, thereby causing land prices to rise by high bidding. We'll all have to admit that land is selling too high, which makes it bad for the renter who has to pay higher rent so his landlord can make reasonable interest on his high-priced land, or if a man is buying a farm for himself to live on and has to go in debt for most of it, it makes quite a difference whether he has paid \$100 per acre or \$50 when it comes to figuring interest and revenue on investments. When people get excited over land and pay a great deal more than it is really worth somebody is going to be dissatisfied sooner or later. The selling price of land isn't always the actual value. We have numerous instances of this everywhere. If you have made a bad buy or are a poor manager you might have free railroad transportation and still make a failure of farming. So let's use a little sense and not shift our poor judgment on the railroad company which has nothing to do with it. We are always ready to blame the other fellow when really the fault is our own.

We shall all have to admit that the railroads have helped the farmers more than anything else could have done, by giving them better transportation and cheaper transportation than we used to have in early days when the freight wagons used to be the only way.

Now it is a fact when we go into any country as a home-seeker or for any other business requiring cheap transportation the first question we ask is, "How far from a railroad?" If very far out we usually do not give it any attention, and if we do invest the saying is this, "Well, I got it cheap and will hold on until we get a railroad that will open up a good market for us and then our land will be worth something."

I want to tell you about another case of freighting the old-fashioned way in the state of Idaho, with which I am thoroughly familiar. In the village of Stites the Northern Pacific Railroad has a terminal. The surrounding country is fertile farming land, but 52 miles up the river is a large mineral belt. The mineral belt has no railroad transportation and the old-fashioned horse freighting is too expensive for the mining companies. So they will have to wait until the railroad is extended, which will then open up a great mineral and timber belt and also a great market for us farmers to sell our products to the mining companies at a good price and create labor of all kinds where there is nothing doing now of any importance. I have made the remark many times myself, and have heard numerous farmers make the same remark, that if the railroad should ever be extended to Elk City, which is a small mining town, this would be one of the greatest countries in the Northwest for the farmer, miner and lumbermen.

These are facts, as I am in a position to know. Then why should we encourage a railroad company to spend several million dollars to build, which it would cost at the very least, as it is an expensive road to build, and then come right back at them and say: "You are making too much money, you will have to cut your rates," after they have spent their money in good faith and to the great benefit of the public. Take it

with ourselves. Suppose we bought a bunch of hogs or cattle and were asking a handsome profit on our risk and investment, and the consumer was to come along and say, "No, I can't afford it and furthermore you are making too much on them, you will have to sell them for so much; if you don't we will have to legislate against you." That would be just as fair in the eyes of good reason as going against railroad companies.

Of course this horse freighting does not appeal to the farmers of the Middle West and older settled States, but is still in existence with us in the West to a certain extent. A short time ago I was talking to an old settler from north central Kansas. He was telling me of earlier days when they used to haul corn to Denver, Col., a distance of 500 miles by wagon before they had railroads, and of the hardships they endured, and the prices of their stuff were not any better at that time than they are to-day. And it is from those days that we must figure our rates. Figure the price they received in those days and the cost of hauling, and then figure the price you get now and the rate you pay now. Compare them, and see which you like best, and which is the most profitable to you.

This talk of someone making too much money is no argument. That is mere jealousy, and we don't want to class ourselves with that class. Let us be brighter and broader. Well, you say, the railroad companies are all getting rich. That may be true, but look at the amount of business they do. If their profits are small, or we will go a little stronger and say reasonable, the immense business transacted would make anyone rich. It would be the same if a large number of farmers combined and formed a company, provided they could agree, which is hardly ever the case. If they would buy immense tracts of land and would manage their business as systematically as the railroads do they would also become very rich, not necessarily from large profits, but from the large amount of business done. It is a well-known fact that the railroad officials thoroughly understand their part. If they don't they don't hold their positions long. If we farmers would spend more time studying our own affairs instead of the other man's it would be better for us. It would purify our minds and teach us better management and also how we can produce more per acre, as that is the coming big question.

Now, in conclusion, I wish to say that I don't want you to think that I am giving the railroads all the credit and the farmer all the blame, but there has been a great amount of unnecessary complaining by the farmer. Whenever it is necessary and possible to lower rates the results are usually accomplished by the proper persons applying to the proper authority. What we should do is to have a get-together good old time oftener, and get better acquainted with one another, and that ill-feeling would not exist so much. There are good men on both sides, and if we understood one another better the feeling would be more friendly and it would be beneficial to everybody concerned. So let us break away from the old idea of playing the other fellow for a robber and a crook when we are just as much to blame.

RAILWAY EXTENSION IN THE CANTON PROVINCE OF CHINA.—A recent British Consular report says that little railway construction was undertaken in Canton Province during 1914. The Canton-Hankow Railway at the end of the year was open as far as Wu Shek, a distance of 121 miles from the Canton terminus. It was hoped to complete the next section of 19 miles to Shiukuan by May last. The total length of the section to be built by the Canton Company is 214 miles, which will take the line to Ichang, just across the Hunan frontier. Prospects of a continuation beyond Shiukuan in the immediate future without outside assistance are remote, as capital is said to be exhausted. Receipts more than cover expenses and upkeep, and are expected to increase considerably with the extension of the railway to Shiukuan. The Canton-Samshui Railway, though only 32 miles long, has had a good year in spite of damage done to the roadbed by floods, which, for a considerable time, stopped traffic six miles from Samshui.

Precedent Versus Progress in the Stores Department

Excessive Increase in Unused Material Due to Adherence to Precedents in Methods of Control and Accounting

BY GEORGE G. YEOMANS

The investment of the average railroad in unused material is rapidly increasing. In 15 years it has increased 283 per cent. This rate is out of all proportion to the increase in any of the units of operation, which render a stock of material necessary.

The official figures of the Interstate Commerce Commission show the following increases to have taken place during the same period:

Miles of track.....	50 per cent.
Freight car miles (10 years).....	50 per cent.
Total car miles (partly estimated).....	57 per cent.
No. locomotives in service.....	70 per cent.
No. cars in service.....	82 per cent.
Tons moved	167 per cent.

Reduced to a "per mile of track" basis, the percentage of increase is as follows:

Unused material	155 per cent.
Freight car miles (10 years).....	10 per cent.
Total car miles (partly estimated).....	15 per cent.
No. locomotives in service.....	14 per cent.
No. cars in service.....	21 per cent.
Tons moved one mile.....	77 per cent.

Why this enormous discrepancy in the growth of the fixed investment in material?

It must be distinctly borne in mind that this is not an increase in the amount of material *used*, but in the amount of material that is not used and which represents a practically permanent investment.

This distinction is important. Consumption of material should be expected to increase in greater ratio than the units of operation referred to, because railroad operations themselves have greatly increased, both in magnitude and complexity. But a stock of material should not increase in direct proportion to the amount consumed, and, while it could not perhaps be altogether limited to the same ratio of increase as those units with which it is here compared, it is reasonable to assume that so great a difference is wholly unwarranted.

It is unfortunate that more exact information on this subject is not procurable. The units with which comparison is instituted are not those of choice, but of necessity, and the comparison is therefore crude, but the discrepancy between cause and effect is so tremendous as to demand serious consideration.

I do not know a railroad executive who will not admit that this investment is larger than it should be, and who is not trying in some way to curb it, but it is evident that the average way is not the right way, for the disproportionate increase continues. A detailed examination of this situation on ten representative railroads in various parts of the country, coupled with results actually obtained in several cases, point to the conclusion that this investment is nearly twice as large as is necessary on the average railroad.

The amount of capital thus impounded is reported as \$240,000,000, and this is undoubtedly the minimum. If 40 per cent of this money could be recovered, there would be \$100,000,000 more of free capital to employ for other purposes.

Analyzed further, this means that the railroads, collectively, have unconsciously expended \$100,000,000 for which no real necessity existed. True, it is not lost. The material which it represents will be used some day or, at least, most of it; but it is idle capital and that means expensive capital. When locked up in stocks of material the carrying charges are seldom less than 15 per cent, and frequently as high as 20 per cent. Thus a further expense of some \$15,000,000 or \$20,000,000 is caused, which is wholly unnecessary.

Why do such conditions exist, and what is the remedy?

Two principal causes contribute to this economic waste and prevent its correction.

1. Absence of exact information regarding the handling of this large investment.

2. A reluctance to depart from long established precedents and customs.

It has come to be generally accepted that the first step toward positive control of this large investment is the creation of an organization to which can be entrusted the care and handling of the stocks and the collection of accurate data concerning them.

Following the example of the pioneers in this reform a majority of the railroads have instituted a "Stores" department, but, as a rule, have placed it in charge of employes whose previous training has all been along the lines of former practice and, through an imperfect conception of the basic principles underlying the effectiveness of such an organization, they have condemned all departures from precedent and expected different results without employing different methods.

Under such conditions the work of the new department has been perfunctory and superficial, for no matter how those in charge of it may strive, they are bound by the dictates of precedent and custom. They must also contend against a natural jealousy over what has come to be regarded as a "vested right" of the individual or the department in the material they use and an equally natural resentment of what is construed to be an abridgment of long enjoyed authority.

The insignificance of the results obtained under these conditions creates a disbelief in the efficacy of the remedy.

The methods of controlling the investment in material are the only ones that have stood still, on the average railroad, since its inception. They are essentially the same today as when the "Stourbridge Lion" made its first trip.

The efforts at improvement have been mainly directed to facilities for the physical handling of the material, which have an important effect on the labor cost, but none at all on the amount of the investment; unless, possibly, to still further increase it.

It is hard to understand why we cling so tenaciously to customs which have produced the very condition which we seek to correct, and blindly follow precedents established under circumstances that no longer exist, but until we realize that they have outlived their usefulness and are ready to discard them in favor of methods which are better adapted to the changed conditions of modern railroad operation, this unproductive and costly investment will continue to increase.

The only methods by which the stock of material on a railroad can be controlled are the same, in all essential particulars, as those employed by any large and successful department store or mail order house. The same basic principles apply in both cases. It is purely a commercial problem, not one of operation or engineering. There must be the same precision of method, the same accuracy of data, that are necessary to the profitable conduct of any commercial business. The law of averages holds just as good in the consumption of material for the ordinary maintenance and operation of a railroad as in any other field of human endeavor, and this law should be intelligently applied in procuring and limiting the supplies for such work, but the averages must be founded on precise and comprehensive knowledge, and not on estimates or imperfect or incomplete information.

Precedent has decreed that the amount of material to be carried in stock shall be determined by the user. The argument is that he is the only one who can decide what his requirements will be. The fallacy lies in not differentiating between

his requirements for immediate use in a given case, and the amount which should be provided for future use in a given period. A sharp distinction must be drawn between these two requirements, for they are essentially dissimilar.

When an engineer is deciding on the strength of a structure, or, in other words, determining the amount of material to be used, he ascertains the ultimate stress to which the members will be subjected, but he does not stop there and perfect his plans. He proceeds to multiply this strain by 4, or perhaps by 5, as a factor of safety, and often adds 5 or 10 per cent to the total thus obtained to cover contingencies and possible errors in calculation.

I am not criticising this practice as it applies to engineering, but I do say that men whose life-long training is along such lines are apt to use similar methods in determining the amount of material to be provided for future use and this is one reason for the discrepancy which has been pointed out, and a partial explanation of the fact that the most disproportionate stocks are usually of material used by the roadway and bridge departments. If the stock of a mercantile establishment was regulated by the estimates of its customers, it would speedily meet with disaster.

Adherence to precedent is also responsible for the lack of exact information, which is one of the primary causes for failure to control the investment in material.

The exigencies of the work demand that material be kept in readiness for use in a multiplicity of places, not only at widely separated points on the line, but at numerous places within the confines of a single large shop or terminal. The custom has been that the labor of handling all this material, which is not in the immediate vicinity of the storehouse, shall be performed by labor gangs in charge of the user.

The physical handling of a stock of material is vital to an accurate accounting, either for its receipt or distribution, and the greater the number of individuals entrusted with it, the less is the likelihood of uniformity and accuracy, and the greater the chance for error and confusion.

Where this custom prevails there is no real precision in the accounting for material, and without this, any adequate regulation of the investment is hopeless.

It is said that the user is responsible for the costs of the work under his jurisdiction and therefore must have entire control of everything entering into them. Granted. But the stock of material never does enter into his costs. The minute it is used, it ceases to be stock, and it is the stock we are dealing with.

The most potent argument for the retention of this pernicious custom is that the work is done by men already on the pay-roll and who could not be dispensed with, and that a separation of the work would involve additional forces and an increase in the labor cost. This argument is very insidious and is too seldom subjected to close analysis. The main difficulty with it is that it is not true. It springs from the very lack of exact information, which the custom itself is accountable for. Where this practice is followed, the actual cost of handling the material is not known, and to say that it will be increased is merely stating a conjecture as a fact.

In every instance where the experiment has been honestly tried the reverse has proved true, and the labor cost has actually been reduced; in most cases sufficiently to cover the added expense which is inseparable from a more precise system of accounting.

It is customary in many places to permit the users to withdraw material from the general stock in anticipation of possible future needs, or as a matter of convenience. This custom is prejudicial to the service. It is an effort to compromise between bad precedent and good practice. It results in duplication of stocks and of labor, complicates the accounting, tends to destroy its accuracy, and renders effective supervision and control of the total investment difficult if not impossible.

The cardinal principles which form the foundation for suc-

cessful control of this investment on a railroad are as follows:

1. The creation of an organization devoted exclusively to that purpose and free from authoritative control of the user, except as to the kind and quality of material to be provided. In that respect the user is supreme, as is the customer in any well-regulated mercantile business.

2. The jurisdiction of this organization must extend to all material not in actual use, and all material released from service for any cause must automatically return to its control.

3. This organization must procure the requisite material from all available sources, including the company's shops, must limit the supply to the actual requirements and be prepared to deliver to the user on demand all ordinary supplies for maintenance and operation, and on reasonable notice all unusual or extraordinary material for betterment or construction.

4. It must have direct charge of all labor necessary for receiving, warehousing and distributing all materials to the user. This is essential to precision in accounting.

5. It must install a system of accounting under which the material is so classified as to facilitate rigid supervision of the amount invested, and so precise in detail as to render supervision of the numerous items effective.

Precision and the inclusion of all material, both in handling and accounting, are the keys to the control of this investment, and one is the complement of the other. To be effective they must be united under a single supervision.

Precision generally involves increased expense and this has been a stumbling-block in the pathway of many who are conscious of doing the best they can, and who cannot convince themselves that the benefit to be derived from more exact methods would be sufficient to pay the added cost. On the other hand, many railroads have recognized its value and made liberal expenditures for more accurate accounting, but have unfortunately followed the line of least resistance when any radical departure from precedent was in question, and have therefore reaped only part of the benefit to which their increased expenditure entitled them.

The few who have studiously analyzed the whole situation in the light of present conditions and have courageously followed their analysis to its logical conclusion, have attained results that they did not originally dream of. These results are not frequently published, because of the reflection they cast on former methods, but they are very real, and they confirm the conclusions previously stated.

The net earnings on one railroad coming under my observation were increased \$1,500,000 in one year, and an average increase of more than \$750,000 was maintained over a period of five years, while the unproductive investment in material was reduced more than 45 per cent, and yet this might have been classed as an average railroad.

There is no reason why the same progress should not be made in handling the investment in material that has characterized every other field of railway operation, but in order to accomplish it, we must abandon the precedents and customs which are mainly responsible for this economic waste, and set up new standards, adopt new methods, establish new precedents; for we cannot reap the highest rewards of progress while we continue to live in the past.

A NEW INDIAN RAILWAY.—The Kalighat-Falta Railway Company will complete a 26-mile 2½-ft. gage railway from Kalighat to Falta, Bengal. The line will run through one of the most densely populated parts of Bengal, the density of population being more than 1,100 per square mile. This is more than double the average density of Bengal, which is 551 per square mile. The only present means of passenger transportation is by hackney carriage or on foot. Almost every foot of the ground through which the line runs is under cultivation, and the only means of transportation heretofore has been the bullock cart, wherefore it is estimated that the freight traffic will be immense.

CANADIAN PACIFIC DRAW SPAN OVER THE LACHINE CANAL

A new electrically-operated double track deck plate girder swing bridge over the Lachine Canal, near Montreal, Can., has recently been opened for traffic by the Canadian Pacific. This bridge is said to be the longest plate girder swing span in existence and is of interest also because of a number of unique features embodied in the design to overcome physical obstacles and to permit rapid construction with minimum interference with traffic. The old structure consisted of a 240-ft. through truss swing span over the canal with a 45-ft. deck girder approach span on the south end to accommodate a highway which is a continuation of St. Patrick street, Montreal. The completion of the double track bridge over the St. Lawrence River, and the double track work between Montreal and Brigham Junction a year or so ago, left this bridge as the last remaining single track structure, necessitating the use of gauntlet tracks over it. Because of the consequent delays to trains, authority was granted in the fall of 1914 for a new double track structure.

The old bridge was supported by a cylindrical pivot pier 18 ft. in diameter and 49 ft. high from top of coping to the rock in the bed of the canal. There were also one intermediate pier and two "T" abutments, all of ashlar masonry. Although the pivot pier was rather narrow for a double track structure, objections to narrowing the waterway of the canal precluded

during a short time in the winter, while navigation was closed on the canal. This necessitated the perfection of arrangements to do the work at the greatest possible speed. Work on the masonry was started December 1, 1914, and was ready for the erection of the steel work on February 8, 1915, the work being carried on by day and night shifts most of the time.

In order to facilitate erection, the old draw span was altered a sufficient amount to permit erection of the center, the loading grillage and the main girders on the upstream side. By this plan it was possible to divert traffic to these girders while the old span was demolished and the girders erected on the downstream side. This operation eliminated the necessity for a temporary structure to detour traffic around the bridge while erection was in progress. The four main girders, each of which weighs 112 tons, were shipped in three sections by the builders, the Dominion Bridge Company, to facilitate handling and shipping. This necessitated field flange and web-splices, which were riveted up after they had been lowered into place by heavy derricks. The new span was operated by hand power for the first time on March 31. The double track was put in service on April 3, while operation by electric power was commenced on April 15.

The bridge is protected by a 16-lever mechanical interlocking machine with power-operated home signals and electric track circuit locking, and is controlled from a signal tower of fireproof construction, supported on an extension of the north abutment.

View of Draw Span in Open Position

the construction of a new pier of greater width. Preliminary studies indicated that a deck structure for the new bridge would simplify the erection. It was also found desirable to provide for a railway track passing under the bridge on the south bank of the canal, thus necessitating an increase in the approach span from 45 ft. to 90 ft.

The girders of the new swing span are 239 ft. 7 in. long and 13 ft. 6½ in. deep at the center, reducing to 8 ft. ½ in. deep at the end, measured back to back of flange angles. The girders for each track are spaced 8 ft. center to center, with tracks 13 ft., center to center. They are supported at the pivot pier on a grillage of loading girders about 8 ft. deep, which transmit the load to a combination center and rim bearing. The total weight of the swing span is 615 tons, while the 90-ft. approach span weighs 143 tons.

The renewal of the superstructure involved extensive changes in the substructure. It was necessary to cut down the pivot pier practically 20 ft. and then provide a new coping with a width of 23 ft., to accommodate the deck girder spans. The north abutment and the intermediate pier had to be increased in width to accommodate the second track. The old south abutment was entirely removed and a new abutment was built a sufficient distance back to provide for the new 90-ft. span. In order to avoid provision for turning the old bridge during the construction of the masonry it was necessary to do all construction work

The structure is also provided with a system of lights as required by the Board of Railway Commissioners, for the protection of shipping on the canal. The new type of bridge gives a much clearer view along the track than formerly, as there is no overhead lattice work projecting above the rail level, and the tower commands a view up and down the canal even when trains are passing over the bridge. The bridge was designed and erected under the supervision of P. B. Motley, engineer of bridges, and J. M. R. Fairbairn, assistant chief engineer.

LINKING-UP THE SUB-CONTINENT. General Botha's victory in the territory heretofore known as German Southwest Africa is of great significance to railway men, for it will doubtless mean the eventual linking-up of the railway systems of the sub-continent in a way that was not possible under the old regime. Thanks to the enterprise shown by the Railway Administration of the Union of South Africa in hastening the construction, firstly, of the Prieska to Upington Railway line, and, secondly, the extension thereof to Kalkfontein, north of Warmbad, in German Southwest Africa, the work of linking-up has already made material progress, and it is now possible to travel by a somewhat circuitous route, it is true—by train from one side of the sub-continent to the other—from Luderitzbucht, in German Southwest, to Lourenco Marques, in Portuguese Southeast, taking Kimberley and Johannesburg en route—*Railway Gazette, London.*

HOW AND WHY FRENCH RAILROADS SELL THEIR SECURITIES DIRECT TO THE PUBLIC

By WALTER S. HIATT*

Is there not a lesson for the railroads of the United States in the way the French railroads sell their securities over the counter to the investing public, thus making easy such investment on the part of people of limited means? Just now the important problem before the American railroad financier is the raising of new capital for railroad development and for the refunding of securities maturing. This problem is all the more difficult because of the return of American railroad securities by crippled European investors.

I am certain that the average small investor in the United States, the person without any financial knowledge, the person who generally in a small town or city puts his money on deposit at the local bank and often without interest or else in the private savings bank or those of the post offices, hasn't the slightest information as to how to buy a railroad stock or bond. Suppose this person with \$50 or \$100, a few hundred dollars at most saved up, would like to buy outright a share or two of railroad stock. Suppose the desire, the inclination is there, what can he do? If he has a friend in a broker's office or in some bank, he may be permitted to buy as a personal favor. This is a condition that exists, as any one can find out by asking the first acquaintance of moderate means he meets in the street how he would go about buying a share of stock or a bond.

France held, or did hold, previous to the war, twenty odd billions of the securities of the whole world. It was the largest holder of such securities after the United Kingdom and the United States. But these securities are not held in France exclusively by the very rich, or the moderately rich, as in the United States. They are held as well by the moderately poor people, by the salaried clerks who earn a thousand dollars a year, by the people who have retired on an income of five or six hundred dollars a year. Although the French are noted for their thrift, their saving bank deposits are small, either in the private or the government savings banks—a little over a billion dollars, as compared to the five billions found in like banks in the United States.

One of the favorite purchases of those whose savings are small is French government bonds. Why? Because the government makes it easy for them to make the purchase. These bonds are put out in \$20 lots. Generally they pay two and a half to three per cent., but just now they are paying five per cent., and about a third of the bill board space of France is plastered to publish the fact.

French railroad securities are also a favorite with the small investor. Why? First, possibly, because the railroads have nearly always paid good dividends, and then because they have made it easy for the small investor to buy. All the investor has to do is to walk into a railroad general office, either in Paris or in some other city along its line, go to the proper window, hand in his money and walk out with his security. He doesn't have to go through the mysterious medium of a bank or a broker's office, though, of course, these latter places sell railroad securities too. Undoubtedly this method of selling railroad securities is a direct benefit to the railroads, in that it makes the public take an interest in their welfare, and then there is the general benefit to the public in that saving itself is encouraged.

Of course, one of the reasons that the railroads are able to sell freely and obtain new capital is that they have the confidence of the public. Only recently I was in the Paris central offices of the Southern Railway (the Chemin de Fer du Midi) and saw posted up a notice that it was issuing new bonds at 3 per cent. People, men and women, were buying them at the proper window just as they would hardware or drygoods. It was surprising that people should be doing this in war time,

when financial markets are troubled and when the end of the war is yet distant. I asked the clerk selling the bonds how it happened that people bought so freely. "Oh, they know we have paid our dividend as usual this year; then they see how we are quoted at the Bourse and know we are offering a good bargain," he explained. "Many of these buyers are our regular customers. They had bonds that we have redeemed this year, so they take this money and put it back into new bonds."

One of the odd sides to this method of dealing directly with the public lies in the fact that that part of the public which has large means prefers to buy of the railroad rather than of bankers and brokers. In past years this latter class has flagrantly betrayed the confidence of the French public, first, in refusing credits to legitimate business, and second, in foisting upon it unsafe securities of North and South American railways.

An agent of London Lloyd's told me recently this story. He happened to be in Paris one day and called on a banker he knew. As he entered the bank he saw a long line of people. "What's the matter? Is there a run on your bank?" he asked. "Not at all, we are putting out a thirty million franc issue of railroad bonds," and the banker mentioned a South American railroad. "But do you know what you are selling? Have you investigated that road?" asked the Lloyd's man. "Certainly," said the French banker. The railroad at the time of this issue had just one engine, a few flat cars and five miles of sloppy track.

The question here raised as to whether standard American railways might not do well to adopt the French system of selling directly to the public is raised because the system works well here and should work well with the American public. In past years a small part of the American public has been encouraged too much to speculate in railroads and the great public, the public of small means, has never been made to look upon them as objects of legitimate investment; or, when the public was given an opportunity to invest, it was in some new railroad scheme that too often wiped out the original investors. The banker was the only holder whose money was secured.

The problem before the American railroad is one that, intricate as are its details, involves, first of all, common sense. The railroads have in late years got down, though tardily, to common sense in dealing with the public in matters of service, and why not deal with this public on the same basis as regards finance?

How rare are the small holders of railroad securities in the United States is astonishing. Let me cite this incident. Two years ago I was present at a meeting of business men of Hoboken and Jersey City, New Jersey, a railroad terminal for many years of the Erie, the Lackawanna, the Pennsylvania, and other railroads. These business men wanted to secure certain minor concessions affecting the interests of the people living in Hudson county. It was moved that a committee be appointed to call upon the local railroad managers. "But they won't listen to you," argued one man. "We've tried that before." "I know a way to make them listen," said one of the men present, a manufacturer. "I own stock in these roads and when I tell the managers that they'll listen all right."

The fact that he owned stock in these roads surprised everybody present, and they then agreed that there was some chance of getting what they wanted. As a matter of fact, when the stock owner disclosed this ownership to the railroad men, he was listened to most respectfully, and he did get what was asked for. Afterwards the manufacturer and stock-owner laughingly told me that he owned but one share of stock in each road, stock that he had bought as a present for his oldest son, as a sort of nest egg, to encourage him to save his money and buy more stock.

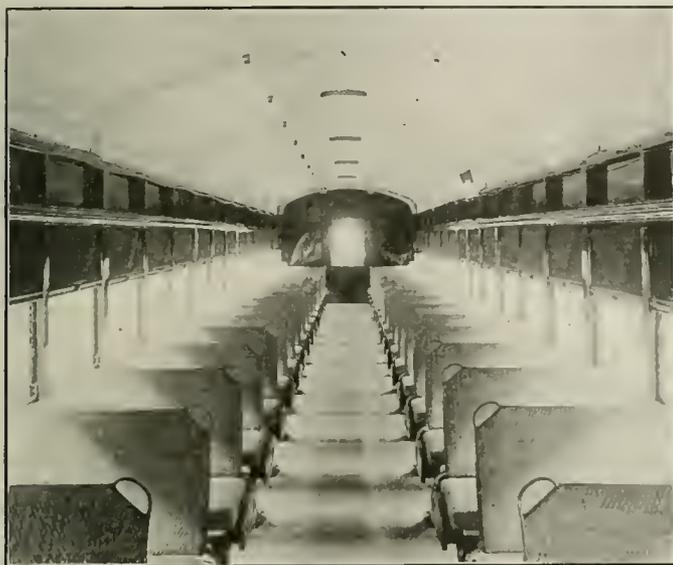

AUSTRO-GERMAN SLEEPING CAR COMPANY.—According to Amsterdam advices negotiations are taking place in Berlin for the formation of an Austro-German Sleeping & Restaurant Car Company. Up to the present the Wagons Lits Company, of Brussels, has operated this traffic in Germany.

* Our special European correspondent.

Steel Coaches for Long Island Suburban Service

For Summer Service Only; Exceptionally Low First Cost
and Light Weight Obtained by Building Without Lining

Passenger traffic conditions are such on the electrified lines of the Long Island Railroad that a considerable increase in equipment is required during the summer months, amounting

Interior of Long Island Steel Trailer Cars

to about 25 per cent of the equipment in service during the remainder of the year. In the design of an order of 20 trailer cars built by the Standard Steel Car Company and recently placed in service, full advantage has been taken of these con-

The use of trailers was decided upon after a general survey of the traffic and operating conditions, it being estimated that three trailer cars could be built for approximately the cost of one fully equipped motor car. Furthermore, where motor cars only are used, if the conditions are such that during a part of the year only a portion of the cars are needed, the service must be distributed over all the cars to provide for proper inspection and maintenance of the electrical equipment.

A number of restrictions were imposed upon the design at the outset. The Long Island class MP-54 motor cars with which the trailers are to operate are each equipped with one motor truck driven by two Westinghouse No. 308 motors, having a normal rated capacity of 225 hp. each. It was required that the weight of the trailers should be such that the operation of one trailer car with three motor cars would be well within the capacity of the motors in express service. At the same time it was necessary to adhere to the general dimensions of the motor car as to height, length and width because of station platform requirements and to preserve the uniform general appearance of the train. The strength of the underframe and body was required to be at least equivalent to the strength of the motor cars with which they are to operate. Owing to the fact that additional equipment was needed for summer service only, it was feasible to reduce the weight and cost by the omission of the false floor, inside lining and provision for heating, and a car has been built which has a seating capacity of 80 with a total of 63,000 lb., a weight of only 787½ lb. per seated passenger; a class MP-54 motor car weighs approximately 110,000 lb. and seats 71 passengers, the weight per seated passenger being about 1,550 lb.

The cars are 64 ft. 5¼ in. long from face to face of couplers.

Long Island Steel Trailer

ditions not only to produce a car of exceptionally light weight, but to secure a maximum carrying capacity for a moderate outlay and to reduce to a minimum the investment tied up in idle equipment during the winter months.

The over all width is 9 ft. 10¼ in., and the omission of inside lining and insulation has made possible an inside width of 9 ft. 9½ in. between posts with a clear width at the posts of 9 ft. 4½ in. An unusually wide aisle has thus been provided. The trucks

are placed 39 ft. 9 in. between centers and the car has a total wheel base of 46 ft. 1 in. The height from the rail to the top of the roof is 13 ft., the ventilators adding $8\frac{1}{4}$ in. to the clear height.

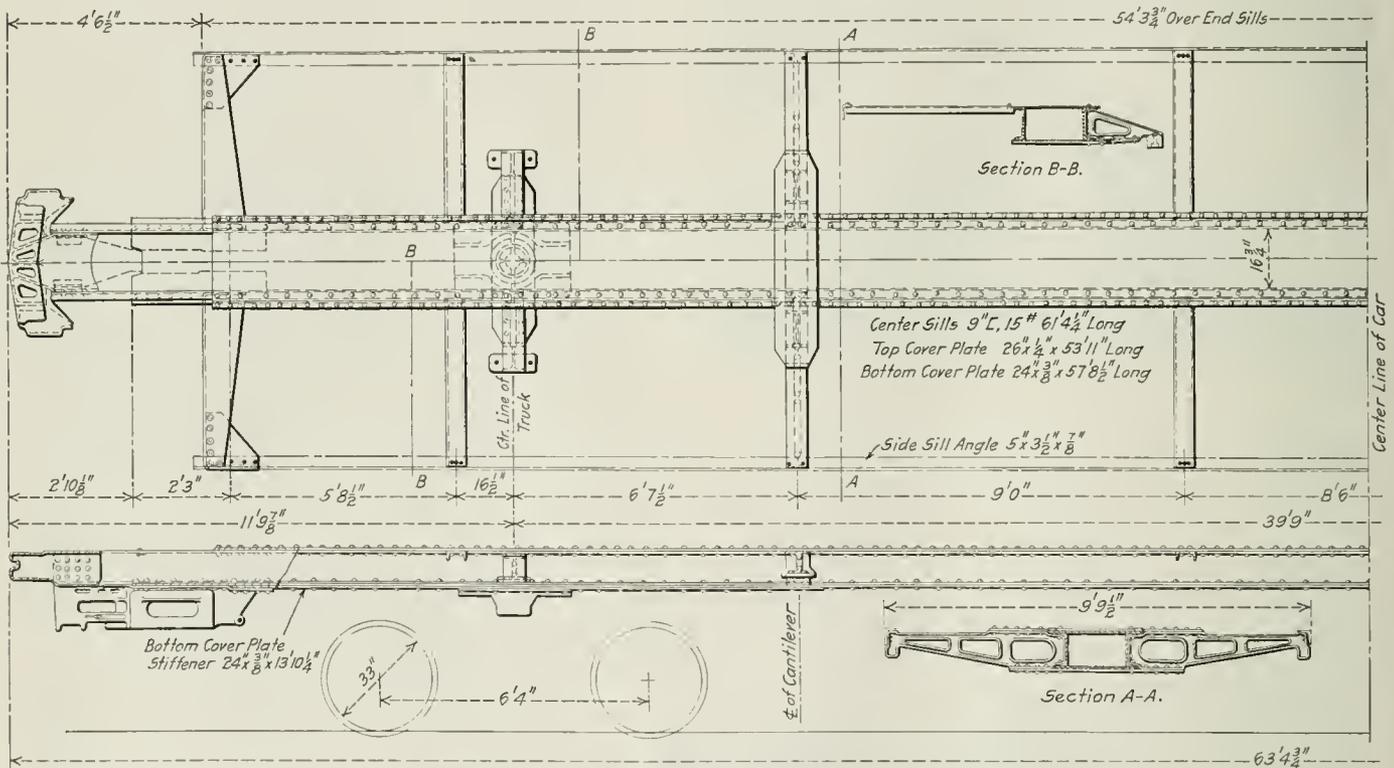

UNDERFRAME

The principal member of the underframe is the box girder center sill which is the same as that used on the class MP-54 motor cars. It consists of two 9-in., 15-lb. channels of 61 ft. $4\frac{1}{2}$ in. long with top and bottom cover plates respectively $\frac{1}{4}$ in. and $\frac{3}{8}$ in. in thickness. Cast steel draft sills which take the Westinghouse friction draft gear, are secured to the bottom of the center sills. Cantilevers extending from the center sill to the side sills of the car are placed 13 ft. 3 in. on either side of the transverse center line. Owing to the light weight of the body of the car, cast steel spiders have been used instead of the usual pressed steel construction, the webs being cored out to reduce the weight. The ends of the center sill are framed and

END CONSTRUCTION

In order to provide ample strength to resist the tendency to telescope in collision, 12-in., 31½-lb. I-beams were used for the vestibule end posts. These are placed between the middle and outer end castings into which they are framed and riveted to the total depth of the casting. The vestibule corner posts are pressed steel, $\frac{1}{4}$ in. thick and are of a special U-section with one leg longer than the other. They extend from the bottom of the platform end sills to the I-beam posts at the roof and serve as a riveting member for the vestibule end sheet and the roof sheet. The vestibule end posts are tied together by a pressed steel diaphragm which serves as a header for the vestibule end door and an additional tie is provided by the roof sheets.

The body end construction is made up of three truss members; two door posts of pressed steel box section and the combined body corner posts and car lines which extend from body end sill

Underframe of Long Island Trailer Car

riveted to the middle castings of the platform end sills, the length over which is 63 ft. $4\frac{3}{4}$ in.

The side sills are 5 in. by $3\frac{1}{2}$ in. by $\frac{7}{8}$ in. angles placed with the horizontal flanges up in order that they may be used as a direct floor support. They are secured to the ends of the cantilevers and to the body end sills. Additional crossies are provided near the truck centers and at points 4 ft. 3 in. on either side of the transverse center line of the car. These are of channel section placed flanges down and the ends are riveted to the horizontal flanges of the side sills and to the lateral projection of the top center sill cover plate.

The body end sills are of pressed steel placed with the webs out, the ends of the web members being bent at right angles to the body of the sill and bearing against the vertical faces of the side and end sills. The top flanges are tapering, the wide ends providing ample strength and riveting area at the center sills. At the outer ends gusset plates are used to furnish suitable connections to the side sills.

The trucks are provided with inside side bearings and the body side bearings are supported by cast steel struts riveted to the center sills and reinforced on the lower flanges by a transverse cover plate.

to body end sill. In common with the combined posts and carlines of the side frame construction this is made in two pieces to facilitate manufacture and welded on the center line of the car, thus forming a continuous member. The door posts have the cover plate members extending the full depth of the end sill to which they are riveted, the U-shaped members being flanged and riveted to the top of the sill. The door header is of the same section as the posts and ties them securely together. They are further tied at the roof by the combined carline posts.

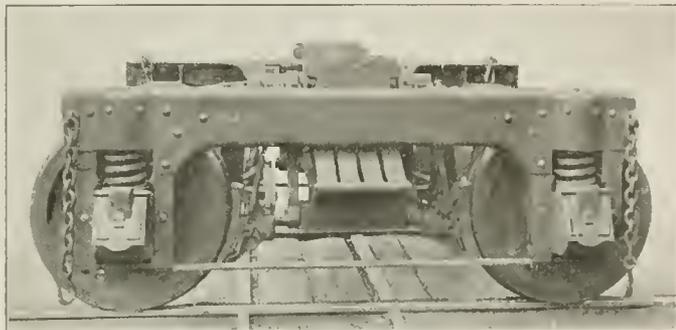

BODY FRAMING

In order to reduce the weight and cost of construction the arch roof was decided upon. The posts and carlines are combined into single continuous members of U-section with the flanges turned outward for riveting to the side and roof sheets, an arrangement which gives a pleasing appearance to the interior of the car. Owing to the shape of the roof and the fact that but $\frac{3}{32}$ in. sheets were to be used the carline construction was inadequate to support the sheets. Continuous pressed steel purlines were therefore placed 21½ in. on either side of the center line. These extend throughout the length of the body from door post to door post. Where they cross the carlines they are

which covers the curtain rollers just above the tops of the windows.

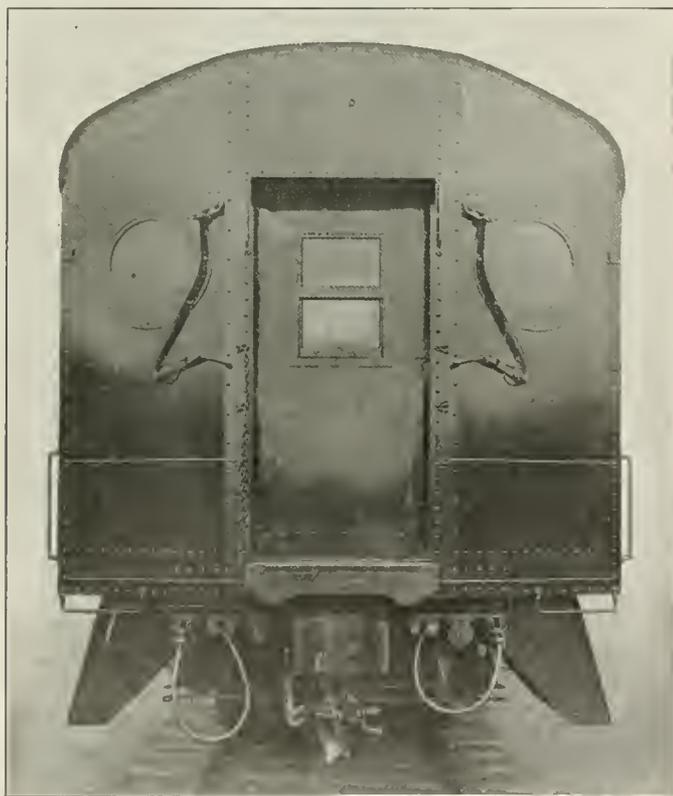

TRUCKS

The cars are equipped with four-wheel trucks having a wheel base of 6 ft. 4 in. These trucks are of an unusually simple design and weigh 9,400 lb. each, complete. The general features of

Four-Wheel Truck for the Long Island Steel Trailers

the construction are clearly shown in the illustrations. The side frames and transoms are of pressed steel, while the bolster and spring plank are steel castings. By widening the flanges of the transoms at the ends and providing corresponding lateral extensions from the top side frame flanges a very rigid transom and

End View of the Long Island Trailer

side frame connection has been secured and end rails are dispensed with. Steel pedestal castings provided with coil spring pockets are riveted to the ends of the side frames, which are specially formed to receive them. The truck is equipped with a light cast steel spring plank, which is suspended by swing links pivoted on the top of the cross frame. Both the bolster guides and the pedestals are fitted with wearing plates, which may be easily removed and replaced. The trucks are equipped with rolled steel wheels 33 in. in diameter, which are mounted on axles with $4\frac{1}{4}$ in. by 8 in. journals. Ajax metal bearings are used.

FINISH

The floor is finished with the railroad's standard top coated monolith laid in Ferro-inclave sheets. No false floor is provided.

The exterior of the car is painted Tuscan red to conform to the Long Island's standard for passenger equipment. The interior is finished in white and light olive green, white enamel being used above the side plates and the olive green from the side plates to the floor. The seats are rattan covered and have no arms. They were furnished by Heywood Brothers & Wakefield Company, and are low enough to make possible the elimination of foot rests. The cars are ventilated by five automatic ventilators set into the roof on the centerline of the car.

Since the cars are trailers no provision has been made in the vestibule for train control. The cars are provided with bus and control lines, however, for attachment to adjoining cars when operated in multiple unit trains. Current for lighting the cars is taken from the bus line. In making up trains where detachable jumpers are used considerable delay is often caused by the failure to find the proper jumpers at hand. In order to overcome this difficulty the jumpers are integral parts of the wiring of these cars and dummy receptacles are provided for holding the jumper head when not in use. This feature is shown in the illustration of the end of the car.

QUALIFICATIONS OF PUBLIC SERVICE COMMISSIONERS

Experience in connection with public utilities should be made a necessary qualification for public service commissioners. This fundamental truth is the subject of a strong letter which has been sent by a committee of engineers representing the national and local engineering societies to the committee on public utilities of the New York State constitutional convention, now sitting at Albany. Men familiar with the technical, financial, commercial and legal matters, which come before a public service commission, are, of course, best fitted to render valuable service to the public, and the committee declares that there are to be found among those connected with public utility companies men with as broad conceptions of public rights and of the duties to be fulfilled to the public as can be found in other walks of life.

The engineers also urge on the constitution makers that the point of greatest importance in any plan for an organization of the public-utility commissions of the States is the preservation of the principle of continuity already established, in the present Public Service Commissions of the State, whereby the term of office of the members of the commission expire at different times, so that only one member of the commission at a time goes out of office.

Represented on the committee of engineers presenting this letter are the American Society of Civil Engineers, the American Institute of Electrical Engineers, the American Society of Mechanical Engineers, the American Institute of Consulting Engineers, the New York Section of the American Institute of Mining Engineers, the Municipal Engineers of the City of New York and the Brooklyn Engineers' Club. The letter, prepared by a sub-committee consisting of Charles Whiting Baker, Gano Dunn and W. W. Brush, says, further:

"If a change were to be made in the public service law so that an entirely new commission would be appointed by each new governor, there would be danger not only that the commissioners would be appointees without the experience and knowledge necessary to formulate and carry on a sound constructive policy, but that the principal employees of the commission would be changed for political or personal reasons with the coming in of each new commission.

"The constitutional requirement we have suggested—previous experience in connection with public utilities as a requisite to a commissioner's appointment—is not to be construed as a rigid limitation upon the governor's discretion in making appointments. The responsibility would properly be upon the governor to judge as to how much experience was requisite to fit a candi-

date for appointment. The value of such requirements, embodied in a statute or a constitution, is that they define the requirement which the governor should have in mind in the selection of candidates. It is not pretended that this requirement or any other which could be framed could prevent the selection of unfit candidates. It is believed that such clauses are of value, nevertheless, in setting up a standard to which most men in the long run will seek to conform.

"There should be one public service commission for the whole State instead of two as at present, it being understood that under such a proposed reorganization the work of constructing and administering the New York City rapid transit system would be transferred to the city, which now owns the system, and would cease to be a State function. New York is the only State which has two separate public service commissions. The reason why New York has two commissions has to do with conditions which existed a quarter-century ago and which do not exist at the present day. By having a single commission for the entire State certain difficult questions as to division of responsibility between the commissions are set permanently at rest."

The committee proposes that each commissioner shall hold office for ten years and that removal by the governor should be made only after the filing of charges and after affording the accused an opportunity to be heard in the matter, provided, however, that at any time within the first six months after making an appointment the governor may exercise the power of summary removal * * *

NEW PITTSBURGH NORTH SIDE FREIGHT STATION OF THE P. R. R.

BY HARTLEY M. PHELPS

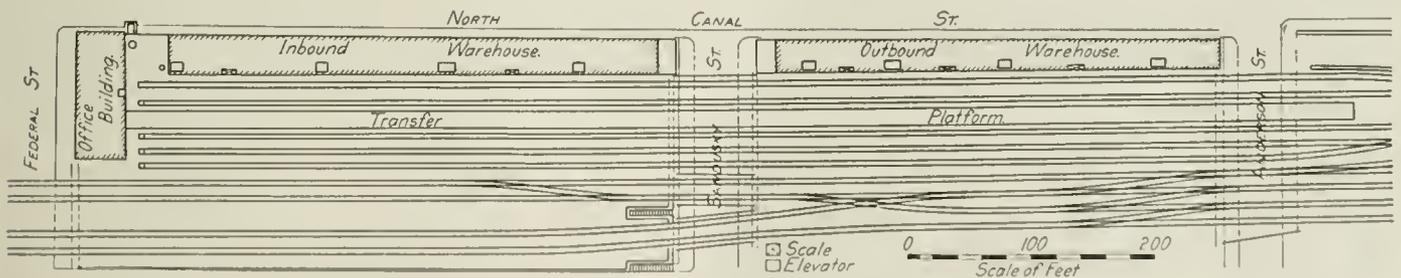

The Pennsylvania Railroad has recently completed a new freight station with inbound, outbound and transfer facilities near the center of the manufacturing district on the north side of the city of Pittsburgh. This station will replace the old Anderson street house, and the transfer station at Ross, 7.8 miles east on the Conemaugh division, and eventually the business now handled at the North avenue house, a few blocks distant from the new

As an indication of the traffic that will be handled at the new station, the Ross Transfer, Anderson street station and North avenue station have handled on an average during the last five years, 3,616 tons of C. L. freight, 348 tons of L. C. L. freight and 456 tons of transfer business daily. No C. L. or L. C. L. business is received or delivered at Ross Transfer, this being exclusively a transfer point. The average tonnage of 219 tons per day handled here consisted of (1) freight moving from points west of Pittsburgh to points on the Conemaugh division or vice versa, (2) Pittsburgh and Monongahela division cars moving to or from the Conemaugh division, (3) shipments to or from points not on the Conemaugh division routed via Black

New North Side Freight Station at Pittsburgh

Lick and the Cresson division and (4) shipments on the Conemaugh division from points west to points east of Freeport and vice versa. At the Anderson street station C. L. and L. C. L. business was forwarded to all points. This station also received C. L. freight from all points and L. C. L. freight from points east of Pittsburgh. No transfer work was done here. The average tonnage at this station for the period named was, C. L. freight received, 1,098 tons, forwarded 387 tons, and L. C. L. freight received, 75 tons, and forwarded, 108 tons. At the North avenue station, L. C. L. business is forwarded to all points on the Pennsylvania system, but received only from the Lines West. Shipments are accepted from the lines east only when specifically consigned to this station. Car load shipments are received from and forwarded to all points on the Pennsylvania system.

Plan of Pennsylvania Freight House and Tracks at Pittsburgh

station, may be transferred to this point. The Anderson street house, which was erected more than forty years ago, had become inadequate for the business which it handled, making the provision of better facilities imperative. An indication of the improvement is the increase in floor space from 8,415 sq. ft. in the old building, to 61,850 sq. ft. in the new. The North avenue house on the Pittsburgh, Fort Wayne & Chicago (Pennsylvania Lines West), built about ten years ago, is still in good condition and has ample capacity to take care of the business in the zone of which it is the center. The shorter distance from the heart of the less-than-car-load freight center of that part of the city to the new station will, however, undoubtedly deflect a considerable portion of the business now going to North avenue to the new location. The new house is located between Federal street, the chief retail business street of the north side, and Anderson street. Sandusky street, intermediate between these two, is carried under the building on the first story level. The entire project, including the construction of the transfer platform and office building, has cost more than \$500,000.

Transfer freight is received from all points west for the east, but very little freight from the east is accepted for the west. The average daily tonnages at this station are as follows: C. L. received, 1,729 tons; forwarded, 400; L. C. L. received, 75 tons; forwarded, 90, and transfer tonnage, 240. A combination of the business of these three stations in the new station at Federal street will eliminate some movements between the stations, some rehandling and the duplication of engines for shifting, station force, etc. In addition, the freight will be handled with greater despatch, therefore better serving the interests of the shippers.

The new structure really consists of four parts, a 3-story office building 41 ft. wide and 110 ft. long facing on Federal street and extending across the end of the inbound house, the transfer platform and the five station tracks; a two-story inbound house 150 ft. long and varying in width from 31 ft. 4 in. to 37 ft.; an outbound house 383 ft. 5 in. long and varying in width from 25 ft. 5 in. to 30 ft. 6 in.; and a transfer platform 1,000 ft. long and 15 ft. 3 in. wide. Provision is made in the design for the addition of a fourth story on the office building and third

and fourth stories on the inbound house if desired. The second story of the houses is carried continuously across Sandusky street, the 60 ft. width over the street being occupied by an office. The width of the building on this floor is 8 ft. greater than the dimensions given above on account of the overhang on the street side, which, in addition to increasing the floor area, provides a shelter for teams loading or unloading at the street doors.

All tracks are elevated over the streets, the grades being such that the second story of the freight house is level with the floors of cars. The subways are of the half-through steel girder type with solid deck on concrete abutments. The surfaces of the abutments are finished with a mixture of marble dust and mortar placed monolithic with the concrete. The appearance of stone work is given to these walls by the impression of strips nailed to the forms which resemble mortar joints. Light steel frames were suspended from the deck of the bridges to which were fastened steel laths plastered with marble dust mortar.

The building is of brick, steel and concrete construction with concrete footings on 16-in. concrete piles extending down through a 15-ft. stratum of filled material. The columns along the north side of the building are spaced 18 ft. center to center and in

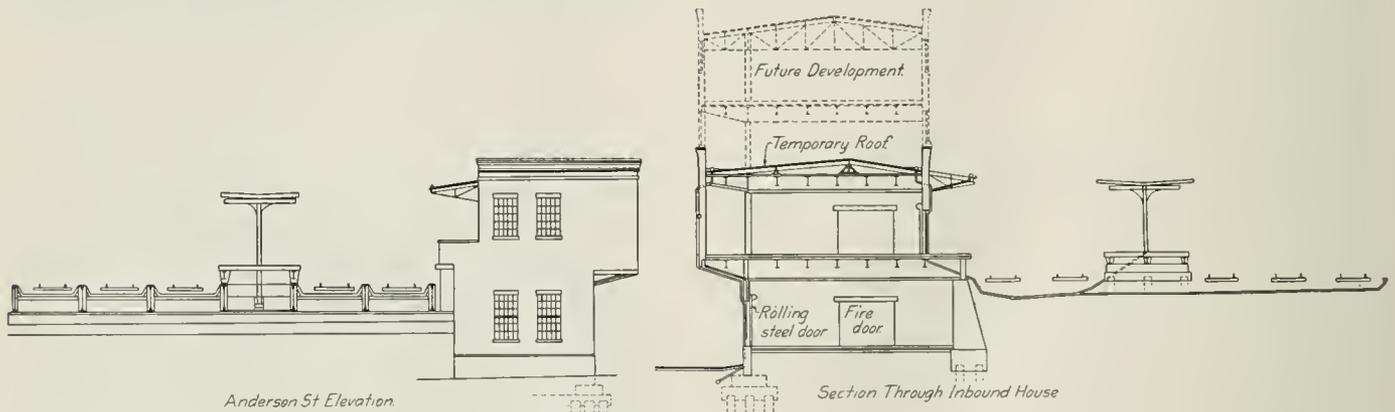

pavement is provided at the east end of the station and is equipped with a 30-ton electric crane for handling heavy freight.

The construction of this building was handled under the supervision of Andrew Keiser, superintendent of the Conemaugh division, and R. L. O'Donnel, general superintendent of the Western Pennsylvania division. The plans were prepared under the general supervision of W. G. Coughlin, engineer maintenance of way.

AUTOMATIC DRIFTING VALVE

An automatic drifting valve for use on superheater locomotives is shown in the drawing. Its operation is controlled by the pressure in the live steam passage of the valve chamber.

The body of the valve has four pipe connections: Pipe *A* leads to the live steam passage of one of the valve chambers or to one of the steam pipes; pipe *B* to the turret, or other source of constant boiler pressure, and the two pipes *C* to the live steam passages of the valve chambers. When the throttle is open the plug piston in the large chamber at the end of the valve body is subjected to the pressure in the valve chamber. The resulting movement of the piston to the left closes communication between the

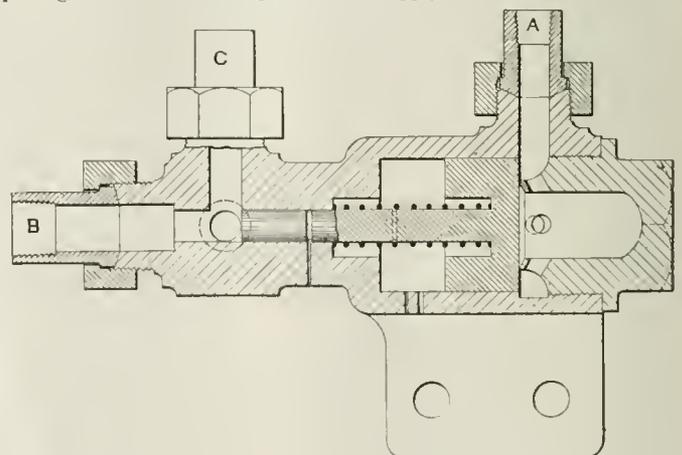

Sections Showing Relation of Tracks to Houses

common with the other columns throughout the building are of an "H" section. A concrete wall 13 ft. high forms the southern wall of the first floor serving also as a retaining wall for the fill under the adjacent tracks. The floors of the station throughout are of 5-in. concrete with a 1½-in. "Truss Con" finish. The lower floor is about 3 ft. 9 in. above the grade of Canal street, which parallels the building on the north, a convenient height for wagons loading and unloading. The floor system at the second story level is extended 8 ft. along the south side to form a trucking platform which is covered by a canopy projecting from the roof. Rolling steel doors are hung between the columns along the entire street base on the first floor and along the entire railroad base on the second floor. Transverse fire walls and fire doors are provided throughout the building; steel window sash of the Fenestra type are used, and the construction is made fire-resisting in every detail. The building is equipped with automatic platform scales, six Otis electric elevators of four tons capacity and two of six tons capacity. Spiral steel stairways connect the warehouse floors. The office building portion is faced with glazed tile, and all window frames are of copper. The ground floor of this portion of the building will be rented for stores and the upper two stories occupied by offices of the Conemaugh division. The warehouse buildings are faced with buff Kittaning brick and have a slightly gabled roof of 3-in. reinforced concrete slabs covered with asphalt paper and pitch and finished with a terra cotta coping.

The transfer platform is of reinforced concrete construction with a "Truss-Con" finish. It is covered by a shelter supported on a single line of steel columns along the middle of the platform. Five station tracks are provided, two between the building and the transfer platform and three between this platform and the first main track. A small team yard with stone block

constant steam supply at connection *B* and the passages leading to the valve chambers. On the release of pressure at *A*, due to the closing of the throttle the spring forces the piston back to the right, opening the communication between connection *B* and passages *C* and admitting a limited supply of steam to the valve

Automatic Drifting Valve for Superheater Locomotives

chambers, which provides a medium for carrying and distributing the lubricant over the valve chamber and cylinder walls.

The device is known as Wood's vacuum breaker. A patent has been applied for and it is being manufactured by the Nathan Manufacturing Company, New York. On service trials its performance is understood to have been highly satisfactory. It may be located at any convenient point on the locomotive, preferably near one of the cylinders.

ELECTRIC LOCOMOTIVES

At the meeting of the Chicago Section of the American Society of Mechanical Engineers, May 14, the subject of electric locomotives was discussed by A. H. Armstrong and A. F. Batchelder, of the General Electric Company, Schenectady, N. Y. Mr. Batchelder gave an illustrated talk in which he briefly described the various mechanical features of electric locomotives. He was followed by Mr. Armstrong who spoke on the performance of these locomotives.

Mr. Armstrong called particular attention to the rating of electric locomotives, stating that the time element is a most important factor in its determination. The motors when operated continuously deteriorate when heated above a certain temperature, although it takes considerable time to reach a dangerous point. It is therefore necessary to know the rating of the electric locomotives, in addition to their starting tractive effort, for short periods of say one hour's performance in addition to the continuous performance. It is important that this be clearly understood at this time when long distances of steam railroads are being electrified. In acknowledging the improvements that have been made in the steam locomotives, it being now possible to get a horsepower with about 15 lb. of steam, Mr. Armstrong claimed that the electric locomotive, notwithstanding these improvements, offered many claims for consideration.

In considering high speed passenger service he called attention to the latest type of New York Central electric locomotive, which will handle a 1,200-ton train at a speed of 60 miles an hour, giving an output continuously without danger from overheating of 2,000 hp.; 2,600 hp. can be obtained for one hour. This engine is able to handle the service of overland trains for any distance at a speed of 60 miles an hour or more.

Referring to electric locomotives for freight service, he called attention to the installation on the Butte, Anaconda & Pacific. This was made for the sole purpose of obtaining more economical operation. The preliminary report indicated that the money saved by putting in the installation would pay 18½ per cent on the capital required to make the change from steam to electric operation. For the first six months the results obtained indicated a yearly return on the capital invested of 20 per cent. This road operates heavy freight trains which average from 3,500 to 4,000 tons, and 4,500 tons is not unusual. Each locomotive unit weighs 80 tons, two units being used to handle the heavy trains on the 0.3 per cent grade. The locomotives have a tractive effort of 26,000 lb. at a speed of 16½ miles per hour continuously. This corresponds to a factor of adhesion of about 6. From investigation Mr. Armstrong stated that it is found to be almost universal practice to give a locomotive a rating calling for a tractive effort on the ruling grade of about 18 or 19 per cent co-efficient of adhesion, and that the electric locomotive was designed to follow this practice very closely, although advantage is taken in the electric locomotive to obtain a greater output for a short time than it can sustain continuously. In heavy trunk line work the difference between the short period rating and the continuous rating is small.

Speaking of the new installation on the Chicago, Milwaukee & St. Paul, Mr. Armstrong explained that this system is a 3,000 volt direct current system, practically the same as used on the Butte, Anaconda & Pacific. The weight of each locomotive unit is 110 tons on drivers and where two are used, as will be the general custom, the total weight will be 270 tons. A continuous 24-hour rating of 3,200 hp. is obtained with these engines and a tractive effort of 72,000 lb. at a speed of 15¾ miles an hour. Mr. Armstrong claimed an increase of 10 per cent in tractive effort for the electric locomotives with the same weight on drivers over that which can be obtained in a steam locomotive on account of the reciprocating and imperfect rotary motion of the steam locomotives.

Over the Belt Mountains where there is an average grade of

.71 per cent for 49 miles, one of these 270-ton locomotives will haul 2,500 tons at a speed of approximately 16 miles an hour. The locomotives for both passenger and freight service are identically the same with the exception that those used in freight service are geared to a ratio of 4½ to 1, while those in passenger service are about 2½ to 1. This is standardization to the highest degree and permits of the minimum number of repair parts. As stated before, electric locomotives are made in two sections, being connected together with an articulated joint for the purpose of permitting the operation of each half singly. This will be of special value in light local passenger trains or for shifting work.

The Chicago, Milwaukee & St. Paul electric locomotives introduce for the first time direct current electric braking of the regenerative type. In other words, the motors are reversible. Going up the grades they receive electrical power, and in going down the grades the train will drive the motors as generators and thus brake the train or hold it electrically and return power to the line. In ascending grades these engines consume from 4,500 to 5,000 kw., and the efficiency of a locomotive under these conditions is about 88 to 89 per cent without considering the losses of the blowers, air compressors and fans and incidental parts of the locomotive itself. In Mr. Armstrong's opinion the benefit of this electric braking on the mountain grades will be not so much in the power returned to the line as the economy introduced thereby in the elimination of derailments due to broken shoes and overheated wheels on the the long down grades.

Referring back to the latter type of New York Central locomotives, Mr. Armstrong stated that there are no bearings on the motors of those locomotives, thus eliminating mechanical friction. This permits of an efficiency as high as 93 to 94 per cent; that is, of the electrical power input to the locomotive between 93 and 94 per cent is returned as mechanical output at the rim of the drivers. The Milwaukee locomotives, on the other hand, will give an efficiency of not much higher than 84 or 85 per cent operating on level track. The profile of the Milwaukee road was such as to preclude the use of the gearless type used on the New York Central.

The Milwaukee electric locomotives have a tractive effort of 72,000 lb. per unit and a starting tractive effort of 120,000 lb. or when run double-headed, a starting tractive effort of 240,000 lb. With the 3,000 d. c. line voltage there will be 1,500 volts on each motor. The electrified portion of the Milwaukee road is 440 miles long, and there will be 14 substations at approximately an average distance of 30 miles apart on the entire road.

WOMEN RAILWAY WORKERS IN GERMANY.—It has been reported from Berne that the Prussian and Hessian State Railways are employing a number of women as line keepers (*Streckenarbeiter*), although this is very heavy work. All women, before being engaged, are obliged to sign an agreement that they will have nothing to do with Social Democracy or with the Transport Workers' Association, that they will never attend Social Democratic meetings, or be in any way associated with the Social Democratic propaganda or efforts.

RAILWAYS IN ASIA MINOR.—The Turkish Ministry of War is reported to have been granted a large credit to build and operate four main and two branch lines, all under military control. The chief of these lines are from Angora to Erzerum, from Erzerum to a point on the Black sea, from Murally to Rodosto, and from a point on the Erzerum Railway to the Black sea.

BETTER FACILITIES ON PHILIPPINE TRAINS.—The Board of Public Utilities Commissioners has handed down a decision ordering the Philippine Railway, on its Cebu lines, to install better lights in its second- and third class coaches and to supply to all passengers individual drinking cups at a nominal cost. The company is also forbidden to permit more passengers than there are seats to ride in the coaches.

General News Department

About 150 machinists, boilermakers and sheet metal workers employed by the Kansas City Terminal Railway went on strike last week on account of a controversy with the company regarding the scale of wages and the employment of non-union labor.

The Chicago railroads were prominent in the lists of contributors to the fund for the relief of families who lost members in the Eastland steambot disaster of July 24. The large roads gave \$2,000 each and smaller roads lesser amounts. The Traffic Club of Chicago gave \$500.

The Veterans' Association of the Baltimore & Ohio will hold its first annual outing at Berkeley Springs, W. Va., August 12. Z. T. Brantner, president of the association and a veteran of fifty years' service, who is superintendent of shops at Martinsburg, W. Va., has charge of the celebration, for the Cumberland division veterans, who will be the hosts. This association has social and fraternal features, the membership including men of every grade of employment and from all branches of the railroad.

On the night of July 25 the ticket collector on a train of the St. Louis, Iron Mountain & Southern was robbed of \$20, in full view of the passengers; and the robbers, two of them, not masked, then stopped the train and leaped off in the darkness. The train was No. 105, eastbound, and the robbery occurred at Fort Gibson, Okla., about midnight. In the panic attending the appearance of the robbers, the trainmen put out the lights in the coaches, and the darkness is believed to have prevented further activities on the part of the robbers.

The safety bureau of the Union Pacific reports that during the year ending June 30, 1915, the road carried 4,550,949 passengers without a fatality to a passenger. Less than half as many employees of the road were killed during the year as in the fiscal year ending June 30, 1913, which was the last year before the bureau of safety was organized. In 1915 28 employees were killed, as compared with 59 in 1913. In 1915 4,537 employees were injured and in 1913 6,097 were injured. In 1915 229 passengers were injured, and in 1913 333 passengers were injured.

At Yaphank, Long Island, on July 21, a westbound express train of the Long Island Railroad, running about a mile a minute, struck a wagonload of gravel, drawn by a steam tractor, the driver of which was following the somewhat prevalent Long Island fashion of risking his life and his employer's property at a grade crossing by driving over the tracks when it was known that a train was approaching. The crossing has an automatic bell, which was ringing at the time of this narrow escape. The tractor and its two trailers made up a heavy gravel train, weighing 15 or 20 tons, and, says Mr. McCrea, general manager of the road, in reporting the accident, might easily have made a fatal obstruction on the track. Had the train come along 20 seconds earlier, it would have struck the tractor itself, or the middle wagon. Mr. McCrea has complained to the Public Service Commission of the state, calling for relief; but that body replies that it has no authority over traffic on the highway. In this case the tractor was being run by a negro who had no license. It was owned by Frank Arrigoni & Brother, who were hauling gravel for road-building purposes.

The Department of Agriculture announces that Stuten County, New York, has been placed under quarantine on account of the discovery of foot and mouth disease in a herd of cattle near Hornell in that county. The counties of Onondaga, Oswego and Rensselaer and the stock yards at West Albany, as well as large areas in other States, have been released from quarantine. The entire State of Kentucky is now freed from quarantine, except that in the Bourbon Stock Yards at Louisville the management has arranged to limit the handling of animals intended for feeding, stocking and dairy purposes to the new sheep and

cattle division, in which no infection has existed. The same order frees the State of Wisconsin entirely, and reduces the quarantined area in Illinois, New Jersey and Pennsylvania. The status of Maryland, Massachusetts, Michigan and Virginia remains unchanged. An order effective August 2 reduces that portion of Hudson County, New Jersey, quarantined against the foot and mouth disease to an area lying within a three-mile radius of infected premises at Secaucus, near New York City. Allegheny County, Pennsylvania, is released from quarantine with the exception of the Pittsburgh Union Stock Yards at Pittsburgh. Philadelphia County is released with the exception that the West Philadelphia Stock Yards, and that portion of the county lying south of Washington Avenue, Philadelphia, and between the Delaware and Schuylkill Rivers remain under quarantine. The counties of Cook and Lee are the only remaining areas still under quarantine in Illinois.

The Gollos Automatic Stop

The operation of the Gollos automatic train control was demonstrated on the Chicago, Burlington & Quincy, between Sugar Grove, Ill., and Big Rock, on August 3 and 4. A special train carrying officers of the company and a number of representatives of the signal and operating departments of central and western roads left Aurora at 12:30 p.m. each day, returning about 4:30 p.m. The installation over which the demonstration run was made is 6 mi. long and includes 8 ramp locations for westbound movements and 10 for eastbound, on a single-track line.

The system is of the intermittent contact rail type, with the engine apparatus inoperative while running between points of indications. When the engine shoe makes contact with an energized contact rail the engine apparatus is still held inoperative. When a train is standing, the apparatus is in such a condition that the train can proceed only at a predetermined reduced speed. When the engineman opens the throttle, a whistle in the cab is automatically started, which continues to sound until the engine shoe engages a clear contact rail. This rail being fully energized, supplies the current which actuates the control in the cab to permit the train to proceed at full speed, and also stops the whistle. The contact with this shoe is recorded by an automatic apparatus, and the contact also causes the lighting of a signal lamp in the cab. The passage of this rail is acknowledged by the engineman by pressing a button which puts out the lamp and records the fact on the automatic recorder. This is the usual procedure in passing a clear contact rail.

When the contact shoe engages a partially energized contact rail, indicating caution, the engine apparatus is again set for reduced speed and the whistle blows continuously. If, while passing through a block at caution speed, the train in the advance block has moved on, so that the next contact rail is in the clear condition, the cab system will be automatically turned to normal full-speed condition; but if the dangerous condition continues, the contact rail is de-energized and the train will be automatically stopped when the contact shoe strikes the de-energized rail. This stop is also recorded and a chime of two whistles is sounded to warn the engineman of the stop application. If the engineman desires to proceed he unlocks and opens a cabinet box which encloses the instruments and resets the automatic apparatus to caution or slow speed condition. Both the opening and closing of this cabinet and the resetting of the instruments are recorded automatically. He may now proceed at controlled reduced speed until he strikes a clear ramp.

If the engineman has observed a stop signal and stops his train before the engine shoe comes in contact with the de-energized rail, he may pass to the energized rail by holding down continuously a separate button until the rail is passed. The pressing of this button is also recorded and if he should attempt to pass a rail by pressing this button before the train has stopped, a stop application would result.

The functions of the system include automatic speed control

and an automatic train stop; a visible signal to indicate entrance to block section, an audible signal sounded continuously in a caution block; an audible signal sounded continuously in "danger" territory as distinguished from the audible caution signal; and an automatic record of the time a block is entered, the time of acceptance of signals by enginemen; automatic application of brakes when the engine passes a signal indicating stop; the opening of the cabinet to release train brakes; release of train brakes after automatic application, closing and automatic locking of cabinet to again secure integrity of the apparatus and non-interference, and permissible emergency passing of a signal at stop.

The system, which is controlled by the Gollos Railway Signal Supply Company of America, Chicago, was turned over to the Interstate Commerce Commission for tests on July 26.

Summary of Revenues and Expenses of Steam Roads

The Bureau of Railway Economics' summary of revenues and expenses and comments thereon for May, 1915, are as follows:

Net operating income of the railways of the United States for May increased \$63 per mile, or 31.9 per cent., as compared with May, 1914. This increase was due in the main to reductions in expenses, which have been effected in all parts of the country. In May, 1914, net operating income per mile was 27.9 per cent. less than in May, 1913.

Total operating revenues amounted to \$237,976,843, an increase from 1914 of \$380,044. Operating expenses were \$167,600,891, a decrease of \$13,787,085. Net operating revenue amounted to \$70,375,952, an increase of \$14,167,129. Taxes amounted to \$11,343,308, a decrease of \$557,253. This left \$58,976,635 for net operating income, available for rentals, interest on bonds, appro-

Total operating revenues of the southern railways per mile of line show a decrease of 6.6 per cent., operating expenses decreased 12.5 per cent., net operating revenue increased 12.1 per cent., taxes decreased 0.7 per cent., and operating income increased 14.7 per cent.

Total operating revenues of the western railways per mile of line show a decrease of 2.0 per cent., operating expenses decreased 7.2 per cent., net operating revenues increased 13.2 per cent., taxes decreased 7.7 per cent., and operating income increased 19.3 per cent.

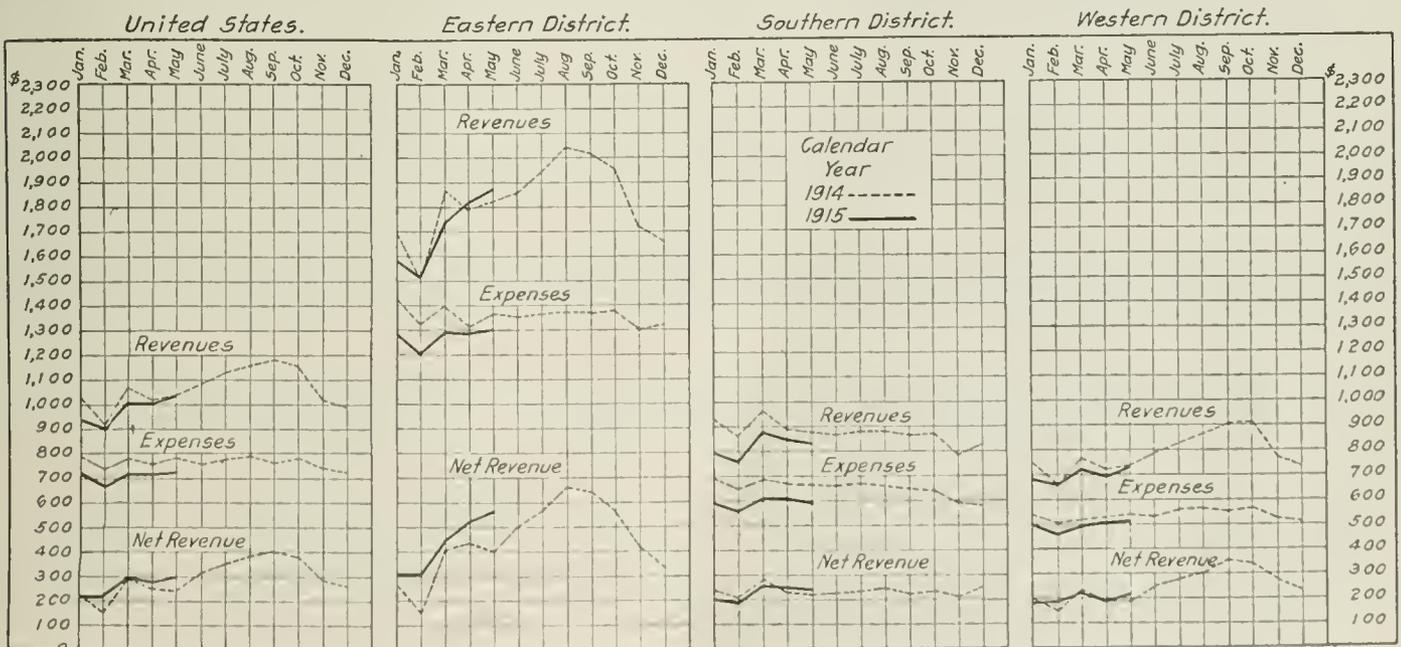

The eleven months of the current fiscal year show a decrease in total operating revenues per mile of line of 6.8 per cent., as compared with the corresponding period of the preceding year, a decrease in operating expenses per mile of 9.5 per cent., an increase in net operating revenue per mile of 0.3 per cent., a decrease in taxes per mile of 2.7 per cent., and an increase in net operating income per mile of 0.8 per cent.

The net operating income per mile increased 11.5 per cent. in the east, decreased 14.5 per cent. in the south, and decreased 2.1 per cent. in the west.

May net operating income per mile was 31.9 per cent. greater in 1915 than in 1914, 5.6 per cent. less than in 1913, 3.3 per cent. greater than in 1912, and 5.0 per cent. less than in 1911.

R. S. A. Convention Arrangements

The committee on arrangements of the Railway Signal Association has announced the completion of arrangements for a special train from Chicago to Salt Lake City for the convenience of members and guests attending the annual convention on September 14-16. The train, which will consist of a buffet-library-

Monthly Revenues and Expenses per Mile of Line in 1914 and 1915

provements for improvements and new construction, and dividends. Operating revenues per mile of line averaged \$1,040, a decrease of 0.8 per cent. This decrease per mile is due solely to an increase in mileage, amounting during the period to about 2,000 miles. Operating expenses averaged \$732, a decrease of 8.4 per cent.; net operating revenue per mile averaged \$308, an increase of 24.1 per cent., while taxes per mile were \$50, a decrease of 5.6 per cent. Net operating income was \$258, an increase of 31.9 per cent. Railways operating 228,818 miles of line are covered by this summary, or about 90 per cent. of the total mileage.

Total operating revenues of the eastern railways per mile of line show an increase of 2.7 per cent., as compared with May, 1914, operating expenses decreased 7.8 per cent., net operating revenue increased 40.1 per cent., taxes decreased 4.5 per cent., and operating income increased 51.6 per cent.

club car, open section compartment drawing room cars, diner and observation car, will leave Chicago over the Chicago & North Western on Saturday, September 11, at 11:55 p.m. It will arrive at Omaha, Sunday, September 12, at 1 p.m., and leave on the Union Pacific at 1:15 p.m., arriving at Ogden, Utah, on Monday, September 13, at 5 p.m., and leaving over the Oregon Short Line at 5:05 p.m., and will arrive at Salt Lake City at 6. It is suggested that those going from points west and southwest of Chicago, who are unable to join the train at Chicago, make arrangements to meet the party at Omaha, and that reservations be requested accordingly. The round trip fare from Chicago to Salt Lake City is \$15, including stopovers at any intermediate points within the final limit of October 31, 1915. The rate for lower berth in standard sleeping car between Chicago and Salt Lake City, one way, is \$8.50; upper berth, \$6.80; compartment, \$24;

REVENUES AND EXPENSES OF RAILWAYS

FISCAL YEAR ENDING JUNE 30, 1915

Table with columns: Name of road, Average mileage operated during period, Freight, Passenger, Total, Operating revenues, Maintenance of way and equipment, Traffic, Trans- portation, Miscellaneous, General, Total, Net operating revenues (or deficit), Railway accruals, Operating income (or loss), Increase (or decrease) comp. with last year.

drawing room, \$30. After the convention some of the members and guests will doubtless desire to make a tour of California to visit the expositions at San Francisco and San Diego. If a sufficient number desire to make this trip, one or more Pullman sleeping cars will leave Salt Lake City at 12:30 a.m., Friday, September 17, on the Oregon Short Line to Ogden, thence over the Southern Pacific to San Francisco, arriving there at 9:30 a.m., September 18. It is important that reservations for this trip be made as soon as possible with H. A. Gross, general agent, passenger department, Chicago & Northwestern, 48 South Clark street, Chicago, or W. D. Lifsey, New York Central, New York, and that C. C. Rosenberg, Sec.-Treas., Railway Signal Association, Bethlehem, Pa., be notified also.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, date of next or regular meetings, and places of meeting:

- AIR BRAKE ASSOCIATION.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 2-5, 1916, Atlanta, Ga.
- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontious, 455 Grand Central Station, Chicago.
- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next meeting, October 21-23, 1915, Boston, Mass.
- AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, Illinois Central, East St. Louis, Ill.
- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.
- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next meeting, August 19-20, 1915, San Francisco, Cal.
- AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 8 W. 40th St., New York. Annual convention, October 4-8, 1915, San Francisco, Cal.
- AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—H. G. McConnaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.
- AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPEFITTERS' ASSOCIATION.—W. E. Jones, C. & N. W., 3814 Fulton St., Chicago.
- AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next meeting, November 17, Chicago.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 19-21, 1915, Detroit, Mich.
- AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 21-23, 1916, Chicago.
- AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Building, Chicago. Annual meeting, June, 1916.
- AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—Owen D. Kinsey, Illinois Central, Chicago.
- AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 7-10, 1915, New York.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, Supt. Timber Preservation, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 18-26, 1916, Chicago.
- ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—E. R. Woodson, Rooms 1116-8, Woodward Bldg., Washington, D. C. Annual meeting, June 28, 1916, Detroit, Mich.
- ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Annual meeting, 2d Tuesday in October, 1915, New York.
- ASSOCIATION OF RAILWAY CLAIM AGENTS.—C. W. Egan, B. & O., Baltimore, Md. Next meeting, May 19, 1916, Atlantic City, N. J.
- ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Semi-annual meeting with Master Car Builders' and Master Mechanics' Associations. Annual meeting, October, 1915.
- ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 20-22, 1916, St. Paul, Minn.
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York. Next meeting, December 14-15, 1915, St. Louis, Mo.
- BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.
- FREIGHT CLAIM ASSOCIATION.—Warren P. Taylor, Traffic Manager, R. E. & P., Richmond, Va. Annual session, May 17, 1916, Washington, D. C.
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.
- INTERNATIONAL RAILWAY FUEL ASSOCIATION.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago.
- INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1126 W. Broadway, Winona, Minn.
- INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, C. H. & D., Lima, Ohio. Annual meeting, August 17, 1915, Philadelphia, Pa.
- MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next meeting, October 19-21, 1915, St. Louis, Mo.
- MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York.
- MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 14-16, 1915, Detroit, Mich.
- MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Building, Chicago. Annual meeting, June, 1916.
- NATIONAL RAILWAY APPLIANCE ASSOCIATION.—C. W. Kelly, 349 People's Gas Bldg., Chicago. Next convention, March, 1916, Chicago.
- NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.
- NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
- RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.
- RAILROAD MEN'S IMPROVEMENT SOCIETY.—J. B. Curran, Erie R. R., 50 Church St., New York. Meetings, alternate Thursdays, October to May. Assembly Rooms of Trunk Line Association, 143 Liberty St., New York.
- RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December, 1915, Waldorf-Astoria Hotel, New York.
- RAILWAY CLUB OF PITTSBURGH.—J. B. Anlerson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.
- RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1063 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.
- RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Next meeting, October 5-7, 1915, Chicago.
- RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Annual meeting, September 14-17, 1915, Salt Lake City, Utah.
- RAILWAY STOREKEEPER'S ASSOCIATION.—J. P. Murphy, N. Y. C. R. R., Box C, Collingwood, Ohio.
- RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Corway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders and Master Mechanics' Associations.
- RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.
- RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.
- ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Annual meeting, September 14-16, 1915, Chicago.
- ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
- SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.
- SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.
- SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, C. R. I. & P., 1134 La Salle St. Sta., Chicago. Annual meeting, October 19-21, Colorado Springs, Col.
- SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. R. R., Atlanta, Ga. Annual meeting, January, 1916.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.
- TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Booddy House, Toledo.
- TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramappo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.
- TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.
- TRAFFIC CLUB OF NEWARK.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, 559 Broad St., Newark.
- TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Hotel Astor, New York.
- TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Agt., Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.
- TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., October to May. Annual meeting in November. Noonday meetings
- TRAIN DISPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7122 Stewart Ave., Chicago. Next convention, June 21, 1916, Toronto, Ont.
- TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.
- TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., East Buffalo, N. Y. Annual meeting, September 7-10, 1915, Chicago.
- UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.
- WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.
- WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Building, Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.
- WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

Traffic News

The summer meeting of the National Industrial Traffic League will be held in Toledo, Ohio, on September 9 and 10. The question of legislation to be urged at the next session of Congress is one of the important subjects to be considered.

At Pinner's Point, Norfolk, Va., the Southern Railway has made extensive additions to its stock pens and other facilities, to accommodate the present extensive export traffic in horses. The French government has recently bought 10,000 horses to be shipped through this port.

According to newspaper reports from Seattle, Frank Waterhouse & Co., of that city, have chartered seven vessels to transport 7,500 freight cars to Vladivostok for delivery to the Russian government. Six thousand cars are to be shipped from New York City through the Panama Canal and 1,500 are to be shipped from Puget Sound ports. The average capacity of the vessels chartered is 150 cars for each trip.

Plans are being made for conferences between the lumber interests and railroad traffic officers for the purpose of working out some changes in the lumber classification. A. Fletcher Marsh, chairman of the traffic committee of the National Hardwood Lumber Association, has sent out a circular letter to members of that association and other lumber interests, announcing that as the result of a conference with Eugene Morris, secretary of the Railroad Classification Committee and of the Central Freight Association, Mr. Morris will be glad to hear from the representatives of the influential lumber organizations of the country as to whether they prefer that the traffic representatives of the railroads should meet with the lumbermen first for local consideration of classifications, or whether a general conference should be called at which the lumbermen of the country could present to the railroads the question of classification. Each association is asked to advise Mr. Morris that such conferences would be of material benefit in ironing out certain questions and whether local conferences should or should not be first called. The letter states that many lumbermen have already strongly expressed the opinion that while lumbermen may not be able to agree on all matters they will all agree that they cannot stand an advance in freight rates, but should have help in being able to remove the largest amount of material from every acre logged.

The Continuous Railway Voyage

[From the New York Times.]

The Interstate Commerce Commission is as up-to-date as England in applying the doctrine of the continuous voyage. A shipment intended to move from Kansas to Oklahoma was not sent direct; it was shipped in the first place to another town in Kansas, and then was rebilled to Oklahoma at an interstate rate. The Commission declares that "first billing to an intermediate point of a shipment that is really intended to reach a destination beyond is simply a device for defeating the lawful through rate, and is unlawful." It would seem to require a mind reader, or a detective, to tell what the rates are in the numerous cases in which a combination of local rates can be used to make a rate lower than the interstate rate.

When such cases used to arise they were put down to original sin on the part of the railways. Now that rates are government made, the railways must carry at the lowest lawful rate, or fifty Commissions would want to know the reason why.

Imagine the dilemma of the Commission if it sought to apply the doctrine of continuous journey to passenger fares. At the present moment it costs \$6 for a round trip to Atlantic City from New York, but \$5 from towns across the river in New Jersey. Would it be lawful to sell a tunnel ticket to a traveler desiring to buy a \$5 ticket to the New Jersey abode of bliss? Would it be lawful for a railway in New Jersey to decline to sell a \$5 ticket if the buyer came from New York to get it? Must passengers and shippers file affidavits of intention when they apply for lawful and public rates?

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission has decided, in the complaint of the Mobile Cotton Exchange and others, that on or before October 1 next, rates by railroad for the transportation of export cotton must be no higher to Mobile than to Savannah or other South Atlantic ports or gulf ports. This order applies to points of origin in the territory lying east of the line of the Louisville & Nashville through Decatur, Birmingham and Montgomery. The carriers are also ordered to establish two scales of rates, one for shipside delivery, no higher than the present rate, and one for station delivery, which shall be at least 3 cents per 100 lbs. less than the shipside rate, and the shipside rate must apply to any dock in Mobile which is served by any of the roads which are defendants in this proceeding. The rate from a station in Mobile to a dock or wharf must be not over three cents per 100 lbs. The carriers are required also to issue through bills of lading to any dock in Mobile at which any of the defendant carriers make shipside delivery.

Rates on Ore from Baker, Ore.

Columbia Gold Mining Company v. Oregon-Washington Railroad & Navigation Company et al. Opinion by the Commission:

The Commission finds that the carrier has justified the cancellation of a joint rate on ore and concentrates in carloads from Baker, Ore., through Portland, Ore., to Tacoma, via the Northern Pacific from Portland, leaving applicable a combination rate based on Portland higher than the rate cancelled and also higher than the rate applying on the Oregon-Washington's through line. (35 I. C. C., 42.)

Rates on Low-Grade Cedar Logs

Nebraska Bridge Supply & Lumber Company v. Nashville, Chattanooga & St. Louis et al. Opinion by the Commission:

The commission finds that the rates on low-grade cedar logs in carloads from Burrows Switch, Guntersville, Stevenson, Huntsville, Bridgeport and Montague, Ala., and Belvidere and Jasper, Tenn., to Atlanta, Ga., are unreasonable to the extent that they exceed rates contemporaneously in effect on common logs in carloads from and to the same points. Rates for the future are prescribed accordingly. (34 I. C. C., 86.)

STATE COMMISSIONS

The Michigan Railroad Commission has authorized the Pere Marquette to discontinue the operation of trains on the Kalkaska branch from Spencer to Stratford, effective on August 14.

The Public Utility commissioners of New Jersey have denied the application of people in Long Branch, Asbury Park and other places for an order to require the Pennsylvania railroad to run more passenger trains between Trenton and the seacoast.

The Louisiana Railroad Commission has suspended its order of June 23 requiring the railroads of the state to report accidents on blanks identical with those used by the Interstate Commerce Commission. It appears that the Interstate Commerce Commission has adopted new forms, which the Louisiana Commission will consider more in detail before deciding to conform to the federal regulations.

The State Railroad Commission of Texas by a recent order requires the general free concentration of cotton. The order says: "Railroad companies are required to concentrate cotton and cotton linters, without additional charge, at the option of the owner or shipper, once at any available point in Texas in line of shipment from origin to destination, and a second time, without additional charge, at Houston, Beaumont or Aransas Pass, or at the port of destination, and before delivery at the wharf; and to carry the concentrated cotton or linters forward to ulti-

mate destination at the request of the owner or shipper, made during the season of shipment and not afterwards; it being understood that the identity of cotton or linters through concentrating point need not be maintained."

COURT NEWS

The Missouri Pacific has filed suit in the United States district court at Lincoln, Neb., to have the Nebraska two-cent fare law declared null and void.

The hearing before Judge Youmans, of the United States district court at Oklahoma City, on the application of the railroads for an injunction against the Oklahoma two-cent fare law was adjourned on July 31, until September 6, because the state was not ready to complete the cross-examination of certain of the railroad witnesses.

Traffic organizations of Sacramento, San Jose, Stockton and Santa Clara, Cal., have secured an order from the United States district court, at San Francisco, directing the United States government, the Interstate Commerce Commission and six railroads to show cause why an interlocutory injunction should not be entered to prohibit the taking effect of new tariffs filed by the railroads accordance with an order of the Interstate Commerce Commission under which the cities mentioned do not have the benefit of "terminal" rates.

Duties to Passengers at Stations—Excessive Damages

Action was brought against a railroad for injuries sustained while attempting to board a train at a flag station. While the plaintiff was trying to reach her coach she stumbled over a log and the jury awarded her punitive as well as compensatory damages. The trial judge had instructed the jury that she was a passenger, and that to a passenger a railroad owes the highest degree of care. It was held by the Arkansas Supreme Court, on appeal, that this instruction was improper, as placing too high a degree of care upon the defendant. A railroad is not liable for the same high degree of care in maintaining its station premises in safe condition as it is in maintaining roadbeds, tracks, cars, and other appliances in such conditions, where the highest degree of care is called for. Some of the decided cases seem to lose sight of this distinction. The evidence, at most, pointed to nothing more than negligence, and mere negligence, however gross, is not sufficient to warrant the infliction of punitive damages.—Chicago, R. I. & P. v. Owens (Ark.), 177 S. W. 8.

Consignor's Liability for Freight Charges

In an action against the consignors for freight charges the defense was that the goods were shipped on condition that the consignee should pay and the company had neglected to collect. The New York Appellate Division holds that testimony offered by the consignors of the company's agreement to accept the goods on condition of collecting the freight charges from the consignee was inadmissible, as being parol evidence tending to vary the terms of a written instrument, namely, the bill of lading. Nor did the mere fact that the charges were not to be prepaid establish an agreement on the part of the railroad to accept the goods on condition of collecting the freight charges from the consignee.—Pennsylvania v. Reifel (N. Y.), 154 N. Y. Supp. 203.

Liability for Injury to Passenger Shot by Another Passenger

A porter wrongfully assaulted a passenger, P., who, in the course of a prolonged struggle, shot at the porter and accidentally hit another passenger, J. In an action against the railroad for J's injuries, it was held by the Arkansas Supreme Court that the wrongful assault upon P. was the proximate cause thereof, rendering the railroad liable. The servants in charge of the train knew of the difficulty, and should have anticipated that injury might result to other passengers because of the conduct of the porter; and the railroad's duty required it to protect such other passengers from resultant injury whether inflicted by its servants in the assault, or unintentionally by the

assaulted passenger, in protecting himself against the wrongful assault of the servant.—St. Louis, I. M. & S. v. Jackson (Ark.), 177 S. W. 33.

Undercharging Passenger—Company May Recover Difference

A passenger bought a return trip ticket between Adams, N. Y., and New York city. The tariff rate was \$13.56, but through a mistake the agent charged only \$7.50. The passenger used the ticket and the railroad subsequently sued him for the difference. The defendant claimed misrepresentation on the part of the agent, inducing the defendant to buy. Under the decided cases, this would be no defense in regard to freight rates, and the Jefferson County Court holds that the same rule applies in passenger rates. The railroad has no option, but must demand and collect the tariff rates. New York Public Service Commission Law, section 31, provides that no common carrier shall receive compensation for transportation of passengers, freight or property less than authorized by the act. The company was therefore held entitled to recover the difference.—New York Central v. Shelmidine (N. Y.), 154 N. Y. Supp. 235.

Passenger Killed Resisting Arrest

A disturbance having arisen on a train, the conductor asked an officer to arrest one of the passengers. The passenger resisted arrest and was killed by the officer. Action was brought against the railroad for his death, on the theory that it was caused by the alleged false statement made by the conductor to the officer that the deceased had been making a disturbance. The Kentucky Court of Appeals held that, assuming it to be true that the conductor falsely stated to the officer that the deceased had been guilty of boisterous conduct, and requested the officer to arrest him, that was not the proximate or direct cause of the death. If the deceased had submitted to arrest, as it was his duty under the law to do, whether the charge against him was true or untrue, he would not have lost his life.—Chesapeake & O. v. Whitaker (Ky.), 177 S. W. 443.

No Duty to Guard Yards or Cars Against Children

Action was brought for the death of a seven-year-old boy found dead in a gondola car in the Northern Pacific's yard at Helena, Mont., the car door having fallen upon him. It was alleged that the car was out of repair, the appliances for keeping the door in place being broken or missing; and that because of this defect the car was a dangerous instrumentality, and because of its shape and the fact that large holes had been burned in its sides, it was unusually attractive to young children, and constituted an implied invitation to them to go on the company's property. This is the first time the Montana Supreme Court has had occasion to make direct application of the doctrine of the turntable cases. Every court, it said, which applies the turntable doctrine predicates liability upon the negligence of the landowner—his failure to discharge a duty which he owes to the injured person. Some of these courts treat the injured party as a trespasser, but excuse the trespass because he was tempted into the place of injury by the wrongful act of the landowner in maintaining the attractive nuisance. Others treat the injured child as rightfully upon the premises by virtue of an invitation impliedly given by the maintenance of the dangerous and attractive instrument; while others hold that a landowner who maintains on his premises an instrumentality of the character of its attractiveness to children of tender years, of its potentiality for harm, and the probability that such children will be attracted to it, shall not be heard to say that a child of that class, attracted to and injured by the device, was wrongfully where his childish instincts naturally led him to be. Under either theory of the doctrine, the court held that an instruction to the jury that if an owner of property maintains exposed thereon something which is peculiarly and unusually attractive to children, and such children are attracted by such thing, they are not trespassers, was erroneous, because it omitted the element of knowledge by the owner that the device was dangerous and alluring to children. Aside from the turntable doctrine, it was held that in the absence of a statute or ordinance requiring it, a railroad owes no duty to guard its yards or cars so as to prevent children from going on them, even if it has on previous occasions assumed such a duty.—Martin v. Northern Pacific (Mont.), 149 Pac. 89.

Railway Officers

Executive, Financial, Legal and Accounting

Charles L. Lowe, assistant secretary and assistant treasurer of the Chicago & North Western, has been appointed auditor of expenditures, with headquarters at Chicago, succeeding Dr. W. H. Stennett, deceased.

Osmer Charles Hill, whose appointment as general superintendent of the Kansas City Terminal Railway, with headquarters at Kansas City, Mo., has been announced, was born on May 7,

1873, at Hiram, Ohio. He was educated in the public schools and the academy at Hiawatha, Kan., and went one year to Washburn College at Topeka, Kan., and one year to the state university at Lawrence, Kan. He entered railway service on April 5, 1895, with the Chicago, Burlington & Quincy at Hannibal, Mo., and worked as brakeman until 1900 when he was made conductor. In 1903 he was made conductor and brakeman for the Wabash at Moberly, Mo., and in 1904 he was brakeman for the El Paso & North Eastern at El Paso, Tex. In the latter part of 1904 he returned

to the Chicago, Burlington & Quincy and worked as switch foreman at North St. Louis, Mo., until 1906, when he went with the Missouri, Kansas & Texas as conductor and brakeman at Parsons, Kan. In 1907 he again returned to the Chicago, Burlington & Quincy, this time as night yardmaster at St. Louis, Mo., and was subsequently general yardmaster at St. Joseph, Mo., from September, 1910, to January, 1913; general yardmaster at Kansas City, Mo., from January, 1913, to September, 1913; general yardmaster at Galesburg, Ill., from September, 1913, to January, 1915, and assistant superintendent at Kansas City, Mo., from January, 1914, to July, 1915, from which position he is now promoted.

Operating

E. C. Huffman, formerly assistant superintendent of the Sioux City division of the Great Northern, has been appointed superintendent of the Breckenridge division with headquarters at Breckenridge, Minn., and J. A. MacKinnon, superintendent at Willmar, Minn., has been transferred to the Sioux City division with headquarters at Sioux City, Iowa.

L. L. Brown, chief dispatcher of the Pacific system of the Southern Pacific at Sparks, Nev., has been appointed acting assistant superintendent succeeding George Geiger. F. P. Small has been appointed chief dispatcher at Sparks, Nev., vice Mr. Brown, and G. G. Porter has been appointed assistant chief dispatcher succeeding Mr. Small.

M. H. Cahill, superintendent of the Baltimore & Ohio at Baltimore has been appointed superintendent of the Cumberland division with headquarters at Cumberland, Md., succeeding C. Le French, deceased. P. C. Allen, superintendent at Philadelphia, succeeds Mr. Cahill, and S. T. Cantrell, formerly assistant superintendent at Cumberland, who has been serving as acting superintendent of the Cumberland division, has been transferred to Philadelphia to succeed Mr. Allen.

W. H. DuFrance, superintendent of the Louisiana division of the Texas & Pacific, has had his headquarters moved from Alexandria to New Orleans, La., and the New Orleans division, of which J. H. Elliott, recently appointed general super-

intendent, was division superintendent, has been divided between the Louisiana and the Eastern divisions, under the jurisdiction of Mr. DuFrance and of Mr. W. M. Lynch, superintendent of the Eastern division, with headquarters at Marshall, Texas.

C. A. Vermillion, superintendent of car service and telegraph of the Spokane, Portland & Seattle, with headquarters at Portland, Ore., has had his jurisdiction extended to include the Spokane & Inland Empire and the Great Northern Pacific Steamship Company. A. J. Davidson, superintendent of the Portland division, has had his jurisdiction extended to include the Vancouver division and the Oregon Trunk, succeeding F. A. Brainerd, who has been granted an indefinite leave of absence on account of ill health.

Traffic

W. B. Knight, chief of the tariff bureau of the Missouri Pacific-Iron Mountain system, has been appointed assistant freight traffic manager, with headquarters at St. Louis, Mo. The office of chief of tariff bureau is abolished.

Engineering and Rolling Stock

J. A. MacRae has been appointed mechanical engineer of the Louisville & Nashville with headquarters at the South Louisville shops, effective August 1.

Joseph Peter Heinzer has been temporarily appointed road foreman of engines of the Northern Pacific at Pasco, Wash., in place of Robert Erwin Wilkinson.

M. C. Blanchard, office engineer of the Atchison, Topeka & Santa Fe at Topeka, Kan., has been appointed engineer of the Eastern district, Eastern lines, with headquarters at Topeka, and E. H. Olson succeeds Mr. Blanchard.

Joseph Weidel has been appointed valuation engineer of the Atchison, Topeka & Santa Fe, with headquarters at Chicago, succeeding H. C. Phillips, who recently resigned to become assistant secretary of the president's conference committee on the federal valuation of railroads.

G. J. Bell, division engineer of the Atchison, Topeka & Santa Fe at Marceline, Mo., has been appointed engineer of the Western district, Eastern lines, with headquarters at Newton, Kan., W. C. Baisinger, division engineer at Chanute, Kan., succeeds Mr. Bell and H. A. Hatch succeeds Mr. Baisinger.

M. C. Bryan, division engineer of the Los Angeles division of the Atchison, Topeka & Santa Fe, Coast Lines, at San Bernardino, Cal., has been transferred to the Albuquerque division, with headquarters at Winslow, Ariz., and W. H. Oliver, division engineer at Needles, Cal., succeeds Mr. Bryan. W. L. Bradley, division engineer of the Valley division at Fresno, Cal., succeeds Mr. Oliver, and E. E. Ball, division engineer at Los Angeles, Cal., succeeds Mr. Bradley.

Purchasing

E. J. Price, traveling storekeeper of the St. Louis & San Francisco, has been appointed general storekeeper, with headquarters at Springfield, Mo., succeeding H. M. Powell, resigned, and R. A. Jacobs succeeds Mr. Price.

OBITUARY

J. J. Moran, formerly master mechanic of the Houston & Texas Central at Ennis, Tex., died on July 29, at Marlow, Okla., at the age of 66 years.

SWEDISH RAILWAY OPENED.—The Swedish State Railways have announced that the railroad from Karungi to Haparanda, on the Russian frontier, is open for traffic. It was previously necessary to make the journey by wagon.

IMPROVEMENTS AT GLASGOW QUEEN STREET STATION.—The North British Railway Company has entered upon a scheme of improvements at Queen Street Station, Glasgow, which will involve an expenditure of about \$200,000.

LIGHTING ITALIAN RAILWAY CARS.—The Italian Ministry for Posts and Telegraph, on December 26, 1914, made an agreement with the state railways for the electric lighting of all the mail cars and compartment cars used for the transportation of mails, and for the oil lighting of all mail cars provided with the proper apparatus, whether such cars are owned by the post office or the railways.

Equipment and Supplies

LOCOMOTIVE BUILDING

THE GILCHRIST-FORDNEY LUMBER COMPANY, Laurel, Miss., is in the market for a light locomotive.

THE RICHMOND, FREDERICKSBURG & POTOMAC, which was reported in the *Railway Age Gazette* of July 9 as being in the market for 6 Pacific type locomotives, has ordered these locomotives from the Baldwin Locomotive Works.

CAR BUILDING

THE NATURAL GUANO COMPANY, Aurora, Ill., is inquiring for two flat cars.

THE AMERICAN STEEL & WIRE COMPANY is said to be inquiring for 100 tank cars.

THE NEW YORK CENTRAL is said to be inquiring for 1,000 gondola cars for its own use.

THE NASHVILLE, CHATTANOOGA & ST. LOUIS is building 200 36-ft. box cars in its own shops.

THE CHESAPEAKE & OHIO has ordered 50 caboose cars from the American Car & Foundry Company.

THE CHICAGO GREAT WESTERN has ordered 500 reinforcing sills from the American Car & Foundry Company.

THE CUBAN CENTRAL has ordered 50 15-ton narrow-gage box cars and 25 15-ton flat cars from the Standard Steel Car Company.

THE GADSDEN CAR WORKS are reported to have ordered 600 center constructions from the Mount Vernon Car Manufacturing Company.

THE CINCINNATI, HAMILTON & DAYTON is said to have ordered 500 center constructions from the Haskell & Barker Car Company. This item has not been confirmed.

MACHINERY AND TOOLS

THE LEHIGH & NEW ENGLAND has issued specifications for 27 machine tools for its new shops at Pen Argyle.

SIGNALING

THE CHICAGO, BURLINGTON & QUINCY is installing automatic block signals between Savannah and Galena Junction, Ill.

Light Signals on the St. Paul

The Chicago, Milwaukee & St. Paul has placed an order with the Union Switch & Signal Company for material for 130 miles of single-track, automatic block signaling, which will be installed by company forces on the Rocky Mountain division in Montana, the district which is now being electrified. The installation will consist of changing two existing D. C. sections from Lennet to Three Forks, 78.5 mi., and from Piedmont to Butte Yard, 35.5 mi. over to A. C. operation and the addition of 16 mi. of new signaling from Butte Yard to Finlen. Semaphores will not be used, Union model 14, three-position, light signals having been adopted as being more readily adaptable to the adverse conditions due to the propulsion power line, which interferes somewhat with the view of engineers. The propulsion current will be 3,000 volts, D. C., taken from an overhead conductor. The signal feeder current will be 4,400-volt, single-phase, 60-cycles. The power for the signals will be secured from the electrification sub-stations, which will be located from 28 to 42 miles apart, the system being arranged so that power can be fed between such stations in either direction. Sectionalizing line switches will be installed in the signal power wires at the railroad stations, which are from four to nine miles apart. Impedance bonds of 500 amperes per rail capacity will be used except on the 2 per cent grade, where 1,500-ampere per rail bonds will be installed.

Supply Trade News

W. Van Ausdall, an electrical engineer of Cincinnati, Ohio, has been appointed superintendent of the C. & C. Electric & Manufacturing Company, Garwood, N. J.

The Canadian Car & Foundry Company, which has been working on an \$83,000,000 order for steels for some time is now reported to have received an additional order for \$71,000,000.

S. J. Turreff, heretofore superintendent of construction of the Federal Signal Company, Albany, N. Y., for its western district has been appointed office engineer with headquarters in New York.

Thomas Cantley, vice-president of the Nova Scotia Steel & Coal Company, Halifax, N. S., has been elected president of that company succeeding R. E. Harris who has resigned to become a member of the Nova Scotia Supreme Court. The vice-presidents of the company now are J. D. McGregor and D. W. Ross.

W. E. Moore, vice-president and general manager of the West Penn Traction properties, has resigned his position with the various West Penn companies to go into business under his own name, as consulting engineer, with an office in Pittsburgh. As Mr. Moore's successor has not yet been appointed, he will continue with the company until the staff can be reorganized.

The Spray Manufacturing Company, Boston, Mass., recently incorporated to construct spray cooling systems, gas scrubbers, odor and fume condensers, etc., has changed its name to the American Spray Company, as it will engage in general engineering work involved in the use of spray systems. The management of the company remains unchanged.

TRADE PUBLICATIONS

NATIONAL PIPE.—Bulletin No. 20, recently issued by the National Tube Company, Pittsburgh, Pa., is an index to bulletins 1 to 20 which have been issued by this company. The bulletin represents an index of considerable detail, the idea being to offer pipe information readily accessible to the reader. The last two pages of the bulletin give a detailed list of the bulletins to which reference is made.

CHICAGO GREAT WESTERN.—The passenger department has just issued an illustrated booklet entitled "Modernizing a Railroad," setting forth some of the various improvements effected by the railroad since its reorganization. These include the expenditure of some \$17,000,000 for installing new and heavier rails, double tracks, straightening, regrading and rebalasting the roadbed, building new bridges, purchasing new all-steel passenger cars and larger and heavier locomotives, automatic block signals, telephone train despatching, etc.

FIRE ALARM AND SIGNAL CALLS.—The McFell Signal Company, Chicago, Ill., has issued two folders describing several new types of the McFell fire alarm signal system, which are electrically operated and are designed for a variety of different uses. They also describe the McFell direct signal call system designed for communicating promptly with the members of the superintending force of a large plant or office building, whose duties call them to different parts of the establishment and who by this system can be readily located by the signal sounding in each department.

LOCOMOTIVES FOR PLANTATION SERVICE.—Record No. 80, recently issued by the Baldwin Locomotive Works, is devoted to the subject of locomotives for plantation service. In the booklet there are shown 29 different designs of locomotives suitable for this kind of work. They vary in type and capacity from light, four-coupled engines, suitable for switching service and short hauls, to large engines of the Consolidation type, which are qualified for road service. Information is given covering the hauling capacity of each locomotive illustrated, as well as the other principal general dimensions.

Railway Construction

ALAMANCE, DURHAM & ORANGE.—Graham, the county seat of Alamance county, N. C., and Thompson's township, according to report, have voted \$55,000 bonds to aid the construction of this electric line, which it is proposed to build from a point in North Carolina, southeast via Burlington, Graham and Haw River to Saxapahaw, thence east to Chapel Hill, and northeast to Durham, about 50 miles. Junius H. Harden, president, Burlington. (March 12, p. 493.)

CANADIAN GOVERNMENT RAILWAYS.—An officer writes that a contract has been awarded to the John W. McManus Company, Ltd., Memramcook, N. B., for the construction of a spur line of railway from a point on the main line of the Intercolonial, about 1.8 miles east of the station at Bathurst, N. B., to a point at or near the Bathurst Lumber Company's mills, a distance of a little over two miles. The contract is to be completed by October 1, 1915. C. B. Brown, chief engineer, Moncton, N. B.

FENTRESS & MORGAN.—This is the name of a line which is reported under construction from the head of Island Creek in Morgan county, Tennessee, to the confluence of Daddy Creek and Obed river, 3 miles. It is said that the line will be ultimately 18 miles long, and that it will traverse territory being developed by the Tennessee Mineral & Lumber Company, Harriman, Tenn. It connects with the Cincinnati, New Orleans & Texas Pacific at Nemo, Tenn.

FLORIDA, ALABAMA & GULF.—This line, which now connects with the Louisville & Nashville at Galliver, Fla., and runs north via Baker, Blackman and Wing to Falco, Ala., about 31 miles, will be extended to connect with the railroad of the Horseshoe Lumber Company, at Falco, over which it has been granted trackage rights. The railway will thus be enabled shortly to run its trains to Andalusia, Ala., 22 miles farther. Thomas A. Johnson, receiver, Pensacola, Fla.

GARYVILLE NORTHERN.—It is reported that the Lyon Cypress Lumber Company, Garyville, La., has chartered a railway by this name to build about 35 miles of line. The work will be done by company forces.

GEORGIA ROADS.—A proposition has been submitted to the Americus Chamber of Commerce by T. B. Ragan, president of the Hawkinsville & Western and others of Hawkinsville, Ga., to build a line between Americus, Ga., and Hawkinsville, as an extension of the proposed line to be built from Byromville west to Americus, about 25 miles, by the Georgia Lumber Company, Byromville, Ga. (See Americus, Flint River & Gains, July 2, p. 38.)

KANAWHA, GLEN JEAN & EASTERN.—A contract has been let to Board & Duffield, Charleston, W. Va., for building the Dun Loup branch of this line from the main line to the mines of the Dun Loup Coal & Coke Company at Dun Loup, one-half mile. Construction work is now under way, but track will not be laid before September 15. V. S. Veazey, chief engineer, Glen Jean, W. Va. (June 4, p. 1181.)

KANKAKEE & URBANA TRACTION.—This company will extend its line from Ludlow to Paxton, Ill., following the Illinois Central tracks. The contract for grading will probably be awarded about October 1. There will be one steel plate girder bridge.

KETTLE VALLEY RAILWAY.—This company has awarded a contract to A. Guthrie & Co., St. Paul, Minn., for the building of snowsheds on its line along the Coquilhalla river in the Hope Mountains. There will be about 7,500 lineal ft. of sheds, requiring about 13,000,000 ft. B.M. of timber. The work has been started.

MERIDIAN & DEEPWATER.—An officer writes that work on the construction of this railway, which is to be built from Meridian, Miss., east via Causeyville, Blankstown, Yantlev, Ala., and Pennington, to Murtlewood, will be resumed in December of this year. S. A. Neville, Meridian, Miss., is vice president. (September 15, 1911, p. 544.)

NEW YORK SUBWAYS.—The Public Service Commission, First district, has awarded contracts as follows: To Holbrook, Cabot & Rollins Corporation, the contract for Section No. 3 of Routes Nos. 4 and 36 of the Broadway subway in Manhattan; this section extends from 38th street northerly under Broadway to Times Square, thence northerly under Seventh avenue to 51st street. To Rodgers & Hagerty, Inc., for Section No. 3 of Route No. 12, of the Eastern Parkway subway in Brooklyn; this section extends from about Nostrand avenue easterly under Eastern Parkway to Buffalo avenue. To Post & McCord, Inc., for Section No. 1 of Route No. 49, the Culver elevated line in Brooklyn which extends from a point near 37th street over Gravesend avenue to a point near Bay Parkway or 22d avenue produced.

The Public Service Commission has laid out Route No. 61, providing for a new tunnel under the East River from 60th street, Manhattan, to the Queensboro Bridge Plaza in the Borough of Queens, where it will connect with the new rapid transit lines in that borough running to Astoria on the north and to Corona on the northeast. This action was taken in pursuance of resolutions adopted by the Board of Estimate and Apportionment, mentioned in this column last week, asking that the tunnel route be substituted for the original route over the Queensboro Bridge. The new route will be operated by the New York Municipal Railway Corporation in connection with the Broadway subway in Manhattan and the new lines in Queens, over which this company will have trackage rights. The Degnon Contracting Company proposed the change from the bridge to the tunnel and said it would submit a bid for its construction not to exceed \$4,500,000, and that it would agree to complete the work within two and one-half years.

Snare & Triest have submitted the lowest bid of \$611,563 for the station finish construction on sections No. 1 and No. 2 of the extension of the Queensboro subway from the Jamaica avenue to the Queensboro bridge Plaza.

PELIHAM & HAVANA.—A survey has been made and construction work is to be started soon, it is said, on an extension to be built from Darsey, Fla., southwest to Havana, about five miles. The company now operates a line from Cairo, Ga., southwest to Darsey, Fla., 19.3 miles.

SCRANTON & BINGHAMTON (Electric).—This company, it is said, plans to build an extension to its lines from Foster, Pa., to Brooklyn, a distance of about five miles.

TENNESSEE RAILWAY.—An officer writes that a contract has been awarded to the Harriman Construction Company, Harriman, Tenn., for the construction of an extension of the main line from Oneida, Tenn., toward Petros, 8 miles, with branch lines 3 miles in length. When this line is completed, but 3 miles more will be needed to carry it to Petros. The main line will have a maximum grade of 1.4 per cent., and a 14 deg. maximum curve. On the branch lines the maximum grade will be 3 per cent. and the maximum curve 16 degrees. There will be a number of timber bridges. The road expects to carry a large amount of coal and timber. It will, in all probability, be built for the most part by convict labor. C. W. Butts, chief engineer, Oneida, Tenn. (July 9, p. 81.)

TROY RIVER FRONT COMPANY, INC.—A company by this name has been incorporated to build a short railroad along the river front at Troy, N. Y. The company expects to apply for a franchise at the next meeting of the common council. The Hudson Navigation Company, Pier 32, North River, New York, is interested.

RAILWAY STRUCTURES

ARGENTINE, KAN.—On July 19 a car repair shed of the Atchison, Topeka & Santa Fe was destroyed by fire. There were also 24 cars destroyed and 12 cars damaged. The total estimated loss will not exceed \$50,000. The cause of the fire is unknown.

BUFFALO, N. Y.—The New York Central, it is reported, will build a reinforced concrete dock to cost \$30,000 on the Buffalo river adjoining the dock of the Eastern Grain & Elevator Company.

CHICAGO, ILL.—The Illinois Central will build an 11-stall brick turntable pit roundhouse and several other buildings at this place to cost about \$15,000. The contract has been awarded to Leyden-Ortseifen Company, Chicago.

DEERING, ILL.—The Chicago & Northwestern is taking figures on the rebuilding of the foundation of its three-track bascule bridge at this place.

EDDYSTONE, PA.—The Philadelphia & Reading has awarded the American Bridge Company a contract for fabricating and erecting a single track 67 feet single span through plate girder bridge over Eddystone avenue.

ISLAND CREEK, N. Y.—An officer write regarding the bridge to be built by the Delaware & Hudson over Island Creek, Albany county, N. Y., that plans are now before the Public Service Commission, Second district, but that these plans have not yet been passed upon.

KENSINGTON, ILL.—The Illinois Central has awarded a contract to the Railroad Water & Coal Handling Company, Chicago, for water facilities at this place. The work will include a pent stock, pipe lines, etc., and will cost about \$8,000.

KEWANEE, ILL.—The Chicago, Burlington & Quincy will build a one-story brick, tile roof passenger station at this place. The contract has been awarded to Joseph E. Nelson & Sons, of Kewanee.

MACON, GA.—The Georgia, Southern & Florida has awarded a contract to the David Shaw Company, Macon, for the remodeling of the company's general offices on Fifth and Plum streets, at a cost of \$10,000. J. A. Griffin, engineer, M. W. & S., Macon.

McMINNVILLE, TENN.—The Nashville, Chattanooga & St. Louis, it is said, will build a bridge at this point. The bridge will be 100 feet long, and will have a 60-foot steel girder with concrete foundations and reinforced concrete approaches. There will also be a 4-foot sidewalk on each side. H. McDonald, chief engineer, Nashville, Tenn.

NEW YORK.—The Public Service Commissions of the first and second districts have issued a joint order requiring the elimination of grade crossings over the New York Central and the New York, New Haven & Hartford at 241st and 242nd streets in the Borough of the Bronx. The tracks are to be shifted and a viaduct constructed over them so that the full effect of recent grade crossing improvements at Mount Vernon will be enjoyed.

READING, PA.—The city engineer of Reading has approved plans of the Philadelphia & Reading for three concrete bridges to be erected at Center avenue, Fourth street and Schuylkill avenue, to cost about \$75,000.

SAN ANTONIO, TEX.—The International & Great Northern has purchased 108 acres of land, 5 miles out of San Antonio, as a site for shops, yards and roundhouses. It is stated that approximately \$500,000 will be expended. The plans for the buildings have been drawn and work will be started soon. O. H. Crittenden, chief engineer, Houston, Tex.

SPARTANBURG, S. C.—The Southern Railway has authorized the remodeling and enlargement of its passenger station at Spartanburg, S. C., and bids for the work are now being asked. The changes include the rearrangement of tracks, some paving, the construction of umbrella sheds, a passenger subway, and an underground waiting room and a bridge to carry Church street across the tracks. The extension of the station will be of brick, on a stone base. It will have a tile roof, and its architecture will conform to that of the present building. There will be separate waiting rooms for white and colored passengers, there being connected with each of these rooms a men's smoking room and a women's retiring room. There will also be lunch rooms for both white and colored persons, a ticket office, telephone office, baggage room and mail room. The contract for the passenger subway was awarded some time ago, as noted in the *Railway Age Gazette* of April 16, 1915, page 871, to M. M. Elkan, Macon, Ga., and R. B. Tufts, Norfolk, Va., and it is reported that these contractors have also been awarded the contract for the construction of the concrete bridge on Church street over the tracks.

UTICA, N. Y.—The New York, Ontario & Western on July 19 started construction work with company forces on a five-stall engine house on Pleasant street in this city. The structure will cost \$12,500, and will be built of brick and concrete with a timber roof. J. H. Nuelle, chief engineer, Middletown, N. Y.

Railway Financial News

ARTESIAN BELT.—The contest over the control of this Texas road has resulted in the ousting of J. O. Terrell from the receivership by order of the Appellate Court at San Antonio. The railroad was built by the late Dr. F. C. Simmons, a patent medicine manufacturer of St. Louis, who owned a 250,000-acre ranch in the territory through which the line runs. Since the death of Dr. Simmons the road has been operated under the direction of the West Texas Bank and Trust Company, which is the executor of his estate. The appointment of Mr. Terrell as receiver was made recently by the district judge of McMullen county upon application of Boston stockholders. By the decision of the Appellate Court the property has again been placed in control of the West Texas Bank and Trust Company. The line extends from Macedonia, Texas, on the Sunset Central, south to Christine, 43 miles.

BOSTON & MAINE.—The Board of Directors on August 3 voted to join with the lines under lease to the road in an application to Governor Spaulding, of New Hampshire, for a special session of the Legislature of that State to consider a new bill for the reorganization of the Boston & Maine system.

CHICAGO & EASTERN ILLINOIS.—The following is the protective committee for the general consolidated and first mortgage 5 per cent. bonds: Harry Evans, chairman, president of the Continental Insurance Company; J. Howard Bagardus, secretary and treasurer of the Stamford Savings Bank of Stamford, Conn.; Herbert H. Dean, of Edward C. Smith & Co.; Samuel F. Streit, of H. T. Carey & Co., and Frank B. Weeks, of Middletown, Conn., ex-governor of Connecticut.

NEW YORK, NEW HAVEN & HARTFORD.—The attorney general complying with the order of the United States District Court, filed in court at New York, August 2, the bill of particulars asked for by the defendants in the suit of the government against 13 present and former directors of this road, charging conspiracy to monopolize interstate commerce. The document fills 63 printed pages, and is made up of 188 paragraphs. The most notable acts charged are those connected with the action of the directors of the railroad company in their management of steamboat lines on the Sound, and their alleged unreasonable acts in competition to drive out of business the Joy Steamship Company. Illegal acts are charged also in connection with the action of the Standard Oil Company and the Florida East Coast Railway in stifling steamship competition. The sending of steamships *Yale* and *Harvard* to the Pacific coast is declared to have been a part of the unlawful policy of the New Haven directors to monopolize water transportation in the East. Lewis Cass Ledyard, one of the directors, is charged with getting Mr. Mellen, in 1912, to write a letter deceiving the United States attorney.

The bill quotes a resolution said to have been adopted by the directors of the New Haven road April 17, 1913, which says:

"That no officer of the New Haven make any address or response to a toast or otherwise that shall in any way refer to the business of the company or its policies, or its prospects unless the same shall first have been submitted to and approved by the Executive Committee; that no officer give any information regarding the business of the company, its policies or prospects except through an authorized publicity department of the company provided for such purpose; direct interviews between officials of the company and representatives of the press being prohibited."

The bill states further that Director E. D. Robbins, before the return of the indictment under the Sherman law, cooperated with other directors in removing the books and records of the Billard Company to Canada and forming the "St. Lawrence Securities Company."

ROCK ISLAND COMPANY.—Vice Chancellor Emery, sitting in Newark on July 29, appointed Chauncey S. Parker, of Newark, receiver of the Rock Island Company.

ANNUAL REPORT

BROOKLYN RAPID TRANSIT CO.

BROOKLYN, N. Y., July 27, 1915.

PROGRESS OF WORK ON RAPID TRANSIT LINES UNDER CONTRACTS WITH THE CITY.

To the Stockholders of

The Brooklyn Rapid Transit Railway:

The passenger earnings of the system for the year ending June 30, 1915 (excluding for the purpose of this comparison the newly acquired Coney Island & Brooklyn Railroad Company's lines), failed for the first time in the history of the Brooklyn Rapid Transit Company to show a substantial increase over the passenger earnings of the preceding year, and instead there was a decrease. There were two main causes for this result:

First—The general depression in business and industry affecting Brooklyn as well as other portions of the country, reflected in a large number of men and women out of work and a tendency towards economy in expenditures.

Second—The very liberal increase in transfer facilities which went into effect on June 1, 1914, under order of the Public Service Commission, whereby the total number of transfer points on surface railroads in the system was increased from 721 to 1,008. The first year of operation under this order shows an increase of 10,552,274 transfer passengers carried, and a decrease of 2,141,700 cash passengers. This situation presented not merely a loss in revenue, but occasioned an increase in expense by reason of the increased service required for the transportation of the large number of additional transfer passengers.

The figures as given in the year's accounts, however, and as herewith reported, show an increase of \$869,437.06 in passenger and other earnings, due to the inclusion of the operations of the Coney Island & Brooklyn Railroad Company for the entire fiscal year as against six months' operation of those lines during the preceding fiscal year. The increase in operating expenses was \$965,828.71, of which \$456,018.38 (nearly half) was due to charges to maintenance of way and structure and maintenance of equipment, and \$267,551.52 to trainmen's wages.

Interest charges were reduced by the conversion of Refunding Bonds into stock, and were somewhat increased by rapid transit improvements placed in operation. The net result shows an increase of \$196,856.26 in net income, and in addition the system's reserves for depreciation were credited with \$256,384.55, as against a debit in the preceding year of \$53,190.75.

Dividends at the rate of 6 per cent. were paid on the amount of capital stock outstanding during the year, namely, \$74,520,000, leaving a surplus for the year over dividend requirements of \$1,045,243.12.

A summary of the financial results is given in the following table:

COMPARATIVE STATEMENT OF THE RESULTS OF THE OPERATIONS OF THE BROOKLYN RAPID TRANSIT SYSTEM FOR YEARS ENDING JUNE 30, 1915 AND 1914.

	1915.	1914.		Increase or Decrease.
Gross Earnings from Operation	\$26,427,686.66	\$25,558,249.60	+	\$869,437.06
Operating Expenses.....	14,960,381.37	13,994,552.66	+	965,828.71
Net Earnings from Operation	\$11,467,305.29	\$11,563,696.94	—	\$96,391.65
Income from other sources	438,715.01	451,771.65	—	13,056.64
Total Income	\$11,906,020.30	\$12,015,468.59	—	\$109,448.29
Less Taxes and Fixed Charges	6,393,459.18	6,699,763.73	—	306,304.55
Net Income	\$5,512,561.12	\$5,315,704.86	+	\$196,856.26
Surplus at Beginning of Year	9,732,588.50	7,904,606.63	+	1,827,981.87
Coney Island & Brooklyn R.R. Co.'s Surplus at Time of Acquisition.....		506,625.76	—	506,625.76
Total	\$15,245,149.62	\$13,726,937.25	+	\$1,518,212.37
Other Credits to Surplus During Year:—				
Miscellaneous Items..	4,131.20	30,653.36	—	26,522.16
Settlement of B'klyn City R. R. Co.'s Suit		582,566.72	—	582,566.72
Sale of easement to B'klyn R'y Co.		738,986.59	—	738,986.59
Total	\$15,249,280.82	\$15,079,143.92	+	\$170,136.90
Of this amount there has been appropriated:				
Accounts written off..	12,327.56	2,315.30	+	10,012.26
Adjustment of Taxes prior years.....		10,801.78	—	10,801.78
Adjustment of Expenses prior years.....	35,088.74	*948.67	+	36,037.41
Supercession and Depreciation	45,062.12	174,339.01	—	129,276.89
Amount set aside as Reserve		1,500,000.00	—	1,500,000.00
Loss from operation of Employees' Restaurants	9,445.97		+	9,445.97
Loss from operation of Surface Cars over Man Bridge... ..	58,071.98		+	58,071.98
Dividend on B. R. T. Co.'s Stock outstanding	4,467,318.00	4,660,048.00	—	807,270.00
Total Appropriations.....	4,627,314.37	5,346,555.42	—	719,241.05
Balance Sheet Surplus..	\$10,621,966.45	\$9,732,588.50	+	\$889,377.95

*Credit

Under the contracts of March 19, 1913, between the City of New York and the New York Municipal Railway Corporation (a constituent company of the Brooklyn Rapid Transit System), the city is to expend upward of \$100,000,000 in the construction of rapid transit lines, and the Company is to expend in contribution toward the cost of such lines and in the equipment thereof, and in extensions, enlargements and reconstruction of existing rapid transit railroads, about \$65,000,000. The contracts contemplated that all of these new lines, and the extension and reconstruction of existing lines, should be completed and ready for operation on the first day of January, 1917. More than half of this period has now elapsed, and it looks as if the most important part of the enlarged system would not be ready for operation until a considerably later date than January 1, 1917. The chief line, in the consideration of net revenue, is, of course, the Broadway-Manhattan Subway, with its connections to Queens and Brooklyn. Rapid progress has been made on those sections between Trinity Place and 26th Street, some of them being nearly completed, and all are at least three-quarters built. In the case of the other section, however, the contractor is not required to finish until some months after January 1, 1917, and the so-called Times Square section has not yet been let. The Board of Estimate has decided to make the connection with the Queens lines by a tunnel under the river instead of over the Queensborough Bridge, which will mean further delay, and in the case of the East River tunnel from the Battery to Brooklyn the contractor has until January 16, 1918, to complete. There is no way of operating the Broadway Subway, even as to those sections which may be completed on scheduled time, until connections are ready for operation between this line and either Brooklyn or Queens, for there is no other way of getting equipment into the subway. Obviously, it will not be desirable to postpone the operation of the Broadway Subway until the East River Tunnel from the Battery to Brooklyn is ready for operation, or until the connection is made to Queens either over the reconstructed Queensborough Bridge or through a tunnel, and the only hope of obtaining even a partial operation of the Broadway Subway is by the speedy completion of the connection on Canal Street with the Manhattan Bridge, and the contractor for this section has until March 16, 1917, for the performance of his contract. If this short section could be completed in advance of the time stipulated in the contract, that portion of the Broadway Line between lower Manhattan and probably 34th Street could be placed in operation shortly after January 1, 1917.

The prospect, however, is that a large part of the city's investment in the Broadway Subway (probably not less than \$20,000,000) will remain idle, owing to the delay in letting contracts for certain sections, with the treble results of:

First, adding to the cost of construction by the interest on the idle investment;

Second, withholding from joint account the net revenue which would come from the operation of the line, and

Third, depriving the people of the improved means of transportation.

Moreover, no contract has yet been let for two comparatively short sections of subway which will connect the Brighton Beach Line with the Manhattan Bridge and Centre Street Loop—a simple extension of facilities which would be of great advantage to the six miles of tributary population between Prospect Park and Sheepshead Bay.

Nor has any contract been let for the 14th Street-Eastern Line, which will be of tremendous benefit to the people of the Eastern District of Brooklyn (now deprived of rapid transit). A portion of this route has not yet even been legalized.
